MUSHROOMS

Mushrooms can be grown in any dark room or cellar, where the temperature can be maintained at 50° to 60°. From old pasture procure the soil and store it away. To one bushel of this soil add two bushels of fresh horse manure. Of this well mixed compound prepare a bed, say four feet wide. Put down a thin layer and pound it down hard, and go on until you have a bed eight inches thick. It will soon become pretty hot, but let the heat recede until it is only 85° or 90°. Then make holes, say a foot apart, and put in the spawn, two or three pieces as large as a walnut in each hole. Cover the holes and press the soil solid and smooth. Let the bed remain in this condition about twelve days; then cover it with two inches of fresh loam, and over this place four or five inches of hay or straw, and the work is done. If the temperature is right, in six or eight weeks you may expect Mushrooms. The bed will continue bearing from twenty to thirty days. After the first crop is gathered, spread over the bed an inch of fresh soil, moisten with warm water, and cover with hay as before. Success is not always certain with the amateur, and it is usually to be attained only after more or less experience. One pound of spawn is enough for a bed 3 x 6 feet.

TOMATO PLANTS

Livingston's New Magnus.

We make a specialty of growing fine double rooted Tomato plants from select seed stocks, and can furnish on short notice large quantities. The small plants are transplanted in boxes containing 200 each. We also have extra large single plants in 4-inch pots and baskets containing six to one dozen.

SEED CORN.

HOLT'S EARLY MAMMOTH

Holt's Early Mammoth.

Ever since we introduced this splendid variety in 1896 it has met with favor everywhere. It is unquestionably the earliest big Yellow Dent Corn we ever saw, and stands to-day without a rival as an early corn suitable to our climate. Notwithstanding the very unfavorable seasons we have had since its introduction we have never failed to harvest our Seed Crops. The stalk is smaller than most varieties producing large ears and although the cob is a trifle larger than some of the newer sorts it does not fall behind when it comes to the number of bushels of shelled corn to the acre. On the contrary we have found it will out-yield them all, and besides the corn being so early it has a chance to fully mature and harden down before it goes to the crib,

PRICES SUBJECT TO CHANGE.**RED COB
ENSILAGE CORN**

Red Cob Ensilage Corn is a pure white corn grown on a red cob, giving it an extremely showy appearance. The seed we offer is re-cleaned and in every way first class. We test every lot of this corn before we offer it for sale. It is put up in bags holding $2\frac{1}{2}$ bushels net weight. The Red Cob Ensilage Corn is sweet, tender and juicy, has short joints, abundance of leaves and grows to a great height, 40 tons fodder having been cut from a single acre. It is adapted to every section of the country and gives satisfaction wherever used. It is the best Ensilage we can recommend for Silo purposes and we want every farmer to try some of it this year. We do not recommend it to you as a novelty, but as a sort that has been tried and highly recommended by some of the largest farmers, Silo owners and dairy-men of the United States. An article of merit always commends itself. A proof of this fact is found in the steady increase of demand for this corn every year.

CANADIAN FIELD PEAS

No other grain crop except perhaps Oats can be devoted to so great a variety of uses. The grain is possessed of a relatively high feeding value, and the same is true of the straw. * * *

As a pasture for certain kinds of live stock, Peas may be made to serve an excellent purpose. The value of the crop for soiling and fodder uses is very great, and as a fertilizing crop, Peas are excelled only by Clover.

There is no kind of live stock on the farm to which Peas cannot be fed with positive advantage. * * * They make good food for horses at work, and colts during the period of development, if given as a part of the grain food. As a food for fattening cattle, Peas are probably unexcelled.

* * *

Peas furnish a good food for milch cows. They have been found peculiarly beneficial for building up dairy cows when "out of condition," and for sustaining them in fine form, and they are also excellent for milk production. When given along with oats and bran to cows in milk, they may usually form from one-third to one-half of the grain portion by weight.

* * *

Peas are superior to Corn for pigs at any time prior to the fattening sea-

son; hence they may be fed to them more freely, but in no instance should they form the sole ration before the finishing period begins. During the fattening period, Peas are unexcelled when fed as the sole grain food. They promote growth, while they fatten in excellent form, and they furnish a sweet, firm and excellent quality of pork.

