INTRODUCTION

The purpose of Volume 1 of the Montana Statewide Comprehensive Outdoor Recreation Plan is to define a goal-objective oriented program management system. Montana Department of Fish and Game goals, policies, objectives, problems, strategies and tasks are developed to aid managers in the decision-making process. Volume 1 is a strategic plan.

Volume 2 consists of an inventory of the recreation resources and opportunities with which the Department must work on a day-to-day basis in order to accomplish the tasks set forth in Volume 1. The inventory includes a brief general description of factors such as climate, topography, scenic resources, wildlife and other physical and social characteristics which influence the character and magnitude of outdoor recreation activity within the state.

Government and other agencies are identified which administer significant recreation resources or programs. Lands and waters presently dedicated to outdoor recreation are identified and listed by county. Special features such as historic and natural areas and recreation roads, trails and waterways are also identified. Finally, processes are described which are helping the Department to assess the recreation potential of existing public lands and waters and opportunities for private lands as well.

The inventory then, represents a catalog of the location, size, capacity and ownership of resources which are presently significant in providing outdoor recreation opportunities.

CHARACTERISTICS OF RECREATION RESOURCES IN MONTANA

Montana has two major land regions. They are (1) the Great Plains and (2) the Rocky Mountains.

The Great Plains of Montana are part of the vast Interior Plain of North America that stretches from Canada to Mexico. In Montana, this high, gently rolling land makes up the eastern three-fifths of the state. The land is broken by hills and wide river valleys. Here and there, groups of mountains rise sharply from the plains. These ranges include the Bear Paw, Big Snowy, Judith, and Little Rocky. In the southeast, wind and water have created a badland of gullies and colorful columns of red, yellow, brown, and white stone.

The Rocky Mountains cover the western two-fifths of Montana. The valleys have flat, grassy floors, and the mountains are forested with fir, pine, spruce, and other evergreens. In southwestern Montana, the valleys may stretch 30 to 40 miles from one mountain range to another. In the northwest, most valleys are narrow--from 1 to 5 miles wide. Snow covers the higher mountains for to six months each year. There are many permanent snowfields and a few active glaciers in the higher ranges. The glaciers that once covered this land carved the highest mountains into jagged peaks and left thousands of clear, cold lakes.

There are over 50 mountain ranges or groups in this area. The most important ranges include the Absaroka, Beartooth, Beaverhead, Big Belt, Bitterroot, Bridger, Cabinet, Crazy, Flathead, Gallatin, Little Belt, Madison, Mission, Swan, and Tobacco Root.

Montana is the only state drained by river systems which empty into the Gulf of Mexico, Hudson Bay, and the Pacific Ocean. The Missouri River system drains

into the Gulf of Mexico by way of the Mississippi River. The Columbia drains into the Pacific Ocean. The Belly, St. Mary's, and Waterton rivers reach Hudson Bay through the Nelson-Saskatchewan river system.

Montana's most important rivers are the Missouri and its branch, the Yellowstone. These rivers drain about six-sevenths of the state. The Jefferson, Madison, and Gallatin rivers meet near the town of Three Forks and form the Missouri. The Missouri flows north past Helena, then through a deep scenic gorge called the Gates of the Mountains. It curves eastward toward Fort Peck in northeastern Montana and leaves the state at the North Dakota border. The main tributaries of the Missouri in Montana are the Marias, Milk, Sun, and Teton.

The Yellowstone flows north out of Yellowstone Park and then runs east and somewhat north. It joins the Missouri in North Dakota. The chief branches of the Yellowstone--the Bighorn, Clarke Fork, Powder, and Tongue rivers--flow into it from the south.

The Continental Divide winds through Montana. The height of land separates the waters running west and the Pacific from those that run east to the Atlantic.

The major rivers west of the divide are the Kootenai and the Clark Fork of the Columbia. The chief branches of the Clark Fork are the Bitterroot, Blackfoot, Flathead, and Thompson rivers. These western streams drain only about one-seventh of Montana.

Montana has only one large natural lake. This is Flathead Lake, which covers about 189 square miles in the northwest. The largest man-made lake is Fort Peck Lake, on the Missouri River, which covers 383 square miles. Other large lakes include Canyon Ferry, Hungry Horse, and Tiber

reservoirs. Yellowtail Dam, which was completed in 1966, creates a lake 71 miles long in Montana and Wyoming.

In 1967, army engineers began building the Libby Dam on the Kootenai River in northwestern Montana. The dam will produce 840,000 kilowatts of hydroelectric power and provide flood control. It creates a lake that is 90 miles long and extends 42 miles into Canada.

Montana's climate varies considerably from one area to the other because the state is so large and has such great differences in elevation. The region west of the Continental Divide has cooler summers and warmer winters than the area east of the divide. In the west, the average temperature is about 20°F. July temperatures average 64°F. in the west, and 71°F. in the east.

Most of Montana, except the western edge, has annual precipitation (rain, melted snow, and other forms of moisture) of 13 to 14 inches. The western mountain areas receive more moisture than the plains. Haron, in the northwest, gets more than 34 inches a year. Snowfall in Montana ranges from as little as 15 inches to as much as 300 inches annually.

Montana's land features divide it into two main economic regions. On the plains, agriculture and coal and oil production are the most important industries. In the mountains, metal mining and logging are the major activities. Both regions have manufacturing plants as well as a heavy dependence on tourism.

The U.S. government owns about 30 percent of the land in Montana. Government agencies control grazing of sheep and cattle, cutting of trees, and mining in those areas. This makes the federal government an important factor in the economy of Montana.

The soils of the northern part of the state are a mixture of clay, sand, and gravel left by melting glaciers.

Much of the soil of the southern part was formed from rocks of shallow seas that covered the area millions of years ago. Along the rivers and in the western valleys, silts deposited by water form the soils. In a few areas, fertile wind-blown dust lies in a thick layer. In southwestern Montana, ash from ancient volcanic eruptions has enriched the soil.

Montana has huge deposits of three important minerals--coal, copper, and petroleum. Reserves of coal rank among the nation's largest. About 2 billion short tons (1.8 billion metric tons) of bituminous (soft) coal lie under Montana. In addition, there is more than 100 times that much coal of lower quality. The reserves of copper around Butte are among the largest in the nation. Petroleum reserves exceed 200 million barrels. Natural gas is found in many oil fields.

Beneath Butte Hills and Summit Valley, in the western mountains, lie huge ore reserves. In addition to copper, this ore contains gold, lead, silver, and zinc. Smaller quantities of metals lie in other western Montana areas. Other mineral reserves include bentonite, chromite, clay, fluorspar, gemstones, gypsum, limestone, manganese, phosphate rock, pumice, sand and gravel, talc, tungsten, uranium, and vermiculite.

About two-thirds of Montana, or 60 million acres, was originally grassland. Of this, about 45 million acres--half of the area of the state--are still used for grazing. The most important grasses are buffalo grass, blue grass, and western wheat grass.

Forests cover about 23 million acres, or about one-fourth of Montana. About 7 million acres are not available for logging. Some forests are in national parks and other reserves. Others are too poor in quality or too far from transportation to be useful. Much of the 16 million acres of commercial timber is still virgin forest. Douglas fir is the most important tree for logging. Various kinds of cedar, pine, and spruce also are important.

Montana has large numbers of big game animals. Deer are found both on the plains and in the mountains. Pronghorn antelope thrive on the plains. Bear, moose, mountain goats,

mountain sheep, and elk live in the mountains. Small fur-bearing animals such as beaver, mink, and muskrat are also found there. Common game birds include wild ducks and geese, grouse, pheasants, and partridges. Montana's high cold streams and lakes are famous for trout and grayling.

Farm products account for approximately half of the value of goods produced in Montana each year. The state has about 25,000 farms. Montana farms average about 2,500 acres, but many ranches cover a much larger area.

Much of the farmland is used for grazing. Livestock products account for about two-thirds of Montana's farm income.

A fourth of the farmland is planted in crops. Montana ranks among the leading states in wheat production. Montana farmers also raise barley, hay, potatoes, and sugar beets. About 1,800,000 acres of Montana's farmland are irrigated. Sugar beets and hay are the chief irrigated crops. Farmers in irrigated areas also grow potatoes and other vegetables. The state's biggest fruit crop is sweet black cherries.

Manufacturing, including processing, provides a fourth of the annual value of Montana's products.

The manufacture of lumber and wood products is Montana's most important industry. The state ranks as a leading producer of softwood logs.

Most of Montana's other manufacturing consists of refining and processing of its farm and mineral products.

