1 Introduction

The Mission of Alberta Labour

The mission of Alberta Labour is to work in partnership with Albertans to promote safe and healthy workplaces, a quality working life and comprehensive safety systems. To this end, Alberta Labour recognizes that monitoring health and safety in Alberta will help to ensure that primary workplace health and safety concerns are actively managed and prioritized and resources directed where most needed.

This report summarizes the lost-time injuries and disease descriptions and characteristics of the injured worker and the risk of injury to workers in Alberta's forest industry for the years 1993 to 1997. A summary of occupational fatalities accepted by the Workers' Compensation Board (WCB) and detailed description of those fatalities investigated by Occupational Health and Safety (OHS) are also provided. Cost of injuries and revenue in terms of insurable earning and premiums and the number of employers that received a certificate of recognition are also provided.

The Forest industry groups in this report include: Primary Forest Activities and Forest Product Manufacturing.

2 Primary Forest Activities

For the sake of simplicity, primary forest activities will be called forestry in this report. This activity is made up of two industries: Logging and Woodlands Operations and Timber Management.

2.1 Industry Descriptions

Logging and Woodlands Operations (Industry # 03100)

This classification involves harvesting trees which are used for a number of wood products, e.g., lumber, ties, lath, plywood, chipboard, building logs, posts, mine props, rails, pulpwood and firewood.

Logging involves cutting trees with hand held chain saws and/or mechanized tree harvesters. Activities include falling trees, delimbing and topping, sawing into lengths, skidding, piling, loading and hauling logs. Logging operations may also include the construction and maintenance of access roads into the logging area, surveying, block layout, log scaling, scarification and reforestation (when completed by the logging contractor).

The trucking of logs is included in this classification.

Woodlands administration refers to the management of one's timber disposition and involves calculations of annual allowable cuts, forest management planning, contractor supervision, etc. When performed by a mill who has contracted all logging to unrelated loggers, woodlands administration is to be classified under the appropriate milling class.

Timber Management (Industry # 03902)

This classification is intended to cover those activities, carried on as a separate industry, that perform a service to the logging industry. Employers in this industry do no logging, sawing or handling of logs, nor do they use any equipment or tools of any significant size.

Planting of seedlings is performed with a variety of hand tools designed to punch a hole in the ground into which a seedling is placed. Check plots are performed on recently planted areas as a visual inspection intended to determine the effectiveness of the planters' work.

Regeneration Surveys are the inspection of logged areas to determine natural stocking levels. The cut block is divided into a grid pattern of equal spacing. Each point in the grid is inspected for a one square metre area in an effort to locate natural regeneration (seedling). Unstocked blocks will require planting and seedling. The only tool used in regeneration surveys are small hand

rakes for clearing tall grass and debris.

Timber Cruising is a method of determining tree stand volumes, type and condition. Performed in pairs, timber cruisers follow predetermined compass bearing to arrive at numerous randomly selected plots. At the plots the timber cruisers use a variety of hand held measuring instruments to measure and record information needed to formulate harvest plans.

Block Layout is the marking of the cut block boundaries. Performed in pairs, this activity involves following predetermined compass bearing or natural stand boundaries while marking trees with seismic ribbon or spray paint.

Cone Picking is the natural gathering of cones to be used for seed. Often cone picking takes place in recently logged areas where cones are readily accessible in the remaining branches of the harvested trees.

Log Scaling is a method of determining volumes of harvested trees. Log scalers often work at the unloading deck of a mill but may scale logs at individual cut block landings. Using a calibrated measuring stick and a can of spray paint, the scaler considers diameter, length and wood rot to determine wood volumes.

Stand Tending is the process where competing vegetation is removed from immature stands to allow for optimum growing conditions. Small trees and vegetation are removed at predetermined spacing using brush cutters. This is a pre-commercial form of thinning. Power saws (chainsaws) are not to be included in this classification.

Economic Activity

Alberta's forestry industry is the fourth largest in Canada with shipment of more than \$4 billion, and is highly involved in export, with about \$2.6 billion shipped to the world market.

While 1995 was a good year for forestry, 1996 fell prey to lower lumber prices. This condition left only moderate potential for growth in forestry. Still, investment has been high in the past and about \$4 billion is expected by 1998.

