Price List

OF

High-Grade Vegetable and Flower Seeds

BULBS AND SMALL FRUITS
FOR SPRING PLANTING

50 Barclay Street,
New York, N. Y.

OUR list of seeds comprises all the standard varieties, together with those apparently most valuable of recent introduction.

The seeds we offer have been raised under the supervision of our most reliable growers, and are unsurpassed in quality, but as practical experience has demonstrated that owing to unfavorable weather and improper treatment the best of seeds may fail, we desire it distinctly understood that for these reasons only we do not warrant seed.

Vegetable or Flower Seeds ordered by the packet will be sent carriage paid. Postage must be added to all seeds in bulk at the rate of 8 cents per pound. Peas, Beans and Corn, 15 cents per quart.

Remittances should be made by Draft on Bank, Post Office Order, Registered Letter, or Express Money Order. Small sums may be sent in Postage Stamps of small denominations. Particular care is essential in giving Name, Post Office, County and State distinctly written. We are in receipt of many orders deficient in these important particulars, often causing a delay of weeks in executing them, to the great inconvenience of both parties.

Appreciating past favors, we solicit your continued orders, which shall receive our careful and prompt attention.

Very respectfully,

STUMPP & WALTER CO.

It is **strictly an evergreen**, retaining its color until fully ripe. On sight, its distinct dark green and spineless skin attracts the attention and admiration of everyone interested. Its fruit sets early, and its vigorous vines abound in long, straight, handsome fruits of most desirable qualities. **The flesh** being peculiarly crisp and tender, and the flavor delicate, highly recommend it as a slicer. **The young fruit** being dark green, straight and tender, makes an excellent pickle, and when ripe none excel it for making sweet pickles. Per pkt., 15 cents, two for 25 cents.

CELERY.

One ounce will produce about 5000 plants.

PERFECTION HEARTWELL CELERY.

Culture.—Sow the seed (which is slow to germinate) in shallow boxes, or in a finely prepared seed bed out-of-doors, in straight rows, so that the small plants may be kept free from weeds.

See to it that the seed bed is kept moist, almost wet, until the seeds germinate, as plenty of moisture is essential to get a satisfactory growth. When about two inches high thin out and transplant so that they may stand two inches apart, and when the plants are four inches high, cut off the tops, which will cause them to grow stocky. The crop is usually made to succeed some earlier crop, and if good plants are used they may be

set out as late as the middle of August, but the best results are usually obtained from setting about the middle of June or the first of July. The most desirable time will depend upon local climate, and is that which will bring the plants to maturity during cool, moist weather. In setting, prepare broad, shallow trenches about six inches deep and four feet apart, in which the plants should be set six inches apart, cutting off the outer leaves and *pressing the soil firmly about the roots*. When the plants are nearly full-grown they should be "handled," which is done by one man gathering the leaves together, while a second draws the earth about the plant to one-third its height, taking care that none of the earth falls between the leaves, as it would be likely to cause them to rust or rot. After a few days draw more earth about them and repeat the process every few days until only the tops of the leaves are visible, or the leaves may be pressed together by two wide boards held firmly a few inches apart by cross ties and stakes, when in a few days more it will be fit for use. Care should be taken that the plants are not disturbed while they or the ground are wet, as it would be sure to injure them. A part of the crop may be simply "handled" and then at the approach of severe freezing weather, taken up and set out compactly in a dark cellar or an unused cold frame, which can be kept just above the freezing point, and it will then gradually blanch so that it may be used throughout the winter. Should the plants begin to wilt, water the roots without wetting the stocks or leaves and they will revive again.

White Solid. An old standard variety. Per pkt., 10c.; oz., 20c.; $\frac{1}{4}$ lb., 50c.; lb., \$1.50.

Perfection Heartwell. The finest and largest of the winter sorts, either for the family or market garden. The heart is golden-yellow, and its crisp tenderness and delicious flavor are unequalled. Per pkt., 5c.; oz., 30c.; $\frac{1}{4}$ lb., 75c.; lb., \$2.50.

Golden Self-Blanching. A self-blanching variety of the "White Plume" order but much superior for either family or market gardener's use; it is of a rich golden-yellow color and is the earliest variety grown. Per pkt., 5c.; oz., 40c.; $\frac{1}{4}$ lb., \$1.00; lb., \$3.50.

Improved White Plume. An early and ornamental variety. Per pkt., 5c.; oz., 25c.; $\frac{1}{4}$ lb., 75c.; lb., \$2.50.

Boston Market. Dwarf, branching habit; solid, crisp; but little else to recommend it. Per pkt., 5c.; oz., 20c.; $\frac{1}{4}$ lb., 50c.; lb., \$1.50.

Covent Garden Red. The red or rose Celeries are much superior in flavor to any of the white varieties. They are very ornamental on the table; are more solid, crisp, and are much better keepers. Per pkt., 10c.; oz., 25c.; $\frac{1}{4}$ lb., 75c.; lb., \$2.50.

