BIRMINGHAM: PRINTED BY M. SWINNEY;

FOR G. G. J. & J. ROBINSON, PATERNOSTER-ROW,
AND J. ROBSON, NEW BOND-STREET, LONDON;
J. BALFOUR, AND C. ELLIOT, EDINBURGH.

M,DCC,LXXXVII.

P R E F A C E.

AT length the second Edition of the BOTANICAL ARRANGEMENT makes its appearance. The Author pleads in excuse for its long delay, the multiplicity of his own professional engagements, and the very great improvements, both in the plan, and in the execution of the work. Being conscious of the unavoidable imperfection attendant on a first attempt to naturalize this science, which, in its improved state was new to the English language; he requested the assistance of others. He is happy to have experienced that approbation of his design, which called forth the

Vol. I.

a

assistance

assistance he sought for; and the effort of naturalising the doctrines of the Linnæan School of Botany, has been crowned with a degree of success beyond his most sanguine expectations.

From the very liberal assistance he has met with, the work is now risen superior to its first institution, aiming at very essential improvements in that branch of Science, which, at first, it only attempted to render more easily accessible. It may therefore be necessary to enumerate some of the more striking features of the present Edition.

The Translation of the Generic and Specific Characters has been compared with REICHARD'S Edition of the Genera and Species plantarum, and the *numbers* of those editions have been adopted.

THE ESSENTIAL GENERIC CHARACTER is subjoined to each Generic description, and the ARTIFICIAL character is retained at the head of the Class.

The particular places of growth of the rarer plants are carefully enumerated, and
many

many new ones are added, which are included between crotchets. This has been done at the request of several friends to the work; their opinion prevailing against the reasons adduced for omitting them in the first Edition*.

The Reader will find in this Edition several species, and many varieties of plants, unnoticed by Linnæus. The Varieties of preceding authors are marked by Greek letters; those peculiar to this work by Arabic numerals.

The Latin Synonyms of Bauhine, Gerard, Parkinson, and Ray, which occupied so much space in the first edition, are now omitted; partly because they could be of little use to those who do not understand

* Mr. Woodward, to whom the readers, as well as myself, are indebted for many improvements, in almost every page of this work, and whose liberality of sentiment is only equalled by his industry and accuracy in botanical investigation, desires me to observe that the *Habitats*, or native places of growth, in the Northern Counties of England, which stand in his name, belong jointly to himself and Mr. Crowe; the plants having been collected in a journey they took into those Counties, in the summer of 1781.

the Latin language, for they who do, may get the references from HUDSON'S *Flora Anglica*; and partly to make room for a new set of references to figures, which my friend Dr. Stokes undertook to furnish. These references make one of the most valuable parts of the present Edition. Nothing short of his extensive knowledge of the subject, joined to an indefatigable industry, could have effected the reformation required; but the full force of his exertions will only be understood by such as have laboured at the subject themselves, and experienced the difficulty of marshalling error crowded upon error, into regular and beautiful order. These references are expressed in the shortest way possible; the best figures are mentioned first: The abbreviations are explained by the author of the references, in the catalogue of authors sub-joined.

The references to RAY are preserved, so far as the Varieties he furnished rendered them necessary.

The Linnæan names have now taken the lead of the English ones, and to facilitate

facilitate their adoption, they are accented. In the difficult task of accentuation I had the assistance of my worthy friends Dr. Arnold of Leicester, and the late Rev^d. Mr. Newling of Birmingham, whose classical attainments, especially in Greek literature, were an ornament to the purity and urbanity of his manners. The English Botanist need not now hesitate to pronounce the Latin names, provided he observe to throw the force of the voice upon that letter which *precedes* the mark of accentuation*. At the same time, the English names are still retained, in order to shew that our language is capable of a regular nomenclature; which, except in a few instances, is taken from old established authors, or from the daily use of the inhabitants of our Island.

The 3^d. Volume is intended to be published in the course of the ensuing year, and will contain the whole of the Class CRYPTOGRAMIA, together with an easy

* Further directions for the pronunciation will hereafter be given with the accented Index.

INTRODUCTION to the Study of Botany; the best methods of preparing and preserving a HORTUS SICCUS, or a collection of dried specimens of plants; the GLOSSARY of terms, illustrated by plates; the necessary INDEXES; the Rules for ACCENTUATION; and, more humiliating, though not less necessary than these, the table of *Errata*. The latter may be made more perfect by the observations of others, and the author will be thankful either for such, or for any other communications which can tend to advance a favourite study, or to render more compleat an undertaking which has cost him much labour and some anxiety.

After all, there is nothing farther from the wishes of the Author than, that the botanical student should confine himself to the information which may be obtained within the limits of this work only, for its professed intention is to lead him to other valuable sources of knowledge which are at present inaccessible to the unlearned reader. On this account he has carefully avoided transcribing any thing from Mr. Lightfoot's excellent work on
the

the plants of Scotland, for, although that work is at present of little use to any but the Latin Botanist, as the specific Characters are given in that language; yet the translations in these Volumes will supply that defect, and render the English reader capable of receiving much useful and interesting information, from the valuable descriptions in English, which he has generally subjoined.

BIRMINGHAM,

24th August, 1787.

A LIST

A L I S T

*Of the Names of those Gentlemen who have favoured
this Edition with their assistance.*

DR. ARNOLD, Fellow of the Royal Medical
Society of Edinburgh, Physician at Leicester.

MR. BALLARD, Surgeon, near Malvern Wells,
Worcestershire.

DR. BEDDOES, Lecturer in Chemistry, at Oxford.

DR. BROUGHTON, late President of the Royal
Medical Society of Edinburgh, Physician in
Kingston, Jamaica.

MR. BRUNTON, Jun^r. Perry-hill, near Birming-
ham.

REV. HENRY BRYANT, M. A. Heydon, Norfolk.

JAMES CROWE, Esq. Tuckswood, near Norwich.

REV. SAMUEL DICKENSON, L. L. B. Rector of
Blymhill, Staffordshire.

JOHN FORD, Esq. Surgeon in Bristol.

MR. HALL, Newton Cartmell, near Ulverstone,
Lancashire.

MR. HAWKES, Birmingham.

T. F. HILL, Esq. late of Ely-Place, Holborn,
London; now in Italy.

MR. J. A. HUNTER, Nursery-man, Perry-hill,
near Birmingham.

REV. WILLIAM HOLLEFEAR, A. M. Vicar of
Wolvey, near Hinkley, Leicestershire.

Mr:

Mr. JONES, late Surgeon in Birmingham.

—— MARTYN, Esq. Teignmouth.

Rev. Mr. NEWBERRY, Fellow of Exeter College,
Oxon.

Mr. PITCHFORD, Surgeon, in Norwich.

Mr. SAVILLE, Lichfield.

Dr. J. E. SMITH, Proprietor of the Linnæan
Collection.

Dr. STOKES, Member of the Royal Medical So-
ciety of Edinburgh, corresponding Member
of the Society of Antiquaries of Scotland,
Physician at Shrewsbury.

ROBERT STONE, Esq. Bungay, Suffolk.

J. WATT, Esq. Engineer, Birmingham.

Mr. WHATELEY, Surgeon, Old Jewry, London.

Mr. WIGG, Schoolmaster, Yarmouth.

Rev. Mr. WOOD, Leeds, Yorkshire.

THOMAS J. WOODWARD, Esq. L. L. B. Bun-
gay, Suffolk.

D E S I G N.

NOTWITHSTANDING the very rapid progress of Science from the middle of the last century, it is only since the beginning of this that the study of Natural history hath attracted the general attention of mankind.

Botanical enquiries in particular have been confined to a few individuals; partly from the difficulties which attended them, and partly from an opinion that they were only useful to the professors of Medicine; but the establishment of the LINNÆAN SYSTEM called forth a number of votaries to cultivate this amiable Science; and the pupils of its admirable author convinced mankind, that the Medical properties of Plants, were far from being the only circumstances worthy their attention.

Still

Still however difficulties remained. An acquaintance with *one* of the Learned Languages was hardly sufficient to enable us to understand his works. The novelty of the subject compelled him to invent a variety of new terms; and without, or even with the advantages of an Academical Education, it was a very laborious task to attain precisely that idea, which he wished them to express.

In this situation of things, what could be done by those, who from nature, or from accident, found themselves possessed with a taste for Botanical knowledge? They studied Botanical plates: but bad plates conveyed false, or insufficient ideas; and good ones were too expensive for general use. If they applied to old voluminous Herbals, the want of method, the deficiencies, and the long continued attention which was requisite, fatigued the most industrious dispositions. If they sought for information in more modern productions, they found such a multiplicity of terms, formed from the Greek and Latin languages, with nothing truly English but the terminations; that they soon began to despair of success, and then relinquished the study in disgust.

A Desire to remove these difficulties, and to render the path in this walk of science, as easy as it is delightful, first gave rise to the present undertaking.

From an apprehension that Botany in an English dress would become a favourite amusement with the Ladies, many of whom are very considerable proficient in the study, in spite of every difficulty, it was thought proper to drop the sexual distinctions in the titles to the Classes and Orders*, and to adhere only to those of Number, Situation, and Proportion. They who wish to know the curious facts which gave birth to this celebrated system, may consult the *Philosophia Botanica*, the *Sponsalia Plantarum*, in the first volume of the *Amœnitates Academicæ*; *Lee's Introduction*, and *Milne's Botan. Dict.* where they will meet with many other very interesting Philosophical disquisitions.

Sexual Distinctions.

All controversies about system are here studiously avoided. Mankind are weary of such unprofitable disputes. Every System yet invented, undoubtedly may glory in its peculiar beauties, and, with no less reason, blush for its particular defects. It is sufficient for the present purpose that the system of LINNÆUS is now very universally adopted; and though confessedly imperfect, it approaches so near to perfection, that we may perhaps never expect to see any other improvements, than such, as will be founded upon his plan. Of System.

* The Linnæan titles however, are still preserved on the top of the left hand pages, to accomodate those who have been habituated to use them.

Language.

With respect to the language, some apology is undoubtedly necessary. It would be no difficult matter to render the sentences more connected. This would make them less awkward, but at the same time less perspicuous. Use will take off from the former defect, but nothing can atone for the latter. The best Systematic Naturalists are those who entertain precise and well-defined ideas, and communicate them in such a manner, that the characteristic features of what they are describing, obtrude themselves upon the eye.*

Terms.

No part of this undertaking demanded more attention, or occasioned more labour, than the selection of the terms. The old English Botanists afforded very considerable assistance: still, however, it must be confessed, that some words foreign to the English language, are necessarily retained: but wherever these occur, or wherever an English word is taken in a more strict acceptation than usual, it may be found in the Glossary; and is there explained, either by a definition, by the assistance of engravings, or by reference to some well-known example.

In quoting examples to explain the terms, it was thought expedient to use the most common
and

* LINNÆUS has great merit in the judicious disposition of his Matter; so that a glance of the eye catches in a moment the subject in question, without the fatigue of reading page after page. In this work, the same mode of printing is adopted.

and well-known names of Plants, and likewise to take instances from Plants which are frequent in our gardens, whether naturally growing in this country, or not.

The Latin terms used by LINNÆUS are thrown into alphabetical order; partly to demonstrate how little the English language stands in need of foreign terms, and partly with a view of affording assistance to the reader, when he has occasion to consult other writers upon Botanical subjects.

The Synopsis of the Genera, at the head of each Class, and the sub-divisions of the Orders, will be found greatly to shorten the labour of investigation. But the sub-divisions are not without exceptions: These, however, as well as the exceptions of particular species, are noted under such Classes, Orders, or sub-divisions of Orders, as the learner from the contemplation of the Plant in question would be most apt to refer it to. The Generic descriptions are translated from REICHARD'S edition of the *Genera Plantarum*; but in some instances, where the original is evidently more adapted to the foreign, than to the British species, it was necessary to naturalize it to our own country, by additional observations, though without the omission of any part of the original text.

The characters of the Species are translated also from REICHARD'S edition of the *Species Plantarum*:
but

but as we have a right to expect that the Flora of a particular country, should be more full and perfect than one that is meant to contain the productions of the whole surface of the earth, additional descriptions are added to almost every Species. These additional descriptions are taken from the Flora Suecica, the Flora Lapponica, the Species Plantarum, or the Amœnitates Academicæ of the same author; so as to include nearly the whole of what that ingenious and sagacious naturalist, or his numerous disciples have said concerning the native plants of the British isles.

After these follow original observations, the communications of my friends; others from my own notes, and sometimes extracts and remarks from Leers, Scopoli, Hudson, Curtis, and other authors of credit, whose names are always added, that the reader may judge of the belief due to the authority.

Many more descriptive extracts might have been taken from HALLER's *Flora Helvetica*, a work abounding with original and ingenious observations; but the liberal use which Mr. Lightfoot has made of that excellent author, in the English annotations to his *Flora Scotica*, has rendered that labour in a great measure superfluous.

Names.

At a time, when the names of Plants are already too numerous, nothing less than the plea of indispensable

spenſable neceſſity can juſtify the introduction of new names for any of the Genera: But the intelligent reader will immediately perceive the impoſſibility of forming a compleat Engliſh ſyſtem, without creating a few Engliſh Generic names. Innovations of this kind are never admitted without an abſolute neceſſity; wherever that neceſſity appeared, and the old Engliſh Botanists afforded no aſſiſtance, ſuch a name was invented as might be expreſſive of ſome ſtriking characteristic of the Plant. To prevent confuſion, the common Engliſh names are ſubjoined to each Species, and where the common name of a Plant cannot be retained for the Genus, it is generally adopted as the trivial name of the Species.

So much for the more ſtrictly *botanical* part; but there are other conſiderations relative to plants, which render this work more generally intereſting, and more extenſively uſeful.

The ſtructure of every leaf and every flower, Peculiarities. exhibits proofs of Divine Wiſdom: but we are too apt to paſs, without attention, the phænomena which are daily preſented to our eyes. In ſome parts of the vegetable kingdom, there are however ſuch peculiarities of ſtructure, and ſuch amazing contrivances to answer the wiſe purpoſes of the Creator, that a total diſregard to them would have been unpardonable: Theſe therefore are mentioned, in a

concise manner, yet sufficiently full to excite the attention of the ingenious.

Sleep of
Plants.

Many Plants in the night-time, from a change in the direction of the leaves and leaf-stalks, assume an appearance so totally different from what is usual to them, that the most expert Botanist would hardly be able at first sight to recognize his old acquaintance. This is called the *SLEEP OF PLANTS*; and is noticed under some of the Species: as is likewise the *WAKEING*, or opening of flowers. Most flowers when once expanded, continue so night and day; some close against rainy weather, but some have their stated times of opening and closing independent of any sensible changes in the atmosphere. Thus the white *WATERLILY* opens at seven in the morning, and closes again at four in the afternoon. The yellow *GOATSBEARD* has long been known to have this property, and is therefore called by the country people, *JOHN GO TO BED AT NOON*. If kept in a bottle of water, it will be found to open at three or four o'clock in the morning, and to close again before noon.

Wakeing of
Flowers.

Oeconomical
Uses.

The Oeconomical Uses of Vegetables, have been too little attended to by men eminent for Botanical Knowledge. The Theory of the Science, and the Practical Uses have been too much dis-joined. At length, however, the generality of mankind are tired with disputes about Systems,
and

and the vegetable productions of Europe are pretty well arranged : It is time therefore to think of turning our acquisitions to some useful purpose. Our own countryman, the ingenious and indefatigable Mr. *Ray*, in his journeys through the different parts of this Island, collected a few important facts; but it is to the industry of LINNÆUS and his Disciples, that we are indebted for the greater part of our knowledge upon this subject. Mr. *Stillingfleet*, with a zeal truly commendable, attempted to render the Study of the Grasses subservient to the great purposes of agriculture*; but it was impossible that his plan should be adopted, whilst the farmer wanted the means of distinguishing the different Genera and Species.

In years of scarcity we are often told, that mankind suffer, and sometimes perish by famine ; but surely this would never be the case, if men were apprized of the very great number of esculent Vegetables which grow wild and unnoticed in the fields. Some of them may be used with advantage, even amidst the luxury of plenty ; and others may easily be gathered in quantities sufficient to support life, when better or more agreeable food cannot be had. With this view, the part of the plant to be preferred, and the usual mode of dressing it, are mentioned under those Species which have been found most suitable for food. Uses as food.

* See his Miscellaneous Tracts.

Uses for Cat-
tle.

It is a matter of the greatest consequence to determine what Species of Plants are preferred by particular Animals; for what is noxious to one Animal is often nutritious to another. Thus the WATER COWBANE is a certain poison to cows; whereas the goat browses upon it greedily, and with impunity. MONKSHOOD kills goats, but does not hurt horses. Bitter Almonds are poisonous to dogs, but not to men. PARSLEY is fatal to small birds, while swine eat it safely; and Pepper is mortal to swine, but wholesome to poultry. Many experiments made with this view by LINNÆUS, and his pupils at *Upsal*, are given in the second vol. of the *Amœnitates Academicæ*. The result of those, which relate to the British Plants, will be found under the particular Species. Many of them were repeated ten and even twenty different times, and with the precautions mentioned below, which are here added for the sake of those, who have leisure and opportunity to pursue these interesting enquiries.

When horses, cows, &c. are said to *eat the plant*, it means that they eat the *Leaves* of the plant. Thus horses and cows eat a great variety of Grasses; but they only eat the leaves; for when left to their own choice they never touch the flowering *Stems*. Some Plants are eaten early in the spring, whilst young and tender, but are rejected in the summer. The animals chosen for these experiments must not be over-hungry, for an empty stomach will compel them

to

to feed upon plants which nature never designed for them: Nor should they be taken immediately out of the house; because after they have lived a considerable time upon dry food, they devour greedily every green vegetable which comes in their way. The Plants offered to them should be handled as little as possible, for some Animals are very nice, and will refuse the most agreeable food, when defiled by sweaty hands. Throw the Plant in question upon the ground; if the Animals refuse to eat it, mix it with others which they are known to like, and if they still refuse it, the point is clear; especially if the experiment be repeated with different individuals.

The Catalogue of Insects which feed upon the different Species of Plants, is confessedly very imperfect; but it will serve as a foundation for future observations of the same kind. Perfection in these matters is not to be attained at once. In its present state it may not be without its use. It will be seen, that Insects live chiefly upon the products of the taller Trees, which grow out of the reach of Quadrupedes, such as the *ELM*, the *PEAR*, the *LIME* and the *OAK*; or upon the thorny and stinging Plants which repel the attacks of other Animals, as the *ROSE*, the *THISTLE* and the *NETTLE*; or upon such plants as exist every where in great abundance as the *GRASSES*; or lastly, upon such Plants as other Animals will not

Uses for Insects.

eat, as the DOCK, the WATERLILY, the FIGWORT and the HENBANE.

Derham supposes. and with a degree of probability on his side; that the Virtues of Plants may be discovered by observing what insects feed upon them. Thus the *Cassida viridis* feeds upon *LYCOPUS* and upon *MENTHA*, which are plants of the same *Natural Order*, and possessed of the same Virtues. The *Phalæna Sambucaria* feeds upon several of the Rundle-bearing plants of the fifth Class, which we know are endued with similar qualities; and the *Papilio Cardamine* devours the Common LADY-SMACK and the MITHRIDATE, which are Plants of the same *Natural Class* and have nearly the same properties.

Changes.

Many Plants change the appearance of some of their parts, to accommodate certain Insects with convenient lodgings: Some of the most remarkable of these changes are noticed.

Uses in the Arts.

It is beyond a doubt, that the Inhabitants of different countries, and artists of different kinds, know how to apply a number of Plants to answer a variety of purposes. Such of these as could be selected from good authorities, or obtained from private information, are subjoined in their respective places.

Medical Virtues.

Many people will be surprized to find so little said upon the Medical Virtues of Plants; but those who

who are best enabled to judge of this matter, will perhaps think, that the greater part of that little might have been omitted. The superstition of former ages, operating upon the ignorance of mankind, gave rise to miracles of every denomination; and the fashion of combining a great variety of ingredients with a design to answer any particular purpose, rendered the real efficacy of any of them extremely doubtful. The dreadful apprehensions which men formerly entertained of POISONS, made them fearful of employing substances that were capable of doing mischief; and therefore they rejected those which were most likely to do good. A number of Vegetables fit only for food, were supposed capable of producing the greatest alterations in the human body; and at length almost every common Plant was esteemed a cure for almost every disease. In this situation of things, little advantage can be reaped from the experience of former times: we shall sooner attain the end proposed, if we take up the subject as altogether new, and rejecting the fables of the antient Herbalists, build only upon the basis of experiments well conceived and accurately executed. To facilitate the work as much as possible, the following observations are added.

Certain Plants, capable of producing sudden and remarkably deleterious effects upon Animal Bodies, are called Poisonous: but Poisons in small doses are the best medicines; and useful medicines

in too large doses are poisonous. Even the most innocent aliments, in certain quantities, are noxious.

We must not disdain to learn the Medicinal uses of Plants from the meanest of Mankind; especially where they use their remedies in an uncompound-form; for what are those celebrated medicines which we import from the *Indies* at a considerable annual expence, as Ipecacuanha, Contrayerva and Sarsaparilla, but remedies, by long experience, approved amongst the common people in the countries from which we purchase them?

Plants of the same *Genus* have something of the same *Virtues*: Those of the same *Natural Order* have still a nearer resemblance; and those of the same *Natural Class* the nearest of all. These properties are remarked in the Introductions to the *Classes*.

Plants having honey cups detached from the petals are generally poisonous, as the *HELEBORE*, the *COLUMBINE* and the *DAFFODIL*.

Plants with a milky juice are frequently poisonous; as some of the *MUSHROOMS*, the *SPURGES*, and *CELANDINE*. Others are so but in a less degree, as *HAWK-WEED*, *GOATS-BEARD*, *SUCCORY* and *LETTUCE*.

Plants

Plants with a simple jointed stem, sword-shaped leaves, and fleshy roots, are generally acrid : thus the juice of the *yellow FLAG* excites vomiting and sneezing.

The pleasant-tasted and sweet-smelling Plants are generally wholesome.

Plants which have an ungrateful smell produce disagreeable effects, as the *ELDER*, and many of the *FUNGUSSES*. Those which smell nauseously, as the *HENBANE*, are generally poisonous.

Plants which are bitter to the taste, are stomachic, and destroy acidity ; as *GENTIAN*, and *CENTAURY*.

Acid Plants abate heat and thirst, and resist putrefaction ; as the fruit of the *CURRENT*, or the leaves of the *WOODSORREL*.

Astringent Vegetables may be discovered by the taste.

A red colour, indicates acidity ; a yellow one, bitterness, or acrimony.

Plants in dry seasons, and growing in dry situations, have most taste. Thus the aromatic Plants, as *THYME*, *SAGE* and *MARJORAM* are by far the best in dry soils ; and every one knows the insipidity of Fruits in wet soils and wet seasons.

Plants which grow in watery situations are often corrosive; as CROWFOOT and WATER-LILY. But the corrosive aquatic Plants lose much of their acrimony when cultivated in a dry soil: Of this, the Garden CELERY is a sufficient example.

ROOTS are in greatest perfection, when the leaves first begin to put forth.

LEAVES are best gathered, when the blossoms are beginning to open.

FLOWERS are in greatest perfection, when moderately expanded.

SEEDS must be gathered, when they have attained their full size and are nearly ripe.

BARKS are best in the winter, before the sap rises.

Different parts of the same Vegetable often manifest very different properties: Thus the leaves of WORMWOOD are bitter, whilst the roots are aromatic. The Seed-vessels, or Heads of POPPIES are narcotic, but the Seeds have no such quality.

It will readily be allowed, that these rules are by no means universal: The exceptions to most of them are numerous. We must be content to consider them, as rude and imperfect out-lines, which the industry of future ages will correct and compleat.

B Y T H E

Author of the References to Figures.

MY Plan in the new references which I here offer to the public, has been to afford the investigating botanist as full a collection of references to figures, as the size of the work would admit. It is not in every one's power to become possessed of a complete collection of figures, and those who are, cannot easily transport them to situations in which their possessor might wish to consult their contents. Different herbals may, however, in most places be met with, though perhaps not the individual one referred to in the more portable works which he may have made the companions of his journey. On this account, I have thought
I might

I might perform no unacceptable office to the practical botanist, to undertake a review of all the figures to which I could obtain access, and to present him in as small a compass as possible, the result of my examinations, in a collection of *all such figures, placed in the order of their supposed comparative excellence*. By this means, I flatter myself, he will be enabled to derive information from any of the old herbals. And if possessed of a complete collection of botanical figures, it is possible that amidst so large a number he might be at a loss which to consult, or in which of them he should confide as the most faithful representation of the plant in question. He may consult all in his possession; and then I doubt not, if accustomed to the inspection of plants and figures, he will form a very just judgment. But if unexperienced, or pressed for time, I flatter myself that mine will not at least prove unacceptable. These opinions I subject to the examination of the experienced botanist, without presuming to instruct him. From such I shall be happy to receive instruction, and to profit by it, with due acknowledgments, in case of a future edition.

I have inserted no figures which I have not examined and compared, unless the contrary is expressly noticed. In forming the above judgment I have endeavoured to abstract myself from the glare of splendid colouring, and the less obtrusive,
though

though not less deceitful finish of the engraver, and to consider with impartiality, which of the figures may have the merit of giving most exactly the true genius and habit of the plant. The reader must not therefore be surpris'd to observe a wooden cut from the old herbals, sometimes to precede an engraving on copper in the *Flora danica*, especially in that part of it which has appeared since the unfortunate affair of Struensee, occasioned the removal of the ingenious O E D E R from the direction of that work.

These references may also be productive of some benefit to science, in pointing out to the ingenious artist, who employs his pencil in botanical works, what plants have been already well figured, and what still remain to be delineated: There are several works which I could mention, where the number of new figures are exceedingly few, and the practical botanist to possess these, is obliged to purchase a great number of others which have before appeared in former publications, J A C Q U I N, P A L L A S, and D I C K S O N, are examples of a just plan. While so many plants, natives of these islands, and not comprehended within the limits of the *Flora Londinensis*, or cultivated in our botanic gardens, remain un-illustrated by accurate engravings, the artist cannot complain of a want of subjects for his pencil. I could wish indeed, that such deficiencies were supplied under the direction
of

of an experienced botanist, such as our rivals in science possess, in the person of M. L'HERETIR, or the artists of Nuremberg, in the excellent SCHMIDEL. But if those who ought to be the patrons of such works, leave them to be directed by artists, every true lover of botanical science should do, what at least he can, to direct their labours, and render them as conducive as possible to the advancement of so useful and pleasing a branch of knowledge.

A revision of the references to figures, appeared to me to be very much wanting. In the 2 *first editions* of RAY's *Synopsis*, as also in all his other works, the names of preceding authors are given but without any reference to the number of the volume or page. In the 3*d* edition, published in 1724, this deficiency was supplied by the ingenious editor DILLENIIUS.

The references of Dillenius, were given in the *Flora Anglica* of Mr. HUDSON, but with the omission of the references to the first edition of Gerard, to which Dillenius in general, seems very justly to have given the preference, and the synonyms of Johnson's edition, generally quoted by the title of *Gerardus emaculatus*, substituted in their place. In all these citations, there are no marks by which the reader can be assured whether the plant cited be figured there or not, which necessarily occasions him frequent disappointment in his researches.

Mr.

Mr. LIGHTFOOT in his *Flora Scotica*, has given us references to figures, evidently the result of actual observation. But they are confined to the plants of Scotland and the Hebrides, and the 2d edition of *Ger.* seems the only one of the older authors whom he refers to.

In the last edition of the *Species plantarum*, published by REICHARD, under the title of *Systema plantarum*, there are many new references to figures, but they are merely transcripts from the authors cited.

But figures, without a system to conduct the reader to them, are almost useless, and there are some plants which have so great a resemblance to each other in their external form, that even when growing, they are with difficulty distinguished. The structure however of their minuter parts, frequently affords unambiguous marks of distinction. Hence the utility of those short characteristic descriptions, called by Linnæus, the *specific character*. RAY had the merit of establishing Classes on botanical principles, and TOURNEFORT that of distinguishing Genera by still more exact modes of discrimination; but it was left for LINNÆUS to distinguish species by certain and unambiguous characteristics drawn from the shape, situation, and proportion of the parts. MICHELI indeed had made some advances towards this mode of discrimination;

mination; but the marks which he fixed upon, were frequently ambiguous, and not sufficiently characteristic, LINNÆUS after the example of MICHELI, considered these characteristical descriptions as the name of the plant, and he even laid down a rule that they should not consist of more than 12 words. But it being discovered that such names could with difficulty be retained in the memory, or employed in conversation, and as genera were already distinguished by a single name, Linnæus was insensibly led to denote the species of each genus by an epithet expressive of the particular species, or a name rendered familiar by long usage. These he called by the modest title of *Nomina trivialia*: or *trivial names*. But they were soon found of great importance in facilitating the diffusion of botanical knowledge, and they have been adopted by almost all intelligent botanists. Some indeed, who have in general adopted them, do not appear to have been fully sensible of their value, and of the mischiefs which must necessarily arise from arbitrarily changing them. Many of the words of the English language might be rendered more harmonious, we might latinise them after the manner of Johnson, or italianise them, on the model exhibited by the author of Letters on literature, but were such innovations to become general, our best writers would be robbed of all the graces of style, and Gray, and Gibbon, become in a few years, as obsolete as Chaucer. No botanists of the

Linnæan

Linnæan school, have been so faulty in this respect as those of our own country. Were they men of inferior talents that committed these faults, I should only remark, how much easier it is to change a name than to discover the essential character of a new genus or species. But the faults which I complain of, originate, I am persuaded, not from a love of self-distinction, but from not sufficiently attending to the importance of possessing an established nomenclature. Where species have been referred to wrong genera, or genera established on erroneous principles, changes in the generic name must inevitably take place, but the *trivial*, or *specific name*, as it ought rather to be called, should if possible remain unaltered. Mr. HUDSON in his 2d edition, has changed *Ononis arvensis* of Linnæus and the 1st edition of his own work to *O. inermis*; *Alopecurus monspeliensis* and *paniceus* to *aristatus*; *Agrostis capillaris* to *polymorpha*; *Melica nutans* to *montana*, because it had been called *Gramen avenaceum locustis rubris montanum* by C. Bauhine; *Bromus mollis* to *polymorphus*; *arvensis* to *erectus*, and *madritensis* to *muralis*; *Pastinaca sativa* to *sylvestris*; *Agaricus virens* of Scop. & Schæff. to *viridis*; *Carthus acanthoides* to *crispus*, and *crispus* to *acanthoides*, *Sparganium erectum* to *ramosum*, &c. Mr. LIGHT-FOOT has changed *Serapias longifolia* to *palustris*; and Mr. CURTIS, in spite of all the arguments I could urge to him at the time, changed *Boletus rugosus* of Jacq. to *lucidus*; and *Agaricus crenulatus*

of Muller to *plicatilis*, though Mr. Lightfoot had already given the name of *plicatus* to a species of the same genus. When a judicious botanist has communicated to the public a new species, and has distinguished it by a name conformable to the principles of the Linnæan nomenclature, it would prevent much confusion if succeeding observers were to adopt the name already given, and be but a proper compliment to the discoverer of a new species. Mr. Hudson, and Mr. Lightfoot, are not to blame for the many species to which they have given different names, as their respective works appeared about the same time, but it could be wished that botanists, especially in the same kingdom, would more freely communicate such plants as appear new to them, and which they propose to name. But I trust the learned, candid, and ingenious possessor of the herbarium, library, and manuscripts of the two Linnæi, will be the means of preventing the evils here complained of. Sensible as I am of the importance of figures in the present state of botany; I am inclined to believe, when the Linnæan principles of discrimination shall have been carried to their full extent, that species, as well as genera, may be distinguished in so clear and unambiguous a manner, that figures may be rendered of far less importance, and their use principally confined to the Fungi, Lichens, and Medicinal plants, which last it is of importance to know in every stage of their growth. Whatever
occurred

occurred to me during the course of the work, that could tend to the improvement of the *specific characters*, or to facilitate the investigation of plants, has been added. Where any circumstance appeared worthy of forming a part of the character itself, it has been given also in Latin at the bottom of the page, but where it was only necessary to correct parts of the specific character, such observations have been placed immediately after it, with a view to facilitate the labour of investigation, but printed in italics, to distinguish mere corrections from circumstances essential to the specific character.

Such are the views which have engaged my attention in the part which I have taken in the present edition of the Botanical Arrangement. No physician who has felt the wish to make himself master of the discoveries made in his profession, during the last and present century, but must have become fully sensible of the importance of botanical knowledge, and it is Linnæan botany alone which can transmit with certainty to our posterity, those discoveries which the present age has made of the powers of vegetable remedies. For want of it, we have been but little benefitted by those of the Greek physicians, and we cannot expect to read their observations on the *materia medica* with any advantage, till a botanical voyage to Greece and

the Archipelago, proposed by the late Mr. Stillingfleet, shall find a patron, and introduce into our gardens the plants used in medicine by the Greeks.

KIDDERMINSTER,

10th August, 1787.

ABBREVIATIONS.

EMPAL. Empalement.

BLOSS. Blossom.

POINT. Pointal.

S. VESS. Seed-vessel.

Capf. Capsule.

ESS. CHAR. Essential Character.

B. *Barren flowers*, or flowers with only Chives.

F. *Fertile flowers*, containing pointals, and producing Seed.

H. *hermaphrodite flowers*, or flowers containing both Chives and Pointals.

A. Annual, enduring only for 1 year, or a shorter time.

B. Biennial, enduring for 2 years.

P. Perennial, enduring many years.

S. Shrub.

T. Tree.

CATA-

CATALOGUE of BOTANICAL WORKS

CITED in this EDITION,

By the AUTHOR of the REFERENCES.

N. B. (1) Roman numerals express the number of the volume, fasciculus, or section, in which the figure is to be found.

(2) Arabic numerals signify in works of plates, the number engraved on the plate referred to, and in printed books, the page where such figure is to be found,

(3) A second set of Arabic figures, marks out the particular figure referred to, in the plate or page already cited.

(4) *abr.* signifies abridged; *cop.* copied; *repr.* reprinted. The blocks from which the wooden cuts of the old authors as Dodonæus, Lobel, and Clusius were taken, being the property of Plantin of Antwerp, their common bookseller, the use of these blocks was purchased by Johnson, the editor of *Ger.em.*—These authors I have generally placed in this order, *Clus.*—*Dod.*—*Lob.*—but in the more common plants, Dodonæus seems to have been the original publisher, in the more curious ones, Clusius.

Gen. pl. Linnæi genera plantarum, edente Reichard. Francof. 1778. 8vo.

Ger. Gerard's historie of plants. 1597. fol.
 [Johnson the editor of the 2d. edition informs us, that the ground-work of this work was a M.S. translation of Dodonæus by Dr. Priest, but to give it the air of an original, disposed in the method of Lobel, then resident in England, and botanist to the King, and illustrated by figures taken from the blocks of Tabernæmontanus procured from Frankfort, by Mr. Norton, who was the common patron of Priest and Gerard. This will explain why I sometimes say of a fig. *reprinted* in *Ger. em.* & *cop.* in *Park & Ger.* (ed. I.) Notwithstanding this, Gerard had the hardiness to speak of Priest and himself, in the following terms, "And since
 " that Dr. Priest one of our London College
 " hath (as I heard) translated the last edition of
 " Dodonæus, and meant to publish the same, but
 " being prevented by death, his translation likewise perished. Lastly myself have presumed to
 " set forth unto the view of the world the first
 " fruits of these myne own labours." Haller says there are about 16 original figures.]

Ger. em. Gerard's herball, or generall historie of plantes, very much enlarged and amended, by Thomas Johnson. 1636. fol. [Figures 2821 from the blocks of Dodonæus, Lobel, and Clusius, with some original ones. HALL.]

Ger. prov. Gerardi (Ludovici) flora, Gallo Provincialis. 1761. 8vo. [Engravings too delicately neat.]

GERM. SYN. Vollständiges systematisches verzeichniß aller gewachse Teutschlandes, &c. Erster Baud. Leipzig 8vo. 1782. [An industrious collation of the synonyms of the plants of Germany. It has merit in the novelty of the arrangement, and has proved peculiarly useful to me in affording as far as the middle of the class Pentandria, a reference to the pages of the works of the older botanists, their names only being given in the Pinax of C. Bauhine. I am sorry however, it is not in my power to praise the author for the detection of old errors, or the discovery of many new facts.]

sule 2 Cells.

11. HIPPU'RIS. Mare's-tail.

EMPALEMENT, O.

BLOSSOM, O.

CHIVE, *Thread* single, growing upon the receptacle of the flower. *Tip* slightly cloven.POINTAL, *Seed-bud* oblong, superior. *Shaft* single; awl-shaped, upright, longer than the chive; situated betwixt the chive and the stem. *Summit* sharp.

SEED-VESSEL, O.

SEED, single, roundish, naked.

ESSENTIAL CHARACTER. *Cup* o. *Petals* o. *Summit* undivided. *Seed* 1.

common

HIPPU'RIS *vulgaris*. Leaves in eights, awl-shaped. LINN. suppl. 81.

Giseke. 32. *Fl. dan.* 87. *J. B.* iii. 732. *fig.* on the left hand the best. *Ger.* 953. *C. B. th.* 243. 4. *Park.* 1200. 4. *Seguier* i. 2? not in flower. (*Dod.* 113. 2. reprinted by *Ger. em.* 1114. 6. is an *Equisetum*, as is evident from the spike which terminates the left hand stem). *Parts of Fruetification.* *Vaill. Mem. de Paris.* 1719. 1. 3.

Leaves narrow; growing in whorls round the joints, 12 or more at each joint. *Flowers* equal in number to the leaves. *Stem* straight, jointed. The flower of this plant is found at the base of each leaf, and is as simple as can be conceived, there being neither empalement nor blossom; and only 1 chive, 1 pointal, and 1 seed. LINN.

Leaves to 13 in each whorl. *Flowers* with only *Pointals* sometimes intermixed in the same whorl. *Tip* when young, truly fitting; its cells of a dark red. SCOP.

Mare's-tail. *Paddockpipe.*

Muddy ponds and ditches, not common. [About a mile from Stafford, on the foot-road to Aston. W.] P. May.

It is a very weak astringent. Goats will eat it, but Cows, Sheep, Horses and Swine refuse it.

10. SALICOR'NIA. Glass-wort.

EMPAL. 4 edged, lopped, distended, permanent.

BLOSS. o.

CHIVE. *Thread* single, undivided, longer than the cup.

Tip double; oblong; upright.

POINT. *Seed-bud* oblong egg-shaped. *Shaft* simple, standing under the chive. *Summit* cloven.

S. VESS. o. The cup distended and blown up includes the seed.

SEED single.

Ess. CH. *Cup* bellying; entire. *Petals* o. *Seed* 1.

Obs. The number of chives not very certain; sometimes there are 2 in each flower. See Philof. Transf. vol. 57. pl. 312.

SALICOR'NIA *herbacea*. Herbaceous, spreading. *jointed*
Joints flatten'd and between nick'd and cloven, at the end.

Fl. dan. 303. *cop. in Blackw. auct.* 598. *Math.* 465. *Dod.* 82. 1. *reprint.*

by Lob. adv. 170. 2. *and Ger.* 535. 1. *Pet.* 9. 3. *H. ex.* v. 33.

8. *J. B.* iii. 705. 2. *n. l.* 11. 111. *Park.* 280. 4. *Barr.* 192.

Spike jointed. *Flowers* near together at each joint. BASTER.

Flowers 3 together on each side the stem, in the clefts of the joints. *Joints* thicker at the end, and blunt. *Stem* wide-spreading.

Glass-wort. *Salt-wort.* *Sea-grass.* *Marsh Samphire.*

Sea-shore, common.

A. Aug. Sept.

From the ashes of this plant, a fossil alkaly is obtained, which is in great request for making soap and glass. It is chiefly made on the coast of the Mediterranean, and is called Soda. The green plant steeped in salted vinegar makes a pickle very little inferior to Samphire. The whole plant has a saltish taste, and is greedily devoured by cattle.

Salicornia europæa herbacea. HUDS. α . β .

SALICOR'NIA *fruticosa*. Stem upright, shrubby. *woody*

Pet. 9. 4.

Evergreen; much larger than the *S. herbacea*. *Spikes* different, never seen in Sweden, though the *herbacea* very common; the difference however very little if any. LINN.

Joints nearly of an equal thickness; blunt; near together. *Stem* more branched than the *herbacea*. GER. PROV. 328.

LIGHTFOOT and HUDSON regard it only as a variety of the former species.

Salicornia europæa fruticosa. HUDS. γ . δ . η .

ox. iii. 22. 7. (Dod. 40. 2. reprinted by Lobel. obs. 250. 1.

and Ger. em. 626. 1. and cop. by Park. 550. 1. seems to be

a different plant; for in none of the specimens which I have ex-

amined, nor in the preceding figures, are any of the strap-shaped

leaves to be found which garnish the lower part of the fruit-stalk in the

figures last referred to.)

Stems scattered on the ground, throwing out roots from the lowermost knots. *Leaves* ascending, toothed. The whole plant hard and dry. *Fruit* ripe in Sept. **Scop.**

Little fruit-stalks shorter than the floral leaves.—*Tube* of the *Bloss.* about half as long as the cup; white. *Border* pale purple: the broadest segment marked with 6 or 7 deeper purple streaks; the narrowest segment with 3, and each of the lateral segments with 4. *Tips* arrow-shaped. *Stems* cylindrical, woolly. *Leaves* opposite, egg-shaped, serrated; hairy underneath, and at the edges. *Floral-leaves* strap-shaped. Some of the *Fruit-stalks* are so near the end of the stem that at first view they appear terminating, but upon more accurate examination we find one or more pairs of leaves beyond them. **WITH.**

Common Speedwell. Male Speedwell. Fluellin.

Barren ground ; heaths.

P. May. June.

The leaves have a slight degree of astringency and bitterness. An infusion of them is recommended by Hoffman, as a substitute for tea, but it is more astringent and less grateful.

It is eaten by Cows, Sheep, Goats, and Horses. Swine refuse it.

✱✱ *Flowers in broad bunches.*

Shrubby

VERONI'CA *fruticulo'sa*? Broad-topped spike terminating. Leaves spear-shaped, blunt. Stems somewhat shrubby.—

Hall. 16. 1. Fl. dan. 342. Pona in Clus. ii. 337. 1. reprinted by Ger. em. 628. 5. and copied by Park. 551. 1.—not the V. saxatilis as Hall. and the German synonyms suppose, as is evident from the description of the colour of the blossoms.

Shoots perennial. Stems trailing and perennial at bottom, upright and dying down at top. Leaves somewhat scolloped ; upper ones larger, smooth. Fruit large. Empal. with 4 clefts ; slightly pubescent. Bloss. white ; with bloody streaks. Fruit-stalks longer than the floral-leaves. LINN.

Stems simple ; always upright. Leaves egg-spear-shaped, or oblong ; concave, pointed, toothed here and there. Bloss. flesh-coloured ; sometimes white ; not large. Empal. segments tapering to a point. Caps. egg-shaped, blunt, not nicked at the end. Scop.

Leaves opposite. Caps smooth. Fruit-stalks longer than the floral leaves. JACQ.

Veronica frutescens. Scop.

Mountains. Ben Nevis, Scotland. Mr. HUDSON. † S. May. June.

Mr. Lightfoot had inserted on the authority of others the *V. alpina*, but the examination of a specimen proved it to be only a slight variety of the *V. serpyllifolia*.

† Besides the above references, Mr. HUDSON has given also the following to what HALLER (545 β) considers as a variety of the *V. fruticulosa* ; but SCOPOLI and LINNÆUS THE SON, (*Suppl.* 85.) think it a distinct species, which they have called the

rock **VERONICA** (*saxatilis* ?) Broad-topped spike terminating.

Leaves opposite. Empalements (omitted by Linn. but probably from an error of the press) smoothish. Fruit-stalks longer than the leaves. JACQ. *enum. p.* 200.

Clus. i. 347. 1. copied by Park. 551. 7. and H. ox. iii. 22. 5.

(not the *V. fruticulosa* as the German synonyms make it, as is evident from the description copied from Clusius.) *J. B. iii. 284. 3.*

(*Pluk. 232. 5. Hall*)

Stems branched, wide-spreading, producing buds. Leaves sitting, nearly egg-shaped, blunt, flattish, very entire. (But both

J. B.

VERONICA *serpyllifolia*. Bunches terminating, smooth nearly resembling a spike. Leaves smooth, egg-shaped, scolloped.—

Leaves with 3 fibres, CURT.

Curt. n. 5. fasc. i. Fl. dan. 492. Walc. Dod. 41. 1. reprinted by ob. Lobs. 250. 4, and Ger. em. 627. 2. J. B. iii. 285. 1. Riv. 99. Veronica minima repens. Id. t. 93. f. 147. 2. V. erecta sylvestris? Pluk. 233. 4. Ger. 503. 3. (Gouan. illustr. 1. 2. has every appearance of being a distinct species.)

Leaves elliptical, seldom more than 4 pair, the rest alternate. Blofs. white; the 3 upper segments marked with blue lines; the throat and tube of a greenish tinge. Threads white. Tips blue. Shaft reddish. Summit white, circular, flat. Fruit-stalks shorter than the floral-leaf immediately below it, pubescent, hairs knobbed. Empal. not so hairy as the fruit-stalks. Scop.

It is difficult to distinguish this from the *V. spicata*, in which Linnæus says the flowers form a “terminating spike,” and in this he says they form a “terminating bunch nearly resembling a spike.” Linnæus gives no other difference by which they can be distinguished, and it is evident that this is hardly sufficient. The stem in the *serpyllifolia* is often undivided as well as in the *spicata*, and when it is branched it is only near the root. Cup deeply divided into 4 equal pear-shaped segments, not evidently hairy. Blofs. pale blue; upper segment with 5 or 8 purple lines, lateral segments with 3; smallest segment white. Tips blue. Seed-bud nearly heart-shaped; Shaft permanent; blue towards the top; Summit whitish. S. Veff. fringed with hairs round the edge. Stem cylindrical, ascending; several rising from the same root, but frequently each has its own particular root; bearing from 5 to 7 pair of leaves; mostly opposite; the upper ones intermixed with the flowers. Leaves egg-shaped, sitting, smooth, very slightly scolloped. Upper floral-leaves

J. B. and Clus. and even Scop. himself in his first Ed. describe them as minutely scolloped here and there, as they are in a specimen given me by the Son of Professor JACQUIN. ST.) Broad-topped spike sometimes running into a bunch. Empal. and Caps. with a very slight hairiness, but sometimes quite smooth. Blofs. segments roundish, very blunt. Floral-leaves sometimes alternate. JACQ.

Veronica fruticans. JACQUIN.

The Higher Alps. SCOP.

June. July. JACQ.

Leaves covered with soft upright prickles, secreting a glutinous liquor. *Bloss.* violet, purple and reddish, with white lips, and an ash-coloured woolly spot on the palate. LINN.

Butterwort. Yorkshire Sanicle.

On Bogs. [Broadmoor, about 3 miles S. West of Birmingham. Mr. BRUNTON. On the N. W. side of Malvern hills, but not on the S. or S. E. side. Mr. BALLARD.] P. May.

If the fresh gathered leaves are put into the filtre or strainer through which warm milk from the Rein Deer is poured, and the milk is set by for a day or two to become acceſcent, it acquires consistence and tenacity ; the whey does not separate, nor does the cream ; in this state it is an extremely grateful food, and as such is used by the inhabitants in the North of Sweden. There is no further occasion to have recourse to the leaves, for half a spoonful of this

this prepared milk, mixed with fresh warm milk, will convert it to its own nature ; and this again will change another quantity of fresh milk, and so on without end. (This did not succeed when tried with Cows milk. Mr. HAWKES.) The juice of the leaves kills lice ; the common people use it to cure cracks or chops in Cows elders. LINN.—The plant is generally supposed injurious to Sheep : occasioning a disease which the farmers call the Rot. But it may be made a question, whether the Rot in Sheep is so much owing to the vegetables in marshy grounds, as to a flat insect called a Fluke (*Fasciola hepatica*) which is found in these wet situations adhering to the stones and plants, and likewise in the livers and biliary ducts of Sheep that are affected with the Rot.—From experiments made on purpose, and conducted with accuracy, it appears, that neither Sheep, Cows, Horses, Goats, nor Swine, will feed upon this plant.

PINGUIC'ULA *villosa*. Stalk with a slight wool- hairy
linefs.—

Lightf. 6. 1.—Fl. lapp. 12. 2.

Stalk very slender ; not very evidently pubescent. Blofs. violet-coloured ; Spur standing out. In all its dimensions 6 times smaller than the *P. vulgare*. LINN.

Leaves tender and delicate ; the edges approaching. Veins purplish. HUDS.

Honeycup shorter than the petal ; nearly cylindrical, blunt. LIGHTFOOT.

Leaves roundish. S. Veff. heart-shaped ; of 2 valves.

Marshes in Dorsetsh. Hampsh. Devonsh. and Cornwall, frequent. HUDS.

Near Air, and in the island of Lamfash, Scotland. Dr. HOPE. P. June. July.

PINGUIC'ULA *alpi'na*? Honeycup conical. Shaft mountain
shorter than the petal.—

Fl. dan. 453.—Gunn. ii. 4. 4.—Fl. lapp. 12. 3, from a dried specimen.

Blofs. white ; woolly spot on the palate yellow. Spur converging, blunt. Threads bowed inwards at the base, touching near the seed-pod. Tips flattened, yellowish. Caps. 2 edged at the point, pubescent ; hairs knobbed. Seeds to 180 ; oblong, brown, scored at the point ; fixed to a roundish, stalked receptacle. SCOP.

Said to have been found in Orkney, and between Erwin and Air, but suspected to have been the *P. villosa*. LIGHTF. P.

34. UTRICULA'RIA. Bladder-fnout. (*Petiv.*)

EMPAL. *Cup* 2 leaves ; leaves very small, egg-shaped, concave, deciduous.

BLOSS. 1 petal, gaping. *Upper lip* flat, blunt, upright. *Lower lip* large ; flat ; entire. A heart-shaped *palate* standing prominent betwixt the lips. *Honeycup*, like a little horn, grows from the base of the petal.

CHIVES. *Threads* 2 ; very short ; bent inwards. *Tips* small and adhering together.

POINT. *Seed-bud* globular. *Shaft* thread-shaped ; as long as the cup. *Summit* conical.

S. VESS. *Capsule* large ; globular ; of 1 cell.

SEEDS. Many.

ESS. CHAR. *Blofs.* gaping, ending in a spur. *Cup* 2 leaves, equal. *Caps.* 1 cell.

OBS. The plants of this genus are very remarkable ; the roots being loaded with small membranaceous bladders.

greater

UTRICULA'RIA *vulga'ris*. Honeycup conical. Stalk bearing but few flowers.—

Fl. dan. 138.—*Riv.* 79, cop. by *Petiv.* 36. 11.—*Ger. em.* 828. 5. cop. by *J. B.* iii. 783. 3. and by *Park.* 1258, 9, with an additional fig.—*Parts of fructification*, *Schmied.* 21. 12, at the bottom.

Cup permanent ; its lower leaf very slightly notched at the end. *Blofs.* full yellow ; with purplish red streaks. *Honeycup* conical, blunt, lined with minute, shining, globular glands. *Threads* thick, fleshy, crooked ; fixed to the base of the seed-bud. *Summit* 2 lips ; one very small ; the other broad, flat, thin, fringed at the edge. After the impregnation of the Seed-bud this larger lip closes the aperture of the Shaft. *Stalk* cylindrical, scaly towards the top, and dividing into three. *Leaves* in whorls ; thread-shaped, greatly branched and forked ; set with minute whitish harmless thorns, and hollow bags, which have a glandular appearance ; they contain a transparent watery fluid, and a small bubble of air. They are pear-shaped but rather compressed ; with an open border at the small end, from the edges of which arise 3 or 4 very slender fibres, which perhaps are the real roots of the plant. See *Pl.* 13. fig. 4. (a) a small branch with its thorns. (b) the open border with the roots. (c) the cavity of the bag, filled with a bubble of air and a watery fluid. This fluid, when greatly magnified, appears to contain a quantity of extremely minute solid particles. WITH.

Hooded

Hooded Water-milfoile.

Wet ditches and stagnant waters. [In shallow water on Birmingham Heath. W.] P. July.

UTRICULA'RIA *mi'nor*. Honeycup keeled.— *lesser*

Schmied. 21.—Fl. dan. 128.—Pluk. 99. 6, cop. by Pet. 36. 12.

Honeycup obsolete; pointing downwards. *Mouth of the blos.* open, gaping; without a prominent palate. *Roots* hair-like, very slender, swimming; beset with small membranaceous bladders. *Stalk* as long as one's finger, simple, very slender; dividing towards the top into 3 fruit-stalks with 3 floral leaves. *Root-leaves* winged, hair-like; little leaves few; equal. *Cup* with the lower leaf reflected. *Blos.* 2 petals, gaping. *Upper lip* horizontal, heart-shaped, perforated at the base, fixed to the receptacle. *Lower lip* larger, heart-shaped, reflected at the sides; bellied at the base on the under side, prominent and keel-shaped. *Seed-bud* egg-shaped. *Shaft* simple, short. *Summit* betwixt egg and tongue shaped. *Blos.* a paler yellow than the preceding species. LINN.

Ditches and muddy ponds. [St. Faith's Bogs near Norwich. Mr. PITCHFORD.] P. June. July.

36, LYC'OPUS. Gypsie-wort.

EMPAL. *Cup* 1 tubular leaf, with 5 shallow clefts; *segments* narrow and sharp.

BLOSS. 1 unequal petal. *Tube* cylindrical, as long as the cup. *Border* with 4 clefts; blunt, open; *segments* nearly equal, but the *lowermost* somewhat smaller; the *uppermost* somewhat broader than the others, and notched at the end.

CHIVES. *Threads* 2; distant; generally longer than the blossom, and bending under its upper segment. *Tips* small.

POINT. *Seed-bud* with 4 clefts. *Shaft* thread-shaped; straight; as long as the chives. *Summit* cloven; reflected.

S. VESS. None.

SEEDS. 4: roundish; at the bottom of the cup.

ESS. CH. *Blos.* with 4 clefts; one segment notched at the end. *Chives* distant. *Seeds* 4, rounded.

Horehound

LYC'OPUS *europæus*. Leaves indented and serrated. —

Curt. n. 34. *fasc.* iii.—*Riv.* 22. *Pseudo-marrub. pal.*—*Math.* 1002.—*Dod.* 595. 2; *repr. by Lob. obs.* 283. 2. and *Ger. em.* 700. 1, and *cop. by Park.* 1230. 1.—*Pet.* 32. 5.—*H. ox.* xi. 9. 20.—*Trag.* 9. 2.—*J. B.* iii. 318. 2.

Cup with 4 or 5 clefts; segments unequal, with 3 scores on the inside, and a rib upon the back, which shoots out into a taper sharp point. *Bloss.* whitish, with a tinge of purple; somewhat hairy within. *Tube* shorter than the cup: upper segment slightly notched at the end; lower one with a few purplish spots on the inside. *Chives*, threads crooked. Betwixt these 2 chives it is not uncommon to find 2 other *shorter threads* without tips; and I once found these shorter threads furnished with tips. *Seed-bud* sitting upon a yellow glandular receptacle. *Shaft* crooked. *Stem* with 4 corners and 4 hollow sides; a little hairy. *Branches* opposite, rising from the bosom of the leaves. *Leaves* a little hairy. *Flowers* several together in the bosoms of the upper leaves. WITH.

jagged

VAR. 2. *dissectus*. Leaves deeply divided.

Water Horehound.

Sandy ground on the banks of streams and ponds. P. July. Sept.

It dyes black. The juice gives a permanent colour to linen, wool, and silk, which will not wash out; travelling gypsies stain their faces with it.—Sheep and Goats eat it. Cows and Horses refuse it.—The *Cassida viridis* feeds upon it.

42. SAL'VIA. Sage.

EMPAL. *Cup* 1 leaf, tubular, scored; enlarging gradually upwards and compressed at the top. *Rim* upright; with 2 lips; *lower lip* with 2 teeth.

BLOSS. A single petal. *Tube* compressed, enlarging gradually upwards. *Border* gaping; *upper lip* concave, compressed; bowed inwards; notched at the end. *Lower lip* broad, with 3 clefts; the *middle segment* largest; roundish, notched at the end.

CHIVES. *Threads* 2; very short, supporting 2 others cross-wise by the middle, which have *glands* at one end, and *tips* at the other.

POINT. *Seed-bud* with 4 clefts. *Shaft* thread-shaped; very long; adjoining the chives. *Summit* cloven.

S. VESS. None; the *cup* closing a little, contains the seeds in its bottom.

SEEDS. 4; roundish.

Ess. CH. *Bloss* unequal. *Threads* fixed transversely to a little footstalk.

Obs. The rudiments of two chives appear in the mouth of the blossom, but they have no tips. The glands in most species are scallous, but in a few they appear like tips, and sometimes contain a small quantity of dust.

SAL'VIA *pratensis*. Leaves oblong heart-shaped, meadow scolloped; upper leaves embracing the stem. Flowers in whorls with hardly any intermixture of leaves. Helmet of the blossom gummy.—

Fuch. 569; *cop.* by *Trag.* 53, and more exactly by *Dod.* 293. 1; *repr.* by *Ger. em.* 769. 3.—*Riv.* 36.—*Ger.* 627. 3.—*H. ox.* xi. 13. 10.—*Clus.* ii. 30. 1. *repr.* by *Ger. em.* 771. 4, and *cop.* by *J. B.* iii. 312. 2. (*Lob. obs.* 300. 2. and *J. B.* iii. 311. 2. referred to in the German synonyms, are a reimpression and copy of *Clus.* ii. 30. 2. which is a different plant.) *Blackw.* 258, is *S. verbenaca*.

Flowers 6 in a whorl. *Cups* expanding horizontally; upper lip with 3 plaits uniting at the point; the lower with 8 elevated lines. *Bloss.* helmet-folded, blunt, hook-shaped. *Tube* filled with a sweet liquor, of which bees are very fond. *Glands* marked with 2 teeth tapering downwards, bowed inwards, adhering; closing the throat of the bloss. SCOP.

DIANDRIA MONOGYNIA.

Cup, upper lip inversely heart-shaped. *Bloss.* bluish purple, 4 times as large as the cup. *Tips* deep purple. *Dust* yellow. *Stem*, *leaves*, and *fruit-stalks* hairy; the hairs upon the latter supporting transparent globules. *Leaves* wrinkled. WITH.

[Surry and Suffex, common. ST.—Castle-hill, Tamworth, W.]
P. July.

Sheep and Goats eat it. Cows and Horses refuse it.

wild

SAL'VIA *verbena'ca*. Leaves indented, ferrated, smoothish. Blossoms more slender than the cup.—

Clus. ii. 31. 1; repr. by Ger. em. 771. 1, and cop. by Park. 57. 8.—

Black. 258.—Barr. 208.—H. ox. xi. 14. 33.—Ger. 628, is a fig. of some other species.

Cup, its upper lip with 3 very short teeth. *Bloss.* blue; its outside sprinkled with white globules. *Summit* a fine deep purplish blue. *Stem* 4 cornered; hairy. *Flowers* 6 in a whorl; the upper whorls almost contiguous; the lower ones more and more distant. WITH.

Wild Clary.

Meadows and pastures. [Plentiful about Kinfare, Staffordshire. Mr. BRUNTON.]
P. June.

25. C I R C Æ' A. Enchanters-wort.

EMPAL. *Cup* 2 egg-shaped, concave leaves; a little bent outwards; deciduous.

BLOSS. *Petals* 2; inversely heart-shaped; expanding; equal; shorter than the cup.

CHIVES. *Threads* 2; hairlike; upright; as long as the cup. *Tips* roundish.

POINT. *Seed-bud* turban-shaped: beneath. *Shaft* thread-shaped, as long as the chives. *Summit* blunt; notched at the end.

S. VESS. *Capsule* betwixt egg and turban-shaped; covered with strong hairs; with 2 cells, and 2 valves; opening from the base upwards.

SEEDS. Solitary; oblong, narrow towards the base.

Ess. CH. *Bloss.* 2 petals. *Cup* 2 leaves, superior. *Seed* 1; cells 2.

Obs. In most plants the seeds are produced within the empalement or blossom; but this genus is an exception, the seed-bud being beneath them.—The number 2 prevails here very remarkably; 2 leaves to the empalement, 2 petals, 2 chives, 2 cells and 2 valves to the seed vessel, and sometimes 2 seeds. ST.

CIR-

CIRCÆ'A *lutetia'na*. Stems upright, supporting several bunches of flowers. Leaves egg-shaped.—

Ger. 280.—*Fl. dan.* 210. confirmed by OED. HALL. LIGHTF. and HUDS. the reference in *Syst. Veget.* being probably an error of inadvertency.—*Lob. obs.* 137. 1; repr. by *Ger. em.* 351. 1; and cop. by *Park.* 351. 1.—*J. B.* ii. 977. 1; with a single flower at the bottom.—*Is Curt. n.* 37. fasc. iii. stem and leaves smooth, *H. ox.* v. 34. row 3. 1. leaves smooth and glossy, and perhaps *Fl. dan.* 256, a smooth var. or the alpina?

Stem a foot and half high; upright. Leaves somewhat serrated, dull. Bunches terminating and lateral. *Empal.* much thicker and of a coarser texture than the blossom, and not of the same colour. LINN.

Stem woolly. Leaves elliptical, slightly hairy. Chives longer than the cup. Fruit-stalks, when the fruit is ripe, bent downwards. Hairs of the fruit hooked. SCOP.

Root toothed. Stem upright, a cubit high; branching. Leaves nearly heart-shaped, but without the hollow at the base: on long leaf-stalks; the edges sometimes entire, sometimes undulated, sometimes serrated and fringed; but mostly serrated. Fruit-stalks rather long; somewhat hairy, expanding, and on the ripening of the seed, bent back. Bloss. white, or flesh-coloured. *Empal.* greenish red, in texture unlike the blossom. HALL.

Bunch mostly solitary. *Emp.* green; red at the points. RETZ. obs. i. p. 9.

Stems somewhat creeping, green. The plant corresponds with Scopoli's character. MR. WOOD.

Whole plant pubescent. Leaves heart-egg-shaped, taper pointed, betwixt toothed and serrated, the points being directed towards the end of the leaf, but the margin between the points hollowed out. *Empal.* when magnified, beset with short cylindrical hairs, ending in heads, just sensibly thicker than the body of the hair. ST.

Leaves a little woolly. Cup with its leaves reflected, betwixt egg and spear-shaped; coloured. Petals reddish white, alternating with the leaves of the cup. Threads thickest towards the top; white. Tips white. Dust 3 cornered. Seed-bud hairy, egg-shaped but compressed; placed under, and at a small distance from, the cup. Shaft thickest upwards, with a double green gland at its base. Summit a fine pink colour. Caps. set with white hairs, hooked at the end. Seeds 2. Stems and branches cylindrical; a little woolly; sometimes red at the joints. Leaves on leaf-stalks, opposite; betwixt egg and spear-shaped; a little woolly, and glandular at the edges. Little fruit-stalks after flowering, pointing downwards. WITH. *Inchanters Nightshade.*

Woods and moist hedge bottoms, common.

P. July. Aug.

It is eaten by sheep,

mountain

CIRCÆA alpina. Stem prostrate, supporting a single bunch of flowers. Leaves heart-shaped.—

Curt. n. 34. fasc. iii.—*H. ox. v. 34. row 3. 2. a very luxuriant specimen.*—*Fl. dan. 256, confirmed by OED. HALL. LIGHTF. and HUDS. the reference in Murray's edit. of Syst. Veget. to 210, being a mistake.*

Stem prostrate, scarcely a finger's length. Leaves heart-shaped, toothed, shining. Different from the *C. lutetiana*, but nearly allied to it. LINN.

These species certainly distinct—SCOP. and MR. WOODWARD; but the specific distinctions do not depend on the direction of the stems, the number of the branches, or the colour of the empalement, but in the figure, &c. of the Leaves, which are heart-shaped, toothed, smooth. Stem ascending. SCOP.

Of a delicate texture. Stem upright, from 3 to 6 inches high; smooth. Leaves smooth; deeply cut at the edges, and more distinctly heart-shaped. Leaf-stalks smooth. Empal. red. Bunches rather more numerous than in the *C. lutetiana*. Cultivated in a garden it does not become the *C. lutetiana*, neither is it a variety of that. HALL.

Empal. smooth. Leaves deeply cut, or ferrated. LIGHTF.

Bunch. often only 1, sometimes 2, or 3. Leaves of a yellower green. Sometimes six inches high. Corresponds with Scopoli's character, and does not materially differ from Mr. Curtis's *C. lutetiana*. If not the *C. alpina* it is at least a striking variety of the *C. lutetiana*. Found about Leeds. MR. WOOD.

Two specimens from botanic gardens, and the same with Mr. Wood's, exactly accord with the above descriptions, except that they are 10 inches high. Empal. smooth. Stems smooth; joints red. Leaves heart-shaped. Bunches from 1 to 5. Empal. white; its points green. RETZ. obs. i. p. 9. Emp. very red. REYGER. ib.

Inchanters Nightshade.

[Rocky Woods in Lancashire, Westmorland, and Cumberland. MR. WOODWARD.] P. July.

Sheep eat it.

Order II.

DIGYNIA. II. POINTALS.

46. ANTHOXAN'THUM. Vernalgrafs. (Ray.)

Pl. II. fig. 1.

EMPAL. *Husk*, 2 valves containing 1 flower. *Valves* concave, egg-shaped, taper; the innermost the largest.

BLOSS. *Husk* 2 valves, the length of the larger valve of the empalement. Each valve sends out an awn from its back, at the lower part; and one of the awns is jointed. *Honeycup* 2 leaves, very slender, cylindrical. The leaves nearly egg-shaped, and one enfolding the other.

CHIVES. *Threads* 2; hair-like; very long. *Tips* oblong; forked at each end.

POINT. *Seed-bud* oblong. *Shafts* 2; thread-shaped. *Summits* simple.

5. VESS. The *Husk* of the blossom grows to the seed.

SEED. Single, cylindrical, tapering at each end.

ESS. CH. *Empal. husk* of 2 valves, containing 1 flower. *Bloss. husk* 2 valves; pointed. *Seed* 1.

ANTHOXAN'THUM *odora'tum*. Spike oblong *sweet-scented* egg-shaped. Florets longer than the awns, supported on short fruit-stalks.

Curt. n. 9. fasc. i.—Schreb. 5.—Giseke. 2.—Fl. dan. 666.—Stilling. f. 1. out of blos. Mus. rust. iv. 2. 3.—J. B. ii. 466. 1.—Anders. Barr. 124, single spike good.—C. B. 44. 1.—H. ox. viii. 4. row 2. 25. and 7. row 3. 25. both bad.—Spike, and parts of fructification, Leers 2. 1.—Seguier. i. 4. 2.—Mont. 84.

Spike-like panicle. *Empal.* longer than the blos. *Petals* unequal, blunt, with a slight woolliness. *Awn* of one petal shorter, upright, proceeding from the middle of the petal; that of the other longer, hooked, proceeding from the base. *Tips* reddish, cloven at each end; cleft straddling. *Seed-bud* tapering. *Shafts* twice as long as the chives. SCOP.

Empal. The outer valve skinny, and sheathing the base of the inner, which is much stronger. *Threads* short, at the first opening of the blossom, afterwards very long. *Summits* woolly.

woolly. It is remarkable, that before the expansion of the blofs. the *Seed-bud* and one end of the *Tips* are inclofed in the *Honeycup*. *Straw* cylindrical, fmooth ; when magnified it appears fcored with green lines. *Leaves* fcored ; fheathing the *straw* ; 2 or 3 upon each flowering ftem. *Straw* with fhining joints. WITH.

Empal. *Valves* fpinkled over with minute yellow dots, fimilar to thofe of the *Ribes nigrum*, whence poffibly its fweet feent ; fometimes fcattered over with foft white hairs. *Blofs.* double. *The outer* entirely different from that of any other of the *Graffes*, fhorter than the leffer valve of the empalement, its outside covered to near the top with ftiff brown hairs lying flat ; *valves* ftrap-shaped, cloven at the end, keeled, upright, ftanding feparate, *that with the twifted awn* narrowing downwards, and juft fenfibly fhorter ; *awns* upright, *the longer* where even with the top of the bloffom bent afide, below the flexure twifted, dark brown, above whitifh, tapering ; *the fhorter* as long as the empalement, inferted above the middle of the valve, ftraight, brownifh, tapering. *The inner* (*Nectarium*, LINN.) refembling the bloffom of a *Poa*, fmooth ; *outer valve*, oblong-roundifh, yellowifh brown, membranaceous at the edge ; *inner valve* membranaceous, as narrow again.—Haller makes it one of his 2-flowered *Avenas*, but it is a genus truly diftinct from all others. It has the awn of the *Avena*, the blofs. of the *Poa*, and the double one of the *Phalaris*. In a natural arrangement it fhould ftand between the *Poa* and *Avena*. SR.

Spring grafs.

Meadows and pastures, common.

P. May. June.

This is one of the earlieft of our graffes, and is faid by Linnæus to occasion the delightful fmell of new-mown hay. Mr. Curtis fays that the leaves, rubbed betwixt the fingers, impart a grateful odour. Boccone fays a diftilled water is prepared from it, as the vehicle of fome perfumes. If it be gathered whilft in bloffom, lapped in a paper and carried in the pocket, it retains the fmell of new-mown hay for a long time. W.

Cows, Goats, Sheep, and Horfes eat it.

Class III.

TRIANDRIA;

III. CHIVES.

THIS Class comprehends, besides other plants, the greater part of those vegetables commonly called GRASSES, and some others nearly allied to them. Although the flowers in these are generally disregarded, they will not, to an attentive observer, appear less curiously constructed, than those which boast of gayer colours and more conspicuous parts.

NATURAL CHARACTER OF GRASSES.

EMPAL. A husk; generally composed of 2 valves: the larger valve hollow; the smaller flat.

BLOSS. Strictly speaking, none: but, instead thereof, a *Husk* of 2 valves, dry and skinny. *Honeycup* of 2 leaves; oblong; very small; superior.

CHIVES. *Threads* 3; hair-like. *Tips* oblong; with 2 cells.

POINT. *Shafts* 2; downy; reflected. *Summits* downy.

S. VESS. None.

SEED. Single; inclosed either by the blossom or the empalement; oblong; tapering at each end.

STEM. Simple, straight, hollow; with knots or joints: it is commonly called a *Straw*.

LEAVES. Entire; narrow; tapering to a point: 1 placed at each joint of the straw.

MARTYN *Cat. Cant.* p. 11.

Besides the plants which fall under this class, there are others of the grass kind that differ in some of their characters, and are arranged accordingly. Thus, the ANTHOXANTHUM, or Vernalgrass, has only two chives, and the HOLCUS, or Softgrass, has its chives and pointals variously disposed upon the same plant; (*See the figures in the plate of Grasses, copied from the Amœnitates Academic.* LINN.)

The great solicitude of nature for the preservation of grasses is evident from this; that the more the leaves are

are consumed, the more the roots increase. The great author of nature designed, that the delightful verdure of these plants should cover the surface of the earth, and that they should afford nourishment to an almost infinite number of animals. But what increases our admiration most, is, that although the GRASSES constitute the principal food of herbivorous animals, yet, whilst they are left at liberty in the pasture, they leave untouched the straws which support the flowers; that the seeds may ripen and sow themselves. Add to this, that many of the seemingly dry and dead leaves of Grasses revive, and renew their verdure in the spring. And on lofty mountains, where the summer heats are hardly sufficient to ripen the seeds, the most common Grasses are. the *FESTUCA ovina* (Sheep's Fescue;) the *POA alpina* (Mountain Meadowgrass;) and the *AIRA caespitosa* (Turfy Hairgrass;) all which are viviparous, and consequently propagate themselves without seeds.

In general, the leaves furnish pasturage for cattle; the smaller seeds are food for birds, and the larger for men. But some are preferred to others; as, the *FESTUCA* (Fescue) for Sheep; the *POA* (Meadowgrass) for Cows; the *PHALARIS* (Canary) for Canary-birds and Linnets; the *AVENA* (Oat) for Horses; the *SECALE* (Rye) *HORDEUM* (Barley) and *TRITICUM* (Wheat) for Man.

Variety of INSECTS too derive their nourishment from grasses; as the *Papilio mara*, *Pap. Ægeria*, *Pap. Galathea*, *Pap. Furtina*, *Pap. Cinxia*, *Phalana quercifolia*, *Ph. Potatoria*, *Ph. culmella*, *Chrysomela Graminis*, and several others which will be mentioned under the different species.

No part of Botany appeared to me more difficult than the study of GRASSES; but the method of accurate dissection and observation once adopted, nothing was more certain or more easy. However, when the great importance of the subject is considered, we cannot labour too much to fix the public attention to it, by rendering it as easy as possible: for which reason the exceptions are carefully noted under each subdivision of the orders, and in the following plate an example is selected from each genus. To gain a clear idea of the structure of the flowers, they must be examined just before the *Tips* discharge their dust; and by comparing them in that state with the figures in the plate, and with the generic description,

GRASSES

to front page 29

scription, every difficulty will soon be surmounted. The Botanic Microscope will be found extremely useful in dissecting the minuter parts.

EXPLANATION OF THE PLATE.

Fig. 1. *ANTHOXAN'THUM* (*Vernalgrafs.*) *a a* husks of the empalement. *b* the awn of the inner valve of the blossom, twisted and jointed. *c* the straight awn of the outer valve of the blossom. *d d* the two tips. *e e* the two shafts.

† *Daëylis cynosferoides*. Blofs. 2 valves. Empal. 2 valves. ST.

Order II.

DIGYNIA; II. POINTALS.

* Flowers scattered; 1 in each empalement.

82. PAN'ICUM. Empal. 3 valves; that upon the back the smallest.
84. ALOPECU'RUS. Empal. 2 valves. Blofs. 1 valve with a simple point; fitting.
83. PHLE'UM. Empal. of 2 valves; lopped; sharp; pointed; fitting.
80. PHAL'ARIS. Empal. 2 valves. Valves keeled; equal; inclosing the blossom.
85. MIL'IUM. Empal. 2 valves. Valves distended; larger than the blofs. nearly equal. (Valves much larger than the blofs. ST.)
86. AGRO'STIS. Empal. 2 valves, (sometimes only 1. ST.) Valves sharp; shorter than the blofs. (somewhat larger than the blofs. ST.)
92. DAG'TYLIS. Empal. 2 valves. The larger and longer valve compressed and keeled.
96. STI'PA. Empal. 2 valves. Blofs. terminated by an awn which is not jointed.
- † *Melica nutans*. *Arundo Epigejos*. *Arundo Calamagrostis*. *Arundo arenaria*.

** Flowers scattered; 2 in each empalement.

87. A'IRA. Empal. 2 valves. Florets without the rudiment of a third.
88. MEL'IGA. Empal. 2 valves. Florets with the rudiment of a third between them.
- † *Holcus*. *Avena elatior*. *Avena flavescens*. *Avena fatua*. *Cynofurus*. *Daëtylis glomerata*. *Sesleria*.

*** Flowers scattered; several in each empalement.

90. BRI'ZA. Empal. 2 valves. Blofs. heart-shaped; with distended valves.
39. PO'A. Empal. 2 valves. Blofs. egg-shaped; with valves somewhat sharp.
- (p. 83.) SESLE'RIA. Empal. 2 valves. Blofs. oblong; toothed at the end. Fence 2 leaves. ST.
94. FESTU'GA. Empal. 2 valves. Blofs. oblong; with sharp pointed valves.

95. BRO'MUS. *Empal.* 2 valves. *Bloss.* oblong; its valve with an awn rising from beneath the point.
97. AVE'NA. *Empal.* 2 valves. *Bloss.* oblong; with a twisted awn upon the back.
99. ARUN'DO. *Empal.* 2 valves. *Bloss.* woolly at the base, and without an awn.
- † Rottbollia. *Aira cærulea, aquatica. Dactylis glomerata.*

**** Flowers on a long toothed seat without fruit-stalks.

105. TRIT'ICUM. . *Empal.* containing many florets.
104. HOR'DEUM. .. *Fence* 6 leaves, containing 3 florets. *Flower* simple. LINN.— *Fence* 2 leaves. *Flowers* growing 3 together; simple. ST.
- (p. 122.) ROTTBOL'LIA. *Empal.* lateral, containing 1 blossom of 2 valves; solitary. ST. from *Sp. plant. and suppl.* 13.
102. E'LYMUS. *Fence* 4 leaves, containing 2 flowers. *Flower* compound. LINN.— *Fence* 2 leaves. *Flowers* 2 or 3 together; composed of from 2 to many florets. ST.
101. LO'LIIUM. *Fence* 1 leaf, containing 1 flower. *Flower* compound.
93. CYNOSU'RUS. . *Fence* 1 leaf, fixed to the side. *Flower* compound.

Order III.

TRIGYNIA; III. POINTALS.