In order to fully understand Montana's complex recreation pattern, an important distinction must be made between resources: some are intrinsic resources

and some are derived resources. Intrinsic resources, such as land, wildlife, water, air, and natural beauty, exist independently as part of self-perpetuating ecological systems and require little application of factors of production (energy, capital, labor) to be of value. Derived resources such as minerals, timber, and agricultural products, only become valuable to man through the production system. Intrinsic resources are unique, their value is independent of the production system, and their value can only increase over time. The value of derived resources is closely linked to availability and cost of production factors and to the emergence of potential substitutes. Since the availability of derived resources inevitably requires compromising certain intrinsic resources, conflict between intrinsic and derived resources are expected to increase as are conflicts between managers of the respective resources.

Recreation, because it occurs in many forms, is dependent upon both derived and intrinsic resources. At one end of the spectrum is the intensively developed recreational facility, such as a gymnasium, which is a derived resource. At the other end is the recreational activity such as the "wilderness" experience which is dependent on intrinsic resources. In between are the vast majority of recreational resources in Montana--those which are themselves derived resources, but which are vital in providing access to intrinsic resources, resources which may be themselves valued for their potential worth as derived resources. The implication is twofold.

First, recreation will inevitably be in the midst of resource use conflicts. Because of the decentralized nature of resource management and the incomprehensible variety of roles, responsibilities, and policies of the several levels of government and the private commercial and non-commercial sector, the possibilities of conflict

are limitless. A central objective of this plan is to contribute to a lessening of the atmosphere of actual and potential conflict by clearly articulating the roles, responsibilities and policies of a single agency--the Montana Department of Fish and Game.

Second, methods of studying recreation resources and behavior are most easily applied to derived resources. Table I illustrates that it is relatively simple to identify and describe derived resources.

Table I
Summary of Derived
Recreational Resources
in
Montana

Administrator	Number of Sites	Percent of all Sites
Federal	425	42%
State	292	29%
Local	36	3%
Private	269	26%
(commercial and non- commercial)	1077	100%

only in the light of adjacent intrinsic resources. While measurement of behavior with respect to intrinsic resources is possible in theory, methodologies in practice remain primitive, uncertain and difficult to implement. Since traditional supply-demand models rely on fairly sophisticated levels of measurement, measurements which cannot be achieved in light of the intrinsic resources which characterize Montana, considerable modification of the "supply-demand-needs" model is necessary.

Consequently, though somewhat more complex, behavior at these derived resources is theoretically relatively simple to quantitatively describe. Intrinsic resources generally are not so simply quantified; however, a sizable amount of recreation activity in Montana is and will remain entirely dependent upon intrinsic resources while much of the value of derived resources (Table I) is comprehensible

STATEWIDE NON-URBAN DEVELOPED RECREATION SITE INVENTORY

The following listings, maps, and glossary were compiled on a county-by-county basis and are intended to update the January, 1976, inventory. The compilation is current as of January, 1978; however, the inventory is only as current as the data base listed below. It is designed to be used as a ready reference and will be subject to continual revision and updating. This inventory was compiled as a part of a cooperative statewide land use mapping effort.

Inventory SourcesFederal Ownership

1. U.S.G.S. Topographic maps - Federal Center, Denver, Colorado.
2. BLM Recreation Guide, Montana - BLM, 316 N. 25th St., Billings, Montana.
3. U.S. Forest Service RIM Directory - Information Document, 1976 (microfilm) Northern Region Headquarters, Federal Building, Missoula, Montana.
4. National Forest Camp and Picnic Area Directory, 1971 - Northern Region Headquarters, Federal Building, Missoula, Montana.
5. National Forests Maps - Northern Region Headquarters, Federal Building, Missoula, Montana.
6. Camping in National Park System, 1977 - National Park Service, U.S.D.I., Washington, D.C.

State Ownership

1. Montana Recreation Guide, 1977 - Parks Division, Montana Department of Fish & Game, Helena, Montana.
2. Montana Water Resources Board Project Recreation Map, 1971 - Montana Department of Natural Resources, Helena, Montana.
3. A Listing of Lands controlled by the Montana Fish & Game Commission July-1976 - Montana Department of Fish and Game, Helena, Montana.
4. The Official Montana 1977 Highway Map - Montana Department of Highways, Helena, Montana.

Local Public and Private

1. Biennial Inventory of Existing and Potential Recreation Use and Development at Licensed Hydroelectric Projects, 1973 - Federal Power Commission, Wash., D.C.
2. Montana Farm & Ranch Vacation Guide, Fourth Edition, February, 1976 - Cooperative Extension Service, Montana State University, Bozeman, Montana.

5. Woodall's Campground Directory, 1977.
6. AAA Northwestern Camping Guide, 1975-1976.
7. KOA Handbook and Directory for Campers, 1977.
8. Old West Trail Vacation Guide, 1977 - Old West Trail Foundation, Rapid City, South Dakota.
9. An Accommodations Guide to Montana, 1975-1976 - Montana Chamber of Commerce, Helena, Montana.
10. Wintertime Guide to Montana, 1977 - Montana Travel Promotion Unit, Montana Department of Highways, Helena, Montana.
11. Inventory of Private Recreation Facilities, 1977 - National Association of Conservation Districts, League City, Texas.
12. Sunset Western Campsites 1978. Lane Publishing Co., Menlo Park, California.

GLOSSARY

Non-urban Developed Recreation Site

Where management intent is to enhance outdoor recreation use opportunities by investing money in site modification and facility installation in areas outside of cities or towns. Examples include:

campgrounds	observation and interpretive sites
picnic areas	water sports sites
organization sites	playgrounds and parks
resorts	State Parks (S.P.)
commercial public	State Recreation Areas (S.R.A.)
service sites	State Monuments (S.M.)
recreation residences	State Fishing Access Sites (F.A.S.)
winter sports sites	

Ownership/Administrator

I. Federal:

BIA - Bureau of Indian Affairs
BLM - Bureau of Land Management
BUR - Bureau of Reclamation
CE - Army Corps of Engineers
FS - Forest Service
FWS - Fish and Wildlife Service
NPS - National Park Service

II. State:

FG - Department of Fish and Game
HD - Department of Highways
DNR - Department of Natural Resources

IV. Private & Non-Profit:

BSA - Boy Scouts of America
MOA - Campgrounds of America
P - Other private or non-private
R - Church or religious group

Picnic Unit

Each unit ordinarily consists of a table with access to a stove or fireplace, garbage can, toilet and drinking water and will accommodate an average of 5 persons or one family.

Camp Unit

Each unit ordinarily consists of a table, parking spur, tent pad and stove or fireplace with access to a garbage can, toilet and drinking water and will accommodate an average of 5 persons or one family.

Facilities/Activities - Other

B - boating	BR - boat rental
F - fishing	BT - bicycle trail
H - hiking	FT - float trips
I - information or interpretive exhibits	HR - horseback riding
S - swimming area	HS - hot springs
T - trailhead	WS - water skiing
TH - trailhead with horse facilities	DS - downhill skiing
TC - trailer/camper hookups	CC - cross-country skiing
W - waste disposal station	SB - snowmobiling
BH - bathhouse	
BA - boat access	
BD - boat dock	

Department of Fish and Game Lands

Fish and Game lands listed in this inventory are unique from other classes of ownership or administration in that this inventory was used to report a listing of Department-owned lands, other than administrative sites, regardless of whether they contain developed recreation facilities. Developed sites are easily recognized however by scanning the "picnic unit", "camp unit" and "other" columns.

HISTORIC AND NATURAL AREAS

National Register of Historic Places

Listed below are all sites currently on the National Register of Historic Places in Montana. They are identified as to name, location, and National Landmark status. Following this listing is a map of Montana showing National Register sites

and a series of regional maps showing other places of historical significance in Montana current as of July, 1975. More information on historic preservation in Montana is available from:

Montana State Historic Preservation Officer
Montana Historical Society
225 N. Roberts
Helena, Montana 59601

National Register Sites in Montana
as of March 1, 1978

Beaverhead County

LEMHI PASS. National Historic Landmark. Alza, Lemhi County, Idaho

BANNACK HISTORIC DISTRICT. National Historic Landmark. S.E. of Dillon.

LAMARCHE GAME TRAP. Dillon vicinity.

BIG HOLE NATIONAL BATTLEFIELD. Wisdom vicinity.

Bighorn County

BIGHORN DITCH HEADGATE. At mouth of Bighorn Canyon.

FORT C.F. SMITH HISTORICAL DISTRICT. Fort Smith vicinity - on Bighorn Canyon National Recreation Area.

CUSTER BATTLEFIELD NATIONAL MONUMENT. Hardin vicinity.

CHIEF PLENTY COUPS MEMORIAL. 1 mile west of Pryor.

BATTLE OF THE ROSEBUD SITE. 6 miles south of Kirby.

Blaine County

CHIEF JOSEPH BATTLEGROUND OF THE BEAR'S PAW. Bear paw Mountain Fight (15 miles south of Chinook.)

