You Can Depend on WYATT'S HYBRIDS

As this catalog is being prepared, we are well along with processing our 1949 crops of Wyatt's Corn Hybrids. Preliminary tests indicate the quality of the hybrids our customers will plant for their 1950 crops will be the finest ever.

Wyatt's hybrids are produced each year from new seed stock directly from North Carolina Foundation Seed Producers. Each crop is grown under the super vision of the North Carolina Crop Improvement Association in well isolated fields. Detasselling of every Wyatt hybrid is systematic and complete.

To preserve this fine quality after the crop is made, all male rows are removed before the double-cross bearing female rows are harvested.

During each step of harvesting and processing each crop is carefully selected. Only well developed, sound seed ears go through the drier. After drying the reselected ears are shelled.

Three separate cleaning operations follow to remove dust, chaff and damaged grains. During these processes the grains are separated according to size for precision planting. At this stage all Wyatt hybrids are sampled and laboratory tested for moisture, physical purity and germination.

After meeting the high quality standards set for them, each lot of Wyatt hybrid Corn is treated with Du Pont's Arasan to protect it in the soil against adverse weather and certain soil borne diseases.

Select your hybrid seed Corn from the three offered on the opposite page. No finer seeds are obtainable at any price.

See opposite page for description and prices of Corn hybrids. See page 45 for open pollinated Corns.
**WYATT'S DEPENDABLE CORN HYBRIDS**

**F-27 N. C. 27 (Yellow)** The most widely planted yellow corn in North Carolina and widely adapted and popular in South Carolina, Georgia, Alabama and Tennessee. While it is not the highest yielding yellow corn in every test, other qualities have won for it by far the greatest planter acceptance. Grain quality, shuck coverage, insect resistance and general good appearance and performance are some of these qualities. N. C. 27 averaged 71.6 bushels per acre in 2 tests in the Piedmont and 92.3 in 4 tests in the Coastal Plain regions during 1949. All tests were official. Root and stalk strength are very good and the plants average 179 ears per 100 stalks. Medium maturity. N. C. 27 at its very best, treated, tested and graded is sealed in the Wyatt bags. Buy it with confidence at your regular seed suppliers store or order it direct from us. Prices: 8 lb. bag $2.40 prepaid. Not prepaid, 8 lbs. $2.00; 14 lbs. (peck) $3.00; 28 lbs. (1/2 bu.) $5.75; 56 lbs. (1 bu.) $10.50.

**F-26 Dixie 17 (White)** Currently the most popular white hybrid corn for the South. Dixie 17 made the highest average yield (111.7 bu. per acre) and highest individual yield (120.4 bu. per acre) in all 1949 N. C. official trials in competition with 38 hybrids and open pollinated varieties in both the Piedmont and Coastal Plain areas. It is widely adapted, yielding 111.7 bushels per acre in Camden County; 120.4 in Halifax; 115.1 in Robeson; 99.6 in Lenoir; 93.8 in Catawba and 65.4 in Rockingham. As the picture on this page indicates, the plants average 202 ears per 100 stalks as compared with 115 ears per 100 stalks of Weekley’s, one of the better open pollinated varieties. Grain quality is good, kernels large and of uniform hard texture. Insect resistance is good except where rice weevils are severe. Husk coverage is good. Plants may stalk-break after maturity in closely spaced plantings and where high yields are produced. Medium maturity. Prices: 8 lb. bag $2.40 prepaid. Not prepaid 8 lbs. $2.00; 14 lbs. (peck) $3.00; 28 lbs. (1/2 bu.) $5.75; 56 lbs. (1 bu.) $10.50.

**F-4 N. C. 1032 (Yellow)** A widely adapted yellow hybrid recommended especially in the Piedmont and Northern Coastal Plain areas of Carolina, Piedmont South Carolina and Central and northern portions of Georgia and Alabama. Yield and grain quality are good, sucker habit light and stalk strength best of all hybrids tried in official North Carolina field tests. Plants average 150 ears per 100 stalks. Shucks coverage is good and weevil resistance fair. The golden yellow kernels are deep, wide and of good quality. Medium maturity. Prices: 8 lb. bag $2.40 prepaid. Not prepaid 8 lbs. $2.00; 14 lbs. (peck) $3.00; 28 lbs. (1/2 bu.) $5.75; 56 lbs. (1 bu.) $10.50.

