Orchids Cultural Directions

The Orchids are without question the most beautiful and most lasting flowers in all the floral kingdom, and also the easiest grown plants of any, if a few common-sense points are observed.

Ventilation—Orchids delight in fresh air at all times when weather permits. During the warmest part of the Summer months it is beneficial to leave the ventilators slightly open at night.

Shading—The glass should be lightly shaded from about February 15th to September 1st, or the sun will burn the plants. During the rest of the year clear glass is desirable.

Watering—When watering see that plenty is given and then allow the plants to dry out before giving more, this will keep the compost in the pots in good condition for a long time. The atmosphere in the house should be moderately moist.

Temperature—A night temperature of 58 to 60 and correspondingly higher in the daytime will suit the greater number of Orchids. (For such as Cattleyas, Brasso-cattleyas, Laeliocattleyas, and most Laelias, a night temperature of 60-65 degrees, and 65-70 degrees in the daytime or higher, with sun and ventilation is desirable).

Potting—Firm potting is absolutely necessary. Orchids will not grow well and thrive if loose in the pots or baskets. In repotting, care should be taken not to disturb the roots, rather break the pots, while the baskets may be taken apart carefully and the plants placed in new baskets, working the material around the plants firmly. This is generally done by placing the material used between the rim of the pot or basket, and the ball of the plant pressing the material towards the plant. When no more material can be conveniently used, it will be found the plants are very firm in the receptacle. Avoid overpotting and do not disturb the plants unless necessary.

Materials for Potting—The best material for potting Orchids is Osmunda fiber, commonly called peat. A few lumps of charcoal and pieces of broken pots may be added to advantage, also a little Sphagnum moss.

Time for Potting—In the greater majority of cases the time for potting is immediately after the plants finish flowering. The plants are then more dormant than at any other time, notably such as Cattleyas, Laelias, Oncidiums, and Odontoglossums and many more. With these general directions, anyone will be able to grow Orchids and reap a rich harvest of these exquisite flowers.

Calanthe veitchi

Calanthe

The *Calanthes* are terrestrial Orchids; that is, they grow in soil. All of those listed below are deciduous.

The potting material should be fibrous loam, finely chopped Orchid peat, a little sphagnum moss, leaf soil if available, sand and a sprinkling of ground bonemeal all mixed well. Plenty of drainage in the bottom of the pots is necessary. In potting the bulbs, press them down firmly, about one-half deep so that they will not topple over. After potting, keep the bulbs shaded from the sun, and water very sparingly at first; in fact, for two or three weeks, light overhead syringing is better. As the new roots appear, increase the water gradually, and when the plants are in full growth they require plenty of water until the flower spikes are formed and the flowers develop; when water should be reduced to a minimum as the flowers are liable to spot. After the flowers are cut, no more water should be given and the bulbs put in a dry place until signs of the new shoots appear at the base of the bulbs, when repotting into fresh soil may be done.

Coelogyne massangeana See page 10

Coelogyne

A genus with showy flowers, variable in size and colors. *C. cristata* is the most useful for cut flowers, having from 5 to 10 large white flowers to the spray. Useful for floral designs of all kinds, or for cut flowers. Others, such as *C. dayana*, *C. flaccida*, *C. lactea*, *C. massangeana*, *C. tomentosa* and *panduarata*, have nearly all pendant spikes, some 10 inches to 30 inches long.

These are very fine and striking for the conservatory and may also be used as decorations in the living room while in flower. All the *Coelogyne*s are of easiest culture.

Potting material: Three-quarter fibrous peat and one-quarter sphagnum moss.

On page 32 we have listed several *collections* of Orchids at reduced prices for the convenience of beginners in Orchid culture. These collections are very interesting and instructive as they contain many kinds of Orchids seldom seen.

Cymbidium

One of the finest and most useful genera of Orchids, both for cutting and for exhibitions. The flowers are unusually large and attractive; many flowers on sprays in various colors and shades. Like the *Cypripedium*, the flowers are of unusual lasting qualities. The plants are of the easiest culture. They require plenty of pot room and should be potted in fibrous loam, rough peat and sand, with good drainage. An abundance of water should be given during the growing season.

Dendrobium nobile See page 14

Dendrobium

Most of the commercial Dendrobiums are easily cultivated, and their brightly colored flowers are freely produced if it is borne in mind that, as a general rule, they require heat and an abundance of moisture when growing, a season of cooler temperature, a reasonable exposure to air and light to ripen the growth, and a drier season to produce and mature the flowers.