Broadwater County

RANKIN RANCH. National Historic Landmark.
Avalanche Gulch.

Carbon County

DEMIJOHN FLAT ARCHAEOLOGICAL DISTRICT. Bridger
vicinity.

PRETTY CREEK ARCHAEOLOGICAL SITE. 70 miles south
of Hardin, Bighorn Canyon National Recreation
Area.

CEDARVALE. Hillsboro and vicinity in Bighorn
Canyon National Recreation Area.

BAD PASS TRAIL. (Sioux Trail) E. of Warren in
Bighorn Canyon National Recreation Area.

PETROGLYPH CANYON. S.E. of Warren.

EWING SHELL RANCH. Dryhead vicinity.

Cascade County

GREAT FALLS CENTRAL HIGH SCHOOL. 1400 1st Avenue N.

CHARLES M. RUSSELL HOUSE AND STUDIO. National
Historic Landmark. 1217-1219 4th Avenue N.

GREAT FALLS PORTAGE. National Historic Landmark
S.E. of Great Falls at junction of Highways 87,
89, and 91.

MULLAN ROAD. N. of Great Falls, in Benton Lake
National Wildlife Refuge.

ULM PISHKUN. (Ulm Buffalo Jump) N.W. of Ulm.

Chouteau County

LEWIS AND CLARK CAMP AT SLAUGHTER RIVER. 40 miles
south of Big Sandy.

FORT BENTON. National Historic Landmark. In Fort
Benton.

FORT BENTON HISTORIC DISTRICT. City of Fort Benton.

GHAHD UNION HOTEL. In Fort Benton.

CITADEL ROCK. (Cathedral Rock) E. of Fort Benton
on Missouri River.

JUDITH LANDING HISTORIC DISTRICT. N.W. of Winifred
on Missouri River.

Dawson County

CHARLES KRUG HOUSE. 103 N. Douglas Street, Glendive.

HAGEN SITE. National Historic Landmark. S.E. of
Glendive.

Deer Lodge County

HEARST FREE LIBRARY. Anaconda, Main & 4th Streets S.

MARCUS DALY HOTEL. Anaconda, Park Avenue and South
Main Street.

Fergus County

JUDITH LANDING HISTORIC DISTRICT. See also Chouteau
County.

ROCKY POINT. 30 miles South of Landusky in Charles
M. Russell National Wildlife Range.

Flathead County

CHARLES E. CONRAD MANSION. Kalispell, 113 6th Ave. E.

SPERRY CHALETS. West Glacier vicinity.

Gallatin County

MADISON BUFFALO JUMP STATE MONUMENT. 7 miles south of Logan.

THREE FORKS OF THE MISSOURI. (Missouri Headwaters) Three Forks vicinity. National Historic Landmark.

Glacier County

MANY GLACIER HOTEL HISTORIC DISTRICT. West of Babb.

CAMP DISAPPOINTMENT. National Historic Landmark. 12 miles N.E. of Browning.

Granite County

MINERS UNION HALL. 4 miles east of Phillipsburg. (Ghost town of Granite).

SUPERINTENDENT'S HOUSE. 4 miles east of Phillipsburg. (Ghost town of Granite)

Hill County

TOO CLOSE FOR COMFORT SITE (WAHPA CHU'GN BUFFALO JUMP AND ARCHAEOLOGICAL SITE) Havre vicinity.

Jefferson County

FRATERNITY HALL. Ghost town of Elkhorn. Lot 14 Main Street.

W. C. CHILO RANCH. Near East Helena.

Lake County

ST. IGNATIUS MISSION. In St. Ignatius.

Lewis and Clark County

FORMER MONTANA EXECUTIVE MANSION. 6th Avenue and Ewing Street, Helena.

HELENA HISTORIC DISTRICT. City of Helena.

KLUGE HOUSE. 540 West Main Street, Helena.

Madison County

ROBBERS ROOST. (ONLY'S PLACE) 5 miles N. of Alder.

BEAVERHEAD ROCK. (LEWIS AND CLARK EXPEITION SITE) 14 miles N.E. of Dillon.

VIRGINIA CITY HISTORIC DISTRICT. National Historic Landmark. Virginia City.

Meagher County

FORT LOGAN AND BLOCKHOUSE. 17 miles N.W. of White Sulphur Springs.

BYRON R. SHERMAN HOUSE. (THE "CASTLE") White Sulphur Springs.

Missoula County

LOLO TRAIL. National Historic Landmark. Also. Clearwater County, Idaho

TRAVELERS REST. National Historic Landmark. 1 mile south of Lolo.

MISSOULA COUNTY COURTHOUSE. Missoula

FORT FIZZLE SITE. South of Missoula

Pondera County

TWO MEDICINE FIGHT SITE. 25 miles S.E. of Browning

Rowell County

GRANT-KOHRS RANCH NATIONAL HISTORIC SITE. North of Deer Lodge.

MONTANA TERRITORIAL AND STATE PRISON. 925 Main Street, Deer Lodge.

Revella County

ALTA RANGER STATION. South of Conner.

CANYON CREEK LABORATORY OF THE PUBLIC HEALTH SERVICE. West of Hamilton.

BIG CREEK LAKE SITE. West of Stevensville.

FORT OWEN. N.W. of Stevensville.

ST. MARY'S CHURCH AND PHARMACY. Stevensville.

Roosevelt County

FORT UNION THADING POST NATIONAL HISTORIC SITE. Also, Williams Co., N.D.

FORT PECK AGENCY. Poplar

Sheridan County

TIPI HILLS. S.E. of Medicine Lake, in Medicine Lake National Wildlife Refuge.

Silver Bow County

BUTTE HISTORIC DISTRICT. National Historic Landmark. City of Butte.

Silver Bow County (cont.)

CHARLES W. CLARK MANSION. 108 North Washington, Butte.

W. A. CLARK HANSION. 219 West Granite, Butte.

BURTON K. WHEELER HOUSE. 1232 E. 2nd Street, Butte.

Wibaux County

PIERRE WIBAUX HOUSE. Orgain Avenue, Wibaux.

Yellowstone County

BILLINGS CHAMBER OF COMMERCE BUILDING. 303 North 27th, Billings.

PARMLY BILLINGS MEMORIAL LIBRARY. 2822 Montana Ave., Billings.

J.D. O'DONNELL HOUSE. Billings.

AUSTIN NORTH HOUSE. Billings.

HOSKINS BASIN ARCHAEOLOGICAL DISTRICT. Billings vicinity.

PICTOGRAPH CAVE. National Historic Landmark. 7 miles southeast of Billings Indian Cave Park.

POMPEY'S PILLAR. National Historic Landmark. West of Pompey's Pillar, on U.S. 10.

National Registry of Natural Landmarks

The National Registry of Natural Landmarks parallels, at the national level, the National Register of Historic Places, in that it lists the natural areas that are nationally significant (natural landmarks) similar in importance to the historical or archaeological areas that are nationally significant (national historic landmarks) listed in the National Register of Historic Places. The difference between the two registers is that the National Register of Historic Places includes, in addition to national historic landmarks, historic areas administered by the National Park Service and historic places of state and local significance.

Criteria

To be eligible for natural landmark designation, a site must be nationally significant as possessing exceptional value or quality in illustrating or interpreting the natural heritage of our Nation, and must present a true, accurate, essentially unspoiled example of natural history.

Examples of the kinds of areas which could qualify for natural landmark designation are:

1. Outstanding geological formations or features significantly illustrating geologic processes.
2. Significant fossil evidence of the development of life on earth.
3. An ecological community significantly illustrating characteristics of a physiographic province or a biome.
4. A biota of relative stability maintaining itself under prevailing natural conditions, such as a climatic climax community.
5. An ecological community significantly illustrating the process of succession and reversion to natural condition following disruptive change.

6. A habitat supporting a vanishing, rare, or restricted species.
7. A relict flora or fauna persisting from an earlier period.
8. A seasonal haven for concentrations of native animals, or a vantage point for observing concentrated populations, such as a constricted migration route.
9. A site containing significant evidence illustrating important scientific discoveries.
10. Examples of the scenic grandeur of our natural heritage.

Implementation

If, after study by the Heritage Conservation and Recreation Service (HCERS), the site is considered to possess the requisite characteristics for landmark designation, it is proposed to the National Park System Advisory Board for consideration. The Advisory Board, authorized by the Act of August 21, 1935 (49 Stat. 667; 16 U.S.C. 463), is composed of 11 nonalarmed members who are appointed by the Secretary of the Interior and who are competent in the fields of history, archaeology, architecture, or human geography. If the Advisory Board finds that the site is of national significance, the Board recommends that the Secretary of the Interior designate the site as a natural landmark. Upon the Secretary's approval, the site is added to the National Registry of Natural Landmarks. The owner is then invited to apply for a certificate and bronze plaque designating the site as a registered natural landmark.

