7a FOREIGN AGRICULTURE REPORT, No. 60 JUNE 1951

U. S. DEPARTMENT OF AGRICULTURE
U.S. OFFICE OF FOREIGN AGRICULTURAL RELATIONS.
5a WASHINGTON, D. C.

FOREWORD

Although the principal outlet for United States fruit is the domestic market, foreign trade is an important factor in the economic situation of the industry.

Fruit exports and imports affect the different segments of the industry in varying proportions and in recent years have been given prime consideration by those elements that historically depend to a large degree on foreign outlets for a market or have felt the competition from foreign sources of supply. The post World War II developments in foreign trade have raised many complicated questions; therefore, an effort has been made to bring together the basic statistical material on foreign trade in fruit and relate it to production. In order to make the statistics comparable and to show the total picture, much of the foreign trade data have been converted from the usually reported basis to fresh fruit equivalents. In this manner a total export or import figure may be obtained and related to production, which in most instances is on a fresh fruit basis.

Briefly, this report is largely a statistical compilation and no effort is made to analyze the situation other than to point out some of the significant facts and longer-time trends. It is hoped that the statistical material will be of considerable benefit to those interested in the over-all statistical picture herewith presented, and as background material for further study of the problem.

Total Fruit Production and Trade

The tonnage of fruit production in the United States nearly trebled during the four decades ended in 1950, but the tonnage of exports (fresh basis) practically kept pace with the rising output, while the tonnage of imports (fresh basis) lost ground. Both exports and imports reached record high levels in the 1920's and declined to moderately lower levels in the 1930's and to very low levels during World War II years. There was some recovery in the immediate post World War II years but the tightening dollar exchange situation caused severe difficulties in the recent seasons.

The proportion of production exported was 6.2 percent in the 1910 fruit season as it was again in the 1949 season. From 1910 to 1922, inclusive, the proportion exported varied between 3.9 percent (1917) and 7.9 percent (1919), but for the period 1923 to 1938, inclusive, the proportion varied between 9.8 percent (1924) and 15.5 percent (1928). Of the four decades, this was the most favorable period for exports. Then came World War II and its aftermath, during which the proportion varied between 4.1 percent (1940) and 8.5 percent (1947).

Because of the significance of bananas in total fruit imports, the problem is treated both with bananas excluded and included. Total imports (fresh basis) excluding bananas were equivalent to 5.8 percent of production in the 1910 season but only 2.7 percent in 1949. For the period 1910 to 1922, inclusive, these imports varied between 2.0 percent (1917) of production and 8.6 percent (1921), and for the period 1923 to 1938, inclusive, the proportion varied between 2.7 percent (1937) and 6.2 percent (1924). From 1939 to 1949, inclusive, the proportion dropped to a lower level, and varied between 0.8 percent (1942) and 3.1 percent (1939). It is evident that somewhat different factors affected imports from those influencing the trend of exports.

If bananas are included in imports, a slightly different trend is indicated. For 1910 the equivalent of production imported was 22.0 percent but in 1949 it was only 11.6 percent. For the period 1910 to 1922, inclusive, total imports ranged between 12.4 percent (1918) and 25.1 percent (1921) but in the middle period, 1923 to 1938, inclusive, the variation was between 11.6 percent (1933) and 21.5 percent (1929). From 1939 to 1949, inclusive, the range was from 4.8 percent (1942) to 12.7 percent (1939).

Contrary to general opinion the United States was a net importer of fruit during the four decades with the exception of the 1934 season and the three war years, 1942, 1943, and 1944. Of course, the relatively large annual imports of bananas were the principal factor. If bananas are excluded from the imported volume, the country would have been on a net export basis for the entire period except in the 1921 season when domestic production was reduced sharply by a heavy late frost. Including bananas, the United States had available for consumption in the 1910 season the equivalent of 15.8 percent more fruit than was produced domestically while in 1949 the net import was 5.4 percent of production. For the period 1910 to 1922, inclusive, net imports ranged between 5.0 percent (1918) and 17.7 percent (1921) of production, while for the favorable export period, 1923 to 1938, inclusive, the range was between 1.2 percent (1934) export surplus to 9.9 percent (1929) net imports. For the World War II and subsequent years, 1939 to 1949, inclusive, the supply of fruit available for consumption varied from 3.2 percent (1943) less than production to 7.1 percent (1940) more than production.