107. MON'TIA. *Bloss.* 1 petal. *Empal.* 2 leaves. *Caps.* 3 valves. *Seeds* 3.
112. POLYCAR'PON. *Bloss.* 5 petals. *Cup* 5 leaves. *Caps.* 3 valves.
110. HOLOS'TEUM. *Bloss.* 5 petals. *Cup* 5 leaves. *Caps.* opening at the end.
189. TILLÆ'A. *Bloss.* 3 petals. *Cup* 3 leaves. *Caps.* 3. *Seeds* several.

† *Alfine media. Empetrum nigrum.*

48. VALERIA'NA. Valerian.

EMPAL. None ; or only a *Rim*, which is superior.

BLOSS. *Tube*, bellied on the under side, containing honey. *Border* with 5 clefts. *Segments* blunt.

CHIVES. 3, or fewer than 3 ; awl-shaped ; upright ; as long as the blossom. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shaft* thread-shaped ; as long as the chives. *Summit* thick.

VESS. A hard substance, not opening ; deciduous ; crowned.

SEEDS. Solitary ; oblong.

Ess. CH. *Bloss.* 1 *petal*, superior ; bellying at the base on one side. *Seed* 1.

OBS. There is a wonderful diversity in the parts of the flowers in different species of Valerian, as well in number as in figure.

VALERIA'NA *ru'bra*. Flowers with 1 chive, with red stamens. Leaves spear-shaped ; very entire.—

Riv. 3. 2.—*Dod.* 351. 1. repr. by *Lob. obs.* 184. 2 —*Ger. em.* 678. 1 ; cop. by *Park.* 123. 11 ; and by *Ger.* 550. 1.—*H. ox.* 7. 14. 15.—*J. B.* iii. 211. 2.

Red Valerian.

Blossoms red ; and in gardens there is a variety with white blossoms. *H. ox. ib.* p. 102.

On old walls and rubbish ; in Devonshire and Cornwall common. HUDS. P. May. Aug.

VALERIA'NA *dioi'ca*. Chives and pointals on small different plants. Leaves winged, very entire.—

Root-leaves egg-shaped. Stem-leaves winged. HUDS.

Plant with chives, but pointals imperfect.

Riv. 2. 3. *V. minor*.—*Fl. dan.* 687. 1.—*Walc.*—*Blackw.* 484 : —*Trag.* 62.—*Math.* 41.—*Ger.* 917 3.

Plant with pointals, but only rudiments of chives.

Riv. 2. 2. *flor. exig.*—*Fl. dan.* 687. 2.—*Clus.* ii. 55. 2 ; repr. by *Dod.* 350. 1.—*Lob. obs.* 411. 3.—*Ger. em.* 1075. 3, and cop. by *Park.* 123. 13, and *J. B.* iii. 211. 1.—*H. ox.* vii. 14. 5. —*Mer. umb.* 10. d. e.

Leafy shoots spring from the crown of the root ; the leaves oval egg-shaped. Leaf-stalks long, 3 cornered. Leaves on the stem either winged or with winged clefts. I have examined great numbers

bers of plants, but never yet found one that had the *Chives* and *Pointals* perfectly distinct; and they all produce perfect seeds. SCOP.

The diversities in the parts of fructification are considerable; in some flowers there are 3 *Chives* and a very short and minute *Pointal*; but in others the *Pointal* is entirely wanting. The *Tips* in these are red, and the *Bloss.* tinged with red, particularly on the outside. *Dust* yellow.

Flowers upon other roots have either no *Chives*, or else only rudiments of chives, and a pointal with the *Summit* cloven into 3 parts. *Bloss.* in these plants much smaller than the preceding, and only slightly tinged with red. *Stems* and *Leaves* in both kinds nearly alike, but in the fertile plants a tinge of red prevails in them. WITH.

It is sometimes much smaller.

Moist meadows, common.

P. May. June.

Riv. 1.—Fl. dan. 570; branch and leaf good.—Fuch. 857; cop. by Trag. 61.

Upper *Floral-leaves* spear-shaped. *Leaves*, all of them, a little hairy or woolly at the base. WITH.

Great wild Valerian.

Hedges, woods, and marshes, common.

P. June.

narrow leaved

2. Leaves narrower.

Riv. 2. 1.—Garidel 96. at p. 520.

Dry heaths and high pastures.

It is the latter variety which is in so much repute as a medicine. The root has a strong, and not an agreeable smell; its taste is warm, bitterish, and subacid; it communicates its properties to wine, water, or spirit; but it is best in substance, and may be taken from half a dram to two drams for a dose. There is no doubt of its possessing antispasmodic virtues in an eminent degree. It is often prescribed with advantage in hysterical cases; and instances are not wanting where it appears to have removed some obstinate epilepsies. In habitual costiveness it is an excellent medicine, and frequently loosens the bowels when other stronger purgatives have been tried in vain.

Cows eat the leaves; Sheep are not fond of them. Cats are delighted with the roots.—Rats are said to be equally fond of them and that the Rat-catchers employ them to draw the Rats together. ST.

VALERIA'NA *locusta*. Chives 3 in each flower. Lettuce stem forked. Leaves strap-shaped.—

3 Leaves entire.

Dod. 647. 1; repr. by *Ger. em.* 310. 1.—*Ger.* 242; cop. by *J. B.* iii. 323. 2.

β vernus. Leaves broader, with flat edges.

Ger. em. 153. 1.—*Clus.* i. 205. 2; *repr. by Ger. em.* 156. 12.
 —*Ger.* 125. 1.

Obs. This variety is inserted on the authority of *Mr. Hudson*,
 but it is to be regretted that he has not mentioned where he dis-
 covered it. *Ray*, from whom he has extracted the place of growth,
 takes no notice of it. ST.

Crocus officinalis sylvestris. HUDS.

The Summits of the Pointal of the *officinalis*, carefully collected,
 and moderately dried, are the Saffron of the shops. That collected
 in England is preferred to all other. It affords a beautiful colour
 to water, wine, or spirit, and gives out the whole of its virtues to
 them. It hath been holden in high repute as a cordial; but modern
 practice pays no great attention to it, since it has been found to
 produce no sensible effect, even when given in doses greatly larger
 than those generally prescribed.

65. I'R I S. Flag.

EMPAL. *Sheaths* 2 valves, separating the flowers; permanent.

BLOSS. With 6 divisions. *Segments* almost distinct petals; oblong, blunt. The 3 outer ones reflected; the other 3 upright and sharper: all connected together by the claws.

CHIVES. *Threads* 3; awl-shaped, lying upon the reflected segments. *Tips* oblong, straight, depressed.

POINT. *Seed-bud* beneath, oblong. *Shaft* simple, very short. *Summit* very large, consisting of 3 divisions which resemble petals; broad, reflected, alternately pressing down the chives and segments; cloven at the end.

S. VESS. *Capsule* oblong, angular; with 3 cells and 3 valves.

SEEDS. Several; large.

ESS. CH. *Blofs. with 6 divisions, alternately reflected. Summits resembling petals.*

I'R I S *pseud-ac'orus*. Blossoms not fringed; the innermost segments smaller than the summit. Leaves sword-shaped.— *yellow*

Curt. n. 33. fasc. iii. — Blackw. 261. — Fl. dan. 494. — Dod. 248. 1; repr. by Lob. obs. 31. 1; Ger. em. 50. 2. and cop. by Park. 1219. — H. ox. iv. 6. 11. (Math. 22. Ger. 46. 2; repr. by C. B. th. 633; Trag. 699; Fuchs. 12; cop. by J. B. ii. 732. 1; the descriptions accord, but the habit very different. — Ludw. ed. 101, cannot be the plant, the 3 inner petals being entire.)

Petals, the 3 outer ones toothed on each side next to the chives. *Seed-bud* with edges, furrowed. LINN. *Blofs. yellow.*

Valves of the empalement spear-shaped. *Petals*, the 3 outer and larger ones streaked with purple lines. *Summits* cut into fringed segments at the top. *Tips* compressed; purple. *Flowers* 3 together at the top of the stem: the 2 outer flowers have each 1 sheathing valve, and the middle flower 2. *Stem* cylindrical but compressed. *Root-leaves* sheathing each other at the base; of a silvery white within; sometimes purplish on the outside. I should be tempted to describe this flower as having 9 *Petals* and 3 *Shafts*; which are connected longitudinally to the 3 innermost petals. WITH.

Sometimes it has a pale yellow flower. RAY. Syn. 375.

Flower de luce. Water flag.

Banks of rivers, marshes, and wet meadows.

P. July.

The juice of the fresh root is very acrid, and hath been found to produce plentiful evacuations from the bowels when other powerful means had failed. *Edin. Med. Eff. vol. 5. art. 8.* It may be given for this purpose in doses of 80 drops, every hour or two; but the degree of its acrimony is so uncertain, that it can hardly ever come into general use. In some cases it proves diuretic. The fresh roots have been mixed with the food of swine bitten by a mad dog, and they escaped the disease, when others bitten by the same dog died raving mad. The root loses most of its acrimony by drying.

Goats eat the leaves when fresh; but Cows, Horses, and Swine refuse them: Cows will eat them when dry. The roots are used in the island of Jura to dye black. *Pennant's Tour, 1772. p. 214.*

sinking

I'RIS *fœtidissima*. Blossoms smooth; the inner segments expanding very much. Leaves sword-shaped. Stem with 1 angle.

Dod. 247. 2, repr. by Lob. obs. 37. 1, Ger. em. 60, and cop. by Park. 256. 5.—C. B. th. 560.—J. B. ii. 731. 2.—H. ox. iv. 5. 2.—In fruit; Fuchs. 794; cop. by Math. 991, Trag. 904, and J. B. ii. 731. 1.—Blackw. 158.—As growing on the sea-shore, Ger. 53. 1; repr. in C. B. th. 564.

Stem cylindrical, as long as the leaves, which cover it, and have a very fœtid smell. Seed-bud like the preceding. Blofs. of a disagreeable purplish ash-colour: not smelling in the night-time. Claws of the outer petals wrinkled and plaited on the under surface. Inner petals larger than the summit, expanding. LINN.

VAR. 2. Leaves striped.

Sinking Gladdon, or Gladwyn.

Near Hornsey, and about Charlton Wood, Kent. HUDS. Near Braintree, Essex. [Near Perthore, Worcesters. NASH. In the West of England not uncommon in lanes. Bath hills; Ditchingham, Norf. Mr. WOODWARD.]

P. June. July.

The juice of the root, both of this and the preceding species, is sometimes used to excite sneezing; but it is an unsafe practice. Violent convulsions have sometimes been the consequence.

Neither Horses, Sheep, nor Cows, eat it.

bulbous-rooted

I'RIS *Xiphium*. Blossoms smooth. Flowers in pairs. Leaves awl-shaped, channelled, shorter than the stem.—

Goats eat it.

72. CYPE'RUS. Galingale. (Ger.)

Pl. II. fig. 3.

EMPAL. *Spike* tiled ; flowers pointing from 2 opposite lines, separated by egg-shaped *Scales* which are keeled on the back, and bent inwards at the edges.

BLOSS. None.

CHIVES. *Threads* 3 ; very short. *Tips* oblong, furrowed.

POINT. *Seed-bud* very small. *Shaft* thread-shaped, very long. *Summits* 3, hairlike.

S. VESS. None.

SEED. Single, 3 cornered, pointed ; not hairy.

Ess. CH. *Husks* chaffy, tiled, pointing 2 ways. *Bloss.* o.

Seed 1 ; naked.

black headed

CYPE'RUS *ni'gricans*. *Straw* cylindrical, naked. Spikes in an egg-shaped head. Fence of 2 leaves. ST.

Cyperus spicis, &c. HALL. n. 1347.

Schænus

* This is the var. of *Schænus compressus* of LIGHTF. t. 24, now allowed to be a distinct species. It has often been described for the *S ferrugineus*, which I believe has never been found in Britain. Mr. SMITH.

Schoenus nigricans, which see.

Fence. The greater valve from 1 to $1\frac{1}{2}$ line below the other. *Head* generally composed of two clusters of spikes, each with its proper fence. *Fences* and *Scales* of a black purplish brown. *Seeds* glossy, of a snowy or livid whiteness, like those of *Lithospermum officinale*. SCHEUCH. ST.

Scales pointing from 2 opposite lines. *Spike-stalk* bent alternately backwards and forwards. *Seeds* roundish approaching to 3 square, of a pearly lustre. HALL. ST.

Spikes spear-shaped, flattened, on very short fruit-stalks. *Scales* spear-shaped, from 5 to 6. *Seed* naked. POLLICH. ST.

Each *Seed* lies within the corresponding curvature of the spike-stalk, and is inclosed by the embracing sides of the scale above it, as well as by its own; marked lengthways by 3 prominent ribs.—Every part of the plant rigid.—To arrange amongst the *Cyperuses* after the *monostachyos*, to which it has the nearest affinity, and which it seems to connect with the umbelliferous species. ST.

CYPE'RUS *longus*. Straws leafy, 3 cornered. Flowers in a treble compound leafy bundle. Fruit-stalks naked. Spikes alternate.— english

H. ox. viii. 11. 13.—*Fuchs. 453. cop. by Trag. 915; (but improperly referred by C. B. to his C. rot. vulg.) and J. B. ii. 501. 1.*—*Math. 26. left half of the fig. cop. in Ger. 28. 1.*—*Dod. 338. 2. repr. by Lob. obs. 40. 1. Ger. em. 30. 1. and cop. by Park. 146. 3. (descr. n. 4.)—C. B. th. 216.—Blackw. 316.—Branch of panicle, Scheuch. 8. 12.—(Pluk. 192. 1, and Mont. 1. 2, quoted by the Germ. synonyms, appear to be other plants.)*

Root long, odoriferous.

Fruit-stalks sometimes to the amount of 12 or 13, forming a sort of rundle, the outer spokes of which are gradually shorter and shorter. *Little spikes* slender, tapering to a point, chestnut-coloured. SCOP.

Sweet Cyperus. English Galingale.

Fens and marshes. [Not found on St. Faith's bogs, as mentioned by Mr. Hudson, Ed. 2.—A specimen of it was by mistake sent to Mr. Hudson with some of St. Faith's plants. MR. SMITH.]

P. July.

The root is agreeably aromatic to the smell, and warm and bitter to the taste. The modern practice disregards it; but perhaps it is not inferior to some of the more costly medicines brought from abroad.

73. SCIR'PUS. Club-grafs.

Pl. II. fig. 4.

EMPAL. *Spike* tiled ; the flowers growing equally from every fide, and feperated by egg-shaped *scales* bent inwards at the edges.

BLOSS. None.

CHIVES. *Threads* 3 ; which continue growing longer. *Tips* oblong.

POINT. *Seed-bud* very small. *Shaft* thread-shaped, long. *Summits* 3, hairlike.

S. VESS. None.

SEED. Single, 3 cornered, pointed ; furnished with foft hairs, which are fhorter than the empalement.

ESS. CH. *Hufks* chaffy ; tiled on every fide. *Blofs* o. *Seed* 1, beardlefs. LINN.

Blofs. o. *Inner scales* fhorter than the *spikeftalk*, the lower ones generally producing *chives* and *pointal*. ST.

OBS. Soft hairs in fome fpecies grow to the point, in others to the bafe of the feed.

* *Spike fingle*.

common

SCIR'PUS *palustris*. Straw cylindrical. *Spike* nearly egg-shaped, terminating.—

tall.

Fl. dan. 273.—*Lob. obs.* 44. 1 ; repr. in *Ger. em.* 1631. 7, and cop. by *Park.* 1196. 1.—*H. ox.* viii. 10. 32.—*C. B.* 186.—*J. B.* ii. 523. 3.—*Spike and fruitif.* *Leers* 1. 3. (the beft.)

VAR. β *Fl. dan.* 167, in the opinion of *Mull. fl. fried.* confirmed by an examination.—*H. ox.* viii. 10. row 3. fig. between 33 and 34.—*Park.* 1196. 2.—*Spike Scheuch.* 7. 17.

Straw not perfectly cylindrical. *Leaves* compressed ; of a reddish brown colour at the bafe. *Hairs*, 3 or 4, at the bafe of each feed-bud. SCOP.

Club-rufh. *Aglet-headed Rufh.*

Banks of rivers, ponds, and ditches ; frequent. [β. Near Stafford, and Severn Stoke, Worcefterfh. ST.] P. July.

Swine devour the roots greedily when fresh, but will not touch them when dry. Goats, Horses, and Hogs eat it. Cows and Sheep refuse it.

SCIR'PUS *cæspitosus*. Straw scored, naked. Spike *dwarf* terminating, with 2 valves as long as the empalement. Roots separated by scales.—

Straw covered at the base with tiled sheaths, the uppermost terminating in short leaves. **ST.**

Scheuch. 7. 18.—J. B. ii. 523. 2.—C. B. 79.—(Fl. dan. 167. referred to this species by every author except Muller is a var. of the *S. palustris*; and H. ox. viii. 10. row 3. 35. cannot be the plant, since the spike is 4 times as long as the empalement.—Pluk. 40. 6. appears to be a different plant, the same with H. ox. viii. 10. row 3. 34; and in Barr. 256. 1. the inner valve of the empalement is nearly twice as long as the outer.)

Straws from 2 to 6 inches high. Spike, the 2 outer scales as long as the spike, and performing the office of a fence, but producing seed. Seeds with hairs from the base. **ST.**

Dwarf Ciubrysh. Deers hair.

Turf bogs and dry heaths.

P. July.

Goats, Sheep, and Cattle eat it.

SCIR'PUS *pauciflorus*. Straw scored, naked. Spike *chocolate*-terminating; with few flowers; longer than the valves *headed* of the empalement. **LIGHTF.**

Scheuch. 7. 19.—Ger. em. 21. 3. cop. by Park. 1270. 7.—J. B. ii. 509. 1? (Fl. dan. 167, according to Oed. and which Mr. Lightfoot refers to, though doubtfully, is a var. of the *S. palustris*.)

Root-leaves as high, or higher than the stalks, which they resemble. Stalks and Leaves sheathed. Sheaths lopped, and not ending in a projecting point as in the *S. cæspitosus*. Empal. valves 2, oval, not ending in a rigid point. (*non mucronatæ*. HALL.) **LIGHTF.**—but Scheuch. describes them as ending in a sharp point. **ST.**

It seems to be a var. of the *S. cæspitosus*. **HUDS.**

Scirpus Bæothryon, inserted by Ehrhart in LINN. the SON's Suppl. 1103?—no figure referred to, but the character seems to have been formed from the descriptions of Haller and Lightfoot. **ST.**

Highland Mountains. [Ellingham Fens, Norf. Mr. WOODWARD.]

P. Aug.

SCIR'PUS *acicularis*. Straw cylindrical, naked, *slender* bristle-shaped. Spike egg-shaped, consisting of 2 valves. Seeds naked.—

Straw 4 cornered. **HUDS.**

Fl. dan. 287.—H. ox. viii. 10. row 3. 37.—Pluk. 40. 7. (Fl. dan. 167, another plant, as Oed. acknowledges: see Fasc. v. p. 8. t. 287.)

Leaves

Leaves crooked, stiff, cylindrical.

Scales 2 on the outside of the spike, egg-shaped, somewhat pointed, as long or only half as long as the spike. *Scales of the Flowers*, shape as the former. POLLICH. In one specimen the 2 outer scales containing no chives or pointal, in 4 others producing feed as the rest, as in the fig. of the Fl. dan. whence Mr. Hudson has very properly omitted that circumstance in his specific character. *Straw* from 1 to 6 inches high. Forms a fine close green turf. ST.

Least upright Club-rush.

Marshes and bogs. [Malvern Chace, Worc. ST.] P. Aug.

floating

SCIR'PUS *flu'tians*. Straws cylindrical, naked, alternate. Stem leafy and limber.—

H. ox. viii. 10. 31.—*Scheuch.* 7. 20. (*Pluk.* 35. 1. *Spikes ill done.*)

Floating Club-rush. Ponds; Ditches. P. July. Aug.

* * *Straw cylindrical; with several spikes.*

Bull-rush

SCIR'PUS *lacus'tris*. Straw cylindrical, naked. Spikes several, egg-shaped, on fruit-stalks, terminating. LINN.—*Empalements* fringed, cloven into 3 segments, the middle one awl-shaped. ST.

tall

α. Fence somewhat membranaceous, shorter than the panicle. Spikes rather oblong. HUDS.

Park. 1191. 1.—*Leaves, Trag.* 674. 1.

Empalements brown, or brownish chestnut. SCHEUCH. ST.

dwarf

β. Fence nearly the length of the panicle. Spikes egg-shaped. HUDS.

Ger. 31. 4, repr. in *C. B.* 181.

Spikes dark chestnut, or dark brown with a tinge of red. SCHEUCH.

Empalements dark brownish purple above; below, whitish with purple spots. ST.

keeled

γ. One side of the straw flattish. HUDS.

H. ox. viii. 10. 2.

Scales of the spikes cloven, and a little pointed substance at the bottom of the cleft. *Seed-bud* with 5 or 6 hairs at the base. *Seeds* brown. SCOP.

Spikes chestnut-colour. W.

Empal. fringed with short curled hairs. ST.

Bull-rush. Rivers; pools; fens.

P. July. Aug.

When fodder is exhausted, Cattle will live upon it. Cottages are sometimes thatched, and pack-saddles stuffed with it. Bottoms of chairs are very commonly made of this rush. If cut at one year old

old it makes the fine bottoms. Coarse bottoms are made of it at two years old ; and those that are still older, mixed with the leaves of the *Iris pseud-acorus*, make the coarsest bottoms of all. Mats are likewise made, either of the *Scirp. lacustris* alone, or mixed with the afore said leaves.—Goats and Swine eat it. Cows and Sheep refuse it.

SCIR'PUS *Holofschæ'nus*. Straw cylindrical, naked. round-headed Spikes nearly globular, congregated, standing on fruit-stalks ; with a fence of 2, unequal, sharp, pointed leaves.—

H. ox. viii. 10. 17.—*Mich.* 31. (*Scirpoides*.)—*Scheuch.* 8. 2—5.

—*Pluk.* 40. 4.—*C. B.* 174.—*Park.* 1194. 4.—(*Fl. dan.* 454, undoubtedly another plant, though *Oeder's* error has been copied by every subsequent author.)

Sheaths of the leaves jagged and fringed. 1 or 2 of the heads of flowers without fruit-stalks. *Scales* roundish, but terminated by a whitish slender point. **SCOP.**

Sea coast.

P. July.

SCIR'PUS *roma'nus*. Straw cylindrical, naked. single-headed Head lateral, compact. Floral leaf bent back.—

Jacq. fl. 448.—*Barr.* 255. 3.—*Head*; *Scheuch.* 8. 6.—*Pluk.* 40. 5.

Straws the thickness of a thread ; those of the *S. Holofschænus* as thick as the *S. lacustris*, and sharp pointed. **LINN.**

Frequently many-headed. *Scales* egg-shaped, sharp, concave. *Tips* yellow. *Summits* white. **JACQ.**

Moist meadows. Marshy places, near Throgmorton, Worcesterhire. **HUDS. and NASH.**

P. July.

SCIR'PUS *seta'ceus*. Straw naked, bristle-shaped. leaf Spike terminating, fitting. **LINN.**—Seeds naked. **ST.**

Fl. dan. 311.—*Leers.* 1. 6.—*Rottb.* 15. 5. and 6.—*H. ox.* viii. 10.

23.—*Park.* 1270. 10 and 9.—*Barr.* 118. 2, wretched, if really the plant. (*Rottb.* 15. 4, which he refers to the *S. setaceus*, *Mant.* came from the Cape.)

Leaves like bristles. *Straws* naked, numerous ; as thick as the leaves, but twice as long. *Spike* 1, rarely 2, terminating, egg-shaped.

Lowermost *Scale* awl-shaped, pale, as long as the spike. **LINN.**

The *Floral-leaf*, called by Linnæus the lowermost *Scale*, is apparently an extension of the *Straw*, sometimes 2 lines in length, (as *Rottb.* 15. 5. *Scirp. setac.* β ; which though gathered near Paris he fancies to be the *Cyperus minimus*,) but frequently half an inch or more, as *Fl. dan.* *Leers.* *H. ox.* and *Rottb.* 15. 6. *Scirp. setac.* γ. *Spikes* 2, 3, or 4 ; or, as on some of the shorter straws, only 1.

TRIANDRIA MONOGYNIA.

SCHEUCH. with whose remarks, my specimens, all from one root, perfectly accord ; except that I find no straw with more than 3 spikes. ST.

The number of spikes varies from 1 to 4. HUDS.

Spikes greenish brown, tinged with rose-colour. W.

heath

NAR'DUS *stricta*. Spike slender, straight ; the florets pointing in one direction.—*Schreb.* 7.—*C. B. th.* 70.—*H. ox.* viii. 7. 8.—*J. B.* ii. 513. 2.—*Lob. ic.* 90. 1 ; *repr. in Ger. em.* 1631. 3, and *cop. by Park.*1199. 5—6—7.—*Spike, &c. Leers* 1. 7.—*Scheuch.* 2. 10.—*Mont.* 31.*Spikes* yellowish white, or violet colour. *Florets* rising only from one side. WITH.*Straw* with 1 joint near the base, and 1 short bristly leaf. *Root-leaves* numerous, long, thread-shaped, a little rough. *Spike-stalk* convex on one side, hollow on the other, with alternate teeth at the edges, and rough, for the insertion of the florets. LEERS.*Small Matweed. Heath Matweed.**Heaths* and marshes. [*Heaths* in Norf. frequent. Mr. WOODWARD. Malvern Chace, Worcest. Mr. BALLARD. Birmingham heath, St. Lillefhall pool dam, Shropsh. W.] P. June. Aug.

This grafs is stiff and hard to the touch, but being generally short, it eludes the stroke of the scythe, and takes off its edge, which makes it disliked by Mowers.

Goats and Horses eat it. Cows and Sheep are not fond of it. Crows stock it up, for the sake of the larva of insects which they find at the root.

Order

Order II.

DIGYNIA. II. POINTALS.

82. PAN'ICUM. Panick.

Pl. II. fig. 7.

EMPAL. *Husk* with 3 valves*, containing 1 floret. *Valves* nearly egg-shaped; the *smallest* standing behind the other two.

BLOSS. 2 valves. *Valves* nearly egg-shaped, the *smaller* valve the flattest.

CHIVES. *Threads* 3; hair-like, short. *Tips* oblong.

POINT. *Seed-bud* roundish. *Shafts* 2; hair-like. *Summits* downy.

S. VESS. The blossom adheres to the seed without opening.

SEED. Single, inclosed in the blossom; roundish, but a little flattened on one side.

ESS. CHAR. *Bloss.* 3 valves; 1 very small.

PAN'ICUM *verticillatum*. Spike whorled. Little *rough* bunches in fours. Little fences of 2 bristles, with 1 flower. Straws spreading.—

Curt. iv. 44.—H. ox. viii. 4. 11. Ger. 14. repr. in C. B. th.

139; cop. by Park. 1177. 2, and J. B. ii. 469. 1.—Ger. em.

15. 1. (J. B. ii. 491. 2. is a different species.)

Greatly resembling the *P. viride*, but the *bunches* of the *Spike* longer, 3 or 4 together, pointing downwards on one side. *Flowers* green. *Pointals* purple. 1 or 2 *rough Bristles* to each flower, and longer than the flower. *Little fruit-stalks*, after the falling off of the

* *Valves* generally 4. The 1st or *outermost*; the 2nd opposite to the outermost, and covering the outer valve of the blossom; the 3rd opposite and similar to the 2^d; the 4th between the 3^d and the inner valve of the blossom, flat, membranaceous, and generally smaller than the 1st.—Mr. Curtis has seen and figured it in the *P. Crusgalli*, f. 5. 6.; but calls it a membrane between the empal. and bloss. It exists in the *P. glaucum*, *viride*, *miliaceum*, *capillare*, *patens*, and even in the *sanguinale*, where, still observing its proportion to the outer valve, it is with difficulty discovered. In the *patens*, with the assistance of the 3rd valve, it performs the office of a blossom inclosing 3 naked chives. In the *P. Dactylon* there are only 2. St.

flowers, terminated by a lopped, hollow, white cup. *Spike-stalk* cloven, with 3 or 4 corners. Straws smooth; spreading; 2 feet high. *Leaves* naked. LINN.

Kneed-grafs.

Cornfields between Putney and Roughampton. RAY. Battersea fields. CURT. A. June. July.

green

PAN'ICUM *viride*. Spike cylindrical. Partial fence including 2 florets; hairy and bundled. Seeds stringy.—

Curt. iv. 44.—Ger. em. 17. 3.—Park. 1154. 2 and 3.—(Fl. dan. 852, called *P. crusgalli*; Mr. WOODWARD.) Ger. 20. 8; repr. in C. B. th. 138, and cop in H. ex. viii. 2. 10.—J. B. ii. 431. 1.—Spike; Leers 2. 2.—Fructif. Scheuch. 2. 2.

Straw from 12 to 18 inches high; leafy; with 3 joints; scored and rough towards the top. *Leaves* rather broad, rough on the upper side. *Spike* betwixt cylindrical and egg-shaped, unequal in thickness; green, purplish on one side. *Fruit-stalks* very short. *Bristles* white, or purplish; several surrounding each floret, and 4 times as long as the floret. The third petal of the bloss. always wanting. LEERS.—not always present. SCOP.

4th valve as short again as the blossom, while that of the *P. glaucum* is nearly as long as the blossom. Blossom oval, roughish, but even; that of the *glaucum* roundish-eggshaped, rough, and undulated. ST.

Sandy fields. [Corn fields, Ditchingham, Norf. Mr. WOODWARD. Many places about Norwich. Mr. SMITH.] A. July.

loose

PAN'ICUM *Crusgalli*. Spikes alternate and in pairs. Little spikes sub-divided. Husks awned, and rough with strong hairs. *Spike-stalk* with 5 angles.—

smooth

α Awns not above once and a half as long as the empalement. LINN. 10 awns. CURT.

Curt. iv. 41.—Math. 407.—H. ex. viii. 4. row 1. 15.—Dcd. 559. 2, repr. by Lob. obs. 25. 2, and Ger. cm. 85. 4; and cop. by Park. 1154. 1.—Ger. 79. 5, repr. in C. B. th. 136.—C. B. th. 142. (Dod. 561. 3. seems a different plant.)

bearded

β Awns 10 times as long as the empalement.

Ger. 15. 1. repr. in C. B. th. 137.—J. B. ii. 443. 2.—Ger. cm. 16. 1, cop. by Park. 1154. 4.—Panicle, &c. Leers 2. 3.—Fructif. Scheuch. 2. 2. F. (Fl. dan. 852. is the *P. viride*. Mr. WOODW.)

Wet corn-fields; rare. About Battersea. Near Martha's Chapel, by Guildford. Hubs. Between Deptford and Greenwich; near Petersfield, by the rivulet, Hants. RAY. A. Aug.

PAN'ICUM *sanguinal'e*. Spikes fingered ; knotty *cock's-foot* on the inside the base. Flowers in pairs ; without awns. Sheath of the leaves dotted.—

Curt. iv. 41.—Schreb. 16.—H. ox. viii. 3. row 1. 2.—Buxb. v. 65.—Clus. ii. 217. 2 ; repr. in Lob. obs. 13. 1 ; and Ger. em. 27. 2 ; and cop. by Park. 1178. 1.—Ger. 25. 2. repr. in C. B. th. 114.—J. B. ii. 444. 1.—(Fl. dan. 388 ? Flowers stiled, and lesser spikestalks bare of flowers a considerable way up. Separate spikestalks well done.)—Spikes, &c. Leers 2. 6. not a good resemblance though the only fig. where the knots at the base of the spikes are represented.—Scheuch. 2. 11. G. H.—(Math. 1000 seems to be the var. noticed by Scheuch. p. 102, 103.)

Flowers slightly hairy. HALL.

Empal. outer valve very minute. SCHREB. ST. ; very often wanting.

Straw leafy, smooth ; with 3 joints, the 2 lower ones procumbent, the upper one very long, rising obliquely. Leaves rather broad, short, smooth. Sheaths of a blood red, set with very minute rising dots, and bristly. Valves of the empal. pubescent. Seeds reddish, shining. LEERS.

Sheaths of the leaves bare, as in the fig of Schreb. and Fl. dan. beset with soft hairs, Scheuch. ; or very hairy, as in Curt. Buxb. Clus. &c. sprinkled with a number of minute round brown tubercles, obvious to the naked eye ; but no knots at the inner base of the spikes. (Specimens from Germany.) Both circumstances wanting in the plant figured by Curtis. ST.

Spike-stalks flattened, as if bordered. Flowers placed in alternate pairs. SCHEUCH. ST.

Straws leafy. Leaf-sheaths dotted. Spikes on very short fruit-stalks. Spikestalks somewhat zigzag. Flowers sometimes in threes, the lowermost on a fruit-stalk shorter than the flower. Empal. (sometimes) pubescent. LEERS. ST.

A callous hairy substance between the base of the spikes and the straw. LEERS. but not discernibly, at least in dried specimens. ST.

Dots on the leaf-stalks scarcely visible ; LEERS and CURT. in my specimens very obvious. ST.

The longer fruit-stalk supporting a flower with only a pointal ; Scop. but in my specimens both flowers have chives and pointal ; but when 3, the uppermost has neither. ST.

Empal. valves bordered with a woolly fringe (specimen from the son of Prof. Jacquin) ; or outer ribs roughish, as in Curt. f. 1. 11. 12. (specimen from Prof. Leske, titled *P. filiforme*, which may perhaps prove to be our English species)—2nd valve half or 3 times shorter than the blossom ; the outer one as much shorter than the

the 2d.—The 4th valve, (see obs. on the genus,) still smaller, and figured by Curt. f. 8, is an additional proof that it is truly a *Panicum*, and not a distinct genus, as Haller and others have supposed. ST.

Corn-fields near Battersea; and Martha's Chapel, Guilford. HUDS. [At Witchingham, Norf. Mr. Woodw.] A. July. Aug.

creeping

PAN'ICUM *dac'tylon*. Spikes fingered, expanding; soft hairs on the inside the base. Flowers solitary. The plant sends out creeping runners. LINN.—Empalement of 2 valves. ST.

Clus. ii. 217, repr. by *Lob. obs.* 12. 1, and *Ger. em.* 28. 3, and *cop.* by *Park.* 1179. 5.—*C. B. th.* 112. 113; *cop.* in *H. ox.* viii. 3. row 2. 4.—*Barr.* 753. 1.—*H. ox. ib.* 6.—*Spikes*, *Mont.* 99.—*Scheuch* 2. 11. I.

Bloss. an awn-like thread proceeding from the base of the inner valve. SCHEUCH. ST.

Bloss. edges slightly woolly. *Flowers* pointing one way. HALL. ST.

Empal. *Husks* spear-shaped, finely tapering, expanding, nearly as long as the blossom. *Bloss.* keeled. *Shafts and Summits* violet. POLLICH. ST.

Bloss. *Inner valve* egg-shaped, keeled, as narrow again as the outer. The awn-like substance from its base apparently the rudiment of a pedicle analogous to those in the *Melica*, &c. ST.

(*C. B.* 117. a good representation of it. Mr. WOODWARD, but from the descr. a distinct species.)

Sandy grounds, sea-shore. Between Penzance and Market-jeu, Cornwall. RAY. P. July.

84. ALOPECURUS. Foxtail.

Pl. II. fig. 8.

EMPAL. *Husk* 2 valves containing 1 floret. *Valves* equal, betwixt egg and spear-shaped; concave, compressed.

BLOSS. 1 concave *Valve* as long as the empalement, with a long *Awn* upon the back fixed towards the base.

CHIVES. *Threads* 3, hair-like. *Tips* forked at each end.

POINT. *Seed-bud* roundish. *Shafts* 2, like tendrils; reflected; longer than the empalement. *Summits* simple.

S. VESS. The blossom incloses the seed.

SEED. Single; roundish; covered by the blossom.

ESS. CHAR. *Cup* 2 valves. *Bloss.* 1 valve.

Resembles the *A. paniceus*, but 3 times as large. *Empal.* with a tubercle at the bottom. *Bloss.* very short, shorter than the awn. *Straw* and leaves stiff. *Husks* rough, but smooth at the edge; both valves awned. LINN.

Marshes and wet pastures.

A. June. July.

A LOPECU'RUS *paniceus*. Panicle spike-like. *hairy*
Empalement set with soft hairs. Blossoms with awns.—

Schreb. 20. 3; confirmed by the Germ. syn. but referred by Linn. to the *A. monsp.*—Barr. 115. 1.—Buxb. v. 66. 1.—Park. 1164.

4?—(Lob. adv. 17. 1; is the *Lagurus ovatus*, Ger. prov. and Fl. dan. 861, is the *Al. geniculatus*.)

This species very much resembles the *A. monspeliensis*, but the whole plant is soft, and only 5 or 6 inches high. *Husks* downy; woolly at the edges. *Awns* of the bloss. shorter than those of the empalement. LINN.

Bloss. Valves 2, as short again as the empalement; hollow, smooth; the outer 3 times as broad as the other; roundish-egg-shaped, blunt, with 4 teeth; an awn longer than the valve, issuing from below the point. *Inner valve* egg-spear-shaped, pointed; with 2 teeth. *Empal.* ending at the base in a hard tubercle. ST.

Dry soil.

A. July.

83. PHLE'UM. Timothy-grafs.

Pl. II. fig. 9.

EMPAL. *Husk* 2 valves, including a single floret: husk oblong, strap-shaped, compressed; open at the end, and furnished with 2 spit-points. *Valves* equal, straight, concave, compressed; one embracing the other; lopped; with a sharp point at the end of the keel.

BLOSS. 2 valves, shorter than the empalement: *outer Valve* embracing the *inner Valve*, which is smaller.

CHIVES. *Threads* 3; hair-like; longer than the empalement. *Tips* oblong, forked at each end.

POINT. *Seed-bud* roundish. *Shafts* 2; hair-like; reflected. *Summits* downy.

S. VESS. None. The empal. and the bloss. inclosing the seed.

SEED. Single; roundish.

ESS. CHAR. *Empal.* 2 valves, sitting, strap-shaped, lopped, with 2 spit-points at the end. *Bloss.* inclosed. LINN.

Empal. 2 valves. *Bloss.* 2 valves, membranaceous. ST.

OBS.

OBS. In the *Phl. arenarium* the empalement is spear-shaped and not lopped ; and must we confine the title of Phleum to such only as are spikéd ? ST.

sea

PHLE'UM *arena'rium*. Spike egg-shaped, fringed. Stem branching.—

Park. 1170. 4. is a good representation of the spike, though meant for the *Phl. prat. nodos.*—*Pluk.* 33. 8.—*Spike, Mont.* 74. good. (Not Barr. 717.)

Spikes scarcely rife quite out of the sheaths of the leaves. LINN.

Sheaths of the leaves wider than the straw, especially the upper. Spikes cylindrical, but tapering at the base and point, from $\frac{1}{2}$ to 1 inch long. *Empal. valves* tapering off to a point, not lopped, keel fringed from the middle to the point. *Bloss.* hairy. SCH. ST.

Straw, when fully grown, bare from 2 to 3 inches above the upper leaf.—*Empal.* Outer edge fringed towards the top. *Bloss.* membranaceous, valves marked with fine teeth at the end. Not cartilaginous, nor any appearance of a double blossom, as in the *Phalaris*. ST.

Phalaris arenaria. HUDS. which see.

branched

PHLE'UM *panicula'tum*. Panicle cylindrical, spike-like. Husks naked. Straw sometimes branched. HUDS.

Barr. 28. 2. and not the *Phl. pratense* as his editor and Schreber suppose.—*Barr.* 54, a var.? confirmed by Haller.—*Ger.* 10. 1; repr. in *C. B. th.* 51, and cop. by *J. B.* ii. 471. 3.—*Spike; Mont.* 53.—(Not *H. ox.* viii. 4. row 3. 2, as Hall. as is evident from the fringed keels of the single floret.—*Barr.* 21. 2. seems awned.)

Root fibrous. Straw a foot high, somewhat slanting ; cylindrical, smooth, knotted. Leaves several, alternate, upright, on leaf-stalks ; sword-shaped, pointed, stringy, rough. Leaf-stalk cylindrical, very long, sheathing, rough. Leaf-scale single ; within the leaf, sheathing, blunt, membranaceous. Panicle very long, bent to each side ; divisible into lobes. Husks tiled, tapering to a point ; bellying out upwards. Bloss. awnless. HUDS.

Straw 2 inches to half a foot high. Leaves in the smaller specimens rising above the straw. Panicles from 1 to $4\frac{1}{2}$ inches long, whitish green ; slightly tapering upwards : branches stiff, lying close. *Empal. Valves* tapering downwards, scarcely embracing each other ; obliquely lopped, inversely triangularly spear-shaped, (inverse deltoidæ) marked on the outside with 3 ribs ending in very short spit-points, nearly equal, the outermost rather smaller. ST.

Pl. II. fig. 10.

EMPAL. *Husk* 2 valves, including a single floret ; compressed ; blunt. *Valves* boat-shaped, compressed, keeled, more blunt upwards ; the edges straight, parallel, approaching.

BLOSS. *Valves* 2, smaller than the empalement. *Outer Valve* oblong ; edges rolled in ; tapering to a point. *Inner Valve* smaller.

CHIVES. *Threads* 3, hair-like, shorter than the empalement. *Tips* oblong.

POINT. *Seed-bud* roundish. *Shafts* 2 ; hair-like. *Summits* woolly.

S. VESS. The blossom closely furrounds the seed, like a shell, without opening.

SEED. Single ; covered ; smooth ; round, but tapering towards each end.

ESS. CHAR. *Empal.* 2 valves, keeled, equal in length, inclosing the blossom.

PHAL'ARIS *canariensis*. Panicle egg-shaped, spike-like. Husks bellying, hairy. Keel smooth. HUDS.

Panicle somewhat egg-shaped, spike-like. Husks keeled. LINN.

Ludw. 117.—Schreb. 10. 2.—Math. 919.—Trag. 669.—Ger.

80. 1 ; repr. in C. B. th. 534.—Dod. 510 ; repr. by Lob. obs.

26. 1 ; and Ger. em. 86, and cop. by Park. 1163. 1.—J. B. ii.

442. 2.—H. ox. viii. 3. row 3. 1.—Spike, Mont. 44.—Fructif.

Leers 7. 3. * (Barr. 9. 2. is the *Phalaris bulbosa*.)

Bloss. double, gristly, glossy ; *valves* embracing, keeled : the outer adhering to the inner and separating along with it from the empalement ; valves nearly equal, parallel to, and embracing those of the inner ; awl-strap-shaped, 3 times as narrow and almost as short again, nearly smooth, membranaceous at the edge : the inner as in the generic descript. and hairy.—The outer is noticed in this species by Scheuch. who calls it a 4 husked follicle, but I have found it equally present, though often very minute, in the *bulbosa paradoxa* and *arundinacea*, though not in the *erucæformis*, which LINN. observes has a near affinity to the *Paspalum*. ST.

This is a native of the Canary islands, but now propagates itself in Hesse. LINN.

Valves of the empal. with 2 green ribs on each side, and much larger than the blossom. Within these are 2 other small, white, skinny valves, not more than half the length of the blossom. WITH.

Road-sides and uncultivated ground. [New's-Wood, adjoining to Malvern, Worcesterfh. Mr. BALLARD.] A. June.—Sept.

It is often cultivated for the sake of the seeds, which are found to be the best food for the Canary, and other small birds. It nourishes the *Coccus phalaridis*.

sea

PHAL'ARIS *arena'ria*. Panicle oblong-spearshaped; spike-like. Husks spear-shaped, the keel fringed. Huns. confirmed by Mr. WOODWARD.—

Phleum arenarium. LINN. which see.

cat's-tail

PHAL'ARIS *phleoi'des*. Panicle cylindrical, spike-like, smooth; here and there viviparous.—

Fl. dan. 531.—*Viviparous floret*, Scheuch.—2. 5. C.

Spike pale, divisible into lobes. It so exactly resembles some of the *Phleums*, that it may be easily mistaken for one of that genus; but when you examine the spike and press it with your fingers, it separates, and proves to be a panicle; and the *Husks* are not notched at the end. *Flowers* different from those of the *Phleum*. It is a kind of intermediate plant between the *Phalaris*, *Phleum*, and *Alopecurus*. LINN. ST. A different plant from the *Phleum paniculatum* of Mr. Hudson. Mr. WOODWARD. ST. Panicle $2\frac{1}{2}$ inches long. *Flowers* have the habit of those of the *Phalaris*; none viviparous in the specimen sent by Mr. Woodward; from 1 to $1\frac{1}{4}$ line long; compressed; bowed gently inwards with their sides facing the spike-stalk. *Empal. Valves* oblong-spear-shaped, keeled, marked with 3 ribs; edges membranaceous, which, on the side facing the spike-stalk, are separate to the base, and on the outer side lapping over; keel roughish above, and ending in short, rough, awn-like spit-points; the outer just sensibly shorter, narrower, and taper-pointed; the inner between lopped and tapering. *Bloss.* half as long as the empalement, betwixt gristly and membranaceous; awnless; not ribbed; sprinkled with numerous minute dots and a few hairs. A stiff awn-like thread rises from the base of the inner valve, $1\text{--}3d$ of its length, analogous to that of *Arundo arenaria*. ST. Never found any of the florets viviparous. Mr. WOODWARD.

[First discovered in Gr. Brit. by Mr. WOODWARD and Mr. CROWE, near Swaffham, Norfolk, in 1780.] P. July.

Sheep and Goats eat it. Swine refuse it.

PHAL'ARIS *arundina'cea*. Panicle oblong, clus- *Reed*
tered. Husks egg-shaped. Keel rough. HUDS. Panicle
oblong, bellying, large. LINN.

Ger. 7. 2, repr. in *C. B. th.* is the *Poa aquatica*.)—Those
marked β are figures of a var. to be met with in our gardens, with
striped leaves, which indeed has not been found in a wild state in Gr.
Brit. but differs from the other only in colour.

Leaves broad, scored; panicle nearly egg-shaped. LINN.

Valves of the *empal.* with 2 ribs on each side, and not much
longer than the blossom. Valves of the *bloss.* hairy at the edges, and
furnished with a small, slender, hairy appendage on each side. WITH.

Outer valve of the blossom not rolled in. MR. HOLLEFEAR.
Haller calls it an *Arundo*; but in that genus the blossom is
single. ST.

Banks of rivers.

P. July. Aug.

It is used to thatch ricks or cottages, and lasts much longer than
straw. In the province of Scandia they mow it twice a year, and
their cattle eat it. LINN. It is of a hard texture, and cattle are
not fond of it. SCHREB.

Horses, Cows, Sheep, and Goats eat it. Swine refuse it.

β Leaves more of a sea-green. RAY *syn.* p. 400. n. 1.

sea-green

Sea-coast of Jersey, and near Lhanperis.

There is a cultivated variety of this in our gardens with beauti-
fully striped leaves. The stripes are generally green and white;
but sometimes they have a purplish cast. This is commonly called
Painted Lady-grass, or *Ladies Traces*.

85. MIL'IUM. Millet.

Pl. II. fig. 11.

EMPAL. *Husk* 2 valves inclosing a single floret. *Valves* egg-shaped, tapering to a point, nearly equal.

BLOSS. 2 valves, smaller than the empalement. *Valves* egg-shaped; 1 larger than the other.

CHIVES. *Threads* 3; hair-like; very short. *Tips* oblong.

POINT. *Seedbud* roundish. *Shafts* 2; hair-like. *Summits* pencil-shaped.

S. VESS. The blossom incloses the seed, which is very smooth.

SEED. Single, covered, roundish.

ESS. CHAR. *Empal.* 2 valves, containing 1 floret. *Bloss.* very short. *Summits* pencil-shaped.

OBS. Blossom in the *M. effusum* nearly as long as the empalement.

Panick

MIL'IUM *lendig'erum*. Panicle spike-like. Flowers with awns.—

Schreb. 23.3.—Pluk. 33. 6.—Gouan. hort. 1. 2. p. 38 *bad*, (*H. ox.* viii. 3. 12. is not the plant.)—Branch of the panicle, Scheuch. 3. 11. C.

Straw oblique. Panicle spear-shaped. *Husks* bellying out at the base; *valves* unequal. *Bloss.* very short, egg-shaped, awned; *awn* from below the point, as long as the husk. HUDS. *Bloss.* valves 2, unequal, the smaller almost imperceptible without a glass. Mr. WOODWARD. *Seed* contained in the bellying part of the empalement. GOUAN.

Empal. valves egg-spear-shaped, below compressed and glossy, above keeled, keel rough. *Bloss.* membranaceous, hairy at the base and sides; outer *valve* oval, generally awned, hollow, slightly cloven at the end, twice as broad as the other; inner egg-spear-shaped, as long as the outer, thinner, notched at the end, marked longitudinally with 2 lines, one terminating in each tooth. *Awn* generally even with the empal. but sometimes longer, bent aside obliquely about half-way up, inserted at the back of the outer valve at the bottom of the cleft yellowish brown; above white. *Seed* oval, flattened, smooth, amber coloured. In its structure it is an *Avena*, and totally different from the *Milium effusum*. ST.

Alopecurus ventricosus. HUDS.

Meadows and pastures. Isle of Sheepey plentifully. [Cornfields, Gillingham, Norfolk. Mr. WOODWARD.]

A. Aug. Sept.

MIL'IUM

MIL'IUM effusum. Flowers without awns, in scattered panicles.—

Curt. iv. 43.—*H. ox.* viii. 5. 10.—*Ger.* 6. 1, repr. in *C. B. th.* 141, and cop. by *Park.* 1153. 1.—Portion of the panicle, *Leers* 8. 7.—*Scheuch.* 3. 6.—*Floret.* *Mont.* 61. (*Dod.* 561. 2, cop. in *Ger. em.* 6. 1, seems to be a different plant.)

Bloss. somewhat cartilaginous, glossy. *HALL.* *ST.* like that of the *Phal. arund.* but no hairs at the base, and not keeled; just shorter than the empalement. *ST.*

Millet Grass. Wet woods, common. [Frequent in Norfolk. *Mr. WOODWARD.*] A. June. July.

Horses, Cows, Sheep, and Goats eat it.

86. AGRO'STIS. Bent.

Pl. II. fig. 12.

EMPAL. Husk 2 valves, inclosing 1 floret, tapering to a point, somewhat smaller than the blossom.

BLOSS. 2 valves, tapering to a point, one Valve larger than the other.

CHIVES. Threads three; hair-like; longer than the bloss. Tips forked.

POINT. Seedbud roundish. Shafts 2; reflected, woolly. Summits set lengthways with stiff hairs.

S. VESS. The Blossom adheres to the seed without opening.

SEED. Single; cylindrical, but tapering towards each end.

ESS. CHAR. Empal. 2 valves, containing 1 floret; somewhat smaller than the blossom. Summits longitudinally rough with hairs. *LINN.*

Empal. 2 equal, pointed valves, containing 1 floret. Bloss. 2 unequal valves smaller than the empal. Summits feathered.

HUDS. *ST.*

Obs. The *A. capillaris* has only one petal, and therefore ought rather to be considered as a species of *Alopecurus*. *Scop.*

This is an artificial genus. *A. spicaveriti*, *interrupta*, *miliacea*, and *bromoides*, have the structure of *Bromus*; *canina* and *arundinacea* of *Avena*. The last *Hall.* *Scop.* and *Wigg.* have referred to *Arundo*, but not to mention the bent awn, the hairiness at the base of the bloss. is much less than in several of the species of *Avena*. *ST.*

* With Awns.

* The *A. stolonifera*, *alba*, and *pumila* are sometimes awned. *ST.*

filky

AGRO'STIS *spicaven'ti*.—Awn straight, stiff, very long, fixed to the outward petal. Panicle expanding. LINN. Awn inferted just below the point of the petal. ST.

Fl. dan. 853.—(*H. ox.* viii. 5. row. 2. 3. ST.) *J. B.* ii. 462.

1.—*Ger.* 5. 2, repr. in *C. B. th.* 35, &c. is the *Aira cæsp.* though *C. B.*'s descr. is undoubtedly that of the *Agrost. Spicav.*—Branch of the panicle, *Leers* 4. 1. *Scheuch* 3. 10. (*Mont.* 62 is not awned.)

Haller calls it an *Avena*, but improperly, according to his own definition of that genus. See obs. on the Genus. *Emp.* valves roughish towards the points. Grows amongst corn, and is equally liable to the smutt. ST.

Sandy fields, very frequent.

A. June.—Aug.

Horses and Goats eat it. Sheep refuse it.

brown

AGRO'STIS *can'na*. Empalements elongated. Awn from the back of the petal, bowed back. Straws trailing, somewhat branched. LINN. Panicle expanding. Blossom bare, one of the valves twice as long as the other, awned. Awn from the back straightish. HUDS.*

Branch of the panicle, *Leers* 4. 2. (*Fl. dan.* 161. and *Scheuch.* 3. 9. *C.* is the *A. stolonifera* with awns.)

Panicle mostly elongated; its branches compact; of a shining purplish hue; more observable at a distance than quite close. *Empal.* coloured. Awn bristle-shaped, white, twice the length of the floret, straight, marked in the middle with a brown knot. Flowers roughish. LINN. Panicle compact; when in flower spreading, of a violet purple, shining; at length pale. *Empal.* outer valve roughish towards the point. *Bloss.* back rough. Awn from the middle of the back twisted, white, straight, as long again as the blossom, at length bent back at a brown knot. (See X in the fig.) *Bloss.* inner valve often wanting, and when present exceedingly minute. LEERS. If the awn is uniformly marked with a brown knot I have never seen the *A. canina*, and from Mr. Hudson's new character it should seem that his *canina* is a different plant from that of Leers and Linn. ST. Awns sometimes wanting. CURT. ST.

* Mr. Hudson comprehends under this new character the following as varieties.

β Root-leaves thread-shaped. Stem-leaves flat. Straw nearly upright. HUDS.

Agrostis alpina var. 1. which see.

γ Leaves bristle-shaped, stiff, sea-green. Straw upright. HUDS.

Agrostis alpina var. 2. which see.

Obs. In β however the panicle is close, the blossom hairy at the base, inner valve exceedingly minute, and the awn bent aside at an angle, ST.

Gram.

* In no genus of the Grasses are the species so ill ascertained as in the Agrostis, and no wonder, when a circumstance which I have shewn to be so inconsistent, as the absence or presence of the awn of the blossom, has been fixed upon as a primary mark of distinction. To supply this loss I would recommend that particular attention be paid to the open or closed state in which the valves of the empalement are found immediately after the shedding of the dust and the ripening of the seed, and also whether the flowers are scattered or clustered, (sparse or congesti.) St.

† AGROSTIS alpina, foliis setaceis, culmo erecto; arista recurva, basi corollæ inserta; corolla basi pilosa. St.

This and also var. 1. being transplanted into a moistish soil, became the *A. canina*. HUDS. But I cannot perceive any appearance of the brown knot described by Linn. and figured by Leers in the *A. canina*.—Haller describes them both, and also the *A. canina* as species of *AVENA*, with which genus they correspond in habit as well as in structure. ST.

Dry mountainous heaths. Hall Down near Exeter, and other places in Devonshire. HUDS.

Short awned

AGRO'STIS vinealis, Empalements coloured. Awn from the back of the blossom, almost as long as the empalement. Straws ascending. SCHREB. Awn nearly straight, from below the middle of the back. ST.

Scheuch. 3. 9. *D. E. awns much longer than described.*

Differs from the *A. canina* in having flowers twice as long. Awns in general not longer than the empalement, but sometimes they project as much as a line beyond. Flowers sometimes awnless. It varies in the breadth of its leaves, the height of the straw, and the shape of its panicle. The size of its flowers is the only circumstance that is constant. Approaches very near to the *Agrostis capillaris*. SCHREB. Panicle close, from 3 to 5 inches long. Empal. outer valve $1\frac{1}{4}$ line long, just perceptibly longer than the inner; lower part of the back brownish purple, edges and upper part yellowish brown; keels beset above with rough points. Bloss. just short of 1 line in length, beset with exceedingly minute rough points; marked with 4 ribs, and a few hairs at the base. Awn hair-like; mostly straight, white, $\frac{1}{2}$ line long, and scarcely even with the point of the blossom, but more rarely 1 line long, yellowish, and just sensibly bent aside at the base, sometimes inserted $\frac{1}{2}$ way between the middle and the base. 88. MEL'ICA. Melic.

Pl. II. fig. 16.

EMPAL. Husk 2 valves, containing 1 or 2 florets. Valves egg-shaped, concave; nearly equal.

BLOSS. Two valves. Valves egg-shaped; without awns; one concave, the other flat. Betwixt the 2 florets there is a small substance.

CHIVES. Threads 3; hairlike as long as the blossom. Tips oblong, forked at each end.

POINT. Seedbud betwixt egg and turban-shaped. Shafts 2; like bristles; expanding. Summits oblong; woolly.

S. VESS. None, the blossom incloses the seed until it ripens.

SEED. Single, egg-shaped.

Ess. CHAR. Blos. 2 valves, containing (1 or) 2 florets, with an imperfect floret betwixt them.

OBS. The rudiment of a third floret standing upon a little fruit-stalk betwixt the other two florets, gives the essential character of this

this genus. It consists of two rudiments, or florets; lopped; alternate. The husks rolled spirally inwards and pellucid. LINN.—When there is only one *floret* in each empal. this *rudiment* is found betwixt the blossom and the inner valve of the empal. WITH.

MEL'ICA *uniflora*. Panicle with few flowers. Em- wood
palements containing 2 florets, 1 with chives and point-
als, the other without either. RETZIUS *obs. i. n. 9.* ST.—
Valves of the empalement pointed. ST.—Petals not
fringed. Panicle nodding; branches pointing one way.
Empalement containing 1 floret. HUDS.

H. ox. viii. 7. 49.—MR. WOODWARD. ST.—Lob. *adv. alt.* 465.

i. cop. in J. B. ii. 434, and Park 1151. 3.

Straw thread-like, (slender ST.) 3, (4) square, smooth.
Sheaths of the leaves hairy at the brim. Panicle, lower fruit-stalks 2,
(sometimes 1, or 3,) one of them shorter, generally bearing 1
flower; the upper ones single, (or 2 together. ST.) Empal. outer
(inner) valve larger, egg-shaped, (oblong) hollow, (with 5 ribs;) the inner (outer) spear-shaped, with 3 ribs. Floret with chives and
pointals sitting; outer valve embracing the inner; edges of the inner
membranaceous, reflected, (folded inwards); the barren one of 2
valves. Often grows along with the *nutans*, but truly distinct. (In
this part of England we have not the *nutans*.) In more than a thou-
sand specimens there was not 1 panicle truly simple, or a single
empal. that contained 2 perfect florets, and being cultivated in a
garden for 3 years, it remained unchanged. RETZ. and ST.—Sheaths
of the leaves pubescent, with the points of the hairs directed down-
wards, but not rough to the hand passed upwards. Panicle slender,
with a gentle slanting curvature. Fruit-stalks straight. Flowers upright.
Bloss. gristly, of a pale greenish tinge, about the length of the inner
valve of the empalement; valves oblong, blunt; the outer smooth, not
glossy, with 7 obsolete ribs at unequal distances; the inner nicked,
and pubescent at the end, with 2 stiff ribs. Little spike of neutral
florets, inversely egg-shaped, between the blossom and the inner
valve of the empalement, together with its fruit-stalk as long as the
blossom, composed of the rudiments of 3 and even 4 florets, each
consisting of 2 membranaceous valves similar in shape to those of the
perfect floret; each supported on a fruit-stalk of its own, rising
from the base of the inner valve of the last rudiment; and each as
small again as the floret below it. No chives or pointals in any of
them. Conjectured it to be a var. of the *nutans*, and called it *M.*
nutans uniflora. Described by Ray *syn. p. 403. n. 6.* and possibly by
Picheuch. *p. 173. n. 2.*—Its bellying valves, the gristly texture of its
blossom, its ribbed empalement, and its habit, combine to point

out an affinity between our 2 species and the *Milium effusum*. ST. May 18. 74. and Aug. 10. 76.—*Empal. valves* brown, with a tinge of purple; *outer* narrower, egg-spear-shaped, just shorter than the blossom; *inner* oblong, generally longer than the blossom. *Bloss. valves* oblong, cartilaginous; *outer* smooth, marked on the outside with 6 ribs, the middle ones but just perceptible; *inner* nearly as long as the outer; lateral ribs pubescent.—*Habit* very different from that of the *nutans*. ST.—*Empal. outer valve* a size smaller than the inner valve. *Panicle* after flowering nearly upright. WITH.

Begins to flower the first week in June, and generally continuing during the whole of the summer. CURT.

marsh *β. palustris.*—Panicle spreading. Little spikes with generally 3 florets. Leaves rough underneath. LINN.

(H. ox.

* The grass known by the above names to the London seedsmen and experimental farmer, is generally believed to be the *Poa trivialis*, as I am informed by that excellent botanist the author of the *Flora londinensis*. It was brought from America by Mr. Wych, of the Society of Arts, in 1763, and highly recommended in the *Mus. russ.* iv. p. 44, as affording a remarkably fine sweet scented hay. The facility with which it may be cultivated, by means of the numerous suckers which it throws out from the lower joints, and the great rapidity with which these again propagate themselves, induce us to hope that it may become permanently naturalized, and expel at length from our meadows and pastures that enormous heap of useless weeds with which they are at present unprofitably encumbered.—Not having had an opportunity of examining it, I shall subjoin the following account of it from Haller. ST.

fowl *Poa stolonifera.* Little spikes containing 3 florets. Florets somewhat woolly at the base. HALLER.

Mus. russ. v. 1. 4.

Approaches very near to the *P. angustif.* but differs in its *Flowers* being more distinct, and its *Florets* being woolly at the base. Straw knee-jointed, throwing out leaves from each knot; upright above, 2 or 3 feet high. Leaves smooth, less than a line in width. Panicle contracted. Flowers crowded, tapering to a point, green at the end, of a purplish chestnut. HALL. *app. to Scheuch.* p. 93. n. 48.

(*H. ox.* iii. 6. 27, from the florets figured on the side, as well as its habit, appears to be rather an *Agrostis*.—*Fl. dan.* 750, edges of the blossom fringed, and the 2 upper florets on long fruit-stalks.)

Empal. valves as long as the blossom, rough on the back. Florets 2 or 3 in each empalement; one floret sitting; the other on short fruit-stalks, which are very rough. Upper leaf sheathing the straw and nearly as long as the panicle. If the third floret was not sometimes found, the student would be led to search for it in the genus *Aira*. WITH.—Florets sometimes only 3. SCHEUCH.—*Poa trivialis palustris*. HUDS. (Not *P. palustris* Gmel. tub. for his hath smooth leaves.)

Watery places amongst reeds and the *Poa aquatica*. June.
γ setacea.—Panicle spreading. Little spikes with 3 florets; pubescent. Root-leaves bristle-shaped. *Poa trivialis setacea*. HUDS.

P O' A angustifolia. Panicle spreading. Florets 4 in each little spike; woolly. Straw cylindrical, upright. LINN.—Panicle nearly upright. Little spikes on fruit-stalks; egg-shaped. Fruit-stalks straddling. Florets hairy at the base. Leaves pointed HUDS.

H. ox. viii. 5. 19.—Panicle, &c. Leers 6. 3.—A branch of it, Scheuch 3. 17. B.

Florets when ripe often woolly, and when separated from the empalement adhering together. LINN.

WAR. β. Florets 2 and often 3. SCHEUCH. ——— *Poa angustifolia nemoralis*. HUDS.—*Poa nemoralis*. LINN. which see.

Woods and hedges. [In Hertfordshire Mr. WOODWARD.]

P. June. July.

Horses, Cows, Sheep, Goats, and Swine eat it.

P O' A pratensis. Panicle spreading. Little spikes smooth stalked smooth; with 5 florets. Straw cylindrical, upright. LINN.—Panicle spreading. Little spikes with generally 5 florets. Straw upright, smooth. Leaf-scales blunt. CURT.—Panicle branched. Little spikes egg-shaped, crowded. Florets woolly at the base. Leaves blunt. Straw not quite upright, sending out suckers. HUDS.

Curt ii. 14.—*C. B.* 28.—*H. ox.* viii. 5. 18.—*Stilling.* 6.—Panicle, &c. Leers 6. 4.—Branch of it, Scheuch. 3. 17. A. (*J. B.* ii. 461. 2, seems rather *P. nemoralis*, and *Dod.* 560. 1, and its copies to be *P. annua*.)

Florets generally 2, and sometimes 3. SCHEUCH.—Root creeping. Straw firm, upright, scarce perceptibly scored. Florets sometimes only two. CURT.

On walls, dry banks, and not unfrequently in meadows, and begins to flower about the 3d week in May. CURT. — June. July. HUDS.

alpine β . *Poa pratensis alpina*. HUDS.—Panicle spreading, very much branched. Little spikes heart-shaped, with 6 florets. LINN.

Scheuch. pr. 3. 4.

Florets from 2 to 5. SCHEUCH.—*Poa alpina*. LINN. Mountains.

viviparous γ *Poa pratensis vivipara*. HUDS.—*Poa alpina vivipara*. LINN.

On Snowdon.

P. June. July.

Horses, Cows, Sheep, and Swine eat it.—Goats are not fond of it.

annual P O' A *an'nua*. Panicle spreading horizontally. Little spikes blunt. Straw oblique, compressed. LINN.—Panicle expanding; pointing one way; branches in pairs. Straw oblique, two edged. HUDS.—Branches of the panicle sometimes horizontal, sometimes slanting. CURT.—Florets without wool at the base. ST.

Curt. 1. 2.—Stillingf. 7.—H. ox. viii. 5. 21.—Mus. rust. iv. 2. 8.—Dod. 560. 1, repr. in Lob. obs. 9. 1, Ger. em. 2. 1; and cop. by Park. 1156. 4, the uppermost on the left hand.—C. B. th. 31, cop. in J. B. ii. 465. 1.—Ger. em. 3. 2. cop. in Park. 1156. 4, the lowermost on the left hand, and J. B. ib. 2. *—Panicle, &c. Leers 6. 1.—Branch of the panicle, Scheuch. 3. 17. E.—Park. 1156, the lowermost on the right hand.

This is distinguished from the *P. trivialis* by its general habit, its spreading panicle, its compressed reclining straws, and by its greater softness and delicacy; from the *P. pratensis* and *angustifolia* by the branches proceeding from the stalk in pairs, by its size, &c. POLLICH.—Florets green, sometimes reddish: 4 or 5 in each em. pal. SCOP.—Bloss. keel between hairy and pubescent. ST.—Branches of the panicle in the middle often in threes, at the top solitary. CURT.—Little spikes larger than those of the *P. pratensis*. Mr. DICKENSON.

Suffolk grass.

Pastures, paths, gravel walks, and the borders of fields.

A. April.—Sept.

Horses, Cows, Sheep, Goats, and Swine eat it.

sea P O' A *marit'ima*. Panicle compact, branched, pointing one way. Branches in pairs. Little spikes oblong. Florets blunt. Leaves sharp; edges rolled in. Straw cylindrical, slanting. HUDS.—(In my specimens, branches 5 from a knot. ST.)

(Fl.

(*Fl. dan.* 251, is referred to by *Lighth.* and *Roth*, but *Hudson* omits it, neither does it accord with my specimens.—*C. B. th.* 130, seems the same plant with *Fl. dan.* 251, tending towards decay.)

Root perennial, creeping. *Straw* from 6 to 12 inches high; smooth. *Leaves* on leaf-stalks, sword-shaped, expanding, tapering to a point; bare. *Panicle* oblong, upright. Lower *panicle* branches sometimes a little expanding. *Florets* from 3 to 7 or 8; bluntish, smooth. *HUDS.*—*Leaves* rolled in so as to resemble rushes. *Panicle* purplish, but little spreading; composed of narrow, oblong spiculæ, not sawned. *RAY.*—Very nearly related to *Festuca fluitans*. Perhaps the sea water may occasion the difference. *LIGHTF. ST.*—The *panicle* when in flower bears some resemblance to that of the *F. fluitans*, but I cannot by any means believe the sea water to have effected such changes; besides it is different in habit and structure, and belongs rather to the *Poas*. *ROTH. beytr. p.* 8.—But the *F. fluitans* has the structure of *Poa*. Cultivation alone can ascertain the point. *ST.*—(*Poa arenaria*, *RETZ. scand.* but he says, “*Panicle* somewhat spreading, little spikes sitting.”) (*Gram. exile durivusc. marit.* *SCHEUCH.* 272 is a quite different plant.) *ST.*

Sea coast, frequent. [*Salt Marshes, Norf. Mr. WOODWARD.*] P. June. July.

PO'A rig'ida. *Panicle* spear-shaped; somewhat hard branched; pointing one way. Branches alternate, pointing one way.—

Curt. ii. 24.—*Vaill.* 18. 4.—*H. ox.* viii. 2. 9.—*Barr.* 49.—*Ger.* 4. 3.—*C. B. th.* 32. 1, cop. in *Park.* 1157.—Branch of the *panicle*, *Scheuch.* 6, 2, and 3.—*Floret, Mont.* 11.

Straw very short and stiff. *Panicle* spear-shaped, inflexible; doubly compound; its branches alternate. Little spikes alternate, on inflexible fruit-stalks, which are shorter than the spikes they support; strap-shaped, sharp, about 8 florets in each. *Florets* sharp and skinny at the point. *Empal.* keeled. *LINN.*—*Florets* from 3 to 9 in each little spike. *HUDS.*

Walls, roofs, sandy and stony places, frequent. A. July.

PO'A compressa. *Panicle* compact; pointing one creeping way. *Straw* oblique, compressed. *LINN.*—*Panicle* upright. *Straw* ascending. *HUDS.*

Fl. dan. 742.—*Vaill.* 18. 5.—*Panicle*, &c. *Leers* 5. 4, branches of the *panicle* horizontally expanding, instead of crowded, as in the specific character.—Little spikes, *Mont.* 10.

Florets generally 6 in each empalement. *LINN.*—*Panicle* more or less scattered. Little spikes 2 to 4 lines long. *SCHEUCH.*—Root somewhat

what creeping. *Little spikes* almost sitting, near together. *Florets* somewhat woolly at the base. LEERS. ST.—A very small tuft of wool at the base of the *lowermost floret*, which may be drawn out to nearly the length of the floret, that of the upper florets scarcely more than a hair or two. ST.—*Little spikes* much larger than those of the *Poa pratensis*. MR. DICKENSON.

Walls, house tops, and other very dry places. P. June. July.
Horses, Cows, Sheep, and Goats eat it.

wood PO'A *nemoralis*. Panicle taper. Little spikes sharp pointed, rough, 2 florets in each. Straw bent inwards.—
Scheuch. pr. 2. 2.—Fl. dan. 749.—Scheuch. it. ii. 18. 3.—(J. B. ii. 461. 2.)—Panicle, &c. Leers 5. 3.—Little spike, Mont. 12.
Florets sometimes 3. SCHEUCH.—from 2 to 5. MR. HOLLEFEAR.
Poa angustifolia nemoralis. HUDS.—A distinct species. MR. WOODWARD.

Woods and shady places. [Plentiful in the North. MR. WOODWARD.]. A. June.

bulbous PO'A *bulbosa*. Panicle somewhat expanding; pointing one way. Little spikes of 4 florets. LINN.—Little spikes egg-shaped. Florets smoothish; sharp. Straw upright, bulbous at bottom. HUDS.

γ Vaill. 17. 8.

Panicle branched, the branches angular, roughish. Little spikes egg-shaped, sharp; with 3, 4, or 5 florets, a little hairy at the base. HUDS.

Florets not unfrequently 5. SCHEUCH.

viviparous β Barr. 703, 1 and 2.—C. B. th. 32. 2, cop. in Park. 1158. 1.—

H. ox. viii. 2. row 2. 6.—*Pluk. 32. 7.*—*Scheuch 6. 5, two little spikes.—C. B. pr. 18. 2, repr. in th. 130, ill done if the plant, though descr. is that of P. loliacea.—C. B. th. 130. is P. maritima.*

Spike mostly pointing one way; sometimes branched at the base. *Branches* upright; very short. *Little spikes* egg-shaped. *Florets* from 3 to 10; smooth. *Huds.*

Triticum maritimum, which see.

* In the London Botanic Garden has been cultivated for some years past, a species which the owner has very happily named *Poa retrofracta*, from several of the branches being as it were broken back. My specimens have induced me to suspect it to be the *Poa distans*, expanded in all its parts by cultivation, or a richer soil; but I flatter myself Mr. Curtis will not be long before he favours the public with a full account of what he may have observed concerning this curious species, in an early number of his excellent Flora. *ST.*

90. BRI'ZA. Quake-grafs.

Pl. II. fig. 17.

EMPAL. *Husk* 2 valves, expanding; containing feveral florets pointing from two opposite lines, collected into a heart-shaped fpike. *Valves* blunt, heart-shaped, concave, equal.

BLOSS. Two valves. *Lower valve* the fize and figure of the empalement. *Superior valve* fmall, flat, roundifh, clofing the hollow of the other.

CHIVES. *Threads* 3; hairlike. *Tips* oblong.

POINT. *Seedbud* roundifh. *Shafts* 2; hairlike; bent back. *Summits* downy.

S. VESS. The bloffom unchanged, contains the feed until it is ripe.

SEED. Single; very fmall; roundifh, compressed.

ESS. CHAR. *Empal.* 2 valves, containing feveral florets. *Little fpiques* 2 rowed. *Valves* heart-shaped, blunt; inner valve very fmall.

fmall BRI'ZA *mi'nor*. Little-fpiques triangular. *Empal.* longer than the florets.—

H. ox. viii. 6. 47. corresponds with our plant and the Linnæan character, though not quoted by Linn.—*Barr.* 16.—*Park.* 1165. 5. (*C. B.* pr. 4. though referred to by Linn. is only a fmaller fpecimen of the *B. media*, which fee.)

In pastures.

A. Linn. P. Hudf. July.

middle BRI'ZA *me'dia*. Little fpiques egg-shaped. *Empal.* fhorter than the florets.—

Fl. dan. 258.—*H. ox.* viii. 6. 45.—*Trag.* 670.—*Barr.* 15. 2.—*Ger. em.* 86. 2. repr. by *C. B.* 22. 1.—*Park.* 1165. 2. 6.—*J. B.* ii. 469. 2. 6.—*Branch of the panicle*, *Leers* 7. 2.—*Scheuch.* 4. 8.—*Floret*, *Mont.* 39. (*Barr.* 16. is the minor.) *Dwarf fpecimens*, *C. B.* th. 25. 1. cop. in *H. ox.* viii. 6. 46.—*J. B.* ii. 469. 2.—*Branch of the panicle*, *Scheuch.* 4. 9.

Straw with 3 joints near the root. *Panicle* with 2 little fpiques upon each branch. *Husks* egg-shaped, keeled. *Smaller petal* egg-shaped, cloven, plaited. *Tips* reddifh brown; yellowifh at the ends. *Dust* yellow. *Seed-bud* cloven at the end. *Shafts* longer than the empalement. *Honey-cup* fmall, valvular, contiguous to the feedbud. *Scor.*—*Smaller petal* flightly notched at the end; the plaits, before flowering, embracing and inclofing the tips.

Florets

Florets from 7 to 9 in each little spike. WITH.

Cow-quakes. Ladies-hair.

Fields and pastures.

P. July.

Cows, Sheep, and Goats eat it.

If a seed is carefully dissected in a microscope, with a fine lancet, the young plant will be found with its root and leaves pretty perfectly formed.

92. DAC'TYLIS. Cocks-foot

Pl. II. fig. 13.

EMPAL. *Husks* compressed; sharp; pointing one way. One *valve* longer than the blossom, keeled; the other shorter.

BLOSS. *Husk*; compressed; oblong; sharp. The longest *valve* keeled; lying within the longest valve of the empalement.

CHIVES. *Threads* 3; hair-like; as long as the blossom. *Tips* forked at each end.

POINT. *Seedbud* turban-shaped. *Shafts* 2; hair-like; expanding, woolly. *Summits* simple.

ES. VESS. None. The blossom incloses the seed until it is ripe.

SEEDS Solitary; naked; depressed on one side, convex on the other.

ESS. CHAR. *Empal.* 2 *valves*, compressed, 1 *valve* larger, and keeled.

OBS. In some species 1 floret in each empalement; in others 3, 4, or more.

DAC'TYLIS *cynosuroides*. Spikes numerous, rough, smooth scattered, pointing one way. LINN. Flowers in spikes. Empalement containing 1 floret. Shaft longer than the chives. ST. *

Linn. the Son, fasc. i. 9.

Straw 2 feet high; like that of an Arundo. Leaves 6 upon each straw; broad, very smooth and longer than the straw; rough at the edges, bent inwards; sea-green on the upper surface. Spikes 6 or more in a row; diverging; chaffy. Florets tiled; rough on the hinder part. Emp. rough along the keel, sharp-pointed, sitting; in 1 row; 1 floret in each, and longer than the floret. Pointals long; woolly.

* Floribus spicatis, monogynis, calyce unifloro. ST.

woolly. LINN.—The structure of the *pointal* marks an affinity with the *Nardus*, which is confirmed by its habit. ST.

