This kinde of Paritary, or (as it is usually called) Pellitory of the Wall, riseth up with many brownish red, tender and weake, cleare, and almost transparent stalkes, about two foote high, upon which grow at the severall joynts, two leaves fomewhat broad and long, like unto thofe of *French Mercury*, or *Amaranthus*.

Amaranthus called Flower gentle, of a darke greene, which afterwards turne brownish. not dented at all, but smooth on the edges, rough and hairy as the stalkes are also: at the joynts with the leaves, from the middle of the stalkes upwards, where it spreadeth into some branches, stand many small pale purplish flowers, in hairy, or somewhat rough heades or huskes, after which come small blacke and rough seede, which will stick to any garment or cloath that shall touch it: the roote is somewhat long with many small fibres annexed thereunto, of a darke reddish colour, which abideth the Winter, although the stalkes with leaves perish, and springeth a fresh every yeare.

2. *Parietaria minor*. Small Pellitory of the Wall.

The lesser Pellitory of the Wall, groweth in the like manner that the former doth, but not so great or high, having tender reddish rough stalkes, and smaller and shorter, and somewhat greener leaves thereon, almost like unto Basil, and rougher also, so that they will cleave to any cloth, or other thing that toucheth it; the flowers and seede differ not much from the other, but smaller, and the seede is more like unto Purslane seede, being rubbed out of the huskes, than the other.

The Place.

The first groweth wilde generally through the land, about the borders of fields, and by the sides of old Walls, and among rubbish: it will well endure also being brought into the garden, and planted on the shady side, where it will spring of its owne sowing, and will not easily be gotten out thence afterwards: The other is rare in our Countrie, and in Germany also, but neare Confluence, where it is naturally found, and not in many other places, neither both of them in one place or very seldome, it doth sometimes hold the greene leaves in the Winter.

The Time.

They flower in June and July, and the seede is ripe soon after.

The Names.

It is called in Greeke *ἡλίχιον* *Helixine*, and *μαρμαριον* *Perdicium*, the one *quod foliorum & seminum hirsutis vestibus adhaerent*: the other *quod perdicis ea libenter vescantur*: in Latine also *Helixine*, (but not *Cissampelos*, which is described before.) *Perdicium*, *Perdicaria*, & *Tricolaris*, *Vitrago* or *Vitriolaria* herba, because the roughnesse thereof serveth to cleanse either pots or glasses; it is called also *Muralium*, and herba *Muralis*, because it most usually groweth by Walls sides, and for the same cause also it is called *Parietaria* or as some doe write it *Paritaria*. Galen and Paulus Aegineta, who followeth him in most things, say, that some in their dayes called it *Parthenium*, but they doe not understand the *Matricaria* for it, but this herbe here entreated of; but there are to be found in the writings of divers, that have written of herbes seven severall sorts of herbēs, called by the name *Parthenion* or *Parthenium*; as *Mercurialis*, *Arthemisia*, *Chamomilla nobilis*, *Amaracus* or *Majorana*, *Marum*, *Matricaria*; and this *Parietaria*; *Cornelius Celsus* also, and *Pliny* out of him, doe call it *Parthenium*; and yet *Leoniceus*, *Colmarius*, and *Rudolphus Agricola*, much doubted, whether any did so call it: the Italians call it *Parietaria* & *Vitriolaria*; the Spaniards *yerva de muro*; the French *Paritoire* and *Paritari*; the Germanes *Sankt Peterskraut*; as *Tragus* saith, & *Tagunacht* and *Glaszkraut*; the Dutchmen *Glasfcruidt*; in English ordinary Pellitory of the Wall, but corruptly as I said, for it hath no correspondencie with Pellitory; but to follow the Latine name, as most other Countries doe, it should be called *Paritarie*, and of the wall is added according to both the names of *Paritaria* and *Muralis*; all Authors doe call it generally either *Helixine* or *Parietaria*, and *Tragus* calleth the other *Paritaria exigua*.

The Vertues.

The dried herbe *Paritaria* made up with hony into an Electuare, or the juice of the herbe, or the decoction thereof made up with Sugar or Hony, is a singular remedy for any old continuall or dry cough, the shortnesse of breath and wheezings in the throat: the juyce thereof taken to the quantie of three ounces at a time doth wonderfully ease those that are troubled with the suppression of their urine, causing them very speedily to make water, and to expell both the stone and gravell that are engendred in the kidneys and bladder, and therefore it is usually put among other herbes that are used in glisters, to mitigate paines in the backe, sides, or bowells, proceeding of winds or the like stoppings of urine, or the gravell and stone: it worketh the like effect also, if the bruised herbe sprinkled with some Muscadine be warmed upon a tyle, or in a dish upon a few quicke coales in a Chaffing dish, and applied to the belly: the decoction also of the herbe being drunke, easeth the paines of the mother, and bringeth downe the courtes that are staid; the same also easeth those griefes that arise from the obstructions of the liver, spleene, and reines: the same decoction also may serve in stead of a bath for men or women to sit in, for the foresaid purposes: the same decoction also with a little hony added thereto, will serve to very good purpose to gargle the throat when it is swollen and pained; the juyce held a while in the mouth easeth the paines in the teeth: the distilled water of the herbe drunke with some Sugar to make it the more pleasant, worketh the same effects, and moreover cleanseth the skinne from spots, freckles, purples, wheales, sunburne, mortheue, &c: and leaveth the skinne, cleare, smooth and delicate: the juyce dropped into the eares easeth the noise and

humblings in them, and taketh away the prickings and shooting paines in them: the said juyce or the distilled water, doth assuage hot and swelling impostumes, burnings or scaldings by fire or water, as also all other hot tumours or inflammations, be it Saint *Antonies* fire, or any other eruptions of heate, being bathed often with wet cloths dipped therein; or the said juice made into a linament with *Cernissa* & oyle of Roses, & anointed therewith, which also doth cleanse foule rotten ulcers, and staeth spreading or creeping ulcers, and the running scabbies or sores in childrens heads: the same also helpeth to stay the falling of the haire of the head; the said ointment or the herbe applied to the fundament, openeth the piles, and easeth their paines, and being mixed with Goates tallow, or the *Cyprian Cerote*, doth helpe the gout: the juyce is very effectuell to cleanse fistulaes, and to heale them up safely, or the herbe it selfe bruised and applied with a little salt: it is likewise so effectuell to heale any greene wound, that if it be bruised and bound thereto for three dayes, you may after wards take it away, for you shall not neede any other salve or medicine to heale it further: a pultis made hereof with Mallowes, and boyled in wine with Wheate branne, and Beane flower, and some oyle put thereto, and applied warme to any bruised sinew, tendon, or muscle, doth in a very short time restore them to their strength, and taketh away the paines of the bruises, and dissolveth the congealed blood of any beatings, or falls from high places.

CHAP. XII.

Heliotropium. Turnefole.

Here are divers sorts of herbes that may be called Sunturners, because their flowers doe oppose the Sunne, whereof to speake in this place is not my purpose, neither will the method of the worke admit: but properly of that kinde so called, whereof there are three or foure sorts, as shall be presently declared.

1. *Heliotropium majus*. The greater Turnefole.

The greater Turnefole riseth up with one upright stalke, about a foote or more high, dividing it selfe almost from the bottoome into divers smaller branches, of a hoary colour; at each joyn of the stalke and branches grow two small broad leaves, somewhat like unto those of Calamint or Basil, but greater than Calamint, and lesser than the greater Basil, somewhat white or hoary also: at the toppes of the stalkes and branches, stand many small white flowers, consisting of foure and sometimes of five very small leaves, set in order, one above another, upon a small crooked spike, which turneth inwards like a bowed finger, opening by degrees as the flowers blow open; after wch in their places come small cornered seede, foure for the most part standing together: the roote is small and threddy, perishing every yeare, and the seede shedding it selfe, riseth againe the next Spring.

2. *Heliotropium majus supinum*. The greater creeping Turnefole.

This creeping Turnefole according to the judgement of *Clusius*, is in a manner but the same with the former greater Turnefole, because it is in most things so like it, yet differeth in these particulars, that it hath more and slenderer stalkes, not standing upright as the former doth but leaneth downe to the ground, the stalkes and leaves are lesser, but hoary in the like manner; the flowers are white, and stand in crooked spiked heads, bowing like a Scorpions taile, as the other, but the seede being smaller, standeth singly, or but two together; the rootes are small and perish in like manner.

1. *Heliotropium majus*.
The greater Turnefole.3. *Heliotropium minus*.
The small Turnefole. 3. *Heliotropium*

3. *Heliotropium minus*. The smaller Turnefole.

This smaller Turnefole groweth very low, lying almost with his slender weake branches upon the ground, having thereon many small leaves, like the other in forme, but three times lesse in substance, neither stalkes nor leaves white nor hoary, but of a darke greene colour: the flowers are much smaller and yellowish, not growing in long crooked or bowing heads like the former, not at the toppes of the branches, but standing at the joynts, upon very small stalkes, some above the leaves and others under them, which afterwards turne into small round heads or buttons, like unto wartes, wherein is such like seede as the left, but smaller and a little rounder.

4. *Heliotropium triccoccum*. The colouring or dying Turnefole.

This dying Turnefole that beareth berries, three alwayes set together, riseth up with an upright stalke, branching it selfe diversly to the height of halfe a yeard or thereabouts; whereon grow broader and softer leaves than any of former, like unto those of the sleepy Nightshade, & whitish withall, set without order at the joynts up to the toppes, yet lesser above than below: at the end of the branches come forth small mossie yellowish flowers, which quickly perish and fall away without giving any seede, herein like unto the *Ricinus* or *Palma Christi*, called the great Spurge, for in the same manner also, at the joynts with the leaves come forth the fruit or berries, standing three for the most part alwayes joyned together upon short foote stalkes, which are of a blackish greene colour, and rough or rugged on the outside, within which is contained a coloured seede, which if the heads be suffered to grow to be overripe, and be dried with the Sunne, will fall out of themselves upon the ground, and spring againe in their naturall places the next yeare, thereby renewing it selfe, for the roote is small, and perisheth after it hath borne seede: but these berries when they are at their full maturitie, have within them that is betwene the outer skinne and the inner kernell or seede a certaine juice or moisture, which being rubbed upon paper or cloth, at the first appeareth, of a fresh and lively greene colour, but presently changeth into a kind of blewish purple upon the cloth or paper, and the same cloth afterwards wet in water and wrung forth, will colour the water into a claret wine colour; and these are those ragges of cloth, which are usually called Turnefole, in the Druggists and Grocers shoppes, and with all other people, and serveth to colour jellies, or other things as every one please.

The Place.

These doe grow in Italy, Spaine and France in divers places, as *Martholus*, *Lobel* and *Clusius* doe set them downe: the two first doe well endure with us.

The Time.

The two first doe flower and seede well with us every yeare, but the other two doe scarce beare any shew of seede with us, in regard we want sufficient heate to ripen them.

The Names.

It is called in Greeke *ἡλιοτρόπιον* *Heliotropion*, that is, *Solisequium* Sunturner, so called saith *Dioscorides*, quoniam folia cum sole circumaguntur; but herein I thinke he erred, for the leaves doe not turne to the Sunne, onely the head of flowers faceth the Sunne; and is called also *scorpiureum* *Scorpiurum*, quia spica florum Scorpionis cauda est effigie; but *Theophrastus* saith, it is called *Heliotropium*, because it flowreth in the Sommer Solstice: the small kinde is called most properly in Latine *Verrucaria*, a tollendis verrucis, and *Herba Cancræ*: the Italians call it *Heliotropio*, and the Spaniards *Tornasolbobo*; but the Spaniards and French call the last *Turnasol* and *Turnefol*. The first is generally called of all Authors *Heliotropium*, and *Verrucaria* of some, onely *Gesner* in hortis, calleth it *Scorpioides album*, and *Lonicerus* *Herba Cancræ major*: the second *Clusius*, *Dodonæus* and *Gesner* call *Heliotropium supinum*, *Lugdunensis* *Heliotropium humi* [parsum] [Lusi], and *Bauhinus* *minus supinum*: the third is called *Heliotropium minus repens* of *Lobel*, and of *Gesner* *Heliotropium minus folio ocimi*; *Lugdunensis* calleth it *Verrucaria altera minor*; the last is called *Heliotropium triccoccum* of *Pliny*, and all others since his time, yet some adde unto it *minus*. *Camerarius* in horto, saith it is called *Herba Clitiæ*, and thereupon the Poet hath these Verses;

*Herba velut Clitiæ semper petit obvia Solem,
Sic pia mens Christum quo prece spectet habet.*

Lobel calleth it *Heliotropium vulgare Turnefol Gallorum*, sive *Pliny triccoccum*, and in his Observations, *Heliotropium parvum Dioscoridis*, being supposed by many to be described by *Dioscorides* under the *minus*, although hee did not particularly name it.

The Vertues.

Dioscorides saith that a good handfull of the greater Turnefole boyled in water and drunke: purgeth both cholles

choller and flegme, and being boyled in wine, it is good against the stingings of Scorpions, to be as well drunke as laid upon the place that is stung: the same also boiled with Cummin and drunke, helpeth them that are troubled with the stone in the reines or kidneys or bladder, provoketh urine and womens courses, causeth an easie and speedy birth, when they are in travell; it killeth the wormes of the belly both long and round, if the herbe and seede of the lesser kinde be taken with Hyslope, Cressies, and Nitar. *Pliny* saith that the *Magi* in his time held this opinion, (idle as many other his relations are) that foure graines or seedes of his Turnefole drunke in wine, an houre before the acceffe of the fit of the *quartaine* ague doth cure it, and that three graines drunke in the same manner will helpe the *tertian*: the leaves bruised and applyed to the places pained with the gout, or that are out of joynt, and being set are full of paine, doth give much ease, as also for children that have the disease called *Syrasis*, which is an inflammation of the parts about the braine, and the *tumors* thereof; the seed of the least kinde (but the greater will doe the same also) and the juice of the leaves also being rubbed with a little salt upon warts, swollen wens, and other hard kernels or excrescences, in the face, eye-lids, or any other parts of the body, will take them away, by consuming them a little and a little, with often using it: The dying or colouring Turnefole is also good against all venomous creatures, and chiefly against that great Spider *Phalangium*, and to cause the sting of Scorpions to be without danger or paine, being applyed thereto: it is said also that if one make a circle upon the ground, round about a Scorpion with a branch of this Turnefole, it shall not be able to get out of the circle, but if any shall touch the Scorpion therewith, or cast any of the herbe upon it, it shall presently dye: we have no other use of those clouts that are dyed with the juice thereof, then to colour gellies or tarts, or any other such things which are frequent in many great mens houses at festive times.

CHAP. XIII.

Urtica. Nettles.

U Shall in this place onely shew you those Nettles that are stinging, as peculiar for this Classis or Tribe, but if I were to write an universall compacted history together, which the method I have proposed doth not permit; I would then in this as in all others, joyne all the *species* under one *genus*, and shew you all the diversities of them, as well those that are sharpe and stinging as those that are not, but called Dead Nettles, and in them such as smell well, and such as stinke, and such as are spotted, and such as are without spots, and so likewise their variation of colours in their flowers, which because I cannot in one, I must doe in severall places of this worke.

1. *Urtica Romana*. The Romane Nettle.

The great Romane Nettle groweth up with many round hairy branches, rather leaning downe then standing upright, sometimes rising to be of foure or five foote long, spreading into many branches, whereon at the joynts

1. *Urtica Romana*.
The Romane Nettle. 2. *Urtica major v. Agaria*.
The greater wilde Nettle.

3. *Urtica media sylvestris*.
The middle wild Nettle.

4. *Urtica minor*.
The lesser wild Nettle.

are two leaves set together, very rough, and although it hath no sharpe prickles, yet it hath a hairy downe thereon, that will sting the skinne most cruelly if it be touched therewith, and raise it full of blisters, as if it were burnt with fire, and dented at the edges somewhat deeply; at divers places of the branches come forth small stalkes of reddish and yellowish flowers, made of threds, which fall away without bearing any thing else; but at the joynts with the leaves in other places, from the middle of the branches upwards, come forth small, round, rough, Greene, prickly pellets or buttons, wherein is contained divers flat browne shining feede, somewhat like unto Line, or Flax feede, but smaller and rounder: the roote is yellowish and spreadeth divers long strings, and small fibres, whereby it taketh fast hold in the ground, yet perisheth every yeare, requiring a new sowing every Spring.

2. *Urtica major sylvestris*. The greater wild Nettle.

This other which is the greater of the wild sorts, hath a pale yellow roote, spreading very deepe into the ground, with long strings, and small fibres, and the branches also lying on the ground take roote againe, and spread a great deale of ground, the leaves are of a darker colour, and sometimes brownish or red, as large, rough and stinging as the former, but not so deeply dented at the edges; at the toppes of the branches, and likewise from the joynts with the leaves underneath, come forth small long branches of flowers and feedes after them, in fashion very like the branches of the female Mercury, wherein is contained small flat whitish feede, the roote perisheth not like the former, but abideth the winter with some Greene leaves upon it, if it be not too extreame.

3. *Urtica media sylvestris*. The middle wild Nettle.

The middle sort of Nettle, is thought by divers to be but one and the same with the former, and differing onely by the place of growing, and not growing fully so great: for it hath the like stalkes and branches, with the like leaves, but lower and smaller, and thinner set upon the branches, otherwise in feede or creeping rootes, it differeth not from the last.

4. *Urtica minor sylvestris*. The lesser wild Nettle.

The lesser or least Nettle, is in most things like the last, but riseth seldome above halfe a yard high, and little or nothing branched, the leaves also are much smaller, and of a fresher Greene colour, but little lesse stinging then the former; the feed is white like unto it, but the rootes are smaller and perish every yeare, yea twise or thrice every yeare, for I have observed it to shed it selfe twise in a hot yeare, and spring up againe the third time of the shedde feede, which being neere winter, perisheth with the first frosts, but riseth againe the next yeare.

The Place.

The first is most usually sown in Gardens where it is desired, as it is also both in the upper and lower Germany, and most places of France also, but it hath bene found naturally growing time out of minde, both at the towne of Lidde by Romney, and in the streetes of the towne of Romney in Kent, where it is recorded *Julius Caesar* landed with his souldiers, and there abode for a certaine time, which it is likely was by them called *Romania* and corruptly there from *Romney* or *Romny*, and for the growing of it in that place, it is reported that the souldiers brought

brought some of the seede with them, and sowed it there for their use, to rubbe and chafe their limbes, when through extreame cold they should be stiff and benumbed; being told before they came from home, that the climate of *Brittaine* was so extreame cold, that it was not to be endured without some friction or rubbing, to warme their bloods, and to stirre up naturall heat, since which time it is thought it hath continued there, rising yearly of its owne sowing. It groweth also in the streete of *Bardney* in *Lincolneshire*. The other three sorts grow in waste grounds, by hedges and wall sides, and many other untilld places, yet they will also be found in many gardens, where if they be suffered or neglected but a while, it shall be hard to rid them out againe.

The Time.

They flower and seede in the end of Sommer, and the lesser is so plentifully that it will seede and shed, and spring, and feede againe, that is, beare ripe seed twice in one yeare.

The Names.

It is called in Greeke *ἀκνύς* *Acalyphe*, quia tacta aspera & injucunda est, and *κνίς*, quod vellicet & punget, a verbo κνίω quod vellicare & pungeret, in Latine *Urtica*, ab urendo quod pruritum pustulasque igni similes excitet. The Arabians call it *Humiuro*, *Uraith latum* *Angiara*. *Tragus* saith *Serapio* calleth it *Hamire Vraith*, and the seede of it *Bezori Bangora* seu *Ragi*. The Italians *Ortica*, the Spaniards *Ortiga*, the French *Ortie*, the Germans *Nessell*, the Dutch men *Nettel*, and we in English *Nettle*. The first is called *Urtica Italica* of some, and *hortensis*, and is the first kinde of *Diccoridis*, called of *Clusius* *Legitima*, of most writers *Romana* and *mas* or *muscula*; for the second is called *famina*, and of most authors *Urtica major*, and *vulgaris* or *urens*. The third is called by *Tragus*, *Urtica vulgaris urens altera*, and of *Lugdunensis* *Urtica Olygophyll*: a paucitate foliorum. The fourth is called *Urtica minor* of all writers, but onely of *Casalpicius* *exigua*, and of *Dodonaeus* *urens minima*, and is the third of *Tragus*, *Matthioli*, *Lugdunensis*, and *Caspor Durantes*: it is the *Cania* of *Pliny*, which *Cornarius* thinketh should be rather written *Canina*.

The Vertues.

Although Nettles doe hurt and sting the skinn and flesh, while they are greene, which is caused by the haire or rough downe upon them, and might be thought to be causticke or exulcerating being otherwise applyed, yet it is not so, being found to be hot and dry in the second degree; the leaves boyled in wine and drunke, is said to open the belly and make it soluble; the rootes or leaves boyled, or the juice of either of them, or both, made into an *Eleuary* with Honey or Sugar, is a safe or sure medicine to open the pipes and passages of the Lungs, which is the cause of wheezings and shortnesse of breath, and helpeth to expectorate tough cold flegme sticking in them, or in the chest or stomacke, as also to raile the impollumated Pleurise, and spend it by spitting: the same also helpeth the Almonds of the throate when they are swelled, to gargle the mouth and throate therewith, the juice also is effectuell to fettle the palate of the mouth in its place, and to heale and temper the inflammations and sorenesse of the mouth and throate: the decoction of the leaves in wine and drunke, is singular good to provoke womens courses, and to fettle the suffocation or strangling of the mother, and all other the diseases thereof, as also applyed outwardly with a little Myrrhe: the same also or the seed provoketh urine, and expelleth gravell and the stone in the reins or bladder; often proved to be effectuell in many that have taken it; the same decoction also of the leaves or seede, or being beaten and drunke in that decoction, killeth the wormes in the bellies of Children, and is said to ease the paines in the sides, and to dissolve or breake the windnesse in the spleene, as also in the body; but others doe thinke that it being somewhat windy of it selfe, is not so powerfull or available to expell wind, but onely to provoke Venerie; the juice of the leaves taken two or three dayes together stayeth bleeding at the mouth, which riseth from the stomacke: the seed being drunke is a remedy against the stinging of venomous creatures, the bitings of madde dogs, the paysonfull qualities of Hemlocke, Henbane, Nightshade, Mandrake, or other such like herbes, that stupify and dull the senses, as also the Lethargy, but especially to use it outwardly to rubbe the forehead and temples in the Lethargy, and the places bitten or stung with beasts, used with a little salt, *Nicander* saith, it helpeth them that have taken Quicksilver, and those that have eaten evill Mushromes, or surfer of the good; the distilled water of the herbe is very effectuell, (although not so powerfull) as well for all the diseases aforesaid, as for outward wounds, and sores, to wash them, and to cleanse the skinn from Morpew, Lepry, and other discolourings thereof; the seede (and some also use the leaves) being bruised, and put into the nostrils, doth stanch the bleeding of them, and taketh away the flesh growing in them, called *Trolym*: the juice of the leaves or the decoction of them or of the rootes, is singular good to wash either old rotten and stinking sores, or fistulaies and Gangrenes also, and such as are fretting eating or corroding scabbes, also manginess and itches in any part of the body, as also greene wounds, by washing them therewith, or putting the juice into the sores or wounds, or applying the greene herbe bruised thereunto, yea although the flesh were separated from the bones; the same also applyed to overwearyed members refresheth them, or to places out of joynt, after the joynt is set in its right place, it strengtheneth, dryeth, and comforteth them, as also to those places troubled with aches and goutes, and the dissolution of humours upon the joynts or sinewes, it easeth the paines, and dryeth or dissueth the defluxions: an ointment made with the juice, oyle and a little waxe, is singular good to rubbe cold and benumbed members, to bring them to their proper activity againe; a handfull of the greene leaves of Nettles, and another of Wall-wort or Dane-wort, bruised and applyed simply of themselves to the Gout, Sciatica, or joynt aches, in any part, hath beene found to be an admirable helpe thereunto: it is said that if greene Nettles be put into the urine of a sicke body, if it be fresh and greene, after it hath lyeen foure and twenty houres therein, the party shall recover of that sicknesse, but if it doe not abide greene, it signifieth death or great danger; if you give hennes some dry Nettles broken small, with their meate in winter, it will make them lay egges all the winter more plentifully; it is said also, that if the herbe be rubbed on the privities of female beasts, that will not suffer the males to cover them, it will cause them the more willingly to suffer them to doe it: the oyle of roses or sallit oyle boyled with the juice, or the juice of the leaves themselves, is a present remedy to take away the stinging of the Nettles: to all the purposes aforesaid, the *Romane Nettle* is held the most effectuell, yet where it cannot be had, the other are in a degree next it, as effectuell, yet the least is thought of some to be lesse powerfull, and of others to be as available as any of the other two.

CHAP. XIV.

Polygonum majus. Great Knot-grasse.

THe Knot-grasses are divided into two kinds, male and female, of the male kinds I shall speake in this and the following Chapters, because they are of many sorts, some greater, others lesser; and some Sea plants, the female being called Sharegrasse, or Horsetaile, shall be entreated of in another place; I thinke it fittest therefore to divide these into three parts, and speake of the greatest in this Chapter, of the lesser kinds in the next, and of those kinds that beare fruite or berries in another following them, that so being orderly set downe, every one apart, it might yeeld the more profit to the reader.

1. *Polygonum minus vulgare majus.* The greater common Knot-grasse.

The greater common Knot-grasse shooteth forth many long slender branches full of joynts, lying upon the ground, with divers long and narrow leaves set thereon, one for the most part at a joynt, having most usually a small white skinne that covereth the joynt; whereat, especially from the middle of the branches upwards come forth the flowers, which are so small, that they are for the most part not seene and discerned, which in some are white, in others of a whitish purple colour, which after turne into very small square seed: like unto Sorrell seed: the roote is reddish, small, short and round, abiding the Winter, and shooting a new every yeare. I saw in Mr. D^r Foxes booke of dried herbes which he received from *Padosa* a greater sort hereof, whole figure I here give you.

2. *Polygonum minus vulgare minus.* The lesser common Knot-grasse.

This lesser Knotgrasse groweth in all things like the former, and differeth from it onely in the leaves, which are smaller, and neither so broad or long, and the flowers hereof are alwayes white.

3. *Polygonum minus brevius folio.* Small short leaved Knot-grasse.

This other small kinde, hath likewise many slender joynted branches, but more woody then the former, spread also into some other smaller ones, whereon grow small short leaves, lesser then those of the small *St. Johns wort*: the flowers are small and white like the other.

4. *Polygonum Saxatile.* Stony Knot-grasse.

The stony Knotgrasse hath many weake trayling branches full of joynts, rising from a small white fibrous rootes, lying upon the ground, round about it, whereon grow leaves that are somewhat round, being of an inch in length, and halfe an inch in breadth, but growing smaller to the stalkeward, Greene on the upper side, and of a whitish mealy colour underneath, at the joynts come forth small pale reddish flowers, like unto the other, and after them followeth such like feede as in the other.

1. *Polygonum minus vulgare majus.*
The greater common Knot-grasse.

Polygonum maximum folijs.
The greatest Knot-grasse.

5. *Polygonum*

5. *Polygonum maximum majus.*

The greater Sea Knotgrasse.

The greater Sea Knotgrasse, runneth out into many and much larger branches then the first, lying on the ground, yet full of joynts, set very close together, with leaves thereon, somewhat like the common kind, but thicker, somewhat shorter and broader, and of a darke greene colour above, and whiter underneath: the flowers stand at the joynts in the same manner, having small white skinnies that cover the joynts, which in some also are of a white, and in others of a purplish colour; after which cometh small feede, enclosed in whitish shining skinnies; the taste of the whole plant and every part thereof is astringent, but somewhat salt withall: the roote is somewhat great, thicke, blacke, long, and somewhat woody.

6. *Polygonum maximum minus.*

The lesser Sea Knotgrasse:

This lesser kind hath longer stalkes then the last, covered with a reddish barke, and more divided into smaller branches, having fewer joynts on the greater stalkes, but the branches are thicke, set with smaller leaves then the former, and are somewhat fat and thicke, long and narrow like the common kinde: the flowers are small and whitish, and the feede is not much unlike the last, the roote is somewhat long blacke and woody, with a few fibres set thereat.

The Place.

The first two sorts grow every where, and in every Country almost, both by the footewaies in fields, and on the sides of high-ways that are greene, for in some it overspreadeth them, and by the sides of old walls. The third groweth upon the higher grounds, and upon hills and mountaines. The fourth in the same places also, among the stones in the rougher parts. The two last grow by the Sea side in divers places.

The Time.

They spring up late in the Spring, and abide all the Sommer untill Winter, when all their branches perish.

The Names.

It is called in Greeke *πολύγονον* or *Polygonum*, quod multis genibus crescit, which name is usuall to it in Latine, yet it is also called *Seminalis*, *Sanguinalis*, *Sanguinaria* and *Proserpinaca* of the severall properties it hath to stanch blood, or to creepe on the ground: in the Apothecaries shops in Italy and many other places *Corrigiola*, and *Centinodia*, for the severall respect unto the qualities to correct the heate of the stomacke and body, or for the joynts and knots that every branch hath. The Arabians call it *Basia trabagi*, the Italians *Polygono*, *Corregiola*, and some *Lingua Passerina*. The Spaniards *Corriola*. The French *Renouée*, *Corrigiole*, and of the Walloones *Marylene de Cure*. The Germans *Weggrasse*, and *Wegdrut*. The Dutchmen *weggras oft duyfscot knoop*. In English Knotgrasse, and Swines grasse, and in the North Country of divers, Birds tongue, from one of the Italian names. The first three sorts are usually of all authors called *Polygonum mas* or *masculum*, for they are all alike, differing only that the one is bigger or lesser then another (for the *Polygonum femina* or *feminum* differeth in forme very much from this, and shall be entreated of among the *Equisetis*, *Stereograsses*, or *Horsetales*, as being likeliest unto them, although not rough:) some also call the first *vulgare* or *majus* for distinctions sake from the second and third, which are both called *minus*; yet the third is thought by *Bauhinus* in his *Pinax*, both to be the *Polygonum masculum fruticosum* of *Thalys*, in the description of *Hareynia stylos*, (which *Camerarius* hath set forth and joynted it to his *Hortus Medicus*;) and also the *Sedum minimum arborescens vermiculatum* of *Lobel*, for he seemeth doubtfull unto which *Thalys* his *Polygonum* should be referred. The fourth *Bauhinus* calleth *Polygonum Saxatile*, and no other before him that I know hath made mention of it. The fifth is called *Polygonum maritimum* by *Lobel* in his Observations, and *Polygonum maximum maximum* in his *Adversaria*, and of *Lugdunensis Polygonum maritimum primum Dalechampi*, as he calleth the last *Polygonum maritimum alterum Dalechampi*; which *Bauhinus* calleth *Polygonum maritimum angustifolium*, calling the former *Latifolium*.

The Vertues.

The common sorts of Knotgrasse are cooling drying, and binding, in so much that the juice of them is most effectual to stay any bleeding at the mouth, being drunke in steed of red wine, and the bleeding at the nose to be applied to the forehead and temples, or to be squirted up into the nostrils; it is also no lesse effectual to coole and temper the heat of blood, or of the stomacke, and to stay any flux of the blood or humours, either of the belly, as all laskes or bloody fluxes that come by chollericke and sharpe humours, or the abundant stowing of womens courses, or the running of the reines also, the juice given before the fit of an ague, be it tertian or quartane doth come, is said to expell it and drive it away, it is also singular good to provoke urine when it is stopped, as also when it passeth away by dropes, and with paine, which is called the Strangury, as also the heate and sharpnesse therein; and to expell powerfully by the urine, the gravell or the stone in the reines or bladder, to take a dramme of the powder of the herbe in wine for many daies together; which effects as *Dioscorides* doth affirme, so *Galen* seemeth not to deny, but onely saith that *Dioscorides* hath not sufficiently exprest himselfe in the manner of the disease and how it should be given: being boyled in wine and drunke, it is profitable to those that are stung or bitten by venomous creatures, and the same is very effectual to stay all defluxions of rheumaticke humours upon the stomacke, and killeth likewise the wormes in the belly or stomacke, and quieteth all the inward paines

paines of the body, either in the stomacke or belly or other parts that arise from the heate, sharpnesse and corruption of bloud and choller: the distilled water here of taken by it selfe, or with the powder of the herbe or seede, is very effectuall to all the purposes aforesaid: the said water or the juyce of the herbe, is accounted as one of the most soveraine remedies to coole all manner of inflammations, even Saint *Anthones* fire, or any other breaking forth of heate, all hot swellings and empostumations, all gangrenous, that is eating and fretting or burning sores and fistulous cancers, or foule filthy ulcers being applied or put into them, but especially for all sorts of ulcers and sores happening in the privy parts of men or women, restraining the humours from falling to them, and cooling and drying up the hot and moist inflammations, that are apt to follow such sores in such places: it no lesse helpeth all fresh and Greene wounds, by restraining the bloud, and quickly consolidating the lippes of them: the jayce dropped into the eares helpeth them wonderfully, although they are foule, and have running matter in them: the sea Kindes of Knotgrasse, are not thought to be so cooling and operative for the griefes aforesaid, in regard they have gotten more heate by their salt habitation; yet effectuall in many of the other properties, the salt qualitie causing somewhat the more penetration.

CHAP. XV.

Polygona minor. Divers sorts of small Knotgrasse.

F these smaller Kindes, there are many more than of the former, differing the one from the other, as shall be declared hereafter: and first I will shew you those that come nearest in outward face and forme unto the other, next going before, and the smallest afterward.

1. *Polygonum montanum nivium*. White Mountaine Knotgrasse.

This Mountaine Knotgrasse is so fine a white silverlike plant, especially in the hotter countries, and when it is growne old, that it giveth much delight to the beholders of it: for it spreadeth many weake trayling branches upon the ground, in some places not past an hands breadth, in others a foote long, as full or fuller of joynts than any of the former, and thicke set also with smaller branches; whereon are placed very small long leaves, lying almost like scales upon the whitish hard stalkes, these leaves are Greene at the first and tender, but when they are growne old, they will be of a shining silver colour, and hard like skinnes or parchment, the toppes of the stalkes and branches being thicke set, with small white silver-like leaves: and at the joynts also come forth very small white flowers scarce to be discerned, where also afterward there is the like seede, but smaller; the roote is small long and white, not perishing neither the branches nor the leaves in the Winter in his naturall place, but will not endure our cold blastes and nights, and therefore perisheth unless it have more especiall care and provision to preserve it.

1. *Polygonum montanum nivium*.
White Mountaine Knotgrasse.

2. *Polygonum montanum Vermiculatæ folijs*.

Mountaine Knotgrasse with Stonecrop leaves.

This small herbe (or Knotgrasse for unto this family *Subinaus* doth referre it) groweth not much more than an hand breadth high, sending forth many slender whitish round stalkes full of joynts which doe a little bend themselves downe againe to the ground; at the joynts are set small long round fat leaves like unto those of Stonecrop pointed but not pricking at the ends, and with the leaves; at the said joynts towards the toppes rise single flowers, that is one at a joynt somewhat large that it doth seeme many, of a greenish colour, laid open like a Star, with divers whitish small threds in the middle scarce to be discerned, after which cometh a small round seed vessell and small seede therein: the roote is small white and threddy; this hath neither taste nor sent much to be perceived therein, onely it is a little harsh and drying and somewhat bitter withall: it seemeth to partake in face with the Stonecroppes, and in taste, with Knotgrasse, and the title riseth from both.

3. *Polygonum Valentinum sive Anthyllis Valentina Clusij*. Spanis Knotgrasse.

This small plant which *Clusius* found in *Spaine*, and thought might be referred to the *Anthyllides*, is by divers the best Herbarists since, accounted a kinde of Knotgrasse, or more neerely resembling them, for it shooteth forth many small weake reddish branches, lying upon the ground, and not able to stand upright, about a foote long, parted into many other smaller branches, whereon grow at severall joynts and spaces many small leaves together, like unto those of Time spurge; whereon, as well as on the stalke there groweth a shew of meallinesse, as many sea plants have; with the leaves come forth small purplish white flowers, consisting of foure leaves apeece; the seede hath not bene observed: the roote is small long and blackish on the outside.

Q q

4. *Polygonum*

4. *Polygonum minus Mompeliense*. Small knotgrasse of *Mompelier*.

This small French Knotgrasse hath divers small branches lying upon the ground, full of joints, whereat are small Greene leaves, being somewhat round and like unto those of the small Lentilles: the flowers are very small and of a whitish colour, tending unto Greene, standing at the toppes of the branches onely, and many set there together, which afterwards give very small feede: the roote is small, but very long, growing down deepe into the ground: this plant is very like *Clusius* his *Anthyllis Valentina*; but *Banhus* contendeth feriously against them that would so take it; for that *Clusius* his *Anthyllis* hath reddish branches, and this hath Greene, his hath much smaller leaves, and more store of flowers, and that of a purplish colour, and none at all standing at the toppes of the branches: all which considered, he determineth that this is a differing sort from the other.

5. *Polygonum Creticum Thymi folio*. Candy Knotgrasse.

This small Candy Knotgrasse lieth likewise with his small branches upon the ground, not past an hand breadth in length: the leaves stand at the joints, sometimes but one or two, and sometimes three or four, differing in bignesse and length one from another; with the leaves stand also many small white flowers together, as it were in a knot or bunch: after which commeth the feede, which is small and plentifull.

6. *Polygonum Serpylli folio Lobely*.

Lobel's Knotgrasse with Mother of Time leaves.

This Knotgrasse that *Lobel* hath set forth in his *Adversaria*, hath very long threddy stalkes spread upon the ground, branched forth in divers places, with many small long and round leaves sapie or full of juyce, somewhat like unto Stonecroppe, set together at the joints: the whole plant somewhat resembleth *Serpyllum Narbonense*, French mother of Time: the roote is long and wooddie, of a bitterish taste, somewhat hot upon the tongue.

7. *Polygonum Germanicum five Knawell Germanorum*.

Germane Knotgrasse or Knawell.

The Germane Knawell sendeth forth from a small slender threddy roote, divers small branches, not fully lying downe on the ground, halfe a foote long full of joints, thickly set together, at every one whereof, stand many very small and long pointed leaves, of a grayish Greene or ash colour, which are of an unequal length, two for the most part longer than the other: at these joynts with the leaves grow out divers small herby or Greene Starre-like flowers, thicke set together, which being fallen there appeare in very small huskes, no bigger than Millet feede, great store of very small feede, like dust, or the feede of *Herniaria Rupturewort*, which are of a quicke hot sent, somewhat sweete.

8. *Polygonum alterum Germanicum*. Another Germane Knotgrasse.

This other Knotgrasse of Germany, doth very much resemble the former, both in the manner of the growing, with slender trailing branches, and small long hoary, or grayish Greene leaves, many set together at a joint, but that they are longer than they, some of them two inches long, especially those next the roote: the flowers hereof stand not at the joints with the leaves, but at the toppes of the stalkes and branches, many clustering together which are very small and white on the inside, but of a brownish red colour on the outside, which after turne into very small feede, and in a plentifull manner: the roote is small long, and white.

9. *Milegrana major five Herniaria vulgaris*. Rupturewort.

The Rupturewort spreadeth very many threddy branches, round about upon the ground, about a spanne long, divided into many other smaller parts, full of small joints, set very thicke together, whereat come forth two very small leaves, of a fresh yellowish Greene colour, branches and all, where at grow forth likewise a number of exceeding small yellowish flowers, scarcely to be discerned from the stalkes and leaves, which turne into feede as small as the very dust: the roote is very long and small, thrusting downe deepe into the ground: this hath neither finell nor taste at the first, but afterwards it hath a little stiptive or astringent taste, without any manifest heate, yet a little bitter and sharpe withall.

10. *Herniaria major Africana*. The greater Rupturewort of Africa.

This African kinde groweth greater, larger, and more upright than the last, and fuller of beanches, in other things little differing.

2. *Polygonum montanum Verniculate folijs*. Mountain Knotgrasse with Stonecrop leaves.

3. *Polygonum Valentinum*. Spanish Knotgrasse.

11. *Millegrana minima* sive *Herniaria minor*.

Rupturewort with longer leaves.

This other kinde of Rupturewort, hath likewise small thrëddie stalkes, but with fewer joints, and long narrow leaves, somewhat rough or hairy set at them, fuller of branches towards the toppes, where the flowers and seede doe grow like unto the other, and in a plentifull manner also: the roote is small but not so long. *Bauhinus* maketh mention in his *Pinax* of one which he calleth *fruticosa* with wooddie low stalkes, and some long leaves growing thicke thereon.

The Place.

The first groweth both about *Arles* and *Marseilles* in *France*, and in *Valentia*, *Marcia*, and *Salamanca* in *Spaine*, as *Clusius* and *Pena* doe record: the second in *Naples* as *Columna* saith: the third *Clusius* saith, groweth likewise about the Castle of *Valentia* in *Spaine*: the fourth both on the mountaines of *Escuriall* in *Spaine*, and in the barren grounds about *Mompelier* in *France*, as *Bauhinus* also saith: the fift in *Candy*, as *Bauhinus* saith, who had the seede from thence: the sixt upon the hills neare the sea in *Provence* of *France*, as *Pena* also saith: the seventh in the West cuntry about *Chipnam*, if *Lobel* his figure be true; and in many places of *Germany* by the wayes sides; and so doth the eight likewise in drie sandy and rockie places: the ninth groweth in many places of our owne Land, as well as in others, in drie barren grounds, where it will be small, and in the moister places also, but not boggie or morish, that are not shadowed: the tenth in *Africa* neare *Tunice* where *Guyllame Boel* gathered it: the last in the drie chalte or stony grounds of *Kent*, and other countries.

7. *Polygonum Germanicum* sive *Knawell Germanorum*. Germane Knotgrasse or Knawell.

Fruticosa.

9. *Herniaria vulgaris*. Rupturewort.

10. *Herniaria major Africana*. The greater Rupturewort of *Africa*.

The Time.

They all are fresh and greene in the Summer, and unto the Winter, which causeth the most of them to wither and drie, and in the meane time they perfect their seede.

The Names.

The first is called of *Lobel* and *Pena* in their *Adversaria* *Polygonum montanum minimum nivum*, & *sericeum*, of *Clusius* *Paronychia Hispanica*; of *Lugdunensis* *Polygoni Hispanici* genus *Clusij*: *Tabermontanus* and *Gerard* call it *Polygonum montanum*; and *Bauhinus* *Polygonum minus candicans*: the second *Columna* calleth *Vermiculata montana nova*; and *Bauhinus* *Polygonum montanum Vermiculata folijs*; the third *Clusius* calleth *Anthyllis Valentina*, because he saith *Plaza* and other the learned Phisitions of the Vniversitie of *Valentia* in *Spaine* did so account and call it; which as he saith, although it might be a kinde thereof, yet it could not be *Dioscorides* his fifth *Anthyllis*, because it hath upright stalkes, which this hath not; but all other Herbarists doe account it a kinde of small Knotgrasse, and so have I called it, although somewhat differing from him; *Bauhinus* maketh it an *Anthyllis* among his *Anthyllides* and a *Polygonum* also among these, calling it *Polygonum gramineo folio majus erectum*, which in my opinion is not fitting unto it, in that it neither groweth upright, nor hath such long leaves, that they should resemble grasse: the fourth *Bauhinus* in his *Pinax*, maketh to be both his ninth small Knotgrasse, calling it *Polygonum minus tenuifolium*; and also his twelfth by the name of *Polygonum minus lentifolium*; and in both places referreth us to the fourth *Polygonum* described in his *Prodromus*, whereby he filleth up the number of sorts without reason: the fifth *Bauhinus* so calleth, as it is in the title: the sixt *Lobel* calleth *Polygonum alterum pusillum vermiculata Serpilli folio*,

folio; and *Lugdunensis*, *Polygonum alterum Serpilli folio*; but *Bauhinus* *Polygonum maritimum minus folio Serpilli*; the seventh *Tragus* accounteth to be a kinde of *Polygonum*, which they of his countrie called *Knawel*; hee also thinketh it might be called *Poliocarpus* of the abundance of feede, and *Polycnemum* of the vertues. *Lugdunensis* also calleth it *Polycarpon*, and *Dodonæus* in his *Pemptades* taketh it to be a *Polygonum exiguum*. *Gerard* calleth it *Polygonum Selinoides* *sive Knawel*, wherein hee is deceived many wayes. First, in that he giveth the name *Selinoides* unto *Knawel*, when as his owne description and figure thereof might have plainly convinced that error in him, in that *Knawel* hath not leaves like *Selinum* or Parsly: secondly, that he maketh *Knawel* and Parsly pert to be one, whereas they are two plants; then againe that he thinketh, that *Saxifraga Anglicana* of *Lobel*, which he saith he found about *Chipnam* in the West countrie to be Parsly pert, when as *Lobel* and *Pena* their description and figure doth contrary also that opinion, although their figure be somewhat like, as *Gerard* himselfe confesseth, which he calleth *Selinoides*: againe, that he thinketh the Parsly pert, that was shewed by a cuntry Empericke, to Mr. *Bredwell*, was *Knawel*, which as it is likely Mr. *Bredwell* shewed him, and yet he could not discern the face of the one herbe from the other; and lastly he findeth fault with the name Parsly pert, calling it a barbarous word, and would amend it with his owne fine Latine word *Petra pungens*, not understanding the true Etymologie of the word being corrupted, as for the most part all unuall or hard words are to the vulgar fort, for the uncorrupted word is *Percepiere*, a true French word, and signifieth the same that *Lithontribon* in Greeke, *Saxifraga* in Latine, or *Gerard* his *Petra pungens*, if ye like it; Breakestone in English, of all which I shall speak more fully in the next Chapter: but I have here before given you my opinion of the *Saxifraga Anglicana* of *Lobel*, neither can I thinke the *Knawel* of *Tragus* to be it as many might imagine by the likeness of their figures being compared together; but surely it may be a kinde thereof: the forme and strong sweeter smell, which *Tragus* saith it hath, inducing me in part so to thinke, but that the small Greene flowers and feede in them be much differing from the Pincke-like white flower in that: the eight, I call *Polygonum alterum Germanicum*, another Germane *Knawel*, because it is so like therunto, and that *Bauhinus* saith, the Germane *Knawel* hath many varieties, whereof I thinke this to be one, and it is probable also, that both the *Polygonum montanum niveum*, and the *Anthylla Valentina* may be a species thereof; *Bauhinus* himselfe calleth it *Polygonum litoreum minus salsolis spadicis albicantibus*: the ninth is called *Emperon* by *Tragus* and *Lonicera*, but not truly; *Polygonum minus* by *Matthiolus* and *Castor Durantes* that followeth him, *Herba Cancris minor* by *Cordus* in his *Scholasticæ*, and *Millegrana* in his history of plants, *Epipactis* by *Anguillara*, *Herba Turca* by *Lobel* and *Cesalpinus*, *Herniaria multigrana Serpylli folio*, by *Pena* in his *Adversaria*, and generally *Herniaria*, and so by *Gesner* in his *horti Germania*, and in libello de collectiōe stirpium, by *Camerarius* *Dodonæus*, *Thalius*, *Lugdunensis*, *Tabermontanus*, and *Gerard*, and by *Bauhinus* *Polygonum minus*, *sive Millegrana major*; the tenth we have imposed the name as it is in the title and most fitting thereunto: the last is called *Millegrana minor* by *Lobel* in his Dutch Herball, and in his *Icones stirpium*, by *Thalius* *Herniaria altera*; and therefore I call it *Herniaria minor*, *Bauhinus* calleth it, *Polygonum minimum*, *sive Millegrana minima*.

The Vertues.

All or most of these sorts of Knotgrasse, doe participate with the former in the binding qualities, although not altogether so much in the cooling, some of them having a little bitterness or sharpnesse in them, which declareth some heate, and therefore hath not that abundant moisture, which *Galen* saith, is in the former, whereby as he saith, they have their cooling qualitie: they serve to provoke urine, and helpe to breake and expell the stone and gravell by urine, as the others doe, yet wee have not so evident testimony of the operations of the five first sort. (howsoever the delicacie of forme in some of them doe argue in mans judgement some singular vertue, which yet doth not alwayes follow, for in many deformed, there is found much more helpe) as we have of the rest, which are these in particular; *Tragus* saith that *Knawel* hath the same properties that Knotgrasse hath, and may serve in the stead thereof to all purposes, as well inward as outward remedies, when the other is not at hand, and that it is very powerfull to breake the stone, being boyled in wine and drunke, which our owne people doe averre also: the other Germane *Knawel* or Knotgrasse being of the same kinde, worketh the like effects. Rupturewort hath not his name in vaine, for it is found by daily experience in a number that have taken it, to helpe and cure the rupture, not onely in children, but in elder persons, so as it be not too old and inveterate; by taking either a dramme of the powder of the dried herbe, every day in wine for certaine dayes together, as the strength of the disease and age of the patient doe require; or the decoction made of the herbe in wine and drunke, or the juice or distilled water of the Greene herbe taken in the same manner; and helpeth all other fluxes, either of men or women, vomitings also and the Gonorrhea, being taken any of those wayes aforesaid; it doth most assuredly helpe also those that have the strangurie, and have their urine stopped, or are troubled with the stone or gravell in their reines or bladder, causing them that take it to urine plentifully, and thereby to remove and wash downe, whatsoever sticketh or is offensive in the passages thereof: Vide *Hollerium de morbis internis*, lib. 1. c. 62. fol. 268. the same also helpeth much all stiches in the sides, all griping paines or torments in the stomacke or belly, caused by collicke or sharpe or salt humours; it helpeth the obstructions of the liver, and cureth the yellow jaundise likewise; it killeth also the wormes in children: being outwardly applied it conglutinaterh wounds very notably, and helpeth much to stay defluxions of rheume from the head to the eyes, nose or teeth, being bruised Greene and bound thereto, or the decoction of the dried herbe, to bathe the forehead and temples, or the nape of the necke behinde, it doth also drie up the moisture of fistulous ulcers, or any others, that by the much accesse of sharpe humors are growne foule and spreading: the lesser Rupturewort is not much wanting, in all the faculties of the other.

CHAP. XVI.

Polygonum Selinoides. Parsly pert, or Parsly Breakestone.

Have as you see separated this kinde of Knotgrasse from all the other in the last Chapter, and not without just reason as I take it, because the face and forme thereof, is so much differing from them, as the ensuing description will declare: the roote is very small and threddy, but abiding divers yeares in the naturall places, from whence come many leaves, spread upon the ground, each standing on a small long foote flatke

talke, and being as broad as the nail of a mans finger or thumb, is very much jagged on the edges; making it seeme somewhat like unto a Parslye leafe, whereof came the name, but of an overworne or dusky Greene colour: from among which riseth up weake and slender stalkes about three or foure fingers long, set full of the like leaves but smaller up to the toppes, that almost no part of the stalkes can be seene, and all for the most part standing close thereunto, few of them having any footestalke at all, or very short: among these leaves come forth very small greenish yellow flowers, scarce to be discerned, where afterwards groweth the feede, as small as any of the former.

The Place.

This groweth naturally in most countries of this land, if it be observed by any that have skill, but especially in such barren and sandy grounds as doe not want moisture, for it joyeth much more in the wet places then in the dry, I found it upon *Hampstead Heath* by the foote pathes, where being a dry ground, and in a dry time, it was very small, which else in a moister time, and in a moister place upon the same Heath, was much greater, as also neare unto the meere stones by *Lambeth*, which divide the liberties of *London* from *Surrey*.

The Time.

It is to be found all times of the Sommer, Spring, and Harvest, even from *April* unto the end of *October*, in severall places, for in the open and Sunny places it will be withered, when in the shadowy and moist it will continue.

The Names.

This plant (being of long continuance in our land and knowledge to us, by the properties, for it hath not bene mentioned, by any the most curious searchers and writers of herbs beyond sea, as being onely peculiar I thinke to our Country, before *Lobel* came to us, who called it *Percepier Anglorum* and *Lugdunensis* from him) hath received no Latine name at all, and therefore I have transferred the name *Polygonum Selinoides* hereunto, as more proper unto it, then *Gerard*'s *Knawell* is unto it; for it may most fitly be reckoned a *Polygonum*, by the manner of the growing, and the name *Selinoides* may most fitly agree unto it from the forme of the leaves, being derived from the Greeke word *Selinon*, for *Knawell* hath no likeness with *Selinum* Parsly. In the former Chapter, I shewed you *Gerard*'s errors herein, now let me shew you mine also (if peradventure I speake not per *Antiphrasim*) concerning these names of *Percepier* or *Perch pier*, as some call it, and Parsly pert, or Parsly breakestone, as they are usually called in *English*; I shewed you before that the word Parsly pert, was but a corruption of time in the vulgar sort, and *Percepier* also, derived from the French word *Percepierre*, which as I said before, signifieth as much as *Lithontribon* in Greeke, *Saxifraga*, *Petrifindula* an old outworne word, and *calculus frangens* in Latine, pierce stone, or breakestone in *English*; some call it Parsly pert and derive it from *petra*: but the more proper *English* is Parsly breakestone. Now concerning this and *Lobel*'s *Saxifraga Anglicana*, both of them are affirmed by *Lobel* to grow in the West Country, and both are used for one purpose, (yet *Lobel* seemeth to referre the *Percepier* unto the *Cerofolium*, & *Scandix* sive *Peilen Veneris*, or partaking of both of them, but most improperly in my minde, which hath caused *Bauhinus* in his *Pinax*, following his opinion to make it a species of *Cerofolium*, calling it *Cherophylo nonnihil similis planta*, and *Tabermontanus* thereupon calleth it *Scandix minor*; and *Columus* was also much deceived in thinking this to be an *Alchymilla*, calling it *minima montana*.

The Vertues.

This herbe hath properly with the vulgar sort, both men and women leeches, who have had most practice of it, not found any other operation then to helpe to provoke urine, and breake the stone in those that are troubled therewith, for which purposes it is most available; for they use to eate it familiarly as a Sallet herbe, and pickle it up as a *Sampire* to eate in winter, but is used also more Physically, either by it selfe or with other things, and either in powder or in juice, decoction or water distilled from it; whose severall wayes, that I may declare them a little more amply are these. Take of the juice of the herbe about three ounces, put this with so much white wine, as is fit to make a posset, take hereof every morning and evening a draught, or ye may adde hereto Wild Time, or Mother of Time. And some Camomill: You may also boyle these herbes aforesaid, in white wine, or in water if wine be not at hand, and drinke it when it is strayned in the same manner, the powder also of the dried herbe, to the quantity of a dramme or lesse, in white wine, or in other drinke where wine is wanting, for divers dayes first and last, and the distilled water of the herbe taken with a little Sugar in the same manner, is found to be a singular remedy to provoke urine, when it is stopped wholly, or passeth away by drops with paine, or unensibly without paine, expelleth store of gravell in those that breede it, and the stone also in the reins or kidneyes, in washing it downe by the abundant passage of the urine, and helpeth also to expulse it out of the bladder, if it be not growne too great for the passages; otherwise it is held very probable, that the abundance of urine brought downe into the bladder by the vertue of the medicine, and there abiding, worketh so much upon the stone, therein confirmed and growne great, that it wasteth it by degrees, avoyding it in gravell with the urine. If you will have the receipt of the Country *Empericke* given to Mr. *Bredwell*, a Chirurgion of *London*, who practised physicke in *London* where he dwelt, as well as in all the Countries where he travelled, it is this. Take of the dried herbes of Parsly pert, and Mousere, Bayberries, Turmericke, and Cloves, the seeds of the Burse Docke, the seede in the heppe or Bryer berries, and the seedes of Fenugreece of each one ounce;

Sive Percepierre Anglorum Polygonum Selinoides.
Parsly pert, or Parsly breakestone.

of the stone in an Oxes gall twenty foure graines weight; let all these be beaten into fine powder and kept by you, in a dry box, or pot, to use upon occasion: whereof the quantity to be taken at a time, is from halfe a dramme to a dramme, as the age and necessity of the party, who is to take it shall require: but assuredly it would worke as effectually in other diseases, either inward or outward, as either the Knotgrasses, or Knawell, or Rupture-wort doe, if it were seriously applied, for being alike in the temperature of the qualities, and working the same effects in some of the diseases, why not in many of the other, whereunto they are tryed to doe good: I may here deplore the carelesse course of many that are learned, who are content onely to sucke the hony that other Bees before them have gathered; but make none for others, whereas if they would be industrious, they might by their good judgement apply things to much better effect then the bold, blind bayards of our time, who dare to doe any thing, especially when under colour of giving Physicke to their pockie patients, they may passe without impunity, and without controll.

СНАР. XVII.

Polygona. Baccifera. Berry bearing Knotgrasse.

Here remaineth of all the sorts of Knotgrasses, to speake of those that beare berries, some whereof are shrubby plants, whose berries are their fruite, bearing seede within them, whereby they are propagated: others are the excessences of the herbe, accidentall onely as I suppose to the soyle, that breedeth them, being not the naturall seede, whereof I intend to speake first, because it cometh neere unto some of the former finall Knotgrasses.

1. *Polygonum Cocciferum Polonicum*, The Polonian Scarlet Knotgrasse.

The Scarlet Knotgrasse is as small a plant as the Knawell, or white mountaine Knotgrasse, spreading in the same manner with sundry small stalkes, full of joynts, whereat are set divers very small and long leaves, pointed, but not sharpe at the endes, which with the stalkes are of a grayish ashecolour, or more whitish, at the toppes of the stalkes stand a number of small white flowers, yet not so small as in the mountaine kinde of Knawell, but such as may be better discerned, coming forth of grayish Greene huskes, wherein after they are past, groweth the seede, which is as small as dust, the roote is small and somewhat long, at the toppe whereof, and on the stalkes next thereunto groweth very small berries, lesser then those of the *Ilex Coccigera*, or Scarlet Oake, but of as orient a scarlet colour as they, and give as precious a dye as they doe, and but that it cannot be had in that quantity (every roote, yeelding but a few berries in comparifon of the other) it would lessen the price, if not abate the use of the other; but howsoever it serveth that Country of *Polonia*, in some measure, to dye some of the cloathes that they weare. *Amatus Lusitanus* in his Commentaries upon *Dioscorides*, folio 623. saith that

1. *Polygonum cocciferum Polonicum*.
Polonian Scarlet Knotgrasse.

3. *Polygonum bacciferum sive Vitis marina major*.
The greater Sea grape.

these berries grow at the rootes of a kind of Saxifrage like unto Burnet or Burnet Saxifrage, as also at the rootes of Coltsfoote, Pelletory of the Wall, and other herbes like wife, and that not onely in Poland but in Italy and other Countries.

2. *Ephedra five Anabasis*. Climbing Knotgrasse or Sea Grape.

This kinde of Sea Grape groweth in the warme Countries where it is naturall into a thicke trunk or stemme as bigge as a mans arme at the bottome; from whence rise many very long branches, full of joynts like unto the other Sea grapes, climbing up to the toppes of the highest Plane trees, or others against which it groweth, otherwise if it stand neare unto a lower tree or shrubbe, it seldome riseth above their height, yet hath it no claspers to winde about any thing, nor doe the branches winde themselves, as the nature of *Apocynum* or *Periploca* Dogs bane doth; yet as the Ivy by sending forth rootes at the joynts, into the barke of the trees that groweth next therunto, it thereby climeth unto the toppe of them: at these joynts grow no leaves for it is wholly destitute of them, but from them shoote forth divers other branches, and at the same joynts upwards, stand many small mossy flowers, of a pale or whitish yellow colour, somewhat like unto the blossomes of the male Cornell tree, which afterwards turne into small red berries when they are ripe, like unto small Mulberries, full of juice, of a fowre taste, wherein lye small yellow feede like Millet, the roote spreadeth divers wayes under ground, being hard and woody.

4. *Vva marina minor*.
The lesser Sea Grape.

3. *Polygonum bacciferum five Uva marina major*.
The greater Sea Grape.

This greater Sea Grape is so like unto the former, except in the long and climbing branches, that it is verily thought of divers to be but the same, not growing neare any shrubbe or tree to cause it to ascend as the other doth, and as it is said before the former kinde useth to doe, by the report of *Bellonius*, in his third booke of Observations, and the 41. Chapter, for this also hath a stubbed stocke, from whence rise many slender branches about a foote long, set with joynts like unto an Horsetayle grasse, up to the toppes, which doe a little bow or hang downe againe, altogether without leaves, and with many mossy pale flowers, but *Anguilara* saith reddish, set together at the joynts, which afterwards turne into small red berries like *Raspis*, of a fowrish taste as the other doth, wherein lie the like yellowish feede: the roote is likewise hard and woody.

4. *Polygonum bacciferum minus, five Uva marina minor*. The lesser Sea Grape.

The smaller Sea Grape riseth up immediately from the roote, with many slender weake, reddish, rush like stalkes, fixe or seaven foote long sometimes, lying for the most part upon the ground, woody at the bottome of them, with the like joynts and branches issuing from them, as in the former, and without any leaves at them also; the flowers are many and pale also, and mossy like them, but standing upon somewhat longer foote stalkes, and the red berries are likewise like unto *Raspis* or Mulberries, of a fowrish taste, wherein is contained a small blackish three square feede or two, like unto the former: the stalkes and branches are no lesse astringent in taste then the last, the roote is smaller, and sendeth forth divers suckers, which creeping under ground spreade farre.

The Place.

The first groweth in many dry, barren, and sandy grounds, in Polonia. The second *Bellonius* in his third booke and 41. Chapter of his Observations, saith groweth in the valleies or lower plaine grounds, at the foote of the mountaine *Olympus*, and in Illyricum betweene *Castello novo*, and the old *Epidourus*. The third *Clusius* saith he found onely in Spaine, in the Kingdome of *Murcia*, by the Sea side, and no where else. The fourth *Lobel* saith groweth not onely neare the Sea side, about *Cape de Sete*, *Perauland* *Magulona* not farre from *Mompelien*, but at *Rochell* also about the Sea side, and in other places, but *Clusius* saith, he found it not farre from *Salamanca*, which is the heart of Spaine in great plenty upon a small hill, whereof he wondreth much, not having found it or hearing of any other to have found it, in any other places then the Sea coasts. *Anguilara* saith in *Dalmatia*, about the river *Sabenicus*.

The Time.

These flower late, and ripen their fruite in the naturall places seldome before October, and never in these colder climates, as hath bene often proved true: yea the rootes will hardly without especiall care and keeping, be preserved in the Winter with us.

The Names.

The first is mentioned by *Camerarius*, by the name of *Polygonum Cocciferum Polonicum* in his Epitome of *Matthioli*, and as I said before by *Amatus Lusitanus*, yet as not growing on *Polygonum* but other herbes. The second is recorded by *Bellonius* in his third booke and 41. Chapter, fol. 197. by the name of *Ephedra*, that it was full of red feede like unto *Androsace*, by *Dodonaeus*, under the name of *Ephedra five Anabasis*, as also by *Ranwolffus*. *Pliny* calleth it *Caucon five Ephedra*. *Banbinus* calleth it *Polygonum bacciferum scandens*. The third is called by *Clusius* *Polygonum quartum Plinij majus*, and saith the Spaniards call it *Belebo*: by *Tabernmontanus* *Polygonum minimum five cocciferum primum*: by *Banbinus* *Polygonum bacciferum maritimum majus, five Uva maritima major*. The fourth is called by *Clusius* *Polygonum quartum Plinij minus*, who thinketh it to be the *Androsace* of *Bellonius*, but I thinke *Bellonius* rather meant the greater sorts, by *Lobel* *Uva marina Mompelienisium*, and contesteth with *Matthioli*; why this should not be *Tragon* or *Traganon* of *Dioscorides*, (as they of *Mompelien* formerly called it, and afterwards *Androsace* as *Bellonius* did) in that he made *Theophrastus* his *Scorpio* to be *Tragos*; by *Ruellius* *Tragos*, by *Lugdunensis* *Tragus, five Scorpius maritimus Dalechampij*, yet in another place he calleth it *Equisetum quartum*, as *Pena* doth *Equiseti facie racemosa planta*; by *Anguilara* it is thought to be *Croton* of *N. cander*, by *Camerarius* *Tragum* and *Uva marina*, by *Gesner* in *hortis Germanicis Tragum*, by *Tabernmontanus* *Polygonum maritimum secundum*, and by *Banbinus* *Polygonum bacciferum maritimum minus*. *Lugdunensis* taketh it to be *Osteocollum Hierocli* & *Abstri*.

