Creamery Package Manufacturing Company

Chicago, Ill.

Copyright 1904 by Creamery Package Manufacturing Company

TO THE TRADE

WE present herewith our Special Export Catalogue. In arranging this catalogue we have endeavored to eliminate the apparatus and supplies which are not likely to be in demand in the foreign markets. It will be understood, of course, that we carry a complete line of everything required to equip a Creamery, Cheese Factory, Dairy or Milk Distributing Plant, and in making up complete outfits same can be included. We desire to call particular attention to the Disbrow and Victor Combined Churns and Butter Workers, the Ideal Skim Milk Weigher, the Farrington Duplex Pasteurizer, the Farrington Cream Ripener, the Acme Butter Printer and our complete line of Babcock Testers. We believe that these articles represent a distinct advance in the field of dairy apparatus. We are sure that they ought to find a ready sale in any market where modern buttermaking apparatus is required.

Kindly bear in mind that we are the largest manufacturers and dealers in this line of goods in the world and that we are constantly bringing out improved apparatus, as the needs of the trade demand. We call your attention also to our complete line of goods used by milk distributing plants. It is our intention to use every effort to secure and hold the export trade in our line of goods.

We earnestly solicit your correspondence and assure you that any business with which we are intrusted will have our best attention.

NOTICE

We are prepared to quote on all goods listed in this catalogue or any other pertaining to the dairy industries delivered on board cars New York City. In packing our goods for export the greatest care is taken to protect our customers in the matter of ocean freight rates. When orders are placed with us direct, it will be necessary to furnish us with proper information regarding financial responsibility. When placing orders through the New York export commission merchants, we request you to see that it is distinctly designated on your order that goods are to be purchased of us. We have no exclusive agents in any of the foreign countries and are prepared to handle orders received through any of the regular channels tributary to the foreign markets.

The specifications and prices given herein are subject to change without notice.

Very respectfully,

CREAMERY PACKAGE MFG. CO.

Cable Address, "Creamery," Chicago.

Private Western Union and Leiber's Codes.

MECHANICAL REFRIGERATION FOR CREAMERIES.

MECHANICAL REFRIGERATION has been recently adopted by a number of our best equipped creameries, and its success in these instances gives promise of its general introduction in the near future. Following are some of the advantages of Mechanical Refrigeration as shown by practical experience:

IT GIVES A DRY STORAGE ROOM. All creamerymen readily understand that, when ice is used, this is a very difficult thing to secure, as the melting of the ice is a process which naturally develops moisture and renders the room damp, and one that does not readily keep its contents in proper condition. On the other hand, the frosted pipes of the Refrigerating Machine condense the moisture of the room upon them, thus drying the air and protecting the contents of the room from moulding.

IT SECURES ECONOMY OF SPACE. A large additional building is always required for the storage of the ice required for the season's use. In addition to this, a considerable part of the refrigerated room must also be utilized for the ice necessary for its refrigeration. Where mechanical refrigeration is used, the ice house is entirely done away with. The machine itself requires but a small space, and can generally be placed in the engine room or some part of the work room of the creamery. The piping required to transmit the cold to the refrigerated room occupies but a very limited space, and does not, therefore, necessitate any enlargement of the room for its introduction.

IT IS CLEAN. The handling and packing of the ice in the refrigerated room is ordinarily a process which brings much dirt into the Refrigerator, and frequently into the manufacturing room of the creamery. The Refrigerating Machine avoids everything of this nature, there being no ice to handle, and nothing in connection with it which brings dust or dirt into any part of the creamery.

BY THE AID OF SUITABLE appliances, the Refrigerating Machine can be utilized for cooling the milk and cream to any temperature desired, and this can be done as fast as desired. The value of this for creamery purposes will be readily understood by every creameryman. Where the operator is able to reduce the temperature of the cream to 40 or 50 degrees as soon as it leaves the separator, he has nothing to fear, even in the hottest weather, from any deterioration. It is also desirable in many cases to cool the skim milk as it leaves the separator, in order that it may be returned to the patrons in the best condition for feeding the calves and other stock. This is a very important advantage which cannot be had where ice is depended upon for Refrigerating purposes.

IT GIVES ABSOLUTE CONTROL of the temperatures of the rooms to be cooled. With Mechanical Refrigeration the refrigerated

BARBER COMPRESSOR CLASS "A"

This type of machine is most largely used by creameries.

room can be reduced to any desired temperature, and can be held there at will. This is a result which cannot be obtained with ordinary Ice Refrigeration, and is very important.

Butter to be shipped in hot weather will arrive at its destination in much better condition if, prior to shipment, it can be thoroughly chilled to a temperature of 30 or 32 degrees. When delivered at this temperature to the transportation companies, it will stand a considerable journey, even in the hottest weather, without suffering from heat.

WHERE MECHANICAL REFRIGERATION is used, the churn room can be easily piped and its temperature controlled. This is a result which cannot be secured by the means of Ice Refrigeration, and has not been attempted. Where, however, the Ice Machines have been used, this is being done, and its advantages will be readily appreciated by every butter maker. Many of the difficulties of butter-making in the hottest summer weather can be absolutely avoided where the churn and work room is held at a temperature of 60 degrees during the working hours.

THE SAVING OF LABOR BY THE USE OF Mechanical Refrigeration is also an important item, in that there is no ice to be handled daily in the filling of an ice box. There is also economy in its use, in view of the fact that it is ordinarily operated only during the hours while the machinery of the creamery is run for other purposes.

BARBER COMPRESSOR

Class "B"

This type is preferred when a direct connected engine is installed

Having acquired the business formerly conducted under the name of the A. H. Barber Manufacturing Co., and having established a refrigerating machinery branch to which our Chicago factory is exclusively devoted, we are prepared to continue the manufacture of improved refrigerating machinery on a much more extensive scale than before.

In describing the Barber Compressor, of which we are the sole manufacturers, we call special attention to the cylinder, the most important feature of the machine. It is cast with flanges on the sides, which allow it to set half way down in the bed and hold it perfectly rigid on the frame. The heads, as well as the cylinder, are cast of semi-steel and made in tongue and groove style, making it impossible for the packing to be blown out. The cylinder heads and valves are water-jacketed for the purpose of keeping them cool. Our patent suction and discharge valves are made in one piece of tool steel with a solid head. There are no threads or nuts on them which can be stripped, therefore there is no danger of the suction valve getting into the cylinder head and wrecking the machine, as is often the case in other styles of compressors. These valves are hardened and ground, so that it is not possible for them to pit and leak, as sometimes happens with soft metal valves.

By taking out the valve cap nuts the valves are easily removed for inspection without disturbing any other part.

In the center of the suction arm is placed a strainer to prevent pipe scales from getting into the cylinder or obstructing the valves. This can be easily removed by taking off the cap nut. The stuffing-box is lubricated by an oiling ring to which oil is supplied by a pipe from the lubricator above. This small pipe is also connected with the suction arm, which draws back any ammonia gas that may have escaped the first packing ring.

Class "D"

Complete Belt Driven Refrigerating Compression Side. Side Crank Compressor, with Double Pipe Condenser.

The gland which is at the end of the stuffing-box is supplied with two springs which, being regulated by nuts, equalize the tension on the packing. On the top of the suction and discharge arms are the table valves used in starting and shutting down the compressor. Above these valves is a very simple and complete by-pass arrangement used in pumping over the ammonia from one side of the system to the other.

On this page is shown our class "D" compressor which we use directly connected to a Corliss engine or for belt driving. This bed is of the tangye style for side crank which we use on all our larger-sized machines.

Our main shaft bearing is formed with quarter box having a wedge adjustment full length of the bearing, the boxes encircling the shaft. The bottom box is free to move with the shaft, thereby remaining central under any strain or displacement of shaft.

All our crank shafts are forged of the best quality machine steel and accurately turned to size. A flat locomotive guide is used, thereby giving the machine a deep and rigid frame which makes it impossible for the cylinder to get out of line. The connecting rod is forged of open-hearth machine steel, and the boxes are made of phosphor bronze.

Our piston is made as light as possible and is screwed and riveted on the rod, and is fitted with metallic packing rings of cast iron, insuring a perfect contact with the walls of the cylinder so that no leakage takes place when the gas is being compressed.

Nos. 6-B, 7-B and 8-B compressors include direct connected slide valve engines.

Nos. 11-D, 12-D and 13-D compressors include direct connected Corliss engines.

Prices for ice-making details, expansion coils or brine coolers to suit requirements of each installation will be furnished on application.

DISCOUNTS

In writing for discounts from the above list, or for other information, address our Refrigerating Machinery Branch, 1142 West Sixteenth Street, Chicago, Ill., U. S. A.

We solicit your orders for our superior steel and malleable iron ammonia fittings, which are all standard and reliable.

Complete Belt Driven Refrigerating Compression Side. Center Crank Compressor. Class A.

TESTIMONIAL

UNIVERSITY OF ILLINOIS
College of Agriculture and Agricultural Experiment Station
Address: Urbana, or Champaign, Ill., U. S. A.

GENTLEMEN:

May, 14, 1903.

Replying to your inquiry in reference to the refrigerating plant which you installed three years ago in the creamery department of the University of Illinois, we wish to say that it has been satisfactory in every respect.

The compressor is working as well now as it did three years ago and a number of tests which were made within the last two years indicate that it is doing work to its full estimated capacity.

Your improved double pipe condenser does all that is claimed for it. We like it very much. It is hung up on the ceiling where it is out of the way and at the same time neat appearing. No condensation or dripping water occurs from the outside of it, as is the case with the old style condenser. Another feature we deem quite important is that it condenses the ammonia quickly, which necessitates a much smaller charge of ammonia for the same machine capacity than with the old style condenser. We only regret we have not installed a similar style brine cooler.

The simplicity of your compressor and workmanship you have displayed here will be a credit to you at all times. I am, yours truly, (Signed) OSCAR ERF,
Prof. Dairy Manufactures.

MILK HEATERS.

THE CLIMAX.

The invention of this implement came from a demand by creamerymen for something better than the common tempering vat for heating milk up to the required temperature for the separator.

It is known that where milk flows into the separator, if it has been thoroughly and evenly heated, better results are obtained, than where it is allowed to run in partially and unevenly heated—the latter causing the skim milk to test more or less butter fat, which defect is always laid to the separator.

In construction, the inside cylinder is a removable one, being held in place by bolts and thumb nuts, and set away from the outside cylinder to form a space for a thin sheet of milk between the outside and inside cylinder. The milk is delivered into this place and spreads out into a thin sheet or layer, so as to be evenly and thoroughly heated.

The inside cylinder may be easily and quickly removed, permitting the ready and thorough cleansing of all surfaces with which the milk comes in contact.

In order to effect the rapid and thorough heating of milk, two things are essential, the milk must be distributed in a thin sheet or layer, and the heating medium must be caused to circulate, otherwise there will not be that even distribution of heat.

The outer cylinder is filled with water and steam applied to its entire length, heating the water and thus heating the thin sheet of milk. No steam comes in contact with the milk, as this has been found quite objectionable, especially where foul water and boiler compounds are used.

The Heater may be used in connection with a rotary pump, or direct from the receiving vat.

Very little steam is required for its use, generally $\frac{1}{4}$ to $\frac{1}{2}$ turn of the half-inch valve is found sufficient.

The heater may be attached to a rotary pump, as shown in cut, or connected direct to the vat, where the gravity system is used.

MILK HEATERS

THE TWENTIETH CENTURY DISC HEATER

In the construction of this heater we have overcome the objectionable features of all milk heaters in use at the present time. The problem of correctly heating milk seems simple, yet it has baffled the efforts of inventors and manufacturers until the invention of the Disc Process.

The Twentieth Century Disc Heater is the outcome of years of thought, study and experiment. The Disc System is an advance in the art of heating milk that places the Twentieth Century so far in the lead that other heaters cannot even approach its work. It is built with a series of heating discs. The milk flows into the heating vat at the opposite end from where the steam is admitted to the system of discs. As the milk rises and flows through the heater, it comes in contact with each disc in turn. Each disc in the system, as the steam inlet is approached, is hotter than the last. The milk is gradually heated until when it reaches the last disc, and is drawn off evenly at the delivery end, it is just the desired temperature. The temperature is perfectly controlled by using more or less steam. There is absolutely no danger of cooking the milk, as the special construction of the disc prevents the live steam from coming in contact with the heating surface. By the distribution of the heat through the disc system, the entire heating energy of the steam is perfectly utilized. To insure the complete separation of milk, especially in winter, the milk must be heated uniformly.

Another advantage in using the Twentieth Century is the aeration which the milk receives while heating. In passing over the discs in a thin film the milk is thoroughly aerated; feed and stable flavors are driven off, and a better grade of cream and butter is thereby insured.

MILK HEATERS

THE TWENTIETH CENTURY DISC HEATER COMBINATION HEATER AND PUMP

The uniformly thorough heating which the Twentieth Century does will enable the separator to skim to full capacity under any condition of milk or climate. Its use cuts the usual loss in skimming in half. Though costing more than other heaters, it will pay for itself in a short time in the increased yield of butter.

We make them suitable for any size creamery, with belt or turbine power, with or without pump attachment. The advantages of using a combination pump and heater are many. First, it takes less power to run a heater and pump combined than it does to run a pump and heater separately. Second, it does away with belt and pulleys or a steam pump, the pump being actuated by a cam running on the shaft, which operates the discs. Third, it takes up less room; it can be set right over the vat. Fourth, there is no undue agitation of the milk, as it is not forced but simply allowed to overflow into the bottom of the heater.

This machine, fitted with pump, can be run with belt attachment only.

The turbine driven machine is intended for use in skimming stations and plants where no engine is used. The exhaust steam from the motor is used to heat the milk, making the cost for power nothing.

