Livingston's Grand Parade of Champions

Seven Popular All-America Selections

The Seven All-America Flower Winners, illustrated in color at left, are our selections as entries in our 1937 Grand Parade of Champions. All except one (Star Dust Zinnia) are, through past performance, worthy of a place on this team and all are deserving of a place in your garden.

Livingston's Full "Carnation-Flowered" Marigold "Yellow Supreme"

GOLD MEDAL, ALL-AMERICA SELECTIONS, 1935

Developed and Introduced by Livingston's

3934 Most talked about introduction of recent years; a large, fluffy, well-rounded bloom with broad, loose, frilled petals of a rich, creamy lemon-yellow color—and the first Marigold flower to have a pleasing fragrance. Unsurpassed cut-flower and exhibition variety as testified by growers and Garden Clubs (See page 3). After cutting, holds freshness fully 10 days and takes on an even more delightful color and graceful form.

Plants, 24 to 30 inches; healthy, vigorous and free branching with foliage practically free from odor. Originated and bred in Ohio; fully acclimated to Northern, as well as Southern, climatic conditions. A dazzling beauty that will give you a delightful surprise.

Pkt. 10 cts.; $\frac{1}{8}$ oz. 25 cts.; $\frac{1}{4}$ oz. 40 cts.; oz. \$1.25

Notice! Garden Clubs: See Special "Yellow Supreme" Club Offer on Page 3.

All-Double Giant Petunia

Award of Merit, 1934

An unapproached improvement in this flower. Comes 100% true double with less than 25% medium sized doubles, termed "Carnation Flowered." Our trials substantiate this statement. The flowers are large, beautifully fringed and ruffled and contain a good range of brilliant and suffused colors. You'll truly love them. Two strains, tall and dwarf, are offered. The blooms are identical; they differ only in habit of growth. Give the small, weak plants great care; they make the finest blooms.

5063 Dwarf, Mixed. Pkt., 50 cts.; $\frac{1}{2}$ Pkt., 30 cts.

5067 Tall, Mixed. Pkt. 50 cts.; $\frac{1}{2}$ Pkt. 30 cts.

Fantasy Zinnia

Award of Merit, 1935

6469 Mixed. Most striking new Zinnia in many years. It is of the curled and crested type, with blooms of medium size having shaggy ray-like petals giving it a delicate and refined appearance. Color range includes reds, yellows, orange and pastel pinks and creams. Plants are 2 to 2½ feet tall, free-flowering.

Pkt., 10 cts.; $\frac{1}{8}$ oz., 30 cts.; $\frac{1}{4}$ oz., 50 cts.

Star Dust Zinnia

Fantasy Type, Award of Merit, 1937

6468 To those who definitely like informal types, Star Dust will be welcomed with enthusiasm. It has a shaggy-petaled, medium-size flower—a delicate graceful bloom. Color is a rich deep golden yellow, one of the vibrant shades closely associated with Zinnias. The plants are 2½ to 3 feet tall, free flowering and early blooming. We predict much popularity for this variety.

Pkt., 25 cts.; $\frac{1}{16}$ oz., 35 cts.; $\frac{1}{8}$ oz. 65 cts.

Orange Flare Cosmos

Gold Medal, 1935

3565 Early Klondyke Hybrid. One of the most discussed introductions of recent years. An early flowering strain, blooming in about four months from sowing seed; a Cosmos feature before unknown in the flower world. It continues to bloom profusely until frost. The color is a deep, vivid orange supported by light green foliage. Plants are 2 to 3 feet tall with long, wiry stems.

Pkt., 10 cts.; $\frac{1}{16}$ oz., 25 cts.; $\frac{1}{8}$ oz., 40 cts.; $\frac{1}{4}$ oz., 75 cts.

Guinea Gold Marigold

Gold Medal, 1933

3935 Reselected Strain. The first introduction of the loose petaled types. Created a sensation at that time and since regarded as a favorite in most gardens. A brilliant orange flower flushed with gold, practically 100% semi-double and double, ruffled, with loose placed petals. Has graceful, pyramidal habit of growth, 2 to 2½ feet high, with many flowers to a plant. The characteristic Marigold odor is less noticeable in this variety.

Pkt., 10 cts.; $\frac{1}{8}$ oz., 20 cts.; $\frac{1}{4}$ oz., 30 cts.; oz., 75 cts.

Gleam Hybrid Nasturtiums

Award of Merit, 1935

4110 Double Mixed. A collection of gorgeously colored, large, double flowers of dazzling beauty; the fountain head from which is issuing the Nasturtiums of tomorrow. The blooms of many bright colors are borne on long, wiry stems and have a pronounced sweet fragrance. Plants are semi-dwarf with short runners.

Pkt., 10 cts.; oz., 25 cts.; $\frac{1}{4}$ lb., 65 cts.

All seeds (Excepting Peas, Beans and Corn, as noted on pages 60, 69 and 84) quoted in this Catalog are now shipped by Parcel Post, Express or Freight, whichever rate is lower, all transportation and packing charges paid by us. The only items on which you must figure or pay transportation are those marked "Not postpaid," and they are few. C.O.D. and money order return fees are not considered as transportation charges and, therefore, must be paid for by the customer. Avoid them by sending remittance with order. Bulk seeds, such as Peas, Beans and Corn, in quantities, are shipped to your nearest express or freight office, transportation paid, except as noted on pages 60, 69 and 84. If you wish them shipped by Parcel Post, please send necessary postage.

SHIPPING ORDERS. When goods are to be shipped by Freight or Express, give plain shipping directions; otherwise we use our best judgment in routing. Goods on which we pay transportation are shipped at our option.

SEND MONEY. Remittance should always accompany the order. Remittances may be made at our risk by any of the following methods (1st and best) **Post Office Order;** (2d) **Bank Draft or Check;** (3d) **Express Company Money Order;** (4th) **Registered Letters.** Cash or stamps are sent at purchaser's risk. While we accept stamps in payment, the Postal Department asks us to discourage their use.

WE GUARANTEE the safe arrival of your seeds. We guarantee to refund your money or give value in other seed if, after properly testing at time of receipt, our seeds fail to grow. Our germination test is printed on all packages (not packets) we send out.

