BADLANDS Ecotype Little Bluestem

- ◆ Deep, fibrous root system
- ◆ Basal portions of stems are flattened
- ◆ Leaves are slightly folded
- ◆ Leaves become reddish brown at maturity, red in fall/winter
- ◆ Mature seed heads become fluffy, white

Flattened leaf sheath

Papery ligule

Projected Area of Adaptation

Collection area of Badlands ecotype (lined)
and projected area of adaptation

Badlands Ecotype Features

- ◆ The source population is a composite of plants from 68 different sites, including the Badlands region of North Dakota and South Dakota
- ◆ A broad, genetic base with plants originating from many different range sites, but primarily shallow, thin upland, sandy, and silty
- ◆ Improved plant vigor, seed production, and disease resistance
- ◆ Variation in plant size, leaf width, and color
- ◆ Plant color varies from light to dark green with occasional blue plants
- ◆ Phenology may vary up to two weeks within the population
- ◆ First seed matures generally in late August at Bismarck, ND
- ◆ Approximately 4 weeks earlier in maturity compared to Blaze and Camper
- ◆ Original area of collections includes USDA Plant Hardiness Zones 2, 3, & 4

Establishment

- ◆ Seed from mid-May to mid-June
- ◆ Shallow seeding depth of .25 to .5 inches is critical
- ◆ Plant through fluffy seedbox with grass drill unless the seed is debearded
- ◆ Plant at a seeding rate of 25 to 30 pure live seeds (PLS) per ft² if planted alone (4.2 to 5.0 PLS lb/ac); generally little bluestem is one component of a range mix, so rate varies depending on percent desired in the stand
- ◆ Number of seeds/pound averages 270,000; debearded seed will vary from this amount
- ◆ Accent plants for landscaping are generally spaced at 1 to 2 feet

Management

- ◆ Proper grazing would include not removing more than half of the new growth during the growing season
- ◆ Quality declines with growth stage, dropping rapidly as the plant matures and sets seed
- ◆ Prescribed burning in late winter or spring will increase seed production and improve forage quality
- ◆ Without proper use or burning, little bluestem can form dead centers
- ◆ Plant crowns may suffer severe damage when burned during dry conditions

Seed Production

- ◆ Seed harvest can be accomplished by combining or stripping
- ◆ Because of the light, fluffy seed, air should be reduced or closed
- ◆ Variable seed maturity, even on the same plant, is common
- ◆ Seed strippers can be used after seeds have reached the “full-fluff” stage, but before heavy shattering occurs
- ◆ Annual seed yields can be extremely variable
- ◆ Clean seed yields at the Bismarck Plant Materials Center have averaged 100 to 200 lb/ac with irrigation and 42-inch row spacing

Seed unit

Seed Availability

Generation 2 seed, equivalent to foundation seed, is available for seed increase from the USDA, NRCS Plant Materials Center, Bismarck, North Dakota. Certified seed is available from various commercial vendors. Contact your local USDA, NRCS Field Office or the Bismarck Plant Materials Center for a list of vendors.

Origin

Selected plants comprising Badlands little bluestem originated from 68 different sites in southwestern North Dakota and western and central South Dakota. The diverse genetic plant material was collected vegetatively on 10 different range sites.