THE FARRINGTON DUPLEX CREAM PASTEURIZER AND COOLER

BELT DRIVEN

America is known the world over as foremost in all kinds of inventions and improved methods of manufacturing. It is hard for us to acknowledge that for a number of years we have been behind the times in the art of making butter. Nevertheless it is a fact.

American creamery men are just coming to realize the importance of pasteurization in the manufacture of high-grade butter. The creamery men of Denmark, Sweden, and Germany have been pasteurizing for years. The high standing of butter made in these countries in the English market compared with the product of American creameries is sufficient evidence of the value of pasteurization.

The question naturally arises: Why will pasteurized cream make a better grade of butter than unpasteurized? We will try to answer this briefly.

It is impossible for the most experienced butter maker to produce a uniform grade of butter day after day unless he pasteurizes the cream before ripening.

Pasteurization should destroy all offensive bacteria, all strong flavors produced by mixed feeding, and places the cream in such shape that it is absolutely under the control of the butter maker, an impossibility with old methods; in other words, it makes possible the correct use of a starter. When this is done uniformly flavored butter follows, as effect follows cause.

The Farrington Duplex Pasteurizer is the most convenient and efficient pasteurizer made for the production of pasteurized cream butter. The Duplex heating and aerating principle, found only in this machine, delivers the cream to the ripening vat in the very best possible condition to respond to the ripening process. It is free from all the various feed and stable flavors found in raw cream, and which, in case the pasteurizing is done in a closed heater, are retained in the body of the cream. This pasteurizing and aerating process alone adds several points of quality to the butter.

The disc principle of pasteurization does away entirely with all the old clumsy devices now on the market. It is far in advance of all other methods in economy and results.

THE FARRINGTON DUPLEX CREAM PASTEURIZER AND COOLER

WITH TURBINE ATTACHMENT

A pasteurizer, to do its work properly, should run easily and with small power. The small size Farrington Duplex runs with a turbine motor, or is belted, if preferred, the power to run being so small as not even to be considered. When run with motor the exhaust steam from the driving motor does the heating.

A pasteurizer should be economical in cooling water and steam. The Farrington Duplex uses so little steam that a steam gauge shows no pressure. The cooling water does not average at full capacity more than two or three times the amount of cream cooled. The cream is cooled to within a very few degrees of the cooling water. The disc principle utilizes all the energy of the steam and cooling water. No other machine can even approach its work.

The Farrington Duplex takes up but little room. The cream from the separator runs directly into the machine and thence into the ripening vat, doing away entirely with pumps or other means of elevating the cream into or from the pasteurizer. There is no baking on, as in all other machines. The cream is not whipped or churned, but smooth and even, churning out more butter than cream from any other machine.

A fruitful source of mottled butter is found in other pasteurizing machines. Direct steam and consequent cooking of small particles of albumen in cream cause mottles. The "disc idea" does away with all this. Direct steam cannot reach the outer wall of the discs.

The Farrington Duplex Pasteurizer, when used in connection with a Farrington Cream Ripener, gives the butter maker control of the ripening of the cream and the flavor of the butter to an extent not possible with any other machine or method.

We will place it in your creamery alongside any machine on the market, prepared to prove its superiority.

Write for Capacities and Prices.

THE FARRINGTON DUPLEX PASTEURIZER

The universal success which has so far attended pasteurization indicates that it has unquestionably come to stay. There is no doubt in the mind of any up-to-date handler of milk that he should use a pasteurizer. The real stroke of good business, however, is in deciding what machine to purchase. The pasteurizer that the milk dealer wants is the one that does the most thorough work at the least possible running expense.

The Farrington Duplex Pasteurizer is constructed on entirely novel principles. A series of heating discs supplied with hot water and steam, followed by cooling discs containing flowing cold water, carry at each revolution a thin sheet of milk which is heated, aerated, and cooled thoroughly and evenly. The idea is new and was developed after years of study and experimenting.

This principle of heating and aerating at the same time is found only in the Farrington Duplex. As a result the product is of the finest flavor, having a clean, pure taste not found in milk or cream heated in a closed machine.

The cream line will show up better in milk pasteurized in the Farrington Duplex than any other.

Another advantage is that there is never any cooked or foreign flavor to the milk.

We are positive that the Farrington Duplex is better in every respect than any other. Being all metal, it will wear longer than any machine that uses wood in its construction. It is also more sanitary. The metal frame will not absorb grease or dirt and is always clean and sweet. No matter how long a Farrington Duplex is in use it can never become foul or sour. The bearings are horizontal, and it is impossible for the machine to get out of alignment.

It is noiseless in operation. The power is transmitted from one set of discs to the other by chain drive. One can scarcely detect by hearing, when standing four feet from the machine, whether it is in operation or not.

The hot water is closely confined in the discs. There is no vapor or steam escaping from the heater. The condensed steam leaves the heating discs almost as cold as the milk enters the machine. All the heat in the steam is utilized. We guarantee to save one-half the amount of water and one-third the amount of steam over any other machine on the market to-day.

Write for Capacities and Prices.

THE VICTOR STARTER CAN

One of the most important developments of modern dairy science is the use of pure culture starters to control the flavor of butter. Good butter-makers find them of great benefit even when the cream has not been previously pasteurized. Their use, however, is absolutely necessary when pasteurization is adopted. The prime requisite to success in making this kind of butter is a good starter can.

In the construction of this can we have met every requirement of high-grade creamery apparatus. It is very strong, the outside cylinder being No. 18 steel plate, corrugated to increase strength, inside cylinder of heavy copper tinned over. Top seams double seamed and riveted every $2\frac{1}{2}$ inches. Bottom of can is soldered and riveted to outside can by means of clips. Steam and water inlet pipe is rigid, being connected to separate casting on top of machine, therefore cannot be broken off. These features make the can light and easily moved. At the same time it is almost indestructible.

The 4-inch insulating space around the can is practically air-tight. It has insulated cover, one inch thick, with air space. It

is, therefore, unequalled for holding the temperature of the contents at the desired point.

Another special feature is the 6-inch brass steam muffler on inlet pipe, doing away with noise while heating.

Power is applied by worm and gear attached to cover, making no noise and requiring very little power.

The cover has a secondary cover 6 inches wide. This makes it unnecessary to remove when taking temperature, etc.

The driving mechanism and cover lift out together. The stirring device is removed by thumb-screw.

These features make the "Victor" easy to handle and, what is more important, easy to clean and keep clean.

THE SANITARY IDEAL VAT.

The above illustration shows our new sanitary Ideal Vat. We believe there is a tendency among the better class of creameries to equip their plants with the most substantial goods it is possible to obtain. There is also a growing demand for utensils of every sort that can be thoroughly cleaned and kept in a perfectly sanitary condition. It is the growing demand for this class of goods that leads us to design this special vat.

It will be seen from the illustration that the vat is of superior construction throughout. There is no wood used in the construction of this vat, except the top rail to which the inner lining is attached. Instead of the ordinary wood body or frame we use heavy galvanized steel frame made in the same form as the tin lining; this will outlast several wood frame vats. The lining and body are so put together that the regular water space is left between them, and a space for ice box on the end provided for in the cream vats. The whole vat is held up and strengthened by strong iron legs which are attached to the inner knees or braces to which the outside lining of the vat is attached in such a manner as to absolutely prevent bulging or sagging.

We fully guarantee these vats in every respect. We believe, considering their convenience and durability, they are the cheapest vat on the market today.

20TH CENTURY SANITARY VAT

This vat is made of heavy material, and makes a very convenient receiving vat for use in creameries and sanitary milk plants.

It has many advantages over ordinary vats, as it has no wood to rot or become foul. The vat is strongly banded to prevent sagging, and the total weight is carried from the top as in the ordinary style vat. When steam or water connections are not wanted this is undoubtedly the most satisfactory vat to use.

We can also furnish this vat without legs for use where it is desired to suspend vat from ceiling.

This vat is equipped, when wanted, with an agitator. This consists of a blade extending the entire length of the vat, suspended from a shaft in the center of the vat. This agitator describes a semi-circular movement about one inch from the sides and bottom of the vat. It moves slowly back and forth, keeping the milk uniformly mixed, and effectually prevents the cream from rising to the top. This is very desirable in milk plants; it insures a uniform output. It is also useful in creameries, as separators will do better work if the milk is of constant richness.

THE SANITARY MILK PUMPS

Most creameries use milk pumps. They are the most difficult pieces of apparatus around the whole plant to take care of. The most

faithful efforts are unavailing to keep them sweet and clean. They are an unavoidable nuisance.

The Sanitary Ideal is a cleanable Pump. By simply unscrewing two hand screws the entire head is removed. This releases the brass cams. When these are taken out there is no part of the pump but which can be easily gotten at with a brush.

This pump is made of solid cast steel. All parts carefully fitted. No springs to break or get out of order. No packing rings of any sort.

The cams are self-adjusting and automatic in operation.

Fitted with tight and loose pulleys of large diameter and adjustable belt shifter.

STEAM MOTOR SANITARY ROTARY PUMPS

In designing this Steam Motor Sanitary Pump, we have followed the same general lines as our belt power pump of the same style. There is a considerable demand for a milk pump of this character, especially in skimming stations where no steam engine is required that can be operated by direct steam pressure.

It is for this class of work that this pump is particularly recommended. Ordinarily, skimming stations are only of moderate capacities, so that sizes No. 1 and No. 2 will do all of the work that will be called for in plants of this sort.

These pumps are thoroughly guaranteed, and are, we believe, more desirable in many instances than in the ordinary styles of steam pumps.

A rotary pump has always been considered the most desirable pump on the market. This pump combines all of the features of other rotary pumps on the market, with the special feature of cleanibility. There is no point in the cylinder of this pump that cannot be thoroughly cleaned after its run. It takes but a moment to loosen the clamps that hold the head in place, when the head can be removed and all of the working parts, ports, etc., exposed for cleaning.

THE IDEAL SKIM MILK WEIGHER.

No. 1

THE PROBLEM OF SKIM MILK DISTRIBUTION

Every Creamery that returns the skim milk to its patrons has experienced the difficulty of getting a fair and equitable distribution. Many otherwise successful and promising creameries have been entirely ruined on account of trouble growing out of this problem. It has been a source of constant friction. The late comers either had no skim milk or it was so diluted with water as to be utterly worthless.

HOW TO OVERCOME IT

A great many different methods have been tried to overcome this difficulty. Some creameries employ a man to pump or dip all the skim milk for its patrons. This plan is expensive and at best is almost entirely a matter of guess work.

WEIGHT THE ONLY PERFECT STANDARD

It has been conceded for a long time that a mechanical distribution of some kind is the only absolutely accurate and satisfactory solution of the problem. This distribution, to be just to all, must be made on the basis of actual weight in exact proportion to the amount of milk delivered.

THE IDEAL SKIM MILK WEIGHER

No. 2

THE IDEAL WEIGHER

As its name implies, the machine actually weighs the milk. The weighing tank is adjusted so as to swing on a scale beam.

Each machine is provided with a set of V-shaped checks, put up in a convenient case. These represent a certain amount of milk.

It is absolutely impossible to get more than the amount of milk represented by the checks. The Ideal Weigher cannot be bribed. It will show no partiality.

DESCRIPTION

This machine is made especially for the distribution of skimmed milk to the patrons of a creamery. It is simple in construction and easy to operate. It takes up small space and is easy to set up. It is thoroughly practical, strong and durable. It has a capacity of 10,000 pounds of milk per hour, and this can be increased if necessary. The entire machine is constructed of iron and brass, with the best chilled steel bearings on scales.

The No. 2 machine is made exactly like the Ideal No. 1, which has been on the market for several years, except that it is enlarged, the capacity greatly increased, and all parts proportionately strengthened. The square weighing can allows much larger capacity in the same space. The inlet and outlet are much larger, and the machine fills and empties very rapidly. The checks run in sizes up to 500 pounds, and the machine has ample capacity for several separators.

Price, No. 1.....	\$100.00
Price, No. 2.....	125.00

CURTIS' AUTOMATIC SKIM MILK WEIGHER.

The increasing demand for a low priced automatic skim milk delivery has induced us to bring out the Curtis' Automatic Skim Milk Weigher, as shown in the illustration.

This machine can be set inside or outside the building. The inside is preferable, as this lessens the danger of freezing in winter.

The skim milk is elevated to overhead tanks by pumps, the machine working on the gravity system.

Overhead tanks with jet pump or rotary pump attachment is necessary where this machine is used. A 12-inch elevation of the bottom of the tank above the valves on the weigher is sufficient.

With $1\frac{1}{2}$ -inch inlet, and ample outlet, the capacity is unlimited. It will handle more milk than any other weigher or pump made.

The illustration shows the tipping buckets and the possibilities of the machine, and it will readily be seen that when the skim milk flows into the buckets on one side, it will, as soon as that side has received the required quantity, oscillate to the other bucket; this lifts the chain which holds the valve and allows the milk to escape from the bucket on that side, and the bucket being thrown over the opposite bucket will fill, as the change of position of bucket brings inlet valve first on one side and then on the other.

Full and complete directions for setting and operating are sent with each weigher. Every machine is adjusted before sending out, and all that is necessary is to set it in its place according to directions, making the pipe connections, and the machine is ready for operation.

THE VICTOR PASTEURIZER WITH OIL TRAP

Every progressive creameryman knows that it pays to take the best possible care of his patrons and their interests. In order to do this, it is essential that the separator skimmilk be returned to them sweet, clean, and free from disease germs.

Pasteurizing the skimmilk before returning it not only keeps it in better condition, but helps to improve the quality of the milk received, as running the hot milk into the cans sterilizes and aids in keeping them sweet and clean.

The Victor Pasteurizer with Oil Trap enables the creameryman to do this, without expense beyond the first cost of the machine.

This machine is made entirely of iron, galvanized throughout. It is self-contained, and so constructed that no steam can escape from it without first passing through the milk, consequently the steam is entirely condensed, making an exhaust pipe connection from the pasteurizer to the open air entirely unnecessary. The milk cannot froth and run over the floor as in an open pasteurizer.