Many of the Dendrobiums flower in the early Spring from March to May, notably *Dendrobium nobile* and its numerous varieties in shades of white, lavender, and purple. Also other species and hybrids in colors of white, purple and yellow. Nothing is more pleasing to the eye than a collection of these plants in flower.

Epidendrum

The Epidendrums require the same treatment as the Cattleyas. The majority have long, flexuous pseudo bulbs producing the flowers in round heads at the apex. They are very attractive, the colors of the flowers being in most cases rose, bright red, and yellow. The flowers are small but very numerous in the heads. Exceptionally free and easy growers, they may be planted out against pillars or walls where they make a splendid show when in flower.

Laelia acuminata

Laelia

The Laelias are closely allied to the Cattleyas, hence the two readily intercross, the result being Laelio-cattleyas, of which there are at present a great variety.

The culture is practically the same as for the Cattleya, although the anceps section prefers a somewhat lower temperature, but if such facilities are not at hand, they grow quite well with the Cattleyas.

The albino forms of *L. anceps* are particularly valuable for cut white Orchids. These include such as *alba*, *hilliana*, *percivaliana*, *sanderiana*, *stella* and *williamsi*.

All the *L. anceps* have 2-6 flowers on tall stems, 3-4 inches across. White *L. purpurata* carries 3-9 flowers on a stem, and these are as large as Cattleyas.

Laeliocattleyas

These are hybrids between *Laelias* and *Cattleyas*. They are as a rule of a stronger constitution than the *Cattleyas*, notably such as have been crossed with *Laelia purpurata*, to mention a few, such as *Lc. Aphrodite*, *canhamiana*, *callistoglossa*, *dominiana*, *eximia*, *Lc. × luminosa* is also very strong growing, but is a *L. tenebrosa* cross.

The treatment of *Laeliocattleya* is practically the same as *Cattleyas*.

The flowering season is not, however, as fixed as that of the parents; they vary a great deal and are liable to flower at almost any time. The variations in colors are well nigh endless and, in shapes and sizes of the flowers there are everything one can wish for.

The *Laeliocattleya* are indispensable where Orchids are grown for cut flowers, as many flower at times when the species do not.

Vanda teres

Vanda

The Vandas are found in the warmer countries of the East. The genus contains some of the handsomest Orchids known, notably *V. caerulea*, the flowers of which are 3 to 4 inches across and are of a soft bluish color, tinted with white to dark blue. They may be grown in pots, pans or wood baskets with plenty of cracks for drainage and dressed with moss.

Cypripedium Alcides superbum (var. C. G. Roebling)

Cypripedium (Lady Slipper Orchid)

The following list of Cypripediums is without a doubt the largest and most varied collection of these plants carried by any commercial house in America. Nothing in the entire Orchid family offers such a great number of species, varieties and hybrids as do the Cypripediums. They are a constant source of interest to the cultivator.

The flowers when cut will outlast anything else we know, and besides, they are the easiest Orchids of all to grow, with few exceptions. In ordering, please use number in the left hand margin, and give number of the list.

Selenipedium Section

These are so distinct in regard to habit of the plants, color and shape of the flowers, that they really form a separate group and we have listed them below, apart from the others. Many of them have long, ribbon-like petals, and all produce a number of flowers on tall scapes, one after another. It is thus possible to have these plants in flower for a long time, for as soon as one flower drops, another takes its place.

Many are white, or nearly so; others are rose pink to purple in color, while some are green, suffused with yellow and purple. They are of the easiest culture and form handsome and stately subjects in the greenhouse or conservatory when in flower.

How to Keep Cut Orchids

Orchids as a whole keep longer cut or on the plants than most other flowers. This is due to the presence of mucilage in the flowers. The question, however, is very often asked, how can I keep my Orchids after they are cut?

In answer to this, the following will probably be useful. If you have Orchids in your greenhouse cut the flowers in the morning or late in the evening. Never cut them when the sun is full on the glass. Place them in cold water in any place free from gas and where the temperature does not exceed 60 degrees. Leave the flowers in this position for several hours before using them. Whenever practical use an earthenware vase instead of glass or metal. When the flowers are used on the table, and they have served the purpose, remove them and place them as indicated above in an earthenware vase, and in a temperature of minimum 56 degrees, maximum 60 degrees. The next time after the flowers have been used cut off the lower part of the stem 1-15 of an inch, and replace in water. Never subject your flowers to a low temperature. They are tropical and cannot stand cold with impunity. If you follow these instructions you will be able to enjoy your Orchids much longer than in any other way.