Alfriti. The French call it *Raysius de mer*, from whence came the name of *Vua marina*.
The *Vertues*.

The *Polonians* with whom the first groweth, doe use the herbe in the same manner that the *Germans* doe their *Knemel*, that is to expell urine and to breake the stone: the second is not knowne, whether the people where it groweth doe use it as the two last sorts are, which may well persuade us, is of the same operation, being so like in the outward face and forme; for the Sea-grapes are both of one qualitie, and serve for the same diseases that the Knotgrasses are used by the *Spaniards* where they grow, as *Clusius* saith, but especially to cure the ulcers of the privy parts in men or women: they are also very effectually to provoke urine plentifully, and are exceeding astringent and drying, so that they powerfully stay all fluxes of the belly, or of womens courses, restraints vomitings of the stomacke, and the defluxions of thinne rheume from the head: they are also very consolidative to soder together the lippes of greene wounds, or to knit broken bones, and to settle and strengthen those that have beene out of joint: it is held to be so powerfull to knit dislevered parts, that being boyled with peeces of flesh, or with other things, it will cause them to be so glued or sodered together, that one cannot pull them in sunder againe; in all sorts of ruptures also, it is most effectually.

CHAP. XVIII.

Cassia Poetica Mompeliensium. The red berried Shrubbe Cassia.

Have been bold to infer this plant in this place, because some have made it a kind of *Polygonum*, and although we cannot find it to be a Saxifrage or breakstone, yet it hath the other drying & astringent qualities of *Polygonum*. This shrubbe riseth up to the height of two foote or thereabouts, spreading many slender twiggie greene branches, whereon grow small long leaves like unto Line or Flaxe, or somewhat resembling those of Lavander, but thinne for all along upon the branches; the flowers are moslie or th eddy, and of a pale yellowish gerene colour, like unto those of the Olive tree, or of the Male Cornell tree; where afterwards come small round berries, greene at the first, but red as Corall, or like the berries of Asparagus when they are ripe, of an astringent glutinous taste, with some sharpenesse joyned therewith, wherein is contained an hard stone, having a white sweete kernell within it: the roote is hard and woody.

The Place.

It groweth by the high wayes, in many places of *Spaine*, both in the countries of *Granado* and *Valentia*, and *Sivilly*, as also in divers places of *Provence* in *France*, about the hedges and borders of the Olive yards: by the bankes also of the river *Lanus*, and about the village *Peraul*, not farre from *Mompelier*, as also in a small Wood or Coppise neare unto the Priory of *Egremont*, neere there adjoining.

The Time.

It flowreth about *June* and *July*, and the berries ripen not untill *September*.

The Names.

Clusius saith that it was accounted for *Osyris* of *Pliny*, while he lived at *Mompelier*, whereunto hee saith, it doth agree in many things, but afterward they called it *Cassia*, but by what reason or cause it is not knowne, for it neither agreeth with that *Cassia* of *Dioscorides* and *Galen*, which is like Cinamon, and is of a spicie taste, called in Apothecaries shoppes *Cassia lignea*, whereas this is nothing so: nor can it be the *Cneoron* of *Theophrastus*, which as *Pliny* saith *Hyginius* called *Cassia*, neither is it the sweete smelling *Cassia* of *Virgil*, whereof he speaketh both in his *Bucolicks* and *Georgicks*; yet as I said they of *Mompelier* did call it *Cassia*; and *Lobel* *Cassia Poetica Mompeliensium*: *Clusius* calleth it *Cassia quarrundum*, and saith that *Placa* a Philisicion and professor in *Valentia*, called it *Polygonum Plinii*; and so doth *Dalechampius* upon *Pliny* call it *Polygonum*. *Plinij*: *Lugdunensis* calleth it *Cassia lignea maritima*: *Casalpini* *Cassia lignea*, and *Genista rubra*, because the stalkes and the leaves will sometimes grow red towards the end of Summer: and *Bauhinus* *Osyris frutescens baccifera*, numbring it among the *Linarias*, because of the leaves; and that he would make it to be the *Osyris* of *Pliny*, lib. 27. cap. 12. as they of *Mompelier* at the first did, which hee there saith, hath small gentle or pliant branches, with blacke leaves thereon like Lin, and a seede blacke at the first, and becomming red afterward, and citing *Galen* in his eigh Booke of Simples, that saith, of *Osyris* is made *κασιμια* for women, which some interpret *Smegmata*, but *Pliny* saith *Scopas*, *αλις πικρυν* *δεν εχον* *ωπλυνται*: but in my mind *Pliny* hath not truly related the words of *Dioscorides* and *Galen*, who both say that the leaves of *Osyris* are first black and then red, which he inverteth to the berries, which make a great alteration of sense; and *Bauhinus*, to make this plant his *Osyris*, taketh him thus corrupted, which yet is not found, that the berries should be blacke before they be red.

The

Cassia poetica Mompeliensium.
The red berried shrubbe Cassia.

The Vertues.

We have little recorded of any especial cure this hath performed, or that it is applied to those that are sicke of any disease; for although all doe agree that it is of a drying, glutinous and astringent taste, and might no doubt be effectfull for laskes and fluxes of blood and humours in men and women, and to performe whatsoever the astringent and drying propertie might, as in *Polygonum* promise to performe, yet there is nothing determined, and therefore I dare not play the Philition to invent new receipts, for the cure of old diseases; it is sufficient to declare the temperature and what others have used or appointed, when I have no new thing to shew.

CHAP. XIX.

1. *Asperula repens* Gesneri, five *Saxifraga altera* Cesalpini. Breakestone Woodroofe.

His small plant which is accounted a kinde of Saxifrage in some places of Italy, resembling in the outward face and forme *Rubia minor*, *Asperula*, *Gallium*, and such other like herbes, doth cause me to joyne it with them, as being a congener of one tribe and family; how therefore to know this plant is in this manner. It spreadeth upon the ground for the most part (and yet in some places standeth more upright) divers small tender stalkes, separated into other smaller branches, of about a foote high, full of joynts, at which come forth three, foure, or more sometimes, small and narrow smooth leaves: the flowers stand at the toppes of the branches, many set together in a tuft, which are long small and reddish, and after they are past groweth, rough, crooked feede, which is small and blackish; the roote is small and thredde, and brownish on the outside.

2. *Rubia Cynanchica saxatilis*. Stone Woodroofe.

This other small Woodroofe, is very like unto the former, but that it is smaller and lower, not past an hand breadth high, and the leaves much smaller, the flowers also of a pale red colour, many tufting together, and every one standing upon a short foote stalke: the feedes and rootes are like the other.

3. *Iuncaria Salmaticensis*.

Small Stone Woodroofe of Spaine.

This small plant is likewise very like unto the first, growing more upright with square, rough rushlike branches, spreading forth into many small sprays, almost like unto an Horsetaile grassie full of joynts, with two leaves and sometimes with more at a joint, somewhat long & narrow like unto Line or Flaxe, but rough: at the toppes of the branches come forth many small white flowers set in spikes, and foure or five standing upon a short foote stalke together, which stand in rough huskes, wherein commeth the feede, which is blacke and small; the roote is white and thredde like the other.

The Place.

The first groweth in shady Woods in many places of Italy, and Germany; the second about Valentia in Dauphine in France: the last about Salamanca in Spaine as Clusius saith; but I found it on the right hand of Bradford bridge at the lower end of Grays Inne Lane by London, neare the water course that passeth along thereby.

The Time.

They doe all flower and feede in the end of Sommer.

The Names.

The first is called by Gesner in libello de collectione stirpium *Asperula herba repens*, and is the second Saxifrage of Cesalpini; Bauhinus referreth it to the *Synanchya* of Lugdunensis, and to the *Gallium montanum latifolium cruciatum* of Columna, and callerh it himselfe *Rubia Cynanchica*: the second he setteth forth in his *Prodromus*, under the title I have here expressed it; the last is called by Clusius *Iuncaria Salmaticensis*, and *Synanchia* species of Lugdunensis, by Tabernmontanus *Iuncaria*, but by Bauhinus *Rubia linifolia aspera*.

The Vertues.

The Italians as I said in divers places of their cuntry doe use the first kinde to helpe those that are troubled with the stone or gravell in their kidneyes, by provoking urine, which washing or passing by the nritories, carrieth with it small gravell, and fretting the stone into gravell, sendeth it forth with the urine: it conferreth likewise much helpe to those that are troubled with the Quinsie, which is an inflammation of the kernells of the throat, which by the extreme paine thereof is ready to stoppe the breath, and doth sometimes suddenly happen so incede: it is a disease that Dogges and Wolves, are much subject unto, for it is derived from the Greeke word *αγρην λαγνους*, in that we usually hang up such Dogges that are troubled therewith, or else that the disease

is as a gibbet to hang them; or from the Greeke word *εναγχι*, quod spiritum continendo respirationem inhibeat: Of the other two sorts, there is not any that hath mentioned any use they are put to in Physicke, or otherwise.

CHAP. XX.

Asparagus. *Asperagus* or *Sperage*.

Have in my former Booke set forth those sorts of garden Sperage or *Asparagus*, whose young buds are most usually eaten with us, as a sallet herbe of great esteeme, whereof I shall not neede to make any repetition, but proccede and shew you the rest of that kinde, whereof there are three or foure sorts more.

2. *Asparagus marinus crassiore folio*. Sea or wild *Asparagus* with thicker leaves. This kinde of sea or wild *Asparagus* riseth up with many, but shorter stalkes then the garden kindes doe, stronger also and thicker, branching forth in the same manner, and having such like winged leaves, but shorter, thicker, harder, and of a blewish Greene colour; the blossomes are like the other, and so are the berries or seede that follow, but greater than they, and not of so fresh a red colour: the roote spreadeth in the ground.

3. *Asparagus sylvestris folijs acutis*. Wilde *Asparagus* with sharpe leaves. This *Asparagus* with sharpe leaves, riseth up from a head of rootes, whose strings are thicker and shorter than any of the former kindes, with three or foure stalkes, which are shorter, stronger and whither then the other, diversly spread and branched into many wings, whereon are set at severall distances, many small, short, hard and sharpe pointed leaves, five or sixe standing at a joint together: at these joints likewise with the leaves come forth the flowers, many set upon a long stalke, which are yellow, consisting of fixe leaves apeece, smelling as sweete as a *March Violet*; after which come small berries, Greene at the first, and of a blackish ash colour when they are ripe, wherein is contained a hard blacke seede.

4. *Asparagus petreus sive Corruada aculeata*. Prickly rocke *Asparagus*. This kinde of thorny *Asparagus*, that groweth in stony and rockie places, hath very thicke and short rootes or strings, many jointed together at the head, from whence rise sundry branched Greene stalkes, having three or foure sharpe Greene thornes, more likely than leaves, they are so hard, small, long, and sharpe pointed, set together all along the stalkes and branches; whereat come forth, small mossie yellowish Greene flowers, and after them store of berries, greater than in the former, and of a blackish Greene colour, when they are ripe, full of a greenish pulpe, wherein lieth usually but one blacke hard seede, or at the most two, having a white kernell within it.

2. 3. *Asparagus marinus crassior, & folijs acutis*.
Asparagus with thicke, and with prickly leaves,

4. *Asparagus petreus sive Corruada aculeata*.
Prickly rocke *Asparagus*.

5. *Asparagus*

5. *Asparagus spinosus*, five *Corruda spinis horrida*.

Asparagus with cruell sharpe thornes.

This thorny *Asparagus* shooteth out from such a short, thicke, stingy roote as the last, but yellowish on the outside, two or three white crooked or bended stalkes, branched forth on every side, and at every joynt where, where the branches are bending and divided, and whereof the leaves are set also, standeth a most cruell sharpe thorne, growing downward, and together with the thorne upon the younger branches, stand five or sixe small long, narrow and soft leaves, clustering together, which are of a sweetish clammy or gummie taste: at the joints likewise with the leaves, come forth the flowers, of a yellowish Greene colour, each of them standing upon a long and slender foote stalk, hanging downward: after which come in their places large roundish berries, red when they are ripe, seeming to be three square, full of a rough or clammy juyce, containing with it one blacke graine or feede, and seldome two.

The Place.

This first kinde by transplanting is thought to become the garden kinde, and groweth in many low meadowes that are nere the sea, as also in many other places further of, the coasts as I doe heare; for it is thought that it is this kinde that groweth in the Marthes of *Tidnam*, neare *Chipstoll*, and in *Apleton* meadow in *Glostershire*, which is about two miles from *Bristow*, from whence the poore people doe gather the buddees or young shootes, and sell them in the markets of *Bristow*, much cheaper then our garden kinde is sold at *London*: the second groweth in stony and rockie places, neare unto *Salamanca* in *Spaine*, and not onely under the hedges, but in the very fields also in *Castile* and *Canary* also: the third groweth both by hedges side, and in many stony and ragged places, both in *Spaine* and *Portugall*, and in *Canary* also as *Belonius* saith: the last groweth also in rough uneven places, very plentifull about *Lisborne*, in the common wayes, and by the river *Tagus*, and in many other places, both in *Spaine* and *Portugall*, and in *Canary* likewise; but it will hardly endure our cold climate.

The Time.

They doe for the most part all flower, and beare their berries late in the yeare, and scarce at all with us, although they be housed in Winter.

The Names.

It is called in Greeke ἀσπάργος and ἀσπαργός, *Asparagus* and *Aspharagus*. *Varro* saith, 'quia ex asperis virgulis ligetur; Pompeius Grammaticus, quod in aspera virgulia nascitur; but as *Galen* saith the first budding of any herbe that was used to be eaten, after it was sprung from the feede, was called *Asparagus*, as in Cabbage, Lettice, and the like buddees, or shootes of herbes; but in speciall, and as most deserving this hath kept the name peculiar to it selfe. It is called also in Latine *Corruda*, quod ubi adolevit facile cornu decidatq; *Pliny* saith the Athenians called it δεινιον Horminion, ἀπὸ τοῦ ὁρμῖου, quod est ruo, say some, but others thinke it to be derived ἀπὸ τοῦ ὁρμῖου, nam & decoctum ex semen Veneris causa bibitur: the Arabians call it *Halion* or *Helion*, the Italians *Asparago*; the Spaniards *Asparago*; the French *Asparge*; the Germans *Spargen*; the Dutch *Corallcrant*, in English *Sperage* or *Asparagus*: the first sort is to be understood of that kind which is set forth in my former Book: the second is called by *Matthiolus*, *Anguilara*, and *Tabernmontanus*, *Asparagus palustris*; by *Lobel* and *Pena* in their *Adversaria*, *Asparagus maritimus* *Dioscoridis*, by *Clusius* and *Camerarius*, *Asparagus marinus*, and by *Bauhinus* *Asparagus maritimus crassore folio*: the third is generally thought to be the *Asparagus petreus* of *Dioscorides* and *Galen*, which he saith is also called *Myacanthus*, in his sixth Booke of Simples or simple medicines, and of *Pliny* *Corruda*, or *sylvestris Asparagus*, *Theophrastus* in his sixth Booke and first Chapter, saith that *Asparagus* (without giving it any another Epithite, which it must be understood of this kinde) and *Scorpio* are nothing but thornes, for they have no leaves. *Matthiolus* and *Tabernmontanus* call it *Asparagus petreus*, and *Corruda*; *Gesner*, *Dodoneus*, *Camerarius*, and others, call it *Asparagus sylvestris*; *Clusius* *Corruda prior*, *Cordus*, *Lobel*, *Lugdunensis* and others *Corruda*, and *Bauhinus* as I doe, *Asparagus folijs acutis*: the fourth is called by *Clusius* *Corruda altera*, by *Lobel* *Corruda Hispanica*, and so doe *Lugdunensis* and *Tabernmontanus*, by *Dodoneus* *Asparagus sylvestris*, and by *Bauhinus* *Asparagus aculeatus alter tribus*, aut quatuor spinis ad eundem exortum: the last is called by *Clusius*, *Corruda tertia*; *Belonius* in his first Book of Observations, and 18. Chapter, saith, that they of *Crete*, called it *Polytrichis*; by *Dodoneus* *Asparagus sylvestris tertius*; *Lobel* and *Lugdunensis* call it as *Clusius* doth, *Corruda tertia*, and *Bauhinus* *aculeatus spinis horridus*.

The Vertues.

The young buds or shootes or branches of any of these sorts of *Asparagus* boyled, are more powerfull in Physicke to helpe diseased persons then the Garden kinde: the buddees or branches boyled in ones ordinary broth helpeth to open the belly, and to make it soluble, and either they or the rootes boyled in wine, provoke urine being stopped: and is good also against the hardnesse or difficulty to make water, or the Strangury when it commeth by drops, and to expell gravell and the stone out of the kidneyes, and helpeth also other paines in the

reines

reines and backe; it is very good to be given to such as are troubled with the jaundise, and taken in wine, helpeth those that are bitten by the *Phalangium*, or great poytous spider, and other Serpents; being boyled in wine or vinegar, it is good for those that have their arteries loosened, and are troubled with the hippe-gout, or Sciatica: the rootes boyled in wine and taken, are said to helpe the frensy, and the falling sicknesse, and to ease the paines of the mother in women; the decoction thereof likewise is good to cleare the sight that is dimme and misty, and being held in the mouth warme, ease the tooth-ache; the same also healeth the paines of the breaſt, stomacke, and bowels, and taken every morning fasting for certaine daies together; stirreth up bodily lust in man or woman, although some have written the contrary, that it hindereth conception and causeth barrennesse, *Chrysippus* saith that three scruples of the seed of Asparagus, Smallage and Cummin, being given in three or foure ounces of wine, for five dayes continually, to them that make a bloody water, it will helpe them; and he saith also that it is not good for any that hath a dropie to take thereof, but rather is an enemy and will doe them harme, although it be powerfull to provoke urine. *Avicenna* saith, that it causeth the body to have a sweete savour, to take the buds as meate, but it doth render the urine stinking: it dissolveth the wind in the stomacke, liver, and guts, and the paines of the chollicke, which rise of pituitous and thicke flegmaticke humours: the Garden Asparagus nourisheth more then the wilde kindes, yet hath it also his effects, both in the urine, reines, and bladder, in opening the body gently, and many other the forenamed diseases, but this inconvenience happeneth by all medicines that strongly provoke urine, if they be too frequently used, they doe exulcerate the bladder: many doe use the seede of Asparagus, for all the purposes before written, and hold them as effectuell as the rootes; the decoction of the rootes or seede made in wine, and the backe and belly bathed therewith, or to sit therein as in a bath, but kneeling or lying low that they may sit the deeper therein, hath bene found to be effectuell against the paines of the reines kidneys and bladder, the paines of the mother and of the chollicke, and generally all those paines and torments that happen to the lower members of the body, it is no lesse effectuell also against stiffe and benumbed sinewes, or those that are shrunk by crampes, or convulsions, and the paines of the hippes called Sciatica; it is said that whosoever shall moisten their hands, face, necke, or any other part of the skinne, with the decoction or juice of Asparagus, there shall no Bee, Waspe, Hornet, or other such like flye sting them. *Dioscorides* saith, that divers did affirme in his time, that if the decoction of it be given to a dogge to drinke it will kill him, divers fabulous things have bene obtruded for truth, in the writings of the ancient, and the moderne writers also, if they either follow the traditions of their elders, without consideration of the probability, or examination of the verity, or else are led by vulgar reports, whereof this is one in the text of *Dioscorides*, which himselfe holdeth to be false, and untrue, because it is so unlike in reason and nature, that if Rammes horne be bearene or bruised, and buried in the ground, from thence shall rise Asparagus; some have affirmed also, that if you sow the seede of Asparagus in canes stucke in the ground, they will grow the sweeter and more pleasant in taste, because they say the Asparagus, and the Cane or Reede, have a great sympathy one unto another, which how true or likely it is, I leave to every one to beleieve as they list; but the practise of many Gardiners that nurse Asparagus for their profit, is to have canes cut of severall lengths, some shorter some longer, which they sticke over the brads or shootes of the Asparagus, whereby they say the buds are made the tenderer, and more delicate to be eaten; which peradventure may be likely in some part, as all other faller herbes that are whited by covering them, or keeping them from the ayre, and are thereby caused to be the tenderer, onely by concealing the superfluous moisture in them, but I cannot beleieve that it commeth from any vertue or sympathy of the cane thereunto; if this be not true and probable, let others bring more probability, and I will yeeld unto it.

CHAP. XXI.

Linaria. Tode Flaxe, or Flaxeweede.

F the *Linaria* or Todeflaxe, there are many sorts, some whereof (that is the most beautifull) I have set forth in my former booke, which are these. *Linaria purpurea sive carulea*, Purple or blew Todeflaxe. *Linaria purpurea odorata*, Sweete purple Todeflaxe. *Linaria Valentina*, Todeflaxe of *Valentia*. And *Linaria magna sive Scoparia Belvidere dicta Italorum*, Broome Todeflaxe, which I shall not neede againe to describe here, but of the rest not there expressed. And because of the great variety I would use this method in setting them forth, first to place those that grow upright, and have broader leaves, then next, those that have narrower leaves, and yet grow upright, and lastly of the smallest kinds, that crepe upon the ground.

Linaria cretæ Latifolia. Vpright broad leaved Flaxeweedes.

1. *Linaria latifolia Dalmatica*. The great *Dalmatian* Flaxeweede.

THE great Flaxeweede of *Dalmatia*, hath divers faire large Greene leaves, spreading upon the ground, being about two inches long, and one broad, ending very sharpe pointed, without any footstalk at them, but rising up with the stalk, which is firme hard and round, about two or three foote high, hath the like leaves set thereon, without any order up to the toppe, but lesser as they grow higher: the stalk is branched at the toppe, having at every one of the branches, such like spikes of deepe or gold yellow flowers, as are in the common wild kinde, with spurs behind them; but each of them are three or foure times larger then the common; the seed is like the wilde kind, and enclosed in the like heads, but larger also, the roote is white, and spreadeth some branches under ground, and perisheth not as the wild kinde doth, but abideth in the winter, with both roote and stalk, shooting fresh leaves every Spring.

2. *Linaria latifolia Cretica major*. The great broadleaved Flaxeweede of *Candia*, This Flaxeweede of *Candia* sendeth from the roote a round thicke stalk, two or three foote high, spread into many

many branches, whereon are set sometimes two and sometimes three leaves together, on a small footstalk, on each side of them, sometimes one against another, and other times keeping no order, each whereof is larger and longer then the former, and of a grayish Greene colour, with three veines or ribbes in every one of them: at the tops of the branches grow flowers, made for the forme like the other kinds, but of a differing colour, for the gaping mouth is of a pale blew colour, and more yellow underneath, with a pale or blewish, and sometimes more purplish spurre behind, the heads and feede are like the wild kinde; the roote is hard and white, bigger at the head and small below with some fibres thereat.

2. *Linaria Americana parva flore.* The yellow Flaxeweede of America.

This Indian kinde shooteth forth divers slender small reddish stalkes, spread into many branches, whereon grow on both sides of them, yet without order, many darke Greene leaves, much narrower but not much shorter then the former, ending also in a sharpe point; the flowers grow at the toppes of the stalkes, in the same manner that the common wilde kinde doth, and of a gold yellow colour, but much lesser then they.

4. *Linaria five Oxyris alba.*

White flowered Flaxeweede.

The white Flaxeweede riseth up with many tough pliant stalkes with long narrow leaves set thereon, somewhat like those of the common fort, at the toppes whereof stand sundry pale whitish flowers resembling the ordinary kinde, but with a wider and more open mouth: the feede is not unlike the other, the rootes are white, long, thicke and great, abiding divers yeares and not perishing.

5. *Linaria triphylla carulea Apula.*

The blew Flaxeweede of Naples.

This blew Flaxeweede of Naples, hath at the joynts of the white stalkes which are sometimes but one, and sometimes more, three leaves set together, divided almost like Rue leaves but greater, deeper cut in, and pointed at the ends, of a grayish Greene or ash-colour; the toppes of the stalkes are furnished with such like flowers, but smaller and of a blew colour wholly, except the mouth which is yellow, after which come small round heads, containing large flat and blackish feed, the roote is small and white.

The Place.

The first according to the title you may know came from Dalmatia, but from what place there, is not signified. The second from Candy. The third from America. The fourth, in gardens: the last from Naples.

The Time.

They doe all flower in the Sommer moneths, yet some sooner or later then others, for those of America flowreth very late, and scarce give ripe feede any yeare.

The Names.

It hath no Greeke name that I can finde mentioned by any author, but in Latine it is called *Pseudo Linum*, and *Linaria*, for the resemblance that the leaves of the wilde common kinde have with Linc or Flaxe, and *Vrinaria* and *Vrinaria* from the effects. Some have called it *Esula adulterina*, for the resemblance it hath with the little *Esula*; whereupon came this verse, *Esula latifolia, five laete Linaria crescit*. Divers have taken it to be the *Antirrhinum* of Pliny, it may be *Oxyris* both of Pliny, *Dioscorides*, and *Galen*, whereunto in most mens judgements it doth in many things agree; and some as *Matthiolus* saith, would make *Beloidere* to be *Oxyris*, which is called by some *Herba studioforum* the Schollers herbe, but because they make their *Oxyris* to have foure or five leaves onely on the stalkes, and that they serve for broomes to sweepe withall; for the Greeke word *κορυμνα* (but *κακοφυμνα*, as some copies have it is false,) doth as well signifie *scopas* broomes, as *Cosmetica*, such things as beautifie the skin, I cannot see well how it should agree thereunto: the *Italians* and *Spaniards* call it *Linaria*, the *French* *Lin Sauvage*; the *Germanes* *Lin kraut*, *Horn kraut*, and *Flachs kraut*. The *Dutch* *Wilt Ulas*. In *English* we call it *Wilde flaxe*, *Tode flaxe*, and *Flaxeweede*. *Baubin* in his *Prodromus* maketh mention of the third, but calleth it himselfe in his *Prodromus* and *Pinax* *Linaria latifolia triphylla*; but referreth the second to the *Cretica Latifolia* of *Clusius*. The fourth is called *Oxyris alba* by *Lobel* in his *Dutch Herball*. The last *Fabius Columna* mentioneth.

Linaria erecta angustifolia. Vpright and narrow leafed Flaxeweedes.

1. *Linaria vulgaris nostras.* Our common wilde Flaxeweede.

Our common Flaxeweede that groweth wild in all countries of this Land as well as beyond Sea, is so well knowne unto all, that are never so little conversant in herbes, that it were almost needelesse to describe it to have divers stalkes, full fraught with long and narrow, blew or ashecoloured leaves; and from the middle of them almost upwards, stored with a number of pale yellow flowers, of a strong unpleasant sent, with deeper yellow mouthes, and blackish flat feedes in round heads, the roote is somewhat woody and white, especially the maine downeright one, with many fibres, abiding many yeares, shooting forth rootes every way round about, and new branches every yeare.

Rr

2. *Linaria*

2. *Linaria Pannonica major*. The great Flaxweede of Hungary.

This is in many things like the former, but that the leaves are larger and the flowers greater and fewer thereon, and of a pale yellow colour, but a deeper yellow in the mouth, with some hairiness therein.

3. *Linaria Cretica angustifolia*. The narrow leaved Flaxweede of Candy.

This Flaxweede of Candy, hath at the three lower joynts of the stalkes, which are many, and of a foote and a halfe high, foure long leaves a peece, but narrower by the halfe then the former, but at the rest of the joynts, they stand without order, growing still smaller as they rise higher upon the stalkes, which are much divided towards the toppes, whereon stand such like flowers as the former, but smaller and of a whitish ash colour, the spurre behind them being of the same colour, the feede and seed vessels are not unlike the former, but quickly fall away, even while the plant remaineth Greene.

4. *Linaria Hispanica tertia Clusij*. Clusius his third Spanish Flaxweede.

The third Spanish Flaxweede of Clusius sheweth from the roote many small stalkes, about a foote high or more, whereon grow very plentifully many narrow leaves, of a grayish or ash colour, and at the toppes of them store of small flowers, that are of a whitish colour on the outside, and more purplish inwardly, about the gaping mouth, being of a more yellow colour, but yet pale also, the spurre behinde being of a purplish colour; the feede that followeth, when it hath any, for it seldome beareth, is like the other, but doth recompence that defect, in that the roote perisheth not, but abideth and encreaseth every yeare.

5. *Linaria Caryophyllata albicans*. The sweete white Flaxweede.

This sweete Flaxweede hath upright stalkes somewhat woody, wherein are set without order, divers narrow and somewhat long leaves, yet shorter then the common kinde, and of a pale Greene colour; the flowers stand not so thicke at the toppe of the stalkes and branches, nor fully so large, but are of a very pale yellow colour, almost white, and in other of a pale blew and white mixt, with a yellow mouth, the feede is like the common, and the roote perisheth not.

6. *Pseudo-linaria montana alba*. The base white Mountaine Flaxweede.

This base mountaine Flaxweede hath slender straked stalkes, with divers long and narrow leavēs on them, both stalkes and leaves of a yellowish Greene colour, diversly spread into branches, from the bottome to the top, bearing on every one of them, a small white flower, standing on a small footestalke, after which come darke grayish flat feede, in greenish yellow round heads, but very small.

7. *Linaria tenuifolia Lugdunensis*. Todeflaxe with very narrow leaves.

This Todeflaxe hath as narrow small leaves as any other sort, set very thicke on the low round stalkes, set dome above a foote high, of a bitterish austere taste, that one cannot well tell which hath the predominancy, the branched stalkes have nothing so many flowers on the toppes of them, nor so closely set together, somewhat reddish while they are in the bud, but of a whitish red when they are open; after which cometh the feede which is small and flat, contained in small and long heads, the roote is blacke and full of threds.

1. *Linaria vulgaris nostras*.
Our common wilde Todeflaxe;

2. *Linaria Pannonica major*.
The greater Flaxweede of Hungary.

6. *pseudo-linaria montana*: alba.
The base white mountain Flaxweede.

Linaria odorata,
Sweetc Flaxweede;

Linaria Valentina Chaffj.
Spanish Flaxweede.

9. *Linaria minor ceritica*.
Small upright blew Flaxweede.

8. *Linaria minima erecta*. The least upright Todeflaxe.

This Todeflaxe, being the least of all the former, and but that it doth not creepe, might else have beene set in the next ranke; hath one small stalke not above halfe a foote high, whereon grow very many small narrow blewish Greene leaves, like the common wilde kinde, and at the toppe many small pale yellow colour, with a spot in the jaw or mouth; the seede is exceeding small blackish and flat, the roote is small and perisheth every yeare, rising againe from its owne sowing.

9. *Linaria minor cerulea erecta*. Small upright blew Flaxeweede.

This small plant hath sundry small stalkes, of very small short leaves set one against another, of the same blewish Greene colour with the last, from among which rise up two or three stalkes, scarce halfe a foote high, bearing longer and narrower leaves thence, with larger flowers then the last, and of a blewish colour; after which come small seede like the last: the roote is threddy and perisheth every yeare.

The Place.

The first as I said groweth every where throughout the whole land, both in the way sides in meadowes, as also by hedge sides, and upon the sides of banks and borders of fields: the second in many places in Germany and Hungary; the third in Candy, the fourth in Spaine, the fifth is not certainly knowne where: the sixth on the hills in Saxony, as *Johannes Thalinus* saith: the seventh in barren dry and open places, the eight and the last we know not whence their originall are, but came with divers other feedes that were sent us from beyond the Seas.

The Time.

These flower in Sommer, and their seede is ripe usually before August be past.

The Names.

The first is called *Linaria* and *Pseudolinum* by *Brunfelsius*, *Lonicerus* and *Dodonaus*; of *Matthiolus*, *Fuchsius*, *Cordus*, and *Lobel*, *Oxyris*. The second *Camerarius* mentioneth in his *hortus Medicus*: The third, *Clusius* saith the seede came from Candy, and grew in *John Hogheland* his Garden; and is very probable to be both the *Linaria tetraphylla* of *Columna*, and the *arvensis cerulea* of *Bauhinus*. The fourth is *Clusius* his *Hispanica tertia*. The fifth *Camerarius* in *horto medico* saith it was so called in his time. The sixth is mentioned by *Johannes Thalinus*, in the description of *Harcynia sylva*, by the name of *Linaria montana sive sylvestris*, and as *Bauhinus* thinketh, is the *Anonymo Linifolio* of *Clusius*, and the *Linaria adulterina* of *Tabermontanus*. The seventh *Lugdunensis* calleth *Linaria tenuifolia*, and *Bauhinus* *Linaria capillaceo folio*. The eighth is called *minima* not having any other epithite. And the last *minor cerulea erecta*.

Linaria minima repentes. The least and creeping Flaxeweedes.1. *Linaria pumila Hispanica*. The dwarfe Spanish Flaxeweedes.

THIS dwarfe Todeflaxe of Spaine, shooteth up many tender weake branches, not able to stand upright, and rising to be about an handbreadth or halfe a foote high, whereon grow many long and narrow leaves very like unto the common wilde kind, as well for forme as colour, and so are also the flowers at the toppes of the stalkes, but lesse by much; the heads and seed are also like it, and the roote small and white, and creeping under ground.

2. *Linaria parva Hispanica altera*. Another small Spanish Flaxeweede.

This other small Spanish Flaxeweede hath divers weake slender branches, with many small narrow leaves set about them, but fatter or thicker in handling, and somewhat lesse also then the last, and of an ash colour; the toppes of the stalkes are furnished with a great many small flowers, of a pale blewish or ash colour, with a yellow spot in the mouth or gaping place, the seed and seede vessels are small according to the proportion of the plant, the roote is small and white, and perisheth every yeare.

3. *Linaria Hispanica atro purpurea repens*. The creeping darke purple Spanish Flaxeweede.

This Spanish kinde also hath many weake trayling branches, whereon grow many small soft ash coloured leaves; at the toppes of the stalkes grow many flowers, somewhat larger then the last, of a sad purple colour, almost

1. *Linaria pumila Hispanica*. The dwarfe Spanish Flaxeweede.

blackish, with pale yellow spots in the mouthes of them, of a pretty sweete sent, the seedes and rootes are alike perishing every yeare.

4. *Linaria cerulea repens*. The small blew creeping Flaxeweede.

This small Flaxeweede sendeth from the roote, a number of small weake stalkes, leaning downe to the ground, scarce being able to stand upright, set without order, with many small and very narrow ashecoloured leaves up to the toppes, where they grow into divers other smaller branches, having a long head or spike of flowers, very small, and of a fine blewish purple colour, with a yellow spot in the mouth of them: the seede is not unlike the former; but the roote shooteth forth many fibres, and abideth, not perishing in the Winter.

5. *Linaria quadrifolia Alpina*. The Mountaine blew Flaxeweede.

This Mountaine Flaxeweede shooteth forth his small weake stalkes, lying almost upon the ground, diversly divided into many smaller branches, even from the bottome: upon which are set small short whitish greene leaves, very orderly at the severall joints, one above another, that is, at some but two leaves, at others three

4. *Linaria cerulea repens*. The small blew creeping Flaxeweede.

5. *Linaria quadrifolia Alpina*.
The blew mountaine Flaxeweede.

Linaria Africana pinnato Helxines folio.
African Flaxeweede with black Bindeweede-like leaves.

or foure, not keeping alwayes proportion in the number, especially below, but rather upward; the flowers that stand at the toppes of the branches, are in forme like the other, and somewhat great, but stand not so thicke clustering together, being of a daintie purple blew colour, with a yellow spot in the mouth: the heads for seede that follow, are somewhat great, having blackish flat seede within them: the roote is small and white, spreading divers wayes under ground, and perisheth not in the Winter.

6. *Linaria lutea Moravica Clusij*. The small yellow *Moravia* Flaxeweede. This small kinde of *Todeflaxe*, is somewhat like unto the last kinde in the precedent ranke, but that it hath more store of stalkes, that doe not stand upright, having many small ash coloured leaves, set upon them, which are rounder and more sappy: the stalkes beare at the toppes of them many yellow flowers, with yellower spots in them, but the least of all these in this third ranke: the seede is small and blacke, and the roote perisheth every yeare.

The Place.

The first groweth about *Salamanca* in *Spaine*: the second and third in some other parts of *Spaine*; it is not certainly knowne where: the fourth on the hills in *Moravia*, as the last doth also; the fifth groweth as well in *Stiria* as *Clusius* saith, as among the *Switzers* and the hills in *Rhetia*.

The Time.

They doe all flower in Sommer, and give their seede quickly after.

The Names.

The first is the fifth *Spanish* kinde of *Clusius*, which *Bauhinus* calleth *Osyris flava sylvestris*, and *Tabernmontanus* *Osyris minor*: the second is the fourth *Spanish* kinde of *Clusius*, as the third is his second *Spanish* kinde: the fourth is *Clusius* his second *Linaria* of *Moravia*, as the last is his first *Moravian* kinde: the fifth is called by *Clusius* *Linaria Stiriac*, by *Gesner* in *hortis Germanie*, and in his *Epistles* *Linaria Alpina & Helvetica*: by *Tabernmontanus* *Linaria Alpina pumila*, and by *Bauhinus*, *Linaria quadrifolia supina*: the last is called by *Clusius* *Linaria Moravica prima* in his *Histoy*.

The Vertues.

All these sorts are in some degree, more or lesse effectually, but the most common kinde is the most used, to provoke urine, both when it is stopped, as also in those that are troubled with the droppe, to spend the abundance of those watery humours by urine, and by the drawing downe of much urine, doth in some sort helpe to wash the reins and urinary parts from gravell or stones gathered therein: the decoction of the herbe, both leaves and flowers in wine, taken and drunke doth somewhat move the belly downwards, openeth the obstructions of the liver, and helpeth the yellow jaundise, expelleth poison, provoketh womens courses, driveth forth the after-birth and dead child: the distilled water of the herbe and flowers is effectually for all the same purposes, and in especiall being drunke with a dramme of the powder of the seedes, or barked of the roote of Wallwort, and a little Cinamon for certaine dayes together, is held to be a singular remedy for the droppe, to spend the water and humors: the juice of the herbe or the distilled water dropped into the eyes is a certaine remedy for all heate, inflammation and rednesse in the eyes: the juice or water put into foule ulcers, whether they be cancrs or fistulous with tents rowled therein, or the parts washed or injected therewith, clenseth them thoroughly from the botome, and healeth them up safely: the same juice or water also clenseth the skinned wonderfully of all sorts of deformity thereof, as leproy, morpew, scurfe, wheales, pimples, or any other spots and markes in the skinned, applied of it selfe, or used with some powder of *Lupines*.

CHAP. XXII.

Halicacabum sive Alkakengi. Winter Cherries.

In the rear of this Classis commeth the Winter Cherrie to be declared, whereof there are some other sorts knowne to us more than in former times, as I shall presently shew you.

1. *Halicacabum sive Alkakengi vulgare*. The ordinary Winter Cherry.

The ordinary Winter Cherry is described unto you in my former Booke, therefore I doe here but onely make mention of it that you may take knowledge, the next is differing from it.

2. *Halicacabum sive Alkakengi Virginense*, *Virginian* Winter Cherries.

This *Virginian* spreadeth the branches with leaves on the ground, scarce raising it selfe up so much as the former, but the branches are greater, and so are the leaves also and more unevenly dented about the edges, of a fad or sullen Greene colour, at the joints, come forth the flowers singly, that is one at a place and more toward the botome than upwards to the height of the branches, which are rather smaller than the former, composed of five small whitish leaves with a circle of red, or every leaf spotted circlewise towards the bottomes of them: the fruite that followeth is a small berry, enclosed in a thinn skinne or bladder as the former, but Greene and not red when it is full ripe, smaller likewise than it, the berrie filling the skinne or bladder more than it, and not leaving so much void roome in the bladder, as the former, yet hath it small whitish seede within it as the other: the roote spreadeth under ground not very farre and perisheth in Winter. I have here onely given you three or foure leaves and a flower hereof with the figure of the former.

3. *Halicacabum Indicum rectum*, *Vpright Indian* Winter Cherries.

This *Indian* kinde riseth up to be about foure foote high, with strong upright stalkes, knotty and cornered, shooting out many branches, whereon grow faire Greene leaves, like unto those of the ordinary Winter Cherrie, but somewhat larger, and dented about the edges: at the joints with the leaves come forth the flowers, of a whitish colour as it is in the ordinary sort, every one by it selfe, which are composed but of one leaf, having five corners, somewhat crumpled about the edges, and although they be not divided into five leaves, yet in the botome of them there doth appeare five blackish purple spots in the botome of every flower, with divers other purplish threads in the middle, tipped with blackish blew chives: after the flowers are past, there commeth in their places the fruit which are bladders or thinn skinned, with berries in them like unto the ordinary Winter Cherrie.

rie, but that the berrie hereof is larger than the other, not onely filling the whole skinn or bladder, but often-times breaking it, and opening into foure parts, which when it is ripe, will be greene as well as the bladder; saving sometimes that part that hath the Sunne beames most upon it will be of a darke greenish purple colour; the whole plant is without taste, yet yeelding forth at the joints a certaine glutinous matter or juyce of a strong sent, like unto that of the *Poma amaris*, or Love apples: this perisheth every yeare in these colder climates, at the first approach of Winter; and whether it abideth in the naturall places, wee know not, nor to what physycall use it is applied, or whether it be used to be eaten.

The Place.

The first groweth by the hedge sides in moist and shadowie place, but is with us onely as I thinke cherished in gardens: the second came to us from *Virginia*, and grew with Mr. *Tradescant*; the last groweth in the *West Indies*, and was first brought into *Spaine*, and *Italy*, and from thence communicated first to *Camerarius* as I thinke, (for he first set it forth) and afterwards to others.

The Time.

They flower not untill the middle or later end of *July*, and the fruit is ripe about the end of *August*, or beginning of *September*.

The Names.

Iosephus de Casa bona, sent the last sort from *Florence* to *Camerarius*, and called it *Halicacabum*, sive *Solanum Indicum*; some others have called it *Arborefcens*, and *Solanum vescarium Indicum*; I have added thereunto *reftu* to distinguish it from the *Virginian Winter Cherie*: but the ordinary kind, is one of the foure sorts of *Solana* or *Nightshades*, set forth and spoken of by *Dioscorides* and *Galen*, and one of the two of *Theophrastus* called *Solanum Halicacabum*; and by *Pliny Vescarium*; either of the bladder wherein the berrie groweth, or of the vertues, against the diseases of the bladder and stone. Of the *Arabians Alkahengi*, which name the Apothecaries doe retain to this day in their shops. *Brunfelsius* calleth it his *Saxifraga quarta* tetuning it *rubra*.

The Vertues.

Neither the *Virginian* nor *Indian* kinde are knowne to be used to helpe any grieve or disease. But our ordinary *Winter Cherries* are of great use, the leaves being cooling and may be used in all inflammations but not opening, as the berries or fruit are, which by opening the uritorie parts, and drawing downe the urine, provoke it to be avoided plentifully when it is stopp'd, or when it groweth hot, sharpe and painefull in the passage: and is good also to expell the stone and gravell out of the reines, kidneys, and bladder, helping to dissolve the stone, and avoiding it by greete or gravell, sent forth in the urine: it helpeth much also to cleanse inward impostumes or ulcers in the reines or bladder, or in those that avoid a bloudie or foule urine. It helpeth the jaundise also, by opening the passages of the gall and liver, and expelling it by urine. The distilled water of the fruit, or the leaves together with them, or the berries greene or drie, distilled with a little milke, is effectuall to all the purposes before specified, if it be drunke morning and evening with a little Sugar, and in speciall against the heate and sharpnesse of the urine. *Pliny* recordeth, that the roote hereof is so powerfull to stupifie the venome of the *Scorpion*, that if it be but put unto them, they will utterly lose all their strength; and being boiled in oyle and applied is powerfull against their sting. But because divers have appointed severall wayes, for the preparing and ordering of the berries hereof, to be helpfull for urine and the stone, I thinke it not amisse to remember some of them unto you. And first they appoint the berties to be put into new wine when it is new made and put up, that the wine working with the berries therein, may have their vertue therein, and serve them to drinke that are troubled in the manner aforesaid: but because our Land affordeth not wine to be made therein, I doubt not but our *Beere* or *Ale* will be as effectuall, having the same proportion of berries, that is three or foure good handfulls, either greene and fresh or dried, bruised and put thereinto, that is, into three or foure gallons when it is new turned up, and after drunke in the same manner, and this drinke taken daily, hath beene found to doe much good to many, both to ease the paines and expell urine, and the stone in whom it is confirmed, and to cause it not to engender. Another way *Matthiolus* much commendeth, having used it many times himselfe, which is, to take some of the juyce of the berries in *Pisane* drink made into a creame with *Poppie* seede, & the kernells of *Melon* or *Pom-pion* seede: also a decoction of *Mallows* with some of the berries therein, or some of the juyce drunke in it: also fixe or nine drammes of the inward pulpe of *Cassa fistula*, drawne forth with the water or decoction of the berries, and given in a cup full of the broth of fat flesh, wherein also some of the berries have beene boiled, is accounted an excellent remedie to cleanse the backe and reines, in those griefes of the stone and urine: the decoction of the berries in wine or water, is the most usuall way to be taken, and the powder of them taken in drinke or broth, I hold to be more effectuall.

1. 2. *Alkahengi* sive *Halicacabum vulgare* & *Virginense*.
The ordinary and *Virginian Winter Cherry*.

Thus have I shewed you all the sorts of Saxifrages or Breakestones, that are properly so called, for of divers herbes and plants that conduce to the same purpose, I have spoken in my former Booke, as you shall finde particularly quoted in the Table of remedies, under the name of *For the stone in the reins and kidneys*. There are divers other herbes also, availeable for the same purpose, but could not fitly be placed in this *Classis*, in that many of them are umbelliferous plants, some Thistles and some of other Tribes: all which could not without much confusion be brought out of their owne stations, to fill up another. Take the rest therefore of those Breakestones, as you shall find them dispersed throughout this whole Worke.

Now it behoveth me to intreat of other herbes, whose vertues are to heale wounds, and therefore called *Vulnerary* in the next *Classis*.

HERBES.
CLASSIS QVINTA,
THE FIFTH TRIBE.

CHAP. I.

Centaurium majus. The greater Centory.

Dare not incline to the opinion of some of the Arabian Physicians and Writers that have said the roote hereof is bitter, and thereby have added strong purging qualities unto this kinde of Centory, which properly belong unto the lesser kinde, thereby confounding them both together; for if I did, I must have placed it in the second Classis among the purging plants. Neither dare I hold with the moderne error of many, that hold the roote of this great Centory, to be the *Rhaponticum* of *Dioscorides*, *Galen*, and others, they being so much differing one from another, as I shall shew you by and by. But as the qualities therein are most certaine to be Vulnerary, I have placed it here. Of this kinde there are three other sorts knowne in these dayes, which were not formerly, which together therewith, shall be entreated of in this Chapter; and first of that

which was first and commonly knowne.

1. *Centaurium majus vulgare*. The common great Centory.

The common great Centory, hath many large and long soft leaves, deeply cut in on the edges into many parts, notched or dented about the edges, of a pale Greene colour on the upper side, and whitish underneath: the stalk is strong and round, three or foure foote high, divided at the toppe into many branches, whereon stand large round scaly Greene heads; shooting forth at their toppes, many small threds or thrummes, of a pale blewish ashe colour; wherein after they are fallen doe grow large whitish smooth shining feedes, somewhat like unto the feedes of Thistles, but larger, and lying among a great deale of downy matter: the roote groweth to be more than two foote long, and as great, as a reasonable great Raddish or Parsneppe roote, blackish on the outside, and somewhat reddish yellow within, abiding many yeares, sending forth fresh leaves every Spring; those dying for the most part, that were Greene all the Sommer.

2. *Centaurium majus Pyreneum*. The Pyrenean great Centory.

This Pyrenean kinde hath larger leaves than the former, and more jagged or cut in deeply on the edges, somewhat resembling an Artichoke leafe in the divisions, Greene above and gray or as it were hoary underneath: the stalk riseth to be about three foote high, cornered and hoary, having sundry smaller leaves and lesse jagged set thereon, and parted at the toppe into some branches, each bearing some small leaves; under the heads which are much greater and more scaly also, with sharpe prickles at their ends, like a little wilde Artichoke head: the tufts of threds which are the flowers, as in the other, are more purple: the feedes are white wrapped in downe like it, and the roote great and blacke on the outside, but longer and of the bignesse of ones wrist.

3. *Centaurium majus alterum sive Lufitanicum*. The great Centory of Portugall.

This other great Centory hath many leaves, rising from the head of the roote, lying almost upon the ground, which are as long and as large almost as the former, but without any jagge or division at all in them, yet somewhat deeply dented about the edges, and of a deeper Greene colour: the stalk is round and great, but riseth not up so high, nor divided it selfe at the toppe into so many branches, but bearing onely two or three heads on a stalk, which are scaly in the same manner, & in it such like thrums, of a pale whitish colour or threddy flowers; which being past, there groweth such like feede also in those heads, lying in a flockie or downie substance, but a little blacker, every one bearded in the same manner: the roote groweth to be as great, or greater than the former, blacke also on the outside; and yellowish within, yeelding forth a yellowish red juice like the other, which is somewhat bitter, but a little more aromaticall than it.

4. *Centaurium*

1. *Centaurium majus vulgare.*
The common great Centory.

2. *Centaurium majus Pyrenaicum.*
The Pyrenean great Centory.

3. *Centaurium majus alterum sive Lysitricum.*
The great Centory of Portugal.

4. *Centaurium majus luteum.*
The great yellow Centory.

4. *Centaurium majus Luteum*. The great yellow Centory.

This yellow Centory sendeth forth many more, both larger and longer leaves from the roote then the former, some of the lowest having fewer divisions in them then others; but those that grow upon the stalk, as well as some of the other below, are very much divided into many parts, making every winged leafe to consist of a dozen or sixteen leaves, the ribbe in the middle betweene them being whitish, each for the most part set against another, with an odde one at the end, and every of them being narrow and long, without any dents on the edges, and of a whitish Greene colour; the stalkes are many, strong and round, somewhat straked downe the length of them, each divided into some other branches, which beare somewhat greater scaly heads then any of the other and larger spread thrums or threds, of a fine lively pale yellow colour, which abide in their beauty a long time without decaying, but seldome giveth seede in this Country, because as I thinke the scaly heads are so full of moisture, that it hindereth seede to grow ripe therein; for if they be but a little pressed betweene the fingers, there will issue forth on all sides, small cleare drops of water, as sweete as Sugar almost, and that not onely at noone dayes as *Bauhinus* saith, but at any time of the day, and not for once onely and no more, but oftentimes; yea every day if ye will, it will yeeld still some, as long as the flowers are fresh, and not quite withered, but when it doth perfect his seede, it is somewhat like the last great Centory, yet lesser, blacker, and more shining: the roote groweth in time, to be greater then either of the other, having many heads, that shoote forth in the Spring, the old leaves dying downe to the ground every yeare, which is wrinkled and blacke on the outside, and yellowish within, full of a slimy moisture in them, running downe deepe into the ground with some greater branches, and but a few small fibres.

The Place.

All these forts grow upon mountaines, the first and third upon the *Alpes* and Mount *Baldus*; the second on the *Pyrenean* hills, *Clusius* saith, he found the third upon some stony hills, beyond *Lisborne* in *Portugall*, neare the river *Tagus*, and the last there likewise and on Mount *Baldus* as *Pona* saith.

The Time.

They doe all flower about the end of *June*, and in *July*, yet the *Portingall* kinde doth least endure our cold aire, seldome shewing forth his flower, nor yet abiding unlesse well preserved.

The Names.

It is called in Greeke *κένταυριον τὸ μέγα* *Centaurium magnum*, and as *Pliny* saith, tooke the name from *Chiron* the *Centaure*, who was healed herewith of the hurt he received in his foote, by one of *Hercules* his arrows that fell from his owne hand thereon, in overlooking them, when hee received *Hercules* as his guest, and therefore of some was called *Chironium*. The first is called of all writers *Centaurium magnum* or *majus*, and *vulgare* of some, as a difference from the others. It hath bene in the former ages of the world (yet long since *Galen* his time, for many yeares, and yet continueth in many parts) called *Rhaponticum*, and used in the stead thereof in all those medicines, that the ancients appoint *Rhaponticum* to be put, which is an error growne so old by custome, that many obstinately persist therein, because they have received it from their elders, but learning and diligence in reading and scanning the writings of the ancient authors, hath not onely discussed this opinion, but many others also; for as I have shewed before in the second Classis, in the Chapter of *Rubarbe*, *Dioscorides* saith that the *Rhaponticum* is a roote like unto the roote of the great Centory; how then can it be the same, when it is but like it, and although the roote of this Centory be yellowish, which encreased their error, yet will it not colour the spittle like unto *Saffron*. *Brasavolus* in his time, did thinke that those rootes called *Rhaponticum* in the Apothecaries shops, were not the rootes of this great Centory; whom *Matthiolum* contradicted, shewing them to be the same. Some also as *Matthiolum* saith, did in his time take the *Lysimachia purpurea*, to be *Centaurium magnum*. The *Arabians*, *Mesues*, *Avicen*, and *Serapio*, have much confounded the Centories, both the greater and the lesser together, giving both the face and qualities of the one unto the other, and *Pliny* also in his 25. Booke, and 6. Chapter runneth into the same error with them, who although he agreeth with *Dioscorides* in the description of it, yet saith it hath a certaine bitternesse in it, which is not found in this greater but the lesser kinde. The second is called by *Cornutus* among his *Canada* plants, *Centaurium folijs Cynare*: *Pona* saith in the description of the plants growing upon Mount *Baldus*, that the third kind, was called of divers there about *Rheus Baldensis*, and *Clusius* saith, the *Portugals* where he found it, called it *Rapontin*. *Bauhinus* saith, that the last he received from out of the garden at *Padoa*, by the name of *Rhaponticum Lusitanicum*.

The Vertues.

The roote of the great Centory saith *Matthiolum* being steeped in wine, or the powder thereof given in wine, is with great good successe and profit, used for those that are fallen into a dropsie, or have the jaundise, or are troubled with the obstructions of the liver: two drammes of the rootes beaten to powder, and taken in wine or in water, helpeth those that spit blood, or that bleede much at the mouth, if they have an ague to take it in water, or else in wine, it is likewise used for ruptures, cramps, and pleurifies, and for those that have an old or long continued cough, and for those that are short winded, or can hardly draw their breath: it is good also to ease the griping paines in the belly, and those of the mother: being scraped and put up as a pessary into the mother, it procureth womens courses, and causeth the dead birth to be avoided; the juice thereof used in the same manner, worketh the same effect: some copies of *Dioscorides* have this, it is called *Panacea*, because it helpeth all diseases and sores, where there is inflammation or bruises causing it; it helpeth the Strangury or pissing by dropses, if it be injected, as also the stone: the decoction or juice of the roote, or a dramme in powder thereof drunke, and the wound washed therewith, taketh away all the paine and danger of the bitings or stings of venomous creatures; it helpeth to sharpen the eyesight, if it be steeped in water and dropped into them. *Galen* in 7. simp. sheweth that it hath contrary qualities in it, and therefore worketh contrary effects, the sharpe taste shewing an hot quality, whereby it provoketh womens courses, &c. and the astringent a cold grosse earthly quality, glueing or sodering the lippes of wounds, and staying the spitting of blood; and by all the qualities joyned together, helpeth ruptures, cramps, and the diseases of the Lungs: the sharpenesse procuring evacuation, and the astringent, the strengthening of the parts: the whole plant as well herbe, as roote, is very available in all sorts of wounds, or ulcers, to dry, soder, cleanse, and heale them, and therefore is a principall ingredient, or should be in all vulnerary drinks and injections.

CHAP. II.

Iacea, Knapweede.

Here are a very great many of herbes that beare the name of *Iacea*, which I must to avoide confusion distribute into severall orders; that so the memory being not confounded, with a promiscuous multitude, each may be the better understood in their severall rankes.

Iacea non Laciniata, Knapweedes with whole leaves.

Ordo primus. The first rank or order.

1. *Iacea nigra vulgaris*. Our common Matfellow or Knapweede.

THe common Knapweede hath many long and somewhat broad darke greene leaves, rising from the roote somewhat deeply dented about the edges, and sometimes a little rent or torne on both sides, in two or three places, and somewhat hairy withall, among which riseth up a strong round stalke, foure or five foote high, divided into many small branches; at the toppes whereof stand great scaly greene heads, and from the middle of them thrust forth, a number of darke purplish red thrums or threds (and sometimes white but very rarely) which after they are withered and past, there is found divers blacke seede, lying in a great deale of downe, somewhat like unto Thistle seed, but smaller, the roote is white, hard and woody, with divers fibres annexed thereunto, which perisheth not but abideth with leaves thereon all the Winter, and shooting out fresh every Spring.

2. *Iacea nigra angustifolia*. Narrowleafed Knapweede.

This Knapweede hath a round rough greene stalke, about a foote and a halfe high, whereon are set on each side, narrow rough, short and somewhat hoary greene leaves, compassing it at the bottome, and divided into some other branches above, on each whereof standeth a scaly whitish greene head, out of the middle whereof rise many small long threds, like unto the former, but smaller, and of a pale reddish colour: after which followeth small blacke seede like the other: the roote is blackish and parted into many small fibres. Of this sort also there is one, whose stalke and leaves are longer, smooth, and all hoary soft and woolly.

3. *Iacea nigra humilis*. The smaller dwarfed Knapweede.

This low Knapweede hath small weake and round hoary stalkes, about a foote high, bending to the ground

4. *Iacea nigra vulgaris*.
The common wild Knapweede.

6. *Iacea Austriaca latifolia villosa capite*.
The greater hairy headed Knapweede.

with

which leaves thereon, of an inch in breadth, and two in length, not divided or dented about the edges at all, but being a little rough and hoary, as it were thereabouts, compassing the stalkes at the bottome; at the toppes thereof stand such like scaly heads, as in the others, with purplish threds or thrummes rising thereout, as in the rest.

4. *Iacea montana Austriaca major*. The greater mountaine Hungarian Knapweede.

This greater mountaine Knapweede, is very like unto the former common wilde kinde, being somewhat broad and long, dented about the edges, and rough and hairy also, and of a darke greene colour; but those that grow upon the straked stalkes, are still up higher smaller, and more cut in on the edges: the heads that stand at the toppes of the stalkes, are not rough or hairy, but smooth and scaly, crackling if they be lightly touched, brownish upward and whitish lower: the flowers consist of many purple whitish leaves, cut in the ends into five slits or divisions, like as those of the *Cyanus*, with many purplish long threds in the middle, and a purple stile in the middle of them, besprinkled at the head, with a mealely whitenesse: the seedethat followeth is like unto the other, but somewhat larger: the roote also is blackish and stringy like the former, and abideth as the rest doe.

5. *Iacea montana Austriaca minor*. The lesser mountaine Hungarian Knapweede.

The lesser Hungarian kinde is in most things like the last, but that it groweth lower, and the leaves and stalkes are nothing so hairy and rough, but smooth and hoary; the flowers also are of a paler purple colour, and the seede is not blacke, but of a whitish gray or ash colour.

6. *Iacea Austriaca latifolia villosa capite*. The greater hairy headed Knapweede.

This greater hairy headed Knapweede, hath many long and broad leaves, larger than any of the former, softer and whiter also, somewhat, but not much dented about the edges, of a certaine clammy or gummy taste. *Io, Thal* us saith it hath both sharpnesse in taste, and tenuitie of parts, so that he maketh it hot and drie in the second degree, not without much bitternesse; from among which rise up divers cornered or straked stalkes, about two foote high, branched forth at the toppes, whereon stand usually three or foure heads close together, and some times but one; whose scales end in such small whitish crooked tangling threds, that they seeme like a net, cast over the heads, out of which start purple flowers like the fift, but larger: the seede is not blacke but grayish like the last.

7. *Iacea angustifolia Austriaca flore albo*. The white flowred Knapweede of Austria.

This other Knapweede differeth not from the last in any thing, but in the flower which is wholly white, and the seede a little grayer.

8. *Iacea angustifolia Austriaca villosa capite*. The lesser hairy headed Knapweede.

This lesser kinde differeth not from the sixth, onely in that it is lower, and the leaves narrower, the heades are netted like it but hairy withall; the flowers are purple, and the seede blacke, and not gray like it.

The Place.

The first groweth with us in most fieldes and medowes, and about their borders and hedges, and in many wast groundes also, almost every where; the second groweth about *Mompeljar* and *Padoa* also: the third in *Austria* neare unto *Saint Hippolitus*; all the rest on the hills in *Hungary* and *Austria*, and in the pasture grounds upon them.

The Time.

They all flower in *June* and *July*, and in *August* sometimes: the seede is ripe soone after.

The Names.

The ancient Greeke or Latine Authors, have not mentioned this kinde of herbe in any of their Writings, as farre as can hitherto be imagine d, and therefore wanteth a Greeke name, whereby it may be called: this latter age likewise, hath scarce found a fit name, whereby to call it, yet all doe agree it is a kinde of *Scabions*, and therefore *Tragus* maketh it his fourth kinde of *Scabions*. *Gesner in hortis Germanie*, taketh it for a kinde of great *Cenotory* of the Medow, and further thinketh it to be that plant, that *Scaliger* calleth *Gethya nigra*. *Thal* us in *Harcynia sylvia*, calleth it *Cyanus sylvestris angustifolius*: but generally it is called *Iacea*, sic dictum ut *Pena* & *Lobelius* volunt a *lanthino-colore florum*, and *nigra*, as a distinction, both from the *Iacea alba* *Monsp.* of *Pena* and *Lobel*, which they in their *Adversaria* call *Ocimoides*, sive *Ocimasstrum*; and from the *Pansie*, which of some is also called *Iacea*, or *Viola tricolor*: some also would make it a kinde of *Strabe*. Many likewise call it *Matresflor*, but very corruptly from *Aphyllanthos*, quasi *apud nos* dicitur, as some would call it, because the flowers are without leaves, being nothing in a manner but threds and thrummes. The first is called *Iacea nigra* of divers, and by *Banhinus* *Iacea nigra praesens latifolia*, and doubteth whether it be not *Solidago Saracenic* altera of *Lonicerus*: the second is called by him also *Iacea nigra angustifolia*, vel *Lithospermum arvensis folijs*: the third he calleth likewise *Iacea integrifolia humilis*. The fourth and fift *Clisus* first made known to the world, as it is thought, and called them *Iacea squammat*o capite *montana prima* & *seconda*, or *major* & *minor*: the sixt *Clisus* also calleth *Iacea Austriaca villosa capite elatior*. *Thal* us in *Harcynia sylvia*, calleth it *Cyanus sylvestris montanus integrifolius*, & saith it might be called *Cynoglossophyllos* from the forme of the leaves. *Banhinus* calleth it *Iacea latifolia capite hirsuto*: the seventh *Banhinus* saith, is a species of the former, varying onely in the flower, and therefore calleth it *Iacea alba hirsuto capite*, which he saith *Dr. Furerus* of *Northusa*, sent unto him by the name of *Iacea Austriaca major villosa capite flore albo*: the last *Clisus* calleth *Iacea montana villosa capite humilis*, and *Banhinus* *Iacea angustifolia capite hirsuto*: we call it in *English* Bullweede, and Knapweede, as also Mattellon.

The Vertues.

This Knapweede being so neare of kindred unto the *Scabions*, are in some part equall to them in their properties: for being of an astringent and drying taste, it thereby helpeth to stay fluxes, both of bloud at the mouth, nose, or other outward parts, and those veines that are inwardly broken, or inward wounds, as also the fluxes of the belly and of the stomacke, provoking castings; it staith likewise the distillations of thinne and sharpe humours from the head, upon the stomacke and lunges: it is good also for those that are bruised by any falls, beatings and other casualties: it is very profitable for them likewise that are bursten, and have the rupture, by drinking the decoction of the herbe and rootes in wine, and applying the same outwardly to the place: it is singular good in all sorts, of running and cankerous sores and fistulous also, drying vp the moisture, and healing them up gently without any sharpnesse or biting: it doth the like also in the running sores and scabbes of the head or other parts; it is of especiall use for the forenesse of the throat, the swellings of the *Uvula* and jawes, it is

also excellent good, for all greene wounds, to stay the bleeding and to close the lippes of the wounds together.