It is provided with an automatic check valve, which prevents the steam from entering the milk inlet pipe should anything happen to check the flow of milk.

Only 8 inches in length by 6 in diameter, it can be thoroughly cleaned in 3 to 5 minutes, being so constructed that the rear head can be removed by loosening two thumb nuts, giving the operator easy access to the interior of the machine.

Although intended for use with exhaust steam, it is so constructed that live steam may be used if desired.

When used with exhaust steam the Victor Oil Trap prevents the oil from the engine from getting into the milk, fouling it and making the cans greasy.

It is entirely noiseless and works with great rapidity. By following the directions sent out with each pasteurizer, any intelligent person can operate it, and it is impossible to scald or burn the milk onto the inside.

The capacity is limited only by the amount of milk which is pumped into it.

The Victor Oil Trap is used by many creamerymen for removing the oil from exhaust steam, which is then used for heating the boiler feed water.

It prevents foaming and other troubles which follow the introduction of oil into steam boilers. As effective as a filter and less expensive.

FARRINGTON CREAM RIPENER.

This machine has been developed as a cream ripener by practical experiments in some of the best creameries in the country. The principal point to which we call attention is that the machine affords the operator perfect control of the temperature of the cream throughout the ripening process. The machine is so constructed that a circulation of hot or cold water can be passed through the drum as desired. The water to cool or heat the cream passes through the hollow gudgeons and circulates around the inner metal jacket and as the machine slowly revolves there is a constant and thorough agitation so that every particle of cream is acted upon in exactly the same manner.

These machines will give equally desirable results whether the cream comes sweet from the separator or is gathered from skimming stations and reaches the churning plant at various stages of acidity. We advocate the use of the acid test as soon as the cream is placed in the ripener. This will enable the operator to determine the operation of the machine so as to bring the cream to the proper condition for churning at churning time. The test should be taken frequently throughout the time of ripening so that the process can be hastened by the application of heat or retarded by the application of cold as may be necessary.

Different grades of cream require different treatment. This ripener enables the operator to secure the most desirable results without regard to these conditions.

The regular style ripener has right angle clutch belt pulley. They can be furnished, however, with pulley on main shaft of ripener if desired.

There is no limit to the opportunities this machine gives the butter maker to carry out his own special ideas on cream ripening.

In ordering extras give number stamped in wood under the cover.

THE FARRINGTON AIR COMPRESSOR.

The simplest and most convenient method of conveying cream from ripener to churn is by the aid of our special air pump or compressor. This pump can be located convenient to power. A pipe connecting with air inlet in cover of ripener completes the outfit. The outlet of ripener is connected with churn by galvanized pipe. As soon as the pump is started the air pressure in ripener forces the cream into the churn. The process is simple, rapid and complete.

The air compressor is fitted with double brass cylinders, calculated to stand heavy pressure. It is furnished complete with counter shaft, connecting rod and crank plate.

BOYD CREAM RIPENER

The Boyd Cream Ripener provides the essential conditions for the practice of modern cream ripening in a simple and convenient way that is easily adapted to every factory.

The cream is held in a pan surrounded by thoroughly good insulation, and the cooling is effected by means of the water coil suspended and moving through the cream back and forth, and coming in contact with every particle of the cream. This aerates and mingles the cream with the starter so that the ripening process is uniform and perfect. With cold well water cream can be cooled perfectly and evenly without ice, which is never required excepting when a very low temperature is desired.

The entire machine is constructed of the best material obtainable with the best and most conscientious workmanship that money can secure.

ROE'S COMBINED CHURN AND BUTTERMILK STRAINER

This strainer consists of two parts, which may be used separately or together. For straining the cream into the churn, the upper half only is used. For straining the buttermilk use the two parts together, and by means of a pipe attached to the spout conduct the buttermilk to the drain. Price, complete, \$2.00

Double the lists to obtain price on above goods furnished in Tinned Copper.

20TH CENTURY MILK CAN WASHER

A power can washer is something needed in every creamery, cheese factory, and sanitary milk plant in order to keep cans perfectly clean and in sanitary condition. Our "20th Century" Can Washer is one we recommend in every particular.

All modern and up-to-date plants are washing patrons' cans as soon as they are emptied. This insures absolute cleanliness, and in many cases prevents souring of milk. This machine requires but little power to operate and washes cans both inside and out. It is so simple it cannot get out of order. An experienced operator can wash one hundred and seventy cans per hour and wash them clean. The machine is strong and substantially made, having heavy iron legs, and tank made of two-inch matched and dressed lumber, painted both inside and out. The brushes are so adjusted that they touch all parts of the can, thereby doing the work better and in much less time than can be done by hand. We ship each machine complete with tight and loose pulley, foot lever for washing inside of can, hand lever for washing outside of can, special inside bottom, breast, and neck brushes, also water and steam connections with valves. All brushes are made of material which we have learned through experience is the best adapted for this special work, and will last an indefinite length of time.

Refitting the machine with new brushes is a simple matter and not expensive. In ordering machines, state size of cans you desire to wash.

We guarantee each machine to do all we claim for it.

Price each, with one set of brushes.....\$125 00

THE DISBROW

COMBINED CHURN AND WORKER

SIZES 5, 6 AND 7 HAVE DOUBLE DOORS.

protected from dirt, flies, and foul odors. A year's time always makes a change in the "profit and loss" account of a creamery, that opens the eyes of the manager and board of directors.

The Disbrow has been a maker of prize-winning butter from the beginning. A long list of prizes at National and State Conventions testify to its superiority as a practical butter-making machine. Among the more noticeable of the recent prizes won by this machine may be mentioned The Grand Prize at the Paris Exposition in 1900; First and Second in the National Buttermakers Educational Contests in 1902, also in 1903. The last two contests, especially, show that the Disbrow is an every-day, steady-going piece of apparatus, making possible the production of uniform high-grade butter, month in and month out.

As the prime object in operating a creamery is to make the most possible profit out of the product, it seems strange that any creamery should attempt to get along with old or out-of-date churns, which are so wasteful in labor, besides making a poorer quality of butter.

The Disbrow is made of the very best material, by the most skilled workmen. It is thoroughly well proportioned, and very durable. The large number sold and in use at the present time, the thousands of satisfied users, furnish ample proof of the practical value of this machine. It is little wonder it is called "The Churn That Works."

THE DISBROW

COMBINED CHURN AND WORKER.

"THE CHURN THAT WORKS"

The "Disbrow" has been on the market for ten years, and has never failed to give complete satisfaction. New improvements have been made from time to time, until we have to-day a perfect Combined Churn and Butter-worker. The working principle is the same as used in the older styles, but the mechanical features are better. These improvements make the churn easier running, easier to operate, stronger, and more durable. Since the machine was introduced there has been an enormous demand for them, not only from all parts of the United States and Canada, but from England, Denmark, Sweden, and even far-away Australia.

It is not hard to understand why the Disbrow has attained such a wonderful popularity. The idea of working butter in the churn was first put to a practical application in this machine. The method used in the Disbrow is so simple that a child can understand it, yet so perfect that no changes in principle have been found necessary.

The Disbrow effects a saving in time, labor, shafting, pulleys; keeps the butter at an even temperature in hot weather while working it, inclosed and

THE DISBROW

Some say it does all we claim, others say we do not claim enough.

This sectional cut of the Disbrow Churn will give a clear idea of how the machine works both in churning and working. The butter is delivered to the working rollers in such moderate quantities that there is no danger of salving it and destroying the grain.

THE NEW DISBROW CHURN GATE.

The new Disbrow Churn Gate closes on inside end. Always perfectly clean.

Price, \$2.00.

Furnished free on all churns.

Please give the size and shop number of your churn when ordering repairs. Also the figures (and letters) on the piece wanted. This will save much delay in filling orders.

THE VICTOR COMBINED CHURN AND BUTTER WORKER.

The above cut shows the "Victor" complete ready to run. The internal works consist of four rollers in two sets with which all the work of churning and working the butter is done.

STYLES C, D, E, F, G.

All "Victor" Churns above size E are provided with two doors, size E, and all smaller sizes with one door. In ordering extra churn doors carefully state whether it is a flat or an oval door that is wanted, and give the exact length and width of the door the new one is to replace.

The "Victor" Combined Churn and Butter Worker is no longer an experiment. It has abundantly proven its high qualities as a first-class butter-making machine.

The running gear of this machine is large, strong and simple, with but a minimum of friction, which promises durability and a great saving of repairs.

It is an exhaustive churner, being so arranged that the working rollers give marked assistance in the process, and the product it presents when its work is finished, speaks more loudly and positively of its high qualities than any combination of words can do.

For simplicity of construction and ease of manipulation, in strength of gearing, powers of endurance and perfection of its work it has no superior; and in the

rapidity of its butter working and the ease with which its product can be removed, it is a delight to every butter-maker who uses it.

The construction of the "Victor" is such that in working, the entire mass of butter passes twice between the rollers at every revolution of the drum, hence it is a very quick worker.

The working rollers which are stationary in churning, are put in motion ready for use when the working process is to begin, by a simple movement, and its novel method of working the butter is so complete that the grain is left intact, and the work is performed in so short a time as to cause astonishment to those who witness its operations.

When the working is finished, by a slight manipulation of gear the rollers are fixed and become elevators, which, by a half turn of the churn bring the butter in a mass to the proper position for removal, thus avoiding the necessity of reaching far into the churn in the act of removing the butter. When the rollers are thus used they bring up the entire mass of butter, leaving none in the bottom of the churn.

The "Victor" in its inside construction has no machinery whatever except its four rollers, in two sets, always bearing the same relation to each other and to the drum, in the heads of which they have their bearings, and with which they always move when the churn is in motion whether they are revolving on their own bearings, as in the working of butter, or are fixed as when churning, or elevating the butter for removal from the churn.

REMOVING THE BUTTER.

To remove the butter from the "Victor," set the rollers, revolve the churn until the door is in the proper place, and the rollers, acting as elevators, will hold the butter in position for easy removal. It will be found that when the churn is stopped for removing the butter, it will remain at the place it is stopped without props or braces, or any other aids to hold it in position. It supports itself regardless of the position of the butter.

THE WIZARD BABCOCK TESTER

We offer the Wizard Tester with the assurance that we have produced a machine that for perfect mechanical features, convenience, compactness, accuracy, and durability cannot be equaled.

Placing the small (7-inch) steam turbine on top of the frame and between the two bearings does away with all vibration and excessive wear. In so doing we have exemplified the old saying: "Runs like a top"—the power being applied in exactly the same manner. It uses only 5 or 6 pounds of steam.

All joints are planed steam-tight, no packing needed. They never leak.

Heating of bottles is from exhaust, practically automatic, regulated by damper in outlet.

The spring brake stops the bottle head quickly, without danger of breaking bottles, with no waste of steam.

Every part can be drained completely.

Made in 24-bottle size only. Price. \$35 00

THE TWENTIETH CENTURY BABCOCK HAND TESTER

The hinged cast-iron cover opens downward on a spring. It cannot break. The Twentieth Century Babcock Hand Tester is operated with spur and worm gear, which gives the high speed necessary for a perfect test.

A speed of from 900 to 1000 revolutions per minute can easily be obtained. It fills completely the demand for a high speed, accurate, durable, easily operated hand power tester, so that either those that sell or purchase milk can tell its true value. It is indispensable in dairies, creameries and cheese factories which are without the necessary steam apparatus for running steam turbines. The pockets are made of seamless brass, exactly the same as on large testers. The outside gearing is encased and at the top of the machine.

We call your attention to the covered gears, compactness and neat construction of the machine. All gears are cut in special milling machine, not cast; are absolutely accurate, and therefore noiseless in operation. The perfect enclosure of the bottles does away with danger from flying acid and glass should one of the bottles break. It is fitted with bearings both top and bottom, which is a great advantage over other makes. The swing of the bottles is wide, owing to the machine being over 16 inches in diameter, thus making a perfect test easy to obtain.

THE "OFFICIAL" BABCOCK MILK TESTER

In placing the "Official Tester" on the market we feel that we are supplying a machine that has long been needed by progressive dairymen.

There has been a demand for a small, perfectly accurate, easy running, low-priced hand tester ever since the Babcock system of milk and cream testing was discovered.

The "Official" Babcock Tester is the outcome of this demand. By its aid the dairyman can with small expense know just what each cow in his herd is doing in the way of paying for her board. He can detect losses in skimming milk in his hand separator, and can keep a check on the milk or cream he sells. By using the test regularly the dairyman can save its cost many times over each year.

The "Official" is also a very convenient machine for use in hotels and restaurants and in the laboratory.

It has enclosed cut gears and swinging brass bottle cups. Runs without noise, jar, or friction. Being fitted with thumb screw and clamp, it can be clamped to table or screwed down, just as the operator may wish. It is only 9 inches high.

The bottle head and bottles are removable—in fact, the whole apparatus can be taken apart instantly and packed in small compass. With the instructions furnished any one can do accurate testing.

Prices include full directions for making test, acid measure, pipette, test bottles, test bottle brush, and acid.

DOUBLE BORE SKIM MILK TEST BOTTLES.

WAGNER'S AND OLSON'S TEST BOTTLE

For accurately determining the percentage of Fat left in skim milk or butter milk.

Reads down to one one-hundredth of one per cent. fat.

One tenth of one per cent. can be read as accurately and as easily as one whole per cent. in the ordinary Babcock bottle.

Tests cannot be spoiled by overflowing with hot water.

Uses but one-half as much acid as the ordinary Skim-milk bottle.

Invaluable to any owner or user of a cream separator, as it tells him just how to regulate the capacity of his machine so that the loss in the skim milk will be reduced to a minimum.

