DREER'S

SEEDS - PLANTS - BULBS

for

Summer Planting

1 9 3 6

This special Summer Catalog is sent to bring to your attention certain seeds, bulbs, plants, and garden requisites that are of special interest to gardeners at this season of the year. It does not replace Dreer's Garden Book but rather complements it. We suggest that you refer to Dreer's Garden Book for items not listed herein.

JUNE is a favorite month for starting all kinds of perennial flower seeds for next year's blooming. Perennial seeds sown in June will develop into nice stocky plants by the time winter arrives and they will produce a profusion of blooms beginning next spring. Quick-growing annuals like Alyssum, Calendula, Candytuft, Centaurea, Clarkia, Gypsophila, Leptosyne, and many others may still be sown in June to bloom during the fall months. Stake all plants that cannot withstand severe wind storms. The lawn as well as all flower beds should have a top dressing of fertilizer. Spray promptly to protect the plants against insects and disease.

JULY still gives the gardener an opportunity to start perennial seeds outdoors. Aquilegia, Bellis, Campanula, Delphinium, Gaillardia, and Hollyhocks are typical of the kinds to be sown now. In order to be sure of your supply of fall blooming bulbs that must be planted during August and early September send in your order for these NOW. Among them the Fall-Flowering Crocus, Colchicum, and Sternbergia lutea deserve your particular attention. As they are perfectly hardy they will last for many years to come.

AUGUST still is time to start seeds of perennials in a protected frame where they will grow until late in the year. Early August is the most opportune time to sow Pansy seed for next spring blooming. Don't delay any longer now ordering your requirements of all the bulbs listed in this catalog if you wish to make sure of a supply and receive them as soon as available. Early planting of these is quite important.

Dreer's Reliable

Perennial Flower Seeds

For Summer and Autumn Sowing

Every good gardener knows that summer and autumn are very important seasons to start the seed of many perennials because it is nature's own time to do her sowing. Best results are obtained where the seed is sown either in a frame or in a well prepared seed bed located in a sheltered spot of the garden. Keep the soil moist and shaded until the seedlings appear and transplant to another frame or bed when large enough to handle. Most of them will be large enough for setting into their permanent locations either in late fall or early the following spring.

To help our customers in selecting varieties for the rock garden we have used the symbol Δ to identify them at a glance. These varieties also are splendid for dwarf beds, borders, or for edgings. Plants suited to the semi-shade are marked $\odot$ and those that will grow in deeper shade $\bullet$. Practically all of these also do well in a sunny position. The vines and climbers are marked $\S$. Those marked * are slow to germinate and are often sown in late fall when they will germinate the following spring.

To assist our patrons in securing the maximum results from seeds we issue a leaflet, "Growing of Flowers from Seed," which we will gladly enclose with any order on request.

The Sensational New Multiflora (Many-Flowered) Hyacinths

The beauty of these Hyacinths lies in the fact that each bulb produces 7 or 8 well-formed flower spikes. Consequently even a single bulb makes a showy display as a pot plant. The individual spikes resemble in general effect the well-known Dutch Hyacinths having the same delightful fragrance and charm. Easy to grow in the house as all that is needed is a cool room with a temperature around 60 to 65 degrees F. They are produced by treating the bulbs of the regular Hyacinth in such a way as to cause the formation of a number of smaller bulbs loosely joined together. Each bulb cluster is packed in an individual container.
