Box

ORDER EARLY

We sell for cash only. Please remit by Draft or Money Order. When check on local bank is sent, please include "with exchange." Small amounts may be sent in good clean postage stamps.

We make no charge for packing, drayage or sacks, except seamless sacks at 25c each.

Our Seeds are all tested for germination and are as good as any to be had in the country, and much better than some.

The Pioneer-Haines Seed Company gives no warranty, expressed or implied, as to purity, description, quality, productiveness or any other matter of any seeds, bulbs or plants they send out, and will not be in any way responsible for the crop. If the purchaser does not accept the goods on these terms they are at once to be returned.

Goods by Parcel Post

We pay postage or expressage on all Vegetable and Flower Seeds, except Beans, Corn and Peas by the pound, and Onion Sets. We do not pay transportation where special prices are named for quantity lots.

There are many articles in this price list, if wanted by mail, customers are to remit extra for postage. Thus we publish the official schedule of

Third Zone, first pound, 6c; each additional pound, 2c.

Fourth Zone, first pound, 7c; each additional pound, 4c.

Fifth Zone, first pound, 8c; each additional pound, 6c.

Limit weight, 20 pounds.

By ascertaining from your postmaster your Zone from Denver, you can readily compute the amount of postage.

Parcels weighing 8 ounces or less, the rate of postage to all Zones is 1c for each 2 ounces or fraction. Over 8 ounces, the Zone rates apply.

Fractions of additional pounds are as if a full pound.

* Local rates include all of Denver, with rural deliveries from Stockyards, Fortieth Street Station, Montclair, South Denver, Englewood and Highlands.

Packages must not be greater in size than 84 inches in length and girth combined.

Insurance against loss, rifling and irreparable damage may be effected upon payment of a fee of 3c for value not exceeding \$5; 5c for value not exceeding \$25; 10c for value not exceeding \$50.

To Our Friends

ON account of the great advance in cost of paper and other materials incident to the printing of a Seed Catalogue, we have decided to cut down on the size this season and leave out many lengthy descriptions of vegetables. We feel sure that most of our customers will have no trouble in making their selections from the names given, as the names of most varieties are familiar and will be recognized as old friends.

The saving thus made in the cost of the book enables us to give better values than otherwise. Note the low prices quoted, some of which are much less than the same seeds can be purchased for in the open market today. We are able to do this by contracting for our supply two and sometimes three years ahead.

Our seeds will be found to be reliable and up to the usual high standard of quality this house has always taken pride in maintaining.

If you are a Market Gardener and grow vegetables in quantity, it will pay you to send us a list of your requirements and we will save you money.

If you plant only a few seeds in your back yard, you will want them good. Our 5-cent packages are put up from the same bin or drawer as the pound and 10-pound lots are taken from; so, large order or small order, we want it and will fill your order carefully and conscientiously.

THE PIONEER-HAINES
SEED COMPANY

HOT BEDS

Good hot-beds may be made by digging down about three feet and filling the excavation with rather fresh horse manure in which there is a good deal of bedding straw. About 18 inches of this manure is sufficient and then fill in on top of it with about one foot of good soil mixed with sand. This manure pile will be compressed, and will soon begin to ferment, and will then keep the top soil warm and cause the seed to sprout quickly, and the young plant will grow very fast. It is best to enclose the hot-bed with boards, making what is called a cold-frame. This is done by running the length of the bed east and west and by making the north side about two feet high and the south side not more than six inches. The ends also should be enclosed and a sash of glass should be hung on hinges at the highest end. This sash should be raised for ventilation during most of the day, since the bed gets very warm and the atmosphere very close if kept too tightly closed for too long a time. As the plants grow, the sash should be left up longer each day to harden them and prepare them for final transplanting.

The hot-bed should have a very sunny location near a hedge or some building, well protected from the prevailing wind.

The object of the cold-frame is to make an artificial heat, and to protect the plants from frost during winter. Seed may be started any time during the winter, and plants can be ready to set out just as soon as danger of frost is over.

As the sun gets too hot it is necessary to shade the bed, and the glass should be whitewashed or covered with sacking if necessary. Too much heat is fatal to the tender young plants.