Marshes in Essex, and other parts of the sea-coast, very common. RAY. P. July. Aug.

rough DAC'TYLIS *glomera'ta*. Panicle crowded, pointing one way.—

Schreb. 8. 2.—*Fl. dan.* 743.—*H. ox.* viii. 6. 38.—*Bauh. pr.* 9.

i. *repr. in th.* 45. 1.—*Mus. rust.* v. 1. 5.—*Park.* 1182. 5. J. B.

ii. 467. 1.—*Barr.* 26. 1. 2.—Panicle, &c. *Leers* 3. 3.—*Floret*, *Scheuch.* 6. 15. (*Park.* 1160. 7. *some other plant.*)

Empal. 4 florets in each. Bunches of flowers but little expanded. Little spikes compressed; in bundles, sitting; diverging when in flower. *Tips* reddish. LINN.—It is not a *Festuca*. It is sometimes viviparous. POLLICH.—*Empal.* containing 2, 3, sometimes 4 florets. LEERS—*Bloss.* no long hairs at the base, as in the *Phalar. arund.* ST.—*Straw* with 5 joints and 3 leaves. *Sheaths* of the leaves 2 edged, and woolly. *Petals* cloven, a little awn from the cleft of the larger petal. SCOP.—*Florets* in rainy seasons, sometimes viviparous. MR. WOODWARD.

Thrives in the shade, and under the drippings of large trees. See a farther account of it in *Mus. rust.* v. p. 45. and iv. p. 186. *Orchard-grass.*

Very common.

P. June. Aug.

Horses, Sheep, and Goats eat it. Cows refuse it.

93. CYNOSU'RUS. Dogs-tail.

Pl. II. fig. 28.

EMPAL. Partial *Fence* large; lateral; generally consisting of 3 leaves. *Husk* 2 valves containing several florets. *Valves* strap-shaped; tapering; equal.

BLOSS. Two valves. *Outer valve* concave, longer than the other. *Inner valve* flat, awnless.

CHIVES. Threads 3; hair-like. *Tips* oblong.

POINT. *Seedbud* turban-shaped. *Shafts* 2; woolly; reflected. *Summits* simple.

S. VESS. None. The blossom closely wrapping round the seed, and not opening.

SEED. Single; oblong, tapering at each end.

ESS. CHAR. *Empal.* 2 valves, containing several florets.

Proper receptacle leafy; fixed to the side. LINN.—*Empal.*

2 valves. *Bloss.* 2 valves; fence winged; composed of scales pointing from 2 opposite lines. ST.

OBS. In most of the species the Fence is like a comb. LINN.—These fences, which connect this genus to the *Hordeum* and *Elymus*,

mus, appear as if abortive little spikes, analogous to the rudiment (*corpusculum*) of the *Melica*, and the *neutral florets* in the *Centaurea*, &c. and like those do not seem to be of any importance to the fertility or life of the plant. Beauty, and even mere variety, I am well persuaded, have not been forgotten in the creation of organised beings. ST.*

CYNOSU'RUS *criflatus* Floral leaves with winged *crested* clefts.—

Schreb. 8. 1.—Leers 7. 4. Spike, &c.—Gisek. 54.—Fl. dan. 238.

—Barr. 27. 2.—Muf. rust. iv. 2. 2.—H. ox. viii. 4. row.

3. 6.—C. B. th. 43. cop. in Park. 1160. 3.—Anderson.—

Stillingf. 11.—J. B. ii. 468. 3.

Floral leaves deeply divided into awl-shaped segments. Husks generally containing 3 florets. Smaller valve of the blos. ending in 2 points; larger valve ending in a short awn. Florets all facing one way. WITH.

VAR. β. Spike 4 cornered. Ray Syn. 399.

Pastures, common.

P. July. Aug.

CYNOSU'RUS *echinatus*. Floral leaves winged with *rough*. awned chaff.—

C. B. th. 59. cop. in Park. 1168. 6.—H. ox. viii. 4. 13.—Barr.

123. 2.—J. B. ii. 474. 1.—Scheuch. 2. 8. B. D. florets.—

Mont. 24. floret. (C. B. pr. 16. 2. is *Cenchrus capital*.)

Bunch congregated, pointing one way. Floral leaves only on the outside of the flowers, alternately winged, the rays ending in awns; 1 floret in each. Husk of 2 valves, containing 2 florets, membranaceous, very fine at the point. Blos. 2 valves, with an awn upon the outer point. Shaft cloven. LINN.

Sandy soil.

A. July.

CYNOSU'RUS *cæruleus*. Floral leaves entire.— *blue* *Sesleria cærulea*, SCOP. which see.

* In the *C. cristatus*, *echinatus*, *aureus*, there are generally only 2 florets in an empalement; in the *cærul.* and *aureus*, the little spikes are inserted on different sides of the spike; and in the *durus*, *coracanus*, *ægyptius* and *indicus*, the receptacle cannot be said to be leafy, as in these the fence is wanting. The *durus* is truly a *Poa*, the *Poa dura*, SCOP. and the 3 others have the habit of *Panicum*, with the structure of *Poa*, forming a natural assemblage of their own. The *Cynosurus* therefore as a natural genus seems to be confined within the following limits, *cristatus*, *echinatus*, and *aureus*. ST.

94. FESTU'CA. Fescue.

Pl. II. fig. 19.

EMPAL. *Husk* 2 valves; upright; containing several florets collected into a slender spike. *Valves* awl-shaped, tapering. *Inferior valve* the smallest.

BLOSS. Two valves. *Inferior valve* the figure of the empalement but larger; rather cylindrical but tapering, and ending in a sharp point.

CHIVES. *Threads* 3; hair-like; shorter than the blossom. *Tips* oblong.

POINT. *Seedbud* turban-shaped. *Shafts* 2, short, reflected. *Summits* simple.

S. VESS. The blossom shuts close upon the seed, and does not open again.

SEED. Single; slender; oblong; very sharp pointed at each end, with a furrow running lengthways.

ESS. CHAR. *Empal.* 2 valves. *Little spike* oblong; almost cylindrical. *Husks* tapering to a point.

OBS. Scopoli says, that he cannot discover any mark of distinction between *Festuca*, *Bromus*, and *Triticum*. *Bromus* and *Triticum* are indeed only one genus. *Bromus* is only a paniced *Triticum*. In *Festuca* the outer valve of the blossom gradually narrows into the awn, whereas in the *Bromus* or *Triticum*, the awn is inserted as it were, below the point of the valve, or the edge of the valve swells out into a thin membrane on each side of the base of the awn. In *Festuca*, the awn is an extension of the whole valve, in *Bromus* and *Triticum*, only of the keel or middle rib, as in *Avena*. ST.

* *Panicle* pointing one way.

barren FESTU'CA *bromoides*. Panicle pointing one way. Little spikes upright, smooth. Empal. valves, 1 entire, the other tapering to a point.—

It differs from the *F. myurus* by the panicle somewhat resembling a spike, and the husks not being fringed. It is like the *F. ovina*, but has broader leaves. LINN.—*Panicle* broader and shorter than in the *F. myurus*, the *Spiculæ* are also larger and broader. *Straw* with 3 or 4 joints. RAY.

Gram. bromoides panicula heteromalla, &c. Scheuch. 290. t. 6. f. 10. is the plant of our herbariums, and I believe that of Linn. (and not *Gram. paniculat. bromoides*, &c. Scheuch. 297. as Linn.) for in Scheuch.

Scheuch. plant 1 of the valves of the empalement ends in an awn, whereas in Linnaeus's, it is, as in ours, simply tapering to a point.

Pluk. 33. 10.—Scheuch. 6. 14, a little spike.

Walls and dry sandy places.

A. June. July.

FESTU'CA *ovi'na*. Panicle pointing one way; *sheeps* compact, awned. Straw 4 cornered, almost naked. Leaves bristle-shaped.—

Pluk. 34. 2.—Mus. rust. iv. 2. 4.—Anderson.—Leers 8, 3 and 4 panicles.—Scheuch. 6. 8.—Mont. 5.—H. ox. 8. 3. 13, little spikes sitting and spear-shaped.

Very small; scarcely exceeding 6 inches in height. Mr. DICKENSON.—Lower little spikes on fruit-stalks: 4 florets in each, with the rudiment of a fifth.

α. aristata. Leers 8. 3.—Scheuch. 6. 6.—Mont. 5.

awned

Little spikes pubescent. Florets awned, pubescent, often fringed.

LEERS. ST.

β. mutica. Stillingf. 8.—Leers 8. 4. † —Scheuch. 6. 6.

awnless

Panicle narrower. Little spikes smaller. Florets without awns.

LEERS. ST.

γ. vivipara. Scheuch. pr. 1. 2; cop. in Scheuch (J. Jac.) it. vi. viviparous p. 458. f. 20.—Ray 22. 1.—Barr. 272.

Mountains in Wales, Yorkshire, and Westmoreland.

Florets 3 to 6 in each little spike: they are generally tapering to a point, or an awn-like point, but very seldom properly awned. HUDS.

Dry gravelly soil. [Malvern Hill and Chace. Mr. BALLARD. On the summits of Skiddow and Ingleborough. Mr. WOODW.]

P. June. July.

It flourishes best in a dry sandy soil: Cows, Horses, and Goats will eat it, but it is the favourite food of Sheep: they prefer it before all other grasses, and are said soonest to grow fat upon it; for though small, it is succulent. The Tartars who lead a wandering life, tending their flocks and herds, always choose those spots where this grass abounds. Is not the superiority of the Spanish and English wool owing to the abundance of this grass in the hilly pastures where the sheep are kept?

FESTU'CA *ru'bra*. Panicle pointing one way; *purple* rough. Little spikes with 6 florets, awned. Floret at the end awnless. Straw semi-cylindrical.—

Scheuch. 6. 9, branch of the panicle, little spikes open.—Leers 8. 1, branch of the panicle, little spikes closed.—Stillingf. 9, ill done.—(Andersf. more like a Poa.)

It is distinguished from the *F. ovina* by its size, its red colour when ripe, its broader leaves, and its nearly semi-cylindrical straw.

TRIANDRIA DIGYNIA.

It differs from the *F. duriuscula* in its broader and flat stem-leaves, in its little spikes being somewhat larger, and its panicle less compressed. The bristle-shaped root-leaves, and the very short awns distinguish it from the *F. myurus*. POLlich.—Leaves on the upper side covered with a soft woolliness barely perceptible to the naked eye. Straw smooth, but within the panicle rough: green, but when the seeds are ripe, red. LINN.—Panicle branches generally single, but frequently in pairs. SCHEUCH.—Taller than the *F. duriuscula*, and distinguished from it by broader leaves, and little spikes with awns. MR. DICKENSON.

High heaths and dry barren pastures.

P. July.

red FESTU'CA *amethys'tina*. Panicle waved. Little spikes nearly awnless, bent inwards, pointing one way. Leaves bristle-shaped.—

Linn. mentions this as being a native of England. ST.—Haller considers it as only a variety of the *F. ovina*. P.

hard FESTU'CA *durius'cula*. Panicle pointing one way; oblong. Little spikes oblong, smooth, 6 florets in each. Leaves bristle-shaped. LINN.—Panicle branched; branches mostly in pairs. Little spikes awned. Root-leaves bristle-shaped. HUDS.

Ray 19. 1.—Leers 8. 2, branch of the panicle.—Lob. obs. 9. 2.—(*H. ox. viii. 2. row 3. 11. is referred by Linn. to the F. dumetorum.*—In *H. ox. viii. 3. 13*, the little spikes are sitting.)—Fl. dan. 848, cannot be the plant, as the florets are pubescent.

It resembles the *F. dumetorum* in its thread-shaped channelled root-leaves, and its flat grass-like stem-leaves, but differs in having its husks smooth. LINN.—Stem and root-leaves bristle-shaped. Little spikes small, egg-shaped; with very short awns. Panicle more contracted distinguishes it from the *F. rubra*. Its cylindrical straw, and the constant presence of the very short awns, from the *F. ovina*. POLlich.—It varies in its root-leaves being bristle-shaped and thread-shaped, and rough: in its stem-leaves being flat and channelled, and bare: in its little spikes containing from 6 to 10 florets, and pubescent. HUDS.—Hardly to be distinguished from the *F. ovina*, but by being taller. It is about 12 inches high. MR. DICKENSON.—Empal. smooth; one valve twice as large as the other.

Dry pastures.

P. June.

pubescent FESTU'CA *dumeto'rum*. Panicle spike-like, pubescent. Leaves thread-shaped.

Fl. dan. 700.—*H. ox. viii. 2*, figure the last?

Straw

Straw 12 or 18 inches high, thread-shaped, cylindrical, with 2 swelled joints. *Root-leaves* 1 foot long; roundish, scarcely 2 edged. *Stem-leaves* shorter, channelled. *Panicle* small, spike-like. *Little spikes* 10 or 12, oblong, pubescent, greyish; the upper ones sitting, solitary: the lower ones in pairs, on fruit-stalks. *Husks* terminating in a minute awn. Figured in *Moris. hist.* 3. § 8. t. 2. fig. the last. Bulbs often grow within the sheath of the straw. Very nearly allied to the *F. duriuscula*. LINN.

Festuca duriuscula dumetorum. HUDS. ST.—*Gram. prat. paniculat. elat.* Sc. var. *locust. villosis*. SCHEUCH. p. 290.

Woods and hedges.

P. June. July,

FESTU'CA *myu'rus*. Panicle spike-like. Empale- wall
ments very minute, awnless. Florets rough; awns long.
LINN.—Panicle pointing one way; strap-shaped, rough;
branches mostly solitary, contiguous. Husk with 1
valve extremely short. HUDS.

Leers 3. 5, panicle.—*Barr.* 99. 1.—*H. ox.* viii. 7. 43.—*Scheuch.*

6. 12, branch of the panicle.—*Ger. em.* 29. * 2, cop. in *Park.*

1162. 8. (*Gouan. hort.* 48. 1, and *Barr.* 100, different plants.)

The awn grows from beneath the point. HALL.—Florets 5 in
each little spike. Panicle branched, but not spreading: very long,
slender, and bending.

Gram. festuaceum myurum elat. Sc. *Scheuch.* 293. t. 6. f. 11, and
Barr. 99. 2; cop. in *Pet.* ii. *gram. ital.* 5. 10, are the plant of our herba-
riums, as it appears to be that of *Pollich*, (and not *Gram. fest. myur. minor.*
Sc. *Scheuch.* 294, as *Linn.*) ST.

Capons-tail-grass.—Walls and dry barren places.

A. June.

FESTU'CA *glabra*. Panicle branched, upright, smooth
compact. Little spikes awl-shaped, of 3 florets, awned,
smooth. LIGHTF.—(Nearly allied to the next species, if not
the same. HUDS.)

See also a description in *Lightf. Fl. Scot.* p. 1085.

Found at Ardbigland in Galloway, by Mr. Lightfoot. P. July.

FESTU'CA *cam'brica*. Panicle pointing one way, Welsh
oblong, upright, branched. Little spikes awned, smooth.
Leaves flat, naked. HUDS.

Root fibrous. *Straw* near a foot high; slanting, cylindrical,
leafy, smooth; with 2 or 3 joints. *Root-leaves* nearly upright;
sword-shaped, sharpish, channelled. *Stem-leaves* 2 or 3; on leaf-
stalks; sharpish, flat, fibrous. *Leaf-stalk* cylindrical, sheathing,
tored, hairy. *Props* membranaceous, sheathing, blunt. Panicle

rather compact, branched at the bottom. *Little spikes* on fruit-stalks, about 6 florets in each, egg-shaped. *Awns* short. *Fruit-stalks* nearly as long as the spiculæ. Nearly allied to the *F. duriuscula*. HUDS.

On the highest hills about Llanberis, plentifully. P. July. Aug.

tall FESTU'CA *ela'tior*. Panicle pointing one way; upright. Little spikes mostly awned; the outer ones cylindrical. LINN.—Branches in pairs. Little spikes egg-shaped. Leaves flat. HUDS.

Schreb. 2.—Leers 8. 6.—Schench. 5. 18, a branch of the panicle.—

H. ox. viii. 2. 15.

Agrees in many respects with the *F. fluitans pratensis*. Its claim to a distinct species may be justly doubted. HUDS.

α. Broad-leaved. β. Narrow-leaved. Buxb. v. app. 16.

Gram. arundinac. locust. &c. SCHEUCH. 266. (as in Linn. syst. veg. but improperly omitted in Syst. plant. a Reich. ST.)

Meadows, pastures, and sides of hedges. P. June. July.

It makes an excellent pasture, but requires a rich soil. LINN.

Horses, Cows, Sheep, and Goats eat it.

flote FESTU'CA *flu'tans*. Panicle branched, upright. Little spikes nearly fitting, cylindrical, awnless. LINN.—Panicle pointing one way; its branches solitary and in pairs. Little spikes strap-shaped. Leaves flat. Straw 2 edged. Fl. dan.

common α. Curt. 1. 6.—Leers 8. 5, a portion of the panicle.—Schreb. 3. (f. 2, out of blossom.)—Fl. dan. 237.—Stillingf. 10.—H. ox. viii. 3. 16.—Ger. em. 14. 1, cop. in J. B. ii. 490.—Muf. rust. iv. 1. 6.—C. B. th. 41, cop. in Park. 1275. 8.—Schench. 4. 5, branch of the panicle.—Mont. 35, a little spike. (Buxb. iii. 54, branches of the panicle twice divided. Its habit, as also that of Barr. 7, induce me to believe it with Buxbaum to be a distinct species. —Muf. rust. iv. 2. 6, is *Poa pratensis*.)

Shafts naked below, and not feathered down to the base as in Schreber's fig. Seed crowned with 2 little horns, the remains of the shafts; sometimes affected with the disease called Ergot. CURT.—EMPAL. 2 skinny spear-shaped valves; the outer valve about half as long as the other, and less concave. They are placed at the base of a slender, cylindrical, but flattened little spike, composed generally of 10 florets. Bloss. outer valve, spear-shaped, concave, ending in a flat blunt point. Inner valve smaller, flat; the edges bent back; slightly cloven at the end into 2 sharp, but very shallow segments. CHIVES. threads very slender. Tips slightly cloven at each end. POINT: seed-bud egg-shaped, very small. Shafts expanding.

Summits

Summits beautifully fringed. SEEDS semi-cylindrical, blunt, marked with a ridge upon the flat side. Stems sending out roots from the joints. Leaves floating upon the water. Panicle very long; issuing from a long 2 edged sheath. WITH.

β. loliacea. Spiked. Little spikes alternate, sitting, flattened. HUDS. ST. Darnel

H. ox. viii. 2. 2. (a) a var. of Lolium perenne, is a good representation of it, as these plants are distinguishable only by their empalements.

F. fluitans in meadows becomes in every respect less, and the panicle is frequently changed to a simple spike. CURT. ST.

Florets 4 to 10. The seeds of *F. fluitans* sown in a garden, became this var. the first year, and the 2d year changed into the following variety. HUDS.

γ. pratensis.—*Mus. rust. iv. 2.*—*H. ox. viii. 2. 2. δ.*—*Scheuch. 4. 6, meadow branch of the panicle.*—*Park. 1146. 8, the fig. with 2 panicked straws.*

Florets blunt, but in dry situations tapering to a point. HUDS.

Gram. paniculat. elatius, paniculis, &c. SCHEUCH. 202, and also Gram. loliac. panicula, &c. SCHEUCH. 200, as Haller could not perceive any difference in the specimens of each in Scheuchzer's herbarium.

Flote grass.

Wet ditches and ponds, very common. P. June.—Sept.

The seeds are small, but very sweet and nourishing. They are collected in several parts of Germany and Poland, under the name of *Manna Seeds*, and are esteemed a delicacy in soups and gruels, upon account of their nutritious quality, and grateful flavour. When ground to meal, they make bread very little inferior to that in common use from wheat. The bran separated in preparing the meal, is given to horses that have the worms; but they must be kept from water for some hours afterwards. Geese are very fond of the seeds, and well know where to look for them. The plant affords nourishment to the *Phalæna Festuæ*.

*** Panicle equal.*

FESTU'CA *decumbens* Panicle upright. Little spikes nearly egg-shaped, awnless. Empalement larger than the florets. Straw decumbent.—

Fl. dan. 162.—*Fluk. 34. 1.*—*H. ox. viii. 1. 6.*—*Mont. 2. 1.*—

Panicle, &c. Leers 7. 5.—*Scheuch. 3. 16. A. B. C.*

Florets 3 in each empalement. Allied to the *Melica*. LINN.—

It should arrange with the *Melicas*. HALL.—Panicle simple. Empalement as long as the little spikes.

Barren moistish ground.

P. Aug.

Sheep refuse it.

FESTU'CA *pratensis*. Panicle upright. Little spikes strap-shaped, without awns. Leaves flat. HUDS. *ed. I.* Mr. WOODWARD.

TRIANDRIA DIGYNIA.

There is a var. of *F. fluitans* which I have found growing along with this, in moist meadows, but the *F. pratensis* and *fluitans* are certainly distinct species. Mr. WOODWARD.

A. July. Aug.

barren

BRO'MUS *sterilis*. Panicle open. Little spikes oblong, florets pointing 2 opposite ways. Husks tapering and awned.—

Curt.

point at the base. Corresponds, except in the length of its awns, with the descriptions of the *B. madritensis*, of which it is probably only a variety. ST.

Gram. bromoides pratense, &c. SCHEUCH. 255.—*Bromus hirsutus angustifol.* &c. HALL. 1507.—*Bromus sylvaticus* when growing in open situations. VOGLER *schediasm.* p. 4. ST.

Curt. 1. 4.—*H. ox.* viii. 7. 11.—*Leers* 11. 4, branch, &c.—*Mont.* 1, little spike.—*Dod.* 540. 2, repr. in *Lob. obs.* 20. 1, and *Ger. em.* 76. 1, and cop. in *Park.* 1148. 1.—*Ger.* 69. 1, repr. in *C. B. th.* 146.—*Math.* 1205.—*J. B.* ii. 439. 2.—*Scheuch.* 5. 14, little spike.—(*Park.* 1148. 2, seems to be the *B. tetragonum.*)

Shafts from the middle of the feed-bud. *CURT.*—Little spikes widening towards the point. *WIEG. ST.*—Panicle nodding, branched; branches in fours. *HUDS.*—(In fours and sixes. *POLLICH.* threes and fours. *WIEG. ST.*)—Fruit-stalks generally with only 1 little spike, but sometimes 2. *LEERS.*—*Empal. valves* very slender, taper, and skinny at the edges. *Bloss.* outer valve skinny at the edges, cloven, and furnished with an awn nearly twice its own length. *Inner valve* flat, fringed at the edges. *Tips* orange colour. *Florets* 6 or 7 in each little spike. *Little spikes* on very long fruit-stalks, 4, 5, or 6 issuing from the same point. *Leaves* ribbed, hairy, not very harsh; the uppermost leaf nearly as tall as the panicle. *WITH.*

Woods and hedge sides, frequent.

A. June. July.

BRO'MUS arvensis. Panicle nodding. Little spikes *corn* oblong egg-shaped.*

Fl. dan. 293.

Straw 5 inches high. Root-leaves awl-shaped, smooth, channelled, stiff. Panicle close, consisting of 8 or 10 little spikes. Little spikes almost fitting, and growing on one side of the stalk; smooth, awnless, consisting of 5 florets. The above differences possibly occasioned by the sea water, and the poverty of the soil. *LIGHTF.*

Shores of the isle of Oransey. *LIGHTF.*

A. July.

* Three distinct plants seem to have been referred to this species.

(1.) *Fl. suec. n.* 97.—*Leers n.* 84. 1. 11. f. 3.—Little spikes strap-shaped, at first egg-shaped at the base, and tapering, 3 times as long as the empalement, pubescent in the microscope. *Empalement* egg-shaped. *Awn* somewhat longer than the blossom. *ST.*

(2.) *Scheuch. p.* 262. 1. 5. f. 15.—*Pollich. n.* 113.—Little spikes strap-spear-shaped, about as long again as the empalement. *Empalement* spear-shaped. *Awn* somewhat shorter than the blossom, and almost from the very point of the valve. *ST.*

(3.) *Fl. dan. t.* 293.—*Scheuch. p.* 251. n. 2, variety without awns.—*Wieg. obs. n.* 3. t. 1. f. 3; who doubts, and, I think, with propriety, whether it be not a variety of his *B. villosus*, the *B. secalinus* α.—*Lightf. p.* 104.—Little spikes oblong egg-shaped. *Husks* smooth, tiled, blunt. *Empalement* egg-shaped. *Awn* half as long as the blossom; sometimes wanting. *ST.*—I have a specimen of this with awns of some length from an excellent botanist, but where gathered I do not know. *MR. WOODWARD.*

B R O ' M U S

tall BRO'MUS *giganteus*. Panicle nodding. Little spikes with 4 florets, shorter than the awns. LINN.—Little spikes spear-shaped. SCHREB. ST.—Branches in pairs. SCOP. HUDS. ST.—Panicle branched. Little spikes with about 4 florets. HUDS.

Schreb. 11.—Leers 10. 1, two branches of the panicle.—Vaill. 18. 3.—Scheuch. 5. 17, branch of the panicle.—Wieg. 1. 5, little spike.—Scheuch. 5. 19, a good representation of the smaller spikes, but does not accord, as Retz. remarks obs. i. n. 11.—Mont. 71; awns too short.—(Fl. dan. 440, has branches in pairs, and not several from a joint, as the triflorus, to which Linn. has referred this fig. though with a note of doubt, is described by SCHEUCH. but they expand different ways, as in the *B. patentissimus* of WIEG. who regards it as an awned variety of that species.)

Panicle branches 2 from each knot. LINN.—Sometimes 3. SCHEUCH. ST.—Leaves bordered at the base on each side with a gristly membrane, upper surface and the under towards the end rough downwards. Sheaths sleek, except the lowermost, which are rough (upwards). Empal. with from 3 to 7 florets. Blofs. inner valve as long or longer than the other. Awn finer than a hair, somewhat winding. LEERS. ST.—Branches lengthened out. Little spikes at first roundish, when at maturity somewhat flattened. WIEG. ST.—Empal. sleek, glossy. Blofs. rough downwards, not hairy, as Wieg. Branches in pairs, almost to the point of the panicle. ST.—Straw 5 feet high. Leaves half an inch broad. WITH.

Græmen. bromoid. montan. &c. Scheuch. 263. t. 5. f. 16, also referred to by WIEG. is the *B. montanus* of SCOP. and POLLICH. ST.

Woods and moist hedges.

P. July. Aug.

Cows, Horses, Goats, and Sheep eat it.

spiked BRO'MUS *pinna'tus*. Straw undivided. Little spikes alternate, nearly fitting; cylindrical, somewhat awned. LINN.—Festuca pinnata. HUDS. which see.

Little spikes with their flat sides turned towards the straw. Awns terminating. Leaves flat. LINN.

Dry mountainous Woodlands.

P.

96. S T I' P A. Feather-grafs.

Pl. II. fig. 14.

EMPAL. *Husk* 2 valves, taper, flexible; inclosing 1 floret.

BLOSS. 2 valves. *Outer valve* terminated by a very long, straight, twisted awn, jointed at the base. *Inner valve* strap-shaped, without an awn; as long as the outer valve.

CHIVES. *Threads* 3; hair-like. *Tips* strap-shaped.

POINT. *Seed-bud* oblong. *Shafts* 2; hairy; united at the base. *Summits* downy.

VESS. The husk adhering.

EED. Single; oblong, covered.

ESS. CHAR. *Empal.* 2 valves, containing 1 floret. *Bloss.* outer valve terminating in an awn. Awn jointed at the base.

STI'PA *penna'ta*. Awns woolly.—

downy

H. ox. viii. 7. row. 3. 9.—*Barr.* 46.—*C. B.* 71.—*Clus.* ii. 221.

3, repr. in *Ger. em.* 42. 6.—*J. B.* ii. 512. 2.—*Flower*, Mont.

68.—*Blossom*, Scheuch. 3. 13. B.

Two branches spring from the first joint of the panicle; only 1 from the others, and that generally undivided. *Husks* smooth. *Petal*, the larger one woolly, except at the top, from which rises the awn. Base of the awn twisted like a rope; above the twisted part it is bent; and above the bend it begins to be hairy. The feathery part of the awn is many times the length of the whole panicle; but the naked part not more than half as long. SCOP.—*Awns* from 6 to 12 inches long, or more; set with very fine, white, soft, pellucid, diverging hairs. WITH.

Mountains. [Near Kendal, Westmoreland. Mr. ALDERSON.]

P. July. Aug.

97. A V E' N A.

97. AVE'NA. Oat.

Pl. II. fig. 21.

EMPAL. *Husk* 2 valves; frequently containing several florets loosely collected. *Valves* large, loose, spear-shaped, distended; sharp; without awns.

BLOSS. 2 valves. *Inferior valve* the size of the husk, but harder; somewhat cylindrical, distended, tapering towards each end, sending out from its back an awn, spirally twisted, and bent back as if jointed.

CHIVES. *Threads* 3; hair-like. *Tips* oblong; forked at each end.

POINT. *Seed-bud* blunt. *Shafts* two; reflected; hairy. *Summits* simple.

S. VESS. The *Blossom* shuts close upon, and adheres to the seed without opening again.

SEED. Single; slender; oblong; tapering at each end; marked with a furrow lengthways.

ESS. CHAR. *Bloss.* 2 valves, containing several florets. *Awn* upon the back; twisted.

OBS. The twisted and jointed awn issuing from the back of the blossom, constitutes the essential character.

tall AVE'NA *elatior*. Panicked. Two florets in each empalement; one containing chives and pointals, nearly awnless; the other with only chives, awned.—

Schreb. 1. (α)—Curt. iii. 32.—H. ex. viii. 7. 38.—Park. 1176. 1.

—C. B. th. 18.—J. B. ii. 456.—Ger. em. 23.—Fl. dan. 165.

(α)—Branch of the panicle, &c. Leers 4. 4.—Scheuch. 4. 27 and 28.—(H. ex. viii. 7. 37, appears to be *Agrostis arundinac.* and Lob. adv. 2. 2, is not the plant.)

Empal. lower valve much smaller. SCHEUCH. Mr. HOLLEFEAR.

—Frequently only 1 floret awned. Mr. WOOD.

fibrous. α. Base of the straws not knobbed. (Figures marked α.)

knobbed. β. Base of the straw knobbed. (The rest of the figures.)

Empal. outer valve smaller, and $\frac{1}{2}$ shorter than the other. Florets 1 fitting, and the awn fixed near to the base; the other on a short fruit-stalk, and the awn fixed nearest to the end. Bloss. hairy at the base. Seed-buds downy. The sitting floret generally barren. Straw about 5 feet high, with cylindrical woolly joints. Leaves rough. Root a double pear-shaped bulb, one above the other. Grows in damp ground. WITH.

Tall oat-grass.

Meadows.

Meadows, pastures, and hollow-ways. P. June. Aug.

Cows, Sheep, and Goats eat it.—The roots are sometimes very troublesome to the farmers in arable lands. ST.

AVE'NA *nu'da* Panicked. Empal. with 3 florets. *naked*
Receptacle longer than the empalement. Petals awned
upon the back. The 3d floret awn-less.—

H. ox. viii. 7. 4.—*Ger.* 68. 2, repr. in *C. B.* 471, and cop. in
J. B. ii. 433, cap. xxi.—*Dod.* 511. 2, repr. in *Ger. em.* 75.
2, ill cop. in *Park.* 1134. 2.

The feeds when ripe fall out of the husks. LINN.—*Little spikes*
with 2 or 3 florets. Awn neither twisted nor jointed. HALL.

Staffordshire. PLOT.—Cultivated in Cornwall. RAY. A. July.
Pilcorn. *Pillis.*

This is nearly as good as the cultivated oat; it will make gruel or
oat cake, and feed cattle as well as that. Ray says it fells in Corn-
wall at the price of wheat.

AVE'NA *fat'ua*. Panicked. Empal. with 3 florets, *bearded*
all awned, and hairy at the base.—

Leers 9. 4, *little spike*, &c.—*H. ox.* viii. 7. 5, empal. hairy, and
only 1 of the florets awned.—*Barr.* 75. 2, is a pretty exact repre-
sentation of it, but, from the separate little spike, which is $1\frac{1}{2}$ inch
long, I suspect it will prove to be the *A. sterilis*.—*C. B.* 149. 2. 3.
4, branch of the panicle, &c.—(*Schreb.* 15.—*Scheuch.* 5. 1.—
Dod. 539. 2, repr. in *Lob. obs.* 20. 3; *Ger. em.* 77, † and cop.
in *Park.* 1148. 4; and *J. B.* ii. 433, fig. the last, appear to me
to be the *Avena sterilis* of Linn. and Virgil. In all of them the
branches of the panicle are undivided as in the *sterilis*.—*C. B.* 149.
1, is *Andropogon gryllus*.)

Taller than the *Avena sativa*. RAY. ST.—Leaves bare. Empal.
whitish green. HALL. ST.—Fruit-stalks of the florets hairy. Florets
hairy at the base and on the back; the third floret often wanting.
Bloss. outer valve ragged at the end. Awn twice as long the blossom;
rough. Seed hairy. LEERS. ST.—Leaves rough downwards. Pa-
nicle pyramidal; its branches expanding; some of them dividing
towards the top. Little spikes turning whitish or yellowish. Empal.
larger than the florets, 11 lines long, or somewhat less. Bloss. inner
valve edged with a fine fringe. POLLICH. ST.—Panicle branches
from 1 to 6 at a knot. Empal. valves 9 to 11 lines long, ribbed,
number of ribs uncertain, from 9 to 11; outer generally a line
shorter than the inner, containing 2 florets, both awned. Bloss.
with tufts of hairs at the base. Outer valve even, the ribs not being
prominent; beset with whitish hairs about the insertion of the awn,

and some few scattered ones between it and the base; sometimes only 1 or 2 hairs at the insertion of the awn; slightly cloven at the end, but readily separable to the depth of 2 lines; fawn coloured when ripe. *Awn* bent aside, about a line above the point of the valve. ST.

(*Gram. avenac. lanuginos. utriculis*, &c. SCHEUCH. 241. n. 2, accords in its admeasurement, but differs in its leaves being woolly. *Gramen. avenac. utriculis lanugine flavesce*. SCHEUCH. 239, though referred to by Linn. cannot be the *A. fatua*, as in that the 2 lowermost florets only are awned. The description of its structure, and the admeasurements, corresponds most exactly with my specimens of the *A. sterilis*. Scheuchzer speaks of his plant as a native of the South of Italy. Barrelier's plant was gathered near Rome. The descr. of J. Bauh. and of the H. ox. accord with Scheuch. ST.)

Bearded wild oats. Hover.

Corn fields.

A. July. Aug.

Horses, Sheep, and Goats eat it.—The awns are used for Hygrometers.—Sometimes so prevalent amongst barley as almost entirely to choke it. It may be extirpated by repeated fallowing, or laying down the land in grass.

rough AVE'NA *pubescens*. Flowers almost forming a spike. Empal. with 3 florets, bearded at the base. Leaves flat, downy. LINN.—Panicle branched. Receptacles bearded. HUDS.—Fruit-stalks of the florets hairy down to the base. ST.

Leers 9. 2.—*Ray* 21. 2.—*Scheuch.* 4. 20.—*Mont.* 65, *little spike.*

Very closely allied to the *A. pratensis*, but the leaves not rolled in. LINN.—Florets sometimes only 2, sometimes 4, and, in the more luxuriant plants, sometimes 5. SCHEUCH.—Fruit-stalks of the florets covered with a close white down, which is short towards the base, but at the point next the base of the floret long. SCHEUCH. ST.—*Spiked panicle* of a purplish shining silvery appearance.

Dry and chalky soils. [In Norfolk. Mr. WOODW.] P. June.

yellow. AVE'NA *flaves'cens* Panicle loose. Empal. short, 3 florets in each. All the florets awned.—

Curt. iii. 35, *left hand figure* cut of blossom.—*Schreb.* 9, *right hand figure* not yet in blossom.—*Leers* 10. 5.—*Scheuch.* 4. 18, *branch of the panicle.*—*H. ox.* viii. 7. 42, *panicle too close and stiff.*—*Mont.* 79, *too small.*

Straws smooth. Leaves, upper side hairy, the lower smooth. Sheaths generally more or less hairy, especially towards the base, but sometimes, and even in specimens of the larger size, smooth. Empal. sometimes containing only 2 florets. SCHEUCH. ST.—In none

of

of my specimens is the under surface of the leaves hairy. *Empal.* sometimes containing 1 fertile, and 1 abortive floret. ST.—Panicle greenish yellow. Straw about 18 inches high. RAY.

Meadows and pastures, common.

P. July.

Cattle are not fond of it.

AVE'NA *pratensis*. Almost spiked. Florets 5 in each meadow empalement. LINN.—Leaves naked; rolled in. Panicle undivided. HUDS.—Fruit-stalks of the florets bare towards the base. ST.

Leers 9. 1.—Ray. 21. 1.—Vaill. 18. 1.—H. ox. viii. 7. 21, awns too straight.—Ment. 66, a little spike.

Leaves smooth underneath. LINN.—*Empal.* rough downwards. Lower fruit-stalks in pairs, one of them longer, supporting 2 little spikes. LEERS.—All the little spikes sometimes single, but generally the lowermost fruit-stalks dividing into 2. ST.—Awns bent back. RAY.—Leaves channelled, smooth. Panicle compact. Florets smooth; the upper one in each little spike barren.

Heaths, and high chalkey lands. [Norfolk, very frequent. Mr. WOODWARD.—King's Park, Edinburgh. Mr. SMITH.] P. July.

Horses, Cows, Sheep, and Goats eat it.

AVE'NA *strigosa*. (SCHREB.) Panicked. Empalement *scrannel* containing 2 florets. Blossoms smooth at the base; outer valve ending in 2 awns shorter than the valve, and with a bent awn from the back. ST.

Empal. the length of the florets. Florets on fruit-stalks. Terminating awns very fine, at the points white. Awn from the back twice as long as the florets, strong, brown at the base. I cannot find it described by any writer. SCHREB. *spic.* ST.—Straw and leaves bare. Panicle rather slightly nodding, than contracted, as Schreber. Fruit-stalks from 1 to 4, rough. RETZ. *obs.* 1. 13. ST.—*Empal. valves* ribbed; ribs from 7 to 10, and bordered on each side with a row of minute dots; lower valve somewhat shorter, from 6 to 7 lines long, upper 8 lines long. *Bloss.* outer valve sleek and smooth below, about the insertion of the awn in some specimens hairy with long white hairs, above the awn scored, rough, cloven at the end to within a line of the insertion of the awn, segments terminating in awns; awns purple, whitish at the end. Seeds hairy.

Specimen in Dr. Witherings's herbarium, compared with others from a friend of Prof. Schreber's, and the King's garden, Paris.

ST.

Amongst oats, barley, and sometimes rye. A. Summer.

99. ARUN'D O. Reed.

Pl. II. fig. 22.

EMPAL. Husk 2 upright valves, containing 1 or more florets. Valves oblong, tapering; without awns. One shorter than the other.

BLOSS. 2 valves. Valves as long as the empal. oblong, tapering; with soft and tender hairs rising from the base, and nearly as long as the blossom.

CHIVES. Threads 3; hair-like. Tips forked at each end.

POINT. Seed-bud oblong. Shafts 2; hair-like; reflected; woolly. Summits simple.

S. VESS. The blossom adheres to the seed without opening.

SEED. Single; oblong, tapering towards each end, furnished with long feathers at the base.

ESS. CHAR. Empal. 2 valves. Florets crowded together, encompassed with wool.

common ARUN'DO *phragmites*. Panicle flexible. Florets 5 in each empalement.—

H. ox. viii. 8. 1.—Dod. 602, repr. in Lob. obs. 28. 1, Ger. em. 36. 1, and cop. in Park. 1209. 1, and J. B. ii. 485. 1.—C. B. th. 269.

th. 269, in the 2 last spikes ill done.—Trag. 674. 2.—Branch of the panicle, &c. Leers 7. 1.—Spike, Mont. Arundo B. E.—Floret, Scheuch. 3. 14. D.

Florets 4 and 5, smooth, but surrounded at the base with down about the length of the florets, and which rises from the spike-stalk, and not from the florets themselves. SCHEUCH. ST.—Empal. sometimes containing only 1 floret. Bloss. one of the valves sometimes awned! Scop.—Seed-bud bare. Seeds inclosed by the blossom, as Linnaeus; not surrounded by long hairs, as Leers has erroneously represented it. ST.

Rivers, lakes, ditches; very common.

P. July.

Horses, Cows, and Goats eat it. Sheep refuse it.

The panicles are used by the country people in Sweden to dye woollen green. The reeds are much more durable than straw for thatching. Screens to keep off the cold winds in gardens, are made of them; and they are laid across the frame of wood-work, as the foundation for plaster floors.

ARUN'DO *epigejo's*. Panicle upright. One floret *small* in each empalement. Leaves smooth on the under side.—

Fl. dan. 280.—Barr. 364.?—Floret, Mont. 85. (86. does not accord with my specimens.)

Straw 2 feet high, thicker than those of wheat. Leaves of the breadth of one's finger. Panicle close, upright. LINN.—Leaves green, 2 or 3 lines broad, smooth underneath, beset above with very short scattered hairs. Flowers $1\frac{1}{2}$ or nearly 2 lines long. Empal. valves nearly equal. Bloss. somewhat shorter than the empal. when dry, whitish. Down rising nearly even with the empalement. SCHEUCH. ST.—Leaves much narrower than those of the A. calamagrostis. Empal. bristle-shaped. Bloss. not woolly. Mr. Woodward.—Empal. flexible, nearly membranaceous, microscopically rough; valves awl-spear-shaped; the outer $\frac{1}{4}$ line longer than the other. Bloss. line long, membranaceous, tapering to a point, point cloven, with an exceedingly minute awn rising from the bottom of the cleft, often but just taller than the end of the valve. Down from the base of the blossom. ST.

Dry hills, banks, and corners of fields. LINN.—Woods and moist hedges. HUDS.—[On the side of a ditch on the borders of Aqualate Meer, Shropshire. ST.—Eanham Wood, Norfolk. Mr. Woodward.]

P. July.

ARUN'DO *Calamagrostis*. Empalements smooth; 1 wood floret in each. Blossoms woolly. Straw branched.—

Scheuch. pr. 5.—Ger. em. 9. 1, cop. in J. B. ii. 476. 1.—Park. 1182. 4.—H. ox. viii. 8. 2.—C. B. th. 95, branches of the right hand panicle too distant.—Florets, Scheuch. 3. 3. (Fl. dan. 280, referred to in the Syst. Veg. cannot be the same plant with Scheuch. pr. 5, to which they also refer; and appears to me to be the *A. epigejos*.)

short-husked 2

Barr. 18. 1.

OBS. No. 1. are figures of *Gram. arund. panic. molli.* &c. Scheuch. but equally represent our plant.

Sometimes rises to the height of a man, and, what is very uncommon in a grass, throws out undivided branches from the bosom of the leaves. LINN.—Specimens sent by Linnæus had *branched straws*, but in the description of Scheuch. referred to by Linnæus, no notice is taken of this circumstance. SCOP.—I have never seen the straw branched. HUDS.—*Straw firm*, from 3 to 5 feet high. *Leaves* without hairs, upper surface smooth, but the under, as also the edges, rough to the hand drawn downwards; stiff, and arid. *Panicle* contracted, sometimes partly chestnut, and partly green, on the opening of the flowers a mixture of green, chestnut, and silky white, and when out of flower of a yellowish brown. *Empal. valves* narrowing to a point, almost entirely equal, and about 2 lines long. *Bloss.* membranaceous, glossy, white. *Down* about the length of the empalement. SCHEUCH. ST.—*Leaves*, some flat, others with their edges rolled in, and sharp-pointed at the end. *Panicle* before it comes into flower upright, afterwards somewhat nodding, the branches and their sub-divisions rather pointing one way. *Empal.* stiff, green, keeled, keel rough, slightly curved sideways. *Bloss.* 1 line long, awned, tapering to a point, point cloven. *Awn* hair-like, straightish, inserted above the middle of the back, extending $\frac{1}{2}$ line beyond the end of the valve. In external appearance it very much resembles the *Dactylis glomerata*. ST.

Gram. paniculat. &c. *minus.* SCHEUCH. p. 122. ST. *

Moist woods and hedges. [Ripton Wood, Huntingdonshire. Mr. WOODWARD.]

P. June. July.

Goats eat it. Cows are purged by it.

sea ARUN'DO *arena'ria*. Empalements with 1 floret in each. Leaves rolled in at the sides, sharp-pointed, and pungent.—

* (Not *Gram. arund. panic. molli.* SCHEUCH. *gram. p.* 122. *t.* 3. *f.* 3. referred to by Linnæus, but judiciously omitted by Hudson. A specimen of it from the son of Prof. Jacquin induces me to believe them to be only varieties, differing merely in the size of the hulks, the inequality of the valves of the empalement being often equally small in both. ST.)

H. ex. viii. 4, row. 3. 16.—*Clus.* ii. 221. 1, repr. in *Lob. obs.* 45. 3, and cop. in *Park.* 1198. 3, and *J. B.* ii. 512, 1.—*Ger.* 38. 3, repr. in *C. B.* 67.—*Ger. em.* 42. 3.—*Florets*, *Scheuch.* 3. 8. *A. B. C.*—*Mont.* 92.

This plant probably originated from the *A. epigejos*, impregnated by the dust of the *Elymus arenarius*. LINN.

Leaves scored within, smooth and glossy without, when growing sometimes expanded. *Bloss.* with a short down at the base. SCHEUCH. ST.—*Empal. valves* nearly equal, spear-shaped, compressed, keeled; the outer the broadest, marked with 1 rib; the inner with 3. *Bloss.* compressed, roughish, dull, of the same texture as the empalement; outer valve marked with 5 ribs, the middlemost ending in a very short spit-point, the base fringed all round with white, straight, stiff hairs, 4 times shorter than the blossom. *Scale* at the base of the inner valve, awl-shaped, fringed with the same hairs, analogous to the outer blossom of the *Phalaris*, or possibly the rudiment of a 2d fruit-stalk. Has a much nearer affinity in habit as well as structure to the *Phalaris*, than to the *Arundo*. ST.

Sea matweed. *Marram.* *Helme.*

Sea shore.

P. June. July.

It grows only on the very driest sand upon the sea shore; and it prevents the wind carrying the sand from the shore and dispersing it over the adjoining fields: which is not unfrequently the case where this Reed is wanting. Many a fertile acre hath been covered with unprofitable sand and rendered entirely useless; which might have been prevented by sowing the seeds of this plant upon the shore. The Dutch have profited by the knowledge of this fact. LINN.

The country people cut, and bleach it for making matts. Where it is plentiful, houses are thatched with it.

It is planted on some of our flat coasts in Norfolk to repel the Sea. As soon as it has taken root, a sand hill gathers round it; and, it is probable, that some of our sandy cliffs have been entirely formed by it. Mr. WOODWARD.

101. L O ' L I U M. Darnel.

Pl. II. fig. 27.

Common *Receptacle* lengthened into a spike. The florets pointing from 2 opposite lines, and each pressed close to a bend in the straw.

EMPAL. *Husk* 1 valve, awl-shaped, permanent; standing opposite to a bend in the receptacle.

BLOSS. 2 valves. *Inferior valve* narrow; spear-shaped; rolled inwards; tapering; as long as the empalement. *Superior valve* shorter, more blunt, strap-shaped, concave on the upper part.

CHIVES. *Threads* 3; hair-like; shorter than the blossom. *Tips* oblong.

POINT. *Seed-bud* turban-shaped. *Shafts* 2; hair-like; reflected. *Summits* downy.

S. VESS. None. The blossom encloses the seed until it is ripe.

SEED. Single; oblong; compressed; convex on one side, flat and furrowed on the other.

ESS. CHAR. *Cup* 1 leaf, fixed, containing several florets.

OBS. The angles in the spike-stalk lying in the same plane with the florets, supply the defect of inner valves to the empalements.

LINN.

red LO'LIUM *perenne*. Spike awnless. Little spikes longer than the empalement. HUDS. — Spike awnless. Little spikes compressed, of several florets. LINN.

Schreb. 37.—Leers 12. 1, spike.—Fl. dan. 747.—Dod. 540. 1, repr. in Lob. obs. 21. 1; Ger. em. 78. 2; cop. in Park. 1145. 2; and C. B. 128.—Math. 1023.—Scheuch. 1. 7. A. B. C. part of the spike, &c.—Mont. 19.—(Ger 71. 2, not the plant.)

A. May. June.

R O T T B O L'

ROTTBOL'LIA.* Linn. the Son. *Hard-grafs.*

Pl. II. fig. 31.

Spike-stalk cylindrical, thread-shaped, very straight, jointed. *Joints* hollowed out downwards towards the joint below with an oblong excavation. *Flowers* enclosed within the excavated hollows of the spike-stalk, solitary, or in pairs; one with only chives, the other with chives and pointal.

EMPAL. *Husk* of 1 valve. (2 valves. Sp. pl. ST.) *Valve* simple, or divided into 2, gristly, lopped at the base, closing up the hollow like a kind of cover, joined to the spike-stalk by a moveable articulation, egg-oblong, pointed, flat.

BLOSS. *Husk* of the *floret* with *chives* and *pointal* of 2 valves; *valves* spear-shaped, pointed, concave, unequal, membranaceous, shorter than the empalement. *Husk* of the *floret* with only *chives*, if such present, similar to the former.

CHIVES. *Threads* 3; hair-like. *Tips* strap-shaped, forked at each end.

POINT. *Seed-bud* oblong, strap-shaped, lopped, furnished with a little head, convex on one side, concave on the other. *Shafts* 2, thread-shaped. *Summits* feathered, or pencil-shaped.

S. VESS. None, except the hollows in the joints closed by the husk of the empalement which contain the ripe seed, till the spike-stalk falls off joint by joint.

SEED. One, the shape of the seed-bud.

ESS. CHAR. *Spike-stalk* jointed, roundish; in several species thread-shaped. *Empal.* egg-spear-shaped, flat, simple, or divided into 2. *Florets* alternate, on a zigzag spike-stalk. LINN. THE SON.

Obs. What is above described as a spike-stalk is in fact the spike. It might have been added too, that in some species it is flattened; neither ought the spike-stalk to form a generic characteristic. Were it admitted, we should be obliged to divide the *Panicum* and *Cynosurus* into 4 genera. ST.

ESS. CHAR. Flowers with chives and pointal.

* In memory of Christian Friis Rottboll, professor of botany at Copenhagen, (See catalogue of authors.) LINN. THE SON.

Empal. Husk solitary, divided into 2. *Bloss.* Husk placed contrariwise to that of the empalement. *Chives* 3. *Shafts* 2. *Seed* 1.

Flowers with only chives.

Empal. Blossom and chives as above. HUDS.

Obs. *Empal.* evidently of 2 leaves. *Bloss.* valves parallel to the larger of the valves of the empalement.—Mr. Hudson, with the above new character, has retained the name of *Ægilops*, which ought, however, to be applied to the genus which comprehends the *Ægilops* of the old authors. ST.

Ess. CHAR. *Empal.* 2 contiguous valves, both placed outwardly, solitary. *Bloss.* of 2 valves, membranaceous, awnless. ST.

Obs. In the disposition of its 2 leaved empalement it corresponds with *Ægilops*, but differs in its blossom, which, instead of being gristly and awned, is membranaceous as in the other *Rottbollias*, in which, however, the empalement is of 1 valve as in *Lolium*. Thus, if its claim to a distinct genus should be inadmissible, we may be allowed to consider it as forming the connecting link between the two. ST.

ROTTBOL'LIA *incurva'ta*. Spike cylindrical, awl-shaped. Husk of the empal. awl-shaped, contiguous, divided into two. LINN. THE SON. *suppl.* 114. sea

H. ox. viii. 2. 8.—*Park.* 1146.—*Barr.* 5 and 6.—*Scheuch.* 2. 1, spike.

Spike without awns, smooth, thread-shaped, crooked; but little thicker than the straw. *Empal.* of 2 valves; both placed outwardly. *Bloss.* valves placed contrariwise to those of the empal. LINN.—*Empal.* valves awl-spear-shaped, scored on the outside just longer than the joint, to the base of which they are fixed, 1 just sensibly narrower, and its edge lapping over that; the inner open when the blossom is in flower of the other. *Bloss.* contained between the hollow of the joint and the innermost of the valves of the empalement; valves equal in length, brownish white, the inner somewhat narrower. Flowers, all which I have ever examined, had a pointal as well as chives. ST.

Ægilops incurvata. LINN.

Sea coast. [Salt Marsh, below King's Weston, near Bristol. ST.] P. July. Aug.

102. E L'Y M U S. Lime-grafs.

Pl. II. fig. 26.

Common *Receptacle* lengthened into a spike.EMPAL. *Husk* 4 leaves, pointing from 2 opposite lines, 2 of the leaves which are awl-shaped, belonging to each little spike.BLOSS. 2 valves; *outer valve* large, tapering; furnished with an awn. *Valve* flat.CHIVES. *Threads* 3; hair-like; very short. *Tips* oblong, forked at the base.POINT. *Seed-bud* turban-shaped. *Shafts* 2; straddling, hairy, bent inwards. *Summits* simple.

S. VESS. The blossom incloses the seed.

SEED. Single; strap-shaped; convex on 1 side; covered.

ESS. CHAR. *Empalement* lateral, of 2 valves, containing several *florets*; incorporated.

OBS. The empalement may be considered as a husk of 2 leaves, and 2 of these empalements growing together.

sea EL'YMUS *arena'rius*. Spike upright, compact. Empalements woolly; longer than the floret.—

Schreb. 40.—Gmel. i. 25.—(Fl. dan. 847, is some other grass. Mr. Woodw. as is evident from its minute blossom.—Clus. ii. 221. 2, cop. in C. B. 68. 2;—Ger. 23, repr. in C. B. th. 14, cop. in Park. 1277. 1, J. B. ii. 478. 2, and H. ox. viii. 2. 11;—Pluk. 33. 3;—and Scheuch. 3. 17. D. not the plant.—In Mont. 17, the florets are more than two, and longer than the empalement.)

Spike upright, long, woolly. Little spikes 2 together, straight, containing 2 florets, awnless. Leaves like those of REEDS, bluish green, or whitish; rolled inwards and sharp-pointed. LINN.

Sea coast, in loose sand.

P. July. Aug.

It resists the spreading of the loose sand on the sea shore. Is it not capable of being formed into ropes as the *Stipa tenacissima* is in Spain?

Cows, Horses, and Goats eat it. Sheep refuse it.

dogs EL'YMUS *caninus*; *Triticum caninum*. HUDS. &c. which see.

wood EL'YMUS *europæus*. Spike upright. Little spikes 2 florets in each; as long as the empalement.—

Scheuch. pr. 1. 1.—Park. 1144. 7. (1)—Mont. 94, floret, ill done.

Very

Very much resembles the *Elymus virginicus*, but the leaves of the fence not scored, and florets 2. Florets, together with their awns, longer than the fence. LINN.—Evidently an *Elymus*. MR. WOODW. ST.—Fence, the 2 leaves proceeding from an exceedingly short pedicle, distinct from that of the floret. SCHEUCH. ST.—Leaves of the fence equal, somewhat scored towards the end. Florets often 2, and both fertile; the lower on an exceedingly short fruit-stalk; the upper on a fruit-stalk, nearly half its length, with the rudiment of a 3d fruit-stalk at the base of the inner valve. Haller, Murray, and Hudson have made it a *Hordeum*, not reflecting, that in the *Elymus philadelph. and canadens.* the lower little-spikes are often found in threes; and, I may also add, with a treble fence of 2 leaves as in the *Hordeum*. Indeed, none of them seem ever to have found it with little spikes of 2 florets, except Mr. Hudson, who speaks of the 2d floret as being abortive. In my specimens the seeds of both were nearly arrived to maturity.—In structure it is an *Elymus*, in habit it approaches rather more to the *Hordeum*. In truth it seems the connecting link between these two genera. Floret generally single. ST.—*Hordeum sylvaticum*. HUDS. which see.

Woods in chalkey soil. [Rocks opposite Matlock Baths; Ripton Woods, Huntingdonshire. Near Berkhamstead, Herts. In the North, frequent. MR. WOODWARD.] P. June.

104. H O R ' D E U M. Barley.

Pl. II. fig. 25.

Common Receptacle lengthened into a spike.

EMPAL. Husk of 6 leaves, containing 3 florets. Florets fitting. Leaves strap-shaped, tapering, distant; in pairs.

BLOSS. 2 valves. Lower valve longer than the empal. bellying; angular; egg-shaped, but pointed; ending in a long awn. Inner valve smaller; flat; spear-shaped. (Honeycups spear-shaped. POLLICH.—Membranaceous, the length of the seed-bud. ST.)

CHIVES. Threads 3; hair-like, shorter than the blossom. Tips oblong.

POINT. Seed-bud between egg and turban-shaped. Shafts 2; woolly; reflected. Summits like the shafts.

S. VESS. The blossom grows round the seed without opening.

SEED. Single; oblong, bellying, angular, tapering at each end; with a furrow on one side.

Ess.

ESS. CHAR. *Empal.* growing by threes; fixed sideways; of 2 valves, containing 1 floret.

OBS. In some species all the 3 florets that grow together are fertile, and have both chives and pointals; but, in others, the middle floret alone is fertile, and furnished with chives and pointals, the lateral florets having only chives.

wall HOR'DEUM *murinum*. Lateral florets with awns and chives. Husks of the intermediate florets fringed.—

Dogs-grass, Squitch-grass, Couch-grass, Quitch-grass.

Very common.

P. June.—Aug.

It is a most troublesome weed in arable lands, and can only be destroyed by fallowing in a dry summer.

At Naples the roots are collected in large quantities, and sold in the market to feed horses; they have a sweet taste, something approaching to that of liquorice; when dried, and ground to meal, they have been made into bread in years of scarcity. The juice of them drank liberally is recommended by Boerhaave in obstructions of the viscera; particularly in cases of schirrhous liver and jaundice. Cattle are frequently found to have schirrhous livers in the winter, and they soon get cured when turned out to grass in the spring. Dogs eat the leaves to excite vomiting.—Horses eat them when young, but leave them when fully grown. MR. SOUTHWELL.

Cows, Sheep, and Goats eat them.

TRITICUM caninum. Empalement pointed. Awns *dogs* longer than the blossom. Root fibrous. ST.—Empalements awl-shaped, with mostly 4 florets. Florets awned. HUDS.—Root perennial. Spike somewhat nodding. Little spikes upright. Awns very long. SCHREB.

Leers 12. 4. II. spike, &c.—H. ox. viii. 1. row. 3. 2.—Buxb. iv. 50. (Gmel. 1. 27, resembles it, but, from the description, seems to be a different plant.)

TRIANDRIA DIGYNIA.

Leaves bare of hairs underneath. *Sheaths* smooth. *Little spikes* 5 or 6 lines long. *Empal.* 3 lines long. *Lowermost blofs.* 4 or 5 lines long; *outer valve* sending out from a bluntish point, an awn, from 7 to 9 lines long. SCHEUCH. ST.—I never saw the *little spikes* in pairs. SCHREB.—*Root* not creeping. REICH.—*Blofs. inner valve* spear-shaped just sensibly longer than the outer; *outer* bare of hairs, edges at the point membranaceous. The above circumstances distinguish it from the *Festuca sylvatica*, which it very much resembles in its general appearance. ST.

BLOSS. Petals 5, deeply divided, blunt, equal.

CHIVES. Threads 3; hair-like; shorter than the blossom. Tips roundish.

POINT. Seed-bud roundish. Shafts 3; hair-like. Summits bluntish.

S. VESS. Caps. 1 cell, rather cylindrical; opening at the top.

SEEDS. Several, roundish.

ESS. CHAR. Cup 5 leaves. Petals 5. Capsule 1 cell, nearly cylindrical, opening at top.

H O L O S ' -

HOLOS'TEUM *umbellatum*. Flowers in rundles.— *rundled*
Cerastium umbellatum. HUDS. which see.

112. POLYCAR'PON. Allseed.

EMPAL. Cup 5 leaves. *Little leaves* egg-shaped, concave, keeled; ending in a sharp point; permanent.

BLOSS. Petals 5, very short, egg-shaped, notched at the end, alternate; permanent.

CHIVES. *Threads* 3, thread-shaped; half the length of the Cup. *Tips* roundish.

POINT, *Seed-bud* egg-shaped. *Shafts* 3, very short. *Summits* blunt.

S. VESS. Capsule egg-shaped, of 1 cell and 3 valves.

SEEDS. Many; egg-shaped.

ESS. CHAR. Cup 5 leaves. Petals 5, very small, egg-shaped. Capsule 1 cell; 3 valves.

POLYCAR'PON *tetraphyl'lum*. LINN.—Stem branch- *four-leaved*
ing, trailing. Leaves in fours. LINN. THE SON.

Matth. 734.—*Barr.* 534.—*J. B.* iii. 366. 2.—*Lob. adv.* 196. 1.

The flowers are sometimes without petals. HUDS.—It alters its habit so much by cultivation as hardly to be known at first sight.

Mr. WOODW.—*Cup-leaves* keeled; edges membranaceous. *Leaves* oval, very entire, on leaf-stalks, growing mostly in fours. Mr.

NEWBERY.

Dry sandy ground. [Lymington, near Exeter. Mr. NEWBERY.]

A. May.—Aug.

Class IV.

TETRANDRIA.

IV. CHIVES.

THE Chives in this Class are 4, and all of the same length; whereas, in the fourteenth class, which is likewise composed of flowers with 4 chives, the chives are unequal in length, 2 of them being long, and 2 short.

The fourth division of the first ORDER includes the STELLATÆ or STARRY plants, which admit of the following NATURAL CHARACTER,

STELLA'TÆ. Starry Plants.

EMPAL. *Cup* small; with 4 teeth; permanent; superior. BLOSS. 1 petal; tubular. *Border* expanding; with 4 divisions.

CHIVES. *Threads* 4. *Tips* simple.

POINT. *Seed-bud* beneath; double. *Shaft* thread-shaped; cloven.

SEEDS. 2; somewhat globular.

OBS. Stem 4 cornered. Leaves surrounding the stem in form of a star, MARTYN. *Cat. Cant.*

The plants corresponding with this natural character are astringent and diuretic.

Order I.

MONOGYNIA; I. POINTAL.

* Flowers of 1 Petal, and 1 Seed—superior. INCORPORATED.

120. DIP'SACUS. - - Common *Empal.* leafy. *Receptacle* conical, chaffy. *Seeds* like little pillars.

121. SCABIO'SA. - - *Empal.* common to several florets. *Recept.* raised, a little chaffy. *Seeds* crowned; rolled in a cover.

*** Flowers of 1 Petal—beneath; and 1 Seed-vessel.

151. CENTUN'CULUS. *Bloss.* wheel-shaped. *Empal.* deeply divided into 4 parts. *Capsule* 1 cell; cut round.

148. PLANTA'GO. - - *Bloss.* bent back as if broken. *Empal.* divided into 4 parts. *Caps.* 2 cells; cut round.

† *Gentiana campestris.* *Gentiana filiformis.*

*** Flowers of 1 Petal—superior; and 1 Seed-vessel.

152. SANGUISOR'BA. - *Bloss.* flat. *Cup* 2 leaves. *Caps.* 4 cornered; between the cup and the blossom.

**** Flowers of 1 Petal—superior; and 2 Berries. STARRY.

134. RU'BIA. - - - *Bloss.* bell-shaped. *Fruit* a berry.

132. GAL'IUM. - - - *Bloss.* flat. *Fruit* nearly globular.

† *Valantia cruciata.*

128. ASPER'ULA. - - *Bloss.* tubular. *Fruit* nearly globular.

127. SHERAR'DIA. - - *Bloss.* tubular. *Fruit* crowned. *Seeds* with 3 teeth.

***** Flowers of 4 Petals—beneath.

† *Cardamine hirsuta.* *Evonymus europæus.* *Parietaria officinalis.*

***** Flowers of 4 Petals—superior.

155. COR'NUS. - - *Empal.* with 4 teeth; deciduous. *S. Vessel* pulpy; including a stone with 2 cells.

***** *Flowers imperfect—beneath.*

177. ALCHEMIL'LA. - Empal. with 8 clefts. Seed 1, enclosed in the empalement.

Order II.

DIGYNIA; II. POINTALS.

180. BUFO'NIA. - - Bloss. 4 petals. Empal. 4 leaves.
Caps. 1 cell, 2 valved, 2 seeded.
182. CUS'CUTA. - - Bloss. with 4 clefts, egg-shaped.
Empal. with 4 clefts. Caps. 2 cells, cut round.
178. APH'ANES. - - Bloss. 0. Empal. with 8 clefts. Seeds 2.

† Herniaria glabra. Gentiana campestris. Gentiana filiformis.
Galium Mollugo. Galium Aparine.

Order III.

TETRAGYNIA; IV. POINTALS.

184. I'LEX. - - Bloss. 1 petal. Empal. 4. toothed.
Berry 4 seeded.
188. SAGI'NA. - - Bloss. 4 petals. Empal. 4 leaves.
Caps. 4 cells. Seeds many.
189. TILLÆ'A. - - See page 132.
186. POTAMOGE'TON. Bloss. 0. Empal. 4 leaves. Seeds 4,
fitting.
187. RUP'PIA. - - Bloss. 0. Empal. 0. Seeds 4, on foot-
stalks.

† Holosteum umbellatum. Linum Radiola.

120. DIP'SACUS. Teasel.

EMPAL. Common Cup many leaves containing several florets.

Little leaves which form the cup longer than the florets; flexible; permanent. Proper Cup superior; scarcely perceptible.

BLOSS. General, regular. Individuals of 1 petal, tubular. Border with 4 clefts; upright. The outer Segment larger and sharper.

CHIVES. Threads 4; hair-like; longer than the blossom. Tips fixed side-ways.

POINT. Seed-bud beneath. Shaft thread-shaped; as long as the blossom. Summit simple.

S. VESS. None.

SEED. Solitary; resembling square pillars; crowned with the entire margin of the proper cup. Receptacle common conical. Florets separated by long chaffy leaves.

ESS. CHAR. Empal common, of many leaves. Proper cup superior. Receptacle chaffy.

DIP'SACUS *fullo'num*. Leaves sitting; serrated. manured

LINN.—Chaff bowed back. MILL. JACQ.—Rather hooked.

SAUV. ST.

Tourn. 265, a single head.—Fuchs. 224, cop. in Trag. 847, and J. B. iii. 73.—Matthiol. 661, cop. in Dod. 735. 1; repr. in Lob. obs. 487. 1.—Ger. em. 1167. 1, which is cop. in Park. 984. 1, with a separate head.—H. ox. vii. 36. 1.—Zanon. 68.

Scales much harder than those of the *D. sylvestris*. HALL. ST.

Dipsacus fullonum. β . LINN.

It is cultivated for the use of the clothiers, who employ the heads with crooked awns to raise the knap upon woollen cloths. For this purpose they are fixed round the circumference of a large broad wheel, which is made to turn round, and the cloth is held against them. The plant flowers in June and July, and the heads are collected in August.

DIP'SACUS *sylvestris*. Chaff straight. MILL. SAUV. wild

Ger. 1005. 1, heads ripe.—H. ox. vii. 36. 3.—(Ger. 1005. 2, is *D. laciniatus*.)

Leaves ferrated. MILL.—Growing together at the base. MURR.—Common *Empal.* leaves long, encircling the head. CURT. ST.—Longer than the head. MR. WOODW.—Chaff, some of the lower ones gently bowed downwards, but not hooked at the point. ST.—*Empal.* common with leaves of different sizes, long, slender, sharp, edged with sharp-pointed bristles, or rather prickles. Florets collected into egg-shaped heads, and separated by white, strap-shaped, channelled leaves, terminating in awns, and hairy towards the end. Proper cup 4 cornered, greenish, downy at the rim. Blofs. tube white, 4 cornered, woolly; border purple, cloven into 4 blunt, shallow, segments, one of which is longer than the rest. Chives not longer than the blossom. Leaves spear-shaped, the mid-rib set with hooked prickles, as is also the stem. WITH.

Dipsacus fullonum, &c. LINN.

Uncultivated places, wet hedge banks.—I have not found it north of Derbysh. and Nottinghamsh. MR. WOOD. B. June.—Aug.

small DIP'SACUS *pilo'sus*. Leaves on leaf-stalks, with little appendages. LINN.—(The lower ones have no appendages. JACQ.)

Curt. 1. 9.—Jacq. austr. 248.—Blackw. 124. 2.—H. ox. vii. 36. 5.—Park. 984. 4.—Matth. 663, cop. in Dod. 735. 3, repr. in Lob. obs. 487. 2, and Ger. em. 1168. 3.—Blackw. 124. 1.—J. B. iii. 75. 2.

Fruit-stalks set with strong bristly hairs. *Empal.* common, spear-shaped leaves, covered on the outside with bristly hairs. Florets collected into globular heads, and separated by leaves similar to those of the common empalement. Outer cup 4 cornered, skinny, lopped. Inner cup larger, 4 cornered, with 4 shallow segments, and fringed with soft hairs. Blofs. segments nearly equal, greenish white. Summit slightly cloven into 2 or 3 parts. Stems angular; set with prickles pointing upwards. Branches opposite, rising from the bosom of the leaves. Leaves spear-shaped, ferrated, prickly along the mid-rib. WITH.

Shepherds Rod. Shepherds Staff.

Hedges and damp places. [Lilleshall Abbey, Shropshire. WITH.—Abbey-lane, Evesham. Worcestershire. MR. BALLARD.]

B. LINN. JACQ. P. HUDS. Aug.

121. SCABIO'SA. Scabious.

EMPAL. *Common Cup* of many leaves, expanding; containing many florets. The *leaves* fit upon and surround the receptacle in several rows, the inner ones of which become gradually smaller.

Proper Cup double; superior.

Outer Cup short; membranaceous; plaited; permanent.

Inner Cup with 5 divisions; the segments between awl and hair-shaped.

BLOSS. *General* regular; but mostly composed of irregular florets.

Individuals of 1 petal; tubular; with 4 or 5 clefts; equal, or unequal.

CHIVES. *Threads* 4; between awl and hair-shaped; limber. *Tips* oblong, fixed sideways.

POINT. *Seed-bud* beneath; rolled in a proper sheath, like a little cup. *Shaft* thread-shaped, as long as the blossom. *Summit* blunt; obliquely notched at the end.

S. VESS. None.

SEED. Solitary; oblong egg-shaped; rolled in a cover; variously crowned by the proper cups.

Receptacle common, convex, beset with chaffy leaves:

ESS. CHAR. *Common empal.* many-leaved. *Proper cup* double, superior. *Receptacle* chaffy, or naked:

OBS. Outer blossoms generally larger and more irregular. Seeds crowned differently in different species. Florets having 4 or 5 clefts. afford a primary specific distinction. LINN.

SCABIO'SA *succisa*. Blossoms with 4 cleft, equal. *Devils-bit*
Stem undivided. Branches near together. Leaves between egg and spear-shaped.—

Ludw. 193.—*Curt.* iii. 32. β .—*Fl. dan.* 279.—*Fuchs.* 715, cop. in *Trag.* 246, *J. Sometimes smooth. Flowers sometimes white, and all the leaves entire. HALL.—Common empal. fringed with long, white hairs. *Proper Cup* 4 cornered, hairy; with 4 small teeth. *Honeycup* (the inner cup of LINN.) enclosing the seed-bud; crowned with a concave receptacle, set with shining glands on the inside, and armed with 8 or 12 spear-shaped, serrated, greenish, bristly substances, hairy at the base. Florets in the circumference larger, with 4 unequal clefts. Florets in the center regular. Tips fixed to the threads by the middle. Summit with 2 or 3 flat, broad clefts. Seed-bud enclosed by the lower part of the honeycup. Leaves rough with hairs and tubercles; spear-shaped, and more or less jagged; some of them cut into winged clefts. Stem, towards the bottom, spotted with dark purple. Bloss. a little woolly; blue, purple, or white. WITH.

Pastures and corn fields.

P. July. Aug.

Sheep and Goats eat it. Horses and Cows not fond of it.

Slightly astringent, bitter, and saponaceous.

small SCABIO'SA *Columbaria*. Blossoms with 5 clefts, radiating. Root-leaves egg-shaped, scolloped. Stem-leaves winged, bristly.—

Walc.

Walc.—Ger. 582. 2.—Column. phytob. 22.—Clus. ii. 2. 2, repr. in Dod. 122. 3, Lob. obs. 290. 2, Ger. em. 719. 2, and cop. by Park. 484. 1.—J. B. iii. 4.—Matth. 970.—Fl. dan. 314, flowers half as large again as any I have ever seen.—H. ex. vi. 14. 20.—(Herm. par. 221, seems to me to be a different species.)

Feather with bristles 5 times as long as the blossom. LINN.

Dry hilly pastures, frequent.

P. June.—Aug.

Horses, Sheep, and Goats eat it. The *Papilio Maturna* feeds upon all the species.

151. CENTUN'ULUS. Chaffweed.

EMPAL. Cup with 4 clefts; expanding; permanent. Segments sharp, spear-shaped; longer than the blossom.

BLOSS. 1 petal; wheel-shaped. Tube somewhat globular.

Border flat, with 4 clefts. Segments nearly egg-shaped.

CHIVES. Threads 4; nearly as long as the blossom. Tips simple.

POINT. Seed-bud roundish; within the tube of the blossom.

Shaft thread-shaped; as long as the blossom; permanent.

Summit simple.

S. VESS. Capsule globular; of 1 cell; cut round.

SEEDS. Several; roundish; very small.

ESS. CHAR. Empal. 4 clefted. Bloss. 4 clefted, expanding.

Chives short. Capsule 1 cell; cut round.

Obs. Allied to *Anagallis*, but differs in its empal. being longer than the blossom; its blossom crowning the seed-vessel, and its threads being bare. St.

CENTUN'ULUS *minimus*.

Pimpernel

Curt. iii. 31.—Fl. dan. 177.—Vail. 4. 2.—Mich. 18. 2, confirmed by Mr. Woodward.

Bloss. minute; white; in the bosom of the leaves. LINN.—Leaves alternate, and not opposite, as in *Anagallis*. MICH.—Bloss. continuing and adhering like a calyptra to the point of the capsule, never expanding but when the sun shines strongly upon them. CURT.—Plant very small, branched, forked. Leaves sometimes opposite towards the bottom; egg-shaped, pointed, smooth, fleshy, pellucid at their edges, and brownish underneath. Flowers solitary. ROTH.

Bastard Pimpernel.

Moist sandy ground.

A. June.

148. PLANTA'GO. Plantain.

H. ox. viii. 17. 31.—*Tourn.* 49, *leaf.*

Spike truly nodding before it flowers. LINN. WITH.—Leaves with winged clefts, the segments very unequal; lying on the ground in form of a star. *Empal.* segments of the cup lapping over each other; fringed with fine hairs at the outer edge, and so deeply divided as almost to form a cup of 4 leaves. *Bloss.* thin and skinny; segments pale brown. *Chives, threads* doubled down before flowering. *Tips* terminated at one end by a small-pointed membrane. *Shyft* downy. WITH.

Coronopus hortenſis. Bauh. pin. 196, as evident from the figures referred to by Linnæus, (and not *Coronopus sylvestris hirsutior* Bauh. *ib.* though referred to by Linnæus, which is variety 4.) ST.

Star of the earth. *Hartshorn.*

Gravelly soil.

A. June.—Aug.

This was formerly in repute as an antidote against the bite of a mad dog, but is now partly fallen into disuse.

Sheep and Goats eat it.

β. Leaves more deeply divided, and more hairy. Heads short, jagged and lax. BLACKST. p. 77.

Between Dartford and Greenhithe.

γ. Leaves strap-shaped, very entire, hairy. Spike roundish. HUDS. grafs-leaved

* Erroneously changed in *Syst. Veget. and Syst. Plant.* to *coronopifolia*, as it is itself the *Coronopus* of Tournefort. ST.

Very much resembles *Lob. ic.* 439. RAY; which is *P. subulata*. LINN. ST.

Dry meadows on the sea coast. HUDS.—Banks of the river near Yarmouth, and near Sheerness, in Shippey. RAY.

broad-leaved 4. Leaves between ferrated and toothed. ST.

Pluk. 103. 5.

Leaves more fleshy than those of (*a*); teeth resembling those of (*P. ferraria*.) COLUMN. ST.—But no appearance of ribs; covered with short whitish hairs; the inner inversely egg-spear-shaped, tapering down into leaf-stalks, teeth expanding; the outer nearly strap-shaped, toothed. Hair whitish ST.

Plantago Coronopus dicta maritima brevi latoque and dentato folio pilosa. Pluk. alm. 299.—*Coronopus Prochytae insulae Column. ecph.*—*Plantaginellæ, &c. Ray. hist.* 879.—*Coronopus sylvestris hirsutior. Bauh. pin.* 190, as evident from the descr. of Column. referred to.—(*Plantago Coronopus. GOUAN. ill.* 6, refers to *Pluk.* 103. 5, but describes the leaves as having only 1 or 2 teeth. ST.)—Found in Cornwall by Mr. WATT.

narrowleaved PLANTA'GO *laxifl'gii*. Leaves strap-shaped, somewhat toothed. Stalk cylindrical. Spike egg-shaped. Floral-leaves keeled, membranaceous.—

Jacq. hort. 126.—*Petiv.* 4. 9.

