PHONE SUNSET 5837

PORTLAND - - OREGON

Do not fail to visit our most interesting ALPINE NURSERY
Street car—Take Woodstock car on Second and Alder Street to
41st and Holgate, walk four blocks east

How to Order--

ORDER EARLY—Send in your order as soon as possible after receiving catalog to insure prompt delivery. All orders are filled the same day they are received, as far as practicable.

PRICES—The catalog prices for plants are for first quality varieties large enough to be planted in the garden without risk of loss. Extra large plants for immediate effect at double catalog prices.

ERRORS—We exercise the utmost care in filling orders, striving to do a little more than we offer; yet in the press of business, errors sometimes occur, in which event we wish to be promptly notified of the fact, after which we will make such corrections as will be satisfactory. Please keep copies of all your orders for comparison.

COMPLAINTS AND CLAIMS about the quality of the plants cannot be entertained unless made immediately upon receipt of same.

WE GIVE NO WARRANTY, express or implied, and will not be in any way responsible for the result of planting or misuse of any plants we send out. However, we guarantee all varieties to be true to name and description.

IF A VARIETY IS SOLD OUT, or stock is exhausted, or plants not ready for market, we reserve the right (unless forbidden in your order) to send you equally good sorts and better values than you ask for.

QUALITY—We sell only first quality hardy plants, with perfect root-system. Our nursery is exposed to the east wind and the plants have to stand below zero weather. Only a few delicate varieties are grown under protection, which plants we recommend only for southern climates. All plants which are difficult to transplant, such as Helianthemum, and others like Cyclamen, Ramonda, some Saxifraga, etc., the culture of which requires considerable care, are grown in pots for shipment.

COLLECTIONS—For those who are only slightly acquainted with the more desirable type of plants for rockeries, wild gardens, shady nooks, etc., we have made up a series of choice collections consisting of contrasting colorings and harmonizing varieties sufficient to produce very pleasing effects in any garden. In ordering, please state whether collections are for small, medium or large rock garden, and whether for sunny or shady exposures. Prices are as follows:

10 varieties, \$2; 20 varieties, \$4; 25 varieties, \$5; all postpaid.

SHIPPING—Unless otherwise ordered, we will send all plants by parcel post, purchaser to pay postage and insurance. Large orders by express.

TERMS—Cash with order. Where credit is desired, good references must be furnished. Address all communications to

PACIFIC LANDSCAPE GARDENERS,
4503 Forty-fifth Ave. S. E., Portland, Oregon.

*Sweet are the little brooks that run
O'er pebbles glancing in the sun,
Singing in soothing tones.—TENNYSON.*

Landscape Gardening

LANDSCAPE GARDENING in a broad sense of the word may be defined as the art of beautifying grounds which surround homes, business structures, educational institutions and recreational places such as parks and playgrounds.

The origin of landscape gardening dates back to the time when the supply of caves became limited on account of the increase of population, and man was compelled to erect abodes of his own crude design. Although primitive, his home was worthy of his protection and profoundest interest, which led him to improve the outside appearance by means of winding paths, groupings of native trees, shrubs and flowers, so arranged that his natural love of beauty as well as a desire for seclusion and privacy were gratified. The effects achieved many thousands of years ago are today the backgrounds which play an important part in modern landscaping.

The old artificial effects of straight lines and symmetrical curves, nursed along for many years by men who made landscape architecture their profession, and which reached its height during the middle ages when immense sums were spent to produce wonderful gardens such as the parks of Versailles of the Royal Court of France, reached their decline about 1850 when men tried to imitate Nature, which they attained by observation. The first rock gardens made their appearance about that time, but the development was greatly impeded by people who objected to changes in the old order.

Today the rock garden is highly favored by nature lovers seeking unconverted beauty, as the modern rock garden resembles the work of nature more than any other branch of landscaping. To advocate this great line of gardening, to stimulate the admirer of nature, and to help further this type of beautification of home grounds, we shall give a few brief instructions and rules which produce the best results.

Location

The first essential to consider is the location. A rock garden needs unobstructed sunshine, although there are several varieties of Alpine plants which do best in shade. The latter can be accommodated by arranging sheltered pockets to protect them from the sun. As to the rockery itself, any slope or embankment is suitable.

Then a rockery, in order to produce the best results in the culture of rock plants, must be provided with the proper drainage which by nature is cared for by the stone and gravel found in the subsoil. The rockery should also be elevated to aid the drainage, and never should a location be chosen which will serve as a place for the accumulation of superfluous water such as from slopes surrounding a valley or meadow, unless proper artificial drainage is provided for.

