

No 3. Winsham Terrace
Ilfracombe. England
Nov 16th 1884

I see no hope for Pactaceas
except someone properly qualified
would take it up. and do as
Dr Engelmann himself frequently
suggested to me. Study them.

de novo "on the spot". The European
collection would be more
confusing than helpful.

Engelmann collections sketches
& notes. would of course be
all important in determining
species. - I should hope that
eventually something might be
done in this direction at
Shaw's garden. which is the best
place. whenever the necessary funds
are available.

We are very comfortable here.
I found the equipment & pg at Kew too
much for me. your my

C.C. Parry

Dear Dr Gray

I have not as good
an excuse as you have for
hasty conclusions. being just now
far from a "busy" man. but I
prefer to write off hand where there
is a chance of correction.

There seems to be only a question
of dates to decide us in the
Auct. Hookeri = (X venulosa) S. I
suppose according to rule the
former must stand for the Mature
bush, but I cannot agree with
your ^{the} Hooker's description in Bk Beech
as done of A. parvum, or don't Bk 2
of A. Hookeri as all "clear"
being based only on leaf branches
and would apply as well to any
thing else. But the single specimen
I have seen in Natl Kew. "Beechey" is clear enough

So then while still insisting
that Nuttall's description is the best
and his name vouloisus the most
appropriate. It must stand only as
a synonym being sustained by
good Nuttallian specimens & by
Haworth. Say & Hosker.

I can only say as to the Kew Herb
that specimens undistinguishable
are marked in your hand writing
on one sheet. A. Hoskeri on another
A. pumila Nutt.

I am equally satisfied from
an examination of Nuttall specimens
of A. pumila in Kew Herb. &
British Museum. that it is
the same as my Lone Mt specimen
which I only mention not as
"authority" but because I have
seen & studied on the spot. and

Made complete specimens which
agree or far as I can see with
Nuttall's description, and which
you named for me A. Hoskeri. But
I am however quite inclined to
agree with you that it is var
A. pungens. but if so Nuttall's
A. pumila must go with it.
This is my final say on
this subject. only I hope that
in case you go to Monterey &
San Francisco next Spring as I
hope you may. It may be all
satisfactorily cleared up.
In this same connection. is there
not a probability that Nuttall's
specimens of A. bicolor marked "Monterey"
should not by some mistake or misnomer
have really come from San Diego. or San Pedro
for no one else has ever found it
so far North
