INTANGIBLE FOREST VALUES

A bibliography

Compiled by A. M. Avakian, Librarian
United States Forest Service
California Forest and Range Experiment Station
Berkeley, California
December 1941

The forest is the source of timber, naval stores, and other forest products to which one may give a specific value. But the forest has other uses,- it anchors the soil, conserves water, shelters wildlife, and serves as a great recreational playground for thousands of persons. What then is the forest worth? How can its intangible values be determined? Our search for references revealed some which attempt to establish a method of evaluation of intangibles, and a considerable number which generalize. However, we decided to include these peripheral references as useful background material. This list is not exhaustive, and it is suggested that the following bibliographies be consulted for other references.

A selected bibliography on management of western ranges, livestock and wildlife (U.S.D.A. Misc. pub. 281)

Bibliography on soil erosion and soil and water conservation (U.S.D.A. Misc. pub. 312)

Bibliography of North American forestry (U.S.D.A. Misc. pub. 364)

Forest recreation; a bibliography. U.S. Forest service, 1938.

A selected bibliography on the economics of forestry in the United States. U.S. Forest service, 1941. (This has just been issued and we have not yet been able to secure a copy for examination)

(Note: Library call numbers are given only for items in the station library)