With few exceptions during the four decades the exports of dried fruit in terms of fresh accounted for a larger proportion of production than either the fresh or processed (in terms of fresh). The record-high year for dried and fresh exports was 1928 when 1,090,000 tons of dried fruit (fresh basis), or 8.0 percent of production, and fresh exports totaled 833,000 tons, or 6.1 percent of production. Processed fruit exports (fresh basis) reached a maximum in 1946 when 246,000 tons, or 1.3 percent of production, was exported. In 1949, fresh exports comprised only 2.3 percent of production, dried in terms of fresh, 3.5 percent, and processed in terms of fresh, 0.4 percent.

Value of United States Fruit Trade

The total value of fruit exports reached three distinct peaks in the four decades; the first was in the 1919 season at \$115 million, the second in 1928 at \$149 million, and the third in 1946 at \$192 million. Although all classes of fruit exports shared in this general trend the record high for each occurred at different times. For fresh exports the first peak was reached in 1920 at \$35 million, the second in 1928 at \$75 million, and the third in 1946 at \$89 million. The total value of canned fruit reached the first peak in 1919 at \$41 million, the second in 1929 at \$30 million, and the third in 1946 at \$29 million. For dried fruit the value of exports reached the first peak in 1919 at \$45 million, the second in 1928 at \$41 million, and the third in 1944 at \$61 million. For a miscellaneous class of fruit preparations, the value of exports reached the first peak in 1915 at \$4.2 million, the second in 1927 at \$4.6 million, and the third in 1943 at \$24.8 million. In 1949

fresh fruit exports were valued at \$46 million, canned fruit at \$11 million, dried fruits at \$32 million, and other fruit preparations at \$19 million, thus making a total of \$107 million.

The total value of fruit imports followed much the same trend as that of exports. The first peak of \$50 million was reached in 1919, the second at \$61 million in 1929, and the third at \$106 million in 1949. As in the case of volume, the value of fruit imports was dominated by the value of bananas imported. The value of fresh imports reached the first peak in 1921 at \$29 million, the second in 1929 at \$46 million, and the third in 1949 at \$73 million. For Dried fruit, the import value reached an all-time-high record in 1919 at \$17 million and then declined sharply until 1943 when it was only \$45,000. The value recovered to \$5.4 million by 1946 but in 1949 it totaled only \$2.8 million. The import value of canned and preserved fruits reached the first peak in 1919 at \$10 million, the second in 1929 at \$9.3 million, and the third in 1948 at \$32 million. There was a slight decrease in 1949 to \$30 million.

Fresh Fruit Production and Trade

Although it is generally difficult to determine what part of fruit production is going to be available for the fresh market, some estimates may be derived by taking the total production figures and deducting the known quantities used for drying, canning, and other processing. For 1934 to date the United States Bureau of Agricultural Economics has released data on the annual utilization of fruits, and (for earlier years) another BAE study (made by BAE) on consumption carries these data back to 1910. The series for the two periods are not strictly comparable for several reasons but they are the best available. One serious complicating factor is the series on apple production; from 1910 to 1934 the estimates include the total apple crop, while for the period 1934 to date only the crop produced in commercial countries is included. Also going back in the earlier period, the data on processing become less and less reliable. Nevertheless, it is considered that the data are sufficiently comparable to show the importance of fresh exports and imports in relation to total production for fresh use.

Whereas total United States production of fruit for all uses nearly trebled in the four decades, the output for fresh use increased only about 60 percent. It is significant, however, that the production of citrus for fresh use increased by more than five times while that of deciduous fruits remained at nearly the same level as of 40 years ago.