Price.....each, \$0 60

"per doz., 6 00

THE IDEAL BABCOCK BOTTLE TESTER.

For testing the accuracy of the graduations on the neck of the bottles.

We have devised this tester for accurately and rapidly testing the graduations in the neck of the Babcock Milk Bottles, and it supercedes the unhandy and difficult mercury test heretofore so universally used.

This little instrument will test for two points without removing it from the bottle, and is always ready for use without auxiliary attachments, such as pipettes, mercury, corks, etc.

To make a test it is only necessary to fill the bottle with water (or milk, which is preferable) so that highest point of the liquid is even with the 0 mark.

Then slowly lower the tester into the bottle until the liquid rises half way between the two sections, and at that point should be the 5 per cent. mark.

After that point is tested for and established, slowly lower the entire tester into the bottle so that the liquid rises over the top of the upper section about one-eighth of an inch, and if the bottle is correct the top of the liquid should be at the 10 per cent. mark.

Endorsed by all creamery men who have seen and used it.

AUTOMATIC PIPETTES

WAGNERS' "UP-TO-DATE"

TO USE WITH THE BABCOCK TEST

The Neatest and Most Convenient Pipette Ever Put on the Market

DIRECTIONS

The mouth is applied to the slanting tube and milk drawn up until it is above the glass cock, then the cock is closed and the measured milk is put in the test bottle. Should there be an overflow same will be caught in the large glass overflow bulb or extension of slanting tube. This overflow bulb can be detached from the Pipette and emptied when desired.

Price, complete each, \$1 25

Overflow bulbs	\$0 35
Pipettes	85
Rubber stoppers	10

COMBINED ACID BOTTLE

Just the simplest thing imaginable, and it always works. Tip the bottle up until the pipette at the side is full up to the mark near the top, and when the bottle is returned to an upright position, the surplus flows back into the bottle again and the pipette is left full up to the mark, and contains exactly 17.5 c.c. The contents of the pipette may then be emptied by turning the cock at the bottom. This apparatus has the advantage of having no rubber connections and bulbs to wear out, and it is very simple and easy to work.

Price each, \$3 00

SCOVILLE MILK SAMPLER

It takes the sample from the top to the bottom of the milk in the weigh can, thus giving a fair sample of the whole body of milk. When it reaches the bottom the movable cap closes, retaining the sample, which can then be discharged into the sample receptacle. Price, \$2 00

MILK THIEVES

This is a very convenient sampler, and gives excellent satisfaction.

Floating.

Flange.

Designed for testing small thermometers. We wish to call special attention to a new 12-inch floating thermometer, which we are having made specially for us. It is graduated from 32 to 212 Fahr., and is absolutely correct. *Every creamery and cheese factory should be provided with one.* We furnish them in one size only. *Thoroughly tested.*

THE HYGROMETER

For Cheese Curing Rooms and Cold Storage Houses

The importance of maintaining a proper degree of humidity of the atmosphere of cheese curing rooms and cold storage houses is beginning to be well understood by all intelligent cheese makers. A proper and even temperature should be held as near as possible, and THE ATMOSPHERE SHOULD CONTAIN A PROPER AMOUNT OF MOISTURE. These being the essential points, we wish to call attention to the application of an instrument called the Hygrometer, which can be used in connection with any good thermometer to assist in effecting the desired result. The Hygrometer hung in a curing room will indicate the moisture in the air; if it stands at 50° and a thermometer beside it shows 72°, then the air is in proper condition for curing full milk cheese. For skims, a lower temperature and a greater degree of moisture. Adapt the application of the instrument to

meet circumstances, and when necessary, sprinkle floors, ventilate, or by other means increase or diminish moisture. As a rule the air of curing rooms is too dry; cheeses shrink too much in weight and crack; the use of this simple instrument will prevent this and save loss. The cured condition of the cheese will also be greatly improved. In COLD STORAGE rooms it is very desirable to know the degree of moisture. For this purpose the Hygrometer will be found invaluable.

Price of Hygrometer, polished wood frame, about 5½ inches in diameter.....\$2 50

Sent by mail on receipt of \$2.75.

MANNS' ACID TEST

PROF. MANNS' ACID TEST, FOR TESTING THE ACIDITY OF CREAM AND MILK.—During the process of ripening cream a certain amount of acid is developed, or, in other words, the cream becomes sour. This is due to the presence of the lactic ferment, which, finding all conditions favorable to its growth, develops rapidly. *The lactic fermentation is the one desired in the ripening process.* After the cream has attained a certain degree of acidity the lactic fermentation ceases and the putrefactive fermentation begins. If the cream should not be churned before this point is reached, the effects of the second fermentation is illustrated in "spoiled" cream. To decide, therefore, upon the proper condition of the cream for churning is a very important and very delicate point, which has heretofore been left to the senses of taste, smell and sight of the butter-maker. The object of introducing this test is to furnish the butter-maker with a means of determining the *exact* acidity of his cream at any time. In churning cream that has not attained its proper strength of acid, lower the temperature, thus saving a serious loss in the butter yield. After cream has attained an acidity indicated by 42 c. c. it is dangerous to the flavor of the product to allow the cream to stand long before churning. In cheese-making the process can be successfully used to ascertain when milk is ripe enough to add rennet.

FARRINGTON'S ALKALINE TABLETS

For Testing the Acidity of Milk or Cream

Apparatus for determining the exact acidity of milk and cream, used especially in cream ripening.

These tablets have been used successfully in the daily work of many men who handle milk and cream. They have proved to be a means by which the dairy-man is constantly learning more about his business. He is therefore more prosperous, as they aid him to get top instead of fair or medium prices for his goods.

As a simple and practical guide for showing the exact sweetness or sourness of milk or cream, they have demonstrated that an acidity tester is as valuable as any other tester for the butter-maker, cheese-maker, milk-dealer and dairy-man.

THE USES OF THE TABLETS

Among the many uses of the tablets are the following:

1. **Selecting sweet milk** for the creamery, cheese factory, milk pasteurizer or milk dealer.
2. **Testing the acidity of cream** for churning at home or at the factory.
3. **Tracing the rate of ripening** of cream, to show what treatment it is necessary to give the cream in order to get the proper acid condition for churning **AT THE PROPER TIME.**
4. **To show whether it is safe** to mix two lots of cream.
5. **To test the acidity of whey.**

ACME BUTTER PRINTER

A Printer that Prints each Brick Square and True

This cut represents an entirely new and very complete machine for making Butter Prints, which is much superior in its workings to anything before offered both in completeness and rapidity of work. It is provided with a convenient table, with shelf underneath for holding tools, is easily adjusted and handled. It is made for two-pound, one-pound and half-pound prints as desired; will put out 25 pounds of half-pound or one-pound prints, or 30 pounds of two-pound prints, according to construction, at one operation of the machine, which requires but a very few minutes, and a great feature of its work is a result never approached by any other machine ever invented for this purpose. It does not shrink the butter any more than the process of packing in tubs.

It is one the most rapid and perfect Butter Printers ever placed on the market.

It is one of the few Butter Printers ever offered that will print so large a quantity at one impression.

It is one of the few Butter Printers ever invented that will leave the prints on a tray so that they can be conveniently removed to the cooler before wrapping, when necessary, using the tray as a carrier.

The tray as seen in the cut leaning against the table leg, is an adjustable rack which by a slight movement can be so opened as to separate the prints, thus preventing the danger of mussing them in handling. Four of these trays go with every machine. By the side of this tray, on the floor in the cut, is seen the trimmer with which the top of the mass of butter is leveled after being packed in the box ready for cutting into prints. One of these trimmers goes with each machine. On the table back of the print box and cutter can be seen the two packers and ladle which go with every machine sold. Directions for operating accompany each printer.

SIZES AND PRICES OF BUTTER PRINTER

Extra Butter Trays, 50 cents each. Extra Butter Packers, 35 cents each. Extra Butter Ladies, 25 cents each. Extra Butter Trimmers, 25 cents each. Plain Followers and Frames go with each machine. Carved Following Boards furnished when ordered, at reasonable cost.

THE AMERICAN BUTTER PRINTER

This is a new printer, very unique in design. It is easy to manipulate. Prints rapidly and leaves the butter in good shape, either to wrap or put in cooling room.

This machine is just what the name implies, a printing and weighing machine, making each print of accurate weight and of a perfectly true and uniform style.

Each machine is supplied with four following boards or trays which are used in removing the butter from the machine, and, if desired, butter can be left on these and placed in the refrigerator to thoroughly harden before being wrapped for shipment.

THE WIZARD BUTTER PRINTER

The Wizard is intended for use in dairies and small creameries. It is simple and very rapid; cuts each print square and true, and uniform in weight.

The box is packed full of butter, which is then struck off even with the top. The following board is swung into place, and the box raised on the upright standards, forcing the cutting

wires through the butter and cutting it into uniformly perfect prints. The butter does not drop from the box, consequently the prints are not damaged.

PRINT BOARDS

We are prepared to make carved print boards to go with the American or Wizard Printers, of either names, initials, or monograms, for which we make a nominal charge. The new feature in this respect is that the letters are raised on the wood instead of being cut into the wood, and thus pressing the letters into the butter instead of raising on same. Any one accustomed to print butter will at once see the advantage of this, as the design will not become obliterated in packing and shipment.

BUTTER PRINTERS "IDEAL LEVER"

THE
ONLY
SUCCESSFUL
PRINTER

FOR
COLD
STORAGE
BUTTER

Above we illustrate one of our newest printers. It is adjustable, so that it will print either pounds or half pounds. It is self-gauging, making the prints neat and also uniform in weight.

This printer is intended for use in creameries, but more especially for printing storage or tub butter. It is very rapid and does excellent work.

To Operate, you press the box full of butter, which is level with the top of the table, working it in solid, using the lever; you then stroke it off level with a paddle, then raise the lever and throw it all the way back, which raises the butter out of the box nicely printed.

There are screws in the bottom of the print block, and also in the bottom of the follower, for adjusting the weight of the butter, which it does more exactly than if weighed. Prints are the same size as those of the I X L Printer.

BUTTER PRINTERS

THE UP-TO-DATE

No. 1

TWO PRINTERS IN ONE

This improved Butter Mold and stamp is self-weighting or gauging. The same stamp can be adjusted to print pounds or half pounds. This adjustment is regulated by a collar that moves up and down on the upright standard and is kept in place by a set-screw. This makes practically two printers in one. It is patented and cannot be used on any other printer. The adjustment is very simple.

The process of printing is very rapid. With little practice a person can easily mold from ten to fifteen prints per minute.

Gives accurate weights when properly adjusted. Prints pounds, $4\frac{5}{8} \times 2\frac{1}{2} \times 2\frac{3}{8}$ inches; also half-pounds $4\frac{5}{8} \times 2\frac{1}{2} \times 1\frac{3}{8}$ inches.

It is made of close-grained wood with gun metal, nickel-plated top and trimming.

No. 2

This Butter Mold is essentially like the Up-to-Date No. 1 in its workings and construction, except that there is no metal band around the top.

The same printer will print pounds or half-pounds of the same sizes as the No. 1, and is also made in two-pound size, twice as wide as the one-pound.

Do not compare the Up-to-Date Printer with cheaper printers which can print but one size prints. Every Up-to-Date Printer prints two sizes, and is, therefore, practically two printers in one.

PRICES

With plain (uncarved) print block.

To print pounds, $4\frac{5}{8} \times 2\frac{1}{2} \times 2\frac{3}{8}$	\$3 00
Or half-pounds, $4\frac{5}{8} \times 2\frac{1}{2} \times 1\frac{3}{8}$	3 00
To print two pounds, $6 \times 3 \times 3$	4 00
Or one pound, $6 \times 3 \times 1\frac{1}{2}$	4 00
To print two pounds, $4\frac{5}{8} \times 5 \times 2\frac{3}{8}$	3 50
Or single pounds, $4\frac{5}{8} \times 5 \times 1\frac{3}{8}$	3 50

ASH TUBS

"ELGIN" STYLE—HAND MADE

These tubs are made from strictly prime White Ash, the stock being first thoroughly air-dried and then kiln-dried just enough to extract all the sour sappy substance from the timber.

In addition to the above drying we still further cure the wood by fire heating in the process of manufacture. This thoroughly softens and sweetens the timber, and thus reduces the possibility of moulding to the minimum.

Our facilities are extensive and of the very best, which enables us to make uniform, solid and brine-tight packages. These are advantages which no other manufacturers of this style of package possess.

A large majority of the *Commission Houses* and large *Butter Manufacturers* use and recommend this package. It is without doubt the best Butter Package now on the market.

Many so-called *Hand-Made Tubs* are made from stock which has simply been air-dried. They shrink and fall down and are wholly unfit for butter, often spoiling it, and entailing a loss many times the cost of the package.

SPRUCE TUBS

"VERMONT"

The Boston Market, at least, prefers a Spruce Tub and gives preference to butter—other things being equal—packed in this style of packages. We have working arrangements with several spruce tub factories whereby we are able to furnish the **Best Spruce Tubs** the market affords at reasonable prices and in quantities of one nest or a car load, and guarantee quality.

"AUSTRALIAN" BUTTER BOXES**WHITE SPRUCE**

THE
LIGHTEST

THE
BRIGHTEST

THE BEST**AUSTRALIAN PACKAGE ON THE MARKET**

The extreme lightness of these boxes will effect a saving in freight alone, between our factory and the consumer of the butter, of from five to eight cents on every package. Outside of this they are beyond all question the finest package made for storage butter that will be satisfactory for foreign shipment. They are the regulation size, 12x12x12 inside measure; the sides, tops and bottoms are each of one piece. These boxes are finely finished inside and out, are cut true to gauge and nail up perfectly. They

IMPART NO BAD FLAVOR TO BUTTER

The superiority of spruce for butter packages has long been recognized, and we are offering our customers the very best box that can possibly be made for butter.

