LETTER OF TRANSMITTAL

U. S. DEPARTMENT OF AGRICULTURE,
BUREAU OF PLANT INDUSTRY,
OFFICE OF THE CHIEF.

Washington, D. C., December 26, 1901.

SIR: I have the honor to transmit herewith the manuscript of a paper entitled Records of Seed Distribution and Cooperative Experiments with Grasses and Forage Plants, by F. Lamson-Scribner, Agrostologist, and recommend its publication as Bulletin No. 10 of the Bureau series.

Respectfully,

B. T. GALLOWAY,
Chief of Bureau.

Hon. JAMES WILSON,
Secretary of Agriculture.

JAN 8 1907
U. of D.

9.7.5. S. 9, 41

PREFACE.

This bulletin relates to the collection and distribution of seeds of grasses and forage plants by the Department of Agriculture through the Office of the Agrostologist, formerly Division of Agrostology, and to cooperative work in grass and forage plant investigations with a number of State experiment stations to whom these seeds were sent. The manner of keeping the records of this seed distribution is explained in detail, and the plan of conducting the cooperative experiments and the line of work or forage problem taken up with each station are fully given. This work was put into operation last year in compliance with an act of Congress, and has proven so satisfactory to all concerned that it has been continued the present year, although there are now no statutory regulations requiring that it should be.

F. LAMSON-SCRIBNER,

Agrostologist.

OFFICE OF THE AGROSTOLOGIST,

RECORDS OF SEED DISTRIBUTION AND COOPERATIVE EXPERIMENTS WITH GRASSES AND FORAGE PLANTS.

PURCHASE AND COLLECTION OF SEEDS, ROOTS, AND SPECIMENS.

House bill No. 121, Fifty-sixth Congress, first session, making appropriations for the United States Department of Agriculture, contained the following clause:

Provided, That six thousand dollars of the amount hereby appropriated [for grass and forage plant investigations] be used to purchase and collect seeds, roots, and specimens of valuable and economic grasses and forage plants to be distributed to the various experiment stations in the several States and Territories, to be by them used, under the direction of the Secretary of Agriculture, to ascertain their adaptability to the various soils and climates of the United States.

In carrying out the plans necessary to meet this provision in the bill making appropriations for the Agricultural Department, Mr. C. L. Shear, an assistant in the Division of Agrostology, was put in charge of the seed and field work July 1, 1900, when the law making the appropriations went into effect. Mr. Shear was instructed to make collections of seeds of the valuable native grasses and forage plants and was directed to secure in quantity seeds of wild range grasses, also those species of probable value in the South for winter pasturage, those likely to prove good meadow grasses for high altitudes, and of those adapted to binding drifting sands. In carrying out this work it not infrequently happened that long, tedious journeys had to be made to regions inaccessible to stock before grasses in seed could be found and collections made. As a result of this work in the field during the season 4 tons of seed of about 130 varieties of grasses and forage plants were gathered, the quantities varying from 1 pound to 500 pounds. A list of the varieties of seeds gathered, with notes upon some of the more important species, was presented in Circular No. 9, issued from the office of the Secretary in December, 1900. In conducting the cooperative work with the stations, which will be referred to later, it was necessary to supplement this amount of seeds of native varieties by purchasing from dealers seeds of the more important tame grasses and forage plants which the experiments called for.

COOPERATION WITH THE STATIONS AUTHORIZED.

In the House bill referred to above, making appropriations for the Department of Agriculture for 1900-1901, there was this clause:

And the agricultural experimental stations are hereby authorized and directed to cooperate with the Secretary of Agriculture in establishing and maintaining experimental grass stations for determining the best methods of caring for and improving meadows and grazing lands, the use of different grasses and forage plants, their adaptability to various soils and climates, the best native and foreign species for reclaiming the overstocked ranges and pastures, for renovating worn-out lands, for binding drifting sands and washed lands, for turfing lawns and pleasure grounds, and for solving the various forage problems presented in the several sections of our country.

In order to carry out this feature of the law, the Secretary of Agriculture, through the recommendation of the Agrostologist, directed Mr. Thomas A. Williams, then assistant chief of the Division of Agrostology, to visit the several experiment stations, especially those in the Western States, to study the forage problems of most importance to each, and by consulting with the directors of the stations to arrange plans for carrying on cooperative work with them with the view of solving the problems determined upon.