Registration as a natural landmark requires agreement by the landowner to preserve, insofar as possible, the significant natural values contained in the site. In applying for such registration the owner agrees to so manage the site as to prevent the destruction or deterioration of the values upon which landmark status is based. He relinquishes none of his

rights or privileges as to use of the land. Neither does the Department of the Interior gain any possessory interest in lands so designated, but will, upon request, provide consultative assistance in protecting and interpreting the natural values of the site.

Should the natural integrity of a designated site deteriorate from either natural or man-induced causes, to the extent that national significance is lost, the site will be removed from the National Registry of Natural Landmarks.

To provide a logical and scientific basis for the selection of natural landmarks, NCRS is using a system of natural history themes which broadly classifies all of the major natural phenomena into themes. The Natural Landmarks Program is contracting studies of natural regions to identify sites that best characterize themes significantly represented in the respective regions. The following inventory lists sites which have thus far been identified through the activities of the Natural Landmarks Program.

The Inventory is divided into three categories:

(1) National Registry of Natural Landmarks; (2) Potentials; and (3) Inactive. Sites listed under the first category, i.e., National Registry of Natural Landmarks, have been designated natural landmarks by the Secretary of the Interior. These sites are periodically listed in the "Federal Register." All natural landmarks are classed as either "Eligible" or "Registered." Eligible sites are those which have only been announced by the Secretary as natural landmarks while registered sites (designated by an asterisk on the Index) are ones in which the owners have voluntarily agreed to preserve the natural values of the site following the Secretary's designation of them as eligible. Whether registered or eligible, they are all natural landmarks and deemed to be of national significance as an illustration of our natural heritage.

For an "Eligible" site, the date shown on the inventory sheet is the day when the Secretary of the Interior approved the site as a natural landmark. For a "Registered" site, the

date shown is the day when the owner's application for registration, in which he voluntarily agrees to preserve the site, is received by Heritage Conservation and Recreation Service.

The Potential category lists areas which have been identified through the natural history theme study method but have not yet been designated as natural landmarks by the Secretary. Sites identified in natural history theme studies must be further evaluated in the field and be reviewed by the Natural Landmarks Program staff. If positive evaluations are made all along the way, the staff recommends these significant natural areas for listing on the National Registry of Natural Landmarks by the Secretary of the Interior. Based on past experience, approximately 50 percent of the sites listed as potentials are eventually designated as natural landmarks by the Secretary. Those areas which are turned down at one point or another in the process are listed in the Inactive category. Inactive sites are those which are considered to possess less than national significance. The date when a particular site was inactivated is shown on the inventory sheet. Most inactive sites would undoubtedly be of either state or local significance.

In order to include as much information as possible in a summary chart format, several abbreviations are used as follows:

1. BLM - Bureau of Land Management, Department of the Interior
2. Eval. 5-73 - Field evaluation report received by Natural Landmarks Program in May, 1973.
3. NWR - National Wildlife Refuge
4. USFS - Forest Service, Department of Agriculture
5. USFW - Fish and Wildlife Service, Department of the Interior

Additionally, the natural history theme study which recommended the site is abbreviated as follows:

1. GP-G - Great Plains Natural Region (Geological Themes).
2. LCS - Limestone Caverns and Springs.
3. GP-E - Great Plains Natural Region (Ecological Themes).
4. WV - Works of Volcanism.
5. IW - Inland Wetlands.
6. MF - Mesozoic Vertebrate Paleontological Sites

National Natural Landmark Briefs

Bridger Fossil Area: This 160-acre site contains exposures of the Cloverly Formation in badlands topography. The site produced nearly all of the known remains of *Deinonychus antirrhopus*, a new genus and species of carnivorous dinosaur, which are now housed in the Yale Peabody Museum. The small bipedal flesh-eating dinosaur was about 3 1/2 feet tall, about 8 feet long and probably weighed approximately 150 pounds.

Bug Creek Fossil Area: The Bug Creek Fossil Area includes three excavations in the Hell Creek formation which have produced abundant remains of Cretaceous Mammals. These mammals must have been tiny, mouse-size, or smaller. The material consists of isolated bones, sometimes broken; jaws or jaw fragments; and isolated teeth. The sediments in which they occur are unconsolidated channel sandstone with streaks of pea-sized mud lumps.

Of the three excavations Bug Creek Anthills has been the most productive. As of December 1964, it has produced 26,000 mammal teeth, 1,000 mammal jaw fragments, and hundreds of isolated mammal bones. Twenty species of multi-tuberculata, marsupials, and true mammals are represented in this wealth of fossils. This very productive site has extended the time-range of four families of Paleocene mammals (Eucomodontidae, Tseniolabidae, Leptictidae, and Arctocyonidae) backward into the Cretaceous which indicated that the sudden explosion of mammal species at the beginning of the Paleocene is more apparent than real due to the incompleteness of the record.

This site is the type locality of five mammal species new to science: *Cinekomys minor*, Sloan and van Valen; *Stygimys kuszmauli*, Sloan and van Valen; *Catopsalis joyneri*, Sloan and van Valen; *Procerverus forniciferus*, Sloan and van Valen; and *Protungulatum donnae*, Sloan and van Valen. (White) The site includes approximately 800 acres.

Capitol Rock: This 240-acre area is an erosional remnant, carved in white clay and sandstone of Tertiary age, which resembles a capitol building when viewed from the east. The base of Capitol Rock is tree-covered, so that even when viewed from 50 miles out on the prairie, the white mass of the "capitol" stands out clearly. Capitol Rock lies at the southeastern margin of the steep-sided, scenic Long Pine Hills, which rise as much as 1000 feet above the nearby Little Missouri River and Boxelder Creek. The Long Pine Hills are a remnant of the widespread deposits that were laid down in the northern Great Plains by streams from the Rocky Mountains from the beginning of Tertiary time, approximately 60 million years ago. About 5 to 7 million years ago, however, streams began to erode and remove much of the material they had deposited over so many millions of years. This major reversal from stream deposition to stream erosion was probably caused by a climatic change. In a few places, such as in the Long Pine Hills, remnants of interstream divides are left as buttes or tablelands to record the former more extensive presence of these deposits. Capitol Rock is an excellent example of such a butte. The site is located 30 miles southeast of Elkhart.

Cloverly Formation Site: The topography of this region is characterized by broad, nearly flat-topped plateaus bounded by 100 to 300 foot scarps along broad stream valleys. Exposures of the Morrison-Cloverly sequence occur in the erosional scarps bounding the plateaus. The Cloverly Formation is nearly 150 feet thick and consists of variegated red-brown, maroon, and gray claystone interbedded with brown sandstone; it lies above the Morrison Formation which is 85 feet thick and is overlain by 14 feet of resistant sandstone of the Sykes Mountain Formation. A total of 15 square miles in this area where the Cloverly Formation is exposed has produced large numbers of vertebrate remains at 44 localities, 23 of which produced important collections, particularly dinosaurs. Since these sites are scattered and widely separated, the most highly fossiliferous 1120-acre site is recommended for landmark status.

Glacial Lake Missoula: Glacial Lake Missoula was the largest of several lakes impounded by the Cordilleran Ice Sheet in the Northern Rocky Mountains during the Quaternary period. It lay in the drainage of the Clark Fork River and was dammed just east of the Montana-Idaho boundary by the Lake Pend Oreille Lobe of the Cordilleran Ice Sheet. During its maximum stages, Glacial Lake Missoula had a surface area of about 2,900 square miles and contained more than 500 cubic miles of water. At the dam the water was at least 2,000 feet deep against ice at least 3,500 feet thick.

Impounding probably occurred during each glacial advance for evidence shows that the ice sheet blocked the Clark Fork River at least five times (Richmond, et al, 1965). The ice dam impounding Glacial Lake Missoula collapsed at least three times, releasing catastrophic floods of enormous magnitude across the Columbia Plateau. Pardee estimated that the waters of Lake Missoula, 1,000 feet deep at Eddy Narrows in the canyon of the Clark Fork River west of Parma, were withdrawn at a peak discharge rate of about 10 cubic miles per hour. Approximately 380 cubic miles of water passed through these narrows during withdrawal. Catastrophic flood withdrawal was demonstrated by Pardee (1942) who described various types of evidence such as scouring, high eddy deposits of flood debris, flood bars of boulders and coarse gravel, and successions of giant arcuate ripples or ridges of gravel resting on bedrock surfaces.

The ripples appear as ridges, 15 to 50 feet high, 100 to 250 feet broad and from 100 yards to a half-mile long. They generally traverse the direction of the current. The form, structure, and arrangement of these features is similar to that of ordinary current ripple marks, but they are so large that the term "ripple mark" is inappropriate. They are, therefore, called flood ripples.