The volume of fresh exports falls into the familiar pattern of three levels during the four decades under review. For the period 1910 to 1922, inclusive, fresh exports ranged between 1.5 percent

(1917) of production for fresh use and 3.8 percent (1920) but rose to higher levels in the period 1923 to 1938, inclusive. In the latter period, fresh exports varied between 4.8 percent (1924) of production for fresh use and 9.4 percent (1930). From 1939 to 1949, inclusive, the proportions ranged between 3.2 percent (1942) and 7.5 percent (1946).

Imports of fresh fruit, excluding bananas, were equivalent to a rather insignificant proportion of production for fresh use during all of the four decades, the proportion ranging between 0.4 percent (1942) and 1.9 percent (1921). With bananas included, however, fresh fruit imports were equivalent to a very important proportion of production for fresh use and of consumption. There is not the noticeable division of the four decades as in the case of exports. Except for the World War II period, total fresh fruit imports were equivalent to between 13.6 and 23.8 percent of production for fresh use. During the World War II years when banana imports were restricted by the lack of available shipping, the proportion of production for fresh use declined to the range of 7.2 and 11.9 percent. It recovered to around 20 percent in recent years.

For all of the 40-year period, the United States was a net importer of fresh fruit, and, of course, primarily because of the relatively large volume of banana imports. The net import balance varied between 3.1 percent (1943) and 20.7 percent (1921) of production for fresh use. In 1949, net imports were equivalent to 15.9 percent.

Canned Fruit Pack and Trade

The volume of fruits canned in the United States expanded greatly during the four decades. The pack rose from slightly more than 300 million pounds in 1910 to slightly more than 3 billion pounds in 1949. Exports of these products did not become very significant until about 1922 when the volume amounted to 13.3 percent of the pack. For the period 1922 to 1939, inclusive, exports of canned fruit varied between 10.2 percent (1937) and 18.8 percent (1938) of the canned pack. During the World War II years and subsequently, exports varied between 0.6 percent (1940) and 5.8 percent (1946) of the pack. In 1949 the proportion was 2.5 percent.

From 1910 to 1916, inclusive, imports of canned fruits ranged between 6.0 percent (1914) and 13.6 percent (1911) of the pack, but from 1917 to 1949, inclusive, the proportion varied between 2.7 percent (1917) and 6.4 percent (1940). In 1949, it was 6.2 percent of the pack. It should be noted that the volume of imports shows a sharply rising trend over the 40 years and since 1917 increased at a faster pace than the pack.

During the favorable period for canned fruit exports, 1923 to 1939, inclusive, the Nation was on a net export basis for these products, ranging between 14.5 percent (1932) and 6.7 percent (1937) of the pack. For the World War II years and subsequently, there was a slight net import except in 1946. The net import was 3.8 percent of the pack in 1949.

Dried Fruit Pack and Trade

The United States pack of dried fruit expanded rapidly from around 350 million pounds in 1910 to a little more than 1 billion pounds in 1923. It has since varied between 800 million and 1.2 billion pounds, with the exception of the wartime-high record of 1,338 million pounds in 1943. Generally speaking, exports followed a similar trend, with the proportion of the pack exported roughly approximating one-third. The variation in the proportion exported during the four decades, however, ranged between 14.1 percent (1917) and 50.2 percent. In 1910 the proportion was 33.8 percent and in 1949 it was 34.2 percent. The period of the late 1920's and early 1930's was the most favorable for exports and the proportion of the pack exported was slightly higher than for the other years under review.

Imports of dried fruits during the 40 years fall into three distinct phases. The first is the period 1910 to 1918, inclusive, in which imports ranged between 2.3 percent (1917) and 7.4 percent (1910) of the pack. During the second phase, 1919 to 1929, inclusive, imports varied between 5.6 percent (1927) and 17.2 percent (1921) of the pack. From 1930 to 1949, inclusive, the proportion ranged between 0.1 percent (1943) and 7 percent (1937). In 1949 the proportion was 3.5 percent of the pack.