CHAP. III.

Lacea non spinosa Laciniata. Knapweedes with divided or torne leaves and without prickly heads.

1. *Lacea nigra vulgaris Laciniata*. The other common wilde Knapweede.

His other wild Knapweede that commonly groweth with us among corne very much, as well as in the Meades, groweth with greater and taller stalkes, the leaves both below and above upon them, are much divided on both sides, even to the middle ribbe, almost like the great *Scabious* of *Matthiolus* but of a darke greene colour, and as rough or rougher, then the former first or common kinde, the scaly heades on the toppes of the branches are greater, and the flowers larger, and of a deeper red colour; the seede is like the other, and so are the rootes, blackish and hard with many fibres.

2. *Lacea Cretica*. The Knapweede of Candy.

This Candy Knapweede hath many leaves lying on the ground, very much cut in on both sides of them, unto the middle ribbe, and each of those againe cut into other smaller peeces; from among which rise up crested hard stalkes two foote high, whereon are set at severall joints, lesser and lesse divided leaves than those below; the toppe of the stalke is severed into sundry small branches, with every one of them, a scaly head on them, thrusting forth the flower composed of many long, threads of a purplish, and sometimes of a white colour, each of them much jagged at the ends, with a pale stile or pointell in the middle of them, which being past, the seede lieth in the like downy matter, and is not unlike the former: the roote is thicke and somewhat great, with fibres thereat.

3. *Lacea montana Narbonensis*. The French mountaine Knapweede.

This French Knapweede hath divers long leaves, very much divided on both sides, into other small long, and narrow ones, but they little or nothing againe divided, of a light greene colour on the upper side, and hoary white underneath, and a little rough or hard withall, somewhat like unto the yellow Knapweede with prickly heades, among which riseth up a round stalk, somewhat rough also, about a foote high, without many branches, but bearing three or foure scaly heads at the toppes, with each of them, a long narrow divided leafe at the foote, with divers purple threads in the middle, smelling sweete; after which commeth the seede, not unlike the rest but lesser: the roote is long and slender and of a bitter taste.

4. *Lacea montana candidissima*. The hoary white mountaine Knapweede.

This hoary white Knapweede, sendeth forth, from a thicke woody roote, divers winged leaves lying upon

3. *Lacea montana Narbonensis*.
The French mountaine Knapweede.

4. *Lacea montana candidissima*.
The hoary white mountaine Knapweede.

the ground round about it, very much rent or torne on both sides into many small leaves, which are each of them deeply dented on the edges, somewhat like unto the leaves of *Stabe* or jagged *Scabious*; all covered over, with a hoary white cotton or wool, or as it were sprinkled with flower or meale; from whence riseth up a crested white hoary stalk, about a foot or a cubite high, scarce having any leaves thereon to the top, where it beareth only two or three scaly heads like the others with purple threads rising out of the middle of them: the seede is like the rest.

5. *Lacea humilis Hieracifolio*. Low Knapweede with torne leaves.

This small Knapweede hath many small and narrow long leaves, unevenly cut in or gashed on the edges, but blunt or somewhat round at the ends of every division, as at the point end also, from among which rise up weake stalkes, not able to stand upright, but leane downe to the ground, of about a foote high, with some smaller leaves on them; and at the toppes small scaly heades, like unto the others, out of which thrusteth the flower, very like unto the *Cyanus* or *Corne-flower*, but of a whitish blew purple colour, somewhat obscure or fullen, and sometimes white, the seede that followeth is not unlike the rest: the roote is thicke and long.

6. *Lacea alia pumila Narbonensis*.

The Pineapple headed Thistle or Knapweede.

6. *Lacea pumila Narbonensis*.
Pineapple headed Knapweede.

This small *French* plant groweth sometimes in the naturall places, without any stalk, bearing his Cone or Pineapple-like head, so neare the ground, that scarce any part of a stalk can be seene under it, and sometimes, and in the same grounds also, it will beare a round hollow stalk, of an handbreadth or two, or a foote high, having divers leaves thereon, cut on both sides, into many narrow short peeces, Greene on the upperside and hoary underneath: at the toppe of the stalk standeth only one large round and long great head, bigger than besemeth the smallnesse of the plant, resembling a Cone or Pine apple, delicately set with scales, blackish at the toppes, and forked or cut into two or three notches at the end, and bright shining white from thence to the bottome of them; from the middle whereof riseth up divers purple threds, as in the other sorts, after which come small seeds wrapped in much down, as the rest are, and like unto the former small Knapweedes, but blackish: the roote is blackish on the outside, and whitish within, of the bignesse of ones little finger.

7. *Lacea Laciniata alba*.

Jagged white Knapweede.

7. *Lacea Laciniata alba*.
Jagged white Knapweede.

This white Knapweede hath the stalk set with many very much jagged leaves, from the bottome branching forth on all sides, with lesser & lesse jagged leaves up to the tops, where on the severall small stalkes stand such like scaly heads as the other before have, but with fine white threds rising out of them: the roote is long and threddy, and spreadeth somewhat under ground.

8. *Lacea montana minima lutea*.

Small yellow mountaine Knapweede.

This mountaine Knapweede, hath divers leaves next the roote, about three inches long, cut into many divisions on both sides, and each of them againe into smaller, but somewhat thicke and fleshie, smooth also, but ending in a sharpe point: the stalk is small scarce a foote high, bearing a greater scaly head, then the smallnesse of the plant should seeme to beare, with a gold-yellow flower in the middle, having many upright threds in the middle, and the outward leaves, lying downwards and compassing them: after which come small seede, wrapped in downe like others, but smaller: the roote is somewhat thicke, hairy at the head, and parted into fibres.

The Place.

The first, as I said groweth in many places of this land, among corne as well as in other fields, especially about *Coventry*: the second groweth in *Candy*, from whence the seede being sent, hath sprung in divers parts: the third groweth upon the hills of *Castrum novum*, neare *Mompelier*: the fourth neare *Capua* in *Italy*; the fift about *Mompelier* also, in the borders of fields; the sixt there also, but among the *Cistus* and skarlet Oakes; the seventh is found in fundry places of our owne land; the last, as *Fabius Columna* saith on the hills *Aequicoli* in *Naples*.

The Time.

The first five sorts flower in Sommer, and their seede ripeneth shortly after, but the two last flower not untill *September* in their naturall places.

The Names.

Divers would referre some one or other of these *Iacea's*, either going before or following after, unto *Hyoscyris* or *Hyosiris* of *Pliny*, (*quasi Iovia Seris* as *Pena* saith) whereof he maketh mention in his 27. Booke, and 11. Chapter, which he saith is like unto *Seris* or *Intibum Endive*, or *Succory*, but lesse and rough in handling, and good for wounds; of which short description it is hard to determine that *Pliny* meant this plant, for if *Hyoscyris* be a kinde of *Succory*, or belonging to that Tribe, as the name aforesaid shou'd declare, this cannot be it, for none of the *Succories*, or of that stocke are found avaleable for wounds as these are. The first here set downe, is the *Iacea* major of *Lobel*, the first *Iacea* of *Clusius*, which he calleth *montana hirsuta capite*, as *Camerarius* doth; and by *Bauhinus* *Iacea nigra laciniata*. The second *Clusius* calleth *Iacea squammata capite Cretica*, and *Bauhinus* *Iacea laciniosa squammata*. The third is called by *Lobel*, *Iacea montana Narbonensis*, by *Tabernmontanus* *Iacea muscaria & quinta*, and by *Bauhinus* *Iacea montana incana odora*. The fourth is so called by *Bauhinus*, as it is in the title, which he called both in his *Phytopynax*, and in his *Matthiolus Iacea montana Laciniata*. The fifth is called by *Lobel* *Iacea pumila humilis serpens*, &c. by *Lugdunensis* *Iacea humilis Hieracii folio*; and by *Bauhinus* *Iacea humilis alba Hieracii folio*. The sixth is called by *Lobel* and *Pena* in their *Adversaria*, *Iacea montana*, and *Carduus pinus Narbonensis*, and thinke it also to be the *Chameleon non aculeatus* of *Theophrastus*, and by *Camerarius* in *horto Iacea alia pumila sive nana*. It is very likely to be that *Iacea*, that *Lugdunensis* calleth *montana Acanop hor*, or very like unto it; and by *Bauhinus* *Iacea montana incana capite pini*. The seventh is mentioned by *Gerard* onely as I thinke. The last *Fabius Columna* calleth *Iacea montana minima tenuifolia*, but *Bauhinus* calleth it *Iacea laciniata brevia*.

The Vertues.

The first of these especially, is equall in property with any of the other Knapweedes, both for inward and outward diseases, and therefore whatsoever is said of any of them, may be effectually found herein, the rest of them that are set downe in this Chapter, are in some sort like unto it, although there is no certaine author, hath appropriated them in such manner as the former.

CHAP. IV.

Iacea Laciniata capitulis spinosis. Thorny headed Knapweedes.

1. *Iacea lutea capitulis spinosis*. Yellow Knapweede with prickly heads.

His yellow Knapweede hath a few leaves next the ground, much rent or torne on the edges into many unequal parts, some bigger and others lesser, of a grayish or overworne Greene colour, and of a little acide or fower taste, among which riseth up a stalk about two or three foote high branched forth into some few, but not into very many branches, set with some smaller and more divided leaves on them, and at the foote of the branches; the toppes of the branches and stalkes are each of them furnished with a great scaly head, set round about with small and sharpe white prickles, and out of the middle thereof many threds, of a pale but fillen yellow colour, which abide in flower a good while, and when they are past, the seede is wrapped in a deale of white flocke or downy matter, of a whitish or ash colour, the roote is long and white, and as sweete almost as the roote of *Eringu* or Sea Holly, but creepeth very much and farre underground, springing up againe in divers places. This in the hotter Countreyes yeeldeth forth among the flowers, a small reddish graine like unto *Gum Tragacant*, but I could never observe it in our land.

2. *Iacea lutea spinosa Apula*. The thorny headed Knapweed of *Naples*. This yellow Knapweede of *Naples*, is in most things so like the former yellow, that if it be not the same, it differeth but little from it, which consisteth chiefly in these things, the roote is woody, as *Columna* who so describeth it saith, covered with a rugged barke, whose head hath many blackish haire, as the ribbes and veines of the last yeares leaves, the first leaves that spring up are smooth and whole, like unto a Docke, but those that follow after are divided into many parts, like unto Radish leaves, but larger and somewhat like unto the great Centory leaves: the crested or straked stalk riseth to be three foote high, somewhat hairy as the latter leaves are, at the head whereof which divideth not it selfe into above two or three branches, groweth on every one a scaly Greene head, the edges and toppes of whose scales are somewhat cut in, and set with sharpe yellowish thornes, and many yellowish threds comming out of the heades; the seed that followeth is white and flat, lying in a purplish downe.

3. *Iacea purpurea spinosa capitulis spinosis*. The purple flowered Knapweede, with prickly heads. This purple Knapweed trayleth with his great long branches upon the ground, having whitish filares or skins on each side of them, extending to two or three yeards in length, branched forth againe into sundry other stemes or stalkes, whereon grow large and long leaves, much cut in on the sides, and of a whitish Greene colour; at the ends of the branches, stand larger scaly heads then the former, and Greene, with cruell sharpe thornes or prickles upon them, ready to pierce their legges that improvidently passe by it, out of the middle whereof start forth many purple threds, and in them after the flower is past, small whitish seede, little bigger then the seede of *Cyanus* or the Bottles, of some called the Corne flower, the roote is very great, thicke, white and fleshy, spreading divers great and long branches, but not creeping within the ground as the former doth.

4. *Iacea montana purpurea echinato capite*. The purple mountaine thorny headed Knapweede. This mountaine Knapweede of *Austria*, hath divers soft narrow Greene leaves, not hard or rough like the common wilde sorts, more cut in on the edges, and into lesser parts, somewhat like unto the leaves of *Calcitrapa*, or *Carduus scellatus*: the stalk that riseth up about two foote high, being crested or straked, is divided at the toppe into divers branches, spreading in breadth more then in length, with many long scaly heads, here and there set thereon, the toppes or end of whose scales end in small prickles, but not so long and sharpe as those of the foresaid thistle, and more forked or divided; the flowers whereof are purple threds, like the other Knapweedes;

weedes; the roote thrusteth downe deepe into the ground, like as that Thistle doth, with many small fibres hanging thereat.

5. *Iacea flore albo capite longis aculeis spinoso.* The white thorny headed Knapweed.

This prickly Knapweede sendeth forth a rough hoary stalke, about two foote high, whose first leaves at the bottome are set with thicke white soft haire, but the rest that follow are somewhat long, and two inches broad, thicke, rough, and deeply dented about the edges, and long also, cut into many peeces with white veines running through them, at the toppes of the branches stand the heads, made of many scales, sharpe up to the toppe, like unto a Pineapple, the ends of whose scales are long, straight, sharpe yellowish thornes, and the edges of them, set with white haire like bristles; from the middle of the head starteth up many long whitish leaves, divided or cut in at the ends: the seede is like to that of the Spanish Saffron, but greater then the ordinary: the roote is white and brittle, easie to be broken, made of many strings or thicke fibres, foulding one within another, yet covered with a brownish skinnie or barke.

1. *Iacea lutea capitula spinosa.*
Yellow Knapweede with prickly heads.

6. *Iacea laciniata Sonchi folio.*

Thorny Knapweede with Southistle leaves.

The leaves that first shoot forth of this Knapweede, are very variable, for some of them are round, standing upon long footestalkes, others afterwards are more and more gashed on the edges, and those especially upon the branches, much more divided, and are so hard and rigid, that if they be a little bowed or foulded together, they will breake with a noyse or cracke, the stalke for the most part is round, and standeth in part upright, but being loaden with heads, bendeth downe to the ground, divided into sundry branches, and set with scaly heads, whose points being Greene at the first, are purplish afterwards, and on every of them seaven small thornes, set together on the one side, somewhat like an halfe starre, the middle one being the largest and the longest: the flower after a long time sheweth it selfe, to consist of many long and hollow threds, of an excellent purple colour, whose toppes are broad and parted into some dents, the bottome being very small, narrow and whitish, the broad cut open end of the flowers are of the deepest purple or red colour, the seed is small gray and long, like unto those of the *Cyanus*, or the blew Bottle; the roote is long and threddey, covered with a brownish skinnie or barke, and very brittle withall, this doth somewhat resemble the *Iacea marina Batrica* following.

7. *Iacea montana incana Laciniata capitulis hispida.*

Hoary mountaine Knapweede.

This small Knapweede hath a round hoary stalke, halfe a foote high, with many hoary, rough, or prickly narrow and long leaves, somewhat torne on the edges at the foote or bottome thereof, but those that rise up with the stalke, are deeper cut in, and the ends sharpe and prickly, at the toppe whereof, which is sometime divided, standeth a small head, composed of prickly scales, whose ends are crooked threds; the flower is purple like the common fort, but much lesse, the roote reddish and threddey.

8. *Iacea tomentosa capitula spinosa.*

The woolly white Knapweede.

This woolly Knapweede, hath a white woolly stalke, scarce a foote high, but divided into branches from the very bottome, having short and narrow leaves thereon, cut or divided into three, or five or seaven parts, or peeces, somewhat round pointed, so white and woolly, that it seemeth as if it were all strowed over with meale, the small heades at the toppes of the branches are composed of many scales, ending in sharpe reddish thornes; what flower it bore was not observed.

9. *Iacea marina Batrica.* The Spanish Sea Knapweede.

This Spanish Knapweede hath many long narrow leaves, unevenly dented or waved on the edges, thicke fleshy and brittle, with a little hairinesse, and of an overworne darke Greene colour, among which rise low weak stalkes with such like leaves as grow below but smaller, bearing at the toppe but very few flowers, of a bright reddish purple colour, like in forme unto the Corne flowers, but much larger, with many threds or thrummes in the middle, of the same colour, standing up higher then any of the former, which riseth out of a scaly great head, set all over with small sharpe (but harmelesse) white prickles many growing together; the feedes are blackish like the Knapweedes but larger: the roote is great and thicke growing downe deepe, fleshy and full of a slimy juice easie to be broken, blackish without, whitish within and enduring long.

St 3

9. *Iacea marina Batrica capitulum.*
The head of the Spanish Sea Knapweede.

10. *Iacea*

10. *Iacea Babylonica*. The great prickly Knapweede of Babylon.

Because we cannot yet give you a full description of this plant, take for the present, so much thereof, as hath come to our knowledge; for a leafe or two onely being sent, seemed upon the view thereof, like unto a leafe of the *Acanthum*, the White-way, or Cotton Thistle, being about a foote and a halfe long, and more than an hand breadth broad, in the middle thereof; somewhat hoary and rough in handling, compassed all about the edges with small sharpe prickles, having at the bottome of the leafe some torne peeces, on each side thereof, three or foure inches long, which growing small to the point, ended in a picke: the middle ribbe being somewhat greater and rough, from whence many veines ranne through the leafe. Thus much and no more, wee can yet say thereof.

The Place.

The first groweth in many places about *Salamanca* in *Spaine*, as *Clusius* saith, and about *Mompelier* as *Lobel* saith: the second in *Naples* as *Columna* saith: the third in *Spaine* also not farre from the sea side: the fourth at the foote of certaine mountaines in *Austria* and *Syria* as *Clusius* saith: the fifth in some other parts of *Spaine*: the sixth by the sea side in *Spaine*, about *Porta Sancta Maria*, and *Cales*: the seventh on the mount *Calcar* by *Mompelier*: the eighth by *Murens* in *Spaine*: the ninth about *Cales* also: the last about *Babylon*, as the name should intimate, but grew in the garden of *Signior Contarini*, a *Clarissimo* of *Venice*.

The Time.

They doe all flower in the Sommer, some earlier or later than others, and their feede is ripe accordingly, onely the sixth is the latest.

The Names.

Clusius calleth the first *Iacea lutea* flore five *Carduus muricatus luteo* flore; *Lobel* and others call it, *Iacea lutea major*: yet in his *Icones* and *Observations* useth but one figure, for *Iacea lutea*, which he saith is *Cardus stellati varietas*, and for *Cardus stellatus* seu *Calcitrapa altera*, whereunto in the description he giveth purple flowers. *Luggerius* hath placed this figure of *Clusius*, under the title of *Cardus Ericephalus Ddoorsi*. It is by *Dodonaeus* called *Spina Solstitii* altera; by *Lobel* *Cardus Stellaris capitulis spinosis* seu *Calcitrapa altera*, as *Bauhinus* saith; but I finde it doth better agree with my third sort here set downe, he calleth it *Iacea lutea capite spinoso*: the second *Columna* calleth, *Iacea lutea maxima Centauroides Apula*, and *Bauhinus*, *Iacea lutea spinosa Centauroides*; the third is very probable to be the same, that *Clusius* calleth. *Iacea purpurea Valentina muricato capite*, and *Bauhinus* *Iacea folijs Seridis candidantibus purpurea*: but I have altered it in the title, his name not fully answering the description in all things: the fourth *Clusius* calleth *Iacea montana echinato capite*, *Dodonaeus* *Cyanoides flos*, whose figure *Clusius* taketh for his *Stabe Salamantica secunda*; *Bauhinus* calleth it *Iacea Cyanoides echinato capite*: the fifth *Bauhinus* calleth *Iacea capite longis aculeis spinoso*: the sixth he also calleth *Iacea laciniata Sonchi folio*, and as I said is very like unto the *Iacea marina Batava*, which is the ninth here: the seventh, eighth and tenth, have their titles as *Bauhinus* in his *Prodromus* setteth them downe: the ninth was sent among others by *Boel* often before remembered; the last is remembered onely by *Bauhinus* in his *Prodromus* to come from *Signior Contarini* his garden.

The Vertues.

All these Knapweedes are no doubt of the same qualitie with the former, being binding, and many of them glutinous, especially the roote of the sixth and ninth which as they are of a very clammy juice and substance, so can they not be, but very consolidative, to knit and foder whatsoever needeth such properties.

CHAP. V.

Serratula. Sawewort.

Here are some other herbes called *Iacea*, by *Lobel* and *Pena*, *Bauhinus* and others, which I dare not so doe, not finding them in my judgement worthy to beare that name, and therefore I thought good to joyne this and the next unto them, in severall Chapters as nearest unto the *Iaceas*, and then those under the name of *Piarmica*, for that they doe best resemble them also, as you shall heare when I come unto them. Of this that is nearest unto the *Iacea*, there is two or three sorts, differing as well in the colour of the flower, as the leaves, being more or lesse divided.

1. *Serratula vulgaris flore purpureo*. Common Sawewort with purple flowers.

This Sawewort riseth up with many of his first leaves, somewhat broader and longer than those of *Betony*, and sharper dented and pointed, all of them set upon long foote stalkes; but those that rise up after them are longer and broader, and deeply cut in or gashed on the sides into many parts, and each part finely dented also in the same manner; from among which spring many brownish stalkes, with divers leaves on them, the lowermost whereof are divided in the manner aforesaid, and so the higher they grow upon the stalkes, the lesse divided they are unto the toppes, which are branched forth into many parts, bearing scaly heads like the former Knapweedes, but nothing so great, round and hard, with divers purple threads or thrummes in the middle like unto them, but shorter: the feede is small and blacke like the *Iacea*, but lesse lying in downe, which sheddeth and falleth away: the roote is a bush of many strings, which encrease into many heads, and shoote forth many like leaves, every one of them, whereby it quickly groweth to be a great tuft or bush. I know some doe make foure distinctions of those: that is to say, one sort that bringeth all his leaves, dented onely about the edges, and none of them cut in or gashed: another sort, part hath them dented, that is, the first leaves, and the rest that grow upon the stalkes, cut in or gashed: a third that hath but one or two, of the first or lowest leaves whole, and dented about the edges, all the rest being divided, some more some lesse; and a fourth, that hath all the leaves in general divided into gashes or parts, but yet dented and none whole: which distinction of these foure sorts as is said, I confesse I could never observe to be constant in any one plant, more than this, I have here formerly described, which while it is young, will have many of the lowest leaves whole, and when it groweth elder, will have many of them divided: but for the first sort, that should have all whole leaves, and none divided, I could never find such a one, and if I, or any other body should, I doe not thinke it would be so every year.

2. *Serratula*

2. *Serratula flore albo.*
White flowered Sawewort.

This Sawwort is in all things like the former, for I never could observe any other distinction, but onely that the flower, or the threads in the middle of the knappes are white, and the heads themselves, and the stalkes, of a fresh Greene colour.

3. *Serratula flore rubro.*
Red flowered Sawewort.

This also as farre as I could learne or heare, is wholly like the first, and not singularly to be found by that marke, that it should have all his leaves divided, and none whole, as the fourth sort, before set downe is said to be: the difference betweene them, chiefly consisting in the flower, which is of a deeper red colour, which is not easily found, or in many places, and is often mistaken for the other,

The Place.

The first is most common in the corners of Fields and Wood-sides, both open and shadowed; but that with a white flower groweth at the further end of *Hamsfeed* wood, neare unto a rill of water, running by the side of a cottage there; as also upon *Water downe* Forrest in *Sussex*, neare unto the path that leadeth from *Eridge* unto *Ivy Bridge*, by a brooke sides; the last is seldome found, and not without good observation.

The Time.

They flower in the end of Sommer, and their seede ripeneth quickly after.

The Names.

It is most generally now adayes called *Serratula a folijs minutim serratis*; yet there be some other herbes also, called by this name, as *Betony* and *Germander*, but because each of them is knowne by a more proper name, this of *Serratula* holdeth to this, and is given but a *forma*. Some doe thinke that it was also called, (especially by those of *Germany* and *Italy*) *Serratula tinctoria* or *tinctoris*, because it was used by them in dying and setting of a Greene colour; for which purposes they in former times, untill they had learned things of better respect, used it much; but I rather thinke it was called *Tinctoria*, by the mistaking of *Tragus*, his *Flos Tinctorius*, in *Fol. 252.* which he calleth *Scharten kraut* to be this; for his is the *Aster Italorum purpureus*, as by his figure under that title may well be perceived; into which error, *Bashimus*, as hee saith himselfe, was misled by *Thalium*, who did so thinke it to be, and called it in his *Hercynia sylva Centauroides*, aut *Centaureum majus sylvestre Germanicum*, untill he found his error, and reclaimed it in his *Pinax* in the title of *Aster Atticus caruleus*, and *Serratula*. I cannot finde any other *Greeke*, *Arabian*, *Italian*, *Spanish*, *French*, *German*, or *Low-Dutch* name given it, than according to the *Latine*, as we in *English* Sawewrot. And for other *Latine* name, *Thalium* onely, as I before said, accounteth it a kinde of great Centory, and *Lonicern Solidago Sarafenica*, from the effects.

The Vertues.

It is commended to be singular good for such as are bruised by any fall, and thereby have some veine broken within them; or that are much bruised by cruell blowes, and much beating, or otherwise much bruised by casualty, for it wonderfully stayeth such bleeding, and easeth the paine and soreness that commeth thereupon, if some of the Greene or dried leaves be boyled in white wine, or the powder of them be put into the said wine and drunke. It is no lesse effectually also, in all inward torments and paines, in the guts and bowels, if both leaves and rootes be boyled in wine and drunke. It is wonderfull good also for all wounds, whether they be fresh, to consolidate and heale them, or being old and filthy sores, to cleanse and heale them also; if the wine of the decoction of the herbe be often used to wash them withall. It is also commended for burstings or ruptures, by often bathing the places, and applying the Greene herbe and roote, as a plaister outwardly; it is good also for the piles, or hemorrhoides, when they grow full of blood and are very painefull, after the applying of leeches, by fomenting the part, with the decoction of the herbe in wine.

CHAP. VI.

Stebe. Silver Knapweede.

His herbe *Stebe*, that is usually so called with all Herbarists now a dayes (but not that which was so formerly of the ancient Writers, & which is quite differing from it) being so like unto the *Iacens*, as none other more; is of divers sorts, differing both in the leaves and heads of flowers, and some other things, as shall be presently shewed you.

1. *Stebe Salamantica prima Clusij.* Clusij his first Spanish *Stebe*.

This first Spanish *Stebe* of *Clusij*, hath divers large leaves lying on the ground, very much cut in on both sides, into

into large peeces, but each of them set closer together than the next, of a sad Greene colour on the upper side, and somewhat whitish underneath, very hairy all over, as also the straight strong stalkes, that rise up to be three or foure foote high or more, with divers such like divided leaves on them as grow below, but much lesser, and every one sharpe at the points, divided at the toppe into sundry branches, bearing upon long bare or naked slender stalkes, and somewhat long, small scaly, smooth, round, Greene heads, but seeming more neatly contrived together, than any of the heads of the former Knapweedes: from the small toppes whereof rise many fine, purplish, or crimson threds or thrummes, or of a colour betwene both, standing round together, somewhat whiter at the bottome of them, which so stand in the flower neare a moneth before they fade; in the meane while, the feede ripeneth in the heads, which is small, not much bigger than the *Cyanus*, and not so great as the ordinary Knapweede: the roote is white, long and woody, when it is growne above two yeares old, and then oftentimes perissheth in the Winter, else it abideth well, and will usually flower and feede two Winters, if they be not too extreme, or they doe not stand too much upon the weather.

2. *Stabe Salamantica secunda Clusij.* Clusius his second Spanish Stabe.

This other Spanish Stabe of Clusius, hath also many divided hairy and somewhat hoary leaves, lying on the ground, divided into severall parts on both sides, but more separate one from another than the former: the stalkes like wise are hairy, and sometimes hoary also, yet stand not so upright, but leaning downwards by the weaknesse of them, divided into many branches, bearing at the toppes of them, somewhat bigger scaly heads, from whence shoote forth bigger flowers also than the former, whose outward leaves, are made like those of the *Cyanus* or Cornflower, of a faire purplish red colour, with such like coloured threds or thrummes in the middle of them, as are in the former, with whitish and yellowish bottomes: the feede that followeth is like the former: the roote hereof is white and long, but lasteth not after feede time.

3. *Stabe Salamantica argentea.* The silver headed Knapweede.

This third Stabe of Clusius, hath likewise many leaves rising from the roote, but they are much more divided, and into smaller parts than either of the former being more hoary, or of a whiter Greene colour than they: the stalkes in the same manner hoary, riseth as high as the first, with thinn cut or divided leaves upon them, sharpe at the points, but smaller and smaller up to the toppes, where it is much divided into branches, and bearing at the ends of them, scaly Greene, but more white edged leaves, seeming as if they were silvered; out of which come small purple flowers, like the rest but smaller, the feede hereof lying in the downie heads as the others doe, are somewhat blacker than they, and having each an hairy toppe on them: the roote is somewhat thicke and long, and abideth sometimes after feede time.

4. *Stabe Austriaca Elatior.* The greater Stabe of Austria.

This Stabe of Austria differeth neither in forme of leaves nor height in growing from the last; neither in the

1. *Stabe Salamantica prima Clusij.* Clusius his first Spanish Stabe.

2. *Stabe Salamantica secunda Clusij.* Clusius his second Spanish Stabe.

3. *Stabe Salamantica teretia Clusj.*
cusius his third Spanish *Stabe*.

8. *Stabe spinosa Cretica.*
 The thorny *Stabe* of Candy.

7. *Stabe plantaginifolia.*
 Narrow leaved *Stabe* of Candy.

9. *Stabe fruticosa latifolia Cretica.* 10. *Fruticosa angustifolia Cretica.*
 Broad leaved shrubby *Stabe* of Candy: and narrow leaved.

flower, but in the scaly heads, which are not of such a shining silver like colour, which onely maketh the difference.

5. *Stabe Austriaca humilior*. The lesser *Stabe* of *Austria*. This also differeth so little from the last, that it is in a manner onely distinguished by the lownesse of the growing, and slenderesse of the stalkes, and not in any thing else.

6. *Stabe argentea minor flore albo*. The lesser silver *Stabe* with a white flower. There is likewise little difference in any other thing in this, from the last, more than in the flower, which is altogether made of white threds or thrummes, without any other colour therein.

7. *Stabe Plantaginis folio*. Narrow leaved *Stabe* of *Candy*. This small *Stabe* of *Candy* hath divers long soft fat and narrow leaves lying next the ground a little dented on the edges, but those that grow up with the slender handfull long stalkes not at all, but resembling the Ribwort Plantane leaves, and are of a yellowish Greene colour: the toppes of the stalkes are furnished with small long huskes or heads, out of which grow yellow flowers, and after them small long feede like unto those of *Scabious*: the roote is white and of a fingers thicknesse.

8. *Stabe spinosa Cretica*. The Thorny *Stabe* of *Candy*. This Thorny *Stabe* of *Candy* riseth up at the first, with small and long whitish Greene leaves, very like unto the small Corne flower or Blewbottle, but those that follow, are much longer, and more cut in on both sides of the leaves, even to the middle ribbe, but the peeces are somewhat round pointed: the stalkes rise not high, but are very much branched, even from the very bottome, into many slender hoary woody twigges, every one ending in a thorne; at severall joynts of these branches come forth such like, but lesse and lesse divided leaves, and with the leaves come forth in divers places small scaly heads, with white flowers starting forth of the middle of them, like unto those of the little *Cyanus* or Corne flower, but never laid open, abiding halfe shut or closed continually: after which commeth the feede which is small and long; the whole plant is of a grayish, hoary or ashe colour, and liveth many yeares in the warmer countries.

9. *Stabe fruticosa latifolia Cretica*. The broad leaved shrubbe *Stabe* of *Candy*. This plant being found growing in *Candy* by *Honorius Bellus*, and the feedes thereof sent by him unto *Clusius*, without any proper name, but *Pulcherrimus frutex*, as you have it set downe in his second Epistle to *Clusius*, which is set forth in the end of his History of plants; I have thought more fit to joine with the *Stabe*, then as *Bauhinus* doth with the *Storax* tree, as if it were a species thereof, onely because *Pons* in his Italian *Baldus* saith, that *Alpinus* did call it, *Cyanus folijs Syriacis*; but he himselfe (I meane *Pons*) there calleth it, *Cyanus fruticosus folijs Pomi*; but betwene *Cyanus* and *Stabe*, there is small difference, that it may be referred to which soever one please; for it partaketh of both sorts, and yet properly cannot be said to belong to either of them; the description whereof is as followeth. It groweth up with a woody stemme for some distance above the ground, and then spreadeth forth divers armes or branches, to the height of two or three foote in compasse round, whereon grow divers very faire and fresh Greene leaves, very delightfull to behold, being somewhat long and broad like unto the leaves of the Appletree, as *Bellus* saith, being very white underneath almost like silver; which thereupon some have compared them to the Quince-tree leaves, which are whiter on the underside than the Appletree leaves; and some as *Alpinus*, unto the leaves of the *Storax* tree, which are very like unto those of the Quince tree; but take which you will, the comparison in part holdeth correspondent: from these armes or greater branches, shoote forth other small long and slender ones, bearing very sparsely the like leaves on them, but lesse; at the toppes whereof come forth divers long scaly heads, longer than any *Stabe*, *Iacea*, or *Cyanus*, and with looser scales parted with white and pale red colour, divers set together as it were in a tuft, in the same manner, as it is to be seene in the *Saponaria*, *Sopewort*, or *Bruswort*; at the toppes whereof stand the flowers, very like for the forme unto the *Cyanus* or Corneflower, but of a pale Orange colour; which heads after the flowers are past doe containe in them small and long feede, somewhat like Cummin feede, but longer, which abide in the heads very long after, not falling away: the roote is hard and woody like a shrubbe or tree, or shrubby tree.

10. *Stabe fruticosa angustifolia Cretica*. The narrow leaved shrubbe *Stabe* of *Candy*. This shrubbe *Stabe* in his naturall place riseth to be three or foure cubits high, with a woody stemme or trunk covered with a hoary rugged barke, the wood it selfe being very hard, & of an evill savour being burned: from whence it spreadeth many branches on all sides rugged also at the bottome and hoary, but smooth at the toppes, somewhat thicke set with very long and narrow leaves, & somewhat like unto those of the Pine tree or rather of Rosemary, but longer and more hoary all other; the greater armes do send forth divers smaller branches, with the like leaves on them but lesse and shorter, and at the ends of every of them one scaly head, from the middle whereof shoote forth the flowers composed of many purplish blew threds like unto a *Cyanus* for the colour, or a *Stabe* for the manner, but larger than either of both: this plant will serve as a hedge bush, to be cut and trimmed into what forme you please like unto other bushes, and will also be encreased by slipping, and abide with the leaves alwayes upon it, especially in the warmer countries, yet will not abide the cold Winter of our climate without some especiall defence: the roote is woody and spreadeth like a shrubbe or bush.

The Place.

The first three sorts grow in divers places of *Spaine*, but especially about *Salamanca*, as *Clusius* who first set them forth saith: the fourth and fifth in *Austria*, and other parts of *Hungary*: the sixth is likewise thought to grow about those parts: the foure last their titles testifie to be in *Candy*.

The Time.

They all doe flower in the Sommer Moneths of *June* and *July*; yet those of *Candy* flower later, even in the end of *August* or *September*, where if any early frost take them, they wither straight wayes, although in their naturall places, which are the warme countries, they continue many yeares.

The Names.

Although I doe acknowledge, (as I said before) that none of these plants are the true *Stabe* of the ancients, which hath thorny or prickly leaves, as *Gaza* falsely translateth *Theophrastus*, but should be thornes and prickles growing with the leaves, yet because as *Clusius* saith, the learned Physicians of *Salamanca* in *Spaine*, did usually to call the former sorts and esteeme of them, because the ends of their leaves were sharpe pointed, which in some part

part as they thought did answer the description of the *Stabe* of the ancients; as also because those plants may in the judgement of many be referred to the kinde of *Scabions* (but more truly I suppose unto *Lacea*) which of most Phisitions of these later ages, is therefore accounted, called, and used for *Stabe*; which notwithstanding is an error great and intollerable, in regard *Scabions* is a smooth herbe, without any shew of pricke or thorne thereon which the true *Stabe* hath, so it is no lesse erroneous to transerre the vertues of *Stabe* to the *Scabions*; for as *Dioscorides* and *Galen* after him doe affirme, *Stabe* hath so drying and astringent a quality, that it wil stay any flux of humours or bloud in the bowells or belly, as also those of wounds, which I thinke was never found in *Scabions*. But that I may informe you, (which to some may seeme doubtfull) that *Stabe* hath a prickly stalke, which is neither extant in *Dioscorides* nor *Galen*'s Coppies: let me shew you it out of *Theophrastus* in his sixt Booke and first Chapter where he numbred *Pheos*, which as he saith, was also called *Stabe*, (and not *Phloum*, whereof hee speaketh in his fourth Booke and eleventh Chapter, among those plants, that grow in watery and inorish places; the likenesse of which two words, hath deceived many, mistaking them to be one thing,) among those plants, that have a leafe besides the thornes on their stalkes, which sentence *Gaza* (as I said before) tranlieth, that it hath beside the prickly leafe, another leafe also by it, for *Theophrastus* in the fifth Chapter of the said sixth Booke, doth deny *Pheos*, and *Hippophaes* to have any prickly but a smooth leafe, although in the third Chapter of the same sixth Booke, he seemeth to say, that *Pheos*, *Tribulus*, and *Capparis* have prickly leaves, beside the thorny stalkes, but both of them cannot be true. And herein *Pliny* hath shamefully erred in confounding *Theophrastus*, making *Pheos* and *phleum* to be one thing, and hath bene the cause of many others errors also. *Plutarch* in the life of *Thebes* about the beginning doth name *Stabe* among the thorny plants, whose words are these: *Menalippifilius Ioxus Ornito socius deducende in Cariam Colonia fuit, unde Ioxides originem traxerunt, quibus mos est patrum, neque spinis Asparagi, neque Stabes igne cremari sed honore & cultu protequi*. In English thus, *Ioxus* the sonne of *Menalippus* was joyned with *Ornitus*, to leade forth a colony to *Carya*, from whence the *Ioxides* have their originall, whose Countries custome it is neither to burne the thornes of *Asparagus* nor of *Stabe*, but to give them honour and reverence: thus much *Plutarch*. *Ætius* also in his third Booke and one and twentieth Chapter, remembereth *Stabe*, saying that *Epithymum*, (or more truly *Dadder*) groweth upon it. But now as I have shewed you that the true *Stabe* is a prickly or thorny plant, and that therefore neither *Scabions* nor this *Stabe* is it. Let me here also shew you what is the true *Stabe*, which is indeede worthy the hearing, but that I reserve it to a fitter place, that is among the thorny plants, where it is called *Pimpinella spinosa*, or *Poterion*, but I forbear any farther to speake thereof in this place. The first of these here set downe, is called by *Clusius* *Stabe Salamantica prima*, by *Dodonæus* *Aphyllanthos prima*, by *Bauhinus* *Stabe major folijs Cichoraceis mollibus lanuginosis*. The second is called by *Clusius*, *Stabes Salamantica prima altera species*, by *Lobel* *Stabe argentea incana Aldroandi*, by *Dodonæus* *Aphyllanthos tertia*, by *Bauhinus* *Stabe major folijs Erucæ mollibus lanuginosis*. The third is called by *Clusius* *Stabe Salamantica altera vel tertia*, by *Lobel* *Stabe argentea Salamantica minor*, by *Dodonæus* *Aphyllantes quarta*, by *Bauhinus* *Stabe calyculis argenteis*. The fourth is called by *Clusius*, *Stabe Gallica* and *Austriaca elatior*, by *Bauhinus* *Stabe major calyculis non splendentibus*. The fifth is called by *Clusius*, *Stabe Austriaca humilis*, by *Gesner* in collectione stirpium, *Centaurij majoris species minor*, and by *Bauhinus* *Stabe incana Cyano similis tenuifolia*. The sixth is called by *Tabernaemontanus* and *Gerard*, *Lacea flore albo*, and by *Bauhinus* *Stabe calyculis argenteis minor*. The seventh is called by *Alpinus* lib. de plantis exoticis as it is in the title. The eighth is called by *Pona* in his *Italian Baldus*, *Cyanus spinosus Creticus*, and so also by *Alpinus* in lib. de exoticis plantis: *Clusius* in his *Austriacum*, to the other Appendix to his history of plants, calleth it *Stabe peregrina*, and saith that *Jacobus Plateau*, who sent him a branch of the plant, with the figure thereof drawne, having gathered it in the Garden of the Duke of *Areschore*, in *Bellomonte*, called it *Stabe spinosa fruticans*. The ninth I have joyned with these *Stabes* as I said before, rather then with the *Storax* trees as *Bauhinus* doth, calling it *Frutex rotundo argenteo folio Cyanis flore*; for *Pona* in the same place above said, calleth it, *Cyanus fruticosus Creticus*, and is the same plant that *Honorius Bellus*, in his second Epistle to *Clusius*, as he saith, could not learne by what name they of *Candy* called it, and therefore he onely called it *Pulcherrimus frutex*. I have as you see, set it and the last with the *Lacea's*, being nearest in likenesse to them, in regard these have all fealy heads, as the *Laceas* have; which are not seene in any *Scabions*. The last *Pona* in the description of Mount *Baldus* first called *Stabe capitata Rosmarini folijs*, but after in his *Italian booke*, he calleth it *Champsipyris fruticosa Cretica Belli*, and by them of *Candy* called *βερνικια*, id est, lignum fetidum, and by *Bauhinus* *Lacea fruticans Pini folio*, and is thought to be the *Champspece* *Plinij* of *Anguilara*. The Spaniards as *Clusius* saith, call the first by the name *Cabesuela*, id est, capitulum a little head, and usually make broomes thereof to sweepe their houses, the learned Phisitions there as he saith, use the third sort instead of *Scabions* for all the purposes thereof.

The Vertues.

The most of these sorts, but especially the three first, do come somewhat nigh unto the qualities of *Scabions* and therefore I must referre you thereunto, to know both what remedies may be had from these plants, and in what manner, and to what purpose to be used: for as *Scabions* fitteth the parts whereunto it is applied, so doe these also.

CHAP. VII.

Ptarmice non vulgares. Vntuall Sneefewort.

Have here as I promised before, brought to your knowledge those other plants, that comming neereft unto the *Lacea's* and *Stabes*, and yet being none of them, were fittest to be enreated of in a Chapter peculiar by themselves; for as I said although *Bauhinus* doth put these two sorts under the title of *Lacea oleæ folio*, and reciteth their authors for them, who are chiefly *Lobel* and *Clusius*, yet I cannot finde, by the same authors, as well as by mine owne sight and knowledge, but that they are differing plants, from both *Lacea* and *Stabe*, but I would not have you conceive, that any of these *Ptarmice's* is that, which groweth wild with us in divers places, for I meane to bring it into that Classis that is fit for it, namely, that of hot, sharpe, and biting herbes; the double kinde whereof, I have set forth in my former booke.

1. *Ptarmice*

1. *Cyanus major vulgaris.*
The great ordinary blew Bottle.

2. *Cyanus minor vulgaris diversorum colorum.*
The small ordinary Corne flower of divers colours.

3. *Cyanus Orientalis major & minor.*
The greater and lesser Orientall Bottle or Sultans flower.

4. *Cyanus repens latifolius.*
Broad leaved French Corne flower.

4. *Cyanus Baticus supinus*. The Spanish Corne flower.

This Spanish kinde hath many square low bending or creeping stalkes not standing so upright as the former, but branching out more diversly, so that one plant will take up a great deale of ground, the leaves are somewhat broader, softer, and of a paler Greene colour, then of the common small kinde, but not much or deeply gashed on the edges; the flowers stand in bigger heads also, and with foure or five leaves under each, of a light purple or bluish colour, after which come white seed like thereunto also, but not so plentifully, yet wrapped in a more downy substance, the roote groweth downe deepe and perisheth likewise every yeare as they doe.

5. *Cyanus repens latifolius Lobelii*.
Broad leaved French Corne flower.

This *Cyanus* that Lobel and Pena in their *Adversaria* have set forth, whose taste is very bitter and unpleasant, hath divers weake hoary and trayling branches not standing upright, about a foote and a halfe high, whereon grow divers hoary leaves, somewhat long and narrow, and somewhat like unto those of Lavander, but harder in handling, at the top of the stalk which is branched forth, grow severall scaly heads like unto the other *Cyani*, whose flowers are like unto them, but of a sadder or deader purple colour, then in any of the other sorts; the roote is about a fingers length.

6. *Cyanus repens angustifolius sive minimus*.
The smallest Corne flower of Mompelier.

This smallest Corne flower, hath likewise divers weake slender yet hard hoary and twigged stalkes, whereon are set divers smaller leaves then the last, but hoary in the same manner; at the toppes of the branched stalkes, stand many scaly heads, much lesser then any of the sorts of Corne flowers; from whence grow such like flowers, but of a sadder or deader colour: the feedes are like the smaller ordinary kinde, and the roote is small, long and woody.

7. *Cyanus Creticus spinosus*.
Prickly Corne flower of Candy.

The lower leaves of this Corne flower are jagged and very hoary, but those on the hoary branches of the stalkes are lesse or not at all, they ending in long sharpe prickles or thornes with small bluish-coloured flowers like the others sorts but smaller, the roote is long and somewhat thicke enduring many yeares.

The Place.

The first groweth naturally upon sandy hills in Germany, but is usually cherished elsewhere in Gardens; The second with blew flowers in many corne fieldes of our owne land and some of the other colours also; The third as is said in Turkey, and the fourth in Spaine, first found and sent unto us by Doctor Boel, who is now resident at Lisbonne. The fifth groweth under the branches of the *Seseli pratensis* by Sella nova neere unto Mompelier, and the sixth thereabouts also, and by *Castrum novum* not farre from Mompelier, as Pena and Lobel doe set them downe in their *Adversaria*; the three last and the other woolly fort in Candy.

The Time.

They flower and feede in the Sommer Moneths when the other doe.

The Names.

It is called *ruay* *Cyanus*, a floribus *Cyaneo vel caeruleo colore*. In the Infancy of Herbarists, *Tragus* who knew not well what to call the first, referred it to the *Verbascum*, and called it *Verbasculum*, but now it is generally called by all Herbarists, *Cyanus major*; some adde thereunto *hortensis*, and others *Montanus*, yet *Hermolus* taketh it to be *Lencoium* of *Dioscorides*, and *Cesalpinus* to be a kinde of *Struthium*, whereof *Theophrastus* maketh mention: *Fabius Columna* judgeth it to be that kinde of *Papaver* which *Theophrastus* calleth *Heracleum*, and *Lobel* maketh a doubt whether it may not be accounted a species of *Chondrilla*. The second sort that groweth in the Corne is called *Flor Frumenti* and *Baptisecula* or *Blaptisecula*, of the turning the edges of sickles in cutting downe the Corne for *Secula* was taken for a Sickle in ancient time. The third was sent us out of Turkey, by the name of *Ambreboi*, which whether it be a Turkish or Arabian name I know not, the *Turkes* themselves as I heare, doe generally call it the *Sultans* flower and so doe I, but that I adde *odoratus* for the sweete sent of the flower. The fourth was sent by Boel under the name of *Iacca Batia*, but because I finde it better agreeing with *Cyanus* then *Iacca*; I have inserted it here. The two next sorts are called *Cyanus supinus* & *repens* by Lobel in his *Adversaria*. The Candy kinde is mentioned by *Alpinus* in his Booke de exoticis.

The Vertues.

The powder of the dried leaves of the greater blew Bottle, or Corne flower, is given with good successe to those that by some fall are much bruised, and for them also if they have broken a veine inwardly, and void much blood at the mouth, being taken either in the water of Plantaine, *Horsetaile*, or the greater Comfrey. It is accounted a helpe or remedy against the payson of the Scorpion and *Phalangium*, and to resist all other venomous and paysons. And therefore *Placentius* affirmeth it to be excellent good in all pestilentiall feavers, and of its owne power, to be powerfull against the plague or pestilence, and all other infectious diseases, either the feede or the leaves taken in Wine. The juice is singular good to put into fresh or Greene wounds, for it doth quickly soder

T t 2

up

up the lippes of them together ; and is no lesse effectuall also to heale all such ulcers and sores as happen in the mouth. The same juice also dropped into the eyes, taketh away the heate and inflammations in them : the distilled water of the herbe, hath the same properties, and may be used for all the effects aforesaid. The lesser blew Bottle or Corne flower is used generally by all our Physitions and Apothecaries in the stead of the greater when it is not to be had, and is held to be in a manner as effectuall as the greater.

CHAP. IX.

Scabiosa. Scabious.

Now that we are come to handle the varieties of the Scabiouses, they are so many, that I know not well how to marshall them into any good method or order, yet that I may endeavour it the best I can, I thinke it fittest to ranke them into foure Orders; that is, first, of such sorts as grow in the Meddowes and Pasture grounds; next of those that grow in the Woods, and upon hills and high grounds; thirdly, of such as beare a round or Globe-like head; and lastly, of such as beare flowers more starre-like than others. And yet I doubt not, but that although I shall endeavour, as neare as I can to set every one in their right order; yet some of them also may be thought as fit for another Order, as that wherein they are set; which notwithstanding take them now in the same manner I give you them. And for the *Morsus Diaboli*, or Divells bit, which is another sort of Scabious, I entende to speake thereof in a Chapter by it selfe: yet I must leave out those three sorts I have mentioned in my former Booke which are *Scabiosa flore albo*, *Scabiosa rubra Austriaca*; and *Scabiosa Indica flore rubra*: although I give you their figures here againe.

Scabiosa pratensis & arvensis. Those sorts of Scabious that grow in Meddowes and plowed grounds.

1. *Scabiosa vulgaris pratensis.* The common field Scabious.

The common field Scabious groweth up with many hairy soft whitish Greene leaves, some whereof are either not at all jagged, or divided on the edges, or very little, others are much rent and torne on the sides, and have threds in them, which upon the breaking may be plainly seene, and are not in divers other sorts; from among which rise up divers round hairy Greene stalkes, three or foure foote high, with such like hairy Greene leaves on them, but more deeply and finely divided, branched forth a little; at the toppes whereof which are naked and bare of leaves for a good space, stand round heads of flowers, of a pale blewish colour, many set together in a head or knopp, the outermost whereof are larger than those inward, with many threds also in the middle, somewhat flat at the toppes, (and not so round Globe-like as the other, which shall be described hereafter.

2. *Scabiosa minor campestris.*
The lesser field Scabious4. *Scabiosa pannonica flore albo.*
White Hungarian Scabious.

Scabiosa flore albo.
White flowered Scabious.

Scabiosa festiva Clusj.
Clusius his Sommer Scabious.

ter) as the head with seede is likewise; the rootē is great, white, and thickē, growing downē deepe into the ground, and abideth many yeares.

2. *Scabiosa minor campestris.* The lesser field Scabious.

This lesser sort is like the former almost in all things, but that the leaves are not so large, or deeply jagged, nor the stalkes rise so high, nor the flowers so great or large, yet of the same bleake blewish colour: this may be thought to be the same with the former, differing onely but in the rankenesse of the ground where they grow, but that this is so usually observed to be no greater or of any other forme, although it grow in the same or as ranke ground as the other.

3. *Scabiosa major segetum.* Corne Scabious.

This Corne Scabious also differeth little from the first, but that it is greater in all respects, the leaves being larger with greater divisions, and some whole leaves with them also: the stalkes are greater and stronger, and the flowers larger, more laid open, and not so closely thrust together, but of the same blewish colour, yet a little more declining to purple: the roote hereof runneth not deepe into the ground, but rather creepeth under the upper crust of the earth.

4. *Scabiosa Pannonica flore albo.* White Scabious of Hungary.

This great white Scabious of Hungary hath large stalkes, three foote high at the least, whereon grow at every joint two leaves one against another, very much and finely cut in, and jagged on the edges, more than any of the former sorts of Scabious, but those that grow next the ground are broader, softer in handling, and more hairy, and onely dented about the edges and not divided, that one would not thinke them to be the leaves of a Scabious: the stalkes are branched and flowers like unto other Scabiouses, stand at the toppes of them, but of a pure white colour, and the outermost row of flowers for the most part being twice as large as any of the rest, with white threds in the middle of them tipped with blew: the seede that followeth is long and browne like, unto the rest, which falling when it is ripe, springeth a fresh before the Winter, and abideth untill they have seeded againe the next yeare, for the roote perisheth yearly.

5. *Scabiosa minima Ovella dicta.* Small sheeps Scabious.

This small Scabious hath divers whitish Greene leaves at the ground divided on both side of the long pointed leafe, onely into one division, on each side, making every leafe seeme like the small Sage leafe, called Sage of Vertue, that hath small peeces of leaves like eares on each side thereof; but a little dented about the ends; the small low stalkes are furnished likewise, with such like leaves but lesser, and small blewish flower or heads on them like unto the other field Scabious but lesser.

6. *Scabiosa festiva Clusj.* Clusius his Summer Scabious.

The stalke hereof being three cubits long beareth long leaves set by couples thereon, which are long and some-

what broad and littlerent or torne at the bottome, but dented all the rest of the leafe: the flowers grow on severall branches at the toppes of a pale blew colour, the roote periseth every yeare.

7. *Scabiosa arborea Cretica Alpina*. *Alpinus* his shrubbe *Scabious* of Candy. This *Scabious* hath a thicke whitish stemme next the ground for a shaftmont high, from whence rise sundry long branches set at certaine distances, with five, sixe, seven or more leaves at a space, each of them somewhat resembling those of the true Houfleeke but hoary white; the toppes of the branches have two or three large flowers, standing on slender long foote stalkes together, like unto the common sort for the fashion, but of a decayed or wash bluish colour, after which succeedeth small seede, and is very tender to keepe.

The Place.

The first groweth most usually in most Medowes of this land, especially about London every where. The second groweth likewise in some of the drie fields about this Citie, but not so plentifully as the former. The third groweth both in the grounds where corne is standing, and in those that were formerly sowne, and now lie fallow, as also in the border of such like fields. The fourth *Clusius* saith he found, nigh unto the wall of *Tirnavia* in a cittie in the upper *Hungarie*: the fift is found in many drie gravelly and heathy grounds throughout the Realme: the sixt grew in the low countries as *Clusius* saith of the seede he had formerly sent thither; and the last in Candy.

The Time.

They all flower in *June* and *July*, and some abide flowring untill it be late in *August*, and the seede is ripe in the meane time.

The Names.

This herbe is not found to be remembered by any the ancient Greeke or Latine Authors; yet some some thinke it is that herbe *Ætius* calleth *Lyssa*, but because there is nothing but the bare name that is extant in him, without any description, it is hard to say it is the same; notwithstanding the Greeke word signifieth *Scabies* in Latine. But it tooke the name of *Scabiosa*, either a *foliorum scabritie que presertim, primo huic generi convenit*, or rather, and that most usually, *quod Scabies medetur*: the name is of divers applied, as I said before, to divers herbes, as to the *Laccus*, *Staber*, and others, calling some of them *Scabiosa major*, and altera *squammaria capitulis*, as *Bauhinus*, and others doe: but as I said before, the heads and flowers of all these herbes called *Scabioses*, being all so neare and like one unto another, and so differing from *Laccus*, *Stabe*, &c. mult needes shew plainly that they should not be so confounded, for a novice shall hardly understand what herbe is meant, by such names as are imposed on divers of them: the Author of the *Pandectis*, is thought to be the first that mistooke *Dioscorides* *Stabe*, to be this *Scabious*, from whence the error thereof soone spread among *Physicians* in all countries, and continuing still, is hardly to be rooted out againe, *Tam facili est descensus in errorem, & e contra arduus ascensus in veritatem*. *Fabius Columna* in his *Phytobasanus*, seemeth to referre the *Scabioses* unto *Phyteuma* of *Dioscorides*: but in his other Booke of rare plants, he declineth to thinke that such small *Valerians*, as he there describeth, because the seedes have holes in them, should be the *Phyteuma* of *Dioscorides*. The *Italians*, *Spanish*, *French*, and *English*, do all follow the Latine name *Scabiosa*, as each Dialect will admit only the *Germanes* call it *Apostem kraut*, *Ästem knaut*, and *Grinde kyaut*. The first is called of most Writers, either *vulgaris*, *communis*, either *pratensis* or *officinarum*: the second is called *Scabiosa media*, and *minor* of divers, and *Columbaria* of *Lobel*, and is *Clusius* his fift *Scabious* in his History of Plants, *Bauhinus* setteth it downe for his second species of *Scabiosa capitulo globoso*, and yet he nameth the same *Scabiosa prima Clusij* for the second of his *montana*; hereby making that one plant to be two severall kinds, which thing is very frequent with him, in many other things and places, in his *Pinax*, *Prodromus*, and *Matthiolum*: the third is called *Scabiosa campestris seu segetum* of *Lobel*, as also *major satorum vulgarior*. The fourth is called by *Clusius*, *Scabiosa Pannonica flore albo*, and is his eight *Scabious* in his History of Plants: the fift is that *Scabious*, which we generally throughout the land, doe call sheeps *Scabious*, called by *Dodonæus* *Ovella*, *alminima*, and yet the figures of neither of them are answerable to the true herbe: the sixt *Clusius* only maketh mention, and *Bauhinus* calleth *Scabiosa fruticans latifolia alba*: the last is that which *Alpinus* describeth and pictureth in his Booke de *plantis exoticis*, and is very likely not to be the same with *Pona* in his *Italian Baldus* setteth forth, in that his is set forth to have but one leafe at a place.

Scabiose montane. Mountaine and wood *Scabioses*.

1. *Scabiosa montana maxima*. The greatest mountaine *Scabious*.

THIS great mountaine *Scabious*, which some for the largenesse thereof, have accounted a great and bastard kinde of great Centory, hath divers very large winged darke greene leaves, that is very much cut in on both sides into divers parts to the middle ribbe, and each part finely nicked or dented about the edges, many leaves (especially growing at large in any good ground) being a foote or sometimes more in length, or most commonly neare there unto: from among which rise up divers hard wooddy stalkes sometimes foure or five foote high, and usually about three foote high, branching towards the toppes, into some other smaller stemmes; at the toppes of each whereof standeth one large great round, blackish greene head, from whence shoote forth divers such like flowers as the *Scabioses* doe yeeld, with threds in the middle of them in the like manner, but each budde before it is blown is more yellow then when it is open, and hath stood any time, which yet at the perfection are of a pale yellowish colour; in which heads when the flowers are past, grow long rough darke coloured seede, which being shed upon the ground, as soone as they are ripe, will soone spring up before Winter, and will abide greene all the Winter time, and shoote up and flower for the most part the next yeare following, yet the old roote periseth not after seede time, but abideth many yeares.

2. *Scabiosa montana glabrofolia*. Mountaine *Scabious* with smooth leaves.

This mountaine *Scabious* is a low plant, in comparison of the former, for it feldome riseth above a foote high, bearing many shining greene leaves, not any thing hoary at all, but smooth soft and full of juice, yet divided or cut in on the edges, like the ordinary field *Scabious*, and each of the divisions dented alittle about the edges: upon the stalkes grow the like leaves, two alwayes at a joint, but much more divided than the lowest, and flowers at the toppes as in other sorts of *Scabious*, of a fine blewish purple colour, with blackish threds at the foote of every flower.

flower on the infide : the feede is like the other sorts, and the roote is long blackish, and long lasting after feede time.

3. *Scabiosa montana Dentis leonis folio.* Scabions with Dandelion leaves.

This *Scabious* differeth little from other sorts of *Scabions*, but in the leaves, which being somewhat hairy and not smooth, broad at the bottome compassing the stalkes, are so divided on the edges, as a Dandelion leafe is, the lower divisions of the leaves, being blunt at the points, and the uppermost sharpe yet all dented about the edges : the stalkes being hairy and about two foote high, are divided toward the toppes into branches, having two leaves at the joints, so joyned together like the leaves of the Teasell, that they will hold water : the flowers that grow at the toppes are of a pale blewish colour like the rest.

1. *Scabiosa montana maxima.*
The greater mountain scabious.

4. *Scabiosa prolifera duarum specierum.*

Many flowered *Scabions* of two sorts.

This kind of *Scabious*, that beareth many heads of small flowers, compassing the greater, as is seene in Daisies, Marigolds, and some other herbes ; is of two sorts, one that hath his leaves cut or divided into some broader and larger divisions than the other : the branches towards the toppes where the flowers doe stand are bare, or naked without leaves, save under the very heads, where there stand three or foure small leaves, very finely cut almost as small as Fennell : round about the middle heads of flowers grow forth, other severall small heads of flowers, all alike both for colour and fashion, which are like the ordinary *Scabions* : these give feede like other sorts, and perish after feede time, and either rise again of their own sowing, or being gathered must be new sowed.

5. *Scabiosa argentea angustifolia.*

Silver leaved *Scabious*.

This *Scabious* from a hard woody living roote, sendeth forth three or foure stalkes, with divers very long and narrow leaves, almost like grass, but of a fine white silver like colour, set without order thereon ; the toppes of the stalkes are not branched at all, but bare and naked for a good space, bearing one flower at the head of them, white and woolly underneath, but of a pale blew colour above, as other *Scabioses* are, and consisting in the like manner of many flowers together.

The Place.

The first groweth in many places on the *Alpes*, and in the fields neare unto divers other mountaines and hills in *Austria* and else where : the second groweth on the like places, as on *Snealben* and *Sneberg* hills in *Austria*, &c. as *Clusius* reporteth : the third upon Mount *Calcar* not farre from *Nemepel* : the fourth with the broader leaves, is onely to be found in gardens, but that with finer leaves if it be not the same with the former hath bene observed to grow wilde, about the baths of our Lady neare *Padoa* : the last was found upon the hill *Sanmo* neare *Vicenza* in *Italy*.

The Time.

They doe all flower at the time when the other sorts doe.

The Names.

The first is called by *Lobel* *Scabiosa montana maxima* ; by *Camerarius* *Scabiosa Alpina Centauroides* ; by *Ingdus* *Centaurium nothum Dalechampi* ; *Bauhinus* calleth it *Scabiosa Alpina folijs Centaurij majoris* : *Bauhinus* maketh the second to be the fifth *Scabious* with *Clusius* in his history of plants, as I said before ; & calleth it *Scabiosa montana glabra folijs Scabiosae vulgaris* : the third is onely remembered by *Bauhinus* in his *Pinax* and *Prodromus*, under the title exprest : the fourth is called both by *Lobel* and *Clusius* *Prolifera*, and their kinde is that with the larger leaves ; the other sort *Bauhinus* saith, hath finer cut leaves like unto *Gingidium* or *Uisnaga* : the last is remembered as well by *Camerarius* in *horto medico*, by the name of *Scabiosa graminea folio argenteo flore purpureo*, as by *Bauhinus* under the title exprest.

Scabiosa globosa flore. Globe flowered *Scabions* :

1. *Scabiosa Neapolitana folio Sinapisylvestris.* The Globe *Scabions* of *Naples*.

This *Scabious* hath a straked stalke a foote and a halfe high, divided from the bottome into long branches, having two long smooth leaves divided to the middle ribbe on both sides, and each part divided also, somewhat like unto the leaves of wild Mustard, standing at each joint, and together with them many small hairens growing there likewise : the flowers that stand singly at the toppes of every stalke, are of a middle size, and very round at the head, whereof it tooke the name : for the heads of the former sorts are somewhat flat at the toppes, and not so round or globe fashion as these in this ranke, and are of a reddish colour, yet not so deepe or darker red, as that which I set forth in my former Booke, by the name *Scabiosa rubra Indica*, Red flowered *Indian Scabious* : which pertaineth to this order, but that it is described there, and the figure here ; the feedes are small, like thereunto, and the rootes likewise perishing after feede time for the most part.

2. *Scabiosa*

2. *Scabiosa flore albo gemino*. Double flower'd white *Scabious*.