NON-WARRANTY. Contingencies continually arising prevent the very best seeds always giving satisfaction. For these reasons, it is impossible to guarantee seeds under all circumstances; therefore We, The Livingston Seed Company, give no warranty, express or implied, as to description, quality, productiveness or any other matter of any seeds, bulbs, or plants we sell, and will not be in any way responsible for the crop.

PARCEL POST RATES. Where you must remit postage ask your postman what zone you are in from Columbus, and using the figures under that zone, multiply the number of pounds by the first figure and add the second and remit that amount in cents. Fractions of a cent count as a full cent.

Contest Offer to Garden Clubs

By Popular Request This Offer is Repeated for the Fourth Time

We are glad to report that in 1936 more than three times as many clubs (in 36 different states and Canada) took advantage of this offer than in 1935. We have received so many letters of appreciation and admiration for this new Marigold with requests for a repeat offer that we have no choice. While the momentum of accumulated interest is resulting in increased cost we are appreciative of the fine spirit shown and are glad to again be instrumental in adding new interest in garden club activities. We invite any club of ten or more members to consider this offer.

SPECIFICATIONS

Any officially recognized Garden Club is eligible to take advantage of this offer. They should notify us of their intentions not later than May 1, stating which class (A or B as defined at right) they are entering.

To qualify, each member entering must purchase at least a packet of Yellow Supreme Marigold seed (Livingston's original strain) from us at 10 cts. When purchasing give the name and address of each entrant. We will send the seed direct to each if desired.

Prizes shall be awarded to the winners as determined by your own judges. Each contestant can have only one entry and receive only one award. There must be at least four persons show blooms before prizes can be awarded.

We will supply ribbons for this contest and will forward premium certificates upon receipt of the names of the winners. These certificates will be deemed by us up to June 1st, 1938.

It is to be understood that Livingston's "Yellow Supreme" Marigold will have a separate classification under artistic arrangements or specimen blooms as you choose. No other company or person shall be permitted to offer prizes in this class.

Enthusiastic Reports from Garden Clubs and Writers

Mrs. Leland E. Coons, Germantown Garden Club, Germantown, New York: "I am sending one of our schedules to give you an idea how large our shows are. The 'Yellow Supreme' Class added greatly to the show. I think it's the most beautiful Marigold that grows and your seeds the best obtainable."

Miss Ursula Griffith, Chairman of the Community Garden Club, White House Station, New Jersey: "This class brought extra interest to our show and was of special pleasure to the club members to whom it was restricted."

Mr. Paul Bernd, Secretary of the Garden Lovers Club, Detroit, Michigan: "Accept the most sincere thanks of everyone of our Garden Lovers. We are most grateful for the opportunity presented by your generosity. The special Livingston Yellow Supreme Marigold Class was one of the bright spots of our fall Show and the competition was very close."

Mrs. Mell Knox, Social Circle Garden Club, Social Circle, Ga.: "The Yellow Supreme Marigold contest of the Social Circle Garden Club was a great success and the exhibit attracted much attention and most favorable comment."

Mrs. J. Edward Lewis, Oak Hill Garden Club, Oak Hill, West Va.: "All the specimen Marigolds entered were so fine in quality that the judges had a very difficult time choosing the winners. Members of the Club are quite enthusiastic about your Yellow Supreme Marigold and appreciate the opportunity of competing for the prizes offered by your Company."

Mrs. Geo. C. Steedman, Grandin Court Garden Club, Roanoke, Va.: "The twenty that were exhibited, did not only our club credit but also you. I don't believe your test gardens could have had finer Marigolds. Some of Mrs. Dooley's, who took first prize, were five inches across."

Mrs. E. Clay William, President of the Smithville Garden Club, Smithville, Texas: "The Yellow Supremes were the sensation of the show. The first prize entry was five inches across. We are enthusiastic over this lovely flower and hope to hold a contest again next year."

Mrs. Malcolm Silar, Library and Garden Club, Summer-ville, Pa.: "Will say that the Yellow Supreme Marigolds were a decided success."

On Livingston's New "Yellow Supreme" Marigold

Gold Medal Winner, All-America Selections, 1935

This new Marigold has overcome the major objections to the Marigold as a cut flower. It has Carnation fluffiness, size, graceful stateliness and is **the first Marigold to have pleasing fragrance**. We have claimed that the foliage is practically free from that objectionable Marigold odor but alongside what horticultural writers (see below) have said this claim appears to be rather modest. It has proven to be such an excellent variety that no one can afford to miss enjoying the delightful thrill of its dazzling beauty. Illustrated in color on inside front cover and fully described on page 1.

Mrs. Chas. A. Braham, President of the Brooklyn Garden Club, Cleveland, Ohio: "This special contest was much enjoyed by those participating and proved to be an interesting feature of the show. The flowers were beautiful. Thank you so much for your splendid cooperation."

Hazel Hankinson in

Better Homes and Gardens Magazine

"In a surprisingly short time this lovely flower has established itself as really dependable. Set close in among other plants, Yellow Supreme has a way of stretching up 4 to 5 feet tall. And the coloring is so delicate and clear that those big blossoms hob-nob with reds, golds, purples, blues, and even magenta—that trial-to-gardeners—with never a clash.

No doubt the fragrance of this marigold is one of the secrets of its popularity. Somewhere in its development, the odorous qualities of its ancestors were whisked away, and the flower came forth not only washed clean of nostril-offense, but with a pleasing scent of its own."

Elizabeth Rawlinson in Horticulture

"Yellow Supreme is such an excellent Marigold that it is difficult to see how the hybridizers can give us any better type for decorative use in the garden and as a cut flower. Its lack of the objectionable Marigold odor will also increase its popularity."

THE LIVINGSTON SEED COMPANY

Quality Lawn Seeds for Beautiful Lawns

PRACTICAL LEAFLET "How to make a better lawn" Sent FREE on Request

Treat Your Lawn To The Best This Year

Your first consideration in a lawn seed mixture should be the "kind of Grass Seeds used." There are hardy, perennial grasses and annual nurse grasses. It is the hardy grasses that ultimately make a good lawn and the large percentage of any good mixture should consist of these perennial grasses, such as Kentucky Blue Grass, Red Top and Cheiving's Fescue. The annual grasses are necessary as a nurse for the better

grasses but if used to excess do not benefit your lawn, although the mixture sells for less money. Therefore, do not be deceived by the price per pound. If you must choose between quality and quantity, and most of us do these days, choose quality in lawn seed and get some real satisfaction. Let us suggest that you use "Capitol Brand" Mixture this year. You will be pleased with the results.

