

Berkeley, Sept. 16. 1886.

Dear Mr. Watson. -

My stay among the S. Barbara Islands was protracted far beyond the time at first allotted, and I am just now returned.

My Stephanthi were easy to get at, and I have already laid aside for you specimens of both. To-morrow I must try to hunt out from the midst of my confused parcels the Euchichlitzas which Dr. Gray has asked for, put them in along with what I am sending you, and then, for the sake of your Crucifera, the parcel shall go, without waiting for many other things which you are to have if you desire them.

Let me say in behalf of my
Sepiaanthus Juratinus, that
you must not expect to find
the real character of the calyx
obvious, or even well perceptible
in dried specimens. This whole
group, for a cruiferous group, is
difficult to understand without
seeing the fresh flowers.

Regarding Cardamine cuneata
Mrs. Curran has replied. Then are
no specimens at all nearer
maturity than those I sent to
Cambridge at the first.

Your queries about Thelypodium
suglectum of Marcus Jones are
somewhat perplexing to me.

You say that - I say it is com-
mon in California. Jones
in his discussion of its merits
says it is found at San Francisco
+ Santa Cruz, and he does not
mention its occurrence in

Sept 16, 76

Arizona, whence, you say,
most of what you have under
that name comes. Again,
you ask Who has referred it
to Ischnurium? To which
I must reply, nobody that I
know of. I merely meant
to append it - as a synonym
of I. lasiosiphonum; for, from
Jones's description and habitat
it must be the same, and one
of the common, large forms with
petals not reflexed. The printer
has made perhaps a misleading
blunder in the atrocious way
in which he has made a
paragraph of I. neglectum, a
so made my comments
susceptible, perhaps, of being
read as if referring to Jones's
plant! Imagine that
name of his put in closely

as the last of the synonymy,
then here my remarks from
the paragraph + you will
understand me. I was
when the proofs could not
reach me, & so this piece
of awkwardness became fixed
beyond easy ~~for~~ rectification.
Of course, according to the
Benthamian opinion to which
you so unhesitatingly subscribe,
G. neglectum, Jones, is to be the
name for the species, provided
this plant is identical with
Sisymbrium reflexum.

I am as strongly on the side of
the party who are insisting that
the very first specific name
of a plant is to be used in
defiance of every other, save
when ~~it~~ it is already in use
in the genus to which a species
is transferred. On this some

Sept 16, '86

score I drop the Nuttallian specific name for Phanerous while retaining the genus. By the way, I must say I did not think and do not see how species of such different shape as those of Phanerous & Panzia can be admitted in the same genus of Cruciferæ.

One request and I will conclude.

I am sadly afraid I shall never see what your Thysanocarpus erectus is like unless you send me at least one samara, together with a pencil tracing of some part of a raceme. The last will show me the precise angle of divergence of the pedicels. Of course they can not be literally erect.

I have a little poor material
of a new one from S. Cruz, (+
I hope I shall find it - in
a few days) in which the
pedicels are straight, but
divaricate, not erect.

Please favor me in this
matter and believe me

Very Truly Yours

Edu. L. Greene
