Collection of Entomopathogenic Fungal Cultures

Catalog of Strains

In cooperation with the USDA-APHIS
National Biological Control Institute

Abstract

Humber, Richard A. 1992. Collection of Entomopathogenic Fungal Cultures: Catalog of Strains, 1992. U.S. Department of Agriculture, Agricultural Research Service, ARS-110, 177 pp.

This is a catalog to approximately 3,700 fungal cultures from more than 72 countries. The cultures are held in the ARS Collection of Entomopathogenic Fungi (ARSEF), an internationally known research resource for the fungal pathogens of invertebrates. In addition to listing the cultures by species, the catalog includes five indices listing host by fungus, fungi by host and location, geographic origin of fungi, alternate collections, and ARSEF accession number. Also included are instructions for ordering fungal strains and brief explanations of free diagnostic, exchange, and deposition services.

Keywords: Catalogs, entomopathogenic fungi, fungi.

Mention of trade names of commercial products in this publication is solely for the purpose of providing information and does not imply recommendations by the U.S. Department of Agriculture.

Copies of this publication may be purchased from the National Technical Information Service, 5285 Port Royal Rd., Springfield, VA 22161.

ARS has no additional copies for free distribution.

Acknowledgments

The body and indices of this catalog are reproductions of direct output from a customized data base management application that is used for all aspects of recordkeeping for the ARSEF culture collection.

Sincere thanks to Timothy S. Larkin for his indispensable role in implementing this collection management application and to Mary-Lynn Cummings for her fine-tuning of the data base design and her diligence in entering, verifying, and rectifying the information in the data base. Without their skills and input, this wholly revised catalog would not have been possible.

COLLECTION OF ENTOMOPATHOGENIC FUNGAL CULTURES

Catalog of Strains

Richard A. Humber

History and Purpose of the Collection

The goal of the ARS Collection of Entomopathogenic Fungi (ARSEF) is to provide fundamental support for basic and applied research on the fungal pathogens of invertebrates. Since its establishment in the early 1970's, this collection has served as a general research resource for the isolation, collection, preservation, and distribution of fungal strains from insects, other arthropods, and nematodes. Emphasis has always been placed on acquiring and distributing strains under active study for use as potential biological control agents. Basic research associated with the collection includes fungal systematics, fungal cytology, pathobiology, and methodology for fungal cryopreservation. The culture collection and its associated collection of microscope slides and herbarium specimens provide invaluable support for taxonomic research on and the diagnoses of fungal pathogens of invertebrates. Identification services for specimens and cultures have always been available free of charge to any laboratories requesting them.

We strive to provide users with pure and accurately identified fungal cultures. Uncertainties about strain identifications not stated in this catalog will be communicated to culture recipients. The curator of the collection welcomes all correspondence about nomenclatural or taxonomic changes or possible misidentifications involving any ARSEF strains.

This culture collection began as Dr. Richard Soper's research collection at the ARS Plant, Soil, and Water Laboratory at the University of Maine at Orono (UMO). The original UMO prefix for these cultures was changed to the site-independent prefix RS for Richard Soper. In 1978, the ARS Insect Pathology Research Unit and its culture collection were relocated to be associated with the Insect Pathology Program of the Boyce Thompson Institute (BTI) in its new building on the Cornell University campus. The Insect Pathology Research Unit and some other small ARS

units on the Cornell campus were united into the Plant Protection Research Unit (PPRU) in October 1985. After occupying transitional quarters, the PPRU insect pathology program and the culture collection moved in November 1990 into newly renovated laboratories in the U.S. Plant, Soil, and Nutrition Laboratory (across the street from the Boyce Thompson Institute).

The Plant Protection Research Unit owns and operates this culture collection; it is not now nor has it ever been owned or controlled by the Boyce Thompson Institute even though BTI administers the collection's sales account. This culture collection is one of the largest microbial germplasm collections in USDA-ARS, and PPRU is widely recognized for its active support and encouragement of global research on fungal pathogens of arthropods. The culture collection and its associated herbarium are respectively registered under the ARSEF acronym with the World Federation of Culture Collections' World Data Center on Microorganisms and with the International Association of Plant Taxonomists' *Index Herbariorum*.

Since 1977, all strains in the collection have been stored by immersion in liquid nitrogen at -196 °C, but limited dewar space will require shifting many strains from cryogenic to lyophil storage within the near future. Requests for cultures are filled with either live cultures on appropriate solid or liquid media or lyophil tubes (plus instructions for fungal recovery), depending on how the requested strain is stored.

Identifying and Acknowledging ARSEF Strains in Publications

We request that all publications using or referring to strains obtained from ARSEF acknowledge the U.S. Department of Agriculture, ARS Plant Protection Research Unit and state the ARSEF accession numbers of these strains. We would very greatly appreciate receiving reprints of all past, current, and future publications or even periodic notification about research in progress involving the use of ARSEF strains.