The site contains 640 acres located about 12 miles north of Parma in Sanders County, Montana. Part is owned by Mr. Sidney C. Cross, and part by his grandmother, Mrs. Anna Lauerman. It is managed by Mr. Cross for cattle grazing which does not destroy the scientific significance of the topography.

Hell Creek Fossil Area: This site is complementary to the Bug Creek Fossil Area which is located approximately 30 miles east-northeast. The fossils here are representative of large dinosaurs of a slightly earlier time, while those of Bug Creek represent small mammals which followed. In effect these two sites span the decline of the dinosaurs and the beginning of mammalian dominance.

The exposure of dark gray siltstones and sandstones found along the valley of Hell Creek are the type exposure of the Hell Creek formation of late Cretaceous age. The type specimen of *Tyrannosaurus rex*, largest of the carnivorous dinosaurs, was found in these sediments. This is the only known locality for this species in North America. It is also the type locality for *Ankylosaurus magniventris* and for *Brachychampsa fontana*, the oldest known true alligator. Several specimens of *Triceratops prorsus*, a horned dinosaur, have been found here.

Middle Fork Canyon: The Middle Fork of Sixteenmile Creek has cut a canyon, over 2,000 feet deep, through Hatfield Mountain exposing a cross-section of a large anticline. This antinormal arch of resistant Paleozoic limestones was exposed as the overlying softer rocks were stripped away by erosion. The deformation of sedimentary rocks in this area has left a landscape of broad synclinal downfolds alternating with sharply deformed anticlines such as Hatfield Mountain. This deformation--which occurred during Paleocene time, about 50 million years ago--was apparently caused by eastward sliding of the entire layered section down the gently sloping flank of a regional uplift to the west. The lowermost layers exposed in the canyon are thinly-bedded limestones of the

Middle Fork Canyon formation that are complexly deformed. The overlying Mission Canyon formation, which consists of very massively bedded limestone, forms a broad and simple arch corresponding to the shape of Hatfield Mountain. Middle Fork Canyon clearly shows the effects of erosion and stream superposition. It appears that the Middle Fork began flowing on a level surface above the present level of its canyon and came down onto Hatfield Mountain as the general level of the surrounding landscape was reduced by erosion. Evidence indicates that the erosion of Middle Fork Canyon has been accomplished within the past 3 million years. The canyon floor is filled with a forest of aspens, cottonwoods, and conifers growing along the stream bank. The canyon walls contain high cliffs of pale limestone rising out of slopes heavily forested with conifers. The 960 acre site is located 30 miles north of Bozeman.

Red Rock Lakes: This 38,144-acre area is congruent with the main unit of the Red Rock Lakes National Wildlife Refuge. The refuge lies in the eastern end of the Continental Valley with the Continental Divide and Idaho-Montana state boundary just a mile and a half to the south. The elevation ranges from 6,600 feet to 9,600 feet at Sheep Mountain. The site contains about 14,000 acres of open water and marsh and 24,144 acres of surrounding wet meadows, bogs, greenlands, alpine meadows, and forests. The two largest lakes, Upper and Lower Red Rock Lakes, contain large expanses of inland saline marsh particularly along their northern perimeters. These saline marshes are dominated by sedges with some cattail, spike rush, bulrush, and pondweed. East of Upper Red Rock Lake are several deep, open, freshwater ponds used as brooding and feeding areas by trumpeter swans. Riverine marshes with burweed and pondweed associated with willow, aspen and spruce-fir stands occur along the waterway connecting the two large lakes. The Shiras moose is found commonly in this habitat. At higher elevations are Engelmann spruce, lodgepole pine and aspen stands that gradually give way to subalpine fir. Mountain meadows also occur at these higher elevations with their inherently great diversity of spring and summer wildflowers. Peregrine and prairie falcons are occasionally observed at the refuge but have not nested in the crags of

Sheep and Teton Mountains for the past few years. Bald and golden eagles are also occasionally observed at the refuge. The refuge provides nesting habitat for 18 species of waterfowl, the most common being mallard, pintail, canvasback and redhead. Approximately 50 Canada geese and 10 to 12 thousand ducks are produced annually on the refuge. More than 50,000 ducks and geese use the refuge as a staging point before beginning their southern migration each fall. Up to 2,000 whistling swans appear at the refuge in October and some 350 trumpeter swans use the refuge continually. This site is centered 2 miles north of the village of Lakeview and is about 30 miles west of Yellowstone National Park.

Montana Natural Areas Act

The Montana Natural Areas Act of 1974 directed the Department of State Lands to implement a program to protect natural areas possessing significant scenic, educational, scientific, biological, and/or geological values, or areas possessing these characteristics to a degree promising their restoration to a natural state. A "natural area" was defined as "an area of land which must generally appear to have been affected primarily by the forces of nature with the visual aspects of human intrusion not dominant, and also must have one or more of the following characteristics:

- (a) An outstanding mixture or variety of vegetation, wildlife, water resource, landscape and scenic values.
- (b) An important or rare ecological or geological feature or other rare or significant natural feature worthy of preservation for scientific, educational or ecological purposes."

Criteria

Representative Natural Areas include land which is in a near pristine condition (or would reach this condition with minor restoration considerations), represents a particular zoological, aquatic, vegetative habitat or geologic feature considered to be an example of that feature.

Unique Natural Areas include a near pristine area which is distinguishable by characteristics which are not representative of the state's natural land features, but which constitute a special relationship by their existence or demonstrate an unusual or significant interrelationship of any land formation or community.

Areas suitable for Natural Areas will not be reclassified as such until the area has been formally declared a Natural Area. However, if the area satisfies many of the requirements for a Natural Area, its value as a possible Natural Area should be recorded and a Natural Area Nominating Form should be completed to permit the formal consideration of the area. The specific requirements for a Natural Area are found in Chapter 27, Title 81 of R.C.M. 1947.

Listed below is the status of each natural area presently identified under the 1974 act.

RECREATION ROADS, TRAILS, AND WATERWAYS

Recreation Roads

Recreation roads include roads designed, designated, or specifically managed for recreation purposes in Montana. Only two public agencies in the state have actually classified roads in this manner - The Montana Department of Fish and Game and the U.S. Forest Service. These roads and mileages are listed below by agency.

Federal - U.S. Forest Service

Listed below by county are the total miles of forest system roads within national forest boundaries. These roads are not restricted to type of use and are thus considered as recreational by the Forest Service.

County	Nat'l. Forest Acres as of Oct. 1, 1977	Road Miles as of June 30, 1976
Beaverhead	1,372,114	942
Broadwater	178,008	281

State - Department of Fish & Game

Section 12-2.26(1)-S2670(e) of the Administrative Rules of Montana adopted in 1969 by the Department of Fish & Game established the category of State Recreation Roads and Trails. Under criteria yet to be developed, such units may be added to the state park system if they are of high recreational value and warrant formal protection against uncontrolled use and development.

In cooperation with the Montana Department of Highways, the Missouri River-Wolf Creek Canyon Recreation Road was

NATIONAL RECREATION TRAILS

added to the state park system in 1970. At this time, it is the only State Recreation Road in the state park system.

County Recreation Road Miles

Recreation Trails

National Trails System

In 1968 Congress passed the National Trails System Act (P.L. 90-543) which established procedures for designating several classes of national trails. The major classes are listed below along with routes in Montana which have been designated or proposed for designation.

This plan recommends that the Policy of the Montana Fish and Game Commission on National Trail System Designations in Montana should be:

To evaluate each proposal on a case by case basis before lending support or opposition to such designation.

National Scenic Trails

Of the 14 routes originally designated by Congress for study and the 8 added to the list, the following is the status of those in Montana.

Continental Divide Trail - proposed

The trail corridor covers some 3100 miles from the Canadian border in Glacier National Park extending to the Mexican border generally along the Continental Divide. Approximately 82 percent of the Continental Divide Trail Corridor is located on federally owned lands. It would provide a complementary north-south scenic route between the Appalachian and Pacific Coast National Scenic Trails.

Pacific Northwest Trail - proposed

The Pacific Northwest Trail extends approximately 1,000 miles from the Continental Divide in Glacier National Park, Montana, to the Pacific Ocean beach of Olympic National Park, Washington. It crosses the Flathead and Kootenai National Forests in Montana.

National Historic Trails

Several of the trails listed for study in the Act are noteworthy for their place in U.S. history. Because of existing conditions--natural or manmade--some of the trails do not fit the National Scenic Trail mold. Some portions of historically notable routes are not amenable to long-distance hike, horse, or bicycle travel, nor are especially scenic, and are located parallel to or overlaid by roads and highways. These are, however, significant historic routes. Therefore, legislation has been proposed to include a new category of trails, National Historic Trails. This would combine the provision of outdoor recreation opportunities in close association with the historic events of national significance.