**F-3 Tennessee 10 (White)** A consistently good white hybrid for Coastal Plain, Piedmont and Mountain regions in North Carolina and extensively used in South Carolina, Georgia, Alabama and Tennessee. In the 1949 official tests Tennessee 10 averaged 96.5 bushels per acre in 4 tests in the Coastal Plain, and 89 in 2 tests in the Piedmont. Its 8 year average 1944-49 in the Mountains is 88.8 bushels per acre. Medium maturity. Prices: 8 lb. bag $2.40 prepaid. Not prepaid, 8 lbs. $2.00; 14 lbs. (peck) $3.00; 28 lbs. (1/2 bu.) $5.75; 56 lbs. (1 bu.) $10.50.

**Chemical Weed Control**

Plainters of large corn acreages should contact us for information on Chemical weed control. No obligation. A large Eastern grower wrote us May 26, 1949, “I treated around 80 acres of corn with the best results. Not hardly a weed left and did not hurt any corn in any way.”

**N. C. Agricultural Extension Service Recommendations for Increasing Corn Yields**

1. Have the soil tested and apply lime as recommended.
2. Prepare a good seedbed and plant level with the ground except where drainage is poor.
3. Use 300-300 lbs. of 6-8-6 or 4-8-8 at planting. Use the higher rates following crops receiving low amount of fertilizer and the 4-8-8 on potash deficient soils or following legumes for hay.
4. Avoid late, deep cultivation but control weeds early. Use a weeder where available until corn is six inches high. Cultivate shallow until the corn is 21/2 feet high, and then stop cultivation. Do not use turning plow or bull tongue. Do not injure corn roots.
5. Place rows about 31/2 feet apart.
6. Space plants about 16-20 inches apart within the row, using wider spacing for less fertile soils.
7. Sidedress with adequate nitrogen (potash where needed) when corn is 6-8 weeks old or about 21/2 feet high. Yield increases of 23-35 bushels per acre may be expected by use of 500 lbs. of Nitrate of Soda, or 400 lbs. of Calnitro or ANL, or from 250 lbs. per acre of Ammonium Nitrate. One-fourth of this rate of application should give yield increases of 10-12 bushels per acre above similar corn receiving no sidedressing.
GREEN POD BUSH SNAP BEANS

**CULTURE:** One of the world's important food crops because of its hardiness, heavy yields and ability to produce the year round. For earliest spring and summer crops, sow in bed after September 28 and transplant as plants become large enough. Late spring and summer crops are seeded January to May. Fall and winter crops are sown in July. Give seedlings in bed room for stocky development. Seeded soil should never be as rich as field or garden soil into which the plants are to be set. This soil should be deep, well limed and rich in nitrogen. Set 2 to 2½ feet apart according to variety in rows 2½ to 3 feet apart. One ounce of seeds produces about 1,000 plants; 1½ pound will produce plants for an acre.

WYATT’S Western Grown Muskmelons

CULTURE: The Melon delights in warm rich soil with good drainage. Good Melons, however, can be grown on almost any land if the trouble is taken to dig holes 2 feet square, filling them with a rich compost of woodsmold and cow-pen manure. Plant three-fourths to one inch deep April or May in 4 feet apart, leaving not less than 4 feet between the hills, putting about 10 seeds to the hill. As insects are often very destructive, it is best not to thin until all of the plants are well started. When they are large enough to be safe, thin to two in a hill, and keep the ground mellow and free from weeds. Those who make a speciality of Muskmelons will find it advantageous to start the seed under protection of glass, so as to have the plants ready by the time seeds could be usually planted in the open ground.

