## 5. List of the Butterflies of Peru, with Descriptions of new Species. By HERBERT DRUCE, F.L.S., F.Z.S. With some Notes by EDWARD BARTLETT.

[Received January 10, 1876.]

(Plates XVII. & XVIII.)

During the past few years Mr. Salvin and I have received several collections from Peru, principally made by Mr. Henry Whitely. I now think it advisable to draw up the following list of the species, only including those that I have been able to examine myself, and of which I am certain of the locality being correct. I hope by so doing to give some idea of the Butterfly-fauna of Peru, as well as to advance our knowledge of the geographical distribution of Butterflies. The collections from which I have made this list were formed by Mr. Bartlett, Mr. Henry Whitely, and Mr. Pearce, in the following localities.

Mr. Bartlett collected in the eastern part of Peru; for the exact places visited by him, see map, P. Z. S. 1873, p. 252, pl. xxv. Mr. Henry Whitely's principal collection was made in the valley of Cosnipata, situated on the eastern slope of the Andes of Caravaya, and the smaller collections at Paucartombo and Huasampilla, eastward of Cuzco, at an elevation of about 9000 to 10,000 feet; he also made a very small collection last year at Huiro, valley of Santana, north of Cuzco, at an elevation of about 4800 feet. Mr. Pearce, who travelled in Peru and Bolivia as a botanical collector for Messrs. James Veitch and Sons, the well-known Horticulturists, collected at Pozzuzu and Müna.

The collections contained 494 species (18 of which I have described as new), representing 133 genera.

Mr. Bartlett's collection had been picked over before any specimens came into our possession; so that this list does not contain all the species collected by him.

7. *C. ALEXIA*, n. sp. (Plate XVII. fig. 4.)

Upperside (*female*) : anterior wing black, with the base rufous orange ; a yellow spot at the end of the cell and one below nearest the anal angle crossed near the apex by a band of yellow, a submarginal row of six small white spots ; posterior wing rufous orange, a spot at the end of the cell and the outer margin black. Underside the same as above, with less orange-colour ; the costal margin of the posterior wing black, and a submarginal row of white spots on the hind margin.

Exp.  $2\frac{1}{4}$  inches.

Peru. Mus. D.

8. *C. BAANA*, n. sp.

Upperside (*female*) orange ; anterior wing crossed beyond the middle by a narrow band of yellow, an elongated spot in the cell, one at the end of the cell, and one below near the inner margin all black ; the apex broadly black ; posterior wing orange, with the outer margin (which is very narrow) black. Underside the same as above, except that the base of the posterior wing is yellow, the costal margin black, and a submarginal band of white spots to both wings.

Exp.  $2\frac{1}{4}$  inches.

Peru. Mus. D.

9. *C. TIGRINA*, n. sp. (Plate XVII. fig. 2.)

Upperside (*female*) like *C. fluonia* without the yellow markings, except a small spot beyond the middle on the costal margin, the apex rufous with a marginal row of black spots ; posterior wing rufous, with the central band as in *C. fluonia*, the outer margin black, dentated on the inner side. Underside as above.

Exp.  $2\frac{1}{4}$  inches.

The specimens of this species from Pozzuzu differ much from the typical form by not having the black band on the underside of the anterior wing, its larger size, and brighter colour. I at first thought it a distinct species; but upon comparison with the specimens in the British Museum, I find that they have a specimen clearly intermediate between the two forms.

Genus **SIDERONE**, Hübn.

**S. THEBAIS**, Feld. Wien. ent. Mon. vi. p. 422 (1862).

Valley of Cosnipata (*H. Whitley*). Mus. S. G.

The specimen differs slightly from Felder's type by having the red band of the posterior wing broken into spots.

Genus **PROTOGONIUS**, Hübn.

**P. CECROPS**, Doubl., var. **ÆQUATORIALIS**, Butl. P. Z. S. 1875, p. 35, pl. v. f. i.

Valley of Cosnipata (*H. Whitley*). Mus. S. G.

The specimen differs from the variety named by Mr. Butler by wanting the yellow spots near the outer margin of the anterior wing, and would, without doubt, be considered a distinct species by some; but I should be very sorry to describe it, not having yet seen any two specimens alike.

## Family II. LEMONIIDÆ.