I gave you in my former Booke, one sort of white flower'd *Scabious*, which pertaineth to this order, and is often found in the meadows and marshes neare the sea side in our owne Land, and is not this I meane here to describe unto you, but another differing both from it, and the other here before also with white flowers having such like leaves but larger and broader then it; the stalkes likewise grow higher and stronger, not leaning downwards, and the flowers are larger than it; sometimes but one at the toppes of the branches, but most usually twoflower'd together, and sometimes three, of a faire pure white colour, and after they are past, the heads with seede appeare more round and not flat, but rather a little cone fashion, that is, rising a little higher in the middle then the rootes hereof abide many yeares.

3. *Scabiosa globularia folijs serratis*. The Globe *Scabious* without leaves.

This Globe *Scabious* is of a middle sized stature, about a foote and halfe high, and hath all the leaves that grow both on the lower parts of the stalkes, and at the foote of them, somewhat long narrow and pointed at the ends, deeply dented at the lower ends of them, but not much gashed in on the edges like the other sorts of *Scabious*; but those that grow highest neare unto the flowers, are much more and finer cut in: the flowers that stand at the toppes of the slender stalkes, being divided into one or two parts, are very round and close set together, of the like pale blew colour as in other sorts, or a little more purplish like unto the flowers of Devils Bit; but about Louvaine as Lobel saith, it is found with white flowers: the seede is small, but long and somewhat rough like the other sorts: the roote is small and long, not abiding after it hath given seede.

4. *Scabiosa Globularia Bellidis folijs*. Globe *Scabious* with small Daisye leaves.

This other Globe *Scabious*, (whice I am somewhat doubtfull, whether to call a Daisye as Bauhinus doth, or a *Scabious* as Clusius doth) creepeth upon the ground, with trailing branches taking roote as they spread, set with many fat thicke leaves, smooth and Greene, not dented at all on the edges, nor small or sharpe at the end, but blunt or round pointed, somewhat like unto the leaves of the small garden Daisye, or *Globularia*, called blew Daisyes, every one like unto them, being small and narrow at the lower end, and broadest toward the end: from the ends of which trailing branches arise slender naked stalkes, about halfe a foote high, bearing on each of them a round ball or head greater than any of the *Globularia's*, yet lesser than those of the field *Scabious*, full of small flowers, of a more deepe purple colour than the *Scabiouses*: after which come small seede lesser than any of the former.

5. *Scabiosa tenuifolia capitulo globoso*. Globe flower'd *Scabious* with thinn cut leaves.

This finely cut *Scabious*, hath the lower leaves more finely cut in on the edges, than any of the former, but those on the stalkes which are many, two alwayes set at a joint, are much more finely cut into smaller parts than they are up to the toppes, where the flowers stand in round heads, but of the same purplish blew pale colour that is in the ordinary sorts of *Scabious*.

Scabiosa rubra Indica.
The red Indian *Scabiosa*.

4. *Scabiosa Globularia Bellidis folijs*.
Globe *Scabious* with small Daisye leaves.

6. *Scabiosa*

5. *Scabiosa tenuifolia globosa*.
Globe flowered Scabious with thinne cut leaves.

6. *Scabiosa tenuifolia globosa elatior*.
Another small leaved Globe Scabious.

6. *Scabiosa tenuifolia altera elatior*. Another small leaved Globe Scabious.

This other riseth up more upright with the single slender stalk, having at the lower joints, two or three small narrow leaves set thereat, finely dented about the edges: but those at the highest part of the stalk stand by couples; the flowers are small and round but like in colour to the other sorts.

The Place and Time.

The first Bauhinus saith, Ferrantes Imperator of Naples sent him, but nameth not the naturall place; the second is not well knowne where it groweth wilde, but is nourished up in the gardens of those that are Herbarists and lovers of plants: the third groweth in Germany, in Hareynia sylva, as Thalus saith: the fourth, as Clusius saith, in rockie and stony places, on the hills of Hungary and Austria, as also in other untilld places thereabouts: the fifth on divers hills in Germany; the last we know not the naturall place, the seede comming among other sorts from Italy, and flower all of them at the time with the rest.

The Names.

Bauhinus onely remembreth the first by the name of *Scabiosa folio Sinapi sylvestris*; and Clusius the second by the same name in the title: the third is called by Lobel *Scabiosa media serrato angustifolio flore Globularia*; and by Thalus in Hareynia sylva *Scabiosa Bellidis majoris folio minor*; and by Bauhinus *Scabiosa capitulo globoso minor*: the fourth is called by Clusius, *Scabiosa montana minor repens, five decima*; and by Camerarius *Scabiosa montana repens*; by Tabernmontanus *Scabiosa odorata*: but Bauhinus following none of them, calleth it *Bellis cerulea montana frutescens*, (as though it did frutescere which is nothing so) because the leaves are somewhat like the small Dayzie, as I said, and that the *Globularia Monspeliensis* is reckoned as a Dayzie, and called *Bellis cerulea*, which is somewhat like unto it; but Clusius doth even account that *Globularia*, to be *Scabiosa pumilum* genus. The fifth is called by Thalus in the place before remembred, *Altera Scabiosa tenuifolia species*. The last being a sort not set forth before hath his title fit for it.

Scabiosa stellato flore. Scabious with Starre like flowers.

1. *Scabiosa Hispanica major*. The greater Spanish Scabious.

His greater Spanish Scabious hath large soft woolly leaves, much cut in on both edges, like the leaves of the great field or Corne Scabious, each part also dented about the edges, the stalks rise to the height of two foote, bearing such like leaves at the joynts, but smaller up to the toppes, where they branch forth into severall small sprigges, bearing every one a head of many flowers, like the other Scabionses, but each made of harder and stiffer skinnies, of a whitish colour, in whose places after they are past, the cuppes of huskes wherein they stood, doe appeare like blacke starres, with divers points, wherein the seede is contained, which is somewhat long, thicke, and hairy, like the other sorts: the roote is thicke and white like the common kinde, but perisheth every yeare, after it hath borne flower or seede.

2. *Scabiosa*

2. *Scabiosa Hispanica minor*. The lesser Spanish Scabious.

The lesser Spanish Scabious is altogether like the former greater, but that it is lesser in every part; and that the leaves are a little smaller, or finelier cut in, and the flowers not white as the former, but of a blewish purple colour.

3. *Scabiosa arborea Cretica* Ponz.
Pona his Shrubbe Scabious of Candy.

This Candy Scabious riseth up with a woody stalke, from whence spring divers hard and woody branches, white or hoary all over, as the leaves are also, which are thicke set thereon, without any division or denting at the edges, being whole like unto the great Cymus or blew Bottle: at the ends of the branches come forth small naked stalkes, bearing a head of flowers, very like unto the former great Spanish Scabious, but of a pale reddish colour; the feede contained in those starre like huskes, are smaller, and smell a little sweeter then other sorts of Scabious doe; the roote is long and hard, divided into divers parts, abiding the Winter both in the naturall and other warme Countries, and holding his Greene leaves also, but is more tender, not able to endure the sharpenesse of our frosts and colds. Camerarius maketh mention of a Scabiosa which he calleth Gallica like hereunto, but that he saith it hath small long blackish leaves, whereas this hath white and woolly, else it might be judged the same.

Gallica
Camerarij4. *Scabiosa stellata minima*.

Small Starre like Scabious.

This small Scabious is very like the smaller Spanish Scabious, having divers narrow leaves, about two inches long, much cut in and divided on the edges; the stalke is scarce halfe a foot long, with such like leaves thereon, and small pale blewish flowers as in the Spanish kinde; the huskes likewise have divers points, standing open spread like a starre, from the middle whereof come forth five small long reddish threds, like haire standing out of the huske: the feede is small, but like the other; the roote is small and perisheth every yeare.

The Place.

The two first sorts Clusius saith he found in the borders of the Vineyards, and in the paths of the fields about Salamanca in Spaine, and in other places; the smaller of which Bauhinus saith he found upon the shore neere Venice. The third in Candy as Pona saith, who had it from Signior Contarini of Venice. The last Bauhinus saith, groweth in Provence of France.

The Time.

The two first Spanish kindes as also that of Candy, flower somewhat later then the former sorts, so that they seldom give good feede with us, and therefore we are still to seeke new feede to sow.

The Names.

The two first Clusius calleth Hispanica, and so doe all others that mention them, onely Dodonæus calleth them peregrina; and Bauhinus calleth the first stellata laciniato folio major, and the other minor five maritima. The third Pona in his Italian Baldus, calleth by the same name is in the title, Lobel, Lugdunensis, and Gerard also Scabiosa peregrina; Tabernmontanus Scabiosa peregrina folijs non dissectis, and Bauhinus Scabiosa stellata folio non dissecto, Casalpini Scabiosa arborefcens. The last Bauhinus onely setteth forth under the title expressed, both in his Pinax and Prodromus, and saith he accounteth it to differ from the lesser Spanish kinde, in some notable parts.

The Vertues.

Now that I have described unto you all the sorts of Scabious, whose variation and difference consisteth chiefly in the leaves and flowers, being yet in taste, not so much differing the one from the other, and therefore their faculties are to be accounted alike, so that the vertues in any one are not so peculiar, but that they may be referred to the generall, which are these; It being hot and dry, is of an opening, cleansing, digesting, and attenuating quality, whereby it is very effectuell for all sorts of coughs, shortnesse of breath, and all other the diseases of the brest and lunges, ripening and digesting cold flegme, and other tough humours, voyding them forth by coughing and spitting. It ripeneth also all sorts of inward ulcers and apollumes, yea the pluresie also, if the decoction of the dry or Greene herbe, being made with wine be drunke some time together, thereby voyding it forth by the urine, as well as other waies; or if you would have it more effectuell, take this receipt, viz. an handfull of dried Scabious, an ounce of Licoris scraped and cut into thinne slices, a dozen figges washed and cut into peeces, an ounce of Aniseede, and as much of Fennelseede bruised, and halfe an ounce of white Oris rootes cut into thinne slices: let all these be steeped for a night, in a quart of faire water, (or rather in so much wine) boyling them the next day, untill a third part be consumed at the least, whereof take a draught every morning and evening, somewhat warme, well sweetned with Sugar or Hony, which worketh wonderfully to helpe all the diseases aforesaid. Foure ounces of the clarified juice of Scabious taken in the morning fasting, with a dram of Mitridatum or Venice Treacle, doth free the heart from any infection of the plague, or pestilence, so as upon the taking thereof they sweate two houres in their beds at the least, yet after the first time taking, let them that are infected take the same proportion againe, and againe if need be, for feare of further danger, the Greene herbe

herbe also bruised, and applied to any Carbuncle or Plague sore, is found certaine by good experience, to dissolve or breake it within the space of three houres: the same inward and outward application, is very avallable against the biting or stinging of any venomous beast: the same decoction also drunke, helpeth the paines and stiches in the sides; the decoction of the rootes taken for forty dayes together, or the powder of them, to the quantity of a dramme at a time, taken in whey, doth as *Matthiolus* saith, wonderfully helpe those that are troubled with dangerous running or spreading scabbes, tetters, or ringwormes, yea although they proceed of the French pox, as himselfe saith, he hath found true by certaine experience: the juice or the decoction drunke, doth wonderfully helpe those that are broken out into scabbes, and itches: and the juice also made up into an oymntment and used, is effectuell for the same purpose. The same also wonderfully helpeth all inward wounds, be they made by thrust or stroke, by the drying, cleansing, and healing quality therein. A Syruppe made of the juice and Sugar, is very effectuell to all the purposes aforesaid, and so is the distilled water of the herbe and flowers made in due time, especially to be used when the greene herbe is not in force to be taken; the decoction of the herbe and rootes outwardly applied, doth wonderfully helpe all sorts of hard or cold tumours, or swellings in any part of the body; and is also as effectuell for any shrunke sinew or veine in any place: the juice of *Scabious* made up with the powder of *Borax* and *Camphire*, doth notably cleanse the skinne of the face or any other part of the body, as freckles, pimples, and other small eruptions therein, yet it prevaileth also in greater deformities, as the Morpew, and Lepry; the same decoction doth also helpe the rednesse, and spots in the white of the eyes, used either of it selfe, or with the juice of Fennell; the head washed with the same decoction cleanseth it from dandraffe, scurfe, scabbes, sores, itches, and the like, being used warme; tents also dipped in the juice or water thereof, doth not onely heale all greene wounds, but old sores and ulcers also, both by staying their fretting or running qualities, and cleansing and healing them up afterwards; the herbe also bruised and applied to any place, wherein any splinter, broken bone, arrow head or other such like thing lyeth in the flesh, doth in short time loosen it, and causeth it to be easily drawne forth.

CHAP. X.

Morsus Diaboli. Devils bit.

Here resteth yet this kinde of *Scabious* to be entreated of, being of all Herbarists accounted an especiall different kinde thereof, yet some referre it to the *Jacea's*, but not properly; the former ages knew but one sort, we have in these times found out some others, as they shall presently be shewed you.

1. *Morsus Diaboli vulgaris flore purpureo*. Common Devills bit.

Devils bit riseth up with a round greene smooth, and not hairy stalke, two foote high or thereabouts, set with divers long, and somewhat narrow, smooth, darke greene leaves, somewhat snipt about the edges for the most part, being else all whole, and not divided at all, or but very seldome, even to the toppes of the branches, which yet are smaller then those below, with one ribbe onely in the middle, and being broken yeeld not such threds as the *Scabious* doth; at the end of each branch standeth a round head of many flowers, set together in the same manner, or more neatly or succinctly then the *Scabious*, and of a more blewish purple (but not darke red as *Gerard* saith, for such I never saw any) colour, which being past, there followeth seede like unto the *Scabious*, that falleth away in the same manner: the roote is somewhat thicke; but short and blackish with many strings, fastned thereto, abiding after seede time many yeares: Fabulous antiquity (the Monkes and Fryers as I suppose, being the first inventors of the Fable) said, that the Devill envying the good that this herbe might do to mankind, bit away part of the roote, and thereof came the name *Succisa*, Devils bit which is so grosse and senselesse a relation, that I merveil at the former times stupidity, to receive as true such a fiction. Of this kinde some doe make a greater and a lesser, which I thinke rather commeth from the place of growing, then from the nature of the plant. Vnto this plant in my opinion belongeth the *Scabiosa rubra Austriaca* of *Clusius*, set forth in my former booke; for the leaves thereof being all whole, and the flowers red, doe notably resemble this Devils bit, and may be a species thereof, proper to *Germany*, *Austria*, &c. *Bauhinus* maketh mention of one of this kind, that hath hairy leaves not differing in anything else, and for his author nameth *Gesner in hortis Germanis*, who as hee saith called it *Morsus Diaboli hirsuta rarior*, which I cannot finde in *Gesner*, but of the three sorts of *Scabious*, one of the lesser he calleth *Scabra hirsutaque*, having leaves without divisions, which whether he should meane this I know not: for he nameth it not *Morsus Diaboli*, therefore I leave it to time to declare the truth thereof.

2. *Morsus Diaboli flore albo*. Devils bit with a white flower.

This sort differeth not from the former in any other thing, then in the flower, which is of a pure white colour as some other sorts of the *Scabiouses* are, and that the greene leafe is not altogether of so darke a colour.

3. *Morsus Diaboli flore carneo*. Devils bit with bluish coloured flowers.

This other sort likewise differeth neither in roote stalke or leafe, from the former, onely the flowers which are of an incarnate or bluish colour, maketh the difference from both the other.

4. *Morsus Diaboli alter flore carneo*. Strange Devils bit.

This herbe which I place here for some likeness, hath divers leaves rising from the rootē, every one severally, on a long foote stalke somewhat like unto Betony or Sage, dented about the edges, the stalke riseth up amongst them a foote or more high, bearing one large flower at the toppe, hanging downe the head and made all of blewish threds.

The Place.

The first groweth as well in dry meddowes and fields as moist, in many places of this land, but the other two sorts are more rare and hard to meeete with, yet they are both found growing wild about *Apple dore*, neere *Rye* in *Kent*. The last groweth in the fields that are on the mountaines beyond the Seas,

The Time.

They flower somewhat later then the *Scabiouses*, as not usually untill *August*.

1. *Morsus Diaboli vulgaris.*
Common Devils bit.

Scabiosa rubra Austriaca.
The red Hungarian Scabious.

The Names.

It is usually called *Morsus Diaboli*, by most writers, or *Succisa* as *Esculapius* doth, and others after him, a *pre-morsa* or *succisa radice*. Some there have been that have thought it to be the *Genm* of the ancients; others take it to be *Nigina* of *Pliny*, whereof he maketh mention in his 27. booke, and 12. Chapter, in these words. The herbe that is called *Nigina*, hath three long leaves like the *Endiver*. *Fabius Columna* referreth it to *Picnocemon* of *Dioscorides*. The *Italians*, *Spaniards*, and *French*, and so likewise all other nations follow the Latine name, each nation in their severall dialect: or else the *Germanes* first calling it *Abbiss* and *Tenfell's abbiss*, caused the Latine name, and all other tongues following it, to call it thereafter: And we following the *Germanes* Devils bit. The last is the second *Aphyllantes* of *Dalechampsius*.

The Vertues.

The taste hercof being somewhat more bitter, declareth it to be hot and dry in the second degree compleate, and therefore is more powerfull and available, for all the purposes whereunto *Scabious* is appropriate, either inwardly or outwardly, as they are declared before, and especially against the plague, and all pestilentiall diseases, or fevers, poisons also, and the bitings of venomous beasts, the herbe or roote being boyled in wine and drunke: the same also helpeth those that are inwardly bruised by any fall, or crushed by any casualty, or bruises by outward beatings or otherwise, dissolving the clotted or congealed blood, and voyding it by excretion, or otherwise, and the herbe or roote beaten and applied outwardly, taketh away the blacke and blew marks, that remaine in the skinne after some accidents: the decoction of the herbe, wherein some Hony of *Roses* is put, is very effectuell to helpe the inveterate tumours and swellings of the *Almonds* and *throat*, which doe hardly come to ripenesse, for it digesteth, clenseth, and consumeth the flegme sticking thereto, and taketh away the tumours by often gargling the mouth therewith: it helpeth also to procure womens courses, and to ease all paines of the matrix or mother, to breake and disperse windes therein and in the bowels: the powder of the roote taken in drinke, driveth forth the worms in the body, the juice or distilled water of the herbe, is as effectuell for greene wounds or old sores, as the *Scabiouses* be, and clenseth the body inwardly; and the head outwardly, from scurffe and sores, itches, pimples, freckles, morpew, or other deformities thereof, but especially if a little *Vitriol* be dissolved therein.

CHAP. XI.

Plantago. Plantaine.

Under the name of *Plantaine*, is not onely comprehended all the sorts of *Plantaine* properly so called, whereof there are a great many sorts, as I shall shew you in this Chapter, but divers other sorts of herbes much differing from them: which shall be set forth in the next Chapter following, each kinde by it selfe as neare as I can, and because the *Plantaines* are divided into greater and lesser, or broader and

and narrower leaved ones, I thinke it the best method to separate them, and speake of each of them and their species apart, and not confound them together to avoide mistaking. One of these Plantaines are called Rose Plantaine, which although I have set it forth in my former Booke, yet I thinke it fit here to expresse it againe, and the severall formes and varieties therein.

Plantaines latifoliae. Broad leaved Plantaines.

1. *Plantago latifolia vulgaris.* Common Waybreade or Plantaine.

This common Plantaine I here set in the front of all the rest, because I would ranke it with the rest of the kinde, which is well knowne to all to beare many faire broad almost round pointed leaves, with seaven ribbes or veines in every of them for the most part, running all the length of the leafe, of a sad Greene colour on the upper side, and more yellowish Greene underneath; among which rise up divers small slender stemmes or stalkes, a foote high more or lesse, not easie to breake, naked or bare of leaves unto the toppes, where each stalk beareth a small long round blackish Greene spike or scaly head, whose bloomings or flowers, are small whitish threads with aglets hanging at the ends of them, almost like unto the blooming of Corne, after which come browne small seede, enclosed in the severall small scales or skins: the roote is made of many white strings, growing somewhat deepe, and taking so fast hold in the ground, that it is not easie to pull it up.

2. *Plantago latifolia maxima.* The greatest Plantaine.

This great Plantaine is in all things like the former, but that it exceedeth it in greatnesse and height, for the leaves that lie on the ground are fixe inches, that is, halfe a foote long many times and more, and foure inches broad, and the stalkes sustaining every leafe, neare an handbreadth long: the naked stalkes that beare spiked heads like the other, are two cubits high, and the head or spike a foote long, the roote hereof is blackish and stringy: Sometimes *Lacinia* his kinde is found to have leaves a foote long and halfe a foote broad, somewhat torne on the edges, and having *folijs* some leaves under the spiked heads.

3. *Plantago major incana.* Great hoary Plantaine.

The hoary Plantaine is likewise like the first, but that the leaves are very hoary white, especially in the hotter Countries of *Spaine*, &c. much more then in these colder climates, and somewhat small, it seldome beareth any spiked heads in *Spaine* as *Clausius* saith, but when it doth, they are smaller then the first, and the rootes are blackish and stringy. *Iohannes Thalium* in *Harcynia sylva* mentioneth a smaller kinde hereof, both in leaves and flowers.

4. *Plantago exorica sinuosa.* The strange crumpled Plantaine.

This strange Plantaine upon the first yeares sowing of the seede, which was sent from beyond sea, rise up but

1. *Plantago latifolia vulgaris.*
Common Waybreade or Plantaine.

2. 3. *Plantago maxima & flos incana.* The greatest
Plantaine and the flower of the great hoary Plantaine:

4. *Plantago exortica sinuosa*.
The strange crumpled Plantaine.

Plantaginix exortica sinuosa spica.
The spiked head of the strange Plantaine.

5. *Plantago latifolia rosea multiformis*, *foliumque incisum & spirale*.
Broad leaved Rose Plantaine of much variety, with a jagged leaf, and buking spike d head.

with one great and large leaf, almost a foot long, foulded as it were together, and wound about spire fashion into two parts at the further end thereof, which opening it selfe, yet remaining somewhat hollow, was much crumpled and waved on the edges; the further end shewing somewhat like unto a Plantaine leaf: but the bottome of the leaf had on each side thereof a large peece as it were torne from it, but yet growing to it, which were likewise crumpled and waved, and each of them shewing the forme of a Plantaine leaf, whose taste also was not unlike, so that the whole leaf seemed, as if divers great large leaves were joyned together to make one: this leaf perishing the first year, there rose up the next Spring divers leaves close together, not formed into one as the former, but as if divers leaves were joyned together, each bearing the Plantaine forme, but somewhat rounder a little crumpled and waved as the former was; the stalk rose up in the middle of these leaves, above a foot and a halfe high, bearing thicke and short spiked flattish heads and feeds therein, like unto the others; the roote is composed of a thicke round head, at the toppe with many long strings or fibres issuing thence downwards, thereby taking strong hold in the ground.

5. *Plantago latifolia rosea multiformis*. The broad leaved Plantaine of much variety.
This kind of Rose Plantaine is of many sorts, yet all of them have large and sometimes hoary Greene leaves spread

spread on the ground either whole like the former great Plantane, or a little jagged toward the lower part: among which rise up short naked stalks, bearing every one at the top, either a broad round head made of many small short Greene leaves in the fashion of a Rose, or a spiked thicke long head made of many shorter Greene leaves bushing thicke below and smaller upwards, and sometimes one plant will have both these formes at once together, and some again out of the middle of the Rose will have another short spike of green leaves rising up; and others at the bottom of the Rose or spike, will have one or two other small tufts either round or long. One sort there is like-wise whose long spiked heads, is parted into many and sundry severall sparfed spikes, and therefore called *Spiralis*: other varieties also are sometimes seene in some of this kinde, as nature listeth to produce them: the roote is like unto the former.

The Place.

The first groweth every where, in fields and in the pathwayes generally: the second about *Mompelien* in France; the third in divers places of Spain, where *Clusius* observed it, and in some other colder countries also: the fourth came from *Caspar Pilleterius* of *Mompelien* to Dr. *Lobel*, and the seede sown with Mr. *Iohn Nesmit* a *Scottishman*, chiefe Chyrurgion in his time to King *Iames*, where it grew divers yeares: the last, although a strange Plantane, yet naturally found in our owne country, and rising as it is likely from the third sort, and from thence cherished in gardens.

The Time.

They are all in their beauty about June, and the seede ripeneth shortly after.

The Names.

It is called in Greeke ἀρνόγλωσσος and ἀρνόγλωσσος, *Arnoglossum* and *Arnoglosses* a forma sc. *agnina lingua*: others call it *multinervia*, and ἑπτανervia *sepinervia*, either of the many, or of the seven ribbes or veines that are in every leafe: in Latine *Plantago* a planta vocabulo: the Arabians call it *Lifen* and *Lofan alhamel*: the Italians *Plantagine*: the Spaniards *Lhanten* and *Tamchage*: the French *Plantain*: the Germanes *Wegerich*: the Dutch *Wechbre*: the English *Waybread*, not *Waybread*, as divers corruptly call it, and *Plantane*: the first is called generally of all Authors *Plantago major*, or *latifolia*, or *vulgaris*. *Brunsellius* and *Tragus* call it *Plantago rubra* because the seede thereof is redder than of others: the second *Bauhinus* calleth *Plantago maximatota glabra*: the third *Clusius* calleth *Plantago major incana*, and *Plantago Salmaticensis*, judging it to be *Cynoglossum* of *Dioscorides*, which he saith beareth neither stalke nor flower, as *Clusius* saith this doth very seldome in Spain, but I doe not hold that a sufficient reason, to judge it to be *Cynoglossum*. *Fuchsius*, *Dodonaeus*, *Gesner*, and others, call it *Plantago media*, and *Lobel* *Plantago major incana*, yet *Turner* and *Tabermontanus* call it *Plantago minor*: the fourth *Lobel* onely expressed the first leaves in his Appendix to the *Adversaria*, by the title of *Plantago umbilicata latifolia*, and *convoluta unifolia*: I have added the Spikes, and call it *Plantago exotica sinuosa*, as best agreeing thereunto in my opinion: the last *Clusius* had the figure thereof from *Iames Garret* an Apothecarie, sometimes in *Lymestreete London*, which he caused to be taken from the living plant, growing in his garden neare *London Wall* by *Aldgate*, and thereupon called it *Plantago peregrina latifolia Garreti*, and *Plantago latifolia exotica*. *Bauhinus* calleth it *Plantago latifolia incana spicis variis*: and that other with many spikes *Lobel* calleth *Plantago panicula sparfa*, and may also be called *Plantago spiralis*.

Plantagines angustifoliae. Narrow leaved Plantaines.

1. *Plantago Quinquenervia major*. The greater Ribbeworte Plantane.

This greater Ribbewort Plantane hath divers narrow, long and hairy darke Greene leaves lying on the ground, with five veines or ribbes for the most part in every one of them, and pointed at the ends; among which rise up many naked and striped stalks, somewhat hairy, at the toppes whereof grow such like long and spiked darke Greene heads, as in the first common Plantaine, and flowering in the same manner, but greater and shorter, wherein lie such seede as in the former but greater and of a darker colour; the rootes are long, fibrous or stringlike like the former. This sometimes is found varying in the heads, for some will have two heads upon a stalke, or one head parted into two parts, or with two or more spiked heads, growing at the bottom of the head.

2. *Plantago angustifolia Rosea & multifloris*. Variable Rose Ribbewort.

This Rose Plantane hath such like leaves as the former hath, that it is not, or very hard to be knowne from it, before the stalks with heads beginne to appeare, which when they are full ripe, shew themselves in a variable manner; some having large or long narrow leaves set together, somewhat sparfedly, imitating a loose or dispersed Rose; others having shorter Greene leaves, and more compact and closed, making a more comely forme of a Rose, sometimes fully laid open, and sometimes more close, and as it were halfe closed, and sometimes out of the middle of the Rose will arise two or three or more short stalks, bearing each a small Greene Rose, and therefore called *Prolifera*, made of many small leaves set together in the same manner, and sometimes many short spikes set close together in one head, or separate each by it selfe: this kinde beareth no seede that ever was observed, but is increased by slipping or parting the roote, and setting it againe.

3. *Plantago angustifolia minor*. The lesser Ribwort Plantane.

The smaller Ribbewort Plantane, is in every part thereof like the first sort, but that it groweth smaller and lower, and this onely maketh it to differ from it.

4. *Plantago angustifolia serrata*. Spanish Ribbewort with dented leaves.

This Spanish Ribbewort is like the lesser sort, but smaller, narrower and harder in handling, being dented about the edges, and so sharpe with all, that they might seeme to be prickles, which hath caused some to call it *peregrina spinosa*: the spiked heads stand upon slender stalks, about halfe a foote high, being somewhat open or dispersed.

5. *Plantago angustifolia fruticans*. Shrubbe Plantane.

The shrubbe Plantane is in all things like the smaller Ribbeworte, but that the leaves are whiter, and the stalks high and woody, with small leaves on them, and the heads are in fashion like them, but shorter and softer, bearing whitish blooming and darke seede.

1. 4. *Plantago angustifolia* sive quatuor minima major & serrata.
The greater Ribwort Plantane with plaine and dented leaves.

2. *Plantago angustifolia* rosea & multiflora min.
Variable and Rose Ribwort.

3. *Plantago angustifolia* minor.
The lesser Ribwort Plantane.

6. *Plantago Apula bulbosa*. 8. *Trisetaria folio angustissimo*.
Bulbed Ribwort of Naples. The smallest Ribwort.

6. *Plantago Apula bulbosa*. Bulbed Ribbewart of Naples.

This Bulbed Ribbewart hath a long small and round head, for the upper part of his roote, like unto a small Bulbe or Onion, of the bignesse of an Hassell Nut or bigger, from whence shoote downe into the ground, many thicke and blacke long fibres: from this head or bulbe spring forth, many long and narrow leaves like the first Ribwort, lying upon the ground, but that each of them are mote hairy and dented, or cut on the edges into gashes, separate a good distance one from the other, somewhat like unto Bucks horne Plantane, from among which rise up slender hairy round stalkes, about a foote high, bearing such like spiked heads, as the first doth, with pale yellow bloomings, and small blackish seede after them.

7. *Plantago montana trinervia*. Small mountaine Ribbewart Plantane.

This small mountaine Ribbewart, hath divers very small and long hoary white leaves, having each of them, but three ribbes or veines a peece running through them, whereof it tooke the name: the stalkes that rise among them are small, and Rush like, not much above a foot high, whereon stand small thicke and short heads, with small flowers on them, made of foure small thiffe leaves, and small white threds hanging out of them, like the other sorts of Plantane, after which come such seede as is in the rest: the roote hath a small long necke, hairy above, and set with pale long fibres underneath.

8. *Plantago trinervia folio angustissimo*. The smallest Ribbewart.

This least Ribbewart hath such like leaves as the last lying upon the ground, but they are neither so white nor so long, very narrow and some longer, or shorter than others, all of them smooth and without any haire upon, or but a very little shew; the smooth stalkes are many that rise up amongst them, being of divers sises, for some rise not above foure inches, others halfe a foote, or a foote, and some a foote and a halfe high, whereon grow small and somewhat long spiked heads, the rootes are many small white fibres.

9. *Plantago angustifolia paniculis lagopi*. Hares foote Plantane.

This Plantane hath many long ribbed rough hairy leaves, very like unto the first Ribbewart, but ending in a smaller and sharper point, it sendeth forth a number of small round brownish stalkes of divers sises or heights, some being not above two or three inches high, and others halfe a hand breadth, or an hand breadth high at the most; whereon stand small long reddish heads, like unto the heads of *Lagopus* or Hares foote, some being longer, and others smaller and shorter, but all soft with small reddish flowers at them, and small threds hanging from them, as in the other sorts, and small seede following: the roote is somewhat long with many reddish fibres growing there from. This sometimes is found so small, that it scarce exceedeth three fingers in height, being more hairy, and having smaller and rounder heads.

The Place.

The first without dents on the edges, and the third grow with us in divers Meddowes and fieldes, and by pathways: in gardens also it is found as a weede: the second is found wilde in divers places of this Kingdome, and brought and cherished in gardens for the rarietie: the fourth and fift were brought us from Spaine by *Guillaume Boel* often remembered both in this and my former Booke where he found them: the sixth and seventh grow in the Kingdome of Naples, *Fabius Columna* having found them there and set them forth: the eight *Bauhinus* saith, groweth with them about Bassill, by the way side and among rubbish: the last in the fields about *Nemausum*.

The Time.

These all flower and seede at the time, that the former doe, that is, in May, Iune, and Iuly.

The Names.

This is called in Greeke *πεντανεύριον* & *Pentanevrius*, that is, *Quinquenervia*; in Latine *Plantago angustifolia*, and *Plantago media* & *minor* of some, and *Lanceolata* and *Lanceola*, in Italian *Lancivola*, in French *Lanceola*, in high Dutch *Spitzer Weegerich*, in low Dutch *Honts ribbe*, in English Ribbewart, and Ribbewart Plantane. The first is generally called either *Plantago angustifolia major*, or *Plantago Quinquenervia major* of many, of *Fuschius*, *Dodonæus*, *Gesner* and others *Plantago minor*; of *Matthiolus* and *Lugdunensis* *Plantago longa*: the second hath many titles to expresse it, according to the formes of the spikes, as *Plantago torosa prolifera*, *rosea*, &c. the third is remembered by *Thaluis* in *Harcynia sylva*: the fourth and fift *Clusius* maketh mention of in his *Cura posteriores*, but the same *Guillaume Boel*, brought the dried plants and shewed them to me and others, before hee shewed them to him; and I had the seedes of them, as of many other things, which hee gathered most part upon my charge, whereof many sprang and seeded, and in their places are remembered: others sprang but seeded not, and so we have lost the kindes, which wee have not of many things gotten againe: the sixt *Fabius Columna* called *Plantago Apula laciniata bulbosa*, and *Bauhinus* *Plantago pilosa bulbosa*; the seventh *Columna* also calleth *Plantago altera minima trinervia montana incana*, and *Bauhinus* *Plantago trinervia montana*: the eight *Bauhinus* calleth *Plantago trinervia folio angustissimo*: the last he also calleth *Plantago angustifolia paniculis Lagopi*.

The Vertues.

All these sorts of Plantane both the greater and the lesser, both the broader and the narrower leaved, are of one properrie, that is, cold and drie in the second degree. I thought good to speake of their vertues in the end of all their descriptions, to avoid prolixitie and tautologie in repeating the same properties divers times. All the Plantanes, (but some hold the Ribbewart to be the stronger and more effectuell) have these properties hereafter ensuing. The juice of Plantane depurate or clarified, and drunke for divers dayes together, either of it selfe, or in other drinke, prevaileth wonderfully against all torments and excoriations in the guts or bowells, helpeth the distillations of rheume from the head, and layeth all manner of fluxes in man or woman, even the feminine courses also, when they come downe too abundantly: it is good to stay the spitting of bloud, and all other bleedings at the mouth, by having a veine broken in the stomacke, and that maketh bloody or foule water by any ulcer in the veines or bladder, as also to stay the too free bleeding of wounds; it is held also an especiall remedy, for those that are troubled with the Priske or Consumption of the lungs, or have ulcers in their lungs, or have coughs that come of heate: the decoction or powder of the rootes or seede, is much more binding, for all the purposes aforesaid than the herbe is. *Dioscorides* saith, that if three rootes be boiled in wine and taken, it helpeth the tertian ague, and foure rootes the quartane; but I hold the number to be fabulous, yet the decoction of divers of them, may be effectuell; but *Tragus* holdeth that the distilled water thereof drunke before the fit is more proper.

the seede made into powder, and mixed with the yolke of an egge, and some wheate flower made into a cake and baked, either in an oven, or betwene a couple of tyles heated for the purpose, this cake prepared every day fresh and eaten warme, for some few dayes together, doth mightily stay any fluxe of the stomacke, when the meate passeth away indigested, and stayeth like wise the vomitings of the stomacke: the herbe, but especially the seede which is of more subtile parts, is likewise held to be profitable against the drop sicke, the falling sicknesse, yellow jaundise, and the oppilations or stoppings of the liver or reines: the rootes of Plantane and Pellitory of Spaine, beaten to powder and put into hollow teeth, taketh away the paines in them: the clarified juice, or the distilled water but especially that of Ribbewort, dropped into the eyes cooleth the inflammations in them, and certainly cureth the pinne and webbe in the eye, and dropped into the eares, caseth the paines therein, and helpeth and restoreth the hearing: the same also is very profitably applied, with juice of Houfleeke against all inflammations and eruptions in the skinne, and against burnings or scaldings by fire or water; the juice or the decoction made either of it selfe, or with other things conducing thereunto, is a lotion of much use and good effect for old or hollow ulcers that are hard to be cured, for cancers and sores in the mouth, or privie parts of man or woman, and helpeth also the paines of the hemorrhoides or piles, and the fundament: the juice mixed with oyle of Roses and the temples and forehead annointed herewith, caseth the paines of the head proceeding from heate, and helpeth frantiecke and lunaticke persons very much, as also the bitings of Serpents, or a madde Dogge: the same also is profitably applied to all hot gouts in the feete or hands, especially in the beginning, to coole the heate, and repress the humours; it is also good to be applied where any bone is out of joint, to hinder inflammations, swellings, and paines, that presently rise thereupon: the powder of the dried leaves taken in drinke, killeth the wormes of the belly, and the said dried leaves boiled in wine, killeth the wormes that breede in old and foule ulcers: One part of Plantane water, and two parts of the brine of powdered beefe boyled together and clarified, is a most sure remedy to heale all spreading scabbes and itch in the head or body, all manner of tetter, ringwormes, the shingles, and all other running and fretting sores: Briefely, all the Plantanes are singular good wound herbes, to heale fresh or old wounds and sores, either inward or outward. *Erasmus* in his *Colloquia*, reporteth a prettie story of the Toade, who being stung or bitten by a Spider, sought out Plantane, and by the eating thereof was freed from that danger.

CHAP. XII.

Holostemum seu *Plantago marina*. Sea Plantane.

Here remaine some other sorts of herbes referred to the Plantanes, which shall follow in their order, and first of those are called *Holostemum*, which for want of a fitter name we call Sea Plantane.

1. *Plantago marina vulgaris*. Ordinary Sea Plantane.

This sea Plantane hath many narrow long and thicke Greene leaves having here and there a dent or two on the one edge pointed at the end, among which rise up sundry bare stalkes, with a small spiked head thereon smaller than Plantane, else alike both in blooming and seede: the roote is somewhat white thicke and long with long fibres thereat abiding many yeares.

1. *Plantago marina vulgaris*.
Ordinary Sea Plantane.

2. *Holostemum Salmanticum*,
Spanish Sea Plantane.

3. *Holosteum angustifolium majus*, sive *Serpentaria major*.
The greater Sea Plantane with grassie leaves.

4. *Holosteum angustifolium minus* sive *Serpentaria minor*.
The lesser Sea Plantane with grassie leaves.

5. *Holosteum Creticum* sive *Leontopodium Creticum*.
Candy Sea Plantane.

- Leontopodium idem diverse expressum*.
The same plant diversely expressed.

2. *Holostemum Salmanticum*. Spanish Sea Plantaine.

This Spanish Sea Plantaine also differeth not much from the former greater kinde, having many narrow hoary leaves lying on the ground, but shorter and broader then they, among which rise up divers naked short stalkes, little more then an handbreadth high, furnished from the middle almost to the toppes with many whitish greene flowers, standing more sparsely in the spiked heads then the former, which afterwards yeeld final seeds in husks like unto Plantaine feede: the roote is somewhat long and hard with divers fibres at it. There is another fort here, of much lesser then the former, the leaves greener and narrower, and the heads

6. *Myosuros Cauda Muris*.
Moufetaile.

*Alia
minus.*

3. *Holostemum angustifolium majus* sive *Serpentaria major*.

The greater Sea Plantaine with grassie leaves.

This greater Sea Plantaine, hath a number of small long leaves, almost like grassie but that they are stiffe and hard sometime lying upon the ground, and sometime from a stemme under them raised a little higher; of a grayish or hoary green colour, and having on some of them, some small gashes on the edges, among which rise up naked stalkes about halfe a foote high, with small spiked heads, like unto Plantaine heads, set on the toppes of them, wherein is contained such like feede also: the roote is somewhat thicke long and woody, with some fibres growing thereat.

4. *Holostemum angustifolium minus*.

The lesser Sea Plantaine with grassie leaves.

This lesser *Holostemum* is very like the former, but that it is smaller and scarce having any dent on the edges, and growth much lower, not exceeding three or foure inches in height, having such like heads but smaller.

5. *Holostemum Creticum* sive *Leontopodium Creticum*.
Candy Sea Plantaine.

This Candian plant (which hath bene diversly named dy divers) hath from a reddish roote, somewhat great and as it were scaly at the head, growing smaller downwards, and spread into many long fibres, many long and narrow soft woolly leaves an handbreadth long, with three ribbes in each of them, among which rise up divers small and short foote stalkes, about two or three inches long and covered with a soft reddish woolliness, on every one whereof standeth a short thicke reddish woolly head, like unto a Plantaine head, having divers whitish flowers upon them, with blackish spots within them, seeming so many holes in them; which after they are past, have small brownish feede enclosed in their huskes, very like unto Plantaine feede, or the feede of *Psyllium* or Fleawort, which huskes when they are full ripe, doe bend downwards to the ground, and are so drawne or bended together, that they resemble herein a Lions foote clasped together, whereof some gave it the name of *Leontopodium*.

6. *Holostemum Loniceri Cauda muris* vocatum. Moufetaile.

I might well have placed this herbe among the grasses, being undoubtedly of that tribe, but that divers authors doe joyne it with these *Holostemum*s because it is in taste and property like them, take it therefore in this place. It shooteth forth divers small grassie leaves, very short, rough and hard, among which spring divers small slender stalkes, with small long blackish greene spiked heads, like unto a small Plantaine head but smaller, having white flowers on them, which quickly fade and fall away, after which there is found very small blackish feede in the long heads, which then in some are a little crooked, and in others straight resembling a Moufetaile, whereof came the name: the roote is small and threddy.

The Place.

The first growth in divers places upon our owne coasts, and others also. The second of both sorts groweth as *Clusius* saith in many places of Spaine, in *Valentia* and *Salamanca*. &c. The third and fourth by the Sea side, in Italy as *Matthiolus* saith, in *Goritiensis* agro, and in the mountaines of *Gualdo* as *Durantes* saith, *Camerarius* saith by a lake of salt water neare *Islebia*, which is in Germany, I have it confidently affirmed to me that both the lesser and greater sorts grow neare the sea side in the West parts of the land, namely in all the tracts of the Marshes, neere *Astferry* in *Gloucestershire*. The fifth in Candy, from whence it hath bene often sent to divers friends. The last groweth in many fertile pastures and meadowes, as also on dry bankes, and by the path sides in many places of our owne land.

The Time.

They doe flower in the moneths of *June* and *July*, and their feede ripeneth quickly after; the last which is the earliest of them all, floweth often in *Aprill* and almost gone in *May*.

The Names.

It is called in Greeke *ὀλίστεμον* and *ὀλίστερον* *Holostemum* and *Holostemum*, for it is written both wayes by many, *quasi tota ossa*, which is per antiphrasim, for as *Pliny* saith, *ex adverso sit a Græcis appellata, sicut fel dulce, quod sine duri- ti est herba nihil enim durum ostendit habet*. There hath bene much controversie among the learned writers and Herbarists about this herbe, divers diversly thinking of it, some holding one herbe to be it which another dis- proveeth, almost every writer framing one to himselfe, as *Lonicerus* the *Cauda Muris*, *Matthiolus* the *Gramen Invenum*, when as before he tooke *Serpentina* to be it, and some as he saith tooke the *Pilosella minor* to be *Holostemum*, whom he contradicted: *Lobel* the *Filix petraea* *Tragi*, *Ruellius* *Leucanthemum*, *Clusius* calleth that *Holostemum Salmanticum majus*, which *Dodoneus* calleth *Plantago angustifolia alba*; and that *minus* which as he saith (and *Lobel* and *Pena* say the same) they of *Mompelier* called *Holostemum parvum*. *Banbinus* includeth not one- ly the *Serpentina*, or *Serpentarias* of *Matthiolus* and others, and the *Holostemum Salmanticum majus* and *minus* of *Clusius*, under the name of *Holostemum*, but the *Leontopodium Creticum* of both sorts of *Clusius*, which as he saith he set forth in his *Phitopanax* above twenty yeares, before *Clusius* set forth his *historia rariorum plantarum*. The first

It was first mentioned by *Lobel* and *Lugdunensis*, and *Gerard* from him. The second of both sorts is called by *Clusius* *Holostium Salamanticum majus & minus*, because the learned of *Salamanca* in *Spain*, called it *Holostium* as he saith, whom *Camerarius*, *Lobelius*, and *Lugdunensis* doe follow. *Camerarius* in his *Matthiolus* calleth it as he saith, whom *Camerarius*, *Lobelius*, and *Lugdunensis* doe follow. *Camerarius* in his *Matthiolus* calleth it *Holostium quorundam*, and *Dodonæus* as I said before *Plantago angustifolia alba*. *Bauhinus* calleth it *Holostium visutum albicans majus*, as he calleth the lesser *Salamanticum* of *Clusius*, *visutum albicans minus*. The third *Matthiolus* called *Coronopus sylvestris*, and saith they of *Goritia* called it *Serpentina*, which since hath beene continued by *Dodonæus*, *Lobel* and others, *Camerarius* in *horto* calleth it *Plantago marina*: *Dodonæus* calleth it also *Plantago angustifolia*. The fourth is mentioned also by *Lobel* by the name of *Serpentina omnium minima*, and is his *Coronopi & Sedimontani media planta Massiliensis* also, for so he saith, they are both one and the same, and is in my judgement the *Holostium quorundam* of *Lugdunensis*, although *Bauhinus* maketh these two sorts to be foure severall plants, with foure distinct titles. The fifth *Bauhinus* as I said before, saith he set forth before *Clusius* in his *Phytopanax*, and after in his *Prodromus*, under the title of *Holostium*, five *Leontopodium Creticum*, and includeth both the descriptions and figures of both the sorts of *Leontopodium Creticum* of *Clusius* in one, wherein I thinke he hath done rightly, whom I have followed, for although *Clusius* hath set forth divers figures, as they were sent him from divers places and persons, yet it seemeth very probable, both by his owne relation, and *Honorius Bellus* his description thereof, which is extant in the first Epistle of the said *Bellus* to *Clusius*, that they are both but one plant, and not two different sorts; but as he and *Bauhinus* say, was sent by *Cortusius* to them both, by the name of *Catanance prima* of *Dioscorides*, which *Honorius Bellus* disproveeth in the said Epistle. *Bauhinus* saith also he received it from *Ferrantes Imperator* of *Naples*, by the name of *Holostium minus*, and from *Alpinus* by the name of *Goine album catharticum*, and is the *Habbures* of *Camerarius*, and the *Plantago* *similis* of *Lugdunensis* in his Appendix. The last as I said before, divers doe referre to these kinds of *Holostium*, as after *Lonicerus*, *Camerarius*, *Thalius*, and *Lugdunensis*. *Bauhinus* himselfe calling it *Holosteo affinis Cauda muris*, and almost all others *Myosuros* or *Cauda muris*, onely *Tragus* calleth it *Coronopus sylvestris*. We may call all these herbes except the last, Sea Plantaines, although they grow in some places farre from the Sea, as well as neere it in others, for the resemblance they have in their narrow ribbed leaves, and spiked heads, unto the smaller Plantaines or Ribbe worts, but especially for their properties which being cooling and binding like unto them, are no doubt of the same faculty: the *Leontopodium* may be called Lions foote, or Lions claw, according to the Latine, although it justly be referred to these kinds of Plantaines. The last is called in *English* *Mousetayle* generally, and of some *Blood strange*, but I thinke corruptly from blood staying, for in that faculty it is predominant, all other Dialects follow the Latine name thereof.

The Vertues.

What hath beene formerly said of the other Plantaines, may in some sort be justly referred to these, for in their qualities of cold and drynesse, they are I said little differing, wherein the Plantaines are excellent; and therefore it shall not neede to reapeate the same things here againe, that formerly have beene there spoken. Onely for the third kind here mentioned, *Matthiolus* saith, that they of *Goritia*, who call it *Serpentina*, have used it to especiall good purpose, as he himselfe saith also, he hath found by good experience, against the birings or bittings of Serpents especially, and of the other venomous beastes, as also to helpe those that are troubled with the dropsie, especially that which hath possessed the whole body, the *Mousetayle* is cooling and drying like the Plantaine, and the Country people in some places of this land, apply it not only to those that bleede at the nose, by bruising the leaves and putting it up therein, but also to stay the much bleeding of wounds, and to heale them up.

CHAP. XIII.

Coronopus sive Cornu Cervinum. Buckshorne Plantaine.

Here are some other sorts of this herbe better knowne in these dayes, then they have beene formerly, which though growing in different climates, we will draw into one Chapter, and expresse them together.

1. *Coronopus vulgaris sive Cornu Cervinum*. Common Buckshorne Plantaine.

This being sowne of seede riseth up at the first, with small, long, narrow, hairy, darke greene leaves like grasse, without any division or gash in them, but those that follow are gashed in on both sides of the leaves, into three or foure gashes and pointed at the ends, resembling the knagges of a Buckshorne, whereof it tooke the name, and being well growne lye round about the roote upon the ground, in order one by another, thereby resembling the forme of a starre, and therefore called *Herba Stella*; from among which rise up divers hairy stalkes, about an handbreadth high, bearing every one a small long spiky head, very like unto those of the common Plantaine, having such like bloomings and seede after them: the roote is single long and small, with divers fibres annexed thereunto, the taste hereof is altogether drying like Plantaine.

2. *Coronopus Prochyta Insular*. Prickly Buckshorne.

This differeth little from the former, but that it hath his leaves somewhat larger, broader, and thicker, more hairy or rough also, and the dents or divisions of the leaves more sharpe and prickly; the stalkes and heads are somewhat more rough and hairy, and differeth not in the rest.

3. *Coronopus tenuifolius maritimus*. Small Sea Bucks-horne of *Naples*.

This small Sea Bucks-horne (for I might well have made our owne Sea Plantaine, to be the greater kinde hereof, in that it hath more eminent dents on the edges of the leaves, then the other *Serpentina* of *Matthiolus*, which I might impute rather to the climate then to a differing kinde, but take it in which sense you please, for neither you nor I can erre much, if we take it in either) hath many leaves lying on the ground, foure inches long, and so narrow that the Sea Southernewood leaves exceed them not, having on each side the leafe, three very long cuts or gashes turned inwards, all of them smooth and of a fresh greene colour, and not rough or hairy at all as the former, among which come up such like heads, upon small stalkes, as are in the first, but smaller,

1. *Coronopus vulgaris* five *Cornu Cervinæ*,
Bucks-horne Plantaine.

Coronopus Ruellij.

5. *Coronopus Ruellij* *reflexa* *vel* *repens*.
Vpright or creeping Bucks-horne or Wart Cresses.

smaller, as the roote is also: the taste hereof is no lesse astringent then the former.

4. *Coronopus maritimus minimus hirsutus*.

The small hairy Sea Bucks horne.

This other little kinde, is somewhat like the last, but that the leaves being very small, are not so finely or finally gashed on the edges, but stand rather like a little *Scabious*, and all hairy over: the stalks likewise are hairy, and not much above an inch high, bearing small hairy spiked heads like the rest, but smaller, whereon appeare white flowers quickly fading.

5. *Coronopus reflexa vel repens* Ruellij.

Vpright and creeping Bucks-horne or Wart Cresses.

Ruellius hath referred this small plant to the ordinary *Coronopus* or Bucks-horne, for some resemblance it hath thereto, although in quality much differing, which notwithstanding divers writers have since *Ruellius* reckoned still with the *Coronopus* or Bucks-hornes, and therefore let it also here passe in the same manner. It is a small low herbe, yet in some places standing more upright, but most usually creeping with many long branches, and spreading a great way upon the ground round about: the creeping kind never rising much above foure fingers high the other more, with divers very small long and divided or cut leaves thereon, all along on both sides of them, somewhat resembling the divisions of the former or the Garden Cresse: the flowers are small and white, coming forth at the joynts with the leaves, many set upon a small long footestalk, one above another; after which come small rough or sharpe round huskes somewhat resembling rough warts, which divide themselves into two parts, and containe in each of them a small brownish seede: the roote is small white and long, with many fibres thereat growing downe deepe into the ground, the taste whereof is somewhat hot like Cresses, but much milder, and is of many used to be eaten as a Salter herbe, both boyled and Greene with vinegar, as *Ruellius* himselfe saith.

The Place.

The first usually groweth in drie sandy grounds, as in *Tuttle fields by Westminster*, and divers other places of the land: it was wont to be planted and nourished up in gardens in *Italy, France*, and other places, where the people more delight in greene and faller herbes than we in this countrie doe, because it was in frequent use to be eaten by them: the second as *Columna* saith, groweth on the rockes, in the Iland *Prochyta*: the third hee saith likewise groweth in many untilld grounds in the Kingdome of *Naples* neare the sea side, and so doth the fourth, neare the sea side, but particularly in what countrie is not expressed: the last groweth every where almost round about *London*, in any moist ground, or the foote of bankes, where there is any low trench or rill, that is not continually filled with water.

The Time.

They all flower and feede in *May, Iune, and Iuly*, and their greene leaves abide fresh in a manner all the Winter.

The Names.

It is called in Greeke *κορωνόπος Coronopus*, *a corvino pede quem effigiant folia*, saith *Pena*, that is Crowfoote, whereunto the leaves are like, which name the Latines doe hold, as also *Cornu cervi*, or *cervinum*, and *Herba Stella*, both of them, from the posture of their leaves. Some also call it, *Harenaria* and *Sanguinaria* or *Sanguinalis*, the one from the place of his growing, the other from the effects or properties. There hath beene much doubt formerly, what herbe should be the true *Coronopus* of *Dioscorides*, for the name signifying a Crowes foote, deceived many, and led them into that errour, to thinke that the herbe called *Pes corvini*, and *Pes gallinaceus* should be it; among whom are not only the Comentators upon *Avicen*, but *Brunfelsius* also of late dayes, who carried away rather with the current of the time, and the signification of the name, than with the opinion of others that contradicted it, and without the due examination of the herbe it selfe held this opinion, whom *Matthiolus* justly reprehendeth therefore, shewing that it was a species of *Ranunculus*, that was generally called *Pes corvini*, and *Pes gallinaceus*, which is an exulcerating herbe, and not this *Coronopus* which *Dioscorides* maketh a faller herbe familiarly eaten, and alloweth of *Monardus Ferrariensis* his judgement, that set downe this *Herba stelle*, or *Cornu cervinum*, to be the true *Coronopus* of *Dioscorides*. *Matthiolus* contesteth also against *Lonicerus* that tooke a kinde of grasse, called *gramen Manne esculentum*, and *Pentadactylon*, which hee saith was called by his countymen *Capriola*, and *Sanguinella* in *Matthiolus* countrie, to be the *Coronopus* of *Dioscorides*; which grasse as he saith, although it hath five small spikes growing at the toppes of the stalkes, which being opened resemble in some manner, the foote of a Crow or other bird (as thereupon tooke the name *Pentadactylon*, of five fingers of a spread hand) yet this hath no divided leaves, neither is a faller herbe for men to eat, but only being a grasse serveth as hay for beastes: there is also another controversie among divers, what herbe *Theophrastus* should meane by his *Coronopus* (which *Gaza* translateth *Solidago*, and) which hee placeth among the prickly plants, whom *Pliny* also herein followeth in his 21. Booke and 16. Chapter; and yet in his 22. Booke making mention thereof, doth not speake of any prickles it hath, following peradventure *Dioscorides* text therein; but *Matthiolus* to excuse *Theophrastus* his prickles in *Coronopus*, suppoeth that the jagges or divisions of the leaves of *Cornu Cervinum*, might be taken or mistaken by *Theophrastus* to be thornes (he might as well say hornes) or prickles, although they be not hard nor sharpe: and therefore judgeth the *Coronopus*, both of *Dioscorides* and *Theophrastus* to be one plant; which thing although with *Matthiolus* I thinke to be true, yet doe I not thinke his reason therefore to be true; but if I may give my judgement thereof, I thinke it more probable that *Theophrastus* might see such a *Coronopus*, as *Fabius Columna* calleth *Insule Prochytae*, which hath sharpe and prickly edges; (as is before said in the description thereof) and therefore placed it *inter aculeatus*; and *Dioscorides* such as we usually have, which grew in milder places, and is a tender herbe, used to be eaten; and hereby as I thinke they may be reconciled together. The first is called *Coronopus sativus*, by *Cordus*, *Gesner*, *Camerarius* and others, and *hortensis* by *Bauhinus*, because it was familiarly sown in gardens for meate, and *Herba Stella*, as I said before, by *Lobel*, *Dodonaeus* and others, and *Cornu cervi*, and *Cornu cervinum*; yet the same herbe is also called *sylvestris*, being found wild by divers, both the same and other Authors: the second is as I said called *Coronopus Insule Prochytae*, by *Fabius Columna*, and by *Bauhinus* *Coronopus sylvestris hirsutus*: the third the same *Columna* calleth *Coronopus Neopolitanus tenuifolius minimus*, and *minimus tenuifolius maritimus*: the fourth *Bauhinus* setteth forth under the name expressed in the title: the last is thought by some to be the *Coronopus* of *Dioscorides*; but called by some *Nasturtium verrucarium*, yet is generally called *Coronopus repens* *Rhelly*: but *Dodonaeus* thinketh it fitter to be called *Pseudo coronopus*, or else *Cornu cervi alterum vulgi*; the upright plant is *Matthiolus* his *Ambrosia*, and *Lobel* his *Ambrosia spontanea strigosior*, and *Bauhinus* himselfe putteth it for a second *Ambrosia*, because it is figured upright by *Matthiolus* and *Lobel*. The first is called by the *Italians* *Herba stella* and *Coronopa*, by the *Spaniards* *Guibella*, by the *French* *Corne de Cerf*, and *pied de cornolle*; by the *Germans* *Krautwensuss*, by the *Dutch* *Hertsharren*, we in *English* call it *Bucks horne*, *Harts horne*, and *Bucks horne Plantane*, and of some Herbe *Ivy*, and *Herbe Eve*; *Gerard* calleth it *Swines Cresses*, but I do rather call it *Wart Cresses* according to the Latine name that some give for the forme of the huskes of feede.

The Vertues.

Buckshorne Plantane boiled in wine and drunke, is an excellent remedy for the biting of a *Viper* or *Adder* (for I hold our *English Adder* to be the true *Viper*, both by the forme thereof, the teeth it hath with poison in the gummies, being deadly and dangerous upon the biting, and by the breeding, which is of quicke young ones, and not by egges as snakes, &c.) by laying some of the herbe to the wound: the same also being drunke, helpeth those that are troubled with the stone in the reins and kidneyes, not that it breaketh the stone or expelleth it, but by cooling the heate of the parts, and strengthening the backe and reins: it layeth likewise all bleedings, and eruptions of blood, whether at the mouth or nose, either by urine or the stoole, and helpeth the lake of the belly and bowells, and the dysentery or bloody fluxe: it helpeth much also those that have weake stomackes, and are much given to casting, not containing their meate; and this the herbe doth well, but the roote more effectually. *Paulus Aegineta* in his seventh Booke writeth, that it helpeth those that are troubled with the collicke; of which some make a doubt, that it might be an errour of the Writer in mistaking the word, but that he in the same place, presently after that he hath shewed, that the *Larke* is a remedy for the collicke adioyneth this also, that the rootes also of *Coronopus* doth helpe the cholicke; it hath beene held profitable for agues, to weaken their fits, and to take them away, to hang the rootes with the rest of the herbe about the necke, as nine to men, and seven

seven to women and children; but this, as many other are idle amulets of no worth or value: yet since it hath bene reported unto me for a certaintie, that the leaves of Bucks-horne Plantane laid to their sides that have an ague, will suddenly ease the fit, as if it had bene done by wicherie: the leaves and rootes also beaten with some bay salt, and applied to the wresses worketh the same effects, which I hold to be more reasonable and proper: the herbe boyled in Ale or Wine, and given morning and evening for some time together, helpeth all sorts of sore eyes, that come by the distillation of hot and sharpe or salt rheumes, falling from the head upon them, by cooling and tempering the heate and sharpenesse, and staying the distillations. The *Coronopus Ruellii* or creeping Buckshorne being as I said a fallet herbe with many, is also thought by some, good to take away warts by a specificall proprietie of the seede.

CHAP. XIV.

Ophris sive *Bifolium*. Tway-Blade or Herbe Bifoile.

Some have made two or three sorts of the upland Bifoile, one greater and another lesser, one with two leaves as is usuall, another with three leaves, as if it were a differing species; but herein I thinke they are deceived, for the superfluitie of leaves in this, is no otherwise than in many others, a *lusus naturæ*, which upon transplanting every one may know that will. I shall therefore shew you the description but of one of this kinde, yet mention these other that are but as accidents in nature, and withall shew you a Marsh kinde not remembred by any before.

1. *Bifolium sylvestre vulgare*. Ordinary wood Bifoile or Twayblade.

This small herbe from a roote somewhat sweete, whose head or toppe is somewhat thicke, which some have called a Bulbe (I have therefore given you it in another figure by it selfe) shooting many long fibres downwards, raiseth up a round Greene stalk, bare or naked next unto the ground, for an inch two or three to the middle thereof, as the plant is in age and growth, as also from the middle upward unto the flowers, having onely two broad and short ribbed pale Greene or hary leaves, very like unto Plantane leaves but whiter set at the middle of the stalke one on each side, and compassing it at the bottome, sometimes it will get three leaves, which thereupon some reckoned to be a different sort, which is as we call it, but *lusus naturæ* by the abundance of nourishment in the plant, as it hapneth to very many other plants, (as to the *Herba Paris* as I said before, sometimes having five leaves, and sometimes sixe or seven, and sometimes wanting a leafe, when as ordinarily it hath but foure, and so likewise in the ordinary field Trefoile, which as all know usuall hath but three leaves upon a

Bifolium sylvestre vulgare seu *Ophris*.
Ordinary wood Twayblade or Bifoile.

Ophris Bifolia cum radice bulbosa.
Twayblade whose bulbous head is more conspicuous.

Stalke, yet oftentimes divers stalkes are found, that beare foure leaves and the like in a number of other plants which were endlesse as well as needlesse to repeate) some also reckon up two species or sorts hereof, a greater and a lesser (but none of them mention the *Palustre* whereof I shall speake in the next place) both in that which beareth but two, as also in that which beareth three leaves; and *Clusius* in his *Cura posterior* mentioneth one very small sort, that the Capuchine Frier *Gregorius de Reggio* found, all which I account to be but the variation of the soyle and aire, and therefore I do not here distinguish them into so many severall sorts as they do: the flowers at the toppe of the stalkes are many small long whitish Greene shaplesse bodies, as it were, somewhat like unto some of the *Orchides* or *Satyriums* which passe away, having small heads with dust in them afterwards.

2. *Bifolium palustre*. Marsh Bifoile.

The Marsh Bifoile hath scarce bene observed by any, or at least hath deceived many that supposed it not to be differing from the former, although differing in the site, yet the difference is manifest, first in the smallnesse, being much lesser, and having sometimes three leaves also: secondly in the greenesse, the other being more hoary white: thirdly in the spike of flowers, which although of the same fashion and colour or very neare, yet lesse by farre: fourthly, in the rootes which in this doe runne or creepe in the ground: and lastly, the place which is not the Woods, but Moores, Bogges, and wet Marsh grounds.

The Place.

The first is usually an inhabitant of Wood-Copses and the like, as betwene *Highgate* and *Hampsteede*, and in many other places of this land: the other not onely in the low wet grounds betwene *Harfield* and *St. Albones*, but in divers places of *Remney marsh*.

The Time.

They are in flower usually untill the later end of *May* at the soonest, and so continue untill the middle or end of *June*, and then wholly will be withered and gone in *July*.

The Names.

