POMARIA NURSERIES,

1856-7.

Address—WILLIAM SUMMER, POMARIA, S. C.

COLUMBIA, S. C.:
STEAM POWER-PRESS OF R. W. GIBBES.

1856.

INSTRUCTIONS, &c.

THE proprietor, in presenting his new Catalogue to the public, is induced to offer a few hints to persons commencing to plant orchards. In the first place, then, if you wish to secure healthy, well-formed trees, the ground must be well prepared, by a good subsoil plowing, to the depth of eighteen or twenty inches; and, if the soil is poor, a liberal dressing of well-decomposed manure will be indispensable.

The ground prepared, next proceed to dig your pits for planting, five feet in diameter, and from twenty inches to two feet deep, then filling up half full with good surface mould. In planting the trees, if a compost of fresh woods earth, ashes, or lime, be added, it will greatly aid in giving them a good start. Be careful to avoid deep planting, as nothing is more injurious. When finished, the neck of the tree should be slightly higher than the surrounding surface; the earth raised a little around the edge of the pits, so as to form a shallow basin round each tree—to prevent the water running off. In planting, be careful to spread out the roots regularly, spreading the soil from the stem outwards. When planted, fill up your pits to within two inches of the top, giving each tree as much water as settles the earth thoroughly. In four or five hours, you can finish, by filling up entirely and treading moderately, as far as the roots extend. If to this treatment is added a good mulching of decayed leaves, bark, or saw-dust, around the trees, it will assist greatly in retaining moisture, and consequently prevent the necessity of more than one or two good waterings.

Next in importance to careful planting is a proper pruning, to secure low, spreading tops, to protect the stems from our scorching sun, by which more fruit trees are killed than by any other cause, as nearly every orchard in the country will attest. To prune a tree up with a long bare stem is an outrage on nature. After the first year, the plow should not go close to the trees; a light forking over in winter, and the addition of a little fresh mulching will be a much better mode of treatment. For the first few years, they will require careful pruning every winter, shortening in the branches more or less, according to their strength; always cutting to a bud pointing outwards, on purpose to keep the head open in the centre.

In sending trees from the nursery, I will always send one or two pruned as they ought to be for planting; for standard trees, I consider two feet, or even less, is abundantly high, and will be found not only conducive to the health of the trees, but also rendering them easier to prune and to gather the fruit from.

Dwarf trees, such as the pear on quince, apple on doucain and paradise

stocks, the cherry on mahalebs, &c., the stems should not be more than fifteen to eighteen inches high. In receiving trees from the nursery, it will be necessary to remove the wired labels before the trees have grown much, as otherwise they may cut into the stems, and often seriously injure them. The names may be preserved by numbering and taking them down in a book.

For ornamental plants they will generally succeed well in any ordinary good soil; if poor, enriching with fresh surface soil and rotted leaves from the woods, avoiding the use of animal manures, especially for all those elegant evergreen trees, termed Coniferæ, such as Pines, Cedars, Cypress, &c. The remarks on planting fruit trees is equally applicable to these; for the more delicate varieties, a screen of Cedar branches on the south west side, at a little distance from the plant, will be found of much advantage to them, especially the first season; it will prevent the evil effects of the sun after a severe frost in winter, and its scorching rays in summer.

ROSES.—To grow these it is only necessary to have a soil rich and deep—such as will grow good cabbages; a severe pruning every winter; cutting out the old wood and cutting in the vigorous young shoots to one-third their length, and adding a fresh dressing of well-decomposed manure every winter; if thus treated, and not smothered up by other plants growing close to them, they will continue to give abundance of their delightful flowers for a great number of years. Moss roses ought to be planted in a damp shady border and very slightly pruned, merely cutting out decayed branches and cutting the branches a very little back.

In ordering pear trees, we would observe to purchasers that many of the varieties do not succeed as dwarfs on the quince. Yet a large number of the very finest do. It will, therefore, be necessary to indicate the number of each kind wanted—dwarfs or standards.

Those unacquainted with the various kinds, will find it to their advantage to leave the selection to us when we shall endeavor to do them justice.

All trees will be carefully packed to insure safe transport. For greater certainty and dispatch I have made arrangements with Adams & Co.'s Express, to forward packages on all the lines where they have agents to whom bills will be sent for collection, on delivery of the parcels. Persons wishing their trees sent by another conveyance will please mention it in their orders.

On dispatching packages receipts will be taken and sent with the bill, after which they are at the risk of the purchaser.

Trees cannot be taken up with safety for transplanting in our climate until the 20th of November.

Early orders are respectfully solicited, and will be promptly attended to, by addressing

WILLIAM SUMMER, *Pomaria, S. C.*
