

NEWS NOTE

The Sénevet Collection at the Paris Museum*

The microscopic preparations belonging to G. Sénevet, a well known specialist of Diptera, Culicidae, have been deposited in the National Museum of Natural History by M. E. Abonnenc. The collection includes more than a thousand slides and includes especially the types of species described by G. Sénevet in the genera *Limatus*, *Wyeomyia*, *Culex* and *Anopheles*. It is necessary to note with regret that the mounting medium used has rendered a great number of preparations scarcely usable and the labelling of many others leaves something to be desired. The collection remains however, especially because of its types, a requisition for the Laboratory of Entomology of the Museum that is not negligible.

Loïe Matile

*Editor's Note: This item appeared in L'Entomologiste 32(3):145.1976 and is reproduced here as being of potential interest to many of our readers. I wish to thank Dr. Ronald A. Ward, Smithsonian Institution for calling it to our attention and Dr. David A. Young, Department of Entomology, North Carolina State University, for the translation.