LINES OF INVESTIGATIONS OF FORAGE PROBLEMS.

Mr. Williams says in his report, published as Circular No. 8 (revised), of the office of the Secretary:

In brief, this series of visits to the stations demonstrates clearly not only that there are many problems which can be studied much better through station and Departmental cooperation, but that the station authorities themselves appreciate the desirability of such cooperative work and are eager to enter into it. It is recognized that in these general problems, while the stations are able to work out the details of experiments and matters of relatively local bearing, there is a most important phase of the investigations that can be much more satisfactorily handled by the Department, and, in order to secure the best results to the country at large, it is highly desirable that there should be the closest cooperation between stations and Departmental investigations. In addition to the assistance which the Department can render the stations in solving these special problems through the detailing of its experts for field investigations and supplying seed for experiments, this cooperation will have a most important bearing on the work of the stations in encouraging greater concentration on lines of greatest importance to the people and in rendering more readily available to the station workers the experience and training of the Departmental experts.

Consultation with the station authorities has emphasized the desirability of cooperation along a number of lines of investigation, the following being perhaps the most important at the present time and including every section of the country.

(1) The formation, care, and management of pastures, including the selection of the best varieties, methods of preparing the soil and of planting the seed, and after treatment of grass lands, including grazing, rest, fertilizing, and cultivation.

(2) Range improvement, or the best methods of bringing up the natural grass lands of the great range regions of the country and maintaining them in the condition of greatest productivity, including the improvement of the native grass cover by reseeding, alternation of rest and grazing periods, scarifying, etc.

(3) Alkali-resistant crops, particularly those best adapted to furnishing forage that can be used to supplement the native ranges.

(4) Cover crops for soils liable to wash, which will at the same time afford a supply of forage or can be turned under for green manure.

(5) A continuous soiling series for use in sections where the dairying industry is paramount.

(6) Winter pasturage for the South and Southwest.

(7) Sand-binding grasses for the coast regions and along the Great Lakes.

(8) Meadow crops for higher altitudes, particularly in the Rocky Mountain States, where, although pasturage is abundant, crops that will produce profitable amounts of hay are greatly needed.

(9) Supplementary forage crops, particularly those with a short season of growth, that can be grown in rotation with wheat, cotton, and other primary crops, either for forage or for the improvement of the soil fertility.

(10) Drought-resistant crops for arid sections.

(11) The selection and development of improved varieties of grasses and forage crops adapted to special conditions and uses.

As a result of visiting the State stations, and through correspondence, it has been ascertained that cooperative work can be arranged for the investigation of each of these problems with one or more stations most advantageously situated, and there is no question as to urgent need of such investigations.

ARTICLES OF COOPERATION.

A plan was devised to carry on this work under articles of cooperation signed by the station officials and officials of this Department, of which the following are presented as examples:

Articles of cooperation in investigations on improvement of the Northwestern ranges between the _____ Agricultural Experiment Station and the Division of Agrostology, United States Department of Agriculture.

The object of these investigations shall be to find the best and most practical way of improving the forage conditions in the dry sections of the Northwest, and specially of renewing the worn-out ranges and devising methods of managing them whereby the highest degree of productivity may be maintained. The following plan of cooperation is agreed upon:

1. The _____ Experiment Station to procure a suitable tract of range land; to undertake immediate supervision of the work through a member of its official staff; and to furnish all implements, fencing, etc., required by the investigations, the same to be the sole property of the station when this cooperative arrangement is dissolved.

2. The U. S. Department of Agriculture, through the Division of Agrostology, to assist in selecting the land and in planning and conducting these investigations; to furnish seed of native and introduced grasses and forage plants for experiments on said tracts, and pay other expenses connected with the investigations, not to exceed _____ in any one fiscal year, it being understood that under the appropriation act the Department can not assume responsibility for the continuance of its contribution beyond June 30, 1901.

3. The investigations conducted under this cooperative agreement shall be planned conjointly by the representatives of the _____ Experiment Station and the Division of Agrostology, officially charged with the work, subject to the approval of the proper authorities in each case.