MUSHROOM CULTURE

May be grown in a great variety of situations—a dark room, cellar, stable or elsewhere. Any place in which an even temperature of about 50 or 60 degrees can be kept is suitable. For materials for the bed, use fresh horse manure, free from straw or chips, and good loamy soil. Some growers use the manure unmixed with loam, after first having well fermented it by alternately piling up and mixing for a few weeks; but it is undoubtedly better not to allow the manure to heat much before forming the bed. Use one-fourth to one-third loam, the rest manure. Mix very thoroughly and upon a dry, firm bottom; make the bed of this mixture about four feet wide and of any desired length. Build it up evenly, pressing it down very firmly, and leave it about a foot high. It will shortly begin to heat. Use a thermometer to thrust into bed, and note the temperature. When the heat has partially subsided, leaving a temperature of 70 to 80 degrees, put in the spawn. Pieces from the size of walnuts to that of eggs are placed in the bed about a foot apart, deep enough to cover them well, and the manure pressed down. Let it remain thus ten or twelve days; then cover with two inches of fresh loam, and make this moderately firm.

The bed is finished by covering all with 4 or 5 inches of straw or other litter. Watering is not necessary unless the surface of the bed gets very dry; in this event moisten freely with water at a temperature of about 80 degrees. In gathering the crop do not cut, but twist them off carefully, filling up the holes with loam to keep insects from the roots. In six or eight weeks from spawning the beds mushrooms should appear.

LAMBERT'S PURE CULTURE SPAWN is far superior to the old-style varieties and much better results can be obtained from its use. Bricks weigh from 18 to 20 ounces. A brick will spawn ten square feet of bed. Prices: Per brick, 25c; 10 bricks, \$2.00; 25 bricks, \$4.00; postage extra.

Book, "MUSHROOM CULTURE," 32 pp.; price, 35c, postpaid.

SPECIAL BULK PRICE LIST OF Select Vegetable Seeds

Seeds in Packets—All Beans Are 10c per Well-Filled Packet.
Peas Are 5c per Packet

Postage.—When Beans, Peas and Corn are wanted by mail, add 5c per pound. We pay postage on all packets, $\frac{1}{4}$ -lb. and $\frac{1}{2}$ -lbs. of Beans, Corn and Peas.

ARTICHOKE

Sow in April in rich soil, transplant the following spring to permanent beds, in rows 3 feet apart and 2 feet between the plants. Only a partial crop can be gathered the first season, but as it is a perennial the beds will remain in bearing for years. Protect in winter by a covering of leaves or coarse manure.

Large Green Globe. Pkt., 5c; oz., 30c; $\frac{1}{4}$ -lb., 80c.

Jerusalem. Tubers in season, 10c per lb.

Write for special prices on quantities.

ASPARAGUS

To grow plants from seeds, sow in drills about 1 inch deep in rows 1 foot apart. Keep the soil mellow and free from weeds; during the summer thin out and the following spring plants may be set in rows 3 feet apart, 12 to 15 inches apart in the row, 4 inches below the surface. Annually, after cutting, the bed should be given a liberal top dressing of manure, which should be thoroughly cultivated into the soil. As soon as the tops turn yellow in the fall they should be cut and removed from the beds, and just before winter cover the beds with 4 inches of coarse straw manure or leaves, which should be removed in the spring. A bed 6 x 40 feet is ample for an ordinary family, and when well established is good for twenty years. One ounce of seed will sow 60 feet of drill. About 400 plants to the ounce.

Early Giant Argenteuil. Pkt., 5c; oz., 15c; $\frac{1}{4}$ -lb., 30c; lb., \$1.00.

Conover's Colossal. Pkt., 5c; oz., 10c; $\frac{1}{4}$ -lb., 25c; lb., 60c.

Palmetto. Pkt., 5c; oz., 10c; $\frac{1}{4}$ -lb., 25c; lb., 60c.

Columbian Mammoth White. Pkt., 5c; oz., 10c; $\frac{1}{4}$ -lb., 25c; lb., 75c.

BROCCOLI

Nearly allied to the Cauliflower, but more hardy. The seed should be sown in the early part of May, and transplanted in June. It succeeds best in a moist and rather cool atmosphere.