Differs from the *Pl. Coronopus* in being a smaller and earlier plant; in the spike being egg-shaped and not long. The flowers are more thinly set, the floral-leaves smooth and keeled; but, in the *Coronopus*, they are pubescent, and extremely narrow. The chives too are shorter, the leaves of the cup sharper, the blossom browner. The leaves strap, not spear-shaped; sparingly toothed; the stalk hairy. LÆFL.—Root annual. Leaves sometimes entire, downy, or smooth. Stalks downy, or smooth, about the length of the leaves. Spike always upright; when in blossom somewhat egg-shaped, when in fruit oblong. Floral-leaves smooth, blunt, edges membranaceous. Seed, 1 in each cell. *JACQ. hort.*—Linnæus refers also, but, I suspect, erroneously, to *P. marina*, *R. syn. p.* 315, as the figures of *Park.* referred to by Ray is a copy of *Lob. obs.* 163, which Linnæus gives as a synonym of *P. maritima*. I am doubtful whether *P. laxifl.* be a native of Great Britain. ST. Mr. WOODW.—The specimens I formerly took for that plant, from finding it with leaves slightly toothed, I am now convinced are *P. marina*, having more frequently found them with leaves quite entire, a circumstance which is by no means constant in plants growing near the sea. See *Atriplex*. Mr. WOODWARD.

Salt Marshes. [Sea coast, Yarmouth. Mr. WOODW.] A. JACQ.

four-leaved 1. *Quadrifolium*. ST.

Galium palustre. Leaves growing by fours; inversely egg-shaped, unequal. Stems spreading. LINN.—Leaves spear-shaped. ST.

Fl. dan. 423, (many of the leaves represented as pointed. Mr. Woodward. St.)—*Pet.* 30. 5.—*Ger.* 967.—(*Ger. em.* 1126. 2, disfigured by Park. 565, and J. B. iii. 721. 1, have leaves in fixes.—Barr. 82, is *G. uliginosum*.)

Stem rough, branching, striking root at the joints; brittle. HALL.—*Lower leaves* often in fives and fixes. LEERS.—Oblong egg-shaped. MÆNCH.—*Stem* flaccid. NECK.—*Leaves* sometimes in fives, and in one of the whorls 6; flexible, horizontal; or expanding; those at the base of the branches largest; smooth, except at the keel and edges, which are beset with very short hooked hairs; the upper sometimes egg-spear-shaped and inversely egg-shaped, smooth on the keel. *Shafts* distinctly 2, as short again as the chives. *Tips* purplish brown; yellowish within. ST.—*Bloss.* segments between egg and spear-shaped. *Tips* reddish brown. *Leaves*, those in the same whorl of different sizes; scarcely rough to the touch. *Stem* 4 cornered; the corners set with sharp hooked prickles, pointing downwards. *Blossoms* numerous, white, on lateral and terminating fruit-stalks; forming a sort of rundle, cloven into 3 parts, and again sub-divided. WITTH.—*White Ladies Bed Straw*.

Cows, Sheep, and Horses eat it. Goats and Swine refuse it.

Banks of rivulets, pools, and moist meadows. P. July.

dwarf 2. *nanum*. ST.—Similar to variety 1, but scarcely a foot in length. HALL. ST.—Resembling the figure of *G. trifidum* in the *Fl. dan.* but readily distinguishable by the blossom with 4 divisions, and the divided fruit-stalks. Found by Dr. Withering. ST.

fix-leaved 3. *hexaphyllum*. ST.—Leaves in fixes, narrower, but always blunt, and generally unequal. As large as variety 1. HALL. ST.—It should seem that Mr. Hudson's new character of "Lower leaves in fours, inversely egg-shaped; upper ones in fixes, strap-shaped; stem spreading," had been taken from a view of this variety only. *Branches* next in roughness to those of the *G. Aparine spurium*, and *Valantia Aparine*. This plant I have been accustomed with Dr. Withering to refer to the *uliginosum*, and I have received it from the son of Prof. Jacquin with the same title. But the inequality and bluntness of the leaves, and the want of the thornlike point of the *uliginosum* as described by Linnæus, Haller, and Pollich, induce me to believe it with Haller, and, I may add, Ray (hist.) to be a variety of the *palustre*, though, being found in the same situations, it is not unlikely but it may turn out to be a distinct species. ST.—In all respects resembling the *palustre* except that the leaves grow in fixes. WITTH.—In the same situations as variety 1.

GAL'IUM *procumbens*. ST. — Leaves in fixés, *trailing* inversely egg-shaped, sharp-pointed, smooth. Stem prostrate. Fruit-stalks 3-forked. HUDS. — Leaves of the flowering stems spear-shaped, slightly hairy; the rest generally inversely egg-shaped, in fours. Stem smooth. —

(*Foliis caulium florigerum senis, lanceolatis, hirsutulis; ramorum subquaternis obovatis; caule prostrato glabro.*) ST.

Pet. 30. 6. — (J. B. iii. 716. 2, seems a different plant, and is referred by Linnæus to *G. uliginosum*.)

Distinguishable from *G. palustre* by its being much less, by the smoothness of its stems and leaves, and by its place of growth. RAY. *hist.* — Seems to be a variety of *G. uliginosum* growing in dry and mountainous pastures. LIGHTF. — But I have found it to be the same in marshes as on hills. ST. — Stems and branches matted together and spreading upon the ground. Fruit smooth. WITH. ST. — Flowering stem from 2 to 6 inches high. Leaves of the stem sometimes inversely egg-spear-shaped; edges beset with minute prickly hairs pointing towards the end; keel smooth; those of the branches sometimes in fives. ST. WITH. — Leaves, often 4 in a whorl at the bottom of the stem, 5 about the middle, and 6 at the top, unequal in size though in the same whorl. Stems twisted; cylindrical to the naked eye, but when considerably magnified they appear to have 4 rounded corners. Rundles of flowers, lateral and terminating, 1, 2, or 3 rundles springing from the whorls at the joints of the stem. Cup none. Style cloven more than half way down. WITH.

Galium montanum. HUDS. who should seem not to have observed that Linnæus had given the same trivial name to a different plant in his *sp. pl.* published in the same year with the 1st edit. of the *Fl. ang.* ST. — (Not *G. caule anguloso, foliis senis, subasperis, aristatis*. HALL. 715, which is *G. asperum*. SCHREB. *spicil.* and *G. sylvestre*. POLLICH. as is evident from a comparison of Haller's description with specimens of both plants. ST.)

Heaths and mountains. HUDS. — Also in marshy places. RAY. ST. — I suspect, however, that Ray's species comprehends also the *G. Mollugo* in its dwarfy state, which see variety 2. ST.

[Dudley Wood. WITH.]

TETRANDRIA MONOGYNIA.

angles rough with minute prickles. *Leaves* 5 lines long, (nearly) 1 broad, often bent downwards. *POLLICH. ST.*

(*Aparine Fl. lapp.* 58, must be a wrong reference, as is evident from the seeds being described with hooked hairs. *ST.*)

Meadows, pastures, and wet heaths. On the lower bog Chiffelhurst. *RAY.* P. July.

Horses, Cows, Sheep, Goats, and Swine eat it.

upright **GAL'IUM erectum.** Leaves mostly 8 in a whorl; spear-shaped, with fine prickly ferratures. Panicles with 3 divisions. Stem rough, flaccid. *Huds.*

(*Jac. austr.* 80, according to *Huds.* but the specimens of the *G. austriac.* *JACQ.* from the professor's son have a smooth stem, and are a quite different plant. *ST.*—*Jacquin* too describes both the leaves and stem as sleek and shining. *WITH.*)

Root branched. Stems numerous, jointed, rather upright; swelled at the joints; 4 cornered, the edges roughish; somewhat hairy, branched: flowering branches opposite. *Leaves* 8, sometimes 6 in a whorl; fitting, spear-shaped, and between strap and spear-shaped; bare. The terminating panicle divided into 3. *Flowers* white, 4 clefted. *Seeds* small, smooth. *Huds.*—*Leaves* in whorls, from 4 to 5 inches distant from each other; bent back; ferratures directed towards the point of the leaf, and not bowed back as in the rest of the rough-leaved species. My specimen agrees in every respect except the stem which is smooth. *ST.*

Meadows and wet pastures. [Heydon Common, Norfolk. *Mr. BRYANT.*] P. June. July.

corn **GAL'IUM spurium.** Leaves growing by sixes; spear-shaped, keeled, rough with prickles pointing backwards. Joints of the stem simple. Fruit smooth.—

Vaill. 4. 4.—(a) the seed-vessel, is referred to by *Haller*, though the fruit has a few short hairs upon it. *Mr. Hudson* does not refer to any figure.—(b. is a seed-vessel of the *G. Aparine.*)

Has a near affinity to *G. Aparine*, but smaller. Stems spreading. *Leaves* 6, not 8 as in *G. Aparine*; surface also beset with prickles pointing backwards. *Seeds*, when ripe, just sensibly wrinkled. *LINN.*

Aparine femine laviore. R. hist. 484. *syn.* 225, from *Ray's* description of “ seeds not entirely smooth, but much less hairy than those of “ the *G. Aparine*,” appears at least to be the plant of *Vaill.* above referred to, which, whether the *G. spurium* or not, is readily distinguishable from the *V. Aparine* by the first division of the fruit-stalks being surrounded with a whorl of leaves. *Haller*, however, assures

us,

us, that the specimen sent him by Mr. Hudf. was the *Valantia Aparine*. It is pity that this remark of his learned correspondent should have escaped Mr. Hudson's notice. My specimens were cultivated under the name of *G. spurium* in the botanic garden of Mr. Sole, of Bath, but are undoubtedly *V. Aparine*. On these accounts I am induced to insert it, believing that, and not the *G. spurium*, to be the plant described in the Fl. ang. ST.

Corn fields. Isle of Wight, and in Surrey. A. June. July.

GAL'IUM *tricorn'e*. Fruit-stalks from the sides of *three-horned* the stem almost bare of leaves, dividing into 3; pedicles bowed back.*—*Valantia Aparine*. The flowers that have only chives cloven into 3; on pedicles which grow on the fruit-stalk of the flower producing chives and pointals. LINN.

Vaill. 4. 3. a.—(b. is *Aparine semine coriandri saccharati* of Park. given as a synonym in the hort. upf. but which, I think, is very properly regarded by Vaill. as a distinct species.)

Fruit-stalks bearing 3 flowers curved downwards. HALL. ST.—Leaves from 6 to 8; upper surface smooth, rib underneath rough. Fruit roughish, beset with a number of minute tubercles, but which do not end in hairs. POLLICH. ST.—Rundles on fruit-stalks, generally 2 to a whorl, opposite, dividing into 3 branches; not leafy at the base, each bearing one fruit. The above as cultivated. In Vaill. fig. each rundle seldom produces more than one perfect fruit. ST.

Place of growth, &c. see *G. spurium*.

GAL'IUM *ang'licum*. Leaves about 6 in a whorl, *small* spear-shaped, taper-pointed, bent back, fringed with prickly hairs. Stem spreading, rough with prickles pointing backwards. Fruit smooth. HUDS. ST.—Blossoms smaller than the fruit. ST.

Ray 9. 1, at p. 128.—(Barr. 58, resembles it, but the blossoms white, fruit hairy, and the branches with whorls of several leaves.)

Stems from 1 to 1½ foot high, spreading, 4 cornered, knotted, branched; flowering branches opposite. Leaves bare, (except at the edge) sometimes 7 in a whorl, and sometimes strap-spear-shaped. Fruit-stalks 3 forked. Flowers greenish yellow. Seeds larger than the blossom, smooth. HUDS. ST.—Root branching. Stem, branches alternate. Panicle terminating, (not so in Ray's figure.) Blofs. of 4 petals, (an error for 4 divisions?) HUDS.—Leaves, the prickly hairs at the edge pointing forwards, sometimes a few scattered on the

* (Pedunculis lateralibus, subnudis, 3-fidis; pedicellis recurvis.) ST.

the surface; those of the branches generally in twos as in Ray's figure. Branches rough. Fruit-stalks smooth, generally dividing into 3, one of them supporting 2 flowers; sometimes dividing simply into 3 or 2. ST.

Aparine minima. R. syn. 225, is referred to by Hudson, but Ray says, "seeds not so rough as in the other Aparines." Linnæus accordingly has referred it to his *G. parisiense*.—*Aparine minima*. VAILL. par. 14. Here, on the contrary, the descr. corresponds; but the *Gallium Tourn. inst.* 664, which is given as a synonym, is also referred by Linnæus to his *G. parisiense*. I have specimens of the plant of Vaill. collected in the King's garden, at Paris, corresponding exactly with the descriptions given above, and others of the *G. parisiense*. LINN.—I cannot discover any difference between them, except in the roughness and smoothness of the fruit, which induces me to believe the *G. anglicum* of Hudson, and the *parisiense* of Linn. to be mere varieties of one and the same plant. ST.

Least Goose-grafs.

—*J. B.* iii. 266.

This plant is parasitical, without seed-lobes. The seed itself opens and puts forth a little spiral body, which does not seek the earth to take root, but climbs in a spiral direction from right to left, up other plants, from which, by means of vessels, it draws its nourishment. *Leaves* none, except here and there a very small membranaceous scale lying close under a branch. LINN. ST.—*Flowers* in globular heads not surrounding the stem but from the side where it divides into branches. J. BAUH. ST.—The seeds sown in a pot produced plants, but which soon died, unless they could attach themselves to some other plant. PARK. and RAY *hist.*

* Corollis urceolatis, laciniis obtusiusculis.

As soon as the shoots have twined about an adjoining plant, they send out from their inner surface a number of little vesicles or papillæ, which attach themselves to the bark, or rind of the plant. By degrees, the longitudinal vessels of the stalk, which appear to have accompanied the vesicles, shoot forth from their extremities, and make their way into the softer plant, by dividing the vessels, and insinuating themselves into the tenderest part of the stalk; and so intimately are they united with it, that it is easier to break than to disengage them from it. *Guetard in Gent. Mag.*

Bloss. white, sometimes with a tinge of purple. *VAILL. ST.*—*Empal.* like a spice clove, running down, as it were, into a kind of fruit-stalk; *segments* egg-shaped, often rounded at the end. *Capf.* cut round close to the base. *Partition* rising from the lower half of the capsule. *ST.*

On furze bushes, near Mollance, in Galloway. *LIGHTF.* who refers to *Fl. dan.* 199, but he appears to have inserted it as a Scotch plant on the authority of a correspondent, not from his own examination. Mr. Hudson also has given *C. europ.* but, from his account of it, his plant appears to have been *C. Epithymum*. I have never seen the true *europæa* of British growth. My specimens gathered in Champagne France, and from Germany. *ST.*—The whole plant is bitter. It affords a pale reddish colour.

Cows, Sheep, and Swine eat it. Horses refuse it. Goats are not fond of it. *LINN.*—Hops, flax, heath, and nettles are its common support.—It never fixes upon trees or shrubs. *SCOP.* but Pollich mentions having found it on some of the *Ericas*. *ST.*

lesser CUS'CUTA *Epithymum*. Flowers sitting, surrounded with floral-leaves. Blossoms 5-clefted. *LINN.*—Bell-shaped. deeply cloven; segments taper-pointed.* *The number of parts constantly 5. ST.*

Fl. dan. 427.—*Park.* 10. 1.—*Math.* 1277.—*Pomet.* 42. 9.

Bloss. with 5 divisions, none with less. Shape of *bloss.* and *empal.* agrees with *Fl. dan.* 427, though in habit it resembles t. 199. Mr. WOODWARD. *ST.*—*Empal.* between cloven and divided; *segments* egg-shaped, taper-pointed, unequal, not running down into a kind of fruit-stalk as in *C. europæa*. *ST.*

Corn fields and heaths, very common. *HUDS.*—My specimens, dried from Mr. Woodward, gathered by Mr. Pitchford; from Dr. Broughton, gathered, I believe, in Scotland; and from the son of Prof. Jacquin. *ST.*

A. June.—Aug.

* Corollis campanulatis partito-quinquefidis; laciniis acuminatis.

178. APH'ANES. Parfleypiert.

EMPAL. *Cup* 1 leaf, tubular, permanent: *Mouth* flat, 4-clefted; *segments* alternately very small.

BLOSS. None.

CHIVES. *Threads* 4; upright; awl-shaped; very small; standing upon the rim of the empalement. *Tips* roundish.

POINT. *Seed-buds* 2; egg-shaped. *Shafts* thread-shaped; as long as the chives; growing from the base of the seed-bud. *Summits* somewhat globular.

S. VESS. None; the *Rim* of the empalement closing, confines the seeds.

SEEDS. 2; egg-shaped; tapering; compressed; as long as the shafts.

ESS. CHAR. *Empal.* 4-clefted. *Blöfs.* 0. *Seeds* 2, naked.

OBS. It very nearly resembles the *ALCHEMILLA*. It has sometimes only 1 pointal and 1 seed. LINN. — Seed 1. POLLICH. RETZ. &c.

Woods, hedges, heaths. [On the north side of the Wrekin, in Shropsh. the trees grow to a large size. WITH.] T. April.—June.

All the varieties which gardeners reckon to the amount of 40 or 50, are derived from this one species, and depend upon the variations of the leaves or thorns, and the colour of the berries.

Sheep are fed in the winter with the croppings. *Pennant's Tour.* 1772. p. 32. Birds eat the berries. The bark fermented and afterwards washed from the woody fibres makes the common Birdlime. It makes an impenetrable fence, and bears cropping; nor is its verdure, or the beauty of its scarlet berries, ever observed to suffer from the severest of our winters. The wood is used in fincering, and is sometimes stained black to imitate Ebony. Handles for knives, and cogs for mill-wheels are made of it.

188. SAGI'NA. Pearlwort.

BLOSS. *Cup* 4-leaved. *Little leaves* egg-shaped; concave; greatly expanded; permanent.

BLOSS. *Petals* 4; egg-shaped; blunt; expanding; shorter than the empalement.

CHIVES. *Threads* 4; hair-like. *Tips* roundish.

POINT. *Seed-bud* somewhat globular. *Shafts* 4; awl-shaped; bent backward; downy. *Summits* simple.

3. VESS. *Capsule* egg-shaped; straight; with 4 cells, and 4 valves.

SEEDS. Numerous; small; fixed to the receptacle.

ESS. CHAR. *Empal.* 4-leaved. *Petals* 4. *Caps.* 4-celled, 4-valved. *Seeds* many. [*Caps.* 1 cell. *Cup-leaves* sometimes 5. ST.]

SAGI'NA *procumbens*. Stems trailing. LINN.— *trailing*
"In dry situations upright. ST.)

Curt.

Curt. iii. 27.—*Seguier.* i. 5. 3.—*Park.* 1340. 6.—*Pet.* 59. 10.—
(*Ger. em.* 567. 5, not the plant.)

Flowers sometimes with petals, and sometimes without. LINN.
JACQ. WITH. ST.—In all the specimens of it gathered in the fields, I could never find any petals, but the same plant being transplanted into the garden produced petals the 2d year. The Root when cultivated perennial. JACQ. enum.—Stem sometimes not above 2 lines high. Leaves, the edges skinny towards the base, and fringed. Empal. leaves upright until the S. vessel opens. S. vess. valves thin, transparent, and, from the minuteness of the petals, may be easily mistaken for them. ST.—Blossoms greenish white. The 4 valves of the capsule, after it opens, have so much the appearance of petals, that I was once deceived by them. WITH.

Chickweed-Breakstone.

Walls, roofs, sandy, and also boggy places; garden walks, paved courts, common, A. June.

annual β . *apetala.* HUDS. *Sagina apetala*, which see.
succulent γ . Leaves shorter, thicker, and more succulent. RAY.

annual SAGI'NA *apet'ala*. Stem rather upright, downy. Flowers alternate; without petals. LINN.—Petals very minute. ST.

Curt. iv. 49.—*Fl. dan.* 845, (see *Sagina erecta*.)—*Plott. oxf.* 9. 7. at p. 146.—*Pet.* 59. 11.—*Pluk.* 74.

Differs from the *S. procumbens* in the root being annual; the stems not striking root from the joints, and being of a dirty brownish green. PLOTT. RAY. ST.—Fruit-stalks smooth. Empal. smooth, its leaves blunt. Petals scarcely twice as large as the tips, whence possibly unobserved by Linnæus; inversely egg-shaped, and sometimes heart-shaped; greenish, resembling honeycups. Summits very short. Capsule of 1 cell; valves larger than the leaves of the empalement, permanent. ST.—Leaves hairy. Hairs not terminated by minute globules as in *Spergula laricina*. CURT. MR. WOODW.

Sagina procumbens apetala. HUDS.

[On a wall belonging to the Alms-house near St. Oswald's, Worcester. ST.]

upright SAGI'NA *erect'a*. Stem upright; generally with only 1 flower. LINN.—Leaves of the cup spear-shaped, tapering to a point. ST.—Stem sometimes ascending. MR. WOODWARD.

Curt. ii. 23.—*Ray* 15. 4. at p. 348.—*Vaill.* 3. 2.—*Pet.* 59. 9.—
(*Fl. dan.* 845, referred to by Murr. is surely the *procumbens* *apetala*, for Mull. himself remarks that it has no petals, and that the leaves

leaves of the empalement are egg-shaped and concave.—Barr. 1165, cannot surely be the plant.)

Stem bearing from 1 to 3 flowers. LINN.—Leaves between strap and spear-shaped. GER. prov. — Flowers closed. Shafts often 5. POLLICH.—Stem in dry seasons generally simple; in moist grounds several, ascending, each supporting from 1 to 3 flowers. Shafts very short. Capsule opening generally with 10 teeth. Agrees with *Sagina* in the number of its parts; in its habit and glaucous appearance it approaches to the *Stellaria Holostium*, but in its seed-vessels it agrees with *Cerastium*. CURT.—It is truly a *Cerastium*. The *Alpine media* and *Cerastium semidecandrum* are *Cerastiums* with half the usual complement of chives. This is a *Cerastium* of the same kind, with one-fifth of its usual number of parts taken away; a circumstance which Linnæus notices in many genera. ST.—Stems, varieties of above-mentioned do not seem owing to a wet or dry season, having, for some years past, found them with these different appearances in their respective places of growth. MR. WOODWARD.—Leaves smooth. Blossoms white. WITH.

Least stitchwort.

Gravelly soil. [Heaths in Norfolk, frequent. MR. WOODWARD.]
A. April. May.

186. POTAMOGE'TON. Pondweed.

EMPAL. None.

BLOSS. *Petals* 4; nearly circular; blunt; concave; upright; furnished with a little claw; deciduous.

CHIVES. *Threads* 4; flat; blunt; very short. *Tips* double; short.

POINT. *Seed-buds* 4; egg-shaped; but taper-pointed. *Shaft* none. *Summits* blunt.

S. VESS. None.

SEEDS. 4; roundish, taper-pointed, bellying on one side, flattened on the other, and angular.

ESS. CHAR. *Empal.* 0. *Petals* 4. *Shaft* 0. *Seeds* 4.

Obs. The leaves of those species which grow under water are pellucid; those of the *natans* which float on the surface or vegetate in air opaque; those of the *densum*, *ferratum*, and *setaceum* opposite, of the rest alternate, except those at the base of the fruit-stalks, where, in all the species that I have examined, they are opposite. ST.

POTAMOGE'TON *na'tans*. Leaves oblong egg- broad-leave-shaped, on leaf-stalks; floating. LINN.

Variety

(Variety 2 grows in air. ST.)

floating 1. Sheaths of the fruit-stalks and leaf-stalks more than half the length of the respective stalks. WITH.—Upper-leaves floating on the surface of the water. ST.

Fuchs. 651, cop. in Trag. 688.—Ger. em. 821. 1, cop. in Pet. 5.

4, and H. ox. v. 29, row 1. 1. at p. 596.—Ger. em. 675. 1.—

Park. 1254. 1. b, a branch with only leaves.—Matth. 1137.

Leaves very entire, ribbed. POLLICH. ST.—Opaque, those of the other species are pellucid. ST.—Spikes from the base of the leaves, on fruit-stalks as large as the stem. Flowers sitting, numerous. Mr. Woodward.—yellowish. Leaf-stalks for the most part longer than the leaves. WITH.

Ponds and slow rivers, common. P. July. Aug.

The leaves floating upon the surface of the water afford an agreeable shade to fish, and are the habitation and food of the *Phalæna Potamogeton*.

boggy 2. *paludosum*. Sheaths of the fruit-stalks and leaf-stalks not half the length of their respective stalks. WITH.—Stem growing in the air, ascending. ST.

When it grows in a place which is dried up in the summer, it surprisingly changes its appearance, growing upright, and resembling a small *Plantago*. LINN. lapp. p. 44. Mr. Woodward. ST.—Spike nearly 1 inch long. Blofs. (or rather cup) fleshy, green. CHIVES, Tips very large. Dust white. POINT. Summits very indistinct; brown. Fruit-stalks about twice as long as the spike. Leaves alternate, except the upper pair, which are opposite; lower ones spear-shaped, on long leaf-stalks; upper ones oval, with shorter leaf-stalks. Stem about 4 inches high. Sheaths of the leaf-stalks seem soon to decay. Flowers a month or six weeks earlier than variety 1. WITH.—Leaves 3 or 4 times less, more pointed. ST.

[Boggy ground on Birmingham Heath. WITH.—And Sutton Park, Warwickshire, in places where stagnant water has been dried up or drained off. ST.] P. May.—A. g.

perfoliate POTAMOGETON *perfoliatum*. Leaves heart-shaped, embracing the stem.—

H. dan. 196.—Dod. 582. 3, repr. in Ger. em. 822. 3, cop. in J.

B. iii. 778. 2, Pet. 5. 6, and H. ox. v. 29, row 2. 3, at p. 596.

Leaves alternate, but where a joint throws out a fruit-stalk, in pairs, ribbed. Leaf-scales none, or very short. HALL. ST. Mr. Woodward.—Leaves with from 5 to 7 principal ribs, with intermediate finer ones, ending in the point of the leaf. ST.

heart β. HUDS.—Pet. 5. 7, probably a copy of Loes. 65.

My specimens seem to evince that these varieties run into one another. ST.—Blofs. yellowish.

Rivers

Rivers and ponds, frequent. P. June.—Aug.

Goats and Cows eat it. Horses, Sheep, and Swine refuse it.

POTAMOGE'TON *lucens*. Leaves flat, spear- long-leaved
shaped, tapering down into leaf-stalks.—

Fl. dan. 195.—*Pet.* 5. 5.—*J. B.* iii. 777. 1.—*Dod.* 582. 2, repr.

River Clyde. LIGHTF.

2. RAY. *ib.*—Leaves somewhat elliptical. Mr. WOODWARD. ST. broad-leaved

—Surface covered with a network of pellucid veins. Blossoms red-

dish. WITH.—Stem cylindrical. Leaves very entire, somewhat

waved at the edge, ribbed. POLLICH. ST.—Egg-spear-shaped,

plumtish, sitting, alternate, but those at the base of the fruit-stalks

opposite; ribs numerous, about a line between each. Leaf-scales

saw-shaped, rising from the joint at the insertion of the leaf, and

sheathing the part of the stem above. ST.

River at Tamworth. ST.

3. Leaves very taper-pointed from the mid-rib, extending a sharp-leaved
great length beyond the body of the leaf. Mr. WOODWARD.

Ger. em. 822. 4, expresses this tho' but very imperfectly. Mr. WOODW.

[R. Waveney, by Bungay, Suffolk. Mr. WOODWARD.]

POTAMOGE'TON *den'sum*. Leaves egg-shaped, close-leaved
taper-pointed, opposite, crowded. Stems forked. Spike
with 4 flowers.—

J. B. iii. 777. 2, leaves far asunder and some of the fruit-stalks
from the sides of the stem.—(*Clus.* ii. 252. 2, repr. in *Ger. em.*

824. 3; cop. in *Park.* 1248. 3; and *Pet.* 5. 8, is *P. crispum*.—

Clus. has not given any fig. of the plant referred to by Linn.)

Fruit-stalk very short, from the fork of the stem. LINN.—Bent

back. Leaves towards the end of the stem tiled. Spike small. Flowers

few, sitting. HALL. Mr. WOODWARD. ST.—Leaves waved at the

edge. Mr. WOODWARD. ST.—Three-ribbed; edge very finely

serrated. WITH. ST.—Serratures, or rather minute prickles, not

visible, unless considerably magnified. Leaves, lateral ribs just

perceptible to the naked eye, and joining the middle rib at some

distance from the point, forming, as it were, an ellipsis within the

disc of the leaf. ST.

Lesser Water Caltrops. Frogs Lettuce.

Ditches and slow streams.

P. May, June.

POT A -

curled POTAMOGE'TON *crispum*. Leaves spear-shaped; alternate or opposite, waved and ferrated.—

Curt. iv. 49.—Ger. em. 824. 2, *cop. in Park.* 1248. 2, Pet. 5. 9, and J. B. iii. 778. 1.—Clus. ii. 252. 2, *repr. in Ger. em.* 824. 3; *cop. in Park.* 1248. 3, and Pet. 5. 8, as is evident from Clus. description.

Stem compressed. RAY. WITH. ST.—In which it agrees with the *compressum*, and differs from the rest. RAY. ST.—Leaves with 3 parallel ribs, connected laterally by transverse ramifications; edges parallel for the greater part of their length. HALL. ST.—Leaves alternate, but at the forks of the stem opposite. POLLICH. WITH. ST.—Ending rather obtusely, very finely ferrated. Fruit-stalks from the forks of the stem. POLLICH. ST. — Leaves oblong-spear-shaped; lateral ribs meet as they approach the point, forming a circular line parallel to the margin of the leaf, without these on each side is a still finer rib running close to the edge. Fruit-stalks generally shorter than the leaves, but sometimes more than twice as long, corresponding with Clus. fig. ST.—Bloss. white or reddish. Stems branched. Leaves fitting; semi-transparent and very crisp. WITH.

Greater water Caltrops.

Ponds and flow streams, very common.

P. May. June.

ferrated POTAMOGE'TON *ferratum*. Leaves spear-shaped, opposite, a little waved at the edges.—

J. B. 988. 4, but leaves, both description and figure, as alternate.—
(Fl. dan. 195, Dod. 582. 2, and Pet. 5. 5, is *P. lucens*.)

Is it not a variety of *P. crispum*? LINN. MR. WOODWARD.—It is at least very closely allied to it.

Leaves, upper ones opposite, lower ones sometimes alternate. HUDS.—Sheaths fringed. SCOP.—Bloss. greenish yellow, on fruit-stalks. WITH.—Wiggers complains that the generality of authors have confounded this with the *lucens*, but he seems to me only to have transposed the characters of the 2 species. ST.

Slow rivers.

P. June.

flat-stalked POTAMOGE'TON *compressum*. Leaves strap-shaped, blunt. Stem flattened.—

Fl. dan. 203.—Pet. 5. 10.—(In Ray 4. 3, the leaves are several times broader than the stem.)

Leaves sometimes alternate, sometimes opposite. LINN.—Leaves alternate, but those at the base of the fruit-stalks opposite. RAY. hist. MR. WOODWARD.—The mid-rib strong, white. MR. WOODW.—
Leaves

Leaves very entire. Leaf-scales short. POLlich.—Stem nearly as broad as the leaves. ST.—Blossoms greenish; on short spikes. WITH.
Slow streams and ditches. P. June. July.

POTAMOGE'TON *pectina'tum*. Leaves bristle-fennel-leaved shaped, parallel, near together, pointing 2 ways.—

Ger. em. 828. 4.—Pet. 5. 13.—Pluk. 216. 5.—(Pet. 5. 12, has strap-shaped leaves.)

Stem cylindrical. Leaves flatted. Bloss. whitish. Tips yellow. WITH.

Rivers and ponds. [River Waveney, frequent. Mr. Woodw.]
P. May.—July.

POTAMOGE'TON *gramin'eum*. Leaves between grass-leaved strap and spear-shaped, alternate, sitting; broader than the props.—

Fl. dan. 222.—Ray 4. 3.—Pet. 5. 12?—(Pet. 5. 10, is *P. compressum*.)

The leaves at the base of the fruit-stalks opposite. Leaf-scales very numerous and large. HALL.—Fl. dan. and Ray are both referred to by Linnæus and Haller.—But Mr. Lightf. has very justly remarked the want of leaf-scales in the fig. of Ray. I suspect they will turn out to be 2 species. Ray 4. 3, is the fig. referred to in the Sp. pl. and with which my specimens correspond.—Leaf-scales much narrower than the leaves, and so as easily to escape the attention of a common artist; rather strap-shaped, bluntish, and set close, as in Ray's figure; not spear-shaped, tapering to a point, toothed, and at a considerable distance from each other, as in that of the Fl. dan.—Ribs 3; very finely serrated as the *Potamogeton alterum nostras*, &c. with long, blunt, shining leaves, very minutely notched of PLUK. amal. 177, and R. syn. 50. n. 11.—Haller describes the leaves of his as gradually diminishing, which corresponds with the fig. of the Fl. dan. ST.

Slow streams and marshy ditches.

P. July.

POTAMOGE'TON *mari'num*. Leaves strap-sea shaped, alternate, distinct; the base sheathing the stem.—

Fl. dan. 186.—Vaill. 32. 5.—H. ox. v. 29. 9, at p. 596.—(Pet. 5. 13, and Pluk. 216. 5, are *P. pectinatum*.)

The props not distinct in this, as in the other species, but the leaves fixed to them. LINN.—Leaves growing from the sheaths, which are slightly forked at the extremity as in *P. pectinatum*. In stagnant salt water ditches the whole plant is shorter; the branches and leaves closer and more frequent. In running water, whether salt or fresh, it grows to a vast length, and the branches and leaves are farther

farther asunder, but in both cases preserve their parallelism. *Spike* long; with sitting flowers, growing mostly in interrupted whorls. Fl. dan. 186 more exactly resembles our fresh than salt water plants, though quoted in *Syst. Veget.* for *P. marinum*. Mr. WOODWARD.—Leaves scarcely a line broad. POLLICH. ST.—In quite fresh water it becomes the *P. pectinatum*. Mr. CROWE. Mr. WOODWARD.—What I have been accustomed to refer to the *marinum* have grown in fresh water, as those of *Pollich. and Vaill.* (par. p. 164. n. 8.) If, however, such should prove to be the *pectinatum*, Linnæus's characteristic mark of the *marinum*, of its leaves growing on leaf-sheaths, will appear to be by no means peculiar to that species.—Reichard's references to Haller in this species and the *pumillum* are transposed. ST.

Salt water ditches. [Near Yarmouth. Mr. WOODWARD.]

A. LINN. P. HUDS. July. Aug.

small POTAMOGETON *pumillum*. Leaves strap-shaped, opposite, alternately distinct, expanding at the base. Stem cylindrical.—

Vaill. 32. 4.—*Pet.* 5. 11. (*Fl. dan.* 186, is, without doubt, *P. marinum*.)

Leaves rather pointed, very entire. POLLICH. ST.—Alternate; but those at the base of the fruit-stalks opposite. NECK. ST.—See observation at the end of the generic character. ST.—*Spikes* very small, composed of but few flowers. HALL. Mr. WOODWARD.—*Spikes* of 6 or 8 florets; placed opposite to each other. *Fruit-stalks* about 1 inch long. SCOP.—*Leaves* rather longer than the joints of the stem; *upper* ones opposite; *lower* ones alternate. *Fruit-stalks* terminating, sheathed at the base by 2 concave, skinny, spear-shaped scales. *Spikes* terminating, nearly globular, about 3 flowers in each. *Summits* a little hollow at the top. Class V.

P E N T A N D R I A.

V. C H I V E S.

THE first division of the first ORDER of this class, includes the plants with ROUGH LEAVES; which admit of the following natural character:

EMPAL. Cup 1 leaf; with 5 clefts, or 5 divisions: permanent.

BLOSS. 1 petal; with 5 clefts.

CHIVES. Threads 5, fixed to the tube of the blossom.

POINT. Seed-buds 4. Shaft single; thread-shaped. Summit blunt.

S. VESS. None.

SEEDS. 4; inclosed by the cup.

MARTYN *Cat. Cant.* 26.

Obs. Leaves rough and hairy; alternate, or scattered; without leaf-stalks. Spikes *before the flowers open, rolled back spirally*. Virtues *slightly astringent, and sometimes narcotic*. MARTYN, *ib.* But LINN. describes them as *mucilaginous and esculent*. Phil. bot. 340. As there is no seed-vessel, the cup does not fall off, but remains after the blossom decays, and contains the seeds.

In the second division of this order, those plants which bear berries and have a blossom composed of one petal, are generally poisonous.

The 3d division of the SECOND ORDER consists of plants whose flowers are disposed in RUNDLES; or the *Umbelliferous* plants of many authors. They admit of the following natural character:

Rundle composed of several *Rundlets*.

Fence, general, inclosing the whole rundle, or *partial*, inclosing only the rundlets.

EMPAL.

EMPAL. *Cup* hardly discernible.

BLOSS. 5 petals; standing on the seed-bud; shedding.

Petals generally heart-shaped, and bent inwards.

CHIVES. *Threads* 5; simple; hair-like. *Tips* simple, or roundish.

POINT. *Seed-bud* beneath. *Shafts* 2, generally distant.

Summits simple.

S. VESS. None.

SEEDS. 2; scored; convex on one side, flat on the other.

MARTYN *Cat. Cant.*

OBS. Stems hollow and pithy. Leaves alternate:

In dry situations these plants are aromatic and carminative: in moist ones, often poisonous. MARTYN. *ib.* The greatest virtues are contained in the seeds and roots. Many of them are eaten at our tables, as the roots of CARROT and PARSNEP, and the leaves of CELERY. The seeds of CORIANDER and CARAWAY are used in confectionary.

Class V.

PENTANDRIA.

V. CHIVES.

Order I.

MONOGYNIA; I. POINTAL.

- * Flowers of 1 petal; beneath. Seeds 4; naked. ROUGH LEAVES.
203. EC'HIMUM. - - Bloss. mouth naked; irregular; bell-shaped.
196. PULMONA'RIA. - Bloss. mouth naked; funnel-shaped. Cup prism-shaped.
193. LITHOSPER'MUM. Bloss. mouth naked; funnel-shaped. Cup with 5 divisions.
197. SYM'PHYTUM. - Bloss. mouth toothed; bellying.
200. BORA'GO. - - Bloss. mouth toothed; wheel-shaped.
202. LYCOP'SIS. - - Bloss. mouth covered; funnel-shaped. Tube crooked!
201. ASPERU'GO. - - Bloss. mouth covered; funnel-shaped. Fruit compressed,
195. CYNOGLOS'SUM. Bloss. mouth covered; funnel-shaped. Seeds depressed, fixed by the side.
194. ANCHU'SA. - - Bloss. mouth covered; funnel-shaped. Tube prism-shaped at the base.
192. MYOSO'TIS. - - Bloss. mouth covered; falver-shaped. Segments notched.

** Flowers of 1 petal; beneath. Seeds in a vessel.

220. ANAGAL'IS. - - Capsule 1-celled; cut round. Bloss. wheel-shaped. Summit a knob.
219. LYSIMACH'IA. - Caps. of 1 cell, and 10 valves. Bloss. wheel-shaped. Summit blunt.
210. PRIMULA.

210. PRIMULA. - - *Capsule* 1-celled. *Bloss.* funnel-shaped: mouth open. *Summit* globular.
216. HOTTONIA. - - *Capsl.* 1-celled. *Bloss.* the tube beneath the chives! *Summit* globular.
215. MENYANTHES. - *Capsl.* 1-celled. *Blossom* shaggy. *Summit* cloven.
231. CONVULVULUS. *Capsl.* 2-celled; 2-seeded. *Bloss.* bell-shaped. *Summit* cloven.
263. DATURA. - - *Capsl.* 2-celled; 4-valved! *Bloss.* funnel-shaped. *Cup* deciduous.
264. HYOSCYAMUS. - *Capsl.* 2-celled; covered with a lid! *Bloss.* funnel-shaped. *Summit* a knob.
262. VERBASCUM. - - *Capsl.* 2-celled. *Bloss.* wheel-shaped. *Summit* blunt. *Chives* declining.
275. CHIRONIA. - - *Capsl.* 2-celled. *Bloss.* jug-shaped. *Tips* spirally twisted after shedding their dust.
233. POLEMONIUM. - *Capsl.* 3-celled. *Bloss.* with 5 divisions. *Chives* on the valves of the tube.
225. AZALEA. - - *Capsl.* 5-celled. *Bloss.* bell-shaped. *Summit* blunt.
322. VINCA. - - - *S. Vess.* 2 upright little bags. *Bloss.* falver-shaped. *Seeds* not winged.
268. SOLANUM. - - *Berry* 2-celled. *Tips* with 2 holes in each.
266. ATROPA. - - *Berry* 2-celled. *Chives* distant; bowed inwards.

† Gentiana Centaurium.

*** Flowers of 1 petal; superior.

232. SAMOLUS. - - *Capsl.* 1-celled; and 5 valves at the top. *Bloss.* falver-shaped. *Summit* a knob.
236. PHYTEUMA. - - *Capsl.* 2 or 3-celled, perforated. *Bloss.* with 5 divisions. *Summit* with 2 or 3 clefts.

234. CAMPAN'ULA. - - *Capsf.* 3 or 5-celled; perforated.
Blofs. bell-shaped. *Summit* 3-
 clefted.

250. LONICE'RA. - - *Berry* 2-celled, roundish. *Blofs.*
 unequal. *Summit* a knob.

† Viburnum Lantana. Lobelia. Rubia peregrina.

**** Flowers of 5 petals; beneath.

284. RHAM'NUS. - - *Berry* 3-celled; globular. *Cup*
 tubular, resembling a blossom;
 with 5 converging scales at the
 mouth.

291. EUON'YMUS. - - *Berry* resembling a capsule, lobed.
Cup expanding. *Seed* like a
 berry; covered with an outer
 coat.

† Viola Impatiens.

***** Flowers of 5 petals; superior.

301. RI'BES. - - - *Berry* many-seeded. *Petals* stand-
 ing on the cup. *Shaft* cloven.

304. HED'ERA. - - *Berry* 5-seeded. *Cup* binding
 round the fruit. *Summit* simple.

† Jasione.

***** Flowers imperfect; beneath.

313. ILLEC'EBRUM. - *Capsf.* 1-seeded; 5-valved. *Cup*
 simple; rough and inelegant.

314. GLAU'X. - - - *Capsf.* 5-seeded; and 5-valved,
Cup simple; bell-shaped; rough
 and inelegant.

† Polygonum amphibium. Atriplex. Salsola. Chenopodium
 maritimum.

***** Flowers imperfect; superior.

315. THE'SIUM. - - *Seed* 1, crowned. *Cup* bearing
 the chives.

Order

Order II.

DIGYNIA; II. POINTALS.

* Flowers of 1 petal; beneath.

51. SWER'TIA. - - Caps. 1-celled; 2 valved. Bloss.
wheel-shaped, with 5 honey-
cup pores.
52. GENTIA'NA. - - Caps. 1-celled, 2-valved. Bloss.
tubular; variously shaped.
- † Cuscuta.

** Flowers of 5 petals; beneath.

† Staphylea pinnata.

*** Flowers imperfect.

339. SAL'SOLA. - - Seed 1; resembling a snail-shell,
covered. Cup 5 leaves.
337. CHENOPO'DIUM. Seed 1; round and flat. Cup 5 con-
cave leaves.
338. BE'TA. - - - Seed 1; kidney-shaped. Cup 5
leaves; with the seed at the
bottom.
336. HERNIA'RIA. - - Seed 1; egg-shaped; covered.
Cup with 5 divisions. Threads
5 with, and 5 without tips.
345. UL'MUS. - - - Berry not juicy; compressed. Cup
1 leaf; soon shrivelling.
- † Scleranthus annuus, perennis. Cuscuta europæa.

**** Flowers of 5 petals; superior—and 2 seeds. In RUNDLES.

A. FENCE both general and partial.

354. ERYNG'IUM. - Florets in globular heads. Recep-
tacle chaffy.
355. HYDROCOT'YLE. Florets in a sort of rundle; fer-
tile. Seeds compressed.
356. SANIC'ULA. - - Florets in a sort of rundle; those
in the centre barren. Seeds
covered with sharp points.

375. HERACLE'UM. - *Florets unequal; almost all fertile. Fence deciduous. Seeds membranaceous.*
382. OENAN'THE. - - *Florets unequal; those in the circumference barren. Fence simple. Seeds crowned; sitting.*
359. ECHINOPH'ORA. *Florets unequal; several barren. Fence simple. Seeds sitting.*
362. CAU'CALIS. - - *Florets unequal; those in the centre barren. Fence simple. Seeds covered with sharp points.*
364. DAU'CUS. - - *Florets unequal; those in the centre barren. Fence winged. Seeds covered with prickles.*
361. TORDYL'IUM. - - *Florets unequal; all fertile. Fence simple. Seeds with a scolloped border.*
370. PEUCED'ANUM. *Florets equal; those in the centre barren. Fence simple. Seeds scored; flattened.*
367. CO'NIUM. - - *Florets equal; all fertile. Petals heart-shaped. Partial fence extending but $\frac{1}{2}$ way round. Seeds bellying; ribbed and furrowed.*
366. BU'NIUM. - - *Florets equal; all fertile. Petals heart-shaped. Partial fence bristle-shaped.*
369. ATHAMAN'TA. - *Florets equal; all fertile. Petals heart-shaped. Seeds convex, scored.*
358. BUPLEU'RUM. - *Florets equal; all fertile. Petals rolled inwards. (The undivided leaves of the partial fence often resemble petals.)*
378. SI'UM. - - - *Florets equal; all fertile. Petals heart-shaped. Seeds nearly egg-shaped; scored.*
368. SELI'NUM. - - *Florets equal; all fertile. Petals heart-shaped. Seeds flattened; scored.*
371. CRITH'MUM. - - *Florets equal; all fertile. Petals rather flat. Fence horizontal.*
376. LIGUS'TICUM. - *Florets equal; all fertile. Petals rolled inwards. Fence membranaceous.*

377. ANGEL'ICA.

377. ANGEL'ICA. - - *Florets equal; all fertile. Petals rather flat. Rundlets globular.*
 379. SI'SON. - - - *Florets equal; all fertile. Petals rather flat. Rundlets of few florets.*

† Coriandrum. Apium graveolens.

B. FENCE only partial.

385. ÆTHU'SA. - - *Florets rather unequal; all fertile. Partial fence extending but half way round.*
 386. CORIAN'DRUM. - *Florets unequal; some of them barren. Fruit nearly globular.*
 387. SCAN'DIX. - - *Florets unequal; those in the centre barren. Fruit oblong.*
 388. CHÆROPHYL'LUM *Florets unequal; those in the centre generally barren. Fruit nearly globular. (Partial fence 5 leaves.)*
 383. PHELLAN'DRIUM. *Florets nearly equal; all fertile. Fruit crowned.*
 389. IMPERATO'RIA. - *Florets nearly equal; all fertile. Rundle expanded and flat.*
 384. CIGU'TA. - - - *Florets nearly equal; all fertile. Petals rather flat.*

† Bupleurum rotundifolium. Heracleum Sphondylium.
 Oenanthe crocata. Caucalis leptophylla. Angelica sylvestris.
 Bunium Bulbocastanum.

C. FENCE 0; neither general nor partial.

393. SMYR'NIUM. - *Florets equal; those in the centre barren. Seeds kidney-shaped; angular.*
 395. CA'RUM. - - - *Florets nearly equal; those in the centre barren. Seeds bellying; scored.*
 392. PASTINA'CA. - - *Florets nearly equal; all fertile. Seeds depressed and flat.*
 394. ANE'THUM. - - *Florets nearly equal; all fertile. Seeds bordered; scored.*

398. ÆGOPO'DIUM.

398. *ÆGOPO'DIUM*. - *Florets* nearly equal; all fertile.
Seeds bellying; scored. *Petals*
heart-shaped.
397. *A'PIUM*. - - - *Florets* equal; almost all fertile.
Seeds minute; scored. *Petals*
bent inwards.
369. *PIMPINEL'LA*. - *Florets* nearly equal; all fertile.
Petals heart-shaped. *Rundles*
before flowering, nodding.

Order III.

TRIGYNIA; III. POINTALS.

* Blossoms *superior*.

400. *VIBUR'NUM*. - - *Bloss.* 5-clefted. *Berry* 1-seeded.
402. *SAMBU'CUS*. - - *Bloss.* 5-clefted. *Berry* 3-seeded.

** Blossoms *beneath*.

404. *STAPHYLE'A*. - *Bloss.* 5-petaled. *Caps.* with 2 or
3 clefts; inflated.
411. *ALSI'NE*. - - - *Bloss.* 5-petals. *Caps.* 1-celled.
Cup 5-leaved. *Petals* cloven.
409. *CORRIGI'OLA*. - *Bloss.* 5-petaled. *Seed* 3-cornered.
Cup with 5 divisions.

† *Montia fontana*. *Arenaria rubra*; *marina*. *Salsola fruticosa*.
Holosteum umbellatum. *Chenopodium maritimum*.

Order IV.

TETRAGYNIA; IV. POINTALS.

415. *PARNAS'SIA*. - - *Bloss.* 5-petaled. *Caps.* 4-valved.
Honeycups 5; fringed with
glands.

Order V.

PENTAGYNIA; V. POINTALS.

419. *LI'NUM*. - - - *Bloss.* 5-petaled. *Caps.* 10-celled;
2-seeded.

421. *DRO'SERA*.

21. DRO'SERA. - - *Bloss.* 5-petaled. *Caps.* 1-celled;
opening at the top.
25. SIBBAL'DIA. - - *Bloss.* 5-petaled. *Seeds* 5. Cup
10-clefted.
18. STAT'ICE. - - *Bloss.* with 5 divisions. *Seed* 1;
enclosed in the funnel-shaped
cup.

† *Cerastium semidecandrium*. *Spergula pentandria*. *Geranium*.
Tagina procumbens.

Order VI.

POLYGYNIA; MANY POINTALS.

26. MYOSU'RUS. - - Cup 5-leaved. *Honeycups* 5;
tongue-shaped. *Seeds* numerous.
- † *Ranunculus hederaceus*.

192. MYOSO'TIS. Scorpiongrafs.

EMPAL. *Cup* with 5 shallow clefts; oblong; upright; sharp; permanent.

BLOSS. 1 petal; salver-shaped. *Tube* cylindrical; short. *Border* flat; with 5 shallow clefts. *Segments* blunt; notched at the end. *Mouth* closed with 5 convex, prominent, approaching valves.

CHIVES. *Threads* 5, very short; fixed to the neck of the tube. *Tips* very small; covered.

POINT. *Seed-buds* 4. *Shaft* thread-shaped; as long as the tube of the blossom. *Summit* blunt.

S. VESS. None. The *Cup* enlarged and upright contains the seeds within it.

SEEDS. 4; egg-shaped; tapering; smooth.

ESS. CHAR. *Bloss.* salver-shaped, with 5 clefts, nicked; *Mouth* closed with a vaulted roof.

mouse-ear MYOSO'TIS *scorpioides*. Seeds smooth. Points of the leaves callous.

Blossoms in a long spirally twisted spike. Apr.—Aug.

When it grows in the water, and its taste and smell are thereby rendered less observable, Sheep will sometimes eat it, but it is generally fatal to them.—Cows, Horses, Swine, and Goats refuse it.

field α . *arvensis*. Leaves hairy.

Fl. dan. 583.—*Dod.* 72, repr. in *Lob. obs.* 245. 4, *Ger. em.* 337. 4; and cop. in *Park.* 691. 7, and *H. ox.* xi. 31. row 2. 1.—*J. B.* iii. 589. 2.

Dry meadows, corn fields, and gardens.

Seeds shining. SCOP. WITH.—*Stem-leaves* egg-spear-shaped. *Empal.* divided more than half way down. *Bloss.* some of the segments very entire; *valves* bright yellow, convex above, and hollow underneath, the tips being placed in the hollow. *Summits* 2, globular, very minute. *Seeds* compressed. WITH.

yellow β . Blossoms yellow. RAY. HUDS. ST.

flowered In very dry situations it has sometimes blue and yellow flowers on the same plant. Mr. WOODWARD.

Walls, dry pastures, and sandy places. A.

broad-leaved γ . HUDS. Leaves broad, hairy. Blossoms larger than α and flowers earlier.

In woods. A. RAY.

Ray 9. 2. at p. 128.—*Barr.* 404?

\delta. *palustris*.

β. palustris. Leaves smooth.

water

Curt. iii. 28.—*Ger. em.* 337. 3, *cop. in Park.* Cg1. 8, and *II. ox.*

xi. 31. row 2. 4.—(*Barr.* 404, from its place of growth, habit, and hairy leaves seems rather to be *γ.*)

Ditches, springs, and rivulets. P.*

193. LITHOSPER'MUM. Gromwell.

EMPAL. Cup with 5 divisions; oblong; straight; pointed; permanent. *Segments* awl-shaped; keeled.

BLOSS. 1 petal, funnel-shaped; as long as the empalement. *Tube* cylindrical. *Border* with 5 shallow clefts; blunt, upright. *Mouth* open, naked.

CHIVES. *Threads* 5, very short. *Tips* oblong, in the mouth of the blossom.

POINT. *Seed-buds* 4. *Shaft* thread-shaped; as long as the tube of the blossom. *Summit* blunt; cloven.

S. VESS. None. The seeds are contained in the bottom of the open cup, which is longer than the seeds.

SEEDS. 4, egg-shaped; tapering; hard; smooth.

ESS. CHAR. *Bloss.* funnel-shaped, open and naked at the mouth. *Empal.* with 5 divisions.

LITHOSPER'MUM officinale. Seeds smooth. common
Blossoms hardly longer than the cup. Leaves spear-shaped.

Ludw. 147.—*Dod.* 83. 2, repr. in *Ger. em.* 609. 2, and *cop. in*

Park. 432. 1, and *H. ox.* xi. 31. row 1. 1.—*Ger.* 486. 2.—

Mauh. 913.—*Fuchf.* 489, *cop. in Trag.* 536, and *J. B.* iii.

590. 2.—(*Blackw.* is *L. arvense.*)

Blossoms white. *Seeds* as hard as bone. LINN.

Gromill. Graymill.

Dry gravelly soil.

P. May. June.

Grew says the seeds have so much earth in their composition that they effervesce with acids, but Linnæus contradicts this assertion.

Sheep and Goats eat it.—Cows and Horses refuse it.

LITHOSPER'MUM arvense. Seeds wrinkled. corn
Blossoms hardly longer than the cups.

Riv.

* This being perennial, while the rest are annuals, has led Haller to make it a distinct species, and yet variety *β.* which Ray asserts to be annual, he has arranged as a variety of this. The varieties of this species in the hands of the cultivating botanist, might form the subject of a course of very interesting experiments. ST.

Riv. mon. 9. 1.—*Fl. dan.* 456.—*Blackw.* 436.—*H. ox.* xi. 28. 7.
—*Ger. em.* 610. 4, *cop. in Park.* 432. 6.—*Matth.* 917, *seeds,*
I suspect, scilicet.

Stems very rough. *Leaves* betwixt strap and spear-shaped, hairy.
Empal. segments beset with long white hairs. *Bloss.* hairy on the
outside; *tube* with ten glandular teeth at the base on the inside.
Chives very short, inserted near the base of the tube. *Shaft* not half
as long as the tube. *Seeds* rather covered with tubercles than
wrinkled. *WITH.*—*Bloss.* white, on short fruit-stalks. *Roots* reddish.

Bastard Alkanet. Bastard Gromill. Salsfern. Painting Root.

Corn fields, common.

A. May. June.

The girls in the North of Europe paint their faces with the juice
of the root upon days of festivity.—The bark of the root tinges
wax and oil of a beautiful red, similar to that which is obtained
from the root of the foreign Alkanet that is kept in the shops.

Sheep and Goats eat it. Cows are not fond of it. Horses and
Swine refuse it.

creeping LITHOSPERMUM *purpu'ro-cæru'leum.* Seeds
smooth. Blossom several times longer than the cup.—

Jacq. fl. 14.—*Pet.* 29. 6.—*Clus.* ii. 163. 2, *repr. in Dod.* 83. 1,

1.—(*Matth.* 917, *seems rather L. arvensc.*—*H. ox. ib.* 5, *a dif-*
ferent plant.)

The barren stems creeping and sending forth roots. Flowering stems
upright. Blossoms purple. LINN.

Mountainous and woody pastures.

P. June.

194. ANCHU'SA. Alkanet.

EMPAL. *Cup* with 5 divisions; oblong; cylindrical; pointed; sharp; permanent.

BLOSS. 1 petal; funnel-shaped. *Tube* cylindrical; as long as the empalement. *Border* with 5 shallow clefts; blunt; a little expanding. *Mouth* closed by 5 convex, prominent, oblong, approaching valves.

CHIVES. *Threads* 5, very short; fixed to the mouth of the bloss. *Tips* oblong; fixed sideways; covered by the valves of the tube.

POINT. *Seed-buds* 4. *Shaft* thread-shaped; as long as the chives. *Summit* blunt; notched.

V. **VESS.** None. The *Cup* growing larger and upright incloses the seeds.

SEEDS. 4; rather long; blunt; bulging.

ESS. CHAR. *Bloss.* funnel-shaped, the mouth closed by a vaulted roof. *Seeds* hollowed out at the base.

OBS. When the blossom is fully expanded it is nearly salver-shaped.

ANCHU'SA *sempervirens*. Fruit-stalks in heads with *evergreen* leaves to each head. LINN.—Or in leafy bunches in pairs. Leaves egg-shaped. ST.*

Munt. 117.—*H. ox.* xi. 26. 2.—*Lob. adv.* 247, repr. in *Ger. em.* 797. 3, heads expanded as is sometimes the case into spikes in pairs.—*Ger.* 653. 3, flowers on long naked fruit-stalks.

Stems from the sides of the crown of the root; upright, rough with hair. *Leaves* egg-strap-shaped, on leaf-stalks; remote; spotted with white. *Fruit-stalks* rising from the base of the leaves, bearing several flowers. *Floral-leaves* opposite, fitting, spear-egg-shaped. *Bloss.* blue; tube short. LINN.—*Leaves* not spotted with white. *Empal.* set thick with long white bristly hairs; segments rather longer than the tube of the blossom. *Bloss. tube* with four corners at the base. *Threads* inserted about the middle of the tube. *Tips* dark purple. *Summit* scored across. *Seed-buds* embedded in a hollow glandular receptacle, 1 or 2 generally abortive. *Seeds* rough, of a bony hardness. WITH.

Road sides and amongst rubbish. [Haddiscoe, Suffolk, Mr. WOODWARD; near Norwich, Mr. PITCHFORD; near Birmingham

* —Vel racemosis, racemis foliatis conjugatis, foliis ovatis. ST.

Both the root and leaves have been suspected to possess narcotic properties, but some will not admit the fact. It is discarded from the present practice; but Mr. Ray says that Dr. Hulse used a decoction of the roots inwardly, and cataplasms of them outwardly in strumous and scrophulous cases.—Its scent is very disagreeable, and very much resembles that of mice. Mr. WALDRON HILL. ST.

Goats eat it. Cows, Horses, Sheep, and Swine refuse it
It furnishes food to the *Phalæna Domina*.

γ. LINN. HUDS.

Park. 512. 5.

green-leaved

Stem with a slight hairiness. Leaves not hoary, but of a dark green; smooth above. Flowers smaller, has not the hoariness, and is entirely destitute of the strong scent of the common *Cynoglossum*. BAUH. prodr.—Leaves rougher. POLLICH. ST.

[Shady lanes about Worcester. Mr. PITTS in R. syn. ST.—Near the 3d mile stone on the road from Worcester to Pershore. NASH.]

196. PULMONA'RIA. Lungwort.

EMPAL. Cup 1 leaf; with 5 teeth; a 5-sided prism; permanent.

BLOSS. 1 petal; funnel-shaped. Tube cylindrical; as long as the empalement. Border with 5 shallow clefts; blunt; not quite upright. Mouth open.

CHIVES. Threads 5; very short; in the mouth of the tube. Tips upright; approaching.

POINT. Seed-buds 4. Shaft thread-shaped; shorter than the empalement. Summit blunt; notched at the end.

SESS. VESS. None. The Empalement unchanged contains the seeds in its base.

SEEDS. 4; roundish; blunt.

ESS. CHAR. Bloss. funnel-shaped. Mouth open. Empal. a 5-sided prism.

PULMONA'RIA *officinalis*. Empal. as long as the broad-leaved tube of the blossom. Root-leaves egg-heart-shaped; rough.—

Ludw. 45.—Fl. dan. 482.—Blackw. 376, blossoms ill-coloured.—

Ger. 663. 4, and 662. 1.—Chuf. ii. 199. 1, repr. in Dod. 135.

1, Lob. obs. 317. 1, and Ger. em. 808. 1; and cop. in H. ox.

xi. 29. 8.—Walc.—Park. par. 251. 1.—J. B. iii. 595.—Matth.

1040.—(H. ox. ib. 9, and Pluk. 227. 4, are good representations, but of a variety different from the common.)

Blossoms purple when newly expanded, but afterwards blue. Stems rough. Tube of the blossom white; mouth hairy.

Spotted Lungwort. Cowslips of Jerusalem.

Woods.

P. May.

When burnt it affords a larger quantity of ashes than almost any other vegetable; often 1-7th of its weight.

Sheep and Goats eat it. Cows are not fond of it. Horses and Swine refuse it.—The *Chrysomela nemorum* feeds upon it.

This species is given on the authority of Mr. Hudson, who refers to *Fl. dan.* 482, the *P. officinalis*, and also to *Ger. em.* 308. 2, *R. syn.* 226. which is the *P. angustifolia*, and gives no place of growth except one transcribed from Ray.—The following is given conformable to the authority of Ray.

narrowleaved PULMONA'RIA *angustifolia*. Root-leaves spear-shaped.—

Fl. dan. 483.—*Ger.* 662. 2.—*Clus.* ii. 170. 1, *rep. in Ger. em.*

308. 2, and *cop. in H. ox.* xi. 29. row 2. 5.—*Park. par.* 251.

2.—(*H. ox. ib.* 10, and *J. B.* iii. 596, is a different plant.)

Bugloss-Cowslips. Long-leaved Sage of Jerusalem.

“Mr. Goodyer found it in a wood by Holbury House in the “New Forest, Hampshire.” *JOHNSON in Ger. em.* p. 809.—*R. syn.* 226.—The authority of Mr. Goodyer is cited also by Parkinson, but who supposes him to have found the *P. officinalis*. ST.

sea PULMONA'RIA *maritima*. Empalement but half as long as the tube of the blossom. Leaves egg-shaped. Stem branched; trailing.—

Lightf. 7.—*Dill. elth.* 65.—*Fl. den.* 25.—*P.* 72. 3, *cop. in H. ox.* xi. 28. row 2. 12.—*Park.* 700. 1.—*Sibth.* 12. 4. *bad.*

MR. WOODWARD.

Leaves upper surface sprinkled with white prominent dots. ST.—Bloss. purple.

Sea Bugloss.

On sandy shores.

1. July.

197. SYM'PHYTUM. Comfrey.

EMPAL. *Cup* with 5 divisions and 5 corners; upright; sharp; permanent.

BLOSS. 1 petal; bell-shaped. *Tube* very short. *Border* tubular; distended; thicker than the tube; edge with 5 blunt reflected teeth. *Mouth of the Tube* furnished with 5 awl-shaped valves, shorter than the border, approaching so as to form a cone.

CHIVES. *Threads* 5; awl-shaped; standing alternately with the valves in the mouth of the tube. *Tips* upright; sharp; covered.

POINT. *Seed-buds* 4. *Shaft* thread-shaped, as long as the blossom. *Summit* simple.

3. VESS. None. The *Cup* grows larger and wider.

SEEDS. 4; bulging, tapering; approaching at the points.

ESS. CHAR. *Bloss.* the border betwixt tubular and bulging; the mouth closed with awl-shaped rays.

SYM'PHYTUM officina'le. Leaves egg-spear-shaped, common running along the stem.—

Ludw. 80, but from the ink having taken only the edge of the stalk has very much of the delicate appearance of *S. tuberosum*.—*Curt.* iv. 28.—*Fl. dan.* 664.—*Blackw.* 252.—*Matth.* 961, *cop.* in *Dod.* 134. 1, *repr.* in *Lob. obs.* 315. 1, *Ger. em.* 806. 1, and *cop.* in *Park.* 523. 1.—*Ger.* 660. 1 and 2.—*H. ox.* xi. 29. row. 1. 1.—*Pet.* 29. 5.—*Fuchf.* 695, *cop.* in *Trag.* 240, and *J. B.* iii. 593.

Root nearly spindle-shaped, single, or generally several, a foot long, as thick as one's finger, round, not knotty, as in the *S. tuberosum*. *Upper leaves* sometimes opposite. Begins to flower in June, continuing the greater part of the summer. *Road sides*, where the rubbish of gardens or ploughed fields has been laid, and the adjoining pastures. *JACQ.*—*Bloss.* valves of the mouth not toothed at the base. *SCOP.*—But in my specimens they are generally toothed down to the base. *ST.*—Blossoms yellowish white.

β. Blossoms purple. *LINN.*—Or pink colour.. *St.*

purple

Empal. corners not very evident. *Bloss.* tube as long as the em-
alement; egg-shaped above. *Valves* spear-shaped, flat, cover-
ing the tips; edge studded with small shining glands. *WITH.*

Banks of rivers and wet ditches.

P. May.

The particles of the dust appear in the microscope like two glo-
ules united together. The leaves give a grateful flavour to cakes

and panada, and the young stems and leaves are excellent when boiled. The roots are glutinous and mucilaginous, and a decoction of them is used by the dyers to extract the colouring matter of gum lac.

Cows and Sheep eat it. Horses, Goats, and Swine refuse it.
LINN.—A Horse eat it. ST.

tuberous SYM'PHYTUM *tuberosum*. Leaves running half
rooted way down; the uppermost opposite.—

Jacq. fl. 225.—Obs. 63.—Clus. ii. 166. 2, repr. in Ger. em. 806. 3, and cop. in H. ox. xi. 29. row 1. 3.—J. B. iii. 594.—(Clus. ib. 1, repr. in Dod. 134. 2, Lob. obs. 315. 2, and cop. in Park. 523. 3, and H. ox. ib. 2, seems to me to resemble more *Hyoscyamus Scopolia* than a *Symphytum*.)

Possibly a variety of the *S. officinale*. Root white, and not black on the outside as that of the preceding. LINN.—Root tuberous, oblong, branched or simple, with slender lateral fibres. Leaves not so rough with hair; edges often running down almost as far as in the *S. officinalis*; upper sometimes alternate. Habit more delicate; not so tall; all the parts in less profusion. Bloss. yellowish white. Begins to blossom in May, and out of flower by the end of June.—Shady woods and brakes. JACQ.—Head of the root tuberous. Bloss. palish yellow; valves of the mouth finely toothed throughout. Scop.—But so are those of the *S. officinale*. ST.

200. B O R A ' G O. Borage.

EMPAL. Cup with 5 divisions; permanent.

BLOSS. 1 petal; wheel-shaped; as long as the empalement.

Tube shorter than the cup. Border with 5 divisions; wheel-shaped; flat. Mouth crowned with 5 prominencies, which are blunt and notched at the end.

CHIVES. Threads 5; awl-shaped; approaching. Tips oblong; approaching; fixed to the inner side, and about the middle of the thread.

POINT. Seed-buds 4. Shaft thread-shaped; longer than the chives. Summit simple.

S. VESS. None. The Cup grows larger and bladder-shaped.

SEEDS. 4; roundish; wrinkled; keeled outwardly towards the point; globular at the base: lying lengthways in a hollow of the receptacle.

ESS. CHAR. Bloss. wheel-shaped; mouth closed with rays.

B O R A ' G O

BORA'GO *officina'lis*. All the leaves alternate. Cups common expanding.—

Ludw. 3.—Fuchf. 142, cop. in Dod. 627. 1, which repr. in Ger. em. 797. 2; and cop. again in J. B. iii. 574, which repr. at 588. 1.—Blackw. 36.—Math. 1186.—Trag. 237.—Ger. 653. 2 and 1.—H. ox. xi. 26. 1, on the left.—Lob. obs. 309. 2, repr. in Ger. em. 797. 1.

Fruit-stalks terminating; supporting several flowers. Came originally from Aleppo; but now found in many parts of Europe. Bloss. blue, white, or flesh-coloured. LINN.—Whole plant rough with numerous white prickly hairs. Bloss. segments spear-shaped; the prominencies, one rising from the base of each segment, brownish, half egg-shaped. Threads, the portion above the insertion of the tips cylindrical, dark blue, that below the insertion thick, brown and glandular. Tips black. Shaft rather shorter than the chives. Leaves egg-shaped, embracing the stem. WITH.

Walls and amongst rubbish.

P. June.—Aug.

By the experiments of Mr. Marggraff, *Mem. de Berlin*. 1747. p. 72, it appears that the juice affords a true nitre.—It is now seldom used inwardly but as an ingredient in cool tankards for summer drinking, though the young and tender leaves are good in fallads, or as a pot-herb.—It affords nourishment to the *Phalæna Gamma*. LINN.—A Horse eat it. ST.

201. ASPERU'GO. Catchweed.

EMPAL. Cup of 1 leaf; permanent; with 5 upright, unequal segments.

BLOSS. 1 petal; funnel-shaped. Tube cylindrical; very short. Border with 5 shallow clefts; blunt; small. Mouth closed by 5 convex, projecting, approaching valves.

CHIVES. Threads 5, very short; fixed in the mouth of the tube. Tips rather oblong; covered.

POINT. Seed-buds 4, compressed. Shaft thread-shaped; short. Summit blunt.

S. VESS. None. The Cup very large; upright; compressed; closes upon and contains the seeds.

SEEDS. 4; oblong; compressed; in distant pairs.

ESS. CHAR. Empal. of the fruit compressed; its sides flat, parallel, indented. (But in A. ægypt. the empal. of the fruit is bulging. ST.)

trailing ASPERU'GO *procumbens*. Empalement of the fruit compressed.—

600. 2, *repr.* in 601. 2.—(590. 1, a different plant.)

Bloss. very small, deep blue. HALL. Mr. WOODW.—*Leaves* mostly by threes, all pointing upwards. Mr. WOODWARD.—*Stem* angular, sides unequal; angles beset with strong hooked prickles pointing backwards. *Leaves* spear-oblong, beset with hairs pointing towards the end; from 1 to 4 to a set of flowers, from the same side of the stem with the flowers. *Empal. of the fruit* assumes an appearance very different from that of the flower, as if composed of 2 distinct valves, though in reality of 1 leaf; *teeth* tapering to a point, the middlemost in one of the valves longer than the other teeth, but in the other valve shorter, and cloven at the end. *Bloss.* scarcely a line broad. *Fruit* on short fruit-stalks, bowed down in a direction opposite to that of the leaves. ST.

Great Goose-grass. German Madwort.

In roads and amongst rubbish.

A. April. May.

Horses, Goats, Sheep, and Swine eat it. Cows are not fond of it.

202. LYCOP'SIS. Bugloss.

EMPAL. *Cup* with 5 divisions; permanent. *Segments* oblong; sharp; open.

BLOSS. 1 petal; funnel-shaped. *Tube* cylindrical; crooked. *Border* with 5 shallow clefts; blunt. *Mouth* closed by 5 prominent, convex, approaching valves.

CHIVES. *Threads* 5, very small; fixed to the bend of the tube. *Tips* small, covered by the valves.

POINT. *Seed-buds* 4. *Shaft* thread-shaped; as long as the chives. *Summit* blunt; cloven.

S. VESS. None. The *Cup* very large and bladder-shaped incloses the seed.

SEEDS. 4; rather long; covered by a dry hard wrinkled coat.

ESS. CHAR. *Tube of the blossom* crooked.

wild LYCOP'SIS *arvensis*. *Leaves* spear-shaped, rough with hair. *Cups* while in flower upright.

Fuchs. 269, *cop.* in *Dod.* 628. 2, which *repr.* in *Ger. em.* 799. 3, and *cop.* again in *J. B.* iii. 531, and *H. ox.* xi. 26. 8.—*Riv.*

man.

mon. 7. 2, bristly hairs not represented.—Fl. dan. 435, leaves tapering to a point; the undulated toothed edge and bristly hairs not represented.—Blackw. 234, leaves rounded at the end, and with the deficiencies of Fl. dan.—Trag. 234,* as the Fl. dan.

Whole plant rough with strong hairs. LINN. ST.—Hairs bulbous at the root. HALL. ST.—Heads of the summit beset with small tubes in lines, the ends of which are expanded into a kind of border. Mr. HOLLEFEAR.—Leaves sometimes nearly strap-shaped, and sometimes nearly egg-shaped; waved at the edge, and somewhat toothed. Stems thick, round. Empal. segments sometimes spear-shaped. Bloss. sky blue. WITH. ST.—Stem either single, or branching from the bottom. Leaves waved, sometimes oblong, and the upper sometimes egg-shaped; teeth terminated by bristly hairs. Empal. upright also when the seeds are ripe. ST.

Corn fields and road sides. [Sometimes on dunghills, when the leaves are often $1\frac{1}{2}$ inch broad. ST.] A. June.—Sept.

Cows, Horses, Sheep, and Goats eat it. Swine refuse it.

203. EC'H IUM. Vipergrafs.

EMPAL. Cup with 5 divisions; upright; permanent. Segments awl-shaped; upright.

BLOSS. 1 petal; bell-shaped. Tube very short. Border gradually widening; with 5 clefts, blunt; upright. Segments generally unequal; the 2 upper being the longest; the lower smaller; sharp; reflected. Mouth open.

CHIVES. Threads 5; as long as the blossom; awl-shaped; declining; unequal. Tips oblong; fixed sideways.

POINT. Seed-buds 4. Shaft thread-shaped; as long as the chives. Summit blunt; cloven.

S. VESS. None. The cup becoming more rigid, contains the seeds.

SEEDS. 4; roundish; obliquely tapering.

ESS. CHAR. Bloss. irregular; the mouth open.

OBS. In the *E. italicum* the blossom is nearly regular.

EC'H IUM *italicum*. Stem upright, hairy. Spikes wall hairy. Segments of the Blossoms nearly equal. Chives extremely long.—

* Referred by C. B. to his *Eugloss. sylv. min. alt. and asperius* C. B. pin. 256, and as Fl. dan. 435 may prove to be at least a distinct variety. ST.

Dod. 631. 2, repr. in Lob. obs. 312. 1, Ger. em. 802. 1; and cop. in H. ox. xi. 27. 6, and Park. 519.—J. B. iii. 588. 1, (the separate flowers do not belong to it.—J. B. iii. 584. 2, is referred to by Ray, but it seems the α of Linn. who regards our plant as a variety of the true italicum.)

Bloss. invariably white. HALL.

Sandy meadows and pastures. On the sandy ground near St. Hilary, Jersey. P. HUDS. A. RAY.

common EC'HIIUM *vulga're*. Stem rough with hairy tubercles. Stem-leaves spear-shaped, rough with hair. Flowers in lateral spikes.—

Fl. dan. 445.—Riv. mon. 7. 1, both beginning to flower.—Matth. 996, cop. in Dod. 631. 1, repr. in Lob. obs. 312. 2, Ger. em. 802. 2, and cop. in Park. 414. 1, in full flower; and H. ox. xi. 27, row 3. 1.—Matth. 892, root and root-leaves.—(J. B. iii. 586, seems more to resemble the *E. italicum*.)

Chives extending beyond the bloss. HALL. Mr. WOODWARD. ST.—Stem frequently, and sometimes the leaves beautifully spotted with red. Mr. WOODWARD.—Stem, the hairs rising from glossy, purplish black tubercles. Bloss. upper and lateral clefts rounded, the lowest somewhat pointed. Threads just equal to, or about a line longer than the upper segment of the blossom. ST.—Root-leaves near 2 feet long, strap-shaped. Flowers numerous, in spikes; those of each spike pointing one way, and closely wedged together. Empal. fringed with white hairs. Bloss. before it expands of a fine red, afterwards of a bright blue; outside beset with short white hairs, and marked with 5 rising ribs, extending from the middle of each segment down to the base, a little distended on the upper side; border, clefts shallow; segments blunt, equal, but the 2 upper longer. Threads much longer than the bloss. of a fine shining red. Tips grey. Shaft very hairy, white, or faintly tinged with red. Seed-buds embedded in a fleshy receptacle. A beautiful showy plant, and meriting a place in our gardens. WITH.

E. caule simpl. erecto, fol. lanceolato-linearibus hispida, &c. flaminibus corolla longioribus. MILL. dict. ed. 6, to which Mr. HUDSON in his 1st edit. gave the name of *E. anglicum*, but in his 2d it stands as a var. of *E. vulg.*—I believe them to be one and the same plant. ST. Mr. WOODWARD.

On the sides of roads and paths, walls and barren corn fields. RAY. ST.—Viper's Bugloss.

Cows and Sheep are not fond of it. Horses and Goats refuse it.—Bees are fond of the flowers. LINN.—But get their wings torn by its strong hairs. SCOP.

α . HUDS.

α. HUDS.—Chives rising even with the blossom. MILL. and HUDS.