The soil must not be heavy nor the clay type. It must be loose and of necessity contain moderate amounts of small rocks (frost-bitten or chipped rock) and some leaf mold, preferably from broad leaf trees (not conifers). If you want to have a rock garden on a certain bank or slope and the soil is not suitable for the culture of rock and Alpine plants as described, you must make it so by adding these essential constituents. Dried and pulverized sheep guano and bone meal may be used which will guarantee the best results in fertilizing the ground.

Construction

The type of rock best suited is that of volcanic origin, and moss covered.

The foundation must be deep and also consist of rocks, and intervals be filled with soil. In building up the rockery, care must be taken as to the position of the rock, for many reasons. A rock which slopes down and is not adjusted properly to its fellow rocks is a weak spot in the construction, and may slide at any time (especially if weather conditions become unfavorable). Furthermore, it will not permit the water (rain or sprinkling) to moisten the ground beneath it, thereby keeping plants dry. (It is natural for the roots of rock plants to grow along the rocks and procure moisture and nutrition in that manner.)

In construction, too much care should not be exercised in forming pockets, for if built according to nature the rocks are fitted and pockets formed automatically. Hammer and chisel should be discarded in natural rock work.

Planting

The most important part in the construction and completion of a rockery is the skill in arranging the rock plants. People often have a large selection of the finest varieties of plants, but the manner in which they are arranged is so inadequate that the value of the best plants is lost. Many of these errors are due to the fact that a large number of gardeners who plant rock gardens are unskilled and their knowledge as to the nature, cultivation and characteristics of the plants is limited.

Attention must be paid as to whether or not a rock plant is of the high or low growing variety, its attitude toward multiplication, whether it requires sunshine or shade; dry, moist, rich or poor soil, and finally, whether a certain variety grows single or in clusters and the color which it assumes when it blooms.

Most of the rock plants improve the appearance of the rock garden when planted in large masses covering big pockets, thereby producing the same effect as if they were grown in nature's own mystic garden, where the most gorgeous mass effects are produced by the simple reseeding of the specie at the original site.

Caution

That your garden may not suffer the consequences of inexperience, carefully follow the instructions in this catalog. And to insure yourself of being able to claim one of the most attractive rock gardens in your neighborhood, have an expert advise you, and have men especially trained to do this work complete it to your satisfaction.

"Most rock plants, if planted in large masses covering big pockets, produce the same effects as if they were grown in nature's own mystic garden."

Our Landscape Department

OUR LANDSCAPE DEPARTMENT is one of the best in the Northwest. Twenty-five years of practical and technical experience here and abroad enable us to give you the best service in planning, creating and planting of parks and gardens.

Italian terrace-gardens and French formal-gardens were for years our line of work.

Alpine and Rock-Gardens, including grottoes, bridges, brooks, waterfalls and lily ponds, are our specialties.

We are glad to offer suggestions and estimates without charge, but where landscape problems require plans and specifications, a charge is made consistent with value of services rendered.

What Are Alpine Plants?

ALPINE (Def.)—Of, pertaining to or like the Alps, or any lofty mountain.

Alpines are rock plants usually found in high altitudes or in mountainous countries, and cultivated in rockeries. They are segregated into the following three divisions:

1. **SUBALPINE** plants usually grow in the rock fissures and moraines above the timberlines of mountains. However, they do not demand a definite altitude, for in the Arctic countries they grow at sea level, while in the southern countries they are found in profusion at 12,000 to 14,000 feet above sea level. (For culture, see page 5, culture Nos. 3-5-8.)
2. **ALPINE** plants are found among the cliffs near mountainous timberlines and in Alpine meadows. (See page 5, culture Nos. 3-5-8.)
3. **MOUNTAIN** plants, including all plants found among the rocks, and in the forests and meadows of mountains where rather moderate climatic conditions prevail. (See page 5, culture Nos. 1-2-4.)

Explanation of Culture

Nos. 1 to 7 refer to the cultures described below.

Symbol	R.—Stands for rock plants.	C.—Soil containing lime or calcium is required.
	N.—Native plants.	G.—Soil containing granite or silicates.
	S.—Unobstructed sunshine.	
	O.—Shade.	
	S.O.—Half shade.	

LEFT—The WRONG way.
Rain or moisture cannot reach plants.

