CHEAPEST — IN PRICE *The best never is!*

**Re-Formulae for Lawn Grass Seed Mixtures Recommended
by the New Jersey Agricultural Experiment Station.**

Mixtures compounded in accordance with formulae may be advertised in any proper manner, providing that it be clearly stated that the New Jersey Agricultural Experiment Station is recommending the formulae only, and not the particular lot of seed being offered for sale. Seed firms of high integrity and sound reputation may be relied on to adhere to the formulae advertised. If mixtures advertised by any concern as being prepared according to these formulae, are found to be below the minimum requirements, legal action may be taken in accordance with the New Jersey Seed Law, and in addition the New Jersey Agricultural Experiment Station shall drop the name of the company from the list of firms offering prepared lawn grass seed mixtures for sale.

A sample of the way in which the name of the New Jersey Agricultural Experiment Station may be used is as follows:

Standard mixtures for lawns. Prepared according to Formula No. 1, as recommended by the New Jersey Agricultural Experiment Station.

State of New Jersey Agricultural Exp. Sta.

J. G. Lipman (Dean and Director)

Howard B. Sprague, (Agronomist)

New Brunswick, N. J.

**GRASS IS SENTIMENTAL — IT REFLECTS THE
MOODS OF NATURE.**

Burns out on hot summer days—

Freezes in cold winter time—

Green—lively—lovely—fragrant—full of dew in springtime.

* * *

Why do I want a bent grass lawn?

Because, if I live in a region of acid soils, bent is not only the most beautiful but the easiest turf grass to produce and care for; if my soil is alkaline, because I want the best and am willing to go to a little extra trouble to get it.

* * *

FRED RADWAY SAYS:

This is the beginning of the end—of

“The Sawdust Trail”

“Chaff—sand and sawdust versus

Highgrade tested but expensive lawn seed”

“Quality will survive the pain suffered by the price.”

QUALITY IS ESSENTIAL

Will bent drive out weeds?

Any well nourished grass will compete strongly with weeds. It is a fundamental law that two bodies cannot occupy the same space at the same time, so if well nourished grass occupies the entire lawn surface, weeds will have very little chance. From recent experiments it seems that most of our bad turf weeds are lovers of alkaline soils and that the acidity which encourages bent discourages weeds.

LAWN SEED —

Is not the cheapest in Price—
the BEST never is!

“GRASSHOPPER PHILOSOPHY”

I sympathize with city folk who live in little flats,
They haven't homes, but merely spots to park their
coats and hats,

To sleep, perhaps to eat, to get their letters and their
bills;

But all the garden space they have is on their window
sills,

Among the dangers of the street, with trucks and
honking horns,

Their children play, instead of having broad and
grassy lawns,

Where trees and shrubs and flowering plants leap from
the living loam.

A house without a garden is a house, but not a home.
The place may be a palace (with a flat on every floor),
But it will be a parking-place, just that and nothing
more,

Despite its marble corridors and gleaming copper
dome;

For you've got to have a garden, if you want to have
a home.

FACTS ON LAWN MANAGEMENT

**By Permission of Professor L. S. Dickinson,
Mass. Agricultural College, Amherst, Mass.
(Extract)**

All Bent seeds are very small. All Blue Grass seeds are small. All Fescue seeds are large. All Rye Grass seeds are very large.

Blue Grasses prefer alkaline (sweet) soil. Bents prefer acid (sour) soils. Fescues and Rye Grasses are not so particular.

Timothy is a hay seed very undesirable for lawn grass (used by seed dealers in conjunction with chaff Red Top to cheapen product and to act as filler, shows quick growth but ruins the lawn eventually).

SOIL—must be considered in three parts. No. 1 foundation (the earth below the sub soil); No. 2, the sub soil; No. 3, the top soil.

The sub soil is the reservoir from which the grass roots obtain water during periods between rain or artificial watering. It need not have any food value but must be of such physical character that it will retain enough moisture to supply the grass roots. Hard coat ashes six inches deep make an excellent sub soil.

The top soil is valued mainly for the organic matter it contains. Roll and rake soil, and then seed. After sowing, seed should be lightly covered by brushing or raking, and roll lightly.

Lawn mower should be set high, young grass should be well established before any attempt is made to clip it short.

SPRAY MATERIAL

It kills plant insects

Sheps PYRETHRUM \$1.25 per pint bottle

FERTILIZER NOTES AND RATE OF APPLICATION PER 1,000 SQUARE FEET

Bone Meal.—18 lbs. Slow acting. Favorable to blue grasses, encourages weeds and clover. Do not use alone.

Cottonseed Meal.—Organic. 16 lbs. Neutral in action. Rapid. Safest of all lawn fertilizers to use, gives a thick, dark green turf quite free from weeds.

Sheep Manure.—Organic. 24 lbs. Neutral or alkaline in reaction. Slow acting. Encourages weeds and clover. Undesirable in any form.

Stable Manure.—Organic. 125 lbs. Neutral reaction. Medium rapid. If manure has been composted for one year there is no better lawn fertilizer. Gives a thick, dark green turf.

Activated Sludge.—Organic. 30 lbs. Medium rapid in action. A very good lawn fertilizer.

Lime.—Inorganic. Use only on heavy clay soils. 40 lbs. One application will show good results, two are too many.

Poultry Manure.—Organic. (Commercial dried). 12 lbs. Excellent lawn fertilizer. Gives a thick dark green turf.

Poultry Manure. (Local).—Should never be used unless it has been composted at least six months with sand or earth or one year without carrier. Excellent lawn fertilizer.

Nitrate of Soda.—Inorganic. 8 lbs. Alkaline, very rapid. Apply during a very heavy rain, or thoroughly wash in by watering. Encourages clover and weeds. Very fine for rough stalked meadow grass and other blue grasses.

Sulphate of Amonia.—Inorganic. 6 lbs. Acid. Very rapid. Excellent lawn fertilizer. Discourages weeds, clover and blue grasses. Must be applied with great care during a heavy rain or thoroughly washed in.

Acid Phosphate.—Inorganic. 10 lbs. Neutral, slow. Encourages weeds and clover. Should not be used alone.

Muriate or Sulphate of Potash.—Inorganic. 9 lbs. Slow. Encourages weeds and clovers. Use where moss and sorrell indicate that the soil is depleted of plant food, and on sandy soils. On average lawn soil seldom needed. Use under trees and where shrubs are consuming a considerable part of the plant food in the soil.

NON-WARRANTY. We give no warranty, express or implied, as to description, quality, productiveness or any other matter of any seeds, bulbs, or plants we send out, and will not be responsible for the crop. As bearing on the above, the following remarks, taken from a recent Bulletin of the U. S. Department of Agriculture, are interesting: "Without attempting to discuss the arguments for the seedsmen's disclaimer pro and con, the fact remains that reputable seedsmen stand back of their seeds and do not knowingly and willfully sell seeds that are unfit for planting purposes."