Injury and Disease Analysis Summary

In 1997, employers engaged in this activity accounted for about 3% of all employers registered with WCB. Also, in terms of person-years, employment represented less than 1% of Alberta's labour force. The total number of lost-time claims decreased by 3% in 1997 to 241. More than 75% of the lost-time claims in forestry were from workers in Logging/Woodlands Operations. The duration rate in 1997 (239) was about three times the provincial average (90).

For the period 1993-1997, the most frequently injured body part was the back accounting for 19% of all the claims. Leg injuries rank second with 17%. 32% of all the injured workers were on long term disability (at least 51 days).

2.2 Injury and Disease Statistics

2.2.1 Duration Rate & Lost-Time Claim(LTC) Rate

Forestry

Year	# of Accounts	Cost	Person Years	Days Lost	Duration Rate	LTCs	LTC Rate
1993	2,140	\$1,388,364	3,345	10,927	327	179	5.4
1994	2,674	\$1,571,045	5,502	12,299	224	263	4.8
1995	3,120	\$1,886,703	5,936	15,155	255	261	4.4
1996	2,964	\$1,832,357	5,254	14,997	285	248	4.7
1997	2,822	\$2,077,085	5,379	12,866	239	241	4.5

2.2.3 LTC Rate By Industry

Logging and Woodlands Operations

Year	# of Accounts	Cost	Person Years	Days Lost	Duration Rate	LTCs	LTC Rate
1993	2,067	\$1,273,161	3,015	9,661	320	134	4.4
1994	2,572	\$1,460,604	4,915	10,737	218	181	3.7
1995	3,004	\$1,536,569	5,284	13,051	247	193	3.7
1996	2,839	\$1,711,024	4,524	13,194	292	179	4.0
1997	2,691	\$1,961,420	4,610	11,465	249	188	4.1

Timber Management

Year	# of Accounts	Cost	Person Years	Days Lost	Duration Rate	LTCs	LTC Rate
1993	73	\$115,204	330	1,266	384	45	13.6
1994	102	\$110,440	587	1,562	266	82	14.0
1995	116	\$350,134	652	2,104	323	68	10.4
1996	125	\$121,333	730	1,803	247	69	9.4
1997	131	\$115,665	769	1,401	182	53	6.9

2.2.4 Forestry LTC Rate By Size¹ of Employer - 1997 only

Size of Employer	# of Accounts	LTCs	Person Years	LTC Rate
A: 0 < PYs <=1	1,786	59	697	8.5
B: 1 < PYs < 5	558	67	1,180	5.7
C: 5 <= PYs < 10	92	29	621	4.7
D: 10 <= PYs < 20	57	26	813	3.2
E: 20 <= PYs < 50	36	41	1,118	3.7
F: 50 <= PYs < 100	7	14	443	3.2
G: PYs >=100	3	1	507	0.2
H: Invalid	283	4	0	N/A
Total	2,822	241	5,379	4.5

¹ Size is measured in terms of estimated person-years (PYs)

3. Analysis Of Lost-Time Claims In Forestry

3.1 Nature of Injury

LOST-TIME CLAIMS ALBERTA: 1993 TO 1997	OCCURRENCE YEAR					Total	
	93	94	95	96	97	Number	Percent

5. Number of Employers that received/renewed a Certificate of Recognition as a result of an External Audit in 1997

	Certified Employers	Cert. & Uncert (# of Accounts)	% Certified
Logging & Woodlands Operations (Industry # 03100)	10	2,691	0.4
Timber Management (Industry # 03902)	1	131	0.8
Forestry	11	2,822	0.4

6. Cost of Claims, Payroll, & Premiums

6.1 Forestry Costs

	Occurrence Year				
	1993	1994	1995	1996	1997
Transaction Year					
1993	\$1,105,090				
1994	\$1,216,987	\$1,287,347			
1995	\$500,921	\$1,208,449	\$1,599,819		
1996	\$202,155	\$661,538	\$428,669	\$1,580,485	
1997	\$184,650	\$856,131	\$686,353	\$727,457	\$1,674,233
Total Costs	\$3,209,802	\$4,013,465	\$2,714,841	\$2,307,942	\$1,674,233

Total Payroll	\$85,929,858	\$125,173,139	\$138,700,995	\$132,322,704	\$139,820,484
Total Premiums	\$9,601,945	\$13,735,875	\$11,860,224	\$7,628,466	\$6,806,618

The above cost for claims, total payroll and premiums are for the five year period 1993 through 1997. The data is as at April 14, 1998.