Blackw. 299. (Mr. Hudf. refers to several of the figures quoted above, but in all those the chives are longer than the blossom.)

Corn fields and road sides. HUDS.

P. HUDS.—A. RAY.—B. LINN. and LIGHTF.—June.—Aug.

β. *E. vulgare anglicum*. HUDS. Chives longer than the blossom. MILL. and HUDS.—There is a variety in which the branches are more straddling, and the chives nearly twice as long as the blosf.

Perhaps the *E. anglicum* of Huds. ed. i. LIGHTF.

Rich meadows and pastures. HUDS. ed. ii.—Barren corn fields pastures, and road sides, common. edit. i.—About Mellrofs Abbey. LIGHTF.—P. HUDS.—A. RAY.—Aug.

EC'H IUM *viola'ceum*. Blosf. and chives of the same *short-chived* length. Tube of the blosf. shorter than the empalement. LINN.? ST. MR. WOODWARD.

Clus. ii. 164. 2, repr. in Ger. em. 802. 4, and cop. in J. B. iii.

589. 1, and H. ox. xi. 27. 2, referred to by Linn. but the chives are longer than the blosf. and Clus. describes the blosf. as red.

Very much resembling the *E. vulgare*, but differs as follows: Blosf. violet. Stems more spreading. Chives not longer than the blossom, purple. Shaft white, hairy. Blosf. tube nearly as long as the empalement. Habit distinct. LINN.—Colour a more pleasing green. Hairs not rising from tubercles. Blosf. not red on the first day of its appearance, as in *E. vulg.* but uniformly of a pale blue. MURR. prod. 143.—Spike shorter and not so compact. Hairs not so stiff. MURR. ST.—Lower-leaves spear-shaped, blunt; upper oblong-heart-shaped, pointed. Flowers pointing one way. Bunches (or rather Spikes) rolled back. Chives, the 5th shorter. Threads flesh-coloured. RETZ. obs. ii. ST.—Whole plant smaller, more slender, weak, and hairy than *E. vulg.* but the hairs softer, some of them rising from tubercles. The tubercles hardly, if at all, discernible on the leaves; though they are on the stem, where they are intermixed with short hairs not rising from tubercles. Empal very unequal. Blosf. unequal, smaller than those of *E. vulg.* deep blue. Chives always within or just even with the blossom. MR. WOODW. ST.—Stem a foot high, branching at the top and bottom. Flower-leaves, the lower ones heart-spear-shaped, longer than the flowers. Empal. segments broader than in *E. vulg.* Blosf. half as long again as the empal. at the base of the 2 upper segments beset both within and without with scattered hairs. Chives even with the 3 lower segments of the blossom. ST.

Echium

Echium alterum, *sive*, *Lycopsis anglica*. R. *syn.* 228, which “ differs from *E. vulg.* chiefly in the smallness of the flower.” Dr. RICHARDSON. *ib.*—*E. caule simpl. erecto, fol. caulin. Sc. flaminibus corollam æquantibus*. MILL. *dict. ed.* 6.?

Banks, and corn fields. Near Norwich, Mr. WOODWARD.—Cultivated in Mr. Ballard’s garden under the title of *E. italicum*, compared with a specimen since sent me by Mr. Woodward. ST.

210. PRIMULA. Primrose.

EMPAL. *Fence* small; of many leaves; including several flowers. *Cup* 1 leaf; tubular; sharp; upright; permanent; with 5 angles, and 5 teeth.

BLOSS. 1 petal. *Tube* cylindrical; as long as the cup; terminated by a short hemispherical neck. *Border* expanding, with 5 shallow clefts. *Segments* inversely heart-shaped; notched at the end; blunt. *Mouth* open.

CHIVES. *Threads* 5; very short; within the neck of the blossom. *Tips* upright; approaching; tapering; within the tube.

POINT. *Seed-bud* globular. *Shaft* thread-shaped; as long as the cup. *Summit* globular.

S. VESS. *Capful* cylindrical; nearly as long as the cup, which covers it; of 1 cell; opening at the top with 10 teeth.

SEEDS. Numerous; roundish. *Receptacle* oblong; egg-shaped; loose.

ESS. CHAR. *A fence to the rundle. Tube of the blosf. cylindrical; mouth open.*

spring PRIMULA *veris*. Leaves toothed; wrinkled. Leaves notched. Empalements woolly, inflated. RETZ. *obs. ii. n. 13.*

cowslip α . *officinalis*.—*P. officinalis*, which see.

oxlip β . *elatior*.—*P. elatior*, which see.

common γ . *acaulis*.—*P. acaulis*, which see.

These varieties, though constant, I do not distinguish as species any more than a Black from a European. LINN.—The latter case, however, admits of proof, the former has only conjecture in support of it. The opposite opinion is supported by Haller, Scopoli, and Hudson. ST.—But the accurate Dr. Martin, in his *Cat. Cant.* p. 30, says, experience hath taught him to adopt the opinion of

Linnaeus:

Linnaeus; though at the same time, with that candour which ever distinguishes real merit, he quotes a different opinion from another author. WITH.

PRIMULA *officinalis*. SCOP.—Leaves toothed, *Cowslip* wrinkled. Border of the blos. concave. LINN.—Several flowers on a stalk, all nodding. HUDS.—Diameter of the blos. not equal to the length of the cup. SCOP. ST.

Ludw. 43.—*Fl. dan.* 433.—*Blackw.* 226.—*Walc.*—*Fuchf.* 850.—*Clus.* i. 301. 1, repr. in *Lob. obs.* 305. 1, and *Ger. em.* 780. 1.—*Trag.* 201.—*Ger.* 635. 2.—*Matth.* 1149, very ill done.—(*Col. phytob.* 6. 2, seems rather *P. elatior*.)

Blos. sweet-scented, full yellow, with a blotch of orange at the base of each segment. The whole plant with a delicate hoariness upon it. HALL. ST. WITH.—Leaves sometimes heart-egg-shaped, with a portion of the leaf running down the leaf-stalk, with a bluish mealiness, shorter than the stalk. Little fruit-stalks shorter than the flowers. ST.—*Blos.* contracted about the middle of the tube, where the chives are inserted. WITH.

Primula veris officinalis. LINN.—*Veris*. HUDS.

Fagils. Paigles. Cowslips.

Meadows and pastures. [Chiefly, if not always, in a clayey soil. Half way up Arthur's Seat, Edinburgh, but the soil a ferrugineous stone decomposed. ST.] P. Apr. May.

The blossoms are used for making cowslip wine. The leaves sometimes eaten as a pot-herb, and in fallads. The root has a fine scent, like anise.—Silk-worms are fond of the leaves and flowers. *Transf. of Soc. of Arts*, ii. p. 157.

PRIMULA *elatior*. (*Germ. synon.* ST.) Leaves *Oxlip* toothed, wrinkled. Border of the blossom flat. LINN.—Several flowers on a stalk, the outer ones nodding. HALL.—Diameter of the blossom exceeding the length of the cup. ST.

Fl. dan. 434, right hand stalk the best.—*Fuchf.* 851, cop. in *J. B.* iii. 496. 2.—*Clus.* 301. 2, repr. in *Dod.* 147. 1, *Lob. obs.* 305. 3, *Ger. em.* 780. 2.—*Ger.* 635. 1.—*Col. phytob.* 6. 2.—*Matth.* 1150, very ill done.—(*Ger.* 635. 2, is *P. officinalis*.)

Leaves like those of the *P. acaulis*. *Blos.* pale yellow, of a deeper yellow at the base of the border. HALL. ST.—Leaves nearly as long as the stalk. *Pedicles* generally longer than the flowers. *Flowers* scentless. The *Polyanthus* of the florists appears to me a variety of this species. See *R. syn. ed.* i. p. 159. ST.—In every respect resembling the *P. offic.* but the parts proportionably larger.—*Blos.* more expanded;

expanded; diameter of the border more than the length of the tube. WITH.

Primula. HALL. n. 609.—*Primula veris elatior*. LINN.—*Vulgaris* β. HUDS. ed. II.—*Veris* β. ed. I.—*Oxlips*. Great Cowslips.

Woods, hedges, and sometimes pastures. [Clayey pastures, Suffolk. Mr. WOODWARD.—High pastures, near Little Wenlock, Shropshire. WITH.] P. Apr. May.

common **P R I ' M U L A** *acaulis*. (Germ. *synon*. ST.) Leaves toothed, wrinkled. No common stalk. LINN.—One flower on a stalk. HALL.—Border of the blossom flat. HUDS.—The diameter of the blofs. exceeding the length of the cup. SCOP. ST.

Sheldr. 11.—*Fl. dan.* 194.—*Walc.*—*Blackw.* 52, blossoms by far too small.—*Clusf.* i. 302. 1, repr. in *Dod.* 147. 3, *Lob. obs.* 305. 4, *Ger. em.* 781. 5, and cop. by *Park.* 535. 1, and *H. ox.* v. 24. 8 and 9.—*Park. par.* 243. 1.—*Col. phytob.* 6. 1.—(*J. B.* iii. 497, is *P. officinalis*.)

It has a common stalk, but it is exceedingly short, and is concealed beneath the surface of the ground, so that the stalks which support the flowers are only elongated little fruit-stalks. LINN. ST.—Leaves somewhat shorter than the fruit-stalks, smooth above, (except along the mid-rib. ST.)—Hairy underneath. HALL. ST.—Bloss. of a pale whitish straw colour, with a yellow star-like blotch of 5 rays furrounding the mouth of the tube. There is found in old gardens a variety with a dull purplish rose-coloured blossom. ST.—Fruit-stalk and empal. woolly. WITH.

Primula veris acaulis. LINN.—*Primula sylvestris*. SCOP.—*Primula vulgaris*. HUDS.—Primrose.

Woods, hedges, thickets, and heaths, [particularly in a clayey soil. WITH.] P. Apr. May.

Gerard reports that a dram and a half of the dried roots taken up in autumn, operates as a strong but safe emetic.

Sheep and Goats eat it. Cows are not fond of it. Horses and Swine refuse it. LINN.—Silk-worms may be fed with the leaves. *Transf. of Soc. of Arts*, ii. p. 157.

Birds-eye **P R I ' M U L A** *farinosa*. Leaves scolloped, smooth. Border of the blossom flat.—

Fl. dan. 125.—*Walc.*—*Gmel.* iv. 44. 2 and 3.—*Ger.* 639. 2 and 1.—*Clusf.* i. 300. 1, repr. in *Lob. obs.* 307. 2, and *Ger. em.* 783. 1, and cop. in *H. ox.* v. 24. row 2. 5 and 6.—*Clusf.* 300. 2, repr. in *Lob. obs.* 307. 1, *Ger. em.* 783. 2, and cop. in *J. B.* iii.

B. iii. 493. 3. *ib.* 3. 6.—*H.* ox. *ib.* 7.—*J. B.* *ib.* 2.—*Swert.* ii. 4. 9.—*Park. par.* 243. 10.

Fruit-stalks and *empal.* as if dusted with flour. LINN.—*Leaves,* veins green; upper surface green. *Stalk* mealy, after flowering losing its mealiness, and lengthening. *Fruit-stalks* expanding, after flowering upright, but approaching. MR. WOODW.—*Leaves* mealy underneath. *Empal.* as long as the tube of the blos. *Bloss.* purplish blue, with 5 yellow glands at the divisions of the border. HALL. ST.—Or rather bordered by an elevated fleshy ring, marked with 5 nicks, giving the appearance of its being composed of as many glands. This has led Haller to consider it as an *Aretia*, probably not recollecting that in *P. officinalis* there is a similar border round the mouth of the tube. ST.

Birds-eye. *Birds-eye.*

Marshes and bogs on mountains in the north. RAY. MR. WOODWARD.—[Meadows near Kendall in the richest profusion. ST.] P. May.

Horses, Sheep, and Goats eat it. Cows refuse it. The flowers are beautiful, but they indicate a barren soil. LINN.—It is, perhaps, the most beautiful of our English plants, or yields only to the *Hottonia*. ST.—The *Phalæna pronuba* lives upon the different species.

215. MENYAN'THES. Buckbean.

EMPAL. *Cup* 1 leaf, with 5 upright divisions; permanent.

BLOSS. 1 petal; funnel-shaped. *Tube* short, somewhat cylindrical at bottom, but funnel-shaped upwards. *Border* cloven more than half way down into 5 segments. *Segments* blunt; reflected; expanding; remarkably hairy.

CHIVES. *Threads* 5; awl-shaped; short. *Tips* sharp; upright; cloven at the base.

POINT. *Seed-bud* conical. *Shaft* cylindrical; nearly as long as the blossom. *Summit* cloven; compressed.

S. VESS. *Capsule* egg-shaped; of 1 cell: bound round by the cup.

SEEDS. Many; egg-shaped; minute.

ESS. CHAR. *Bloss.* hairy. *Summit* cloven. *Caps.* of 1 cell.

Obs. The 1st species has the segments of the petals fringed at the edges; but the upper surface is not hairy.

MEN-

fringed MENYAN'THES *nymphoides*. Leaves heart-shaped, very entire. Blossoms fringed.—

Fl. dan. 339.—*Tourn.* 67, *flowers*, &c.—*J. B.* iii. 772. 1, *cop.* in *Pet.* 71. 4.

Rundle simple, sitting, from the side of a leaf-stalk. LINN.—*Leaves* circular-heart-shaped, serpentine at the edge. *Empal. segments* spear-shaped. *Bloss.* twice as large as the *empal. segments* with spear-shaped impressions. *Habit* that of *Nymphaea*. WIGG. ST.—*Bloss. segments* inversely egg-shaped, the middle of each veined, and the part so veined bordered by 2 stronger veins, which, converging towards each end, give the appearance of a narrow spear-shaped petal being laid upon it; finely toothed at the edge, by no means according with Linnæus's character of "bloss. hairy;" *teeth* tapering. ST.—Allied to *Claytonia*, totally distinct from *Menyanthes trifoliata*, not belonging even to the same natural order. WIGG.—The structure of the bloss. as above described, induces me to accede to the opinion of *Tourn.* Gmelin, and Wiggers. ST.

Waldschmidia nymphoides. WIGGERS. but he gives us no generic character, and offers us no reason for not having adopted Gmelin's name of *Limnanthemum*. ST.—*Blossoms* yellow. *Leaves* sometimes spotted.—*Fringed Water Lily*.

Large ditches and slow streams. P. June. July
[Lady Clifford's botanical garden at K. Weston, near Bristol.]

Trefoil MENYAN'THES *trifoliata*. Leaves growing by threes.—

Curt. iv. 40.—*Fl. dan.* 541.—*Blackw.* 474.—*Ger.* 1024. 1 and 2.—*Dod.* 580, *repr.* in *Lob. obs.* 496. 2, *Ger. em.* 1194, and *cop.* in *Park.* 1212, in *fruit*.—*H. ex.* xv. 2. row 2, 1st figure on the left hand.

Fruit-stalk (or rather *Bunch*) opposite to the leaves, but below the summer leaves. *Flowers* 3, from the same part of the fruit-stalk as in *Hottonia*. *Bloss.* hairy; *segments* stand distinct, not lapping over each other. LINN.—Rose-coloured without, white within. CURT.

Marsh Trefoil. Water Trefoil. Marsh Cleaver.

Ponds and pits, frequent. P. June. July.

An infusion of the leaves is extremely bitter, and is prescribed in Rheumatisms and Dropsies. A dram of them in powder purges and vomits. It is sometimes given to destroy worms. In a scarcity of hops this plant is used in the North of Europe to bitter the ale: two ounces supply the place of a pound of hops. Some people smoke the dried leaves. The powdered roots are sometimes used in Lapland instead of bread, but they are unpalatable. Some

the people say that sheep will eat it, and that it cures them of rot; but from the Upsal experiments it appears, that though rats eat it, Sheep sometimes will, and sometimes will not. Cows, horses, and Swine refuse it.

216. HOTTONIA. Featherfoil.

EMPALE. Cup of 1 leaf, with 5 divisions. Segments strap-shaped; upright; open.

LOSS. 1 petal; salver-shaped. Tube as long as the empale. Border with 5 clefts; flat. Segments oblong, egg-shaped; notched at the end.

HIVES. Threads 5; awl-shaped; short; upright; standing upon the tube, and opposite to the segments of the blossom. Tips oblong.

POINT. Seed-bud globular, tapering. Shaft thread-shaped; short. Summit globular.

.. VESS. Capsule globular, tapering; 1 cell; standing upon the empalement.

SEEDS. Many, roundish. Receptacle globular; large.

ESS. CHAR. Bloss. salver-shaped. Chives fixed on the tube of the blossom. Capsule 1-celled.

HOTTONIA *palustris*. Fruit-stalks in whorls *water* consisting of several flowers.—

Curt. i. 4.—Fl. dan. 487. β .—Matth. 1168.—Dod. 584. 2, repr.

in Lob. obs. 463. 2, Ger. em. 826. 1, and cop. in Park. 1256. 4.

Near Maidstone. RAY.

CONVOL'VULUS *sepium*. Leaves arrow-shaped, *great* the posterior angles lopped. Fruit-stalk 4-cornered, bearing 1 flower. LINN.—Flower-scales heart-shaped. HALL.—Close to the flower. ST.

Curt. i. 6.—Fl. dan. 453.—Sheldr. 56.—Blackw. 38.—Dod. 392, repr. in Lob. obs. 340. 1, Ger. em. 861. 1, and cop. in Park. 163. 3, and H. ox. i. 3. 6.—Ger. 712. 1.—Fuchf. 720, cop. in J. B. ii. 154.—Trag. 805.—Blair. 4. 3.—Swert. ii. 14. 8.—(Matth. 1212, is some other species.)

Edges of the leaves brown. Blossoms white. LINN.—Floral-leaves 2; close to the cup.

Moist hedges.

P. July. Aug.

The inspissated juice of the plant, in doses of 20 and 30 grains, is a powerful drastic purge. Scammony is the inspissated juice of a species of *Convolvulus* so much resembling this, that they are with difficulty distinguished. Can it then be worth while to import Scammony from Aleppo at a considerable annual expence, when a medicine with the very same properties grows spontaneously in many of our hedges? But though an acrid purgative to the

human race, it is eaten by Hogs in large quantities without any detriment.

Sheep, Goats, and Horses eat it. Cows refuse it.

* * Stem not twining.

sea CONVOLVULUS *Soldanel'la*. Leaves kidney-shaped. Fruit-stalks with 1 flower.—

Matth. 469.—*Dod.* 395, repr. in *Lob. obs.* 329. 2, *Ger. em.* 838.

1, and cop. in *Park.* 168. 2. 6, and *H. ox.* i. 3. 2.—*Ger.* 690.

Root, on being broken, pours out a whitish water, bitter, salt, and unpleasing to the taste. *PARK.*—*Stems*, in open ground short, and lying flat, taking a semi-circular direction; but among bushes grows to some length unbranched, bearing no flowers. *Leaves* sometimes heart-shaped. *Leaf-stalks* long. *Mr. Woodward.*—*Flower-scales* at the base of the flower, inclosing the empalement; 2 opposite, heart-oblong, nicked at the end just longer than the empal. *Empal.* rather of 5 leaves; *leaves* oblong, the innermost involving the fruit, and each successively wrapping round those beneath it. *St.*—*Blossoms* red.

Scottish Scurvy Grass. Sea Colewort.

Sea shore. [Norfolk coast, frequent. *Mr. Woodward.*]

P. July.

Half an ounce of the juice, or a dram of the powder, is an acrid purge. The leaves applied externally are said to diminish dropfical swellings of the feet. The different species furnish nourishment to the *Sphinx convolvuli* and *Phalæna Elpenor*.

233. POLEMONIUM. Jacobsladder.

EMPAL. Cup beneath; of 1 glass-shaped leaf; permanent; sharp; with 5 shallow clefts.

BLOSS. 1 petal; wheel-shaped. Tube shorter than the cup, closed by 5 valves, placed at the top of it. Border with 5 divisions; large; flat. Segments roundish; blunt.

CHIVES. Threads 5; thread-shaped; inclining; shorter than the blossom; standing upon the valves of the tube. Tips roundish; fixed to the thread sideways.

POINT. Seed-bud egg-shaped, sharp. Shaft thread-shaped; as long as the bloss. Summit with 3 clefts, rolled back.

S. VESS. Capsule covered, egg-shaped, but with 3 angles; 3 cells and 3 valves.

SEEDS. Several; irregular; rather pointed,

Ess,

ESS. CHAR. *Bloss.* with 5 divisions, closed at the bottom with valves which bear the chives. Summit cloven into 3. Capsule 3-celled; superior.

POLEMONIUM *cæruleum*. Leaves winged. common Flowers upright. Empal. longer than the tube of the blossom.—

Tourn. 61. 1, parts of fructif.—*Fl. dan.* 255.—*Dod.* 352. 1, repr. in *Lob. obs.* 412. 1, *Ger. em.* 1076. 5, and cop. in *Park.* 123. 12, and *J. B.* iii. 212. 2.—*Ger.* 918. 5.—*Swert.* ii. 28. 3.

Little leaves egg-spear-shaped; 11 pair or more on each leaf. Bloss. blue.—Greek Valerian. Ladder to Heaven.

[Malham Cove, Yorksh. RAY. Mr. WOOD.—And at the Lover's Leap, Buxton. Mr. WOOD.—Near Bakewell. Mr. WHATELY.]

P. June.

Its beauty has obtained it a place in our gardens.

Cows, Goats, and Sheep eat it. Horses are not fond of it.

β. Bloss. white. *Fl. juéc.* ST.—I have seen several stems, white which, on examination, appeared to rise from one and the same root, some of which bore blue, and others white blossoms. LINN.—“I have a sort of it whose bloss. is all white, which came up of the feede of the blew one.” *M. S. note in a copy of Ger. em. in an old hand.*

About Malham Cove. RAY.

234. CAMPAN'ULA. Bellflower.

EMPAL. Cup with 5 divisions; sharp; not quite upright; superior.

BLOSS. 1 petal; bell-shaped; with 5 clefts, close at the base; shrivelling. Segments broad; sharp; open. Honey-cup in the bottom of the blossom, composed of 5 sharp valves; approaching and covering the receptacle.

CHIVES. Threads 5; hair-like; very short; growing upon the ends of the honey-cup valves. Tips compressed; longer than the threads.

POINT. Seed-bud beneath; angular. Shaft thread-shaped; longer than the chives. Summit thick; oblong; with 3 divisions which are rolled backwards.

S. VESS. Capsule roundish; angular; of 3 or 5 cells, and letting out the seed at as many lateral holes.

SEEDS. Numerous; small. Receptacle columnar, fixed to (the capsule?)

ESS. CHAR. Bloss. bell-shaped, closed at the base by valves which support the chives. Summit cloven into 3. Capsule beneath, opening by lateral orifices.

OBS. The figure of the S. vess. is different in different species.

* Leaves rather smooth and narrow.

round-leaved

CAMPAN'ULA rotundifolia. Root-leaves kidney-shaped; stem-leaves strap-shaped. LINN.—Root-leaves sometimes heart, and stem-leaves sometimes spear-shaped. ST.

Curt. iv. 38.—Fl. dan. 855, erroneously named C. Rafunc. which see; the heart-shaped root-leaves having been probably overlooked, agreeably to what Mr. Curtis remarks, that when growing among herbage they are seldom observed, unless particularly sought for.—Walc.—Chif. ii. 173, repr. in Dod. 167, Lob. obs. 178. i, Ger. cm. 452. 3; and cop. in Park. 651. 11, and H. ex. v. 2. 17, and J. B. ii. 810. 1.—ib. 796.—Ger. 367. 3.

Leaves sometimes very entire; the lower stem-leaves sometimes sparingly serrated. ST.—Stem round, smooth. Leaves sometimes thread-shaped. Empal. segments considerably expanded when out of blossom. Honey-cup, valves fringed, white. Caps. with 3 cells. Bloss. blue, or purple; sometimes white. WITH.

Heaths and barren pastures.

P. Aug.—Oct.

EMPAL. Cup 1 leaf; with 5 divisions; sharp; not quite upright; superior.

BLOSS. 1 petal; starry; expanding; with 5 divisions; segments strap-shaped; sharp; bent back.

CHIVES. Threads 5; shorter than the bloss. Tips oblong.

POINT. Seed-bud beneath. Shaft thread-shaped; as long as the blossom; bent back. Summit with 3 divisions; oblong; rolled back.

S. VESS. Capsule roundish; 3-celled.

SEEDS. Several; small; roundish.

ESS. CHAR. Bloss. wheel-shaped, divided into 5; segments strap-shaped. Summit cloven into 2 or 3. Capsule of 2 or 3 cells; beneath.

round-headed PHYTEU'MA *orbiculat'ris*. Head roundish. Leaves serrated. Root-leaves heart-shaped. LINN.—Spike sometimes oblong. HUDS.

Jacq. austr. v. 437.—Barr. 525.—Riv. mon. 109. 1, lower part of the stem wanting.—H. ox. v. 5. 47.—Ger. em. 455. 5.—(J. B. ii. 810. 1, is *Campanula rotundifolia*. β.)

Blossoms purple; or bluish.

Chalky

Chalky pastures. Downs of Suffex and Hampshire. Near Leatherhead. P. July. Aug.

238. SAM'OLUS. Brookweed. (*Hill.*)

EMPAL. Cup with 5 divisions; superior; blunt at the base; permanent; segments upright.

BLOSS. 1 petal; salver-shaped. Tube open; very short; as long as the cup. Border flat; with 5 blunt divisions. Valves very short; approaching; fixed to the bottom of the clefts in the border.

CHIVES. Threads 5, short; 1 between each segment of the blossom. Tips approaching; covered.

POINT. Seed-bud beneath. Shaft thread-shaped; as long as the chives. Summit knobbed.

5. VESS. Capsule egg-shaped; of 1 cell, and 5 valves; opening half way down; bound round by the cup.

SEEDS. Many; egg-shaped; small. Receptacle large; glo-bular.

ESS. CHAR. Bloss. salver-shaped. Chives defended by the scales of the blossom. Capsule of 1 cell; beneath.

in Lob. obs. 358. 1, Ger. em. 891. 1, and cop. in Park. 1460. 1.

Bloss. the lower segment divided twice as deep as the rest. Stem and leaves smooth. LINN.—Stem scored. Leaves spear-egg-shaped, smooth, fitting, opposite. Heads with from 5 to 30 flowers, or more. Bloss. tube somewhat crooked, distended on the under side towards the top, beset on the outside with fine short hairs, crowned with globular glands; the lower part is a receptacle for honey. Tips yellow. Summit greenish. Bloss. red on the outside; yellowish within. Berries red. WITH.

Common Honeyfuckle. Woodbine.

Hedges.

S. May.—July.

The beauty and fragrance of its flowers renders it a pleasing ornament to our gardens, hedges, and harbours.

Cows, Goats, and Sheep eat it. Horses refuse it. *Sphinx Ligustri*, and *tipuliformis*; and *Phalæna dydaëtyla*, and *hexadaëtyla* feed upon it.*

oak-leaved β. Leaves indented. [In Sir J. Woodhouse's Woods, Norf. Mr. WOODWARD.]

* *Lonicera Xylosteum* is said by Wallis, p. 149, to grow under the Roman Wall, on the west side of Shewing Sheels, in Northumberland.

262. VERBAS' CUM. Mullein.

EMPAL. *Cup* of 1 leaf, with 5 divisions; finall; permanent; *segments* upright; sharp.

BLOSS. 1 *petal*; wheel-shaped. *Tube* cylindrical; very short. *Border* with 5 divisions, expanding; *segments* egg-shaped, blunt.

CHIVES. *Threads* 5; awl-shaped; declining; shorter than the blossom. *Tips* roundish; compressed; upright.

POINT. *Seed-bud* roundish. *Shaft* thread-shaped; inclining; as long as the chives. *Summit* rather thick and blunt.

S. VESS. *Capsule* roundish, with 2 cells, opening at the top. *Receptacle* the shape of half an egg; fixed to the partition.

SEEDS. Numerous; angular.

ESS. CHAR. *Bloss.* wheel-shaped, somewhat unequal. *Capsule* 1 cell, 2 valves.

OBS. In most of the species the *Chives* are inclining, unequal, and the bottom of the *Threads* cloathed with soft, coloured hairs.

VERBAS' CUM *Thap'sus*. Leaves running down great the stem, downy on both sides. Stem undivided.—

Blackw. 502.—*Fl. dan.* 631.—*Blackw.* 3.—(*Ger.* 629. 1 and 2. —*Math.* 1143, cop. in *Dod.* 143, repr. in *Lob. obs.* 303. 1, and *Ger. em.* 773. 1, which again cop. in *Park.* 60. 1, *H. ox.* v. 9. row 1. 1, and *Pet.* 62. 1. *Spikes* nodding, the drawings made from faded specimens, as when growing they are always upright.)—(*Fuchf.* 848, cop. in *Trag.* and *J. B.* iii. 871. 1, is the plant of *C. B.* referred by *Linn.* to the *phlomoides*.—*Ludw.* 124, has blossoms wider than the spikes; probably *V. Thapf. bicolle*, *Murr. pr.* 47?)

The whole plant woolly; in dry situations very tall. Spike club-like. LINN.—*Threads*, 2 smooth, the rest woolly. J. BAUH. ST.—*Spikes* sometimes branched, (as in the fig. of *Ger. ST.*)—*Leaves* scolloped, notches concealed by the down. *Flower-leaves* spear-shaped. *Bloss.* 2 upper segments shortest, the lowermost longest. *Threads*, 3 uppermost with a whitish beard; 2 lowermost bare. HALL. ST.—*Threads*, the two lowermost longer than the other 3. LEERS. ST.—*Flowers* sitting. MÆNCH. ST.—*Leaves*, upper ones taper-pointed. *Flower-leaves* smooth within, awl-pointed, 5 in each set of flowers; the lowermost the largest, as long as the flower; 2 pairs above, of which the lowermost the smallest. *Flowers*

4 in a set, with a minute rudiment of others at the base of each flower-leaf; the *lowermost* between the lowermost pair of flower-leaves, which blossoms the second; the *lateral ones* at the base of each of the upper flower-leaves; and the *uppermost* above them, which blossoms first. *Bloss.* bright yellow, from 10 lines to 1 inch 2 lines in diameter. *Threads*, the 2 *lowermost* with a few hairs from about the middle. *Tips* bright orange. *Capsule* egg-shaped, blunt. *Down* thread-shaped, with several sets of lateral simple-pointed branches, and terminated by a set expanding starwise. ST.—*Verbascum Thapsus*. POLLICH.—Seems a variety with larger blossoms. “*Flowers* somewhat more than $1\frac{1}{2}$ inch in diameter,” accords with those of *Ludw.* 124. See also *Willich in Reich. Jyll. p.* 91. ST.—*Leaves* egg-spear-shaped. *Shaft* woolly towards the base. *Bloss.* in a long terminating spike, yellow. WITH.

Great White Mullein. High Taper. Cows Lungwort. Ladies Foxglove.
Dry ditch banks, in chalky and gravelly soil. B. July.

Externally used it is emollient. Dr. Home advises a decoction of it, 2 ounces to a quart, in diarrhoeas of an old standing: he gave a quart every day. *Clin. Exp. p.* 439. it eases the pains of the the intestines; is used as an injection in tenesmus with advantage; and is often applied externally to the piles. *ib.*—It is said to intoxicate fish so that they may be taken with the hand.—In Norway they give it to cows that are consumptive.—The down serves for tinder. Neither Cows, Goats, Sheep, Horses, or Swine will eat it.—The *Phalena Verbasci*, and the *Curculio Scrophularia*, live upon it.

whiteflower'd 2. Bloss. white. Mr. STONE.

bastard VERBAS'CUM *Thapsoides*. Leaves running down the stem. Stem branched.—

Fuchf. 846, *cop. by Dod.* 143. 2, *Ger. em.* 773. 2, and *J. B.* iii. 872. 4.

A hybrid plant, produced in the gardens of Upsal, in the year 1761, from the seeds of the *V. Lychnitis*, impregnated by the dust of the *V. Thaps.* both which grew in the same bed. Seen long ago by Agerius, who sent it to J. Bauh. from whom succeeding authors have copied it. Agrees with *V. Lychn.* in its branching stem; its *flowers*, and also tho' less so in the purple hairs of the *threads*; & with the *V. Thaps.* in size, in its *leaves*, which run down the stem, though not all the way, and which are not so white; in its *emphal.* which, however, have longer *fruit-stalks*, tho' not so long as those of the *V. Lychn.* In a word, it is not a distinct species, but rather a variety of *V. Lychnites*. LINN.

Chalky and sandy meadows and pastures, in Kent. HUDS.

B. July. Aug.

VERBAS'CUM

VERBAS'CUM *Lychu'tis*. Leaves wedge-oblong. *hoary*
 LINN.—Root-leaves sometimes wedge-oblong, but most commonly
 oblong-spear-shaped. ST.

Stem panicked. Leaves spear-shaped, the lower ones tapering
 down into leaf-stalks. Fruit-stalks crowded, undivided. LINN.—
 Stem branching. Leaves on short leaf-stalks; the upper fitting.
 HALL. Mr. WOODWARD. B. July.

α . *pulverulentum*. Mr. WOODWARD. ST.—Whole plant covered *duffy*
 with a mealy down. SCOP. Mr. WOODWARD. ST.—Lower-leaves
 imperfectly notched; the upper egg-spear or egg-shaped. Mr. W.
 ST.—Down easily rubbing off. RAY. ST.—Blossoms sprinkled
 with glandular globules. ST.

J. B. iii. 873. 1.

When a part of the down falls off, what remains gives the plant
 the appearance of having been sprinkled over with powder. Stem
 4 to 5 feet high. Leaves, the upper sometimes embracing the stem;
 uppermost more and more pointed, and at length taper-pointed.
 Bloss. yellow. Mr. WOODWARD. ST.—Leaves, the upper egg-shaped,
 or oblong, ending suddenly in a finely tapering point. Down of
 a clear white, flock-like, equally thick on each side of the leaf,
 readily coming off on passing the leaf or stem between the finger
 and thumb; viewed in the microscope appears to be composed of
 distinct hairs beautifully branched. Bloss. to $7\frac{1}{2}$ lines in diameter,
 with little or no down upon it. ST.

About Norwich. RAY [and Mr. PITCHFORD.—Very common
 in Norfolk. Mr. WOODWARD.]—Bury, and Wollerton, Nor-
 thamptonshire. RAY.

Neither Cows, Goats, Sheep, Horses, or Swine will touch it.

β . *album*. ST. Lower-leaves nearly smooth above, downy under *whiteflower'd*
 underneath, deeply notched; the upper spear-shaped; the uppermost
 strap-spear-shaped. Mr. WOODW. ST.—Down adhering firmly
 to the leaf; sometimes rather woolly than downy underneath. ST.

Ger. 631. 1, cop. in Pet. 62. 4.—Fuchs. 847, cop. in *J. B. iii. 873.*

2.—Matth. 1147, cop. in Lob. obs. 303. 2, repr. in Ger. em.

775. 3, and cop. again in Ger. 632. 3.—Fl. dan. 586.—A branch,
 &c. Fl. dan. 586.

Threads equal, woolly. LEERS.—Lower-leaves of a darkish green.
 J. BAUH. ST.—Bloss. small, white. J. BAUH. Mr. WOODW. ST.
 —Stem seldom more than 3 feet high. Fruit-stalks longer than in α .
 Mr. WOODW. ST.—Lower-leaves of a pleasant green, their upper
 surface shining. Mr. WOODWARD.—The differences noted above
 were the result of a comparison of α growing wild, with β culti-
 vated, though, I very much doubt, whether they can be thought
 sufficient to establish a specific difference between them. Mr. W.

—*Stem, branches, fruit-stalks, and empalement* covered with a close short down. *Leaves* slightly downy, and often smooth. POLLICH. ST.—*Leaves* thicker than those of α ; the *lower* betwixt toothed and notched; the *upper* with a degree of downiness on the upper surface; in all the native specimens covered underneath with a close compact down, which renders them opaque; in the cultivated specimens rather woolly (*villosa*) and readily admitting the light through them. *Down* of a dirty white, close, short, may be scraped off by the nail; but not by passing it between the finger and thumb. *Flowering-branches* numerous, scattered, open, shorter than the stem. *Flowers* thick set, on fruit-stalks, bundled. *Bloss.* dirty white, and on drying changes to a reddish white; $5\frac{1}{2}$ lines in diameter; *segments* oblong, inversely egg-shaped; the lower gradually smaller, sprinkled above, and especially underneath, with a down, but no glandular globules. *Threads* yellowish white; all bearded with long hairs; club-shaped at the end. *Tips* and *dust* saffron-colour. *Shaft* broken back at a very obtuse angle, beset with down at the base. I believe them to be distinct species, but, I must at the same time own, that of the *pulverulentum*, I have seen only dried specimens. In Lord Stamford's pleasure ground, at Enville, is a plant corresponding in all respects with the above descriptions, except that the blossoms are pale yellow, with glandular dots on the under surface. I believe it to be a real variety of the *album*. Ray accordingly in his *Cat. plant. exterrar.* speaks of white and yellow having risen from the seed of the same plant. ST.

Verbascum album. MILL. according to Reich. but Mill. characterises it, "Leaves heart-oblong." ST.

Chalky and sandy meadows and pastures, road sides, Kent.—[Has never been found in Norfolk. Mr. WOODWARD.—On the ramparts of Brussels, and there the *pulverulentum* is not to be found.—Enville, near the Rock Houses. ST.]

black VERBAS'CUM *ni'grum*. Leaves heart-oblong, on leaf-stalks.—

Fuchs. 849; *cop.* in *Dod.* 144. 1, *J. B.* iii. 873. 3, and imitated in *Trag.* 218.—*Ger.* 631. 2.—(*Ger. em.* 775. 2.—*H. ex. v.* 9. row 2. 5, only upper-leaves)—(*Matth.* 1145, more branched than I have ever seen it.)

Leaves notched, downy underneath. *Stem* angular. *Spike* loose, sometimes branched. LINN.—*Leaves* wrinkled; the *upper* egg-spear-shaped, pointed. HALL. ST.—*Leaves* (the lower) doubly notched. *Threads*, all bearded. SCOP. ST.—*Flowers* on fruit-stalks, bundled. *Leaves* gradually smaller upwards; the uppermost nearly sitting. POLLICH. ST. W.—*Stem* beset with scattered down; angles more numerous

numerous upwards, being continuations of the edges of the leaf-stalks tinged of a dirty purple. *Down* jointed, with simple awl-shaped branches from the joints; that on the flowers forked. *Flowers* from 5 to 9, but generally 7 in a set, with rudiments of others, but seldom more than 4 come to perfection, blooming in the same order as those of the *V. Thapsus*. *Fruit-stalks* as long as the flowers, lying to the stem, becoming longer during blooming; sometimes, though rarely, with 2 or 3 flowers. *Flower-leaves*, 3 to each set, the lowermost the largest, the uppermost awl-shaped. *Bloss.* from 8 lines to 1 inch diameter, pale yellow; tube and edges of the mouth with pointed blotches of brownish purple. *Threads* from the middle to near the point purple, and generally beset with purple hairs, above and below tawny, but in some plants there are no hairs, or only 1 or 2 scattered ones to be seen; the uppermost the shortest, the rest gradually longer downwards. *Hairs* slightly club-shaped at the end. *Dust* deep orange. In habit very much resembles the *Digitalis purpurea*. *ST.*—*Leaves* heart-spear-shaped, not doubly scolloped; the lower on short broad leaf-stalks. *Flowers* about 7 in a set. *Spike* long, but not very compact. *Tips* yellowish scarlet. *Seed-bud* woolly. *Shaft* thickest towards the top. *Summit* green, not extending down the shaft. *WITU.*

Hedges and road sides. [Road sides, sandy soil, Suffolk. Mr. WOODWARD.—At Hamstead, betwixt Birmingham and Walsall. *WITH.*] P. July.—Sept.

A beautiful plant. The flowers are grateful to bees.

Swine will eat it. Sheep are not fond of it. Cows, Horses, and Goats refuse it.

VERBAS'CUM virga'tum. Downy. Root-leaves *rodlike* somewhat lyre-shaped; stem-leaves sitting. Stem branching. Fruit-stalks several together, sitting.* *ST.*

J. B. iii. 875. 1.?

Stem stronger and longer than *V. Blattaria*. *Bloss.* gold-coloured. *veff.* round, 2, 3, or more together, but most usually 1. *PARK.* *ST.*—*Whole plant* beset with very short hairs; *hairs* numerous, straight, whitish, with globular heads, which wither away. *Root* branched, slanting, biennial, whitish, bitter. *Stem* upright, from 5 to 6 ft. high, branching from the bottom, round, marked with superficial angles from the edges of the leaves running down the stem, and of a woodlike hardness below. *Branches* undivided, long,

Q 2

* Pubescens, foliis radicalibus sublyratis, caulinis sessilibus, caule ramoso, pedunculis aggregatis sessilibus. *ST.*

long, rodlike, alternate, solitary, leafy below, beset with flowers to the length of 2 feet and upwards. *Root-leaves* a good deal resembling those of the *Common Primrose*, spear-shaped-oblong, wing cleft-scolloped towards the base, unequally and doubly notched, wrinkled; above somewhat glossy, with scattered hairs; *underneath* venous; and woolly; veins hairy; the hairs generally forked, and dotted with minute black dots, which, when viewed with a lens, by transmitted light, appear semi-transparent. *Lower stem-leaves* oblong-spear-shaped, or egg-oblong-spear-shaped, notched, and some of the lowermost scolloped towards the base, narrowing down into very short leaf stalks. *Upper stem and branch-leaves* egg-shaped; or oblong-egg-shaped, toothed, not serrated as in *V. Boerh.* and *Blatt.* fitting; not embracing the stem as in *V. Blatt.* *Flower-leaves* egg-shaped, gradually diminishing, the uppermost spear-shaped, and at length becoming a kind of flower-scales. *Flowers* nearly fitting; in small clusters from the sides of the stem and branches, at moderate intervals; but in plants whose main stem has been injured they sometimes appear solitary, but, on examination, the rudiments of others will be found at the base of each. *Flower-scales*, one at the base of each flower, the outermost egg-shaped, taper-pointed, or spear-shaped, rather shorter than the flower; the *inner* ones spear-shaped, the length of the *empal.* *Empal. segments* spear-shaped, expanding, as soon as the blossom is fallen closing up, the upper one smaller than the rest. *Bloss.* with a purplish ring round the mouth; $1\frac{1}{4}$ inch diameter; 2 or 3 in bloom at once. *Fruit-stalks* horizontal, very short, seldom more than half the length of the empalement, the upper part of the outside and round the tube beset with hairs tipped with glands. *Threads* purplish on one side; and yellowish on the other; bearded with thread-like hairs club-shaped at the joints, which, in the upper one, are whitish, in the rest purple. *Seed-bud* beset with very short white hairs tipped with glass-shaped glands. **ST.**

Blattaria lutea major, five, Hispanica. Park. 64, and par. 383.—Blattaria lutea fol. long. laciniato altera 4 cubitorum, 3, 4, 5, et plura vascula conjuncta habens. C. At night the leaves, particularly the upper ones, rise up and inclose the flowers. *Bloss.* white, with sometimes a tinge of purple, or violet.

Amongst rubbish, and on dunghills. [Tritton Heath, Suffolk. Mr. WOODWARD.]—A native of America, but now naturalized in Europe. LINN. A. July.

An ointment prepared from the leaves gives ease in external inflammations and Hæmorrhoids. The Edinburgh College direct an extract to be prepared by evaporating the expressed juice of the leaves. This has been given with great advantage in convulsive affections and epilepsies. Out of 14 epileptic patients, 8 were entirely cured by it, at Stockholm. The dose from 2 to 16 grains a day. *Med. Comm.* i. 368. iii. 22. See also *Lond. Med. Jour.* ii. 295. The seeds or leaves given internally bring on delirium, tremors, swelling, itching, eruption, and inflammation on the skin: these effects

ffects were produced by a dose of a dram and a half in a girl 9 years old. See Dr. Fowler's account, *Med. Comm. vol. 5, p. 164.* Cows, Goats, Sheep, and Horses refuse it.

264. HYOSCY'AMUS. Henbane.

EMPAL. *Cup* 1 leaf, tubular; distended in the lower part. *Rim* with 5 clefts; sharp; permanent.

BLOSS. 1 *petal*, funnel-shaped. *Tube* cylindrical; short. *Border* not quite upright; with 5 shallow clefts. *Segments* blunt, 1 broader than the rest.

CHIVES. *Threads* 5; awl-shaped; inclining. *Tips* roundish.

POINT. *Seed-bud* roundish. *Shaft* thread-shaped; as long as the chives. *Summit* somewhat globular.

3. VESS. *Capsule* egg-shaped; blunt; marked with a line upon each side; of 2 cells, formed by 2 capsules closely pressed together, but cut round, and with a lid opening horizontally. *Receptacle* half egg-shaped, fixed to the partition.

SEEDS. Numerous; unequal.

ESS. CHAR. *Bloss.* funnel-shaped; blunt. *Chives* inclining. *Capsule* 2-celled, with a lid.

HYOSCY'AMUS *ni'ger*. Leaves embracing the common stem, indented. Flowers sitting.—

1.—*Trag.* 133.—(*Variety* β of the *Germ.* synonym, is *H. reticulat.*)

Flowers on very short fruit-stalks. **Mr. HOLLEFEAR.**—*Empal.* hairs soft, long, and matted with those of the flower next below and above it. *Bloss.* irregular, gradually tapering down into a tube, with 5 prominent ribs on the outside; the upper segment the largest, the rest gradually diminishing downwards; the upper incisions shallow, the lowermost extending half way to the base, and much wider than the rest. *Threads* white, with soft hairs below; the uppermost the shortest, those below gradually increasing in length. *Empal.* becoming rigid, and the capsules continuing on the dead plant till the plants of the next year are in blossom; when the leaves being fallen off the fruit appears in bunches pointing 1 way, in 2 rows from 1 side of the branch. **ST.**—Whole plant woolly and clammy. *Empal.* woolly at the base, a little distended on the

under side, smooth within. *Bloss. tube* white, with the middle deep purple; *border* pale yellowish brown, beautifully veined with purple. *Threads* woolly, unequal in length. *Tips* deep purple, of 2 cells. *Dust* white. *Shaft* of a fine purple. *Summit* white. WITH.

Villages, road sides, and amongst rubbish, not uncommon.

B. LINN. ST.—A. HUDS. June.

The seeds, the leaves, and the roots, taken internally, are all poisonous; and many well attested instances of their bad effects are recorded. Madness, convulsions, and death, are the general consequence. WITH.—I have often eaten the seeds of this plant with impunity. DR. SMITH.—In a smaller dose they occasion giddiness and stupor. It is said that the leaves scattered about a house will drive away mice. The Edinburgh College order the expressed juice of the plant to be evaporated to an extract; and perhaps in this state it may be advantageously joined with opium, where the effects of that medicine are desirable, and costiveness is to be avoided. There is no doubt of its being an useful medicine under proper management. The dose is from half a scruple to half a dram.

Goats are not fond of it. Horses, Cows, Sheep, and Swine refuse it. LINN.—Sheep sometimes eat it when young. MR. BALLARD.—*Chrysomela Hyoscyami*, and the *Cimex Hyoscyami*, are found upon it.

266. AT'ROPA. Dwale.

EMPAL. *Cup* 1 leaf; permanent; with 5 divisions; bulging. *Segments* pointed.

BLOSS. 1 *petal*; bell-shaped. *Tube* very short. *Border* distended; egg-shaped; longer than the cup. *Mouth* small; with 5 clefts; open. *Segments* nearly equal.

CHIVES. *Threads* 5; awl-shaped; from the base of, and as long as the blossom; approaching at the base, but bowed outwards, and diverging towards the top. *Tips* rather thick; rising.

POINT. *Seed-bud* half egg-shaped. *Shaft* thread-shaped; inclining; as long as the chives. *Summit* knobbed; transversely oblong; rising.

S. VESS. *Berry* of 2 cells; globular; fitting upon the cup, which enlarges. *Receptacle* fleshy; kidney-shaped; convex on both sides.

SEEDS. Numerous; kidney-shaped.

WITH.—Blossoms dark purple.

Deadly, or sleepy Nightshade. Dwayberries.

Hedges, amongst limestone and rubbish. [St. Faith's, Newton, near Norwich, and in Herts, frequent. Mr. Woodw.—Dudley Castle, WITH. ST.—Yard of Lautony Abbey, near Gloucester. Mr. BALLARD.—Hardwicke Park, Derbyshire. ST.]

P. June.—Aug.—Fruit ripe from Aug. to Oct. ST.

The whole plant is poisonous; and children, allured by the beautiful appearance of the berries, have too often experienced their fatal effects. Buchanan, the Scotch Historian, gives an account of the destruction of the army of Sweno, when he invaded Scotland, by the juice of these berries being mixt with the drink, which the Scots, by their truce, engaged to supply them with. The Danes became so intoxicated, that the Scots fell upon them in their sleep, and killed the greatest part of them; so that there were scarcely men enough left to carry off their King. Whatever credit is due to this story, there is no doubt but those who eat the berries are attacked with stupor or delirium, and become variously convulsed, and that death is the certain consequence, if not prevented by timely and plentiful vomiting, so as to evacuate the poison. WITH.—Miller recommends drinking a large glassful of warm vinegar, and I am inclined to accede to the propriety of this remedy, or rather to recommend the swallowing plentifully of repeated draughts of a tea spoonful of spirits of hartshorn, taken in a large glass of brandy and water, as these narcotics frequently diminish the irritability of the stomach, so far as to render it insensible to the operation of vomits. ST.—Tumours of the breasts, even of the cancerous kind, are said to have been resolved by a topical application of the fresh leaves. Dr. Graham, in the *Med. Communicat.* vol. i. p. 419, says, he found great benefit from
a poul-

a poultice made of the roots, boiled in milk, and applied to hard ill-conditioned tumours and ulcers; and relates a deplorable case, in which this poultice effected a perfect cure. The powdered root has been given in doses of 10 or more grains every other night, as a preventative after the bite of a mad dog. *Lond. Med. Journ. vol. iii. p. 199.* There is no doubt but their external application may be productive of good effects in several cases, but the following instance shews us that their application is dangerous when the skin is broken: .

A lady, who had a small ulcer a little below one of her eyes, which was supposed to be of a cancerous nature, put a small bit of the green leaf upon it. In the morning the uvea of that eye was so affected that the pupil would not contract, even in the brightest light; whilst the other eye retained its usual powers. The leaf being removed, the eye was gradually restored to its former state. This could not be an accidental effect, for it was repeated three separate times, and the same circumstances attended each application. *Ray. hist. 680.*—In the *Phil. Transf. vol. 50. p. 77*, there is a well attested case of a woman cured of a cancer in her breast by taking a tea-cup full of an infusion of the dried leaves every morning. The complaint became worse at first, but afterwards the symptoms abated, and in 6 months she was perfectly well. The infusion was made by pouring 10 tea-cups full of water upon 20 grains of the dried leaves, letting it stand all night in a warm place. It hath since been tried in our hospitals, with the effect of mitigating the symptoms, but hardly ever perfecting a cure. Mr. Gattaker gives the preference to the *Solanum nigrum* in these cases, as he found that to increase the secretions, and produce similar good effects, without affecting the nervous system so disagreeably as this generally does. *See his Treatise on the Nightshade.*—The juice of the ripe berries stains paper of a beautiful and durable purple. WITH.

268. SOLA'NUM. Nightshade.

TEMPAL. *Cup* 1 leaf; permanent; with 5 shallow clefts; sharp; upright.

BLOSS. 1 petal; wheel-shaped. *Tube* very short. *Border* large; plaited; with 5 shallow clefts; turned back and flat.

CHIVES. *Threads* 5; awl-shaped; very small. *Tips* oblong; approaching so as to touch; with 2 open pores at the end.

POINT. *Seed-bud* roundish. *Shaft* simple; longer than the chives. *Summit* blunt.

S. VESS. *Berry* roundish, glossy; with a hollow dot at the end; and 2 cells. *Receptacle* convex on both sides; fleshy.

SEEDS. Several, roundish, dispersed among the pulp.

ESS. CHAR. *Bloss.* wheel-shaped. *Tips* almost uniting, opening at the point by 2 pores. *Berry* 2-celled.

SOLA'NUM *Dulcamara*. Stem without prickles, woody somewhat shrubby, zigzag. Upper-leaves halberd-shaped. Bunches tuft-like.—

3. Bloss white. HUDS.

whiteflower'd

Boerhaave says it is a medicine far superior to China and Sarsaparilla as a sweetner and restorative. Linnæus says an infusion of the young twigs is an admirable medicine in acute rheumatisms, inflammations, fevers, and suppression of the lochia. Dr. Hill says he has found it very efficacious in the asthma. Doctor Hallenberg

Hallenberg advises it in ischiatic and rheumatic pains, jaundice, scurvy, and lues venerea. He directs a pint of boiling water to be poured upon 2 drams of the stalks sliced and dried, after standing half an hour, it must be boiled 15 minutes. The dose 2 tea-cups full or more, morning and evening. The stalks may be gathered early in the spring, or at the end of autumn. *Med. Comm.* vol. 3. p. 15.—The root has the smell of the potatoe. Mr. BEDDOES.

Sheep and Goats eat it. Horses, Cows, and Swine refuse it.

garden SOLA'NUM *nigrum*. Stem without prickles, herbaceous. Leaves egg-shaped, toothed, angular. Bunches nodding, pointing 2 ways.—

Ludw. 172.—*Curt.* ii. 16.*—*Fl. dan.* 460.—*Sheldr.* 106.—*Blackw.* 107.—*Dod.* 454. 1, repr. in *Lob. obs.* 133. 2, *Ger. em.* 339. 1, and cop. in *Park.* 346. 1, and *H. ox. a.* xiii. 1. row 1. 1.—*Matth.* 1069.—*Ger.* 268. 1.—*Fuchf.* 686, cop. in *J. B.* iii. 6. 608.—*Trag.* 303.

Stem angular, roughish, branching from the base. Leaves running down the leaf-stalk. Fruit-stalks from the sides of the stem and branches, without any leaf at the base. POLLICH. ST.—Arising from the middle of the joint. CURT, ST.—Bloss. white. Berries black,

Common Nightshade,

Amongst rubbish, and on dunghills.

A. June.—Oct.

From 1 to 3 grains of the leaves infused in boiling water, and taken at bed-time, occasions a copious perspiration; increases the secretion by the kidneys, and generally purges more or less the following day. These properties, judiciously applied, render it capable of doing essential service in several diseases, as may be seen in Mr. Gattaker's Treatise on the Solanum. But its effects on the nervous system are so uncertain, and sometimes so considerable, that it must ever be administered with the greatest caution. The leaves externally applied abate inflammation, and assuage pain. The flowers smell like musk.

Horses, Cows, Goats, Sheep, and Swine refuse it.

* Corresponds with the "*S. nigrum virginicum* = Linn. with the branches "angular, toothed; leaves serpentine at the edge, smooth;" and figured by *Dill. t.* 275. *f.* 256. Possibly indigenous to Great-Britain as well as America, or rather, perhaps, naturalized in the environs of the metropolis, from the refuse of gardens. ST.

275. CHIRONIA. Centory.

(Centaurium minus. Tourn. 48. ST.)

EMPAL. Cup 1 leaf, with 5 divisions, permanent; little leaves oblong, upright, pointed.

BLOSS. 1 petal; equal. Tube narrower. Border with 5 divisions, expanding; segments egg-shaped, equal.

CHIVES. Threads 5; broad; short; growing from the top of the tube. Tips oblong; upright; large; approaching; spirally twisted when their dust is shed.

POINT. Seed-bud egg-shaped. Shaft thread-shaped, a little longer than the chives, declining. Summit knobbed, rising up.

S. VESS. Egg-shaped; 2-celled.

SEEDS. Numerous; small.

ESS. CHAR. Bloss. wheel-shaped, (rather funnel or salver-shaped; see generic description. ST.) Point. declining. Chives inserted into the tube of the blossom. Tips at last spiral. Seed-vessel of 2 cells, (of 1, see below. ST.)

OBS. Linn. in his *fl. lapp.* p. 62. gives us reasons for uniting the *Centaurium minus* of Tourn. to the *Gentiana*; but the subsequent establishment of the Genera *Chironia* and *Chlora*, the individuals of which Tourn. had referred to his *Centaurium minus*, may be regarded as a tacit recantation of that opinion. *Chironia* and *Chlora* agree in the structure of their fruit, but differ in that of the empalement. ST.

CHIRONIA *Centaurium*. CURT. Mr. WOODW. common
ST. Herbaceous. Leaves oblong spear-shaped segments of the empalement awl-shaped, shorter than the tube of the blossom. ST. *

Curt. iv. 42.—*Fl. dan.* 617. *Walc.*—*Sheldr.* 82.—*Fuchs.* 387, *cop. in J. B.* iii. 353. 2.—*Matth.* 655, the closed blossoms excellent, the expanded too blunt.—*Dod.* 336, repr. in *Lob. obs.* 218, *Ger. em.* 547. 1; and *cop. in Park.* 272. 1.—*Blackw.* 452.—*Trag.* 140.—*Ger.* 437.—*H. ox.* v. 26, row 1. 5.

Bloss. with sometimes only four clefts, and segments pointed.

Huds.—Stem from four inches to a foot, and in a specimen on the sea coast, $\frac{3}{4}$ inches high, often branching out some way above

* Herbacea, foliis lanceolato-oblongis, calycinis laciniis subulatis tubo corollae brevioribus. ST.

above the root; branches upright, simple; and sometimes branching all the way to the top. *Flower-Leaves* strap-shaped. *Flowers* in a kind of rundle, solitary, almost sitting, one at each division of the rundle. *Bloss.* shrivelling, salver-shaped when fully expanded; *tube* 1-3d longer than the empalement, slightly coloured; *border* generally closed, except in clear fair weather, plaited at the base, the fissures being keeled on the outside, and the segments on the inside. *Chives* shorter than the blossom; *threads* awl-shaped; *tips* egg-oblong, upright, and after they have shed their dust strap-shaped, and twisted spirally from right to left. *Seed-bud* green, smooth, with a longitudinal furrow on each side. *Shaft* as short again as the threads, cloven half way down. *Summits* 2, on short pedicles, nearly orbicular, greenish-yellow. *Caps.* oblong, round, marked with a furrow on each side; of 2 valves, readily separating into 2 halves, but of only one cell, the edges of the valves being turned inwards, but not so far as to meet, as in *Chlora*. *Seeds* roundish. Compare the above description with the *Chironia*. How exactly do they correspond! or rather they seem to be the same. The *Chironia* indeed is described with a capsule of 2 cells. Linnæus however appears to have examined only dried specimens, and in one species at least, the *Chironia frutescens*, there is also only *one* cell, which induces me to suspect that in the other species it must be the valves being rolled inwards, that has induced Linnæus to describe them as having *two*. *ST.* Notes, Oct. 1775, and Ap. 1777.—The declining *Summit*, and twisted *Tips*, correspond with the Genus *Chironia*. *MR. WOODWARD.*—*Stem* with 4 or 6 edges. *Root-Leaves* wedge-shaped; *stem-leaves* opposite, sitting, spear-shaped, smooth. *Empal.* adhering to the tube of the bloss. *Bloss.* funnel-shaped; *tube* cylindrical, skinny, yellowish, longer than the empal. adhering to the seed-bud; *border* pink-coloured, with 5 spear-shaped segments, lapping over each other. *Threads* white, fixed to the top of the tube. *Tips* yellow, twisting into a spiral after shedding their dust. *Shaft* cylindrical, cloven at the top, and divisible without much force all the way down. *Summits* 2, shaped like a horse-shoe, yellowish green. *WITH.* *Lesser Centory.*—Barren pastures. *A.* June.—Aug. Extremely bitter. It is the basis of the famous Portland Powder, which prevents fits of the gout, when taken in a large quantity, and a long time together; but brings on hardness of the liver, palsy, and apoplexy. A tincture of the leaves, and the upper part of the root, is a good medicine in weak stomachs and cachectic habits. A decoction of the whole plant destroys lice, and cures the itch.—Cows are not fond of it. *LINN.* and in sheep pastures it is frequently left untouched. *ST.*

Gooseberry RIBES *Uva-crispa*. Branches prickly. Berries smooth. Fruit-stalks with a flower-scale of 1 leaf.—

Schmied. 1.—*Blackw.* 277.—*Fuchf.* 187, *cop. in Trag.* 977.—*Matth.* 167, *cop. in J. B. i.* 6. 47.—*Lonic.* i. 43. 1.—*Dod.* 748, *repr. in Lob. ic. ii.* 206. 1, *obs.* 617. 2, *Ger. em.* 1324, and *cop. in Park.* 1560. 1.—(*Il. dan.* 546, *should seem from the hairy berries to be R. grossularia.*)

Buds woolly. *Empalement* bent back. *Bunch* none. *Fruit-stalk* woolly. *Flower-scale* egg-shaped, embracing the fruit-stalk, generally with 3 divisions. *Flower* single, pendant. *Leaf-stalks* fringed with knobbed hairs. A triple thorn beneath the buds. LINN.—*Flowers* whitish. *Flower-scale* very small. MÆNCH.—Sometimes 1, and 2 others at its base. POLLICH. ST.—*Flowers* generally in pairs. *Flower-scale* concave, with a border divided into 2 lips. *Thorns*, their number uncertain, under 3. Hairiness of the berries inconstant, and sometimes difficult to say whether smooth or hairy. SCHMIED. who appears to consider this and *R. grossularia* merely as varieties of one species. I must own I have not been able to observe any essential marks of difference between them, except the hairiness and smoothness of the berries, and Parkinson assures us that the seeds of his hairy or prickly green gooseberry produced plants bearing smooth berries, with few or no hairs upon them. In our smooth-berried gooseberry I have found 2 and 3 flower-scales as in the rough-berried gooseberry. ST.

Woods and hedges. Parker's Piece, Girton, Shelford, Ditton, Harston Church Yard, and Triplow, Cambridgeshire. RELHAN. S. Apr. May.

304. HED'ERA. Ivy.

EMPAL. Fence of the simple rundle very small; with many teeth. Cup very small, with 5 teeth, binding round the seed-bud.

BLOSS. Petals 5; oblong; expanding; bent inwards at the points.

CHIVES. Threads 5; awl-shaped; upright; as long as the blossom. Tips fixed side-ways; forked at the base.

POINT. Seed-bud turban-shaped; bound round by the cup. Shaft simple; very short. Summit simple.

S. VESS. Berry globular; with 1 cell.

SEEDS. 5; large; bulging on 1 side, angular on the other.

ESS. CHAR. Petals 5, oblong. Berry 5-seeded, bound round by the empalement.

HED'ERA *Helix*. Leaves, some egg-shaped, and common others lobed.—

Curt. i. 8.—Sheldr. 103.—Blackw. 188.—Trag. 801.—Ger. 708, 1 and 2 β .—Fuchf. 722, and 723 β , cop. in J. B. ii. α . 111. 1 and 2 β .—Dod. 413. 1 and 2 β , repr. in Lob. obs. 336. 2, and 337. 1 β , and Ger. em. 857. 1 and 2 β ; and cop. in Park. 678. 1 and C78. 4. β .—Matth. 624 and 625. β .

When it trails on the ground its branches are small and weak, and its leaves with 3 lobes. CURT.—In which state it does not produce fruit, and has been called *Barren* or *Creeping Ivy*. To the figures of it in this stage of its growth the letter β is subjoined. ST.—But when it climbs up walls or trees it grows much stronger, and the leaf changes to egg-shaped. CURT. ST.—At least when arrived to its full growth, in which state it is called *Climbing* or *Berried Ivy*. ST.—Leaves glossy. Blossoms greenish white. Berries black.—Woods, hedges, and old buildings. S. O&T.

The roots are used by leather-cutters to whet their knives upon. Its ever-green leaves adorn our walls and cover the naked trunks of trees. Apricots and peaches covered with ivy during the month of February, have been observed to bear fruit plentifully. Phil. Transf. No. 475.—The leaves have a nauseous taste. Haller says they are given in Germany as a specific in the atrophy of children. Common people apply them to issues. The berries have a little acidity. They purge and vomit. WITH.—In warm climates a resinous juice exudes from the stalks.—Horses and Sheep eat it. Goats and Cows refuse it. LINN.—Sheep are fond of it. ST.—And in severe weather it is stripped off the trees as food. Mr. HOLLEF.

313. ILLEC'EBRUM. Knotgrafs. (Pet.)

EMPAL. Cup 5 leaves and 5 angles; leaves coloured; tapering; distant at the points; permanent.

BLOSS. None.

CHIVES. Threads 5; hair-like; within the cup. Tips simple.

POINT. Seed-bud egg-shaped; sharp; ending in a short cloven shaft. Summit simple; blunt.

S. VESS. Capsule roundish; tapering at each end; with 5 valves, and 1 cell; covered by the cup.

SEED. Single; very large; somewhat round, but sharp at each end.

ESS. CHAR. Empal. of 5 leaves, gristly. Bloss. o. Summit simple. Capsule of 5 valves, and 1 seed.

whorled ILLEC'EBRUM *verticillatum*. Flowers in whorls, naked. Stems trailing. LINN.—*The floral-leaves are so much shorter than the flowers, that the latter appear naked.* ST.

Fl. dan. 335.—*Vaill.* 15. 7.—*J. B.* iii. 378. 2, *cop. in Pet.* 10. 7.

—*Ger. em.* 563, *cop. in Park.* 1333, and *ill cop. in Ger.* 449. 1.

Leaves oval, keeled, fleshy. MR. WOODWARD.—*Upper whorls crowded near together, by no means so far asunder as in Fl. dan.* MR. WOODW. ST.—*Empal. leaves nearly cylindrical, tough, white without, slightly keeled underneath, flattened, and greenish within from a little below the point; points tapering into short hairs. When closed they exactly resemble the seed-vessels of the Sedum. Floral-leaves egg-shaped, semi-transparent, whitish, at the base of the flowers, performing the office of a fence.* ST.—*Blossoms white.*

Marshes, and wet pastures in Cornwall.

P. July.

314. G L A U ' X. Saltwort.

EMPAL. None, unless you consider the blossom as such. BLOSS. *Petal* single; upright; bell-shaped; permanent; with 5 blunt segments, rolled back.

CHIVES. *Threads* 5; awl-shaped; upright; as long as the blossom. *Tips* roundish.

POINT. *Seed-bud* egg-shaped. *Shaft* thread-shaped; as long as the chives. *Summit* a knob.

S. VESS. *Capsule* globular; tapering; of 1 cell and 5 valves.

SEEDS. 5; roundish. *Receptacle* large; globular; with hollows where the seeds lie.

ESS. CHAR. *Empalement* of 1 leaf. *Blossom* 0. *Capsule* of 1 cell, 5 valves, and 5 seeds.

black G L A U ' X *maritima*.

Lob. obs. 227, 2, *repr. in Ger. em.* 562, and *cop. in Park.* 1283. 2.

—*Fl. dan.* 548.*—*Ger.* 448.

Leaves oval-oblong. LINN.—*Stems* trailing; jointed. *Leaves* fitting. *Bloss.* at the base of the leaves; purple; sometimes greenish white; or white; or striped.—*Flowers* fitting, from the bosom of the leaves, from about the middle of the stem. LYONS.

Sea Milkwort. Black Saltwort.

Sea coast. [Norfolk coast. MR. WOODW.—Between Marazion and Penzance. MR. WATT.]

P. July.

Cows eat it.

* *Leaves* too pointed, and *stems* too naked. MR. WOODWARD.

315. THE'SIUM. Flaxweed. (*Park.*)

EMPAL. *Cup* 1 leaf; permanent; turban-shaped; with 5 shallow clefts. *Segments* half spear-shaped; upright; blunt.

BLOSS. None, unless you consider the *cup* as such, from its colour on the inside.

CHIVES. *Threads* 5; awl-shaped; inserted at the base of the segments of the cup; shorter than the cup. *Tips* roundish.

POINT. *Seed-bud* beneath; at the bottom of the cup. *Shaft* thread-shaped; as long as the chives. *Summit* rather thick and blunt.

S. VESS. None. The *cup* contains the seed in its bottom without opening.

SEED. Single; somewhat round; covered by the closing cup.

ESS. CHAR. *Empalement* 1 leaf, into which the chives are inserted. *Seed* 1, beneath.

THE'SIUM *Linophyllum*. Panicle leafy. Leaves mountain strap-shaped.—

Clus. i. 324. 1, repr. in *Ger. em.* 555, and cop. in *Park.* 459. 6,

Ger. 442. 7, *Pet.* 9. 5, and *J. B.* iii. 461. 3.—*H. ox.* xv. 1. 3.

Root woody. *Leaves* of a yellowish green. POLLICH. ST.—

Floral-leaves on foot-stalks, cloven into 3; the middle segment long, pointing downwards; the 2 outer short, pointing upwards,

Flower sitting in the division. MR. WOODWARD.—*Stems* numerous,

branching above, and sometimes trailing, probably from the first

shoots having been eaten down. *Flowers* on fruit-stalks in bunches.

Fruit-stalks about the length of the flowers. *Floral-leaves* 3, terminating the fruit-stalk, the lowermost the longest. ST.—*Bloss.* white.

Bastard Toadflax.

Mountainous pastures, particularly in a chalky soil.—[Near Bury, Suffolk. MR. WOODWARD.] P. June. July.

Obs. Haller under *T. alpinum* describes a *Thesium*, which seems, he says, to unite the *T. alpinum* and *Linophyllum*. *Stem* taller, and more upright than *T. alpinum*; but *leaves* strap-shaped, soft, and flaccid. *Flowering-branches* about an inch long, somewhat branched, sometimes with only 2 flowers. *Flower-leaves*, 2 smaller, the larger in full grown plants shorter than the flower. HALL. ST.—But in the younger plants extending beyond the flower. HALL.—All the English specimens which I have hitherto seen, seem to be this

plant of Haller's, which, from Linnæus's character of *leave, strap-shaped*, should seem also to be his *T. Linophyllum*, whereas those of Hall. 1573, and Clusius's figure are truly *spear-shaped*. Leaves nerveless, not with 3 strings as in the *Theſum* of Hall. 1573, and Scop. 172. Cultivation may ascertain its claim to be a species or variety. See also Relhan at p. 99.

[Chalk cliff between Fresh-water Bay and the Needles in the isle of Wight. ST.]

322. VIN'CA. Periwinkle.

EMPAL. *Cup* with 5 divisions; upright; sharp; permanent.

BLOSS. 1 *petal*; falver-shaped. *Tube* longer than the cup; cylindrical in the lower part; wider above; marked with 5 lines, and 5 angles at the mouth. *Border* with 5 divisions; horizontal; the segments connected with the top of the tube; broadest at the outward edge, and obliquely lopped.

CHIVES. *Threads* 5; very short; first bent inwards, and then backwards. *Tips* membranaceous; blunt; upright, but bowed inwards; with the dust at the margins.

POINT. *Seed-buds* 2; roundish; with 2 roundish bodies lying contiguous to them. *Shaft* common to both seed-buds; cylindrical; as long as the chives. *Summits* 2; the lower one round and flat; the upper summit a concave knob.

S. VESS. 2 *bags*; cylindrical; long; tapering; upright; of 1 valve, opening lengthways.

SEEDS. Numerous; oblong; cylindrical; furrowed.

ESS. CHAR. *Contorted*. *Bags* 2; upright. *Seeds* naked.

OBS. One of the NATURAL ORDER of the CONTORTED plants. The structure of the flower of this genus, will help, in some measure, to explain to us that of *Asclepias*.—The want of dust, however, in the *Asclepias*, distinguishes that genus from all those comprehended under the great division of perfect plants. ST.

lesser VIN'CA mi'nor. Stems trailing. Leaves spear-egg-shaped. Flowers on leaf-stalks. LINN.—*Flowering-stem* upright in the spring, but in autumn it bears flowers on the shoots of the year, which are trailing. Mr. WOODWARD.

Curt. iii. 29.—Ludw. 75.—Sheldr. 22, except the blossom which is ill drawn; no seed-vessel.—Blackw. 59.—Dod. 405, repr. in Lob. obs. 360. 1, Ger. em. 894. 1, and cop. in Park. 381. 1, and J. B. ii. 131.—Matth. 956.—Walc.—Trag. 394.—Fuchf. 360, blossom bad.

Leaves blunter, smooth at the edge. Fruit-stalks curved. Empal. Thort. LINN.—The ripe seed-vessel I have never been able to discover. CURT.—The fruit seldom comes to maturity, and Cæsalpin. seems the only one that has observed it in that state. It may, however, be easily obtained by planting the *V. major* in a pot, where the roots not having free room to extend themselves, the juices are more copiously propelled towards the pointal, which then expands into well-formed seed-vessels. TOURN.—This affords a very pleasing confirmation of a general remark of Mr. Curtis's, on the frequent barrenness of plants which propagate themselves by their roots. ST.—Shaft inversely conical. Upper summit woolly. Leaf-stalks short. Flowering-stems upright. Bloss. blue. WITH.

Woods and hedges but rare. [Near Hampstead. Earsham Wood, plentifully. Mr. WOODWARD.] P. May.

A Horse refused it. ST.

V I N' C A *ma'jor*. Stems upright. Leaves egg-shaped. *greater* Flowers on fruit-stalks. LINN.—Leaves fringed at the edge. HALL. ST.

Curt. iv. 37.—Tourn. 45, fructification with the seed-vessel.—Walc.—Clus. i. 121. 2, repr. in Dod. 406. 1, Lob. obs. 360. 2, Ger. em. 894. 2, & cop. in Park. 381. 2.—J. B. ii. 132.—Garid. 81.

A variety of the *V. minor*. LINN.—Mr. Curtis has not described the fruit, neither have I ever seen it. ST.—Empalement as long as the tube of the blossom. Bloss. tube woolly within, just above the tips. Leaf-stalks long. Bloss. blue; with a blush of purple. WITH.

Woods and hedges. [A grove in Thorpe, by Norwich. Mr. WOODWARD]. P. May.

Bitter and slightly astringent. WITH.—A Horse refused it. ST.

Order II.

DIGYNIA; II. POINTALS.

336. HERNIA'RIA. Rupturewort.

EMPAL. Cup 1 leaf; with 5 divisions; sharp; expanding; coloured within; permanent.

BLOSS. None.

CHIVES. Threads 5; awl-shaped; small; within the segments of the cup. Tips simple. There are 5 other threads without tips, alternating with the segments of the cup.

POINT. Seed-bud egg-shaped. Shaft hardly any. Summits 2; tapering; as long as the shaft.

S. VESS. Capsule small; at the bottom of the cup; covered; scarcely opening.

SEED. Solitary; egg-shaped, but tapering; shining.

ESS. CHAR. Empal. divided into 5. Blossom 0. Chives, 5 of them barren. Capsule 1-seeded.

smooth HERNIA'RIA *glabra*. Smooth.

Fl. dan. 529.—Trag. 527.—Matth. 953.—J. B. iii. 378. 3.—

Ger. 454.—Dod. 114, repr. in Ger. em. 569.—Blackw. 320.

—Pet. 10. 9.—Park. 447. 9.

Floral-leaves white, fringed. Scop. Mr. WOODWARD. ST.—Bloss. yellowish.

Gravelly soil. Lizard Point, Cornwall. HUDS. A. July.

A little falstish and astringent. It increases the secretions by the kidneys. The juice takes away specks in the eye.

Cows, Sheep, and Horses eat it. Goats and Swine refuse it.

β. HUDS. *H. lenticulata*, which see.

hairy HERNIA'RIA *hirsuta*. Rough with hair.—

Sheldr. 110.—Pet. 10. 10.—J. B. iii. 379. 1.—H. ox. v. 29.* row 1. 2. 6.

Scarcely more than a variety of *H. glabra*. LINN. ST.—Floral-leaves membranaceous, white, fringed. Flowers not more fitting than those of *H. glabra*. ST.—Bloss. greenish yellow.

Gravelly soil. Colney Hatch, near Barnet. A. July. Aug.

sea HERNIA'RIA *lenticulata*. Somewhat shrubby. Leaves oblong-egg-shaped, hairy.—

Pluk,

Pluk. 53. 3, *cop. in Pet.* 10. 6.—*Buxb.* i. 28. 2, but I am doubtful whether I have ever seen the plant. My specimens, which I gathered in the King's garden, Paris, are not distinguishable from the *H. hirsuta*. Mr. Hudson makes it a variety of *H. glabra*, though Linnæus characterises it as having hairy leaves.

Bloss. greenish white.

Sea shore.

P. Aug.

337. CHENOPO'DIUM. Goosetoot.

EMPAL. Cup 5 leaves; concave; permanent; leaves egg-shaped; concave; membranaceous at the edges.

BLOSS. None.

CHIVES. Threads 5; awl-shaped; as long as the leaves of the cup, and standing opposite to them. Tips roundish; double.

POINT. Seed-bud round and flat. Shaft short; divided. Summits blunt.

S. VESS. None. The cup closes upon the seed; has 5 sides; 5 compressed angles; falling off (with the seed.)

SEED. Single; round; depressed.

ESS. CHAR. *Empal.* of 5 leaves, and 5 angles. *Bloss.* o. *Seed* 1, lentil-shaped.

OBS. In some species the shaft is divided into 3.

* Leaves angular.