733 Stokescross* No. 5 A new F2 Tomato Hybrid of great importance

This second generation hybrid is distinguished by its amazing vigor. Production increases up to 30% are not unusual. Stokescross No. 5 has now been tested comparatively in all parts of the United States and has been very generally accepted as an introduction of great importance. Stokescross No. 5 is one of the strongest cropping tomatoes ever introduced. It will mature within 75 days from transplanting—10 days earlier than Rutgers—developing a continuing harvest of highly colored, rich flavored, 6 oz. fruit, that is nearly crack-free. It is offered as an important addition to our list. Although bred essentially as a processing tomato, Stokescross No. 5 has been found equally palatable as a market tomato. We shall not be surprised to have you report that it will out-produce and out-sell any tomato you have ever grown. This seed is sold in the introducer’s original package. Postpaid prices:

- Garden packet (approx. 200 seeds) $0.50
- Trade packet (approx. 500 seeds) rich. 1.00
- Ounce (approx. 5,000 seeds) 5.00

### PELLETED SEEDS
The Why and Whereof of Pelleted Seeds:

In the pelleting process, each kind of seed is treated with individual formulas designed for its maximum protection and productivity. The seed is first coated with layers of fungicides to control seed and soil born diseases. Next, a layer of chemical fertilizers is added to supply sufficient food to the plant during the critical stages of sprouting. Finally, a coating of vitamins and hormones in an inert material base assures early and rugged growth. Soil deficiencies are often counter-acted by the use of minor elements such as boron or manganese in the pellet.

The increased size of pelleted seeds permits accurate spacing of even the tiniest seeds. Another feature of pelleted seeds is that transplanting is eliminated. This process allows direct garden seeding of usually transplanted tomatoes, cabbage, cauliflower, etc. The time and labor saved here is obvious, and pelleted Seeds can be planted up to two weeks earlier in the season as the seedlings will withstand much lower temperatures than transplants.

VEGETABLE PLANTING CALENDAR

Many otherwise successful gardeners lose months of valuable production because of a failure to realize the cold hardness of a number of the most popular and productive vegetables.

By successive plantings beet, broccoli, cabbage, carrot, chard, kale, mustard, onion, parsley, radish, spinach and turnip (sage or root) can be kept in production, out of doors and without protection winter or summer, every day in the year in the least isothermic zone.

The planting information shown in the chart on this page is the result of careful preparation and years of actual gardening experience. Planting dates shown for tender varieties are based on the average U. S. Weather Bureau records of the last killing frost in the spring and the first killing frost in the fall in this zone, for the past 50 years.

Throughout our catalog we have endeavored to give the approximate number of days to maturity for all varieties. This information should be helpful, especially in determining the latest safe date to plant tender varieties in the summer or fall, in order to make a crop before frost.

Soil conditions permitting, we recommend planting on or immediately after the average date of the last frost in the spring, otherwise spring rains may delay planting days or weeks.

"TESTED SEEDS"

The term "tested seeds" as used in this catalog, and in all of our advertising means that every bag or package of seeds purchased at Wyatt's is supplied from a lot that has been carefully tested by the North Carolina Seed Testing Laboratory and the seeds are known to grow. Every lot of seeds reaching our warehouse is sampled and tested before the seeds are moved into our store for packaging or sale in bulk. This account for the fact that "Wyatt's Tested Seeds" are more and more in demand in North Carolina and in the South.

Plant Wyatt's Tested Seeds and be sure of success.

For new lawns 1 bale should be thoroughly pulverized and mixed in each 100 to 200 sq. ft. of lawn area. Nothing is so beneficial to establish lawns as a bale of peat mixed with 100 pounds of Sheep Manure applied to each 2,000 sq. ft. 3 or 4 times each summer. Peat should also be used liberally in gardens, flower beds and borders, and as a mulch for shrunbery, because of its capacity to hold moisture. Prices: Large Bale 18" x 20" x 39" $5.50; Handy Bale 18" x 11" x 30" $4.25.

