# An Infrageneric Classification for *Poa* in North America, and Other Notes on Sections, Species, and Subspecies of *Poa*, *Puccinellia*, and *Dissanthelium* (Poaceae)

#### Robert J. Soreng

Department of Botany, MRC-166, Smithsonian Institution, Washington, D.C. 20560, U.S.A.

ABSTRACT. An infrageneric classification for the genus Poa L. in North America, new taxa, combinations, names, hybrid status, and lectotypes are proposed for forthcoming treatments of the genus in the Americas. New names, combinations, and taxa are: Dissanthelium atropidiforme (Hackel) Soreng, D. atropidiforme var. patagonicum (Parodi) Soreng, D. calycinum subsp. mathewsii (Ball) Soreng, Poa sect. Alpinae (Hegetschweiler ex Nyman) Soreng, P. sect. Dasypoa (Pilger) Soreng, P. sect. Sylvestres V. L. Marsh ex Soreng, P. arnowiae Soreng, P. chambersii Soreng, P. tovari Soreng, P. unilateralis subsp. pachypholis (Piper) D. D. Keck ex Soreng, P.  $\times$ gaspensis Fernald, and Puccinellia atacamensis (Parodi) Soreng. Lectotypes are proposed for the following taxa: Dissanthelium sclerochloides Steudel ex E. Fournier, Poa [unranked] Arenariae Hegetschweiler, Poa [unranked] Caespitosae Fries ex Lange, Poa [unranked] Fasciculiferae Fries ex Lange, Poa [unranked] Glareosae Hegetschweiler, Poa [unranked] Hydrophilae Hegetschweiler, Poa [unranked] Macranthela K. Koch, Poa [unranked] Micranthela K. Koch, Poa [unranked] Stoloniferae Fries ex Lange, Poa [unranked] Subbulbosae Fries ex Andersson, Poa sect. Incanae V. Jirásek, Poa sect. Nervosae Rouy, Poa sect. Obsoletae Rouy, Poa sect. Spizopoa Dumortier.

In the course of working on Poa for North America (Soreng, 1985, 1990, 1991a, 1991b, 1986; Soreng & Hatch, 1983) it became apparent that the number of sections of *Poa* needed to be expanded, and the taxonomy of certain introduced Old World and circumboreal sections needed to be straightened out. Some of the changes proposed here stem from the results of chloroplast DNA (cpDNA) restriction site analyses for the genus. Other changes stem from a better understanding of the importance of the branching system to the taxonomy of Poa, and experience gained through having worked with the genus for 20 years. Physiographic divisions for distributions follow Takhtajan (1986). In addition, two new species are described, and five new combinations and one new name are proposed.

A. Two New Sections of Poa

Poa [subg. Poa] sect. Dasypoa (Pilger) Soreng, comb. et stat. nov. Basionym: Dasypoa Pilger, Bot. Jahrb. Syst. 25: 716. 1898. TYPE: Dasypoa tenuis Pilger (= Poa conglomerata Ruprecht ex Peyritsch).

Slender, caespitose, annuals or short-lived perennials, without rhizomes, to 30 cm tall; branching intravaginal; leaf sheaths weakly keeled to terete, not persisting on the plant for more than one season, without bulbous thickened bases, those of the uppermost culm leaves closed \(\frac{1}{4} - \frac{1}{5}\) their length; leaf blades thin, flat, lax, at most sparsely scabrous above, with two lengthwise adaxial grooves, one on either side of the central vascular bundle; panicles densely flowered, cylindrical, somewhat lobed; spikelets 2-3-flowered; lemmas mostly 1-3 mm long, strongly to obscurely 5-veined, strongly keeled, sparsely pubescent (rarely glabrous); florets with one or three tufts of hair on the callus (callus rarely glabrous); palea keels scabrous and sometimes strigose below; flowers perfect, with three anthers 0.3-0.5 mm long.

Species included: Poa conglomerata Ruprecht ex Peyritsch, of the volcanic highlands of central Mexico and Guatemala, and P. parviceps Hackel and P. scaberula Hooker f. (= P. conglomerata), Andean and Chile-Patagonian regions of South America and Tierra del Fuego.

Watson and Dallwitz (1992) placed the genus Dasypoa Pilger in tribe Aveneae, without explanation, whereas Clayton and Renvoize (1986) placed it in synonymy within Poa. Tzvelev (1989) recognized the genus as a member of his broadly defined tribe Poeae (including Aveneae). On morphological grounds the type of the genus, Dasypoa tenuis, cannot be distinguished from Poa. Poa conglomerata, which is not morphologically distinct from P. scaberula (under which D. tenuis has been synonymized in the past), shares derived cpDNA restriction sites with cpDNA "group IV" species (see section D, below), including sections Homalopoa,

188

Madropoa, and Dioicopoa (Soreng, 1990). For discussion and synonymy of South American species of P. sect. Dasypoa, see Parodi (1962) [excluding P. atacamensis Parodi, = Puccinellia sp. (see section F, below), and P. darwiniana Parodi]. As there is little or no difference between the North American P. conglomerata and the South American P. scaberula, there is no reason to treat them as distinct species. Although Parodi counted P. darwiniana of Tierra del Fuego among related species, I have reservations about including it in section Dasypoa. This species lacks any hair on the florets, the lemmas are abruptly and stoutly short-awned (a peculiar trait for *Poa*), the ligules are lacerated, and the abaxial surface of the blades are abundantly hispidulous and have more than two grooves. Poa darwiniana may be related to Poa flabellata Lamarck, P. cookii (Hooker f.) Hooker f., and P. ramosissima Hooker f. of the Antarctic Islands, but more study is needed of this set of taxa, and I am not yet convinced P. darwiniana belongs in Poa.

Poa [subg. Poa] sect. Sylvestres V. L. Marsh ex Soreng, sect. nov. TYPE: Poa sylvestris A. Gray.

Plantae perennes caespitosae; innovationes plerumque pseudointravaginales; culmi vaginis connatis ad ½0-apices; ligulae lacerae usque ad 4 mm longae; laminae planae sine pilis, apice non cucullato; panicularum rami scabri patuli, spiculis distalibus; callus arachnoideus (eo *P. autumnali* excepto); lemmae glabrae vel pubescentes, nervis lateralibus prominentibus, marginibus et apicibus anguste membranaceis pellucidis vel lactineis; flores hermaphroditi, antheris 0.5–2.0 mm longis.

Perennials; caespitose or rhizomatous (Poa kelloggii); shoots pseudointravaginal, or intravaginal (P. autumnalis), the pseudointravaginal prophylls mostly fused for more than half their length, and the first true shoot leaves usually without a developed blade; sheaths moderately to weakly keeled, those of the upper culm leaves with margins fused from  $\frac{1}{10}$  to over the whole length; ligules of upper leaves lacerate less than 4 mm long; leaf blades flat, soft, the tips acute, with costal and sometimes intercostal hooks, with one lengthwise adaxial groove on either side of the central vascular bundle, with prominent abaxial central nerves; panicles open, the main axis internodes elongate, over 3 cm long (except in *P. sylvestris*), the branches sparsely to densely scabrous on the angles, flowered in the distal ¼ (½); spikelets 2–3-flowered, the third rachilla internode often more than 1.0 mm long; lemmas strongly keeled, strongly 5-veined, the narrow hyaline apex and margins clear or whitish, often acuminate, but sometimes obtuse and blunt, usually glabrous throughout, less often sparsely villous only on the keel (*P. alsodes*), or pubescent on the keel and marginal nerves (*P. autumnalis* and *P. sylvestris*), and rarely between the nerves (*P. autumnalis* and *P. sylvestris*); callus with a single dorsal web of crinkled hairs (glabrous in *P. autumnalis*); flowers perfect, anthers 0.5–2.0 mm long.

Species included: Poa alsodes A. Gray, P. autumnalis Muhlenberg, P. kelloggii Vasey, P. marcida Hitchcock, P. saltuensis Fernald & Wiegand, P. sylvestris A. Gray. All the species are native to North America, principally occurring in the Atlantic Region, Appalachian Province, with a secondary distribution in the Coast Ranges of the Vancouverian Province of the Rocky Mountain Region.