Early Large White. Very early; heads solid, firm and of most delicious flavor. Pkt., 5c; oz., 35c; $\frac{1}{4}$ -lb., \$1.

BRUSSELS SPROUTS

This is one of the best vegetables for winter use, producing from the axils of the leaves an abundance of sprouts resembling small cabbages; of excellent, mild flavor. One ounce produces 1,500 plants.

Tall French. Very fine variety and very tender. Pkt., 5c; oz., 15c; $\frac{1}{4}$ -lb., 45c; lb., \$1.50.

Improved Dwarf. A variety producing compact sprouts of excellent quality. Pkt., 5c; oz., 15c; $\frac{1}{4}$ -lb., 45c; lb., \$1.50.

BEANS — DWARF

Earliest varieties ready for table in 40 days. One pound to 50 feet of drill; 80 lbs. to the acre.

Beans are extremely sensitive to both cold and wet, and it is useless to plant them before the ground has become dry and warm. The largest returns will result from planting in drills from 2 to 3 feet apart and leaving the plants 2 to 6 inches apart in the row. Up to the time of blossoming they should have frequent shallow cultivation. Never hoe when the vines are wet, as the pods would become discolored.

Any above Beans, $\frac{1}{4}$ -lb., 15c; $\frac{1}{2}$ -lb., 20c.

PEAS

Northern grown. One pound to 50 feet of drill; 90 to 120 lbs. per acre.

For first early peas sow in a light, rich soil, as early in March or April as the ground can be worked; for later varieties, sow in April or May. As soon as sufficient growth has been made draw the earth about the vines. The wrinkled varieties are not so hardy as the smooth sorts and should be planted later, owing to their liability to rot in the ground, but are much superior in flavor to the smooth peas. Dwarf varieties sow in rows one foot apart, and taller sorts from 2 to 3 feet apart. For succession of dwarf varieties plant Nott's Excelsior, Everbearing Stratagem.

	Lb.	10 Lbs.
Alaska, very early.....	\$0.20	\$1.15

When more than 10 lbs. of Peas are wanted, write for price. For Field Peas, see page 33.

Seeds in Packets — All Varieties on This Page at 5c per Packet,
Except Snowball and Erfurt Cauliflower

SWEET CORN

Postage on Corn is 5c per lb. extra, except on $\frac{1}{4}$ -lb. and $\frac{1}{2}$ -lb. lots.

One lb. to 200 hills; 10 lbs. to the acre. In an average season from planting to first fair picking is from 55 to 85 days, according to variety.

Sweet Corn, being liable to rot in cold, wet ground, should not be planted before May, or until the ground has become warm; practically nothing is gained in time, and much is lost in quality, by planting too soon. Plant in rich ground in hills 3 feet apart each way, covering about half an inch, and thin out to three plants to a hill. The extra early varieties can be planted closer. Give frequent and thorough but shallow cultivation until tassels appear.

	Lb.	10 Lbs.
Peep o' Day, very early.....	\$0.20	\$1.25

Beet — Detroit Dark Red

BEETS — TABLE VARIETIES

One ounce to fifty feet of drill; 6 to 8 pounds to acre in drills. The early turnip varieties are ready for table in from 50 to 60 days from sowing seed.

The best results are obtained on a deep, rich, sandy loam, in freshly prepared soil, which should be pressed firmly over the seed.

Sow in drills 18 inches apart, and thin to 3 inches in the row. For winter use the turnip varieties may be sown in June, and the beets may be kept by storing in a cellar and covered with sandy soil to prevent wilting.

BEETS FOR STOCK AND SUGAR

One ounce will sow 50 feet of drill; 6 to 8 pounds per acre. 140 to 150 days are required from sowing to maturity.

Mangels grow to a larger size and will produce a greater bulk of roots per acre than sugar beets, but the latter are richer in quality and of superior feeding value. Sow in April to June, in rows 18 inches to 2 feet apart, and thin to 8 inches in the rows.

	Oz.	¼-Lb.	Lb.

Five to 25 lbs., any one variety, not postpaid, at 40c per lb. Larger lots on application.

Cauliflower — Danish Giant

CAULIFLOWER

All our Danish seed is Growers' First Quality Sifted Seed. One ounce to 1,500 plants. Ready for table in 160 to 175 days from seed.