**Ten Steps in Lawn Building**

1. Break or plow deep, with subsoil or similar plow to prevent burying top soil—then level or grade as needed.
2. Apply the equivalent of 3 heavy, green cover crops or 3 inches weed free manure or both if available.
3. Apply lime as needed up to 50 lbs. per 1,000 sq. ft. and fertilizer 40 lbs. per 1,000 sq. ft.
4. Pulverize and smooth surface.
5. Seed 6 lbs. Carolina, Sunny South or Shady Nook, or 3 lbs. Colonial, mixture per 1,000 sq. ft., between September 1 and October 1.
6. Soak thoroughly but slowly to avoid moving seeds. Keep moist until grass is up. Soak occasionally during dry seasons.
7. Mow Bermuda and rye grasses close and often; Blue grasses once every 2 weeks is often more necessary, particularly during hot, dry seasons.
8. Compost clippings with liberal amount of sand and return to lawn in light applications as mulching during summer.
9. Feed at 6 to 8 week intervals from February through November with 20 to 40 lbs. per 1,000 sq. ft., high grade fertilizer or 50 to 100 lbs. per 1,000 sq. ft. sheep manure, or both. Always sprinkle after feeding.
10. Apply additional seeds as needed with regular feedings.

CLOVER SEEDS

F97 Alfalfa (Oklahoma Approved) While Alfalfa is a relatively expensive crop, the first cutting usually returns about double the cost of seeds, lime, fertilizer and planting. A good method is to lime the land and plant an annual legume crop that can be thoroughly disked, not turned, in preparing the alfalfa seed bed. Use 20 to 35 pounds (not more) borax per acre and drill August 20 to October 1, or February 15 to March 25, 25 to 40 pounds of thoroughly inoculated seeds per acre. Roll or cultipack after seeding. At seeding time use 1,200 pounds 2-12-12 or 8-10 tons barnyard manure if available and not weed infested. Apply 400 pounds 0-12-12 annually thereafter. Cut before 1/4 flowers open. Always leave the alfalfa stand 6 inches tall or more for winter since any closer cutting invariably results in severe damage. If your stand of alfalfa becomes thin or weak sow 3 to 5 lbs. Orchard grass per acre to help control weeds and increase production. We handle only premium quality seeds. Supplies of good seeds will be limited. Prices: 1 to 4 lbs. 85c lb.; 5 to 10 lbs. 80c lb., postpaid. Not prepaid 10 lbs. $7.00; 25 lbs. $16.75; 100 lbs. or more at 65c lb.

F82 Red Clover (N. C. Grown) One of the most productive of the clovers. Well adapted to our piedmont soils. Especially valuable in pasture mixtures. Sow early spring or fall 10 pounds per acre. Lime and fertilizer as for other clovers. Prices: 1 to 4 lbs. 85c lb.; 5 to 10 lbs. 80c lb., postpaid. Not prepaid 10 lbs. $5.50; 25 lbs. $15.00; 100 lbs. or more at 65c lb.

F83 Crimson Clover Should be sown from August to October. When sown by itself, 23 to 30 pounds are required to the acre; sown with grain or vetches, 15 pounds would be sufficient. Write for prices.

F95 Sericea Lespedeza Scarified and recleaned. This is the perennial lespedeza being grown so largely over the south. Its greatest asset is that it grows on the poorest soils without fertilizer or lime and while it steadily improves the land, it produces an abundance of nutritious hay if cut when tender. Prices: 1 lb. 55c; 2 lbs. $1.00; 5 lbs. $1.50; 10 lbs. $2.65, postpaid. Not prepaid 10 lbs. $3.20; 25 lbs. $7.75; 100 lbs. or more at 30c lb.

F89 Ladino Clover—More Popular Every Year A perennial clover of exceptional merit for pastures, especially on moist, fertile land. Recovers rapidly from grazing or clipping and is leafy and succulent. A complete recovery after grazing often takes place in two weeks. Its growing season is as long as that of any other legume. Like all clovers, Ladino succeeds best on well limed, fertile and somewhat moist land. Sow 5 to 6 pounds per acre alone or 1 to 3 pounds in mixtures. Prices: 1 lb. $2.85; 2 lbs. $5.40; 5 lbs. $12.25; 10 lbs. $26.00, postpaid. Not prepaid 10 lbs. $25.50; 25 lbs. $63.50; 100 lbs. or more at $2.50 lb.