The first is generally thought to be the *Ophris* (quod aliqui supercilium reddunt) of *Pliny*, which he saith in his 26. Booke, and 15. Chapter, is an herbe like unto the dented or toothed Pot-herbe with two leaves; but what that dented Pot-herbe is, is not well knowne, and therefore it is but supposed as I said, that this herbe with two leaves should be it; but because we know no other herbe, that hath but two leaves it carrieth the more probability. *Cordus* and *Gesner* in *hortis Germanie*, have thought it to be *Alyssa* or *Damasonium*, others to be *Gramen Parnassi*: *Bruselsius* would make it a kinde of *perfoliata*, because the two leaves doe so compasse the stalke at the bottome, as if it were but one leafe, and that the stalke went thorough them, and others have thought it to be a kinde of *Helleborine*, because the flowers are somewhat like unto it: *Dodonaeus* calleth it *Esendo orchis*, sive *Bifolium*, and *Tragus* maketh it his tenth *Satyrium*, calling it *Bifolium*, by which name it is now generally called and knowne of all Herbarists, the other hath not bene by any before remembered: the *French* call it *Double Fucille*, the *German* *Zweyblat*, the *Dutch* *tweeblat*, and we *Twayblade*, or herbe *Bifoile*.

The Vertues.

It is not much astringent in taste, but rather clammie or glutinous, and somewhat sweete, whereby it may be judged to be hot and drie, it is much and often used by many and to good purpose for wounds, both Greene and old, and for to consolidate or knit ruptures. *Pliny* saith *Ophris* is good to make the haire of the eye browes blacke; but this hath not bene tried by any in our dayes, to have any such effect that I know.

CHAP. XV.

Monophyllum sive *Unifolium*. One blade.

Monophyllum sive *Unifolium*.
One blade.

His small plant never beareth more than one leafe, but onely when it riseth up with his stalke, which thereon beareth an other, and seldome more, which are of a blewish Greene colour, therein very like unto the leafe of a small Lilly Convally, but somewhat broader at the bottome, and pointed with many ribbes or veines therein like *Plantane*; at the toppe of the stalke grow many small white flowers starre fashion, smelling somewhat sweete; after which come small reddish berries when they are ripe: the roote is small of the bignesse of a Rush lying and creeping under the upper crust of the earth, shooting forth in divers places.

The Place.

It groweth in moist shadowie and grassie places of Woods; in many places of the Realme.

The Time.

It flowereth about *May*, and the berries be ripe in *June*, and then quickly perissheth untill the next yeare, it springeth from the same roote againe.

The Names.

It may be called in Greeke *μονοφυλλον*, after the Latines *Unifolium*, for it is not mentioned by any ancient Greeke Author, or yet by any ancient Latine, as is thought, unlesse as *Dalecampius* upon *Dioscorides* supposeth, it may be the *Cyclamienaria* of *Pliny* in his 25. Booke and 19. Chapter, which hee

saith hath but one leafe, unlesse the place be corrupted, whereof there is some doubt. *Tragus* calleth it *Corydalis sylvestre*, and *Unifolium*; most of the later Writers call it *Monophyllum* or *Unifolium*, onely *Bauhinnus* referreth it to the *Lilium convallium*; calling it *Lilium convallium minus*, but he setteth it downe in his *Matthiolus*, that the *Gramen Parnassi* of *Matthiolus*, whom *Lugdunensis* and others doe follow, is this *Unifolium* ill set forth, which it be so, then *Lobel*, *Dodonæus*, and all others, have beene utterly mistaken in *Gramen Parnassi*, who all give the same or thelike figure of *Gramen Parnassi*, that *Matthiolus* doth, and even *Bauhinnus* himselfe, calleth that *Gramen Parnassi albo flore*, that hee saith, *Lobel*, *Dodonæus* and others call, *Gramen Parnassi*, how can it then be mistaken when all others and himselfe agreeeth to call it *Gramen Parnassi*, and not *Unifolium* as they doe this; and indeede with what reason or judgement can the *Gramen Parnassi* be this *Unifolium*, when this hath never more than one leafe untill it flower, and the *Gramen Parnassi* is never without more leaves than one: the *Germans* call it *Einblatt*, and the *French* *Une feuille*, as we doe One blade.

The Vertues.

Halfe a dramme or a dramme at the most in powder of the rootes hereof taken in wine and vinegar of each equall parts, and the party presently thereupon laid to sweate, is held to be a soveraigne remedy for those that are infected with the plague, and have a sore upon them, by expelling the poyson and infection, and defending the heart and spirits from danger: it is also accounted a singular good wound herbe, and thereupon used with other herbes in making such compound Balmes, as are necessarie for the curing of wounds, be they fresh and Greene, or old and malignant, whereof there hath beene often and sufficient triall made to be very availeably, but especially if the nerves or sinewes be hurt.

CHAP. XVI.

Ophioglossum sive Lingua serpentina. Adders tongue.

His small herbe also hath but one leafe, which with the stalke, riseth not above a fingers length above the ground, being fat or somewhat thicke, of a fresh Greene colour, formed very like unto the head of a broad Javelin or Partizan, or as some doe liken it, to the leafe of the water Plantane but lesse, without any middle ribbe therein, as all or most other herbes have: from the bosome or bottom of which leafe on the inside, riseth up a small slender stalke, about a fingers length, and sometimes the small stalke will have two heads thereon, and sometime three, or else abortive as *Lobel* expresseth one; the upper halfe whereof is somewhat bigger, and as it were dented about with small round dents, of a yellowish Greene colour, resembling the tongue of an Adder or Serpent, which never sheweth any other flower, and falleth away with the leafe also quickly after the tongue hath appeared, without bringing any seede, that could be observed: the roote is small and fibrous abiding under ground, and shooting forth the next Spring, nor perishing in the Winter, although the leaves doe. Some have made hereof two other sorts, one whose leaves at the lower end is somewhat more forked than the other; and another smaller than it, which I doe account but *lusus nature*, and from the foyle or climate.

The Place.

It groweth in many moist meddowes of the land where the roote lyeth covered with the grasse.

The Time.

It is to be found in Aprill and May, and quickly perisheth with a little heate.

The Names.

The later Writers have put the Greeke name *Οφιογλωσσον* *Ophioglossum* hereunto according with the Latine *Lingua serpentina* or *serpentina*, as it is usually called now adayes, for it is not found in any of the ancient Greeke or Latine Writers, except it be the *Lingua* or *Lingulaca* whereof *Pliny* maketh mention in his 24. Booke and 19. Chapter, and in his 15. Booke and 11. Chapter, that groweth about fountaines, but because he maketh no description of the forme, it is doubtfull whether it be it or no; for *Lugdunensis* referreth it to the *Ranunculus gramineus*, whereof I have spoken both here before, and in my former Book, and *Dalechampius* as he saith, would make *Pliny* his *Lingua* to be a kind of *Coryza palustris serratifolia*. Some also would make this to be *Cerastia Plinij*, in his 26. Booke and 8. Chapter, which he saith hath but one leafe and a roote made of nodes or knottes, but so is not this; but as I shall shew you shortly, *Fabius Columna* doth most properly of any other, referre his *Cerastia*, to the *Dentaria Coralloide radice*. Some also would make it *Lunaria minor*, but we have another herbe more properly called by that name, as you shall understand in the next Chapter: *Amatus Lusitanus* calleth it *Unifolium*, which doth well agree hereto; and *Lobel* in his *Adversaria Eucaphyllum*; but because the herbe in the Chapter next going before, is so called with most; I thinke it not convenient so to confound two herbes by one name, and I finde none other to follow them herein. *Brunsellus* maketh it his *Serpentaria secunda*, as thinking it a species of that kinde: *Cerodius* calleth it *Lingua Vulneraria*; *Gesner* in hort. *Lancea*

Christi

Christi, but most writers now a daies doe call it *Ophioglossum* & *Lingua serpentis*, or *serpentina*. The *Italians* call it *Ophioglossa*, *Herba senza costa*. *Luaciola*, *Argentino*, and *langue de serpent*. The *French* *langue de serpent*. The *Germanes* *Naterzunglin*. The *Dutch* *Speerkruijs* as *Dodonæus* saith. And we in *English* *Adders tongue* or *Serpents tongue*.

The Vertues.

Adders tongue is temperate betwene heat and cold, and dry in the second degree; the juice of the leaves given to drinke, with the distilled water of *Horsetaile*, is a singular remedy for all manner of wounds in the breast or bowels, or any other parts of the body. It is with no lesse good successe given to those that are much given to casting, or vomiting, and also to those that void blood at the mouth or nose, or otherwise downwards; the said juice or the dried leaves made into powder, and given in the distilled water of *Oaken buds*, is very good for such women as have their usuall courses, or the whites come downe upon them too abundantly: the said powder of the herbe taken for some time together, doth cure the rupture as *Baptista Sardus* saith. The greene herbe infused or boyled in red wine, or white wine, and those eyes that are much given to water, washed therein or dropped therein, taketh away the watering, and cooleth any inflammation that commeth thereby; with the leaves hereof infused in oyle *Omphacine*, or of unripe *Olives*, insolated or set in the Sunne for certaine dayes; or the greene leaves boyled in the said oyle sufficiently, is made an excellent greene oyle, or *Balsame*, singular good, not onely for all sorts of greene or fresh wounds, but for old and inveterate ulcers also, quickly to cure them, especially if a little fine cleare *Turpentine*, be dissolved therein; the same also stayeth and represseth all inflammations that rise upon paines, by any hurt or wounds.

CHAP. XVII.

Lunaria minor. Small Moonewort.

Any Authours have set forth varieties of this small Moonewort, which becaufe they are but from the Luxurioufnesse of the Plant, in a fertile soyle and accidentall also, not to be found constant, which should make a particular *species*. I have wholly refused to set downe many descriptions of one herbe, but sometime degenerating; let one description therefore serve instead of many, with the relation of some casualties as they happen. The small Moonewort riseth up usually but with

one darke greene thicke and fat leafe, standing upon a short footestalke, not above two fingers breadth high, but when it will flower it may be said that it beareth, a small slender stalke, about foure or five inches high, having but one leafe set in the middle thereof, which is much divided on both sides into many parts, most usually with five or seaven on a side, yet some have beene found with nine divisions on a side, and sometimes with more, yea some have thought that it may have as many leaves or parts of leaves rather, as there are dayes in every Moone, but this is onely opinionative; each of those parts is very small, next the middle ribbe, but broad forwards, and round pointed, resembling therein an halfe Moon, from whence it tooke the name, the uppermost parts or divisions being lesse then the lowest: the stalke riseth above this leafe two or three inches, bearing many branches of small long tongues, every one very like unto the spiky head of the Adders tongue, of a brownish colour, which whether I should call them the flowers or the seed, I well know not, which after they have continued a while, resolve into a mealy dust, therote is small and fibrous. This is sometimes found to have divers such like leaves, as are before described, with so many branches or toppes arising from one stalke, each divided from other. And *Clusius* setteth forth another, which he calleth *ramosa*, and came out of *Silesia* to him and others, which had more store of leaves, and each leafe more divided, and each part dented about the egdes, bearing divers stalkes, with branched tops like the other, which leaves, were more fat thicke and fappy, and with a little hairy downe upon them.

The Place.

It groweth upon hills and on hearthes, yet where there is much grasse, for therein it delighteth to grow.

The Time.

It is to be found onely in *Aprill* and *May*, for in *June* when any hot weather commeth, for the most part it is withered and gone.

The Names.

It is not certainly knowne to be remembered by any of the ancient Greeke or Latine Authours, yet some would make it to be *Cerastia Plinij* whereof is spoken before; some to be *Tragium secundum Dioscoridis*, which growing on mountaines, hath the leafe of *Scolopendrium* or Miltwaste, but the root he saith smaller strong, which this doth not, and therefore cannot be it, some also doe thinke it to be *Hemionitis altera* and *Selenitis*, becaufe some take the *Hemionitis* to be *Lunaria major*. Some also as *Columna* to be *Epimedium* of *Dioscorides*, but he saith with all, that the roote hath a strong sent, which cannot agree hereunto; Some also have called it *Ophioglossum* for the likenesse of the toppes. *Clusius* saith that those of *Silesia*, where that kinde groweth, that he calleth *ramosa*, doe call it in their language, *Rechter widerthon*; that is as he saith, *Trichomanes legitimum*.

Lunaria minor. Small Moonewort.

legitimum, the true Mayden haire; all late writers doe call it *Lunaria minor*, *a folijs lunæ crescentis modo falcatis*, & *botrytis sive ramosa*, aut *racemosa*, *a capitibus racemi in modum formatis*. Gesner in libro de *Lunarijs*, calleth it *Lunaria petraea*, and *Taura*, as he saith the Heardsmen and Shepherds doe, because if the Kine feede, where this herbe groweth, they will speedily goe to the Bull. *Tabermontanus* calleth it *Ruta Lunaria vel jecoraria*. The *Italians* call it *Lunaria del grappolo*. The *French* *Taure* and *Petite Lunaire*. The *Germanes* *Montrauten* and *Monkraut*. The *Dutchmen* *Maencruijt*. We in *English* *Moonewort*, but there are so many herbes called by the name of *Lunaria*, that it would make any man wonder how so many should be so called. Gesner hath collected them all or the most part, and set them forth together, in a treatise by it selfe, whereunto if any be desirous to understand them, I must referre them to him; for it were too tedious to repeat them all here.

The Vertues.

Moonewort is cold and drying more then Adders tongue, and is therefore held to be more available, for all wounds, both inward and outward, the leaves boyled in red wine and drunke, stayeth the abundance of womens ordinary courses, and the whites also; it stayeth bleeding, also vomiting, and fluxes; it helpeth all bruising and beatings; it helpeth to consolidate all fractures or dislocations; it is good for ruptures; but it is chiefly used of most, with other herbes to make oyles or ballames, to heale fresh or Greene wounds, either inward or outward as I said, for which it is excellent good. It hath bene formerly related by impostors and false knaves, and is yet beleevd by many, that it will loosen lockes, fetters, and shooes from those horses feete, that goe in the places where it groweth; and have bene so audacious to contest with those have contradicted them, that they have both knowne and seene it to doe so; but what observation soever such persons doe make, it is all but false suggestions and meere lyes: Some Alchymists also in former times have wonderfull extolled it to condensate or convert Quicksilver into pure silver, but all these tales were but the breath of idle headed persons, which divers to their cost and losse of time and labour have found true, and now are vanished away with them, like the aire or smoake therein.

CHAP. XVIII.

Pyrola. Winter greene.

Although there were formerly but one sort of *Pyrola* knowne, yet *Clusius* and some others have found out other sorts thereof, which shall be handled together in this Chapter.

1. *Pyrola nostras vulgaris*. Our ordinary Winter greene.

This ordinary (for so I call it in regard it nor onely groweth in our Country, and few or none of the rest, but because it is best knowne and of most use,) Winter greene sendeth forth seven or eight or nine leaves, from a small brownish creeping roote, every one standing on a long footestalke, which are almost as broad as long, round pointed, of a sad Greene colour, hard in handling, and like unto the leafe of the Pear tree, from whence it tooke the name, but others compare them to be like unto the small leaves of wild Beetes, which is not so proper in my mind, from whence ariseth a slender weake stalke, yet standing upright, bearing at the toppe many small white flowers, smelling as sweete as those of Lilly convally, laid open like a starre, consisting of five round pointed leaves, with many yellowish threds standing in the middle, about a Greene head, and a long stile with them, which in time groweth to be the feede vessel, which when it is ripe is formed five square, with a small point at it, wherein is contained as small seede as the dust it selfe.

2. *Pyrola minor sive minima*.

The least Winter greene.

This little *Pyrola* hath the roote creeping in the same manner that the former doth, and rising up in divers places; from whence rise up divers stalkes, about two or three inches high, bare for a space, in the middle whereof are set at severall joints two or three leaves a peece, each being smaller, rounder, and thinner then the former, a little stript about the edges, and at the toppes standeth only one flower a peece, made of five round white leaves, somewhat greater then the first, very like unto the flower of *Parnassus* grasse, having divers yellow threds in the middle, compassing a Greene head, which hath a pointell thereat, parted at the toppe into five threds: the head groweth in time to be five square, with such like seede therein as are in the former.

3. *Pyrola tenerior*. Slender Winter greene.

This tender or slender Wintergreene, riseth up from a small roote like Couchgrasse, creeping divers waies under the ground with divers more weake and slender stalkes then the former, from whence grow somewhat longer pointed leaves, and denred about the edges, nothing so hard in handling, else very like the former, the stalkes have divers white flowers, standing at the toppes of them, like unto the former but smaller, as the

1. *Pyrola nostras vulgaris*.
Our ordinary Winter greene.

3. *Pyrola tenerior*.
Slender Wintergreen.

4. *Pyrola Europaea Alpinæ flore*.
The Winter green of Europe with Chickweede flowers.

5. *Pyrola Brasiliana Alpinæ flore major & minor*.
Winter green of America with Chickweed flowers.

6. *Pyrola fruticans*.
Shrubby Winter green.

Xx 3

five square heads of feede that follow are likewise, wherein is such like dusty feede.

4. *Pyrola Europea Alpinæ flore.* The Winter greene of Europe with Chickeweede flowers. This small Winter greene riseth up with one or more straight round stalkes, about halfe a foote high or better, almost bare of leaves for a space next unto the roote, or at the most but with two or three very small leaves, set one a little above another, but at the toppe thereof there groweth five or sixe, or seaven or eight leaves, somewhat long and pointed at the end, somewhat like unto the leaves of the Peare tree, but longer and not so round, being many of them an inch and a halfe long, or more, tender, smooth, Greene, and having one middle ribbe, with divers veines in the leafe, finely dented about the edges, from among which leaves arise weake footestalkes, rather then stalkes, about three inches long, sustaining three or foure flowers, each of them by it selfe, made of six white pointed leaves a peece starre fashion, somewhat like the flower of a Chickeweede, but larger, with divers small yellowish threds in the middle; after they are past, there riseth in their places one small round head, smaller then a Coriander feede, containing within it divers small blacke feede, covered with a thinne white skinne: the roote is made of many small fibres set together at a small round head; Hereof there is found another sort smaller then the other, both in leaves, stalkes, and flowers.

Minor.

5. *Pyrola Brasiliæna Alpinæ flore.* Winter greene of America with Chickeweede flowers.

This Winter greene also of Brasill in America, is of two sorts, one greater then the other: From a small white roote very full of fibres, there riseth one single small smooth stalk, of six or seaven inches high, without any leaves thereon up to the middle thereof, where there are two small ones set one against another; but at the toppe thereof breaketh forth six or seaven leaves laid round about it, which are some larger and smaller then others: some being two inches long, others but an inch or an inch and a halfe long, smooth, tender and Greene, pointed at the end, having five ribbes running thorow every one of them, like unto the Ribwort Plantaine, and not dented about the edges, from among which riseth up a small footestalk or two, not above an inch or two long, sustaining every one of them, one somewhat large whitish yellow flower, consisting of six narrow and pointed leaves, two whereof are somewhat broader then the rest, having divers reddish threds in the middle. The lesser sort hereof groweth somewhat lower, with lesser leaves then the former, and with lesser flowers then it also, but yet longer and greater then the greater of the European kinde.

Minor.

6. *Pyrola fruticans.* Shrubby Winter greene.

Although this plant be no shrubbe of any hard woody substance; yet because the stalkes be hard abiding long, and encreasing every year without withering or dying, it is called shrubby, therein coming nearest unto the nature of a shrubbe: it riseth up with divers limber stalkes, which for some yeares remaine firme and upright, but after they be growne elder, that they are laden with leaves, the waight of them doth heare them downe to the ground, wherein sometimes they take roote againe, these stalkes have at every joynt two three or foure fleshy leaves of a deepe shining Greene colour, somewhat like to the leaves of the Strawberry tree, both for forme and bignesse, but dented about the edges: from the middle whereof arise certaine buds, made as it were of small scaly heads, which turne into small twiggies, whereon are set three or foure or five flowers a peece, of a whitish purple colour, somewhat bigger then the flowers of the first *Pyrola* or Winter greene, after the flowers are past come five square heads, containing very small seed: the roote is slender with some firings annexed thereunto, and creepeth farre abroad under the ground.

The Place.

The first sort groweth in our owne land, yet but in very few places, and those Northwards, in Yorkshire, Lancashire, and further North, yea even in Scotland, in the woods every where, and seldome in fields. The second groweth at the foote of the high hills in Austria and Stiria as *Clusius* saith. The third in Germany, as also neere Savoy. The fourth groweth in the woods of Germany in divers places, as also in the Beech wood in Scotland, as it is recorded by *Bauhinus*, who saith Dr. Craige sent it him from thence, and on the mountaines in Wales likewise. The fifth of both sorts groweth in Brasill, towards the West Indies. The last groweth in most of the Provinces of Hungary, Germany, and Bohemia.

The Time.

They doe all flower except the American sorts about Iune and Iuly, but the other more late with us.

The Names.

It is called *Pyrola* in Latine (for it hath not found any Greeke name) a *foliorum pyri arboris*, & *florum etiam similitudine* of the likenesse of the leaves, and I may say of the flowers also, unto Peare tree leaves and flowers, divers have taken it to be *Limonium*, as *Fuchsius*, *Lonicerus*, *Tragus*, and *Cordus* also, who calleth it *Beta sylvestris*, but the true *Limonium* is now so well knowne, that it putteth all out of doubt, and some would make it to be *Brittanica Pliny*, whereunto it hath no resemblance, but is generally of all now adiaes called *Pyrola*, and vulgarly, because the rest are rarer to be found. The second *Clusius* calleth *Pyrola minima*, and *Bauhinus* *Pyrola rotundifolia minor*. The third is called by *Clusius* *Pyrola tenerior*, by *Camerarius* *Pyrola Pannonica secunda*, by *Thalys* *Pyrola minor*, by *Dalechampius* upon *Dioscorides*, and by *Lugdunensis* *Ambrosiana montana*, and by *Bauhinus* *Pyrola folio mucronato serrato*. The fourth is called by *Cordus* in observationum sylva, *Herba Trientalis* by *Schwenckfeldius* *Alpinæ Alpina*, by *Thalys* *Alpinanthemum*, id est, *Alpinæ flor*, and by *Bauhinus* *Pyrola Alpinæ flore Europea*, to distinguish betweene it and the next, which he calleth *Pyrola Alpinæ flore Brasiliæna* and *Americana*, and doth much resemble the *Polyrrhizos latifolia* of *Lugdunensis* in my opinion, although *Bauhinus* referreth it to *Cariopeltis pentaphyllea*. The last is called by *Clusius* *Pyrola fruticans* or *frutescens*, and *Bauhinus* *Pyrola frutescens Arbuti folio*. It is called by the Italians *Pyrola*, by the French *Pyrole*, by the Germanes *Wintergrün* and *Hofsmangolt*, and *Waldmangolt*, after the name of *Beta sylvestris*, or *Limonium*, by the Dutch *Wintergreen*, and in English *Wintergreene*.

The Vertues.

Wintergreene is very cold and drying and exceeding astringent, and glutinous withall, whereby it is a most singular remedy for Greene wounds, to consolidate their lippes speedily together, either the Greene leaves bruised and applyed of themselves, or the juce of them, or a salve made of the Greene herbes stamped, or the juce boyled with *Axungia* or Hogs lard, or with faller oyle and waxe, and some turpentine added unto it; which is so soveraigne a salve for all manner of wounds and sores, that the Germanes use it exceeding much, and extoll it beyond

beyond any other salve made of a simple herbe : they likewise use it for inward wounds or hurts, being boyled either by it selfe, or with other wound herbes, as Comfrey, Moufear, Burnet, Perywinkle, Tormentill, Horsetaile, Avens, Ladies Mantle, Betony, Agrimony, Madder rootes, and Golden Rodde, and the like, where with they use to heale whomsoever is wounded, either in the body or bowells or any other part, by giving them to drinke of such a decoction; the herbe boyled in wine and water and thereof given to drinke to them that have any inward ulcers in their kidneys, or neck of the bladder, doth wonderfully help them; it staeth also all fluxes, whether of blood or of humors, as the laske, bloody fluxe, or womens too abundant courses, as also the bleeding of wounds, and both taketh away any inflammation rising upon the paines of the heart, and hindereth any to arise being presently applied after the hurt received : it is no lesse helpfull for foule ulcers hard to be cured, as also for cancrs or fistulas : the distilled water of the herbe doth effectually performe the same things, and some keepe the dried herbe to use in decoctions, or made into powder to drinke.

CHAP. XIX.

Cynoglossum. Hounds tongue.

Dioscorides maketh mention but of one sort of *Cynoglossum* or Hounds tongue, which is generally thought to be that which is ordinary with us, but there hath bene of late dayes, divers other sorts found out, all which shall be here set downe together.

1. *Cynoglossum majus vulgare.* The ordinary great Hounds tongue.

The great ordinary Hounds tongue hath many long and somewhat narrow, soft, or as it were hairy darkish green leaves lying on the ground, somewhat like unto the leaves of Buglosse, from among which riseth up a rough hairy stalke, about two foote high, with some smaller leaves thereon then grow below, and branched at the toppe into divers parts, with a small leafe at the foote of every branch, which is somewhat long with many flowers set along the same, which branch is crooked or turned inwards, before it flowreth and openeth by degrees, as the flowers doe blow, which consist of foure small purplish red leaves, somewhat of a sad or dead colour, scarce rising or shewing themselves, out of the rough Greene huskes wherein they stand with some threds in the middle ; this hath bene sometimes found with a white flower : after the flowers are past there come in their places rough flat seede, with a small thread or pointell in the middle, easily cleaving to any garment that it toucheth, and are not so easily pulled off againe : the roote is blacke, thicke, and long, tough or hard to breake, and full of a clammy juice, smelling somewhat strong, or of an evill sent, like as the leaves doe, which some doe call a soporiferous sent.

2. *Cynoglossum maximum.* The greatest Hounds tongue.

This kinde differeth not from the former, either in leafe, flower, or seede, but onely that in them all it is neerer to the sunne so large which maketh the difference.

3. *Cynoglossum maximum montanum.*

The great mountaine Hounds tongue.

This great mountaine Hounds tongue hath also many large but hairy and soft leaves, lying on the ground, above a foote long, and an hand breadth broad, of a whitish Greene colour, having every one the middle ribbe reddish; with many Greene veines running thorough them, and reddish foote stalkes to sustaine them, those which are in the middle of them standing more upright; from amongst which riseth a thicke hollow crested, reddish, woolly, or hairy stalke, two foote high and above stored on all sides with such leaves, but lesser and lesser up to the toppe, where it breaketh forth into foure or five branches of flowers, standing all on one side, yet forming at the first a round head, very pleasant to behold for the varietie of colours therein : the hairy stalkes of the flowers being Greene ending in five points, the flowers hollow and long consisting of five purplish red leaves, somewhat sweete, standing above the flowers and Greene leaves among them with red ribbes in them, which in the shadow where it delighteth to grow, is the more conspicuous and beautifull; after which in the said huskes come larger seede than the former, foure usually together, which on the upperside are flat circled about with a few short prickles, whereby it cleaveth fast to garments : the roote is blackish on the outside, and whitish within, somewhat like the former.

4. *Cynoglossum medium montanum angustifolium.*

Narrow leaved hoary mountaine Hounds tongue.

This Hounds tongue hath many soft woolly, or hoary long and narrow leaves standing upright and not lying upon the ground, being halfe a foote long, and an inch broad in the middle, but small at both ends, whose middle ribbe, and foote stalkes are both reddish : the stalke riseth up to be somewhat more, then halfe a foote high, replenished so thicke with such like leaves as grow below, that no part of the stalke can be seene, each whereof are more hairy or woolly, and compasse

1. *Cynoglossum majus vulgare.*
The ordinary great Hounds tongue.

the

3. *Cynoglossum maximum montanum.*
The greater mountain Hounds tongue.

5. *Cynoglossum semper virens.*
Ever green Hounds tongue.

6. *Cynoglossum subrubente variegato flore.*
Hounds tongue, with party coloured flowers.

7. *Cynoglossum Creticum latifolium.*
Broad leaved Hounds tongue of Candy.

8. *Cynoglossum Creticum angustifolium*.
Narrow leaved Hounds tongue of Candy.

10. *Cynoglossum flore caeruleo*.
Small Hounds tongue with blew flowers.

the stalkes at the bottomes of them, and sharpe at the point : on the toppe of the stalke standeth a round hoary head, of the bignesse of a reasonable apple, which opening it selfe, sheweth forth many woolly leaves, with red ribbes, standing at the foote of the branches and stalkes of flowers, which are of an excellent vermillion red colour, standing in larger and more woolly huskes, and are more laid open like a starre, standing on both sides of the stalke, and not all on side as the last : the feede that followeth is smaller and not so rough, with a smaller hollow middle : the roote is thicke and long, with a thicke blackish bark, on the outside, and a hard wooddy pith in the middle, of an unpleasant taste as the leaves, bitter and astringent and hairy at the head, which are the ribbes of the withered leaves : the roote springeth afresh before Winter, after the leaves and stalkes are all drie and withered.

5. *Cynoglossum semper virens*. Ever greene Hounds tongue.

This Hounds tongue doth not much differ, from the common or ordinary sort, but that the leaves are alwayes fresh and greene, somewhat long and narrow with a great whitish greene ribbe in the middle, smooth on the upper side, and more hoary underneath : the stalke at the first is but low, with many narrow long leaves, compassing it about, but more thinnely than in the former : the flowers are red, but somewhat larger than the ordinary, standing in the like manner upon small branches that are writhed or turned like the *Heliotropium*, or the first kinde : the feede that followeth standeth all on the one side, and is smaller and lesse rough, but the stalke is then growne much higher : the roote is blackish, as the other : This hath no manner of hoariness, or is of so strong a sent as the last, and doth spring forth with fresh leaves, before the old stalke with feede is quite drie and withered.

6. *Cynoglossum subrubente varicolore flore*. Hounds tongue with party coloured flowers.

This beautifull and rare Hounds tongue, from a small slender wooddy roote, shooteth forth divers heads, of soft hairy and smaller leaves than the last : the stalke riseth up a foote and a halfe high, set on both sides, with the like smaller leaves than those below, the toppe whereof is parted into three branches of flowers, which are smaller than the last, but of a bluish colour, striped with long bloud red strakes, having the bottomes of them of a deeper bluish : the feede standeth in the same manner that others doe foure together in a huske, but they have the middle somewhat raised up, and small at the toppe, with a pointell thereat, and a large thinne circle or list about them.

7. *Cynoglossum Creticum latifolium*. Broad leaved Candy Hounds tongue.

This Candy hath for the first yeare of the springing many leaves lying on the ground, somewhat broad and not very long, with a long foote stalke to every one of them, soft, and covered with a whitish shining woolliness, almost like silver, and a thicke whitish ribbe in the middle : but the next yeare after, the stalke riseth from the middle of them, set here and there with shorter leaves compassing it at the bottom, and so smaller up to the toppe : this stalke is branched from the middle upwards into divers others, that are crooked or writhed inwards, opening

opening by degrees as the flowers blow, which are short but somewhat large, ending in five round leaves, of a whitish colour at the first, with bluish edges, and in some with pale purplish veins or stripes, which afterwards decaying grow wan or blewish, standing in hoary cuppes, wherein after they are past, the feede groweth four joyned together, rough and cleaving to garments as in the rest, with a pointell in the middle: the roote is woody, and perisheth after it hath given feede, springing from the feede that falleth of it selfe, but while it is young of the first yeare, is somewhat like unto others, not so thicke or fleshy and blackish on the outside, of an evill or unpleasant sent, as the rest of the plant is.

*. *Cynoglossum Creticum angustifolium*, Narrow leaved Candy Hounds tongue.

This other *Candian* hath divers long and narrow leaves, somewhat broad at the end, and round pointed or whitish Greene colour, lying next to the roote upon the ground; from among which riseth up a stalke, in some plants higher, in others lower, whereon grow without order, such like leaves but shorter and lesser, compassing it at the foote of them: from the middle whereof upwards, it spreadeth into branches, bearing such like flowers as are in the ordinary fort, ending in five leaves, but of a paler red colour, with each of them five darke red threds in the middle: the feede and roote is somewhat like the ordinary, but hath no evill sent like it or the last: this perisheth every yeare, and is sowed or riseth of the fallen feede againe.

9. *Cynoglossum minus sive pusillum*, Small Hounds tongue.

This small Hounds tongue that groweth with us in divers places of our land, is not much differing from the greater ordinary kinde, but is smaller in all things, having such like leaves smaller and shorter, tur greener and more shining: the flowers also being small, are of a pale red colour, and the whole plant hath not so strong or evill a sent: this might be thought to be thus small from the barrenesse of the soyle wherein it doth grow, but that is not so, for it is often found in the same grounds where the greater groweth, and besides being either transplanted, or the feede sown in gardens, it will still continue much smaller than the other.

10. *Cynoglossum minus flore ceruleo*, Small Hounds tongue with blew flowers.

This other small Hounds tongue sendeth forth from a small long but annuall roote, one round small hairy stalke, sometimes but a foote, and sometimes two foote high, brownish below and Greene above, whereupon are set on both sides without order, divers small and somewhat long but narrow leaves, of a blewish Greene colour, covered with a long hairy down, that is tough and sticking, the middle ribbe being somewhat great and eminent, of a hot bitter taste; from the bottome of these leaves, especially upwards, come forth sometimes other smaller leaves in a tuft together, and is parted into divers branches, the toppes whereof are bended, as in divers other sorts, bringing forth very small flowers, of a faire blew colour, with a yellow starre in the bottome, standing in such like huskes, wherein after they are past is contained very small roundish feede, without any pricke in the middle, as others have, but very rough or prickly, ready to stick upon any garment, as others will.

The Place.

The first groweth in most places of the land, in wast grounds and untilled places, as by high wayes sides, lanes, and hedge sides: the second in the *low Countries*, especially in their gardens: the third on the mountaines of *Naples* to the Southward: the fourth on the same hills to the Northward: the fifth in the shadowie woods on the hills in *Germany* and *Naples* also: the sixth groweth only at the foote of a certaine hill in *Naples*, to the Southwards, as *Colonna* saith, who there observed it: the seventh as by the name it should seeme, is originally of *Candia*, from whence being brought into *Italy*, hath from thence bene communicated to many countries: the eight not onely in *Candia*, but on the hills of *Naples* also: the ninth is found in *Germany*, as well as in our owne land, being mentioned by *Cordus* upon *Dioscorides*, and it may be is that kinde that is said in the *Adversaria* to grow about *Mompelien*, and called *Pusillum Narbonense*: the last groweth in *Austria* as *Clusius* saith, and in other parts of *Germany* as *Tragus* saith, in *Naples* also as *Colonna* saith.

The Time.

They all flower about *May* and *June*, and the feede is ripe not long after.

The Names.

It is called in Greeke *Κυνόγλωσσον*, and *Κυνόγλωσσος*, *Cynoglossum* and *Cynoglossos*, id est, *Canina lingua*, a *folijs caninum linguam imitantibus*. There hath bene great controversie among divers the learned Writers of our time, whether the *Cynoglossum* that is here first set downe, and is the most ordinary in all countries, and therefore called *vulgare*, should be the *Cynoglossum* of *Dioscorides*, because he saith it beareth neither stalke nor flowers, which this doth; among whom wee must account *Matthiolus* to be one, who saith he found in some sandy grounds in *Rome*, behind or beyond *Adrianus* Mount the true *Cynoglossum* of *Dioscorides*, whom *Pena* and *Lobel* in their *Adversaria*, doe both taxe of want of knowledge of the true *Cynoglossum* *Dioscoridis* (for say they it doth in the same and other places beare both stalke and flowers; although in divers yeares and places it doth not beare, yet will beare after some respite of time in any place, as not onely they but divers other good authours have acknowledged as well herein, as in other plants; and we our selves have often found divers plants of the first kinde of Hounds tongue, not to beare flowers in the same places that others have the same yeare, and therefore by the best Herbarists in these dayes, there is now no doubt, but that the common kinde is the right) as also that hee knew not that this his *Cynoglossum* *Dioscoridis*, is *Lycopsis*, that sometimes doth not beare flowers, but refteth without stalke, as hath been observed oftentimes, as well herein as in *Onosma* stone Buglosse: the next that oppose this truch, is *Ruellius* & *Fuchsius*, who say that this *Cynoglossum*, which was then used by Apothecaries, in *Germany* and other places as the right was not the true kind of *Dioscorides* but rather *Lycopsis* Wall Buglosse, whereof we shall speak hereafter, against whom *Cordus* upon *Dioscorides* and *Matthiolus* also do contest, *Cordus* acknowledging that *Cynoglossum* to be right, for the reasons before set downe, and *Matthiolus* simply citing it as an error in them, and judging the *Lycopsis*, for the red rootes sake, and other things therein, to be a kinde of *Anchusa*, and also accounteth this common kinde, to be the second *Cynoglossum* of *Pliny*, in his 25. Booke and 8. Chapter (for his first kinde that is fit to make Arbors, or Imagery hedges, is not yet knowne what is it) which beareth small burres, and of the best Writers and Herbarists now adayes is accounted the eight kinde here set forth: *Lacuna* also calleth it *Lycopsis*. There is an error likewise in *Etius* which *Dodonæus* noteth, in making *Limonium* and *Cynoglossum*, to be both one plant. And another in *Rondeletius*, who tooke *Glastrum* sylvestre, which differeth very little from the *Sativum*, to be *Cynoglossum*: and lastly *Lugdunensis*, who setteth the *Plantago media* or *angustifolia*,

folia, to be the *Cynoglossum Diofcoridis*, calling it *Cynoglossum quorundam*. The first is generally called by all Authors, either *Cynoglossum*, or *vulgare*, or *Cynoglossa vulgaris*: the second is but onely mentioned by *Lobel* in his observations, under the title of *Cynoglossum maximum*: the third is called by *Fabius Columna*, *Cynoglossum montana maxima frigidaem regionum*, and by *Bauhinus* *Cynoglossum sylvaticum rubente caule*, because he thinketh it is the same that *Thalim* in *Harcynia sylva*, calleth *Cynoglossum sylvaticum Harcynicum*, and the *Cynoglossum montanum* of *Cesalpini*: the fourth is called by *Fabius Columna* *Cynoglossa media montana incana angustifolia altera*; & by *Bauhinus* *Cynoglossum globoso flore*: the fifth is called by the said *Columna*, *Cynoglossa media virente folio*, & by *Bauhinus* *Cynoglossum semper virens*: the sixth is also called by *Columna*, *Cynoglossa altera media fructu corollodes. sive Lychnodes*; and by *Bauhinus* *Cynoglossum fructu umbilicato*: the seventh is called by *Clusius*, *Cynoglossum Creticum secundum*, and by *Bauhinus* *Cynoglossum Creticum latifolium fetidum*: the eight is called also by *Clusius* *Cynoglossum Creticum primum*, by *Camerarius* in *horto Cynoglossum parvum cinereum Creticum*, by *Columna* *Cynoglossa media argentea Apula campestris*; and by *Bauhinus* *Cynoglossum Creticum argenteo folio*: the ninth is mentioned by *Cordus* upon *Diofcorides*, and by *Lobel* in his *Adversaria*, calling it *Cynoglossum pusillum Narbonense*, whom *Lugdunensis* followeth: the last is very much confounded by *Bauhinus* in his *Pinax* for his eight species, which he calleth *Cynoglossum medium*, and saith it is the same that *Cordus* upon *Diofcorides* calleth *Cynoglossa minor*, and *Camerarius* *Cynoglossum Italicum*, and *Lobel*, *Lugdunensis*, and *Eystetenensis* call *Cynoglossum pusillum Narbonense*, who all say that it is like the ordinary great one having such like red flowers, and yet he maketh the same to be *Clusius* his *Cynoglossum pusillum sive Austriacum alterum*, and also *Columna* his *Cynoglossa minor montana scrotina altera Plinij*, who both say that theirs have blew flowers, as the *Elatine* of *Tragus*, and the *Lappular rusticorum* of *Lugdunensis*, which are both one and the same with it; this also *Bauhinus* himselfe maketh his tenth species, calling it *Cynoglossum minus*, and there also making it to be the same *Cynoglossa Plinij* of *Columna*, before set downe; so that he confoundeth them much, maketh that sort with red flowers, to be the same with that of *Tragus* and *Lugdunensis* which hath blew flowers, and doth corresponde altogether with theirs, which errour in him is usuall in many other places of his *Pinax*, and not in this onely. It is called by the *Italians* *Cinoglossa*, and *Lingua di cane*, by the *Spaniards* *Langua de perro*, by the *French* *Langue de chien*; by the *Germans* *Hunds zungen*; by the *Dutchmen* *Honts tonghe*; and we in *English* *Hounds tongue* generally, or of some *Dogges* tongue.

The Vertues.

Hounds tongue is temperately cold, drying and astringent, and yet hath a mollifying qualitie. The roote is very effectually used in pills as well as in decoctions ootherwise, to stay all sharpe and thin defluxions of rheume, from the head into the eyes or nose, or upon the stomacke or lungs, as also for coughs and shortnes of breath; for which purpose the *Pilule de Cynoglossa*, either of *Mesues* or *Trallianus* description, or as it is corrected by *Fernelius*, is singular good, which is set downe in this manner, Take of *Myrrhe* five drammes, *Olibanum* fixe drammes, of *Opium*, of the seedes of white Henbane, and the barke of the dried rootes of *Hounds tongue* of each foure drams or halfe an ounce, of *Saffron* and *Callos* of each one dramme and a halfe; let all these be made into a masse or lumpe for pills, according to art, with the syrupe of *Stechados*, the leaves boiled in wine, saith *Diofcorides*, but others do rather appoint it to be made with water, and to add thereunto oyle and salt, mollifieth or openeth the belly downewards: the same also taken doth helpe to cure the biting of a mad Dogge, and applying some of the leaves also to the wound: the leaves bruised, or the juice of them boyled in *Axungia*, that is *Hogges larde*, and applied, cureth the falling away of the haire, which commeth of hot and sharpe humours: the same also is a very good remedy, to apply to any place that is scalded or burnt with fire: the leaves of themselves bruised and laid to any greene wound, doth heale it up quickly: the same ointment aforesaid with a little *Turpentine* added thereunto, as also the jayce used with other fit things, doth wonderfully helpe all old ulcers and deepe or much spread sores, in the legges or other parts of the body, and taketh away all inflammation that rise about them, or any where else in the body, be it *St. Anthones fire* or the like: the roote likewise baked under the embers, either wrapped in paste or wet papers, or in a wet double cloth, and thereof a suppository made and put up into the fundament, or applied to the fundament, doth very effectually helpe the painefull piles or hemorrhoides: the distilled water of the herbe and rootes is very good to all the purposes aforesaid, to be used as well inwardly to drinke, as outwardly to wash any fore places, for it doth heale all manner of wounds, or punctures, and thofe foule ulcers that rise by the *French Poxe*.

CHAP. XX.

Anchusa. Alkanet.

Here are divers sorts of Alkanet, whereof I have given you the description of one, and under it have made mention of some other sorts in my former Booke; but because I there did not shew you them at the full; I will in this place make further mention thereof, with the rest of it is kinde.

1. *Anchusa lutea major*. The greater yellow Alkanet.

This yellow Alkanet hath many long and narrow hoary leaves lying on the ground, and thicke set on the stalkes likewise, which riseth not much above a foote and a halfe high, at the toppes whereof stand many yellow flowers, with a small leafe at the foote of every flower, which are somewhat long and hollow, very like unto *Comfrey* flowers, but a little opening themselves at the brimmes, like unto *Buglosse* flowers, with a pointell in the middle: after they are past there come in their places, small long blackish seede, not unlike both to *Buglosse* and *Comfrey* seede: the roote is of the bignesse of ones finger, and of the length of two, whose outward barke is somewhat thicke; and of an excellen orient red colour, ready to colour their hands and fingers with its red colour that shall handle it, the inner pith being white and woody: the whole herbe is of an astringent taste.

2. *Anchusa lutea minor*. The lesser yellow Alkanet.

This small Alkanet is very like unto the former, but that the leaves are narrower, and not so long, yet covered with

1. *Anchusa lutea major*.
The great yellow Alkanet.

2. *Anchusa lutea minor*.
The lesser yellow Alkanet.

3. *Anchusa minor purpurea*.
Small Alkanet with purple flowers.

5. 6. *Anchusa arborea*. 7. *Anchusa humilis*.
Tall and low Alkanet.

with an hairy hoariness, as the stalkes are also, which in some are but a foote, in others a foote and a halfe high, with smaller leaves thereon: the flowers are hollow and yellow like the other, but lesser; the feede also is alike: the roote is great in respect of the plant, red and tender while it is young, but growing woody when it is old, and blackish, but liveth and abideth after seed time, which some others doe not.

3. *Anchusa minor purpurea*. Small Alkanet with purple flowers.

The small purple Alkanet hath greater and longer leaves then the last hairy and Greene like unto Buglosse, and somewhat like unto the first; but yet lesser and narrower, although more plentifull, that lye upon the ground, and those also that rise up with the stalkes, which are many, tender and slender, whose flowers being like the others, are of a reddish purple colour: the feede following is more gray; the roote is greater and thicker then the other. We have another sort hereof, whose small flowers scarce rising out of the huskes, are of a sad or dead colour, the feede blackish rising againe yearly of its owne sowing, and leaning downe to the ground.

4. *Anchusa lignosa angustifolia*. Woody Alkanet.

This smallest Alkanet, which scarce deserveth to be accounted one of them, both for the want of colour in the roote, and the hardnesse of both rootes and stalkes; for the stalkes are scarce a foote high, hard and woody, having many small and narrow sad Greene hairy leayes, much smaller and shorter then the last the flowers stand on crooked stalkes, bending inwards like *Heliotropium*, and are hollow but smaller then the former, and of a very blew colour like unto them, for the forme and manner of growing, the roote is hard and woody, brown shined on the outside, and not colouring the hands with any red colour, or very little, such as the rest doe.

5. *Anchusa humilis Cretica*. The low Alkanet of Candy.

From a small long reddish roote of a fingers bignesse, spring small stalkes halfe a finger long, bearing thereon many small white leaves on each side of them, set very thicke together, like but lesse then the other Alkanets, at the toppes whereof stand reddish flowers inclining to purple, larger then those of Alkanet, and formed like those of bastard Sena, after which come small long rough vessels, containing within them the small feede: in the Summer time the roote will give a red juice, that will die their fingers that touch it, which is much commended by the natives, to be singular good against the poyson of any Serpent.

6. *Anchusa arborea*. Great and tall Alkanet.

The roote of this Alkanet is insipide, woody, long, and of a fingers thicknesse, somewhat reddish within, and with a thinne blackish rough barke without; the stalke is thicke and rugged, shooting forth divers branches, and they other smaller, with many small leaves like Savory set together at the joynts, and small white prickles about them, but on the smaller branches they stand single for the most part, one above another at equall distances, at the ends whereof grow small flowers, somewhat like unto the ordinary Alkanet, of a yellowish purple colour, and the like feede succeeding, and is not of any knowne use.

The Place.

The first groweth both in Italy, Spaine, and France, as well neare the Sea as further of into the land. I have not yet heard of any that have seene it growing any where in our Country. The second *Columna* saith groweth in Naples. The third about *Mompelier* and *Lions*, as *Lobel* saith, and this I thinke is the same that groweth in our Country, namely in Kent neare *Rocheester*, in a field neare *Sr. Iohn Leveson* his house, and in some other places thereabouts: as also in the West parts, as *Devonshire*, and *Cornwall*, as it hath bene affirmed. The fourth also about *Marseilles*, and *Frontignana* as *Pena* saith, the two last in Candy.

The Time.

They flower in July for the most part, and sometimes in August, but their rooteshave their bravest colour in July and August or thereabouts.

The Names.

It is called in Greeke ἀνχούσα *Anchusa* πικρὰ δὲ ἀνχούσα, quod vim suffocatoriam habet, ut aliqui volunt, sed alij melius & verius a Græco verbo ἀνχούω, quod est fucare & colorare formam, & eo derivatum nomen, b radice sanguineum floridum ve colorem; for the beautifull red colour in these rootes, hath not onely made them knowne, but distinguished from *Echium*, *Lycopsis*, *Buglossum*, and the rest that are like unto them in leaves, but want that colour in their rootes; some have called it *Alkanna* but very falsely, others *Fucus herba*. The first is thought to be the third kinde of *Anchusa*, whereof *Matthiolus* giveth a figure, although he saith that all the *Anchusa's* that were knowne to him, bore purplish flowers: it is called *l'fenda anchusa* by *Dodonæus*, and is the same *Anchusa exalbido flore*, that *Clusius* setteth forth in his History of Plants; it is also very likely to be the same, that *Cordus* upon *Dioscorides* maketh his first sort, and *Lobel* calleth *Anchusa lutea*. The second *Columna* calleth *Anchusa Echivides minor*. The third *Camerarius* in his Epitome calleth *Anchusa altera minor*, and *Banbinus* *Anchusa minor Patavina*, and yet he distinguisheth it from the *Anchusa minor Alcibiadon* five *Onochiles* of *Lobel*, and *Clusius* making them to be two sorts, *Lonicerus* calleth it *Buglossa rubra*. The fourth is called by *Lobel* and *Pena* in their *Adversaria*, *Anchusa lignosa angustifolia*, and by *Clusius*, *Anchusa lignosa*, *Banbinus* calleth it in his *Pinax*, *Anchusa angustifolia*, and saith it is the same he formerly in his *Phitopinax*, called *Lithospermum minus repens*; and in his *Matthiolus* *Lithospermum fruticosum angustifolium*, and saith also that this is the same that *Lugdunensis* setteth forth, under the title of *Tragoriganum Mompelienfe Dalechampii*. The two last are remembered by *Alpinus* in his History of strange Plants, under the same titles they are here expressed. The *Italians* call it *Anchusa*, the *Spaniards* *Soagem*, and as *Clusius* saith *Argamulo*, the *French* *Orchanette*, the *Germanes* *Oxenzange*, the *Dutch* *Ghile Anchusa*, and take it for a wilde Buglosse, we in *English* after the *French* word, *Alkanet*.

The Vertues.

Dioscorides saith that his first kinde (which as I suppose, is that I have described in this and my former Booke, with a purplish flower) doth helpe old ulcers, and those that are burnt with fire, being made into a salve with waxe and oyle, and used with barly flower, it cureth all hot inflammations, and even that which is called *Saint Anthoines* fire, used with vinegar, it helpeth the morphew, leproy, and the like; the same also applied to the lower parts, draweth forth the dead childe, the decoction thereof made in water, for those that are aguish, or else in wine, is profitable for those that are troubled with the yellow jaundise, the spleene or gravell, and the stone in the kidneys; the Apothecaries that used to make ointments saith he, used it to thicken their ointments, which *Pliny* altereth (as he doth in some other things, relating the text of *Dioscorides*) and saith it is used to

colour ointments, and for that purpose they take *Cinnabaris* and *Anchusa*. To the second kinde (which we generally take to be that with the yellow flower, and is the first here described) *Dioscorides* giveth these properties; that whether it be eaten or drunke, or but bound to the wound, it helpeth all such as are bitten by Serpents, especially by the viper (or adder) and that if any that hath eaten hereof shall but spit it into the mouth of any Serpent, it will presently kill it, the leaves (but much more the roote) being drunke in wine stayeth the fluxe of the belly. *Pliny* addeth hereunto somewhat more; the chiefeft strength hereof saith he is in harvest time, a draught of wine wherein some of the dried leaves and rootes have bene boyled, and given to those that are troubled with the falling downe of the mother doth helpe them; it killeth wormes, being taken with Hyssope. it is good also taken in wine for the paines of the backe and reines, as also for the liver. *Galen* doth more accurately and distinctly set them forth in this manner. *Oncleas* saith he hath a roote astringent and somewhat bitter, and thereby fit both to condensate the thinne humours in the body, and somewhat to extenuate those that are thicke, and as well to cleanse the chollericke, as to wash the salt humours therein; for it is said before, that a harsh tasted quality joyned with a bitter, can performe those properties; in the like manner it is profitable for the yellow jaundise, for those that are splenetick, and for those that have paines in the backe and loines, by reason of the stone in the kidneys. It is also cooling and applyed with Barly flower, helpeth inflammations and *Saint Antonies* fire: it cleanseth also either inwardly taken, or outwardly used, and therefore with vinegar helpeth morpheus, leprosy and the like, but these properties are chiefly in the rootes, yet the leaves although they be weaker then the rootes, are not without the qualities of drying and binding, and therefore they being taken in wine, are good for all fluxes and taskes, but that which is called *Oncleas* or *Alcibiadion* is more physickall, for in taste it hath a greater acrimony, and speedily helpeth those that are bitten by a viper, whether they eat it, or apply it as a salve to the wound, or but hang it or tie it to the wound, but the little *Anchusa*, which scarce hath a name, is like unto the *Alcibiadion*, being more bitter, and therefore more fit to give remedy, and is good to kill the broad wormes in the body, being given to drinke with Hyssope and Cresses, thus saith *Galen*. It is of late daies given to those that are bruised by some fall, or by beatings, or any other casualties, as also to drive out the small poxe, measles, or the like, to be drunke in hot drinke. Some have said that it will colour waters, gellies, and the like; but *Pliny* saith it will not dissolve in water, but in oyle, and so we have it true by experience, yet the colour holdeth not long, being boyled in oyle, butter, or other fat thing; and therefore the painting that was made therewith by the French Ladies, served onely for a small while. except they take it while it is fresh; but the ointment that is made with a pint of good faller oyle, wherein two ounces of the rootes of Alkanet, and twenty earthwormes hath bene boyled, and afterwards strayed forth and kept in a pot, is a singular good salve to use for any fresh wounds, made either crosse the flesh or deepe thrusts thereinto, or into the body, as also where nerves and sinewes are, to consolidate and knit them againe; some of the roote put into *Petroleum*, or oyle of Peter, and being let stand till any one needeth, it is a singular good remedy to heale any fresh cut or thrust: workemen of all sorts, that use sharpe and pointed tooles, ought to have it familiar among them, to use upon all occasions of harme.

CHAP. XXI.

Lycopsis. Wall Buglosse.

BEcause this herbe is so like unto the *Anchusa*, that as *Dioscorides* saith, it was called of divers *Anchusa*, and *Galen* in his time accounted it as a kinde thereof, as also that is like unto *Echium*, and other sorts of wilde Buglosse, whereof *Anchusa* is also accounted a species; I thinke it fit to joine it next unto them, whose description is as followeth; it spreadeth upon the ground, with many long and narrow rough or rugged darke Greene hairy leaves, somewhat like unto the *Echium* or wilde Buglosse, which doe abide in that manner, some yeares, without sending forth any stalke or flowers at all, (which divers having marked, have thought it never did beare flower or seede,) but if it or any other plant should doe so, how could any man thinke it could come there, or any where else, where they are found; and therefore I am verily perswaded, there is no herbe or plant growing upon the ground, but hath a kinde of seede, whereby it is encreased, in all the places where they are naturall; I doe neither except the Fearnie, Maidenhaire, Miltwaite, Harts tongue, Coltsfoote, Butter butte, or any other whatsoever, although I know this my opinion, doth not onely contradict divers other more learned mens observations, or rather other mens conceites now adaies (but it hath bene sufficiently I thinke said before in the Chapter of *Cynoglossum*, that as that, so this notwithstanding, that it doth not beare a stalke for flowers or seede some yeares, yet it is found to beare it in others; because divers plants of each kinde, have bene found, as well with stalkes and flowers, as voided without) and when it beareth a stalke which riseth two foote high, it carryeth many such like leaves thereon as grow below, but set one distant from another, without order and smaller up to the toppe, where the flowers stand upon the severall branches, that it hath spread, as also coming forth at the joynts with the leaves, like unto the hollow flowers of *Echium* or Wild Buglosse, with uneven and gaping dented brimmes or edges, of a pale purple colour, with a long sticke or pointell in the middle, growing out of the flower above the length thereof; after which followeth seede like unto Buglosse, but not altogether so great or blacke, the roote is somewhat woody, long, and not much greater then a finger with some fibres thereat, of a brownish red on the outside, little or nothing colouring the fingers, as the *Anchusa*'s doe.

2. *Lycopsis Anglica*. The English Wall Buglosse.

This *Lycopsis* differeth very little in leaves, stalkes, or flowers from the former, the onely difference consisteth in that the flowers doe all grow at the toppes of the branches, and are of a deeper purple colour, with divers threads shooting out of them, the toote is a little reddish like the other, and giveth as little colour.

3. *Lycopsis Aegyptiaca*. Egyptian Wall Buglosse.

The roote hereof is red, the stalke straight, and two cubits high, with many rough and hard leaves like unto Bramble leaves, but long narrow and pointed, spread upon the ground, and dispersed upon the stalkes, but not
in

in that manner the rough wilde *Cynoglossum* doth, the stalke is branched from the middle to the toppe thereof into a number of slender twiggies, bare or naked of leaves for a good distance, and the flowers at the ends of them, which are small, and of a purple colour, made of fixe leaves like a flarre.

The Place.

The first groweth not farre from the sea-shore about *Frontignan* neare *Junto Mompelier*, as *Pena* and *Lobel* say: the other *Lobel* observed in the West country in the way from *Bristow* and *Bath* to *London*: the last *Ranunculus* saith hee found in a field where corne grew in *Egypt*.

The Time.

These flower about *July*, and sometimes in *August*.

The Names.

It is called in Greeke *Λυκόψις* *Lycopsis*, sic dicta ut aliqui volunt, quod caulis foliorum & florum imitatio hirsuties pedem *Lupinum* imitat, vel ut alij, ob radicis fuscum ex purpureo colorem a quo *Lycopsis* derivata fuit; id est, fuscedo sive obscuritas quedam, qualis est diluculi summi & prima lucis, que ortum solis precedit, vel vespertini crepusculi, que vulgus in Gallia inter canem, & *Lupum* vocat: sed alij melius & verius ut opinor a florum hianse figura que lupi fauces apertos emulatur: some as you have heard did take the *Cynoglossum* vulgare to be it, as *Ruellius* and *Fuchsius*; in which opinion *Matthiolus* saith, he himselfe was formerly, but afterwards was dissuaded because the roote was not red, but in finding fault with them, hee himselfe is reprehended by *Pena* and *Lobel*, I have given the same figure of *Lycopsis*, being not in flower for the *Cynoglossum* of *Dioscorides*: *Dodonæus* taketh the common Buglosse to be *Lycopsis*, and so doth *Lonicerus* also, and saith that the Buglosse in the warmer countries hath a redder roote; but herein surely he is much deceived; for the taste and propertie, as *Galen* saith, is nothing so alstringent in Buglosse, as in *Lycopsis*, wherein it exceedeth *Anchusa*, whereof he maketh it the fourth sort; and besides, *Dioscorides* describeth *Lycopsis* purpurascens flore, with a purplish flower, but so hath not Buglosse, but blew, although the buds be somewhat reddish, before they be full open. The first, as is said, is *Matthiolus* his *Cynoglossum*, whom *Lugdunensis* doth follow and *Durantes* also. *Dodonæus*, as is before said, maketh our knowne Buglosse to be the *Lycopsis* of *Dioscorides*, and calleth this *Lycopsis* *Echy altera species*. *Lobel* and *Pena* in their *Adversaria* calleth it *Lycopsis* vel *Lycopsis degener Anchusa* *Æginete*. *Bauhinus* doth call it *Lycopsis* simply without more words, and he maketh his *Lycopsis altera Anglica*, to be it also, although *Lobel* sheweth the difference: the last is set forth in the *Appendix* to *Lugdunensis*, where hee sheweth that *Ranunculus*, who found it, did account it a kinde of *Cynoglossum*, and called it *Lycopsis vera Dioscoridis*.

The Vertues.

The roote of Wall Buglosse boyled in oyle, healeth greene wounds speedily, and applied with Barly flower helpeth all inflammations, and *St. Antonies* fire, and being anointed in convenient places, provoketh sweate. *Galen* in his sixt Booke of Simples saith, that *Lycopsis* is cold and drie, and more alstringent than *Anchusa*, especially the roote, and therefore is very good against inflammations: it staith rheumes and fluxes, and the accessle of hot and sharpe humours to old sores, whereby they are hard to be cured.

CHAP. XXII.

Onosma. Stone Buglosse.

He forme and likenesse of this plant with the former, and both with *Anchusa*, hath made me to joine it next to them, although the vertues herof be not answerable unto them: it hath many long and narrow smooth leaves lying upon the ground, not above a finger broad, but foure long, like unto those of the lesser *Alkanet*; this is said by *Dioscorides* to have a reddish roote, and to be without either stalke flower or seede, which thing he saith likewise of *Cynoglossum* and *Lycopsis*, which both have beene knowne in divers plants, to beare both flowers and seede, and therefore it is as probable in this, as in them. *Matthiolus* onely saith, that such a plant was brought unto him, with long leaves, and reddish rootes like those of *Madder*, and had neither stalke nor flower, which he thereupon tooke to be the right *Onosma*, not knowing whether it had or would beare.

The Place.

It groweth in rockie and stony places neare *Goritia*.

Lycopsis Anglica. English Wall Buglosse.

The Time.

It is greene all the yeare, and histime for flowering if it doth at all, is not expressed.

The Names.

It is called in Greeke *Orosqua*, and so likewise *Onosma* in Latine, *Galen* saith it was called also in his time *Osma Phlomis*, and *Ononis*; wee may call it in *English* for distinctions sake Stone Buglosse, both for that it is like in forme and manner of growing unto some of the sort of wilde Buglosse, and that it chiefly delighteth in stony dry, and rockie grounds.

The Vertues.

This is sharpe, hot, and bitter in taste, differing in qualitie from the other sorts before, which are rather cold and dry: the leaves hereof in powder taken in wine, or the decoction of them made in wine and given to women with child, will cause them quickly to miscarry, and if the child be dead before the birth, it will cause it speedily to be driven forth; it is also dangerous saith *Dioscorides* for great bellied women to passe over it, for feare of causing them to miscarry.

Onosma. Stone Buglosse.

CHAP. XXII.

Cerinth. Honywort.

Although in former dayes there was but one kinde of *Cerinth* knowne, or two at the most, yet since in these our dayes, there have beene some other sorts found out, and published by *Clusius*, and some others also not untill now expressed by any; and although *Gesner* first, and *Bauhinus* following him, doe call it *Cynoglossum montanum*, and thereupon joyneth it next therunto, yet by comparing the flowers, I finde it therein most to resemble the Comfries, and therefore I have interposed it betweene them.

1. *Cerinth major flore luteo & rubro.*

The greater yellow and red Honywort.

The greater partly coloured Honywort, riseth up with divers thicke, hairy stalkes, almost two foote high, whereon are set large long leaves, of a blewish Greene colour, spotted with great white spots, round at the further ends, and so much compassing the stalkes at the lower end, that it seemeth to goe thorough them, set with some small prickles or thornes thereon, and a little hairy withall: the stalkes are branched toward the toppes into other smaller ones, full of leaves but much smaller, whose ends doe turne inwards like the Turnesole heads; at every leafe whereof commeth forth a long hollow flower, like unto a Comfrey flower and as great, which in some are all yellow, with a reddish circle about the middle thereof; but in others from the middle forward is of a yellow colour, the other part next the stalke being of a purplish red colour, with some threads in the middle, tasting sweete like Hony, wherewith Bees are much delighted, each of them standing in a Greene huske divided into five parts at the toppes, in which after they are past grow the feede, two for the most part set together, greater than Burrage feede, blackish, a little cornered and flat at the bottome, where it is joyned to the huske;

1. *Cerinth major flore luteo & rubro.*
The greater yellow and red Honywort.

3. 5. *Cerinth major flore flavo vel purpureo.*
The greater yellow or purple Honywort.

4. 6. *Cerinth minor flore flavo vel albo.*
The lesser yellow or white Honywort.

the roote is somewhat great and thické, spreading many fibres within the ground, but perisheth every yēare after seede time.

2. *Cerinth minor flore luteo & rubro.* The lesser red and yellow Honywort.

