

NOTES.

ON THE OCCURRENCE OF *PISIDIUM SUPINUM* IN THE LIVING STATE IN ENGLAND. (*Read 14th May, 1909.*)—In their paper read before this Society in December last Mr. J. E. Cooper and Mr. A. Loydell announced the re-discovery of *Pisidium supinum* living in the Thames at Hampton Wick and Twickenham, and in a tributary stream at Bedfont. Last meeting specimens collected in the Thames at Richmond by Mr. H. Overton were exhibited by me, and now I am able to show specimens from the collection of Mr. Charles Oldham from widely different localities, viz., Aylestone, near Leicester, where they were found in the canal close to the River Soar, and Kelsall, Cheshire, where they occurred in a pond. Mr. J. E. Cooper informs me that the species has also been identified by Mr. J. W. Taylor from a place near Lincoln. Mr. Oldham's specimens show slight variations in the hinge as compared with the Thames specimens, as might be expected from their quieter habitats. The Kelsall examples have a less massive hinge, while in those from Aylestone, although the hinge-plate is wider at the umbo than in the Thames forms, it is yet not quite so stout.

B. B. WOODWARD.

Woodward, Bernard Barham. 1909. "ON THE OCCURRENCE OF PISIDIUM SUPINUM IN THE LIVING STATE IN ENGLAND." *Proceedings of the Malacological Society of London* 8, 330–330.