BUTTER PRINT BOXES

These boxes are made from poplar, planed one side and very neatly finished. The ends are made with hand hole as shown in cut. We furnish these boxes in the K. D. only. The freight charges are much less shipped this way, and it costs but a trifle to put them together. They should be lined with parchment paper before using.

BUTTER CARTONS

Open

MONARCH AND PEERLESS BRANDS

The advantage of small butter packages is so apparent that the practice of making butter into one-pound prints is rapidly growing. In addition to the parchment paper wrapper, many manufacturers now put each print in a separate carton.

Our cartons have been designed especially for this trade. Cleanly and sanitary in every respect, they increase sales and hold trade.

Being brine-proof, the outside of the carton is always dry and clean, and the butter presents a much better appearance, due to the fact

Set Up

that it does not dry out on the surface. It also keeps fresh and sweet much longer.

The wrapper should be set up around the print of butter. This will be found more convenient than to put the print into the set-up box.

PRICES

Printed cartons are printed on one side only.

BUTTER COLORS

WELLS & RICHARDSON CO.'S

The Dandelion trade mark is now known all over the world as standing for perfection in butter color.

Wells & Richardson Co.'s "Improved" Butter Color is the standard color of the world. It has been on the market for many years and never fails to give complete satisfaction. The last drop is as clear as the first. Guaranteed not to fade or color the buttermilk. Always gives that perfect June tint which consumers so much desire.

TUB FASTENERS

IDEAL.

TIN AND TACK COMBINED

We can recommend to consumers as being far superior to any device known for safe transportation and preservation of the contents of the package.

No lacerating and poisoning the hands.

Receivers of butter in all sections are strongly urging shippers to encourage among creameries and dairymen the use of the Ideal Fastener in preference to any other. The Ideal is quickly applied and can be easily withdrawn to examine butter, and can be re-used. Remember, the Ideal is a time, labor and money-saver to every creamery, butter-maker or shipper.

We are the exclusive Western Agents for these Fasteners.

Try the Ideal. We guarantee satisfaction. Send for circulars and prices. Samples free.

CURD MILLS

GOSSELIN

This style of mill has been used for several years in Canada. We have recently introduced it in this country. It is one of the most satisfactory mills ever placed on the market. Our customers who have used it are well pleased. It shoves the curd into thin slices and at the same time slits it getting it into the most desirable shape. It is made strong and durable and is easily operated.

Double the lists to obtain the price on above goods furnished in tinned copper.

NEW STYLE STEEL "FRAZER" GANG PRESS.

Our new Steel Press is of great durability and strength—easily kept clean and sweet, so necessary in *all* cheese implements. We also make a *Single Gang Steel Press* for Young Americas.

It is safe to say that a steel press will last twice as long as the ordinary wood press. Wood presses for both Cheddars and Young Americas furnished when wanted.

SIZES AND PRICES

Standard size, 16 ft. long.....	\$45 00	Young Americas, double row....	\$50 00

For Young America Cheese.....	40 00	ble row.....	\$60 00

COMBINATION STEEL GANG PRESS.

As can be seen from the cut the combination press takes two side by side gangs of cheese, on one side the large diameter cheese from $13\frac{1}{2}$ to 16 inches in diameter, and on the other side a gang of Y. A. or 7 inch cheese. The press consists of one of our Standard Steel Gang Presses, with the Y. A. parts bolted on one side and supported by three bracket castings. Capacity twelve 10 inch deep large cheese, and 21 Y. A. or 7 x 7 cheese. Shipping weight, 800 lbs. Length, 16 feet.

Price..... \$60 00

GANG PRESS HOOPS

"FRASER" TINNED

We furnish all kinds of Gang Press Hoops. The latest and best thing in this line is the "Fraser Steel Tinned," which we recommend as being superior to the galvanized iron hoop, in that it is more durable, makes a finer-looking cheese—and the cheese can be taken out of the hoop much more easily.

NOTE—The depth of a cheese hoop is measured from the bottom of the hoop to the bottom of bandager rim.

THE LOOSE BOTTOM HOOP.

The most convenient hoop to use ever made. They are made whole with no rivets to tear the bandage as the cheese drops out. The loose bottoms makes it possible to remove the cheese after 24 hours hard continuous pressing quite easily. The hoop does not become injured by continuous rappings or running a knife around the cheese with danger of cutting the bandage. No other hoops so strong or convenient.

Prices same as on regular hoops given above.

FIBROUS PRESS RINGS

They are used generally. They can be cut to fit any sized hoop, and give good satisfaction.

TWENTIETH CENTURY CHEESE HOOP

There is a growing demand among the better class of dealers for special shape cheese, put up in proper form to be conveniently served to their customers. There are already on the market several special brands of cheese, made in different shapes, which can be conveniently cut into one-pound bricks, of shape similar to one-pound prints of butter.

We believe that this trade is sure to increase, and that the cheese factories manufacturing high-class goods for the best market will find it very greatly to their advantage to adopt the manufacture of this special cheese. We have investigated this trade very carefully and believe that the form of cheese made in our Twentieth Century Hoop is the most desirable that can be secured.

The cheese pressed in these hoops measures $14 \times 6\frac{5}{8} \times 4$. The V-shape strips on the followers make a depression in the cheese dividing it into 10 equal parts of one pound each. This enables the grocer to serve his customers with one or more pounds of cheese of symmetrical shape, and in convenient form for use. These hoops are made of galvanized iron in the most substantial manner, and are furnished complete with followers.

SPECIAL CHEESE MOLDS

EDAM CHEESE MOLDS

Edam Mold.

Mold Top

At Press

Considerable difficulty has been found in obtaining satisfactory wood for the Edam Cheese Molds. We have had such poor success in this direction that we determined to try a substitute in galvanized cast iron molds. The illustration showing the mold in several positions conveys fully the idea of the advantages of the iron mold. The lower half is made of sufficient depth so that when it is filled with curd, the other half of the mold, or top, will telescope it sufficiently to make the Edam Cheese round.

The price which we have put upon these molds make them cheaper than any wooden mold that has been sold. They will last a life-time. They can be re-galvanized should the galvanizing wear off.

Our price is \$3.50 each.

GOUDA CHEESE MOLD

A new fancy cheese is being marketed in some localities in oval form about nine or ten inches in diameter. We have provided a mold, as shown in the illustration; oval top and bottom, the top telescoping into the mold itself.

Price, each\$3 00

VICTOR CHEESE PARAFFINING TANKS

The **Victor Gasoline Paraffining Tank** is designed for small factories, making a small amount of cheese and having no steam for heating. It is built of heavy galvanized iron, thoroughly braced. The burner is of our own manufacture, and will work under very slight head or pressure.

The **Steam Paraffining Tank** is intended for use in large factories and in commission houses where large amounts of cheese are dipped. The steam is admitted into the jacket around the tank and keeps the paraffine at the proper temperature. It is made in two sizes, and a large amount of cheese can be dipped and handled in the most economical manner.

The last decade has witnessed many improvements in the manufacture and marketing of cheese. Not the least of these changes is the practice of paraffining cheese. This has so many advantages that it has been rapidly adopted by cheese manufacturers and dealers and will doubtless soon become general.

Among the benefits derived from paraffining is the saving of a large part of the shrinkage which occurs during the curing. The paraffine seals the rind and prevents evaporation. This saving is, of course, greater in the smaller sized cheese, which have a relatively large surface exposed to the air, but is profitable in the larger sizes as well.

The quality of the cheese is also better, due to the fact that the moisture being retained in the cheese makes it more mellow and palatable.

To obtain the best results from paraffining, it is essential that the temperature of the melted paraffine be evenly maintained at the proper point. Specially constructed apparatus is, therefore, necessary.

Nothing is better for this purpose than the Victor Paraffining Tanks. These are made in two styles to suit the needs of different sized factories.

The dipping tongs enable the operator to handle the cheese easily and rapidly.

CHEESE BOX MACHINE

THE TWENTIETH CENTURY

Cheese factories are often located at long distances from box factories. Factories so situated can effect a large saving in freight by buying boxes K. D. and making them up at the factory.

The Twentieth Century Cheese Box Machine has been in use in cheese-making districts for many years, and is the most practical box machine for use in small factories on the market.

It has been designed with a view to producing a machine capable of very rapid work. The nail-box is very conveniently placed on top of the frame. The crank, foot levers, etc., are all within easy reach. An expert workman can turn out about 200 boxes a day.

To obtain the best results the drum should be proportioned to the size of the box you wish to make, although it will make boxes larger than the drum.

The Twentieth Century is thoroughly well made and nicely finished. It will last for years.

We guarantee it in every way as the most economical, simple, and durable machine on the market.

In ordering machine, state size of box to be made.

Price	\$15 00
Extra drums, any size	each, 5 00

CHEESE BANDAGE

“EXCELSIOR”

The Best—The Neatest—The Cheapest

The large increase in our trade for “Excelsior” Bandages is the very best testimonial that could be given for them. They are being exclusively used by many of the largest Cheese Manufacturers in the country, and are giving the very best of satisfaction. They are carefully made from a fine grade of soft cloth and make a finer appearing cheese than any other style of bandage. The warp of cloth which we use in making these bandages runs straight both ways. There is no danger of cracking as is the case with other bandages. We make them both taper and straight seam. The taper seam bandage is for the Fraser style Hoop, and the straight seam for the old style galvanized iron hoop. In using the “Excelsior” bandages, there is no loss in cutting. Every bandage paid for will cover a cheese. The cloth is one-half heavier than that in any other style of bandage. These two items taken into account, make it the cheapest bandage.

STOCK SIZES AND PRICES—Either Taper or Straight Seam.

CHR. HANSEN'S COCO-RENNET

A palatable digestive tablet that immediately relieves the distress so often felt after a hearty meal.

One or two of the tablets allowed to dissolve in the mouth after each meal will remove the distress caused by over-eating or indigestion, and will prove very beneficial in all forms of stomach trouble caused by poor digestion. Many cases of nervousness and insomnia are directly traceable to the stomach, and Coco-Rennet has proved quite effective in such troubles. The Coco-Rennet Tablets are put up in packages retailing at 10 cents each. FOR SALE BY DRUGGISTS. Under no circumstances will we be responsible for delivery by mail unless 8 cents extra are sent for registration.

In Ordering Please Write Your Name and Address Plainly.

WISCONSIN CURD TEST

Cheese-makers are often troubled with gassy or floating curd, which makes defective cheese, creamerymen and milk dealers are perplexed with tainted milk without means of finding the source of the trouble. These faults come from some particular lot of milk which contains impurities. The Wisconsin Curd Test detects these defects and enables the cheese-maker, creameryman or milk dealer to trace the fault to the dairy, and the very cow which causes the trouble.

HOW TO MAKE THE TEST

Thoroughly cleanse the jars with live steam or scalding water. Take the rack of jars to the taking-in room; take a sample of milk from the patron, numbering the jar to correspond with the patron's number on the milk sheet, fill the jar about two-thirds full, continue until all the jars in the rack contain a sample. Put on the tight covers and put the rack in the vat. Fill vat with water as high as the milk in bottles, set an oil stove under the vat and heat the water in the vat to 100 degrees F. Take out the rack with jars and shake occasionally. When the milk reaches 98 degrees F. add 10 drops of rennet extract to each jar, shake the rack with a rolling motion, and after the milk curdles let it stand about 20 minutes, or until firm, then cut the curd fine with a thin knife, rinsing the knife thoroughly for each jar. When the curd settles, take the perforated covers and put them on top of the jars, then turn the rack bottom side up and shake gently until all the whey has run off. Let it stand a few minutes in the vat and then repeat the operation until all the whey is drained off. The more completely the whey is drawn off the better the test. Put tight covers on jars and return to vat. Now regulate the wick of the oil stove to hold the temperature at 98 degrees F.

Let the bottles stand from 6 to 12 hours, then open the jars, drain off what whey remains and cut the curd in two pieces; take them from the jar, and those curds having a spongy texture, or bad odor, can be detected by smell, thus showing which patron is furnishing the bad milk. Now take the rack of jars to the patron's barn and take a sample of milk from each of the cows and test them the same as above; this will locate the identical cow that is causing the trouble.

COST OF A CREAMERY

The question of the cost of a Creamery is asked us many times. It is as difficult to answer exactly as the question, "What will it cost to build a house?"

It depends upon the number of cows butter is to be made from, and the style and capacity of machinery.

We can give approximate figures, however, which will serve every purpose in planning.

A first-class building (not a cheap affair such as creamery organizers build) can be built at from \$800 to \$1,000. We give a good plan on page 268.

The machinery for making butter from 300 to 500 cows, including 15-Horse Steel Boiler, Comp. French Penn, Alpha Separator of 3,000 pounds capacity, Disbrow Combined Churn and Worker, "Ideal" Milk Weigher, Twentieth Century Milk Heater, and all the other necessary machinery and apparatus, will cost from \$1,500 to \$2,500.

If a United States, Springer, Russian or any other Hollow Bowl machine is used, the cost of the outfit would be from \$100 to \$300 less.

These figures will enable any one to make their plans with safety.

We shall be pleased to furnish plans of buildings and complete lists of machinery to suit individual needs, on application.

CREAMERY MACHINERY

In buying machinery of any kind buy nothing but the *best*. It is economy in the long run. It is not always possible to sell the best goods at as low a price as those of inferior quality. As we are the largest manufacturers of creamery machinery in the country, however, our large production enables us to make close prices, and frequently our goods will be found to cost no more, and in many cases less, than those of inferior make. Our prices are uniform, and as for quality, every article is guaranteed.

We take especial pleasure in recommending the Alpha Separators, Farington Duplex Pasteurizers, New Disbrow Combined Churns and Workers, "Ideal" Skimmed Milk Weighers, Wizard Testers, Twentieth Century Milk Heaters, and our Steel Boilers and Victor Engines. We never offer useless or obsolete articles, and every creamery we equip is done on honor.