Chloroplast DNA restriction site data (for *Poa* alsodes, P. autumnalis, and P. saltuensis) suggest that this group is old and early diverging within Poa (Soreng, 1990). Members of the section examined have distinctly different chloroplast restriction site patterns from other sections, except P. sect. Arctopoa (Grisebach) Tzvelev (Soreng, 1990). Poa sect. Sylvestres is morphologically and ecologically far removed from the arctic and mainly Asian, halophytic P. subg. Arctopoa. Members of P. sect. Sylvestres are primarily restricted to rich forest soils with a strong deciduous tree component. They occur in low mountains of eastern and far western North America, and are perhaps a relictual element of a mid-Tertiary vicariance event between North American and Laurasian Poa.

New cpDNA restriction site data suggest Poa marcida Hitchcock belongs to this group (Soreng, unpublished). Morphologically P. marcida and P. kelloggii Vasey are not separable from the eastern North American members of the section. Although P. bolanderi Scribner has similar spikelets and lacks pubescence on the lemma, it is excluded because it is an annual and has extravaginal branching. Despite the section's putatively early origin within the genus, the species do have the single web on the back of the callus, typical of many species of Poa, but absent outside the genus (with one exception; see comments under Dissanthelium in section F, below). The morphological boundaries of P. sect. Sylvestres blur into P. sect. Homalopoa, and to some extent P. sect. Oreinos Ascherson & Graebner. The following species are difficult to assign to these sections on morphology alone: P. autumnalis, P. chapmanniana Scribner, P. howellii Vasey & Scribner, P. laxiflora Buckley, P. leptocoma Trinius s. str., P. wolfii Scribner; more work is needed to understand the affinities of these species.

#### B. On Poa Section Dioicopoa

The infrageneric nomenclature and taxonomy of the following group need clarification of rank.

Poa [subg. Poa] sect. Dioicopoa (E. Desvaux)
Bentham, J. Linn. Soc., Bot. 19: 125. 1881.
Basionym: Poa [unranked] Dioicopoa E. Desvaux, in C. Gay, Flora of Chile, 6: 413. 1853.
Poa subg. Dioicopoa (E. Desvaux) J. R. Edmondson, J. Linn. Soc., Bot. 76: 331. 1978.
TYPE: Poa chilensis Trinius (= P. denudata
Steudel) (lectotype, designated by Keng (1959: 163)).

Species dioecious, different sex plants slightly dimorphic or not; perennials, rhizomatous or caespitose and sometimes with moderately bulbous thickened sheaths at the base of the plant; branching extra- and intravaginal; uppermost culm sheaths closed only near the base or up to 3/3 the length; leaf blades glabrous, flat or folded, with two lengthwise adaxial grooves, one on either side of the central vascular bundle; panicles dense, cylindrical to narrowly lanceolate or ovate, often somewhat lobed; spikelets numerous, crowded; lemmas strongly keeled, with long silky hairs on the keel and marginal and sometimes lateral veins, or glabrous, the pubescence of pistillate florets often much more abundant than that on staminate florets and always [?] present, lemmas of staminate florets sometimes glabrous; callus hairs long and plicate (not woolly as in most Poa, except in P. hubbardiana, where the copious hairs surround the callus but are still longer and more concentrated beneath the keel and marginal nerves, and P. bergii; rarely straight, except in P. pogonantha, and less so in P. tristigmatica), and, when present, originating in tufts from three points (below the keel, and below each marginal vein); anthers in staminate plants 1.5-3(4.5) mm long.

Species included: Poa alopecurus (Gaudichaud ex Mirbel) Kunth, P. arachnifera Torrey, P. arechavaletae Parodi, P. barrosiana Parodi, P. bergii Hieronymus and var. chubutensis Spegazzini, P. boecheri Parodi, P. boelckei Nicora, P. bonariensis (Lamarck) Kunth, P. buchtienii Hackel, P. calchaquiensis Hackel, P. chilensis Trinius (= P. denudata Steudel), P. commersonii Franchet (= P. rigidifolia Steudel), P. curva Nees (= P. tristigmatica E. Desvaux), P. decolorata Pilger (= P. resinulosa Nees ex Steudel), P. denudata Steudel, P. dolichophylla Hackel, P. dusenii Hackel, P. eligulata Hackel, P. fuegiana (Hooker f.) Hackel ex Dusén (= P. alopecurus subsp. fuegiana D. M. Moore & Doggett),

P. hubbardiana Parodi, P. ibari Philippi, P. iridifolia Hauman, P. lanigera Nees, P. lanuginosa Poiret, P. ligularis Nees, P. megalantha (Parodi) Herter, P. montevidensis Arechavaleta, P. nahuelhuapiensis Nicora, P. obvallata Steudel (= P. tristigmatica E. Desvaux), P. pachypogon Nees (= P. tristigmatica E. Desvaux), P. patagonica Philippi, P. patagonica var. neuquina Nicora, P. pedersenii Nicora, P. pilcomayensis Hackel, P. pilcomayensis var. calamagrostidea Hackel, P. poecila Philippi, P. pogonantha (Franchet) Parodi (= P. alopecurus subsp. fuegiana D. M. Moore & Doggett), P. prichardii Rendle, P. resinulosa Nees ex Steudel, P. reitzii Swallen, P. rigidifolia Steudel, P. schizantha Parodi, P. sellowii Nees, P. shuka (Spegazzini) Parodi, P. spiciformis (Steudel) Hauman & Parodi (= P. poecila Philippi), P. stuckertii (Hackel) Parodi, P. stuckertii var. megalantha Parodi (= P. megalantha (Parodi) Herter), P. subaristata Philippi (= P. tristigmatica E. Desvaux), P. superata Hackel, P. superbiens (Steudel) Hauman & Parodi, P. trachyantha Hackel, P. tristigmatica E. Desvaux, P. umbrosa Trinius (= P. sellowii Nees), P. uruguayensis Parodi, and P. vaginiflora Steudel (= P. denudata Steudel).

In caespitose species the sheaths at the bases of plants may be moderately bulbous and indurate. Upper culm leaf sheaths may be closed only near the base, or up to 3/3 their length. An unusually high degree of variation exists in the length that the sheath is open in many species of P. sect. Dioicopoa, when compared to most other species of Poa. This variation comes from the tendency of the sheath margins to fuse for irregular distances within the region of overlapping folds, whereas in most other species of *Poa* the margins fuse where they meet or just above the lower end of the overlap. The species of the section differ from the dioecious members of P. sect. Madropoa chiefly in the absence of adaxial pubescence on the leaf blades and the presence of three tufts of plicate hairs on the calluses of lemmas. Although there was no chloroplast DNA restriction site support for or against the monophyly of P. sect. Madropoa, restriction site analysis showed P. sect. Dioicopoa to be monophyletic and to be derived from the same group of species that gave rise to P. sect. Madropoa (Soreng, 1990, 1991a).

The section contains some 50 dioecious species mainly from the Chile-Patagonian Region of South America, and one from the southern Great Plains of North America (Anton & Connor, 1995). Poa arachnifera probably arrived in North America from South America, as its lower polyploid relatives occur there. The rank of section is preferable, since to treat Dioicopoa as a subgenus would make Poa

subg. Poa paraphyletic (Soreng, 1990). Poa subg. Poa, as recognized here, encompasses all species of Poa, except those belonging in P. subg. Arctopoa and P. subg. Andinae Nicora.

The formal rank of *Poa* [unranked] *Dioicopoa* E. Desvaux remained to be established until Bentham (1881) cited it as a section of Poa. Bentham stated that without more detailed study he could not divide the genus into natural groups, but several genera and sections had previously been proposed that apply to the genus Poa. Hackel (1887: 73) clearly applied it in the rank of section. Although Anton (1978) later took it up as Hackel's section, other authors used it as unranked or at the rank of subgenus. Nannfeldt (1935: 7) mistakenly began its use as a subgenus, citing Hackel as having "divided it into three subgenera, viz. Eupoa, Dioicopoa, and Pseudopoa." Parodi (1950: 182, apparently his first use of *Dioicopoa* with a stated rank), Torres (1970), and Nicora (1978) explicitly treated it as a subgenus, without citing the basionym. Edmondson (1978), inadvertently, but effectively, first validated it in the rank of subgenus.

