PRICES AND SPREADS FOR PROCESSED FRUITS, VEGETABLES, AND JUICES SOLD IN SELECTED MARKETS, 1970/71-1975/76, by Alfred J. Burns and Stephen M. Raleigh, Commodity Economics Division, Economic Research Service, U.S. Department of Agriculture, AGERS-36.

ABSTRACT

Prices and margins for 24 processed fruit and vegetable products sold in selected major cities are examined. Retail prices, processor prices, farm values, the wholesaler and retailer margins and the processor margins of most processed fruits and vegetables increased. However, farm values and the marketing margins expressed as a percentage of retail price did not change significantly. The farm value of all 24 products averaged 22 percent of the retail price, the processor margin averaged 42 percent, and the wholesaler and retailer margin 36 percent.

KEYWORDS: Canned, farm, frozen, fruits and vegetables, margins, marketing, prices, processor, retail.

PREFACE

The U.S. Department of Agriculture conducts continuing studies to monitor spreads between prices paid by consumers and those received by growers. This is the second comprehensive report on processed fruits and vegetables. The first was Statistical Bulletin No. 477, "Prices, Margins, and Farm Value of Canned and Frozen Fruits, Vegetables, and Juices Sold in Selected Markets, 1965/66--1969/70," published in October 1971.

You may purchase either microfiche or paper copy of this report from National Technical Information Service (NTIS), 5825 Port Royal Road, Springfield, Virginia 22161. The price of this report is \$3 for each microfiche or \$5.50 for each paper copy.

When requesting "Prices and Spreads for Processed Fruits, Vegetables, and Juices Sold in Selected Markets, 1970/71-1975/76, AGERS-36," indicate whether you want microfiche or paper copy. Include zip code with your address. Make checks payable to NTIS, or, if you have an NTIS deposit account, specify your account number.

SUMMARY

Examination of statistical data indicates considerable variation in prices, margins, and farm values of 24 processed fruit and vegetable products sold in selected markets in 1970/71--1975/76.

Retail prices and their components increased for most processed fruits, vegetables, and juices over the 6-year period. For all products, the retail price rose 33 percent, the wholesaler and retailer margin 38 percent, the processor margin 25 percent, and farm value 51 percent. Retail price, farm value, and the processor margin increased sharply for most products in 1974/75 after a slow upward trend in 1970/71--1973/74. Retail price and the processor margin declined in 1975/76 for most products, but farm value continued to increase that season.

The market shares which comprise the retail price did not change significantly in 1970/71--1975/76. The farmer's share of all products averaged 22 percent of the retail price. The remainder, or marketing margin, of 78 percent was divided into the processor's margin of 42 percent and the wholesaler and retailer's margin of 36 percent.

Farmers received about 14 percent of the retail price of canned vegetables, 19 percent of canned fruits and frozen vegetables, and 33 percent of canned and frozen juices. The processor received about 50 percent for canned fruits and vegetables, 39 percent for frozen vegetables, and only 30 percent for juices. The wholesaler and retailer received 31 percent for canned fruits, 35 percent for canned vegetables, 37 percent for juices, and 42 percent for frozen vegetables.

For the six vegetables in both canned and frozen forms, the total marketing margin expressed as a percentage of the retail price was about the same for canned and frozen. The percentage wholesaler and retailer margin was larger for the frozen than the canned, and the percentage processor margin was smaller for the frozen than the canned.

GLOSSARY

Retail price: Bureau of Labor Statistics estimate of the average price paid for a specified commodity by customers in a sample of retail stores in a given city on the first consecutive Tuesday, Wednesday, and Thursday of the month. The retail price is reported per can or package and expanded to a case basis.

Processor price: The midpoint of the f.o.b. plant price range for a specified case of a canned or frozen fruit or vegetable listed by processors in a specified processing area. This does not include off-list allowances sometimes offered by processors.