The claim cost amount reflect only 'paid or current' cost on claims which have occurred in the five year period. These cost are tracked by year of occurrence and year that the cost were transacted. These cost are incomplete in that a workers compensation claim may take many years to be closed.

The payroll have been totalled for a year.

The premium is the total of employer's premium paid for each year.

7. Occupational Fatalities

An occupational fatality is the death of a worker which results from a work-related incident or exposure. Alberta Labour classifies occupational fatalities into three general categories: motor vehicle collision, workplace incident and occupational disease. Each of these is described below.

Motor Vehicles Incidents

Motor vehicles incidents typically involve a non-industrial vehicles operating on public roads in which the fatally injured worker was either a driver or a passenger. This category also includes fatalities involving air plane crashes, train crashes, helicopter crashes etc.

Workplace Incidents

Fatal workplace incidents consist of cases in which the worker dies at a work site, or as a result of injuries sustained at a work site. This is the type of fatality that Alberta Labour typically investigates.

Occupational Disease

Occupational disease fatalities consist mostly of recognized occupational disease, that is, disease known to be primarily or exclusive work-related. Examples are asbestos and black lung disease. Occupational diseases are usually diagnosed many years after the initial or crucial exposure to the toxic substance, and in such cases it is very difficult to determine when the exposure occurred. This category should, therefore, not be interpreted to reflect present work site hazards. This category also includes heart attacks suffered on the job.

Each year the Workers' Compensation Board (WCB) accepts occupational fatality claims for compensation. Claims accepted for compensation in a particular year does not mean the event or exposure happened in that year. Most of the occupational disease fatalities accepted in a particular year are the result of incidents or exposure from prior years.

Description of Forestry Fatalities Accepted by WCB Alberta, 1993-1997

Year	Occupational Disease		Motor Vehicle incident		Workplace Incident		Total	
	N	%	N	%	N	%	N	%
1993	0	0.0	0	0.0	0	0.0	0	100
1994	0	0.0	0	0.0	2	100.0	2	100
1995	1	33.3	0	0.0	2	66.7	3	100
1996	1	33.3	0	0.0	2	66.7	3	100
1997	0	0.0	1	25.0	3	75.0	4	100
Total	2	16.7	1	8.3	9	75.0	12	100

8. OHS Investigated Occupational Fatalities, 1993-1997

Primary Forest Activity (Forestry) (11)

YEAR:	1993	FILE:	0763
OCCUPATION:	Journeyman, Millwright and Crane Operator	AGE:	52
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	25 years		

DESCRIPTION: A worker was fatally injured when he was struck by the end of a crane boom. The boom was being installed on a log deck when a lifting sling broke, allowing the boom to fall, and strike the worker who was under the suspended load. The injury to the worker was caused by using a tag line that was too short, which forced the worker to a position under the boom, causing the boom to strike the worker when the rigging failed. The companies have been instructed to ensure that proper equipment designed for the task be used in all future lifts. The company responsible for the work site have developed written rigging procedures and will ensure that these procedures are adhered to. Presentations on responsibilities under the OHS Act will be presented to all employees and managers to assist the company in making their employees aware of the duties of supervisors and workers in health and safety matters.

YEAR:	1994	FILE:	0782
OCCUPATION:	Logger	AGE:	35
INDUSTRY:	Logging, Woodland Operations		
EXPERIENCE:	Approximately 3 years		

DESCRIPTION: The worker had been removing trees from his LTP. He was working alone at the time of the accident. Circumstances indicate he was topping a fallen tree and was struck by another large poplar tree. The premise is the tree had been partially cut and not felled at the time. Later a gust of wind toppled it onto the worker.

YEAR:	1994	FILE:	0795
OCCUPATION:	Equipment Operator	AGE:	39
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	4 years		

DESCRIPTION: A worker was fatally injured when he was crushed in a tree harvester's processing head. The worker, employed in a tree harvesting operation, was operating a track excavator machine fitted with a Lake Tree processor on its boom. The machine is used to fall, delimb, and top trees. The processor includes a saw, grapple arms, feed rolls, delimbing knives and an onboard computer. Part of the computer's function is to record the length of a tree as the top is cut off. This function is done by means of a length encoder located in the processing head. On the day of the incident, the length encoder stopped functioning properly and repairs were required. The worker, who was alone at the time, positioned the processing head on the ground, parked the machine and began to change the encoder. In order to change the encoder, the worker positioned himself in the bight of the processing head and removed the defective encoder. It appears while he was attempting to install a new encoder, an electrical short occurred causing the processing head's arms to close, crushing the worker.