This lesser Honywort, hath his branches both shorter and leaning downewards, not standing upright, whereon grow long Greene leaves, without any spots on them, and lesser than the former: the tops of the branches are as full of leaves and flowers as the former, but turne not in the same manner: the stalkes that sustaine the flowers, and so likewise the small leaves at the foote of every stalke, are somewhat purplish, but the huske wherein the flower standeth is Greene, cut into five divisions, the flower is long and hollow like the former, and almost as great, of a gold yellow colour, dented at the ends, and with a red or deepe crimson circle about the middle of them: the seede that followeth is like the former, but a litle lesser: the roote is long and full of fibres, perishing every yeare.

3. *Cerinth major flore flavo.* The greater yellow Honywort.

This yellow Honywort riseth up with a reasonable great stalke, branched on all sides from the bottomē to the toppe, many of the lowermost lying upon the ground, and the other standing more upright, whereon are set large and long blewish Greene leaves, spotted as the former is, but not so large at the bottomē, where they compasse the stalkes, yet having some prickles in the middle thereon as they have, and a litle hoary about the brimmes or edges; the toppes of the branches doe bend downewards set with small leaves and flowers at them as the former, and as great, but without any circle or bottomē of purple, being wholly of a faire yellow colour, with such like threads as the rest have; the seede is like the former, and so is the roote also perishing after seede time in the same manner.

4. *Cerinth minor flore flavo.* The lesser yellow Honywort.

This smaller Honywort hath a slenderer stalke than the former, neare two foote high, set with smaller, narrower yet spotted leaves thereon without order, one above another on both sides of the stalkes, which spreadeth into many small but longer branches, from the middle thereof thicke set with leaves and flowers, which are like the last, all yellow but smaller, and dented at the brimmes of them; after which come such like seede as the last, but smaller: the roote hereof is likewise white and long, and that which grew in my garden, did not abide the first Winters blast, and most usually perished at the first therewith, yet *Clusius* saith that his lesser yellow wort, which he found wild in the fields of *Austria* and *Stiria*, did sometimes abide Greene in the Winter.

5. *Cerinth major flore purpurante.* The purple Honywort.

The purple Honywort groweth very like the great yellow kinde, with low bending branches, and somewhat large blewish Greene spotted leaves, like as the rest have: the flowers stand in the same manner that the rest doe, and as large, wholly of a darke purplish colour, on the superficies whereof is a litle whiteneffe perceived: the seede that followeth is like the other, but greater than any of them, and two for the most part standing together

in a huske, flat at the bottome, the roote perisheth every yeare, and must be new sown againe.

6. *Cerinthe minor flore albo.* White Honywort.

This small Honywort hath divers weake and small branches, leaning or rather lying downe upon the ground, set with such like pale Greene leaves, but lesser than the former, whose white spots are not so easie or conspicuous to be seene as in many of the other: the flowers are white long and hollow, like them but smaller, with a reddish circle about the middle of the flower, and standing with Greene leaves, and in Greene huskes as the rest, wherein after they are past, come very like seede, but not halfe so great as the last; the roote likewise is long, slender, and white, perishing every yeare after it hath given seede.

The Place.

The first as *Clusius* saith, groweth generally throughout *Betica* of *Spaine* plentifully, and in some places of *Portingall* also: the second is not knowne from what place it came, but was onely observed by *Clusius*, in *Iohn* ab *Hogbeld* his garden: the third *Clusius* saith he found in the Kingdome of *Valencia* in *Spaine*. *Gesner* in *hortis* saith it groweth in *Monte Palatino* at *Rome*, as also in *Germany*, betwene *Dresda* and *Misena*; and *Clusius* saith he found it in divers fields of *Austria* and *Stiria*, where sometimes it would out live a Winter; and *Dodonaeus* saith in *Bohem*: and divers parts of *Hungary*: the fifth and sixth grow in divers places of *Spaine*, from whence we had them, by *Guillaume Boel* his diligence in finding them out there.

The Time.

They doe all flower in *July* and *August*, yet sometimes so late, that we doe not gather good seede of any of them but the red, if the yeare prove not warme enough, and wet with all to ripen them, or be not well watered if the Sommer be drie to bring them forward the sooner.

The Names.

Theophrastus among the ancient Greeke Writers, in his 6. Booke, and 7. Chapter maketh mention of *Cerinthe*, and calleth it *Krein*, and *Pliny* and *Virgil* among the ancient Latines, make mention thereof likewise, and it is but thought also to be their *Cerinthe*: *Pliny* speaketh thereof in his 21. Booke and 12. Chapter, and *Virgil* in *quarto Gorgicorum* in these words,

—Hucus jussos asperge saporis,
Trita Alei phylla & *Cerinthe* ignobile gramen.

and not *gratum* as some reade it; whereby is understood that it is a base or vile weede or herbe, growing every where as grasse, for so divers herbes are named grasse. Many learned men in *Germany* and *France*, especially about *Paris*, where they nurse it in their gardens, have called it *Telephium maculosum*, supposing it to be the *Telephium* of *Dioscorides*. *Dodonaeus* and *Clusius* saith, that many tooke it to be the herbe *Almaru* or *Almara* of *Avicen*, whereof in his 464. Chapter, he maketh five sorts, and this to be the fourth; but *Clusius* saith that he taketh *Avicen* to meane no other herbe but either our Borage or Buglosse; he saith also this may very well agree with the *Leucographis* *Pliny*, whereof hee maketh mention in his 27. Booke and 11. Chapter, because the leaves are spotted white; some also hee saith tooke it to be *Alcitha* of the *Arabians*, but *Clusius* supposeth that to be *Glaucium Gracorum*: *Gesner*, as I said before in *hortis Germanie*, saith it was called of some in his time *Cynoglossum montana*; and *Bashinus* thereupon calleth it *Cynoglossum montanum*; but *Clusius* referreth it rather to the kinde of Borage or Buglosse, whereof in temperature he saith it is nearest. *Dalechampius* tooke *Calendula* to be *Cerinthe*, a cereo ipsius flore sic appellata: but the most usuall and common name, whereby it is generally called now a dayes is *Cerinthe*, and *Pliny* added, because the most and best Herbarists, doe thinke it comes nearest unto his description. The first is called *Cerinthe major* by *Lobel* and *Camerarius*, and by *Clusius* *Cerinthe quorundam major versicolore flore*, and *Bashinus* *Cerinthe seu Cynoglossum montanum majus*: the second is *Clusius* his fifth kinde, whereof he maketh mention in his other Appendix, which is joynted to his Booke of *Exoticke* things; and *Bashinus* calleth it *Cerinthe folio non maculato viridi*: the third *Clusius* calleth *Cerinthe quorundam major flavo flore*, and *Bashinus* *Cerinthe flore flavo asperior*: the fourth is called by *Clusius* *Cerinthe quorundam minor flavo flore*; by *Lobel* *Camerarius* and *Tabermontanus* *Cerinthe minor*, by *Lugdunensis* *Cerinthe* *Pliny*: the fifth is the third *Cerinthe* of *Clusius* in his history of plants, and called by *Bashinus* *Cerinthe flore rubro purpurascete*: the last is not yet extant, or remembred by any Author, we being the first to whom it was brought out of *Spaine* by *Guillaume Boel*.

The Vertues.

They are all of a temperate qualitie betwene cold and hot, but rather inclining to cold, and somewhat astrigent withall, it is held good to stay the bleedings at the mouth or nose, to stay womens immoderate fluxes, and the fluxes or laskes of the belly, the herbe being boyled and given to drinke: the juice of the herbe with a little saffron dissolved therein, is good for bleared and watering eyes, and is used in foule ulcers after they are clenfed, to helpe to incarnate them, especially such as are in the tender parts of the body: Some doe apply it as a remedie whereunto Borage and Buglosse are good. *Pliny* and *Virgil* in the places before mentioned, did affirme that Bees are much delighted with the flowers being swete, and from them as much, or more then from any other flowers, doe gather both Hony and Waxe, and thereupon peradventure it is more likely, tooke the name of *Cerinthe*.

CHAP. XXIV.

Symphitum majus. Great Comfrey.

Here are many sorts of *Symphitum* called *Consolida* and *Solidago*, that is *major*, *minor* and *media*, a greater, a lesser, and a middle one: as also another kinde called *Symphitum petraeum*, whereof *Dioscorides* maketh mention, and another called *Consolida* or *Solidago Serrajenica*, which becaue they are all several herbes, I shall speake of them severally in the Chapters following: for in this I intend only to set forth unto you the greater Comfrey, which is of divers sorts, some ordinary by growing wild, by the fields and ditches sides of our owne land, others nursed up onely in gardens with us.

1. *Symphitum majus vulgare*.
Common great Comfrey.

3. *Symphitum tuberosum*.
Comfrey with knobbed rootes.

1. *Symphitum majus vulgare*. Common great Comfrey.

The common great Comfrey hath divers very large and hairy darke Greene leaves lying on the ground, so hairy or prickly, that if they touch any tender part of the hand, face, or other part, it will cause it to itch: the stalke that riseth up from among them, being two or three foote high, hollow and cornered, is very hairy also, having many such like leaves as grow below, but lesser and lesser up to the toppe; at the joints of the stalkes it is divided into many branches, with some leaves thereon, and at the ends stand many flowers in order, one before or above another, which are somewhat long and hollow, like the finger of a glove, of a pale whitish colour, after which come small blacke seede: the rootes are great and long spreading great thicke branches under ground, blacke on the outside and whitish within, short or easie to breake, and full of a glutinous or clammy juyce, of little or no taste at all.

2. *Symphitum majus purpureo flore*. Great Comfrey with purple flowers.

This Comfrey differeth in no other thing from the former, but in this that it is somewhat lesser, and the flowers are of a pale purple colour.

3. *Symphitum tuberosum*. Comfrey with knobbed rootes.

The knobbed Comfrey riseth up with a hairy crested or cornered stalke, much lower than the former, with smaller leaves, and more thinnely set thereon, of the same forme and greenenesse, that thereby it may at the first sight, to any that hath well marked the former, be knowne to be a Comfrey; but especially when the toppe branches are in flower, which being set after the same manner, and of the same hollow fashion, but smaller, are of a more sad yellowish colour, whose seede following is like the former: the rootes branch out into thicke and short sprays, more knobbed at the ends with divers fibres thereat, blacke on the outside and yellowish within, fraught with such clammy or slimie juyce, as is in the former, but not so glutinous, yet as tender or easie to be broken as it, or rather more easie: the stalke and leaves dye downe every yeare as they doe in the former: the roote abiding and increasing in the ground, and shooting forth new stalkes and leaves every Spring: some doe make a lesser sort hereof, which I never saw, nor can be well assured thereof.

4. *Symphitum angustifolium Apulum*. Narrow Comfrey of Naples.

This narrow leaved plant *Columna* maketh an Alkanet like an *Echium*, yet from the viscous or slimy binding and sodering juice in the roote, may (as hee saith himselfe) therefore be accounted rather a Comfrey, and so doe I among them with the description thus. The roote while it is young is reddish, but growing old is long and woody, greater than the smallnes of the plant might seeme to have with a blacke rugged barkke, in, which sendeth from it sundry heads of narrow long leaves round about it with a whitish hairinesse on them, from among some of which rise reddish stalkes of a foote or more high, with somewhat broader leaves up higher thereon, at the toppes whereof which turne themselves like to a Scorpions taile, grow many hollow long, yellow flowers, opening at the brimmes into five parts, all of them flowing one after another with a long pointell in the middle of them, after which come foure blackish browne smooth seeds in each huske.

The Place.

Both the former grow by ditches and watersides, and in divers fields that are moist, for therein chiefly they delight to grow, the first generally through all the land, and the other but in some severall places, the third in the Woods of Germany, Austria, and Hungary, but in gardens onely with us: the last in the stony places of the hills of *Aquicoli* in Naples on the Southside.

The Time.

They flower in June and July, and give their seede in August.

The Names.

It is called in Greeke *συμφυτον* & *συμφυτον* *symphytum* and *symphitum*, a faculate glutinandi sic dictum, unde *Consolidida* Latinis: it is also called as *Dioscorides* saith *μυρρις*, or *μυρις*, *peccor* or *peccor*. Pliny saith it was called *Alum* and *Alum*, and is also of some called *Solidago*, and of *Scribonius Largus* *Insula rustica*, of some as *Dodonaeus* saith, *Osteocollon*; and *Urtica* from the Germane word *Schmerwurtz*: but the most usuall name is by all authors now *Alum*, either *Symphytum* or *Consolidida major*; that with purple flowers is called *ma*, and the white *femina*. The second is so called by most, as is in the title. The last sort I have transposed hither, with a new title, as being fittest for it in my judgement, although both *Columna* and *Baubinus* make it an *Anchusa*, for some reasons set downe in the description *Columna* calleth it *Anchusa echinoides lutea* *Cerinthe flore montana*, and *Baubinus* *Cerinthe lutea minor*. The Italians call it *Consolidida maggiore*, the Spaniards *Suelda*, and *Consuelda maggiore*, the French *Consyre*, *Grande Consolide*, and *Oreille d'Asne*, the Germanes *Großwurtz*, *Schmerwurtz*, *Schmerwurtz*, *Schmerwurtz*, and *Beinwurtz*, the Dutch *Wachtwortole*, in English *Comfrey*.

The Vertues.

The great Comfrey is as some say, cold in a temperate degree, and others say hot, which is not held true, but drying and binding in a greater measure, for it helpeth those that spit blood, or that bleed at the mouth, or that make a bloody urine: as also for all inward hurts, bruises and wounds, and helpeth the ulcers of the lungs, causing the fleagme that oppresseth them, to be easily spit forth, the roote being boyled in water or wine; the same also drunke, stayeth the defluxions of rheume from the head upon the Lungs, the fluxes of blood or humours, by the belly, womens immoderate courses, as well the reds as the whites, and the *gonorrhoea* or the running of the raines, happening by what cause soever: A Syrupe made thereof is very effectuell for all those inward griefes and hurts; and the distilled water for the same purpose also, and for outward wounds or sores in the fleshy or sinewy parts of the body wheresoever, as also to take away the fits of agnes, and to alay the sharpnesse of humours: a decoction of the leaves hereof is available to all the purposes, although not so effectuell as of the rootes: *Camerarius* saith, that two ounces of the juice drunke, doth much good in the Lethargy and dead sleepe; the rootes being outwardly applyed, helpeth fresh wounds or cuts immediately; being bruised and laid thereto, by glucing together their lips, and is especiall good for ruptures and broken bones; yea it is said to be so powerfull to consolidate or knit together, whatsoever needeth knitting, that if they be boyled with disfileted peeces of flesh in a pot, it will joyne them together againe; it is good to be applyed to womens breasts, that grow sore by the abundance of milke comming into them: as also to repress the overmuch bleeding of the hemorrhoids, to coole the inflammation of the parts thereabouts, and to give ease of paines: the rootes of Comfrey taken fresh, beaten small, spread upon leather, and laid upon any place troubled with the gout, doe presently give ease of the paines; and applyed in the same manner, giveth ease to pained joynts, and profiteth very much for running and moist ulcers, gangrenes, mortifications, and the like, often experimented and found helpfull.

CHAP. XXV.

Bugula sive Consolidida media. Bugle or the middle Confound.

His browne Bugle is so like unto the *Prunella* or *Selse heale*, that divers have made them but *species* to one *genus*, and to have confounded them together, and yet they have seemed to distinguish them, calling this *Consolidida media*, and the other *Consolidida minor*: yet there are other herbes that they so call also, which shall likewise be entreated of in the Chapters following; but I finding them to differ notably one from another, have disposed of them severally; intreating of the greater in this Chapter, and of the lesser in the next.

1. *Bugula vulgaris flore ceruleo.* Ordinary blew flowered Bugle.

This Bugle hath larger leaves then those of the *Prunella* or *Selse heale*, but else of the same fashion, or rather a little longer, in some greene on the upper side and in others more brownish, dented about the edges, somewhat hairy as the square stalke is also, which riseth up to be halfe a yeard high sometime, set with such leaves thereon by cuples; from the middle almost whereof upwards, stand the flowers together, with many smaller and browner leaves then the rest on the stalke below, set at distances, and the stalke bare betweene them, among which flowers are also small ones, as those of *Selse heale*, and of a blewish and sometime of an ash-colour, fashioned like the flowers of *Alehoofe*, or *Ground Ivy*, after which come small round blackish seede: the roote is composed of many strings, and spreadeth upon the ground into divers parts round about. Of this kinde there is another whose leaves are longer then these, and deeper dented in about the edges.

*Alba longi-
cristus folijs*

2. *Bugula flore albo.* Bugle with a white flower.

The white flowered Bugle differeth not in forme or greatnesse from the former, saving that the leaves and stalkes thereof are alwaies greene and never browne like the other, and that the flowers are very white.

3. *Bugula flore carneo.* Bugle with bluish coloured flowers.

This other Bugle differeth little also from the other before declared, but that it is a more tender plant, soft and smooth in handling, not rising full so high as the former, and the flowers thereof are of a pale red or bluish colour, which maketh the greatest difference.

4. *Bugula*

4. *Bugula Alpina cœrulea*. Blew mountaine Bugle.

The mountaine Bugle is not unlike the other, having longer and thicker leaves, especially at the bottomes of
 em, seeming for the smallnesse to be footestalkes, dented
 o about the edges, and somewhat hard or hairy, thinnely
 by couples upon the square hairy stalkes, a foote high or
 ore, at the toppes whereof the flowers stand in spikes,
 erer set together then the former, and of a blew colour,
 hioned like unto the rest; the roote is long, with divers fi-
 es thereat.

5. *Bugula flore luteo*. Bugle with yellow flowers.

This yellow Bugle is smaller then any of the former by
 uch, having rounder leaves upon the stalkes, and dented
 out the edges like unto them: the flower is yellowish,
 anding in the same manner that the rest doe.

6. *Bugula odorata Lusitanica*.

Sweete Portingall Bugle.

This kinde of Bugle riseth up with three or foure round
 and hairy stalkes about a foote high, at the joynts whereof
 row leaves by couples, which are long hairy, and divided
 r torne on both sides into two or three gashes, each bow-
 ng backe a little, the largest leaves are lowest, and smaller
 ill up to the toppes, where among the great spikie heads
 f flowers they are very small: the flowers are of a violet
 purple colour, formed hollow with lips as it were hang-
 ing downe, somewhat like the former Bugles, standing in
 uppes, wherein afterwards grow white feede, which by
 owing it selfe doth often rise againe, for it is but annuall,
 the roote is composed of many blacke fibres: all the whole
 plant hath a very pleasant sent.

The Place.

The first and second grow in woods and wet copses, and
 fields generally throughout England in many places, but the
 second is harder to be met withall. The third groweth in
 Austria and some other places of Germany as *Clusius* saith.
 The fourth upon Mount *Baldus*. The fifth is said to grow
 with us, and the last in Portugall.

The Time.

They all flower from May untill Iuly, and in the meanē
 time they perfect their feede, the roote and leaves next thereunto upon the ground, abiding all the Winter,
 untill the next Spring.

The Names.

It hath no Greeke name or author, that we are certaine of, but is called in Latine in these times *Consolida*
media, and *Solidago media* (but there are many herbes that are called *Consolida* and *Solidago*, from their vertues
 as you shall finde them remembered in their severall Chapters) and *Buglum* or *Bugla*, as *Ruellius* saith the French
 were wont to call it, and more usually now a daies *Bugula*; but some as I said before confounded this with *Prun-*
ella, making them all one: some also tooke this to be *Symphitum petraeum* of *Dioscorides*, to which it answereth
 in nothing to his description, as you shall heare hereafter in the next Chapter. *Matthiolus* calleth it *Laurentina*
 or *Herba Laurentina*. Some would have it to be *Chamecissos spicata* *Pliny*, lib. 24. c. 15. and others to be his
Anonymos, lib. 27. c. 4. The first is called by *Tragus* *Prunella cerulea prima*, vel *major*, and as he saith is the *Prun-*
ella Argentinensis, by *Thalys* *Consolida media major*, by *Dodonæus* and *Clusius* *Bugula*, by *Lobel* and *Pena* *Bugula*
 and *Prunella quibusdam*, by *Anguillara* *Arborea Pandestary*; by most writers *Consolida media pratensis cerulea*.
 The third is mentioned by *Clusius* with the name *Bugula carnei coloris flore*, by *Thalys* *Consolida media minor*, by
Tragus *Prunella purpurea vel quarta* as *Bauhinus* thinketh, who calleth it himselfe *Consolida media pratensis pur-*
purea. The fourth *Bauhinus* describeth in his *Matthiolus* and *Prodromus*. The fifth is remembered onely by *Bau-*
hinus in his *Prodromus*, that he had it out of England. The last is mentioned by *Iacobus Cornutus*, among his
Canada Plants. By the Italians it is called *Consolida mezzana*, and of them of Siena as *Matthiolus* saith, *Morandola*,
 by the French *Bugle*, by the Germanes *Gunzel*, and *Gulden Gunzel*; by the Dutch *Sevegroen*, in English *Bugle* or
 Browne Bugle, and Middle Cumfrey or Confound.

The Vertues.

Bugle is temperate in heate, but drying moderately, and is somewhat astringent. It is of excellent use for
 those that have caught any fall, or are inwardly bruised, for it dissolveth the congealed blood, and disperseth it
 by taking the decoction of the leaves and flowers made in wine; the same is no lesse effectually for any inward,
 wounds, thrusts or stabbes into the body or bowels, and is an especall helpe in all wound drinckes, as also for those
 that are Liver growne as they call it, whose inward griefes and paines arise from the obstructions of the Liver,
 and gall, and strengthening the parts afterwards; it is wonderfull in curing all manner of ulcers and sores, whe-
 ther they be new and fresh, or old and inveterate, yea gangrenes and fistulaes also, either the leaves bruised and
 applied, or their juice used to wash and bathe the places; and the same made into a lotion with some hony of
 roses and allome cureth all sores of the mouth or gums, be they never so foule or of long continuance, it worketh
 no lesse powerfully and effectually, for such ulcers and sores as happen in the secret parts of men or women: it
 helpeth those also that have broken any bone of their body, or have any dislocation of a joynt, both used inward-
 ly, and applied outwardly; an ointment made with the leaves of Bugle, Scabious, and Sanicle, bruised and boy-
 led

1. *Bugula vulgaris*.
Ordinary Bugle.

3. *Bugula flore carneo*.
Bugle with bluish coloured flowers.

6. *Bugula odorata Lusitanica*.
Sweete Portingall Bugle.

led in *Axungia* untill the herbē be dry, and then strained forth and kept in a pot, for such occasions as shall require it, is found so singular good for all sorts of hurts in the body, or any part thereof, that I would not wish any good Gentlewoman in the land, that would do good either to her owne family, or other her poore neighbors, that want helpe and meanes to procure it, to be without this ointment alwayes at hand by them, it hath done and would doe so much good, for beyond the Sea in *France* and *Germany*, it is a common proverbe amongst them, that they neede neither Physition to cure their inward diseases, nor Chirurgeon to helpe them of any wound or sore that have this Bugle (or the *Prunella* Selfeheale, for with them they are accounted but one herbe, as I said before) and Sanicle at hand by them to use.

CHAP. XXVI.

Prunella sive *Consolida minor*. Selfeheale.

Here be divers sorts of this Selfeheale, some differing in forme, others in colour onely, as you have them here set forth unto you.

1. *Prunella vulgaris*. The common Selfeheale.

The common Selfeheale is a small low creeping herbe, having many small and somewhat round yet pointed leaves, somewhat like the leaves of wild Mints, of a darke greene colour, without any dents on the edges at all, or very seldome, from among which arise divers square hairy stalkes, scarce a foote high which spread sometimes into branches, with divers such small leaves set thereon, up to the toppes, where stand browne spiked heads, of many small brownish leaves like scales and flowers set together almost like the head of *Stechas* or *Cassidony*, which flowers are gaping and of a blewish purple, or more pale blew colour, in some places sweete, but not so in others: the roote consisteth of many strings or fibres downewards, and spreadeth stringes also whereby it encreaseth, the small stalkes with the leaves creeping upon the ground, shoote forth fibres, taking hold of the ground, whereby it is made a great tuft in a small time.

2. *Prunella vulgaris flore albo*. Selfeheale with a white flower.

This Selfeheale differeth very little from the former, in any thing but in the flower, which in this is pure white, and the small scales or leaves greene and not brown, saving that it doth not encrease or spread so much.

3. *Prunella magno flore purpureo*. Selfeheale with a great purple flower.

The greater flowered Selfeheale, hath a square soft hairy stalke, rising somewhat higher then the ordinary, with two leaves, and sometimes more at every joynt thereof, up to the toppe, which are somewhat greater and

and longer than those of the former : the heads of flowers at the tops are much greater than in the former, but made after the same fashion, with small browne leaves among the flowers, but greater and more open and displayed, which in some are of a blewish purple colour, in other more pale, or almost blew or pale blew : after which come foure small seedes set together in a huske : the roote is blacke with white fibres thereat shooting forth and encreasing new heads of leaves every yeare.

4. *Prunella magna flore albo.*

Selfheale with a great white flower.

This selfheale likewise differeth from the last onely in heade and flowers, for the small leaves are greene, and the flowers whire, as in the ordinary fort before.

5. *Prunella Laciniato folio.*

Selfheale with jagged leaves.

The stalkes of this Selfheale are likewise square and hairy as the leaves set thereon by couples at the joynts, the lowest whereof are long and whole without any cut or jagge in them, all the rest being longer and narrower, are cut in or jagged on the sides, and the higher leaves more divided or cut: the heads are like those of the common fort, and of the same forme and bignesse, but varying in colour as both the former sorts doe; for some plants are found with purplish flowers, others more de-laied like blew, some betwene blew and white, like an ash colour; others altogether white: the roote bereof is like the other, and encreaseth by the shooting strings, that put forth fresh leaves every yeare.

The Place.

The two first are found in woods and fieldes every where, yet the second much more seldome than the former: the third and fourth, and so likewise the last, on divers hills and parts of Germany and France.

The Time.

The two first sorts flower in May, and sometimes in April, the other fort, somewhat later, as for the most part all mountaine herbes doe.

The Names.

This is generally called *Prunella* (for it was not knowne to the ancient Greeke or Latine Writers, that can yet be found) and *Brunella* from the Germans, who called it *Brunnellen*, because it cureth that disease which they call *die Bruen*, common to fouldiers in campe, but especially in garison, which is an inflammation of the mouth, throat, and tongue, with blacknesse therein, accompanied for the most part with a strong burning feaver, and distraction of the senses: it is also called *Consolida minor*, and *Solidago minor*, and of *Camerarius* *Consolida minima*. *Lobel* and some others also with him, rooke it especially that with jagged leaves to be *Symphitum petraeum* of *Dioscorides* which that it cannot be, you shall heare the description thereof as *Dioscorides* giveth it: (that is *Symphitum petraeum*) groweth faith he in rockie and stony places, with slender small branches like *Origanum*, and with the heads and leaves of Time; it is all woody, swelling sweete and pleasant in taste, yet drawing water into the mouth: and causing one to spit it out: the roote is somewhat reddish or browne, of the length of a finger; yet some coppies have, it hath branches like *Origanum* and small leaves and heades like Time: this is *Dioscorides* his text: but this herbe Selfheale, hath no woody stalkes, nor reddish rootes, nor finelleth sweete except in some places, nor doth it so strongly consolidate or knit flesh together, as the great Comfrey doth; which is one of the properties *Dioscorides* appropriateth unto *Symphitum petraeum*. *Lobel* therefore first imagined that the *Coris Monspeliensis* should be it; *Bauhinus* also after him faith he did, but afterwards he learned that *Matthiolus* his *Symphitum petraeum*, was much differing, his figure being of *Coris lutea*. The first and so the rest are called *Brunella*, by *Brunselsius*, *Dodonaeus* and *Lobel*, by *Tragus* *Prunella vulgaris*, and so by all Authors, only as I said before, *Lobel* in his *Adversaria* calleth this last, *Symphitum petraeum* and *Bauhinus* *Prunella Laciniato folio*.

The Vertues.

The Selfheale being so like the Bugle as I said in outward forme, is no lesse like it in the qualitie and vertues being by the bitterness taken to be hot and drie, and yet temperate in both degrees, and by some thought to be bath or more cold, in regard it is so powerfull to helpe such an hot sicknesse as the Germane disease, called *die Bruen*, which as hath bin in some part said before, commeth with inflammation and swelling both in the mouth and throat, the tongne rough and rugged or blacke, and a fierce hot continuall ague thereon, which is remedied chiefly by drinking the decoction of this herbe continually, and washing the mouth often also therewith, having some vinegar added unto it; but blood letting must be used in the cure, and that under the tongne, without which it will not, or very hardly be effected: this herbe serveth for all the purposes whereunto Bugle is applied, and with as good successe both inwardly and outwardly: for inward wounds and ulcers wherefoever within the body: for bruises and falls, and other such griefes, for if it be accompanied with Bugle, Sanicle, and other the like wound herbes it will be the more effectfull and to wash or inject into ulcers, in the parts outwardly, for where there is cause to repress the heate and sharpenesse of humours, flowing to any sore, ulcer, inflammation, swelling or the like; or to stay the fluxe of blood in any wound or any part, this is used with good successe, as also to cleanse the foulness of all sores, and to cause them the more speedily to be healed: it is an especiall reme dy

5. *Prunella Laciniato folio* sive *Symphitum petraeum* *Lobellij*.
Selfheale with jagged leaves.

medy for all greene wounds to soder the lippes of them, and to keepe the place from any further inconvenienc. the juyce hereof uled with oyle of Roses, to annoint the temples and forehead, is very effectuall to remove the head-ach, and the same juyce mixed with a little Hony of Roses, clenseth and healeth all ulcers and sores in the mouth and throate, and those also in the secreet parts: the same ointment that is set downe in the former Chapter is made as often with this herbe instead of Bugle; if it be not at hand, or if it be, yet they are oftentimes both put together, to serve to helpe broken bones, or joints out of place: the Proverbe of the *German, French*, and others, whereof is made mention in the former, is no lesse verified, as I there said then of this, that he needeth neither Physition or Chirurgion, that hath Selseheale and Sanicle by him to helpe himselfe.

CHAP. XXVII.

Bellis. The Daisie.

Here be many sorts of Daisies, some growing wild both greater and smaller, and others in gardens chiefly, whereof I have in my former Booke given you the hint of divers, but many more is to be spoken of here, that is not there set downe, which are fitter for this than that place; and I am the more willing and thinke it fitter to joyne their Chapter next unto the last, because some of them are called *Consolida*, which I would set altogether.

1. *Bellis major vulgaris sive sylvestris*. The great white wild Daisie.

The great white Daisie hath many long narrow and round pointed leaves next the ground, cut in on both sides, making it seeme almost like the divisions of some sorts of Oaken leaves, the stalkes grow to be somewhat high, with divers leaves thereon, but smaller and lesser divided than the lower, at the toppes whereof grow large flowers each upon severall footstalkes, consisting of many white and narrow leaves as a pale or border, and the yellow thrummes in the middle, of no sent at all, whose seede which is somewhat long is blownen away with the winde: the roote is a bush of white stringes, which abide many Winters with the leaves, shewing forth every Spring anew. Of this kinde there is one that beareth double flowers differing from the former in nothing else, which is set forth in my former Booke.

*Flare
pleno.*

2. *Bellis montana major folio acuto*. The mountaine great Daisie with sharpe pointed leaves.

This Daisie groweth lower than the former, and hath much narrower leaves, and shorter also, not deeply dented, nor sharpe about the edges, but ending in an exquisite point; the stalkes beare but one flower apeece, somewhat lesse than the former, but else in all things alike.

3. *Bellis major vulgaris sive sylvestris*.
The great white wilde Daisie.4. *Bellis major ramosa umbellifera Americana*.
The great strange white Daisie.

3. *Bellis Alpina major rigido folio.* The greater mountaine Daisie with sharpe edged leaves.

The leaves of this Daisie are longer and narrower then the first sort, whose dented edges are very sharpe, and leaves harder in handling, the ends in some are pointed, in others somewhat rounder: the toppes of stalkes are furnished with single flowers like the first, but larger then it: the seede is small and long like it, the rootes are blackish with strings or fibres thereat, being somewhat hard and woody.

4. *Bellis major ramosa umbellifera Americana.* The great strange white Daisie.

The stalke of this great Daisie is higher and greater then of the first great sort, the leaves also are larger, and addest towards the ends, but longer and smaller at the bottomes, dented likewise about the edges, shooting forth sundry branches, and all of them bearing many white flowers at their toppes, as it were in an umbell, not so great, nor the white leaves so large as it, but smaller, and more in number, with a greenish yellow tinge in the middle, and some a little larger then others, the seede is smaller then the other, and the rootes of fibres.

5. *Bellis Alpina minor rigido folio.*

The smaller great Mountaine Daisie with rigid leaves.

This mountaine Daisie is very like unto the last but that it is less, growing scarce a foote high, with hard or harsh narrow or short leaves, deeply and sharply dented at the edges: the stalkes have each of them one large flower, made like the first, whose border of white leaves, have sometimes yellow, and sometimes purplish yellow thrums in the middle.

6. *Bellis maritima folijs Agerati.*

The small Sea Daisie with *Maudeline* leaves.

This small Sea Daisie, riseth with a small downy stalke, not above halfe a foote high, divided into two or three very small long branches, at the bottom whereof grow a few very small leaves, dented about the edges; very like unto the leaves of *Maudeline*, the rest of the stalkes and branches, being bare or naked of leaves unto the toppes, every one whereof beare one small flower, having above twenty small white leaves, compassing a greenish head in the middle: the rootes small and white.

7. *Bellis major spinosa flore luteo nudo.*

The greater yellow Daisie with prickly leaves.

This prickly leaved Daisie springeth up with divers heads, of many small greene leaves, dented about the edges, and very dent sharpe at the point, which shooting up into stalkes, with the like, but lesser leaves on them, become hard and woody up to the toppes, sometimes branched, otherwhiles not, but carrying on their toppes divers small round flowers, in severall small footestalkes, which have no border of leaves, either white or yellow to compass them, but are like the naked Camomill, or Fetherfew, and somewhat lesser, being a yellow round knop, somewhat hollow in the middle; after the flower is past, there stand in their places small heads with seede, each whereof is small long and whitish, which must soone be gathered when it is ripe, or else it quickly falleth, or is blowne away with the winde, the roote is a great tuft or bush of long blackish strings, or long fibres; the taste hereof is bitter and unpleasant, and the smell somewhat strong.

8. *Globularia Monspeliensium sive Bellis cerulea.*

Blew Daisies.

The blew Daisie hath many narrower shorter and blacker greene leaves then the common field or garden small Daisie lying on the ground: the stalke riseth to be halfe a foote high or more, set with some such small leaves, and at the toppe a small round head, composed of many blew flowers, somewhat like unto the head of a small Scabious, and sometimes with white flowers: the roote is hard and stringy, the whole plant is bitter in taste.

9. *Bellis cerulea spinosa.*

The blew Daisie with prickly leaves.

This Daisie is wholly like the former blew Daisie, but that the leaves that grow below upon the ground, as well as those upon the small stalkes, being like in forme unto them, are dented about the edges, the points whereof are prickly, as the ends are likewise: at the toppes of every stalke, which is not higher then the other, standeth one round flower, larger or greater then of the other, but composed of the like blew threads as they.

7. *Bellis major spinosa flore luteo nudo.*

The greater yellow Daisie with prickly leaves.

8. *Globularia Monspeliensium Bellis cerulea.*
Blew Daisies.

Zz

10. *Globularia*

10. *Globularia lutea montana*.
The mountaine yellow Daisie.

11. *Bellis minor simplex sylvestris*.
The lesser wilde white Daisie.

12. *Bellis minor alba ramosa*. Branched small wilde white Daisies.

10. *Globularia lutea montana*. The mountaine yellow Daisie.

This yellow Globe flower hath many thicke, hard, smooth, round pointed leaves spread into sundry heads on the ground, from among which spring sundry stiffe rushlike stalkes about a foote high, with a joynt towards the middle of them, and two small upright leaves set thereat, each bearing on their toppes, a globelike round head of flowers inclosed in a skinne, which opening, a number of flowers appeare, thicke thrust together, like unto a head of Scabions, each flower being set in a rough purplish huske consisting of five sweete faire yellow leaves laid starre fashion, with tenne long threds in the middle, standing about a small round umbone, having a pale flat bicorned pointell rising out thereof, which umbone growing ripe is rough, and containeth within it an hard shell, opening at the toppe into foure parts, wherein lie round flat, blacke seed, divided as it were with a small cut; the roote is white, a foote long, and of a small fingers thicknesse, with a thicke brownish barke, and a hard wooddy pith within, divers long fibres issuing out therefrom, whose taste is drying, and sent quicke and heady, the leaves being bitter and sharpe withall.

11. *Bellis minor sylvestris simplex.*

The lesser wilde white Daisie.

The small common single field Daisie hath many thicke and somewhat long Greene leaves, lying upon the ground, small at the bottome, broad and almost round at the point, and a little dented about the edges; from among which rise many very slender, weake, and naked stalkes, or rather footestalkes, of two, three or foure inches high, bearing every one a small Greene head, from whence rise many small white leaves, set about a yellow thrumme or head in the middle, sometimes the Greene leaves will be found to be much larger in one place then another, and the flower likewise in some will be reddish at the ends, and sometimes understained, and yet is but all one kinde or sort, and not divers as some would have it: the roote is many small white fibres.

12. *Bellis minor alba ramosa.*

Branched small wild white Daisie.

This small Daisie differeth very little from the last Daisies, but that the leaves are a little shorter and more dented about the edges, and the sundry small stalkes beare such like leaves on them at the joynts where they branch forth into many parts, with such like small white flowers at their toppes.

13. *Bellis hortensis multiplex.* Double Daisies.

This differeth very little from the last, either in the leaves or manner of growing, the chiefest difference consisteth in the flowers, which in some are all white, but composed of sundry rows of leaves, others of a whitish red, or more white then red, or rather white leaves dispersed among the red and others of other varieties, as I have formerly expressed them in my Booke.

The Place.

The first groweth every where by hedge sides, in the borders of fields, and other waste grounds. The second on the Engagean hills by Padoa. The third on Mount Baldus. The fourth came to us from Virginia. The fifth groweth on the Mountaines among the Switze^rs. The sixth in sandy barren places in the Ilands of Stechades, which are over against Marseller. The seventh was first brought me out of Italy, by Mr. Dr. Flud, with many other seedes, that grew in the Garden of Pisa, in the Duke of Florence his Dominions, but of whence it is naturally, I have not yet certainly knowne, whether of Candy or any other place. The eighth groweth about Montpellier, and in many other places both of France and Italy. The ninth, grow on the hills in the Kingdome of Granada, there gathered by Dr. Albinus, and brought to Bauhinus as himselfe relateth. The tenth, on the hills of Aequicola in Naples, as Columba maketh mention. The eleventh groweth in every field and meadow almost. The twelfth was sent from Portugall. The last in Gardens.

The Time.

All the fixe first sorts doe flower in May and June, but the other foure next sorts later, that is, not untill the end of Iuly or beginning of August, and but sometimes give good feed with us, the rest all the Spring and former part of the Sommer.

The Names.

It is thought by most writers and others, that this was not knowne to any of the ancient Greeke authors, although some doe thinke that it is the same that Theophrastus in his seventh Booke, and ninth Chapter, calleth *Anthemis*, which is with him *ad terram foliate species*, which Gaza translateth *Nigella*, but it cannot be that. Pliny onely among the Latines maketh mention of *Bellis*, in his 26. Booke, and fifth Chapter, saying *Bellis* groweth in meadows, with a white flower somewhat reddish, which sheweth us our small wilde Daisie, but that whereof he speaketh in his 21. Booke and 8. Chapter which he calleth *Bellio* or *Bellius luteus*, as some have it, and hath 55. beards to crowne it, and is a field flower is not certainly knowne what herbe it should be, yet many thinke the place corrupted, and to be otherwise read, but howsoever it be, he maketh it knowne no better. Some would have the name *Bellis* to be taken from *Belus* the King of Danais, whose fifty daughters, being married to their fifty husbands, did the first night of their marriage make a mournfull massacre, every one of their husbands excepting one: some derive the word a *bello* quasi, *bellis presidium*, some also from the French word *Marguerites*, doe call the lesser wilde sort *Herba Margarita*. The first sort is called of divers *Consolidamajus*, and the common small or field Daisie, called *Consolidaminor*: yet *Matthioli* maketh a sort of them to be *minor*: but no other liketh of that division. *Brunsellius* called it *Oculus bovis*, and *Bupthalmus*, and *Tabernmontanus* *Bellum majus*, but all other authors *Bellis major*. The next two that follow, that is the fifth and the sixth have their names in their title, as *Bauhinus* who first set them forth hath called them. The fourth I have so entituled, as fitteth thereunto. The seventh was brought me with the title *Bellis spinosa Patria M. luccy*, who was Preident over the Dukes garden at Pisa, at that time that Dr. Flud brought me the seedes thereof from thence, but *Lobel* calleth it *Bellis spinosa elatior & fruticosior herbariorum bullatis aureis floribus*. The eighth is called by *Lobel* *Bellis cerulea*, *Globularia Monspeliensis*, *Aphyllanthus* by *Angularia* and *Camerarius*, *Bellis montana* by *Cesalpini*, and *Scabiosa pumilus* genus by *Chesius*, as he doth the ninth *Scabiosa montana minor repens*, but not rightly in my minde, seeing himselfe in the description saith, that the leaves and seede are like the other blew Daisie. The tenth is by *Columba* called *Globularia lutea montana*. The eleventh is called *Bellis minor sylvestris* and *Consolidaminor & minima*, of divers *Solidago minor*, by others and *Primula veris* by many. The twelfth and last have their titles best besitting them. The *Italians* call both sorts, *Fior de prima vera*, and the lesser *Margarite*, and *Fior de*

prima vera gentile. The French call them both *Marguerites* and *Pasquets*, yet usually they call the lesser *Margueritons*. The Germanes call the greater *Genßblum*, and the lesser *Maisliebchen* oder *zeitlosen*. The Dutch call the great sort wild oft groote *Madaliencen*, and the lesse *Madaliencen*, and *Margrietten*. We in *English* call the greater the great Daisie, and Mandelinelwort, and the other the lesser or field Daisie, &c.

The Vertues.

The greater wild Daisie is a wound herbe of good respect, often used and seldome left out in those drinks or salves that are for wounds, either inward or outward: both it and the small are held by the most to be cold and dry, yet *Dodonæus* saith they are cold and moist, which none other doth allow of: for the drying qualities doe more properly consolidate, the juice or distilled water of either of them doth much temper the heat of choler, and refresheth the liver and other inward parts. It is said that they loosen the belly that is bound (which *Lobel* contradicteth, and true judgement doth the same) being taken in a sallet with oile and vinegar, or the hth of fat flesh wherein the leaves hereof and a few Mallowes have beene boyled: they helpe to cure the wounds of the breast made in the hollownesse thereof, if a decoction be made of them and drunke; the same also doth cure all ulcers, and pusses in the mouth or tongue, or in the secret parts: the leaves hruised and applied to the cods, or to any other parts that are swollen and hot, doth resolve it, and temper the heat; they are also much commended that a decoction be made hereof and of Wallwort, and *Agrimony*, and the places fomented, or bathed there with warme, that are afflicted either with the pallsie, the Sciatica, or the gout, to give a great deale of ease of paine: the same also dissolveth and disperseth the knots or kernels that grow in the flesh of any part of the body, and the bruises and hurts that come of fals and blowes; they are also used for ruptures, or other inward burblings with very good successe: an ointment made thereof doth wonderfully helpe all wounds, that have inflammations about them, or by reason of moist humours having acceffe unto them, are kept long from healing, and those are such for the most part that happen in the joynts of the armes, and legges: the juice of them dropped into the running eyes of any doth much helpe them: the small Daisie is held to be more astrigent and binding then any other fort.

CHAP. XXVIII.

Sanicula. Sanicle.

Here be divers herbes that the learned writers have entituled Sanicle, from their especial properties in healing, as *Avens*, *Beares eare*, *Corrallwort*, *Butterwort*, and divers others, as they are remembered in their severall places, and some in my former Booke, as the spotted and *Beares eares* Sanicle, whereof I thinke it not amisse to speake a little here, and to give you their figures withall, but this that I here first propose unto you, is properly and peculiarly called Sanicle, simply without any other *epithite*, and thereof I finde no other fort, although some have made *mas* and *femina*, accounting this the *mas*

1 *Sanicula vulgaris* sive *Diapensa*.
Ordinary Sanicle or Selfe heale.

2 *Pinguicula* sive *Sanicula Eboracensis*.
Butterwort or Yorkshire Sanicle.

3. *Sanicula guttata*.
Spotted Sanicle.

4. *Sanicula Alpina* five *Cortusa Matthioli*.
Beares care Sanicle.

and *Astrancina nigra* *Dioscoridis*, to be the *femina*; but yet I thinke fit also to adjoyne hereunto, the *Pinguicula* or Butterwort, called of some *Sanicula Eboracensis* and an *American Cortusa*, for the properties and use sake, although differing in forme one from another. The description of the ordinary Sanicle is thus. It sendeth forth many great round leaves, standing upon long brownish stalkes, every one somewhat deeply cut or divided into five or sixe parts, and some of those cut in also, somewhat like the leafe of a Crowfoote or Doves foote, and finely dented about the edges, smooth and of a darke greene shining colour, and sometimes reddish about the brimmes; from among which riseth up small round greene stalkes, without any joynt or leafe thereon, saving at the toppe, where it brancheth out into floweris; having a leafe divided into three or foure parts, at that joynt with the flowers, which are small and white, starting out of small round greenish yellow heads, many standing together in a tuft; in which afterwards are the feedes contained, which are small round rough lures, somewhat like unto the seeds of *Clevers*, and sticke in the same manner, upon any thing that they touch: the roote is composed of many blacke strings or fibres set together, at a little long head, which abideth with the greene leaves all the winter and perish not.

2. *Pinguicula* five *Sanicula Eboracensis*. Butterwort.

Butterwort hath divers fat and long leaves lying upon the ground about the roote, broad at the bottome and pointed at the end, of a pale greene colour on the upper side, and white underneath, folded together at their first rising which then are more white, from among which arise two or three slender naked stalkes, about an handbreadth high, bearing onely one flower at the toppe of every one, set in a small greene huske, made somewhat like a Violet flower or those of the Larkes heels or spurs, having a small tayle or spurre behinde, in some of a purple, in others of a more blew colour, and in some white: after the flowers are past, come in their places small pointed round heads, wherein is contained small long blacke feede: the roote is composed of divers small white fibres or strings which dye not but abide with the greene leaves upon them all the Winter.

3. *Sanicula guttata*. Spotted Sanicle.

Having given you the description hereof and the varieties in my former Booke, I shall here rather point at it, then fully declare that it hath roundish leaves, greene above and grayish underneath, and reddish withall, the toppe of the branched stalk is stord with many small five leaved white flowers, so finely spotted with red spots, that they seeme to be pricked thereon.

4. *Sanicula Alpina* five *Cortusa Matthioli*. Beares care Sanicle.

This also being there described at large needeth the lesser relation, that it hath larger and more crumpled hairy round leaves then the last: the stalkes also lower and bearing sundry small pendulous purple flowers.

5. *Sanicula* five *Cortusa Americana fruticosa*. The Shrubbe Sanicle of America.

The shrubby Sanicle of America, hath sundry almost round leaves lying on the ground each upon a little long footestalk divided at the edges into two parts, dented likewise about the brimmes, from among which rise hard woody stalkes neere two foote high, having such like leaves thereon as grow below and branching forth with sundry

sundry small white starrelike flowers in a tuft together at the toppes,

The Place.

The first is found in many shadowye woods and other places of this land. The second in the common fields and sundry bogs, on the hills in *Torkeshire* chiefly; in many places also of the West Country, and *Wales*, and likewise in a Common, about a mile from *Oxford*, neare a village called *Herington*. The third and the fourth as *Clusius* saith, groweth in all the *Austrian* and *Strian* hills in the shadowy places of them. The last came from the backe part of *Virginia* called *Canada*.

The Time.

The first and second flower not untill *June*, and their seede is soone ripe after the other two next flower much earlier and sometimes againe in *Autumne*. The last flowreth in *July*.

The Names.

I have not found that any of these Sanicles were knowne to any of the ancient Greeke or Latine authors, but are as many other vulnerary, and other herbes found out and named by later writers. For the first it hath his name *Sanicula a potiore sanandi munere*, it is also called *Dispersia*, by *Brussellius*, *Matthiolus*, and *Lebel*, and by *Tabermontanus*, *Consolida quinqnesolia*, for *Matthiolus* maketh it his fourth kinde of *Quinqnesolium*. *Fabius Columna*, would referre it to the third *Sideritis* of *Diocorides*: but of most writers it is generally called *Sanicula*, and some as I said before call it *mas*, because they would make the *Asstrantia nigra* *Diocoridis*, (set forth in the third Classis of this worke, which is of purging plants, and 23. Chapter, under the title of *Helleborus niger Sanicula folio major*, the great purging Sanicle) to be the *femina*. It is called by the *Italians* *Sanicola*, by the *Germanes* and *Dutch* *Sanikel*, by the *French* *Sanicle*, and by us *Sanickle*. The other was first called *Pinguicula* by *Gesner* in *descriptioe montis fracti*, and from him all others doe so call it: some also with us *Sanicula Eboracensis*, because it groweth so plentifully in *Torkeshire*: *Ingdunensis* calleth it *Cucullata*, and thinketh it may be *Crias Apulei*, *Gesner* thought it to be *Dodscatheon Plinii*, others *Lingula Plinii*, and some, as *Gesner* *Viola humida aut palustris*, *Bauhinus* in putting it among his *Sanicules* calleth it *Sanicula montana flore calcaris donata*. We in *English* doe call it *Butterwort*, and *Butter roote*, because of the *unifoliositie* of the leaves, or else of fanning as *Gerard* saith, but untrectly, for they call it white rot and not white roote as *Gerard* saith, for the Country people doe thinke their sheepe will catch the rot, if for hunger they should eate thereof, and therefore call it the white rot, of the colour of the herbe, as they have another they call the red rot, which is *Pedicularis* red Rattle. The third is called *Sanicula montana altera* by *Clusius*, and *Alpina*, and guttata by *Camerarius* and others, by *Lobel* *Gariophyllata sive Genm Alpinum recentiorum folio baderaceo*. The fourth *Matthiolus* called *Cortusa* having received it from *Cortusius*, and reckoneth it among the *Aventis*, and thereupon *Lobel* calleth it *Caryophyllata Veronensium flore Saniculae in fine*; *Clusius* calleth it his first *Sanicula montana*, and others *Alpina*: The last for some resemblance was called *Cortusa* by the *French*, and *Americana* added to distinguish it.

The Vertues.

Sanicle is bitter in taste, and thereby is heating and drying in the second degree, it is astringent also, and therefore exceeding good to heale all greene wounds speedily, or any ulcers, impostumes, or bleedings inwardly; it doth wonderfully helpe those that have any tumour in their bodies in any part, for it representeth the humours, and dissipateth them, if the decoction or juice thereof be taken, or the powder in drinke, and the juice used outwardly; for there is not found any herbe that can give such present helpe, either to man or beast, when the disease falleth upon the lungs or throate, and to heale up all the maligne putride or stinking ulcers of the mouth, throat, and privities, by gargling or washing with the decoction of the leaves and roote made in water, and a little hony put thereto; it helpeth to stay womens courses, and all other fluxes of blood, either by the mouth, urine, or stoole, and laskes of the belly, the ulceration of the kidneyes also and the paines in the bowels, and the gonorrhoea or running of the reynes, being boyled in wine or water and drunke, the same also is no lesse powerful, to helpe any ruptures or burstings used both inwardly and outwardly: and briefly it is as effectually in binding restraining, consolidating, heating drying, and healing, as Comfrey, Bugle, or Selfheale, or any other of the Confolids or vulnerary herbes whatsoever. Butterwort is as one writeth to me a vulnerary herbe, of great esteeme with many, as well for the rupture in Children as to heale greene wounds; the Country people that lye where it groweth, doe use to annoint their hands when they are chapt by the winde, or when their Kines Vdders are swollen by the biting of any virulent worme, or otherwise hurt, chapt or rift, the poorer sort of people in *Wales* make a Syrupe thereof, as is of *Roses*, and therewith purge themselves and their children: they put it likewise into their broths for the same purpose which purgeth flegme effectually: they also with the herbe and butter make an ointment singular good against the obstructions of the liver, experienced by some Physicians there of good account.

CHAP. XXIX.

Primula veris pratensis & sylvestris. Primroses and Cowslips.

Here is so great a variety in these sorts of plants, Primroses and Cowslips, whereunto for likeness both in forme and quality, is to be joynd the little army of *Auriculas* Eeares eares, (or *French* Cowslips) as they are called, especially in the various colours of their flowers, that to describe them all againe, would but too much augment this volume, I will therefore here but give you some figures of those, described fully in my former Booke, and the relation of such others as have since the publishing thereof come to our knowledge.

1. *Primula veris Turcica Tradescanti flore purpureo.* Tradescants *Turkie* purple Primrose.

The leaves of this Primrose are so like unto other Primroses, that they can very hardly be distinguished untill the flowers appeare, but the chiefest difference in the leaves is, that they are somewhat longer, rounder pointed and a little reddish at the very bottome of the leaves; the flowers are as large as any other Primrose or rather larger, made of five leaves like unto them, but of a delicate violet purple colour, the bottome of them yellow,

circled

Primula veris vulgaris.
The ordinary field Primrose.

Primula Heketti versipellis.
Heketti Camoleon Primrose.

Primula veris flore purpureo Turcica.
The Turke purple Primrose.

Paralyfis flore pleno.
Double Paisley.

Paralytica Alpina major.
The greater Bird's eye.

Paralytica Alpina minor.
The lesser Bird's eye.

Asicula vrsi lata.
The yellow Bear's ears.

Asicula vrsi minima alba.
Small white Bear's ears.

reled as it were with a deepe Saffron like yellow, which addeth a greater grace thereunto; in other things it is
ke unto the ordinary Primroses.

Of this kinde there is also another sort little differing from it in any thing save in the colour of the flower,
which in this is crimson, as in the other purple.

2. *Paralyfis varie species.* The divers sorts of Cowslips.

Of the various sorts of Cowslips, I have given you all the flore I know are extant, and therefore will describe
one of them here, but referre you to my former Booke, where you shall finde them.

3. *Auricule urfi varietates.* The varieties of Beares eares or French Cowslips.

I have there also divided the varieties of the Beares eares or French Cowslips into three colours, that is pur-
ple or red, white, and yellow, of the rest that I have not there spoken, I will here make but briefe mention, of
the difference in leafe and flower onely, without any larger description.

The bright crimson hath leaves of a middle size more Greene then mealy, and flowers of a bright crimson colour
larger then the blood red.

The deepe crimson velvet colour.

The double purple hath the purple flower once more double then the single, but is not constant.

The stript purple differs in leafe little or nothing, from the ordinary purple, nor yet in flower, but onely that it
is variously stript with a kinde of whitish bluish colour; some of these will change wholly into the one or the o-
ther colour, as all or most of the severall sorts of other stript flowers, whether *Tulipas*, *Gilliflowers*, &c. are
observed often to doe, yet as in them so in these, if they change into the deeper colour, they seldome or never
returne to be marked, as they will if they change into the lighter.

The heavens blew hath the leafe broader and of a duskie yellowish Greene colour, the flowers being of a blew-
ish colour tending to a purple.

The paler blew is somewhat like unto the last in the Greene leafe, the flower being of a paler blew.

Borage leaved blew Beares eares is sufficiently exprest in my former Booke.

The *collie* as the French call it, or the farre Collier as we in *English*, hath a pale greenish leafe without dents,
and somewhat a large flower, and of a dainty violet purple colour, somewhat sad but very lively.

The *Camberfine* hath a smaller Greene leafe without dents or very few, and the flower neere that of the faire
Collier, but not altogether so lively nor so great a flower.

A purplish blew with a white bottome, and a mealy leafe.

The *Poutrine* or blood red hath a yellowish Greene leafe, somewhat small and long, with a few dents on the
edges, the flowers are of a blood red colour with a yellow eye, and but few upon a stalk.

The party coloured red and white, we heare for certaine of such an one, but we have not as yet seene it.

There are sundry sorts of blushe, paler or deeper, more or lesse beautifull by much then others, as also wonder-
full much variety of each of the former colours not to be exprest, in that from the sowing of the seede ariseth
new colours almost every year.

The pure white, Snow white, or Paperwhite, as they are called by divers, hath flowers of a pure Snow white
colour, but smaller then the next.

White hath a little larger flower, but is not so pure a white as the former, but yet commeth white from the
first budding, and not yellowish as in the next.

The common white hath sundry flowers upon a stalk, of a reasonable size, whose buds are yellowish at the
first, and become white afterwards.

Other sorts may be reckoned to these whites, and some may be set under the blushe of the paler sorts.

Of the great yellow there are sundry different sorts, all of them having large mealy leaves, and great tufts of
flowers, some deeper or paler then others, and some greater or lesser also.

The Lemman colour is of a delicate pale yellow colour and of a middle size both leafe and flower.

Straw colour, Shamwey colour.

A number of other sorts of plaine yellows there be, impossible to be distinguished.

The diversities likewise of the diversified or variable yellows are numberlesse, which although their ground is
yellow yet are so mixed and varied thereupon that I cannot expresse them.

The leather coate is larger or lesser, deeper or paler one then another, they have all large mealy leaves, yet not
so much as in the greatest yellow, but yet seemeth to be produced from thence they come so neere it.

Haire colour of divers sorts.

Spanish bluish.

The Place and Time.

The purple and crimson Primroses came first from *Turkie* to us, and flowreth with other Primroses very early
in the Spring, and sometimes againe in Autumne. The originall of the *Auricules* came first from the mountaines
of *Germany*, *Hungary*, *Italy*, as the *Alpes* and *Ppyrenes*, &c. but the greatest variety hath risen from sowing of
the seede, and many of them will flower twice in the yeare, viz. in *Aprill* and *May*, and then againe in *August*
and *September*, if the Autumne proove temperate and moist.

The Names.

The purple Primrose is said to be called *Carchichek* by the *Turkes*, *Fabius Columna* referreth the Cowslips
to the *Alisma* of *Discorides*, and calleth them *Alisma pratorum* & *sylvorum*, others call them *Verbascum*,
Gesner Arithritica, *Anguslura* *Dodecatheon*, but generally *Paralyfis* and *Herba Paralyfis*. The *Auricula urfi* is
entitled by divers names, by sundry authors as *Lunaria Arithritica*, and *Paralytica Alpina* by *Gesner*, *Primula*
veris pachyphyllor by *Legdumensis*, *Sanicula* & *Auricula urfi*, first by *Matthiolus*, and after by *Lobel*, and *Sanicula*
Alpina by *Gesner* and *Baobinus*, but usually now adaies *Auricula urfi* by all, and thereafter we in *English* Beares
eares or French Cowslips.

The Vertues.

Primroses and Cowslips are much used to be eaten in *Tansies Sallets*, &c. by those beyond Sea, and are account-
ed very profitable for paines in the head, and are accounted the best for that purpose next unto *Be-ony*, they are
excellent good against any joynt aches as the palse and to ease the paines of the sinewes, as the names doe im-
port.

port. Of the juice or water of the flowers of Cowslips, divers Gentlewomen know how to denſe the ſkin from ſpots or diſcolourings therein, as alſo to take away the wrinkles thereof, and cauſe the ſkinne to become ſmooth and faire, the rootes made into a decoction and taken, eaſeth the paines of the backe and bladder, opening the paſſages of urine which was the cauſe thereof; they are likewiſe often uſed in wounds either greene or old, and that to very good purpoſe. The Beareſeares according to their name Sanicle, are no leſſe powerfull in healing then the common, as alſo for the palſie and trembling of the joynts, *Cleſius* ſaith that the mountainerſ that hunt after wilde beaſts doe uſe the rootes of Beareſeares to helpe either paines in the head, or the giddineſſe that may happen thereto, by the ſight of ſuch fearefull precipices or ſteepe places, that they muſt often paſſe by in following their game, and are admitted as good Wound herbes as the former Cowſlips.

CHAP. XXX.

Alchymilla. Ladies Mantile.

Unto the Sanicles ſet downe in the laſt Chapter, I thinke it fitteſt to place this next unto it, becauſe both for forme and quality it is ſo aſſuredly like it, that it is called of divers the greater Sanicle, and will adde thereunto another ſort thereof, which hath not bene formerly well knowne.

1. *Alchymilla major vulgaris*. Common Ladies Mantle.

Our common Ladies Mantle is very like to the former Sanicle, having many leaves riſing from the roote, ſtanding upon long hairy footſtalkes, being almoſt round, but a little cut in on the edges, into eight or tenne parts more or leſſe, making it ſeeme like a ſtarre, with ſo many corners and points, and dented round about, of a light greene colour, ſomewhat hard in handling, and as if it were ſoulded or plaited at the firſt, and then crumpled in divers places, and a little hairy, as the ſtalke is alſo which riſeth up among them, to the height of two or three foote, with a few ſuch leaves thereupon, but ſmaller, and being weake is not able to ſtand upright, but benderh downe to the ground, divided at the toppe into two or three ſmall branches, with ſmall yellowiſh greene heads, and flowers of a whitith greene colour breaking out of them, which being paſt, there commeth ſmall yellowiſh ſeede like unto Poppy ſeede, the roote is ſomewhat long and blacke, with many ſtrings and fibres thereat.

1. *Alchymilla major vulgaris*.
Common Ladies Mantle. 2. *Alchymilla minor quinquefolia*.
Cinquefoile Ladies Mantle.

This ſmall Ladies Mantle, hath alſo a few ſmaller and ſmoother greene leaves, riſing from the ſmall blacke fibrous roote, ſet upon long footſtalkes, but divided at the edges into five cornets or points, and ſomewhat deepeher dented about the brimmes then the former; from whence two or three ſmall weake bending ſtalkes doe riſe, not halfe a foote high: the flowers that grow at the toppes are ſmaller, but alike according to the bigneſſe of the plant, and of the ſame herby or greene colour.

The Place.

The firſt groweth naturally in many paſtures and wood ſides, both in *Hartford* and *Wiltſhire*, and in *Kent* alſo, as in *Kingwood* neere *Feverſham*, in the paſtures nigh *Tidnam*, and *Chepſtow*, and in other places of this land; the other groweth on *St. Bernard's hill* among the *Switzerſ*.

The Time.

The firſt flowreth in *May* and *June*, the other not untill *Auguſt*, but both abide after ſeede time, greene all the *Winter* after.

The Names.

It was not knowne by name unto the ancient writers, as can be gathered, and although *Brunſelſum* and ſome others thought it to be *Leontopodium* or Lions foote, deceived by the name, becauſe divers nations have ſo called it, from the forme or likenefſe of the leafe, yet is it not that of *Dioſcorides*, as may plainly appeare by his deſcription thereof. It is uſually called *Alchymilla* by moſt writers, becauſe as ſome thinke the Alchymiſts gave ſuch commendations of it. It is called alſo of *Matthiolus*, *Lugdunensis*, and others *Stellaria*, from the forme of the leafe, that with the corners reſemble a ſtarre, but there are divers other herbes called *Stellaria* by divers authours, and ſome alſo call this *Pes Leonis*, and *Pata Leonis*: others call it *Sanicula major*, not without good reaſon. *Cordus* in *hiſtoria de plantis*, calleth it *Droſera*, *Droſum*, and *Pſiadion* from the Germane name *Sinnaw*, becauſe the hollow crumplings and the edges alſo of the leaves, will containe the dew in droppeſ like pearles; that falleth in the night. *Bauhynus* calleth the other *Alchymilla Alpina Quinquefolia*. The *Italians* call it *Stellaria*, and *Stella herba*. The *French* *Pied de lyon*. The *Germanes* as I ſaid before *Sinnaw*, and ſome *Levensfuſſ*, and *Unſerſrawen mantel*. The *Dutch* *Onſer urawen mantel*. And we in *Engliſh* Our Ladies Mantle, and great Sanicle, and ſome Lions foote, or Lions paw, or *Padehon* after the *French*.

