Abstract

Five species of aphids and new host records are added to the taxonomic list of the aphids of British Columbia.

INTRODUCTION

Thirteen previous lists of the aphids of British Columbia (Forbes, Frazer and MacCarthy 1973; Forbes, Frazer and Chan 1974; Forbes and Chan 1976, 1978, 1980, 1981, 1983, 1984, 1985, 1986a, 1986b, 1987; Forbes, Chan and Footitt 1982) recorded 392 species of aphids collected from 919 hosts or in traps. The records include 1764 aphid-host plant associations. The present list adds 5 aphid species (indicated with an asterisk in the list) and 279 aphid-host plant associations to the previous lists. One hundred and thirty-three of the new aphid-host plant associations are plant species not recorded before. The additions bring the number of known aphid species in British Columbia to 397. Aphids have now been collected from 1052 different host plants and the total number of aphid-host plant associations is 2043. The aphid names are listed alphabetically by species and are in conformity with Eastop and Hille Ris Lambers (1976), except *Sitobion dorsatum* (Richards) has been changed back to *Aulacorthum dorsatum* Richards based on karyotyping ($2n = 12$, R.L. Blackman, personal communication). Two new collection sites are tabulated in Table I. The location of each collection site can be determined from Table I or from the tables of localities in the previous papers. The reference points are the same as those shown on the map which accompanies the basic list (Forbes, Frazer and MacCarthy 1973).