In contrast to the situation with respect to fresh and canned fruits, the United States has been consistently on a net export basis for dried fruit. In 1910 the net export amounted to 26.5 percent of the pack and in 1949 it was 30.6 percent. For the 40-year period, net exports varied between 1.4 percent (1920) of the pack and 43.1 percent (1928).

Trade by Country of Destination

Fresh Fruits

The principal fresh fruits exported from the United States are apples, pears, grapes, grapefruit, oranges, and lemons. There are a few others, primarily shipped to Canada, apricots, peaches, plums and prunes, cranberries, etc.

The volume of fresh apple exports reached a relatively high level in the 1925-29 period but declined to somewhat lower levels in the 1930's and to a very low level during the World War II period. There was some recovery by 1949 but not enough to restore the pre-war levels, nor even the average of 1910-14. The principal reason for the low level of exports was the sharp reduction in the trade with such historical markets as Brazil, Argentina, Western Europe, and primarily the United Kingdom, largely because of a shortage of dollar exchange. On the other hand, there was considerable improvement in exports to Cuba, Venezuela, Hong Kong, and the Philippines. Exports to Canada lost ground, partly because of an increase in production there and partly because Canada also lost export outlets.

Much the same situation existed with pear exports -- a sharp decline from the prewar levels due to the loss of market outlets in Western Europe and particularly the United Kingdom. In the late 1940's, the United Kingdom, which in prewar years imported on the average a total of 1.2 million bushels of United States pears, definitely excluded them under a system of tight import controls.

In the late 40's, United States exports of grapes expanded sharply over the prewar levels, with exports to Canada accounting for most of the increase. Exports to such prewar markets as Mexico and Brazil decreased and those to Western Europe and the United Kingdom in particular were practically stopped, but these decreases were offset by increases to Cuba, Venezuela, Hong Kong, and the Philippines.

The exports of grapefruit and oranges followed much the same pattern in that there were slight increases over the prewar level in the exports of both in the late 1940's. A sharp rise in exports to Canada more than offset decreases to the United Kingdom, France, and Germany. There have been some notable increases in exports to Belgium, the Netherlands, and Switzerland over the prewar levels. Before the World War II, the principal export outlets for lemons were Canada and the United Kingdom but in the late 40's only Canada took any sizable quantity.

Canned Fruits

Historically, the United Kingdom has been by far the principal market for all types of canned fruits produced in the United States. The average export during the 1935-39 period to the United Kingdom totaled 24 million pounds of canned apricots, 14 million pounds of apples and apple sauce, 35 million pounds of fruit salad and cocktail, 38 million pounds of grapefruit segments, 72 million pounds of peaches, 64 million pounds of pears, and 11 million pounds of canned pineapples. In all, a total of 258 million pounds of canned

fruits were exported on the average to the United Kingdom, or 87 percent of total exports of these products. France, Belgium, the Netherlands, Ireland, Canada, and Cuba also took sizable quantities. In the late 1940's, however, the United Kingdom was practically eliminated as a market because of the dollar exchange situation, and the total export volume dropped from 296 million pounds -- the prewar average -- to 72 million pounds, with Cuba, Venezuela, Belgium, the Netherlands, and the Philippines being the best market outlets. In other words, the export of canned fruits follows closely the dollar exchange situation. Exports of canned grapefruit segments suffered the greatest decline and fruit salad and cocktail and canned pineapples held up the best when compared with prewar levels.

Dried Fruit

As in the case of other types of fruits, Western Europe has been the historical market for United States dried fruit, but in this instance the United Kingdom has not been the dominating outlet. France, Germany, the Low Countries, Scandinavia, and Canada shared fairly well in importance. In the late 40's, however, the total volume of exports of cut fruits (dried apricots, apples, and peaches) declined sharply from the World War II levels, with nearly all countries sharing in the decreases.