The

The Vertues.

Ladies Mantle is more cooling then Sanicle, and therefore more proper for those wounds that have inflammation, and more astringent binding and drying, and therefore is more effectfull to stay bleedings, vomitings, fluxes in man or woman of all sorts, and bruises by falls or otherwise, and to helpe ruptures, it helpeth also such maides or women that have overgreat flagging breasts, causing them to grow lesse and hard, being both drunke, and outwardly applied, and serveth also to stay the whites in them, wherein it is so powerfull that it is used as a surfuling water also, the distilled water drunke continually for twenty daies together, by such women as are barren and cannot conceive, or retaine the birth after conception, through the too much humidity of the matrice, and fluxe of moist humours thereunto, causing the seede not to abide but to passe away without fruite, will reduce their bodies to so good and conformable an estate, that they shall thereby be made more fit and able to retaine the conception, and beare out their children, if they doe also sit sometimes as in a bath, in the decoction made of the herbe. It is accounted as one of the most singular wound herbes that is, and therefore the *Germanes* extoll it with exceeding great praise, and never dresse any wound, either inward or outward, but they give of the decoction hereof to drinke; and either wash the wound with the said decoction, or dippe rents therein, and put them thereinto, which wonderfully dryeth up all the humidity of the sores, or of the humours flowing thereunto, yea although they be fistulous and hollow, and abateh also such inflammations, as often happen unto sores: but for fresh or greene wounds or cuts, it so quickly healeth them up, that it suffereth not any quittance to grow therein, but consolidateth the lippes of the wound, yet not suffering any corruption to remaine behinde: it hath formerly bene much accounted of by Chymists, who have affirmed that the juice hereof will constrain the volatility of Mercury, and make it fixt, from whence as it is thought it tooke the name, but these idle fancies are now quite worne out, as I thinke.

CHAP. XXXI.

Solidago Saracenica. Sarafins Confound.

Here have bene divers herbes that have bene mistaken and set forth for the right Sarafins Confound, we will therefore shew you here in this place some of them that are not right, with the true one also.

1. *Solidago Saracenica vera Salicis folio*.

The true Sarafins Confound with willow leaves.

The true Sarafins Confound groweth very high sometimes, with brownish stalkes, and other

whiles with greene and hollow, to a mans height, having many long and narrow greene leaves snipt about the edges set thereon somewhat like unto those of the Almond, or Peach tree, or Willow leaves, but not of such a white greene colour; the toppes of the stalkes are furnished with many pale yellow starrelike flowers, standing in greene heads, which when they are fallen, and the seed ripe, which is somewhat long, small, and of a yellowish browne colour, wrapped in downe, is therewith carryed away with the wind, the roote is composed of many strings or fibres, set together at a head, which perish not in winter, but abide, although the stalkes dry away, and no leafe appeareth in Winter; the taste hereof is strong and unpleasant, and so is the smell also.

2. *Solidago Saracenica major*.

The greater Sarafins Confound.

This greater *Solidago* differeth not much from the former, rising up with upright hard round hollow stalkes, as high as it, with many darke greene leaves at the first, set at the head of the roote, which afterwards rise up with the stalkes, and are set there without order, somewhat larger then they, and dented about the edges; the flowers are much greater with more and yellower long leaves star-fashion, standing in greene heads many together, wherein after they are past, are contained the seede, which with the downe thereof flieth away with the winde, in the like manner as the former doth, the rootes are composed of a great bush of white strings, or white fibres growing very strongly in the ground, and shooting forth stringe nall sides, which produce new plants, encreasing in a small time, and overspreading a great quantity of ground, the head of leaves is somewhat browne at the first shooting out of the ground, and so is the head of the roote before the Spring, and are of a bitter taste, and binding withall.

3. *Solidago Saracenica frue Germanica filiquosa*.

The *Germane* Confound with small cods.

This Confound riseth up with great round woody stalkes, to as great an height as the former, or more, but

are so weak by reason of the length and weight of leaves thereon, that they cannot stand upright, but fall downe upon the ground, bearing many darke Greene leaves thereon, long and narrow like the first, with a white ribbe in the middle, snipt or dented about the edges, and many smaller yellowish flowers at the toppes of them, which turne into very small and long round darke pods, as small and long as those of *Sophia* or *Flixeweede*, and small brownish feedes within them, of an hot and quicke, sharpe and unpleasant taste withall, as the herbe in selfe is, but much more, the roote in time groweth to be very great, even of the bignesse of a mans arme, and very deepe also (for such I have digged up in my owne Garden) of a strong unpleasant savour and taste, sharper then *Cresses*, and very like unto that of *Flixeweede*, abiding many yeares: but the stalkes perishing downe to the ground, and shooting forth anew in the Spring.

4. *Solidago Saracenica altera sive tertia Tragi.* *Tragus* his *Germane Confound*.

This other *Germane Confound*, is somewhat like both in stalkes and leaves unto the middle kinde of *Neppe*, with long leaves, being white as they are, the flowers stand at the toppes of the stalkes, many together upon small round Greene heads, very like unto the first sort, being small and yellow, which after they are past, and the heads with seed are ripe, open themselves, and with the downe in them, is carried away by the wind, in the same manner: the roote creepeth in the ground, and shooteth up branches round about; the taste of the herbe is bitter, whereby it is found to be drying, and of a piercing quality.

The Place.

All these doe grow in moist and wet grounds, by woods sides, and sometimes in the moist places of the shadowy groves, as also by water sides.

The Time.

They flower in *July*, and the seede of the two first, is soone ripe, and carried away with the winde after; the third hath not his pods and seede ripe until the end of *August*, or beginning of *September*.

The Names.

None of these herbes are of ancient, but later invention and appellation; it is called *Solidago* and *Consolida* from the old Latine word *Consolidare*, which in the barbarous Latine age did signifie, to soder, close, or glue up the lips of wounds, and *Saracenica*, because the *Turkes* and *Saracens* had a great opinion thereof, in healing the hurts and wounds of their people, and were accounted great Chirurgions, and of wonderfull skill therein, whom the Christians followed and called it thereafter, others called it *herba fortis* from the strong sepe and raste as it is thought. *Tragus* after he had described the *Solidago Saracenica vera*, addeth two sorts more, the one which is, his second, is the *Lysimachia cerulea spicata*, and the third which is the last here, *Banbinus* calleth it *Conize affinis Germanica*, referring it to the *Conyza*'s or *Fleabanes*, but I have thought it fitter to place it here. *Tragus* calleth the first *Solidago Saracenica prima*, and saith that *Brunsfelsius* wrote very largely thereof, and yet *Banbinus* quoteth not *Brunsfelsius* to have called it so, but that he called the *Bellis sylvestris minor*, to be *Solidago Consolida species*, divers have thought the *Virga aurea* to be it, and so doth *Banbinus* also, and therefore saith that *Tragus* his first *Solidago* is the *Virga aurea angustifolia serrata*, *Tabernmontanus* calleth it *Consolida aurea*. The second is called by *Luadmonensis*, *Solidago Saracenica major*. The third I presume is the same that *Lobel* giveth us the description of in his *Adversaria*, and the figure in his *Observations*, yet maketh the heads with seed to slye away with the wind as the others doe, but surely the figure hereof, doth so truly represent this plant, that I doe here set forth unto you, as no other can come neerer unto it, and therefore I am perswaded that he was mistaken in the heads of seede, which as I shew you in this, give small long pods with small browne seed therein; or else there is another so like this as can be, whose seed with the downe is carried away with the winde. The last is as I said *Tragus* his third *Solidago Saracenica*, which he calleth *Herba vulncaria ad curandum de Pfrim*. The *Germanes* as it is thought first called it *Heidnisch Wundkraut*, that is *Vulneraria Turcica* *Heathenish Woundwort*, from whence came the name *Solidago Saracenica*, and the *French* thereafter *Confolde Sarazine*, and so all other nations in their severall tongues.

The Vertues.

Among the *Germanes* this *Wound herbe*, is not onely of especiall account, but even preferred before all other of the same quality, be it *Bugle* or *Sanicle*, or whatsoever else, for it is hot and dry almost in the third degree, and binding withall: being boyled in wine and given to drinke, it helpeth the indisposition of the *Liver*, and freeth the gall from obstructions, whereby it is good for the yellow jaundise, and for the dropie in the beginning thereof, as also all inward ulcers of the reins, or elsewhere, and inward wounds or bruises; and being steeped in wine, and then distilled, the water thereof drunke is singular good to ease all gnawing in the stomacke, or any other paines or torments in the body, as also the paines of the mother; and being boyled in water, helpeth continuall agues; and this said water or the simple water of the herbe distilled, or the juice or decoction are all very effectuell to heale any Greene wound, or old sore or ulcer whatsoever, both cleansing them from any corruption is bred in them, and healing them up quickly afterwards; the same also is no lesse effectuell, for the ulcers in the mouth or throat, be they never so foule or stinking, by washing and gargling the mouth and throat therewith, and likewise for such sores as happen in the privy parts of man or woman, briefly whatsoever hath been said of *Bugle* or *Sanicle*, may be found herein. The other sorts of *Confounds* doe runne the same course with this, and are as effectuell in a manner as it.

CHAP. XXXII.

Herba Doria sive Aurea. *Doria* his *Woundwort*.

E'ecause this herbe doth notably differ, both from the former *Confounds*, and the *Golden rodde* that shall follow, I have thought good to set it betweene them, whereof there are more sorts then one, as they may best be referred.

1. *Herba Doria vulgaris.* The ordinary *Doria* *Woundwort*.

This *Woundwort* hath many great thicke fleshy long deepe Greene leaves rising from the roote, almost

1. *Herba Doris vulgaris*.
The ordinary *Doris* Woundwort.

2. *Herba Doris minor Americana*.
Doris Woundwort of America.

almost as long as Docke leaves, but thicker, sharper at the points, smaller at the lower ends of them, and broadest in the middle, somewhat harsh or hard in handling, among which riseth up but one great stalke for the most part, but exceeding high, above any man, whereon are set very sparingly, scarce two or three such leaves, but smaller as grow below, at the toppes whereof stand a few yellow flowers, in Greene scaly heads, greener then those of the golden rodde, or of the former Confound, which when they are ripe, are blowne away with the winde: the roote is not so great, as the plant would make shew it should be, having many fibres set at the head together, which take strong hold of the ground, and dyeth not, nor the leaves lose their verdure in the winter, but spring afresh every yeare.

3. *Herba Doris minor Americana*. *Doris* Woundwort of America.

This stranger is so like the former in shew, that it cannot better be referred then unto the former, abiding Greene all the winter, whose leaves are thicke somewhat long and narrow, but not halfe so great as the former, and of a paler Greene colour, else for forme very like them: the stalkes which are many, and rise not to halfe that height are round, and for the most part, leane downe, not being able, by the multitude of flowers and leaves thereon, to stand upright, which flowers stand upon longer, and greater Greene scaly heads then the former, and are themselves also greater, and more laide open, with many small, long narrow leaves, which turne into a white mossie downe, and is carryed away with the winde, the roote is composed of many blackish fibres.

3. *Consolida aurea nemorum*. The golden Confound.

This golden herbe hath divers long and narrow sharpe pointed leaves, standing at the toppe of the roote, very like unto *Doris* Woundwort, but not so great, yet thicke like them, and of a darker Greene colour, the stalkes rise not much above a foote high, having here and there narrower long leaves on them, then below, the flowers that stand at the toppes of them, are larger then of the former, having many narrow long yellow leaves thereon, laide open like a starre flower, with divers rhymmes in the middle, the rootes are many small white fibres, lik unto the Daisies, the taste thereof is somewhat sharpe, and aromaticall, and alstringent or binding withall.

The Place.

The first as *Lobel* saith, groweth neare the banks of Rivers, in *Provence* and *Narbonne* of *France*. The second came from the *French* Colony in *America*, into *France*, for from *Vespasian Robin* of *Paris* I had it. The last in the thicke woods neere *Orleance*, as *Lobel* also saith, they doe all well abide in Gardens.

The Time.

The first and the last doe for the most part, flower a moneth before the second, which is not in flower before *August* at the soonest.

The Names.

The first is thought to have bene found out by *Andreas Doris*, the Generall of the Emperour, and the *French* Kings fleet, or at least commended or commanded to be used for the reliefe of his Souldiers and Marriners, although

though *Lobel* seemeth to invert the name, from the French, *L' herbe Doree*, herba Dorea, quasi aurea herba, and thinketh it may be the *Panax Chironium* of *Theophrastus*, which he describeth in the 12. Chapter of his 9. Booke, whose forme and properties there related, doe very fitly answer hereunto (yet some doe rather referre the *Bupleuron* hares care unto it) or else (as he saith) is one of those *Panaces* of *Theophrastus*, which *Pliny* in his 23. Booke, and 4. Chapter speaketh of, found by *Chiron*, and called *Centaureum*, and called also *Pharnaceum*, of the King *Pharnaces*, who is said also to finde it. *Gesner* in *hortis Germaniae*, saith it was called of some, *Panaces Chironium*, and *Tabernmontanus* also calleth it, *Panax Chironium Theophrasti*, it is that *Limonium alid*, that *Lugdunensis* saith was so called of some Herbarists, setting it forth in the Chapter of *Limonium*, and yet is the same that he set forth for the *Dorea Narbonensium* of *Pena* and *Lobel*, in the Chapter of *Virga aurea*, although it seemeth he did not know so much, which kinde of error is very frequent in him. *Banbinus* calleth it *Virga aurea major vel Doria*, The second came to me under the same name that is in the title, which because it can be no waies bettered, I thinke not fit to alter. The last *Pena* and *Lobel*, doe onely make mention of in their *Adversaria*, by the name of *Consolida aurea nemorum Limonij folijs*, and *Banbinus* calleth it, *Virga aurea major flore*.

The Vertues.

The properties of healing greene wounds, and old sores is proper hereunto, being accounted as a meane in the vertues, betweene the former Confounds, and the golden rods that follow, and therefore it needeth not any further repetition, or amplification of the same things: but if it be the *Panax Chironium* of *Theophrastus* as aforesaid it should then be available against the bitings of the viper, and the *Phalangium*, and other venomous Creatures. being given in wine inwardly, and annointed therewith, and the oyle outwardly; as also for old or foule ulcers, used with wine and oyle, and with hony for excrescences in the flesh, and to destroy the moths of garments, unto all which properties, both the smell and taste so aromaticall in leaves and rootes, like unto that of wild Angelica, may very well conduce us to beleieve, for many both Physitions and Chirurgeons in France doe much esteeme thereof, and use it both inwardly and outwardly, in many medicines for their Patients, and to good effect.

CHAP. XXXIII.

Virga aurea. Golden Rod.

Nto the two sorts of golden Rods, that are knowne and set forth by many writets, we have another sort not yet knowne publicly, whose original was in *America*.

1. *Virga aurea vulgaris*. The ordinary Golden Rod.

This Golden Rod, that is most common to our Country, riseth up with brownish small round stalkes, halfe a yard or two foote high. but higher if it grow in a fat soile, or in a Garden, having thereon many narrow and long darke greene leaves, very seldome with any nickes or dents about the edges, and as seldome with any strakes or white spots therein, and yet sometimes and in some places, they are so to be found, divided at the tops into many small branches, with divers small yellow flowers on every one of them, which are turned one way, not looking sundry waies, as all the flowers of the former kindes doe, which likewise being ripe, doe turne into downe, and are carried away with the winde, the roote consisteth of many small fibres, which grow not deepe into the ground, but abideth all the Winter therein, shooting forth new branches every yeare, the old ones dying downe to the ground.

2. *Virga aurea serratis folijs*.

Golden Rod with dented leaves.

The stalkes of this Golden Rod, rise not up so high as the former, but are as great, bearing larger, but shorter leaves thereon, and dented about the edges, the branches beare such like flowers, facing one side of their stalkes as the former doth, and are turned into downe, flying away in the same manner, the roote is like the other.

3. *Virga aurea Americana*. Golden Rod of America.

The leaves of this Golden Rod, before it runne up to stalkes, are as great as the last, being but narrow and long, yet broadest in the middle, and very sharpe pointed at the ends, somewhat dented also about the edges, but lesse then the former, and of a darke greene colour, the stalkes is a little hairy, rising higher then the last, or about a foote and a halfe high at the most, bearing yellow flowers all on one side, like the former, and lye in the winde, with the downe as the rest, the roote is not much unlike the other, and abideth under ground in winter in the same manner, losing all the old stalkes. I have given but one figure for all these three plants, they are all so like that it were needlesse to multiply more figures, the place and the dented leaves making the whole difference.

The Place.

The first is as I said frequent enough in divers places of the land; in the open places of woods and copses; both in moist and dry grounds, the second is not so frequent, and is found but in few places, although Gerard, deceived with the common kinde, which he found sometimes, to have but a few dents about the edges, thought it to be the other, and therefore said that both sorts were to be found plentifully in Hampstead wood, nere unto the gate that leadeth to Kentish Towne, when as all that there groweth, as I said for the most part, is but of the first sort, yet in some places it is there to be found also, but more sparingly. The last as I said before, came from America, but from what part I know not.

The Time.

The first flowreth later then the second, which is about July, and the other in the beginning or middle of August. The last also flowreth very late.

The Names.

The first is generally called by all writers almost, *Virga aurea*, because the stalkes being reddish, make the bushy toppes of flowers seeme as if they were of a gold yellow. The second is called *folijs non serratis*, by Camerarius in his Epitome of Matthioli, or *major angustifolia*, as he doth in herbo, Lobel in *Adversaria*, giveth the title of *Virga aurea Villanovani*, but his description is of the other, (for in his *Icones* and observations, he called that which is not dented about the edges *Virga aurea Villanovani*, and the other *altera serrato folio*) Anguillara thought it might be the *Leucographis* of Pliny, because it is said in the description thereof, it is found sometimes with white strakes in the leaves, but why Tabernmontanus should take it to be *Symphitum petraeum*, is not well knowne, for he maketh three sorts, whereof this is his third, and the other two be the other *serratis folijs*, whereof he found or saw one, with somewhat rounder leaves, and whose flowers were more white then the others. The last hath his name in his title, as is fittest for it. It is called in French *Verge d'or*, and in high and low Dutch *gouden roede*, and we in English *Golden Rod*.

The Vertues.

As Golden Rodde is like unto the Sarafins Confound in forme, but much lesser, so is it also in the properties; not much inferiour, being hot and dry almost in the second degree. *Arnoldus de villa nova*, commendeth it much against the stone in the reines and kidneys, and to provoke urine in abundance, whereby the gravell or stone engendered in the uritory parts, by raw and tough flegmaticke humours, may be washed downe into the bladder, from growing into a stone in those parts, and thence may be avoided with the urine: the decoction of the herbe Greene or dry, or the distilled water thereof is very effectually for inward bruises, as also to be outwardly applied: the same also stayeth the bleedings in any part of the body, and of wounds also, and the fluxes of the menstruall courses in women, and the fluxes of the belly and humours, as also the bloody fluxe in man or woman: it is no lesse prevalent in all ruptures, or burstings, to be both drunke and outwardly applied: it is the most soveraigne woundherbe of many, and can doe as much therein as any, both inwardly for wounds and hurts in the body, and for either Greene wounds, quickly to cure them, or old sores and ulcers, that are hardly to be cured, which often come by the fluxe of moist humours thereunto, and hinder them from healing: it is likewise of especiall use in all lotions for sores or ulcers in the mouth, and throate, or in the privy parts, of man or woman: the decoction thereof likewise helpeth to fasten the teeth that are loose in the gummets.

CHAP. XXXIII.

Lyfimachia. Loofelstrife or Willow herbe.

Intending next unto the Golden rods, to shew you the sorts of Loofelstrife or Willow herbe, I am forced for methods sake, and that I might not encumber your memory, with too many in one Chapter, to divide them, and speake of them severally; those with yellow flowers first; and secondly, of those that doe not beare their flowers in spiked heads: thirdly, of them that doe beare spiked flowers: and lastly of those that doe beare their feede in long huskes, or pods, be they wilde in our owne land or in others, and brought into gardens.

1. *Lyfimachia lutea major vulgaris*. Common yellow Loofelstrife or Willow herbe.

The greater yellow Loofelstrife, or Willow herbe, which is the more common, groweth in ranke moist grounds, to be foure or five foote high, or more, with great round stalkes, a little crested, diversly branched, from the middle of them to the toppes, into great and long branches, on all which at the joynts there grow, long and narrow leaves, but greater and broader below, most usually two at a joint, yet sometimes three or foure, somewhat like unto Willow leaves, without nickes or dents on the edges, and of a faint Greene colour, from the upper joynts of the branches, and at the toppes of them also stand many yellow flowers, of five leaves apeece with divers yellow threds in the middle, which turne into small round heads, wherein are contained small cornered feede, the roote creepeth underground; almost like Couchgrasse, but greater, and shooteth up every spring brownish heads, which afterwards grow up into stalkes, &c. it hath no sent or taste, but onely astringent and thereby drying.

2. *Lyfimachia lutea minor*. The lesser yellow Willow herbe.

This yellow Willow herbe, or Loofelstrife, as it riseth not up so high as the former, with his round joynted stalkes, which are somewhat woolly or hairy, so the leaves being also woolly and somewhat like them, are narrower and shorter then they, foure for the most part, and sometimes but three set together at a joint, spotted with blackish spots, on the underside of them, not compassing it at the bottome, but every one standing upon a short footestalk, and not dented about the edges at all, from the middle of the stalke almost, upwards at every joynt commeth forth the branches, which are short, nothing so long as the former, and standing closer together, whereon grow a few leaves, lesser then those below; at whose toppes, and at some of the upper joynts also, stand a few flowers lesser then the former, but yellow, and consisting of five leaves as they are, with many yellow threds in them, of a strong sweet sent, which so joyne together at the bottome, that the whole flower

1. *Lysimachia lutea major vulgaris.*
Common yellow Lookefrise or Willow herbe.

3. *Lysimachia lutea flore globoso.*
Roundheaded yellow Willow herbe.

falleth away together, and not any leafe apart, the roote creepeth under the ground, and shooteth up againe in the same manner, this hath a little more acrimony in it then the other, causing one to spit after the chewing thereof, a while in the mouth.

3. *Lysimachia lutea flore globoso.* Round headed yellow Willow herbe. The stalkes of this Willow herbe rise not up to be above a foote high, bearing onely two leavēs and no more at a joynt, which are shorter and narrower, yet very like unto those of the common sort, and of a pale Greene colour, at the joynts of the stalkes, which are crested and hollow, with the leavēs come forth long stalkes of flowers, without any leaves on them, which are close set together, almost round, but yet shewing the small yellow flowers, of five leaves a peece, the rootes are long, creeping underground, with many joynts therein, and shooting fibres at every one of them.

The Place.

The first groweth in many places of the land, in moist meadows and by water sides. The second groweth also neere water sides, and in the valleys, and moist fields of the Alps, and hills in Austria, as Clusius saith. The last as Lobel saith; he found in the ditches neere Gaunt in Flanders, as also among the reedes, wherewith they thatch their houses, hard by Amsterdam in Holland, and Clusius saith it was found by a Physitian neere the Alps, who sent it unto him among other plants.

The Time.

All these sorts doe flower from Istne unto August.

The Names.

It is called in Greeke *Λυσιμαχία* & *Δωκυδιον*. *Lysimachium*, and *Lysimachia* by divers in Latine, it is thought by divers that this is that herbe, whereof Pliny saith *Lysimachus* the King of Illyria was the first finder, and of him tooke the name *Lysimachia*, but therein they are deceived, for Pliny attributeth a purple flower thereto, and is therefore the *Lysimachia purpurea spicata*, hereafter described, which is made famous by Erasistratus, who wrote a volume of the properties thereof, and so saith Pliny, and is also supposed to have taken the name, a pugna *Arimenda* for *δύετον τὴν μάχην*, est certamen dirimere, of taking away strife or debate betweene beasts, not onely those that are yoked together, but even those that are wilde also, by making them tame and quiet, which as they say this herbe will doe, if it be either put about their yokes, or their neckes, which how true I leave to them shall try, and finde it so. This is called also in Latine *Salicaria*, aut quod inter *Salices* oritur, aut quod *Salicis Leonicerus* saith it was called by divers in his time *Corneola*, and that they dyed a Greene colour therewith. The first is called by all writers, either *Lysimachia lutea* & vera; by Cordus in *Dioscoridem*, or *Lysimachium verum*, & *Legitimum*, because it is the same of Dioscorides. Tragus onely, and Gesner in hortis call it *Salicaria*, Bauhinus calleth it *Lysimachia lutea major*, quae est *Dioscoridis*. The second is called by Clusius, *Lysimachia lutea altera*, by Gesalpinius *Lysimachia lutea in alio foliorum floreus*, and by Bauhinus *Lysimachia lutea minor folijs nigris punctis notata*.

notatis, The last is called by *Lobel*, *Lyfimachia lutea altera*: by *Clusius* *Lyfimachia lutea tertia five minor*: by *Dodonæus* in his *Dutch Herball*, *Lyfimachium aquaticum*: by *Bauhinus* *Lyfimachia latifolia flore globoso luteo*. *Dodonæus* sheweth that *Ruellius* erreth, in thinking that *Lyfimachia*, was the *Lutea herba*. It is called of the *Italians* *Lyfimachis*: of the *Spaniards* *Lyfimacho*: of the *French*, as *Ruellius* saith, *Cornolle* and *Cerneolle*, as also *Sonfey d'eau*, *Perce bosse*, and *Pelle bosse*, idest, *Pesti fuga*; but *Dodonæus* contradicteth *Ruellius* therein, saying that *Pellebosse*, with those of *Cenomania*, is another herbe, even the *Ranunculus flammens*, which will raise blisters upon the skinne, and will draw the venome of a Plague fore another way: of the *Germanes* *Widerich* and *Geilweydrick*: of the *Dutch* *Geel Wederick*: and in *English* Willow herbe, and Loofelstrife.

The Vertues.

Galen saith that this Willow hearbe, hath an exceeding binding quality, and therefore *Dioscorides* saith, it is good to stay all manner of bleedings at the mouth or nose, or of wounds, or howsoever, and all fluxes of the belly, and the bloody flux, given either to drinke, or taken by glister; it stayeth also the abundance of womens courses: it is a singular good herbe for greene wounds, to stay the bleeding, and quickly to soder, or close together the lippes of the wound, if the juyce of the herbe onely be bruised and applyed: it is often used in gargles for sore mouthes, as also for the secrete parts: it is found very certaine by good experience, that the smoake hereof being burned, driveth away flies and gnats, and other such like small creatures, which use in diverse places, that are neere to Fennes, Marshes, or water sides, to infest them that dwell there, in the night season to sting and bite them, leaving the marks and spots thereof in their faces, &c. which besides the deformity, which is but for a while, leaveth them that are thus bitten, not without paine for a time: it is sayd also to drive away Serpents, or any other venomous creature, by the smoake of the hearbe burned.

CHAP. XXXIIII.

Lyfimachia non spicata. Willow herbe, with disperfed heads of flowers.

The second sort of Loofelstrife is of those whose flowers stand not in spiked heads, but disperfedly upon the stalkes, whereof there is two sorts onely to be remembred in this Chapter.

1. *Lyfimachia minor rubra five purpurea*. Small red flowered Willow herbe.

This small Willow herbe or Loofelstrife, is much lower than that of the purple spiked head, being but a foote and a halfe high, with smooth and square stalkes, whose toppes are parted into many branches; on the lower part thereof stand long leaves, smaller and narrower than the other purple spiked kinde; two alwayes set together at a joynt, one against another: but those that grow above toward the toppes of the stalkes, are smaller than the lowermost, and keepe not that order, but stand confusedly thereon one above another, neere unto which, at the joynts with the leaves, come forth severall flowers, but not spike fashion, infixe square heads usually whose toppes are not so pointed, nor layd so open as in the other, but being more close, thrust forth their flowers out of them, which consist of fixe small reddish purple leaves, with some threds in the middle: the roote creepeth not as the others doe, but is hard and somewhat wooddy, with many small fibres, getting encrease from the sides thereof.

1. *Lyfimachia purpurea five rubra minor*. The small purple flowered Willow herbe.

2. *Lyfimachia purpurea five rubra minima*. The least purple flowered Loofelstrife.

This other Loofelstrife, being the least, riseth up scarce a foote high, the stalkes branch themselves forth, from the very bottom; set thicke with small, long, and narrow leaves, almost like those of Line or Flaxe, but shorter; with whom at the joynts come forth the flowers, sometimes two at a place, but more usually one, standing in greene huskes, like unto the last; composed of five small blewish purple leaves, enclining to red; in which huskes after the flowers are fallen, stand small skinnie heads, wherein is contained small whitish seede, the roote is small, long, and browne. Vnto this sort might belong, according to some mens opinion, the *Lyfimachia cerulea galericulata*, which I have already set forth in the Chapter of *Gratiola*, as a sort of that kinde, in the Classis of purging plants; but as I there sayd, there was the fittest place for it in my judgement; both for that it is extreame bitter, and hath hooded owers, both which are proper to the *Gratiola*, and not to the *Lyfimachia*, none of them being so: as also that diverse good judgement have likewise called it *Gratiola cernua*.

The Place.

The first groweth in moyst Meddowes, and grounds nigh unto water courses, in many places of Hungary, as *Clusius* saith, the other he saith also he had of Doctor *Mera*, who gathered it in some places (not named) in his returne out of Italy to Germany.

They flower in *June* and *July* with the rest.

The Time.

The Names.

The first *Clusius* calleth *Lyfimachia purpurea secunda sive minor*: and by *Bauhinus*, *Lyfimachia rubra non siliquosa*: the other *Clusius* likewise calleth, *Lyfimachia rubra minima*: and *Bauhinus* *Lyfimachia Lini folia purpurea cerulea*.

The Vertues.

It is no doubt but these herbes, being so like in face and outward forme unto the *Lyfimachia*, are not onely to be accounted as *species* thereof, but of the same property in some measure with them, but thereof I know not any tryall made, and therefore can say no more of them.

CHAP. XXXV.

Lyfimachia spicata. Loofstrife with spiked heads of flowers.

Here are likewise two sorts of this kinde of *Lyfimachia*, to be entreated of in this Chapter, which are as followeth.

1. *Lyfimachia spicata purpurea*. Purple spiked headed Loofstrife.

This Willow herbe or Loofstrife, that carryeth a spiked head of flowers, groweth with many woody square stalkes, full of joynts, about three foote high at the least, at every one whereof stand two long leaves, not altogether so great and large as those of the common yellow, but shorter, narrower, and of a deeper greene colour, and some brownish: the stalkes are branched into many long stemmes of spiked flowers, halfe a foote long, growing in rondles one above another, out of small huskes, very like unto the spiked heads of Lavander; each of which flowers have five round pointed leaves, of a purple violet colour, or somewhat enclining to rednesse; in which huskes stand small round heads, after the flowers are fallen, wherein is contained small feede: the roote creepeth under ground like unto the yellow, but is greater than it, and so are the heads of leaves, when they first appeare out of the ground, and are more browne than those of the yellow.

Lyfimachia Virginiana flore carneo. Blush Willow herbe of Virginia.

This Willow herbe hath many faire long and large leaves, &c. expect the rest hereafter.

2. *Lyfimachia spicata cerulea*. Blew spiked Loofstrife.

This blue flowered Loofstrife, groweth somewhat lower, with some branches in the like manner at the toppes of the square stalkes, and with darke greene and narrower leaves, set by couples at the joynts towards the

1. *Lyfimachia purpurea spicata*.
Purple spike headed Loofstrife.

2. *Lyfimachia cerulea spicata*.
Blew spike headed Loofstrife.

toppes; but with three or foure at a joynt lower, somewhat deepelyer snipped or dented about the edges: the flowers grow in the same manner as the former doe, in long spiked heads, set round about with blue flowers, of foure leaves a peece, which turne into small flar heads with brownish seede therein: the roote creepeth not as the first doth, but shooteth forth many sprouts round about it, whereby it doth much encrease.

The Place.

The former groweth usually by rivers, and ditches sides, in wet grounds; as upon *Lambeth* side about the ditches there, in many places: the other is seldome found in our Land, but in *Austria*, and other places of *Germany* plentifully.

The Time.

Both these doe flower in the monthes of *June* and *July*.

The Names.

The forme of it is certainly the *Lyfimachia* that *Plinie* remembreth, and to take the name from *Lyfimachus*, as is before sayd, and is the *Lyfimachia altera* of *Mathiolus*, the *Lyfimachia Pliniana* or *purpurea* of *Lobel* in his *Adversaria* and Observations; the *Lyfimachia purpurea communis maior*, of *Clusius*; the *Pseudo Lyfimachium purpureum alterum* of *Dodonaeus*; and the *Solidaginis Sarafenica* alia species of *Tragus*: there have beene some that have taken it for *Eupatorium*, and some for a kinde of *Centaureum*, but they have erred both: the other is taken by some, to be *Veronica recta maior*, but others and that more truly make it a *Lyfimachia*; as *Clusius*, who calleth it *Lyfimachia cerulea flore*; *Lobel* *Lyfimachia cerulea hortensis*; *Lugdunensis* and *Dodonaeus*, who calleth it *Pseudo Lyfimachium ceruleum*, and saith that many *Dutch* did call it *Partioke*; *Banbinus* calleth it *Lyfimachia spicata cerulea*, whom I thinke to be of as good and sound judgement, as any other, whom I doe follow as you see.

The Vertues.

The properties of these hearbes, being cooling and drying, are to be referred to the former, wherein they scarce come behind the best of them, and therefore it needeth not that I should make a repetition of the same things againe, seeing any man may safely use the one instead of the other, when it is not neere at hand, or to be gotten. And more by particular experience this hereafter hath beene found, and by a friend imparted, of whose learning and judgement there needeth no question: The distilled water is a present remedy for hurts and blowes on the eyes, and for blindness, so as the cristalline humor, or sight it selfe of them be not perished or hurt, or be not spoyled; which experiments was found true; upon a boy, whose eye by chance was pricked, and restored hereby; as also by another who being hurt in the eye, athwart by a dart, was cured onely by applying this water outwardly: he that performed this cure, and the like upon divers, would not declare this secret to any; and therefore the Physicians and Chirurgeons, that undertooke to cure another hurt in the same manner, and refusing this water, failed of their cure, and left him blind that they dealt with. It is of as good use to cleere the eyes of any dust, or other thing gotten into the eyes, and keepeth the sight from much danger. It is also available against wounds and thrusts; to be made into an oymment with *May* butter, waxe, and sugar, in this manner. Take to every ounce of the water, two drammes of *May* butter without salt, and of sugar and waxe of each as much also, let them boyle gently altogether; let tents be dipped in the liquor that remaineth after it is cold, and put into the wounds, and the place covered with a linnen cloath, doubled and annointed with the oymment: this was proved on a Captaine, who was shot in two places with bullets, the one through his breast, the other through his thigh, and was perfectly cured of both wounds without any scarre, onely by applying them as aforesayd, when as he could not be holpen by other remedies applied. It likewise clenseth and healeth all foule ulcers and sores where soever, and stayeth their inflammations, by washing them with the water, and laying on them a greene leafe or two in summer, or dry leaves in winter. This water gargled warme in the mouth, and sometimes drunke also, doth cure the Quinsie, and Kings Evill in the throate: The sayd water applied warme taketh away all spots, or markes and scarres in the skinne, which are caused by the Measells small Poxe or the like. And lastly, if one drinke of this water, when they are very thirsty, or in any journey not having any drink, it will presently slake their thirst.

CHAP. XXXV.

Lyfimachia filiquosa. Codded Loofstrife.

HE last kinde of Loofstrife to be spoken off, is those that beare their seedes in cods, whereof there are divers, one kind hereof under the name of *Chamenerium flore delphinij*, Willow flower, and the *Virginian* Loofstrife, belongeth to this place; which although I have set them forth in my former Book, and will not describe them againe, yet I will here give you the figure of the *Virginian*.

1, *Lyfimachia filiquosa angustifolia* *Chamenerium Gesneri dicta*.

The narrow leaved codded Loofstrife.

This codded Loofstrife (I place first of this kinde, as most worthy in my judgement, both for the rarity, beauty and property) riseth up with divers hard stalkes, about two and sometimes three foote high, with many very narrow long greene leaves thereon, somewhat like unto *Rosemary* leaves in my opinion, set very thicke with two at a joynt, those below, being shorter then those up higher, at the toppes of the stalkes come forth many flowers, made of foure small round pointed leaves, of a fine reddish colour, and some threds in the middle, *flore albo* every one standing on the toppe of a small long almost square codde, whitish on the outside, and stuffed with fine cotton or downe, wherein lye bright red seedes, which cods with seedes therein appeare, before the flowers doe breake forth at the ends of them. whereupon some have called it *Filius ante patrem*, the roote creepeth in the same manner that the yellow and blew doe. Of this kinde both *Gesnerus*, *Tholius*, and *Clusius* say, they found one with white flowers, not differing in any thing else from the other.

2, *Lyfimachia Chamenerium dicta Alpina*. The mountaine codded Loofstrife.

This mountaine Loofstrife hath very short stalkes, seldome more then a foote high, whereon grow very narrow,

narrow leaves, like unto the former, yet some longer then others set without order: for the smaller come sometimes from the middle of the longer, and sometimes stand at the joynts; at the toppes of the stalkes stand the flowers upon slender long purplish stalkes, and sometimes whitish, of a purplish or reddish blew colour, and in some of a whitish blew colour, consisting of foure reasonable great leaves, even as great as the former, which the smallness of the plant doth scarce admit, with some threds in the middle, every one of them standing in a small huske, composed of foure short greene leaves, wherein after the flowers are fallen, grow up small ong pods, with smal seed in them, enclosed in downe like the other, the roote hereof creepeth not, but is composed of many fibres, which whether it be annuall or longer abiding, I have not yet learned.

3. *Lyfimachia filiquosa major*.

The greater coddled Loofstrife.

This greater Loofstrife shooteth forth divers round greene stalkes, three foote high at the least, bearing thereon at the severall joynts, two leaves a peece, which are somewhat like the common yellow Loofstrife, but smaller and smoother, greene on the upper side, and of a yellowish greene underneath, and dented about the edges, the stalkes send out from the middle upwards many branches, at the toppes whereof grow many small long pods, of a whitish greene purple colour, wherein the reddish seed lying in downe is contained, and at the end of them after they have appeared a good while; come forth the flowers made of foure round pointed leaves a peece, with some threds in the middle, of a faint reddish or purplish colour, the roote is somewhat great and white, creeping every way underground, and quickly possessing a good plat of ground, which abide in the winter, although the stalkes dye downe every yeare. Of this sort likewise there hath beene one found with white flowers, but very seldome and rare.

Flore albo.

4. *Lyfimachia filiquosa minor vulgaris sylvestris*.

The wilde lesser coddled Loofstrife.

This lesser sort that groweth wilde in divers places, riseth up scarce two foote high, and in some places, not a

3. *Lyfimachia filiquosa major*.

The greater coddled Loofstrife.

1. *Lyfimachia filiquosa angustifolia Chamaenerium Ge'neri dista*.
The narrow leaved coddled Loofstrife.

6. *Lyfimachia filiquosa Virginiana*. Coddled Loofstrife of Virginia, or tree Primrose of Virginia.

bore

bove a foote high, with smaller stalkes and narrower leaves, not so greene, but rather of a grayish dusty greene colour, and hath many branches, bearing his flowers of foure leaves a peece, at the ends of long pods, of a deeper red colour, as the former doth, and hath like feede in downe but smaller: the roote is small and fibrous, dying every year.

5. *Lyfimachia filiquosa sylvestris hirsuta*. Hairy wilde coddled Loofestrife.

This other is in growing, and height in leaves and flowers, and yearely dying like unto the last described, the onely difference betwene them is, that the leaves are more hairy, and as it were woolly, and the flowers also small and paler.

6. *Lyfimachia filiquosa Virginiana*. Coddled Loofestrife of Virginia.

This is set forth in my former Booke, and so is *Chamenerium Gesneri*.

The Place.

The first groweth more often in moist grounds then in dry, yet *Gesner* and others say, it doth grow in those places that are open to the Sunne all day, it will hardly abide in our Gardens, unlesse it be planted in some shadowy place. The second groweth upon the *Alpes*, in the Country of the *Switzers*. The third groweth in divers moist places, and is often found of it selfe in Gardens, alwaies delighting where it may be kept moist by shadowing, the other sorts grow wilde in dry grounds, as by the wayes, and lanes, and borders of fields.

The Time.

They doe all flower in June and July, and are quite past in August for the most part.

The Names.

They are all called *Lyfimachia filiquosa* from the long cods they beare, which none of the others have, the foremost are also called *Chamenerium* by *Gesner*, but in my minde that name doth more fitly serve to the other sort hereof, which we call the Willow flower, set forth in my former Booke, by the name of *Chamenerium flore delphinij*, for that hath long greene leaves, very like unto Peach leaves, or the leaves of *Nerium*, or *Oleander* the Rose bay, whereas this as I said, hath narrow leaves like Rosemary, and *Gesner* himselfe doth not well like of the name *Chamenerium*, but rather calleth it *emolus Epilobium*, a word made of three, that is *emolus lobus, quia violae, id est floris, super filiqua nascitur*, and reckoneth up fixe sorts thereof, as he setteth them downe, at the end of *Cordus* his History of Plants. *Dodonaeus* and *Lobel* have set this forth as a finaller kinde of the greater wilde sort, which is the third here set downe. And *Bauhinus* calleth it *Lyfimachia latifolia*, and this *Angustifolia*, as they ought to be. *Lugdunensis* expresseth it under the name of *Linaria rubra*. *Dodonaeus* calleth it *Pseudo Lyfimachium purpureum minus*, for as I said before, he maketh the third sort here to be the *maius*. The rest neede no further amplification, being every one is expressed in their title answerable unto them, and not much varying from what others call them; onely *Casalpina* calleth the third sort, *Onagra genus alterum*, for hee calleth the *Chamenerium flore Delphinij, Onagra*.

The Vertues.

The first which is more used in phisicke then any of the rest, is hot and dry in the second degree, as *Gesner* saith, and very astringent withall, and somewhat absterfiv, whereby it consisteth of divers parts, but is effectuell both to stanch blood, restraîne fluxes, heale the sores of the mouth and secreet parts, close up quickly greene wounds and heale old ulcers, and briefly doe and performe almost as much as the ordinary *Lyfimachia can*.

CHAP. XXXVII.

Veronica mas. The male Speedewell.

¶ The Speedewells there are two Kindes, the male and the female, of the male there are many sorts, which shall be set forth in this Chapter, and the female in the next.

1. *Veronica mas vulgaris supina*. The common Speedewell.

The common Speedewell hath divers soft leaves, of an hoary greene colour, a little dented about the edges, and somewhat hairy also, set by couples at the joynts of the hairy brownish stalkes, which leane downe to the ground, never standing upright, but shooting forth rootes as they lye upon the ground at divers joynts, the flowers grow one above another at the toppes, being of a blewish purple colour, and sometimes it is found white, after which come small flat huskes, wherein is small blackish feede included, the roote is made of many fibres.

2. *Veronica mas erecta*. Vpright Speedewell.

This Speedewell differeth from the former in this, that the stalkes leane not downe to the ground, but stand more upright, having somewhat narrower and greener leaves then the other, and the flowers stand thicker together, as it were in a spike, of a faint blew colour, and the roote creepeth under ground. There is a lesser sort hereof, differing onely in the lownesse, and in the smallnesse both of leaves and flowers.

Minor.

3. *Veronica spicata latifolia major*. The greater spike flowered Speedewell.

This greater spiked Speedewell, riseth up with divers crested stalkes full of joynts, two foote high, whereon stand two large, shining, thicke, and darke greene leaves, and in some neither shining nor so darke, somewhat dented about the edges, the stalkes have very feldome any branches, but have sometimes two or three stalkes of spiked flowers, somewhat larger then the last, and of the same pale blew colour, flowering by degrees the lowest first, the feede that followeth is small, enclosed in small flat huskes as the other, the roote is somewhat blacke and fibrous, encreasing by the sides.

4. *Veronica erecta angustifolia*. Spiked Speedewell with narrow leaves.

¶ This upright Speedewell hath his stalkes about two foote high, set at the joynts with two leaves a peece, which are longer and narrower then the last, and slightly dented about the edges, of a bitter and unpleasant taste, on the toppes of the stalkes, which are as feldome branched as the last, stand the flowers in long spiked heads, many set together, every one having foure pale blew leaves a peece, with some threds in the middle, which after they are past give small feede vessels, which are flat, but a little swelling in the middle, and bicornered at the head.

1. *Veronica mas vulgaris* supina.
The common Speedewell.

2. *Veronica mas crella*.
Upright Speedewell.

3. *Veronica spicata latifolia* major.
The greater Spikeflowered Speedewell.

4. *Veronica crella angustifolia*.
Spiked Speedewell with narrow leaves.

head, wherein lye very small brownish seede; the root creepeth in the ground and shooteth forth many fibres,

5. *Veronica pratensis minor*.
Small meadow Speedewell.

The small meadow Speedewell, hath many leaves, smaller, greener, smooother, and rounder then any of the former, growing by couples on the divers spreading stalkes, and at the toppe, divers small blew flowers like the last, and so is the seede likewise, the roote creepeth in the same manner.

6. *Veronica minima Bellidis folio*.

The least Speedewell with Daisie leaves.

This Speedewell groweth not an handbreadth high, with an hard hairy flexible stalke, bending downe to the groundward, at the foote whereof are many hairy leaves, small, thicke, somewhat round pointed, and of a darke greene colour, very like unto the Blew Daisie leaves, but on the stalke it hath but few, two standing alwayes at a joynt, one opposite to the other, the flowers are blew, of foure and sometimes of five leaves a peece, with a pointell and two threds in the middle, the seed vessels that follow are flat and short, bearing a pointell in the middle, and containe such like small brownish seede, the roote creepeth about, and encreaseth quickly.

7. *Veronica fruticans*.
Shrubby Speedewell.

Shrubby Speedewell hath many woody flexible branches, a foote high or more, lying upon the ground, and taking roote as they lye, full of joynts, whereat stand two long thicke greene shining leaves, dented about the edges, one against another, at the joynts with the leaves on each side of the stalke, arise long greene branches, with such like leaves on them, at the toppes whereof stand fixe or seaven flowers, one above another consisting of foure and sometimes of five leaves, of a very dainty blew colour, and more pale in the middle, circled about with a red ring, having in the middle a long stile or pointell, and two

8. *Veronica minor Alpina*.
Small mountaine Speedewell.

7. *Veronica fruticans*.
Shrubby Speedewell.

9. *Veronica Tenetis facie*.
Germanderlike Speedewell.

small long threds, after which come the seede vessels, being greater then any of the rest, flatter also and broader wherein the seede lyeth, being flat, yellowish, and small, the roote is long and woody, with many fibres thereat.

8. *Veronica Alpina minor*. Small mountaine Speedewell. This small Speedewell from a small hard and threddy roote, shooteth forth sundry stalkes with small leaves thereon by couples, somewhat larger then Mother of Time leaves, seldomedented about the edges, and of darke Greene colour, the flowers are small and of a pale blew colour, standing without order at the toppes of them, sometimes consisting of foure, and sometimes of five or sixe leaves apeece, the seede that followeth, is small round and blacke, and abideth with Greene leaves thereon all the Winter.

9. *Veronica Teucrij facie*. Germanderlike Speedewell. This Speedewell hath square rough stalkes about a foote high, with long narrow dented leaves, set by couples at the joynts, the toppes ending in a long spiked head of foure leaved blew flowers and seede succeeding like the greater Speedewells.

The Place;

The first groweth in all Countries of this land, upon dry bankes and wood sides, and other waste sandy grounds, especially. The second groweth in *Austria* and other parts of *Germany*. The third and fourth grow, as well on the mountaines of *Hungary*, as in the vallies at the foote of the *Alpes* in *Austria*, *Stiria*, &c. The fifth groweth in some places of this Land, as well as beyond the Sea. The sixth *Clusius* saith he found on the hill in *Stiria*, called *Sneberg*, whereon Snow lyeth almost all the yeare through. The seventh was found on the *Pyrenian* hills, by Doctor *Burserus*, who brought it to *Banhimus*. The eighth, and the last on Mount *Baldus*.

The Time.

They flower in *June* and *July*, and their seede is ripe in *August*.

The Names.

It hath no Greeke name that I know, being not knowne to the ancient writers, *Dodonæus* onely taketh it to be the other *Betonica Pauli* & *Eginete*, which he saith is like unto *Pennirovall*, but not that is called *Kiss*, where by the Greekes call the true and right *Betony*, and thereupon this is very ordinarily called of many, *Betonica Pauli*, or *Veronica mai*, and *supina*, to distinguish it from the other. *Tragus* in his time tooke it to be *Teucrium*, and many learned men doe likewise referre most of the other sorts thereunto. The second ordinary upright sort, is called by *Casalpini* *Auricula muris tertia*, as the *spicata* is his fourth, and the fifth here, his *prima*, which *Dodonæus* calleth *pratensis*, *Tragus* *Teucrium alterum*, and *Brusselsius* *Eufragia nobilis*, but *Lobel* in his *Adversaria* *Veronica minor serpillifolia*. *Dodonæus* in his *French* Herball calleth this *famina*, and so did *Tabernaemontanus*, but by the judgement of the best Herbarists of our times, all these sorts are species of the male kind, the female being another herbe of a differing forme, as you shall presently understand, *Gerard* hath foully erred not onely in the figure, but in the description also of his second *Veronica*, which is called *vestita*, not onely in saying that it creepeth contrary to the very title, but in the flowers also, saying they are yellow. All the rest have their names in their titles, as proper to them by most other authours, and therefore I shall not neede a further explanation of them. The *Italians* call it *Veronica maschio*. The *Germanes* *Grundbeyl*, and *Ehrenpreiss*. i. e. *laudata nobilitas*, that is to say, honour and praise, and so the *Dutch* as *Lobel* saith call it. In *English* Speedewell, and *Pauls* *Betony*, and of some *Fluellen*, which being a *Welch* name, is more proper I thinke to the female kinde, whereof they give admirable praises.

The Vertues.

The male Speedewell is temperately hot and dry, the bitternesse thereof shewing it, and is held a singular good remedy for the Plague, and all Pestilentiall Fevers, and infectious diseases, to expell the venome and payson from the heart, and afterwards to corroborate and strengthen it, from noysome vapours, if the powder of the hearbe to the quantity of a dramme or two, be given with a dramme of good Treacle, in a small draught of wine, and they be layd to sweate: the decoction of the herbe in wine, or the distilled water thereof, given in some wine, performeth the same thing: it is reported that a *French* King troubled with the Leprosie, was cured thereof by this hearbe, one of his huntsmen advising him thereunto; it doth also wonderfully helpe the memory, and to ease all turnings and swimings, and other paines of the head, and as it is sayd helpeth women to become fruitfull, that were barren: it clenseth the blood from corruption: the decoction of the hearbe in water, or the powder thereof dried, and given in it owne distilled water, is singular good for all manner of coughes and diseases of the brest and lunges, by the warming and drying quality; which thing the Shepherds have insufficiently tried, who give their sheepe that are troubled with the cough, or the like, some of this hearbe, and a little salt with it: it openeth the obstructions of the liver, and is therefore good for the yellow Jaundise: it openeth also the obstructions of the spleene, being taken for some time together inwardly, or the herbe bruised and applied with some Vinegar to the region of the spleene outwardly; it clenseth the exulcerations of the reins and bladder, or of the mother also, or any other inward wounds or sores: it provoketh Urine, and helpeth thereby to breake the stone, and as *Paulus* *Egineta* saith, is of much good use in all medecines for the backe and reins: it is singular good to heale all fresh wounds, and cuts in the flesh, speedily closing the lippes of them together, and not suffering them to gather corruption: it is no lesse effectuell also for spreading tetters, and for soyle or old frettings, or running sores or ulcers, that are of hard curation, or are of long continuance: it slayeth the bleedings of wounds or other fluxes of blood in any otherpart, and dissolveth all tumors and swellings especially those in the necke. The distilled water of the herbe, either simple of it selfe, or the hearte first steeped in wine for twelve houres at the least, and then distilled in an ordinary still, but not in any *Limbcke*, to make it an hot water, as others are after that manner, doth wonderfully helpe, for all the purposes aforesayd, either for the Plague, the Cough, Consumptions, &c. and all the other diseases before mentined, as also to wash wounds and sores therewith; a little coperas also dissolved in the sayd distilled water, doth wonderfully helpe all itches, scabbes and scurfe, tetters also and the morpew, and all discolourings of the skinne, as freckles, spots, and markes whatsoever, either risen from the infection of the blood, and from hot and sharpe salt humours, or the scarrs that remaine after hurts or bruises, if they be bathed therewith: a little alome dissolved in the sayd distilled water, and sprinkled upon garments, keepeth them from moths that spoyle them.

CHAP. XXXVIII

Veronica femina five *Elatine*. *Fluellen* or the female Speedwell.

Of this *Elatine* there are some varieties, observed by diverse, namely two sorts, but we must therunto adde a third as followeth.

1. *Elatine folio subrotundo*. Round leaved *Fluellen*.

This *Fluellen* shooteth forth, many long branches, partly lying upon the ground, and part standing upright, set with almost round leaves, yet a little pointed at the ends, and sometimes more long than round, without order thereon, being somewhat hoary, and of an evill greenish white colour: at the joynts all along the stalkes, and with the leaves come forth small flowers, one at a place, upon a very small short foote stalk, gaping somewhat like those of *Snapdragon*, or rather *Linaria* *Todesflaxe*, whose upper jaw is of a yellow colour, and the lower of a purplish, with a small heele, or spur behind, as the *Linaria* hath: after which come small round heads, that containe small blacke seede, the roote is small and threddy, dying every yeere, and raiseth it selfe againe of it owne sowing.

2. *Elatine folio acuminato*. *Fluellen* with cornered leaves.

This other *Fluellen* hath longer branches, wholly trayling upon the ground, two or three foote long, and sometimes more, and more thinnely set with leaves thereon, upon small foote stalkes, which are a little larger, and somewhat round, and cut in or cornered sometimes in some places on the edges, but the lower part of them, being the broadest hath on each side, a small point, making it seeme as if they were eares, somewhat hayric but not hoary, and of a better Greene colour than the former: the flowers come forth at the joynts with the leaves, upon little long stalkes, every one by it selfe, one above another, in forme very like unto the other, but the colours therein are more white, than yellow, and the purple is not so faire: it is a larger flower, and so are the seede and seede vessels: the roote is small and threddy like the other, and perisheth every yeere.

3. *Elatine flore ceruleo folioque acuminato*. Cornered *Fluellen* with blew flowers.

This third *Fluellen* differeth little from the last, but that the leaves thereon are not so much cornered about the edges, and lesse pointed also, at the foote or lowest part of them, and the flower is almost all blew, with a very little whitish colour therein.

The Place.

These doe all grow in divers cornfields, and in borders about them, and in other fertile grounds, as about Southfleet in *Kent* abundantly: at *Buckworth* also, *Hamerton* and *Richersworth* in *Huntington* shire, and divers other places, both there and else where.

The Time.

They all likewise are in flower about *June* and *July*, and the whole plant is dry and withered before *August* be done.

1. *Elatine folio subrotundo*.
Round leaved *Fluellen*.

2. *Elatine folio acuminato*.
Fluellen with cornered leaves.

The Names.

It is called in Greeke *Ελατίνη* *Elatine*, by the Arabians *Atbin*, and by the judgement of the most judicious in those latter times, taken to be the true and right herbe that *Dioscorides*, hath set forth by that name, although some did seeme to doubt of it, as not knowing what *Helxine* *Dioscoridis* meaneth, unto whose leaves he compareth it, whether unto *Helxine*, which is *Parietaria*, or *Helxine* *Cissampelos*, the blacke Bindweed. *Scrapia* seemeth to make *Elatine* a kinde of small *Tolubilis* or Bindweede, for so he compareth it to *Helxine*, which can bee no other than *Cissampelos*, but his interpreter *Paulus Aegineta* doth turne *Helxine* to be *Parietaria*. *Kuellus* tooke *Rapistrum campestre*, the wilde *Charlocke* to be it, for the which *Matthiolus* contesteth against him, as also against those that would make *Nummularia* Moneywort, or herbe two pence to be *Elatine*, and against others that made *Pimpinella*, *Burnet*, because neither of them were haytie, nor grew in Corne grounds, as *Dioscorides* saith *Elatine* doth. *Fuschius* calleth it *Veronica femina*, and so doth *Matthiolus*, *Loniceru*, *Camerarius*, *Dodonæus*, and others, and *Lobel* and some others *Elatine* *Dioscoridis*. *Lugdunensis* calleth it *Verbascum quorundam*, for that some in those parts, did it should seeme to call it, and yet giveth the same figure thereof that he gave to *Veronica femina* *Matthioli*. The second is called *Elatine* *Matthioli* by *Lugdunensis* and *Caspar* *Durantes*, because he first set forth the figure thereof in his last Edition, sent him as he sayd from *Cortegius*, for in his other Editions he knew not this sort. *Dodonæus* and others call it *Elatine altera*. *Fabius Columna* calleth it *Linaria Hedernula folio*, because as I sayd the flowers are somewhat like a *Linaria* or *Todeflaxe*, and the leaves cornered like *Ivie*: the *Italians*, *French*, *Dutch*, &c. doe all follow the Latine *Veronica femina*, and we call it by the name of female *Speedwell*.

The Vertues.

Although that *Fluellen* be somewhat bitter, yet it is held to be more cooling with the drying property, than the former *Speedwell*. The leaves, saith *Dioscorides* and *Pliny*, bruised and applyed with Barly meale, to the eyes that are watering, by defluxions from the head, and that are hot and inflamed withall, doe very much helpe them: it helpeth also all other defluxions, as also the fluxes of blood, or humours, which are the laske, and bloody slix, as also womens too abundant couries, and stayeth all manner of bleeding, whether at the nose, mouth, or any other place, or that commeth by any veine burst, bruised or hurt, wonderfully helping all those inward parts, that neede consolidating or strengthening, and is no lesse effectuall. both to heale and close greene wounds, as to close or heale all foule or old *Vlcers*, fretting or spreading *Cancers*, or the like, as the tryall thereof made upon one can witness; whose nose being almost consumed with a *Canker*, was (as *Pena* reporteth it) to have his nose cut off, by the Chirurgians appointed thereunto by the Physicians, to preserve the rest of the body, ready to fall into a *Leprosie*, whose determination being over heard by a simple Barber in company, desired that he might beforehand, make tryall of an herbe, he had seene his Master use in the like case; which being granted, he by using the juyce and concoction of this herbe taken inwardly, and the herbe used outwardly, recovered the man, who was not onely cured of the danger of his nose, but of his whole body, and thereby he was freed from the disease he was falling into. This occasion doth make me thinke, that not onely in this herbe, but in many other simple herbes, our forefathers found helpe of many diseases, and therefore used fewer compounds: and were we in these times as industrious, to search into the secrets of the nature of herbes, as the former ages were, and to make tryall of them, we should no doubt finde the force of simples; many times no lesse effectuall than of compounds: but of this enough, yet not too much, so as I might provoke some learned to bee more industrious, and not like dooanes onely to sucke the honey from others hives: it helpeth also all the outward defects of the skinned, when it is discoloured, as it is sayd of the former: for they are both of a faculty very neete in effect, one unto another, and therefore what is sayd of the one, may very well be applyed to the other.

CHAP. XXXIX.

Nummularia. Money-wort, or herbe two pence.

Hère be two sorts of *Nummularia*, one greater than another, that beare both of them yellow flowers; if that the fertility, or sterility of the soyle doe not cause the same, which I shall shew you here, and with them I have another lesser sort, with purple flowers, which is also found wilde in our owne Land, although but in a few places, which is remembered by no author but *Bartholinus* in his *Prodromus* and *Pinax*.

1. *Nummularia vulgaris*. Common Money-wort.

The common Money-wort, sendeth forth from a small thredde roote, divers long, weake, and slender branches, lying and running upon the ground, two or three foote long or more, set on both sides with leaves, with two at a joynt, one against another, at equall distances, which are almost round, but pointed at the ends, smooth and of a good greene colour: at the joynts with the leaves, from the middle forward, come forth at every joynt, sometimes one yellow flower and sometimes two, standing each on a small footstalk, and made of five narrow leaves, pointed at the ends, with some yellow threads in the middle, which being past, there stand in their places, small round heads of feede.

Minor.

There is one of this sort, much lesser than the former, not else differing.

2. *Nummularia minor flore purpureascente*. Small Money-wort with purplish flowers.

This small Money-wort spreadeth and runneth on the ground, in the same manner that the former doth, with two very little leaves, set at every joynt of the stalke, which are as round or more than the former, with a little point at the ends: the flowers likewise stand in the same manner at the joynts, but much smaller than they, and of a purplish red colour: after which come feede in round heads alike, but lesser, as the roote is so likewise.

The Place.

Both the former sorts grow in our owne Land, in moyst grounds by hedge sides, although the first more plentifull

1. *Nummularia vulgaris*.
Common Money-wort.

Nummularia minor.
Small Money-wort.

2. *Nummularia minor flore purpurecente*.
Small Money-wort with purplish flowers.

lentifully, and almost every where, the last hath been found with us also in sundry places.

The Time.

They doe all of them flower in June and July, and their feede is ripe quickly after.

The Names.

It is called of the later Latine writers (for none of the ancient either greeke or Latines, have made any mention of it, unlesse it be *Ereuthedanum* of Theophrastus, lib. 9. c. 14. as Penathinketh, which *Caxa* translateth *Rubia*, but that the vertues thereof doe not agree herewith; and *Numulum* of Pliny, lib. 18. c. 28. which is falsly set downe *Mimulus*.) *Nummularia* of the round forme of the leafe, like unto money. *Brinselfus* and others call it *Serpentaria*, because it hath beene found that Serpents have helped themselves therewith being wounded, and *Centummorbum*, and *Gesner Centimorbia*, or *Centum morbia*, of the singularity to helpe diseases and wounds. Some have called it *Lunaria minor*. *Tabermontanus* (and others before him) calleth it *Hirundinaria*, some say, *quod hirundinis instar pascim terre adhercat*. *Bauhinus* hath made mention of the last. The *Italians* call it *Nummularia*, the *French Monnoyere*, the *Germanes Egelskraut*, and *Pfeuningkraut*; the *Dutch Pennickecruyt*; and we in *English* *Herbe two pence*, or *two penny grasse*, but more usually *Money-wort*.

The Vertues.

Moneywort is somewhat cold, but very astringent, binding and drying, whereby it is singular good for to stay all fluxes of blood in man or woman, whether they be laskes, bloody fluxes, the flowing of womens monethly courses, or bleedings inwardly or outwardly, also the weakenesse of the stomacke, that is given to casting, it is very good also, for all ulcers, or excoriation of the lungs or other inward parts; yet some shepherds and others doe thinke it is very hurtfull for their cattell to feede thereon, and that it causeth their lungs to blister, which assuredly is but a conceit or opinion, for no cold and binding thing was ever knowne to exulcerate. It is exceeding good for all wounds either fresh or Greene, to heale them speedily, for old ulcers also, which by their humidity,

humidity, and by the fluxe of moist and sharpe humours, are either spreading or long in curing, for all which purposes, the juice of the herbe, or the powder drunke in water, wherein hot Steele hath bene often quenched, or the decoction of the dry or Greene herbe in wine or water drunke, or the seede, juice, or decoction used to the outward places, to wash or bathe them, or to have tents dipped therein, and put into them are effectually.

CHAP. XL.

Paronychia. Whitlow wort, or Whitlow grasse.

Although *Bauhinus* disclaimeth all the sorts of *Paronychia* expressed by all other Authours, referring them all to some one or other herbe, and although those that I shall set forth here by that name, doe not fully answer the description of *Discozides*, yet because divers worthy Authours have so called them, and I had rather if they have erred, erre with them, then be singular in error with *Bauhinus*, let them therefore receive their place here at this time.

