1955 PULPWOOD PRODUCTION IN THE SOUTH

by

James W. Cruikshank

and

J. F. McCormack

Division of Forest Economics

U. S. DEPARTMENT OF AGRICULTURE
FOREST SERVICE

SOUTHEASTERN FOREST EXPERIMENT STATION
ASHEVILLE, N. C.

and

SOUTHERN FOREST EXPERIMENT STATION
NEW ORLEANS, LA.

in cooperation with

SOUTHERN PULPWOOD CONSERVATION ASSOCIATION
ATLANTA, GA.

PREFACE

Through the McSweeney-McNary Act of 1928, Congress authorized the Secretary of Agriculture to conduct a survey of the forest resources of the United States. The Forest Survey was organized by the Forest Service to carry out the provisions of the Act. The Southeastern Forest Experiment Station, Asheville, North Carolina, is responsible for the work in Virginia, North Carolina, South Carolina, Georgia, and Florida. The Southern Forest Experiment Station, New Orleans, Louisiana, directs the work in Alabama, Arkansas, Louisiana, Mississippi, Oklahoma, Tennessee, and Texas.

The work of the Survey is divided into five major phases:

1. Inventory. Determination of the extent, location, and condition of forest lands, and the quantity, species, and quality of timber on these lands.
2. Growth and mortality. Determination of the current rate of timber growth, and the total loss resulting from fire, insects, disease, suppression, and other causes.
3. Timber cut. Determination of the amount of industrial and domestic wood used, and the amount removed by land clearing and cultural operations.
4. Requirements. Determination of the current and probable future requirements for forest products by all classes of consumers.
5. Policies and plans. Analysis of the relation of these findings to one another and to other economic factors as a basis for public and private policies and plans of forest land use and management.

ACKNOWLEDGMENT

The statistics presented herein are based upon reports furnished by the wood procurement officials representing 73 mills located in, or drawing wood from the South. Reports showed either production by county or by shipping points which were used to assign production to counties. County data are approximate, but totals for small groups of counties should have little error.

Figure 1.--Pulp mills drawing wood from the South, 1955. Numbered areas are Forest Survey units. Small numbers at mill locations correspond to numbers in tables 16 and 17.

1955 PULPWOOD PRODUCTION IN THE SOUTH

Another record high was established in pulpwood production by southern states during 1955. The total harvest amounted to 18,014,600 cords, an increase of 1,745,000 cords, or 10.7 percent, over production in 1954. The sharp upward trend of production in the South is especially apparent when compared with earlier years. The 1955 cut was about double the amount cut in 1947 and three times as great as the total production in 1940. Current activity in construction of new mills, together with installation of additional capacity in operating mills, can be expected to create new production records for many years to come.

Pine pulpwood cut in 1955 amounted to 15,487,700 cords, or 86 percent of the total. Hardwood production was 2,526,900 cords, of which 26,100 cords were chestnut. Production changes by species group over 1954 were gains of 9.8 percent in pine and 17.5 percent in hardwoods, and a decrease of 20.4 percent in chestnut. The use of blight-killed chestnut timber has been declining in recent years because of supply problems, deterioration of the remaining timber, and lack of markets for chestnut tanning extract. It is no longer an important source of raw material.

Georgia was still well in the lead over other southern states with a total production of 3-3/4 million cords (fig. 2), about one-fifth of the total production in all 12 southern states. Alabama edged ahead of

Figure 2.--Pulpwood production in the South, 1955

Mississippi, and Louisiana displaced North Carolina in state standings since 1954. Clinch County, Georgia, led in county production with the surprising total of nearly 324,000 cords (as compared to 150,000 cords in 1954). Eleven other counties or parishes in Alabama, Florida, Georgia, Louisiana, and South Carolina cut between 100,000 and 150,000 cords each.

^{1/} Includes 26,100 cords of chestnut used for pulp.

^{2/} Includes 32,800 cords of chestnut used for pulp.

The use of wood residues for pulp also made important gains. Consumption of this material, obtained from other wood-using industries, amounted to 374,132 cords. Of this total 258,909 cords, or nearly 70 percent, were pulp chips made from slabs and other coarse sawmill waste, veneer cores and cull crossties made up 107,209 cords, and miscellaneous materials, mostly pine pole and piling ends, accounted for 8,014 cords, as shown in the following summary.

	<u>Pine</u>	<u>Hardwood</u>	<u>Total</u>
Sawmill chips	250,591	8,318	258,909
Veneer cores, crossties	368	106,841	107,209
Miscellaneous	8,014	--	8,014
	<u>258,973</u>	<u>115,159</u>	<u>374,132</u>

In 1955 there were 73 pulp mills drawing wood from the South. Sixty-nine of these mills are actually located in southern states and have a current pulping capacity of 34,100 tons per day. Table 17 lists 8 additional wood-using mills for the South which are now under construction or for which definite plans have been announced.