These need a deep, rich, moist soil, and require the same treatment as cabbages. For early summer varieties seed should be sown in hotbed early in March; transplant when weather is warm. For late or autumn varieties, sow in March or April, transplant in June; hoe often.

	Pkt.	¼-Oz.	Oz.

Extra Early Dwarf Erfurt.....	.15	.60	2.25

We grow good Cauliflower Plants and have them ready in April. See prices on page 25.

CUCUMBER

One oz. to 50 hills; 2 to 3 lbs. to the acre. Earliest varieties ready for table in 50 to 55 days from seed. Main crop in 65 to 75 days.

As soon as the weather becomes settled and warm, plant in hills 4 to 6 feet apart each way, with 8 to 10 seeds in a hill; cover half an inch deep, smoothing the hill off with the hoe. Keep the soil well stirred, and when the plants are out of danger of insects leave 3 or 4 plants to a hill. For pickles, plant from first of June to first of August. The fruit should be gathered when large enough, whether required for use or not, as, if left to ripen on the vines, it destroys their productiveness. A few hills for early use may be had by sowing on pieces of sod in a hotbed, and when warm enough transplant to open ground.

CABBAGES

Ready for table in from 100 to 160 days from seed, according to varieties. One oz. to 2,500 plants; 4 ozs. to transplant for an acre.

Seeds in Packets—All Varieties on This Page at 5c Each.

For early summer use sow in hotbed in February or March. Before transplanting to the open ground they should be hardened off by exposing them gradually to the night air. For winter use sow in open ground in May or June, taking care in either case not to let the plants stand too closely, as this makes them "spindling." When 5 or 6 inches high, transplant in rows 2 feet apart one way, and 12 to 18 inches the other, according to variety, burying to the first leaf, whatever the stem length. Hoe frequently, drawing the earth up about the plants until they begin to head.

CARROTS

Fresh Seed, Supply Limited

Ready for table in from 95 to 120 days from seed, according to variety. One ounce to a row 100 feet long; 3 lbs. per acre.

Seeds in Packets—All Varieties on This Page at 5c Each

Any good land, if thoroughly and deeply worked, will produce satisfactory crops. Sow as early as the ground can be worked; sow the smaller kinds in rows 16 to 18 inches apart. For field culture sow in drills 18 to 24 inches apart. Cover one-half inch deep and see that the soil is pressed firmly above the seed. Do not let the weeds get a start. Thin to 3 to 6 inches apart in the row as soon as the plants are large enough. For winter use gather and store like turnips.

Celery — Golden Self-Blanching

CELERY

1 oz. will produce 3,000 good plants. One pound to an acre.

Sow the seed (which is slow to germinate) in shallow boxes, or hotbed, cover the seed not too deep. Keep the bed moist, almost wet, until the seeds germinate. When about 2 inches high, thin out and transplant so that they may stand 3 inches apart, and when the plants are 4 inches high, cut off the tops, which will cause them to grow stocky. The essentials to success in celery growing are rich soil and plenty of water. The best results are usually obtained from setting about the middle of June or the first of July. In setting, prepare broad trenches about 6 inches

deep and 4 to 6 feet apart, cutting off the outer leaves and pressing the soil firmly about the roots. Cultivate freely. Earth up a little during the summer, keeping the leaf stalks close together, so that the soil cannot get between them. Finish earthing up in autumn, and never hoe or earth up when plants are wet, as this would be likely to cause them to rust or rot.

To keep celery for winter, dig trenches a foot wide and as deep as the tops of the plants. Stand celery in these erect, with what dirt adheres to the roots, packing closely, but not crowding. It should be covered with straw or leaves, a little at a time, as the cold becomes greater. Celery will bear a good deal of frost.

Lettuce — Los Angeles Market

LETTUCE

Fit for use in 3 or 4 weeks, marketable size 60 to 65 days from seed. One ounce for about 3,000 plants.

Lettuce thrives best in a light, very rich, moist soil, but does well in common garden soil enriched with rotten manure. For

first crop sow in gentle heat in February and transplant to 10 inches apart. It may be sown thickly and cut when the plants are very young. For a summer supply sow thinly in shallow drills in a cool, partially shaded place, in rich soil, and thin out to a foot apart.