Farm value: The equivalent returns to all inputs used in producing, harvesting, and delivering to the processing plant door a specified quantity of a fruit or vegetable required to pack a case of the product. For certain commodities, particularly vegetables grown under contract, the processor provides varying amounts of services, equipment, or other inputs used in producing, harvesting, or delivering the commodity. The farm value includes the cash payment to the grower plus the value of any services, equipment, or other inputs provided by the processor.

Wholesaler and retailer margin: The difference between the retail price and the f.o.b. processor price. This margin is the amount received by those who perform the functions of transporting from the processor to the consuming city, wholesaling or brokerage, intracity transportation, and retailing.

Processor margin: The difference between the f.o.b. processor price and the farm value. This margin is the amount received by those who perform the functions of processing, warehousing, and selling the product.

Marketing year: A 12-month marketing period for a processed fruit or vegetable beginning with the first month of the major packing season for that product.

INTRODUCTION

The growth of processing in the fruit and vegetable industry reflects changes in consumption patterns. Consumption of processed fruits and vegetables has steadily increased at the expense of fresh produce. Use of processed fruits and vegetables reached a high of 258 pounds (fresh weight) per person in 1976; 28 percent more than in 1966; and 47 percent more than in 1946. Consumption of processed items accounted for slightly under 60 percent of total fruit and vegetable consumption per person in 1976, up from about 50 percent in 1956 and near 40 percent in 1946.

The spread between the farm value and the retail price of a processed commodity is the total of charges made by marketing agencies involved in moving the commodity from the farm to the consumer. Rapidly rising food prices in recent years have focused attention on the size of the total spread and the distribution of the consumer's dollar among its component parts and the grower.

This report presents prices, margins, and farm values for selected canned and frozen fruits, vegetables, and juices sold in specific retail markets. Data are presented for 24 fruit and vegetable products; 7 in both canned and frozen forms.

METHODOLOGY AND SOURCES OF DATA

Prices are reported at three levels in the marketing channel--retail, processor, and farm. Prices are given in terms of a can or package and in terms of a case of a given number and size of cans or packages.

Retail prices are those paid by consumers in a sample of food stores in selected urban areas. Prices collected in each store are for brands usually selling in greatest volume in that store. Prices were reported per can or package by the Bureau of Labor Statistics and expanded to a per case basis. No adjustment was made for losses from nonsalable, spoiled, or damaged cans or packages. This report considers these losses as an expense to the retailer to be covered by his margin.

Processor prices (f.o.b. processing plant) are midpoints of price ranges listed in industry trade magazines. They do not include off-list allowances sometimes offered by processors. Processor prices for most canned items are from Food Production/Management magazine (The Canning Trade, Inc., Baltimore, Md.), and some canned items and all frozen items are from the Report on Food and Markets (The American Institute of Food Distribution, Inc., Fair Lawn, N.J.).

Prices at the farm level are expressed as the farm value of a case of the canned or frozen product.

Farm value was computed by multiplying the seasonal average price or value received by the appropriate farm weight equivalent (the quantity of the raw product required to pack a case of the processed product). These equivalents, except for Florida citrus products, were computed from data in Statistical Bulletin No. 362, Conversion Factors and Weights and Measures for Agricultural Commodities and Their Products, June 1965. The equivalents for Florida citrus products were computed from data in the Florida Cannery Association's annual Statistical Summary.

Farm values of most fruits and vegetables were computed using seasonal average processing plant door prices or values per unit published in annual reports of the USDA Statistical Reporting Service. Values for asparagus, green beans, lima beans, beets, broccoli, corn, cabbage for kraut, peas, spinach, and tomatoes were obtained from Vegetables - Processing Annual Summary: Acreage, Yield, Production, and Value (Vg 1-2). Values for brussels sprouts and strawberries are from Vegetables, Fresh Market, Annual Summary: Acreage, Yield, Production, and Value (Vg 2-2).

Fruit prices, other than Florida citrus, are from Noncitrus Fruits and Nuts, Annual Summary: Production, Use, Value (FrNt 1-3) and various monthly issues of Agricultural Prices. Florida orange and grapefruit prices are from the Florida Cannery Association's annual Statistical Summary.

