

D. L. Adair

Office of CORRESPONDING SECRETARY  
OF

The North American Bee-Keeper's Society.

Hawesville, Ky. January 31 1873.

Prof. Asa Gray

THE First National Society of Bee-  
Keepers was organized at Indian-  
apolis, Ind., in December, 1870,  
under the name of North Ameri-  
can Bee-Keeper's Society—Rev.  
L. L. Langstroth, President—with a repre-  
sentation from fourteen States and Terri-  
tories.

In February, 1871, a rival Society met  
at Cincinnati, Ohio, of which Mr. Lang-  
stroth was also elected President. It had  
about the same representation, and took  
the name of American Bee-Keeper's As-  
sociation.

On the 6th day of December, 1871, both  
Associations met at Cleveland, O., formed  
a union under the name of "The North  
American Bee-Keeper's Society," and elected  
Mr. M. Quinby, of New York, Pres't.

The Second Annual Meeting of the  
Society was held at Indianapolis, Ind., on  
the 4th, 5th, and 6th days of December,  
1872. Rev. W. F. Clarke, of Ontario,  
Canada, was elected President; Rev. H.  
A. King, of New York, Secretary; D. L.  
Adair, of Kentucky, Corresponding Sec-  
retary; Hon. M. L. Dunlap, of Illinois,  
Treasurer, with Vice Presidents from 26  
States, Territories, and Provinces in which  
the Society has a membership.

The Third Annual Meeting will be held  
at the City of Louisville on the first Wed-  
nesday, Thursday, and Friday of Decem-  
ber 3d to 5th, 1873.

All persons interested in the develop-  
ment of the interesting science of Agricul-  
ture are solicited to attend.

Dear Sir. At the meeting of the  
North American Bee-Keeper's Society at  
Indianapolis in December, the ques-  
tion was asked, "Is there such a  
thing as honey?" and also, "What is  
honey?" Some very odd if not origin-  
al answers were elicited. (I send  
you a copy of the American Bee-Journal  
containing the Transactions.)

My object in writing to you is to get  
some information that I do not  
know where else I can find. And  
if it would not be taxing you too  
heavily I would like to have you  
write a short article on the elab-  
oration of sugar (sucrose) not only  
as it appears in the nectaries of  
the flowers but in the sap and  
fiber of plants, as we know it  
exudes from the leaves and young  
wood of the Linum (Lilia) and  
other trees, and is secreted in  
the cells of the sugar-cane, and

other plants. It is also produced by the sprouting or germination of many seeds, as in barley before malting.

The use I will make of the article will be to publish it in "The Annals of Bee Culture" for 1873, an annual publication I have been editing since 1869. I send you the last volume, with this that you may see the character of the work. You will see that it numbers among its contributors the most eminent Apiculturists and also some prominent Naturalists.

Bees use any and all of the sugars, and from them generate wax, rear their young and subsist, equally well.

Can you throw any light on the process by which the different species of *Aphis* produce what is called honey dew, or on its origin otherwise?

D. L. Adair,  
Cor. Sec. N. A. B. K. Society.

Adair, D. L. 1873. "Adair, D. L. Jan. 31, 1873." *Asa Gray correspondence*
