

as for instance *Melletia chinensis* (which  
has no N° attached to it & that I take may  
be a quid). There was I believe a specimen  
of his of *Canarium Rivula* (168) which  
I have somehow mislaid. Have written  
that that plant is not in Hong Kong. He  
gathered it in "Dense dense Thompson's  
Poy, let me know whether Wright really  
found it well in Hong Kong - or otherwise  
must strike it out of the flora.

I have made a few corrections in the  
determinations of *Vitis*, *Trebeanthus* etc  
which I sent you last year but I have  
unfortunately left the memorandum at  
Kow where I do not go today and if I  
do not send this letter today it may  
hinder I know not how long - I shall  
mark Wright's numbers consecutively  
throughout the margin of my paper.

You ask "where is Agardhi's paper  
published" I suppose by this time  
you have seen and marvelled at the  
substantial & so beautifully printed  
in a close small type - He has worked  
hard at it for years and I believe  
a great deal but I do not think his book  
will contribute much to that clearing  
of nomenclature which is essential to enable  
us to form <sup>any</sup> idea of the vegetable  
kingdom wholesale and retail  
you mentioned I believe somewhere

My dear Gray

I believe I have several of your  
letters unanswered but on looking them  
over I do not find anything particularly  
urgent requiring a reply - only so  
far as general thanks - for although  
so bad a correspondent myself I am  
always particularly glad of letters  
from you - and only hope that you  
are carrying into effect what you  
said you intended to do in one of your  
last year's letters - finishing off your  
Amer. Explor. Exped. with a view to  
paying us a visit - when you must  
bring Mr Gray with you. We long  
to see you both again and as regards  
the Atlantic is now quite out of the  
question. Do not however come  
this summer as we shall be away  
the purpose going abroad about  
the second week in June and shall  
scarcely be back before November.

I got the *Braertia Dalbergiae*  
and *Lophozoa* off my hands but about  
10 days ago when I sent them off to  
Mortier. They took me up so much more

time than I expected for I had to work up in detail non-Braconid as well as Braconid species in order to settle the genera. Besides those days in each week I have had to work with Moluccas (whom I have to outfit me more days) either on the Amherstbridge Herbarium or on species plants. I am now getting on with the determination of his Sarapoto collection which I shall dictate before I leave town.

Since I cut off the Braconid Papilionae I have resumed the Hong Kong Plants I am revising the whole flora and as I must re-examine so much and compare with S. Indian now that Dr. Hooker's plants are mostly lost in I give generally short specific descriptions and general distribution which rather lengthens the time it takes as well as the paper itself. I doubt if I shall finish it before I go but will send you as much as is ready - but pray tell me how to send the MSS - It is too much for post - the bookpost does not take MSS - shall I read it through Triibner? but then it must not be perda as Leucaea Journal n. g. d. - The Hong Kong Flora is much

less Japanese than I expected. It consists chiefly of 1 widely spread L. Asiatic plants, many of them wood - 2 North Indian that is Khasia Pikkim + Himalayan 3 South Indian that is Ceylon Malabar the Moluccas and Philippines to more eastern which we have only from the Moluccas or Philippines 5 China proper which we have as yet either only from Hong Kong or only from the adjacent islands and parts of P. China. We have however very little from China excepting from the immediate neighbourhood of Hong Kong or Macao and a few small away collections where already the vegetation is different and shows more of Brunei, North China, Pekin etc plants. Some Japanese plants do certainly extend to Hong Kong but they seem to bear a less proportion to the flora than the Khasia ones. However I shall work all this up more accurately when I have done the number of phaeogamous species will be I believe near 1000. As far as I have finished 160 of Seemann's Enumeration have become 100. With Wright I have no memoranda, and some of his are evidently garden plants

to Europe. I believe however he is procuring some other employment and I doubt whether we shall hear much more from him - I have now on hand this Tarapoto collection which is considerable and a small Ecuadorian one which by his desire I wait to distribute till I receive the rest as the sets of many are only completed in what has still to come - The foolish war between Peru and Ecuador although it appears to have been hitherto blottedly interfered with the despotism of Ignacio's collections.

*Strophio Pendlerii* Venezuela (Nov)  
plants contain many very good things  
I am particularly anxious about  
tropical American plants (especially  
of course Leguminosae) - The central  
American flora is remarkably varied  
I have seen a good deal from both two  
countries - our surveying expeditions  
etc and am surprised at the number  
of remarkable plants in one collection  
and not in others according to the  
mountains ascended - Many must  
be very local there

I hope to present a synopsis of all the recent

in the Linn. Journ. - at least of American ones. Of *Doreochorospus* I have only 20 *Brauniorum* species out of 46 ~~sooth~~  
~~altogether~~ - and I reject a few of the old ones into other genera but include *Nevroscopha* & *Sphenotobium* - In *Dalbergia* I include *Myrtolema*, *Microlobium* and *Americanum*. I also reunite the sections of *Stroscopus* except *Atelia* which is a *Coccolpina* (I saw a specimen in Wright's Cuba plants of one species and have seen specimens of others another in other Cuba collection) - *Millettia* must be decidedly excluded from *Dalbergia* as the pod always opens when quite ripe in two valves - I have not again worked it up from an open seed as comes very near *Gloriosa* and other Robinioid genera - and I believe my former genera *Mandulea* and *Otemna* can scarcely stand at least characters from the collonies or from the pods at the base of the vegetum break down generally except as specific - In all these *Sequiminiac* the great difficulty is to match the flower and fruit In doubt they are very much mismatched since his time many a species has been made up (by myself as well as by others) of the flower of one with the

90-2

front of another owing to lower  
fruity having been sent by collector,  
also with the wrong flowering  
specimens. Collector, however, are  
often deceived by the intricate  
manners in which the bracts  
of different trees or leaves are  
interwoven - But in most cases  
we get flowers without any fruit.  
There are 7 or 8 Central American Lourte,  
crops of which I have never seen the pods  
and I hope you will impress upon all  
collectors in tropical countries  
the necessity of gathering fruiting  
specimens with the leaves attached.

With kindest regards to Mr  
Gray Ever yours sincerely

George Bentham

what you had seen in the paper about  
the Government grant for an  
Australian Flora. When it came  
however to putting it in the estimate,  
the Colonial Office found they had  
so many extras that they had to cut  
down, and topped this off in the first  
instance. Since then letters have been  
written to the colonies themselves to  
take it up. If they do in a satisfactory  
manner that will be my chief  
occupation for some years to come  
but I shall finish up the Hong Kong  
revision first.

You ask about your account  
It is I believe as follows.

1858	June Seminae primit Botany 1 copy 2 part sets (4 for 1) —	12.00
	July Seminae Journal vol 3, 2 complete and 5 Botany —	2.. 0.. 0
	Spruce's Linguarum etc collection 393 pp.	7.. 17.. 0
1859	July Seminae Journal Supplement 7 copies (at 3 for 1) —	1.. 1.. 0
		<u>\$ 11.. 18.. 0</u>

Miller's slopes will be concluded in  
another supplemental part which  
will be charged rather less.

All Spruce appears to be now settled  
in the Ecuador and talks of not returning