Keng (1959) lectotypified *Poa* sect. *Dioicopoa* with *P. chilensis* Trinius. However, the two species he cited as members of the section from China (*P. pleurinodis* Keng ex Keng f. [= *P. grandis* Handel-Mazzetti], and a second species that remains a nomen nudum) are not dioecious, nor are they in my opinion directly allied to *Dioicopoa*. These two species are at least superficially close to species of the *P. nervosa* Vasey complex of North America in morphology, and also in apparently possessing a partially gynodioecious breeding system (Soreng & Hatch, 1983; Soreng, 1985).

Four South American dioecious species have thick, folded, rigid leaf blades, more like Poa sect. Madropoa than other species of section Dioicopoa, and lack a web on the lemma callus. Poa cumingii Trinius, P. hueca Parodi, P. holciformis J. Presl (including P. chilensis sensu E. Desvaux (not Trinius) and its var. robustior Philippi), and P. indigesta Parodi (the former three of Dioicopoa, "grupo Holicformes," Parodi, 1950: 182) seem better placed in P. sect. Madropoa. Poa cumingii (including Distichlis ammobia Philippi) may be closely allied to P. douglasii Nees of North America (Beetle, 1955; pers. obs.).

Also described as dioecious Poa from South America are: P. araucana Philippi, P. dialystostachya Philippi, P. gayana E. Desvaux, P. pallens Poiret, P. paposana Philippi, P. stachyodes Philippi, P. tricolor Nees ex Steudel, and P. valdiviana Philippi. I have not seen type or other material of P. araucana or P. valdiviana. The others are members

of *P.* sect. *Dioicopoa*, but may be synonymous with one or more of the above species. *Poa stachyodes* appears to be a staminate specimen of *P. dialytostachya*. *Poa paposana* may be the same as *P. buchtienii*, and if so would be an older name for that species.

Species belonging to *Poa* subg. *Andinae* and *P*. flabellata Lamarck and relatives are excluded from P. sect. Dioicopoa. Species of P. subg. Andinae are gynodioecious, and all have other morphological features unlike P. sect. Dioicopoa, including leaf blades with more than two adaxial grooves, and lemmas with a crown of hairs on their calluses, or glabrous calluses, rather than isolated tufts of hairs (except for *P. robusta*). Species of *P. sect. Dioicopoa* historically have been described in Arundo, Distichlis, Festuca, Koeleria, and Trisetum, as well as Poa, but I have not attempted to gather together heterogeneric synonyms. Moreover, the above listing of species included in the section is intended only as a summary of past usage. The section needs revision.

### C. On *Poa* Sections of Ascherson and Graebner

The correct names for some sections of Poa introduced from Europe need clarification. Ascherson and Graebner (1900) began their landmark treatment of *Poa* by discussing older classifications of Poa developed by Hegetschweiler (1838) and Nyman (1882), explicitly calling previously unranked taxa "Sectionen." Had they accepted these older names they would have effectively established previously unranked legitimate infrageneric names in the rank of section. However, they explicitly rejected those taxa and went on to produce their own classification for the genus, included elements of the older unranked groups within their own new sections, and did not mention those unranked groups of Hegetschweiler or Nyman again (with one exception; Poa [unranked] Vagantes Nyman (1882: 833), nom. nud., no type cited, was placed in P. sect. Ochlopoa Ascherson & Graebner, 1900). The dismissal of the groups of Hegetschweiler and Nyman in favor of their own sections was primarily a consequence of using the old circumscription method versus the modern type method, as the older infrageneric taxa tended to be very heterogeneous (Ascherson & Graebner, 1900).

These older infrageneric taxa are reiterated here to clarify their status. Some are naked names, some are superfluous, some are untypified, and others are automatically typified. Several of these group names were accepted by Stapf (1896) and Lindman

(1926), but because those authors did not assign them rank they remained unranked. Lindman (1926) considered some of the older names to have priority over those of Ascherson and Graebner (1900).

The Hegetschweiler names are all listed with full citation in the classification for *Poa* in North America, section D, below, where their typification is also dealt with.

Poa [unranked] Alpinae Hegetschweiler ex Nyman: Hegetschweiler provided the description and Nyman the name.

Poa [unranked] Arenariae Hegetschweiler: Hegetschweiler's Arenariae is apparently a descriptive name, because it is not taken from any of the three homonyms, Poa arenaria Retzius, Lamarck, or Willdenow ex Sprengel, as none of those were included, nor are synonyms of any of those species included in the group. Arenariae initially included only P. bulbosa and P. concinna Gaudin (≡ P. perconcinna J. R. Edmondson), two members of the P. bulbosa complex, and one of these should be selected as the lectotype (see P. sect. Bolbophorum in section D, below).

Poa [unranked] Glareosae Hegetschweiler: Glareosae is not based on any name in Poa. Poa glareosa (Trinius) Kunth (= Eragrostis articulata (Shrank) Nees), from Brazil, is nomenclaturally, morphologically, and geographically unrelated to any of the species Hegetschweiler included in his group.

Poa [unranked] Hydrophilae Hegetschweiler: The name Hydrophilae might have been derived from P. hydrophila Thuillier ex Steudel (nom. inval., as a synonym of Poa serotina Ehrhart), or Poa hydrophila Persoon, both of which are synonyms of Poa palustris L. Hegetschweiler included P. palustris Hegetschweiler (hom. illeg., non L.) in his group and P. fertilis Hegetschweiler (hom. illeg., non Host), both of which are probably synonymous with P. palustris L. Although Hegetschweiler specified "nob." after each of the latter illegitimate species, it appears that he intended it in the sense of emended description, not as new species. Thus, it is possible to infer that P. hydrophila Persoon should be the automatic type of the group. However, as Hegetschweiler made no mention of that name, it seems appropriate to select one of the other included species as the lectotype (see synonymy under Poa sect. Pandemos in section D, below).

Poa [unranked] Nemorales Hegetschweiler: The automatic type is the same as the (later designated) lectotype for the older section, Poa sect. Stenopoa Dumortier, which has priority.

Poa [unranked] Pratenses Hegetschweiler: This

has as the automatic type the same species that is the automatic type of *Poa* sect. *Poa*.

Poa [unranked] Silvaticae Hegetschweiler ex Nyman: Hegetschweiler provided the description and Nyman the name. The automatic type is the same as the (later designated) lectotype for the older section, Poa sect. Homalopoa Dumortier, which has priority.

Ascherson and Graebner (1900) also mentioned three legitimate sections of Dumortier, but used only one of them in their formal classification. These were initially published as sections. Two of them were later lectotypified, and one lectotype is established in section D, below.

According to J. R. Edmondson (1975: 25), Ascherson and Graebner's (1900) ranks of infrageneric taxa are explicitly "indicated by means of a typographical convention of symbols, which was explained on the fly-leaf of the unbound parts of the Flora." Edmondson (1980) accepted these as Ascherson and Graebner's sections. In case there remains any doubt, Jirásek (1934, 1935a) also recognized these as Ascherson and Graebner's sections. Others (e.g., Tzvelev, 1972, 1974, 1976; Soreng, 1990), who were unaware of these fly-leaf notes, have considered Ascherson and Graebner's sections as unranked and attributed the rank of section to Jirásek (1935a).

Since there has been much confusion surrounding the ranks used by Ascherson and Graebner (1900) in the genus *Poa*, their classification is outlined below:

Poa subg. Eupoa Hackel 1889 (Ascherson & Graebner, 1900: 387) (nom. superfl.,  $\equiv Poa$  subg. Poa).

(Unranked?) Leptoneurae Döll, Fl. Baden 1: 172. 1855 (Ascherson & Graebner, 1900: 387).

Poa sect. Ochlopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 387. 1900 (species 1) TYPE: Poa annua L. (Ascherson & Graebner included: Poa [unranked] Annuae Fries ex Andersson, Pl. Scand. Gram. 47. 1852; Döll, Fl. Baden 172. 1855).

Poa sect. Bolbophorum Ascherson & Graebner, Syn. Mitteleur. Fl. 391. 1900.

Gesammtart *Poa bulbosa* L. (Ascherson & Graebner, 1900: 391; species 2–6).

Poa sect. Oreinos Ascherson & Graebner, Syn. Mitteleur. Fl. 400. 1900.

Gesammtart *Poa laxa* Haenke (Ascherson & Graebner, 1900: 401; species 7–8).

Poa sect. Cenisia Ascherson & Graebner, Syn.