YEAR:	1995	FILE:	0812
OCCUPATION:	Log Loader	AGE:	45
INDUSTRY:	Logging , Woodlands Operations		
EXPERIENCE:	20 Years		

DESCRIPTION: The worker was unloading a log loader from a sixteen-wheel tractor trailer unit. He was walking the loader off the trailer when the unit shifted ahead as it descended the beaver-tailed trailer. The sudden shift of the loader caused the front tracks of the unit to contact the ground and the unfastened cab of the loader struck the ground. The worker sustained injuries that later resulted in his death

YEAR:	1995	FILE:	0823
OCCUPATION:	Chainsaw Operator	AGE:	28
INDUSTRY:	Forestry		
EXPERIENCE:	10 years		

DESCRIPTION: The company was harvesting trees on private land. The operation consisted of one faller, falling trees with chainsaw, two workers operating mechanical wheeled skidder and two workers limbing, topping and cutting trees into lengths. The worker was employed as a chainsaw operator falling trees in a logging operation. The worker notched and put the falling cut in a large poplar tree. The tree, instead of falling, leaned back against the falling cut and remained standing. The worker then moved about 30 metres from the partially cut tree and started the notch in another tree. While he was bent over cutting the notch, the partially cut tree fell, striking the worker causing fatal injuries.

YEAR:	1996	FILE:	0829
OCCUPATION:	Faller	AGE:	51
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	20 years		

DESCRIPTION: The faller was cutting trees in an area of mature growth. There were several large black poplar trees, which appeared partially rotten and stumps in the area showed varying quality of cut. The faller cut one tree and it was moved to the south with the skidder. The employer moved the skidder to the south. The faller cut the second tree and the faller moved away to the south to clear the area. The falling spruce tree hit a poplar tree, knocking off the top portion, which fell and struck the faller, fatally injuring him.

YEAR:	1997	FILE:	0851
OCCUPATION:	Equipment Operator	AGE:	36
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	Two years		

DESCRIPTION: The slasher is a large machine used to cut trees into log lengths. The slasher consists of an operators cab, a log grapple, a log deck and a large saw used to cut the trees. Two workers were preparing to remove a portion of a broken saw guard. The injured worker had positioned himself up on the frame of the saw, when the other worker activated the saw to move it up onto the slasher deck. When the saw was activated, the worker was crushed between the moving saw frame and the fixed saw guard.

YEAR:	1997	FILE:	0853
OCCUPATION:	Faller	AGE:	28
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	Two years		

DESCRIPTION: A 28-year old male was employed as a hand faller for a company contracted to a Metis Settlement logging company in Northwestern Alberta. The faller's chainsaw became stuck in a tree and he called a skidder over to push the tree so he could dislodge the saw. The skidder operator backed his machine into the tree, and in doing so, his left front tire contacted a 7-metre high dry snag, knocking it over and onto the faller who was standing 5 metres behind and to the left of the skidder. The faller received fatal head and crushing injuries.

YEAR:	1997	FILE:	0869
OCCUPATION:	Tree Faller	AGE:	60
INDUSTRY:	Logging, Woodlands Operations		
EXPERIENCE:	33 years		

DESCRIPTION: The worker was a member of a crew of workers harvesting trees in a logging operation. He was operating a chain saw falling trees. He cut a large pine tree which was supporting a leaning dry snag. When the tree that he cut fell, the dry sang came down striking the worker on his head causing fatal injuries.

9. Forest Product Manufacturing

This section provide a comprehensive picture of workplace health and safety in Alberta's Forest Products Manufacturing industry. Cost of injuries, total payroll and premiums information and number of employers that received a certificate of recognition as a result of an external audit in 1997 are also provided.

Description of Forest Product Manufacturing Industries:

Employers in this activity may be classified into the following industries:

Sawmills and Planing Mills, Manufactures of Wood Products, Peeling and Pointing of Post, Wood Preserving, Pulp Mills, and Plywood, Chipboard, Strand board and Fibreboard Mills.

