FARM PRODUCTION, FARM DISPOSITION, AND VALUE OF
FIELD AND SEED CROPS, 1948 AND 1949

Estimated farm disposition of grains, hay, seeds, potatoes and a few other commodities are presented in this report. It is one of a series dealing with farm disposition of crops, livestock and livestock products. First of these was the report for fruits and tree nuts published in January 1950. Estimates for cotton and cottonseed appear with the Cotton Report of May 5; those for tobacco, sugar beets and sugar cane for sugar appear in the issue of Crop Production dated May 10, 1950. A report covering farm disposition of turkeys was issued in March, those for chickens and eggs, milk, and meat animals were issued in April.

This report shows estimated sales from 1948 and 1949 crops and portions of production used or to be used for designated purposes on farms where grown. Total estimated production is the same as previously published in the December 1949 Annual Summary of Crop Production. Quantities shown as fed to livestock and poultry represent that part of each crop which was fed only on the farms that produced the crop in a given year. These quantities do not represent total quantities of the commodities ultimately used for livestock feeding. Quantities of principal feed crops sold and used in farm households, if any, are estimated directly. Therefore, the quantity estimated for feed and seed is the residual (production less household use and sales); grain purchased for feed and seed does not enter into these estimates. Some of the products shown as "sold" from farms are used for feed or seed on other farms in the same or other States. For certain crops total seed requirements are shown, and for some a further breakdown is made between purchased and home-grown seed.

Basic data for these estimates of farm disposition are collected from many sources. Most items of farm use are estimated from an analysis of individual farm data on individual crops, as reported in responses to special disposition inquiries. In these inquiries farmers are asked to report their production of each commodity and the quantities used on their farms for each purpose. Sales of some commodities are estimated directly from survey data, in which farmers report production and sales. For certain commodities of which there is virtually no farm use, the entire production is shown as sales. Whenever possible, sales have been checked by enumerations, such as reports of processors, or by records of handlings and shipments by rail, boats and trucks.

Season average prices are, in most cases, the estimated mid-month prices received by farmers, weighted by estimated quantities sold in each month of the crop marketing season. The marketing season is shown below the table for each crop. Season average prices for popcorn, broomcorn, sugarcane for sirup, maple products, hops, and most of grass and covercrop seeds are based primarily upon special survey data. For sugarcane sirup (except Louisiana) and sorghum sirup, season average prices are those reported on December 1 of each year. Price estimating procedure makes allowance for loans unredeemed at the end of the crop season and for quantities bought by the Government under purchase agreements when such transactions are of significant volume. Footnotes designate the years affected for each commodity.

These season average prices for quantities sold are used to evaluate quantities sold and used on farms. Value of sales is thus the unit price applied to quantity sold during the marketing year. In like manner the value of production and value of home consumption are computed by applying the season average price to the quantity produced or used. Therefore, these value estimates should not be confused with cash receipts, which relate to the calendar year, irrespective of the year of production.