Mitteleur. Fl. 404. 1900 (species 10). TYPE: *Poa cenisia* Allioni.

Poa sect. Glaucopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 405. 1900 (species 11). TYPE: Poa caesia Smith (= Poa sect. Stenopoa Dumortier).

Poa sect. Hylopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 406. 1900 (≡ Poa sect. Stenopoa Dumortier).

Gesammtart *Poa nemoralis* L. (Ascherson & Graebner, 1900: 407; species 12–14).

Poa sect. Tichopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 419. 1900 (species 15). TYPE: Poa compressa L.

Hybrid (Ascherson & Graebner, 1900: 421; species 16).

(Unranked?) Pachyneurae Ascherson, Fl. Brand. I: 847. 1864. (Ascherson & Graebner, 1900: 422).

Poa sect. Homalopoa Dumortier, Observ. Gramin. Belg. 110, 113. 1823. (Ascherson & Graebner, 1900: 422; species 17–18).

Poa sect. Pandemos Ascherson & Graebner, Syn. Mitteleur. Fl. 425. 1900. Nom. superfl. as circumscribed.

Gesammtart *Poa trivialis* L. (Ascherson & Graebner, 1900: 425; species 19–20).

Poa pratensis L. (Ascherson & Graebner, 1900: 428, species 21) (in P. sect. Pandemos, but not in Gesammtart Poa trivialis).

Hybrid (Ascherson & Graebner, 1900: 434; species 22).

Poa sect. Pseudofestuca Ascherson & Graebner, Syn. Mitteleur. Fl. 434. 1900 (= Bellardiochloa Chiovenda). TYPE: Poa violacea Bellardi (= B. variegata (Lamarck) Kerguélen).

Poa subg. Psilantha (K. Koch) Boissier, Fl. Orient. 5: 599. 1883. Poa [unranked] Psilantha K. Koch, Linnaea 21: 405. 1848 (= Eragrostis Wolf). TYPE: Poa collina (Trinius) K. Koch (≡ Eragrostis collina Trinius).

Under each section with more than one species included, except *Homalopoa*, there is one "Gesammtart" species listed. The German word Gesammtart (spelled with one m today) means the whole, or in the broadest concept. I take this Gesammtart species to represent the authors' concerted effort to pin down the section name, and thus to be the automatic type. This argument is made stronger by the fact that the authors provided Greek names for their sections that are derived from the Latin Gesammtart species epithets. (Note: *Poa* sect.

Pseudofestuca and Poa subg. Psilantha belong to other genera.)

Although the *Poa bulbosa* and *P. alpina* groups have been placed as subsections of *P.* sect. *Poa* (Tzvelev, 1974, 1976), subsections of *P.* sect. *Bolbophorum* (Jirásek, 1935a), or together in *P.* sect. *Bolbophorum* (Ascherson & Graebner, 1900; Edmondson, 1978), molecular data suggest they are more remotely related within *Poa*, neither belonging to section *Poa* (Soreng, 1990; see cpDNA groups in section D, below). Thus, it is necessary to establish the correct names for the sections to which these species complexes belong, and this depends on the typification of *P.* sect. *Bolbophorum*.

It may be argued that *Poa* sect. *Bolbophorum* is automatically typified by *P. bulbosa* (D. Nicolson, pers. comm.), or not (R. Korf, pers. comm.). If this is automatic, as I have argued above, then the subsequent lectotypification by Edmondson (1978), on *P. alpina*, is contrary to the Code (Greuter et al., 1994) and should be rejected. In this case a new sectional name is needed for the *Poa alpina* complex.

If one does not accept that *Poa* sect. *Bolbophorum* is automatically typified, then the lectotype of *P. alpina* stands. In this case the *Poa bulbosa* complex would need a new sectional name.

It appears that Lindman (1926) was the next author to employ an infrageneric classification of *Poa*. This 26-year gap in the usage of infragenera in Poa is problematic in that other authors may have picked up any of these or additional sectional names in the meantime. However, I have searched many publications and not yet found intervening applications. In Lindman's outline of Poa infrageneric taxa, although one of Ascherson and Graebner's names was accepted, Bolbophorum species were divided among Arenariae and Alpinae. The rank was not explicitly stated by Lindman, and no new infrageneric combinations were made. Hermann (1939: 456) called the P. bulbosa group s. str., "Poa sect. Bulbopoa," but that name is invalid as it was published without Latin. As no other alternative sectional names are available for either taxon, I propose the following taxonomic treatment.

Poa sect. Bolbophorum Ascherson & Graebner, Syn. Mitteleur. Fl. 391. 1900. TYPE: Poa bulbosa L. [lectotypification on P. alpina L., by J. R. Edmondson (1978: 331) is rejected here as unnecessary and contrary to the original intent].

Synonyms: (see section D, below).

Densely caespitose perennials, without rhizomes;

internal sheaths at the base of shoots indurate, thickened, with accumulations of hemicellulose, bulbous; leaf blades thin, lax, tending to wither early in the season, with one lengthwise adaxial groove on either side of the central vascular bundle; lemmas strongly keeled, pubescent or glabrous, the callus with a single dorsal tuft of woolly hairs or glabrous; palea keels scabrous, sometimes pilose below; flowers perfect, anthers 1–2 mm long.

Species included: Poa akmanii Soreng, P. Hein & H. Scholz, P. bulbosa L., P. bactriana Roshevits, P. cephalonica H. Scholz, P. densa Troitsky, P. eigii Feinbrun, P. pelasgis H. Scholz, P. perconcinna J. R. Edmondson, P. perligularis H. Scholz, P. pitardiana H. Scholz, P. pseudobulbosa Bor, P. sinaica Steudel, P. timoleontis Heldrich ex Boissier, and P. vvedenskyi Drobow.

The species are mainly native to the Mediterranean Region, with a secondary center in the Irano-Turanian Region. *Poa bulbosa* is widely introduced. The species are generally early spring-flowering in the Mediterranean Region. Several comparative studies of leaf and root trans-sectional anatomy have been made that differentiate between *P. sect. Bolbophorum* and sect. *Alpinae* (Buschmann, 1942; Vukolov, 1928, 1929; Jirásek, 1935b).

Poa [subg. Poa] sect. Alpinae (Hegetschweiler ex Nyman) Soreng, comb. et stat. nov. Basionym: Poa [unranked] Alpinae Hegetschweiler [1838: 84, providing the description] ex Nyman, Consp. Fl. Eur., part 4, 835. 1882. TYPE: Poa alpina L.

Synonyms: (see section D, below).

Densely caespitose perennials, without rhizomes; branching intravaginal; sheaths strongly overlapping at the base, tending to persist for more than one season (not bulbous and thickened), those of the uppermost culm leaves closed over ca. ¼ the length; leaf blades flat or folded, strict, glabrous, with one lengthwise adaxial groove on either side of the central vascular bundle; lemmas pubescent, the callus generally glabrous; palea keels scabrous, sometimes villous in part; flowers perfect, the anthers 1.2–2 mm long.

Species included: Poa alpina L., P. badensis Haenke ex Willdenow, P. ligulata Boissier, P. media Schur, P. pumila Host, P. molinerii Balbis, P. thessala Boissier & Orphanides.

Although *P. alpina* is circumboreal in distribution, these are mainly mountain species of the Mediterranean Region, and mountainous European provinces of the Circumboreal Region.

## D. Infrageneric Classification for *Poa* in North America North of Mexico

Following is an outline of infrageneric taxa for *Poa* in North America. References to V. L. Marsh refer to unpublished names used in his 1950 dissertation and in Marsh (1952). Chloroplast DNA groups correspond to clades resolved using restriction site data (Soreng, 1990):

(cpDNA group I)

Poa subg. Arctopoa (Grisebach) Probatova, Novosti Sist. Vyss. Rast. 8: 34. 1971. Basionym: Glyceria sect. Arctopoa Grisebach, in Ledebour, Fl. Ross. 4: 392. TYPE: Poa glumeris Trinius (= P. eminens J. Presl).

Poa sect. Arctopoa (Grisebach) Tzvelev, Arktich. Fl. SSSR 2: 121. 1964. Basionym: Glyceria sect. Arctopoa Grisebach, in Ledebour, Fl. Ross. 4: 392. TYPE: Poa glumeris Trinius (= P. eminens J. Presl).