MUSKMELON

One ounce to 50 hills; 2 to 3 pounds per acre.

Earliest varieties ready in 90 to 100 days from sowing. General crop requires 115 to 140 days. Melons thrive best in a light, rich soil. Plant when the ground has become warm and dry, and danger from frost is past, in hills 6 feet apart each way, in well-enriched soil, 12 to 15 seeds in each hill. After all danger of bugs is over, thin out to 3 plants per hill. When about 3 feet long, pinch off the tips to make them branch and cause the fruit to mature earlier.

WATERMELONS

One ounce to 30 hills; 4 lbs. per acre. Ready from 90 to 140 days from seed.

To get good strong vines early in season, form large, well-drained hills of earth, made very rich, about 8 feet apart. In these plant the seed as soon as the ground is warm and dry, and carefully protect the young plants from insects and hasten their growth by the use of liquid manure.

ONION

One ounce to 100 feet of drill; 4 to 5 pounds to the acre. Ready for green onions in 60 days. Main crop matures in 130 to 190 days from sowing.

The onion is most successfully grown in a rich, sandy loam. Continued cultivation upon the same plot of ground, contrary to the general rule, rather improves the crop than otherwise. As early as the ground can be worked in the spring, sow the seeds in drills 14 inches apart, covering half an inch. When the plants can just be seen in rows, commence hoeing, just skimming the

Seeds in Packets—All Varieties on This Page at 5c Each

surface. Subsequently weed thoroughly and carefully by hand. When the tops die, pull the onions and spread evenly over the ground; stir or turn until thoroughly dried, then cut the tops off one-half an inch from the bulb.

RHUBARB OR PIE PLANT

1 ounce to 500 plants.

The richer the ground is, the better. Sow in drills an inch deep, and thin out to 6 inches apart. In the fall transplant into very highly manured and deeply stirred soil, setting them 4 feet apart each way, and give a dressing of coarse manure every spring. The stalks should not be plucked until the second year, and the plant never allowed to exhaust itself by running to seed. In removing be careful to pull off close to the roots instead of cutting.

	Oz.	¼-Lb.	Lb.
Linnaeus, small early.....	\$0.10	\$0.35	\$1.00
Victoria, large, late.....	.10	.35	1.00

For Rhubarb Roots, see page 25.

SPINACH

One ounce to 100 feet of drill; 12 lbs. per acre. Cultivated very extensively for "greens." A profitable crop for market. Select a rich, well-drained soil, highly manured. For a succession, sow early in April and again in May, in drills 1 foot apart and 1 inch

deep, properly thinning out when plants are an inch in the leaf. For early spring use, sow early in autumn and protect the plants with a light covering of leaves or straw.

5 to 25 lbs., one variety, at 65c per lb., not prepaid.

SALSIFY OR VEGETABLE OYSTER

One ounce to 60 feet of drill.

Resembles a small parsnip, and when thinly sliced and cooked is a good substitute for oysters, having a very similar flavor. It succeeds best in light, rich soil. Sow early and quite deep. The leaves, when they first appear, look like grass, making it especially important to plant in rows. Thin out and cultivate like the carrot; roots are perfectly hardy and may remain out all winter, but should be dug early in the spring; store a quantity for winter use in a cellar.

Mammoth Sandwich Island.....	\$0.15	\$0.45	\$1.30
------------------------------	--------	--------	--------

SQUASH

Summer and early sorts ready for use in from 55 to 65 days from planting. One ounce to 30 hills; 4 lbs. to the acre. Hills 4 feet apart each way.

Any good enriched soil is adapted to the growth of the squash. The seed should not be sown in the spring until danger from frost is past and the ground is warm and thoroughly settled. Keep the earth about the plants loose and clean. Three plants to the hill.

If troubled with squash bugs, use Hammond's Slug Shot.

TURNIP

Very scarce this year.

Ready from forty to sixty days from seed. One ounce to 150 feet of drill; 2 lbs. to acre.

The turnip is most easily affected in form and flavor by soil, climate and mode of culture. Sow in drills about 16 inches apart and half an inch deep, or sow broadcast. Get the spring crop started very early, so that the turnips may have time to grow before hot weather causes them to become tough and strong. Sow for main crop the middle of July to the last of August.