4. Both parties to this agreement shall be free at any time to use the results obtained in these investigations in their official correspondence and publications, giving proper credit to the fact that such results have been secured by cooperative work.

_____,
Director _____ Experiment Station.
_____,
Chief Division of Agrostology.

Approved:

_____,
Secretary of Agriculture.

*Articles of cooperation in grass and forage plant investigations between the _____
Agricultural Experiment Station and the Division of Agrostology, United States Department of Agriculture.*

The object of these investigations shall be to find the best crops for supplying forage to supplement the natural ranges and for the improvement of cultivated lands. The following plan of cooperation is agreed upon:

1. The _____ Experiment Station to provide land at the home station, or at outlying representative points in that territory, upon which to make said experiments, and to undertake the immediate care and supervision of the work.

2. The U. S. Department of Agriculture, through the Division of Agrostology, to furnish all seeds necessary in making these experiments, and to otherwise assist in planning and conducting said investigations.

3. The investigations conducted under this cooperative agreement shall be planned conjointly by the representatives of the _____ Experiment Station and the Division of Agrostology officially charged with the work, subject to the approval of the proper authorities in each case.

4. Both parties to this agreement shall be free at any time to use the results obtained in these investigations, giving proper credit to the fact that such results have been secured by cooperative work.

_____,
Director _____ Experiment Station.
_____,
Chief Division of Agrostology.

Approved:

_____,
Secretary of Agriculture.

The following is the form in use since the organization of the Bureau of Plant Industry:

Articles of cooperation in grass and forage plant investigations between the Wyoming State Experiment Station and the Bureau of Plant Industry, United States Department of Agriculture.

The subject of these investigations shall be grasses and forage plants for alkali soils and arid lands.

1. The Wyoming Experiment Station to furnish the land necessary for the said experiments, to undertake the immediate supervision and care of the work, and to assist in planning the investigations.

2. The United States Department of Agriculture, through the Bureau of Plant Industry, Office of Grass and Forage Plant Investigations, to assist in planning and conducting the said investigations, and to furnish all seeds necessary for making the experiments.

3. The investigations conducted under this cooperative agreement shall be planned conjointly by the representatives of the Wyoming Experiment Station and the Bureau of Plant Industry, officially charged with the work, subject to the approval of the proper authorities in each case.

4. Both parties to this agreement shall be free, at any time, to use the results obtained in these investigations in their official correspondence and publications, giving proper credit to the fact that such results have been secured by cooperative work.

ELMER E. SMILEY,

Director Wyoming Experiment Station.

B. T. GALLOWAY,

Chief Bureau of Plant Industry, United States Department of Agriculture.

At the present time fifteen of the experiment stations are working in cooperation with the Department on one or more of the lines connected with grass and forage plant investigations.

SEED DISTRIBUTION.

Since the organization of the Division of Agrostology seeds of grasses and forage plants have each year been distributed to the agricultural experiment stations and to many individual experimenters. The following table shows the number of packages of seed so distributed during the fiscal years 1896-1901, inclusive; the total number of packages sent to the experiment stations during this time being 4,166, and to individuals 9,377, or a total of 13,543 packages (see Table I). These for the most part were seeds which were obtained through the direct efforts of the employees of the Division by collections in the field. During the fiscal year 1900-1901 there were distributed to the experiment stations 16,101½ pounds of seed, embracing 171 varieties, as shown in Tables II and III.

TABLE I.—*Number of packages of seed distributed to the experiment stations and to individuals during the fiscal years 1896 to 1901, inclusive, or for five years, through the Division of Agrostology.*^a

Distribution.	1896 to 1897.	1897 to 1898.	1898 to 1899.	1899 to 1900.	1900 to 1901.	Total for the five years.

Total		16,101½	7,651½	23,152½

NOTE.—Total varieties, 171.

SEEDS TO PRIVATE INDIVIDUALS.

Many applications were made to the Secretary of Agriculture by individuals for seeds of grasses adapted to special conditions for purely experimental purposes. In order to meet these requests and to keep all of our work in line of cooperation with the experiment stations, the following letter was addressed to the directors of the several stations under date of January 31, 1901:

U. S. DEPARTMENT OF AGRICULTURE,
BUREAU OF PLANT INDUSTRY,
OFFICE OF THE AGROSTOLOGIST,
Washington, D. C., January 31, 1901.

