WOOD'S CROP SPECIAL

Giving Timely Information and Prices of Seasonable Seeds

PUBLISHED BY T. W. WOOD & SONS SEEDSMEN RICHMOND VA.

VOL. XVI.

MAY EDITION

1921

Our "Wood's Crop Special" is issued monthly during planting seasons. There is no subscription price, but is mailed free upon request. If any of our customers do not receive Wood's Crop Special regularly, and desire to do so, advise us and we will place your name on our regular mailing list.

SEASONABLE NOTES

As was predicted in our last edition of the **Crop Special**, there has been a very material advance in the price of Cow Peas, with stocks of several important varieties fast being depleted. This advance in Cow Peas has had its effect on Soja Beans, and there is every indication that still higher prices will prevail before the season is over.

Unlike a great many commodities which are now being sold at prices based on high costs, Seeds have followed the decline, and in very many instances are being offered in this edition of the **Crop Special** at below prewar prices. We feel reasonably safe in saying to our customers that prices on practically the entire list of seasonable seeds, both for summer and fall planting, will show an advance rather than a decline. Early purchases of your immediate requirements will be to your advantage. A comparison of prices now with those of last year will reveal to you some astonishing drop in prices.

Of the summer legume crops, **Cow Peas** are the favorite, being a sure cropper, and one of the very best soil improving and forage crops for the South. The **Brabham Pea** is the most economical variety to sow, both from a standpoint of seeding cost and growth. One of our customers in Georgia writes: "The farmers in this section began raising the **Brabham Pea** about six years ago, and they have proved so very satisfactory as a vining pea, as well as in yield, that all other varieties have practically been abandoned. I do not think it will be but a few years until they will be used altogether throughout the South. In addition to having the above qualities they do not wilt as easily as the Whippoorwill and Clay Peas, and make a much more luxuriant vine."

For hay crop, the sowing of **Mixed Cow Peas** and **Soja Beans** together is very desirable, as the Soja Beans help to hold up the pea vines, and the addition of the Soja Beans considerably increases the value of the feed.

The **Brabham Peas** are O. K. They yielded better than the other varieties we have planted this year.—Z. F. GIBSON, Scotland County, N. C., October 18, 1920.

PEARL MILLET will furnish continuous cutting of excellent and nutritious green food all through the summer until late in the fall. When cut it stools out and grows off again rapidly, and if a sufficient quantity is sown, it will furnish a daily supply of green food that is greatly relished by all kinds of stock. Can be cut at a height of 2½ to 3 feet, or if allowed to attain its full height will grow 10 to 12 feet high. Plant 5 pounds to the acre in drills 3 feet apart during May, June or early July.

The sowing of **Cow Peas** with **Millet** for a summer forage crop is increasing to a considerable extent, as experience has proven that it makes one of the best, largest yielding, surest cropping and most nutritious of summer forage crops. We recommend the sowing of one bushel of early maturing peas, such as the Whippoorwill or Brabham, with three-fourths of a bushel of German Millet to the acre, and to cut the crop when the Millet is heading out, regardless of the condition of the Cow Peas. The Cow Peas are usually in a dough state at this time and at the best stage for cutting and curing for hay. The use of Millet with Cow Peas enables the Cow Pea hay to be cured to much better advantage than when Cow Peas are sown alone, and at the same time improves the condition of the hay crop to a considerable extent.

Sowing the crop in this way will not only make larger yields of hay and forage than is possible with the natural grasses, but the tendency of the Cow Peas sown with the Millet is to improve the land, as the action of the roots and root nodules stores nitrogen in the soil and improves the condition of the land where the crop is grown, which is the reverse when Millet is sown alone.

We strongly recommend to our farmers to make sowings of these crops as above indicated, for a sure-cropping and large-yielding hay and forage crop.