Livingston's "Capitol Brand" Lawn Seed

Famous for Making Good Lawns Better

Capitol Brand is the formula for a beautiful lawn. The ingredients are the choicest, top-grade grasses suitable for making a beautiful, durable, lasting lawn—always. Germinates quickly and roots deeply; these features enable it to withstand the intense heat of summer and the hard cold of winter. Contains high percentage of heavy, hardy seeds of perennial grasses with small amount of clover and annual nurse grasses; guaranteed free of dandelion and crab grass seeds. Makes thick turf of rich, velvety green. Your lawn, once established with "Capitol Brand," lasts for years. Literally, we lean backwards to make it the best you can buy at near the price. Owing to the high-grade seeds used in this mixture, one pound is sufficient to sow 300 square feet of new lawn.

ALEXANDER W. LIVINGSTON
Tomato Pioneer and Founder of Our
Company

From a plant that was considered poisonous and rated even lower than common weeds the Tomato has risen to its important position in approximately 65 years. It was not until 1870 when Alexander W. Livingston introduced the first modern Tomato (The Paragon) with fixed color, size and shape that this appetizing vegetable came to the attention of the general public. We are greatly indebted to Mr. Alexander W. Livingston, founder of our company, for his untiring efforts in producing an edible Tomato. This was the beginning of Livingston's supremacy in Tomatoes and the now world wide demand for this luscious vegetable.

Tomato Culture

In this locality, for very early fruit, the seed should be sown in a hotbed about the first week in March, in drills 5 inches apart and ½ inch deep. Later sowings may be made until the last of April. You can approximate your sowing date from this according to your location. (Sufficient plants for a small garden can be started by sowing a few seeds in a shallow box or flower-pot and placing in a sunny window in the house.) When the young plants are about 2 inches high, they should be set 4 to 5 inches apart in another hotbed or coldframe, or transplanted into small pots, allowing a single plant to a pot. Expose to the air as much as possible to harden them for planting out. Water freely at the time of transplanting in the open ground and shelter from the sun a few days until the plants are thoroughly established. Cultivate as long as the vines will permit, but the last two or three workings of the soil should be very shallow. The use of fertilizer, high

in potash, makes tomatoes more solid and tends to keep them from cracking.

Tomatoes grow splendidly trained to stakes or trellises. The fruits are of better quality and appearance and ripen earlier. This method is common with market gardeners and is practiced by private gardeners where neatness and conservation of space is desired. The usual method is to set one strong plant to a stake 5 to 7 feet high, tying the plant up with wool or other strong, soft twine, and pruning quite freely as the vine advances in growth. By this method plants may be set much closer than in the ordinary way, permitting the harvesting of a much better and larger crop to a given acreage. Ask for Tomato Booklet, giving more detailed instructions. About 2,000 plants will be produced from one ounce of seed. 4 ounces will plant an acre. Maturities given are from the time plants are placed in the garden to first ripe fruits.

Livingston's Serial Picture Story

Picture Proof of "True Blue" Quality

We believe that you buy seeds largely upon a quality and confidence basis—confidence in the people who supply them. Because of this belief we have operated big trial grounds, as pictured here, since the start of this business in 1850. Here is where new varieties are created, old varieties are improved and standard varieties are tested under actual growing conditions the same as exist in your garden.

The seeds we offer to you must pass rigid growing tests before you get them.

We call these trial grounds our "quality and confidence manufacturing plant." This operation costs money but, if conscientiously conducted, attracts new and holds old customers on a justified quality and confidence basis. We believe that this is the only way that you can be assured of a "Square Deal."

Livingston's "TRUE BLUE" Flower Seeds

How to Succeed with Flowers

Demand Quality Seed

Your success with flowers depends largely upon the quality of the seed you buy and the proper method of growing the plants. There is a difference in the germinating and productivity qualities of flower seeds. If the amount you invest in flower seeds is invested in quality rather than quantity, there is no doubt but that you will have better success.

Depth of Sowing as Related to Germination

We know that seeds cannot be exempt from all blame for poor results but the most common cause of failure to germinate is improper sowing. There is a decided relation between the depth to which seeds are sown and their germination power. The most frequent mistake is sowing too deeply when the seeds do not get air and cannot push through the layer of soil above them. Flower seeds vary as to size, shape and length of time required to germinate. Extremely small seeds, such as Petunias, should be sown on the surface and merely pressed into the soil. Large seeds, such as Sweet Peas and Nasturtiums should be sown to a depth four times their diameter. Another mistake may be in fining down the soil. If it is too fine, after wetting, it binds and becomes hard preventing root development. The proper depth to sow seeds is given under each variety heading in this catalog.

Sowing Seed in the Garden

After frost is out of the ground it should be dug and broken up to a depth of at least 9 inches, mixing in plant food if necessary. Pulverize the top soil well and sow the seed evenly, covering as directed herein. Keep the soil at as even moisture as possible until the little plants appear. Thin or transplant as necessary to prevent crowding. Water thoroughly every few days instead of a light sprinkling every day and cultivate often to keep down weeds and to retain moisture in soil.

Growing Seedlings Inside

The ideal box for growing both flower and vegetable seedlings is a window flat about 3 to 4 inches deep. For a few plants, any shallow box (cigar box) will do. In any event, place holes in the bottom for drainage. Fill to a depth of 1 inch with cinders or gravel, and the remainder with good, well sifted garden loam to within $\frac{1}{4}$ inch of the top. Place furrows in the soil 2 inches apart and sow seed to depth as indicated under each variety heading.