We have furnished the equipment for hundreds of creameries throughout the country, and have scores of testimonial letters expressing the pleasure of the owners with the quality and price of our goods and reliability of our statements.

Should you desire to communicate with some one near you who has dealt with us, please write us; no doubt we can give you the address of some one whom you may know by reputation, if not personally.

We shall be glad to have intending purchasers see or write to any creamery we have ever equipped to ascertain the satisfaction we have been able to give in both quality and price.

Please remember, we court inquiry, and at all times are pleased to furnish any information in our power to aid those building creameries.

GROUND PLAN OF CREAMERY

The accompanying cut shows ground plan of an up-to-date creamery capable of handling from 10,000 to 15,000 lbs. of milk per day. This plan has been devised after careful study of the subject, and from long experience we feel warranted in the assertion that for convenience in working and economy of space and cost it could not be materially improved upon, and it has been adopted by many of our customers.

This plan shows the latest and most approved machinery for the manufacture of fine butter in the most economical manner.

Of course, the engine-room can be placed on either side of the creamery, as the situation would make most convenient. We have other plans of Creameries and Skimming Stations, and we furnish to our customers detail plans and specifications for use in building their creamery.

SPECIMEN OUTFIT LIST

FOR 300 TO 500 COW CREAMERY

1 20-H. P. Half or Full Arch front tubular boiler, complete with stack. 1 Boiler Feed Pump and Heater, or Injector as desired. 1 12 to 15 H. P. Horizontal Engine, including Sight Feed Lubricator. 400 Fire Brick. 1 Bbl. Fire Clay. 2 No. 1 Sanitary Whole and Skimmed Milk Pumps. 1 3,000 lbs. capacity No. 1 Alpha Belt Separator. 1 20th Century Milk Heater. 1 Farrington Duplex Cream Pasteurizer. 1 60-gal. Weigh Can with 3-in. Perfection Gate. 1 400-gal. Milk Receiving Vat. 1 300-gal. Farrington Cream Ripener. 1 Farrington Air Compressor. 1 No. 4 Disbrow Churn and Worker. 1 Victor Starter Can. 1 Portable Wash Sink, galvanized lined. 1 Vat Strainer. 1 Disbrow Churn Strainer. 1 24-Bottle Wizard Turbine Tester, complete. 1 Conductor Head. 6 Feet Conductor Pipe. 1 200-gal. Galvanized Steel Skimmed Milk Tank. 1 300-gal. Galvanized Steel Buttermilk Tank. 1 Ideal Skimmed Milk Weigher. 1 Victor Pasteurizer, with Oil Trap. 1 Noiseless or Penberthy Water Heater. 1 Buttermilk Strainer. 1 14-in. or 17-in. Iron Head Mop. 1 50 to 250 Patron Elgin Milk Ledger. 1 Eureka Check Register. 1 dozen weekly, monthly, or semi-monthly Milk Sheets. 1 Newton Computator. 1 Ideal Test Measure (Composite). 1 Babcock Test Bottle Brush. 6 Composite Test Jar Brushes. 25 or more ½-pint or pint Composite Test Jars with Lightning tin top. 1 18-in. to 24-in Butter Trier. 1 8-oz. Graduate (for butter color).	6 Common or Large Floating Thermometers. 1 Butter Packer. 1 Dairy or New York Style Ladle. 1 Factory Ladle. 1 Acme Butter Printer. 1 Canvas Apron (light or heavy weight). 1 600-lb. Double Beam Platform Scale. 1 Butter Salting Scale. 5 12 x 1½-in. Adjustable Drop Hangers. 4 1½ Shaft Collars. 20 ft. 1½ Main Shafting. 10 ft. 1½ Countershafting. 20 ft. ¾-in. 4-ply Steam Hose. 30 ft. ¾-in. 3-ply Conducting Hose. 1 Belt Awl. 100 ft. Cut Rawhide Lacing. 5 lbs. Italian Hemp Packing. 1 lb. each Piston and Cylinder Packing. 1 Spiral Engineers' Favorite or Steam Flue Cleaner. 1 Coal Scoop. 1 Poker. 1 Enterprise or Malleable Pipe Vise. 1 Barnes, Stanwood, or Saunders Pipe Cutter. 2 Stillson, Trimco, or B. & C. Pipe Wrenches. 1 Coe or Alligator Wrench. 1 Zinc, Steel, or Brass Oiler. 1 Well Pump, pulley, or steam style as desired, with necessary pipe rod and cylinder. Necessary connection and exhaust pipe (black iron or galvanized), for boiler, engine, pumps, wash sink, and buttermilk vats, etc. Necessary Check, Globe, and Angle Valves for above connections. Necessary Ells, Tees, Unions, Nipples, Reducers, Couplings, Plugs, etc. for above connections. 1 Main Drive Wood Split Pulley. 1 Main Shaft Wood Split Pulley. 1 Countershaft Wood Split Pulley. 2 Small Pumps Wood Split Pulley. 1 Well Pump Wood Split Pulley. 1 Churn and Worker Split Pulley. 1 Separator Split Pulley.

ONE REFRIGERATING PLANT

The above is a general list for creamery, and is altered to suit needs of purchaser, and demands of location and building specifications. It is intended to give a general idea of apparatus necessary, and will be completed and thoroughly itemized on application. Complete outfit for above sized creamery can be furnished for from \$1,500 to \$2,500, exclusive of refrigerating plant. Write us for full particulars, plans, specifications, and estimates.

We make a specialty of fitting out private dairies. We handle and manufacture nothing but first-class goods, and guarantee satisfaction.

Write for Net Prices before Buying.

“IDEAL” DOG POWER

In the “Ideal” we have overcome the weak points of various other dog powers, and removed the objections against small powers in general by manufacturing a power which combines the positive motion, heretofore possible only to large-sized horse powers, with simplicity and lightness. It is constructed in a very substantial manner from carefully selected stock and on thoroughly mechanical principles, and a dog, sheep, or goat will furnish sufficient power to run the various sizes of Dairy Separators.

Connection may be made from the “Ideal” Power directly to crank of separator, churn, or other small machinery. The crank attachment is included with each power. No pulleys, belting, or shafting is required.

Connection can also be made from 12-inch pulley on power to pulley on crank-shaft of separator, or it may be connected as shown in cut.

Price, Plain Power \$25 00

Write for prices on large powers.

STRAINERS

MORE’S “PYRAMIDAL”

We sell large numbers of these to Chicago milk dealers, and they all say: “I wish my farmer used them.” The brass straining cloth is of so fine a mesh that no cheese cloth is required, and yet the dirt never settles where it can clog.

PRICES.

Strainer, with rest or funnel.....	each, \$1 50

Extra rests or funnels.....	“ 15
“ strainers	“ 40

“COMMON” MILK CAN

This is made of very heavy tin. Has a combined wire strainer and flannel cloth strainer holder. It will fit a milk can, Cooley or the Common Sense Setters.

PRICE.

Each.....\$1 00

STRAINERS

THE "BEVERLY" DOUBLE

The best strainer made. The milk passes through a double system of screens of different meshes. The strainer is provided with a detachable cup into which all impurities which may pass the upper or coarser strainer are deposited, the floating particles never passing the first strainer. The milk is flushed over and through the lower or finer strainer, pure and clean. At no time does milk "wash-over" any previously deposited sediment. By removing the upper and lower cups the strainer is easily cleaned.

PRICES

No. 3, with bowl 12 inches in diameter,	\$1 50	Sponge	\$0 25
No. 4, " 14 " " " "	2 00	Extra rubber washers.....each,	10

By using our specially prepared Sponge in the sieve receptacle of the Beverly Strainer we have a most perfect filter. Straining milk with a sponge extracts nearly every impurity in the milk.

When not in use, keep the sponge in brine water. This will keep it soft as well as sweet. Will fit any size Beverly Strainer.

ELGIN STRAINER

The construction of this strainer is such that there is no trouble with the clogging of the sieve. All of the sediment is collected underneath the convex disc and remains there until cleaned. This disc, which has the sieve in the top, fits into a sleeve in the bottom of the strainer so that it can be easily removed for cleaning.

The Elgin is a perfect strainer.

Price.....each, \$2 50

THE "CHAPMAN" CHANGEABLE STRAINER

Very convenient. Easily cleaned. Milk passes two removable strainer cloths that are held in place by a wire spring, all being easily and quickly removed and cleaned. It also has an extra holder for cheese cloth.

PRICE

12-in bowl.....each, \$1 25

"LAKIN" BUTTERMILK

Especially adapted for dairy use.

MILK AND CREAM COOLERS

UP-TO-DATE MILK COOLER

There is no doubt that milk cooled and aerated as soon as milked makes more and better butter and cheese. The Up-to-Date is unquestionably the best cooler on the market for this purpose. It not only cools the milk, but completely aerates it, removing all offensive flavors.

There are several styles of similar coolers on the market, but none of them are constructed of as good material as the Up-to-Date. Made of the best quality of heavy tin, with a galvanized bottom; it is of the same high-grade workmanship as all our goods.

The Up-to-Date is a thorough cooler, reducing the temperature of the milk in one minute nearly to the temperature of the cooling medium. The corrugated surface retards the flow of milk somewhat, and greatly increases the cooling capacity. It is equally well adapted to the use of any cooling medium, either running water, ice water, or, if a very low

temperature is not required, ordinary well or spring water. The top is made extra large, so that ice may be put directly into the cooling drum if so desired.

It is automatic, requiring no attention while in use. Low down, simple in construction, and as easily cleaned as a common milk pail. Strong and durable, will last for years, costs but little, and pays for itself in time saved and better quality of product.

Creamery men should insist that each of their patrons use one of these coolers. We quote special prices to creameries and cheese factories on these coolers, to introduce them among their patrons.

The following sizes of the Up-to-Date are gauged, as nearly as possible, to take care of the milk as fast as drawn from various sized dairies with the average number of milkers. Be sure to get one large enough, as best cooling results are obtained with low pressure of milk in the receiver.

No.	Capacity of Milk or Cream Receiver.	Capacity of Water Receiver.	Size of Dairy.	Takes Care of Milkers.	Price.
2	4½ gal.	12 gal.	10 to 25 cows	3	\$7 00
3	5½ gal.	20 gal.	25 to 50 cows	5	8 00
4	11½ gal.	28 gal.	50 to 100 cows	8	10 00

Extra sizes on special orders.

"BABY" UP-TO-DATE CREAM COOLER

The Baby Up-to-Date Cream Cooler is constructed on the same general lines as the Up-to-Date Milk Cooler, and is designed for use with a hand separator. Only 14 inches high; it sets on the shelf of the separator, and cools the cream as fast as separated. Handled in this way, cream keeps much better, and is of much better flavor, than if separated into a can which is then closed up and set in water to cool.

Price, each\$2 00

STAR MILK AERATORS AND COOLERS

ALL COPPER. TIN COATED

This Cut Represents Style of
Nos. 1, 2, 3, and 4.

The capacity of Star Coolers is based on hot weather temperatures, having ample reserve. *Capacity guaranteed.*

No. 00. Fixed Trough. For use in dairies of from 10 to 14 cows. Size $13\frac{1}{2}$ inches wide, $22\frac{1}{2}$ inches high, 1000 square inches cooling surface; will cool 40 gallons of milk per hour to 54 degrees with water at 52 degrees.

Plain cooler.....	\$9 00
Elevated water, complete.....	15 00
Syphon attachment, complete.....	20 00

No. 0. Removable Trough. For use in dairies of from 14 to 16 cows where two or three men milk. Size 14 inches wide, 20 inches high; 1100 square inches cooling surface; will cool 50 gallons of milk per hour from 54 degrees with water at 52 degrees.

Plain cooler.....	\$15 00
Elevated water.....	20 00
Syphon attachment, complete.....	27 00

Nos. 1, 2, 3, and 4 have Removable Trough and a galvanized frame around the cooling surface, which protects same.

The water enters and discharges through frame which hangs on centers; cooler turns over to be cleaned, and does not have to be removed from brackets, saving time and handling. Short trough at bottom of cooler can be turned from one can to another without siphoning the milk.

No. 1. Twenty-two inches wide, 24 inches high, 1200 square inches cooling surface, for three or four milkers. Will cool 60 gallons of milk per hour to 54 degrees with water at 52 degrees.

Plain cooler for $\frac{3}{4}$ -inch fittings.....	\$25 00
Elevated water, complete.....	30 00
Syphon attachment, complete.....	37 00

No. 2. Milk flows down over 50 inches cooling surface. Outside, 24 inches wide, 27 inches high, 1700 square inches of cooling surface; for four to seven milkers. Will cool 90 gallons of milk per hour to 54 degrees with water at 52 degrees.

Plain cooler for $\frac{3}{4}$ -inch fittings.....	\$27 00
Elevated water, complete.....	33 00
Syphon attachment, complete.....	40 00

No. 3. Milk flows down over 60 inches cooling surface. Outside, 31 inches high, 28 inches wide, 2760 square inches cooling surface; for six to twelve milkers. Will cool 125 gallons of milk per hour to 54 degrees with water at 52 degrees.

Plain cooler for 1-inch fittings.....	\$35 00
Elevated water, complete.....	42 00
Syphon attachment, complete.....	49 00

No. 4. Thirty inches wide, 46 inches high, 3970 square inches cooling surface. Will cool 200 gallons of milk per hour to 54 degrees with water at 52 degrees.

Plain cooler for $1\frac{1}{4}$ -inch fittings.....	\$70 00
Elevated water, complete, same fittings as smaller size, but with 15 gallon milk tank.....	80 00
Syphon attachment, complete.....	90 00

FAMILY CHEESE-MAKING APPARATUS

A very simple Apparatus, adapted to the wants of all farmers or dairymen. So simple that any girl or boy of average intelligence can learn the process in a very few operations. It makes perfect cheese each time, whether five pounds or more.