F92 Korean Lespedeza Korean Lespedeza will grow on any soil, wet or dry, rich or poor, sour or sweet. Unexcelled for hay crop since it will produce from 2 to 4 tons of good hay per acre on a good thick even stand. It is almost equal to alfalfa in feeding value, and compares favorably in fineness, palatability and protein content. A good stand will make one ton of hay per acre for each 4 to 5 inches above cutter bar. Korean Lespedeza is earlier than other lespedezas, this insures harvest before fall rains and early frost and gives time for seed bed preparation for small grain that fall.

F87 White Blossom Sweet Clover Adapted to a wide variety of soils; is used for pasture, forage, for ensilage, for bees, for soil improvement. Especially good as a manure crop and to inoculate the soil in preparation for a crop of alfalfa. The roots break up, aerate and drain stiff subsoils and add humus. Spring sowing will yield a crop the following fall and two crops the following year. The first season it grows 1½ to 2½ feet high, but if cut when 6 inches high it stools out and makes a more tender growth for grazing. Sow 15 pounds per acre July to October or February, March. Prices: lb. 60c; 2 lbs. $1.00; 3 lbs. $2.00; 10 lbs. $3.85, postpaid. Not prepaid 10 lbs. $3.40; 25 lbs. $8.75; 100 lbs. or more at 32c lb.

F93 Kobe Lespedeza A variety particularly adapted to lowlands and lighter soils. The leaves and stems are slightly coarser making a heavier hay crop. This variety is recommended by the N. C. Experiment Stations for all but the mountainous regions of North Carolina, South Carolina and Virginia. Sow 30 to 40 lbs. per acre. Responds to liming and fertilizing.

F90 White Dutch Clover Because of its spreading habit and persistent year round growth White Dutch is invaluable for lawn and pasture use. It grows in all soils and will grow both in the shade and open areas responding to lime and fertilizers recommended for other clovers. Like other clovers White Dutch enriches the soil while furnishing nutritious grazing. Sow 6 to 8 pounds per acre alone or 2 to 3 pounds with other clovers or grasses. HEGARI

F197 Hegari  Recognized as the most valuable and widely adapted member of the sorghum family, and well suited to conditions in the Southern states. Hegari has great forage value for two reasons. First, because its high sugar content makes stalks and leaves highly palatable to livestock, and second, it yields heavily with its many broad leaves and substantial stalks. As an ensilage crop many acres are planted to Hegari every year in the South. As a pasture crop, in thickly seeded plantings, it pastures well and also makes good hay. Its largest use is in bundle feeding and it can be left shocked in the field until fed, or as it is coming into more general practice, it is ground head, stalks and leaves through a hammer mill. Hegari makes a good substitute crop for corn, which it out yields on light soils, and it can be planted much later. Prices: lb. 30c; 5 lbs. 85c; 10 lbs. $1.55, postpaid. Not prepaid 10 lbs. $1.00; 25 lbs. $2.25; 100 lbs. or more at $1.75 lb.

WYATT’S RECLEANED MILLETS

F186 Pearl, or Cot-Tail Millet  One of the best and most nutritious of the continuous cutting green forage plants. Grows 8 to 10 feet high, but cutting can commence when it has attained the height of 3 to 4 feet, when it will stand out enormously and make rapid growth; can be cut in this way three to four times during the season. It does well even on poor land, and surprisingly well in dry seasons. Plant April to August, 6 to 8 lbs. to the acre in rows 3 feet apart. Prices: lb. 35c; 5 lbs. $1.20; 10 lbs. $2.35, postpaid. F47 Orchard Grass
SOY BEANS

CULTURE: Soy beans may be planted either broadcast or in drills. They grow equally well on light and heavy soils, but on heavy soils they should not be planted more than 1 to 1½ inches deep except in dry seasons. On light sandy soils plant deeper, but not more than 3 inches. Plant in April, May or June. Such large seeded varieties as Mammoth Yellow require 1 bushel or more per acre, whereas Laredo small seeded kind only require 1 peck to the acre.

Ogden Ogden is considerably earlier than most beans and is consequently better adapted to rotations with small grains. Seedings as late as June in the Wake County trials made a substantial production of hay. Average yield for 6 tests at scattered points in the state during 1943 was 27.8 bushels per acre. Plants are nicely branched and for that reason are more desirable for hay than the coarser growing types. Prices: 2 bu. bags $3.75 per bu.

