The Goodhold Floral Gardens Co's Catalogue for 1926

Introduction

We present you this, the new sales book of the Goodhold Floral Gardens Co. for the year 1926. At this, the beginning of another new year it is but proper that we should give voice to the feeling of gratitude that we have for the many friends, it has been our pleasure to serve. We assure you that the patronage you have given us in the past is appreciated and it is our earnest wish that we may continue to satisfactorily serve you in the future.

To the many others who will use "Goodhold" grown products this year for the first time, we wish to say that we welcome your patronage and will assure you of fair treatment. It has always been our policy to supply our customers with the best stock it is possible to grow and to do all that we can to make their dealings with us satisfactory and pleasant. The continued and growing patronage that we have received convinces us that this policy is appreciated.

Visitors Welcome

Goodhold Floral Gardens are located at Mentor, in northeastern Ohio, on the main highway between Cleveland and Buffalo. Every week during the summer months, thousands of tourists pass our gardens over this great highway. We welcome visitors and any of our customers making this tour are asked to turn in and visit our gardens. The many acres of Gladioli present a wonderful sight when in full bloom and can usually be seen at their best during the month of August.

"Goodhold" Plants are Thrifty and Hardy

In our location we have everything favorable to the production of strong, healthy plants and bulbs. On our large acreage can be found every kind of soil, from light sand and rich black muck to heavy clay. With this wide variation of soil we can grow plants on land best adapted to them, resulting in superior stock.

In this northern latitude, nothing but the hardiest of plants can survive our severe winters. All of our hardy plants are field grown and are often covered with a deep blanket of ice and snow and subjected to a temperature way below zero. "Goodhold" grown plants must be hardy to withstand such conditions.

Hints on Planting Gladiolus

The Gladioli can be successfully grown on any soil that will produce any of our ordinary garden crops. The bulbs should be planted in the open and not under trees, or among shrubbery. The ground should be thoroughly pulverized and given a coating of well-rotted manure or a sprinkling of a balanced commercial fertilizer; fresh stable manure may be worked into the ground the previous Fall, it is unsafe to apply it in the Spring just before planting.

Planting can be done in April, after frost is out of the ground, all danger from frost will be past by the time growth reaches above ground. By planting at intervals up to about July 1st, it will be possible to have a succession of flowers from July until frost.

The bulbs may be planted from three to five inches deep and this same distance apart in the row. In garden culture, a good plan is to plant three rows one foot apart, skipping a row and then plant three more rows, thus leaving a path two feet wide between each block. When only a few are used they can be planted with a trowel, in open spaces between other plants in the border or in groups, giving the bulbs the usual spacing. The only attention required until flowering time is to keep the ground well stirred and free from weeds.

Fertilizer for Gladiolus

After the flower-spikes appear the plants should not at any time suffer from the lack of water. The Gladiolus responds very quickly to the use of fertilizer and there are many kinds that may be successfully used. The use of any good well balanced commercial fertilizer is good; using it as a top dressing, afterwards working it well into the soil. Liquid manure may be used freely, if this is not obtainable, an occasional application of Nitrate of Soda may be used. This should be dissolved in water, at the rate of a teaspoonful to the gallon, thoroughly wetting the soil around the plants. Care should be taken not to wet the soil with this solution. Top dressing with pulverized sheep manure which usually can be obtained from your local dealer—is always a good and safe fertilizer. In the use of any fertilizer it is always best to make frequent applications of a small quantity, rather than to use a large amount at one time.

Cutting the Blooms

The flower spikes are best cut at the time when not more than three blooms are open. The ends of the stalks should be cut off an inch or so and the water in the vase renewed daily. Removing the terminal buds by pinching off the tip end of the spike, arrests stalk development and produces larger and better flowers from the earlier maturing buds. The stalks should never be cut off near the ground; not less than three leaves should be left, they are essential to the growth that produces the new bulb.

CULTIVATION

Frequent cultivation is essential to the growth of all plants. Regardless of whether they are weedy or not, your plants will be greatly benefited by having the soil around them worked at frequent intervals. Loosen the soil to a good depth, leaving the surface with a mulch of fine dirt, free of lumps. This will help to keep the plants in a good growing condition and is especially beneficial in a dry season.
