HAND LIST
OF
MOLLUSCA.

INDIAN MUSEUM.

CALCUTTA :
OFFICE OF SUPERINTENDENT OF GOVERNMENT PRINTING,
8, HASTINGS STREET,

HAND LIST
OF
M O L L U S C A
IN THE
INDIAN MUSEUM,
CALCUTTA.

BY
GEOFFROY NEVILL, C.M.Z.S., &c.
FIRST ASSISTANT TO THE SUPERINTENDENT OF THE INDIAN MUSEUM.

PART I.
GASTROPODA.
Pulmonata and Prosobranchia-Neurobranchia.

CALCUTTA.
PRINTED BY ORDER OF THE TRUSTEES,
1878.

PREFACE.

THE collection of Mollusca in the Indian Museum had for its beginning the recent shells which formed a part of the Museum of the Asiatic Society of Bengal.

These Mollusca, when in the possession of the Asiatic Society, were catalogued in 1860 by Mr. W. Theobald,¹ and the Catalogue was published by order of the Society.

In 1866 the Mollusca and other collections generally of the Asiatic Society of Bengal were transferred by an Act of the Legislature to the Government of India, thus constituting the foundation of the Indian Museum.

Some years after the transfer, the Trustees of the Indian Museum purchased from Mr. Nevill an extensive collection of Mollusca which he had formed before he had entered the service of the Trustees, and to this and the Asiatic Society's collections, many extensive additions have been made by donations, exchanges and purchases, chiefly of Asiatic species.

A list of the names of the contributors mentioned in this work will be found after this Preface, and among the principal donors of recent years may be mentioned the late Dr. Stoliczka who, besides presenting many species during his life time, bequeathed his entire collection of Mollusca to the Trustees of the Indian Museum.

Mr. Nevill is indebted to Professor Edward von Martens for much valuable assistance in the identification of species, and the thanks of the Trustees are also due to Professor

¹ Cat. Recent Shells, Mus. As. Soc., Bengal, Cal. 1860.

Martens for the presentation of an important set of typical examples of certain Eastern Asiatic forms of land shells.

Mr. Nevill, in drawing up this Hand List, followed the system adopted by Carus and Gerstaecker in their "Handbuch der Zoologie," and accepted the various terms used by these authors.

This, the First Part of the Hand List of Mollusca, includes only the Pulmonate Gastropods and the Neurobranchiate division of the Prosobranchiata, but it is hoped that Mr. Nevill will soon be able to complete the remaining portion of the second order of the Gastropods.

JOHN ANDERSON,
Superintendent, Indian Museum.

Lake Ashangi, Abyssinia; coll. W. T. Blanford, Esq.

Mr. W. T. Blanford has been kind enough to allow me to publish his notes on this Mollusk. I can find no mention in Jickeli or other authors of the animals of the Abyssinian *Vitrinas*. "Animal apparently not retractile; mantle large and rugose, only partially reflected over peristome, a little more so over the shell at the suture; foot coarsely granulate above, sole not margined by a furrow at the side; tail bluntly keeled above, pointed, with no trace of a gland; three furrows from near breathing orifice to lower tentacles, lower two uniting in front; lower tentacles short, upper ones (eye pedicels) moderate; the rounded process of the mantle reversed over the suture sometimes reaches the apex and appears easily extensible. Pale flesh colour, yellowish on back, two dark lines from base of tentacles; mantle with opaque yellow spots; jaw narrow without process in centre, smooth."

81. *Nanina sikrigallensis*, n. sp.

Body, livid colour, with very minute red specks ; peduncles grey ; the mantle covers the edge of the shell and has one lobe below the periphery, and a lingulate lobe also on the right side ; furrow of sole rather indistinct ; tail truncate ; mucous gland rather large, with a depressed, rather small projection above ; ten-

tacles very widely apart at their base. Distinguished from its close ally *N. pansa* by the depressed spire, almost rounded periphery, &c. : it is figured in the *Con. Indica*, pl. 130, fig. 8.

Animal dark brown, reddish at the peduncles; mantle thick, dark grey, freckled with white; body roughly furrowed; the pedal row very distinct; the elongated tubercles composing it whitish, basal edge pale grey; tail truncated; gland large, sub-rotundate, surrounded by a swollen margin; mantle lobes small. The animal very closely resembles that of *N. ligulata*, in a less degree *N. orobia*, the tail of which is less truncate, &c., and some species of *Ariophanta*. This description is taken from some of my own notes and from those of Dr. Stoliczka, which accompanied an excellent drawing, made under his supervision.

"No projection above the gland, which is rather small; sole broadly margined, and with a double line."—(W. T. B.)

This species is the type of Pfeiffer's sub-genus *Oxytes*. From a drawing of Dr. Stoliczka's, the animal resembles *N. ligulata* and *N. haughtoni* as to the furrowed body and distinct pedal row. It differs, however (resembling that of *N. orobia*), by the larger, more excavated gland, pointedly oval-shaped, and extending to the sole of the foot.

8. *Helix* (*Patula*) *humilis*, Hutton.