#### Poa subg. Poa

Poa sect. Sylvestres V. L. Marsh ex Soreng, Novon 8: 188. 1998. TYPE: Poa sylvestris A. Gray.

(cpDNA group II)

Poa sect. Alpinae (Hegetschweiler ex Nyman) Soreng, Novon 8: 193. 1998. Basionym: Poa [unranked] Alpinae Hegetschweiler ex Nyman, Consp. Fl. Eur., part 4, 835. 1882. TYPE: Poa alpina L.

Synonyms:

Poa subsect. Caespitosae V. Jirásek, Věstn. Král Ceské. Společn. Nauk, Tř. Mat.-Přír. 2: 3. 1935. TYPE: Poa alpina L. (lectotype, designated by Tzvelev (1974: 25)).

Poa ser. Alpinae Roshevits, Fl. URSS 2: 411. 1934. TYPE: Poa alpina L.

Poa [unranked] Subbulbosae Fries ex Andersson, Pl. Scand. Gram. (Fasc. 2) 45. 1852. TYPE: Poa alpina L. (lectotype, selected here).

(cpDNA group III)

Poa sect. Ochlopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 387. 1900. TYPE: Poa annua L.

Synonyms:

Poa [unranked] Micranthela K. Koch, Linnaea 21: 404. 1848. TYPE: Poa annua L. (lectotype, selected here).

Poa [unranked] Annuae Fries ex Andersson, Pl. Scand. Gram. 47. 1852. TYPE: Poa annua L.

#### (cpDNA group IV)

#### Poa sect. Poa. TYPE: Poa pratensis L.

#### Synonyms:

- Poa [unranked] Macranthela K. Koch, Linnaea 21: 404. 1848. TYPE: Poa pratensis L. (lectotype, selected here).
- Poa [unranked] Stoloniferae Fries ex Lange, Haandb. Danske Fl. 75. 1851. TYPE: Poa pratensis L. (lectotype, selected here).
- Poa sect. Cenisia Ascherson & Graebner, Syn. Mitteleur. Fl. 404. 1900. TYPE: Poa cenisia Allioni.
- Poa [unranked] Glareosae Hegetschweiler, Fl. Schweiz 86. 1838. TYPE: Poa distichophylla Gaudin (= P. cenisia Allioni) (lectotype, selected here; see section C, above). [The lectotype proposed by Keng (1959: 203) is rejected here because Poa polycolea Stapf was not among the original elements.]
- Poa [unranked] Pratenses Hegetschweiler, Fl. Schweiz 81. 1838. Nom. superfl. TYPE: Poa pratensis L.
- Poa sect. Incanae V. Jirásek, Věstn. Král Ceské. Společn. Nauk, Tř. Mat.-Přír. 2: 4. 1935. Nom. superfl. (included two previously published legitimate sections). TYPE: Poa cenisia Allioni (lectotype, selected here).
- Poa sect. Obsoletae Rouy, Fl. France 14: 267. 1913. TYPE: Poa pratensis L. (lectotype, selected here).
- Poa sect. Nervosae Rouy, Fl. France 14: 278. 1913. TYPE: Poa cenisia Allioni (lectotype, selected here).
- Poa sect. Spizopoa Dumortier, Observ. Gramin. Belg. 110, 111. 1823. TYPE: Poa pratensis L. (lectoty-pe, selected here).
- Poa sect. Homalopoa Dumortier, Observ. Gramin. Belg. 110, 113. 1823. TYPE: Poa chaixii Villars (lectotype, designated by Hermann (1939: 457)).

#### Synonyms:

- Poa [unranked] Silvaticae Hegetschweiler [1838: 80, providing the description] ex Nyman, Consp. Fl. Eur., part 4, 833. 1882. TYPE: Poa silvatica Chaix [non. Pollich] (≡ P. chaixii Villars).
- Poa sect. Diversipoa V. Jirásek & Chrtek, Preslia 34: 65. 1962. TYPE: Poa chapmanniana Scribner.
- Poa sect. Dioicopoa (E. Desvaux) Bentham, 1881: 125. Basionym: Poa [unranked] Dioicopoa E. Desvaux, Fl. Chil. 6: 413. 1853. Poa subg. Dioicopoa (E. Desvaux) J. R. Edmondson, J. Linn. Soc., Bot. 331. 1978. TYPE: Poa chilensis Trinius (= P. denudata) (lectotype, designated by Keng (1959: 163)).
- **Poa** sect. **Madropoa** Soreng, Syst. Bot. 16: 512. 1991. TYPE: *Poa piperi* Hitchcock.

- Poa subsect. Epiles Hitchcock ex Soreng, Syst. Bot. 16: 512, 513. 1991. Poa [unranked] Epiles Hitchcock, Man. Grasses U.S. 129. 1935. Nom. inval., description in English. TYPE: Poa epilis Scribner.
- **Poa** subsect. **Madropoa** Soreng, Phytologia 71: 410. 1991. TYPE: *Poa piperi* Hitchcock.

#### (cpDNA group V)

Poa sect. Pandemos Ascherson & Graebner, Syn. Mitteleur. Fl. 425. 1900. TYPE: Poa trivialis L.

#### Synonyms:

- Poa [unranked] Hydrophilae Hegetschweiler, Fl. Schweiz 81. 1838. TYPE: Poa trivialis L. (lectotype, selected here; see section C, above).
- Poa [unranked] Fasciculiferae Fries ex Lange, Haandb. Danske Fl. 74. 1851. TYPE: Poa trivialis L. (lectotype, selected here).
- Poa [unranked] Neurantha K. Koch, Linnaea 21: 405. 1848. TYPE: Poa trivialis L.
- Poa sect. Coenopoa Hylander, Bot. Not. 3: 354. 1953. Nom. superfl. TYPE: Poa trivialis L.
- Poa sect. Abbreviatae Nannfeldt ex Tzvelev, Novosti Sist. Vyssh. Rast. 11: 30. 1974. TYPE: Poa abbreviata R. Brown.
- Poa sect. Tichopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 419. 1900. TYPE: Poa compressa L.
- Poa sect. Oreinos Ascherson & Graebner, Syn. Mitteleur. Fl. 400. 1900. TYPE: Poa laxa Haenke.
- Poa sect. Stenopoa Dumortier, Observ. Gramin. Belg. 110, 112. 1823. TYPE: Poa nemoralis L. (lectotype, designated by Tzvelev (1972: 50)).

#### Synonyms:

- Poa [unranked] Nemorales Hegetschweiler, Fl. Schweiz 83. 1838. TYPE: Poa nemoralis L.
- Poa [unranked] Caespitosae Fries ex Lange, Haandb. Danske Fl. 51. 1851. TYPE: Poa nemoralis L. (lectotype, selected here).
- Poa sect. Glaucopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 405. 1900. TYPE: Poa caesia Smith.
- Poa sect. Hylopoa Ascherson & Graebner, Syn. Mitteleur. Fl. 406. 1900. Nom. superfl. TYPE: Poa nemoralis L.
- Poa sect. Bolbophorum Ascherson & Graeb-

ner, Syn. Mitteleur. Fl. 391. 1900. TYPE: *Poa bulbosa* L. [lectotypification on *P. alpina* L., by J. R. Edmondson (1978: 331), is rejected in section C, above].

#### Synonyms:

- Poa [unranked] Arenariae Hegetschweiler, Fl. Schweiz 87. 1838. TYPE: Poa bulbosa L. (lectotype, selected here).
- Poa subsect. Bulbosae V. Jirásek, Věstn. Král České. Společn. Nauk, Tř. Mat.-Přír. 2: 3. 1935. TYPE: Poa bulbosa I.

#### Synonyms:

- Poa [unranked] Nevadenses Hitchcock, Man. Grasses U.S. 136. 1935. Nom. inval., description in English.
- Poa [unranked] Scabrellae Hitchcock, Man. Grasses U.S. 134. 1935. Nom. inval., description in English.

#### E. Two New Species

Poa chambersii Soreng, sp. nov. TYPE: U.S.A. Oregon: W side of Cascade Mountains, 15 mi. SW of Oakridge, SE "Lane Co., Fairview Mountain, T. 23 S., R. 1 E., Sec. 11, 5900 ft, northwest side of the summit peak, . . . on steep open slope in pockets of soil on shelving rock. . . . Pistillate and staminate plants in separate clumps," 9 July 1993, K. L. Chambers 5746 (holotype, US; isotypes, K, OSC, WTU). Figure 1.