9.1 Industry Description

Sawmills & Planing Mills (Industry # 25100)

This classification involves sawing logs into rough lumber of various dimensions varying from 1" X 2" to 12" X 12". Sawmills vary from one man portable mills to large automated mills employing in excess of 100 personnel. Labour is performed largely by those trained on the job and would include equipment operators, sawyers, scalers and labourers. Large mills will employ mechanics, millwrights, welders, ect.

Planing mills often accompany the large sawmills and function as a final cutting process for the timber. Rough lumber is further reduced into the final product by various types of planing methods. The most common of which is a set of knives attached to a rotating drum.

Various forms of specialized remanufacturing also forms part of this industry. This may involve cutting of grooves, bevels, edges, and may include cutting special edges on the boards such as tongue and grooves or ship lap. Remanufacturing lumber to metric sizes for overseas markets is also prevalent in this industry.

The restoration of railway ties and the manufacture of wooden shakes are activities also included in this industry.

Large mills often operate huge kilns to dry their dressed lumber.

This industry encompasses all related activities including: operation of lumberyard and wholesaling with warehousing. Also included is the administration of a mill's woodlands, but only when the mills itself is not actively logging their harvest area.

Manufacturing of Wood Products (Industry # 25401)

Manufacturing includes cutting lumber to specification, assembling and finishing the product. The assembly may consist of gluing, clamping and/or nailing pieces together. Finishing may be fancy or plain, depending on the product, and may consist of planing, sanding, scroll work, filling and coating. This industry includes the manufacturing of pallets, wooden boxes, and grain doors; also, shuffleboards, pool tables and other game tables.

The operation may be run on its own such as a separate shop or factory, or in conjunction with another industry such as lumber yard. When installing their own product, it forms part of this industry.

Products manufactured and/or repaired in this industry include prefab homes, mobile homes, garages, granaries, livestock feeders and pre-cut logs for log houses.

Peeling & Pointing of Post (Industry # 25900)

Post of uniform length are fed into a machine that rotates them much the same as a lathe at the same time peeling the bark off. One end is then ground to a point. The post are usually dip-treated following the peeling and pointing.

When done in conjunction with peeling and pointing, the treating is considered incidental.

Treating of Timber (Industry # 25901)

This classification involves the coating of wood with a preservative, including items such as fence posts, hydro poles bridge timbers and railroad ties.

Some employers in this industry are involved only in dip-treating posts and poles. The product is immersed in a preservative solution in an open tank. Square cedar post for fences are usually treated on one end only.

Another, more elaborate process uses large cylinders (often seven feet in diameter and 150 feet long). The ties, timber, post or poles to be treated are strapped to small rail carts then loaded into cylinders. The timber is then subject to pressure and heat while being treated with the appropriate preservative. Following the prescribed time (which varies by product), the preservative solution is pumped out and the timber is then vacuum dried. The timber then leaves the cylinder and is moved to a temporary storage area to drip dry.

Some pressure treaters will slightly modify the product by predrilling holes for hardware, cutting special ends and cutting out defective areas. Pressure treaters usually have the capacity to peel,

cut and incise their product using variety of machinery and hand tools. Equipment used includes forklifts and mobile cranes.

Pulp Mills(Industry # 27102)

This industry covers the actual conversion of wood to wood pulp.

There are two types of pulp manufacturing:
bleached kraft pulp mills and chemithermomechanical pulp mills(CTMP).

Bleached kraft pulp mills rely on chemical processes to break down wood into paper and often are the source of the rotten egg smell. CTMP mills rely on the mechanical grinding process to break down wood into paper and are comparably much cleaner smelling.

This industry includes the manufacture of paper when performed by the same employer.

Changes in technology may introduce new methods of converting wood into paper; however, such process will still remain classified as pulp mills. Also included in this classification is the administration of the mills woodlands, but only when the mills itself is not actively logging their harvest area.

Plywood, Chipboard, Strandboard & Fibreboard Mills (Industry # 27103)

Chipboard, Strandboard and Fibreboard: Spruce and aspen logs are cut to 2' and 3' length, then moved by conveyor to a machine that slices them into small chips or wafers. The chips are conveyed to a rotating dryer where moisture is removed, then to a chamber, where a mixture of glues and waxes is sprayed onto the chips. The chips are dropped into trays 16' long by 4' wide which move to a heated press. Once in place, the trays (and chips) are pressed and heated to bond the chips into a board. 8' by 4' sheet are then cut and passed to a dryer where they are rotated until cool, then stacked and prepared for shipment.