Prices for processed items normally do not change much during a marketing year and are reported at 3-month intervals. A simple average is reported for each marketing year.

Stocks of a product at the processor level not sold at the close of a marketing year are carried over. Carryin stock is packed during the preceding marketing year, hence the grower of the raw product receives the preceding season's price. The farm value for the first pricing month of each marketing year is adjusted to reflect the sale of carryin stock. The first pricing month is either the first, second, or third month of the marketing year. All carryin stocks are assumed to be sold during the first 3 months of a marketing year. Carryin stocks are also assumed to be sold concurrently with the new pack, but with a declining influence on the current marketing year.

Adjustments for carryin stock are made as follows: When the first pricing month is the first month of the marketing year, the farm value is based on 75 percent of the preceding season's farm price and, 25 percent of the current season's price; if the second month, 50 percent each; and if the third month, 25 percent and 75 percent.

This report presents the seasonal average retail price per can or package for each product sold in selected cities. Retail prices are shown for seasons prior to 1970/71, where data are available. Quarterly and seasonal average retail price, processor price, and farm value per case of a given quantity of cans or packages are also shown. Farm value is also shown as a percentage of the retail price. The processor margin and the wholesaler and retailer margin are shown both in dollars per case and as a percentage of the retail value. The above statistics are also capsulized for canned fruits, canned vegetables, frozen vegetables, and canned and frozen juices in four summary tables.

CANNED FRUITS

Seasonal average retail price, wholesaler and retailer margin, processor margin, and farm value of canned applesauce, apricots, sour cherries, grapefruit sections, cling peaches, and Bartlett pears increased sharply between 1970/71 and 1975/76, with most of the increase occurring after 1972/73 (summary table 1). The retail price of a no. 303 can equivalent of these fruits averaged 36.8 cents in 1975/76; about two-thirds more than in 1970/71. Retail price increased 10 percent in the first three seasons and more than 50 percent in the last three seasons. The pattern of price increases was similar for each canned fruit except grapefruit sections and pears, for which increases were more evenly spread over the six seasons and were smaller than for other fruits.

The seasonal average wholesaler and retailer margin for canned fruit was 12.6 cents per can in 1975/76, three-fourths higher than in 1970/71. This spread declined slightly in 1972/73, then accelerated sharply in the last three seasons. Sour cherries experienced the greatest increase, followed by peaches. Applesauce increased the least, followed by Bartlett pears.

The processor margin for canned fruits averaged 18 cents per can in 1975/76, 71 percent higher than in 1970/71. This margin was only 0.4 cents higher in 1975/76 than a year earlier, as the margin declined in 1975/76 for apricots, cherries, and pears.

The farm value of canned fruits averaged 6.2 cents per can in 1975/76, 41 percent more than five seasons earlier. Farm value reached a high of 7.6 cents per can in 1974/75, then declined 18 percent in 1975/76. That season farm value declined for each fruit except peaches.

A simple trend analysis shows that the retail price of canned fruits increased an average of 3.4 cents per no. 303 can equivalent per season in 1970/71-1975/76. During this period, the wholesaler and retailer margin rose 1.1 cents per can per season; the processor margin went up 1.7 cents; and farm value rose 0.6 cent.

The processor margin accounted for about half of the retail price of canned fruit in 1970/71-1975/76, ranging from 41 to 53 percent. The wholesaler and retailer margin took 28-33 percent of the retail price, and farm value 17-21 percent.

Summary table 1--Selected canned fruits: Seasonal average retail price, wholesale and retail margin, processor margin, and farm value per can, average of major markets, 1970/71-1975/76

3/ Sold in Detroit and Pittsburgh.
4/ Sold in Detroit and Pittsburgh.
5/ Sold in Detroit and Pittsburgh.
6/ U.S. average.
7/ Weighted by canned pack.