A Poa cusickii subsp. purpurascente rhizomatibus praesentibus, laminis omnibus planis (non involutis) laevibus sine pilis adaxialibus, floribus sexualiter fungentibus, dioeciis (non apomicticto-pistillatis cum antheris omnibus vestigialibus), plantarum staminatarum floribus antheris 1.8–3.7 mm longis praeditis differt.

Dioecious or gynodioecious; perennial, rhizomatous, branching extravaginal; culms from sparse tufts, often decumbent at the base, old sheaths persisting at base, 10–50 cm tall, with 0–2 nodes exposed; leaf sheaths weakly keeled, those of the uppermost culm leaves closed ca. ½–½; ligules of

uppermost culm leaves 0.5-2.0(-2.5) mm long, truncate to rounded, adaxially smooth; leaf blades 2.0-5.0 mm wide, moderately firm, flat or folded, those of the culm less than 8 cm long, the basal culm blades vestigial, the innovation blades flat, smooth and glabrous on both surfaces; panicle 2-9 cm long, loosely contracted, lanceolate to ovoid, erect, few-flowered (fewer than 30 spikelets), the branches 1-2 per node, ascending to little spreading, naked below, smooth or very sparsely scabrous, less than 3.5 cm long; spikelets with 2-7 florets, 6-12 mm long; glumes, 3-veined, 3.5-4.5 mm long, <sup>3</sup>/<sub>5</sub>−<sup>4</sup>/<sub>5</sub> the length of adjacent lemmas; callus sparsely webbed on at least some florets, infrequently all glabrous; lemmas 5-7 mm long, glabrous or villous on the keel and marginal veins over the lower 1/4, 5-7-veined; palea keels very sparsely scabrous; rachillas glabrous or sparsely scabrous; flowers unisexual; anthers 1.8-3.7 mm long in males and less than 1 mm long and early abortive in females; caryopses ca. 2 mm long, laterally compressed, flat adaxially, weakly keeled abaxially, yellowish brown, glabrous, endosperm solid, hilum round, ca. 0.3 mm diam.; lodicules two, ca. 0.6 mm long, broadly lanceolate, with a lateral lobe, glabrous.

The Steens Mountain plants are gynodioecious (vs. dioecious), somewhat tufted (vs. forming loose turf), with culms 10–33 cm tall (vs. 15–50), nodes exposed 0–1 (vs. 1–2), sheaths closed ½–½ their length (vs. ½–½), panicles 2–7 cm long (vs. 4–9), lemma calluses rarely webbed (vs. usually with a sparse, short web on at least some florets). They appear to represent a gynodioecious and more alpine race of the same species.

*Distribution*. Rich subalpine slopes, west side of the Cascade Mountains and alpine slopes of the Steens Mountain in Oregon. The species is at best infrequent in occurrence and probably should be considered rare.

The new species is named in honor of Kenton L. Chambers, Oregon botanist, teacher (from whom I took agrostology), and collector of the type.

Poa chambersii is considered to be a member of the P. nervosa complex. It is similar to those species but has smooth branches and a more condensed inflorescence. The other species (see list under P. arnowiae in section E, below) are partially gynodioecious, or, in the case of P. rhizomata Hitchcock, subdioecious. In the Cascade Mountains, P. chambersii appears to be dioecious, with an equal number of plants with fertile stamens and without them, but more detailed study of seed development and sex-ratios in the field are needed to confirm this. Population samples collected by D. H. Mansfield

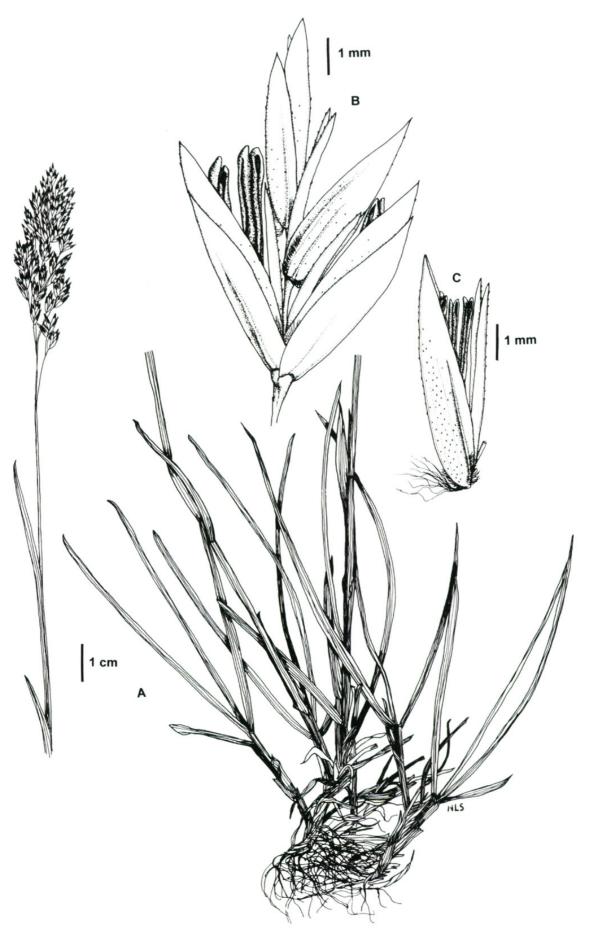

Figure 1. Poa chambersii Soreng, illustrated from an isotype collection (K. L. Chambers 5746, OSC). —A. Habit. —B. Spikelet. —C. Floret.

from the Steens Mountains yielded sex-ratios of 10 pistillate to 35 perfect-flowered individuals (95-75a), and 9 pistillate to 21 perfect-flowered individuals (95-78a), indicating gynodioecy occurs in that region.

The origin of the new species also requires additional study. The species was postulated to have been one of the parents of *Poa cusickii* Vasey subsp. purpurascens (Vasey) Soreng, with P. cusickii subsp. epilis (Scribner) W. A. Weber being the other (Soreng, 1986; discussed as a form of *P. rhizomata*). Poa chambersii is marginally distinct from P. cusickii subsp. purpurascens (Vasey) Soreng except that it is rhizomatous and sexually reproducing (producing staminate, hermaphroditic, and pistillate individuals, vs. strictly pistillate and apomictic) and has blades that are mainly flat and smooth (never involute and hairy above). Most material of P. cusickii subsp. purpurascens is caespitose, but some collections exhibit short lateral shoots, and a few clearly have rhizomes (e.g., Oregon: Marion Co., Breitenbush Lk., Peck 18734 (WILLU)). Most of the latter plants, however, have innovation blades that are involute and hairy to scabrous adaxially on and between the veins, and all plants are pistillate (herbarium sample size = 132 distinct specimens). Considering the evidence of intermediacy between P. chambersii and P. cusickii s.l., it might seem preferable to treat the new taxon as a subspecies of P. cusickii. However, the postulated independent origins of these taxa, putatively in different sections, makes this solution unsuitable.

The new species has been confused in herbaria with Poa rhizomata (specifically the Baker collections, see paratypes below), but its ligules are shorter (0.5-2.5 mm vs. 2-8 mm), sheaths more closed  $(\frac{1}{3})\frac{1}{2}\frac{1}{7}$  (vs.  $\frac{1}{3}\frac{1}{7}$ ), culm blades mostly flat, 2.0– 5.0 mm wide, the longest less than 8 cm in length, the apex broadly acute and smooth (vs. folded, 2.0-2.5 mm wide, the longest usually over 10 cm in length, the apex narrowly acute and scabrous), floret pubescence sparser or absent, the lemma keel sometimes glabrous, the callus web sparse and short or absent, the panicles loosely contracted, ovoid, erect, branches smooth or very sparsely scabrous (vs. open, nodding, the branches moderately densely scabrous), functional anthers 1.8-3.7 mm long (vs. 2.5–4). The Steens Mountains populations approach P. stebbinsii Soreng, except that plants are rhizomatous (vs. caespitose), the ligules are shorter and milky white (vs. long and hyaline), and the blades are flat and short (vs. involute and elongate), and the panicles are smooth (vs. scabrous).

