U.S. Forest Facts

Introduction

The forest lands of the United States are of vital importance to the Nation's economy. They provide the timber and minerals that are the basic raw materials for the products used to build, furnish, and heat our homes, factories, and offices and to make paper and paper-board products, containers, and hundreds of other items. In this brochure, facts about forests, forest products, and the National Forest System in the United States, as well as a brief overview of world forests and forest products, are presented in a concise format.

Important Terms

Forest land—Land at least 10 percent stocked by forest trees of any size, including land that formerly had such tree cover and that will be naturally or artificially regenerated.

Growing-stock volume—Live trees of commercial species meeting specified standards of quality or vigor. Cull trees are excluded. Includes only trees 5.0-inches in diameter or larger at 4½ feet above ground.

Mortality—The volume of sound wood in trees that died from natural causes during a specified year.

National Forest System—A system of federally owned units of forest, range, and related land consisting of National Forests, Purchase Units, National Grasslands, and Other Lands, waters, and interest in lands, which are administered by the Forest Service or designated for administration through the Forest Service.

Net annual growth—The net increase in the volume of trees during a specified year. Components include the increment in net volume of trees at the beginning of the specific year surviving to its end, plus the net volume of trees reaching the minimum size class during the year, minus the net volume of trees that died or that became cull trees during the year.

Other forest land—Forest land other than timberland and reserved timberland. It includes unproductive forest land, which is incapable of producing annually 20 cubic feet per acre of industrial wood under natural conditions.

Receipts—Money collected from Forest Service operations such as timber sales, grazing and recreation fees, and mineral leases and permits.

Removals—The net volume of trees removed from inventory during a specified year by harvesting, cultural operations such as timber stand improvement, land clearing, or changes in land use.

Sawtimber volume—Live trees of commercial species containing at least one 12-foot sawlog or two noncontiguous 8-foot logs, and meeting regional specifications for freedom from defect. Softwood trees must be at least 9.0-inches in diameter, and hardwood trees must be at least 11.0-inches in diameter at 4½ feet above ground.

Stumpage—Uncut marketable timber.

Timberland—Forest land that is producing or is capable of producing crops of industrial wood and not withdrawn from timber utilization by statute or administrative regulation. Timberland has the capability of producing in excess of 20 cubic feet per acre per year of industrial wood in natural stands.

Land Area

	U.S.	North	South	West
Land classification (million acres)				
Total land area	2,257.4	606.7	534.1	1,116.6