The percentage of the retail price of canned fruits going to the farmer and other market factors did not show any significant change during the period. For the six seasons, the processor margin averaged 50 percent; the wholesaler and retailer margin, 31 percent; and farm value, 19 percent.

The market shares of individual canned fruits fluctuated from season to season, but no fruit showed any significant trend during the period. Farm value of cherries was 25 percent in 1970/71 and 1972/73; 40 percent in 1973/74; 20 percent in 1975/76; and averaged 28 percent for the six seasons. The processor margin for cherries ranged from 35 to 51 percent and averaged 40 percent for the period, well below the average size of this margin for other canned fruits.

Prices and margins for individual canned fruits sold in selected cities are shown in tables 1-25. Data for Thompson Seedless raisins are in tables 26-29 and for frozen strawberries in tables 30-33.

CANNED VEGETABLES

The seasonal average retail price, farm value, processor margin, and wholesaler and retailer margin for canned asparagus, green beans, lima beans, beets, corn, sweet peas, sauerkraut, spinach, tomatoes, and tomato catsup increased sharply in 1970/71-1975/76, with most of the increase occurring after 1973/74 (summary table 2). The retail price of these vegetables averaged 38 cents per no. 303 can equivalent in 1975/76, 48 percent higher than in 1970/71. Retail price for each vegetable increased about the same amount, except for beets (70-percent rise) and spinach (36-percent rise). Retail prices for green beans, lima beans, and sauerkraut reached a high in 1974/75, and dropped slightly in 1975/76.

The processor margin for canned vegetables reached a high of 19.7 cents per can in 1974/75, 56 percent higher than in 1970/71; and dropped 11 percent in 1975/76. A lower processor margin in 1975/76 resulted from a higher farm value and lower processor selling price that season. Processors of most canned vegetables found it necessary to reduce selling price several times in 1975/76 in order to move large stocks in a sluggish market. Lower processor selling price was offset by a larger wholesaler and retailer margin, resulting in slightly higher retail prices for most vegetables that season.

A simple trend analysis found that the retail price of canned vegetables increased an average of 2.9 cents per no. 303 can equivalent per season since 1970/71. During this period, the processor margin went up 1.3 cents per can per season; the wholesaler and retailer margin rose 1.0 cent; and farm value went up 0.6 cent.

The processor margin accounted for about half of the retail price of canned vegetables in 1970/71-1975/76, ranging from 46 to 53 percent. The wholesaler and retailer margin took 33-38 percent and farm value took 14-16 percent. The market shares did not show any significant change during the period. For the six seasons, the processor margin averaged 51 percent of the retail price; the wholesaler and retailer margin, 35 percent; and farm value, 14 percent.

Summary table 2--Selected canned vegetables: Seasonal average retail price, wholesale and retail margin, and farm value per can, average of major markets, 1970/71-1975/76

Vegetable and season	Retail price	Wholesale and retail margin	Processor margin	Farm value	Index (1970/71=100)

Market shares of individual canned vegetables fluctuated from season to season, but, with the exception of sweet peas, no vegetable showed any significant change in 1970/71-1975/76. The wholesaler and retailer margin's share of the retail price of sweet peas declined about 1 percentage point per season, and the farmer's share increased about the same amount.

Prices and margins for individual canned vegetables sold in various markets are shown in tables 34-37, 42-46, 51-54, 59-63, 71-75, 80-83, 88-95, and 100-110.

FROZEN VEGETABLES

Seasonal average prices and margins for frozen asparagus, green beans, lima beans, broccoli, brussel sprouts, corn, sweet peas, and spinach increased in 1970/71-1975/76, with most of the increase occurring after 1973/74 (summary table 3). The retail price of these vegetables averaged 37.5 cents per 10-ounce package equivalent in 1975/76, 43 percent higher than in 1970/71. The wholesale and retail margin went up 48 percent in this period. Both the retail price and the wholesaler and retailer margin went up only about 1 percent prior to 1974/75.

