

## CONTRIBUTION TO THE LICHEN FLORA OF NORTH AMERICA<sup>1</sup>

VELI J. P. B. RÄSÄNEN

*Instructor in the Agricultural School, Kurkijoki, Finnland*

The lichens here described have been collected in the northern section of North America. Of these specimens, 18 are Alaskan, 60 from eastern Canada (New Brunswick, except one from Quebec), approximately 150 from western Canada (British Columbia and Alberta), and a few from the state of Wyoming.

The Alaskan lichens, 15 species in all, are largely the usual arctic ground lichens. The New Brunswick lichens, which comprise 46 species, come from around Dalhousie and were collected in the year 1930 by the agronomist Tapio Reijonen. *Usnea longissima* was collected near Franklin, Quebec, by Dr. Viljo Kujala in 1931 during his scientific journey. On this same journey, he collected in western Canada (120 species, varieties, and forms) and in Wyoming (6 species). The latter specimens come from the sandstone in a cactus desert.

The lichens from western Canada were collected by Dr. Viljo Kujala in various types of forest in British Columbia in the following localities: Jackman, Longworth, Aleza Lake, Prince George, Six Mile Lake (Trout Lake), Hazleton, Dorreen, Cowichan Lake (Vancouver Island), Kamloops, Fish Lake (near Kamloops), Blue River, Valemount, Golden, Field, and in Alberta in the vicinity of Lake Louise. The desert lichens come principally from the vicinity of Kamloops in British Columbia and from Wainwright in Alberta.

Although the same species have been encountered in several different localities, the total number of species, varieties, and forms is 171 with 5 entirely new species, as follows: *Usnea Kujalae*, *Placodium xanthostigmoideum*, *Nephromium canadense*, *Diploschistes canadensis*, and *Sphaerophorus Tuckermanii*.

The list further includes eleven new varieties and forms, as follows: *Usnea comosa* var. *stuppea*, *Alectoria sarmentosa* var. *gigantea*, *A. Fremontii* f. *perfertilis*, *Cetraria nigricans* var. *pallida*,

<sup>1</sup> Duplicates of most of the specimens have been deposited in the herbarium of the Missouri Botanical Garden.

Issued April 29, 1933.

*C. tenuifolia* var. *reticulata*, *C. tenuifolia* var. *pseudoislandica* f. *septentrionalis*, *C. juniperina* var. *canadensis*, *C. juniperina* var. *crispata*, *Parmelia elegantula* var. *americana*, *Cyanisticta Hookeri* var. *septentrionalis*, *Mycoblastus sanguinarius* var. *Dodgeanus*.

Species new to North America or otherwise noteworthy include the following: *Usnea lapponica*, *U. dasypoga*, *U. caucasica*, *U. prostrata*, *U. rugulosa*, *U. similis*, *Alectoria Fremontii* subsp. *olivacea*, *A. jubata* var. *Vrangiana*, *Ramalina Roesleri*, *Ochrolechia upsaliensis*, *Pertusaria xanthostoma*, *Physcia pyrithrocardia*, *P. muscigena* f. *squarrosa*, *P. endophoenicea*, *Peltigera Maurizii*, *P. canina* var. *suomensis*, *P. lepidophora*, *P. Nylanderi*, *Cetraria Merrillii*, *Parmelia Delavayi*, *Squamaria alphoplaca*, *Nephromium subparile*, *Lobaria oregana*, *Diploschistes bryophiloides*.

The lichens collected by Dr. Kujala are principally epiphytic and soil-lichens from a variety of forest types, although a few of the soil lichens come from fields or desert. It might be interesting to note here that in regions as widely separated and isolated as the North American prairies and the south Russian and Asiatic steppes and deserts there appear many identical, or, at least similar, lichen forms living on the ground. Such steppe lichens are: *Parmelia vagans* (appearing also in south Russia and Asia), *Physcia muscigena* (many forms, a few also growing in the mountains), *Acarospora Schleicheri* (appears in the Asiatic, North-African, and Russian steppes, in addition to the European Alps and Pyrenees),<sup>1</sup> *Psora decipiens* (also in deserts and mountains), *Diploschistes canadensis* (the similar Russian *D. scruposus* var. *terrestris*), *Ochrolechia upsaliensis* (sporadically found outside of the steppes), *Cladonia cariosa* var. *cribrosa* (particularly on other mineral substrates, slightly calciphile).

As the lichens in this collection were not collected by a lichenologist, the lichen flora of the various localities is very poorly represented and poor in species. They are, however, of particular interest to the European investigator on account of the many similar forms. The typical European *Cetraria juniperina* and *C. islandica* do not appear at all amongst the American lichen specimens (the latter also being absent from the "*Cetraria islandica*" specimens collected in Tierra del Fuego by Professor Auer's expedition in 1929).

<sup>1</sup> Magnusson, Monogr. *Acarospora*. p. 395, 1929.

As the lichens from the various localities have not been sufficiently collected, conclusions as to the relationship between the American and European species are still hypothetical, particularly as the present systematic revision of lichens necessitates many corrections of the earlier determinations. We can, however, state that as far as our present knowledge extends a great number of identical lichen forms appear both in North America and Eurasia, although the quantitative relationships between the different species differ considerably on the two sides of the Atlantic.

I wish to acknowledge with thanks Dr. C. W. Dodge, Mycologist to the Missouri Botanical Garden, who has kindly translated my manuscript from German to English, and T. Hidén, of Helsinki, Finnland, who has gone over the latin text of this work.

The sorediose form, named by Du Rietz (Arkiv f. Bot. 20<sup>11</sup>: 8. 1926) subsp. *Eriks-sonii*, was not seen among the North American specimens. It would appear more correct, as Du Rietz (*l. c.*) thinks, not to regard the sorediose form as the main species. My subspecies *olivacea* (Räsänen, Medd. Soc. Fauna Flora Fennica 43: 4.

1916) is much shinier than the North American type and has very rare apothecia, so that we have here three different *Alectoria* types.