With fibreboards, it is the fibres being pressed into board rather than chips or wafers. Otherwise the processes are similar. This industry includes the manufacture of straw matting.

Plywood: Trees (mostly white spruce) are debarked and cut into peelers (8' 6" long), sorted and conditioned or steamed for 10 to 35 hours. The logs are then placed on a lathe and strips of veneer are peeled off from 1/10 to 1/8 inch thick. A clipper cuts out any defects, the veneer is trimmed and sent to the plywood mill. At the mills the sheets are sorted into grades, then lined up in presses. The interior cross banding (narrow strips) are glued on both sides and placed by hand between the layers. The sheets are glued and built up to required thickness. The ends are trimmed and the units are placed in a loading basket and put in the hot press automatically.

Staining & Painting: Employers who paint or stain board products are also included in this industry. Staining is a simple process of passing a board through a mechanical stainer (often called an Olympic Stainer). The stainer will apply stain (or paint) to both sides and the edges of the board. Boards are then stacked to dry. This entire process can be handled by one person.

This industry encompasses all related activities including the wholesaling and warehousing of board products. Also included is the administration of a mill's woodlands, but only when the mill itself is not actively logging their harvest area.

Economic Activities

Forest products manufacturing industries employs about 40,000 people in Alberta (18,000 full-time jobs as well as 22,000 indirect jobs) and is the third largest primary economic sector in Alberta. With an annual operating expenditure of over \$2 billion, this industry is a major source of employment and revenue in more than 50 Alberta towns and cities.

Like roller coasters on different tracks, Alberta forest products demonstrated the economic salvation of product diversification. While the values of one product category declined, the values of another begun to recover. 1997 year-end statistics indicated that total shipment value was \$3.3 billion, compared with almost \$3.0 billion in 1996. Production of lumber and secondary manufactured products, pulp and paper, and panel boards were all ahead of the previous year. Shipment of lumber and secondary products was valued at \$1.2 billion, 5% more than 1996. Panel board production was valued at \$410 million, up 39%. Total production value of pulp was \$1.6 billion, representing an 8% increase over 1996. While pulp prices achieved modest increase throughout 1997, they remained at levels that barely cover production.

Based on the continued volatility of overseas market and ongoing restriction imposed by the softwood lumber agreement with the U.S, 1998 is expected to be difficult year for the Alberta forest product industry with the degree of difficult driven by factors outside Canada.

Summary of Injury and Disease analysis

For the period 1993-1997, Pulp Mills and Manufacturing of Plywoods are the only industries with LTC rates consistently lower than that of the provincial average. For example, in 1997, Peeling and Pointing of Post had a rate which is four times higher than the provincial average.

In 1997, injuries to the wrist, hands and fingers accounted for 31% of the claims while back injuries accounted for 23%. 44% of all injuries in 1997 resulted in between one and five days of work lost. 43% of the injured workers had been employed for more than a year. 64% of the claims were from workers in the manufacture of wood products industry.

9.2 Injury And Disease Statistics

9.2.1 Lost-Time Claim(LTC) & Duration Rates

9.2.2 All Forest Product Manufacturing Industries

Year	# of Accounts	Cost	Person Years	Days Lost	Duration Rate	LTCs	LTC Rate

11. Number of Employers that received/renewed a Certificate of Recognition as a result of an External Audit in 1997

		Certified Employers	Cert. & Uncert (# of Accounts)	% Certified
Sawmills & Planing Mills	(Industry # 25100)	9	308	2.9
Manufacturing of Wood products	(Industry # 25401)	7	589	1.2
Peeling & Pointing of Post	(Industry # 25900)	0	19	0.0
Treating of Timber	(Industry # 25901)	0	4	0.0
Pulp Mills	(Industry # 27102)	7	15	46.7
Plywood//Fiberboard Mills	(Industry # 27103)	1	19	5.3
Forest Product Manufactures		24	954	2.5

12. Cost of Claims, Payroll, & Premiums

12.1 Forest Product Manufacturing Costs

	Occurrence Year				
	1993	1994	1995	1996	1997
Transaction Year					
1993	\$2,729,715				
1994	\$2,721,583	\$2,691,009			
1995	\$2,040,062	\$1,885,471	\$2,146,177		
1996	\$921,298	\$1,116,747	\$1,487,988	\$2,098,139	
1997	\$511,171	\$660,318	\$627,764	\$1,454,774	\$3,164,399
Total Costs	\$8,923,829	\$6,353,545	\$4,261,930	\$3,552,914	\$3,164,399

Total Payroll	\$401,271,864	\$442,147,388	\$479,260,275	\$538,458,673	\$580,234,870
Total Premiums	\$19,148,766	\$20,798,489	\$18,269,941	\$18,377,389	\$18,949,864

The above cost for claims, total payroll and premiums are for the five year period 1993 through 1997. The data is as at April 14, 1998.