The farm value of these vegetables averaged 8.2 cents per package in 1975/76, nearly three-fourths more than in 1970/71. The processor margin reached a high of 14 cents a package in 1974/75, 37 percent higher than in 1970/71; but fell 10 percent in 1975/76. A higher farm value, combined with a lower processor selling price, resulted in a smaller processor margin that season than a year earlier. Processors of most frozen vegetables reduced selling price several times in 1975/76. However, the lower processor selling price was more than offset by a larger wholesaler and retailer margin, resulting in a slightly higher retail price for most frozen vegetables that season.

A simple trend analysis found that the retail price of frozen vegetables increased an average of 2.4 cents per 10-ounce package equivalent per season in 1970/71-1975/76. During this period, the wholesaler and retailer margin went up 1 cent per package per season; the processor margin rose 0.6 cent; and farm value increased 0.8 cent.

Farm value of frozen vegetables was 18-19 percent in 1970/71-1973/74, and increased sharply to 22 percent in 1974/75 and 1975/76. The processor margin was 39-41 percent in 1970/71-1974/75 and fell to 34 percent in 1975/76. Due mainly to this shift in market shares, the farmers' share increased on the average about 1 percentage point per season in 1970/71-1975/76, and the processor margin declined by a similar amount. For the six seasons, the wholesaler and retailer margin averaged 42 percent; the processor margin 39 percent, and farm value 19 percent.

The farmers' share of the retail price of brussel sprouts, corn, sweet peas, and spinach increased by a significant amount during 1970/71-1975/76, mainly at the expense of the processor margin. Market shares of other individual frozen vegetables did not shift much.

Summary table 3--Selected frozen vegetables: Seasonal average retail price, wholesale and retail margin, and farm value per package, average of major markets, 1970/71-1975/76

Prices and margins for individual frozen vegetables sold in various markets are shown in tables 38-41, 47-50, 55-58, 64-70, 76-79, 84-87, and 96-99.

CANNED AND FROZEN JUICES

The seasonal average retail price of canned apple juice, grapefruit juice, orange juice, tomato juice, and frozen concentrated orange juice averaged 57.4 cents per 46-ounce can equivalent (single strength basis) in 1975/76, 30 percent higher than in 1970/71 (summary table 4). The farm value and wholesaler and retailer margin for these juices each increased 35 percent in the period. The processor margin rose 52 percent to a high of 20.8 cents per can in 1974/75, and fell 18 percent in 1975/76. The lower processor margin that season was more than offset by a higher farm value and a higher wholesaler and retailer margin, resulting in a slightly higher retail price for most juices.

A simple trend analysis found that the retail price of canned and frozen juices increased an average of 2.8 cents per 46-ounce can equivalent (fresh-weight basis) per season since 1970/71. During this period, the wholesaler and retailer margin went up 1.1 cents per can per season; the processor margin rose 1.1 cents; and farm value increased 0.6 cent.

The market shares for canned and frozen juices fluctuated from season to season, but did not show any significant trend in 1970/71-1975/76. The wholesaler and retailer margin ranged from 35-39 percent for the period. The processor margin was 27-31 percent and farm value 32-38 percent in five seasons. However, in 1974/75 the processor margin jumped to 38 percent and farm value fell to 28 percent. For the six seasons, the wholesaler and retailer margin averaged 37 percent, the processor margin 30 percent, and farm value 33 percent.

The market shares of individual juices differ widely. The farmers' mean share of the retail price of canned orange juice and canned grapefruit juice was only 29 percent and the processor's share was 42 percent. However, for frozen concentrated orange juice the farmers' mean share was 36 percent and the processor's 25 percent.

Prices and margins for individual juices sold in various markets are shown in tables 111-133.

Summary table 4--Selected canned and frozen juices: Seasonal average retail price, wholesale and retail margin, and farm value per can, average of major markets, 1970/71-1975/76

Juice and season	Retail price	Wholesale and retail margin	Processor margin	Farm value	Index (1970/71=100)