Lewis and Clark Trail - proposed

The Lewis and Clark Trail route follows the outbound and inbound 3700-mile route of the 1804-1806 Lewis and Clark Expedition from St. Louis, Missouri, to the Pacific Coast in Oregon.

Nez Perce Trail - proposed

The trail extends from Wallows Lake, Oregon, to Bear Paw Mountain, Montana. Most of this 1350-mile route taken by the Nez Perce Flight for Freedom is located in Montana and Idaho, traversing National Forests and Yellowstone Park, Wyoming. Also known as the Nee-Me-Poo Trail, this route which the great Indian leader, Chief Joseph, and his tribe followed is noted for its historic significance and many portions provide outstanding scenic quality.

National Recreational Trails

At a time when economic conditions and the energy situation impose a responsibility to provide ample, low-cost, close-to-home recreation opportunities, the focus is to increase the number of quality national recreation trails, including trails devoted to hiking, bicycling, handicapped, horseback riding, cross-country skiing, snowmobiling, and ORV that can be enjoyed close to where people live. We need trails that are accessible to people after work or school, evenings, and on weekends. There are currently over 118 national recreation trails in 44 states. These are shorter trails than national scenic trails and include a wide range for all users. During studies for National Scenic or Historic Trails, it was determined that there was also a potential for national recreation trail designation of certain segments of proposed national scenic or historic trails. These include the Continental Divide, Oregon, Mormon, Lewis and Clark, and the Nez Perce Trails.

Big Hole Battlefield Trail - designated August 9, 1977

This is the first national recreation trail in Montana and the first segment of a proposed national historic trail to be designated. Located within the 665-acre Big Hole National Battlefield, administered by the National Park Service, this 1/2 mile portion of the Nez Perce Trail is part of a joint Forest Service-National Park Service proposal for a 224-mile continuous trail. The trail recognizes and commemorates the valiant flight in 1877 of the Nez Perce Indians. The designation of this national recreation trail was announced at an impressive memorial at the site on August 9, 1977, the 100th anniversary of the Battle of Big Hole. A similar ceremony was held at Bear Paw Mountains, commemorating the last battle of Chief Joseph's Flight for Freedom.

Palisade Falls Scenic Trail - designated December, 1977

This trail is presently a one-way spur of about one-third mile. A return leg of the trail was located during the summer of 1977. Construction of the return leg (scheduled for completion in 1977) will permit a two-thirds mile loop trail. The trail is four to six feet wide and constructed to a standards that permit blind people to negotiate it with the aid of a sighted companion. The trail winds through a mixed stand of lodgepole pine, Englemann spruce, Douglas-fir, subalpine fir, and aspen. There are 16 stops along the trail where trees, geologic, and plant features are interpreted to the trail users. The interpretive stops are signed with both braille and English text. The trail was constructed as a cooperative project by the Montana School for the Blind and the Gallatin Forest. One of the highlights of the trail is 98-foot Palisade Falls.

National Forest Trails

Almost all public trail mileage in Montana is currently located on national forest lands. Listed below, by county, are the total miles of forest system trails within national forest boundaries. These trails are not restricted to type of use and are thus considered as recreational by the Forest Service.

County	Nat'l. Forest Acres as of Oct. 1, 1977	Trail Miles as of June 30, 1976
Beaverhead	1,372,114	909

State Recreation Trails

Section 12-2.2G(1)-52670(e) of the Administrative Rules of Montana which established State Recreation Roads also established State Recreation Trails within the same category. As with roads, criteria have yet to be developed but trails may be added to the state park system if they are of high recreational value and warrant formal protection against uncontrolled use and development.

At this time there is only one State Recreation Trail in the state park system due to the nature of the land holdings and the fact that there are very few large or linear parks in the system which would be amenable to this type of development.

The Belt Creek State Recreation Trail has not been designated as a unit of the park system itself since it lies within Glacier House State Monument. Its location and length are given below:

County	Recreation Trail Miles
Cascade	7.3

Snowmobile Trails

Superimposed upon many of the above roads and trails are winter recreation trails; one category of which is snowmobile trails. Existing snowmobile use areas in Montana were inventoried and mapped by the Department of Fish and Game.

This study was listed as one of the primary data needs in regard to snowmobile activity in the "Annual Report on Outdoor Recreation in Montana, January 1, 1975." This study was also a recommendation of a literature review undertaken in 1974.

The data was gathered in order to determine use locations, amounts, and types (trail vs. play areas) so that planning priorities could be identified according to concentration areas, user or wildlife conflicts areas, and/or opportunity areas.

Base maps used for the inventory are U.S.G.S. 1:250,000 topographic maps upon which use information was drawn in colored pen or pencil. During February and March, 1975, the maps were presented at a series of Department of Fish and Game Warden meetings throughout the state at which time each warden was requested to plot use locations and estimates to the best of his knowledge in blue marking pen.

At a Montana Snowmobile Association directors meeting in Helena, April 4, 1976, those present were also asked to help map existing snowmobile use areas statewide. Each District Director was sent maps covering his district and these groups collected and mapped information in addition to fish and game wardens.

These sources of trails information were then collated and remapped onto clear plastic overlays using standard symbols. In addition to this infor-

mation, big game winter range overlays have also been prepared to identify potential winter recreation conflicts.

These maps and overlays are on file in the Parks Division of the Montana Department of Fish and Game in Helena. They are available according to the following schedule:

Recreation Waterways

National Wild and Scenic Rivers System

In 1968 Congress passed the Wild and Scenic Rivers Act (P.L. 90-542) which designated 8 river segments as part of the system and 27 river segments to be studied for possible inclusion in the system.

In light of local concern with Federal Wild and Scenic River designations in Montana, the policy of the Montana Fish and Game Commission should be:

- 1) To evaluate each proposal for wild and scenic river designation on a case by case basis.

and,

- 2) To continue to experiment with other techniques which stimulate local control while conserving the amenities of rivers in their natural state. Among these techniques should be the enhancement of the State Recreational Waterways System (ARM 12-2,26(1)-S267D) so that it constitutes an effective management tool

To be considered eligible for inclusion in the national system, a river must be free flowing and possess outstandingly remarkable scenic, recreational, geologic, fish and wildlife, historic, cultural, or similar values. If included in the system, one or more of the following classifications will apply:

- 1) Wild river areas - Those rivers or sections of rivers that are free of impoundments, and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted.
- 2) Scenic river areas - Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.
- 3) Recreational river areas - Those rivers or sections of rivers that are readily accessible by road or railroad, and that may have undergone some impoundment or diversion in the past.

Listed below are those river segments in Montana which have been considered for designation:

January, 1978

RIVER MILEAGE CLASSIFICATIONS FOR COMPONENTS OF THE

NATIONAL WILD AND SCENIC RIVERS SYSTEM

<u>Present Units in the National System</u>	<u>Administering Agency</u>	<u>Miles by Classification</u>			<u>Total Miles</u>	<u>Total Acres</u>
		<u>Wild</u>	<u>Scenic</u>	<u>Recreational</u>		
Missouri, Montana (P.L. 94-486 - 10/12/76)	BLM	72	18	59	149	147,800
Flathead, Montana (P.L. 94-486 - 10/12/76)	FS/NPS	97.9	40.7	80.4	219	57,400

Present Units

Flethead River: 219 miles - The North Fork from the Canadian border downstream to its confluence with the Middle Fork; the Middle Fork from its headwaters to its confluence with the South Fork; and the South Fork from its origin to Hungry Horse Reservoir.

The legislation establishing this unit required that detailed boundaries be established, that the class of river be set, and that a management plan be prepared within one year. The Flathead National Forest is completing these requirements.

Formulation of the scenic easement acquisition program began in early summer 1977. This is the most critical phase from the standpoint of the River System itself and also from the public interest and concern shown to date. The legislation authorized appropriation of \$6.7 million for the acquisition of lands and interest in lands.

Missouri River: 149 miles - The segment from Fort Benton downstream to the Fred Robinson bridge.

This last remaining major free-flowing portion of the Missouri is unlike any other river in the region. It passes through the Missouri Breaks, a highly-eroded "badland" type topography. Unusual eroded sandstone formations resembling castles, parapets, and other ancient structures border the river, which is generally wide and slow-moving. Outcroppings of dark intrusive rock thrust upward through this white sandstone, forming what appears to be huge manmade walls of rectangular blocks.

Important historic evidence of early trappers, settlers, and explorers, including Lewis and Clark,

is found near the river. Occasionally there are sightings of rare species, such as the black-footed ferret and the bald and golden eagle, in the abundant wildlife. The opportunity to view the wildlife and unique geologic features combined with the slow wanderings of the river to provide a unique boating experience.