The claim cost amount reflect only 'paid or current' cost on claims which have occurred in the five year period. These cost are tracked by year of occurrence and year that the cost were transacted. These cost are incomplete in that a workers compensation claim may take many years to be closed.

The payroll have been totalled for a year.

The premium is the total of employer's premium paid for each year.

13. Occupational Fatalities

An occupational fatality is the death of a worker which results from a work-related incident or exposure. Alberta Labour classifies occupational fatalities into three general categories: motor vehicle collision, workplace incident and occupational disease. Each of these is described below.

Motor Vehicles Incidents

Motor vehicles incidents typically involve a non-industrial vehicles operating on public roads in which the fatally injured worker was either a driver or a passenger. This category also includes fatalities involving air plane crashes, train crashes, helicopter crashes etc.

Workplace Incidents

Fatal workplace incidents consist of cases in which the worker dies at a work site, or as a result of injuries sustained at a work site. This is the type of fatality that Alberta Labour typically investigates.

Occupational Disease

Occupational disease fatalities consist of mostly recognized occupational disease, that is, disease known to be primarily or exclusive work-related. Examples are asbestos and black lung disease. Occupational diseases are usually diagnosed many years after the initial or crucial exposure to the toxic substance, and in such cases it is very difficult to determine when the exposure occurred. This category should, therefore, not be interpreted to reflect present work site hazards. This category also includes heart attacks suffered on the job.

Each year the Workers' Compensation Board (WCB) accepts occupational fatality claims for compensation. Claims accepted for compensation in a particular year does not mean the event or exposure happened in that year. Most of the occupational disease fatalities accepted in a particular year are the result of incidents or exposure from prior years.

14. OHS Investigated Occupational Fatalities, 1993-1997

Forest Product Manufacturers (6)

YEAR:	1993	FILE:	0769
OCCUPATION:	Operating Technician	AGE:	33
INDUSTRY:	Manufacture of Wood Pulp		
EXPERIENCE:	3 Months		

DESCRIPTION: An operating technician was drenched with water during a cleaning process. A number of the crew discovered that the quickest way to dry off after becoming wet was to stand inside the wind boxes with the door open. The wind boxes are part of the dryer used to do maintenance on the circulation fans. The temperatures can reach 90°C in these boxes. The worker entered one of the wind boxes and the door shut behind him. He was found approximately 30 minutes later and could not be resuscitated. The push rod mechanism used to release the door from the inside was corroded and totally inoperable.

YEAR:	1993	FILE:	0772
OCCUPATION:	Wet End Technician	AGE:	50
INDUSTRY:	Pulp & Paper Mills		
EXPERIENCE:	18 years		

DESCRIPTION: A worker was seriously injured during routine start-up activities at a pulp mill. He died a few days later as a result of a head injury sustained in the stock preparation area of the mill when a pump was started, forcing water and, possibly a projectile, out of a NOSS cleaner. It was concluded that the incident occurred because safe operating procedures were not followed during start-up, ie. the NOSS cleaner system was operated in a condition that allowed for a release of water/cap/cone through a cap hole in the canister while workers were nearby. The employer instituted engineering and policy changes to prevent a similar reoccurrence. Although the employer had documented operating instructions from the NOSS cleaner manufacturer, these were not entirely followed during start-up operations. The employer has instituted training/procedures to ensure safe practices are carried out in future.

YEAR:	1993	FILE:	0778
OCCUPATION:	Truck Driver	AGE:	44
INDUSTRY:	Manufacturing of Wood Boxes, Pallets, etc.		
EXPERIENCE:	20+ years		

DESCRIPTION: A flat bed tractor trailer unit operated by the deceased was parked inside the employers warehouse. The deceased was either standing at the back of the truck or walking around the back of his truck when a fork lift truck carrying construction materials entered the warehouse. The driver of the fork lift was unable to see beyond the load his equipment was carrying. He drove into the back of the truck pinning the fatally injured between the truck and the load of the fork lift.

