SUPPLEMENT 137

HOST AND PATHOGEN INDICES TO THE DISEASES OBSERVED
ON GRASSES IN CERTAIN WESTERN STATES DURING 1941

August 15, 1942

The Plant Disease Reporter is issued as a service to plant pathologists throughout the United States. It contains reports, summaries, observations, and comments submitted voluntarily by qualified observers. These reports often are in the form of suggestions, queries, and opinions, frequently purely tentative, offered for consideration or discussion rather than as matters of established fact. In accepting and publishing this material the Division of Mycology and Disease Survey serves merely as an informational clearing house. It does not assume responsibility for the subject matter.

HOST AND PATHOGEN INDICES TO THE DISEASES OBSERVED

ON GRASSES IN CERTAIN WESTERN STATES DURING 1941^{1/}

By George W. Fischer, Roderick Sprague,
Howard W. Johnson, and John R. Hardison^{2/}

Plant Disease Reporter
Supplement 137

August 15, 1942

The host and pathogen indices which follow summarize the data resulting from collections and observations of grass diseases in the States of Arizona, California, Idaho, Minnesota, Nebraska, North Dakota, Oregon, South Dakota, Utah, Washington, and Wyoming in 1941.

Most of the records are from the extensive observational row nurseries of the Soil Conservation Service and the Bureau of Plant Industry, United States Department of Agriculture, at Mandan, North Dakota; Pullman, Washington; Corvallis, Oregon; Tucson, Arizona and Pleasanton, California. State observational grass nurseries at Berkeley and Davis, California were surveyed intensively also. However, these records are well supplemented and substantiated by extensive collecting and survey trips in most of the States mentioned above.

In general the 1941 growing season was one of almost unprecedented rainfall, in most of the area covered. As a result, the development of foliage diseases was considerably favored as evidenced by the unusual number and extent of development of leaf spots, rusts, and bacterial diseases.

This report includes 259 species and varieties of native and introduced grasses, on which a total of 161 diseases are recorded; 62 leaf spots, streaks, etc., 30 rusts, 28 rootrots and secondary rootrots, and 25 smuts. Some of these diseases were found on a large number of grasses, as outlined in Table 1.

^{1/}Grass disease investigations of the Divisions of Forage Crops and Diseases, Cereal Crops and Diseases, and Dry Land Agriculture, Bureau of Plant Industry in cooperation with the Nursery Division, Soil Conservation Service, United States Department of Agriculture, and the North Dakota and Washington Agricultural Experiment Stations. Published as Scientific Paper No. 517, College of Agriculture and Agricultural Experiment Station, State College of Washington, Pullman.

^{2/}Associate pathologist, pathologist, pathologist in charge of investigations of forage crop diseases, and agent, respectively, Bureau of Plant Industry, United States Department of Agriculture, Pullman, Washington; Mandan, North Dakota; and Washington, D. C.

Selenophoma stem speckle and leaf spot	<u>Selenophoma donacis</u> and varieties	43
Root browning	<u>Pythium arrhenomanes</u>	42
Root necrosis and Damping-off	<u>Pythium debaryanum</u>	39
Rootrot	<u>Rhizoctonia solani</u>	36
Bends	Cause unknown	33
Powdery mildew	<u>Erysiphe graminis</u>	31
Stem smut	<u>Ustilago hypodytes</u>	26
Head smut	<u>Ustilago bullata</u>	26
Chocolate spot	<u>Bacterium coronafaciens atropurpureum</u>	24
Brown stripe rust	<u>Puccinia montanensis</u>	22
Crown rust	<u>Puccinia coronata</u>	16
Stripe smut	<u>Ustilago striaeformis</u>	13

It has seemed desirable to give the authorities for grass names in the host index and for the pathogens in the pathogen index.

The task of identifying the thousands of collections forming the basis for this report was in general divided as follows: Smuts and rusts were identified at Pullman, Washington, leaf spots and root rots at Mandan, North Dakota, and other diseases at both places. Many of the pathogens are named to genus only, because they are being studied further or are in the process of publication elsewhere. This is particularly true for species of Ascochyta, Selenophoma, Septoria, Tilletia and Ustilago. The collecting was performed by the authors as follows: Fischer and Hardison covered Washington (east of Cascades), Idaho, Montana, western Wyoming, northern Utah, and northeastern Oregon. Sprague collected in Montana, North and South Dakota and adjacent Minnesota, briefly in Nebraska and, on personal travel, in southern Montana, northwestern Wyoming, northern Idaho, and central Washington; Johnson collected in Arizona, California, and western Oregon.

The authors are grateful to the many persons who have aided in this survey by collecting and submitting grass disease specimens from practically all parts of the area represented.