Study Rivers

Section 5(d) of P.L. 90-542 directed the Secretaries of Interior and Agriculture to make specific studies and investigations to determine which additional wild, scenic and recreation river areas within the U.S. should be evaluated--by all federal agencies, in all planning for the use and development of water and related land resources--in order to give consideration and discuss potentials for national wild, scenic, and recreation river designation. The following Montana rivers were among the 47 selected streams named by the Departments of Interior and Agriculture on September 11, 1970:

Blackfoot River: 100 miles - Segment from Landers Fork to Milltown Dam.

Although the Blackfoot River is identified as a potential addition to the Wild and Scenic Rivers System under Section 5(a) of the Act, it is not proposed for study under Section 5(d) as are the two other rivers in this classification since it has been protected through local initiative described later.

Madison River: 50 miles - Segment from Earthquake Lake to Ennis Lake.

Excellent fishing opportunities are possible along this segment of the Madison River, which attracts anglers

from across the Nation. The Madison also is one of Montana's most popular floating and canoeing streams, especially that portion from McAtee Bridge (22 miles south of Ennis) to Ennis Lake. The float through Beartrap Canyon is probably the most hazardous of any rivers in southwestern Montana. Below the canyon, the river meanders slowly and affords few obstacles to floating.

Streamside subdivision of lands for recreation homesite and related developments is the most immediate threat to the river. Such development has been occurring for a number of years and is likely to continue due to a lack of control over uses on private lands that border the river.

Concerning potential water resource development projects, the only one that is proposed in the river segment discussed here is the Cameron Bench Unit. A small diversion dam (no storage) would be located about 25 miles below Earthquake Lake that would provide water for the irrigation of about 20,700 acres (3,400 acres of supplemental water).

At its upstream end, the Madison River flows through a portion of the Gallatin National Forest for a distance of about 8 or 9 miles. Between the forest boundary and Ennis Lake, most of the land bordering the river (about 95 percent), is in private ownership except for small scattered tracts of public domain and state-owned lands. Much of the private land is either devoted to agriculture or being developed for private homesites.

Yellowstone River: 250 miles - Segment from Yellowstone Lake to Pompey's Pillar.

The Yellowstone River, which stretches from its source at Yellowstone Lake in Wyoming to its confluence with the Missouri River in extreme northwestern North Dakota, is one of our nation's last large, essentially free-flowing rivers. The initial segment of the river within the boundaries of Yellowstone National Park encompass the gamut of wilderness values. Downstream, fish and wildlife, recreation and historical values are significant. The Montana Stream Classification Committee determined that 153 of the 225 miles of river between Gardiner (at the northern boundary of Yellowstone National Park) and Pompey's Pillar are of nationwide or statewide trout-fishing significance. That same stretch of river in recent years has been managed by the Montana Fish and Game Commission as a free-flowing recreation waterway. Two trails of historic significance, and potential additions to the National Trails System, either follow or cross the river segment--the Lewis and Clark and Nez Perce Trails.

Numerous water projects either exist or have been proposed along the length of the Yellowstone. The Allenspur Dam and Power Plant and the Billings Water Supply Unit are the two which would have the greatest effect on the river.

Other Rivers Identified with Free-Flowing Values

More than 4,000 miles of Montana streams have been identified as having free-flowing values. Most of these streams are under constant threat of having their flows diverted, harnessed or their scenic values otherwise destroyed. These growing competitive demands include flood control, power industrial, municipal, irrigation, and stream-side subsistence. Before the wild and scenic attributes of these streams are destroyed beyond restoration, decisions must be made as to designate or not the eligible select rivers or sections thereof for inclusion in either the national or other comparable wild and scenic rivers system.

Other rivers with identified free-flowing values are as follows:

<u>River or Stream</u>	<u>Counties</u>	<u>River Segment</u>	<u>Approximate Total Length In Miles</u>	<u>River or Stream</u>	<u>Counties</u>	<u>River Segment</u>	<u>Approximate Total Length In Miles</u>
Belt Creek	Cascade Chouteau	Entire stream.	75	Gallatin	Gallatin	From boundary of Yellowstone Nat'l. Park to confluence with Missouri River.	90
Big Hole	Beaverhead Deer Lodge Madison Silver Bow	Entire stream.	140	Kootenai	Lincoln	From Libby Dam to Idaho border.	40
Big Spring Creek	Fergus	From state fish hatchery to mouth.	27	Madison	Madison Gallatin	Ennis Lake to confluence with Missouri River.	40
Bitterroot	Beavall Missoula	Junction of the West and East Forks to its confluence with the Clark Fork River.	72	Missouri	Lewis & Clark Broadwater Cascade	Toston Dam to confluence with Smith River.	86
Bull	Sanders	From confluence of Smith & Middle Forks to Cabinet Gorge Reservoir.	27	Rock Creek	Missoula Granite	Origin to confluence with Clark Fork	51
Clark Fork	Mineral Granite Missoula Sanders	From Drummond to Milltown: from mouth of Bitterroot River to Plains, Montana.	60 200	Smith	Meagher Cascade	From its forks to confluence with Hound Creek.	70
				Stillwater	Flathead	From upper Stillwater Lake to north city limits of Kalispell.	42
Dearborn	Lewis & Clark Cascade	Entire Stream.	40	Sun River	Teton	Origin to Gibson Dam Diversion dam to Great Falls.	28

<u>River or Stream</u>	<u>Counties</u>	<u>River Segment</u>	<u>Approximate Total Length In Miles</u>
Swan	Lake Missoula	Origin to Swan Lake.	47
Thompson	Sanders Flathead	Outlet of Lower Thompson Lake to confluence with Clark Fork River.	44
Yaak	Sanders	From Canadian border to con- fluence with Kootenai River.	45

State Recreational Waterways

Section 12-2.26(1)-S2670(d) of the Administrative Rules of Montana sets forth criteria for State Recreational Waterways. The purpose of these units is to protect and enhance the natural and historical values of state waterways and provide for enjoyment of these values.

Rivers and streams which are generally undeveloped, possess outstanding scenery and/or important historical features and susceptible to increasingly heavy recreational use are eligible for designation.

Development and management of these waterways have so far been restricted to accommodations for recreational activities at public access points and acquisition of selected access, camping, and picnic sites.

The following waterways were designated in 1972 as state Recreational Waterways although the public use areas developed adjacent to them are included in the state park system under different criteria.

Flathead Recreational Waterway: The Flathead River above Flathead Lake, the North and Middle Forks and the South Fork above Hungry Horse Dam.

Missouri Recreational Waterway: The Missouri River from Fort Benton to the head of Fort Peck Reservoir.

Rock Creek Recreational Waterway: Rock Creek near Missoula.

Smith River State Recreational Waterway: The Smith River from its forks to the mouth of Hound Creek.

Yellowstone State Waterway: The Yellowstone River from the Yellowstone Park line to Pompey's Pillar.

Other Recreation Waterways

Blackfoot River Recreation Management Corridor: 26 miles - the segment from the Missoula County line downstream to Johnsrud Park.

This corridor provides public access to the river through private lands, public lands and quasi-public lands which otherwise would not have been available. This was accomplished through the cooperative efforts of Missoula County, Champion International Corporation, private landowners, The Nature Conservancy, Bureau of Outdoor Recreation, Department of Fish and Game and other state agencies. This effort is unique in the nation and has substantially demonstrated that it is a workable alternative to the creation of wild and scenic rivers. It is thus far successful in meeting its goals and is receiving national attention.

Fishery Resource Value Classification -

In addition to the above waterways, all significant rivers and streams in Montana are now being classified by the Fisheries Division of the Montana Department of Fish and Game as to their fishery resource values. This classification is anticipated to be completed by fall, 1976.

INVENTORY OF RECREATION POTENTIAL ON STATE TRUST LANDS

Introduction

Most states have traditionally received upon statehood a grant of land from Congress to aid in the development and support of common schools and other important public institutions. Seventeen western states still retain a substantial proportion of this grant land and in many of these states these lands amount to millions of acres. Among these millions of acres an unknown amount has significant recreational value.

Before this recreational value can be realized, the appropriate lands must be identified and a lease issued permitting recreational use and development at an acceptable rent. Until recently, most state and local agencies with recreational responsibilities have lacked the funds necessary to enter into such lease arrangements so that identification of the recreational potential of state trust land on a statewide basis was little more than a fruitless exercise. Recent years, however, have witnessed dramatic increases in the funding of local, state, and federal recreational land acquisition programs. The availability of these funds have made state lands attractive candidates for satisfying public recreational demands while benefiting the revenue producing capacity of the trust lands.