Along with oats, in, say, equal parts, by weight, Peas make good grain ration for ewes in milk, and also lambs, more especially when the latter are for early market. * * * When sheep are being fattened for the block in winter, no grain food can be fed which will be found more suitable than Peas and oats.

* * *

When Pea straw is well cured, it is more relished by horses, cattle and sheep than the straw of rye, wheat, barley, or even oats. * * * Pea straw harvested rather under than over ripe, and then properly cured, will be eaten readily. * * * When cut with the scythe or the pea harvester, cured properly, and then housed or carefully stacked, the straw, except that of some of the coarsest varieties, is nearly equal to Clover hay in feeding value, especially for sheep.

Dwarf Essex Rape

This plant is extensively grown for forage, especially for sheep and for green manure, for which purpose there is perhaps no better plant adapted where a quick, rank growth is desired. Farmers who raise much stock and desire to get young cattle, sheep and lambs into favorable condition to be sold advantageously in the Fall, can do it most cheaply by growing this Rape. Prepare the ground as for turnips and sow in June or July, with a turnip drill, in rows two and a half feet apart, at the rate of three pounds of seed per acre, or broadcast at

the rate of six pounds to the acre. Our stock is the true English Grown Dwarf Essex, our own importation. Per lb. 8c; per 100 lbs. \$6.00.

COW PEAS

A valuable and nutritious Green Forage or Hay Crop. Enriches poor land improves good land.

One of the best and most economical ways of improving the soil is the plowing under of a leguminous crop. COW PEAS have been found superior for this purpose, making one of the largest yielding and most nutritious crops known, while as a soil improver they are invaluable. They will grow on any soil that is not wet or cold, and especially on soils medium or light. Like Clover, they absorb Nitrogen from the atmosphere, and the roots, reaching deep into the soil, bring up the necessary Potash, thus making a complete and natural fertilizer. The COW PEA has power greater than any other legume to extract the nitrogen or ammonia from the atmosphere and store same in the vines and roots, so that even if the crop is cut off, the land is enriched and improved by the roots. From 5 to 9 tons of green fodder to the acre have been produced. If planted early in the central corn belt section, a crop can be cut and cured for hay the same as clover, then the stubble in a short time will put out a new growth which can be turned under in the Fall, as a fertilizer. Understand they are sown through the middle north as late as the first of July, while through the south as late as the first of August. Sown 1 to 1½ bushels to the acre broadcast.

WHEN TO PLANT.

MONTH OF MARCH

Make hot beds. Sow Tomato, Cabbage, Lettuce, Celery and Pepper.

APRIL 1st to 15th. Sow out-of-doors:—Radish, Spinach, Turnip, Peas, Onion, and plant Onion Sets, Asparagus and Rhubarb Roots, and sow Sweet Peas and Lawn Grass.

APRIL 15th to MAY 1st. Sow Beet, Carrot, Parsley, Parsnip, Salsify, Mangel Wurzel, Celery, Cabbage and Cauliflower for fall and winter use, and Plant Sweet Corn, Early Potatoes, Early Cabbage, Celery, Cauliflower and Lettuce.

MAY 1st to 15th. Plant Garden Beans, Cucumber, Musk and Water Melon, and Summer Squash.

MAY 15th to JUNE 1st. Plant Field Corn, Lima Beans, Tomatoes, Winter Squash, Pepper and Pumpkin, and sow Winter Radish and Beets for winter use.

MONTH OF JUNE. Sow Cow Peas, Dwarf Essex Rape, Rutabaga, Millet and Hungarian, Buckwheat, and plant Winter Cabbage, Cauliflower and Celery, and sow Fodder Corn.

JULY 1st to AUGUST 15th. Sow Turnip for Winter use.

This little weeding device is intended especially for outside crops. It works to perfection among Onions, Carrots, Beets and all small crops. For thinning out it has no equal.

Price 20 cents. - 3 for 50 cents.

The best weeder for florists and especially adapted for working among Carnations and Roses. Does not cut or destroy the roots of plants. The pushing edge is thin enough to work easily through the soil but too dull to damage the stems of plants. The inner edge is sharp. Takes out all the weeds and grass, its oval shape permits the operator to weed behind the plants while standing in front. Ask for circular giving full description. Price 25 cents.