CHENOPO'DIUM Bonus-Henri'cus. Leaves triangular-arrow-shaped, very entire. Spikes compound, leafless, from the bosom of the leaves.—

Curt. iii. 31.—*Ludw.* 185, but flowering spike bent down by force.

cop. in Park. 749. 8, and *H. ox.* v. 31. row 2. 2.—*Pet.* 8. 6.

When full grown, red, and spreading. Dies down on the first frost. *Stems* drooping, and lying close to the ground. *Leaves* thick, shining. *Spikes* with sitting balls of flowers, interspersed with strap-shaped leaves. LINN.—Is not this and the *C. ur'bicum* the same plant? HUDS.—*Bunches* short, close, branched. Mr. WOODWARD.—*Stem* furrowed. *Leaves* alternate, upright, running down into leaf-stalks, nearly three-square, pointed, sharply toothed, smooth above. *Leaf-stalks* as long as the leaves. *Bunches* from the bosom of the leaves, shorter than the stem, but the whole panicle longer than the stem. LYONS.—*Stem* pale green, smooth, slightly scored with lines of a deeper green. *Branches* from

* The plant which accords with the figures referred to by Linnæus I would characterise thus: Leaves trowel-shaped, toothed, indented; teeth tapering. Bunches upright, compound, leafy, shorter than the leaves. (*Foliis deltoideis, dentato sinuatis, dentibus acuminatis; racemis erectis, compositis, foliaceis, foliis brevioribus.* ST.)

From the bosom of the leaves, upright. *Leaves* with their leaf-stalks as long or longer than the branches that rise from them; no shining spangles upon them or the *empalement*, so as to give the plant a white appearance, but when held against a strong light an infinite number of shining particles appear. *Bunches* sitting in the bosom of the upper leaves. WITH.

G. qsfout. Sarcbauc.

Dunghills, rubbish, and cultivated ground.

A. Aug.

CHENOPO'DIUM murale. *Leaves* egg-shaped, *wall* shining, toothed, pointed. *Bunches* branching, naked.—

Pet. 8. 5.—*Ger.* 256. 2, *cop. in J. B.* ii. 976. 1.—(*Ger. em.* 323. 1, *seems rather to be C. rubrum*, and *J. B.* ii. 975. 2, referred to by *Linnaeus*, is a copy of *Fuch.* 653, which is *C. rubrum*.)

Of a green colour. *Stems* upright, open, thick, smooth on the upper side. *Leaves* thickish, glossy, smooth, very like those of *C. rubrum*, but more sharply toothed. *Flowers* in broad-topped spikes as in *C. hybridum*, not in bunches as in *C. rubrum*. *Fruit* in a sort of panicle. LINN.

Dunghills, and rubbish.

A. July. Aug.

Cows eat it; but it is said to be poisonous to Swine.

β. HUDS. Procumbent blite with a thick, shining, waved leaf.

RAY. p. 154. 6.

(*Pet.* 8. 5, is referred to by *Ray*, but has an upright stem.)

Bocking-street, Essex; and Jesus Coll. Lane, Cambridge. *RAY. A.*

CHENOPO'DIUM fero'tinum. *Leaves* trowel-fig-leaved shaped, indented, toothed, wrinkled, smooth, uniform. *Bunches* terminating.—

Curt. ii. 18, named *C. viride*, at least if we may depend upon its exact correspondence with *Pet.* 8. 3, the figure referred to by *Linnaeus*, *Haller*, and *Hudson*.

Stem of the height of a man, very much branched. *Leaves* pale green, resembling those of *C. album*, but broader. LINN.—*Leaves* oblong, narrow, with a deep sinew on each side. BUDDLE in R. syn.—Greener than the *C. album*, though not without a degree of mealiness. *Stem* of a bright red at the insertion of the branches. *Leaves* longer than those of *C. album*. *Empal.* not quite so much covered with little globules. *Seeds* reticulated with imprinted dots. CURT

Dunghills, and rubbish.

A. Aug. Sept.

CHENOPO'DIUM album. *Leaves* diamond-triangular, gnawed, entire behind; the uppermost oblong. *Bunches* upright.—(*Lower-leaves* rhomboidal, betwixt toothed and

and hollowed; upper oblong. Bunches branching, mostly bare, (including *C. viride* as variety β . HUDS.)

Curt. ii. 16.—Blackw. 553.—Fuchf. 119, cop. in *J. B.* ii. 972. 1, and Dod. 615. 2, which repr. in *Ger. em.* 326. 6.—*Ger.* 257. 4.—Pet. 8. 2.—(Matth. 461, cop. in *Lob. obs.* 128. 1, which repr. in *Ger. em.* 326. 5, and cop. in *Park.* 748. 6, is an *Atriplex*, as is evident from its seed.)

Plant whitish when full grown. Bunches always branched, and, as it were, tuftlike, straight, composed of clustered spikes. Spikes small, egg-shaped, sitting, alternate, crowded; composed of flowers set close together. Flower-leaves strap-shaped, very entire, sitting, small, 2 or 3 to each spike. LINN.—Stem shining, bluntly angular, streaked with green, purple, and white. Branches, 2 together, especially at the lower part of the stem. Leaves with 3 semi-transparent veins springing from the base, sprinkled, especially on the under side, with white shining particles; the upper spear-shaped. Empal. spangled with minute glands; of 1 leaf, deeply divided. Tips yellow. Seeds black. WITH.

Atriplex sylvestris altera. *C. B.* pin. 119.—(And not *Atriplex sylvest.* fol. sinuato candicante *C. B.* ib. at least if we may judge from the figures referred to.)

Common Wild Orache.

Old dunghills, rubbish, and gardens.

A. Aug.

Cows, Goats, and Sheep eat it. Horses refuse it. Swine are extremely fond of it. LINN.—Horses sometimes eat, and even appear fond of it. ST.—A black *Aphis* feeds upon it, and sometimes destroys it. ST.

EMPAL. *Cup* 5 leaves; concave; permanent; *leaves* oblong-egg-shaped; blunt.

BLOSS. None.

CHIVES. *Threads* 5; awl-shaped; as long as the leaves of the cup, and standing opposite to them. *Tips* nearly round.

POINT. *Seed-bud* in a manner below the receptacle. *Shafts* 2; very short; upright. *Summits* pointed.

S. VESS. *Capsule* in the bottom of the cup; of 1 cell; soon falling off.

SEED. Single; kidney-shaped; compressed; lying in the substance of the base of the cup.

ESS. CHAR. *Empalement* 5 leaves. *Bloss.* o. *Seed* kidney-shaped, within the substance of the bottom of the empal.

BE'T A *marit'ima*. Flowers in pairs.—

sea

No figure of it, but *Ger. em.* 318. 2, is a pretty good representation of it, as *Mr. Lightfoot* observes.

Differs from *B. vulg.* in flowering the first year; in the leaves growing oblique or vertical; in the leaves of the cup being equal, and not toothed. LINN.

Sea coast, and about Nottingham. [Near Lynn. *Mr. Woodw.*
—And Isle of Wight. *Str.*] B. Huds. P. Ray. Aug.

339. SAL'SOLA. Kelpwort.

EMPAL. *Cup* 5 leaves; egg-shaped; concave; permanent.

BLOSS. None, unless you call the cup the blossom.

CHIVES. *Threads* 5; very short; standing upon the leaves of the cup.

POINT. *Seed-bud* globular. *Shaft* short; with 2 or 3 divisions. *Summits* bent back.

S. VESS. *Capsule* egg-shaped; of 1 cell; lapped up in the cup.

SEED. Single; very large; spiral like a snail shell.

ESS. CHAR. *Empalement* 5 leaves. *Blossom* o. *Capsule* 1 seed. *Seed* snail-like.

SAL'SOLA *Ka'li*. Herbaceous, drooping. Leaves prickly awl-shaped, thorny, rough. *Empalement* bordered, from the bosom of the leaves.—

Fl. dan. 818. a.—*Dod.* 81. 1.—*H. ox.* v. 33. 11.—(*Lob. obs.* 463. 1, repr. in *Ger. em.* 1117. 3, and cop. in *Park.* 1034, and *Pet.* 9. 2, which is referred to by Ray and Hudson.—*Matth.* 1035, cop. in *Ger. em.* 960. 4; and *J. B.* iii. 706. 2, seem to be *S. Tragus.*)

Blossoms greenish.

Prickly Glaswort.

Sea shore, frequent. Mr. WOODWARD.

A. July. Aug.

Cows, Horses, Goats, Sheep, and Swine refuse it.

Shrubby SAL'SOLA *fruticosa*. Shrubby, upright. Leaves thread-shaped, bluntish.—

Lob. adv. 163. 3, cop. in *J. B.* iii. 704. 2.—(*Lob. obs.* 206. 2, repr. in *Ger. em.* 523. 4, and cop. in *H. ox.* v. 33. 10, and a branch of it cop. in *Park.* 731. 7, is *Reaumuria vermiculata.*)

Shrub Stone Crop, or Glaswort.

(*Sedum minus fruticosum*. *C. B. pin.* 284, is *Reaumuria vermiculata.*)

Sea shore. [Near Southwold, Suffolk. Mr. WOODWARD.]

S. Aug.

345. UL'MUS. Elm.

EMPAŁ. Cup 1 leaf; turban-shaped; wrinkled; permanent. Border with 5 clefts; upright; coloured on the inside.

BLOSS. None.

CHIVES. Threads 5; awl-shaped; twice as long as the cup. Tips with 4 furrows; upright; short.

POINT. Seed-bud round and flat; upright. Shafts 2; reflected; shorter than the chives. Summits downy.

S. VESS. Berry oval; large; not pulpy; compressed and membranaceous.

SEED. Single; somewhat globular; but a little compressed.

ESS. CHAR. Empalement with 5 clefts. Blossom o. Berry juiceless, flattened, membranaceous.

common UL'MUS *campest'ris*. Leaves doubly serrated, unequal at the base.—

Fl. dan. 632, the double serratures of the leaves not expressed.—*Nat. displ.* ii. 8. 2, at p. 63, cop. in *Nat. delin.* ii. 6. 2, at p. 65.—*Hunt. Evel.* 118.—*Park.* 1404. 1. 6.—*Matth.* 144, cop. in *Lob. obs.* 607. 1, which repr. in *Ger. em.* 1480. 1, and cop. in *Park.* ib. a. blisters on the leaves, no fruit.—*Ger.* 1297. 1.—*Trag.* 1087.

The

The *flowering-buds* are beneath the leaf-buds. *Flowers* in very short broad-topped spikes. *Bark* of the trunk cracked and wrinkled.

Common Elm.

Hedges. Not found to the north of Stamford. RAY. EVERL. ST.—[Most plentiful in Worcestershire and Middlesex, which counties are beds of gravel and marle. ST.]

A decoction of the inner bark drank freely has been known to carry off the water in dropsies.—It cures the *Lepra ichthyosis* of Sauvages. *Lettsom's Med. Mem.* § 3.—The bark dried and ground to powder, has been mixed with meal in Norway to make bread; in times of scarcity.—The flowers have a violet smell.—The wood being hard and tough is used to make axle-trees, mill-wheels, keels of boats, chairs, and coffins.—The tree is beautiful, and well adapted to make shady walks, as it does not destroy the grass, and its leaves are acceptable to Cows, Horses, Goats, Sheep, and Swine; for this purpose it should be grafted upon the *U. glabra*; and then the roots will not send out suckers, which the common elm is very apt to do, and give a great deal of trouble to keep the ground clear of them.—It loves an open situation, and a black or clayey soil. It bears to be transplanted.—*Papilio polychloros*, and *C. album*; *Phalæna lubricipeda*, *Pavonia betularia* and *vellica*; *Cimex ulmi* and *striatus*; *Cicada ulmi*; *Aphis ulmi*, feed upon it. The latter generally curl up the leaves, so as to make them a secure shelter against the weather. LINN.—Silk-worms will devour the tender leaves with great avidity. *Transf. of Soc. of Arts* ii. 157.

β. Differs from α only in the smallness of all its parts. RAY. *letter*

Nat. displ. ii. 27. 1, at p. 287.—*Dod.* 837, repr. in *Ger. em.* 1480.

2, and cop. in *Park.* 1404. 4, blisters on the leaves from insects, no fruit.

Between Christ Church and Lymmington. RAY.—[In Lord Dudley's Woods, at Himlèy, Staffordshire. WITH.]

Narrow-leaved Elm.

δ. Leaves smooth. GER. EM. RAY. &c.

Ger. 1297. 2, cop. in. *Ger. em.* 1481. 4; which cop. in *Park.* 1403. 3;

Witch Elm.—Road beyond Dartford, and near Rumford. RAY. and GER.—[Two trees in hedge rows between Stourbridge and Affcote. ST.]

Ü L' M U S *mont'na*. Leaves oblong-egg-shaped, doubly serrated, unequal at the base. Bark smooth. HUDS. *Wych Häfel*
ed. I.—That of the trunk rough. ST.

Nat. displ. ii. 27. 2, at p. 287.—*Ger. em.* 1481. 3; cop. in *Park.*

1404. 2.—(*Ger. em.* 1481. 4, appears to me rather a variety of

U. campestris.)

The *bark* will peel from the boughs for many feet without breaking. The *boughs* spread themselves wider, and hang more down than those of the *U. campestris*. *Leaves* and *seeds* much larger. JOHNSON in *Ger. em.* ST.—*Trunk* soon dividing into long wide-spreading winged branches; when at its full growth seldom rises to above one third of the height of the *U. campestris*. It flowers when even under 30 feet high, while the *U. campestris* seldom flowers till it has gained a much greater age and height. *Branches* very brittle. *Clefts* of the *empalement* 5, 6, and in one instance 4 and 9. *Chives* 5 and 6. *Summits* 3. I am clearly of opinion that it is a distinct species. ST.

Ulmus montana. C. B. pin.

Wych Hafel. Broad-leaved Elm.

Shady lanes, and outskirts of woods. RAY. ST.—It is certainly a native. LIGHTFOOT.—In Scotland, and the north of England, it seems more peculiarly to prevail, from the scarcity of the *U. campestris*, which last LINNÆUS notes as growing near the villages of Europe, whereas this species is found in woods and brakes, as well as hedge rows. ST.

S. March. ST.

351. SWER'TIA. Felwort.

EMPAL. *Cup* with 5 divisions; flat; permanent. *Segments* spear-shaped.

BLOSS. 1 *petal.* *Tube* none. *Border* flat; with 5 divisions. *Segments* spear-shaped; larger than the cup; connected by the claws. *Honey-cups* 10, consisting of 2 hollow dots in the inner side of the base of each segment, and encompassed with small upright bristles.

CHIVES. *Threads* 5; awl-shaped; not quite upright; shorter than the blossom. *Tips* fixed side-ways to the threads.

POINT. *Seed-bud* oblong; egg-shaped. *Shaft* none. *Summits* 2; simple.

S. VESS. *Capsule* cylindrical; tapering at each end; with 1 cell, and 2 valves.

SEEDS. Numerous; small.

ESS. CHAR. *Bloss.* wheel-shaped. *Honey-cup* pores at the base of the segments of the bloss. *Caps.* of 1 cell, and 2 valves.

marsh SWER'TIA *perennis.* Blossom with 5 clefts. Root-leaves oval.—

Jacq. austr. iii. 243.—*Clus.* i. 316. 2, repr. in *Ger. em.* 433. 5, and cop. in *Barr.* 91, and *H. ox.* xii. 5. 11.

Marsh Gentian.

Mountainous places in Wales.

P. Aug.

352. GENTIA'NA. Gentian.

EMPAL. *Cup* with 5 divisions; sharp; permanent. *Segments* oblong.

BLOSS. 1 *petal*; tubular below; tube close; above cloven into 5; flat; shrivelling; and variously shaped.

CHIVES. *Threads* 5; awl-shaped; shorter than the blossom. *Tips* simple.

POINT. *Seed-bud* oblong; cylindrical; as long as the chives. *Shafts* none. *Summits* 2; egg-shaped.

B. VESS. *Capsule* oblong; cylindrical; tapering; slightly cloven at the end; of 1 cell, and 2 valves.

SEEDS. Numerous; small. *Receptacles* 2; each growing lengthways to a valve.

ESS. CHAR. *Blossom* of 1 *petal*. *Capsule* 2 *valves*; 1 *cell*. *Receptacles* 2; longitudinal.

OBS. The figure of the fruit is constant; but the flowers vary in different species, both as to the number and shape of the parts. In one species the throat of the blossom is open, in another it is closed with soft hairs. In some, the segments of the blossom are fringed; in others, the border is bell-shaped, upright, and plaited. Some have a starry appearance, with small segments betwixt the larger; others are funnel-shaped, &c. LINN.

GENTIA'NA *Pneumonan'the*. Blossoms with 5 clefts; *marsh* bell-shaped; opposite; on fruit-stalks. Leaves strap-shaped.—

Fl. dan. 269.—*Gmel.* iv. 51. *A.*—*Matth.* 646.—*Clus.* i. 313. 2, repr. in *Lob. obs.* 166. 2, *Ger. em.* 438, and cop. in *Park.* 406. 1, and *H. ox.* xii. 5. 12.—*Ger.* 355.—*Barr.* 51. 1, and according to *Hall. Barr.* 52. 1 and 2.—*J. B.* iii. 524. 1.

Matth. 490, *cop.* in *Ger.* 427.—*Dod.* 705. 2, *repr.* in *Lcb. obs.* 408. 2, *Ger. em.* 533. 2, and *cop.* in *Fark.* 1286. 3.

Petals white; or reddish.

Thorny or prickly *Samphire*. *Sea Parsnep*.

Sea coast. At Roosebeck Low Furness, Lancash. RAY. where I searched for it, which has been frequently done by a person resident near that place, but without success. MR. WOODWARD.—Between Feversham and Sea Salter. BLACKSTONE.

361. TORDYL'IUM. Hartwort.

Rundle unequal; of many spokes. *Rundlets* unequal; of many parts; very short; flat.

EMPAL. *General Fence*; the *little-leaves* slender; undivided; frequently as long as the *rundle*. *Partial Fence* going half way round; outwardly longer than the *rundlet*. *Cup* with 5 teeth.

BLOSS. *General*, irregular in its shape, and unequal. *Florets* all fertile. *Individuals in the centre*, with 5 equal petals; heart-shaped, but bent inwards; *those of the circumference* like the others; but the outermost petal largest, and deeply divided.

CHIVES. *Threads* hair-like; 5 in every *floret*. *Tips* simple.

POINT. *Seed-bud* beneath; in all the *florets*, roundish. *Shafts* 2; small. *Summits* blunt.

S. VESS. *Fruit* roundish; almost flat, a little scolloped at the edge; divisible into 2 parts.

SEEDS. 2; roundish; almost flat; but raised and scolloped at the edge.

ESS. CHAR. *Radiated*. All the flowers with *chives* and *pointals*. *Fruit* roundish, notched at the edge. *Fences* long, undivided.

Obs. Differs from *Caucalis* principally in all the *florets* being fertile, but in *T. anthriscus* the *rundle* is somewhat radiated, and the *florets* in the centre of the *rundlets* have only *chives*. LINN.

TORDYL'IUM *officinale*. Partial fences as long as small the flowers. Little leaves egg-shaped, jagged.—

Dod. 314, repr. in Lob. obs. 425. 1, Ger. em. 1050. 1, and cop.

in J. B. iii. 6. 84. 2, and ill cop. in Park. 906. 8.—Ger. 894.

Stem nearly smooth, round, scored. *Lower-leaves* with 2 pair of *little-leaves*; *little-leaves* hairy, on leaf-stalks, the odd one at the end with 3 lobes; *those of the upper-leaves* spear or strap-spear-shaped, deeply serrated. *Florets* tinged with purple. *Seeds* large, flat, with broad, raised, notched edges. Mr. WOODW.—Which last circumstance required that it should be kept distinct from the other English species. These Mr. Hudson has accordingly very properly removed to the genus *Caucalis*. Mr. WOODWARD. ST.

Corn fields. On the banks of the road to Heddington about $\frac{1}{2}$ a mile from Oxford. SHERARD in R. syn.—[Shewn me growing near Oxford by Mr. Newberry, but not on the road to Heddington. Mr. WOODWARD.]

TOR-

hedge **TORDYL'IUM** *Anthrif'cus*. Rundles crowded. Little-leaves egg-spear-shaped, with winged clefts.—

Caucalis Anthrifcus. HUDS. which see.

Stem rough, hairs pointed, stiff, pressed back; while those of the *spokes of the rundles* are upright. *General fence* of several leaves, regular, sometimes of 1 leaf; *leaves* simple. *Seed-bud* rough with hair; hairs purplish. *Rundle* somewhat radiated. *Rundlets*, the florets of the centre with only chives. *Bloss.* not radiated, white, red underneath. LINN.—Some florets without chives. HALL.

knotted **TORDYL'IUM** *nodo'sum*. Rundles simple, fitting. The outer seeds rough.—

Caucalis nodosa. HUDS. which see.

362. CAU'CALIS. Hensfoot.

Rundle unequal; of very few spokes. *Rundlets* unequal, with more spokes; the 5 outermost of which are the longest.

EMPAL. *General Fence* with the leaves undivided; short; membranaceous at the edges; egg-spear-shaped; equal in number to the spokes of the rundle. *Partial Fence* with leaves similar to the foregoing; longer than the spokes; generally 5 in number. *Cup* with 5 teeth, standing out.

BLOSS. *General*; irregular in its shape, and unequal. *Florets* in the centre barren. *Individuals in the centre*, without pointals; small; petals 5; equal; heart-shaped, but bent inwards; *in the circumference*, with both chives and pointals. *Petals* 5; heart-shaped; bent inwards; the outermost the largest, and cloven.

CHIVES. *Threads* hairlike; 5 in all the florets. *Tips* small.

POINT. *Seed-bud* beneath; in the florets of the circumference oblong and rough. *Shafts* 2; awl-shaped. *Summits* 2: blunt; expanding.

S. VESS. *Fruit* oblong-egg-shaped; scored lengthways; rough with bristly hairs.

SEEDS. 2; oblong; flat on 1 side; convex on the other; armed with awl-shaped prickles placed along the scores.

ESS. CHAR. *Blossoms* radiated; those in the centre with only chives. *Petals* nicked, and bent inwards. *Fruit* rough with bristles. *Fences* entire.

CAU'CALIS

CAU'CALIS *daucoides*. Rundles cloven into 5, *small* leaf-lets. Rundlets with 3 seeds, and 3 leaves. LINN.—Prickles of the seeds smooth. ST.*

Jacq. *austr.* ii. 157.—H. *ox.* ix. 14. 6.—Pet. 27. 8.—J. B. iii. 6. 80. 1.—Park. 920. 6.

Stem very much straddling, spreading, angular, scored, rough with hair. Leaves those of the *Daucus*, but fewer. *Fruit-stalks* smooth, very long. *Rundle* cloven into 3 or 5. *Rundlets* sitting, generally 3. *Fence* none. *Fencelets* of 3 leaves. *Florets* equal, not radiated, reddish, most of them barren. LINN.—*Fruit* generally 3 to each rundle, straddling, crowned with the cup, oblong, with prickles. *Prickles* hooked, at some distance from each other, smooth. LINN. ST.—*Seeds* large. *Leaves* finely divided. DAY. MR. WOODWARD. ST.—*Leaves* more than doubly compound, extremely elegant. *General* and *partial* rundles with sometimes 4 spokes. *Partial fence* of mostly 5 leaves. *Little rundles* with sometimes 4 and 2 seeds. MR. WOODWARD.—*C. daucoides* sp. pl. appears to have been a distinct plant from that of the subsequent works, and it should seem a variety of *C. grandiflora*. ST.

Kex.—Hedges, orchards, rubbish, cultivated ground, and dunghills. B. June. July.

The whole plant is poisonous, and many instances are recorded of its deleterious effects; but modern experience has proved it to be less virulent than was formerly imagined. Dr. Storck, of Vienna, was the first who ventured to give it internally in considerable quantities, and from his account of its good effects in a variety of cases, particularly in cancers and schirrous tumours, it has been very generally employed in this kingdom. He directs an extract to be prepared from it by evaporating the expressed juice over the fire, and then adding a sufficient quantity of the powdered leaves to form it into pills. He generally gave from 2 to 12 grains for a dose, but some have taken it in much larger quantities. By the accounts from Vienna, the expectations of the world were raised to a very high pitch; and, as is then generally the case, these expectations have been disappointed; so that after a very extensive application of it for several years, it is now likely to be entirely disregarded, as a medicine of little or no use. Perhaps, however, the truth will be found to lie in the medium between the two opinions. Many reasons may be assigned to shew that it has yet undergone but an imperfect trial; some of which I shall beg leave to mention.

1st. The *Wild Cicely*, or *Cow Weed*, has often been gathered instead of the intended plant; and it is not improbable but other plants may have been likewise mistaken for it, for many of the *Rundle-bearing* or *Umbelliferous Plants* are so much alike, that it requires more skill in botany to distinguish them, than we can suppose the common collectors of medicinal plants to possess. They know plants that they have been taught to collect and to distinguish, but this was one that had never before been in request. After some time, however, the spots upon the stalks were pointed out as a criterion, and then there was less probability of mistakes.

2dly. The season of its highest perfection has never yet been sufficiently ascertained. Some suppose it ought to be gathered just as its blossoms open, others say not till the seeds are forming; but even these suppositions have been too little attended to.

3dly. Perhaps the plants of this natural order have their properties more changed by soil and situation, than those of any other natural order; yet this circumstance has been entirely disregarded.

4thly. No vegetable that is used in medicine is more liable to ferment than this. I have seen it, when collected in a bag, and, carried only two miles on horseback, heat and ferment to such a degree, that the yield of extract was much less than usual, and the properties of it greatly impaired,

5thly.

5thly. At its first introduction it was very common to take only the clearer part of the expressed juice, and to throw away the feculencies. Whenever this is done, the medicine is spoiled.

6thly. Too little attention has been given to the degree of heat applied during the evaporation. Many things lose their peculiar properties when exposed to more than the heat of boiling water, and others are greatly changed even by that. Many reasons may be alledged to prove that Hemlock is one of these.

When further experience has pointed out the best season for gathering the plant, and in what soils and situations it possesses the greatest virtues, I believe a medicine much more efficacious than that commonly used, may be obtained by attending to the following directions:

Let several people be employed to gather the plant, and as fast as it is cut, let others carry it in hand baskets to the press; but it must lie light and loosely in the baskets. Let it be bruised and the juice immediately squeezed out; and as fast as it runs from the press, it must be put over the fire, and boiled till three parts out of four of the whole liquor is wasted. Then it must be put into a water bath, and evaporated to the consistence of honey. If it be now taken and spread thin upon a board or marble slab, and exposed to the sun and to the air, it will soon be of a proper consistence to be formed into pills. From 5 to 10 grains of this extract is a proper dose; few constitutions will bear more without experiencing disagreeable effects.

Such a medicine as this, I believe, will be found an useful addition to our materia medica: not that I have seen it cure cancers either in an ulcerated state or otherwise, but I have never given it without a mitigation of pain, and an amendment of the discharge. Dr. Fothergill, in the 3d vol. of the *Med. Obs.* has given us a variety of cases, to which I can with pleasure refer the reader, as they perfectly correspond with my own experience in a pretty extensive hospital practice for several years past. Dr. Butter uses it in the chincough; but I have had no opportunity of trying it in that disease. WITH.—An extract prepared from the seeds is said to be much more powerful than that from the juice of the plant, and to have done considerable service in some cancerous cases at Edinburgh. See *Med. Comm.* i. p. 326.

After all it may be said, that it acts merely as a narcotic, and only effects what small doses of opium will do, in a less disagreeable manner. But till further experience gives a sanction to this opinion it must not be too hastily adopted; and if it should prove at last that it is only a narcotic, surely there are many cases in which a narcotic that does not occasion costiveness is preferable to one that does. WITH.

The preceding directions were given in the first edition of this work, and they are retained in this for the assistance of those who may still wish to administer the extract; but such is the uncertainty of that preparation, owing to the difficulty of making it, that I have now for some years laid aside the use of it, and prescribed only the powder of the dried leaves. Let the leaves be gathered about the end of June, when the plant is in flower. Pick off the little-leaves and throw away the leaf-stalks. Dry these selected little-leaves in a hot sun, or on a tin dripping-pan or pewter dish before a fire. Preserve them in bags made of strong brown paper, or powder them, and keep the powder in glass vials, in a drawer, or something that will exclude the light, for the light soon dissipates the beautiful green colour, and with its colour, the medicine loses its efficacy. From 15 to 25 grains of this powder may be taken twice or thrice a day. I have found it particularly useful in chronic rheumatisms, and also in many of those diseases which are usually supposed to arise from acrimony. The nature of this book does not allow of minute details of the virtues of plants, but I can assure the medical practitioner that this is well worth his attention. WITH.

Sheep eat the leaves. Horses, Cows, and Goats refuse them. LINN.—A Horse eat some of the young leaves, but was rather indifferent to them. ST.—Thrushes feed upon the seeds.

Ess,

ESS. CHAR. Fruit oval ablong; between compressed and flat; scored along the middle. Fence bent back. Petals heart-shaped; equal.

SELI'NUM *palustre*. Somewhat milky. Root *marsh* single. LINN. HUDS. CURT. cat.—Shafts widely expanding. Petals rolled in at the point.* ST.—Root often manifold. HALL. MR. WOODWARD. ST.

Jacq. austr. ii. 152.‡—Dod. 699, repr. in Ger. †em. 1020, and cop. in Park. 928, and ill cop. in H. ox. ix. 17. 2, with the addition of seeds of the natural size.—Lob. obs. 409. 1; ic. i. 711. 1, C. B. pr. 85, cop. in Park. 904. 6, in fruit, fences wanting.—Fl. dan. 412, fruit smooth.—(Crautz. iii. 4. 1, is justly believed to be *S. Carnifolia*.—Fl. dan. 257, not the plant.—J. B. iii. 6. 188, is a different plant.)

Herb somewhat milky. Stem mostly single, harder, deeply scored. The terminating *little-leaves* elongated. Root hot in the mouth. LINN.—The whole plant when wounded pouring forth a milky juice. Root thick, branching, yellowish without, white within. Stem upright, 2 and often 3 cubits high, deeply furrowed, of a pleasant green, smooth, reddish at the base, $\frac{1}{2}$ inch thick, hollow, knotty, forked. Leaves of a pleasant green, smooth, triangular, in the more luxuriant plants upwards of a cubit long, and $1\frac{1}{2}$ feet or more in breadth; the uppermost sitting, trebly and quadruply winged, the last leaflets winged-cleft; wings with 2 or 3 clefts, strap-shaped, very entire, reddish at the points. Rib smooth. Sheaths smooth, scored. Fruit-stalks of the rundles scored, smooth. Rundle large, beautiful; spokes about 30. Rundlets, spokes upwards of 40. Fence permanent; leaves spear-shaped, about 9. Fencelet about 12. Seeds roundish, blunt, edged with a kind of border, scored in the centre, smooth. Flowers about 2 lines in breadth. Petals blunt, with 2 slight lobes, white, before flowering reddish on the outside. POLLICH. MR. WOODWARD. ST.—Root single next the stem, but then branched into numerous, thick, tapering divisions. Leaflets, the extreme ones cloven into 3, and the middlemost of these elongated. In the Lancashire plants strap-shaped, and but little broader than the rib. Rundle spreading.

Rundlets

* *Stylis patentissimis, corollulis apice involutis.* ST.

‡ Called by the author *S. sylvest.* but it should seem from the scored stem to be *S. palustre*. REICH. ST.—Our plant exactly accords with the figure, as also with specimens of the Austrian plant given me by the Professor's son. ST.

† Referred by C. B. to *S. sylvestre*, but the stems are described and figured by Dod. as scored. ST.

Rundlets distant. Mr. WOODWARD. ST.—*Leaflets* in the Norfolk plants shorter, strap-spear-shaped, spear-shaped, and sometimes oval-spear-shaped. Mr. WOODWARD.—*Root* when broken pouring out from several places a milky juice, of an aromatic flavour, somewhat like that of *Daucus Carota sylvestris*, with a degree of bitterness, and when chewed sometimes attended with a considerably pungent heat; branches horizontal. Whole *plant* smooth. ST.—*Stem* 3 feet high, branched. *Leaves* resembling those of *Daucus Carota*. *Rundles* large. *Bloss.* white. *Roots* and *seeds*, particularly after seeding, of a very strong but agreeable scent when bruised. Mr. HALL.

S. sublaet. leve, Sc. Hall. n. 799.—*S. Tysselinum*. Crantz. 170.—*S. laetescens, caule aspero*, Sc. Hall. n. 800, should seem to be the same with n. 799, if Crantz's obs. be well founded. ST.

Wild Parsley. Wild Milky Parsley. PARK.

Marthes, near Doncaster. TOFIELD in HUDSON.—[But a friend writes me from Doncaster, that the best botanist in that neighbourhood is of opinion that it does not grow there, and that Mr. Tofield's specimen came from a distance. Mr. WOOD.—Found in 1779 or 1780 by Mr. Seattle, at Cannon Winder, near Flookburgh, Lancashire, in the ditches near the sand side not very plentiful; and I have since found it round the sides of Ayfide Tarn, 3 miles north of Cartmell. Mr. HALL.—Brought to me and Mr. Crowe, when in Lancashire in 1781, by the Rev. Mr. Jackson. Mr. WOODWARD.—In Alder Swamps, near Yarmouth. Mr. WIGGERS.]

369. ATHAMANTA Spiguel.

Rundle of many spokes; expanding. *Rundlets* with fewer spokes.

EMPAL. *General Fence* many strap-shaped leaves; a little shorter than the spokes. *Partial Fence* strap-shaped; as long as the spokes. *Cup* not discernible.

BLOSS. *General*, uniform. *Florets* all fertile. *Individuals*, petals 5; heart-shaped; bent inwards; nearly equal.

KNIVES. *Threads* 5; hair-like; as long as the petals. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; distant. *Summits* blunt. S. VESS. None. *Fruit* oblong-egg-shaped; scored; divisible into 2 parts.

SEEDS. 2; egg-shaped; convex and scored on one side, flat on the other.

ESS. CHAR. Fruit egg-oblong; scored. Petals bent inwards; nicked.

ATHAMAN'TA *Libanotis*. Leaves doubly winged, mountain flat. Rundles hemispherical. Seeds hairy.—

Jacq. austr. iv. 392 and 392,* cop. in Relh. at p. 113.—Fl. dan. 754.—J. B. iii. 6. 105.—Pluk. 173. 1.—C. B. pr. 77. 1.—
In both the last the leaves are simply winged with wing cleft leaves; but Gouan informs us, that from the seeds of this he has raised plants according with the Linnæan character.

Root descending, bearded at the top. Stem about 2 feet high, with strongly marked angles; unequally furrowed; generally simple, and rather smooth, somewhat zigzag towards the top. Leaflets wedge-like, remote, not tiled, with wing-like gashes, somewhat confluent; the posterior and lower wings larger; all smooth above, underneath pale, with the veins and edges just sensibly hairy. Leaf-stalks somewhat flattened, and amongst the leaflets channelled. The terminating rundle terminating, upright, on a furrowed fruit-stalk, the whole whitish. Fence, leaves awl-shaped, half as long as the rundle. Fencelets of many leaves. The uppermost lateral rundles opposite, shorter, arising from the bosom of a bellying membrane similar to the base of the other leaf-stalks, but which here is leaf-lets. Tips, shafts of the fruit, and receptacles of the flower purplish. LINN.—Terminating rundle sometimes proliferous, with the spokes of the rundlets 2 inches long. RELH.—The first pair of wings (in the lower-leaves. ST.) next the leaf-stalk placed cross-wise. HALL. Mr. WOODWARD.—Lower-leaves almost trebly winged, the wings being deeply wing-cleft. Mr. W.

Daucus montanus, apii folio minor. C. B. pin. 150, prodr. 77, as given by Scop.—(And not *Libanotis apii folio minor*. C. B. 157, who refers to Lob. obs. 402. 3, which is a plant with the little-leaves merely serrated.) The source of the above error may be seen from examining the synonyms of the Fl. suec. ST.

Mountain Stone Parsley.—Chalk Pit Close, Hinton, Cambridgesh. First discovered in Great-Britain by Mr. RELHAN. P. Aug. Sept. Sheep and Swine eat it. Cows refuse it.

ATHAMAN'TA *Oreoselinum*. Leaflets straddling.—straddleleaved

Jacq. austr. 80.—Clus. ii. 195. 2, repr. in Dod. 696, Lob. obs. 406. 1; ic. 707. 2, Ger. em. 1015.—(Mr. Hudson refers to J. B. iii. 6. 105, & Pluk. 173. 1, but these according to Linnæus are his *A. Libanotis*.)

Little-leaves egg-shaped, pointed; wings cut, not serrated. Partial leaf-stalks straddling and bowed. LINN.

Dry

Dry meadows and pastures. Gogmagog Hills, Cambridgesh. RAY and HUDS.—No longer to be found there. Mr. WOODWARD.—Neither does Mr. Relhan notice it in his *Flora cantab.* ST.—Between St. Alban's and Stony Stratford. HUDS. P. July. Aug.

Sea coast. [On the chalk cliffs near the Needles in the Isle of Wight. *ST.*—On all the cliffs on the Cornish coast. *Mr. WATT.*]—Fields about Porth Gwylan, Caernarvonshire, covered with it.

PENN. Wales. ii. 200.

P. Aug.

Poor people on the sea coast eat it as a pot-herb, and gather it for sale, it being much used as a pickle.

Sheep and Cows eagerly feed, and are said to grow fat upon it. *PENN. ib.*

375. HERACLE'UM. Hogweed.

Rundle very large; consisting of numerous flat *Rundlets*.

EMPAL. *General Fence* many leaves; shedding. *Partial Fence* going half way round on the outer side; leaves from 3 to 7; between strap and spear-shaped; the outer longer. *Cup* just perceptible.

BLOSS. *General*, unequal; irregular in its shape. *Florets* nearly all fertile. *Individuals of the centre*; of 5 equal petals; bent and hooked inwards; notched at the end. *Of the circumference*; of 5 unequal petals; the outer petals largest; with the deepest notches; hooked; oblong.

CHIVES. *Threads* 5; longer than the petals. *Tips* small.

POINT. *Seed-bud* beneath; somewhat egg-shaped. *Shafts* 2; short; near together. *Summits* simple.

S. VESS. None. *Fruit* oval; compressed; notched; scored along the middle on each side.

SEEDS. 2; egg-shaped; compressed; with a leafy edge.

ESS. CHAR. *Fruit* elliptical; nicked; compressed; scored; with a border. *Blossom* dissimilar; nicked; bent in. *Fence* shedding.

Obs. In some species the florets in the circumference have only pointals without chives, and produce seeds; the central florets have chives without pointals, and are barren. In the *H. Sphondylium* the florets have all chives and pointals. The general fence is sometimes altogether wanting. In the two British species the florets in the centre are composed of unequal petals as well as those in the circumference.

HERACLE'UM *Sphondylium*. Leaflets with winged clefts,* even. Flowers uniform. LINN. *syfl. veg.*—Radiated. *Syfl. nat.* HUDS. ST.—And improperly changed in the *errata* and subsequent works to uniform. ST.

Blackw. 540.—*H. ox.* ix. 16. row 1. 1. f. 2.—Dod. 307, repr. in *Lob. obs.* 401. 2; *ic.* i. 701. 2, *Ger. em.* 1009, and *cop.* in *Park.* 953, and *Pet.* 24. 1.—*Park.* 954. 3.—*Matth.* 791.—*Fuchs.* 53, *cop.* in *J. B.* iii. 6. 160.—*Trag.* 437. In the 2 last the lower leaves represented as only wing cleft.

* "Lævibus" opposed to "rugosis" in the *H. asfriacum*. ST.

Outer petals of the circumference 4 times as large; those of the centre nearly equal. HALL. ST.—Stem-leaves winged, hairy; leaflets about 2 pair, jagged, and indented, the odd one cloven into 3. Stem furrowed, rough with white hairs. Leaf-stalks spreading out at the base into a kind of bags, scored, membranaceous, woolly at the edges, and in its younger state sheathing and inclosing the fruit-stalks and rundles. Florets of the centre with nearly equal petals. Florets, particularly the outer ones, have a horned appearance before they expand. Tips greenish. Summits semi-transparent. Seeds with 3 rising ridges on each side; the leafy border often purplish. WITH.

Cow Parsnep. Madnep. Hogweed, in Norfolk.

In Poland and Lithuania, the poor people prepare a liquor from the leaves and seeds; which undergoes a fermentation, and is drank instead of ale.—The stalks, when peeled, are eaten by the Kamshatkians. —The Russians take the leaf-stalks of the root-leaves, peel them, and hang them in the sun to dry a little; then they tie them in little bundles, and hang them up again till they become yellow: in this state they put them into bags, and a mealy substance like sugar forms upon the surface of them. This they shake off, and treat their guests with it as a great delicacy. They likewise distill an ardent spirit from it. *Gmelin. sibir. i. p. 214.* The peelings of the stalks are acrid.—The leaves are a favourite food of Rabbits and Hogs. Cows, Goats, and Sheep eat them; but Horses are not fond of them.

Hedges, meadows, and pastures.

ST.—Egg-shaped, pointed, and sometimes oval and rounded at the end. ST.—Rundles, some of them opposite the leaves. GOUAN.—Never opposite the leaves. RETZ.—But in all the specimens of our herbariums they are uniformly opposite the leaves. In stems indeed not yet fully expanded rundles will appear proceeding from the bosom of the leaves, but on examination such will be found to arise from a young branch furnished also with leaves, and opposite to the base of one of these leaves the short fruit-stalk of the rundle will be found to proceed. ST.—Stem scored, angular. Lower-leaves with 2, the upper with 1 pair of leaflets. Leaflets fitting. Rundles nearly fitting. General fence none. Partial fence of 5 or 6 spear-shaped leaves, bent back. Petals white. WITH.

Creeping Water Parsnep.

In rivers and ditches.

P. July. Aug.

A young lady 6 years old was cured of an obstinate cutaneous disease, by taking 3 large spoonfuls of the juice twice a day; and I have repeatedly given to adults 3 or 4 ounces every morning in similar complaints, with the greatest advantage. It is not nauseous, and children take it readily if mixed with milk. In the doses I have given it, it neither affects the head, the stomach, nor the bowels. WITH.

SI'U M *inunda'tum*. WIGG.—Creeping. Rundles with least 2 spokes. ST.

Sifon inundatum, which see.

379. S I ' S O N, Honewort. (*Petiv.*)

Rundle unequal; with fewer than 6 spokes. *Rundlets* unequal; with fewer than 10 spokes.

EMPAL. *General Fence* 4 leaves; unequal. *Partial Fence* the same. *Cup* hardly perceptible.

BLOSS. *General*, uniform. *Florets* all fertile. *Individuals*, equal; of 5 petals; spear-shaped; flat; but a little bent inwards.

CHIVES. *Threads* 5; hair-like; as long as the petals. *Tips* simple.

POINT. *Seed-bud* beneath; nearly egg-shaped. *Shafts* 2; reflected. *Summits* blunt.

S. VESS. None. *Fruit* egg-shaped; scored; divisible into 2.

SEEDS. 2; egg-shaped; convex and scored on one side; flat on the other.

Ess. CHAR. *Fruit* egg-shaped; scored. *Fence* of generally 4 leaves.

hedge S I ' S O N *Amo'mum*. Leaves winged. Rundles upright.—

Cerfolium vulgare sativum. GER. em. 1038.

Common Chervil.

[Found near Worcester growing in considerable plenty in the hedge on the south east side of the Bristol road, just beyond the Turnpike, May 1775.—And in the hedges in Upper and Lower Old Swinford, though not to be discovered in any of the neighbouring gardens. I believe it like the *S. odorata* to be only a naturalized plant, as Linnæus informs us it is in Sweden: Str.]

A. May.

It is cultivated in our gardens as a pot-herb, and for fallads. It is slightly aromatic and aperient.

Cows are extremely fond of it. Sheep and Goats eat it. Horses refuse it.

SCAN'DIX *Anthriscus*. Leaves egg-shaped, rough rough with hair. Blossoms uniform. Stem smooth.—

Curt. i. 3.—Jacq. austr. ii. 154.—Fl. dan. 863.—Pet. 27. 12.—

H. ex. ix. 10. row 1. 2.—J. B. iii. 6. 182. 1.

Stem a cubit high, upright, branching, round, tubular, scored, smooth; knots rather swollen. Leaves winged with an odd one, hairy; wings opposite, 4 on each side, winged; leaflets cloven, pointed. Leaf-stalks channelled, woolly, and embracing the stem at the base; those on the stem very short. Fruit-stalks opposite to the leaves.

Rundle, spokes generally 3; rundlets, spokes 3, 4, and 5 rays. Fence-let, leaves spear-shaped, awn-pointed, permanent, sometimes 5.

Florets, all with chives and pointals. Petals nearly equal. Seeds egg-shaped, rough with hairs hooked upwards. Shafts upright.

LYONS.—Rundles on fruit-stalks, but sometimes sitting; fruit-stalks smooth; spokes smooth, from 2 to 5. Rundlets, spokes sometimes only 2. Haller and Scopoli have considered it as a *Caucalis*, but such a disposition separates it from the *S. Cerfolium*, to which it is most closely allied both in habit and structure. Petals white. ST.

Rubbish, road sides.

A. May. June.

Cows, Goats, and Sheep eat it.

388. CHÆROPHYL'LUM. Chervil.

Rundle expanding. *Rundlets* with nearly the same number of spokes.

EMPAL. *General Fence* none. *Partial Fence* of about 5 leaves; spear-shaped; concave; reflected; nearly as long as the rundlets. *Cup* not discernible.

BLOSS. *General*; pretty uniform. *Florets* in the centre generally barren. *Individuals*; petals 5; heart-shaped; bent inwards; flattish; with a sharp point bending inwards; the *outermost* petals rather the largest.

CHIVES. *Threads* 5; simple; as long as the rundlet. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; reflected. *Summits* blunt.

S. VES. None. *Fruit* oblong-egg-shaped; taper; smooth; divisible into 2.

SEEDS. 2; oblong; growing smaller upwards; convex on one side; flat on the other.

ESS. CHAR. *Fence bent back*; concave. *Petals heart-shaped*; bent in. *Fruit oblong*; smooth.

OBS. *Seeds* of the centre often barren. *Figure* of the fruit variable.

Cow-weed CHÆROPHYL'LUM *folves'tre*. Stem smooth, scored, a little swollen at the knots. LINN.—Smooth to the touch, but generally woolly. Lesser branches smooth. ST.

Gal. iv. 46.—Jacq. austr. ii. 149.—H. ox. ix. 11. 5.—Fuchs. 525.—Pet. 25. 2.—Lonic. i. 238.

Stem nearly furrowed. *General fruit-stalk* round. *Petals* entire, flat, the outer larger. *Rundle* somewhat radiated. LINN.—Stem when fully grown generally beset with a white downiness, but sometimes smooth. *Petiolets*, leaves egg-spear-shaped, hairy at the edge. *Blossom* at first yellowish white, but growing whiter when farther advanced. *Seeds* glossy, not furrowed, or scored. CRANTZ. ST.—Root generally branched. Stem mostly woolly. *Rundles* before their expansion nodding; *spokes* smooth. *Fencelets* twice as short as the rundlet. *Petals* flat, inversely egg-shaped, those of the outer florets of each rundlet somewhat inversely heart-shaped, and larger. CHAR.—*Rundles* when in blossom convex, in fruit flat. ST.—*Flowers* in the centre of each rundlet often barren. *Inner petals* gradually smaller. *Silfs* scarcely rising above the surface of the receptacle while in blossom, when in fruit expanding. ST.

Joints

Joints of the stem, leaf-stalks, and fencelets sometimes with a purplish tinge. *Shafts* permanent. **WITH.**

Wild Cicely. Cow-weed. Cow Parsley.

Hedges, orchards, and pastures.

P. LINN. CRANTZ. CURT. A. HUDS. Apr. May. June.

The roots eaten as parsneps have been found poisonous. The rundles afford an indifferent yellow dye; the leaves and stems a beautiful green. Its presence indicates a fruitful soil.

Neither Horses, Sheep, or Goats are fond of it. Cows and Swine refuse it. LINN.—A horse eat the young leaves. ST.—Cows and Rabbits are fond of it. In some parts of the kingdom, in times of scarcity, it is used as a pot-herb. CURT.—Cows are so fond of it, that when a pasture is over-run with it, as is often the case about Dudley, they always turn them in to eat it up. Mr. WAINWRIGHT.

CHÆROPHYL'LUM *tem'ulum*. Stem rough, swollen wild at the knots.—

Jacq. austr. i. 65.—Ger. 867, cop. in Ger. em. 1038. 2, and Park.

915.—*Pet. 25. 3.—H. ox. ix. 10. 7.—J. B. iii. 6. 70. 2 and 1.*

Rundles before flowering drooping. Stem but little furrowed; marked with purple spots, and set with white hairs which stand out. Rundlets in the centre barren. LINN.—Stem 1 or 2 cubits high, hairy, rough, solid. Leaves hairy, very finely winged; wings winged; lesser wings half winged, gradually decreasing. Fence wanting, or of 1 to 4 leaves. Fencelet of 1 leaf, with 6 to 8 leaflets. Rundles but few. Petals cloven. Seeds tawny, obscurely scored. Petals very white. RELHAN.

Wild Chervil.

Hedges.

A. July. Aug.

Cows and Sheep refuse it. LINN.—A horse eat the young leaves. ST.

389. IMPERATORIA. Masterwort.

EMPAL. *General Rundle* expanded; flat; *partial* unequal.

General Fence none; *partial* of 1 or 2 leaves; very thin; nearly as long as the rundlet. *Cup* indistinct.

BLOSS. *General*; uniform. All the *florets* fertile. *Individuals*; *petals* 5; bent in; nicked; nearly equal.

CHIVES. *Threads* 5; hair-like. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; bent back. *Summits* blunt.

S. VESS. None. *Fruit* roundish; compressed; bulging in the middle; bordered; divisible into 2.

SEEDS. 2; egg-shaped; marked on the outside with 2 furrows; edged with a broad margin.

ESS. CHAR. *Fruit* roundish; compressed; bulging in the middle; bordered at the edge. *Petals* bent in; nicked.

common

IMPERATORIA *Ostru'thium*.—

Found by Mr. Lightfoot on the banks of the Clyde, particularly about Arden Caple, Isle of Bate, near Mount Stewart. [Near Bridgnorth, but in a situation that would allow of its being an outcast of a garden. WITH.] P. June.

Root warm and aromatic; a sudorific, diuretic, and sialagogue; recommended in dropfy, debilities of the stomach and bowels, and an infusion of it in wine is said to have cured quartans that have resisted the bark. ST.

392. PASTINA'CA. Parsnep.

Rundle of many spokes; flat. *Rundlets* of many spokes.

Fences none.

EMPAL. *Cup* hardly perceptible.

BLOSS. *General*; uniform. *Florets* all fertile. *Individuals*; petals 5; spear-shaped; entire; rolled inwards.

CHIVES. *Threads* 5; hair-like. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; reflected. *Summits* blunt.

S. VESS. None. *Fruit* oval; compressed and flat; divisible into 2.

SEEDS. 2; oval; nearly flat on each side; bound round with a border.

ESS. CHAR. *Fruit* elliptical; compressed; flat. *Petals* rolled in; entire.

PASTINA'CA *sativa*. Leaves simply winged.— common
α. wild.

Fuchf. 753, *cop. in J. B.* iii. 6. 149, *H. ox.* ix. 16. 2.—*Matth.* 776.—*Ger.* 856.

Stem 2 or 3 cubits high, upright, stiff, angular, downy, hollow, branching. *Leaf-stalks* downy. *Leaflets* very soft, serrated, often with 3 lobes. *Rundle*, spokes 10 and upwards. *Rundlets*, spokes 20 and upwards. *Blossom* yellow. RELHAN.

garden

Fuchf. 751, *cop. in Dod.* 680. 2, *repr. in Ger. em.* 1025, and *cop. in J. B.* iii. 6. 150.—*Ger.* 870. 2.—*Matth.* 747; *cop. in Ger.* 870. 1; and also in *Dod.* 680. 1, which *repr. in Lob. obs.* 407. 2, *ic. i.* 709. 2, *Ger. em.* 1025. 1, and *cop. in Park.* 944.—(*Trag.* 440, seems to be *Daucus Carota*.)

The roots when cultivated are sweeter than carrots, and are much used by those who abstain from animal food in Lent: they are highly nutritious. In the north of Ireland they are brewed, instead of malt, with hops, and fermented with yeast. The liquor thus obtained is agreeable. The seeds contain an essential oil, and will often cure intermittent fevers.

Hogs are fond of the roots, and quickly grow fat with them.

393. SMYR'NIUM. Alexanders.

Rundle unequal; daily increasing. *Rundlets* upright. *Fence* none.

EMPAL. *Cup* hardly perceptible.

BLOSS. *General*; uniform. *Florets* in the centre barren. *Individuals*; petals 5; spear-shaped; keeled underneath; slightly bent inwards.

CHIVES. *Threads* 5; simple; as long as the petals. *Tips* simple.

POINT. *Seed-bud* beneath. *Shafts* 2; simple. *Summits* 2; simple.

S. VESS. None. *Fruit* nearly globular; scored; divisible into 2.

SEEDS. 2; crescent-shaped; convex on one side, and marked with 3 angles; flat on the other.

ESS. CHAR. *Fruit* oblong; scored. *Petals* taper-pointed; keeled.

common SMYR'NIUM *Olusā'trum*. Stem-leaves 3-fingered; on leaf-stalks; ferrated.—

Ger. 864. 2.—Trag. 436, an improved copy of *Lonic.* i. 237. 2.—*Blackw.* 408.—*J. B.* iii. 6. 126, foliage.—*Dod.* 698. 1, repr. in *Lob.* i. 708. 2, *Ger. em.* 1019, and cop. in *Park.* 930. 1.—*Pet.* 24. 1.—*H. ox.* ix. 4. row 2. n. 1. fig. 3d.—(*Fuchf.* 760, is a different plant, as is evident from its general fence.—*Matth.* 773, cop. in *Pet.* 24. 12, has also a general fence.)

Root-leaves twice 3-fingered, *Uppermost stem-leaves* opposite, 3-fingered. *Sheaths* of the leaves torn and fringed. *Fencelets* very short. *Flowers* of the centre with only chives, those of the circumference with chives and pointals. LINN.—*Bloss.* irregular, of a whitish greenish hue. RELHAN.

Aliffanders.

Ditches and rocks on the sea coast. About Scarborough Castle, Deptford, Battersea, Vauxhall, and Nottingham. [Almost covers the south west end of Anglesea. PENN. wales ii. 253.—Bungay, Suffolk. Mr. Woodw.—Under the walls of York. Mr. Wood.—Between Great Comberton and Wollershill, under hedges near the Avon, Worcestershire. NASH.—Found by the Rev. Mr. Welles at Hill Croome, Worcestershire. Mr. BALLARD. ST.—And Pirton, plentifully. Mr. HOLLEFEAR.] B, May. June.

It

It was formerly cultivated in our gardens, but its place is now better supplied by celery.—It is boiled and greedily eaten by sailors returning from long voyages, who happen to land at the south west corner of Anglesea. PENNANT.

394. ANE'THUM. Dill.

Rundle of many spokes. *Rundlets* the same. *Fences* none. EMPAL. *Cup* hardly perceptible.

BLOSS. *General*; uniform. *Florets* all fertile. *Individuals*; petals 5; rolled inwards; entire; very short.

CHIVES. *Threads* 5; hair-like. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; placed close together; but not very discernible. *Summits* blunt.

S. VESS. None. *Fruit* nearly egg-shaped; compressed; scored; divisible into 2.

SEEDS. 2; somewhat egg-shaped; convex and scored on one side; flat on the other.

ESS. CHAR. *Fruit* nearly egg-shaped; compressed; scored. *Petals* rolled in; entire.

β. Cultivated in gardens.

garden

Sweet Fennel.

The tender buds are useful in fallads.—The leaves boiled are used in sauce for several kinds of fish, and eaten raw with pickled fish.—In Italy the stalks are blanched as a winter fallad.—The seeds abound with an essential oil, which is carminitive and diuretic, but not heating.—The *Papilio machaon* feeds upon it.

395. CA'RUM. Caraway.

Rundle with 10 spokes; long; and often unequal. *Rundlets* crowded. *General Fence* often of 1 leaf; *partial* none.

EMPAL. *Cup* hardly perceptible.

BLOSS. *General*; uniform. *Florets* in the centre barren. *Individuals*; unequal. *Petals* 5; unequal; blunt; heart-shaped; bent inwards at the end.

CHIVES. *Threads* 5; hair-like; as long as the petals; shedding. *Tips* very small; roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; very small. *Summits* simple.

S. VESS. None. *Fruit* oblong-egg-shaped; scored; divisible into 2.

SEEDS. 2; oblong-egg-shaped; convex on one side, and scored; flat on the other.

ESS. CHAR. *Fruit* egg-oblong; scored. *Fence* of 1 leaf. *Petals* keeled; bent in; nicked.

OBS. Some of the florets in the centre have neither chives nor pointals.

common CA'RUM Ca'ru.

Ludw. 156.—*Jacq. austr.* iv. 393.—*Tourn.* 160. 3, leaf.—*Blackw.* 529.—*Ger.* 879, cop. in *H. ox.* ix. 9. row 2. 1.—*Pet.* 26. 1.—*Dod.* 299. 2, repr. in *Lob. obs.* 418. 1, ic. i. 724. 1, *Ger. em.* 1034, and cop. in *Park.* 910.—(*Math.* 755, has egg-shaped leaflets; and *Fuch.* 396, cop. in *Trag.* 455, and *J. B.* iii. 6. 69, seems to me a different plant.)

Stem 1 to 1½ cubit high, solid, smooth, with expanding branches. *Leaves* long, smooth, wings in pairs; the first little wings cross-wise; segments flat, long, pointed. *Leafstalk* long, narrow, keeled. *Rundles* terminating. *Blossom* white or reddish.

RELH.—*Plant* quite smooth. *Stems* furrowed. *Leaves* doubly compound; leaflets in fives, in a sort of whorl, 2 of them longer; segments terminating in a reddish semi-transparent substance. *General fence* from 1 to 5 leaves. *Rundle*, spokes 9 to 12. *Florets* all fertile. *Tips* yellowish. *Petals* and *shafts* slightly tinged with red.

WITH.

Meadows and pastures. [Near Bury. Mr. CULLUM.]

B. May. June.

Parkinson says, the young roots are better eating than parsneps.—The tender leaves may be boiled with pot-herbs.—The seeds are

are used in cakes; incruſted with ſugar are called Caraway Comfits, and are diſtilled with ſpirituous liquors for the ſake of the flavour they afford.—The ſeeds were formerly recommended by Dioſcorides to pale-faced girls, and in more modern days their uſe in that caſe is not forgotten.—They are no deſpicable remedy in tertian agues.—They abound with an eſſential oil, which is antiſpaſmodic and carminative.—Sheep, Goats, and Swine eat it. Cows and Horſes are not fond of it.

396. PIMPINEL'LA. Anife.

Rundle of many ſpokes. *Rundlets* of ſtill more. *Fences* none.

EMPAL. *Cup* not very diſcernible.

BLOSS. *General*; nearly uniform. *Florets* all fertile. *Individuals*; *petals* 5; nearly equal; heart-shaped; but bent inwards.

CHIVES. *Threads* 5; ſimple; longer than the petals. *Tips* roundiſh.

POINT. *Seed-bud* beneath. *Shafts* 2; very ſhort. *Summits* nearly globular.

S. VESS. None. *Fruit* oblong-egg-shaped; diviſible into 2.

SEEDS. 2; oblong; narrow towards the point; convex and ſcored on one ſide; flat on the other.

ESS. CHAR. *Fruit* egg-oblong. *Petals* bent in. *Summits* nearly globular.

PIMPINEL'LA *Saxifraga*. Leaves winged. Leafſits *Saxifrage* of the root-leaves roundiſh; thoſe of the upper-leaves ſtrap-shaped.

This

This and the former species partake nearly of the same qualities. The root is very acrid, burning the mouth like pepper. It affords a blue oil. Its acrimony hath occasioned it to be used to cure the tooth-ache, and to cleanse the skin from freckles. It is chewed to promote the secretion of saliva, and is used in gargles for dissolving viscid mucus in the throat. In Germany it is prescribed in the asthma and dropfy.—The *Papilio Machaon* is found upon both species.

PIMPINEL'LA *dioica*. Rundles very numerous, *leaf* compound and simple. LINN.—Leaves mostly doubly winged. Leaflets strap-shaped, simple, and 3-fingered. Flowers with chives and pointals on distinct plants. HUDS.

Jacq. austr. i. 28.—*Clus.* ii. 200. 1, repr. in *Ger. em.* 1054. 3, and cop. in *Ger.* 863, and *J. B.* iii. 6. 18. 1.—*Lob. adv.* 331. 2, cop. in *ic.* i. 745. 2, which repr. in *Ger. em.* 1021. 3.

Stem a hand's breadth high, straddling, smooth, scored, with but few leaves. Leaves 3 or 2-fingered, strap-shaped. Rundles 1 terminating, and 2 lateral, opposite, generally compound, some few simple. Petals long-spear-shaped, bowed in, not nicked. Chives white, long. Fences none. Some plants with only chives, others with chives and pointals. Nearly allied to *P. glauca*, or constituting a distinct genus. LINN.—Root spindle-shaped, perpendicular, somewhat branched at the base, and woolly at the head. Stem 8 to 16 inches high, upright, angular, very much branched. Branches open. The lower leaves opposite, on leaf-stalks, winged and doubly winged; leaflets simple, and in threes, strap-shaped; channelled, bare, sea-green. Leaf-stalks membranaceous, sheathing, oblong, scored, entire. Rundles on leaf-stalks, terminating, and from the bosom of the leaves; general, spokes long, about 6; partial crowded, spokes short, about 5. Flowers yellowish or whitish. FLOWERS WITH ONLY CHIVES. Petals oblong, bowed in at the point, equal. Threads awl-shaped. FLOWERS WITH POINTALS. Threads 5, but the tips barren. Shafts distant. Fruit egg-shaped. HUDS.

Mountainous pastures. St. Vincent's Rock, near Bristol. Uphill, Somersetshire. P. May. June.

397. A'PIUM. Parsley.

Rundle with few spokes. *Rundlets* with many.

EMPAL. *General Fence* none; or else of one or more leaves.

Partial Fence the same. *Cup* hardly perceptible.

BLOSS. *General*; uniform. *Florets* almost all fertile. *Individuals*; petals circular; equal; bent inwards.

CHIVES. *Threads* 5; simple. *Tips* roundish.

POINT. *Seed-bud* beneath. *Shafts* 2; reflected. *Summits* blunt.

S. VESS. None. *Fruit* egg-shaped; scored; divisible into 2.

SEEDS. 2; egg-shaped; scored on one side; flat on the other.

ESS. CHAR. *Fruit* egg-shaped; scored. *Fence* 1 leaf. *Petals* equal.

Smallage

A'PIUM *grave'olens*. Stem-leaves wedge-shaped.—

General fence often wanting. LINN.—*Stem* angular, furrowed. *Rundles* sitting, or on a fruit-stalk; spokes about 15. *Bloss.* white. *Seeds* small. RELHAN.—*Stem* smooth, shining, deeply furrowed. *Rundles*, some sitting, others on long fruit-stalks, appearing as if proliferous. MR. WOODWARD.—*Root-leaves* winged. *Leaflets* divided into 3 lobes, serrated. *Rundles*, spokes 5 to 11; those of the *rundlets* 11 to 16. *Petals* white.

Smallage.—Ditches and marshes. [Salt Marshes, near Yarmouth, and in the midland counties. MR. WOODW.—Bog near Marazion, Cornwall. MR. WATT.—Moors, Sanfom Fields, Worcester. ST.]

B. Aug.

The root in its wild state (when it grows near water, ST.) is fetid, acrid, and noxious; but when cultivated (in dry ground, ST.) it loses these properties, and the root and lower part of the leaf-stalks and stem blanched by covering them up with earth, are eaten raw, boiled in soups, or stewed. In this latter state it is called *Celery*. They are said to be hurtful to people subject to nervous complaints. They are certainly good antiscorbutics. The seeds yield an essential oil.

Sheep and Goats eat it. Cows not fond of it. Horses refuse it.

398. ÆG O-

398. ÆGOPODIUM. Goutweed.

Rundle of many spokes; convex. Rundlets the same, but flat. Fences none.

EMPAL. Cup hardly discernible.

BLOSS. General; uniform. Florets all fertile. Individuals; petals 5; inversely egg-shaped; equal; concave; bent inwards at the point.

CHIVES. Threads 5; simple; twice as long as the petals. Tips roundish.

POINT. Seed-bud beneath. Shafts 2; simple; upright; as long as the petals. Summits roundish.

S. VESS. None. Fruit oblong-egg-shaped; scored; divisible into 2.

SEEDS. 2; oblong-egg-shaped; convex and scored on one side; flat on the other.

ESS. CHAR. Fruit egg-oblong; scored.

ÆGOPODIUM *Podagra'ria*. Upper stem-leaves Gerard's 3-fingered.—

Fl. dan. 670.—*Ger.* 848, *cop. in J. B.* iii. 6. 145.—*Dod.* 320.

2, *repr. in Lob. obs.* 398. 3, *ic. i.* 700. 2, *Ger. em.* 1001. 2, and *cop. in Park.* 943, *Pet.* 25. 10, and *H. ox.* ix. 4. 11.

Upper leaves opposite. LINN.—Root creeping. Stems 1 or 2 cubits high, furrowed, with open branches. Rundles and Rundlets, spokes 14. Blossom white. RELH.—Leaflets spear-shaped, serrated. Mr. WOODWARD.—Lower leaf-stalks 3-cornered, the lower sides flat, the upper hollow. WITH.—Roots creeping. Leaves, ramifications of both surfaces beset with very short minute hairs. Petals white. ST.

Herb Gerard. Goutweed. Ashweed. Ground Ash.

Orchards, gardens, and pastures, common. P. May.

The leaves may be eaten early in the spring with other pot-herbs.

Cows, Sheep, and Goats eat it. Horses are not fond of it.

LINN.—It sometimes proves a very troublesome weed in gardens.

Lob. obs. 589. 2, which repr. in *Ger. em.* 1426, and *J. B. i.* a 549.

2.—*Fuchf.* 65.—*Ger.* 1238.—*Trag.* 796.—*Park.* 209. 7.

Stems very brittle. *Leaves* winged, with several pair of leaflets.

Leaflets spear-shaped, serrated, unequal at the base, the upper margin deficient. Sometimes small leaves grow at the base of the leaf-stalks, and also on the leaf-stalks of the larger leaflets. *Mr.*

WOODWARD.—*Stem* and *leaf-stalks* furrowed. *Little-leaves* at the base of the leaf-stalks heart-shaped. *Leaflets*, serratures purple at the points.

Empal. segments sometimes 6, purple. *Bloss.* segments pointed.

Threads thick, wrinkled. *Berry* 3 cells. *Bloss.* white above; purple beneath. *Chives* white. *Tips* purple; one fixed on each side of every thread, so that there are properly speaking 10 tips.

WITH.

Dwarf Elder. *Wallwort.* *Danewort.*

Hedges and road sides.

S. July.

Has

Has the same medical properties with the *S. nigra*, but in some respects more violent, and therefore less manageable. A dram and a half of the root is a strong purge.—The berries give out a violet colour.—The green leaves drive away mice from granaries, and the Silesians strew them where their pigs lie, under a persuasion that they prevent some of the diseases to which they are liable.

Neither Cows, Goats, Sheep, Horses, or Swine will eat it.

common SAMBU'CUS *nigra*. Tufts of 5 spokes. Leaves winged. Leaflets nearly egg-shaped, serrated. Stem woody. LINN.—Leaves winged. Little-leaves somewhat egg-shaped, serrated. RETZ. *obs.* iii. 47. ST.

Fl. dan. 545.—*Blackw.* 151, the best fruit.—*Matth.* 1268, *cop. in Ger.* 1234.—*Fuchf.* 64.—*Ger. em.* 1422. 1.—*Dod.* 845. 1, *repr. in Ger. em.* 1422. 2, and *cop. in Park.* 208. 1.—*Trag.* 997.—*J. B. i. a.* 544.

Leaves winged; leaflets 5 to 7, somewhat egg-shaped, pointed, serrated. Summit spotted. Berries green, at length blackish purple, with a juice of the same colour. Seeds 3. RELH.—Blossoms white. Berries black. Tips yellow, arrow-shaped, one on each thread.

Woods and damp hedges.

S. Apr. May.

The whole plant has a narcotic smell; it is not well to sleep under its shade.—The wood is hard, tough, and yellow. It is commonly made into skewers for butchers; tops for angling rods; and needles for weaving nets. It is not a bad wood to turn in the lathe.—The inner green bark is purgative, and may be used with advantage where acid purgatives are requisite. In smaller doses it is diuretic, and has done eminent service in obstinate glandular obstructions, and in dropsies. If sheep that have the rot are placed in a situation where they can get at the bark and the young shoots, they will soon cure themselves. It is an ingredient in the black dye.—The leaves are purgative like the bark, but more nauseous. They are an ingredient in several cooling ointments. If turneps, cabbages, fruit-trees, or corn, (which are subject to blight from a variety of insects) are whipped with the green leaves and branches of elder, the insects will not attack them. *Phil. Transf.* v. 62. p. 348. A decoction of the flowers, taken internally, is said to promote expectoration in pleurifies. If the flowers are fresh gathered they loosen the belly. Externally they are used in fomentations to ease pain and abate inflammation. Many people use them to give a flavour to vinegar. They are fatal to turkies. A rob prepared from the berries is a gentle opener, and promotes perspiration. The juice of the berries is employed to give

give a red colour to raisin or sugar wines. The berries are poisonous to poultry.—The *pith* being exceedingly light, is cut into balls, used in electrical experiments.

Sheep eat it. Horses, Cows, and Goats refuse it. LINN.—Others say that Cows are fond of it.—The *Aphis Sambuci*, and the *Phylloxera Sambucaria*, are found upon it.

β. Berries white or green.

Corn fields and sandy pastures in Dorsetshire and Devonshire. [Near Cawston, Norfolk. Mr. BRYANT.—Corn fields, Ripton, Huntingdonshire. Mr. WOODWARD.—Downs, old pastures, and corn fields, near to commons about Redruth and Trelubbus, Cornwall. Mr. WATT.] A. July.

This valuable plant originally came from those parts of Ægypt which are exposed to the inundations of the Nile. The *seeds* yield, by expression only, a large proportion of oil, which is an excellent pectoral, as is likewise the mucilaginous infusion. They make an easy and useful poultice in cases of external inflammation; and they are the food of several small birds. After the oil is expressed, the remaining farinaceous part, called Oil Cake, is given to oxen, who soon grow fat upon it. The oil itself differs in several respects from

from other expressed oils; it does not congeal in winter, nor does it form a solid soap with fixed alkaline salts; and it acts more powerfully as a menstruum upon sulphureous bodies. When heat is applied during the expression it gets a yellowish colour, and a peculiar smell. In this state it is used by the painters and the varnishers.—The fibres of the *stem* are manufactured into linen; and this linen, when worn to rags, is made into paper.

LI'NUM *perenne*. Empalements and capsules blunt. *perennial*
Leaves alternate, spear-shaped; very entire. LINN.—
Empalement very entire and smooth. ST.

Sundew. *Rosa folis.* *Redrot.* *Youthwort.* *Moorgrafs.*

Mossy bogs. [Malvern Chace on the side of the rivulet flowing from the Spa. Mr. BALLARD.—Birmingham Heath. WITH.]

P. July. Aug.

The whole plant is acrid, and sufficiently caustic to erode the skin; but some ladies know how to mix the juice with milk, so as to make it an innocent and safe application to remove freckles and sunburn. The juice that exudes from it unmixed will destroy warts and corns.—The plant has the same effect upon milk as the *Pinguicula vulgaris*; and like that too is supposed to occasion the rot in Sheep. Is not the four coagulated milk of the Syrians, called *Leban*, or *Leven*, at first prepared with some plant of this kind? See *Ruffel's nat. hist. of Aleppo*.

The name, SUNDEW, seems to be derived from a very striking circumstance in the appearance of these plants; the leaves are fringed with hairs, supporting small drops or globules of a pellucid liquor like dew, which continue even in the hottest part of the day, and in the fullest exposure to the sun. Perhaps the acrimony of the plant resides in this secreted liquor.

DRO'SERA

long-leaved DRO'SERA *longifolia*. Stalks from the root. Leaves oval-oblong. LINN.—Shafts 6. HUDS

Dod. 474. 2, repr. in Ger. em. 1556. 2, and cop. in Fet. 63. 11.

1052. 2, are the *Rorella longif. max.* of Ray, which Mr. Hudson refers to, though he does not to the above figures.

Has many things in common with the preceding species, but is larger, and the capsules have 4 valves. HUDS.

Boggy ground in the northern counties. Devonshire, Hants, and Norfolk. P. July. Aug.

Few persons can have observed the DRO'SERA in its native bogs, without seeing some of the leaves doubled up; but the cause of this, I believe, was first ascertained in this kingdom by the attention and ingenuity of my friend, Mr. WHATELY, now a surgeon in London. In the month of August, 1780, that gentleman, being upon a visit in Derbyshire, and gathering some specimens of the Drosera, examined some of these folded leaves, and finding a dead insect in each, was prompted to irritate the upper surface of other leaves, by touching them with a pin. The effect was as he expected, a sudden contraction of the leaf upon the pin. He communicated this curious fact to me; and though the experiment has since failed in my hands, I am satisfied he saw what he described. His friend, Mr. GARDOM, a Derbyshire botanist, who accom-

panied

panied him at the moment of this discovery, has since written me the following account:

“ In August, 1780, examining the *DROSERA* in company with Mr. WHATELY, on his inspecting some of the contracted leaves, we observed a small insect or fly very closely imprisoned therein, which occasioned some astonishment, to me at least, how it happened to get into that confined situation. Afterwards, on Mr. Whately's centrically pressing with a pin other leaves, yet in their natural and expanded form, we observed a remarkable sudden and elastic spring of the leaves, so as to become inverted upwards, and as it were encircling the pin, which evidently shewed the method by which the fly came into its embarrassing situation. This experiment was renewed repeatedly, and with the same effect, so that Mr. Whately and myself are both certain of the fact.”

Two or three years after Mr. Whately had sent me an account of his discovery, I was much pleased to find the following account of the *Drosera* in a German author, which, though it differs in some respects from the observations of Mr. Whately and Mr. Gardom, yet upon the whole it tends further to illustrate the singular properties of these curious plants:

“ July, 1779. *Dros. rotundifolia* and *D. longifolia*.—I remarked that many leaves were folded together from the point towards the base, and that all the hairs were bent like a bow, but there was no apparent change on the leaf-stalk. Upon opening these leaves I found in each a dead insect. Hence I imagined that this plant, which has some resemblance to the *Dionæa muscipula*, might also have a similar moving power.

“ With a pair of pliers I placed an ant upon the middle of a leaf of the *D. rotundifolia*, but so as not to disturb the plant. The ant endeavoured to escape, but was held fast by the clammy juice at the points of the hairs, which was drawn out by its feet into fine threads. In some minutes the short hairs on the disk of the leaf began to bend, then the long hairs, and laid themselves upon the insect. After a while the leaf began to bend, and in some hours the end of the leaf was so bent inwards as to touch the base. The ant died in 15 minutes, which was before all the hairs had bent themselves. On repeating this experiment, I found the effects to follow sooner or later, according to the state of the weather. At 11 in the morning, a small fly placed in the centre of a leaf, died sooner than the ant had done, the hairs bent themselves as before, and at 5 in the evening the leaf was bent together, and held the fly shut up. The same experiment being made on the *D. longifolia*, the same effects followed, but more rapidly. I observed, that in sultry weather, and hot sunshine, when the drops of juice
upon

upon the points of the hairs are largest, the experiment succeeds best. If the insect be a small one, sometimes only one edge of the leaf is folded up; hence it should seem necessary that the insect should stir all the hairs of the leaf.—Wroth. Beytrog, p. 64.

These accounts will I hope occasion numerous observations to be made upon this British Fly-trap, which so nearly approaches in its wonderful properties to the *Dionæa muscipula* or Venus Fly-trap, a native of the Bogs of Carolina. It is natural to enquire whether this destruction of insects be not necessary to the welfare of the plant? It is obvious that the experiments should be made upon well-grown vigorous plants in a fine day, as then the drops of adhesive liquor at the ends of the hairs are always the largest.

It may be useful to remark, that these plants are not to be found without a pretty close inspection of the Bogs they grow in, as they are much covered by, and entangled with Mosses.

425. SIBBAL'DIA. Silverweed.

EMPAL. *Cup* 1 leaf; with 10 shallow clefts; upright at the base; permanent. *Segments* alternately narrower; half spear-shaped; equal; expanding.

BLOSS. *Petals* 5; egg-shaped; standing on the cup.

CHIVES. *Threads* 5, hair-like; shorter than the petals; standing on the cup. *Tips* small; blunt.