In the case of dried prunes and raisins, exports in the late 1940's were maintained or increased through export payments or other surplus-removal programs developed by the United States Department of Agriculture. Dried prune exports totaled 152 million pounds in the fiscal year beginning July 1, 1949, compared with the 5-year (1935-39) average of 186 million pounds and the 1925-29 average of 201 million pounds. Canada, Sweden, the United Kingdom, the Netherlands, Belgium, Western Germany, and Italy were all important outlets in the late 40's. In addition to these countries, Norway, Denmark, France, and Finland were important in the 1935-39 period. Under the food relief program in 1947, Japan and Austria took sizable quantities of dried prunes.

Exports of raisins totaled 174 million pounds in the fiscal year 1949-50 compared with the 5-year (1935-39) average of 129 million pounds and the 1925-29 average of 166 million pounds. In the late 1940's, Canada, Sweden, the United Kingdom, the Netherlands, Belgium, and Western Germany, were the important outlets. There were only minor shifts in outlets for this fruit as compared with prewar, except when a food relief program was in effect.

Imports

Historically, major fruit imports have consisted largely of fresh bananas, dried dates, and figs. In the late 40's, some apples and blueberries from Canada and a few pears and grapes from Argentina, Chile, and the Union of South Africa were imported. There were other fruit imports from time to time from various parts of the world but they did not loom large in relation to production or trade in other types of fruit.

Bananas have been an important imported item for many years. The volume reached a relatively high average of 61 million bunches in the 1935-39 period, declined sharply during the war period and then recovered to practically the prewar level in the late 40's. Practically all the bananas imported into the United States came from Latin America, with the bulk from Central America. There were some shifts in sources after World War II, however, in that Honduras replaced Mexico as the largest supplier. Haiti, Costa Rico, Colombia, the Dominican Republic, and Ecuador also improved their supplier position after the prewar years whereas, Guatemala, Nicaragua, Panama, Mexico, Jamaica, Cuba, and others lost ground. The decrease in nearly every case was attributable to the ravages of Panama and Sigatoka diseases.

For many years, imports of dates have come largely from Iraq, with Iran supplying a few in recent years. The total quantity imported in the late 1940's averaged only slightly more than one-half of the prewar level.

Dried fig imports also declined from the World War II levels and, in the late 40's, were only a fraction of quantities imported annually in the 1920's. Greece and Turkey supplied most of the imports during the late 1940's as they had in the prewar period. In the 1920's, Turkey was by far the dominant supplier.

1/ See individual commodity tables for detailed information and conversion factors.

2/ Less than 500 tons.

3/ Less than 0.1 percent.

4/ Preliminary.

Production, records of the Bureau of Agricultural Economics.

Trade, official records of the Bureau of the Census.

FRESH FRUITS: U.S. PRODUCTION FOR FRESH USE, IMPORTS, EXPORTS AND APPARENT CONSUMPTION

Production from official records of B.A.E. For 1910-33 inclusive, adjustments have been made for plums, prunes, strawberries and cherries not included in official estimates. In the case of grapes, the quantity shipped fresh for juice purposes is included for the years 1919 to date. Trade from official records of the Bureau of the Census.

1/ Preliminary.

CANNED FRUIT: U.S. PACK, IMPORTS, EXPORTS, AND QUANTITY AVAILABLE FOR CONSUMPTION

DRIED FRUIT: U. S. PACK, IMPORTS, EXPORTS AND QUANTITY AVAILABLE FOR CONSUMPTION

FRUIT, DRIED, processed weight: United States pack, trade and available for consumption
as percent of total production

- 1/ Estimates of the commercial crop refer to the production of apples in the commercial apple areas of each State and include fruit produced for sale to commercial processors, as well as for fresh consumption. Since 1938, official estimates of apple production have been reclassified by law to the commercial crop.
- 2/ Dried and canned are converted to terms of fresh on the following basis:
1 pound of dried is equivalent to 7 pounds of fresh 1910-42; subsequent years, 1 pound is equal to 8 pounds fresh; dried apples in fruit salad are 7 percent of total dried fruit in salad; 1 pound canned is equivalent to about 2 pounds fresh.
- 3/ Less than 0.1 percent.
- 4/ Not reported separately prior to January 1, 1924.
- 5/ Less than 500 bushels.
- 6/ Preliminary.

