Choice Flower Seeds

Everyone should give more attention to planting flowers around their homes. There is nothing that adds more to the looks or beauty of a home than a bed of flowers. They should be given a space by the farmer as well as those who live in the city. The care is small as most flowering plants will live in almost any soil. The soil best adapted to flowers generally is a light loam containing a sufficient amount of sand to render it porous. Many flowers are larger and finer if produced on plants of vigorous growth, hence a portion of the garden should be prepared by deep digging, thorough pulverization, and liberal enriching with plenty of well-rotted manure. Some other varieties produce largest and finest flowers on rather light, poor soil. The principal thing is to make the soil as fine and smooth as possible. Never plant flower seed when the ground is wet. Cover each lot of seed to a depth which should not be greater than six times the thickness of the seed. Plant in rows, press the soil firmly over the seed. The young plants should be thinned out to prevent crowding.

Plants are usually divided into three classes: Annuals, Biennials and Perennials.

Annuals are plants that usually live but one season.

Biennials are plants that bloom the second year from seed and the plant dies after blooming.

Perennials are plants that bloom the second year from seed and the plant lives and blooms for several years.

PEONIES

The Peony is perhaps the oldest and best known inhabitant of the flower garden and rivals the rose in coloring and perfection of bloom. The flowers are perfectly double and very large. They are not troubled with insect pests or disease and the dark green foliage is exceptionally clean and attractive. Peonies will do well in almost any garden soil but the better enriched the soil and the more liberal the space allowed for each plant, the more vigorous the growth. In planting the roots, cover the eyes with about 2 or 3 inches of soil. A deep, lively loam is preferable and the ground about the plants should be worked well. Fall planting is the best although they can be planted in the Spring also.

- FESTIVA MAXIMA.** This is the most popular and beautiful White Peony. Flowers are extra large and of the double rose type. The edges of center petals are dotted with carmine spots. It is a free bloomer and very early **\$0.60**

- KARL ROSENFELD.** Rich velvety bright red. Large flowers of the semi-rose type. A sturdy grower and free bloomer. Medium early. Considered one of the best all around red Peonies **1.25**
- OFFICINALIS RUBRA PLENA.** The old-fashioned red peony of our grandmother's garden. It is perhaps the earliest of all peonies, usually in full bloom before Decoration Day. Large double flowers of a rich dark red color **1.25**
- MONS. JULES ELIE.** This is considered by many the finest of all peonies. Flowers are of immense size, full and globular in form. Wonderful glossy flesh-pink shading to deeper rose-pink at the base. When fully opened it looks like a giant Chrysanthemum. Fine cut flower **1.25**

How to Care for Your Lawn

Nothing will add to the appearance and, for that matter, actually enhance the value of your home to such a degree as a well-made well-kept lawn. A good lawn is easily made.

Soil and Preparation. The ideal lawn soil is a well drained, moderately rich and moderately heavy loam. If raw sub-soil has been exposed in grading, cover or replace it to a depth of 8 inches with top soil from an old meadow or garden. Avoid fresh stable manure, as it is almost invariably full of weed seeds. Vigoro or Bonemeal is excellent. Spade up the soil to a depth of 6 to 8 inches, mixing in the manure or other fertilizer, and then rake the surface fine and level.

Seeding. Sow the seed evenly over the surface. To insure a thick, even stand, use plenty of seed. Then go over the surface with a rake and rake it in such a way that the seed will be covered. In shady places sow Shady Lawn Seed.

Watering. If the soil contains plenty of moisture-retentive humus, little artificial watering should be required. If it becomes necessary to use the hose during the dry spells, an occasional thorough soaking is better than frequent light sprinklings.

LAWN SEED

We use only the very best grades of Grass Seeds and White Clover, especially selected for purity and high germination.

All solid seed, no chaff. Do not waste time and money by sowing cheap grass seed which is mostly chaff. Sow our Fancy Mixed Lawn Seed and enjoy a beautiful lawn. One pound will sow about 300 square feet.

