

EDITOR'S CORNER

During 1986 we will continue to recognize the accomplishments of scientists who have made outstanding contributions in mosquito systematics. In the next issue we will honor Elizabeth Marks, an Irish lady, who moved to Australia at an early age and grew up to become Australia's leading mosquito scientist.

Later in 1986 we will honor James B. Kitzmiller, who has contributed immensely to our knowledge of the genetics and cytogenetics of mosquitoes with over 150 publications on the subject.

Also in the coming year, we will continue to publish papers of broad interest from world wide contributors. The majority of our papers are short articles, but we also continue to receive monographs such as the recent "Mosquitoes of Argentina" and the excellent and useful "Mosquitoes of the Ryukyu Archipelago" which appears in the present issue.

We would like to encourage comments from our readers, which we would be happy to publish if appropriate (See Vol. 14(2): 135-137). Scientific Notes are also accepted and can generally be published very quickly. Waiting time for all accepted papers to be published is usually less than one year.

I would also like to remind our readers that membership in the AMCA is not necessary to publish in Mosquito Systematics and that we also have limited funds to publish worthy papers without cost to the author (See Instructions to Contributors in the journal).

At present we have slightly more than 300 subscribers. We would like to increase that number and hope that present subscribers will publicize the journal and help us to increase its circulation.
