

specimen is an immature. Its measurements are: total length 26 millimeters, "tail" one millimeter, hind limb 39, hind foot 18, overlap of heels behind anus 4, head width 9, length of parotoid 7, width of parotoid 2.7. The specimen agrees in all but minor points with descriptions of *truei*. There is a gular fold across the chest. The color in alcohol is uniform, dark, slaty grey above, without any traces of darker markings, and including the top of the head anterior to the eyes. The snout has a lighter Y-shaped median, vertical band between the two darker spots about the nostrils. Below the eye is another dark area separated from the nasal patch by a lighter spot. The underparts are dusky yellow and a continuation of this color is seen in a light band across the shoulder. The numerous small tubercles on the back are each tipped with white.

STUDYING THE BOX TURTLE.

While collecting insects in woods at Orient, Oct. 8, 1916, I met an unusual, large, handsome male box turtle *Cistudo carolina*. The plastron measured six and a half by five inches. The head and neck exceptionally bright orange.