PEAT

(Imported German Peat Moss)

Peat is used with excellent results in the making of garden soils, especially those soils that are very heavy or very dry. Peat stimulates the development of roots of all plants and in the Summer it is an excellent moisture retainer, as it absorbs more than 8 times its own weight in water. For mulching it is ideal. A slight covering of 2 inches thrown over the beds will prevent all freezing and heaving. When the Winter is over, peat may be dug in and should not be removed. It acts therefore in a double capacity. Peat is not a fertilizer although often sold as such. It is a decomposed plant material which loosens the soil and prepares it so that the most delicate plants and trees may be grown to perfection. It is also an excellent ground cover under Roses, Evergreens and other shrubs as it keeps the soil moist and cool during the hot Summer months. Peat may be stored in a garage or woodshed for any length of time as it will not spoil. Our Peat Moss is thoroughly dried before packing; this gives more material for the same weight. One bale will cover about 250 square feet, 1 inch deep; 125 square feet, 2 inches deep; 80 feet, 3 inches deep. 20-lb. bag, \$1.00; 50-lb. bag, \$2.50; bale of about 160 to 180 lbs., \$5.00.

STIM-U-PLANT

Plant Stimulant Tablets

THE IDEAL YEAR-ROUND FEEDING METHOD

These tablets are rich in plant food, containing 11 per cent Nitrogen, 12 per cent Phosphoric Acid and 15 per cent Potash. They keep well, are odorless and clean. Compare this analysis with that of any other fertilizer.

Plants in pots, especially when growing vigorously, soon use up the nourishment that is in the soil, therefore to keep your plants healthy, feed them about every ten days or two weeks and avoid the error of feeding too much at one time.

Have Stim-U-Plant Tablets on hand so you can apply them to your outside plants as soon as they start growth and note the amazing results.

Fine for all kinds of vegetables, flowers, bulbs and shrubs. They are a proven success with rose growers, nurserymen, landscape gardeners, strawberry growers and market gardeners. Complete directions with every package. Easy to use. Simply insert in soil near plants, or dissolve in water at the rate of four tablets to the gallon and apply as liquid manure. Price, 30 tablets, 25c; 100 tablets, 75c; 1000 tablets, \$3.50.

Garden Pest Exterminators

Ants Destroyed

New Method "gets" them at their source—safe; permanent; effective.

The Antrol system is adapted to any size house or garden and quickly destroys all species of sweet eating ants. It is composed of small glass containers and a special formula of syrup. The containers are partially filled with syrup and placed about the outside edges of the house or along "ant" trails in the garden if the infestation occurs there. The ants smell the syrup, eat it and then transmit its mild poison to the queen in the nest. Soon the entire ant colony is destroyed!

The complete system should cover every 15 feet around the outside of the house or "ant" trails in the garden. Once installed, permanent, effective and safe protection is insured from these annoying pests. Prices—Antrol sets containing 4 containers and 1 4-oz. bottle of syrup, 95c; Antrol extra containers (each), 15c; Antrol syrup, 4-oz. bottle, 45c; pints, 95c; gallons, \$3.75.

DUBAY SEED DISINFECTANTS INCREASE *your* FARM PROFITS *and* GARDENING PLEASURES

by Preventing Seed-Borne Disease Losses

Regardless of the care taken in the preparation of the seed bed and the selection of the seed, field crop and garden failures may result from attacks of seed-borne diseases. These losses and disappointments may be easily avoided by disinfection of the seed before planting. It is estimated that one or more of some 200 disease organisms are commonly carried on farm and truck crop seeds. The Du Bay Seed Disinfectants now enable you to prevent loss from many of these seed-borne diseases easily, inexpensively and quickly without seed injury. Treat all seeds before planting with the proper Du Bay Seed Disinfectants.

SEMESAN—for flower and vegetable seeds

Diseases carried on the seed often reduce germination and cause a poor stand, lowered quality and unsatisfactory yields. Destroy these disease organisms without injuring the seed by treating your seeds, bulbs, roots, corms and tubers with Semesan. Easily and quickly applied as a dust or liquid. Effective in controlling damping-off of seedlings and cuttings. Use Semesan to control seed-borne diseases and improve your vegetables and flowers.

SEMESAN BEL—for seed potatoes

Prevent seed-borne disease losses by treating seed before planting with Semesan Bel, the instantaneous dip disinfectant. No time-consuming soaking necessary. Semesan Bel is effective in controlling such destructive seed-borne diseases as scab, rhizoctonia and black leg. Protects the seed piece against rotting by soil-borne organisms. Improves germination and usually produces a bigger crop of better quality. One pound treats 16 to 22 bushels of seed.