The milk is heated by a coal oil lamp, which is easily kept under control. The heating vat is so constructed that the lamp gives all the heat that is necessary. The management of the heat is the secret of success in making good cheese. It does not take up quite as much room as an ordinary kitchen table. A lady can make cheese in the kitchen or pantry, and carry on her household work at the same time.

With each machine we send simple and full instructions how to make cheese successfully.

Each Apparatus is complete with Heating Vat, Press, Curd Knife, Lamp, and Thermometer. Made of good material, strong, and well finished.

The Apparatus is guaranteed to do the work exactly as represented.

“VICTOR” DAIRY COMBINED CHURN.

STYLE A1, A2 AND A3. FOR DAIRY USE ONLY.

These churns have an 18-inch clutch pulley with 4-inch face, speed at 34.

For years the effort has been made to create a dairy churn that would bring the small dairy to a level with the factory in the production of first-class butter in a rapid and uniform manner. Taking the factory “Victor” as a guide, we have at last produced a strictly farmers’ Combined Churn and Butter Worker, the “Dairy Victor,” at a price that is within the reach of all, as complete in its operations as the now famous factory “Victor,” and can be run by dog, goat, sheep or pony power. These three strictly farmers’ churns are all furnished with pulley, and the A1 machine can be run by hand; a crank is furnished when desired.

SIZES AND PRICES OF DAIRY CHURNS.

	Diameter	Length Outside	Length Over All	Shipping Weight	Capacity in Pounds	Price
A	2 ft. 10 in.	2 ft. 4 in.	4 ft. 4 in.	300	10 to 80	\$95 00
AA	2 ft. 10 in.	3 ft.	5 ft.	350	10 to 100	110 00

"BABY" DAIRY COMBINED CHURN.

The "Baby" is a geared machine run by hand, and so constructed that two rollers and two simple lifting boards serve to do the churning, and the working of the butter with no change of gearing.

In working, the turning of the shaft puts the rollers in motion, lifts the butter from the bottom of the churn, places it upon the rollers, and stops the churn until the butter passes downward through the rollers, then starts the churn again, and lifts the butter as before to the top of the rollers, continuing the process as long as the crank is turned.

When the churning is to be done, the working rollers are fixed (do not turn on their axis), until the time for working the butter comes, and both in churning and working the turning of the crank is all the operator has to do, as the needed changes in the gearing are made automatically, entirely relieving the operator from all trouble of placing pins, moving levers or shifting belts, no shifting of parts being necessary.

One very attractive feature of this churn, which recommends it highly, is the ease with which the butter can be removed from it. When the working is completed, the door brought to the convenient point, the churn stopped, and the door removed, it will be found that the butter is massed on the lifting board and the rollers in front of the door in the most convenient position possible for removal, and the churn is held in that position by its own devices until the work is finished.

The chief objection that has been raised against combined churns and workers for small dairies and for farm use is their cost, and in producing the "Baby" we have sought to overcome this objection by bringing out a churn so low in price as to be within the reach of all.

The "Baby" is made with iron supports and frame, neat, light and strong

BUTTER WORKERS.

IMPROVED EUREKA.

The Eureka worker is so constructed that all portions of the butter are equally worked with an even pressure. The brine and buttermilk are drawn off, the butter rolled out into a thin sheet, a portion of salt sifted on, and then by a quick backward motion of the roller the butter is turned bottom

side up or folded in the tray, rolled out again, more salt sifted on, again turned and rolled. This worker has folding legs, same as on the Lever worker.

LEVER.

This cut represents the Lever worker with our patent folding legs, which can be taken down and set up again in a moment's time by anyone; and when set up it stands firm and substantial. It has no equal, because it has more good points and fewer poor ones than any other, and is, therefore, the most deservedly popular butter worker in the country; and what is more to the purpose, it has been purchased and practically tested

from day to day by hundreds of dairymen in all parts of the country, and is by them universally commended. With it the butter can be re-worked and freed from the last vestige of buttermilk, and the grain of the butter preserved intact.

THE "IDEAL" BOILER AND STEAM FEED COOKER

The long felt need of a good, reliable farm boiler for cooking feed, heating water, etc., is supplied by The IDEAL BOILERS, which are made from boiler iron, and have regular lap-welded boiler flues, making them durable, rigid and strong in all their parts, and will last, with ordinary care, a life-time. They are well riveted and corked, and while we test these boilers at 100 lbs. hydraulic pressure they are only intended for use when low pressure is required.

The IDEAL BOILERS are claimed to be the best in the market for the following reasons: They are made of heavier and better material, and as they have a number of boiler flues passing directly through the water, thereby distributing the heat, they require less fuel than other boilers, and the boiler is provided with grates, which adapts them to the burning of all kinds of fuel, such as coal, wood, corn-cobs, etc. Any careful buyer can readily see that the Ideal boilers, or feed cookers, manufactured from the quality and weight of the material used in these boilers, are capable of running and giving good service for an unlimited number of years.

The IDEAL STEAM BOILER will cook or steam any kind of food placed in a barrel or vat, with but little care and without danger of burning, thus overcoming the objections to a kettle or cauldron. It will steam *dry corn stalks and straw* so that they will become soft and palatable, and *cook potatoes* so as to render them digestible and valuable for food. It will also enable a farmer to *save one-third to one-half of his corn* and other feed, and at the same time make his *stock thrive better*. It will *save labor in feeding*, rather than increase it, as stock fatten much faster when their feed is cooked.

TINWARE

POURING CANS

These cans are made of **extra heavy XXXXXX tin**, being well bound with a heavy iron hoop at the bottom covered with a brass one. The end of the spout is also protected by a brass band. All seams are well soldered inside and out so that the cans are perfectly smooth, leaving no crevices for milk to get in and sour. The bottoms are raised and japanned making them rust-proof. The bails are made of heavy copper wire. A detachable strainer of extra heavy wire strainer cloth is used on inside of can, being held in place over the outlet by means of small clips. The can is, therefore, very easily cleaned.

BUTTERMILK CANS

Summer trade calls for a special style of can to supply the demand for buttermilk. They have chained covers and well fastened spouts, and are made in two styles—light for barroom and restaurant trade, and heavy for wagon use. All sizes have wire protected and japanned bottoms and smooth seams.

TINWARE

CREAM CANS

With Chained Cover

These cans are designed to be used for cream that is sold in large quantities to restaurants, stores and small dealers. They are well made of heavy block tin and all seams are soldered perfectly smooth inside and out. The six-quart sizes and smaller have wire protected japanned bottoms. The eight-quart sizes and larger have heavy tinned hoop and raised japanned bottom. The cover is chained with tinned linked chain, preventing the covers from being lost through carelessness. The handle is attached to the side, because it has been found more convenient for handling than where the old style bail is used.

IDEAL MILK JARS

(No. 2, Cap Finish)

EXTRA HEAVY

Strictly **hand made** and free from spots, cords, rough edges and curls. Made of clear, flint glass evenly distributed and properly annealed. With this jar is used a wood pulp cap or cover which seals the jar perfectly, making a receptacle in which milk is kept free from all outside influences such as moisture, dust, dirt, odors, disease germs, etc. This jar has a regular medium tapering neck as shown in cut.

Lettered jars are furnished in lots of **one gross** or more, of **each size ordered**, at the same price as regular plain jars with an additional expense of \$2.50, which is the **cost of lettering each size name plate**. This extra expense is on the **first order only**. **Each single size jar** must have a **different size name plate**. Six weeks is the usual time required to execute an order for lettered jars.

SLIM NECK JARS

These jars are made of the same quality glass as our regular Ideal Jars but have a very slim tapering neck, which shows a very deep cream line. These jars can be furnished in quart and pint sizes only and in nothing less than gross lots of one or more sizes. Time required to execute orders, either plain or lettered, four to six weeks. Cost of lettering plates same as described under Ideal Jars.

Can also furnish **square graduated jars** plain or lettered. Prices on application.

Imperial Measure Jars furnished in half pint, pint and quart sizes, plain or lettered.

Five and six to the gallon jars also furnished.

PULP CAPS

(Flat, No. 2 Finish)

All of our caps are made of the very best of spruce fibre and are absolutely odorless and tasteless. We use the very best white paraffine in waterproofing and spare no pains in making them befitting the purpose for which they are intended. All paraffining is done after the caps are cut, so that the edges as well as the sides of the caps are made thoroughly waterproof.

Plain

Flat caps are furnished in four different grades, as follows:

Keystone Brand. Made of heavy stock, heavily paraffined and represents our best cap.

Shield Brand. Similar to the Keystone brand but made of stock a little lighter in weight; also heavily paraffined.

Bell Brand. This is an **unparaffined** cap and is made of the same thickness and quality of board as the Keystone but is not waterproofed. Not furnished in lots of less than 5,000.

Diamond Brand. Represents our cheapest cap. It is **unwaterproofed** and made of stock a trifle thinner than the Shield brand. Not furnished in lots of less than 5,000.

Printing. The Keystone and Shield Brand Caps can be printed in lots of 10,000 or more at no extra expense, but when 5,000 only are ordered printed there will be an extra charge of seventy-five cents made to cover the cost of making a printing die. This expense will be on the first order only. Customers having previously ordered printed caps of us and wishing to **change** the printing will be requested to pay this extra charge providing only 5,000 are ordered.

Printed

We make special arrangements with customers desiring to order a year's supply of caps and allowing us to ship as needed, in lots of 100,000 or more at a time. Give us the number of caps you use per year and the amount and number of shipments per year, and we will quote you prices.

PULP CAPS

OUR LATEST CAP — THE HYGIENIC "CRIMP LIP."

Patented { January 23, 1900.
December 3, 1901. Other patents pending

The cap embodies a large number of very valuable sanitary features. Every housekeeper has been more or less aggravated by splashing cream on the floor, wall, or over her hands and dress while removing the old style cap. These vigorous efforts also tend to shake the bottle, mixing the cream with the milk, often-times breaking the fork, knife or other instrument used in removing the cap. By this method of extracting the cap, small particles of glass may be broken off the edges of the bottle and are very liable to fall in the milk, rendering it quite dangerous for use.

Plain

In removing the old style cap it is punctured and rendered unfit for further use in case it is desired to use only a part of the milk or cream, and have the balance left to be placed in the refrigerator.

Around the outer edges of the old style cap, dust, water, sand and disease germs accumulate. When the cap is removed this accumulation settles in the milk.

With the "Crimp Lip" Cap all of the objectionable features are overcome. The lip is designed to be used in taking the cap from the bottle in place of a sharp pointed instrument. The cap is left in perfect condition and can be used as many times as necessary.

The extended rim of the cap engages the sides of the mouth of the bottle, filling it completely and covering any misshapened side perfectly, preventing any dust, sand or other accumulation from seating itself on the rim of the cap. This is all gathered in the hollow of the cap and is taken off with it. This is a very important feature, thus preventing any microbes or disease germs from entering the milk at any time.

"Crimp Lip" Caps can be furnished printed with customer's name in lots of 6,000 at an extra expense on the first order only of seventy-five cents for lettering the printing die. No extra charge is made for printing in 12,000 lots or over. Put up in cartons containing 1,000, baskets containing 6,000 and 12,000, and drums containing 25,000 and 50,000.

MILK JAR DELIVERY CASES GALVANIZED IRON

This case is strong and light, being well made of heavy galvanized iron. Around the outside at the top is placed a strong iron band, the galvanized iron being turned around this band. Three strips of band iron extending lengthwise of the bottom and up the ends make the bottom rigid and prevents continual wear. All seams are half inch and soldered entire length. Handles are reinforced by an extra strip of band iron. It is also fitted with a removable dowl rack to make cleaning easy.

In warm weather crushed ice may be placed between and on top of the jars after they are in the cases. The rack will keep the ice up around the necks of the bottles, keeping the cream thoroughly cool.

These cases are especially desirable for those wishing to fit their wagons with them, using iron shelves for rests.

Our galvanized cases are guaranteed to be the best that can be procured. We have a department devoted exclusively to their manufacture, and no money or time is spared to make them right. The number of duplicate orders we receive demonstrates that they are satisfactory in every particular.

SIZES AND PRICES

Sizes.....	Twenty-four ½ Pint	Twelve Pint	Twelve Pint	Eighteen Pint	Eight Quart	Twelve Quart	Twelve Quart	Twelve ½ Gallon	Twelve ½ Gallon
Arrangement.....	3 x 8	2 x 6	3 x 4	3 x 6	2 x 4	2 x 6	3 x 4	2 x 6	3 x 4

In one dozen lots ten cents per case less. For galvanized rack add ten cents per case.

Any size furnished to order. Write for further information, giving quantity, size, arrangement and style of rack wanted. Special prices in large quantities.

REFRIGERATOR CASES

These cases are made of one inch well seasoned lumber, are carefully nailed and bound clear around each end with galvanized iron, making them doubly strong. The cover is fitted with inside hinges, preventing them being in the way and making it impossible to remove them while case is locked. The back edge of the cover is beveled, so that when thrown clear back the hinges will not be wrenched out of place or the cover broken off. The cover and front of the case are fitted with small copper eyelets, through which seals may be passed and the case sealed, the lined eyelets protecting the wood part of the case when seals are broken.

A removable galvanized lining makes this the most desirable case for summer use, either for shipping, delivery or holding cases for restaurants, stores and hotels. The milk can be iced down and the case closed, thus serving as a perfect refrigerator at all times. No water can drip from the case as the ice melts to make a sloppy mess on the floor or shelves. The cases are fitted with removable wooden dowl racks.

These cases are painted gray both inside and out and the racks are dipped in linseed oil, making them thoroughly waterproof.

Name and address can be stenciled on either side of the case and on cover without extra charge. Covers always included and will be charged for if not sent.

