Lawn Making

Lawn making has been reduced to a science by the Department of Agriculture. Experiments have demonstrated that the stand-by of lawns in this country, where lawns can be made, is Kentucky blue grass; and that the best method of obtaining a blue grass lawn is to sow a mixture containing red top. The latter germinates more quickly, and helps make a thick lawn the first few years, but gradually gives way to the spreading blue grass. White clover is usually mixed in, where clover is not objectionable, because it helps thicken the early turf, and secretes nitrogen from the air, which helps the grass. Our grass seed is exactly what we represent, recleaned and free from weeds.

Loosen the soil in which a new lawn is to be made to a depth of at least five inches, and lighten it with humus or several inches of sand, compost, manure or wood ashes if it is heavy and inclined to bake. Apply fertilizer liberally, either sheep manure, bone meal or a commercial fertilizer.

Sow in the early spring when cool weather and ample rainfall will insure complete germination and a good start for the seedlings before hot dry weather comes.

If seeding must be delayed, special precautions must be taken to prevent the ground drying out. Early fall is a very desirable time to plant.

See that the seed is well covered. Rake it into a new seed bed and roll so that the soil is firmed over the seed. Where seed is sown on an old lawn always cover it with a top dressing of sand or soil and fertilizer. Seed thrown on the top of hard ground has no chance to grow and will merely wash off.

Quantity to use — On new lawns, use 1 pound for 300 square feet; 5 pounds for 1,500 square feet; 10 pounds for 3,000 square feet; 15 pounds for 4,250 square feet; 25 pounds for one-fourth acre; 100 pounds for one acre. To replenish lawns where turf is thin use half quantity.

Special Lawn Mixture — Of scientifically balanced blue grass, red top, white clover. Pound, 45 cents; 5 pounds, $2.15; 10 pounds, $4.25.