Place the box in a pan of water and let the water be absorbed from the bottom until the top soil shows moist. Let the surplus water drain out. Cover top with glass or paper and place in warm location. Turn the cover several times a day to prevent moisture forming. As soon as the seeds have germinated remove the cover and place in window, preferably with southern exposure. Give the seedlings as much air and sunshine as possible but shade them from the noon sun if it is extremely hot. After the plants are well up, keep them cool rather than warm, and grow them slowly. The soil should be kept moist but not wet. This should be done with bottom moisture as above. Before the plants are transplanted into the garden, they should be hardened off. On mild days expose them to the outdoors and they will soon be able to stand the outside weather without injury.

The Cause of "Damping Off"

"Damping off" and Rots of seedlings are actually caused by living germs that live in the soil. If the seedlings are not killed before they emerge they are attacked again at the soil level and topple over and die. Attention to proper moisture, ventilation and transplanting to prevent overcrowding tends to decrease this disease. The most successful way of combating it is to sterilize the soil with FORMACIDE or treat the seed with CUPROCID. (Both are offered on page 15.)

Our Flower Seed "Quality Building Plant"

The trend in recent years has been to more and better flowers and here in our flower seed workshop, portions of which are illustrated, we have kept abreast of the times. Here we test standard varieties and constantly endeavor to find or create improvements—here we grow seeds for stock purposes—here is where "Yellow Supreme" Marigold, our recent introduction, was perfected and is grown (upper left illustration) for seed purposes.

Cultural Directions for Flowers

Under each flower variety heading on the following pages you will find keyed references which refer to the information given below. These keys indicate whether the variety is an annual, perennial, etc., and what culture it takes. The depth to sow the seed is also given. This same information is given on each packet we send you. The depth you sow the seed is very important. Lack of this information has been a common cause of failure with flowers. We hope the simplified way we tell you "how" contributes to your success with flowers this year.

Culture A.—Sow seed inside in shallow box of well pulverized soil in early spring covering to depth as indicated under variety heading; firm down with board. Apply bottom moisture, cover with glass or paper and place in warm location until germination, after which, remove cover and place in sunny window, applying bottom moisture as needed. When large enough to handle, thin or transplant 2 inches apart in other boxes and gradually expose to outside conditions. Plant outside after danger of frost. This seed may also be sown outside in the garden in well pulverized soil after frost.

Culture B.—Sow seed outside in well pulverized soil after last killing frost covering to depth as indicated under variety heading; firm down and keep moist. Thin or transplant as necessary. If earlier bloom is desired, sow inside in shallow box of well pulverized soil in early spring covering to depth as indicated under variety heading and treat the same as in culture A above. Thin or transplant 2 inches apart in other boxes and plant outside after frost.

Culture C.—Sow seed thinly outside in the garden in well pulverized soil after last killing frost covering to depth as indicated under variety heading; firm down and keep moist. Thin out as necessary so that plants are not crowded. It is best to sow this seed where the plants are to remain as they do not transplant very successfully.

Culture D.—Sow seed outside in early spring as soon as the soil can be well pulverized covering to depth as indicated under variety heading; firm down and keep moist. Thin or transplant as necessary. For very early bloom, sow outside in late fall just before freezing weather, or can be started quite early inside in box as in culture A and transplanted outside after frost.

Culture E.—Sow seed inside in shallow box of well pulverized soil, preferably during spring months, covering to depth as indicated under variety heading; firm down with board. Apply bottom moisture, cover box and place in warm location until germination, after which, remove cover and place in sunny window applying bottom moisture as needed. When large enough to handle, transplant to pots and shift to larger pots as necessary.

KEY TO SYMBOLS

Apply bottom moisture, cover box and place in warm location until germination. When large enough to handle, transplant 2 inches apart in other boxes and plant outside after frost. For earlier bloom sow seed in fall, carry over in coldframe and plant out in spring. June sown seed will bloom in fall.

Culture G.—Sow seed inside in shallow box of well pulverized soil in early spring covering to depth as indicated under variety heading; firm down with board. Apply bottom moisture, cover box and place in warm location until germination, after which, remove cover and place in sunny window applying bottom moisture as needed. When plants are large enough to handle, transplant 2 inches apart in other boxes. Plant outside after frost. In the fall take up roots and store in cool, dry place. Can also be sown outside after frost.

Culture H.—Sow seed inside in shallow box of well pulverized soil in early spring covering to depth as indicated under variety heading; firm down with board. When plants are large enough to handle, transplant 2 inches apart in other boxes. Plant outside after frost. In the fall take up roots and store in cool, dry place. Can also be sown outside after frost.

Culture J.—Sow seed thinly in shallow box of well pulverized soil after frost and any time up to August or September 1st covering to depth as indicated under variety heading; firm down with board. Apply bottom moisture, place in cool shaded outdoor location and give additional moisture as needed. Thin as necessary and transplant to permanent location when large enough to handle. Double Scarlet Glean Nasturtium

Dwarf Double Nasturtiums

The greatest sensation of recent flower introductions. Both types have flowers which are identical, the Glean plants being semi-dwarf with short runners while the Gem plants are truly dwarf, totally without runners. The flowers, mounted on long, wiry stems, are large and sweet-scented; a large percentage coming double, two features heretofore unknown in Nasturtiums.

For Complete Protection

Spray or Dust Underside of Leaves

Much spray and dust material is wasted on the upper sides of leaves of flowers and vegetables. Insects instinctively inhabit the undersides because of more protection and easier feeding. In applying sprays and dusts it is very necessary to do so on the underside of the leaves otherwise a large amount of your efforts are wasted. Always use a good spray or dust gun. See page 17 for our recommendations in these.

PANSIES

Imported From the Best European Specialists

Culture F (Page 30). Sow seed $\frac{1}{8}$ inch deep. Hgt. about 6 ins. They thrive best in a rich soil and cool, moist, partially shaded location. Seed sown outside after frost will bloom in fall. For earlier blooms start inside and for extra early bloom start in the fall and carry over in a cold frame. When transplanting, cut back the tops if they are too spindly and tall. Picking blossoms regularly will give better plants for later bloom. If plants become untidy later, cut them back and they should bloom again. Our strains are imported direct by us from the most noted foreign Pansy Specialists and should give you unbounded satisfaction. Prices by ounce or larger quantities will be quoted upon application.

Leaflet on the culture of Pansies free to customers.