SIZES AND PRICES

WIRE DELIVERY BASKETS

"IDEAL" WIRE WOVEN

This is considered to be the strongest, best and most attractive wire basket furnished to the trade. It is as good in every respect as baskets that are sold for twice the amount. Besides the regular heavy tinned wire frame, the basket is surrounded by close meshed, woven tinned wire, making it serviceable as a carrier for small, as well as large sized jars. The handles are so fitted that the basket balances at all times, whether full or partly full. The hand hold is well bound by spring wire. Made in two sizes only.

PRICES

	Four Quart and Two Pint Size	Six Quart Size
Each.....	\$1.50	\$1.50

HEAVY WIRE

In general outline this basket is the same as the wire woven, but does not have the extra wire woven covering.

All crossings and joints are well fastened and soldered. They are retinned and will resist rust and wear and stand a great deal of rough usage.

Each.....	\$1.85	\$2.00	\$2.25

THE UP-TO-DATE BOTTLE FILLER

In the construction of this bottle filler we have endeavored to overcome the objectionable features found in all of the bottle filling arrangements on the market at the present time.

The problem presented in the construction of a filler for milk bottles is entirely different from that involved in the construction of a machine for handling other liquids. The special feature of this filler, which distinguishes it from all other bottle fillers, is found in the construction of the valve. The pressure on the foot pedal throws the jar up so that the neck is engaged with the filling valve, forcing it up and opening the inlet valves. The milk itself flows into the jar, and on account of the special construction of the valve opening, the milk is sprayed against the side of the bottle and flows down the wall, filling from the bottom. There is consequently a clear opening for the air to escape through the center of the valve, which is connected with the air tubes shown in the illustration. While the bottles are filling the air rushes out of these tubes with a strong current. This prevents air bubbles in the milk, which produces foam when bottles are filled from the old style fillers. The overcoming of this foaming makes it possible to fill the bottles completely with the Up-to-Date Filler without the necessity of topping. We guarantee these machines to fill the bottles full enough for capping without a particle of foam or the slightest overflow.

This machine is so constructed that it can be easily arranged to fill half pint, pint or quart bottles without any special adjustment. The machine admits of a wide variation in the height of the bottles and in the size of the necks, so that a difference in this respect will not make it necessary to alter the machine in any way.

There are no expensive rubber valve attachments which are likely to wear out and require replacing frequently.

The machine itself, although very rapid, occupies very little space, and is easy to care for.

Less labor is required in the operation of this machine than any other filler of equal capacity on the market. The operation being performed by foot power the hands are left free to handle the bottles, and the process proceeds without interruption, so that a very large number of bottles can be filled without the necessity of a large number of assistants.

The machine has been carefully tested under the most trying conditions, so that all the weak points have been discovered, and the machine is so strengthened in all parts as to be substantial and durable.

A little time is required to become accustomed to the operation of the machine, but after the operator becomes familiar with it we guarantee the two-row machine to have a capacity of 800, and the four-row machine a capacity of 1,500 bottles per hour.

PRICES

Four row.....	180.00

IDEAL BOTTLE FILLER WITH SQUARE TANK

For a low-priced bottle filler, we recommend the Ideal. It is substantially made and provided with a zinc-lined sink, with a holding capacity of 24 or 48 quart jars. The tanks hold about 13 and 27 gallons and have the filling device attached. The machine's filling capacity is about 12 and 18 quarts per minute, filling two or four jars at once, but the attachment is so made that one jar can be filled at a time if so desired. It is easily cleaned and very durable.

THE EUREKA BOTTLE FILLER

The tank and attachments of this filler are identical to those of the "Ideal," but instead of moving the tank and milk on trucks the tank and milk are stationary, the tank being attached to a special iron stand. Underneath this stand running on brass tracks is placed the bottle sink or tray, in which the bottles are placed. This is made of galvanized iron and fitted with small runners or wheels attached directly to the bottom of the tray.

The filling operation is similar to that of the "Ideal," the bottles, however, moving underneath the tank, while in the "Ideal" the tank moves over the bottles. The outfit is complete with filler attachments, tank, iron stand, galvanized iron tray fitted with trucks, and track.

The tanks hold about 13 and 27 gallons. The trucks having a holding capacity of 18 and 36 quart jars for two and four rows, respectively. The racks included are for use in filling different size jars.

PRICES

Combined ½-pint and pint racks	"	2.25	3.00

Extras, same as for "Ideal" filler.

IDEAL STERILIZING OVENS

In order to handle milk in a sanitary manner it is absolutely necessary that all milk jars and other utensils used about a milk distributing plant be thoroughly sterilized after washing. This is done by heating to the boiling temperature for one half hour or more. To get best results special sterilizing ovens are necessary, and we believe the Ideal Oven, illustrated herewith, has no superior for this purpose.

It is made with a view to sterilizing bottles in the most thorough and convenient manner. Other utensils may be sterilized in these ovens by removing the shelves.

The sterilizing ovens are made of the very best of heavy galvanized steel, well braced and put together. They are provided with divided removable shelves, either wooden or galvanized iron. The steam enters at the bottom and is distributed through the oven from perforated galvanized pipe placed near the bottom. The bottom is pitched so that all drain runs off easily. The top is oval in shape and has a controllable ventilator, besides special attachments for our new straight bath thermometer with metal frame, showing a reading of from 70 to 310 degrees. The smaller sized ovens have a low and substantial stand on which they are to be placed. The doors have special fastenings and are fitted with cork seats, which prevents all possibility of steam escaping.

The outfit is very neat and attractive, all the woodwork being nicely painted. It is surely an ornament to any plant.

It is complete with stand, galvanized iron piping, valve, straight bath thermometer with expansion chamber, shelves, etc.

The operation of sterilizing milk jars is simple and effective. After the jars are sprayed, the racks with the jars are placed in the oven and sterilized thirty minutes. They are then taken out and placed on resting shelves and left until ready for use.

We have special baskets designed for these ovens, but we find where a sprayer is used that the sprayer rack is more convenient. This rack can be used in all the ovens except the 144 bottle size.

The ovens are made in the following sizes, the first three only being stock sizes:

IDEAL TURBINE BOTTLE WASHER

This machine is intended for use in large milk distributing plants. With this machine bottle washing is easy instead of an arduous task as when washing by hand.

The frame is made of heavy iron and so arranged that the entire front of the machine, with gearing, can be removed. The turbine flyer is of the very best design, being so constructed that the teeth receive all the energy of the steam, enabling the machine to be run with from two to eight pounds of steam.

The machine is fitted with a large and a small bronze gear, so proportioned as to allow the fly-wheel to run twice as fast as the brush. This gives the fly-wheel sufficient speed to insure steady motion, and at the same time gives the proper speed to the brush. All bushings are made of bronze. The brush spindle is so constructed that it will hold the brush handle firmly and when it is desired to replace worn out brushes with new ones, a few seconds time is all that is required. The spindle is divided and after placing the brush handle in position a collar is slipped on and held in place by a set screw, which holds the brush firmly in place.

The machine is fitted with sight feed oil cups, bronze gears and bearings, special steam gauge and syphon, globe valve, and all necessary pipes and couplings. With each machine we furnish one each of our Ideal, India Bristle, and Horse Hair Bottle Brushes, together with complete directions for operating.

These machines are furnished with either single or double brush, the double brush machine having brush attachments on both sides. We finish them in either painted or galvanized iron style. From a large number of tests that have been made with this machine it has been found that from 1,000 to 1,500 bottles can be washed per hour with a single brush machine, and washed well and without usual effort.

Double " " 75.00

ACME BELT POWER BOTTLE WASHERS

For those who have already fitted their plants with small powers, and do not care to go to the expense of purchasing one of our Ideal Turbine Washers, we can recommend the Acme Belt Power Machine.

This machine is very compact and well made. It is fitted with tight and loose pulley, size 3 inch diameter by 1½ inch face, and should run at a speed of 800 revolutions per minute. The machine is fitted with sight feed oil cups.

The machine is also fitted with belt shifter that can be operated easily. Taking everything into consideration we think that for a low priced article there is nothing on

the market that can compete with this little machine.

We can furnish them only in the galvanized iron style, single or double brush, complete with brushes and directions, same as with the Ideal Turbine Machine.

PRICES, FIGURES

Single Brush

Galvanized iron.....each, \$18.00

Double Brush

Galvanized iron.....each, \$22.50

THE IDEAL BOTTLE WASHING OUTFITS

In this outfit we have endeavored to embody all the requisites necessary for cleansing a milk bottle, from the washing to the rinsing. It is compact and very convenient and rapid in operation.

The outfit as shown includes an Ideal Turbine Bottle Washer fastened to a strong shelf covered with galvanized iron. The tank is very strongly made of one-inch cypress finished in natural wood and has heavy iron legs. It is lined throughout with heavy galvanized iron which extends over the edge and down the outside to a distance of three inches and is securely nailed. This does away with all danger of tearing the clothing or injuring the hands on sharp edges. The corners are also bound with strips of heavy galvanized iron.

Underneath the shelf on which the bottle washer rests, and also under the sprayer, are galvanized iron removable overflows, in front of which is fastened a removable wooden rack, or guard, intended to prevent the bottles from being broken by striking against the overflow and also to keep the bottles within easy reach of the operator.

As fast as washed the bottles are rinsed in the rinsing tank with clean water and then placed mouth downward in the sprayer rack. When this rack is full a slight pressure on the foot lever opens the valve and sprays the inside of the entire twenty-four bottles at one operation. The rack full of bottles is then removed and another rack put in its place. It is designed to use cold water only in spraying the bottles as a clearer effect is produced than when warm water is used.

It is furnished complete with all necessary pipe, fittings, valves, steam gauges, noiseless water heater, etc., ready to be connected to steam and water pipes. But one connection to each is required.

These washing outfits are also made double, *i. e.*, the bottle washer has brushes on both sides and the tanks are made double, making a complete double washing outfit.

Complete Dimensions of Single Outfits

Length over all, including sprayer valve, 69 inches.	Height over all, including legs, also valves and fittings on top, 56 inches.
Width over all, including piping in rear, 34½ inches.	

Inside Dimensions of Washing Tank

Length from front to back, 30 inches.	Inside, from front to rack partitions, 23 inches.
Width from right to left, 25½ inches.	Width of washer shelf, 8½ inches.
Depth, 18 inches.	

Inside Dimensions of Rinsing Tank

Length from left to right, 33¾ inches.	Width of sprayer rack over all, 12¼ inches.
Width from front to back, 30 inches.	Inside from front of vat to rack partitions, 23 inches.
Depth, 18 inches.	Width of sprayer, 9 inches.
Length of sprayer, 33¾ inches.	Height of overflows, adjusted, 14½ inches.
Length of wood sprayer rack over all, 35¼ inches.	Height of iron legs, 14½ inches.

Double Brush Outfit.....	255.00	260.00

SANITARY BOTTLE WASHING OUTFIT

It has been our aim in bringing out this machine to supply large plants a complete sanitary bottle washing outfit, capable of very rapid operation.

This machine is built entirely of metal, and contains bottle soaker, washer and sprayer, all arranged to give the fastest work with the smallest expenditure for labor. The floor space required for the entire machine is $12\frac{1}{2}$ by $6\frac{1}{2}$ feet. The soaking tank is seven feet long, three feet wide and three feet deep. In this tank, supported by the shaft, are two all metal large soaking wheels. On these wheels are riveted galvanized iron bottle cups.

The bottle washer is constructed especially for this machine; is belt driven and very durable. From the bottle washer to the spraying tank is a circular, angle iron track for conveying the bottles. The sprayer tank is two feet wide and four feet long, fitted with sprayer for spraying the inside of the bottles. Overhead is a sprayer tank, the bottom of which is perforated with holes fitting exactly above the bottles, each bottle getting a thorough rinsing inside and outside.

In operation it is very fast. Instead of filling the washing tank with dirty bottles, as in the ordinary bottle washing outfit, the dirty bottles are placed in the galvanized iron cups, which is done quicker than by dumping them into the washing sink. The increased weight of the bottles on the wheel causes it to revolve slowly without other power, and carries the bottles down into the water in an inclined position filling them instantly. By the continued addition of bottles the wheel lifts the bottles up on the opposite side by the bottle washer, allowing the washing solution to flow out of the bottle, only enough remaining for washing. It is not necessary to grope around in the washing tank for a bottle, as they are always at hand. The operator knows just where to place his hand on the bottle; and each one contains the proper amount of water for washing. Thus, no time is lost and breaking and chipping of bottles is avoided. As fast as washed, the bottles are turned, mouth downward, into the sprayer racks, and the water remaining drops into the catch pan underneath, and thence back to the soaking tank. When a sprayer rack containing twenty-four bottles is filled it is conveyed on the slides to the sprayer tank, and the bottles sprayed both inside and out with water at the desired temperature. The racks of bottles are then ready for the sterilizing oven.

This machine is a time and bottle saver. After being placed on the soaking wheel no bottle comes in contact with another bottle during the whole operation. The operator does not have to look for the bottles in the wash sink; there is one always ready. Neither does he have to drain the bottles after washing. This saves much time.

The machine is built double, each side being independent of the other. With five men working the machine the capacity is from 3,000 to 4,000 bottles per hour.

At present the machine is made in the double style only, but we are prepared to build single machines on order.

Price.....\$500.00

CODES

FOR the benefit of our customers who frequently find themselves in need of goods and are unable to stand the delay necessary in ordering same by mail, we have compiled a telegraphic code, by the use of which they can wire us an order of considerable size without great expense. In using this code you will observe the necessity of spelling each word with great care, as the misplacement of a single letter might cause a serious misunderstanding. By using the different number codes in connection with the general codes you will see that it will be possible to order most any quantity of goods within reasonable telegraphic limits.

We give you below a sample message, which will illustrate how the code is to be used.

Acrostic Dale Dagger Banter Debatable Deaden Ball Debatable Belong Deaden