Rose. Excellent flavor; not quite so deep in color as the preceding. Per pkt., 10c.; oz., 20c.; $\frac{1}{4}$ lb., \$1.00; lb., \$2.50.

**ENGLISH FRAME OR FORCING
VARIETIES.**

[Culture.—This favorite fruit may be grown any season of the year, in a house or frame where a temperature of 75° can be obtained. Sow in pots of light soil, and pot off when the third leaf appears. The soil should be prepared and placed in the house or frame several days before it is required. Plant out when the third rough leaf is developed, keep a moist warm temperature. Allow them to make several joints, when they should be stopped to make them branch, then pinch out the shoot where the fruit appears; keep them thin and trained regularly; supply with plenty of water, which should not be colder than the temperature of the place; keep adding fresh soil, as the roots appear above the surface, which they do freely when the plants are thriving and healthy. The soil should be light turf, well rooted, and

leaf-mould without sand, and should not be sifted, enriched with manure. The heat should be regulated by shading or giving air; be sure to keep the fruit cut as soon as large enough for use, or the plants will deteriorate and be much less productive.

How to Sow Flower Seeds.

THE interest attached to the raising of plants from seeds, whether of old-established favorites or others of a more recent introduction, is well known to all who have attempted it; therefore, the following practical directions cannot fail to prove of value to amateur cultivators:

Take boxes from three to five inches deep, filled to within half an inch of their tops with a light, sandy soil, sifted fine; sprinkle the seeds on top and cover lightly, according to the kind, the coarser the seed, the more soil being required. Then press the soil lightly with a flat piece of wood or a trowel; water with a sprinkler or with a very fine spray. Place your boxes in a light sunny place, covering them with a piece of glass, or if too early in Spring place them in the house in front of the window where the sun's rays can reach them. When the tiny little plants have as many as four or five leaves, transplant them into larger boxes or pots, containing a somewhat richer soil, two inches apart each way. When the weather becomes warm and you are prepared to arrange your garden, transplant to places where you want them to grow and bloom. These directions refer principally to small seeds, but may be followed with all kinds, as they point out the surest way to raise plants from the seeds.

All hardy Annuals and some Perennials will succeed well if sown in the open air, about the end of April or the beginning of May; in this case one more important point must be observed, that of "thinning out" the plants in their earlier stages—for if the young plants are allowed to remain in a crowded state they will soon spoil each other, and therefore must be thinned out. This should be done cautiously, at first, only enough to give the remainder a clear space, and again, when two or three inches high; the number of plants finally left must depend on the size and habit of the species; if large and spreading, single plants are best, otherwise two or three may remain an equal distance apart; if small and spreading or trailing, two or three more may be left, but they should be six inches apart.

In transplanting, care must be taken: lift the plants carefully, by the use of a garden trowel, retaining as much soil to the roots as possible. This should be done in wet or cloudy weather, and if the ground is dry, a good soaking with water before and after planting is advisable.

Hints Regarding Watering Plants and Bulbs.

During dry weather it is necessary frequently to water Lawn and Garden plots. The water used for such purpose should never be colder than the atmosphere. Young plants and bulbs when chilled with *cold water* generally droop and die from the shock.

A good plan is to keep a cask in your garden, filled with water, so that the water may be warmed by the sun, or add sufficient warm water to the well or hydrant water so as to make it the same temperature as the atmosphere.

CENTRAL PARK LAWN SEED.

Scene Around Music Stand, Central Park.

HOW TO MAKE A LAWN.

The ground should be thoroughly plowed, then harrowed until the surface is completely pulverized.

When the seed has been sown a light harrow should be applied, after which the surface should be made smooth and even with a roller.

To make small plots or to replant bare spots, rake the ground well, then sow the seed and rake it in lightly and make the surface smooth with a roller.

When the grass is well grown, cut it frequently. The oftener it is cut the finer and thicker the lawn will be.

Grass seed may be sown at any time during the spring or fall.

One quart of the CENTRAL PARK MIXTURE is sufficient to sow about fifteen feet square; an acre will require from three to four bushels. To produce a good lawn it is always best to sow the seed thickly.

CENTRAL PARK LAWN GRASS.

The Dwarf-Growing seed we offer under the above name, is the same mixture of selected seed as has been furnished or several years to the Department of Parks, and to most of the Florists and Gardeners of New York City and Brooklyn.

Nymphæa. (The Pink Water Lily Dahlia.) A strong sturdy grower of the cactus variety, while the flowers which are always full to the centre, are produced in endless quantities on long stems well supplied with bud and foliage; the color is a soft delicate light shrimp-pink, shading slightly darker toward the outer petals, while the flowers are of a large size, perfect form and of most exquisite finish.