Accession numbers of strains from commercial culture collections such as the American Type Culture Collection (ATCC), Centraalbureau voor Schimmelcultures (CBS), CAB International Mycological Institute (IMI), and the University of Alberta Microfungus Collection (UAMH) are listed in this catalog only for the sake of providing complete information. **Representation of cultures obtained from ARSEF as ATCC, CBS, IMI or UAMH cultures is a**

violation of trademark laws; persons doing so are subject to prosecution. Cultures received from ARSEF should be referred to by their ARSEF numbers only.

Updated, Special, and Electronic Catalogs

All accession information for ARSEF cultures has been computerized. This catalog was generated directly from the data base. General catalog updates will be issued approximately every 2 years. Supplements listing cultures accessioned since the printing of the current catalog or special catalogs focusing on strains of particular fungal species or from particular hosts or geographic regions can be prepared on request.

The ARSEF catalog is not available in any electronic format directly readable by word processing or text editing software. Complimentary copies of the ARSEF data base or the customized application used to manage it or both can be obtained upon consultation with the curator of the ARSEF collection. This application program requires users to have access to either full or run-time versions of the 4th Dimension data base manager (Acius, Inc.) and an Apple Macintosh computer. Planning is under way to include accession information for ARSEF cultures in the computerized ARS Germplasm Resources in the Nation (GRIN) information network; this information should be available on-line after the activation of the newly revised GRIN-III system.

Depositing and Exchanging Cultures

The Plant Protection Research Unit encourages deposition of entomopathogenic fungal cultures with the ARSEF collection—particularly strains used in published studies—as well as of voucher and reference specimens to its herbarium. Depositors may reserve the right to limit redistribution of any culture deposited with ARSEF for specified times upon consultation with the curator. Depositors can receive subcultures of their own depositions at any time; these cultures do not affect any allowances of free cultures.

Exchanges of cultures between ARSEF and other research or general collections of fungal cultures are encouraged and are not subject to numerical limits.

Prior to shipping cultures from countries outside the United States, contact the curator to obtain the appropriate needed importation permit from the U.S. Department of Agriculture, Animal and Plant Health Inspection Service, Plant Protection and Quarantine.

When sending cultures or specimens or both to ARSEF, it is very important to include as much of the following information as possible:

1. Scientific name (and taxonomic authority) of the fungus.
2. Common and scientific name (with taxonomic authority) of the host.
3. Order and family of the host. **(This is especially critical information.)**
4. Date and site of collection.
5. Name of collector.
6. Date and name of isolator.
7. Any collection, accession, or other identifier number(s) applied by the collector or sender.
8. Medium on which a culture is sent.
9. Any special requirements or conditions for growth (such as medium, temperature, pH).

Diagnostic Services for Cultures and Specimens

Specimens and cultures of unidentified fungi from invertebrates can be submitted to ARSEF for diagnosis. This service is an important function of the ARS Collections of Entomopathogenic Fungi and is provided without charge. Identifications and information about the disposition of specimens will be mailed to the sender.

Release of ARSEF Cultures From Containment or Quarantine

Neither the curator nor any employee of ARSEF or of the Plant Protection Research Unit is entitled to authorize the release of any culture it provides from laboratory containment or quarantine in the United States or elsewhere. Recipients of ARSEF cultures are responsible for obtaining appropriate and necessary permissions from or for providing official notifications to State and Federal regulatory agencies.

Ordering Information

All requests for isolates should be sent directly to the curator, ARS Collection of Entomopathogenic Fungal Cultures, U.S. Plant, Soil, and Nutrition Laboratory, Tower Rd., Ithaca, NY 14853–2901, USA; telephone: (607) 255–1276; fax: (607) 255–2459.

Academic, Government, and Other Nonprofit Institutions

5 or fewer isolates per order (up to 7 per calendar year) no charge

6 or more isolates per order (8 or more per calendar year) US\$40 per strain

Users from nonprofit institutions can receive up to five isolates without charge in any 6-month period and up to seven cultures in any calendar year. Users requesting in excess of these limits will be charged at the rate of US\$40 per additional isolate requested. Commercially sponsored research programs undertaken by nonprofit institutions are charged at the commercial rate and are not subject to numerical limits. **Prices are subject to change without notice.**

Commercial and Industrial Institutions US\$75 per strain

Nonprofit institutions working on commercially sponsored contractual projects (such as screening programs) are charged at the rate of US\$75 per strain requested. There are no limits on the numbers of cultures that can be requested or shipped. **Prices are subject to change without notice.**

Commercial or industrial firms supporting research at the ARS Plant Protection Research Unit are entitled to free access to cultures pertinent to contracted projects; all other requests are charged at the current rate.