TOMATOES

Select Stock

One ounce to 1,500 plants; ¼-lb. (transplanted) per acre. Mature in from 90 to 150 days from planting.

For early plants sow seed in boxes or hotbeds in March. When the plants are about 2 inches high, transplant to 4 inches apart each way. Set out of doors as soon as danger from frost is over. Transplant carefully 4 feet apart each way and cultivate well as long as the vines will permit. To obtain early fruit pinch off the ends of the branches when the first fruit is set.

Bird Gravel from the Atlantic Ocean, white; per pkg.....	.10
Bird Manna, ready to attach to cage; each	.15

"New Model" Clover Cutter

The "New Model" Clover Cutter is designed for cutting either green or dry such growths as clover, alfalfa, vegetable tops, etc., into $\frac{1}{8}$ -inch lengths. These growths are the cheapest and most productive egg-forming poultry foods for cold weather.

The feature that gives the "New Model" easy supremacy over similar machines is the cutting mechanism. The machine can be kept in perfect order at all times, because the cutter bar is adjustable and easily accessible, and the four 7-inch spiral steel knives can readily be removed for sharpening. Those who are familiar with "ordinary" cutter construction will appreciate these improvements.

The "New Model" is made only of iron and steel, from entirely new patterns; it is a strong feeder, has large capacity, runs unusually easy and will do perfect work indefinitely. Length over all, 28 $\frac{1}{2}$ inches. The machine is intended to be mounted on a box or bench at any height to suit the operator. Weight, 60 lbs.
 Price\$10.00

Poultry Supply Department

On Incubators and Brooders Freight Will Be Paid to Points East of the Rocky Mountains

"MANDY LEE" INCUBATORS

Heat Quickly — Run Evenly — Regulate Automatically
 Fresh Oxygen

Life-giving oxygen is freely supplied at the egg level when the chicks are coming out, without losing the moisture or lowering the temperature.

Egg Level Ventilation

The new "Mandy Lee" has large ventilators in the lower part of the door. These openings are covered with finely woven brass wire cloth; through these ventilators fresh oxygen is constantly being supplied and the carbonic acid gas passing out. This diffusion of gases has no perceptible effect on the heat or moisture, but insures the chicks against suffocation at a time when the machine cannot be opened. The only perfect method of ventilation—no draft. No other incubator gives this important advantage.

Egg Tray has a combined wire and slat bottom, and can be used either way. Large machines are furnished with sectional trays and one extra tray for turning. This enables you to turn the eggs quickly and to change trays to any position in the egg chamber.

Here Is the Rule

HIGH HEAT must have LOW MOISTURE. LOW HEAT, HIGH MOISTURE.

At 102 degrees, 50 to 55 per cent moisture is good, but for every degree of heat added moisture must drop 5 per cent to be safe.

The "Mandy Lee" is built to automatically meet these requirements—no other incubator can give as good results.

New Moisture Pan can be removed or refilled without opening incubator.

Drop Nursery Bottom, permitting removal of chicks without opening incubator.

Nursery Tray has a cloth bottom that can be turned up until the eighteenth day, thus cutting off the air space beneath the eggs.

The Heating System

The heating system insures the same degree of heat to every egg and is an exclusive feature. Heat can be adjusted from end to end, and in the larger sizes from center to back and front. The heating pipes can be removed instantly for cleaning by drawing them out without removing the top. The hot air does not come in contact with the eggs as in other hot-air incubators, but warms them by radiation through the air-tight metal pipes. The control and adjustment is so perfect that the heat will vary but a fraction of a degree, even should the outside temperature change as much as 20 degrees.

The Features of the "Mandy Lee" Heater

All parts exposed to heat are fully protected by sheet metal and asbestos.

A special burner with high wick tube and wide flame slot.

New Single-Walled Chimney increases the heating capacity, reducing the oil expense and lowering the outside temperature of the heater. It is also self-seating and is always in place.

A lamp bowl in one piece.

A special vent for any gas forming in the lamp.

A perforated sheet metal cylinder in top of heater, which puts out the lamp in case of accident.

A protecting circular shield guarding the body of the incubator.