Paratypes. U.S.A. Oregon: Lane Co., Fairview

Mountain, E slope, Calapooya Range, open rocky soil, 4 July 1948, W. H. Baker 5545 (OSC ♀, ♂, WILLU ♀, US♀); Fairview Mountain, Bohemia District, 14 July 1940, Baker 1898 (ID ♂), Baker 1896 (ID ♂), Baker 1897 (ID  $\eth$ ), N slope, Baker 1934, (ID  $\Im$ ), on top, Baker 1888 (ID 3); McKenzie Pass, 7 mi. W of summit of Cascade Mountains, 7 Aug. 1920, M. E. Peck 9823 (WILLU ♀); White Branch, stream bank, T. 16 S., R. 7 ½ E. Sec. 12, 3370 ft., 26 July 1938, L. E. Detling 3370 (ORE ♀); Harney Co., Steens Mountains, Kieger Rim, 8000 ft., 3 Aug. 1992, D. H. Mansfield 92-254, Little Blitzen Cirque, 8600 ft., 17 Aug. 1992, 92-666, 8700 ft., 18 Aug. 1992, 92-807, 8960 ft., 28 July 1992, 92-126, Little Blitzen Cirque, 9000 ft., dry rocky benches, 21 Sep. 1995, 95-76a, moist ground adjacent to receding snow banks 95-75a, 95-78a (all CIC, see population sex ratios above).

Poa arnowiae Soreng, sp. nov. TYPE: U.S.A. Utah: Utah Co., Provo, 8000 ft., 3 July 1894, M. E. Jones 5573 (holotype, US-914888 [with a fragment of the type of P. curta Rydberg, Tweedy 13 (ex NY)]; isotypes, DAV, GH, NY, RSA-100264, UC-157763, US-278718, WTU). Figure 2.

A *Poa wheeleri* [typum *P. curtae* Rydbergii, non auctor, includente] paniculis internodiis basalibus (3.5) 4–9 (13) cm longis, ramis plerumque deflexis, laminis planis sine pilis adaxialibus, vaginis et ligulis non dense scabris, pilis retrorsis carentibus, plantis partialiter gynodioeciis, floribus aliquis vel omnibus hermaphroditis, infrequenter omnibus pistillatis differt.

Partially gynodioecious; perennial, short rhizomatous; culms loosely tufted or solitary, erect or decumbent, 15-80 cm tall; leaf sheath smooth to sparsely scabrous, glabrous, keeled, the margins of the uppermost culm leaves closed ½-% their length; ligules 0.5-4 mm long, smooth or very sparsely scabrous abaxially, truncate to obtuse, the lower ones erose; culm leaf blades 2.5-6 mm wide, flat, smooth or sparsely scabrous adaxially and abaxially, glabrous, those of the uppermost culm leaves mostly 2.5–6 cm long; panicle (5–)12–22 cm long, open, sparse, longest lower internodes within a plant (3.5-)4-9(-13) cm long, the branches nearly glabrous to moderately scabrous, 2-3(-4) per node, some of the lower ones eventually reflexed; spikelets strongly compressed, with 2-6 florets, 5-9 mm long; glumes 1/4-3/4 the length of the lower lemma, the first glume 1-3-veined, the second 3veined; callus glabrous; lemmas 3-6.5 mm long, glabrous, sparsely hirsutulous (infrequently the keel and marginal veins sparsely villous, but never pilose between the veins); palea keels scabrous; rachillas smooth, the distal internodes more than 1 mm long; flowers all perfect, or pistillate and perfect mixed within the same spikelet and inflorescence, or all pistillate, functional anthers (1.3-)2-3.6 mm long.

Figure 2. Poa arnowiae Soreng, illustrated from an isotype collection (M. E. Jones 5573, US-278718). —A. Habit. —B. Spikelet.

Distribution. Southeast Idaho, northern Utah, western Wyoming. Flowering late spring to mid summer. Shady slopes and margins of meadows, in rich soil, under oak, maple, aspen, and spruce/fir forests, from upper sagebrush to subalpine, 1500–3300 m.

The type specimen of *Poa curta* Rydberg (Wyoming: Teton Co., Spread Cr., 9800 ft. [2900 m], July 1897, *F. Tweedy 13* [holotype NY]) has uppermost culm sheaths 46% closed, lower culm sheaths moderately densely retrorsely pubescent, their ligules ca. 1 mm long and pubescent; panicles 5.2–6.3 cm

long, lowest internodes 1.2–2.1 cm long, branches mostly ascending, flexuous, less than 2 cm, moderately scabrous on the angles, peduncles 18–19 cm long; spikelets to 6 mm long; florets all pistillate, the lemmas more or less evenly and sparsely scabrous. It is fully within the range of characteristics of *P. wheeleri* Vasev.

In Poa sect. Homalopoa, in the P. nervosa complex, a new description is required for Poa curta sensu auctore, non Rydberg (Soreng, 1985). The new species honors Lois Arnow, Utah botanist, who came to the same conclusion independently that the type of Poa curta Rydberg belongs to P. wheeleri Vasey [P. nervosa var. wheeleri (Vasey) C. L. Hitchcock], and not to P. curta in the sense of other authors. She presented a detailed description (slightly narrowed here to eliminate what I consider to be characteristics of hybrid individuals) and discussed the need for a new name (Arnow, 1987: 764, 767). Poa wheeleri and the type of P. curta, unlike P. arnowiae, have a more densely tufted habit, retrorsely puberulent to scabrous sheaths and ligules, the sheaths often more open, innovation blades folded and hairy above, panicles with internodes mostly less than 4 cm long, the branches ascending or spreading (infrequently reflexed). Poa wheeleri produces seed apomictically and autonomously, normally producing only pistillate flowers. Poa arnowiae apparently is sexually reproducing and partially gynodioecious, usually producing pollenbearing anthers, some plants with all flowers perfect and others bearing a mixture of perfect and pistillate flowers, infrequently all flowers on an inflorescence (or possibly a whole plant) pistillate. The two taxa apparently occasionally hybridize (Arnow, 1987; e.g., L. Arnow 6122 [UT]), but for the most part are readily distinguishable.

Poa arnowiae belongs to a group of partially gynodioecious species, the P. nervosa complex. Other members of the complex are P. cuspidata Nuttall from the central Appalachian Mountains, P. tracyi Vasey from the Southern Rocky Mountain Front Ranges, and P. nervosa (Hooker) Vasey, P. rhizomata Hitchcock, and P. chambersii Soreng from west of the Cascade Mountains. There appears to be a close relationship between these species and P. grandis of China (see section B, above). Poa wheeleri is thought to have originated as a hybrid between some member of this complex and a species of section Madropoa Soreng, P. cusickii being the most likely candidate (Soreng, 1991a).

Paratypes. U.S.A. Idaho: Teton Co., Victor, damp shaded soil near a stream, 11 July 1901, Merrill & Wilcox 213 (US). Utah: Wasatch Mountains, Manti Natl. Forest, Trinkler's Station, moist meadow, 8300 ft., 18 July 1908,

(US); Ogden, 1887, S. M. Tracy 356 (US). Wyoming: Jackson Hole, Cache Cr., 23 July 1926, A. S. Hitchcock 23118 (US; toward P. wheeleri in shorter inflorescences, to 11 cm long, and shorter inflorescence internodes, to 3.5 mm long, but with reflexed branches, nearly smooth sheaths, and looser habit).

F. New Names and Combinations in Poa, Puccinellia, and Dissanthelium

Poa unilateralis subsp. pachypholis (Piper) D. D. Keck ex Soreng, comb. et stat. nov. Basionym: Poa pachypholis Piper, Proc. Biol. Soc. Wash. 18: 146. 1905. TYPE: U.S.A. Washington: Pacific Co., Ilwaco, ocean bluffs, 22 June 1904, C. V. Piper 4900 (holotype, US-556775; isotypes, US-3151666, US-748809, US-923750).

Lemma keels pilose for  $\frac{1}{2}$ —4 the length, marginal and lateral veins pilose for about  $\frac{1}{2}$  the length, the callus of some florets within spikelets with hairs 0.2—0.5 mm long distributed around the base. Chromosome number 2n = 42.

Distribution. United States: Oregon (Newport, Peck 1613E), and Washington (Pacific Co., type locality).