Terms of Shipment

Billings for isolates are issued through the Boyce Thompson Institute. We encourage prepayment for isolates. **Checks or money orders for strains must be made out to the Boyce Thompson Institute** but sent directly to the curator of the ARS Collections of Entomopathogenic Fungi. Consult the curator of the collections with questions about fees due for any particular shipment.

We request confirmation of receipt and viability of cultures shipped. Strains that are inviable upon receipt will be replaced.

ARSEF reserves the right to refuse to ship strains

- to recipients who cannot handle them with standard microbiological practices,
- to laboratories that cannot assure laboratory containment of isolates *except* after obtaining permissions from applicable State and Federal regulatory agencies,
- if use of routine mailing or shipping procedures cannot assure the receipt of viable cultures.

ARSEF, the ARS Plant Protection Research Unit, and the Boyce Thompson Institute are not liable for damages arising from the misidentification of strains.

Basidiobolus haptospora Drechsler
[Zygomycetes: Entomophthorales]

Synonym: *Basidiobolus meristosporus* Drechsler. *B. haptosporus* is a probable synonym of *B. ranarum*.

Caution: This species can cause human mycoses; most strains can be demonstrated to survive temperatures $\geq 37^{\circ}\text{C}$. Exercise caution to avoid inhalation of conidia or contact with cuts or abrasions.

Basidiobolus ranarum Eidam

[Zygomycetes: Entomophthorales]

Possible synonyms: *Basidiobolus haptosporus* Drechsler, *Basidiobolus meristosporus* Drechsler.

Caution: Strains of this species may be able to grow at temperatures $\geq 37^{\circ}\text{C}$ and may be regarded as potential mycotic agents for humans and other mammals. These strains should be safe in research and/or teaching laboratories with routine microbiological precautions; avoid inhalation of conidia or contact with open cuts or abrasions.

Batkoa apiculata (Thaxter) Humber

[Zygomycetes: Entomophthorales]

The nuclei of this taxon stain well and have granular contents when mounted in aceto-orcein or other nuclear stains. This entomophthoraceous fungus has a morphologically similar ancylistaceous fungus, *Conidiobolus pseudapiculatus* (q.v.), whose nuclei do not stain well and do not have granular contents.

- Caution:** This species is known to cause human mycoses that are primarily tropical in occurrence and confined to the nasal passages and adjacent superficial areas. Avoid inhalation of conidia and do not handle cultures without gloves if unhealed cuts or abrasions are present. This species has low pathogenicity for mammals and should be relatively safe if handled with good microbiological technique.

These strains produce secondary microconidia; their morphologies match the description of *C. coronatus* in every way except that no villose conidia have been observed. Positive identification as *C. coronatus* requires observation of villose conidia.

Caution: All precautions about handling *C. coronatus* should be observed with these strains.

Hirsutella thompsonii Fisher
[Hyphomycetes]

The separation of *H. thompsonii* into two varieties based on whether synnemata may or may not form in culture is unreliable and probably artificial. Some strains included may form synnemata but do not do so consistently; these strains could be recognized as *Hirsutella thompsonii* var. *synnematosa* Samson, McCoy & O'Donnell if accepting this variety as a legitimate taxon.

- Metarhizium anisopliae* (Metschnikoff) Sorokin
[Hyphomycetes]
- These strains have not been reconfirmed to belong to *Metarhizium anisopliae* var. *anisopliae*, the small-spored variety of this species. Strains listed here are very unlikely to be more properly assigned to *M. anisopliae* var. *majus*, the large-spored variety of this species. There may be considerable variation among strains in fundamental characters such as color, and relative production of mycelium and conidia.

Neozygites sp.

[Zygomycetes: Entomophthorales]

This culture is provided as hyphal bodies in a liquid tissue culture medium. Spores may be induced by plating hyphal bodies on solid media. Taxonomic criteria separating *Neozygites* species from mites are too poorly understood to allow specific identifications.

Early vegetative development of cultures on solid media usually occurs in mucoid colonies of fusoid yeast-like cells: mycelial development should begin after several days. Most strains are observed to sporulate most abundantly on Sabouraud maltose agar + 1% yeast extract.

Paecilomyces lilacinus (Thom) Samson
[Hyphomycetes]

This species is being actively studied for the control of nematodes.

Caution: It is also known to be the causative agent of mycoses (primarily of the eye) in humans. There is probably little or no risk to workers handling this species for small-scale laboratory propagation and bioassay procedures. Caution should be observed to prevent chronic and/or massive exposure to airborne conidia of this species to minimize any associated health risks.