2 Chur, near Simla; coll. Dr. F. Stoliczka.

These are both sinistral specimens. Hutton in his original description records the strange tendency of this form to become reversed; it is interesting that Dr. Stoliczka, after so many years, was able to confirm the observation!

20. *Helix* (*Rhytida*?) *inaequalis*, Pfeiffer.

2 New Caledonia; ex c. A. Morelet, Esq.

I do not see how Messrs. Crosse and Fischer can make this species the type of *Rhytida*, when its author states that the type of the latter is the New Zealand *H. greenwoodi*. When proved that they belong to different genera, the New Caledonian group must receive a new name: the same applies to *Rotula*. Prof. Semper cannot now make its type *N. caelatura*; the type is and must remain *N. detecta*, as correctly asserted by Dr. Stoliczka; the two belong to different sub-generic sections.

3. *Ferussacia hierosolymarum*, Roth.

5 Syria ; ex c. H. F. Blanford, Esq.

4. *Ferussacia barclayi*, Benson.

16 Mt. Oriz and Moka, Mauritius.—Only distinguished from its European close ally, *A. folliculus*, by the more tumid last whorl and broader aperture. It lives gregariously under large blocks of stone; the animal is bright-yellow and very active. A single one of the living specimens which I found was reversed. Has the European form been found sinistral? The anatomy of one of these specimens is described by Semper, (Heft III Philipp. Moll., p. 135,) as a shell sent by me labelled "*Glandina vesiculata*, Bens.;" this was the name under which the form was known at Mauritius, and used by me before I had access to any conchological works.

Sub-Genus *LOVEA*, Watson (type *F. tornatellina*, Lowe).

Genus COELOSTELE, *Bens.* (type *C. scalaris*, *Ben.*).

1. *Coelostele scalaris*, Benson.

2 Sind; coll. W. T. Blanford, Esq.

Perfectly smooth, except that there are a few distant broad vaxex-like ribs, on the penultimate whorl.

2. *Coelostele paladilhiana*, Nev.

[= *C. scalaris*, Palad., not *Bens.*]

6 Aden; ex c. Arturo Issel, Esq.

Only separable from the preceding by the distinct, almost microscopic striation, and the whorls being a trifle less cylindrical.

Genus CAECILIANELLA, *Bourg.*

[= *Acicula*, Leach; *fide* Carus and Gerst. = *Geostilbia*, Cr.]

[= *Cionella*, Jeffr., pars., types *C. lubrica* and *C. acicula*]

var.

5 Godalming and Scarborough; coll. G. Nevill, Esq.

2. *Caecilianella* (?), n. sp., (prox. *C. isseli*, Palad.).

A very handsome species, with truncate columella.

1 Aden; ex c. Dr. F. Stoliczka.

3. *Caecilianella* (?), n. sp.

I know of no Mollusk resembling this peculiar form; but for Mr. A. Adam's label, I should have supposed it to be marine! The columella is not truncate, the margins of aperture being entire.

1 Japan; coll. A. Ad., ex Damon, with label "*Vertigo*, n. sp.," in Mr. Adam's own handwriting!

Sub-Genus *GEOSTILBIA*, Crosse (type *G. caledonica*, Crs.).

4. *Caecilianella* (*Geostilbia*) *balanus*, Benson.

10 Deccan and Sind; coll. W. T. Blanford, Esq., and W. Theobald, Esq.

There are, I think, two distinct species amongst these specimens.

5. *Caecilianella* (*Geostilbia*), n. sp.

Genus CAMPTONYX, Benson (type *C. theobaldi*, Bens.).

I do not find the genus in Carus and Gerst.; probably they follow Fischer in uniting the genus to *Valenciennesia*, Rouss. (very doubtful in my opinion); it is rather an allied form to the Bourbon *Lanzia*, Jous. Woodward classed the genus in the *Otivinæ*.

2. *Acmella* *hyalina*, Theob. & Stol.

1 S. of Moulmein (type); coll. Dr. F. Stoliczka.

3. *Acmella* *roepstorffiana*, n. sp.

Shell not quite so large as the preceding, with less convex whorls, less globose last whorl, and less open umbilicus; in these respects it is nearer *A. hyalina*; the last whorl is, however, more produced and contracted than in *A. hyalina*. The sculpture differs altogether from that of the other described species of the genus; it is throughout regularly, closely, evenly striated, the striæ incised and oblique; excavated at the suture. Long. $1\frac{1}{2}$; diam. 1 mil.

3 Katchall, Nicobar I.; coll. Dr. F. Stoliczka.

4. *Acmella* *moreletiana*, n. sp.

Shell smaller than *A. tersa*, larger than *A. hyalina*. Whorls fine, more convex than in either of the above; the last whorl globosely rounded, with a much more open umbilicus; sculptured round the umbilicus in a very characteristic manner, with

regular distinct plications; beneath the suture, a faint striation is discernible, by the aid of a lens. Long. 2; diam. $1\frac{1}{2}$ mil.

39. *Cyclophorus bensoni*, Pfeiffer.

15 Sibságar; coll. S. E. Peal, Esq.

var. *cryptomphaloides*.