POINT. *Seed-buds* 5; egg-shaped; very short. *Shafts* as long as the chives, and standing upon the sides of the seed-buds. *Summits* somewhat globular.

S. VESS. none. The *Cup* closes upon the feeds.

SEEDS 5; rather long.

Ess. CHAR. *Empal.* 10 clefts. *Petals* 5, inserted into the *empal.* *Shafts* from the side of the seed-buds. *Seeds* 5.

procumbent SIBBAL'DIA *procumbens*. Leaflets with 3 teeth.—
Fl. dan. 32.—*Penn. voy.* ii. 5. at p. 43.—*Fluk.* 212. 3.—*Pet.* 41.
7, as cultivated.

Root woody. *Stems* trailing, covered with the remains of the dead leaf-stalks. *Leaf-stalks* slender, slightly woolly, below oblong, membranaceous, brown, embracing the stems, slightly cloven, pointed. *Leaves* 3-fingered. *Leaflets* inversely egg-shaped, but somewhat lopped at the end, beset on each side with soft hairs; teeth somewhat pointed. *Bloss.* yellow, smaller than the *empal.* *Pointals* sometimes 10, and 5 in the same plant. In what respects it differs from the *Potentilla* may be seen by comparing

paring the descriptions of the 2 genera. Indeed it agrees with that and the rest of the natural order of *Senticosæ*; except in the number of chives and pointals. LINN.—The younger *Root Leaves* silky, the older bald. *Chives* and *Seeds* not more than 5. HALL.—*Leaf-stalks* long. *Leaflets* wedge-shaped, slightly cloven into 3 at the end. MR. WOODWARD.—*Leaf-stalks* longer than the leaflets. *Leaves* with fine silky hairs on both sides. *Chives* 7 or more in all the flowers examined of a cultivated specimen. *Threads* reddish. *Tips* yellow, *Seed-buds* 10. *Seeds* 10, fixed to a dry hairy receptacle. WITH.

LINN.—*Leaves* and *leaf-sheaths* deeply furrowed. *Bulbs* numerous. *Fruit-stalks*, some upright. *Bloss.* pale, with purple lines. *Threads* fixed to the petals. *Seed-bud* prism-shaped, of 6 angles. *Shaft* slender, longer than the blossom. Excepting that the *leaves* can hardly be called rough, corresponds very exactly with *A. oleraceum*. Mr. WOODWARD.

Meadows, pastures, and amongst corn. P. July.

The tender leaves are very commonly boiled in soups, or fried with other herbs.—Cows, Goats, Sheep, and Swine eat it.

**** *Leaves from the root. Stalk naked.*

Ramson AL'L IUM *ursinum*. Stalk naked, 3-square. Leaves spear-shaped, on leaf-stalks. Rundle flat-topped.—

Fl. dan. 757.—*Fuchs.* 739, *cop. in J. B.* ii. 566. 1, and *Trag.* 748. 2.—*Walc.*—*Math.* 560, *cop. in Dod.* 683. 2, which repr. in *Lob. obs.* 80. 2, and *Ger. em.* 179. 2; and *cop. again in Ger.* 141. 2, and *Pet.* 66. 8.—*H. ox.* iv. 15. 15.

Stalk below, semi-cylindrical. RETZ.—*Root-leaves* egg-oblong, as long as the stalk. *Sheath* falling off. *Flowers* to 20. *Threads* inserted into the claws of the petals, shorter than the shaft. *Seeds* nearly egg-shaped, 1 in each cell. RELHAN.—*Bulbs* oblong. *Root-leaves*

leaves 2 to 4, on long leaf-stalks. Sheath oval, cloven. Petals spear-shaped, white. MR. WOODWARD.—Leaves as long as the stalk. Threads fixed to the base of the petals, shorter than the shaft. W. Ramsoms.—Woods and hedges. P. May.

An infusion in brandy is esteemed a good remedy for the gravel. Penn. tour. 1772. p. 175.—Other plants that grow near it will not flourish.

Cows eat it; but it communicates its flavour to the milk.

AL'LIUM *Schænop'rasum*. Stalk naked, as long as *chived* the leaves. Leaves cylindrical, awl-thread-shaped.—

Fuchf. 635.—Trag. 742. 2.—Lonic. i. 194. 2.—Dod. 689, repr. in Lob. obs. 77. 1, Ger. em. 177. 1.—Ger. 139. 1.—H. ox. iv. 14. row 1. 4.—Matth. 550, cop. in Dod. 689. 2, and which repr. in Lob. obs. 78. 1.

Meadows and pastures. By Fast-Castle, on the borders of Berwickshire, and in Westmoreland. P. June.

444. FRITILLA'RIA. Fritillary.

EMPAL. Cup none.

BLOSS. bell-shaped; expanding at the base. Petals 6; oblong; parallel. Honey-cup a hollow in the base of each petal.

CHIVES. Threads 6; awl-shaped; approaching the shaft. Tips 4-cornered; oblong; upright.

POINT. Seed-bud oblong; 3-sided; blunt. Shaft simple; longer than the chives. Summit with 3 clefts; expanding; blunt.

S. VESS. Capsule oblong; blunt; with 3 lobes, 3 cells, and 3 valves.

SEEDS many; flat; outwardly semi-circular; in 2 rows.

ESS. CHAR. Blossom of 6 petals; bell-shaped; with a cavity containing honey above the claws. Chives as long as the blossom.

FRITILLA'RIA *Melea'gris*. All the leaves alter- *chequered* nate. Stem with 1 flower.—

Curt. iii. 36.—Walc.—Jacq. austr. v. app. 32.—Park. par. 41. 2.—Clus. i. 153. 1, repr. in Ger. em. 149. 1, and cop. in Ger. 122. 1.—Clus. i. 152, repr. in Dod. 233. 2, and Ger. em. 149. 2; and cop. in Ger. 122. 2.—Swert. i. 7. 4.

Honey-cup

Honey-cup oblong. LINN.—*Flowers* generally 1, sometimes 2, and even 3. C. B. *pin.*—*Bloss.* bellying at the base. CURT. ST.—*Root* bulbous, solid, small for the size of the plant, throwing out numerous fibres beneath, and increasing by off-sets. *Stem* from the side of the root, 12 to 18 inch. high, cylindrical, smooth, bending at the top into an elegant arch. *Leaves* 3 to 5, short, grass-like, half embracing the stem, alternate, distinct. *Flower* drooping. *Petals* oval, the 3 outer bulging at the base, the 3 inner flat, of a dull red, chequered with a deeper colour, without any mixture of green or yellow. *Summit* deeply cloven. *Capsule*, angles blunt. MR. WOODW.—*Stem* cylindrical, crooked. *Leaves* 4 to 6, spear-shaped. *Honey-cup* a fleshy glandular substance connecting the chives to the petals. *Tips* nearly as long as the threads, of 2 cells. *Seed-bud*, corners blunt. WITH.—*Fruit-stalks* slender. *Bloss.* nodding, chequered with purple, and greenish yellow. *Stalk* grows considerably longer after the flowering.

Fritillary. Chequered Daffodil, or Tulip. Snakeshead. Guinea-henflower.

Meadows and pastures. Mawde Fields, near Rissip Common, Middlesex; near Bury, Enfield; and in the meadows between Mortlake and Kew. [Between Laxfield and Stirrup-strect, Suff. MR. WOODWARD.—In a meadow near Blymhill, Staffordshire, plentifully. MR. DICKENSON.—Near Leicester. DR. ARNOLD.]

P. April. May.

451. ORNITHOG'ALUM. Bethlemstar.

EMPAL. *Cup* none.

BLOSS. *Petals* 6; spear-shaped; upright below the middle, but expanding and flat above; permanent; but fading.

CHIVES. *Threads* 6; upright; broadest at the base; shorter than the blossom. *Tips* simple.

POINT. *Seed-bud* angular. *Shaft* awl-shaped; permanent. *Summit* blunt.

S. VESS. *Capsule* roundish; angular; with 3 cells, and 3 valves.

SEEDS many; roundish.

ESS. CHAR. *Blossom* of 6 petals; upright; permanent; from about the mid-way expanding. Every other thread broader at the base.

Obs. The threads in some species are upright and flat; every other thread having 3 points, and the tip fixed upon the middle point. In other species these alternate threads are undivided.

* *All the threads awl-shaped.*

ORNITHOG'ALUM *lu'teum*. Stalk angular, with yellow 2 leaves. Fruit-stalks in rundles, undivided. LINN.—Rather stem. ST.

Walc.—Clus. i. 188. 2, repr. in Dod. 222, Lob. obs. 72. 3, Ger. em. 165. 2, and cop. in Pet. 66. 12.—Fl. dan. 378.*—Fuchs. 169, cop. in J. B. ii. 622. 1.—Ger. 132. 2.—Lonic. 193. 1.—H. ex. iv. 13. 12.—Swert. i. 57. 3.—Park. par. 137. 7.—(Trag. 737. 2, seems rather *O. minus*.)

Root-leaf generally single, longer than the stem. Stem-leaves sometimes 3 or 4, unequal. 1 much larger. Fruit-stalk sometimes solitary. Petals in 2 series, the inner greenish yellow, the outer green. Mr. WOODWARD.

Meadows and pastures. Woods on the banks of the Tees near Greta Bridge, and Bignal, Yorkshire. R. syn. [and Rev. Mr. ZOUCH.]—Near Doncaster and Kendal. [Under Malham Cove: Mr. WOOD.—In a meadow adjoining to the Copper Mills, Derby. Mr. WHATELY.] P. April.

The bulbous roots of all the species are nutritious and wholesome, and those of this species have been employed for food in a scarcity of provisions.—Horses, Goats, and Sheep eat it. Swine are not fond of it. Cows refuse it.

ORNITHOG'ALUM *pyrena'icum*. Bunch very *spiked* long. Threads spear-shaped. Fruit-stalks when in flower expanding, equal, but afterwards approaching the stalk.—

Clus. i. 187. 1, repr. in Dod. 209. 1, Lob. obs. 47. 3, Ger. em. 97, and cop. in Ger. 89, and J. B. ii. 627. 1.—Park. par. 137. 5.

Nearly 3 feet high. Flower-scales solitary, not embracing the stem, as long as the pedicles. Every other chive shorter. GOUAN.—Stalk $1\frac{1}{2}$ or 2 feet high. Fruit-stalks slender. Flower-scales membranaceous at the base, broad, and half embracing the stalk, upwards awl-shaped. Petals narrow, expanding, pale yellow within, green without, with whitish margins. Mr. WOODWARD.

Meadows and pastures. Near Ashley, between Bath and Bradford; and near Chichester. P. June.

** *Threads alternately notched at the end.*

ORNITHOG'ALUM *umbella'tum*. Flowers in broad topped spikes. Fruit-stalks rising above the top of the stalk. Threads widening at the base. LINN.—None of the threads cloven. WITH. SCOP. ST.

* Much larger than any specimens I have ever seen. Mr. WOODW. ST.

Jacq. austr. iv. 343.—*Ger.* 132. 1.—*Dod.* 221. 1, repr. in *Lob. obs.* 72. 2, *Ger. em.* 165. 1, and cop. in *Swert.* i. 57. 4.—(*Mauh.* 542, if the plant, the leaves and stalk misfigured.)

Root-leaves about 9. The lowest fruit-stalks rising higher than the rest. A flower-scale at the base of each fruit-stalk. SCOP. WITH.—Fruit-stalks very long, broad. Flower-scales very large, white, membranaceous. Mr. WOODWARD.—Petals white, with a broad green streak along the under side. Threads spear-shaped, flat, fleshy; every other broader. Seed-bud with 6 blunt angles. Shaft cylindrical, with 3 blunt angles. WITH.

Woods, meadows, and pastures in Norfolk. P. Apr. May.

452. SCIL'LA. Squill.

EMPAL. Cup none.

BLOSS. Petals 6; egg-shaped; greatly expanding; deciduous,

CHIVES. Threads 6; awl-shaped; half as long as the petals. Tips oblong; fixed side-ways.

POINT. Seed-bud roundish. Shaft simple, as long as the chives; falling off. Summit simple.

S. VESS. Capsule nearly egg-shaped; smooth; with 3 furrows, 3 cells, and 3 valves.

SEEDS several; roundish.

ESS. CHAR. Blossoms of 6 petals; falling off. Threads thread-shaped.

vernal SCIL'LA *ver'na*. Broad topped spike hemispherical, with floral-leaves, and but few flowers. Leaves awl-strap-shaped, channelled. HUDS.—Flower-scales nearly as long as the flowers.* ST.—Flowers 3 to 8, and in gardens 6 to 16. See Hudson's description.

Fl. dan. 568.†—*Clus.* i. 188. 1, repr. in *Ger. em.* 166. 4.—*Park.* par. 137. 6.

Root bulbous, coated, brown, the size of a hazle-nut. Stalk 2 to 6 inches high, upright, cylindrical, leafless, even, smooth.

Leaves

* Add to the character of *S. bifolia*, Flower-scales very minute. Leaves blunt. HALL. ST.—And to the description, Leaves very broad. HALL. ST.

† Corresponds exactly with the Cornish specimens, is referred in the Syst. veg. to *S. bifolia*, but this it cannot be from its flower-scales being nearly as long as the flowers, in which as well as other respects it corresponds with the character of *S. verna*, though not referred to by Mr. Hudson. ST.

Leaves several, pointed, nearly as long as the stalk. *Blossoms* pale blue. *Floral-leaves* permanent, membranaceous, hollow, pointed. HUDS.

Meadows and pastures. Cliffs on the sea shore in Anglesea and Wales; about St. Ives, and other places in Cornwall. I have received specimens of it under the title of *S. bifolia*, but that species is not a native of these islands. HUDS.—Gloddaeth, Caernarvonshire. [Near Redruth, Cornwall. Mrs. WATT.]

P. April. May.

SCIL'LA *autumnalis*. Leaves thread-shaped. Flowers *autumnal* in broad-topped spikes. Fruit-stalks naked, ascending, as long as the flowers.—

Chif. i. 185. 2, repr. in *Dod.* 219. 1, *Lob. obs.* 53. 3, *Ger. em.* 110. 1, and cop. in *Ger.* 98. 4.

Bloss. about the size of a pea. LINN.—Root bulbous, coated. Leaves numerous, much shorter than the stalks. Mr. WOODW.—*Blossoms* blue.

Dry pastures. St. Vincent's Rock, near Bristol; Lizard Point, Cornwall; Black Heath; near Ditton, on Moulsey Hurst, over against Hampton Court. [Common, near Chace Water Mine, Cornwall. Mr. WATT.]

P. Aug. Sept.

455. ANTHER'ICUM. Spiderwort.

EMPAL. *Cup* none.

BLOSS. *Petals* 6; oblong; blunt; greatly expanded.

CHIVES. *Threads* 6; awl-shaped; upright. *Tips* small; with 4 furrows; fixed side-ways to the threads.

POINT. *Seed-bud* with 3 corners, but slightly marked. *Shaft* simple; as long as the chives. *Summit* blunt; 3-cornered.

S. VESS. *Capsule* egg-shaped; smooth; with 3 furrows, 3 cells, and 3 valves.

SEEDS numerous; angular.

ESS. CHAR. *Bloss.* of 6 petals; open. *Capsule* egg-shaped.

* Spiderworts. Leaves channelled. Threads for the most part smooth.

ANTHER'ICUM *serotinum*. Leaves flattish. Stalk *Saffron* with 1 flower.—

Jacq. austr. v. 38.—*Ray* 17. 1. at p. 474.—*J. B.* ii. 663. 1.

Root

Root oblong, covered with scales the remains of dead leaves. Stalk with 3 or 4 floral-leaves or leaves, spear-shaped, alternate, very minute, sheathing. No flower-sheath. Flower beneath. Petals with tawny lines, and yellow claws. Threads not woolly. LINN.

Mountain Saffron.

On high mountains, as on Snowdon, and on the mountains in the neighbourhood of Llanberrys on the west side of Trigvylchau. RAY.—Rocks on Crib y Distil. HUDS. P. April. May.

** Nartheciums. Leaves sword-shaped.

Lancashire ANTHER'ICUM *offifragum*. Leaves sword-shaped. Threads woolly.—

Narthecium offifragum. HUDS. which see.

Scottish ANTHER'ICUM *calyculatum*. Leaves sword-shaped. Cups with 3 lobes. Threads smooth. Shafts 3.—

Tofieldia palustris. HUDS. which see.

Remarkable as a Liliaceous plant in having a cup. In external appearance it accords so exactly with the *A. offifragum*, that so far from removing it from that natural order, we are obliged to place them in the same genus, notwithstanding its 3-cornered empalement, the absence of a shaft, 3 seed-buds, and its naked threads. LINN.

NARTHE'CIUM. (Moehr. and Hudf.) Kingspear.

EMPAL. none.

BLOSS. Petals 6; equal; spear-shaped; pointed; nearly upright; permanent; (stiff; widely expanding; after blossoming upright; bluntish at the point. ST.)

CHIVES. Threads 6; awl-shaped; woolly. Tips small; fixed side-ways.

POINT. Seed-bud 3-square. Shaft none. Summit blunt; (oblong. ST.)

S. VESS. Capsule egg-shaped; pointed; 3-square; 3 cells, 3 valves.

SEEDS numerous; chaff-like; (cylindrical, tapering to a point each way. ST.) HUDS.

ESS. CHAR. Blofs. 6 petals; expanding; permanent. Shaft o. Capsule egg-shaped Seeds with tail-like appendages at each end. ST.

Obs. Moehringius and Mr. Hudson appear to me to have done well in making this a distinct genus. Linnæus urges indeed that

“ it

“ it is connected to several of the Anthericums in its hairy threads,” but acknowledges at the same time that it “ differs from them in having a pyramidal seed-bud, chaff-like seeds, and a permanent blossom,” circumstances surely sufficient to constitute a distinct genus. Add to which that its habit is totally distinct. ST.

NARTHE'C IUM *offis'ragum*. HUDS. ST.

Lancashire

Fl. dan. 42.—*Clus.* i. 198. 1, repr. in *Dod.* 208. 2, *Lob. obs.* 47.

1, *Ger. em.* 95. 2, and cop. in *J. B.* ii. 633. 2, *H. ox.* iv. 1.

ib. 1. in *Huds.* an error of the press for 2. Mr. Woodward. St.)

Threads bearded. LINN.—*Leaves* sometimes short, and sword-shaped, sometimes long, and grass-like, scored, with prominent ribs. *Petals* yellow within, green without, with yellow edges. Mr. WOODWARD.—*Stem* cylindrical, 4 to 6 inches high. *Root-leaves* strap-spear-shaped, flat, scored. *Stem-leaves* lying close to the stem. *Flower-scales*, 2 to each fruit-stalk, spear-shaped, alternate, concave. *Petals* strap-spear-shaped, a little concave, greatly expanding, greenish on the outside, of a full yellow within. *Threads* yellow. *Tips* scarlet. WITH. ST.—*Stem* ascending, 4 inch. to a foot high. *Leaves* all bowed one way in the same direction as the stem. *Stem-leaves* sometimes like the root-leaves, and above 2 inches long, but generally resembling sheath-like floral-leaves. *Flowers* in a terminating bunch, upright. *Flower-scales* awl-shaped, the lower at the base of the fruit-stalk, and nearly as long, the upper thrice as small. *Petals*, the 3 outer awl-shaped, the inner oblong-strap-shaped. *Threads* saffron-coloured, covered with thick white wool; the wool hair-like, knotted like a chain. *Summit* slightly nicked. *Capsule* spear-egg-shaped. *Seeds* oblong, tapering each way into bristle-shaped tails nearly twice as long as the seed; disposed lengthways and nearly as long as the seed-vessel. ST.

Asphodelus Lancastriæ. *Ger. em.* 96. n. 2.—Lancashire, or Bastard *Asphodel*.

Turf bogs. [Derfingham Moor, Norfolk. Mr. CROWE.—Bogs in the north very common. Mr. WOODWARD.—Birmingham Heath. WITH. ST.] P. July. Aug.

It is believed in Sweden to be noxious to sheep, and has been supposed to soften the bones of animals that eat it, but this opinion wants confirmation.

Cows and Horses eat it. Sheep and Swine refuse it.

457. ASPAR'AGUS. Asparagus.

EMPAL. *Cup* none.

BLOSS. *Petals* 6; oblong; permanent; connected by the claws into an upright tube. The 3 inner petals alternate; reflected at the top.

CHIVES. *Threads* 6; thread-shaped; standing on the petals; upright; shorter than the blossom. *Tips* roundish.

POINT. *Seed-bud* turban-shaped; with 3 corners. *Shaft* very short. *Summit* a prominent point.

S. VESS. *Berry* globular; with 3 cells and a dot at the end.

SEEDS 2; smooth; roundish; but angular on the inside.

ESS. CHAR. *Bloss.* with 6 divisions; upright. The 3 inner petals bent back at the point. *Berry* 3 cells, and 2 seeds.

OBS. It is not easy to say whether the blossom is composed of 1 or 6 petals. Flowers pendant, though the pointal very short.

common ASPAR'AGUS *officina'lis*. Stem herbaceous, cylindrical, upright. Leaves bristle-shaped. Leaf-scales in pairs. LINN.—Solitary. ST.

Ludw. 78.—Fl. dan. 505.—Mill. 55.—Sheldr. 83, fertile plant.—Math. 477.—Fuchf. 58, cop. in Trag. 222, and J. B. iii. 726. 1.—Ger. 949.* 1.—Blackw. 332.—Clusf. ii. 179, repr. in Dod. 703. 1, Lob. obs. 458, and Ger. em. 1110. 1, and cop. in Park. 454. 3.—par. 501. 6.—Lonic. 141. 2.

Stems herbaceous, upright, paniced. Leaf-scales, the outer solitary, with 2 smaller ones within, from between which rise 3, and sometimes 4 and 5 strap-shaped leaves. This is the case in the upper part of the branches where there are no flowers, but in the lower part of the branches a small branch rises in their stead. Fruit-stalks in pairs, limber, bearing 1 flower, pendant, with a jointed knot. Bloss. bell-shaped; inner petals longer. In the cultivated varieties the chives and pointals are not on different plants. LINN. The wild varieties have chives and pointals on different plants. GOUAN.—The cultivated as well as wild varieties have chives and pointals on different plants. LEERS.—Stem upright, or lying flat. Flowers, some with only chives, others with only pointals, and others again with chives and pointals. Berries with sometimes only 1 seed. HUDS.—Branches alternate, with props, not leaves, at the base. Props solitary, membranaceous, brownish; those at the base of the branches triangular-egg-shaped, tapering out into a point; the
base

base also running down into a pointed prominence; those at the base of the leaves heart-egg-shaped, pointed, ragged at the edge, and often cracking at the sides, its base inclosing the whole bundle of leaves; the 2 inner ones described by Linnæus not to be found. *Dust* and *seed* produced on different plants. *Flowers of the plants producing dust* nearly as large again. *Chives* nearly as long as the petals. *Threads* adhering to the petals for half their length. *Tips* oblong, upright, orange. *Dust* orange. *Seed-bud* half as long as the threads, and as large as the other at the same stage of growth. *Shaft* none. *Flowers of the plants producing seeds* not so conspicuous, and of a greener and browner hue. *Chives* not half so long as the petals. *Tips* whitish, membranaceous, barren. *Dust* none. *Seeds* generally 2, but sometimes 3. *Fruetification* examined in cultivated plants, the rest from the wild and cultivated. *St.*—*Bloss.* yellowish green. *Berries* red.

Asparagus. Sparagus, corruptly *Sparrowgrafs. Sperage.*

Meadows and rocks on the sea coast. Lizard Point, Gravesend, and in the marshes below Look's Folly, two miles from Bristol; about Harwich and Greenwich. *RAY.*—Isle of Portland. *HUBS.*—[In the Salt Marshes below King's Weston, near Bristol, with *Dr. BROUGHTON. ST.*]

P. July.

The young shoots of this plant, in its cultivated state, are very universally esteemed for their flavour and nutritious qualities.—They impart to the urine the scent of water in which they have been boiled.—The *Sparagus Chrysomela* lives upon it.

459. CONVALLA'RIA. Solomons-feal.

EMPAL. Cup none.

BLOSS. 1 petal; bell-shaped; glossy. *Border* with 6 clefts; segments blunt; expanding and reflected.

CHIVES. Threads 6; awl-shaped; standing on the petal; shorter than the blossom. *Tips* oblong; upright.

POINT. Seed-bud globular. *Shaft* thread-shaped; longer than the chives. *Summit* blunt; 3-cornered.

S. VESS. Berry globular; with 3 cells; spotted before it is ripe.

SEEDS solitary; roundish.

ESS. CHAR. Blossoms with 6 clefts. *Berry* spotted; with 3 cells.

* Lily of the Valley. *Blossoms* bell-shaped.

CONVALLA'RIA *maja'lis.* Stalk naked.—

Lily

Root horizontal. *Leaves* sword-shaped. *Spike* lateral, oblong.

LYONS.—*Leaves*, one edge waved, the other even. Mr. Woodward.—*Root* $\frac{1}{2}$ to 1 inch diameter, often $1\frac{1}{2}$ foot long or more, sending out a number of long coarse fibres. The old one decays every year, but 2 young ones shoot out from the crown of it. *Leaves* sword-shaped, sheathing one another, some plaited in a serpentine line. *Spike* proceeding from the edge of the leaf. *Petals* skinny, thin, crowned with a kind of horizontal hat. *Stem* flattened, bordered with a leafy edge, and above the insertion of the spike expanding into a leaf. *Threads* flat, oblong. WITH.—*Petals* oblong, slightly keeled, of a thicker gristly substance at the end, which is bent obliquely inwards, flat, and generally 3-sided. *Threads* strap-shaped. *Tips* yellow, narrower than the threads. ST.

Myrtle Flag. Sweet Smelling Flag, or Calamus.

Banks of rivers with a muddy bottom. R. Yare, near Norwich. Hedly in Surry, in Cheshire, near Cambridge, Hounslow Heath, near Harefield. [R. Waveney, near Bungay, Suffolk. Mr. Woodward.—R. Avon, near Pershore. Mr. BALLARD.—R. at

Tamworth, at the bottom of Mr. Oldershaw's garden. WITH.]
P. May. June.

The root powdered might supply the place of our foreign spices. It is our only native true aromatic plant. LINN. The powder of the root has cured agues when the Peruvian Bark has failed. The roots have a strong aromatic smell, and a warm, pungent, bitterish taste. The flavour is greatly improved by drying. They are commonly imported from the Levant, but those of our own growth are full as good. The Turks candy the roots, and think they are a preservative against contagion.

Neither Horses, Cows, Goats, Sheep, or Swine will eat it.

471. JUN'CUS. Rush.

EMPAL. *Husk* 2 valves. *Cup* 6 leaves; oblong; tapering; permanent.

BLOSS. none; unless you call the leaves of the coloured cup petals.

JUN'CUS

JUN'CUS *biglumis*. Leaf awl-shaped. Husk with 2-flow^{ered}
2 flowers, terminating. LINN.—Rather flower-leaves than
husk. ST.

Fl. dan. 120.—*Amoen. acad.* ii. 3. 3.

Root fibrous, simple, perpendicular. Straw somewhat more than a thumb's breadth high, cylindrical, marked with a single longitudinal score, at the root surrounded by the remains of 4 or 5 decayed leaves. Leaf single, as long as the straw, glossy, cylindrical, as thick again as the straw, at the point tubular and dead; channelled below, sheathing the straw from the middle to the base. Husk, outer valve large, egg-shaped, tapering, blackish purple, green on the back, keeled; the lower as small again, pointed, blackish purple on both sides. Petals spear-shaped, blackish purple; the 3 outer marked within along the middle with a greenish line. Threads white, 3 inserted into the base of the petals, 3 fixed to the base of the seed-bud. Seed-bud blunt, corners with a kind of fringe. Summits purplish, as long as the shaft. Agrees in many respects with *J. triglumis*, but other circumstances will not permit it to be considered as a variety. LINN.—Straw a finger high, naked. Leaves few, scarcely half the length of the straw, flat. Fence, outer valves awl-shaped, longer than the flowers; inner oval and shorter. Perhaps only a variety of *J. triglumis*. LIGHTF.

Upon the top of Mal-ghyrdy a mountain between Glenloch and Glenlyon, and upon Ben Teskerny, both in Breadalbane. Discovered by Mr. Stuart.

P. Aug.

common BER'BERIS *vulgaris*. Fruit-stalks in bunches. *Syst. veg.*—Thorns 3-forked. *Fl. suec. and Murr.*

Mill. 63.—*Blackw.* 165.—*Fuchf.* 543.—*Trag.* 993.—*Clus.* i. 120. 2; repr. in *Dod.* 750, *Lob. obs.* 599. 2, *Ger. em.* 1325, and cop. in *Park.* 1559.—*J. B.* i. 6. 54.—*Ger.* 1144.—*Lon.* i. 46. 1.—(*Blackw. ib.* 2, is surely a species of *Prunus*.)

The first leaves inversely egg-shaped, between serrated and fringed, not jointed. *Leaf-scales* terminated on each side by a hair-like tooth. *Stem-leaves* alternate, the lowermost somewhat wing cleft, with thorny teeth; the rest are changed into 3-forked thorns. The secondary leaves in pairs, oblong, serrated. Between the lowermost leaves and the thorns are concealed lesser leaves. Thus, when the leaves of the present year are changed into thorns, others will succeed to take place of them in the next. Is there any instance analogous to this? *LINN. sp. pl.*—*Leaf-scales* solitary, 3-forked, changing into thorns. *Fl. suec. ST.*—In searching for the honey-cup at the base of the petals when the flower is fully expanded, if you happen to touch the threads, though ever so slightly, the tips burst and throw out the dust with a considerable expansive force.—The threads of this plant, though said by Linnæus to be upright before the tips are ripe, are only expanding; and only upright after they have shed their dust, or are about to do it. When the tips are thoroughly ripe, if the bottom of the thread be irritated with a pin, or a straw, the chive rises with a sudden spring, and strikes the tip against the summit of the pointal; affording a remarkable instance of one of the means used to perform the important operation of impregnation. *Mr. WHATELY, from Dr. SIMS.*—*Bloss.* yellow, sometimes streaked with orange. *Berries* red. *WITH.*

Barberry. Tipperidge-bush.

Woods and hedges. On Chalk Hills. About Walden, Essex. S. May. June.

The leaves are gratefully acid. The flowers are offensive to the smell when near, but at a proper distance their odour is extremely fine. The berries are so very acid that birds will not eat them, but boiled with sugar they form a most agreeable rob or jelly. They are used likewise as a dry sweetmeat and in sugar-plumbs. An infusion of the bark in white wine is purgative. The roots boiled in lye dye wool yellow. In Poland they dye leather of a most beautiful yellow with the bark of the root. The inner bark of the stems dyes linen of a fine yellow, with the assistance of alum. This shrub should never be permitted to grow in corn lands, for the

ears

ears of wheat that grow near it never fill, and its influence in this respect has been known to extend as far as 3 or 4 hundred yards across a field. WITH.

Cows, Sheep, and Goats eat it. Horses and Swine refuse it. LINN.—And the former refused the young leaves picked off the branches. ST.

481. FRANKENIA. Frankwort.

EMPAL. Cup 1 leaf; nearly cylindrical; 10-cornered; permanent. Rim with 5 sharp teeth; standing out.

BLOSS. Petals 5; the claws as long as the cup; border flat; limbs nearly cylindrical and expanding. Honey-cup a channelled, tapering claw, fixed to each claw of the petals.

CHIVES. Threads 6; as long as the cup. Tips roundish; double.

POINT. Seed-bud oblong. Shaft simple; as long as the chives. Summits 3; oblong; upright; blunt.

S. VESS. Capsule oval; of 1 cell, and 3 valves.

SEEDS many; egg-shaped; small.

FRANKENIA *la'vis*. Leaves strap-shaped, crowded, smooth fringed at the base.—

Michel. 22. 1.—Lob. adv. 180. 3, repr. in Ger. em. 566. 3.—Barr.

714.—J. B. iii. 703. 2.—Pet. 10. 11.—(Park. 1484, has tiled leaves.)

Leaves rolled back at the edge, somewhat fringed on each side at the base. Flowers at the divisions of the stem, and in the middle of a bundle of leaves, solitary, sitting. Shaft deeply cloven into 3.

RELHAN.—Stem and leaves thinly sprinkled with white globular particles. Leaves fleshy, egg-shaped, but the edges being rolled in they appear almost cylindrical with a groove underneath, flattened at the base. Empal. with 6 or 7 ribs and as many teeth. Petals wedge-shaped, a little scalloped at the end. Honey-cup a fleshy scale, fixed to the base of each petal. Threads taper, flat on one side, convex on the other. Tips yellow. Shaft cloven half way down into 3 segments. WITH.—Stems numerous, branched, trailing. Blossoms purple.

Salt marshes in a muddy soil. Lovingland, near Yarmouth. Isles of Shepey and Thanet; Essex, Suffex, and Kent, common. [Near Yarmouth. Mr. CROWE.]

dusky FRANKENIA *pulverulenta*. Leaves inversely egg-shaped, dented at the end, dusted underneath.—

Clus. ii. 186. 2, repr. in *Dod.* 376, and *Ger. em.* 566. 2.—*Zanon.* 79.—*Lob. adv.* 196. 2.

Stems lying flat, slender, branching; knots about a finger's breadth from each other. Leaves 4 at a joint, hoary underneath. Flowers in the bosom of the leaves. MONT. in *Zanon.* ST.—Sitting. Leaves with very short hairs underneath, edges not rolled in, on short leaf-stalks. Empalement tough, rigid, with 5 angles; teeth upright. ST.

Sea coast of Suff. between Bognor & Brighthelmstone. A. July.

482. PEP' LIS. Purflane.

EMPAL. Cup 1 leaf; bell-shaped; very large; permanent. Rim with 12 teeth; every other bent back.

BLOSS. Petals 6; egg-shaped; very minute; growing from the mouth of the cup.

CHIVES. Threads 6; awl-shaped; short. Tips roundish. POINT. Seed-bud egg-shaped. Shaft very short. Summit cylindrical and flat.

S. VESS. Capsule heart-shaped. Cells 2; with an opposite partition.

SEEDS many; 3-cornered; small.

ESS. CHAR. Empalement bell-shaped; mouth with 12 clefts.

Petals 6, inserted into the cup. Capsule, cells 2.

Obs. In the greater number of the flowers, of one and the same plant, the blossom is altogether wanting.

water PEP' LIS *Portula*. Flowers without petals. LINN.—More commonly without. LINN.—Rather, Flowers with 6 chives. ST.*

2. 7.

Root red. LINN.—Differs from *R. acutus* in the whorls of flowers being more numerous and closely set, and the leaves below the whorls being shorter. RAY.—Seeds larger, and whorls of flowers fewer than in variety 2. PLUK.—Root without of a reddish brown, within of a beautiful carmine red. Leaves sometimes found with red veins, like those of *R. sanguineus*. Valves green, with 2 or 3 fine long teeth on each side; grains oblong, rather large. CURT.—Stems very leafy. MI. WOODWARD.

Rumex aureus. RELH. an unjustifiable change of what ought to be inviolate.

Hydrolapathum minus. Park. 1225.—(*Lapathum acutum minimum*. *R. syn.* 141. n. 5, seems rather to be a variety of *R. acutus*.—Haller 1590, has “valves entire at the edge.”) ST.

Road sides, and amongst rubbish. Tothill Fields, London. PLUK.—St. George's Fields, and many places about London. RAY. CURT. P. July.—Sept.

α. HUDS.—Whorls crowded, and when ripe covering the branches so as to give them the appearance of spikes. Flowers yellow. ST.

Pet. 2. 8.—J. B. ii. 988. 1.

Bur Gold Dock.—*Lapathum aureum*. *R. syn.* p. 142. n. 10.

Stem branched, scored, cylindrical. Leaves pointed, flat, smooth on both sides, keeled. Flowers keeled, in whorls, numerous. Valves triangular, pointed, deeply toothed, all with grains. LYONS.—I am clearly of opinion that this is a distinct species, and which may be distinguished by Petiver's name of *aureus*, which Mr. Relhan has improperly applied to the true *R. maritimus*. ST.

In marshes; about Crowland, Lincolnshire; near the Trent at Swarston, Derbyshire; and between Hithe and the sea. RAY.—Sea coast, in low wet places. Solway Frith. LIGHTF.—[Severn Stoke, Worcestershire. Mr. BALLARD. ST.] P. July. Aug.

R U ' M E X *acutus*. Valves toothed, with little grains. *sharp-pointed*
Leaves heart-oblong, taper-pointed.—

Fuchf. 461, cop. in J. B. ii. 984. 1.—Lonic. i. 87. 1.—Pet. 2. 3.

—H. ox. v. 27. 3, leaves.—(In Matth. 446, imitated in Dod. 643. 1, which repr. in Lob. obs. 150. 2, ic. i. 284. 1, Ger. em. 388. 1, and cop. in Park. 1225. 1, and Munt. brit. 88, which

cop. in phyt. 189, the flowers are on long solitary fruit-stalks.—*Blackw.* 491, seems to be *R. sanguineus*, variety 2.—*Curt.* iii. 31, is *R. sanguineus*, variety 2, which see.)

Teeth of the valves, several on each side, unequal, equal in length to the diameter of the valve. LINN.—Leaves flat throughout, not curled, very entire. Flowers greenish, in whorls on the stem and branches. A flower-leaf to each whorl, extending a good way beyond the whorl. POLlich.—Flowers in separate whorls, with a strap-shaped leaf to each whorl. Seeds more than as small again as the *R. obtusifolius* and *crispus*. RAY.—Stem upright, branching, angular, scored, solid. Branches upright. Leaves on leaf-stalks, pointed, smooth, veined underneath, keeled. Leaf-stalks scored, half embracing the stem. Leaf-scales membranaceous, within the leaf-stalks, and without the fruit-stalks. Flowers in whorls. Valves ferrated below, oblong, bluntish, one of them with a grain. LYONS.—I have never seen this plant. What is commonly taken for it has “valves very entire, one of them with a grain,” as described by Mr. Curtis, but appears to be a variety of *R. sanguineus*. ST.

Meadows, pastures, and road sides. HUDS.—In uncultivated and watery places. RAY.

Cows and Horses refuse it.—It is infested by the *Aphis Rumicis*. LINN.—The root is used by the dyers. It gives a great variety of shades, from straw colour to a pretty fine olive, and a fine deep green to cloths which have been previously blued. ST.

broad-leaved RU'MEX *obtusifolius*. Valves toothed, with grains. Leaves heart-oblong, bluntish, finely notched.—

Curt. iii. 29.—*Lob. ic.* i. 285. 1, repr. in *Ger. em.* 388. 3, *cop. in Park.* 1225. 4, and *Pet.* 2. 9.—*Munt. brit.* 68, *cop. in phyt.* 187, teeth of the valves not expressed.—*Ger.* 312. 3, *cop. in J. B.* ii. 985. 1.

Stem-leaves spear-shaped, pointed. MR. WOODWARD.—Stems furrowed, and set with short white transparent bristles, about 2 ft. high. Leaves curled at the edge, ribs downy; the upper heart-strap-spear-shaped. Leaf-stalks shorter than the breadth of the leaves. Fruit-stalk sprinkled near the top with white shining globules. Pedicles surrounded near the base by an indistinct cartilaginous ring. *Empal.* leaves boat-shaped, nearly as long as the petals. Petals spear-shaped, flat, green, not very evidently toothed. Tips white, or yellow. Summits pencil-shaped. Valves, that with the largest grain outermost when the fruit-stalk bends downwards, and with the longest teeth; none of the teeth equal in length to the diameter of the valve. WITH.

Amongst

Amongst rubbish, farm yards, courts, and sides of ditches.

P. July. Aug.

Fallow Deer eat it with avidity, biting it close to the root, so that it is very rarely to see a Dock growing in a park. MR. DICKENSON. MR. HACKETT.

Horses sometimes eat it. ST.

R U' M E X *pul'cher*. Valves toothed; generally one fiddle with a grain. Root-leaves fiddle-shaped.—

H. ox. v. 27. 13.—Pet. 2. 10.—J. B. ii. 988. 3, stem bad.—Till. pis. 37. 2, seed-vessel and leaf, but without its characteristic hollow.

Stem-leaves egg-oblong, entire, not hollowed out at the sides. *Flowering branches* bowed back. *Valves* blunt at the end, the outer with a grain, and the rest with an imperfect grain. LINN.—*Stem* much branched. *Branches* alternate, with a strap-spear-shaped leaf under each. MR. WOODWARD.

Rubbish, dry meadows, and road sides. [In Norfolk, very common. MR. WOODWARD.]

P. July. Aug.

R U' M E X *paludofus*. Valves entire, with grains. *marsh*
Leaves egg-spear-shaped, somewhat pointed. HUDS. ST.
—Grains roundish egg-shaped.* ST.

(*J. B. ii. 987. 2.? Huds.—Rather R. maritimus, variety 1.*)

Root branching. *Stem* upright, 4 feet high, scored, branching; *branches* alternate, upright. *Root-leaves* egg-shaped, bluntish, somewhat finely notched; *stem-leaves* alternate, on leaf-stalks, somewhat finely notched, rather pointed, flat, naked, on short leaf-stalks. *Leaf-scales* sheathing, membranaceous. *Flowers* in whorls, on fruit-stalks. *Whorls* generally distinct. *Valves*, the outer with a large red grain; the rest with a small grain. HUDS.—Resembles the *R. crispus*. Doubtful whether a distinct species. RAY. MR. WOODWARD. ST.—Whole plant very smooth. *Stem* furrowed. *Leaves* a little scolloped and waved at the edge. *Fruit-stalks*, some as long, others twice as long as the fruit, with a very evident ring somewhat below the middle. *Valves* slightly toothed; particularly towards the base, only 1 of them with a grain. WITH. ST.—Sometimes, though very rarely, two of them with grains; grains roundish-egg-shaped, nearly 3 times shorter than the valves. In its foliage it resembles the *R. Hydrolapathum*, and in its fruit most exactly the *R. crispus*, of which it is possibly only a var. ST.

SEEDS many; nearly globular; wrinkled.

ESS. CHAR. *A sheath. Blossom* with 6 divisions; the tube rising from the root. *Capsules* 3; connected; inflated.

COL'CHICUM *autumna'le*. Leaves flat, spear-shaped, upright.—

Stoerck.—*Fuchf.* 356, 357, the expanded blossom inferior to the other parts; cop. in *Trag.* 759, and *J. B.* ii. 649.—*Blackw.* 566.—

Dod. 460. 2, repr. in *Ger. em.* 157. 1.—*Ger. em.* 157. 2, cop. in *Pet.* 67. 2.—*Tourn.* 181, and 182.—*H. ox.* iv. 3. 1.—*Ger.* 127. 1 and 2.

Flowers in September, produces its fruit in the following spring, and ripens it in summer. LINN.—*Bloss.* pale purple, soon wither. In the spring several spear-shaped leaves arise, with generally 1 or 2 as long as the rest, but only $\frac{1}{4}$ as wide, being a kind of flower-leaves to the seed-vessel. *Capsule* large, somewhat egg-shaped, with 3 very blunt angles. MR. WOODWARD.—*Bloss.* tube 3-cornered; segments rather unequal. *Tips*, with a fleshy glandular substance between the lobes. *Dust* orange-coloured. *Shafts* reaching down to the root. *Seed-bud* at the root surrounded by the rudiments of the future leaves. The seeds lie buried all winter within the root, in spring they grow up on a fruit-stalk, and are ripe about the time of hay harvest. May not the very great length of the shafts account in some measure for the delay in the ripening of the seeds? As this plant blossoms late in the year, and probably would not have time to ripen its seeds before the access of winter, which would destroy them, providence has contrived its structure such, that this important

portant office may be performed at a depth in the earth, out of reach of the usual effects of frost: and as seeds buried at such a depth, are known not to vegetate, a no less admirable provision is made to raise them above the surface when they are perfected, and to sow them at a proper season. WITH.

Meadow Saffron.

Meadows, low as well as mountainous, in rich soil in the west and north of England. [Near Bury. Mr. WOODWARD.—Derby. Mr. WHATELY.—In orchards on the borders of Malvern Chace, Worcestershire. Mr. BALLARD.—On the meadows bordering the Severn, Worcestershire. ST.—Wellington, and Hales Owen, Shropshire. WITH.] P. Aug. Sept.

This is one of those plants that upon the concurrent testimony of ages was condemned as poisonous; but Dr. Storck, of Vienna, hath taught us that it is an useful medicine. The roots have a good deal of acrimony. An infusion of them in vinegar, formed into a syrup, by the addition of sugar or honey, is found to be a very useful pectoral and diuretic. It seems in its virtues very much to resemble Squill, but is less nauseous and less acrimonious, tho' more sedative. WITH.—In a pasture in which were several horses, and eaten down pretty bare, the grass was closely cropped even under the leaves, but not a leaf bitten. Mr. WOODWARD,

Order V.

POLYGYNIA; MANY POINTALS.

CHIVES. *Threads* 8; simple. *Tips* with 2 horns; opening at the point; and furnished with 2 expanding awns, which are fixed to the back.

POINT. *Seed-bud* beneath. *Shaft* simple; longer than the chives. *Summit* blunt.

S. VESS. *Berry* with 4 cells; globular; with a hollow dimple.

SEEDS few; small.

ESS. CHAR. *Empal. superior. Blossom* 1 *petal. Threads* inserted into the receptacle. *Berry* 4 cells; many seeds.

Obs. In some species all the parts of fructification are increased $\frac{1}{2}$ th in number. The *empalement* in *V. myrtillus* is very entire, in most of the rest with 4 clefts. The new blown *blossom* is hardly divided, but in the *V. Oxycoccus* it is rolled back to the base.

* *Leaves* annual, or deciduous.

VACCIN'IUM *Myrtillus*. Fruit-stalks with 1 flower. *Bilberry*
Leaves serrated, egg-shaped, deciduous. Stem angular.—

Sheldr. 18.—*Matth.* 231.—*Dod.* 768. 2, repr. in *Lob. obs.* 546.

2, *Ger. em.* 1415. 1, and cop. in *Park.* 1456. 1.—*Blackw.* 463.

Chives 10. *Bloss. segments* 5. *Capfule*, cells 5. Stem and branches 4-cornered. *Leaves* alternate, serratures blunt. *Berries* black.

LINN.—*Bloss.* nearly globular, but a little flatted at the base; pale reddish purple; mouth very small, with 5 small reflected teeth.

WITH.—*Bloss.* reddish white. *Berries* bluish black.

Black

Black Worts. Black Whortle-berries. Hurtle-berries. Bilberries. Wind-berries. Blea-berries.

Woods and heaths. [Porland Heath. Mr. CROWE.—Rocks above Great Malvern, Worcestershire. Mr. BALLARD.] S. Apr. May.

The berries are very acceptable to children, either eaten by themselves, or with milk, or in tarts. The moor game live upon them in the autumn. The juice stains paper or linen purple.

Goats eat it. Sheep are not fond of it. Horses and Cows refuse it.

great VACCIN'IUM *uliginosum*. Fruit-stalks with 1 flower. Leaves very entire, inversely egg-shaped, blunt, smooth.

Fl. dan. 231.—*Clus.* i. 62. 1, repr. in *Ger. em.* 1416. 6, and cop. in *Park.* 1456. 2.

Stems generally a foot high. Leaves when young fringed at the base, flat. Berries blue, with 4 slight angles, with a white pulp. LINN.—Leaves with a net-work of veins underneath, sometimes slightly dented at the end, often tinged with red. Mr. WOODW.

Great Bilberry Bush. [Rash-berries. Mr. WOODWARD.]

Moistish woods, heaths, and pastures, and tops of mountains. Between Hexham and Penrith. Forest of Whinfield, Westmorel. Near Julian's Bower, Highland mountains. [Near Gambleby, Cumberland. RAY. Mr. WOODWARD.] S. April. May.

Children sometimes eat the berries; but in large quantities they occasion giddiness, and a slight head-ach, especially when full grown, and quite ripe. Many vintners in France are said to make use of the juice to colour their white wines red.

Horses, Cows, Sheep, and Goats eat it. Swine refuse it.

* * Leaves evergreen.

red VACCIN'IUM *Vitis-idea*. Bunches terminating, nodding. Leaves inversely egg-shaped; edge very entire and rolled back, dotted underneath. LINN.—Edge often obscurely serrated towards the end. ST.

Fl. dan. 40.—*Dod.* 770. 1, repr. in *Ger. em.* 1415. 2, and cop. in *Park.* 1456. 4. leaves the best.—*J. B.* i. a. 522.

Is seldom found in blossom. CURT.—Stems obliquely ascending, scarcely a span high, cylindrical. Leaves alternate. Berries red. LINN.—Leaves with deep veins above, which are equally prominent underneath, some much smaller leaves intermixed with the rest. Mr. WOODWARD.—Floral-leaves and calycement coloured. Threads very short, white, woolly. Tips red, longer than the threads, of 2 cells, each of which bears a yellowish tube at the point. Dust yellow. Shaft green. Receptacle glandular. WITH.—

Leaves

Leaves slightly dented at the end, the mid-rib terminating in a roundish knob, pale underneath, dots dark brown, prominent. *Stems* and *leaf-stalks* downy. ST.—*Blossoms* reddish white.

Red Whortle-berries.

Mountainous parts of Derbyshire, Staffordshire, and Yorksh. RAY.—Dry places in heaths, woods, and tops of mountains. LIGHTF.—And marshy heaths. HUDS.—[Top of Skiddow, and Ingleborough. MR. WOODW.—Cannock Heath, Staffordshire, in a dry gravel. ST.] S. March. April.

The berries are acid, and not very grateful, but they are eaten by the Laplanders, and by the country people, and are sent in large quantities from W. Bothnia to Stockholm for pickling. LINN.—They are also made into tarts, rob, and jelly.

Goats eat it. Cows, Sheep, and Horses refuse it.

VACCINIUM *Oxycoc'cos*. Leaves very entire, *Cran-berry* rolled back at the edge, egg-shaped. Stems creeping, thread-shaped, without hairs.—

Fl. dan. 80, *cop. in Blackw.* 593.—*Lob. obs.* 547. 3.—*J. B. i. a.* 227. 2.—*Dod.* 770. 2, *repr. in Ger. em.* 1419, and *cop. in Park.* 1229, and *Ger.* 1367.

Bunch very short. *Fruit-stalks* very long. *Floral-leaves* 2, alternate. *Bloss.* segments rolled back. LINN.—*Leaves* sometimes egg-spear-shaped, alternate, on short fruit-stalks. MR. WOODW.—Thick, grey underneath. *Fruit-stalks* red, and semi-transparent. *Flowers* nodding, generally 1 on a fruit-stalk. *Empal.* coloured. *Blossom*, segments oblong, bent back as in the flower *Solanum Dulcamara*, which it much resembles in form, falling off as if distinct petals. *Threads* spear-shaped, brown, hairy at the edge. *Tips* orange-coloured, of 2 cells, each ending in a hair-like tube open at the end. *Shaft* red, tubular. *Summit* an open hole. *Empalement* smooth, but fringed at the points. *Fruit-stalks* downy, crooked at the end. *Floral-leaves* about half way up near each other. *Bloss.* deep flesh-colour. *Berry* pale red, mottled with purple dots, when fully ripe purplish red. WITH.

Cran-berries. *Moss-berries.* *Moor-berries.* *Fen-berries.* *Marsh Whorts.* *Marsh Whortle-berries.* *Corn-berries.*

Peaty bogs, near Glastenbury. [Sutton Coldfield Park, Warwickshire. RAY. ST.—Derlingham Moor, Norfolk. MR. CROWE.—In the North, frequent. MR. WOODWARD.] S. May. June.

The berries have an agreeablisth acidity, but are seldom eaten raw. They are made into tarts, which are much esteemed, but on account of a very peculiar flavour are disliked by some. They may be kept for several years by wiping them clean, and then closely corking

corking them up in dry bottles; but the best method of preserving them is, to fill up the interstices with pure spring water. ST.—At Longtown, in Cumberland, 20 or 30l.'s worth are sold by the poor people each market day, for 5 or 6 weeks together. LIGHT.

524. ERI'CA. Heath.

EMPAL. Cup with 4 leaves; egg-shaped; upright; coloured, permanent.

BLOSS. 1 petal; bell-shaped; with 4 clefts; often distended.

CHIVES. Threads 8; hair-like; standing on the receptacle. Tips cloven at the point.

POINT. Seed-bud roundish. Shaft thread-shaped; straight; longer than the chives. Summit resembling a little crown; with 4 clefts, and 4 edges.

S. VESS. Capsule roundish; inclosed; smaller than the cup; with 4 cells, and 4 valves.

SEEDS numerous; very small.

ESS. CHAR. Empal. 4 leaves. Blossom 4 clefts. Threads inserted into the receptacle. Tips cloven. Capsule 4 cells.

OBS. In some species the cup is double. The figure of the blossom varies between egg-shaped and oblong. The chives in some species are longer, and in others shorter than the blossom. LINN.—The summit also varies. REICH.

* Tips awned.

common ERI'CA *vulgaris*. Tips awned. Blossom bell-shaped, nearly equal. Empalement double. Leaves opposite, arrow-shaped. LINN. *sylt. veg.*—Leaves tiled, in 4 lines. Hort cliff. ST.—Inner empal. longer than the bloss. ST.*

Curt. iv. 50.—Walc.—Fl. dan. 677.—Matth. 152.—Fuchs. 254, cop. in Trag. 952, and Dod. 767. 1, which repr. in Ger. em. 1380. 1, and cop. again in Park. 1432. 5.—Lonic. i. 37. 1.—Ger. 1196. 1 and 2.—Park. 1480, 1.

Leaves tiled, in 4 lines, opposite, nearly 3-edged, keel channelled, fixed above the base, base pointed, cloven. Bloss. cloven into 4, more than half way down, of the size and appearance of the empalement. Shaft ascending, generally projecting beyond the blossom. LINN.—Little branches square. Leaves nearly egg-shaped, bluntish,

* Calyce interiore corolla longiore. ST.

bluntish, with a whitish furrow, slightly hairy at the edge. *Flowers* solitary, on fruit-stalks, from the sides of the branches, slightly nodding, opposite, but generally pointing one way, giving the branches the appearance of long bunches, but leafy shoots will be always found at the end. *Fruit-stalks* shorter than the flower, with a floral-leaf at the base. *Floral-leaves* roundish arrow-shaped, hollow, woolly at the edge, 2, and sometimes 3 at the base of the flower, of the same shape as those of the outer empalement. *Outer empal.* often tinged with red, woolly without; the 2 outer somewhat larger, egg-shaped, slightly keeled; the 2 inner roundish-egg-shaped, somewhat membranaceous. *Inner empal.* of 4 leaves, of the colour, and nearly of the same texture as the blossom, five times as long as the outer; *leaves* oval-oblong, concave, slightly adhering at the base, alternating with the segments of the blossom, open, after flowering approaching with the points bent in. We may here observe a curious instance of the gradual transition from the green herbaceous leaves of the stem, to the more delicate texture of the blossom. *Blossom* bell-shaped, flattened at the base, pale purplish rose-colour, whitish towards the base, divided 2-3ds of the way down; *segments* egg-shaped, blunt, equal, open. *Chives* just shorter than the blossom. *Threads* awl-shaped, doubled to and fro towards towards the point, white, or tinged with purple. *Tips* spear-shaped, brown, of 2 cells, cells opening at the sides by spear-shaped apertures nearly as long as the tips; *horns* awl-shaped, white, microscopically woolly, sometimes cloven, pointing downwards, nearly half as long as the tip. *Dust* white. *Seed-bud* orbicular, but thick in proportion to its breadth, reddish, with 8 perpendicular ridges beset with soft white hairs. *Shaft* slanting upwards, white, purplish above, longer than the empal. *Summit* purplish red. *Capsule* slightly depressed. *ST.*—*Branches* in opposite pairs. *Empalement* close to the base, 4 or 5 circular, concave, coloured leaves, fringed with soft hairs; and on the outside of these 2 or 3 others partly resembling these, and partly the leaves of the empalement. *Proper cup* coloured, so as in every respect to resemble the blossom. *Blossom* not distended, clefts 4 or 5. *Threads* flat, white, springing from small glandular substances at the base of the seed-bud, *Tips* reddish brown, with white horns at the base, *Shaft* white. *Summit* red. *Seed-vessel* inclosed by the proper cup. *WITH.*—*Stems* brown, woody.

Heath. *Ling.* *Griz*, in Shropshire. *Hather.* in Scotland.

Heaths and woods.

S. June.—Aug.

This plant, but little regarded in happier climates, is made subservient to a great variety of purposes, in the bleak and barren Highlands of Scotland. The poorer inhabitants make walls for their

their cottages, with alternate layers of heath, and a kind of mortar made of black earth and straw, the woody roots of the heath being placed in the center, the tops externally and internally. They make their beds of it, by placing the roots downwards, and the tops only being uppermost, they are sufficiently soft to sleep upon. Cabbins are thatched with it.—In the island of Ilay, ale is frequently made by brewing one part malt, and 2 parts of the young tops of heath; sometimes they add hops. Boethius relates, that this liquor was much used by the Picts. *Penn. tour. 1772. p. 229.*—Woollen cloth boiled in alum water, and afterwards in a strong decoction of the tops of heath, comes out a fine orange colour. The stalks and tops will tan leather. In England besoms are made of it, and faggots to burn in ovens, or to fill up drains that are to be covered over. Sheep and Goats will sometimes eat the tender shoots, but they are not fond of them.—Cattle not accustomed to browse on heath, give bloody milk, but are soon cured by drinking plentifully of water. *Penn. tour. 1772. p. 229.* Horses sometimes refuse it. ST.—Bees extract a great deal of honey from the flowers; and, where heath abounds, the honey has a reddish cast.

Woods near Andover, [and Laxfield, Suffolk. Mr. Woodw.]
S. Feb. March.

An ointment prepared from the bark, or the berries, has been successfully applied to ill-conditioned ulcers. The whole plant is very corrosive; 6 of the berries will kill a wolf. A woman gave 12 grains of the berries to her daughter, who had a quartan ague; she vomited blood, and died immediately. A decoction made of 2 drams of the cortical part of the root, boiled in 3 pints of water
till

till 1 pint is wasted; and this quantity, drank daily, is found very efficacious in resolving venereal nodes, and other indurations of the periosteum. See Dr. Ruffel's paper in the *Med. obs.* iii. p. 189.

—The considerable and long continued heat and irritation that it produces in the throat, when chewed, made me first think of giving it in a case of difficulty in swallowing, seemingly occasioned by a paralytic affection. The patient was directed to chew a thin slice of the root as often as she could bear to do it; and, in about 2 months, she recovered her power of swallowing. This woman bore the disagreeable irritation, and the ulcerations its acrimony occasioned in her mouth, with great resolution; but she was reduced to skin and bone, and for 3 years before had suffered extremely from hunger, without being able to satisfy her appetite; for she swallowed liquids very imperfectly, and solids not at all. The complaint came on after lying-in. WITH.

It is eaten by Sheep and Goats. Cows and Horses refuse it.

DAPH'NE *Laure'ola*. Bunches of 5 flowers from the bosom of the leaves. Leaves spear-shaped, smooth. LINN. *Laurel*
—Flowers 4 to 7 in a bunch. Mr. HOLLEFEAR.

Bunches from the sides of the stem, nodding. Floral-leaves concave, alternate, without any flowers from their base. Flowers terminating the bunch. Bunches clustered into a rundlet. Flowers sad in colour, ungrateful in scent, and blossoming in a gloomy season. Blofs. yellowish green. LINN.

Spurge Laurel.

Woods and hedges.

S. March. April.

Very happy effects have been experienced from this plant in rheumatic fevers. It operates as a brisk and rather severe purgative. It is an efficacious medicine in worm cases; and upon many accounts deserves to be better known to physicians; but, in less skilful hands, it would be dangerous, as it is possessed of considerable acrimony. The whole plant has the same qualities, but the bark of the root is the strongest. Dr. Alston fixes the outside dose at 10 grains.

Order II.

So much larger in all respects than the *C. oppositifolium*, that, where they grow intermixed, by this circumstance alone they may be distinguished at some distance. Leaves deeply notched.

Root.

Root-leaves 2 or 3, on long hairy leaf-stalks, kidney-shaped, bluntly notched. *Stem-leaves* similar to those of the *E. oppositifolium*, 2 or 3, on leaf-stalks decreasing in length as they approach the summit; the upper smooth. *Stem* 3-cornered, with imperfect angles, hairy below, smooth upwards, near the summit forked; the forks bare of leaves. *Branches*, 1 or 2 very short ones, just above the root-leaves, with alternate leaves similar to those of the root; *subdivisions* of the upper not so regularly forked as in the *C. oppositifolium*. *Flowers* solitary, and in rundles; the solitary ones on a short fruit-stalk on one of the branches a little above the forks; those in rundles with a leaf at their base. *Chives* in all the terminating ones I examined, which were a great number, as well as in the lateral ones, 8, 4 of them from the base of the segments, the other 4 from the fissures. *Capsule* bursting into 2 parts. *Seeds* roundish, shining, not readily shaking out, brownish. Mr. WOODW.—With the *C. oppositifolium*, but less frequent

Near Bingley, Yorkshire. [About Esholt, on the river Air, 8 miles above Leeds, plentifully. Mr. WOOD.—Boggy grove on Portland Heath, near Norwich. Mr. WOODW.—Purlicu Lane, leading from the Wytch to Mathon, Worcestersh. Mr. BALLARD.]

P. March. April.

CHRYSO SPLE'NIUM *oppositifolium*. Leaves *oppositeleaved* opposite.—

Curt. ii. 23.—Pl. dan. 365.—Dod. 316. 2, repr. in Lob. obs. 336.

1, Ger. em. 841. 2, and cop. in Park. 425. 2, H. ox. xii. 8. 7, and Pet. 6. 9.

Very closely allied to the *C. alternifolium*. LINN.—With us all the flowers with 4 clefts, and 8 chives. LEERS. ST. 1775. Mr. WOODWARD.—*Empalement* sometimes, though rarely, with 5 divisions. *Chives* in the terminating flower sometimes 10, proceeding from beneath the receptacle or rather honey-cup. CURT.—*Stem* upright, with 2 or 3 pair of leaves, roundish, with 2 opposite furrows, near the top forked; forks without leaves. *Branches* dividing again into forks with a leaf and a single flower at each division, from which also arise small leafy rundles of sitting flowers. *Suckers* from the base of the stem, covered with leaves, creeping. *Leaves* all alike, circular, with the base lopped on each side, indistinctly and irregularly notched, with a few hairs on the upper surface; the under smooth. *Root-leaves* several, on short hairy leaf-stalks. Mr. WOODW.—*Stems* 4-cornered. *Leaves* roundish, notched; the lower ones set with glandular bristles on the upper surface. *Chives* sometimes only 6 or 7. WITH.—*Leaves* on short leaf-stalks. *Flowers* bright yellow.

Golden Saxifrage.

Moist shady places, sides of boggy rivulets. [Copse on Poling-land Heath, near Norwich. Mr. PITCHFORD.] P. Apr. May.

Order III.

TRIGYNIA; III. POINTALS.

537. POLYG'ONUM. Snakeweed.

EMPAL. *Cup* turban-shaped; with 5 divisions; coloured within; *segments* egg-shaped; blunt; permanent.

BLOSS. none, unless you call the cup the blossom.

CHIVES. *Threads* generally 8; awl-shaped; very short. *Tips* roundish; fixed sideways.

POINT. *Seed-bud* 3-cornered. *Shafts* generally 3; thread-shaped; very short. *Summits* simple.

S. VESS. none. The *Cup* laps round the seed.

SEED single; 3-cornered; sharp.

ESS. CHAR. *Empal.* o. *Bloss.* 5 divisions; of the texture of an *empalement*. *Seed* 1; angular.

OBS. In some species there are 6 or 7 chives, and in others 5. In some the pointal is cloven.

* The Bistorts. *Spike* single.

Bistort POLYG'ONUM *Bistort'a*. Stem quite simple, with a single spike. Leaves egg-shaped, running down into leaf-stalks.—

Ludw. 31.—*Curt.* i. 2.—*Blackw.* 254.—*Mill.* 66.—*Fl. dan.* 421.—*Sheldr.* 111.—*Chuf.* ii. 69. 1, repr. in *Dod.* 333, *Lob. obs.* 156. 3, *Ger. em.* 399. 1, and ill cop. in *H. ox.* v. 28. row 3. 2.—*Matth.* 946.—*Park.* 392. 1.—*Fuchf.* 773, cop. in *Trag.* 321, *J. B.* iii. 539. 1, and *Lonic.* i. 202. 3.—*Fuchf.* 774, cop. in *J. B.* iii. 538.—*Ger.* 322. 1 and 3.

Upper-leaves arising from long sheaths inclosing the stem. Mr. WOODWARD.—*Sheaths* of the leaf-stalks sometimes rising above the insertion of the leaf-stalks to half the length of the leaves. *St.* *Root-leaves* extended down the leaf-stalks. *Stem-leaves* sheathing the stem. *Flowers* in a spike. *Common empalement* of 2 valves, each containing 2 flowers; *valves* skinny, the one large, lopped, the other

other smaller, and terminated by a skinny awn. *Flowers*, 2 within each common empal. one of them on a fruit-stalk, the other sitting furrounded with a kind of proper cup, thin, skinny, nearly cylindrical; mouth even and very entire. *Blossom* with 5 divisions, pale red. *Tips* double, the 2 parts being only united by the threads. *Seed-bud* purple. *Receptacle* glandular, formed by an expansion of the bottom of the threads. WITH.

Greater Bistort. Snake-weed.

Moist meadows in the northern counties. Bishop's Wood, near Hampstead, and Battersea. [Brome, Norfolk. Mr. WOODW.—Ham Green, near Mathon, and Martley, Worcester-sh. Mr. BALLARD.—Near Derby. Mr. WHATELY.—Near the Infirmary, Stafford. WITH.] P. May. June.

The root is one of the strongest vegetable astringents. The young shoots are eaten in herb pudding in the north of England. ST.

POLYG'ONUM vivip'arum. Stem quite simple, *viviparous* with a single spike. Leaves spear-shaped.—

Fl. dan. 13.—*Clus.* ii. 69. 2, repr. in *Ger. em.* 399. 2, and cop. in *Park.* 392. 4, *Ger.* 322. 2, and *J. B.* iii. 539. 2.—*Fluk.* 151. 2.

Lower flowers of the spike frequently changed into vegetating bulbs. LINN.—*Stem-leaves* strap-shaped, arising from a sheath. *Sheaths* inclosing the stem, terminated by a blunt membrane. Mr. WOODWARD.—*Bulbs* darkish purple, egg-shaped, sometimes intermixed with the flowers, mealy and white within. ST.—*Blossom* whitish.

Small Bistort.

Mountainous pastures. Crosby Ravensworth, and other places in Westmoreland; near Settle, Yorkshire, and Scotland. [Edge of Semer Water at Carr-end Wensley Dale. CURT.] P. June.

The roots dried and ground to powder are nutritious.

Cows, Goats, and Swine eat it. Sheep are not fond of it. Horses refuse it.

β. HUBS. Root-leaves roundish, and minutely ferrated. Stem about 4 inches high. RAY.

H. ox. v. 28. 3 and 5.—*Park.* 392. 6.

Pastures on a high rock called y Grib Goch, above the Lake Ffynnon Frech, near Llanberys.

each other, 2 or 3 together. *Seeds* faintly 3-cornered. LEERS. ST.—*Leaves* of a yellower hue, and more waved than those of *P. Persicaria*. *Empal.* sprinkled with very minute glands. *Seeds* larger and more pointed than those of *P. Persicaria*. CURT.—*Spikes* nodding even before flowering. Mr. WOODW.—Whole *plant* sprinkled with minute glandular dots, but even with the surface, and more obvious with a moderate than a higher magnifying lens, probably the seat of its very acrid property. *Stem*, and all its subdivisions, quite smooth, smooth above the knots, knots red. *Leaf-scales* tinged with red, ribs scarce sensibly prominent. *Flowers* green, red towards the end. ST.—*Blossoms* purple, or white.

Water Pepper. *Arsmart.* *Lakeweed.*

Watery places, on the sides of rivulets, lakes, and ditches.

A. July,—Sept.

The whole plant has an acrid, burning taste. It cures little aphthous ulcers in the mouth. It dyes wool yellow. The ashes of this plant, mixed with soft soap, is a nostrum, in a few hands, for dissolving the stone in the bladder; but it may be reasonably questioned whether it has any advantage over other semi-caustic preparations of the vegetable Alkali. Its acrimony rises in distillation, and the distilled water drank to the amount of 2 or 3 half pints daily, has been found very effectual in some nephritic cases. WITH,

Horses, Cows, Goats, Sheep, and Swine refuse it. LINN.

β. HUDS. *Polygonum minus*, which see.

POLY G'ONUM *minus*. Chives 6. Shafts 2. *creeping*
Leaves spear-shaped. Leaf-scales fringed. Stem with wide spreading branches. HUDS. *ed.* i.—Shaft slightly cloven. Leaves strap-spear-shaped. Stem creeping at the base. CURT.—Spikes interrupted, very thinly set. GMEL. ST.—Spikes thread-like.* Chives sometimes 5 and 7. ST.

Spotted POLYG'ONUM *Perficaria*. Chives 6. Shafts 2.* Spikes egg-oblong. Leaves spear-shaped. Leaf-scales fringed. LINN.—Shafts cloven half way down. Fruit-stalks smooth. Spikes upright. CURT.—Floral-leaves fringed.† *Fruit-stalks sometimes beset with hairs.* ST.

Fl. dan. 702.—*Walc.*—*Curt.* i. 5.—*Pet.* 3. 7.—*Blackw.* 118.—*Dod.* 607. 2, repr. in *Lob. obs.* 171. 1, *Ger. em.* 445. 1, and cop. in *Park.* 857. 1.—*Ger.* 361. 1.—*Trag.* 90.—(*Fuchs.* 630; cop. in *Trag.* 91, *J. B.* iii. 779. 2, and *Lonic.* i. 162. 1; from the breadth of the leaves, and *Ger.* 361. 2, from the thickness of the spikes appears to be *P. pennsylvanicum*, and *Dod.* 608, repr. in *Ger. em.* 445. 2, and cop. in *Park.* 857. 2, and *H. ox.* v. 29. row 2. 2, from the breadth of the leaves seems rather the *P. pennsylvanicum* with spotted leaves.—*Matth.* 584, seems to be *P. orientale*.)

I must confess there are not always 2 shafts, having often found them united below. GMEL.—Stem sometimes creeping at the bottom. Leaves, edge and mid-rib slightly hairy, mostly marked with a blackish spot somewhat like a horse shoe. Flowers of a bright rose-colour. Seed-bud oval and flattened, or 3-square. Shaft often cloven half way down into 3 parts, and, when this is the case, the seed-bud and seed are 3-square. Seed egg-shaped, and slightly convex on one side, or 3-square. CURT.—Shaft cloven half way down. MR. HOLLEFEAR. ST.—Stem sometimes smooth, sometimes beset above with hairs, in general lying close to the stem; above each knot swollen and hunched on the under side, giving each joint the appearance of the thigh of a fowl, dotted here and there with red. Leaves sometimes dotted underneath with minute green dots, and sometimes beset above with whitish dots. Leaf-scales hairy, with prominent ribs, the lower ones bursting from the swelling of the knots. Fruit-stalks sometimes sprinkled with a few glands.

Seed

* I know no species which has 2 shafts, and, at the same time, such leaf-scales as Linnæus would describe as fringed, when he calls those of the *P. Hydropiper* “*submuticis*.” The *P. pennsylvanicum* with a spotted stalk, of Mr. Curtis, so much resembles this, that I am inclined to believe that Linnæus formed the above character with specimens of both before him, and supposing them to be one and the same species, neglected to examine microscopically the shafts of the true *P. Perficaria*. ST.

† Floribus hexandris semidigynis, spicis oblongis erectis, stipulis bracteisque ciliatis. ST.

Seed sometimes 3-cornered even when the shaft is cloven only into 2. *Floral-leaves* hairy, ribbed, hairs of the fringe nearly half as long as the leaf. *Shaft*, arms straight, expanding. *Spikes* sometimes white tinged with pink. *ST.*—*Stem* nearly cylindrical, thickest at the joints, more or less tinged with red. *Leaves* nearly smooth, but with very minute bristles lying along the edge. *Leaf-scales* sheathing, ribbed. *Common fruit-stalks* springing from the sheathing leaf-scales at the joints of the stem. *Flowers* 3 or 4 together, included in a membranaceous fringed sheath, on short fruit-stalks of different lengths, which are again inclosed by skinny sheaths. *Bloss.* segments concave, unequal. *Chives* sometimes 5 and 7. *Tips* sometimes 2 upon one thread. *Shaft* cloven nearly half way down. *Summits* globular. WITH.

Dead or Spotted Arsmart.

Ditches, on the side of water, and not unfrequently in corn-fields. A. July.—Sept.

Its taste is slightly acid and astringent. Woollen cloth dipped in a solution of alum obtains a yellow colour from this plant.

Goats, Sheep, and Horses eat it. Cows and Swine refuse it. LINN.

Buck Wheat. Bucke. Branks. French Wheat. Crap.

Corn fields.

A. July. Aug.

This plant is very impatient of cold, dying at the very first attack of frost. The seeds furnish a nutritious meal, which is not apt

apt to turn acid upon the stomach. It is made into thin cakes in some parts of England, called Crumpits. It is usual with farmers to sow a crop of Buckwheat, and to plough it under when fully grown, as a manure to the land. The seeds are excellent food for poultry. Sheep that eat this plant become unhealthful. As it flowers late in the summer, M. Du Hamel, in his observations upon the management of bees, advises to move the hives in the autumn, to a situation where plenty of this plant is sown.

Cows, Goats, and Sheep eat it. Swine and Horses refuse it.

POLY G'ONUM *Convoll'vulus*. Leaves heart-shaped. *climbing*
Stem twining, angular. Flowers blunted. LINN.

Curt. iv. 44.—Fl. dan. 744.—Ger. 713. 4.—(Dod. 396. 1, repr. in Lob. obs. 343. 2, Ger. em. 863. 5, and cop. in Park. 172. 8, J. B. ii. 153, H. ox. v. 29. row 1. 2. f. 2, and Pet. 2. 12, is *P. dumetorum*, but, excepting the seed-vessel, it is, perhaps, the best representation of this species when in its most luxuriant state.)

Bunches from the bosom of the leaves. Some flowers also at the base of the common fruit-stalk. Seeds covered with a 3-square empalement. Tips violet. LINN.—Leaves arrow-shaped. CURT. ST.—Tips red. ST. WITH.—Keel of the valves sometimes edged with a shallow, white, membranaceous border, similar to that of *P. dumetorum*, but not exceeding $\frac{1}{4}$ of a line. ST.—Fruit-stalks channelled, the upper part covered with flowers. Empalement concave. Threads yellowish white. Tips double, with a small gland just behind the tip. Shafts 3, very short. Summits globular. Seed, sides hollow. WITH.—Bloss. greenish white. Leaves, angles at the base sometimes lopped.

Black Bindweed.

Corn fields, gardens, and hedges.

A. June.—Sept.

The seeds are quite as good for use as those of the preceding species, are produced in greater quantity, and the plant bears cold better.

Cows and Goats eat it. Sheep, Swine, and Horses refuse it.

LINN.—A horse eat it. ST.

Obs. The *Phalæna Lubricipeda* is found upon several of the species.

Order IV.

TETRAGYNIA; IV. POINTALS.

542. PA'RIS. Truelove.

EMPAL. *Cup* 4 leaves; permanent; leaves spear-shaped; pointed; as large as the blossom; expanding.

BLOSS. *Petals* 4; expanding; awl-shaped; resembling the cup; permanent.

CHIVES. *Threads* 8; awl-shaped; short; beneath the tips. *Tips* long, growing to the middle of the threads, and on each side of them.

POINT. *Seed-bud* roundish; but with 4 angles. *Shafts* 4; expanding; shorter than the chives. *Summits* simple.

S. VESS. *Berry* globular; with 4 angles, and 4 cells.

SEEDS several; lying in a double range.

ESS. CHAR. *Empal.* 4 leaves. *Petals* 4; narrower (than the empalement.) *Berry* 4 cells.

four-leaved PA'RIS *quadrifolia*.—

Fl. dan. 139.—*Blackw.* 286.—*Math.* 1093.—*Dod.* 444, repr. in *Lob. obs.* 137. 2, *Ger. em.* 405. 1.—*Ger.* 328. 1, cop. in *Pet.* 44. 8.—*Fuchs.* 87, cop. in *J. B.* iii. 613.—*Park.* 390. 1, cop. in *H. ox.* xiii. 3. 6.

