

Landerdale, Wis.  
July 16<sup>th</sup> / 92

My dear Mr Deane:—

We came up here a week ago to-day and already things are so settled in their places that it seems as if we had been living here right along since last summer. For my own part I was loth to leave Rockford quite so soon. There had been no weather to provoke a hankering after lake-side cottage life and goodness knows we had had enough of water this spring and the care for a further intimacy. But the children were unfortunate and I could assign no other reason for wishing to stay except that I wanted to look after the garden and enjoy the Sweet Peas that were just coming

into blossom - I have done a  
little collecting but it is scarcely  
worth mentioning only, as an earnest  
of better to come - I have been  
trying to make some good specimens  
of our Western Pimpernel but it is a  
different subject - The petals - like the  
leaves - have one surface from which  
the moisture escapes readily and the  
other almost as impervious as if  
varnished - It follows thus where the  
petals lie thickly imposted near the  
centre thus dry very slowly and as a  
consequence discolor - I have also  
gathered some Carex Tribuloides var  
Bottae - partly because it is almost the  
only Carex that has not gone by - partly  
no fault for its names sake - Bailey  
says of this "common throughout" but  
I have never received it from any  
locality east of Michigan (D. Clarke)  
From Mich. westward it is indeed  
common and looking apical - more so  
than in the tutarium - like a good  
specie. If you have this from the  
eastern states please remember me  
for a specimen - and I will fill the  
vacancy thus made in your Duplicate

Herb. by specimens from Standardale.  
There must be great social or other  
movements to carry you to a  
region where the flora has been  
so thoroughly explored that a  
botanist and an enthusiast  
collector like yourself is reduced  
to "circling about in front of the  
house" on a bicycle for exercise!  
On the "streets of Cambridge" I  
should not have been "surprised".

With Dr. N. P. Bailey I have  
had occasional correspondence  
for years but I have never met  
him - Mather says that his  
wife and children are "lovely".

Cratly sends me, some time  
ago a plant for identification  
which he said he "couldn't even  
guess at" - It was nothing less  
than Carex sphaerocephala! He is in  
hopes to get more of it this  
season - I had a few meagre

specimens - including some from  
the original collections of Knobell  
and Vasey - has all bunches together  
and doubled five times over they  
would not have equalled Pratt's one  
specimen -

I did a little piece of botanical  
work and it was work for I was  
driven to it - just before I came  
away from library and herbarium &  
viz. reporting on the Willows of the  
Death Valley Expedition - I have  
been thinking for sometime that  
should have the knock Salix California  
out of the head and Corrles  
specimens from the Sierra Nevada  
finished the business - S. Barclayi  
Andrus, as now understood has a  
range from Alaska southward along the  
Cascade & Sierra Nevada to California and  
presents another of those protean species  
which is more just as reasonable  
to call three or four as one. For every  
the one presents an almost unbroken  
transition from S. cordata to S. glauca  
I imagine I never so much as once thought  
ten years ago that S. California might be only  
variety of species which as then known was