As a further precaution the lamp cannot be filled without removing it.

A self-seating chimney.

The "Mandy Lee" is built of air-seasoned California redwood, is of handsome cabinet construction, with cherry finish, has heavy brass and bronzed metal trimmings, double glass doors and the double walls are insulated with from 1½ to 3 inches of asbestos or mineral wool. No other incubator is so well built.

The "Mandy Lee" is GUARANTEED to hatch bigger chicks, stronger chicks and more chicks that live than any other incubator or even the mother hen.

“MANDY LEE” BROODERS

Direct Contact Heat

The idea of applying a soft contact heat direct to the backs of the chicks was never incorporated into anything practical until we began the manufacture of the “Mandy Lee,” nor until that time had the correct principle of brooding been recognized, namely, that the little chick cannot comfortably breathe the same heat required for giving a comfortable warmth to its body. By our method each chick always gets just that amount of heat it desires — no more and no less — natural heat in a natural way, and always breathing fresh, pure air. It’s nature’s method.

No. 1 Mandy Lee Primary Brooder; holds 100 chicks; weight, 130 lbs.\$13.00

QUEEN INCUBATORS AND BROODERS

(SOLD ON MERIT)

“Queen” Incubators are made of California Redwood, double case, each lined with asbestos felt; dead air space all around; extra heavy copper heaters and tanks with lock steam joints, making them indestructible; the improved heaters use all the heat generated — no oil loss. Large up-to-date sanitary nursing tray safety lamp, with seamless galvanized bowl that cannot leak. Faultless ventilation that requires no attention; regulators that control the temperature, making the “Queen” Incubators automatic and easiest to operate. Cost less than other standard incubators. The “Queen” is made for every-day use by work-every-day people, and will work successfully in any place where a hen might be housed.

The “Queen” Incubator as a whole is made to hatch chickens any time and under varying temperatures at a saving of your time and worry, and faster and for less expense than with the hens.

Turnips, for storage.....	65 to 90 days

POULTRY FOODS and Mixtures

THE ORIGINAL HOYT'S MIXTURE The Best Balanced Dry Food for Chicks

This is our own formula; beware of imitations. In Hoyt's Mixture we know we have a food far superior to any other chick feed on the market. It is made from the best of seed grain; in fact, every grain that is put in this food would grow if planted. Hoyt's Mixture is a perfect chick food. It contains all the necessary ingredients that a chick needs until it is two months old. Hoyt's Mixture will prevent bowel trouble and all other chick complaints. It is used by almost every poultry raiser in Colorado. We have never had a single complaint against it; everyone pronounces it a wonderful food. Price: 6-lb. pkg., 25c; 14-lb. sack, 50c; 30-lb. sack, \$1.00; 50-lb. sack, \$1.60; 100-lb. sack, \$3.00.

DEVELOPING FOOD

Has no equal for growing chicks. A mixture of small grains, beef scraps, charcoal and other ingredients for the quick growth of poultry. Should be fed as soon as chicks get too large to eat our Hoyt's Mixture: Price: 7 lbs., 25c; 15 lbs., 50c; 50 lbs., \$1.35; 100 lbs., \$2.50.

MIXED HEN FEED

This is a balanced food of mixed grains for laying hens. It contains bone, sunflower and mixed grains of different kinds in suitable proportions to promote egg yield. The variety of grains, bone, etc., being of different size, induces fowls to scratch more, and as exercise is necessary to promote digestion they will be kept strong and vigorous. Ask for price.

EGG MASH

A Carefully Balanced Mash Food for Eggs and Feather Making

Having had many years' experience in Colorado, we feel that we are familiar with the needs and requirements of our Western poultry breeders, and in offering this mash we know we are offering a high-grade article that gives favorable results. A trial will convince the most skeptical that this food is an egg-producer. Ask for price.

"MORE EGG"

Is a condition powder for promoting the general health and acting as a gentle stimulant to the egg-producing organs of fowls. It is the best condition powder on the market. Composed of sixteen different ingredients for the purpose of putting the fowls in perfect health and egg-laying condition. This is our own mixture and is highly recommended. Price: 1 lb., 10c; 3 lbs., 25c; 7 lbs., 50c; 15 lbs., \$1.00.