Our **Ensilage Corn** trade has been very large this season, which is due to the increasing yields of ensilage wherever used. One farmer in Prince Edward County, Va., writes: "**Wood's Pamunkey Ensilage Corn** can't be beat for ensilage on good land. It grows from 12 to 14 feet high and large stalks, plenty fodder, and some have two ears to the stalk. Never used any variety except my regular corn before this year. I didn't think it was so much difference in the growth in height and size of the stalk." Another in Fauquier County writes: "I do not feel that I can say enough for **Virginia Ensilage Corn**. I have a farm I purchased a few years ago, and some of the land is very thin. After planting **Virginia Ensilage Corn** on it one year I found that it yields just twice as much as it did in other ensilage corn. It is the best ensilage corn grown for poor or thin land. I would not raise any other variety."

Repeated letters from our customers praising our **Virginia-Grown Ensilage Corns** convinces us of their superiority over other corns from a standpoint of actual tonnage, and we can strongly recommend their use to dairymen and farmers for silage purposes.

Raising Soja Beans for a Hay Crop.

SOJA BEANS—A PROFITABLE CROP

The Soja Bean is one of the most vigorous summer legumes, rich in protein and fats, and considered one of the best summer forage plants. As to tonnage of hay, it equals Cow Peas, and will produce almost double the quantity of grain yield per acre. This valuable legume can be used as a **green manure, silage, hay, seed, and pasture crop**, which is the cause of its increasing popularity.

The **Mammoth Yellow** and **Tarheel Black** of the bushy, upright type, are most generally used where long growing seasons are available, making a large growth of hay of fine feeding value. They hold up well even when sown broadcast, being heavy grain producers; the **Mammoth Yellow** having a slight advantage as a forage bean.

The **Wilson Early Black** and **Virginia**, of the semi-vining type, mature about thirty days earlier than the above varieties, but do not make such a large growth of vine. The hay crop of the earlier beans, however, is more palatable to stock, their stems being much smaller and less woody, making a better quality hay.

I have had splendid success with the **Mammoth Yellow Soja Beans** as a hay crop. Some hay that I cut this year measured from three to five feet. For this section the season is too short for the beans to properly mature for seed. I think it is a great nitrogen gatherer and a land improver.—J. L. BELL, Charlotte County, Va., October, 1919.

Your **Wilson Soy Beans** are the beans for my part of Maryland. The **Wilson** is the only bean that matures in time to be harvested for seed. I would recommend **Wilson** for Washington County, Maryland. I have talked with others who have tried them, and they said the same thing.—C. L. SMITH, Washington County, Md., January 2, 1920.

SUDAN GRASS—FOR SUMMER HAY

In quickness of growth, it ranks with Millet, and a second cutting is ready in 45 days after the first one. In luxuriance its wonderful stooling properties place it in the highest class, and after the first cutting it surpasses other continuous-cutting crops, for more than a hundred stems have been found growing from one root. In quality of hay it is equal to Timothy, especially if cut when in bloom; yet few grasses are so little injured by standing beyond the right stage for cutting. **Four tons to the acre** is not an exceptional yield, and eight tons have been grown where the season allowed four cuttings. Sown in rows it grows 6 to 7 feet tall, and even as high as 8 feet was reported in Delaware. Sown broadcast, it grows 4 to 5 feet high.

COLD STORAGE POTATOES FOR JULY PLANTING

We are now booking orders for Potatoes for June and July shipment, as per prices on back page of this edition. Potatoes are very reasonable in price now, and we firmly believe good prices will be had for the late crop. It is almost an invariable rule that when potatoes are low they have no friends, and consequently the crop is cut short to extent of reduced acreage, which will undoubtedly be smaller than previous years. For a money crop this fall we can certainly recommend potatoes.

VELVET BEANS FOR THE SOUTH

For the Carolinas and Southern States the Velvet Bean surpasses all other legume crops from a standpoint of growth. It makes an immense amount of fall and winter grazing, produces seed abundantly, and leaves the soil in a fine condition for any following crop. It is one of the very best plants for growing on newly cleared lands, as its growth is so dense that it smothers all grasses and weeds, and leaves the soil in better condition than practically any other crop.