5020 Swiss Giants, Mixed

Swiss Giants are of recent introduction, coming direct from Switzerland. This mammoth New strain, often measuring $3\frac{1}{2}$ inches across, is composed of well-rounded, perfectly shaped flowers with thick velvety petals, in a multitude of harmonious and enchanting shades, colorings, and markings. It includes the richest reds, coppers, bronzes, and yellows, together with the delicate rose-pinks and those beautiful light blues so much desired in Pansies. One of the outstanding features of this wonderful strain is that the long, stiff stems hold the flowers well above the foliage. The blooms retain their size almost throughout the season making it most valuable as a cut-flower.

Pkt. 25 cts.; $\frac{1}{16}$ oz. 85 cts.; $\frac{1}{8}$ oz. \$1.50.

FIRST—In Our Trial Gardens Livingston's "TRUE BLUE" The Vegetable Garden

The Right Start is a Good Start with Good Seeds—this is an unquestionable fact, not artful selling propaganda. When we say "First—in our Trial Garden and then—in Your Garden" we mean our seeds are grown by us under comparable conditions that will exist in your garden. We must know they are good seeds before you receive them.

This catalog gives you complete cultural directions, a **planting table** on page 57, a **spraying chart** on page 93 and a large selection of the best varieties. In addition, we offer a free inquiry letter service through our staff of experienced, practical gardeners and cultural leaflets for various vegetables and flowers. On page 2 you will find our **Gift Offers**. Extra seed with \$1.00 orders and "My Pocket-Garden Guide" if the order amounts to \$1.50 or more.

Nod-O-Gen (Jelly) Inoculator for Legume Crops

It always pays to inoculate legumes, thus stimulating bacterial growth on their roots, forming nodules which take nitrogen from the air for use by the plant and enrichment of the soil.

Each different crop or group has its own specific culture. In ordering, specify the crop or group for which it is to be used by number and state the amount you want. Peas and Beans are the only garden legume crops that can be inoculated. We supply fresh cultures in dated bottles.

Livingston's Serial Picture Story

Continued from page 41

Here are pictures from our vegetable "quality building plant." Many varieties are put through rigid tests for germination, productiveness, type, earliness, etc., the results being used in growing and placing contracts.

Continued on page 71

To the critical market gardener who demands good seeds these trials mean much. Knowing that this is their assurance of quality, they are large users of "True Blue" seeds.

Culture—The soil best suited for the culture of the Beet is that which is rather light, well fertilized. If wanted very early, sow in hotbeds and transplant; but for main crop sow in April, as soon as the ground becomes fit to work, in drills $1\frac{1}{2}$ feet apart, $\frac{1}{2}$ inch deep. For succession later sowings can be made up to August. For winter use, the turnip varieties may be sown as late as June and the seed covered 2 inches. When the plants are 3 to 4 inches in height, thin out so that they stand 2 to 3 inches apart. Keep free from weeds by frequent hoeing and hand-weeding if necessary. Before freezing weather sets in the roots may be stored in cellars or pits same as potatoes. Dry earth thrown over them before the straw is put on insures their keeping over winter.

One ounce of seed will sow 50 feet of drill; 5 to 6 lbs. to the acre

Culture.—Sow in early spring as soon as the ground can be worked, in drills 15 to 18 inches apart, finally thinning the plants to 2 to 3 inches apart. Do not allow growth to be checked; water, if necessary. If sown early on moist soil, a half-inch is deep enough to cover the seed. The seed is slow to germinate. Keep clean by frequent hoeing and weeding. If neglected, the young plants are easily smothered, and the crop lost. Successive sowings can be made up to July.

One ounce sows 100 feet of drill; 4 pounds sow one acre

Culture—As soon as the weather has become settled and warm (about May 15), plant in hills 4 to 6 feet apart each way, with 8 to 10 seeds in a hill; cover $\frac{1}{2}$ inch deep, smoothing the hill off with the hoe. Later, thin to 3 or 4 plants to a hill. For pickles, plant from June 1 to August 1. The fruit should be gathered when large enough for pickling, whether required for use or not; if left to ripen on the vines, it destroys their productiveness.

One ounce of seed will plant about 50 hills;

Chicory for Salads

Culture—Sow seed $\frac{1}{4}$ inch deep in June in open ground, in rows 12 to 14 inches apart, keeping free from weeds; water if necessary. Take up the roots in November and cut off top to about $2\frac{1}{4}$ inches from the neck and shorten lower end to a uniform length of 8 to 10 inches. Prepare a trench 16 to 18 inches deep and place roots upright, $1\frac{1}{2}$ inches apart. Fill in level with good, light soil and by covering with $1\frac{1}{2}$ feet of manure any portion may be forced as needed. In four to five weeks the heads will be ready for use. The blanched head is the edible portion and is generally eaten raw as a salad.

slicing variety.

Early Fortune. Strong growing, early, productive White Spine type. The fruit is of uniform size and shape and is of very firm texture, thus permitting long-distance shipping. Popular in South. Vegetable Seed Operations at "True Blue" Farms

Operations such as shown here have been going on at "True Blue" farms since the year 1850. Trials of various strains of a variety are tried beside each other where their merits and faults can be directly compared. Literally, this is a never-ending competitive contest with us—old strains showing weakness being discarded and new strains with meritorious features being accepted.

The first picture below at left shows Tomato seed harvesting operations at one of our mills. We grow and harvest all tomato seeds of our own introduction. The third picture shows a crop of Select Giant Pascal Celery maturing seed. In the picture below at right a crop of a new bean is being harvested.

Why Good Seeds Don't Always Grow

or

What Happens After Germination?

Contrary to widespread belief, the destructive disease called "Damping-off" is not caused by dampness but by living germs or fungi which live in the soil. These soil fungi sustain their own vitality by drawing the life from the tender seedlings either before they emerge or after, when the plant withers and breaks off at the soil surface. Decay of seeds before sprouting is simply another phase of this disease.

Against the thread-like tentacles of the soil octopus the best seed—when unprotected—is entirely helpless. There are two ways to combat these fungi: sterilization of the soil with **FORMACIDE** or treatment of the seed with **CUPROCID**. Order either or both to come with your seeds. Offered on page 15.

