RED JUNE

Use thoroughly rotted manure or bonemeal mixed with the roots.

ALL CATALOG PRICES F.O.B. AUGUSTA
UNLESS OTHERWISE STATED.

PLANTING INSTRUCTIONS:

When to plant. As early as possible after the first killing frost.

Care of Trees on Arrival. If not ready to plant immediately, dig a trench, unpack the trees and heel in, cover the roots with earth, and water freely.

Preparing the Trees for Planting. Remove all broken roots. Cut back one-year peach, apple, cherry, pear and plum trees to a naked stem. 1½ to 2 feet high, leaving no side branches. Two-year-old trees should have branches cut back to half their length, the lower limbs shorter than those immediately above, then cutting them shorter as you go upward, leaving a long leader.

Preparing the Soil. Fruit trees succeed best in rich loam, naturally dry or made so by drainage. Make the holes at least 2 feet wide, and 2 feet deep. Cover the roots with surface soil, tamping thoroughly as the hole is filled.

E-early; L-late; MS-Midseason).

- **IMBRICATED:** Petals overlapping from center outward; no stamens showing.

CULTURE OF CAMELLIA JAPONICA

Camellias will grow in full sun if protected for the first few summers with a lattice frame. However, an ideal place for planting is where the plants get only a half day's sun. Do not plant in full shade, as they will not blossom as freely. If the soil is not fertile, use the following mixture: one-half good garden soil; one-fourth well-rotted cow manure; one-fourth peat or leaf-mold, well mixed. After planting, mulch with half-rotted leaves or peat. Each spring Camellias should be fertilized with well-rotted cow manure and A-C fertilizer. Keep the plants well mulched and watered.

The foliage is sometimes attacked by a scale-insect, which may be readily controlled by spraying with Volck. Be sure to wet the under-side of leaves. This spray material may be found on page 15 of our catalogue.
