INTRODUCTORY REMARKS.

The publisher of this modest little list was doubtless not alone in experiencing the great need of it; but it would not have made its appearance without the great assistance received from Mr. J. Davidson, who has provided practically the whole of the information it contains, including his manuscript notes on the new species recorded since the publication of Messrs. Blanford & Oates' volumes on Birds in the "Fauna of British India."

The list is, by the kind permission of the late Dr. Blanford, based on Messrs. Blanford and Oates' work, and the numbers used in that work are retained in the present list, the new species being denoted by the addition of an index-letter to the preceding number. Hume's numbers follow the names of all the species mentioned in his catalogue.

Several changes in classification, which have already been generally approved, have been made: thus Chalcoparia has been placed among the Pycnonotidæ, the generic name Sittiparus has been changed to Pseudominla, Micropus to Microtarsus, and Erythrospiza to Bucanetes. A new generic name Curzonina has been substituted for the name Gypsophila, employed by Mr. Oates, as the latter was already in use in Botany.

It has not been deemed advisable to make any change for the present in respect of the alterations suggested as a result of the Richmond Expeditions.

The publisher hopes to issue further editions of this list from time to time as necessity arises, and will be grateful for the co-operation of all who are interested.

St. Mary Cray,

September, 1905.