As a forage crop for hogs, the Velvet Bean has few equals. Its chief value is in the grain, and as the pods do not shatter easily, this crop will furnish excellent grazing for two or three months. Due to the long trailing habits of the Velvet Bean, it is preferable to combine this crop with corn for support, as the production of seed is lessened if the vines lie flat on the ground.

The Velvet Bean as a nitrogen gatherer, with the large amount of humus which it adds to the soil, makes it one of the very best soil improvers. The low cost of seeding will undoubtedly make this a very popular crop to put in the coming season.

The **Bunch Velvet Bean** is the latest addition to the legume family, resembling the 100-Day variety, but grows in more compact form as the name describes, and is considered a better bean for growing with corn. This new Velvet Bean is meeting with very popular favor throughout the South, as it is easier handled for both hay and turning under for soil improving purposes.

I find the **Osceola Velvet Beans** to be more than you claim for them. They are just wonderful. I measured some that were 5¼ inches long. Some have 20 pods in one cluster. I consider them far superior to anything I have seen in the bean or pea line.—Q. M. LENNON, Columbus County, N. C.

SORGHUM—A WONDERFUL FORAGE CROP

Yields of five to ten tons or more per acre are not uncommon with Sorghum, and makes an excellent feed for dairy cows. It stands drought better than corn, and is a better yielder on poor land. The combination of Sorghum with **Cow Peas** or **Soja Beans** is very generally used for pasturage purposes, and makes a very desirable crop.

The **Sugar Drip** variety has attained first rank of the Sorghum family, being especially adaptable for syrup-making purposes, as well as supplying a very nutritious ensilage that is greatly relished by live stock. The **Early Amber** and **Orange** are more generally grown for forage, yielding at least two cuttings if planted early.

CHUFAS

AN ECONOMICAL FATTENING CROP.

On one-third of an acre planted in Chufas, the Arkansas Experiment Station reports having kept three hogs for 46 days. During this time the hogs, which weighed an average of 122 pounds each, gained an average of 66 pounds each.

Considering what Chufas will do and the results from other crops used for feeding and fattening hogs, taking into account the small amount required to plant an acre (1 to 1½ pecks), and the further fact that Chufas require little or no cultivation—just enough to keep down weeds—it will be seen that on light or sandy land, especially that which has been well fertilized for a previous crop, nothing else compares with Chufas in the large returns from a small outlay.

Chufas are not only nutritious and fattening, but their high sugar content causes them to be greatly relished, and this also gives the meat a sweeter taste than that of corn-fed hogs.

Plant now in rows 2½ to 3 feet apart, dropping 3 to 5 Chufas together, about 1 to 1½ feet apart in rows.

I found the **Golden Millet** received from you to be a splendid grade of millet. I tried it on both rich and poor soil, sandy and clay soil. It did better on moderately rich soil with a light mixture of cow peas. The yield was good. The hay looks fine.—JAMES STEPHENS, Floyd County, Ky., October 8, 1920.

WOOD'S CROP SPECIAL.

Prices of Field Seeds are always subject to market fluctuations. We always fill all orders entrusted to us at lowest ruling prices on date order is received. If prices decline, we give our customers the benefit of it. If they advance, we charge the advance prices. In case customers desire to limit us to filling orders at prices quoted on any particular date, they will kindly so state on order. Mention date and number of "Wood's Crop Special" upon which the order is sent.

Terms on all Field Seeds, net cash. Customers who have no regular accounts with us will kindly remit the amount with their order or name business reference as customary before opening new accounts.

While we exercise great care to have all seeds pure and reliable, we give no warranty, express or implied, as to description, quality, productiveness, or any other matter connected with the goods we send out, and will not be in any way responsible for the crop. Every order for articles named in this price-list will be executed on these conditions only.

All prices quoted are for our best TRADE MARK BRAND quality.				These Prices f. o. b. Richmond			Postpaid (see next page)