-----FOREST PRODUCT MANUFACTURING-----

YEAR:	1994	FILE:	0800
OCCUPATION:	Canter	AGE:	49
INDUSTRY:	Sawmills and Planing Mills		
EXPERIENCE:	20 Years		

DESCRIPTION: A log become crossed in the infeed conveyor of a 4 saw Scrag. The canter left his canting position to straighten the log. The worker went and stood directly behind the sharp chain conveyor. The log became immobile in the saw causing the saw to heat up and waver violently. The wavering saw contacted the immobile cant causing it to lift up twist on its side and kickback. The cant was propelled through the air and struck the worker squarely in the chest. The worker was killed instantly.

YEAR:	1996	FILE:	0838
OCCUPATION:	Labourer - Pulp and Paper Industry	AGE:	27
INDUSTRY:	Plywood, Chipboard, Strand board and Fibreboard Mills		
EXPERIENCE:	Unspecified		

DESCRIPTION: A worker, employed by Ranger Board Ltd, was killed at Blue Ridge. The self-propelled elevated work platform she was using, was positioned near a large hydraulic press. The action of the press lifted the platform beyond its normal extended limits. As a result the platform tipped and the railing and hydraulics failed, causing the platform to collapse. She fell approximately 4.5 metres to the plant floor, sustaining fatal injuries.

YEAR:	1997	FILE:	0878
OCCUPATION:	Electrician	AGE:	42
INDUSTRY:	Plywood, chipboard, Strand board and fibreboard Mills		
EXPERIENCE:	19 years in electrical trade (Journeyman Electrician)		

DESCRIPTION: Two electricians were making adjustments to the moulding panel stacker outfeed rollcase. The stacker was operating in the automatic mode and the unit was not stopped or locked out by either electricians. One of them crawled underneath the stacker while the other placed himself on the opposite side to assist. When the adjustments were complete, the worker who was underneath the stacker started to crawl back out. The elevator of the stacker descended and pinned him against a lower cross member resulting in fatal injuries.

Appendix A: Terms, Definitions and Formulas

Lost-Time Claim(LTC)	A lost-time claim (LTC) is the claim for an occupational injury or disease which disables the worker beyond the day of injury. Included are the claims for which wages compensation are paid, permanent disability claims, fatalities, and cases in which the injured worker is assigned light duties or other modified work.
Person-Years	Person-years estimates are calculated from wage and payroll data provided by account holders to the WCB. Alberta Labour uses these data to estimate an average industry wage, and uses the average industry wage and employer payroll data to estimate person-years for each employer and each industry. One person-year is equivalent to one full-time worker working for one year, and can be assumed to equal 2,000 hours worked.
LTC Rate	<p>The lost-time claim (LTC) rate is calculated by dividing the number of lost-time claims by the person-years estimates, and multiplying the result by 100. The LTC rate represents the probability or risk of disabling injury or disease to a worker during a period of one year's work. Comparisons of LTC rates between industries or between years, can be used to indicate increase, decrease or differences in this risk.</p> $\text{LTC Rate} = \frac{\text{Number of LTCs} \times 100}{\text{Estimated person-years}}$
Duration (Days Lost)	The duration of disability is the number of days following the injury or disease for which the worker was disabled, and unable to perform normal work duties. This information is obtained for this report from data on compensation days paid on each claim from WCB. Alberta Labour obtains these data on March 31 of the year following the claim year, and does not update the information, even though many injured workers continue to be disabled beyond this date. As a result, the duration information reported here underestimates the true impact of lost-time injury and disease.
Duration Rate	<p>The duration rate is calculated by dividing the number of work days lost(disability days) by the person-year estimate, and multiplying by 100. The result is expressed as 'days lost per 100 person-years worked', and indicates, in part, the economic impact of occupational injury and disease. Duration rates are not recommended as reliable indicators of full economic costs. In addition, readers are warned that duration rates are highly unstable when based on only a few lost-time claims; it is recommended that the duration rate not be calculated based upon fewer than 30 lost-time claims.</p> $\text{Duration Rate} = \frac{\text{Disability Days} \times 100}{\text{Estimated person-years}}$
WCB Accepted Fatality	The death of a worker which results from work-related incident or exposure and which has been accepted by the WCB for compensation. A fatality is counted in the year it is accepted.
NEC	Means 'Not Elsewhere Classified'
UNS	Means 'Unspecified'