RIGHT—The right way.
Moisture can enter crevices and seep down to roots.

Culture of Alpine Plants and Perennials

No. 1. For plants of mountainous region, border plants and bulbs. They need a fertile garden soil. Where too loamy, add sand and peat moss or leaf mold and old rotten manure.

No. 2. For plants in need of full or partial shade. These plants are used for planting in forests, shady hillsides or the north side of rock gardens. A rich soil with peat moss or leaf mold is suitable for this class.

No. 3. Plant suitable for bog or swamp gardens and water plants. They need fertile soil mixed with peat moss or turf, sand and old rotten manure.

No. 4. For plants saxatiles, the finest and most attractive in rock gardens, steps and wall gardens. They form tufts or carpets between crevices. The well developed root systems give them the advantage to find nourishment and humidity deep under the rocks and in the walls. They need a perfectly well drained place and a soil mixture of one-third garden soil, one-third peat moss and leaf mold and one-third crushed rock and sand. (Some plants need granite, some need lime rock.) This mixture is also excellent for prairie plants and by adding sand for desert plants.

No. 5. Plants from the highest mountain and glacial regions. These are the finest in form and color, but very difficult to grow. They need a sunny well drained place and protection against dampness during the winter. Soil consisting of one-half fine crushed rock (granite, or for some, lime rock), one-fourth fertile garden soil, one-eighth peat or turf and one-eighth leaf mold will be excellent for them.

No. 6. Plants of Category No. 5 which need crushed granite rock (obtainable in granite or monument works).

No. 7. Plants of Category No. 5 which need crushed lime rock or marble.

No. 8. For plants suitable for turf gardens. In making turf gardens, select a sunny location over running or standing water. As a foundation, use a five-sixths inch layer of small rocks, cover them with sphagnum and add a layer of soil one and one-half to two feet in depth, consisting of a mixture of one-third turf, one-third sphagnum and one-third leaf mold.

LEONTOPODIUM ALPINUM
(Edelweiss, Queen of the Alps).
Known to the Swiss as a fairy of the high mountains. Many Swiss youths have lost their lives attempting to secure the flowers for their sweet-hearts. A rare and beautiful plant.

Woollen Androsace (*Androsace Lanuginosa*). A jewel in the rock garden. The trailing plants are covered with silvery woolen leaves which, during blooming season are nearly hidden by flowers of soft pink color with a red eye in the center. They need a well drained soil with an addition of lime.

A mass planting of
CAMPANULA PUSILLA
ALBA, which do well in
 rocky, sandy soil.
CAMPANULA PULLA
 give a similar effect.

**A finer lawn
next spring...
if you protect it
NOW!**

GARDENERS and nurserymen say *fall* is the best time of year to make new lawns. Also the time to give special care to old lawns.

For properly nourished now, grass is hardier and in much better condition to withstand freezing weather, and will have a head start for early growth in spring.

To assure vigorous growth, better root systems, thousands of home owners have come to rely on Vigoro. Complete, balanced—it

supplies *all* the elements of plant food growing things need. It increases the humus in the soil. It helps check weeds.

Clean, odorless, Vigoro can be applied with your kitchen colander. Just apply light top dressing—no spading!

A most practical, effective, economical way to assure finest results! Only 10c to 20c for every 100 square feet!

See your dealer now. Full directions in every bag—100, 50, 25 lb. sizes; 5 lb. packages.

A Swift & Company Product

*So clean,
odorless,
can be sown
by hand!*

VIGORO
Makes better lawns, gardens
flowers, trees and shrubs

*Endorsed by
leading
landscape
gardeners,
nurserymen*

The use of Artificial Fertilizer for Rock Gardening is quite dangerous. Only three years of experimenting with Vigoro did give us the finest results, so we recommend it as the only artificial fertilizer to be used in Rock Gardening.

100 lbs. \$6.00, 50 lbs. \$3.75, 25 lbs. \$2.00, 5 lbs. 60c.

Pacific Landscape Gardeners, Portland, Oregon

If you have a small creek that flows through a piece of level land, you are in luck. Beautiful effects can be attained by a skillful arrangement of rocks and plants.

We do the planning and supervise most of the prominent flower and horticultural shows—Rose Festival Show, 1928-1929; Dahlia Show, 1929; Horticultural Show for Northwestern Florists' Convention, March 23-25, 1930. If you need help in such work call on us.

In the first rank among the Commercial Exhibits at the Portland Rose Show was that of Adolph Meyer.