Umbilicus completely covered by a very thin and porcellaneous extension of the columellar margin; transverse bands almost obsolete, except the characteristic broad one at the periphery.

3 Nágá Hills; coll. Captain Butler.

40. *Cyclophorus alabastrum*, Pfeiffer.

(? *C. fulguratus*, var.)

1 Loc. ? ex c. G. Nevill, Esq.

A less solid shell, with slightly more convex whorls and more open umbilicus than any variety I know of *C. fulguratus*.

41. *Cyclophorus fulguratus*, Pfeiffer.

A Protean shell, both in its size and coloration and in the size of the umbilicus.

25 Prome and Meimboo; coll. Dr. J. Anderson and ex c. As. Soc., Bengal.

12 Thyet Myo; coll. W. T. Blanford, Esq.

var. *patens*, Blf.

6 Pegu (typical); coll. W. T. Blanford, Esq.

42. *Cyclophorus pearsoni*, Benson.

Distinguished from *C. fulguratus* by the sub-angulation of the periphery; perhaps it would be better classed as a variety only of it?

(Form agreeing with Pl. XLVIII, fig. 5, Con. Indica).

12 Khási Hills; coll. Major H. H. Godwin-Austen.

8 Tezpur; ex c. Dr. F. Stoliczka.

4 Sylhet and Assam; ex c. As. Soc., Bengal.

10 Gauhati; coll. Museum collector.

var. *minor*.

Smaller, umbilicus less open, periphery more angulate; coloration less sombre.

8 Khási Hills (type var.); coll. Major H. H. Godwin-Austen.

Assam (variety with the periphery scarcely angulate).

var.

A peculiar small variety, with the spire much raised, the last whorl almost detached, the periphery acutely keeled.

2 Sylhet; ex c. As. Soc., Bengal.

var. *fuscicolor*, God.-Austen.

A large variety with a trifle more open umbilicus and still more sombre coloration.

2 Dafia Hills (typical); coll. Major H. H. Godwin-Austen.

1 Khási Hills (typical); coll. Major H. H. Godwin-Austen.

var. *subalabastrum*, nov.

20 Arakan Hills; coll. Dr. Kurz.

2 Tranquebar (?); ex c. As. Soc., Bengal.

20 Chittagong; coll. H. Raban, Esq., and ex c. As. Soc., Bengal.

A small form of this variety.

3 Cox's Bazaar, near Chittagong; coll. H. Raban, Esq.

A still smaller form.

43. *Cyclophorus scurra*, Benson.

(? an extremely small variety of the preceding).

2 Tongop Pass, Arakan; coll. W. T. Blanford, Esq.

2 Upper Burma; coll. Dr. J. Anderson.

2 Arakan; ex c. Dr. F. Stoliczka.

var. *Con. Indica*, Pl. 105, figs. 2-3.

Periphery more rounded, and umbilicus less open than in the preceding.

1 Pegu; ex c. Dr. F. Stoliczka, labelled "*C. patens*, small var."

var. *davisoniana* (? n. sp.)

Very close to the above quoted figure, the last whorl more contracted and base less convex; it will probably prove to be a distinct species.

1 Tenasserim; collected by Mr. Davison, so well known for the many interesting birds he has obtained for Mr. Hume.

• 44. *Cyclophorus polynema*, Benson.

(Agreeing with *Con. Indica*, Pl. II, fig. 8).

• 10. *Pupina artata*, Benson.

[var. = *Pupina blanfordiana*, Theobald].

My friend Mr. Theobald has, I fear, led Mr. Hanley into an error in the *Con. Indica* regarding this group; the form from Thyet Myo called *P. blanfordiana* by Mr. Theobald is exceedingly close to *P. artata*. I consider it nothing but a mere local variety; the shell figured for it in the *Con. Indica* is quite different, being exceedingly close to *P. arula* (so close that I am inclined to doubt its being more than a variety); the figure is an exact representation of the type of *P. peguensis*. A comparison with Benson's admirable description, where he points out

its close affinities to his *P. arula*, should convince even my friend Mr. Theobald himself.

In any case *P. blanfordiana* must be altogether eliminated from the list of species, if my view is correct, as it is a mere local form of *P. artata*; if the figure, however, in the Con. Indica really represents Theobald's form, it becomes a synonym of *P. peguensis*.

14. *Pupina hungerfordiana*, n. sp.

Shell about the same size as *P. imbricifera*, between which and *P. artata* it is fairly intermediate; from the former it can be distinguished by the slightly more produced spire and less convex whorls, much less everted last whorl, smaller aperture, even more evenly circular, and in a marked manner by the single instead of double peristome; the parietal callosity is quite different, being compressed, vertical, and more lateral and produced; the incised canal at the columella is also more covered by the triangular callosity, above which it is less compressed and more evenly expanded; from *P. artata* by its size, proportions, and additional whorl, but especially by the quite different characters of the two callosities; the parietal callosity especially is quite different, being much longer (it reaches beyond the

middle of the last whorl), more vertical, and much more laterally inclined; indeed it extends further back than the pristome.