In order to take the most advantage of the potential of state lands, however, it is desirable to identify *a priori* those lands having the greatest potential for inclusion in state and local recreational systems. Such an approach economizes on the time and effort involved in evaluating state lands in a more "piecemeal" approach, enhances uniformity and comparability in the decision-making process, and permits development of an orderly

leasing system which minimizes potential conflict between public and private users of state lands. In addition, such an *a priori* approach may provide less obvious secondary benefits such as enhancing the data base available to decision-makers whose concerns are not so directly involved with benefiting the recreating public.

The inventory method which has been developed in Montana for identifying the recreational potential of state lands is reviewed below. Some salient characteristics of this method are:

- 1) It has been designed to identify lands worthy of further consideration for inclusion in a state or local recreation or park system and to identify the point in the leasing cycle when that consideration must be made.
- 2) Though time consuming, it has been designed to be inexpensive, eligible for receipt of 50% matching funds from the Federal Land and Water Conservation Fund Act of 1965 (Public Law 88-578), and simple enough to be executed by a staff having minimum skill and training with the method.

Caution is necessary however. The approach described is not a substitute for the more detailed analyses necessary when leasing land for recreation or carrying out the design and development of specific sites. Rather, it is designed to classify a large number of scattered tracts, on the basis of several observable variables, according to their

potential for further consideration as high value recreation assets. In this sense the approach is sufficiently generalized to be applicable with only minor modification to many situations in which it is desired to make a cursory evaluation of scattered land holdings in order to identify potentially valuable recreation tracts.

The Approach

For the purposes of illustration, the 1976 field season will be used as the example of the approach to inventorying the recreational potential of Montana state lands. The Central Montana area surveyed in 1976 (figure 1), consists of 3,376 parcels of state land where a parcel is defined as all contiguous state land in a single section.

Obviously, many of these parcels can be eliminated as lacking in recreational potential without making an on-site evaluation.

In the 1976 survey, the 3,376 parcels were reduced through examination of aerial photographs and topographic maps to 349 or ten percent worthy of on-site evaluation by:

- 1) Elimination of parcels devoted to agricultural as opposed to grazing uses.
- 2) Elimination of flat or lightly rolling parcels with grass or grass-shrub vegetation.
- 3) Elimination of flat to lightly rolling parcels with numerous shallow, hardpan or alkaline areas.

In any event, parcels showing evidence of live streams, rivers or ponds, or possessing a forest cover were retained for on-site evaluation.

The field survey involved evaluation of 43 variables grouped under topography, vegetation, water resources, access, recreational use, and scenery determined by the Montana Department of Fish and Game and the Montana Department of State Lands to be important in attracting recreational users.

For illustrative purposes the measurement of variables associated with vegetative cover are explored in detail. The field investigators were asked to approximate and record the number of forested acres and their percent of the total parcel; the percent forest cover on the entire and the usable portion of the parcel in categories of high (>50%), medium (25% to 50%) and low (<25%); the predominant forest type and dominant species. This information is retained in the record of the file but does not enter into the final numerical analysis of the parcel. Numerical scores on a scale of zero-to-five are calculated for variables of forest pattern and density; forest quality; forest variety; forest scenery; brush and shrub pattern and density; brush and shrub variety and pattern; density and variety of ground cover on the basis of characteristics summarized in table 1.

A composite score for vegetation can then be calculated by summing the scores for the individual variables. When the sum of vegetational scores for all inventoried lands are available, individual parcels can be assigned an overall rating of "A" (high vegetational quality for the purposes of providing outdoor recreation), "B" (medium quality) and "C" (low quality). There are many ways this could be done, but experience has taught that relative values for each rating on a statewide scale are best maintained by

Figure 1. Montana state trust lands inventoried for recreation potential.

Table 1 "Forest" portion of evaluation guide for vegetation

Factor Ranking		4	3		1	0
Forest Pattern & Density	Forest and scattered trees throughout most usable area. Sufficient variation in density of pattern to provide open space, clearings for variety, interest, enclosures, shade, privacy.	Forest and open areas scattered throughout most usable area, but lack of variety of forest pattern provides little interest.	Forest on usable area often too dense for easy use, but provides occasional areas of open space.	Forest present, but stands unrelated to most usable area. May add to scenery.	Sparse forest or scattered trees, or dense with no openings.	None or very few trees on parcel.
Forest Quality	Vigorous, little disease evident. Good specimens.		50 - 50 mixture of good and poor specimens.		Mostly poor quality trees (burns, disease, blowdowns, etc.).	None or very few trees on parcel.
Forest Variety	Much variety of size and species.		Some variety of sizes and species. 2 or 3 different major species.		Little variety of sizes all about same height, size. Predominantly one species.	None or very few trees on parcel.
Forest Scenic Evaluation	Very high	High	Medium	Low	Very low	Distracting, or none or very few trees on parcel.

Table 2. Classification code for 1976 inventory.

establishing class limits for the letter code on the basis of arbitrary percentages adjusted slightly to conform with "natural breaks" in the frequency diagrams of current and previous seasons' inventories. The 1976 frequency diagram, for example, contained natural breaks which required only slight adjustment to establish letter codes conforming with previous seasons critical points.

The same procedure can be followed for the variable groups of topography, water, scenery, and other site factors and a total or amalgamated score. This information may then be summarized as a simple fractional code with the total score designated in the numerator, the score for each variable group designated in the denominator. Since recorded evidence of recreational use and the possible existence of historical values deserve special attention regardless of total scores, these factors are also recorded in the numerator. Table 2 displays the fractional code with the critical limits of each category used in 1976.

There are numerous advantages to the fractional code system. Both the raw scores and the categorical letter codes are amenable to automated storage, retrieval and manipulation. Further, the fractional system permits easy identification of parcels with exceptional scores in one category but a low overall score.

The 1976 Findings and Cost Comparisons

<u>Total Score Category</u>	<u>Number of Parcels</u>	<u>Evaluated Parcels</u>	<u>% all parcels in survey area</u>
A	26	16.9%	.8%
B	55	21.4%	1.6%
C	120	59.7%	3.5%
Eliminated by office procedures	<u>3,175</u>	<u>-</u>	<u>94.1%</u>
	3,376	100.0%	100.0%

Summarized above are the findings of the 1976 season. The 26 "A" category parcels represent those most deserving of efforts toward preservation, control of land use changes, and complimentary recreational developments. "B" category lands are presently of marginal concern for recreational management. However, preservation policies serve as a valuable tool in the case of "B" parcels since, by protecting the alternative available, management can protect options until the sensitive and fluctuating desires of the public can be better determined. "C" category lands possess little present or anticipated recreational use value unless identified potential historic values are confirmed or unless actual recreational evidence was discovered. The inventory process was designed to identify "natural resources" valuable for recreational purposes so parcels possessing a high "user potential" may have been neglected. Specifically, parcels located near urban areas or adjacent to major traffic arteries may possess a high public use potential for rest stops, urban fringe campgrounds, and open space despite a relatively weak natural resource potential. A "C" classification, then, does not preclude future recreational use of a parcel of land--it only indicates that the natural resources associated with such use are relatively lacking and consequently the recreational use is not likely to develop.

The 1976 central Montana inventory was done at a cost of \$6,267 to the Department of State Lands, half of which was provided through the Federal Land and Water Conservation Fund. It enabled the Department to scan and evaluate over 1.5 million acres of its lands for recreation potential and to identify land use conflicts, recreational, cultural, scientific, and aesthetic features, and feature combinations which are associated with natural or pristine areas.

During the seven year project period, almost all state trust lands with significant recreation potential have been identified for a total of \$52,375 for nearly 5 million acres or about one penny per acre.

POTENTIAL RECREATION LANDS

Identifying potentially valuable recreational lands on an priori basis is a futile task in a state like Montana where condemnation is rarely used and seldom a desirable approach. Of necessity land acquisition for recreational purposes must remain opportunistic with the major agency acquiring recreational land - the Montana Department of Fish and Game, competing with other potential land purchasers in the private real estate market.

Until recently the Montana Fish and Game Department has competed in this private and opportunistic market through elaborate but informed procedures. As more funding has been made available, it has been discovered that such informal procedures risk confusion and misunderstanding among those responsible for land acquisition as well as the general public. What is needed is an approach which preserves ability to freely compete in the land market while clearly establishing the method by which potential land acquisitions are evaluated for priority against stated goals and objectives.

In light of this, the 1978 Montana SCORP has established the following tasks and objectives for the Parks Program:

Task:

Overall policies, procedures, and criteria to adequately evaluate potential land acquisitions must be established and/or more adequately articulated.

Objective:

To establish and continually evaluate an approach to land acquisition based on clearly understood procedures and policies reflective of goals and objectives. To communicate this approach to Department of Fish and Game personnel, the Fish and Game Commission, the legislature and the public.
