DISCLAIMER

We will not in any way be responsible for your crops, as there are so many conditions, too numerous to mention, why we cannot guarantee a crop to grow and mature. Purity and germination tests are taken carefully, and are mentioned for guidance only.

MARK MEANS COMPANY,
Lewiston, Idaho.

—o—

BUY YOUR SEEDS EARLY.—You will gain a distinct advantage by arranging early for your seed supply, as orders must be filled carefully

—o—

IMPORTANT—Owing to fluctuations in market prices, it may be necessary to change some of the prices quoted herein during the season. Should prices change and orders are received at prices named, seed will be sent equivalent to the money received figuring the order at current prices.

—o—

HOW TO SHIP.—Always state how you want heavy seed shipped, by freight or express, and if your station is a prepay point, don't forget to add enough money to take care of charges. Should you not receive the goods you ordered within a reasonable time, write us regarding the matter and we will gladly put a tracer after your shipment.

—o—

Seed buying is different from the buying of most any other commodity. With seed there are many things to watch, weeds, both annual and noxious, mixed varieties, etc., that take a trained man to detect. But men who have spent twenty or thirty years in the practical study of seed can be depended upon to handle only high grade varieties—tested for purity and germination.

LAWN MIXTURE

For lawns we recommend a mixture of White Clover and Blue Grass, sowing one pound to every 300 square feet.

It is not the house alone that gives contentment to a home; a beautiful lawn and well-kept grounds also bring out the smiles.

You must not expect to make a fine lawn with cheap seed. The best lawn grass mixtures cost more at first than the poorer substitutes, but will be found much cheaper and more satisfactory in the end.

WINTER OR HAIRY VETCH

This is a hardy, valuable crop for either forage or fertilizer. Thrives on nearly all soils, and grows four to five feet long. Being a legume it is a great soil builder. Can be sown either in the spring or fall. When it is to be cut for hay, it is best to sow some grain with it to act as a support. It can be cut twice, or used as a pasture after the first crop is taken off. Although an annual, it resows itself, and will come up on the same ground for several years.

FIELD PEAS

Peas are a very profitable crop, and will also build up the land by returning the much-needed nitrogen to the soil. The clovers alone rank higher than peas in their soil enriching properties. The vines can be used for hay, or the peas threshed and used for feed. Next to corn, peas have a higher feeding value than any other grain. Sow 100 to 180 lbs per acre. SULPHUR OR CROP YIELD

Experiments conducted by the Oregon Experiment Station proved beyond all doubt that the addition of sulphur to soils, increases the yield of ALL crops, and in many instances phenomenally. A remarkable result recorded is that by Dr. Reimer, who found that by harrowing in 300 lbs. of elemental sulphur per acre, the yield of alfalfa increased over 500 per cent. It has also been proved that the only benefits derived from the use of Land Plaster, were undoubtedly due to the sulphur which it contained, therefore making it poor business to apply land plaster. The sulphur in it being in the sulphate form, was rapidly consumed and exhausted by the plant. In applying the pure flour of sulphur, this form is broken down gradually into the sulphate form and the process may take two or three years. During this time the beneficial results of the sulphur continues. During this time the beneficial results of the sulphur continue. the influence of sulphur:—Barley 52.3 per cent, Oats 57.3 per cent, Wheat 127.8 per cent, Maize 182.6 per cent, Canadian Field Peas 383.3 per cent, Potatoes 63 per cent, Hubbard Squash 187.9 per cent. It has come to our notice that some prominent wheat growers made the experiment last year of using sulphur instead of formaldehyde for treating the wheat seed before planting. It is claimed that about 10 pounds of sulphur to ninety pounds of wheat seed drilled into the soil when planting, not only increased the crop of wheat, but prevented smut.

We certainly would appreciate a letter from you in July or August, 1922, giving us condition of your growing crop, and anything in our line you will have for sale after harvest. Only those things true to name and well matured and not mixed with other varieties.

MARK MEANS COMPANY,

The only path to success is the frequent turnover of your capital. On the farm this means the increased use of the money in a diversified way, such as dairying, poultry, hogs, cattle and sheep. This supplies ready money as well as keeping up the fertilizing of the soil, which necessitates the use of grasses and clovers.

SEED TREATMENT

Dipping either in a solution of Formaldehyde or one of Bi-Chloride of Mercury (Corrosive Sublimate) are the two methods generally recommended for treating seed potatoes, as follows:

Formaldehyde, 4 per cent Commercial Solution.....1 pint
Water 30 gallons

Soak the potatoes in this solution for two hours and spread out to dry. This treatment is effective against Scab but as it is not to be depended upon for Rhizoctonia, the Bi-Chloride of Mercury solution is always recommended as it will do all that the Formaldehyde accomplishes and takes care of our most troublesome disease, Rhizoctonia. The Bi-Chloride of Mercury solution is prepared as follows:

Bi-Chloride of Mercury (Corrosive Sublimate)..... 4 ounces
Water 30 gallons

Soak the potatoes in this solution from 1 1-2 to 2 hours and dry before planting.

SPECIAL NOTE—In dissolving the corrosive sublimate use a small amount of hot water, about a gallon to the ounce, adding it to the cold water when it is dissolved as it will be impossible to get good results by attempting to mix the entire amount in cold water.

WARNING—The poisonous nature and corrosive action of this solution makes it necessary to use care in handling and keep the potatoes from stock or poultry. Any that are not used should be burned or buried. Make the solution in a wooden or porcelain container as it will corrode metals and rapidly lose its strength.

Both of these solutions will lose strength through use or standing for any length of time and should be made up fresh and not more than four lots of potatoes dipped without renewing the solution. The dipping can be done in bags or crates but the potatoes should then be spread out to dry, care being taken not to re-infect them by using the same bags or containers or spreading them where they would again be in contact with untreated stock.

GREENING—After dipping, the seed should go through the process of greening, leaving them spread in the light and warmth when the light will cause them to assume a greenish color and sprouting will begin. Sprouts brought on in this way will be short and thick and the potato will awaken from its dormant condition and develop much more vigor and vitality than potatoes that are not so treated. The greening also is a big factor in eliminating fungus growth and diseases. Another very valuable result from greening is the time gained as the potatoes thus treated will germinate and develop very much earlier than they would otherwise.