SIR: Requests for seeds of grasses and forage-plants for special purposes are received by this Department from many private individuals throughout the country and prior to the current fiscal year the Secretary has, so far as possible, generously responded to these requests. For the most part they have come from intelligent and progressive farmers who had definite objects in view and whose reports relative to the seeds sent them have oftentimes been of great value. A record has been kept of every package of seed thus sent out and we have classed the parties as our "volunteer experimenters" and our cooperation with them, costing only the seed sent, has been mutually advantageous. We would be glad to continue this line of work and hope that you will enable us to do so and respectfully ask your cooperation in the matter. If agreeable to you, we will refer all applications for seeds and grasses and forage plants made by individuals in your State to you by addressing them a letter like the inclosed (marked 1). If they then should write to you and you deem it wise for us to honor their request, the seeds will be forwarded, so far as our supply will permit. We will notify you of the shipment of the seed on a card similar to the inclosed

(marked 2), which is our preliminary step in the record. We could, if you wish, send seed in quantity to you to be redirected to individuals in your State from your station. In such case we would expect you to furnish us the addresses of the parties to whom the seed was sent and the amount in each case. At the close of each season we send blanks (marked 3) to every individual to whom seeds have been sent from this office for the purpose of obtaining a report as to the results of the experiments or progress made. We arrange with every one receiving seeds in the way here described to report results to this office and we will, upon your request, send you duplicate copies of these reports and thus share with you in all the results obtained. I would be pleased to have an expression from you in regard to this plan of cooperation with individuals.

Respectfully,

F. LAMSON-SCRIBNER,
Agrostologist.

AGRICULTURAL EXPERIMENT STATION,
Manhattan, Kans.

The scheme proposed in this communication met with very favorable reception on the part of the experiment stations, as will be seen by the replies here quoted, which are in the main expressions of all those received.

WASHINGTON AGRICULTURAL COLLEGE AND SCHOOL OF SCIENCE,
Pullman, Wash., February 8, 1901.

DEAR SIR: I am in receipt of your favor of January 31, and note carefully the plan outlined therein for the distribution of seeds of grasses and forage plants in the several States. The plan you propose meets with my approval and will have the hearty cooperation of this station.

Yours, very truly,

E. A. BRYAN, *President.*

F. LAMSON-SCRIBNER,
Agrostologist, Department of Agriculture, Washington, D. C.

THE PENNSYLVANIA STATE COLLEGE
AGRICULTURAL EXPERIMENT STATION,
February 19, 1901.

DEAR SIR: Replying to yours of January 31, relative to the matter of distribution of seeds and forage plants, I beg to say that it would give this station pleasure to accept your very courteous and generous proposal in regard to cooperation. If you will refer applicants to us as requested, we will be very glad to advise you as to the matter of honoring their requests and to receive from you the duplicate reports of results.

Very respectfully, yours,

H. P. ARMSBY, *Director.*

Mr. F. LAMSON-SCRIBNER,
United States Department of Agriculture, Washington, D. C.

The total amounts of seeds thus distributed to individuals in each State is shown in Table II, and the total quantity of each variety of seed so distributed is shown in Table III.

SYSTEM OF KEEPING RECORDS.

In order to bring all this work into such shape that the results might be utilized by both the stations and the Department, the following plan of records was adopted. Upon the receipt of an application from a

correspondent in any given State, the following letter was sent to the applicant:

U. S. DEPARTMENT OF AGRICULTURE,
GRASS AND FORAGE PLANT INVESTIGATIONS, DIVISION OF AGROSTOLOGY,
Washington, D. C., ———, 1901.

DEAR SIR: Your letter of ———, addressed to ——— ———, has been referred to this division. The law (House bill No. 121, Fifty-sixth Congress, first session, making appropriations for the Department of Agriculture) requires that all seeds of grasses and forage plants distributed by this division for experimental use be sent to the experiment stations. We will be pleased to honor, so far as possible, any requests for seeds made through the director of your agricultural experiment station, located at ———. Please state definitely to the director the object of your request.