Production, records of the Bureau of Agricultural Economics.
Trade, official records of the Bureau of the Census.

1/ Canned apricots 1922-38 converted to fresh on basis that 55 cases (45 pounds each) packed from 1 ton of fresh fruit. Subsequent data converted on the basis that 60 cases are equivalent to 1 ton fresh.

2/ Dried apricots converted to unprocessed dry weight by dividing by 1.07. Unprocessed dry weight converted to fresh on the basis that 1 ton dried is equivalent to 5.5 tons fresh. Dried apricots in fruit salad are 12 1/3 percent of total dried fruit for salad.

3/ Not separately classified prior to January 1, 1923

4/ Not separately classified prior to January 1, 1930

5/ Not separately classified prior to January 1, 1937.

6/ Less than 1/2 ton.

7/ Less than 0.1 percent.

8/ Preliminary.

1/ Canned, natural, sulphured or in brine converted to fresh on the basis of 1 ton processed is equivalent to 1 ton fresh. Canned in fruit salad is 3 percent of total fruit canned in salad.

2/ Dried converted to fresh on the basis of 1 ton dried is equivalent to 5 tons fresh.

3/ Not separately classified prior to January 1, 1922.

4/ Not separately classified prior to January 1, 1924.

5/ Less than 0.1 percent.

6/ Not separately classified prior to January 1, 1936.

7/ Less than 1/2 ton.

8/ Preliminary.

Production, records of Bureau of Agricultural Economics. Trade, official records of the Bureau of the Census.

1/ Canned grapes in fruit salad are 12 percent of fruit canned in salad. Canned converted to fresh on the basis that 1 pound canned is equivalent to 0.741 pounds fresh.

2/ Includes raisins and currants converted to sweat-box basis at the ratio of 1 to 1.08. Converted to terms of fresh on the basis that 1 ton dried is equivalent to 4 tons fresh.

3/ Includes wine converted to a fresh basis on the assumption that 1 ton of grapes makes 97.6 gallons of wine. Exports beginning January 1, 1941 include small quantities of canned grapes converted to fresh basis.

4/ Imports of fresh grapes reported in pounds 1910-1926; subsequent years in cubic feet converted on the basis of 40 pounds to a cubic foot.

5/ Not separately classified prior to January 1, 1922.

6/ Less than 500 tons.

7/ Less than 0.1 percent.

8/ Preliminary.

1/ Exports of dried fruit converted to unprocessed dry weight by dividing by 1.07. Unprocessed dry weight converted to terms of fresh on the basis that 1 pound of dried is equivalent to 5.5 pounds of fresh, 1910-28; subsequent years, 1 pound dried equivalent to 6.5 pounds fresh. Dried peaches are 21 percent of total dried fruit for salad. Canned converted to fresh on the basis that 1 pound canned is equivalent to 1 pound fresh. Peaches canned in fruit salad are 40 percent of total fruit canned in salad.

2/ Not separately classified prior to January 1, 1922.

3/ Less than 0.1 percent.

4/ Not separately classified prior to January 1, 1930.

5/ Less than 500 bushels.

6/ Preliminary.

Production, records of the Bureau of Agricultural Economics.
Trade, official records of the Bureau of the Census.

1/ Dried plums and prunes converted to unprocessed dry weight by dividing by 1.025. Unprocessed dry weight converted to fresh on the basis that 1 ton dried equals 2½ tons fresh. Includes dried prunes in salad estimated at 43 percent of total dried fruit for salad.

2/ Includes small quantities of canned, converted to fresh on the basis that 1 pound canned is equal to 0.729 pounds fresh.

3/ Not separately classified prior to January 1, 1936.

4/ Less than 0.1 percent.

5/ Preliminary.

Production, records of the Bureau of Agricultural Economics. Trade, official records of the Bureau of the Census. Imports negligible.