Livingston's Leaf and

Leaf or Loose Headed Varieties

Grand Rapids. Especially adapted for greenhouse culture; also good to sow outside early in the spring. Our stock of this variety is extra fine. It does not form a head, but makes large, compact bunches of light, attractively curled and fringed leaves. It grows very rapidly and keeps in good market condition for a long time after cutting. Should be sown more shallow than the other sorts, otherwise it may not germinate. Pkt. 5 cts.; $\frac{1}{4}$ oz. 10 cts.; $\frac{1}{2}$ oz. 15 cts.; oz. 20 cts.; $\frac{1}{4}$ lb. 50 cts.; lb. \$1.65.

Grand Rapids, Tip Burn Resistant. A new strain

of this variety that is resistant to tip burning. Gives greater weight per square foot due to compactness and does not become spindly or bolt to seed as quickly as others. Excellent for greenhouse growing but equally as good outside. Developed by the Ohio Agricultural Experiment Station. Pkt. 5 cts.; $\frac{1}{4}$ oz. 15 cts.; $\frac{1}{2}$ oz. 20 cts.; oz. 30 cts.; $\frac{1}{4}$ lb. 85 cts.; lb. \$3.00.

OHIO GRAND RAPIDS. It is a dark-leaved Grand Rapids, and a quick grower. Especially adapted to midwinter crops in greenhouse. Very hardy. Not advised for home-gardens. Pkt. 5 cts.; $\frac{1}{4}$ oz. 10 cts.; $\frac{1}{2}$ oz. 15 cts.; oz. 20 cts.; $\frac{1}{4}$ lb. 50 cts.; lb. \$1.65.

DOGZOFF keeps dogs away. See page 15.

Culture—To grow good Leaf Lettuce outside sow the seed very thinly ($\frac{1}{4}$ inch) in rows 15 inches apart, covering with very fine soil. This can be done in April as soon as the cold wet days of spring are past. Successive sowings can be made at 2 week intervals for a continuous supply. Diligent hoeing, especially in dry weather, and plenty of water are essential. Thin plants to 2 inches apart when a few leaves appear and normal use will further thin the row as they develop. For fall crop sow seed in August. For extra-early crop sow in cold-frame in fall and protect through the winter or in hot-bed in early spring and set out when soil is dry and warm.

One ounce of seed sows 100 square feet; plants 120 feet of row; produces 3,000 plants.

Black-Seeded Simpson. The Universal home-garden variety. Forms

a large, loose head of nearly white, curly leaves that are large, thin, very tender and of good quality. For home table use you can get no better. Pkt. 5 cts.; $\frac{1}{2}$ oz. 10 cts.; oz. 15 cts.; $\frac{1}{4}$ lb. 40 cts.; lb. \$1.30.

Arlington Fancy Curled. A beautiful variety of the curly-leaf type.

It resembles the best stocks of the Grand Rapids, but it is more beautifully curled and produces greater weight to a given space. It is very true to type, of excellent quality, and for garnishing nothing in the Lettuce line excels it. Everyone should grow some of it, as it is one of the popular favorites with the general public. It has a slight tendency to head, which makes it very crisp. Heading Varieties

Culture—Head Lettuce requires a longer growing season than leaf lettuce but must reach maturity before hot weather and while the nights are relatively cool. Therefore, the secret of growing it is an extra-early start, quick and uninterrupted growth. This requires diligent cultivation and a constant and fairly high moisture content in the soil. It is best to start seed inside or in hotbed in March and transplant later in rows 15 inches apart. Plants should be 12 inches apart in the row. Seed can also be sown outside in early spring or late summer.

Maturities given are from transplanting date.

Wonderful (New York). A truly wonderful heading variety. It is peculiar in having a dark green leaf when growing, but the head blanches to a light green with a center of creamy white. Heart is solid, sweet, tender, and crisp. This variety frequently weighs 2 to 3 pounds and has been known to grow to 6 pounds. Should be planted to avoid hot seasons for heading. 60 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 25 cts.; ¼ lb. 65 cts.; lb. \$2.00.

New York No. 12. A new strain of New York. Perfectly round; solid and crisp; grows to a large size. Prefers cool weather and well fertilized soil. Matures early and is a sure header. Popular for shipping. 60 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 25 cts.; ¼ lb. 70 cts.; lb. \$2.25.

Imperial No. 152. New variety of the New York type; resistant to Brown Blight but susceptible to Tip Burn. One of the surest heading. Medium sized plants with heads close to ground. A cool weather sort; should be planted for early spring or late fall maturity. 60 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 25 cts.; ¼ lb. 80 cts.; lb. \$2.75.

ICEBERG. Beautiful large, curly leaves of light green, with a slight red tinge at the edges. Heads solid, crisp, tender, and of fine flavor. Do not confuse with Wonderful; they are entirely different. 50 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.50.

IMPROVED HANSON. Large heads; outer leaves are bright green and frilled; inner leaves white, sweet and crisp. Reliable header, stands summer heat well. 48 days. Pkt. 5 cts.; ½ oz. 10 cts.; oz. 15 cts.; ¼ lb. 45 cts.; lb. \$1.40.

Big Boston. (White-seeded.) This selected Lettuce is a very desirable large variety for forcing in coldframes and for outdoor planting. Plants large, hardy, vigorous. Leaves broad, smooth, thin, of a light green color. It forms good-sized heads and does particularly well during the cool fall and spring months. Superior quality. 50 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.55.

White Boston. Forms a fine, large, solid, buttery head similar to Big Boston, but does not have brown edges on the outer leaves. The head has a light green color and blanches to a creamy yellow. Desirable for coldframe forcing and outside growing, especially on muck soil. 50 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.65.

Livingston's Crisp-as-Ice. Introduced by us in 1895. The large, solid heads deserve their name as they are exceedingly crisp, tender and brittle. Beautifully crimped and curled with outer leaves variegated dark brown, bronze and green; heart, creamy-yellow. Quite hardy. 50 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 55 cts.; lb. \$1.75.

TRIANON COS (Romaine). The long, narrow leaves, which form solid heads, blanch and become snowy white. Excels in quality and crispness. Can be eaten same as celery. 55 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.50.

MAY KING. An early variety of head lettuce. Grows quickly, producing fine, medium-sized heads, even in poor soil. It is not easily affected by cold or wet weather. 45 days. Pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.50.