Poa unilateralis subsp. unilateralis differs from subspecies pachypholis in that it has lemmas that are glabrous to ciliate on the margins, rarely sparsely pilose on the keel and marginal veins near the base, and glabrous between the veins, and also has calluses that are glabrous or infrequently with a minute crown of hair to 0.3 mm long. Its chromosome numbers are 2n=42, and 84. It has a more southerly distribution: United States: California (south to Monterey Co.) and Oregon (north to Tillamook Co., Netarts Bay).

#### Poa alpina L. × Poa pratensis L. s.l.

Poa ×gaspensis Fernald (pro sp.) Rhodora 31: 46.
f. 1. TYPE: Fernald & Collins 344 (holotype, GH; isotype, BH).

Perennial; culms from dense to loose tufts, erect or decumbent at the base, caespitose (rhizomatous or appearing rhizomatous in slumping soils), 15–50 cm tall; leaf sheaths of the uppermost culm leaves closed ¼–½, new shoots intra- and extravaginal, the old sheaths persisting; ligules 2–6 mm long, obtuse to acute; blades 1.5-3.5 mm wide, thin, flat; panicle 3-12 cm long, narrowly ovoid to lanceolate, erect, densely flowered, the branches 2-4 per node, ascending to spreading, flowered from above the middle, sparsely scabrous; spikelets with 3-4 florets, 3.5-6.0 mm long; glumes, the lower 3-veined, broadly lanceolate, sharply keeled, distinctly scabrous on the upper 1/3 of the keels; callus short webbed; lemmas 2.5-4.5 mm long, villous on the keel, lateral and marginal veins, puberulous between the veins; palea keels villous, glabrous between the keels; flowers perfect, anthers 1.2–1.4 mm long.

*Distribution.* Rocky or gravelly shores and slopes: Canada: Quebec (Gaspe Peninsula) south to Newfoundland (Labrador).

Poa ×gaspensis is a problematical taxon of suggested hybrid origin in the original publication (P. alpina × P. alpigena). It differs from P. alpina in its extravaginal branching and presence of a web; from P. pratensis in its acute ligules and more pubescent lemmas; from P. arctica in its sharply keeled and more scabrous glumes. It is quite vari-

able in form, with traits appearing to segregate in various combinations toward the putative parents. It does produce seed as well as spread vegetatively. This would be the same hybrid combination as *Poa* × herjedalica H. Smith, which has a suggested origin from *P. alpina* × *P. pratensis* s.l., but that taxon of northern Europe is strictly viviparous and more rhizomatous, and thus I hesitate to call it that.

Poa tovari Soreng, nom. nov. Replaced name: Poa geniculata Tovar, Publ. Mus. Hist. Nat. Lima, Ser. B. Bot. 32: 8. 1984; non Poa geniculata Durieu, Expl. Sci. Algerie 2: pl. 40, f. 4. 1849. TYPE: Peru. La Libertad: Prov. Contumaza, cerca Usquil, 3100 m, E. Anderson 1265 (holotype, US-2012876; isotype, US-2012877).

The new name honors Oscar Tovar, Peruvian agrostologist, who originally described the species.

Puccinellia atacamensis (Parodi) Soreng, comb. nov. Basionym: *Poa atacamensis* Parodi, Revista Argent. Agron. 29: 18. 1963. Nom. nov. Replaced name: *Poa nana* Philippi, Anales Mus. Nac. Chile Bot. 8: 87. 1891; non *Poa nana* Savi, Ann. Bot. (Usteri) 24: 49. 1800. TYPE: Chile. Ad Machua in aquis cresit [Tarapaca], *Philippi* [396] (type, fragment US-88754).

This species belongs in *Puccinellia*. It has the generic diagnostic features of hard opaque caryopses with oval hila (somewhat larger than in *Poa*), short broadly obtuse glumes, papillae over much of the epidermis, and open culm sheaths.

Dissanthelium atropidiforme (Hackel) Soreng, comb. nov. Basionym: *Poa atropidiformis* Hackel, Svenska Exped. Magell. 3(5): 224. 1900. TYPE: Chile. [Isla Grande de Tierra del Fuego] Hab. Fuegia Orientalis, Rio Cullen, Paramo, [1896 or 1897], *Bruno Ansorge s.n.* (type, fragment US-89697).

# Dissanthelium atropidiforme var. patagonicum (Parodi) Soreng, comb. nov. Basionym: Dissanthelium patagonicum Parodi, Physis (Buenos Aires) 8: 80. f. 7. 1925. Poa atropidiformis var. patagonica (Parodi) Nicora, Darwiniana 18: 97. 1973. TYPE: Argentina. Santa Cruz: [Rio Gallegos], 24 Dec. 1922, L. Dauber 180 (ho-

Spikelets of *Poa atropidiformis* var. *patagonica* are barely distinguishable from *Dissanthelium californicum* (Nuttall) Bentham. The former is, how-

lotype, BA; isotypes, SI, US-2947335).

ever, a tufted perennial with sclerophyllous leaves, and the latter is a slender annual with soft lax leaves. Poa atropidiformis var. atropidiformis has glabrous lemmas but is otherwise indistinguishable from variety patagonica. I believe P. atropidiformis is closer to other species of Dissanthelium than to any in Poa. Although both species infrequently have a web on the dorsal side of the callus, like that in Poa, I have seen a web in other species of Dissanthelium as well. The leaf blades of Dissanthelium are also like those in Poa in having only two grooves on the adaxial surface. In addition, the caryopses of Dissanthelium are hard and translucent, and have a punctiform hilum, as in Poa. In view of these features, it seems likely that Dissanthelium is either a sister group to Poa or an offshoot of it, and that the characteristic of glumes longer than the lowermost floret is once again found to be homoplasious between Poeae and Aveneae. It should be noted that several species of Poa also have glumes that are longer than their adjacent florets as in Dissanthelium.

Dissanthelium calycinum subsp. mathewsii (Ball) Soreng, comb. et stat. nov. Basionym: Deschampsia mathewsii Ball, J. Linn. Soc., Bot. 22: 60. 1885. Dissanthelium mathewsii (Ball) R. C. Foster & L. B. Smith, Phytologia 12 (5): 249. 1965. TYPE: Peru. Above Caspalta, 14000–14300 ft., 22 Apr. 1882, J. Ball s.n. (holotype, K, fragment US-908709 ex K; isotype, GH not seen).

Dissanthelium sclerochloides Steudel ex E. Fournier, Mexic. Pl. 2: 112. 1886. TYPE: Mexico. Nevado de Toluca, 1865–1866, M. Hahn s.n. (lectotype selected here, P, fragment US; isolectotype, P). SYNTYPES: Mexico. San Luis Potosi, Vierlet d'Aoust 1435 (P, fragment US ex P); Chile. Lechler 1832 (P).

Having examined all the Dissanthelium material at US I found it apparent that D. calycinum and D. mathewsii (including D. sclerochloides) overlap in their diagnostic features. The Mexican plants (previously known as D. sclerochloides) extend slightly into the morphological range of D. calycinum as delimited by Swallen and Tovar (1965) and Tovar (1993), and the Peruvian plants overlap well into the morphological range of the Mexican plants. However, considered together, the plants clearly exhibit a bimodal pattern of variation. All the Mexican material is considered to be subspecies mathewsii. Both subspecies are present in the Andes, but there subspecies *calycina* is the more common. Of the three specimens available for lectotypification of D. sclerochloides, the Hahn s.n. collection with the binomial written in Fournier's hand (the script verified by A. Lourteig, pers. comm.) is selected for the lectotype. The second *Hahn s.n.* collection was not annotated by Fournier, and the *Vierlet d'Aoust 1435* collection, although annotated by Fournier, is scanty and is mixed with *Poa annua*.

Acknowledgments. I thank Dan Nicolson, Gerrit Davidse, and Dick Korf for discussions concerning application of the Botanical Code; Ken Chambers for collection of the type material of his new species, and Donald Mansfield for the new collections from Steens Mountain; Nancy Soreng for the illustrations; Bill Dress for assistance with the Latin; reviewers including Paul Peterson, Dan Nicolson, Hildemar Scholz, and anonymous for their constructive comments; Alicia Lourteig for comments on syntypes borrowed from P; and the curators of OSC, NY, P, and US, who have loaned specimens for this project.