Volstate A yellow seeded variety producing high yields of good oil beans. Plants are somewhat taller than Ogden and slightly less branched. For a hay crop or a crop that might be optional we would recommend Ogdens, but for a crop planted on light land and for combining we would recommend the Volstate owing to the height of the plant and the fact that the beans are somewhat bunched on the plant. Prices: 2 bu. bags $3.75 bu.

ARASAN

Use 35 lbs. small varieties; 45 lbs. large varieties (shelled) per acre. Buy 1-3 more nuts by weight in the shell for the desired amount of shelled nuts. GRANVILLE WILT RESISTANT

F254 Oxford 26, Certified
Resistant to Granville wilt which is widespread in Granville, Wake, Durham, Pitt, Carteret, and Craven counties and is present in nearly every North Carolina county. In appearance Granville wilt is similar to other diseases that attack the crop, but in mid-summer can be easily distinguished by the presence of dark streaks which extend for 18 or more inches above the soil in the woody part of the stem. Oxford 26 is recommended only for fields known to be contaminated with Granville wilt. This strain is highly resistant, but for best results should be grown on soil rotated to other crops for 1 to 2 years. It can be planted closer together in the row for increased yield and the quality compares favorably with other varieties. Our seeds are chemically treated. Prices: Oz. $2.00; 3 ozs. $3.25; lb. $26.00, postpaid.

BLACK SHANK RESISTANT

The Planet Jr. trade mark has been known in the Implement field since 1871 and Planet Jr. machines and equipment have been sold by our company since 1881. More than three-quarters of a century of experience in design and manufacture is your recommendation to buy a Planet Jr. Garden Tractor.

Ranking above any tractors in their class are the efficient, sturdy and versatile 1½ h.p. and 2½ h.p. tractors shown at left of this page. These sizes are ideal for small farms, nurseries and home gardens. They have a variety of uses with attachments shown at right of page.

At the left below is shown the 3 h.p. and 5 h.p. tractors, which are designed for the farmer who has given up his horse and plans to use power equipment, or the commercial vegetable grower who wants ample power for plowing, harrowing, seeding, cultivating and mowing.

The illustration shows the many features of advantage to you—adjustable handles shaped for easy handling; sturdy construction, actually the frame is welded instead of bolted together; the motor is set well ahead of the wheels, balancing the weight, making it easier to turn at the ends of rows, and providing maximum traction and power beyond the rated horsepower of the motor.

The patented Planet Jr. Jiffy Hitch provides for quick-change of attachments without the use of tools.

PLANET JR. TOOLS

You cannot afford to till the ground without Planet Jr. tools. They not only save hard labor, but enable you to cultivate double the acreage in the same time, and thus add over 100 per cent to your crop yield. Invented by a practical farmer and manufacturer—the result of fifty years' experience. Strong lasting con-

NO. 4—COMBINED HILL AND DRILL SEEDER AND SINGLE WHEEL HOE

The small grower should select one of the combined machines. The drill attachment will not be used as often as the hoeing and cultivating tool, but will be a source of much saving. This machine is a special favorite. There are probably more of them in the world than any other seeder made. As a Hill and Drill Seeder it opens the furrow, deposits the seed, covers it and pulls it, either in drills or hills. Price: $27.95. No. 4-D. Seeder only, no cultivating attachments. Price: $25.25.

NO. 12—DOUBLE AND SINGLE WHEEL HOE COMBINED

The arch is high enough to straddle a row until plants are 20 inches high; this insures close work. It can be altered to an admirable single wheel hoe for working between rows. Price: $17.25.

Send for Complete Planet Jr. Catalog

NO. 16—SINGLE WHEEL HOE

Designed to do all work required in the small garden: hoeing, cultivating, hoeing and raking. It is very light, and can therefore be easily carried about. Price: $13.65.

NO. 19-R—SINGLE WHEEL HOE

A medium priced wheel hoe with all the attachments necessary for cultivating a small garden. Price: $8.70.