CHICKEN LETTUCE. Does not head but has stalks 3 to 4 ft. high which yield as much chicken-feed as any "greens" plant. When cut it starts to grow again. Pkt. 5 cts.; oz. 15 cts.; ¼ lb. 45 cts.; lb. \$1.50.

MUSKMELONS

Culture—A rich, sandy soil and good seed are absolutely necessary for success in raising the best Muskmelons. The seed should not be planted until the ground has become dry and warm; plant in hills 6 feet apart each way; old, well-rotted manure should be thoroughly mixed with the soil in each hill and in liberal quantity. Put six to eight seeds in the hill and when danger from insects is past, leave one or two of

the strongest plants only. Muskmelons or Cantaloupes may also be sown in rows that are made about 6 feet apart, and when the plants are well up thinned to stand in hills 5 to 6 feet apart, just before the plants begin to run. This method requires more seed but insures a good stand of plants in spite of the bugs. Cover seed 1 inch. Cultivate often and not deep.

One oz. will plant 60 hills; 2 to 3 lbs. will plant an acre.

in quality, appearance, and productiveness. Introduced by us in 1892. This splendid melon has "held its own" for many years against all introductions in the melon line, and no yellow-fleshed melon of which we have any knowledge compares with it in good qualities. The testimony of all who have used **Tip-Top** is that every melon produced, whether large or small, early or late, is a good one—sweet, juicy, finest flavor, firm fleshed and edible to the outside coating. Its appearance on the market is very attractive—sells on sight. Customers soon learn to pick them out and will have no other variety. Fruit of large size, and flesh bright salmon in color; slightly oblong, evenly ribbed, moderately netted, very productive. 80 days. **Originator's Strain**, pkt. 5 cts.; ¼ oz. 10 cts.; ½ oz. 15 cts.; oz. 20 cts.; ¼ lb. 50 cts.; lb. \$1.50.

WATERMELONS

Culture—A light, sandy soil, with good exposure to the sun, is the best situation for Watermelons. The ground should be prepared deeply, but receive shallow cultivation. Hoe often and very thoroughly about the hills. If extra-large Watermelons are desired for exhibition purposes, leave but one or two on a single vine. Plant 1 inch deep in hills 6 to 8 feet apart each way, with a very generous shovelful of well-rotted manure mixed with the soil in each hill. If commercial fertilizer is used, it should contain a large percentage of ammonia and potash. Plant eight to ten seeds in each hill, and finally, when danger from insects is past, thin out to three strong plants. Watermelon seeds being large, an ounce is about right for small gardens.

One ounce of seed will plant 20 to 30 hills
4 to 6 lbs. will plant an acre

ONIONS

Livingston's Choice

Culture—Onion seed should be sown as early in April as it is possible to get the ground in shape, even though the weather is cold. Thorough preparation of the soil is one of the most essential points in successful Onion-growing. They delight in a rich, deep, sandy loam, but excellent yields can be obtained from heavier soils properly fertilized. Sow the seed in rows 12 to 15 inches apart and about $\frac{1}{2}$ inch deep. After they are well started, or about 3 to 4 inches high, thin out to stand about 2 inches apart, keeping them well hoed and free from weeds at all times throughout the season.

Large Sweet
A splendid sort for
canning and mar-
ket use.

Culture—Pumpkins are not so particular in regard to soil as melons or cucumbers, but in other respects are cultivated in a similar manner. Sow in the month of May, when you plant your corn. Make hills the same as you do for squashes, but about 8 to 10 feet apart each way. Place about 8 seeds in a hill, cover 1 inch, and thin to 3 to 4 vines. It is preferable to grow Pumpkins in the field, and not in the garden, as they mix with the squashes and other vines.

One ounce of seed will plant 15 hills; 3 to 4 pounds will plant an acre

Large Sweet. (Kentucky Field.) A large, round, flattened Pumpkin that is hardy and productive. It grows 1 to 2 feet in diameter and has thick orange flesh of extra-fine quality. A splendid sort for canning and market use. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 25 cts.; lb. 75 cts.

LARGE SWEET CHEESE. One of the best for canning. Large, round, flattened variety with thick, sweet orange flesh. An excellent keeper. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 25 cts.; lb. 75 cts.

Small Sweet. (Sugar.) Best pie pumpkin. This is the small, sweet Pumpkin that has made the New England States famous for their Pumpkin pies. The flesh is very fine grained, most deliciously sweet-flavored, and a splendid keeper. It averages about 10 inches in diameter and is of deep orange-yellow color. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 30 cts.; lb. \$1.00.

MAMMOTH POTIRON. One of largest grown. A really enormous variety (specimens often grow 2 feet in diameter and sometimes weigh 150 lbs.) with depressed ends and slightly ribbed salmon-color skin; flesh bright yellow. Great exhibition sort. Pkt. 5 cts.; $\frac{1}{2}$ oz. 10 cts.; oz. 15 cts.; $\frac{1}{4}$ lb. 35 cts.; lb. \$1.15.

COMMON YELLOW FIELD. (Yankee Cow; Conn. Field.) Cultivated chiefly by farmers for stock-feeding and used some for canning. Very productive. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 25 cts.; lb. 75 cts.

Winter Luxury. Excellent for pies. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 30 cts.; lb. \$1.00.

Why Not Grow Some Peanuts?

Culture—Peanuts require rich, sandy soil. Plant when the soil is warm and dry, about the middle of May. Plant 2 to 3 inches deep, with the hulls on, in rows about 3 feet apart, and about 10 inches apart in the rows. When ripe dig up the vines and hang up to dry. Complete Peanut cultural leaflet free on request.

PLEASE READ THIS

At these low prices we cannot pay transportation on Peas beyond the 4th zone, unless ordered with other seeds. We cannot supply less than 5 pounds of one variety at the 5-pound rate; neither can we supply 5 pounds made up of two or more varieties at the 5-pound rate.

Culture—Peas thrive best in a rich soil and moderate temperature. Smooth seeded varieties are extremely hardy and can be planted quite early in April, about 2 to 3 inches deep. Wrinkled varieties are not so hardy but are of superior quality. They should be planted when the ground is warm and dry and if they are planted quite early they should be covered only 1 inch.

For dwarf varieties make the rows 20 to 24 inches apart and for tall varieties make them 30 to 36 inches apart. The seed should be placed 1 to 2 inches apart in the row. In the home garden, double rows, 6 inches apart, with brush or trellis between is ideal for conservation of space. Cultivate often and gather the crop as rapidly as it is fit for use. Successive sowings of early, medium and late varieties will provide food over a long period.

Two pounds sow 100 feet of row; 75 to 100 ft., an acre; 2 pounds equal 1 quart, 15 pounds 1 peck, 56 pounds 1 bu.

Grow Your Own Peppers

Culture—Peppers should be started in a hotbed or coldframe in late March or early April and transplanted the latter part of May into a sunny corner of the garden, in rows about 2 feet apart, with the plants about the same distance between them in the rows. They can be sown $\frac{1}{2}$ inch deep in open ground in a seed-bed when all danger from frost has passed and the weather has become settled and the soil warm. When the plants are about 3 inches in height, transplant as above into the rows where they are to remain. Some very rich fertilizer, stirred into the soil when the plants are about 6 inches high, will be beneficial. Maturities given are from transplanting dates.

One ounce of seed will produce about 1,500 plants
5 to 6 ounces to an acre

Culture—All varieties thrive best in light, sandy loam. For early use, sow in the hotbed in February, giving plenty of ventilation, or outside in the garden, in drills 1 foot apart as soon as the soil is warm and dry in April. Cover seed $\frac{1}{2}$ inch deep. Sow every two weeks from March until September, except in extreme hot

weather, for a succession of crisp Radishes for table use. Radishes must grow rapidly to be crisp, mild-flavored, and tender. The use of Nitrate of Soda or Sulphate of Ammonia applied when they first come up will promote this.

One ounce of seed will sow 100 feet of drill; 8 to 10 pounds will plant an acre.

Round and Oval Varieties

Early Scarlet Globe. Most popular of all globe-shaped early Radishes.

Used more than any other variety by market gardeners for both forcing and open ground. Glowing Ball. Gold Medal, All-America Selections, 1934. A round, short top variety with smooth, silky, bright scarlet-red skin with almost an orange glow. Very small tap-root. OLD DOMINION. A blight-resistant variety, in type and quality the same as Virginia blight-resistant, but has longer standing qualities; therefore can be sown in July for early fall crops and in September for early spring crop, as it winters well. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 15 cts.; lb. 40 cts.

Swiss Chard or Spinach Beet

Culture—A peculiar variety of Beet. The leaves only are used as greens and the leaf-stalks or midribs may be cooked like Asparagus. Sow seed 1 to 2 inches deep in April or May in drills 12 to 18 inches apart, and thin to 8 to 10 inches apart in the row.

One ounce sows 100 feet of row; 4 to 5 pounds to an acre.

Fordhook Giant. Leaves broad, upright in growth, very dark green, savoyed, with broad white midrib. This variety, on account of its giant size and pleasing deep green color, will probably supersede other sorts. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 25 cts.; lb. 90 cts.

Lucullus. Improved, heavy yielding variety. Creamy white curled leaves. Plants grow 2 feet tall. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 25 cts.; lb. 85 cts.

Culture—Will succeed in any ordinary soil, but rich soil promotes better growth and makes leaves more tender and succulent. Can be grown as a spring or summer crop, but seed will not germinate in extreme dry weather. Sow in April in rows 12 to 15 inches apart, covering seed 1 inch deep, and thin to 2 to 3 inches apart. For fall crop sow about August first, and for wintering over, about September first, and cover lightly with straw or other litter at approach of cold weather.

One ounce of seed will sow 50 feet of drill; 12 to 15 pounds will plant an acre

Bloomsdale Savoy Reselected. A new selection from

Bloomsdale Long-Standing (below), which has the completely crumpled and blistered leaves and long standing qualities, but in which the male plants have been eliminated, preventing it shooting to seed so early. Pkt. 5c.; oz. 10c.; $\frac{1}{4}$ lb. 15c.; lb. 40c.

Bloomsdale Savoy Long-Standing. A new strain

of merit. It is just as early as the old-type Bloomsdale, but stands in marketable condition ten to fourteen days longer. Intensely crumpled, blistered, uniform, deep glossy green leaves. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 15 cts.; lb. 40 cts.

IMPROVED THICK LEAF (Viroflay). Good for fall or spring sowing. Has heavy, broad, dark green, curled leaves. Inclined to shoot to seed early. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 15 cts.; lb. 35 cts.

PRICKLY-SEEDED WINTER. Triangular, oblong or arrow-shaped leaves. Hardest of all, therefore best for fall sowing where winters are severe. Pkt. 5 cts.; oz. 10 cts.; $\frac{1}{4}$ lb. 15 cts.; lb. 35 cts.

Sunflower

MAMMOTH RUSSIAN. Gigantic growth; heavy foliage, which is sometimes mixed with corn as ensilage; large flower heads, filled with seed. Use 10 to 12 pounds of seed to the acre. Pkt. 5 cts.; $\frac{1}{4}$ lb. 15 cts.; lb. 25 cts.; 5 lbs. 75 cts.

Culture.—Turnips serve the double purpose of summer greens and useful roots. Early varieties should be planted as soon as the ground is dry in April. Sowings of these and other later ones can be made as late as August or September. Early sowing should be in rows 12 to 15 inches apart, covering seed $\frac{1}{2}$ inch and thinning to 3 to 4 inches apart in the row. Cultivate often and thoroughly. Late sowing can be broadcast rather than sown in rows.

One ounce of seed will sow 100 feet of drill;
One to two pounds will plant an acre

DAMPING OFF OF SEEDLINGS

"Damping Off" and Rots of Seedlings are actually caused by living germs that live in the soil. The most successful combatant is sterilization of the soil and seed or seed-pieces. We recommend the use of Forniacide or Cuprocid for this purpose. It is offered on page 15.

If you wish information on the Dormant Spraying of fruit and shade trees, cane fruits, grapes, etc., ask for complete spray calendar.

INSECTICIDES AND FUNGICIDES MENTIONED ABOVE ARE OFFERED ON PAGE 15.