Respectfully,

F. LAMSON-SCHIBNER,
Agrostologist.

If the request was indorsed by the director of the experiment station a card was then made out in accordance with the following blank, directing the shipping clerk to send the seed, and when the shipment was made this card was returned to the office of the Agrostologist and filed for record.

State: ———. ———, 1901.

U. S. DEPARTMENT OF AGRICULTURE,
OFFICE OF PLANT INDUSTRY,
WASHINGTON, D. C.

COOPERATIVE EXPERIMENTS IN GRASS AND FORAGE PLANT INVESTIGATIONS WITH
——— EXPERIMENT STATION.

Name and address of experimenter: ———.

Variety of seed and amount sent: ———.

Source and age of seed: ———.

Object of experiment: ———.

Date of shipment: ———.

At the same time a card, the form of which is shown below, was sent to the director of the experiment station, advising him of the shipment, and this card was designed for filing at the station:

COOPERATIVE EXPERIMENTS IN GRASS AND FORAGE PLANT INVESTIGATIONS.

U. S. DEPARTMENT OF AGRICULTURE,
WASHINGTON, D. C.

———
EXPERIMENT STATION

Name and address of experimenter: ———.

Variety of seed and amount sent: ———.

Source of seed: ———.

Object of experiment: ———.

Seeds shipped ———, 190—. Report received ———, 190—.

When seeds were sent to any individual under this plan he was advised of the fact by the following letter, in which the nature of final report expected from the correspondent was outlined. We found this to be important, for in many cases when we had called for reports as to results of seeds distributed the party receiving them often said that he wished he had known earlier the nature of the report wanted,

and he would have taken the necessary notes. This letter was designed to cover this ground.

U. S. DEPARTMENT OF AGRICULTURE,
GRASS AND FORAGE PLANT INVESTIGATIONS,
Washington, D. C., ———, 190—.

DEAR SIR: In accordance with arrangements made with the director of the agricultural experiment station of your State for conducting cooperative experiments with grasses and forage plants, the following seeds are being sent to you:

In sending you these seeds it is understood that you will try them in an experimental way to test their adaptability to your section or their special value. It is further understood that you will give them all the care necessary to meet the requirements of the experiment and report the result obtained on blanks which will be furnished you at the proper time. These reports will be filed in this office and copies will be sent to the director of your State experiment station. The following are the principal points to be noted:

Condition and preparation of soil.	Yield per acre of forage or seed, or
Date and method of planting.	both.
Method of cultivation, if any.	Stand and amount of growth made.
Date of full bloom.	Value of the plant as food for stock.
Date of ripening.	Also any other miscellaneous notes of
Date and method of harvesting.	economic interest.
Quality of the product.	

The seed produced by native and introduced plants, not obtainable from seedsmen, should be carefully saved.

Respectfully,

F. LAMSON-SCRIBNER,
Agrostologist.

Mr. ———.

At the close of the season blanks for reports of the form here presented will be sent to everyone who received seeds. Copies of these reports will be sent to the directors of the experiment stations in the States where the experimenters are located.

UNITED STATES DEPARTMENT OF AGRICULTURE.

GRASS AND FORAGE PLANT INVESTIGATIONS.

EXPERIMENTS WITH GRASSES AND FORAGE PLANTS.

Report on varieties cultivated at ———. [Name town, county, and State.]

Common name, ———. Latin name, ———.

From Griffiths & Lange. Locality, Billings, Mont. Date, July 14, 1900. Altitude ———. Amount, pounds, 31½.

Habit of growth, ———.

Character of soil, ———.

Use ———.

By this system of records the Office of the Agrostologist has full data in regard to all seeds received or sent out, and it is possible to show at any time the variety or amount sent to any experiment station or to any individual in cooperation with the station. The totals of these amounts for the fiscal year 1900–1901 are shown in Tables II and III.

Table IV contains a list of those experiment stations with which the Department of Agriculture, through the Office of the Agrostologist, is carrying on cooperative experiments in grass and forage plant investigations. This is a list of the stations with which the Department is working during the current fiscal year, for, although the law cited specifically directing the stations to cooperate with the Secretary of Agriculture along these lines is no longer in force, it having been omitted from the bill making appropriations for the Department during the present year, it has been deemed best to continue the work, apparently so well begun under the bill of last year.

TABLE IV.—*List of experiment stations with which articles of cooperation have been signed.*

State.	Object of investigations.	Department allowance.
Arizona ¹	For improving the forage conditions and renovating the ranges.	Seeds and funds.
California	The planting and testing of sand-binders.....	Do.
Colorado	Grass and forage plants for alkali and arid soils	Do.
Kansas	The best method of pasture and range improvement..	Do.
Maryland	To find the best crops for use in securing a continuous soiling.	Seeds only.
Michigan.....	To find the best grasses for fixing the drifting sands along the Great Lakes and to determine the possibility of converting these into lands productive of forage and other crops.	Do.
Missouri.....	To find the best method for the formation and management of meadows and pastures in the Middle Western States.	Do.
Nebraska	Growing and testing of native and cultivated grasses for the Great Plains region.	Do.
New Hampshire....	Improvement and renovation of worn-out hay and pasture land.	Seeds and funds.
New Mexico.....	Forage crops to supplement ranges and the improvement of cultivated lands.	Seeds only.
Oregon	To find the best sand-binding grasses and to determine the possibility of rendering sandy lands productive of both grasses and forage plants.	Seeds and funds.
South Dakota	For testing drought-resisting forage plants with a view to finding varieties suitable for use in the range region.	Do.
Tennessee	Formation and management of pastures and meadows in Middle Southern States.	Seeds only.
Texas	Formation of meadows and pastures in the Middle Southern States.	Seeds and funds.
Washington	For improving forage conditions and renewing worn-out ranges.	Do.
Wyoming.....	Forage plants for arid and alkali lands	Seeds only.
Delaware.....	Cover crops for orchards	Do.
Utah	Forage plants for arid and alkali lands	Do.

¹ Not renewed for 1901-2.

Since this work of cooperation was first inaugurated the Bureau of Plant Industry, which includes the Office of the Agrostologist, has been established, and the new articles of cooperation now in force have been slightly modified from those of last year to meet the new terms of expression required by this new organization, and a similar modification has been made in the letter addressed to individual applicants for seeds, as will appear from the copy presented below, which is that of the form now used:

U. S. DEPARTMENT OF AGRICULTURE, BUREAU OF PLANT INDUSTRY,
GRASS AND FORAGE PLANT INVESTIGATIONS, OFFICE OF THE AGROSTOLOGIST,
Washington, D. C.,———, 190—.

DEAR SIR:

Your letter of ———, addressed to ———, requesting seeds, has been referred to this office. The Department of Agriculture is conducting experiments with grasses

and forage plants in your State in cooperation with your agricultural experiment station located at ———. In order to continue the plans already made we would ask you to kindly present your request through the director of your experiment station. We will be glad to honor, so far as possible, all such requests. Please state definitely to the director of the station the object of your request.

Respectfully,

F. LAMSON-SCRIBNER, *Agrostologist*.

CONCLUSION.

Thus far our plan of cooperation with the stations in grass and forage plant investigations and the manner of keeping our records, as above described, have been quite satisfactory, but it is not unlikely that some changes or improvements may be made as the work progresses. Doubtless the work can be rendered more effective and more certain of useful results if an official of the Department can be located at those stations where important cooperative work is being carried on. This officer may be a scientific aid—and we are already employing scientific aids in this way—or he may be someone more experienced. In any case, he should be given immediate charge of the work, to which he should give his whole time while at the station. During some months of the year, especially during the winter season, he could spend his time at the Department in order to familiarize himself with our methods and make up his reports. It is to be regretted that the important work of grass and forage plant investigations has not more funds available for conducting this cooperative work on a larger, more effective, and more striking scale.

I have only to add that I wish to give expression here to our most sincere regrets at the loss of Mr. Thomas A. Williams, in whose charge this cooperative work had been placed and who had so successfully carried out the ideas of the Department while engaged upon it. The present season Prof. A. S. Hitchcock has been placed in charge of this work and has visited many of the stations and made a special study of the conditions existing where cooperative work is being carried on.