Leaves sometimes 3, 5, and 6. C. B. HALL.—*Root* somewhat fleshy. *Stem* naked. *Leaves* shining. *Flower* 1. LINN.—*Stem* undivided, cylindrical. *Leaves* in a whorl, expanding, sitting, egg-shaped, very entire, taper-pointed, smooth, ribbed underneath. *Fruit-stalk* terminating, somewhat angular, with 1 flower. *Flower* green. *Empalement*, leaves strap-shaped, bent back. *Petals* bent back, somewhat shorter than the blossom. *Seed-bud* black. *Shafts* thrice as short as the chives. LYONS.—*Leaves* sometimes 5. MR. WOODWARD. WITH. ST.—And, in a number of plants growing together, only 3, but they were all small and barren, possibly young plants not arrived at maturity. *Flower* on a fruit-stalk from 1 to 2 inches long. MR. WOODWARD.—*Leaves* sometimes 6, egg-shaped, tapering to a point, fixed to the top of the stalk. *Shafts* purplish black, hardly so long as the berry. WITH.—*Blossoms* pale green, shorter than the empalement, longer than the chives. *Shafts* shorter than the chives, and longer than the berry. *Herb*

Herb Paris. Truelove. One-berry.

Woods and shady places. [Wood near the Devil's Den near Clifton upon Teme, Worcesterfh. Mr. BALLARD. ST.—Woods on fides of Breedon Hill, Worcesterfh. NASH.—Ripton Wood. Huntingdonfhire. In Norfolk, rare. Mr. WOODWARD.—Love Lane, near Derby. Mr. WHATELY.—About Frankly, Worcesterfhire. WITH.] P. May. June.

The leaves and berries are faid to partake of the properties of Opium. The juice of the berries is ufeul in inflammations of the eyes. Linnæus fays the roots will vomit as well as Ipecacuanha, but it muft be given in a double quantity.

Goats and Sheep eat it. Cows, Horses, and Swine refufe it. LINN.—The berries give out on infufion in water a purplifh red, which an acid turns to a bright florid red, and an alkali to a bluiſh green. ST.

543. ADOX'A. Moschatel.

EMPAL. Cup beneath; cloven; flat; permanent.

BLOSS. 1 petal; with 4 clefts; flat; *segments* egg-shaped; ſharp; longer than the cup.

CHIVES. *Threads* 8; awl-shaped; as long as the cup. *Tips* roundiſh.

POINT. *Seed-bud* beneath the receptacle of the bloſſom. *Shafts* 4; ſimple; upright; as long as the chives; permanent. *Summits* ſimple.

S. VESS. Berry globular; between the cup and the bloſſom; the cup being connected with the under ſide of the berry; of 4 cells; dimpled at the end.

SEEDS ſolitary; compressed.

ESS. CHAR. *Empalement* beneath; cloven into 2. *Bloſſom* with 4 or 5 clefts; above. *Berry* with 4 or 5 cells; united with the empalement.

OBS. Such are the characters of the terminating flowers; but the lateral flowers have bloſſoms with 5 clefts, 10 threads, and 5 pointals.

1, and *J. B. i. a.* 83.—*Matth.* 270, cop. in *Ger.* 1310. 2.—

Lonic. i. 56. 1.

Berries rough with tubercles formed by the seeds. LINN.—Stem, serratures of the Leaves and Flower-scales coloured. *Empal.* segments lapping over each other, coloured at the points. *Blossoms* greenish white, a little hairy within. *Threads* very hairy, about the middle very thick and pulpy. *Tips* reddish-scarlet, double, opening at the base, with 2 yellow horns. *Seed-bud* beset with glands. Berries red. WITH.

In the West of Ireland; in the county of Kerry; near the Lake of Killarney. RAY. [Mr. CROWE.]—On barren limestone rocks.

S. Sept. [Nov. at Birmingham. WITH.]

It is a beautiful ornament to our shrubberies, not only on account of its foliage and flowers, but of its fruit, which is pleasing to the eye, though not grateful to the taste. The country people, however, in Ireland, eat it, but always drink water after.

AR'BUTUS *alpina*. Stems trailing. Leaves mountain wrinkled, serrated.—

Fl. dan.

Fl. dan. 73.—*Lightf.* 11. *a. b.* at p. 216.—*Clus.* i. 61, *cop. in Ger. em.* 1417. 4, and *Park.* 1456. 3.—*Ger.* 1230. 4.—*J. B. i.* a. 519.

Berries black, globular, sitting upon a very small red cup.

Dry mountains, in Scotland and the Western Isles. S. May.

The berries have something of the flavour of black currants, but they are not so good.—Goats refuse it.

Bearberry **AR'BUTUS** *Uva-ur'si.* Stems trailing. Leaves very entire.—

Fl. dan. 33, *cop. in Blackw.* 592. 2 and 3, with the addition of 1.—

Fl. lapp. 6. 3.—*Lightf.* 11. *c. d.* at p. 216.—*J. B. i. a.* 523.—

Zanon. 178, serratures too much like hairs.—*Ger.* 1221. 1.—*Clus.*

i. 63. 2, repr. in *Lob. obs.* 547. 1, *Ger. em.* 1416. 5, and *cop. in Park.* 1457. 6, is represented with leaves much larger than any I have ever seen.

Leaves oblong-wedge-shaped, with a net-work of veins underneath, and corresponding wrinkles above. Blossom, mouth very much contracted, tinged with red. *Mr. Woodward.*—Flowers flesh-coloured. Berries red. Leaves not dotted underneath as in *Vaccinium Vitis-idaea*. **LIGHTF.**—*Vaccinium Ur'si*, five *Uva-ur'si* apud *Clusum.* *Ger. em.* 1416. (*Mr. Ballard.*)

Bear-berries. *Bear Whortle-berries.*

Dry heaths and woods. East Common Wood, near Hexham, Northumberland. Isle of Mull, next to Y-Columb-Kill, growing plentifully for some miles together, where it was first observed by *Mr. Lhwyd.* **LIGHTF.**

S. May. June.

The berries are insipid, pulpy, and mealy. The plant is much used in Sweden to dye an ash-colour, and to tan leather. Half a dram of the powdered leaves given every, or every other day, has been found useful in calculous cases. It was first used for this purpose at Montpelier, and afterwards by *Dr. de Haen*, at Vienna, who relates several cases, in which it proved of the greatest service. Its success in England has been uncertain. Sometimes the patients found no relief, but thought their complaints rather aggravated than alleviated; whilst, in other calculous and nephritic cases, the symptoms have been almost entirely removed. Perhaps, upon the whole, we shall find it no better than other vegetable astringents; some of which have long been used by the country people, in gravelly complaints, and with very great advantage; though hitherto unnoticed by the regular practitioners. **WITH.**

Horses, Cows, Goats, and Sheep refuse it.

593. PY'RO LA. Wintergreen.

EMPAL. *Cup* with 5 divisions; very small; permanent.

BLOSS. *Petals* 5; circular; concave; expanding.

CHIVES. *Threads* 10; awl-shaped; shorter than the blossom. *Tips* large; nodding; with 2 horns pointing upwards.

POINT. *Seed-bud* roundish; angular. *Shaft* thread-shaped; longer than the chives; permanent. *Summit* rather thick.

S. VESS. *Capsule* roundish; depressed; with 5 angles and 5 cells; opening at the angles.

SEEDS numerous; chaffy.

ESS. CHAR. *Empalement* with 5 divisions. *Petals* 5. *Capsule* 5 cells; opening at the corners.

OBS. In some species the threads and shaft are upright, in others declining to one side, and in others again expanding. The shape of the summit is different in different species.

PY'RO LA *rotundifolia*. Chives ascending. Pointal common declining.—

Fl. dan. 110, *cop. in Blackw.* 594.—*Matth.* 982.—*Fuchsf.* 467, *cop. in Trag.* 707, *J. B.* iii. 535, and *Dod.* 138, which repr. in *Ger. em.* 408. 1.—*Ger.* 330. 1.—*Clus.* ii. 116. 3, repr. in *Lob. obs.* 157. 2, improved with the addition of a bunch in fruit in *H. ox.* xii. 10. row 2. 1, and *cop. in Fark.* 508.—*Lonic.* 186.

Blaffons white, on slender fruit-stalks.

Wintergreen.—Woods and groves in the North of England; in the South, rare. Near Halifax, Yorksh. Stoken-church Woods, Oxfordshire. [Hockfall Woods, near Grewelthorpe, Raydale Wood, near Carr-end Wensley Dale, and Tennant's Wood, near Kilnsay, Yorkshire. CURT.—Meadow at Gorleston, Suffolk. Mr. Wigg.] P. June. July.

Goats eat it. Cows, Horses, Sheep, and Swine refuse it.

PY'RO LA *minor*. Flowers in a bunch, scattered. *lesscr* Chives and pointal straight.—

Fl. dan. 55.

Much resembles the *P. rotundifolia*. Stem in both 3-cornered. It is very probable that this plant was first produced by the dust of the *P. secunda*, impregnating the seed-bud of the first species, *Bloss.* reddish white. LINS.—Two flowering stems frequently arise from the

the same root. *Leaves* much smaller than in *P. rotundifolia*. Whole plant smaller and weaker. Mr. WOODWARD.

Woods. Near Clapham, Yorkshire. Highlands, and Isle of Skye. [Near Tring, Herts. Mr. WOODWARD.] P. June. July.

ferrated PY'ROLA *secunda*. Flowers in a bunch, from one side.—

Fl. dan. 402.—*Clus.* ii. 117. 1, repr. in *Ger. em.* 408. 2, and cop.

in *J. B.* iii. 536. 1, *Park.* 509. 3, and *H. ox.* xii. 10. row 2. 4.

The chives project beyond the blossom, and the summit beyond the chives. *Blossoms* white.

Woods. Haslewood, near Sir Walter Vavasor's Park, Yorkshire.

P. Hudson. S. Linn. June.

Goats eat it. Sheep refuse it.

Order II.

DIGYNIA; II. POINTALS.

608. SAXIF'RAGA. Saxifrage.

EMPAL. *Cup* 1 leaf; with 5 divisions; short; sharp; permanent.

BLOSS. *Petals* 5; expanding; narrow at the base.

CHIVES. *Threads* 10; awl-shaped. *Tips* roundish.

POINT. *Seed-bud* roundish, but tapering, and ending in 2 short *Shafts*. *Summits* blunt.

S. VESS. *Capsule* somewhat egg-shaped; with 2 bills, and 1 cell; opening between the bills.

SEEDS numerous; minute.

ESS. CHAR. *Empal.* 5 divisions. *Blossom* 5 petals. *Capsule* with 2 bills, 1 cell, many seeds.

OBS. In some species the *Seed-bud* is beneath; in others, it is above. After the flower is open, 2 of the *Chives* opposite to each other, bend down to the *Summits*, and discharge their dust perpendicularly over them. The next day 2 others bend down; and this is continued until they have all done the same.

* *Leaves* undivided. *Stem* nearly naked.

hairy SAXIF'RAGA *stella'ris*. *Leaves* ferrated. *Stem* naked, branched. *Petals* taper-pointed.—

Fl. dan.

Fl. dan. 23.—*Fl. lapp.* 2. 3, root, leaves, and stem.*—*Scop.* 13. n. 492. at p. 290.—*Pluk.* 58. 2.—*ib.* 222. 4, cop. in *H. ox.* xii. 9. 13.—*J. B.* iii. 708. 1.

Leaves close to the root, numerous, oblong-spear-shaped, narrowing downwards, serratures pointed, mostly towards the end. Stem a finger's length, bare. Flowers 3 to 5, on short fruitstalks. Empalement bent back. Petals spear-shaped, tapering each way, white, with 2 oblong tawny spots near the base. Tips purplish. LINN.—Leaves in one or more star-like tufts from each root, wedge-shaped, entire at the base, rather indented at the top, slightly hairy. Stem, 1 from each tuft, slightly hairy. Branches, each having at its base a leaf, spear-shaped, entire, or cloven into 3, and bearing 1 or 2 flowers. Mr. WOODWARD.—Stem-leaves generally 2 together at the base of each branch, sometimes spear-shaped, but generally strap-shaped, and sometimes with a tooth on each side towards the point. ST.

Hairy Kidneywort.

Moist rocks, and by the rills of Snowdon, Carnedd-Llewellyn, and Caderidris, &c. North of England, and in Scotland. [About Buckbarrow Well, Longsledale, Yorkshire. CURT.—Mountains in Lancashire, Westmoreland, and Cumberland. Mr. WOODW.—Between Paterdale and Winander Mere. ST.] P. June. July.

SAXIFRAGA *nivalis*. Leaves egg-shaped, scol- mountain
loped, nearly fitting. Stem naked. Flowers in heads.—

Fl. dan. 28.—*Lightf.* 12. at p. 221.—*Ray* 16. 1, in its most luxuriant state.—*Fl. lapp.* 2. 5 and 6, in its dwarfer and more common state.

Leaves blunt, lying on the ground. Stem somewhat hairy, with a slight tinge of purple. Petals blunt, white. Scarcely is any plant subject to such remarkable variations, in appearance as well as size. Sometimes it is exceedingly small, with heart-shaped leaves, flowers collected into a single head, and a strap-shaped leaf at the base. Sometimes it produces only a single flower on a stalk, and sometimes 2 of these rise from one root. At other times it bears a number of flowers at the top of the stalk, on fruit-stalks disposed in form of a rundle, and sometimes it appears twice as large, with a spike composed of smaller ones as figured in Ray. But in all these states it is easily distinguishable by its leaves reddish underneath, and purplish pointals. LINN.—Root-leaves smooth, in a tuft

* The rest of the figure represents a variety in which the greater part of the flowers run into leafy tufts. ST.

tuft. Stem slightly hairy. Flowers, each with a small floral-leaf, reddish at the point. *Empal.* segments reddish at the point. Mr. WOODWARD.

Summits of the higher mountains of Wales and Scotland.—Glyder Vawr, near Snowdon. PENN. Wales. P. July. Aug.

London Pride SAXIF'RAGA *umbro'sa*. Leaves inversely egg-shaped, somewhat dented at the end. LINN. Mr. DICKENSON.

* * Leaves undivided. Stem leafy.

heath-like SAXIF'RAGA *oppositifolia*. Stem-leaves opposite, tiled; the uppermost fringed.—

Fl. dan. 34, stems undivided.—*Fl. lapp.* 2. 1.—*Pet.* 61. 9.—*J. B.* iii. 694. 1, cop. in *H. ox.* xii. 10. 36.

Stems thread-shaped, hanging down, creeping. Leaves from 4 lines, fitting, fringed. Terminating flower solitary, sitting. LINN.—Leaves oval, somewhat running down the stem, in opposite pairs, alternately from each side of the stem, giving the appearance of being quadrangularly tiled, all fringed, sea-green, frequently tinged with purple. *Empal.* purplish, fringed. Petals very blunt, bright purple. Tips purple. Mr. WOODWARD.

Rocks. On the north side of Ingleborough; higher rocks of Snowdon, about Llanberys; Highland mountains, and Isles of Rum and Skye. [Ingleborough and Pennigent. CURT.—This beautiful plant insinuates its roots into every crevice, and, with its numerous trailing branches, clothes, with a rich tapestry, the perpendicular rocks on the west side of the summit of Ingleborough. Mr. WOODWARD.] P. March. April.

marsh SAXIF'RAGA *Hir'culus*. Stem-leaves spear-shaped, alternate, naked, without prickles. Stem upright. LINN.—Leaves pointed. Stem ascending, leafy. HUDS.—Leaves fringed with hairs, but not with thorns or stiff bristles. LINN. fl. suec. RETZ. obs. i. 45.—These hairs sometimes wanting. WIGG.

Fl. dan.

Fl. dan. 200.*—*Breyn. cent.* 48, *cop. in H. ox.* xii. 8. row 2. 6.
a.—*Breyn. ib.* p. 106, *cop. in H. ox.* 6.—*Gmel.* iv. 65. 3.—
Hall. 11. 3.—*Clus. cur.* 6, *repr. in Ger. em.* 1284. 8, and
cop. in Park. 656, *figure the lowest, and H. ox.* xii. 8. 5.

Stem purple, simple, generally with 2 or 3 flowers. *Fruit-stalks* downy. *Empalement* bent back. *Leaves* not fringed. *Petals* ribbed, yellow, with tawny dots, towards their base an oblong hollow or chink of 2 valves, with pointed ends, containing honey. LINN. mant. ii.—*Root-leaves* spear-shaped. *Stem-leaves* strap-shaped, in an alpine specimen elliptical. In none of my specimens are the *fruit-stalks* without down, as in the figures of Haller and Gmelin, though in the alpine specimen they are somewhat less downy. RETZ.—*Stems* simple, somewhat woody, beneath the flowers very hairy. *Leaves*, the lower on short fruit-stalks, the upper sitting. *Flowers* 1 or 2, large, yellow. *Petals* oval, which as also the segments of the empalement are marked with several nearly parallel ribs, which clearly distinguishes it from the *S. autumnalis*. Mr. WOODWARD.

Turf bogs. Knutsford Moor, Cheshire. RAY and LIGHTF. who first ascertained it to be the *S. Hirculus* P. July. Aug.

SAXIFRAGA *autumnalis*. *Stem-leaves* strap-shaped, *autumnal* alternate, fringed. *Root-leaves* incorporated.—

Clus. ii. 60. 3, *repr. in Ger. em.* 516. 2, and *cop. in Park.* 737. 7, *J. B.* iii. 693. 2, *Pet.* 61. 10, *H. ox.* xii. 6. row 2. 3. f. 5, has most of the true habit.—*Scop.* 14, at p. 214.—*Fl. dan.* 72.—*H. ox.* xii. 6. row 2. 3. f. 5.—(*H. ox.* xii. 8. 6, is a copy of *Breyn. fig. of P. Hirculus.*)

Empalement far shorter than the blossom, green. *Flowers* beneath. LINN.—*Leaves*, hairs at the edge sometimes numerous, sometimes few, and sometimes altogether wanting. JACQ.—*Hairs* at the edge of the leaves more properly minute prickles. RETZ.—*Root-leaves* matted. *Stems* numerous, ascending. *Stem-leaves* numerous, strap-spear-shaped, scattered, half embracing the stem, sometimes with a few hairs at the edge, but oftener without. *Fruit-stalks* many, from the bosom of the leaves, of various lengths, the lower ones longest; generally with 1 flower. *Flower-leaves* 2 on each fruit-stalk. *Empalement* nearly as long as the blossom. *Petals* blunt, yellow, spotted. *Tips* yellow. Mr. WOODWARD.

* The hairs at the edge of the leaves represented too like the little prickles of the *S. autumnalis*. RETZ.

S. aizoides and *autumnalis* seem to be one and the same plant. JACQ. LIGHTF. HUDS. and RETZ.—Our plant is, without doubt, the *S. aizoides*; but, when I find Linnæus describing “the em-palement” of the *S. autumnalis* as “far shorter than the blossom,” and retaining his reference to *H. ox.* though a copy of Breyn. fig. of *S. Hirculus*, I am induced to suspect his *S. autumnalis* to be the variety of *S. Hirculus* with fringed leaves, rather than a variety of *S. aizoides*. In confirmation of this, it may be observed, that in the 1st edition of the Fl. suec. the *S. Hirculus* is characterised as having fringed leaves, in the 2d, the character is altered, but it is still described as fringed, and in the Sp. pl. the leaves are expressly said *not to be fringed*. Caryophyllus simplex, flore minore pallide rubente. R. syn. 336. (ST.)

Common Pink. RAY.—Single Red Pink. *GER. em.* ST.

Old walls. Rochester, Deal, Sandown, and other castles,
 plentifully. RAY. HUDS. P. July.

DIAN'THUS *deltoi'des*. Flowers solitary. Two maiden
 scales to each empalement, spear-shaped. Blossoms scol-
 loped. LINN.—Scales egg-shaped, taper-pointed. LYONS. ST.

* Blossoms too large. Mr. WOODWARD.

† This is referred by C. B. to his *Caryophyllus simplex*, flore minore pallide
 rubente, which Mr. Hudson makes a variety of *D. Caryophyllus*. But, to omit
 other marks of distinction, the leaves of the Red Pink are microscopically serr-
 ated, those of the *D. Caryophyllus* quite entire. ST.

Fl. dan.

Fl. dan. 577.—*Chif.* i. 285. 1, repr. in *Lob. ic.* 444. 1, *Ger. em.* 593. 6, and cop. in *Pet.* 56. 2.—*J. B.* iii. 329. 4.—(*Ger.* 477. 10, seems to be *D. Glaucus*.)

Root slender, long, with a few fibres. *Barren stems* numerous, reclining, throwing out roots; *flowering stems* 6 to 8 inches high, cylindrical, slender, weak, jointed. *Leaves* very narrow, in opposite pairs, embracing the stem; those of the barren branches narrower, not much pointed. *Flowers* 2 or 3 on a stem. *Blossoms* reddish, with a ring of deeper coloured dots surrounding the eye. *Seeds* chaffy, brown. It flowers during the summer and till autumn. *RAY*.—*Leaves* greener, somewhat hairy, like those of *Hyssop*, but smaller. *Empal.* scales taper-pointed, (cuspidatæ.) *Flowers* appearing later than those of *D. glaucus*, that is, about June and July, at which time the *glaucus* is out of blossom. *Blossoms* of a deeper colour. *DILL*. *Mr. Woodward*.—With numerous silvery dots, which the *D. glaucus* has not. *Empal.* scales much more taper-pointed than those of *D. glaucus*. *DILL*.—*Root* yellowish, knotted, fibrous. *Stem* reclining, a foot or somewhat higher, cylindrical, with a very fine downiness, forked; joints fivefold. *Leaves* sitting and growing together at the base, awl-shaped, rather pointed, very entire, of a pleasant green, downy, or smooth, 6 to 7 lines long, scarcely 1 line broad. *Fruit-stalks* round, downy, from the ends of the stem and branches. *Empalement* of a greenish yellowish tinge. *Flowers* 10 to 11 lines diameter. *Petals* inversely egg-shaped, blunt, ferrated, with dark purplish teeth near the mouth, and beset with white silvery points with hairs proceeding from them; borders nearly $\frac{1}{2}$ inch long, and 3 lines broad. *POLLICH*.—*Stem* usually upright, square above with sharp angles, below nearly cylindrical, simple, or branched, slightly downy. *Leaves* strap or awl-shaped, not acutely pointed, nearly as long as the joints, pressed to the stem, slightly downy. *Fruit-stalks* frequently 2 from the same knot, each bearing a single flower. *Empal.* scales, the 2d pair, which is often below the 1st, nearly awl-shaped. *Petals* toothed, bright crimson above, sometimes pale underneath. *Mr. Woodward*.—*Stem* cylindrical, ascending, knotty, forked, $\frac{1}{2}$ a foot high. *Leaves* opposite, strap-shaped, keeled, shorter than the joints. *Fruit-stalks* terminating, with a single flower. *Scales* 2, concave. *Petals* toothed, purple. *LYONS*.—*Blossoms* always red.

Maiden Pink.

Sandy meadows, pastures, and heaths. Near Nottingham, on the road to Lenton, in Bedfordshire. Mantham Hill, not far from Slough, near Windsor; Hildersham, Cambridgeshire; Bridgenorth, Shropsh. near G. Strickland, Westmoreland; and about Hampton Court Park. *RAY*.—Dupper's Hill, near Croydon.

Hubs.—

Dill. elth. 298. 384. HUDS. ST.

My fpecimens from gardens. WITH. ST.

Dianthus glaucus. LINN. (ST.) which fec.

DIAN'THUS *glau'cus*. Flowers mostly folitary. *mountain*
Four fcales to each empalement, fpear-shaped, fhört. Bloffoms fcolloped, LINN.—Scales of the empalement fometimes 2. DILL. WILLICH.

Dill. elth. 298. 384. LINN. Mr. WOODWARD. ST. WITH.—

(Dill. elth. 298. 385, and Pluk. 81. 3, * according to Mr. Hudfon, but the figure of Dill. is made by Linneus a variety of *D. virgineus*; and that of Pluk. which is referred by Mr. Hudfon, in his 1st edit. to *D. arenarius*, appears, from the fcales of the empalement being represented as long as the empalement, to be *D. alpinus*. Flukenet's figure fhould feem to have been taken from Du Bois's fpecimens.)

Bloffoms white, with a tinge of green, and, on the upper furface, with a tinge of purple from a number of very fine lines, and, about the middle of the petals, furrounded with an elegant purple circle. DILL. ST.—So nearly allied to *D. deltoides*, that they are difficultly diftinguifhed, except in fize and colour. Stem longer, more upright. Bloffoms greenifh underneath, above white, with a toothed fcarlet circle. Tips bluiſh. LINN.—Bloffoms white, with a purple eye. In other refpects differs very little from the *D. deltoides*. LIGHTF. ST.—The ring is double, both toothed, the inner pale, the outer broader and fcarlet. WILLICH.—Stem and leaves covered with a microſcopical woollinefs. Stem rather angular. Fruit-ftalks folitary, or in pairs. Scales of the empalement in 2 oppofite pairs, skinny at the edges, the 2 inner ones the largeſt. Empal. teeth skinny at the edges, pointed. Petals ferrated at the ends, white, but ſtained with pink at the baſe of the limbs. Tips grey. Summits white. woolly. Receptacle nearly as long as the S. veſſel. Accords with the Linnæan character and ſynonyms. WITH. ST.

* Does not this ſynonym belong rather to *D. alpinus*? WITH.

ST.—The *D. deltoides* and *glaucus*, (*Fl. dan.* 577, and *Dill. t.* 394,) seem to be one and the same plant, liable to a variety in the number of the scales of the empalement, and the *Armeria species flore in summo caule singulari*. *R. syn.* 336, which Mr. Hudson has, I think erroneously, referred to the *D. glaucus*, I am inclined to believe, will prove to be the *D. virgineus*, or a distinct species.—*Dill. t.* 298. *f.* 385, referred to by Mr. Hudson, and considered by Linnæus as a variety of *D. virgineus*, corresponds with a specimen from the botanic garden of my friend, Mr. Saville, who received it from Mr. Sole, of Bath, for the true *Chedder Pink*. ST.—*Armeria species flore in summo caule singulari*. *R. syn.* 336, which is described by Ray as “very different from the Maiden Pink, and more truly “answering the name, having but a single flower on the top of “the stalk,” cannot surely be the *D. glaucus*. ST.)

Mountainous situations. North of England. Mr. Du Bois PLUK.—King’s Park, Edinburgh; but Mr. YALDEN was of opinion that the *D. deltoides* was the only species in the neighbourhood of Edinburgh. LIGHTF.—Chedder Rocks, Somersetshire. Mr. BREWER, in *R. syn.*—[But specimens received by Mr. Crowe, from Chedder Rocks, where he was assured no other species grew, proved to be *D. deltoides*; but, I have been assured by others, that they have received what was by no means the *D. deltoides* from Chedder Rocks. Mr. WOODWARD.] P. June. July.

*** Stem herbaceous; supporting a single flower.

singleflowered

DIAN'THUS *arenarius*. Stem with generally 1 flower. Scales of the empalement egg-shaped, blunt. Petals with many clefts. Leaves strap-shaped.—

Clus. i. 282, repr. in *Dod.* 176. 3, *Ger. em.* 594. 12, and cop. in *Park. par.* 315. 5, and *H. ox. v.* 25. 11.

Empalement of a dull lake colour. Blossoms pale purplish red, more or less mottled with white. WITH.

Caryophyllus virgineus. *GER. em.* 594. WITH.

Common Pink.

On old walls.

P. July. Aug.

The above character and synonyms are inserted on the authority of Mr. Hudson, who prefixes an asterisk, implying, that it is supposed to be a naturalized plant, calling it the *Common Pink*. Now the *Red Pink*, the *D. damascenus*, of Miller, he had already given as a variety of *Caryophyllus*, and the *Pleasant-eyed Pink* is the *D. plumarius*. I must, therefore, own, I do not know what Mr. Hudson means by his *Common Pink*. Mr. Lightfoot has also inserted it on the authority of Sibbald, but he afterwards doubts whether the *D. deltoides* had not been mistaken for it. ST.

Order

Order III.

TRIGYNIA; III. POINTALS.

615. CUCU'BALUS. Campion.

EMPAL. Cup 1 leaf; tubular, (or globular, WITH.) with 5 teeth; permanent.

BLOSS. Petals 5; claws as long as the cup; border flat; limbs generally cloven; not crowned by a honey-cup.

CHIVES. Threads 10; awl-shaped; every other thread fixed to the claws of the petals; 5 of them shedding their dust later. Tips oblong.

POINT. Seed-bud rather oblong. Shafts 3; awl-shaped; longer than the chives. Summits downy; oblong; bending towards the left.

S. VESS. Capsule covered; tapering; with 3 cells; opening at the point in 5 different directions.

SEEDS many; roundish.

ESS. CHAR. Empalement inflated. Petals 5; with claws; not crowned at the mouth. Capsule with 3 cells.

CUCU'BALUS *bacciferus*. Empalements bell-berry bearing shaped. Petals distant. Seed-vessels coloured. Branches straddling.

Silene baccifera, which see.

CUCU'BALUS *Be'hen*. Empalements nearly glo-Bladder bular, smooth, with a net-work of veins. Capsules with 3 cells. Blossoms almost naked.—

J. B. iii. 356.—Pet. 57. 2.—Blackw. 268.—Clus. i. 293. 2, repr. in Dod. 172, Lob. obs. 184. 1, Ger. em. 678. 2, and cop. in Park. 263, and Ger. 550. 2.—Trag. 130, cop. in Lonic. ii. 33.—H. ox. v. 20. 1.

Empalement sometimes without veins, when it appears white. GMEL.—Stem panicled. Leaves soft, opposite, egg-spear-shaped. Flowers nodding. Empalement egg-shaped, inflated, longer than the claws of the petals. Chives somewhat longer than the petals. Seed-bud supported by a column with 10 corners. Seed prickly. RELH.—Capsule opening in 6 directions. LEERS. ST.—Each of the valves generally splitting into 2 teeth, though sometimes 5 and 7.

Empalement

Empalement before the expansion of the blossom oblong, pointed at the end; when the blossom is expanded globular-egg-shaped, whitish, with brownish purple veins; when the blossom is shrivelled globular-bell-shaped. *Petals*, no appearance of honey-cup teeth. *Tips* yellowish. *Dust* greenish dirty yellow. *ST.*—*Stem* forked at the top. *Leaves* heart-spear-shaped, 'not properly united, beset on each side with numerous minute pimples, opposite; *flower-leaves* at the forks of the stem frequently tinged with purple. *Flowers* at the ends of the branches, crowded, some on long fruit-stalks. *Tips* green. *Empal.* veins green. *MR. WOODW.*—*Plant* free from hairs. *Stem* branched, joints large. *Leaves* spear-shaped, fitting. *Flowers* terminating. *Empalement* egg-shaped. *Petals*, claws broadest at the top. *Summits* not downy. *WITH.*—*Leaves* sea-green, smooth, oval-spear-shaped. *Flowers*, some solitary at the divisions of the stem, others crowded at the ends of the branches. *Empalement* bellying, inflated, with green or purple veins. *Petals* distant; *claws* with projecting edges, forming a kind of ears, analogous to those of the *Silene*, thus forming the link of connection between *Silene* and the rest of the *Cucubalus*. *HALL. ST.*—*Leaves* sometimes fringed with prickle-like hairs, as in *Silene amœna*, and sometimes with a few short hairs scattered over the surface. *Young shoots* sometimes hairy. *Empal.* veins purplish, or green. *Chives*, 5 of them fixed to a glandular honey-cup at the bottom of the flower, and shedding their dust sooner than the other 5, which are fixed to the petals. *ST.*

Spatling Poppy. White Bottle. Bladder Campion.

Corn field, and dry meadows and pastures.

P. [June. *WITH.* and] July. August.

The leaves boiled have something of the flavour of pease, and proved of great use to the inhabitants of the island of Minorea, in the year 1685, when a swarm of locusts had destroyed the harvest. The Gothlanders apply the leaves to erysipelatous eruptions.

Horses, Cows, Sheep, and Goats eat it. *LINN.*—A Horse refused it. *ST.*

2. Leaves rough. *Huds.*

Spanish CUCU'BALUS *Orites.* Chives and pointals on different plants. *Petals* strap-shaped, undivided. *LINN.*—*Sometimes with chives and pointals. ST.*

Fl. dan. 513.* *a.* the flowers of the fertile plant, *b.* those of the barren plant.—*Clus.* i. 295. 1, *repr.* in *Ger. em.* 593. 1. *a.* fertile plant, *b.* barren

* Root-leaves 4 times as broad as they are in a wild state. Probably from a garden specimen. *MR. WOODWARD.*

b. barren plant, cop. in *J. B.* iii. 350. 2, and *Pet.* 57. 11, in which *a.* and *b.* are reversed, and the fertile plant cop. in *Ger.* 396. 1, and *H. ox.* v. 20. 5, leaves in all too large.

Root long, spindle-shaped. Stems several. Root-leaves wedge-shaped, tapering downwards into leaf-stalks, forming a thick tuft. Stem-leaves opposite. Empalement marked with green lines. Petals strap-shaped, narrow, quite entire, somewhat bowed in at the point; of a yellowish whitish green. *POLLICH.* *MR. WOODW.*—Leaf-stalks long, channelled. Stem sometimes single, the lower part with a few leaves, above naked and clammy. Flower-leaves somewhat membranaceous, growing together at the base, 2 under each set of fruit-stalks. Capsules oblong-elliptical. The barren plants bear more flowers, and in closer panicles than the fertile ones. I have examined many hundred plants, but never met with one with chives and pointals in the same empalement. *MR. WOODWARD.*—Flowers on fruit-stalks in whorls on the stem and branches, in the specimens examined with chives and pointals. *POLLICH. ST.*—In other specimens, as described by *Linnæus.* Seed-bud oblong, scored, crowned by a glandular substance, similar to the receptacle of the *Umbelliferae*. Shafts 2. *ST.*—Bloss. pale green, or white. Root-leaves lying in a circle on the ground.

Gravelly pastures. Gravel pits on the north side of Newmarket, and between Barton Mills and Thetford, Norfolk. [Near Swaffham and Narborough, Norfolk. *MR. WOODWARD.*

P. July. August.*

CUCU'BALUS *acaulis.* Sp. pl. ed. i. HUDS. ed. ii. *mois*
Silene acaulis, which see.*

* *Cucubalus viscosus.* It is time this plant was excluded from our Flora. There can be little doubt but Ray's plant was the *Silene nutans*, which has been found on Dover cliffs; and, I am informed, has been received from thence by Mr. Lightfoot, under the name of *C. viscosus*; and, from Ray's account of it, it appears, that the Dover plant was not much unlike the Nottingham one, differing in nothing material but the degree of clamminess, whereas the plant figured in *Tourn. voy.* 361, is extremely unlike that description, and has not the most distant resemblance to *S. nutans*; and, in the *Syst. veg.* the synonym of Ray is directed to be erased. *MR. WOODWARD.*—Retzius, however, in his obs. iii. 52, says, he cultivates the *Lychn. maj. notifl. Dubronis peren. R. syn.* in his garden, and finds it to be only a slight variation of *Cucubalus italicus.* *ST.*

616. SILE'NE. Catchfly.

EMPAL. *Cup* 1 leaf; tubular; with 5 teeth; permanent.

BLOSS. *Petals* 5; *claws* narrow; as long as the cup; bordered; *limb* flat; blunt; frequently cloven. *Honey-cup* composed of 2 little teeth at the neck of each petal, and constituting a crown at the mouth of the tube.

CHIVES. *Threads* 10; awl-shaped; every other thread fixed to the claws of the petals; and shedding their dust later. *Tips* oblong.

POINT. *Seed-bud* cylindrical. *Shafts* 3; simple; longer than the chives. *Summits* bending to the left.

S. VESS. *Capsule* cylindrical; covered; with 3 cells, opening at the point in 5 different directions.

SEEDS many; kidney-shaped.

ESS. CHAR. *Empalement* bellying. *Petals* 5; *with claws*; *with a crown at the mouth*. *Capsule* with 3 cells.

* *Flowers* solitary; lateral.

English SILE'NE *anglica*. Hairy. Petals nicked at the end. Flowers upright. Fruit on reflected, alternate fruit-stalks. LINN.—Petals generally quite entire. Flowers upright, nearly spiked. Fruit-stalks of the fruit between straddling and bent back. HUDS.—*Lower Capsules* only bent back. MR. WOODWARD. ST.

Curt. iv. 45.—Dill. elth. 309. 398.—(Vaill. 16. 12, is *S. gallica*.)

Petals not scolloped. *Lower-leaves* inversely egg-spear-shaped, fringed towards the base. *Empalement* not hairy, but the angles hedge-hogged with reflected prickles hardly perceptible. LINN.—*Petals* blunt, sometimes nicked. *Fruit* when ripe bent downwards horizontally, not pendant, angular, clammy, hairy. HUDS.—*Leaves* spear-shaped. *Flowers* from the bosom of the leaves, hairy, clammy. *Petals* entire, or nicked. CURT. ST.—*Stem* branched. *Empalement* as hairy as the rest of the plant. *Upper Capsules* upright, and nearly fitting. MR. WOODWARD. ST.—*Empalement* thick set with short hairs, terminated by globular glands, and the 10 ribs with long expanding hairs. Mr. Curtis's figure accords with this, but by no means does the Linnæan description. *Petals*, 2 strap-shaped teeth at the base of the limbs. ST.

Small Corn Champion, with a very small white flower. RAY.

Sandy

Sandy corn fields. Near the Devil's Ditch, Cambridgeshire. In Effex. About Coombe Wood, Surry; and near Newport in the Isle of Wight. A. June. July.

SILE'NE *quinquevul'nera*. Petals very entire, round-*variegated* ish. Fruit upright, alternate.—

(*Clusf.* i. 290. 1, repr. in *Lob. obs.* 183. 1, *ic.* i. 339. 1, *Ger. em.* 470. 5, and cop. in *Park.* 639. 6, *H. ox.* v. 21. 35, and *Ger.* 383. 5, expresses the general habit, but the petals are represented as having 3 teeth, an error which the accurate *Clusius* would hardly overlook.)

Empalement of the fruit upright, hairy, clammy. Petals blunt, scarcely nicked, very entire at the edge, purple, with a white margin. LINN

Sandy corn fields about Wrotham, Kent.

A. July.

It is cultivated in our flower borders. ST.

** Flowers lateral; crowded.

SILE'NE *nu'tans*. Petals cloven. Flowers lateral, *Nottingham* pointing one way, bowed downwards. Panicle nodding.—

Fl. dan. 242,* segments of the petals represented as spear-shaped, pointed, instead of strap-shaped.—*Clusf.* i. 291. 1, repr. in *Ger. em.* 470. 8, and cop. in *Park.* 631. 5.

Stem simple, cylindrical, a foot high, with 3 joints below the panicle of flowers, beset with clammy hairs. Leaves spear-shaped, with short hairs. Root-leaves on short leaf-stalks, forming a close turf. Petals white, narrow, cloven more than half way down; segments scolloped at the end, rolled inwards in the day time. Claws of the blofs. twice as long as the cup. Chives white, twice as long as the claws of the petals. Shafts 3, white, as long as the chives. LINN. —Stem frequently branched from the root. MR. WOODWARD.

Mountainous meadows. Walls of Nottingham Castle. [Rocks in Dovedale, Derbyshire. MR. WOODWARD.—Near Gloddaeth, Caernarvonshire. PENN. Wales.] P. June. July.

Sheep, Horses, Goats, and Swine eat it. Cows refuse it.

SILE'NE *amœ'na*.† Petals cloven. Crown slightly *sea* joined together. Flowers pointing one way. Fruit-stalks opposite, with 3 flowers. Branches alternate.—

Fl. dan.

* Leaves too large. Flowers not sufficiently nodding. Flowering branches too short. MR. WOODWARD.

† It does not accord with Linnæus's description of *S. amœna*. MR. WOODW. WITH. ST.—The empalement is neither hairy, nor has it 10 angles. WITH. Vol. I. G g ST.

Fl. dan. 857.*—*Lob. adv.* 143, repr. in *Ger. em.* 469. 2, and cop. in *Ger.* 382. 2, *Park.* 639. 3 and 4, *J. B.* iii. 357. 1, *Pet.* 57. 1, and *H. ox v.* 20. 2.

Stems spreading, rather smooth and ascending. Branches straddling, short. Leaves smooth upon the upper surface. The angles of the empalement 10, purple and woolly. Petals white, cloven $\frac{1}{2}$ way down. LINN.—Stems smooth, trailing, 6 to 12 inches high. Flowering branches ascending. Leaves spear-shaped, growing together at the base, smooth, 1 or 2 inches long, $\frac{3}{4}$ broad. Flowers on short fruit-stalks, from 1 to 3 at the end of each of the flowering branches, much resembling those of *Cucubalus Behen*. Empal. veins generally purple. Petals deeply cloven, segments oval, beneath which are 2 prominent teeth. Tips deep purple. Differs from *Cucubalus Behen* in the presence of the crown at the mouth of the blossom, and in the leaves not being heart-shaped at the base. MR. WOODWARD.—Leaves spear-shaped, fringed. Flowers altogether similar to those of *Cucubalus Behen*, except that the veins of the empalement are less distinct, and that the claws of the petals are extended into ear-like teeth. HALL. ST.—Stem weak and slender. Leaves of the barren branches, and the lower ones of the stem generally strap-spear-shaped, fringed with prickles-like hairs; those of the upper part of the stem egg or egg-spear-shaped, taper-pointed, 3 or 4 times as broad as the rest. Flowers often solitary, and frequently only 1 on a stem, terminating and lateral, the terminating one solitary, generally over-topping the lateral flowering branches; the rest at the end of 2 lateral flowering branches, with 2 leaves at their base. It retains its habit and characters when cultivated. In one plant, shafts and cells 5. This species evinces how little essential difference there exists between *Cucubalus*, *Silene*, and *Lychnis*. ST.—Leaves opposite, spear-shaped, edges transparent, serrated with very minute prickles. Flowers on long fruit-stalks from the bosom of the leaves, or terminating. Empal. semi-transparent, with a net-work of veins. Petals, edge very entire, white, each with 2 small plaits at the summit of the claw. Seed-bud oblong, mulberry-coloured, with a green glandular substance at the top. Shafts sometimes 5. Seeds fixed on short pedicles to the receptacle. Receptacle loose. WITH.

ST.—Neither can it with propriety be arranged under the division of "Flowers lateral, crowded," and, if the *S. amœna*, as, from the synonyms it ought to be, it is surely remarkable that the circumstance of "empalements smooth, with net-work veins," which is applied to *S. Behen*, as well as *C. Behen*, should have been omitted. ST.

* Is this plant beyond a doubt. MR. WOODWARD. ST.

Sandy.

Sandy places on the sea coast. [Southwold, Suffolk. Mr. CROWE.—Wells, Norfolk. Mr. WOODWARD.—Coast of Wales. Mr. SAWYER.—Portreath, near Hayle, Cornwall. Mr. WATT.]
P. June. July.

β. HUDS. Leaves broader. RAND.

*** Flowers growing from the forks of the stem.

SILE'NE *conoi'dea*. Empalements of the fruit glo- corn
bular taper-pointed, with 30 scores. Leaves smooth. Pe-
tals entire. LINN. HUDS. ST.

Clus. i. 288. 2, repr. in Lob. obs. 183. 2, ic. i. 339. 2, and Ger. em. 470. 7, and cop. in J. B. iii. 349. 4, Park. 631. 4, and H. ox. v. 21. 33. LINN. ST.*—(Lob. ic. i. 338. 2, repr. in Ger. em. 470. 6, and cop. in Park. 633. 11, and abridged in J. B. iii. 350. 1, with the addition of a branch in fruit, is the figure referred to by Dill. in R. syn. under *Lychn. sylv. angustifol.* &c. C. B. referred by Hudson to *S. conoidea*, but by Linnæus to *S. conica*.)

Stem beset with clammy hairs. Leaves spear-shaped, smooth. Empal. ribs rough with hair. Capsules globular, with a cylindrical beak. Petals small, undivided, entire. Honey-cups with 3 clefts, pointed, and with a tooth besides on each side at the base of the blossom. LINN.—Leaves, edges and mid-rib underneath downy, and sometimes also the whole of the leaf. Stem downy below, clammy above, being beset with hairs terminated by globular heads. Empalements rounded at the base, clammy, beset with short close hairs, interspersed with longer ones. In the *S. conica* the empalement is lopped at the base, and the whole plant is beset with a short thick down, without any longer hairs intermixed, and not clammy. ST.

Sandy corn fields. A little to the north of Sandown Castle, plentifully. Mr. J. SHERARD and Mr. RAND. R. syn. ed. iii.

A. June. July.

* These are the figures which Linnæus refers to his *S. conoidea*, and with these, as well as with the description of *S. conoidea*, my specimens from the London Botanic Garden accord. Mr. Hudson, indeed, gives to the *S. conoidea*, the synonyms which Linnæus has referred to the *S. conica*, but he mentions no place of growth, except on the authority of R. syn. It is possible that the *S. conica* and *conoidea* may be both native species. In Dr. Withering's herbarium I have found a specimen of *S. conica*, which he believes to have been of native growth, and which exactly corresponds with the figure of it in Jacq. austr. iii. 253. ST.

night flowering SILE'NE *noctiflora*. Empalements with 10 angles; the teeth as long as the tubes. Stem forked. Petals cloven.—

Cam. hort. 34, cop. in H. ox. v. 20. 12.—(J. B. iii. 344. 1, is a different plant.)

Stem upright, hairy, clammy. Leaves broad-spear-shaped, hairy. Flowers solitary, on fruit-stalks, slanting, whitish. Empalement cylindrical; those of the fruit globular-egg-shaped, full of seed, scored, with a net-work of veins; teeth nearly as long as the empalement. Flower opening in the night, sweet-scented in the summer, but not so in the autumn. LINN.—Whole plant hairy. Leaves growing together at the base, oval-spear-shaped. Flowers few, in the bosom of the upper-leaves, and terminating, mostly nodding. Seed-vessel upright. Mr. WOODWARD.

Corn fields. Between New-market and Canva's-hall in Wood-ditton. About Norwich. [Sandy fields, Norfolk, frequent. Mr. WOODWARD.]

A. July.

Pheasants are fond of the seeds.

common SILE'NE *Armeria*. Flowers in broad-topped bundles. Upper-leaves heart-shaped, smooth. Petals entire.—

Fl. dan. 559.—Clus. i. 288. 1, repr. in Dod. 176. 4, and Lob. obs. 242. 3, and cop. in H. ox. v. 21. 26.—Ger. 481. 2.

Whole plant smooth. Stem upright, upper joints of the stem clammy. Leaves oblong, the upper heart-shaped. Flowers terminating, the ends of the branches sub-dividing into forks, the forks close together. Petals nicked at the end; teeth of the crown taper-pointed, open. LINN.—Stem forked. Leaves sea-green, opposite. Floral-leaves very small, 2 at each division of the bundle of flowers. Empalement with 10 scores; teeth very small, and skinny. Petals pale red, slightly notched at the end; teeth of the crown long. Chives, every other shorter and shedding its dust later. Tips pale purplish blue. Shafts white. WITH.—Empalement somewhat bellying upwards. Blos. claws whitish green, border and teeth purplish rose-colour; teeth half as long as the border. Petals, Chives, and Pointal fixed to the summit of a green columnar receptacle, half as long as the empalement. ST.

Corn fields, and old walls. Banks of the River half a mile below Chester.

at the forks of the branches. Petals cloven, distant.
ST.*

Mill. 112.—*Clus.* ii. 183. 2, repr. in *Dod.* 403, *Lob. obs.* 136. 3,
Ger. em. 614. 13, and cop. in *Park.* 759. 1, and *J. B.* ii. 175.
1.—*Tourn.* 176, *fructification*, petals ill done.

Petals crowned, and therefore a *Silene*. REICH. *Branches* horizontal, and sometimes slanting downwards. *Fruit-stalks* often as if broken back. *Petals* ferrated, with little ears at the base of the border, so that it cannot with propriety arrange where Linnæus has placed it. HALL. ST.—*Stems* cylindrical, roughish, of a pleasant green. *Branches* opposite. *Leaves* egg-shaped, taper-pointed, running down into leaf-stalks, roughish. *Fruit-stalks* short. *Empal.* downy. *Petals* expanding, white; *claws* very narrow; teeth at the base of the border, in which respect it seems to depart from the Linnæan character. POLLICH. ST.—*Stem* hairy. *Leaves* hairy, opposite, oval-spear-shaped, very entire, on short leaf-stalks, those below the branches bent down to the stem. *Empalement* belling, frequently tinged with purple. MR. WOODWARD.—Whole plant somewhat hairy. *Stem*, joints large; *branches* nearly horizontal. *Leaves* in pairs at the joints. *Flowers* nodding. *Empalement* egg-shaped. *Petals*, when young, not seeming to have honey-cup teeth, but afterwards they become visible, and are ferrated at the ends, so that it is properly a *Silene*. *Capsules* with 3 partitions, but not sufficiently projecting to separate it into distinct cells. WITH.—As *Cucubalus* and *Silene* are genera merely artificial, the rules of arrangement require that it be removed to the latter genus. Tournefort, and after him Gmelin, have, in my opinion, very properly considered it as a distinct genus. Its habit is that of *Cerastium*, but its general structure that of *Silene*. It appears to form the connecting genus. *Empalement* cloven more than half way down. *Petals* cloven; *teeth of the crown* at the base of the border growing to the petal, except at the outer and upper edges, oblong, square, irregularly toothed at the upper edge with 2 or 3 teeth. *Capsules* at first of 3 cells, but the partitions being of a loose texture, they soon shrivel up, and, separating from the sides, give the appearance of there being but 1 cell; not opening at the point as in *Silene*, *Cucubalus*, &c. † Mr. WOODWARD.—It is wanting in our copy. ST.

STELLA'RIA *nem'orum*. Leaves heart-shaped, on broad-leaved leaf-stalks. Panicle with branching fruit-stalks.—

Fl. dan. 271.—*H. ox.* v. 23. 2, *cop. in Park.* 762. 1.

So nearly allied to *Cerastium aquat.* as with difficulty to be distinguished from it. Stem a foot high. Leaves, under surface much paler than in those of *Cerast. aquaticum*, the greater part of them on leaf-stalks, but few sitting, and those smaller only near the panicle. Leaf-stalks hairy, especially on the upper surface. Panicle terminating, distinct, smooth. Fruit-stalks after flowering pendant. *Empal.* smooth. LINN.—Allied to, but most truly distinct from *Cerastium aquaticum*. Stem low, never climbing. SCHREB.—Stem once or twice forked, afterwards branched; smooth below, hairy above. Leaves opposite, below the divisions of the stem, on leaf-stalks, at and above them sitting. Fruit-stalks long, branched, hairy, each with a pair of leaves similar to the stem-leaves. Differs from *Cerastium aquaticum* in having the upper part only hairy, and not clammy; the petals full twice as long as the empalement; the segments of the empalement more pointed, the fruit-stalks very slender, shafts only 3, and seed-vessel upright. Mr. WOODW.—Lower-leaves heart-egg-shaped, the middlemost egg-shaped. Fruit-stalks solitary. Empalement even, not ribbed. In habit it resembles *Alfina media* (*decastemon.*) ST.

Woods, moist hedges, and banks of rivers, in the northern counties. [By Casterton Mill. near Kirkby Lonsdale, Westmorel, Dr. J. E. SMITH.—Near Kendal, shewn me by Mr. GOUCH, son of a manufacturer of that place, a blind botanist, who had lost his sight early in his infancy, but who, by means of touch, had learnt to distinguish plants with wonderful accuracy. The plants he was familiar with he recognized by what may be called an intuitive touch, by simply drawing them through his hand; with others he took more time, examining the particular parts between his fingers. 8.—J. B. iii. 365. 2.—(Fl. dan. 415, is γ Linnæus.)

Leaves fringed at the base. Fruit-stalks from about the middle, and from near the end of the stem, in threes, from the bosom of the leaves, thicker towards the end, the 2 lateral ones dividing into 3, and bearing 3 flowers. Flower-scales spear-shaped, 2 at the base of the fruit-stalks in the bosom of the leaf. Petals shorter than the empalement, divided down to the base, the segments distant. Chives, 5 inserted into the claws of the petals, the other 5 into as many glands, surrounding the seed-bud. LEERS. ST.—Stems several, from 2 to 12 inches high, square; angles acute, smooth, weak, and sometimes creeping at the base, above upright, extending beyond the panicles, but little branched; branches upright. Leaves smooth, except at the base, sitting, or tapering down into short leaf-stalks, upright. Panicles pointing one way, sitting, upright, generally 2 on each stem; mostly consisting of 3 primary branches, the outermost bearing a single flower; the other 2, in the more luxuriant plants, dividing into forks, with a fruit-stalk bearing a single flower at each fork; the shorter as long again as the single fruit-stalk; and the 3d nearly as long again as the 2d. Flower-scales 2, at each fork of the panicle. Empalement smooth, membranaceous at the edge, generally closed. Petals white; segments strap-shaped. Shafts sometimes 4 and 5. ST.—Leaves sitting. Empal. leaves spear-shaped, expanding when in flower, but afterwards closing upon the capsule. Panicles from the bosom of the leaves. Summits rolled back. WITH.

Stone Crop. *Wall Pepper.*

Walls, roofs, rocks, and dry pastures. P. June. July.

This plant continues to grow when hung up by the root, which is a proof that it receives its nourishment principally from the air, as is the case with most of the succulent plants. It is very acrid. Applied externally it blisters. Taken inwardly it excites vomiting. In scorbutic cases, and quartan ages, it is an excellent medicine under proper management.

Goats eat it. Cows, Horses, Sheep, and Swine refuse it.

β. HUDS. *Sedum sexangulare*, which see.

SE'DUM *sexangula'rè.* Leaves somewhat egg-shaped, *insipid* growing to and sitting, bellying, nearly upright, tiled in 6 rows.—

Curt. iv. 37.

H h 2

Root

Root not forming a turf. Agrees with the *S. acre* in appearance, flowers, and situation, but differs in its leaves being before blooming evidently tiled in 6 rows, and, instead of having a biting, acrid taste, being insipid. Branches never so copious as to form a turf. Flowers in each branch of the tuft seldom more than 3. LINN.—*Clives* 8 to 12. MENCH.—Stems several, with short expanding branches. Leaves pale green, insipid. Tuft with 3 branches, terminating. Flowers on fruit-stalks, one at the division of the tuft, with a leaf at the base of each. *Empal.* leaves growing to and sitting, yellowish at the base, much smaller than the blofs. Petals egg-spear-shaped, concave, yellow. Flowers later than the *S. acre*. One 5th of the parts of fructification sometimes wanting. RETZ.—Leaves of the flowering stem nearer to each other than those of the *S. acre*, longer, more numerous, in general much redder, and nearly of the same thickness throughout, in the young shoots disposed in 6 rows, which are sometimes straight and sometimes slanting. CURT.

Walls, roofs, and dry pastures. Near Northfleet and Sheerness, the Isle of Shepey, and south side of Greenwich Park Wall, near the west corner. P. June.

Goats eat it.

English S E'DUM *anglicum*. Leaves somewhat egg-shaped, growing to and sitting, bellying, alternate. Tuft with 2 branches. HUDS.

Fl. dan. 82.—*Ray* 12. 2. at p. 326.—*Pet.* 42. 10.

Root branching. Stem trailing, cylindrical, leafy, smooth, branching, reddish; branches alternate. Leaves tiled generally in 3 rows, somewhat pointed, flattish above, bellying underneath, pulpy, naked. Tuft, branches somewhat bowed back. Flowers sitting, pointing one way. Blofs. white, or purplish white. Caps. purplish. HUDS.—Whole plant frequently of a purplish cast. Stems prostrate, with numerous ascending branches. Branches numerous, ascending, before flowering club-shaped, being covered by the leaves closely tiled. Leaves fleshy, blunt. Flowers terminating, on short fruit-stalks, crowded. *Empalement* divided almost to the base; segments not so pointed as the petals. Petals as long again as the empalement, pointed, pale flesh-coloured, with red lines. Tips purple. Capsules very pointed. MR. WOODWARD.

Corresponds in structure very exactly with *β.* WITH.—*Stems* weaker. *Leaves* softer and more flaccid than in *β.* RAY.—The male of this kind is that in which there are *apices* projecting from the middle of the flower; the female where these are wanting. And this takes place in both colours, for there is a white and a purple male, and the like of the female. GESNER in C. B. pin.—Gesner's observation is just. His male, however, is the fertile, and his female the barren plant. ST.—There are plants with fertile and barren flowers, both of a red and white colour, whence there is reason to believe them to be two distinct species. DR. BURGESS in *Lightf.* p. 1103.—The constancy in the colour of the two varieties, together with some other circumstances, have led me to suspect them to be distinct species. CURT.—There is little doubt but that they are distinct species. They never grow intermixed, nor have I ever found them near each other. MR. WOODW.

Red Flowered Wild Campion.

Hedges, ditches, and moist woods. The rocks in the Isle of Ailfa are covered with it, where there is none of the white. LIGHTF.

P. [May.—Sept. ST.]

β. Blossoms white.

white

Walc. fertile plant.—Matth. 997, cop. in J. B. iii. 342, and Pet.

57. 5.—Fl. dan. 792, fertile and barren plants, no hairiness.—

H. ox. v. 21. 21.—(Till. hort. 41. 1, has the air of a distinct species, though it is possibly the fertile plant.)

Capful of 1 cell. LINN. LEERS. CURT.—Flowers frequently with chives and pointals within the same empalement. WITH. ST.—But early in the summer and in the autumn they are generally on distinct plants. Stems nearly cylindrical, hollow, coloured, beset with fine hairs. Leaves spear-shaped, sitting, opposite, soft to the touch like velvet. BARREN PLANT; Empalement hairy, tinged on one side with red. Petals, border divided down to the claws; claws fringed at the top with 4 little scales which nearly close the mouth of the blossom. Threads fixed to the receptacle, unequal, hairy. Tips terminating, those on the longer threads discharging their dust first. Pointals, the rudiments of generally 1 or 2 in the centre of the receptacle. FERTILE PLANT; Empalement more distended, with 5 prominent ribs, and 5 intermediate smaller ones, ribs coloured. Petals, border cloven but half way down to the claws. Receptacle of the seeds large. WITH.

Lychnis alba. CURT. cat. n. 321.

Wild White Campion.

Pastures, hedges, [and fallow fields sometimes so plentifully as to make them appear at a distance quite white, where the red is never found. ST.]

P. June.—Aug. [May.—Sept. ST.]

3. Blossoms flesh-coloured. Flowers with chives and pointals flesh-coloured within the same empalement. HUDS. Mr. WOODW. but sometimes on distinct plants. Mr. WOODWARD.

Aphis Lychnidis lives upon it. LINN.

A Horse eat it. ST.

637. CERAS'TIUM. Moufe-ear.

EMPAL. *Cup* 5 leaves; egg and spear-shaped; sharp; expanding; permanent.

BLOSS. *Petals* 5; cloven; blunt; upright; but expanding; as long as the cup.

CHIVES. *Threads* 10; thread-shaped; shorter than the blossom; alternately longer and shorter. *Tips* roundish.

POINT. *Seed-bud* egg-shaped. *Shafts* 5; hair-like; upright; as long as the chives. *Summits* blunt.

S. VESS. *Capsule* egg-cylindrical; or globular; blunt; with 1 cell; opening at the top; with 5 teeth.

SEEDS many; roundish.

ESS. CHAR. *Empalement* of 5 leaves. *Petals* cloven. *Capsule* of 1 cell; opening at the point.

* *Capsules* oblong.

narrowleaved CERAS'TIUM *vulgatum*. Leaves egg-shaped. Petals as long as the empal. Stems spreading. LINN.—Panicle forked. HUDS.—*Petals* generally longer, sometimes shorter than the empalement. ST.

Curt. ii. 22.—Vaill. 30. 1.—Pet. 58. 6.—J. B. iii. 359. 1.—
(Vaill. 30. 3, and Pet. 58. 5, is *C. viscosum*.)

Very much resembling *C. viscosum*, but stems more numerous, more reclining, forming a thicker turf before they flower, flowering later, continuing longer. Leaves less spear-shaped, and more egg-shaped.* Fruit-stalks not clammy. Capsules smaller. Empal. outer leaves not membranaceous at the edge. LINN.—Whole plant rough with hair. Flowers never much expanded. Capsule opening with 10 teeth. WITH.—Hairs not terminated by globular glands; sometimes but thinly scattered over the plant. Stems from 1 inch to 2 feet high. Leaves varying very much in breadth, the lower ones oblong-egg-shaped. Bloss. varying in size, smaller when the plant is luxuriant, and the reverse. CURT.—Blossoms white.

Meadows, pastures, walls, sides of roads, and amongst rubbish.

P. VAILL. CURT. May.—Aug.

* The reverse of this is generally observable with us. CURT. ST.

CERAS'TIUM *viscosum*. Upright, woolly, and clammy. LINN.—Panicle forked. Flowers longer than the fruit-stalks. HUDS.

Curt. ii. 14.—Vaill. 30. 3.—Pet. 58. 5.

Chives sometimes 5. HALL.—Stems in a barren situation simple, and 2 inches high. Flowers while the plant is young closely crowded together. Petals narrow. Foliage paler than that of *C. vulg.* and *semidec.* Chives 10. CURT. ST.—Stem cylindrical, woolly. Leaves egg-shaped, blunt, woolly, sitting, opposite. Flowers on very short fruit-stalks, forming a sort of rundle in the bosom of the upper pair of leaves. Empalement with fine shining hairs on the outside and at the edges. Petals shorter than the empalement. Summits woolly. Capsule opening with 10 teeth. WITH.—Plant woolly; hairs thick set, whitish, tapering to a fine point, in the upper part of the stem intermixed with others terminated by oval, transparent glands, scarcely thicker than the hairs. Leaves oblong-inversely egg-shaped. Blossoms white. ST.

Meadows, pastures, walls, dry banks, and ant-hills.

A. Apr. May. [to Oct. WITH.]

Horses and Goats eat it. Cows and Sheep refuse it.

CERAS'TIUM *semidecan'drum*. Chives 5. Petals least notched at the end.—

Curt. ii. 21.—Ray 15. 1. at p. 348, as growing on heaths.—Vaill. 30. 2.

Stems very short. Leaves egg-shaped, opposite, somewhat channelled, blunt, sprinkled with very short hairs. Fruit-stalks very short, each with 1 flower. Empalement with glutinous hairs, membranaceous at the point and edges. Petals strap-shaped, white, sharply notched at the end. Chives 5, with white tips, the 5 inner ones without tips. Five honey-cup dots between the fruitful chives and the petals. Seed-bud egg-shaped. Shafts 5. LINN.—Chives 5 to 10. Shafts 3 and 5. GERARD prov.—Chives 5. Shafts 3. HALL.—All the 10 chives with tips. SCOP.—Shafts 5. SCOP. and POLLICH. Stem in very dry situations simple, and about 2 inches high, but more commonly branched, or numerous ascending stems 6 inches high, and clammy with glandular hairs. Empal. leaves terminated by a pointed membrane, clammy with glandular hairs. Petals shorter than the empalement, often gnawed. Chives generally 5, now and then 6, seldom more. CURT.—Empalement tinged at the end with purple. MR. BALLARD.

Walls, pastures, and heaths.

A. Apr. May.

CERAS'-

corn CERAS'TIUM *arven'se*. Leaves strap-spear-shaped, blunt, smooth. Blossoms larger than the empalement. LINN.—*Leaves always a little hairy*. HALL. Mr. WOODW. ST.—*Hardly to be called blunt*. ST.

Cows and Sheep eat it.

mountain (*CURT. ST.) CERAS'TIUM *latifolium*. Leaves egg-shaped, somewhat downy. Branches, each with 1 flower. Capsules globular. LINN.—*Leaves downy*. Capsules roundish, but when ripe lengthened out into a straight horn. HALL. Mr. WOODWARD.

Lightf. 10. at p. 242. †—[Marten Spitzb. G. d. not examined.]

Stems

* If this mark of difference should prove uniform, Lightf. 10. at p. 242, will prove to be *C. alpinum*. ST.

† This figure accords in habit with Fl. dan. 6, which is referred by Linn. to *C. alpinum*, as does Mr. Lightfoot's description of it with that given by Linn. in

Stems trailing, branched, straddling at right angles. *Flowers* large. *Empalement* bell-shaped. G. in LINN.—*Stems* with 2 flowers. *Leaves*, all downy, the lowermost egg-shaped, crowded, the upper egg-spear-shaped, thickish, pulpy. *Flowers* upright, generally only 1, sometimes 2. HALL.—*Whole plant*, except the petals and capsules, covered with long, soft, shining hairs. *Lower-leaves* oval; *upper* oval-spear-shaped, opposite. *Branches* terminated by 1 or 2 flowers. *Flowers* large, on separate fruit-stalks, each furnished with 2 opposite spear-shaped branches. *Capsule*, horn blunt. Mr. WOODWARD.

On a rock near Glogwyn y Garnedd, the highest in all Wales, near Llanberys, Caernarvonshire; and rocks on the summits of the Highland Mountains. LIGHTF. P. May. June.

* * *Capsules* roundish.

CERAS'TIUM *umbellatum*. Leaves egg-shaped. *umbelliferous* Flowers in rundles. Petals nearly entire. Fruit pendant. HUDS. ST.

J. B. iii. 361. 1.—Rose 2. 4.—Ger. cm. 595. 16, cop. in Park. 1338. 6.—H. ox. v. 22. 46, (not 49.)

Description in English. ROSE p. 446.

Petals with 3, and sometimes only 2 teeth. *Chives* 5, but sometimes only 4 or 3. *Shafts* 3, and sometimes 4. HALL.—*Chives* always 3, except once when I found 5. LEERS.—*Flower-scales* very small, egg-shaped, at the base of the fruit-stalks. *Petals* inversely egg-shaped, with 3 teeth at the end, white. POLLICH. ST.—*Chives* 3, 4, and 5, with 3 shafts, and also 10 with 5 shafts. HUDS. *Whole plant* smooth. *Stem* above bare of leaves. *Fruit-stalks* terminating, mostly hanging down, of various lengths, each with 1 flower. Mr. WOODW.—*Petals* with 5 white ribs; teeth unequal, sometimes 5. *Holostium* differs from *Cerastium* only in number. There are *Cerastiums* with 5 chives; in the *C. pentandrum* the petals are

in the *fl. lapp.* of *C. alpinum*. Switzerland is the only place of growth assigned by Linnæus to his *C. latifolium*. The botanists of that country, however, C. Bauh. and Haller, describe the capsule as *oblong*, which induces me to believe that Linnæus was misled respecting the form of the seed-vessel, from examining dried specimens in which the fruit was not advanced to maturity; and that the variety of *C. alpinum* with woolly leaves of the *fl. lapp.* and the *C. latifolium* are one and the same plant. Neither Mr. Lightfoot nor Mr. Hudson appear to have seen both species. My specimens accord with the *C. alpinum* with woolly leaves of the *fl. lapp.* hairs long, soft, and wool-like; stems ascending, bearing one flower; or forked with 1 fruit-stalk from the fork without floral-leaves, the 2 lateral branches bearing each 1 flower with 2 opposite floral-leaves; capsules oblong, with a scarcely perceptible degree of curvature. ST.

are entire, in the *repens* cloven into 4 and 5; and, on the other hand, in the *Holosteum cordatum* they are divided, as in the generality of the *Cerastiums*, into 2. Sr. (W. 85.)

Holosteum umbellatum, which see.

Old walls, banks, and sandy corn fields about Norwich, where it was first discovered and examined by Mr. J. Pitchford. ROSE. Mr. Woodw.—Found about Bury, in Suffolk, by Mr. Cullum. A. April. May.

marsh CERAS'TIUM *aquat'icum*. Leaves heart-shaped, sitting. Flowers solitary. Fruit pendant.—

Curt. i. 3, but the engraver has forgotten to give the stem its due hairiness.—Dod. 29. 1, repr. in Ger. em. 611. 1, and cop. in Park. 759. 2.—Ger. 488. 1.—(Ger. 613. 10, cop. in Park. 1259. 1, is also referred to by Ray, and is possibly the same plant before any of its seed-vessels become pendant.—J. B. iii. 362, is *Polygala vulgaris*.)

Allied to *Stellaria nemorum*. Stems 1 or 2 feet high, weak, cylindrical, scarce perceptibly 2-edged, jointed; joints reddish at the base. Branches rather few, solitary, alternate, simple, often as long as the stem, hairy above. Leaves heart-egg-shaped, oblong, fitting, embracing the stem, waved at the edge, pointed, smooth, keeled, keel sharpish; the uppermost somewhat hairy, and the 1st leaves of the branches smaller, heart-shaped, on fringed leaf-stalks. Flowers from the bosom of the upper leaves and forks of the stem, on fruit-stalks, solitary, with fruit-stalks and empalements hairy, clammy. Petals divided into 2, white, twice as large as the empalement. Clives 10, white. Pointals 5, white. The empalement and fruit-stalk of the fruit nodding downwards; Capsule egg-shaped, with 5 blunt corners, scarcely longer than the empalement, of 5 valves, hollow above, of 1 cell. Seeds roundish, yellowish red. LINN.—Shafts often 6. POLLICH.—Leaves often heart-spear-shaped, and sometimes curled at the edge. Whole plant set thick with fine short hairs, terminated by globular heads, containing a clammy liquor. Stem not always red at the joints. Branches forked. Empal. segments spear-shaped. Petals rather longer than the empalement. WITH.—It has the greatest natural affinity to *Alfine media*. CURT. Sr.—But is distinguishable by the lower stem-leaves of the *Alfine media* having leaf-stalks, and one of the edges of the stem being set with hairs, while in the *C. aquaticum* the hairiness is general. Sr.

Watery places, and banks of rivers.

P. July.

CERAS'-

CERAS'TIUM *tomento'sum*. Leaves oblong, downy. *woolly*
Fruit-stalks branched. Capsules globular.—

Whole plant white with a thick down. Stems in a thickly matted tuft, forked, with sometimes a single flower on a long fruit-stalk from the division; the divisions branched, but expanding, each branch bearing a sort of rundle. Leaves gradually narrower downwards, the pair below the forks of the stem about $3\frac{1}{2}$ lines broad, and 10 long, much broader than the stem, or the whole empalement; the pair next below $\frac{1}{2}$ a line narrower, and the 3d pair 1 line shorter, and $\frac{1}{2}$ a line narrower than the 2d. Fruit-stalks single, of various lengths. Flower-leaves spear-shaped, with membranaceous edges, in pairs at each division of the stem. Empal. leaves spear-shaped, with membranaceous edges. Petals as long again as the empalement, cloven not $\frac{1}{2}$ way down; segments blunt. Chives 10, as long as the empalement, downy. Tips yellow. Capsules globular. Shafts 5, downy, as long as the chives. Mr. WOODWARD.

Specimens gathered in the garden of Mr. WHITELOCK, who assured me that it was the individual plant he had transplanted from Ripton Wood, Huntingdonsh. where he found it growing wild. Mr. WOODWARD.

636. SPER'GULA. Spurrey.

EMPAL. Cup 5 leaves; egg-shaped; blunt; concave; expanding; permanent.

BLOSS. Petals 5; egg-shaped; concave; expanding; entire; larger than the cup.

CHIVES. Threads 10; awl-shaped; shorter than the bloss. Tips roundish.

POINT. Seed-bud egg-shaped. Shafts 5; upright, or reflected; thread-shaped. Summits rather thick.

S. VESS. Capsule egg-shaped; covered; with 1 cell, and 5 valves.

SEEDS many; globular, but depressed; encompassed by a border, with a notch in it.

ESS. CHAR. Empal. leaves 5; entire. Capsule egg-shaped; of 1 cell, and 5 valves.

SPER'GULA *arven'sis*. Leaves in whorls. Chives *corn*
10. LINN.—Fruit pendant. HUDS.—Chives 5, 7, 8, 10.
SCOP. ST.—often 6 and 7. POLLICH.

Curt. v. 52.—*Dod.* 537, repr. in *Lob. obs.* 467. 1, *Ger. em.* 1125, and cop. in *Park.* 562.—*J. B.* iii. 722. 1, cop. in *Pet.* 59. 6.

Leaves 6 in a whorl, 3 on each side, round, thread-like, woolly, clammy. *Fruit-stalks* branching. *LINN.*—*Leaves* somewhat flattened, convex above, with a single furrow underneath. *Seeds*, border sharp, exceedingly shallow, very entire, but with a nick at its insertion on the receptacle; in some plants beset on each side with exceedingly short brown hairs, or rather cylindrical prominencies, in others with scarcely prominent dots. *Chives* equally variable in the plants with rougher or smoother seeds. *ST.*—*Root* simple, descending. *Stems* upright, cylindrical, knotty. *Leaves* strap-shaped, fleshy. *Flowers* in panicles. *Flower-scales* opposite, very minute. *Fruit-stalks* bent back after flowering. *Blossoms* white. *LYONS.*—*Chives* in the autumn frequently fewer than 10. *Seeds* rough with rising dots, when ripe black, with a white border. *WITH.*—If the stems are forcibly extended, the cortical part separates at the base of each joint, while the inner part, which is very elastic, stretches and continues entire, or, on increasing the extension, breaks generally a considerable way above the joint. *MR. WOODWARD.* *WITH.*

Corn fields, and sandy places. A. July. Aug. [Sept. ST.]

Poultry are fond of the seeds; and the inhabitants of Finland and Norway make bread of them when their crops of corn fail. Experience shews it to be very nutritious to the cattle that eat it.

Horses, Sheep, Goats, and Swine eat it. Cows refuse it.

β. *pentandra*. *HUDS.* *MR. WOODWARD.*—Flowers with 5 and 10 chives found on the same plant. *HUDS.*

Spergula pentandra, which see.

5-chived SPER'GULA *pentan'dra*. Leaves in whorls. Chives 5. *LINN.* *CURT.* cat. n. 753.

Very much like *S. arvensis*, but smoother. *LINN.*

Spergula annua semine foliaceo nigro, circulo membranaceo albo cincto. *R. syn.* 351, is referred to by Hudson, but, from his not having given us any place of growth, it should seem to have retained its place in the Fl. angl. from Linnæus's direction, in *Munt.* II. 90, to erase the synonyms of *S. pentandra*, having escaped Mr. Hudson's notice. It is referred by Linn. to *Arenaria media*, which may possibly prove a British species. I have a specimen from Germany which accords with the descriptions of Morison and Ray, and which I believe to be the *S. pentandra* of Mænoch and Scopoli. In habit it resembles *S. arvensis*, not *Arenaria rubra maritima*, and has 5 shafts; but the fruit is upright, and the seeds similar to those of *A. rubra maritima*, are flat, inversely egg-shaped, and surrounded with a membra-

membranaceous border, deeper than the diameter of the seed, with a nick at the place of infertion to the receptacle. Add to this, that *no* furrow was observable on the under surface. These circumstances sufficiently mark it out as distinct from the *S. arvensis*. The botanists of Ireland may enable us to ascertain this point. ST.

SPER'GULA *nodo'sa*: Leaves opposite, awl-shaped, knotted smooth. Stems simple.—

Curt. iv. 44, in its most luxuriant state.—Fl. dan. 96, in its more contracted state.—J. B. iii. 724.—Ger. 567. 6, cop. in Park.

427. 3.—Pluk. 7. 4.—Pet. 59. 5, lateral branches too numerous in the 2 last.

Bunches of very minute leaves in the bosom of the opposite leaves which are the rudiments of small branches. RAY. ST.—Foliage very much resembling that of *Sagina procumbens*. Stems not unfrequently branched; branches lateral, short. Flowers terminating, generally solitary. Empalement of 1 leaf, with 5 divisions; segments oblong, membranaceous at the edge, every other shorter. Petals white, as long again as the empalement, inversely egg-shaped, streaked. Tips oblong, whitish. Seeds kidney-shaped, minute, black, with a net-work on the surface, not bordered. Capsule egg-shaped. The structure of its seeds shew it not to be of the same natural genus with *S. arvensis*. It is most closely allied to *Arenaria loricifolia*. ST.

Marshy places, wet pastures, and sides of rivers, lakes, and marshes. [Bogs about Settle, and in the North. CURT.—Boggy ground in Sutton Park, Warwickshire. ST.]

P. July. Aug. [Sept. ST.]

SPER'GULA *saginoïdes*. Leaves opposite, strap-shaped, smooth. Fruit-stalks solitary, very long. Stem creeping. LINN. RETZ. CURT. MR. WOODWARD. ST.—Chives 5. HUDS.—5 to 10, but mostly 5. CURT.

Curt. iv. 40.—Fl. dan. 858.

Stem trailing, 2 inches high. Leaves in bundles (also) at the joints. Fruit-stalks quite simple, lateral, without flower-scales. Flowers nodding. LINN.—Root branched. Stems several, branched. Leaves connected, awl-shaped, fringed, pointed. Fruit-stalks towards the ends of the branches, cylindrical, with 1 flower. Petals white. Chives 5, more rarely 10. HUDS.—Has the habit and leaves of *Sagina procumbens*, but taller. Empalement beset with very short hairs. VAILL.—Agrees also with *Sagina procumbens* in the form of its capsules, shape and size of its seeds, but the whole plant is beset with short hairs terminated by minute globules, very distinguishable

able when magnified; and the *petals* are as long as the *empalement*, and when fully expanded very conspicuous. CURT.

S. laricina. LIGHTF. HUDS. *Fl. dan.* (Not *S. laricina* of Linnæus. RETZ. CURT. ST. which Gmelin describes as fringed towards the base, and with alternate fruit-stalks from the upper part of the stem.—*Fl. dan.* 12, is referred also by Linnæus himself to *Stellaria biflora*, not to mention the flower-scales on the fruit-stalks. ST.)