NO. 19—SAME AS ABOVE LESS RAKE. PRICE: $7.10

NO. 220—PLANET JR. FERTILIZER DRILL

The No. 220 will distribute fertilizer in the middles of three rows 12 to 14 inches apart; it will side-dress one side each of two rows up to 30 inches apart (one complete row and corn in wider rows). You can use it in very narrow rows—as close as 2 inches. You can use it in 42 to 48-inch rows by closing off the flow in three spoons and distributing through the other three in rows on the right or left hand side. The No. 220 spreads fertilizer from 4 to 30 inches on the ground. The hopper capacity is one bushel and the weight of the load is placed over the wheel, making it easy to push. The No. 220 will distribute 100 to 2000 pounds of commercial fertilizer to the acre. Quantity per acre is regulated by a notched index on the right hand handle. The shut-off rod is operated from the same point. Price: $41.75

NO. 9—PLANET JR. HORSE HOE AND CULTIVATOR

These Planet Jr. Horse Hoes and Cultivators are stronger, better made and finished than any other one-horse cultivators, and enable you to increase your yield, because they do a greater variety of work in corn, potatoes, cotton, beans, tobacco and other crops requiring similar cultivation, and do it more thoroughly. Cultivate deep or shallow, in different width rows, and the extra long frames make them steady running. All Planet Jr. cultivator steels are made of beveled steel thickest down the center, making them self-sharpening, and the points retain their shape and strength. No. 9 has lever expander, allowing quick adjustment for different width rows. Used with or without a wheel. Price: $21.95.

NO. 4-D—PLANET JR. PLAIN CULTIVATOR

This tool is strong and simple. It has patent handle braces; very firm, simple and convenient. With them the frame and handles seem almost like one solid piece. Changes in width are quickly made by loosening one nut on each side, and one side may be opened wide, while the other is closed. An everyday all-day tool.

NO. 100-D—PLANET JR. PLAIN CULTIVATOR

We offer this Cultivator with the object of filling a definite need where lands are light or where farming is done on a modest scale. It weighs but 42 pounds. It will stand hard usage and do excellent work. A steady running tool and easy to handle and adjust.

NO. 90—PLANET JR. TWELVE-TOOTH HARROW, CULTIVATOR AND PULVERIZER

This tool is a special favorite with strawberry, tobacco and sugar beet growers, market gardeners and farmers, because of its twelve chisel-shaped teeth. The teeth and pulverizer leave the ground in fine condition. Cultivates any width from 12 to 32 inches.

Price, complete with steel wheel, $27.30

**DAHLIAS**

For variation of form, color and size no other fall flowering plants can equal or so much as approach dahlias. Over 12,000 varieties have been described since the introduction of dahlias to North American gardeners. Florida growth occurs profusely from late July until frost.

CULTURE: Plant from early May to the middle of July. Dahlias are not very exacting in their requirements. Plant in any fertile garden soil having good drainage. Sunshine is essential for best development of both flowers and plants. Dahlias will bloom six inches to three feet apart for the decorative and cactus types. Smaller growing varieties may be planted somewhat closer. Drive a five-inch pick into the ground at least a foot from the hole and near each hole for support during storms. Place the root flat with the stem end nearest the stake. Cover with two inches of soil. As the plant grows gradually fill to grow height and cultivate at first rains and as often as is necessary to keep free from weeds and grasses. Any good potato fertilizer may be applied two or three times during the growing season. Excellent results are obtained with VIGORO. Avoid excess use of nitrogen. Allow only one bud to remain per stem and only one stalk per plant. Sub-lateral branches should be kept pinched out to provide good stems for cutting. After frost cut Dahlias to six inches above the ground. Dig carefully so as not to break the root. Cover the shoots with sawdust or other mulch, provide good water and remove the stakes. Store away from heat and frost.

In dividing, part of the old stalk must be left with each root, otherwise new sprouts will not appear. Divide preferably after sprouting.

The varieties offered are of the following classes:

F.D.—Formal decorative—Petals broad and flat and in orderly arrangement. Flowers dished outward.

I.D.—Informal decorative—Double flowers with petals curled, twisted or otherwise irregular.

S.C.—Semli Cactus—Double flowers with petals many inches in diameter. Formed of a central cone with a broad spreading rim. This class is divided into the following:
