Deciduous Shrubs

The shrubs we offer are of a standard commercial grade, young and thrifty. They are not crowded in rows to make them grow tall, but are given space enough for proper development. This insures a bushy and full plant, which far more than height ought to be, and indeed is, the standard of excellence.

Humus

The productiveness of the soil depends on its fertility. Humus is a fertility maker. Without it there would be no plant life. It is one of the most important soil constituents. It is the chief source of nitrogenous food for plants. It helps a sandy soil by greatly increasing its water holding capacity. It makes a clay soil more granular and lessens its tendency to bake. The use of Humus means an increased yield of vegetables, better flowers, shrubs, trees and lawns.

Rhododendron—Kalmia—Wildings

The use of Humus, in the proper quantity, will insure success with Rhododendrons, Kalmia, Ferns and Wild Flowers because it reproduces the soil conditions in which they are found growing wild. In addition, if a suitable mulch of Humus is used, it will keep the roots moist during the extreme heat of summer, and a strong, healthy growth will be assured.

Cultural directions will be sent upon request.

Prices

\$5.00 for five 100-lb. bags; \$18.00 per ton, f. o. b. Stanhope, N. J.

A great saving may be effected in purchasing humus in bulk, in carloads of 30 to 35 tons, owing to the saving in bags and labor of handling and the fact that the freight is much less on bulk humus. Price quoted upon application.