1. *Paronychia major*. The greater Whitlow wort.

The greater Whitlow wort hath very many leaves lying on the ground, in a round compasse one by another, of three inches long, and one broad a peece, rough, hairy, of a darke Greene colour, and somewhat dented about the edges, standing upon short footstalkes, from the middle of whom rise up one or two small round naked stalkes, with few or no leaves thereon, scarce able to stand upright, but bending downwards, at the tops whereof stand small white flowers, after which come small long pods containing small reddish seede, nothing so hot and sharpe as the next.

2. *Paronychia altera minor*. The lesser Whitlow-wort.

This other that is smaller, hath likewise divers leaves lying on the ground, lesser then the former, somewhat like unto the lesser Mouseare, called Cats foote, but not so hoary, yet a little hairy, and of a yellowish Greene

3. *Paronychia Alpinæ folio*.
Common Whitlow grasse.

4. *Paronychia altera rotundæ folium*.

4. *Paronychia incisæ folijs*.
Tagged Whitlow grasse.

colour from which spring divers small straight and crested stalkes, halfe a foote high or more, branching forth at the toppes, where stand divers white flowers, unto whom doe follow very slender long pods, like those of Flixweed, full of small reddish seede, as sharpe and hot in taste as Cresses, the roote is small, hard and woody.

3. *Paronychia vulgaris Alpinæ folio*.
Common Whitlow grasse.

This is a very small herbe, seldome rising to be an handbreadth high, having many small and somewhat long leaves, lying next unto the roote, somewhat like those of Chickweede, but somewhat longer and whiter, from whence rise divers slender naked stalkes, bearing many white flowers one above another, exceeding small, after which come small flat pouches, lesse then of any *Thlaspi*, wherein is contained very small seede, of a sharpe taste, the rootes are a few small fibres.

4. *Paronychia folijs incisæ*. Tagged Whitlow grasse.

This other Whitlow grasse, hath some pale or reddish; Greene leaves, cut in on the edges into two or three small cuts, making them seeme like unto the leaves of Rue, or herbe grace; it hath fewer stalkes then the former, and such like leaves but smaller, set thereon in some places, with some white flowers at the tops of the stalkes, which

which turne about like a Scorpions taile, greater then the other, and huskes that hold the seede greater also, the rootes are small and fibrous.

The Place.

The two first sorts are found upon open hills, and in the dryer grounds of them, both the last sorts are often found together, that is either upon old stone or bricke wals, or in dry gravelly grounds, yet still where it hath grasse or mosse or the like, growing neere to shadow it.

The Time.

They flower very earely in the Spring, for they are all past by the end of *Aprill*, and are not to be found all the Sommer following.

The Names.

These are not as I said, the true *παρονυχία* *Paronychia* of *Dioscorides*, but received under that name by good Herbarists, *Bauhinus* as I said before disclaimeth all the sorts of *Paronychia*, & referreth them all to one plant or other, as he thinketh best, and therein I think he hath as much erred, as he thought others did, for although the *Paronychia prima Matthioli*, be true *Rutamarria*, or *Salvia vite*, being of the taste and qualty of the rest of the capillary herbes, as you shall heare when wee come to speake of them in their proper place, and *Matthiolus* his *Paronychia altera*, be *Anthyllis Alpinæ folio*, yet how *Bauhinus* should make the *Paronychia folijs incisifive rutaceo folio* to be a *Sedum*, rather then the other, calling it *Sedum tridactylites testorum*, I cannot well see; for the leaves thereof doe not lye compassing one another, as all or most of the *Seda's* doe, neither are the leaves thereof thicke, as most of them are, nor are the *Seda's* hot in taste as these are, and although *Lonicæ* setteth forth the *Medica lunata*, (whose figure and description I have given you in my former Booke) for a *Paronychia*, whereunto as he saith, *Dioscorides* his description doth not much vary, which is called also *Lunaria Italica*, as a difference from the *Lunaria Germanica*, which may be refused, yet in my opinion he hath erred as much as in the others, to make all the other here set downe to be species of *Bursa pastoris*, and I cannot but meruaile also at *Gerard*, in that hee had meant, if he had lived to have seene his worke published againe, with the additions, to have made another *Paronychia*, by the name of *Paronychia Cambrensis*, of an herbe that he had received from a friend that sent it him, being gathered upon a mountaine in *Wales*, which is the *Pyrola Europea alpinæ flore minor*, as by his description may plainly appeare, but I must excuse him in that, I thinke he never read, or marked what he read of *Pyrola alpinæ flore*, spoken of before in the Chapter of *Pyrola*, and therefore he referred the plant upon sight, unto the neereft his wits would serve him. The first is called by *Thalium Pilosella siliquata major*, *Aizon Telephium Dalechampi* by *Lugdunensis*, and *Bauhinus*, *Bursa pastoris similis siliquosa major seu majoribus folijs*. The second is *Thalium Pilosella siliquata minor*, which *Gesner* calleth *Paronychia altera Myagri folijs*, and *Bauhinus* *Bursa pastoris similis siliquosa minor seu minoribus folijs*. The third is called *Paronychia Alpinæ folio*, by *Lobel*, *Lugdunensis*, and *Camerarius*, *Paronychia vulgaris* by *Dodonæus*, *Thlaspi minima species*, by *Thalium* who yet saith it may well be referred to these sorts, by *Lugdunensis* *Myosotis altera species*, and by *Bauhinus* *Bursa pastoris minor loculo oblongo*. The last which is *Paronychia incisifolys* and *rutaceo folio* by *Lobel*, *Paronychia altera* by *Dodonæus*, *Alpine petrea rubra* & *Paronychia tertia* by *Tabernaemontanus*. *Tragus* not knowing by what name best to call it, entituled it in his owne language *Hendelkraut*, and *Thalium* thereafter *Dactylobotanon alterum*, and as I shewed you before, *Bauhinus* maketh it an *Aizon* or *Sedum*.

The Vertues.

There is no exact and certain tryall made of late dayes of this herbe *Whitlow-grasse*, whether it performeth the cure, *Dioscorides* and *Galen* attribute unto their *Paronychia*, for being by taste found to be somewhat hot and sharpe, it hath not that drying faculty without sharpnesse, that they say is in theirs, and therefore it is not probable to worke those effects, to heale the impostumes that grow at the rootes of the nailes of a mans hand, and other hot inflammations and impostumes, but onely a generall supposition it hath from the name that it will helpe whitlowes and fellons, that rise upon the fingers, most usually about the joynts of them, which is performed by a digesting quality.

CHAP. XLI.

Anagallis. Pimpernell.

Here were formerly onely two sorts of *Pimpernell* knowne to *Dioscorides*, and the other ancient Authours, which are that with the red flower, and that with the blew, but our times have found out other sorts, as shall be shewed in this Chapter, yet I doe not meane to speake of any of the Brooke limes, or Water sorts here, for they shall be entreated of in their proper place, which is among those plants that delight to grow in watery places.

1. *Anagallis flore phaniceo*. Red flowered *Pimpernell*.

The Common *Pimpernell* hath divers weake square stalkes lying on the ground, beset all along with two small and almost round leaves at every joynt, one against another, very like unto *Chickweede*, but have no footestalkes, for they doe as it were compass the stalkes, wherein it differeth from *Chickweede*, the flowers stand singly, each by themselves, at the joynts betweene them and the stalkes, consisting of five small round pointed leaves, of a fine pale red colour, tending to an Orenge, with so many threds in the middle, in whose places after they are past, succeed smooth round heads like those of *Chickweedes*, wherein is contained small seede, the roote is small and fibrous perishing every yeare.

2. *Anagallis flore ceruleo*. Blew flowered *Pimpernell*.

This other *Pimpernell*, is in all things like unto the former, saving onely in the colour of the flower, for whereas that is of a red colour, this is of a faire blew colour, wherein consisteth the difference.

3. *Anagallis flore obsolete purpurea*. *Pimpernell* with fallen red flowers.

This *Pimpernell* doth in all things likewise resemble the former, save that the flowers hereof are of a fallen or darke red colour, having a glimpse of purple therein,

4. *Anagallis flore carneo*. Pimpernell with bluish coloured flowers.

Of the same kinde also is this other, not differing in any thing, but in the colour of the flower, which is of a faire bluish or incarnate colour.

5. *Anagallis flore luteo*.

Pimpernell with yellow flowers.

The yellow Pimpernell groweth in the like manner, that the former doe, with many spreading branches upon the ground, but they are somewhat greater, and so are the leaves also, larger then the former sorts, but set by couples at the joynts, where the flowers come forth upon long footestalkes, like unto the other, but larger or greater, and of a faire yellow colour, with pointed leaves somewhat like unto *Nummularia*, with round heads also containing the seede, and small fibrous rootes not perishing every yeare, as the rest doe; for with the plant in flower, which I have gathered, there hath remained the dry stalke, with the heads of seede, of the former yeares growing.

6. *Anagallis tenuifolia flore caruleo*.

Narrow leaved Pimpernell with blew flowers.

This blew flowered Pimpernell, groweth in the same manner that the rest doe, with spreading branches upon the ground, and leaves set at the severall joynts thereof, all along up to the toppes, but they are longer and narrower, somewhat resembling the leaves of *Cratiola*, or hedge Hyssope, and not alwaies two at a joynt, but oftentimes three, or peradventure more, yet very seldome: at the joynts likewise with the leaves, stand severall flowers as in the other sorts, upon small long footestalkes, made of five small round pointed leaves, yet somewhat greater then those of the former blew sort, having a shew or circle of a purple colour in the middle, or bottome: which afterwards yeeld such like round heads and feedes, and having small threddy rootes like unto the other, perishing in the same manner every yeate.

The Place.

The first groweth every where almost, as well in the meadowes and corne fields, as by the wayes, or in gardens

5. *Anagallis flore luteo*.

Pimpernell with yellow flowers.

1, 2, 3, 4. *Anagallis floribus phoeniceis, caruleis, obsolete purpureis & carnis*. Pimpernell of foure sorts of colours in the flowers. that is, red, blew, sullen red, and bluish colour.

6. *Anagallis tenuifolia flore caruleo*.
Blew flowered Pimpernell.

rising of it selfe: the second is nothing so common, yet is found growing neere *Battle* by *Oxford*, and plentifully in *Rumney Marsh*, at *Higham Ferrers*, *Artiborough*, and *Raundes* in *Northamptonshire*, and at *Beaconsfield* in *Buckinghamshire*. The third as *Clusius* saith, first grew with him, in his Garden at *Franckford*, and continually by the shedding of the seede, preserved it owne kinde, as well there, as in *Holland* at *Leyden*. The fourth grew of it selfe, in my owne Garden here in *London*, and commeth up every yeere, of it owne sowing. The fifth groweth in the shady places of *Hampsted* wood, and in many places of *Kent*, and about *Alford*, at a place called the *Parke*. The last *Clusius* saith he had from the noble and learned *John Monnet* of *Tornay*, who received it from *Adis*, or *Calis*, where it grew; and grew likewise in his garden at *Tornay*.

The Time.

They doe all flower from *May*, unto *August*, and the seede ripeneth in the meane time, and falleth.

The Names.

It is called in Greeke *Αναγallis*, *Anagallis*, and so likewise in Latine. *Pena* thinketh it might take the name *anagallis*, quod Graece dicebatur *Hyacinthus* unde a colore *Hyacintheo*, *Anagallis* nuncupari potuit: vel forte dixit antiquitas *Anagallidem*, quia superhula floribus venustis vias passim ornet, colore oculis grato & amico. *Iacobus Manlius*, and *Matthiolus* after him, call it *Morsus Gallinae*, and *Morgelina*, but that name is more truly the name of *Alsine Chickweede*, whereof this may be accounted a species. Some have called it *Auricula Muri*, following therein the *Pandectarum* author. *Dioscorides* saith, that in his time it had divers names, among which he numbred *Macia*, which *Marcellus Virgilius* also remembereth, and *Corchorus*, and *Halicacabus*, whereby it is supposed to be the *Corchorus* of *Theophrastus*, which in his seventh booke, and seventh chapter, he reckoneth *Inter olera*, among the pot herbes, or saller herbes; and for the bitteresse became a Proverbe *αργετο εν λαχανοις*, *Corchorus inter olera*; which is understood of those men, that would be esteemed of some worth and account among others; when they are the vilest of others, for so *Pliny*, in his twenty fifth booke, and thirteenth chapter, doth say that this *Anagallis Pimpernell*, was called *Corchorus*, or *Corcorus* in the same manner: but not that *Corchorus* he mentioneth, in his 15. booke, and 32. chap. which as I sayd before, is more truly taken to be *Melochia*, *Oliv Indicum*, the *Teves Mallow*. *Paulus Aegineta* used the male *Pimpernell* in the composition. *Diacorallion*, because it was called *Corallion*, whereof he speaketh in his seventh booke, which is used against the diseases of the Arteries and joynts, and was to be made with this herbe, which some doe rather thinke should be called, *diacollarion*, and the herbe *Collarion*, which may seeme to take the name of glewing, which is proper to *Pimpernell*. Some also take this to be the *Melochia* of *Serapio*, but *Serapio* calleth the *Anagallis flore pheniceo*, which is generally called *Mai*; In the *Arabian* tongue *Xaniala*, and the other flore *cerulea*, which is the *Femina Cardabella*, as *Tragus* saith. The *Italians* call it *Anagallo*, and *Morso di gallina*. The *Spaniards* *Murages*. The *French* *Mauiron* and *Morgeline*. The *Germanes* *Gauch heil*, quasi *salus sanorum*, or *coccygis sive cuculi*, for so they call *Gauchbrot* *Panis cuculi*, and *Gauchblum* *flos cuculi*, from a superstitious conceit as it is thought, that it being hung over the threshold of the porch or dore, will frustrate or expell all witchcraft or forceries. The *Dutch*, *Gnichel heil*: and we in *Englis* *Pimpernell*. The first here set downe is generally of all writers called, *Anagallis mai* & flore *pheniceo*, as the other, or second, *Anagallis famina flore ceruleo*. The third *Clusius* maketh mention of in his history of plants. The fourth is not remembered or spoken of by any other but my selfe: the fifth is generally called *Anagallis lutea*, but of *Gesner* in *hortis Germaniae* *Numularia sylvatica* & *mai*, and of *Lugdunensis* *Alsine lutea*. The last *Clusius* calleth *Anagallis tenuifolia* *Monelli*, and *Baibinns* *Anagallis cerulea foliis binis ternisve, exadverso nascentibus*.

The Vertues.

Pimpernell as *Galen* saith, in his sixth booke, of the faculties of simples, of both sorts with red or blue flowers, are of a cleansing faculty, they have also an attractive heate, whereby they draw forth thornes or splinters, or other such like things fastned in the flesh, and therefore the juyce put up into the nostrils, purgeth the head; briefly also they have a drying faculty without sharpnesse, whereby they are good to soder the lippes of wounds, and to cleanse foule ulcers; thus saith *Galen*; whereby it is plaine, that they erre greatly, that make *Pimpernell*, to be cold and moist, when as they are quite contrary hot and dry, and of such a cleansing quality, that the distilled water or juyce, are by the *French* Dames accounted mervailous good to cleanse the skinne from any roughnesse, deformity or discolouring thereof, and to make it smooth neate and cleere: being boyled in wine and given to drink, it is a good remedy against the Plague, and other Pestilentiall Fevers, and contagious diseases, so as after the taking thereof warme, they lye in their beds, and sweate for two houres after, and hereby the venom of the disease would be expelled, yet so as that it be used twice at the least: the same also helpeth all stings and birings of any venomous beasts, be they of Serpents, as the *Viper*, *Adder*, or *Scorpion*, or maddé dogges, or any other, used inwardly, and applied outwardly: the same also openeth the obstructions of the Liver, and is very available against the infirmities of the raines, provoketh urine, and helpeth to expell the stone and gravell out of the Kidnies and Bladder, and conduceth much in all inward wounds, and ulcers: The decoction or the distilled water, is no lesse effectfull, to be outwardly applyed to all wounds, be they fresh, to consolidate them, or old filthy or fretting and running ulcers, venomous also, or infected, by cleansing their corruption, by restraining their malignant corroding, and infectious qualities, by drying up their fluxe of humours, which hindereth their cure, and quickly bringing them to healing: a little honey mixed with the juyce, and dropped into the eyes, cleanseth them from cloudy miltres, or filmes growing over them, which hinder and take away the sight: it helpeth the toothach being dropped into the eare, on the contrary side of the paine: it is effectfull also to ease the paines of the hemorrhoides, or piles: the male *Pimpernell* is sayd to drive forth the fundament, and the female to repell it, and drive it into his place againe, whereby it is found that the male is more powerfull in expelling, and the female in repelling.

CHAP. XLII.

Androsaces altera Matthioli. Matthiolus his Navelwort.

Although these plants contained in this Chapter, be referred to the Chickweedes, by divers authors and might therefore have been placed among them, yet in regard I finde them not onely to vary from all the sorts of Chickweedes, as well in the outward forme, as in the inward qualities, as by the taste may plainly be discerned, I have therefore thought good to separate them, and speake of these in this Classis, and of them in another.

1. *Androsaces major Matthioli.* *Matthiolus* his *Androsace* called the greater Navel-wort. The greater hath diverse somewhat broad fresh greene leaves, a little hayrie, lying upon the ground, somewhat resembling a Plantaine leaf, with some ribbes in them, but much smaller, and a little unevenly dented about the edges: from among which rise up divers round stalkes, foure or five inches high, somewhat hayrie also, bare

1. *Androsace altera major Matthioli.*
Matthiolus his *Androsace* called Navel-wort.

or naked without a leaf up to the toppes, where stand foure or five leaves, like those that grow below but lesser, and among them start forth divers slender footestalkes, bearing every one of them a small white flower, consisting of five small notched leaves, standing in a greene huske, divided also at the toppes into five parts, wherein after the flower is past, standeth a small round head, containing small blackish seede: the roote is small and fibrous, perishing as soone as it hath borne seede, and riseth often of it owne sowing againe, which if it spring before winter, or that it doth not runne up for flower, the first yeere of the sowing, will abide the first winter, and flower the sommer following.

2. *Androsaces minor.* The lesser *Androsace*, or *Matthiolus* Navel-wort.

The lesser Navel-wort groweth like the former, with many leaves lying on the ground, but they are smaller and narrower by much, yet somewhat hayrie, and dented about the edges; from whence rise also many small naked hayrie stalkes, three or foure inches high, not having any leaves at the toppes like the former, but an umbel or tuft, of many small flowers, like the former but whiter; after which come forth such like small round heads with seede: the roote is likewise small and fibrous, but more reddish, and perisheth every yeere, after seede time.

3. *Androsaces minima.* The least *Androsace* or *Matthiolus* Navel-wort.

The least Navel-wort is also very like the former, with many hayrie leaves, lying in a round compasse upon the ground, very like unto the leaves of the smallest Sheapherds purse, with more pointed and deeper dented edges, than either of the former: the stalkes that rise from among them are much smaller than the former, so are they shorter also, but not lesse hayrie, having five small greene leaves, set in a round compasse at the joynt, which is about the middle height, from whence arise as in the first sort, three or foure small white flowers, which afterwards beare seede in small heads like the former: the roote is also a few

threds as the rest, and answerable to the plant.

The Place.

These all grow in divers places of Germany: the first in Austria in the cornefields about Baden, and Vienna as *Clusius* writeth, although *Matthiolus* his friend that sent it him, sayd it was brought out of Syria: the second Doctor *Burserus* gathered neere a village called *Markerson*, about foure miles from *Herbipolis*, as *Banhinus* in his *Prodromus* setteth it downe. The last he saith likewise Doctor *Fuervus* told him, groweth in the plaines of *Northisa*.

The Time.

They doe flower in May, and their seede is ripe in June and July, yet the last is the earliest of the rest, both for flower and seede.

The Names.

Ἀνδρῶσας, in Greeke, is called also in Latine *Androsaces*, ut quis forte putare possit ἰδῆσθαι ab urina & hydro-picorum aquis educendis, yet this is not the right *Androsaces* of *Dioscorides* and *Galen*, because he saith it groweth without leaves, as it is extant in some copies, yet in others it is said to have leaves, having onely a head with seede, *Matthiolus* first exhibited two plants under the name of *Androsaces*, the one which is a Sea plant, sent unto him, as he saith from *Lucas Ghinus* of Pisa, who found it about the Sea coasts in *Hetruria*, *Tuscan*, or *Florence*, which doth not answer unto the Text of *Dioscorides*, who saith foliolum in capite habet in quo semen, it hath a huske at the toppe, wherein is the seede, and therefore *Bellinus* called the *Polygonum quartum* *Pliny*, which

which is the lesser *Uva marina*, or Sea Grape, by the name of *Androsace*, as it is declared before in the Chapter of *Polygona baccifera*, Berry bearing Knotgrasses, *Anquillaria* accounteth the *Cuscuta* to be the *Androsace* of *Dioscorides*, which is without leaves, according to those copies that have it so, and as *Tragus* before him doth, who saith that *Antonius Musa*, and *Ericius Cordus* were of the same minde before him, which is not without some probability, in that it carryeth no leaves but heads of flowers and feede, upon a number of small threds, but that this is not of a Sea plant, as *Dioscorides* his *Androsace* is, nor is white as some copies have it, or with slender rushy stalkes, as other copies have, and therefore I thinke we may easily conclude, that *Cuscuta* is not *Dioscorides* his *Androsace*, but the *Uva marina* Sea Grape, may be thought & is by many, to come neerer therunto, and I should with *Bellonius* thinke so also of it, if it were an herbe, and not a shrubbe, and if it had white and slender stalkes, as it hath woody, and climbing, bearing red berries, which it is likely *Dioscorides* would not have omitted, if he had meant that plant, and for that first Sea plant of *Matthioli*, for any thing we can perceive it is but an excrecence of the Sea, not bearing any heads with feede, but small round Navell-like leaves, and therefore at *Mompeliser*, called *Umbilicus marinus*, which grow hard and white, being out of the water, although tender underneath it, as *Corall*, *Coralline*, and some other Sea plants doe, whereof you shall heare more in the proper place, which is of Sea plants, the other *Androsace* that *Matthioli* setteth forth and calleth *altera* was sent him as he saith, by *Cortisus*, for *Androsace*, which although it agree not unto that of *Dioscorides*, yet all other writers since, have so called it, but both *Clusius* and *Lebel* deny it to be any Sea plant however *Cortisus* saith, it came from the places, neare the Sea in *Syria*. The first here described is generally called *Androsaces altera Matthioli*, who as it should seeme, held the reading of *Dioscorides* his text, to be *tenues spargens junco cum folijs*, spreading small rush like stalkes with leaves, for so hath this plant, and as I said before is referred to the kindes of *Alfine*, Chickweede; but for the reasons before alledged, I doe as ye see distinguish them, but *Rauhinius* calleth it *Alfine affinis Androsaces dicta major*. The second is called by *Bauhinius* in his *Pinax* and *Prodromus*, *Alfine affinis Androsace dicta minor*. And the last is called also by him, in the places before named, *Alfine verna Androsaces capitulis*. I have called it in *English*, (not simply Navel-wort, for I see no reason why such a name should be given it) as others doe, but *Matthioli* his *Androsace*, or Navel-wort, as a distinction betwene it and the *Coryledon altera*, called also Navel-wort.

The Vertues.

This Navel-wort, being somewhat sharpe in taste, is accounted hot and dry in the second degree, and doth both cleanse old sores and ulcers, and stayeth those that are corroding or fretting from their malignity, and afterwards dryeth up the superfluous humidity, which hindereth their healing, and cleanseth also the skinne outwardly from roughnesse, Sunburning or the like discolouring, the juice clarified and dropt into the eyes, cleanseth them from those films or skinnies, that by growing over the sight, cause blindnesse.

CHAP. XLIII.

Sagina Spargula. Francking Spurry or Spurrewort.

These plants also as the former, I might as others doe, referre unto the kindes of Chickweedes, but their qualities being not alike, nor the forme of them, but very little conformable, I must likewise for this worke disjoyne them, howsoever for another they may be joynd.

1. *Sagina Spargula major*. The greater Franck Spurry, or Francking Spurrewort.

The greater Spurry or Spurrewort, sendeth forth divers small round and upright stalkes, scarce halfe a foote high, whereon at severall distances or joynts, grow many small and narrow leaves, set together in the manner of a starre, or the rowell of a spur, whereupon came the name, the flowers are many, small, and white, standing at the toppes of the stalkes, which turne into small round heads, containing therein blacke feede, the roote is small and threddey, perishing every yeare after feede time.

2. *Sagina Spargula minor*. The lesser or Sea Spurry.

This Sea Spurry is not much differing from the former, but that it hath not so many long and narrow leaves set together at the joynts of the stalkes, which doe not rise fully so high, and doe somewhat more leane downwards to the ground, which together with the leaves are more white, and of a saltish or brackish taste, if it grow neere the Sea side, as most Sea plants are, otherwise nothing so hoary white, or brackish at all, the flowers likewise are fewer, but of a white colour, and the feede blacke like the other, the roote is likewise, small, long and somewhat hard, with small fibres thereat.

3. *Sagina Spargula minima*. The least Franck Spurry.

The smallest Spurry hath likewise divers weake stalkes, but somewhat bowing downe to the ground, seldome above an handbreadth high, full of joynts, and at every of them, two small short leaves, compassing them at the bottome, from betweene the stalkes and the leaves come forth other small leaves without number, towards the toppes of the stalkes from the said joynts come forth the flowers, every one upon a small footestalke, which are of a pale blew colour, and sometimes more blew, or tending to a purple, after which come such like round heads with blacke feedes in them, as are in the former, the roote is small and long, with some fibres, or threds at it.

4. *Asterias sive Stellaria Mompeliensis*. French Spurry, or Spurrewort.

The French Spurry, is likewise not much differing from the last sort, but that the small short and narrow leaves, that stand at the joynts of the small low stalkes, are all of an equall length, and being stiffer and harder, stand straight outright in an equall distance, one from another like a starre, the flowers hereof are small, having five narrow pointed leaves laid open abroad like a starre also, but of a reddish colour, so that whether you respect the leaves or the flower, they both resemble a starre, and from thence tooke the name, and yet we know there are many other herbes so called, much differing one from another.

The Place.

These doe all grow in dry sandy grounds, as well among the Cornē in divers Countries, as in untilled and shadowy

shadowy places; especially the first and second, although it is also found growing neare the Sea shore in the like places.

The Time.

They flower in *June* and *July*, and the seede is ripe usually in *August* before Harvest time.

The Names.

It is called *Spergula* of all those that have written thereof, except *Thalim*, who calleth it *Anthylloides*, and *Fabius Columna*, who calleth the first, *Alpine tenuifolia altera*, vel *sylvestris altera, tricophylla*. *Lobel* calleth it *Sagina Spergula*, a *saginandis pecoribus*, from the *Franking* or feeding fat of cattle, and therefore he saith, that divers *Brabanders* and others in the Low Countries, did sow their grounds therewith, for the same purpose, to cause their Kine to give the more store of milke. *Bauhinus* calleth them *Alpine Spergula*. The last *Lugdunensis* maketh mention of, under the same name in the title. Both the *Dutch* and we in *England* call it *Spurry*, or *Frank Spurry*, for the causes aforesaid, but I do a little more explaine the names, in calling it *Franking Spurre wort*.

The Vertues.

The seede is held to be a provoker to vomit, and thereby to bring forth stegmaticke and foule slimy humours, that sticke in the stomacke, both troubling the body, and hindering digestion, and health, the herbe a little bruised and laid to the fingers, or other places that are cut, will speedily heale them, whereof the Country people in divers places, say they have had good experience. It fatteneth cattle as you have heard before, and so it doth also Pullaine, and as it causeth the Kine to give more store of milke then ordinary otherwise, so it causeth Pullaine likewise to lay more store of egges, which is no idle conceit, for those of *Brabant*, and other the parts thereabouts have found it sufficient true, by their daily use and tryall thereof.

1. *Sagina Spergula major*.
The greater Frank Spurry.

CHAP. XLIIII.

Asperula. Woodroofe.

Here are two or three sorts of this herbe Woodroofe, whereof although some be common, and well knowne, yet the others are not so.

1. *Asperula odorata*. Common Woodroofe.

The Common Woodroofe, or Woodrowell, sendeth forth divers square stalkes, halfe a foot high or more, full of joynts, and at every joynt seaven or eight faire Greene shining leaves, broader then those of *Clevers*, in a manner smooth or but little rough at all, at the toppes of the stalkes stand foure or five white sweete smelling flowers, made of five leaves a peece, laid open like a starre, after which come small round feede, a little rough, or cleaving to whatsoever it toucheth, the roote runneth creeping under ground, and shooteth up new stalkes round about it every yeare.

2. *Asperula flore ceruleo*. Woodroofe with a blew flower.

This Woodroofe hath seldome more then one round stalke, rising from the roote, set full of joynts, at every one whereof stand divers small and somewhat long Greene leaves compassing it, not so smooth and Greene as the former, and likewise small branches, from the bottome almost up to the toppe, set with the like leaves but smaller, where the flowers stand three or foure together, each upon a small footestalke, which are of the same greatnesse with the former, or rather somewhat lesse, and of a faire blewish purple colour, without any sent at all: and after they are past, in their places grow small round brownish feede, not rough at all, the roote is small, somewhat yellowish and fibrous, and perisheth every yeare, and from the seede when it falleth, springeth new plants every yeare.

3. *Asperula purpurea*. Woodroofe with a purple flower.

This is very like unto the last, but with more store of stalkes, and fewer pale Greene leaves at the joynts of them, having purplish flowers, and small fat oylie feede.

4. *Asperula Muralis minima*. Small stony Woodroofe.

This small Woodroofe, (which doth in my judgement, better resemble *Gallium* then *Asperula*, yet because others so call it, I am content to let it so passe also) hath divers square, rough, and upright stalkes, about halfe a foot high, which are in a manner transparent, being full of joynts, and at every joynt sometimes foure or five but usually stand fixe small rough Greene leaves, somewhat hairy and bitter in taste: at the joynts above the leaves come forth the flowers, round about the stalkes, at certaine distances up to the toppes of them, which consist of foure small yellowish leaves, the roote is threddey and small, perisheth also every yeare in these Countries.

1. *Asperula* aut *Aspergula* odorata.
Common Woodroose.

2. *Asperula* cerulea.
Woodroose with blue flowers.

The Place.

The first is found in the open woods of Germany and other places ofentimes, but is most usually planted in gardens, as the second is also. The third groweth as well in the fields as gardens, about Lyons. The last *Columna* faith, hee found in stony or rockie places, on the hills *Unkenfer*, which are in the Kingdome of Naples.

The Time.

They doe all flower early, even about May, and their seede is ripe while they are yet in flower, or ptesently after.

The Names.

It is generally called *Asperula*, *Aspergula* or *Spergula*, & *odorata* is put to the first, to distinguish it from the other, and not mentioned by any of the antient writers, except it be as *Gesner in collectione stirpium*, thinketh it to be *Alyssum minus* of *Pliny*, in his 26. booke. and 9 chap. and some others that tooke it to be *Alyssum Galeni*, but erroneously: the first hath beene diversly taken, of divers of the later writers, for *Bruselsium* calleth it *Caprifolium*, vel *Stellaria*, or *Herba Stellaria*, and *Hepatica quarta*. *Tragus*, *Cordus*, *Loxiceus*, and *Thalius* call it *Matrisylvia*. *Dodoneus*, *Lobel*, and *Lugdunensis*, *Asperula*. *Clusius* and others *Asperula odorata*. *Pena* in *Adversariis*, *Aspergula odora nostras*; *Cordus* upon *Dioscorides* *Aparine sylvestris quedam*. *Gesner* in his *Appendix Rubia sylvestris alia minor*, and *Tabermontanus* *Hepatica stellata*: but generally now adayes it is called of most men *Asperula odorata*, although it hath but little roughnesse therein at all, save onely as I sayd in the seede: the Italians call it *Asperulla*: the French *Muguet*: the Germanes *Hertsfroidt*, *waldneister*, & *Leberkrant*: the Dutch *Walneester*: and we in English *Woodroose*, and *Woodrowell*: the second is called *Asperula cerulea*, by *Dodoneus*, *Lobel*, *Camerarius*, and *Lugdunensis*, and our English *Turner* calleth it *Alysson*, and so doe others also but falsely. *Bauhinus* calleth it *Asperula cerulea arvensis*: the third is called *Myagrum alterum minus Dalechampii* by *Lugdunensis*; and *Asperula hexaphyllis purpurea* by *Bauhinus*. The last is called by *Columna* *Asperula verticillata muralis minima*, and by *Bauhinus* *Asperula verticillata luteola*.

The Vertues.

The Germanes doe account very highly of this *Woodroose*, using it very familiarly in wine, like as we doe *Turner* to take away melancholy passions, to make the heart merry; and to helpe the stomacke dejected, unto a good appetite, and the Liver being oppressed and obstructed: it is held also to be good against the Plague, both to defend the heart, and vitall spirits from infection, and to expell the noysome vapours that are received: it helpeth also to dissolve hard impostumes, being bruised and applied, and in the same manner many Country people use it, for any fresh or greene wound, or cut in the flesh any where: the distilled water of the herbe is no lesse effectuall, for the purposes aforesayd, either inwardly or outwardly.

CHAP. XLV.

Gallium. Maidenshaire, or Ladies Bedstraw.

Gallium Ladies Bedstraw, there are diverse sorts, some growing with us, others rare, and brought from other places, all which is fit that we should joyne in one chapter, as followeth.

1. *Gallium luteum vulgare*. The common Ladies Bedstraw.

This Ladies Bedstraw riseth up with divers small browne and square upright stalkes, a yarde high or more, sometimes branched forth into divers parts, full of joynts. and with divers very fine small leaves, at every one of them, little or nothing rough at all: at the toppes of the branches grow many long tufts or branches of yellow flowers, very thicke set together, one above another; from the severall joynts, which consist of foure small leaves a peece, which smell somewhat strong or resinous, yet not unpleasant; the feede is small and blacke, like Poppie feede, two for the most part joynted together: the roote is reddish, and hath many small threds fastned unto it, which take strong hold of the ground, and creepeth a little also, and the branches leaning a little downe to the ground, take roote at the joynts thereof, whereby it is easily increased.

2. *Gallium flore rubro*. Red flowered Ladies Bedstraw.

This small plant hath slenderer and lower stalkes than the former, yet divided into many branches, at whose joynts stand 4. 5. or 6. long leaves, and not of so darke a Greene colour: the flowers are of a red colour, not so thicke set together as the former, consisting of foure small pointed leaves, with a yellow pointell in the middle, but 5. or 6. or more standing together at the toppes of the branches at the most, which afterwards turne into small blacke feede like the former; the roote also is reddish like it, but greater and creepeth not, abiding many yeeres, and perisheth not. Like hereunto is that *Gallium nigro-purpureum montanum tenuifolium* of Columna, which therefore I doe but onely remember here, not thinking it to be a differing species from it, although the flower bee in some places a little darker, they are so like in all things, although *Bauhinus* doth make them divers.

3. *Gallium flore albo major sive Mollugo montana*. Mountaine white flowered Ladies Bedstraw.

The white flowered *Gallium*, which is the greater *Mollugo*, shooteth forth from the roote, which is blacke, and very threddy or fibrous, a number of slender and weake stalkes, which yet stand upright of themselves, diversly branching forth into many parts, so that it maketh shew of a pretty well spread bush, having many shorter and broader smooth Greene leaves, set at the joynts, than any of the former, or the next that followeth: the flowers

1. *Gallium luteum*.
Common Ladies Bedstraw.

2. *Gallium flore rubro*
Red flowered Ladies Bedstraw.

very small and white, standing at the toppes of the ranches, more thickly or plentifully set than the other, with red flowers before, which likewise turne into small blacke round feede.

4. *Mollugo vulgarior*. The common white flowered Ladies Bedstraw.

This is in all things like the last, but that the branches are so weake, that unlesse they be sustained by the hedges, or other things neere which it groweth, it will lye downe on the ground; and the leaves are smaller and narrower, yet not so small as the former, with yellow flowers; the flowers are likewise small and white, but not plentifully set thereon: and the roote threddy and abiding; some doe make a smaller sort hercof, which is not a proper species, for upon transplanting it will grow as great as the last.

5. *Galium montanum Creticum* Mountaine Candy Gallium. *Galium montanum Creticum* groweth like the ordinary but much lesser, with greater rootes and branches: it is a more effectually rennet than the other, it is hot and astringent, staying fluxes of blood.

6. *Galium montanum alterum*. Another small Candy Gallium.

The rootes are small and woody; it hath two or three small, long leaves, broad pointed and whitish flowers, standing in spikes.

The Place.

The first and the fourth are frequent in many places of this Land, in Meddowes and Pastures both wet and dry, and by the hedges: the second was found in Italy, as *Clusius* saith, and *Columna* his in the Kingdome of Naples: the third is found in Germany, on divers hills there; the two last in Candy.

The Time.

All these are in flower in May, for the most part, yet that with the red flower is later than the other, & flowereth not untill June: the feede is ripe in July and August.

The Names.

It is called in Greeke γαλιου, and in Latine also *Galium*, or as others have it γαλιον *Galium*, and as *Dioscorides* saith, of some γαλιον, & γαλιον *Galerion* and *Galarion*, and was so called from the effect, which is to cause the milke to gather into a curd, when they set it to make cheese; and therefore in many Countries, as well here as beyond the seas, they call it Cheese rennet, and serveth for that purpose very well. The first is generally called of all writers, without variation *Galium*, and *Galium luteum*. The second *Clusius* first made mention of, and then *Columna* by the names formerly set downe. The third is the *Mollugo montana* of *Dodonaeus*, *Clusius*, *Lobel*, *Lugdunensis*, *Thaluis* and *Tabermontanus*, *Gesner* in *hortis* calleth it *Rubia sylvatica altera*, & major in his Appendix, and is the second *Matrisylvia* of *Tragus*. The fourth is the *Mollugo vulgarior herbariorum* of *Lobel*, and the *Mollugo prima* of *Dodonaeus*, *Lugdunensis*, and *Tabermontanus*; it is *Tragus* his third *Galium*, and called of *Camerarius*, *Thaluis*, *Pena* and others *Galium album*. The two last are mentioned by *Alpinus* in his book *de plantis exoticis*. The Italians call it *Galio*, the Spaniards *Coja leche yerva*: the French *Pey Muguet*: the *Germanes* *Walstro*, and *Unserlichen frauen Betsstro*, and *Magerkyut*, of helping of the dry scabbe in children, which they call *Megerrey*: the Dutch *Walstro*, and we in English, our Ladies Bedstraw, according to the Germane name, or Cheese rennet, and Maides haire in divers Countries of this Land.

The Vertues.

The decoction of the hearbe, I meane the common Ladies Bedstraw, being drunke, is used by divers, to helpe to provoke Urine, and thereby to fret and breake the stone: the same also drunke helpeth to stay inward bleedings, as also to heale inward wounds, by the drying and heating qualities therein, the herbe as the flowers being bruised, and put up into the nostrils, stayeth their bleeding likewise. *Dioscorides* writeth that the roote is good to provoke bodily lust, and some say the flowers doe so also: the flowers and the hearbe likewise made into an oyntment or oyle, in oyle to be insolated or set into the Sunne, and changed after it hath stood some tenne or twelve dayes, but if it be made into an oyntment, it must be boyled in *Axungia*. or faller oyle, with some waxe melted therein after it is strayed; which will helpe burnings with fire, and scaldings with water: the same also or the decoction of the herbe and flowers, is good to bath the feete of travellers, who are surbated with travaile, and for Lackies or such like, whose running long, causeth not onely wearinesse, but stiffenesse in their sinewes and joynts; for which both the decoction warme is very available; and so is the oyntment to use afterwards: the same also as is sayd before, helpeth the dry scabbe, and the itch in children, whereof the *Germanes* doe make dayly experience: these sorts with white flowers have bene thought unprofitable, and of no use: but *Clusius* saith, the poore women in *Austria*, *Hungaria*, and other places in *Germany*, that gather herbes and rootes for their uses that neede them, bringing them to the market to sell, calleth it *Gleidkraut*; and by their experience have found it good, for the sinewes, arteries, and joynts, to bathe them therewith, both to take away their wearinesse, and weakenesse in them, and to comfort and strengthen them also, after travaile, cold, or paines.

4. *Galium album* sive *Mollugo vulgarior*.
The common white flowered Ladies Bedstraw.

Alpinus
fiore albo.

CHAP. XLVI.

Cruciata. Crosswort.

we have formerly knowne but one sort of *Cruciata* Crosswort, but because I find two other herbes neere in forme thereunto, and it may be in property also, as the taste may induce one to thinke, I have placed them together.

1. *Cruciata vulgaris*. The common Crosswort.

The common Crosswort groweth up with square hairy browne stalkes, litle above a foote high, having foure small broad, and pointed, hairy, yet smooth not rugged yellow greene leaves, growing at every joynt each against other crosswise, which hath caused the name; towards the toppes of the stalkes at the joynts, with the leaves in three or foure rowes upwards stand small pale yellow flowers, after which commeth small blackish round seed, foure for the most part set in every huske, the roote is very small and full of fibres or threds, taking good hold of the ground, and spreading with the branches a great deale of ground, which perisheth not in the winter, although the leaves die downe every yeare, and spring againe anew.

2. *Cruciata minor lutea*. Small yellow Crosswort.

This small plant is like the other, but smaller, and not hairy, having smooth pale greene leaves, with yellow flowers.

3. *Cruciata minor montana*. Small Crosswort with bluish flowers.

This small Crosswort (for so I take it to be rather then *Gallium* as *Columna* entitleth it) hath divers square weake branches, lying at the first upon the ground, but afterwards raising themselves up on high, and spreading many branches full of joynts, and foure leaves usually at them, the lowest very small and short, but those that grow more upwards to the middle of the stalkes, are larger and longer, and from the middle upwards much longer, and towards the tops but two leaves, long and narrow standing at a joynt, which joynts are more separate one from another then below, all of them smooth, and not hairy at all, as the stalkes are likewise: the flowers stand at the toppes of the branches, in a thinne or sparsed umbell, as the small Centory, or Saint Johns wort doth, which have somewhat a long and hollow truncke, and then end in foure small leaves of a bluish colour, very like for their forme, as well as for their sweetnesse, unto the flowers of the white or yellow *Iasmine* but lesser then they, and larger then any flowers of *Gallium*, after which come small rugged and somewhat crooked and long feedes, two alwayes set together, greater then those of the former, and of a yellowish colour, the roote is long and great, in respect of the plant, with divers fibres set thereat, of a brownish colour on the outside and white within.

4. *Cruciata minima muralis*.

The least Crosswort.

The least Crosswort hath many smal square stalkes, smaller at the bottome, and greater upwards, sometimes reddish and somewhat hairy also, set full of joynts, and at every one of them, foure small leaves, one against another, in manner of a crosse; from those joynts likewise upwards, come forth the flowers, of a pale greene colour, consisting of foure leaves, but set in such a manner that they are scarce to be discerned from the threds, that stand with them, for one part seemeth to be a body or belly, with prickles thereon, another a head shewing to be prickly also, but not hurting, and the rest which are as it were beards, seeme to be armes, which when they are withered, seeme to be hooded: after they are past come small heads, or swelling round vessels, which were the bellies of the flowers, wherein is contained small round yellowish feede like Pannicke feede, the taste of the whole plant is somewhat bitter and harsh withall, the roote is as small almost as a thred with some small fibres at it.

The Place.

The first groweth in many moist grounds, as well meowes as untilled places about London, in the Church yard at *Hampstead* neere London, at *Wye* in Kent, at *Rande*, and neere *Ringmore* in *Sussex*, along the high way, and in sundry other places. The second groweth under the hedges about *Bononia*. *Fabius Columna* saith that the third groweth in the open hills in *Naples*, and the last in the ruines of the walls of *Dioclesian*, his baths in *Rome*, and some other places therabouts.

The Time.

They are all in flower from *May* all the Sommer long, in one place or another, as they are more open to the Sunne, and the feede ripeneth soone after.

The Names.

It hath no Greeke name that we know, being unknowne to the ancients; it is called in Latine *Cruciata*, and *Crucialis*, of the situation of the leaves, as I said before, and so doe most other writers. *Thalim* calleth it *Cruciata herniaria*,

bernardia, and *Lobel Cruciatâ minor*, to distinguish it from the *Gentiana cruciata*. *Lugdunensis* calleth it also *Asperula Aurea*, and *Tragus* maketh it his second kind of *Gallium*, for his *Cruciata* is *Gentiana cruciata*. *Bauhinus* calleth it *Cruciata bifida*, the French call it *Croise*, the Germans *Golden Wildmeister*, the Dutch *Crosette*, and wee in English *Croffewort* and *Golden Croffewort*. The second *Bauhinus* in his *Prodromus* describeth by the name of *Gallium latifolium glabrum*, but in his *Pinax* he calleth it *Cruciata glabra*: The third *Columna* calleth *Gallium montanum latifolium cruciatum*, but because I thinke it doth more truly represent a *Cruciata*, by the standing of the leaves; I have called it *Cruciata minor montana*. The last *Columna* calleth *Cruciata nova Romana minima muralis*, and *Cesalpinius* *Crucialis minima in maritimis*.

The Vertues.

This *Croffewort* is of a binding and drying propertie, and is accounted as singular a good wound herbe almost as any, and is used inwardly not onely to stay bleeding of wounds, but to consolidatate them, as it doth outwardly any greene wounds. for by closing the lippes of the wound together it is quickly healed. *Camerarius* saith it helpeth to expectorate flegme out of the chest, and is good for the obstructions in the brest or stomacke; for in the bowells, or miseraicke veines, and helpeth a decayed appetite, to use the decoction of the herbe in wines the same will serve also to wash or bathe any wound, or running moylt sore, to cleanse and heale it, the herbe bruised and then boyled and applied outwardly for certaine dayes together, renewing it often, and in the meane time, the decoction of the herbe in wine taken inwardly every day, doth certainly cure the Rupture in any, so as it be not too inveterate, but very speedily if it be fresh and lately taken.

CHAP. XLVII.

Aparine. Goose grasse, or Clevers.

The herbe that is usually called Goose grasse or Clevers, is of two sorts, one which is rough, which is knowne to all; the other not rough at all, which is not so well knowne or observed by many, of which there are some varieties which I shall entreat of in this Chapter, but of a greater kind, whereof *Gerard* maketh mention, we know not of, but are sure his figure exhibited, is of a wilde Borrage, which *Lobel* calleth *Alyssum Germanicum Echoides*, as *Bauhinus* also testifieth.

1. *Aparine vulgaris*. Common Clevers.

The common Clevers hath divers very rough square stalks, not so bigge as the tagge of a point, but rising up to bee two or three yards high sometimes, if it meete with any tall bushes or trees, whereon it may climbe (yet without any claspers) or else much lower or lying upon the ground full of joynts, and at every of them shooteth forth a branch beside the leaves thereat, which are usually six, set in a round compasse like a Starre, or the Rowell of a Spurre, from betwene the leaves at the joynts, towards the toppes of the branches come forth very small white flowers, every one upon a small threddy soote stalk, which after they are fallen, therè doe shew two small round rough feedes joyned together like two testicles, which when they are ripe, grow hard and whirish, having a little hole or hollownesse on the side, somewhat like unto a Navel, both stalks, leaves and feede are so rough, that they will cleave to any thing shall touch them, the roote is small and very threddy, spreading much in the ground, but dyeth every yeare.

2. *Aparine levis*. Smooth Goose grasse.

The smooth Goose grasse groweth like the former, but that it neither groweth so high, nor are the leaves so great, and not at all rough, or sticking to what it toucheth: the flowers are as small and white as the former, and give such like feede, but smooth also, and not rough as the former. There is another little differing from this in any other notable thing, but the feede which is rough like unto a Coriander Comfit.

3. *Aparine floribus purpureis*. Purple flowered Clevers.

This kinde of Clevers is in all things like unto the former sort, except the colour of the flower, which in this is purple, as in the other it is white.

The Place.

The former sort groweth by the hedge and ditch sides in many places of the Land, and every where also in Gardens, where it is a weede of much labour to weede out, for it will rampe upon every thing groweth next unto it, and be ready to choake and spoyle it, shedding the feede if it be suffered of both sorts. The second was brought me out of Spaine, but the last is as great a stranger.

The Time.

These doe flower in June and July, and the feede is ripe and falleth againe by the end of July, or in August, not springing any more from the rootes, but from the shaken feede.

1. *Aparine vulgaris*. Common Clevers.

Semine
Coriandri,
sugarati.

ing the branches; the roote is somewhat great, thicke and woody, blackish on the outside, with many fibres thereat.

2. *Camphorata minor*. The lesset stinking Groundpine.

The smaller *Camphorata*, hath many slender and weak stalks lying or bending to the ground in a compasse, with divers tundles of small long leaves, set at spaces, as in the former, of a yellow Greene colour, especially towards winter, when the tops of the branches also will be reddish with some wolliness thereon, whereon divers flowers do stand together, as it were in a tuft, consisting of five small white leaves a peece; after which rise small hard seede vessels, of the bignes of two barley cornes, wherein is enclosed very small seede: the roote is greater and longer then the proportion of the plant above ground may seeme to allow, of a reddish yellow colour on the outside, with many fibres thereat: the whole plant both leaves, flowers and seede, are of a strong and grievous sent, and of a very sharpe and quicke taste.

3. *Camphoratae congener seu Anthyllis altera Italorum*. Ground Pine not stinking.

The other Ground Pine that smelleth not so strong as the former sorts doe, groweth upright in the same manner, with divers upright slender stalkes, and many small leaves set at the joynts, some of them being longer and some shorter then others, all covered with a small wolliness: the flowers are very small, standing many together at the toppes of the branches, of a pale yellowish colour, and of an astringent and drying taste.

The Place.

The first groweth neate unto *Mompelier*, and *Nemausium*, especially out of the rifts and chinkes of the old walls of the *Amphitheater* there, and seldome in any other part of *France*, or *Italy* as *Pena* saith; yet *Lugdunensis* saith it prospereth better in fertile and moyst places, then in such as are barren and dry. The second groweth both in sandy dry grounds, and in rotten moottish grounds likewise: The last groweth in many places of *Italy*, but whether naturally of that country or no, is not signified, but they there keepe it in their gardens, where most usually it is to be seene.

The Time.

All these flower very late, or not at all with us, and are very hardly preserved in the winter, being tender, coming from so hot and dry places.

The Names.

None of these plants were knowne to the ancient writers, eyther Greekes, or Latines, by any the names of their herbes knowne to us now a dayes; the name *Camphorata*, is taken from *Camphora*, because the sent is thought to be so like unto *Camfire*, as divers doe imagine, but surely then it smelleth othertwise in the hotter countries then they doe in ours, for with us the former two have a grievous heady sent, yet nothing so fierce, and quicke in my judgement as *Camfire*: *Anguillara* first, and others afterwards, as also *Pena* and *Lobel* referre the former unto the *Chamepeuce* of *Pliny*, whereof he maketh mention in his 24. Booke and 15. Chapter, saying that *Chamepeuce* hath leaves like unto the *Larche* tree; but *Lugdunensis* saith, that divers did rather referre this to the *Selago* of the sayd *Pliny*, mentioned in his 24. Booke and 11. Chapter, where he saith that *Selago* is like unto *Savine*: Divers also tooke it to be the *Cneorum nigrum* of *Discorides*, and *Theophrastus*, but the learned of *Mompelier*, called it *Camphorata major*, and so doth *Lobel* call it *Camphorata Mompeliensis*, *Bauhinus* calleth it *Camphorata hirsuta*, when as according to *Lugdunensis* his description, the roughnesse belongeth rather to the second in the stalkes and leaves, and not unto this first. Divers also tooke it to be *Erica prius genus*, a kind of Heath; others to be *Hyssopus nemorensis* and some also to be that *Musci terrestris genus* that *Tragus* doth set forth, by the name of *Sabina sylvestris*. Our London dispensatorie, or pharmacopeia Londinensis, in the description of *Unguentum Marciatum*, maketh *Camphorata* to be *Abrotanum*, which is utterly untrue, yet I think it may very well be the substitute or *succedaneum* thereof for that oymntment: and *Lugdunensis* also saith, that divers did referre the second which he calleth *Camphorata minor Dalechampii*, to the *Chamepeuce* of *Pliny* aforesaid: but *Bauhinus* calleth it *Camphorata glabra*, as though this were smooth, which as I sayd before is contrary: The last is called *Anthyllis altera*, by *Anguillara* and others: The learned in *Italy*, as *Lobel* in his observations saith, referre it to the second sort of *Anthyllis* of *Discorides*; but because as he there saith it is not sweet as that second *Anthyllis* of *Discorides* should be, hee doth rather judge the *Iva Moschata Mompeliensis* to be the truer *Anthyllis altera*, then this *Anthyllis Italorum*. *Gerard* hath much erred in calling this *Anthyllis lentifolia*, and yet his figure doth expresse this *Anthyllis Italorum*, and not *Anthyllis lentifolia*, although his description doth. *Bauhinus* calleth it, as *Lobel* and others before him have done, *Camphoratae congener*, & *Tabermontanus Camphorata altera*.

The Vertues.

These herbes are all of them of a drying faculty, and are very profitably used inwardly to stay defluxions from the head, that fall into the eyes, and upon the Lungs: and outwardly in bathes, to stay running humours that rest in the joynts, as the Goute, Crampes, Palfies, and Aches; it is no lesse effectually for the Nerves and Sinewes to comfort and strengthen them, to be made into a salve or oymntment; and is available both in fresh wounds, and old running ulcers and sores; and therefore divers doe account it of the same propertie with Southernwood for all the purposes whereunto it is used.

CHAP. XLIX.

Coris. The faire Heath Low Pine.

Here are three sorts of herbes called *Coris*, the one *Matthiolus* first set forth, and made known the other *Honorius Belus* of Candy; and *Pena* and *Lobel* set out the last; which are as followeth.

1. *Coris Matthioli*, *Matthiolus* his faire Heath Low Pine.

This springeth up to the height of a foote or more, with divers hard, woody, reddish stalks full of joynts, and many small and long thicke, fat leaves, set together at every of them upon a short foote stalk, consisting of five or six leaves, somewhat like unto *Hypericum*, *S. Johns wort*, or *Ornithogalum* Starre of *Bethlehem*, as *Lobel* compareth them, but of a whitish red colour, with yellow threds in the middle; yet *Matthiolus* and others say, the flowers are all yellow like *Hypericum*, smelling somewhat sweete, the seede is enclosed in round heads: the roote is somewhat long and woody, with many thready fibres thereat: this keepeth his greene leaves all the winter, but turne somewhat of a yellowish red colour towards Autumne or seede time.

2. *Coris legitima Cretica Belli*. The Candy faire Heath Low Pine.

This *Candiot* as *Bellus* saith, groweth to be a cubit and a halfe high in good ground, branching forth many wayes, and bearing many small leaves, like unto Heath on the woody stalks and branches: the flowers at the toppes, are not unlike to *S. Johns wort* and yellow, which passe into seede enclosed in huskes like it also: the roote is long, spreading, and woody, abiding with greene leaves thereon all the winter.

3. *Coris Monsfelsensum*. The purple faire Heath Low Pine.

This faire Heath Low Pine, riseth up likewise, with many round woody and reddish stalks, not so high as the former, having many small, long, thick, & roundish leaves set thereon, without order most commonly, & yet sometimes conformable one unto another, somewhat like unto the great kinde of Heath: the tops of the stalks are stored with a great spiked tuft or bush, of purplish blew flowers. (but pale red with us) smelling somewhat sweete, each consisting of foure leaves a peece, double forked as it were at the ends, two whereof that stand uppermost, are greater than the other two that are lower, which will abide long in their perfect colour, being gathered in

1. *Coris Matthioli*.
Matthiolus his faire Heath Low Pine.

2. *Coris legitima Cretica Belli*.
Candy faire Heath low Pine.

their prime, and each of them standing in a brownish huske, parted at the toppes into five points, and spotted with five blackish spots, on the outside, wherein afterwards groweth the seede; which is small round and blackish, wrapped up as it were in many coates or filmes, whose huskes then doe grow somewhat hard and sharpe at the ends, when as before, while the flower lasted, they were not so: the roote is reddish, and hard, or woody, greater than the proportion of the plant should seeme to require; giving a dye or colour, not onely to the fingers of them that touch it, but serveth also to dye linnen clothes withall, for those where it groweth naturally: this also abideth the winter, although the leaves are then more reddish than in Summer, but requireth some care to preserve it with us.

The Place.

The first growth in many places in Italy, in dry grounds and hills, as *Matthiolus* saith, and *Pena* seemeth to confirme the same, in giving a more exact description thereof, than *Matthiolus* did: *Camerarius* saith it groweth by *Carava*, a Village in *Liguria*: the second in *Candy*: and the last neere *Mompelien*, and the parts thereabouts, as *Pena* saith, and *Clusius* saith, he found it in the dry grounds about *Salamanca* in *Spain*, and neere the Sea also in *Valentia*, and by *Mompelien*.

The Time.

They flower early in the hot Countries as *Clusius* observed, to be as well in *March* in some places, as in *May* in others; but late with us, and seldome doe perfect their seede.

The Names.

It is called in Greeke *κισς*, and as *Discorides* saith, of some in his time *Hypericum*, and in Latine *Coris* also: ob pulchritudinem videtur dicta, nam xip virgo puellave dici potuit, saith *Pena*, quia tota pulchella, & perquam hilaris est; verum Hippocrates & antiqui, xip, id est, pupillam vocarunt, propter semina oculi pupille, seu anteriori humori cristallino, ambitu sphaerico haud ab simile, cujusmodi in hac *Monspeliaca* cernitur. The first is called *Coris Matthioli*, by *Camerarius*, Gesner in hortis, *Lacuna*, *Lonicerus*, *Lobel*, *Lugdunensis*, *Tabermontanus* and others; *Bauhinus* calleth it *Coris lutea*; the second *Honorius Bellus*, in his first Epistle to *Clusius*, calleth *Coris legitima*, *Erica similis*, and contesteth against *Bellonius* for that in his first booke of Observations, and 17. chap. he saith, that the roote of the *Coris* which he found in *Candy*, having yellow flowers, is very unpleasant, whereby *Bellus* doth presume that *Bellonius* did never see this true *Coris*, for the cause aforesayd; that is, the unpleasantnesse of the roote, but that it was *Acyrum* scilicet fetidum which *Bellonius* saw, and called it *Coris*; and therefore I also suspect, *Bauhinus* hath not so rightly referred, *Honorius Bellus*, his *Coris legitima*, to this first *Coris Matthioli*, but should rather have made it agree with the *Monspeliaca*, or *Hispanica*, of *Lobel* and *Clusius*, in regard of the manner of the growing and posture of the leaves: the other is called *Coris Monspeliaca*, by *Pena* and *Lobel* in their *Adversaria*, and so also by *Camerarius* and *Tabermontanus*, and by *Clusius*, *Coris quorundam*. *Bauhinus* calleth it *Coris cerulea maritima*; and saith that although *Clusius* did suspect that the *Symphitum peruvianum* of *Matthiolus*, was this *Coris*, yet assuredly, saith he, it was a differing plant, and was brought him from the same place, where *Matthiolus* saith his did grow. *Clusius* saith that the *Spaniards* did call it *Pinsel* in their Language; and *Bellus* saith that they in *Candy* called his sort *Orpiloscorto*, id est, herba orpilo. I have given unto these, so well as unto the other in the last Chapter, such fit English names, as I thinke are proper unto them.

The Vertues.

The *Corides* especially that of *Mompelien*, is hot and bitter, and somewhat sweete in sent withall, and is very good to provoke Urine, and womens courses that are stopped, and for the strangury, if the bladder be not exulcerated, if the seede be boyled in wine or bruised and drunke therein: the decoction thereof or the seede it selfe drunke, is a remedy for those that have beene bitten with the venomous Spider called *Phalangium*, as also for those that are troubled with the Goute or Sciatica, to be bathed therewith, or made into an oyle or oyntment: it helpeth also the shiverings or shaking fits of agues, taken with some Pepper: It is often used also in oyntments and salves, that are made to heale any old or running sores, and to dry up the moisture of them which hindreth their cure.

3. *Coris Monspeliensium.*
Purple faire Heath Low Pine.

CHAP. L.

Hypericum. St. Johns wort.

The ordinary *S. Johns* wort is well knowne at this day to many, but there are some other sorts brought to our knowledge, which *Dioscorides* and the other auncient writers, knew not of besides the *Ascyrum*, and *Androsomon*, which are to be accounted other severall kindes thereof, but larger: each whereof shall be declared in their order.

1. *Hypericum vulgare.* Common *St. Johns* wort.

The common *S. Johns* wort shooteth forth brownish, upright, hard, round stalkes, two foot high, spreading many branches from the sides, up to the toppes of them, having two small leaves, set one against another, at every place, which are of a deepe Greene colour, somewhat like unto the leaves of the lesser Centory, but narrower, and full of small holes in every leafe, which cannot be so well perceived, as when they are held up to the light: at the toppes of the stalkes and branches, stand yellow flowers, made of five leaves a peece, with many yellow threds in the middle, which being bruised doe yeeld a reddish juyce like blood: after which come small round heads, wherein is contained, small blackish feede, smelling like Rosen: the roote is hard and woody, with divers strings and fibres at it, and of a brownish colour, which abideth in the ground many yeeres, shooting a new every spring.

1. *Hypericum vulgare.*
Ordinary *S. Johns* wort. 2. *Hypericum minus erectum.* Small upright
S. Johns wort.

This small *S. Johns* wort, is very rare to meete withall, being like the former, but that it is smaller, yet the leaves doe not fully answere the forme of the former, but are a little broader and not so sharpe pointed; the stalkes are reddish and the flowers smaller, and not fully so yellow, nor give so bloody a colour, when they are bruised betwene the fingers; and sometimes stand in circles at the joynts of the stalkes as well as at the toppes: the feede is resinous as the former, and the roote long lasting also.

3. *Hypericum minus supinum.* Small creeping
S. Johns wort.

This other small *S. Johns* wort, differeth little from the last small sort, having reddish stalkes, not above an hand breadth high at the most, nor standing fully upright, but leaning downewards, with small narrow smooth leaves, and small yellow flowers.

4. *Hypericum nummularie folio.* Round leaved
S. Johns wort.

This little *S. Johns* wort, is as small an herbe as the last, whose small reddish square branches, rise no higher than

5. *Hypericum tomentosum wajas Hispanicum.* Great woolly *S. Johns* wort.

having two leaves set one against another, at every joynt up to the toppes: and are almost round, like unto Money-wort or hearbe pence, of a darke or sad Greene on the upper side, and whitish underneath, spotted sometimes with reddish spots and streaks: the flowers are of a paler yellow colour, than the former, but somewhat large in comparison of the plant, with divers yellow threads in the middle: the roote is small and long.

5. *Hypericum tomentosum majus Hispanicum*. Great woolly S. Johns wort.

The greater woolly S. Johns wort, hath divers bayrie, whitish woolly branches, lying upon the ground, and shooting forth fibres, very thicke set with such like leaves, as the Common S. Johns wort hath, but hoarie, white, and woolly; at the joynts towards the toppes, and at the toppes also, stand paler and smaller flowers than in the common: after which come feede vessels like unto the other sorts, and so is the feede, and woody roote.

6. *Hypericum supinum tomentosum minus*. Small creeping Woolly S. Johns wort.

The lesser woolly S. Johns wort, is in most things like the greater, but that it is smaller, the branches having the woolly leaves, not so thicke set together, smaller and rounder than the former.

7. *Hypericum frutescens Americanum flore albo*. Indian S. Johns wort, with white flowers.

The Indian S. Johns wort, riseth up with sundry woody stems almost to a mans height, covered with a whitish barke, from whence spring on all sides, divers branches, set thicke with Greene leaves, narrow below, and broad and round at the ends, sometimes 2 or 3 at a place, from which joynts also rise divers white flowers, made of foure leaves a peece: the leaves fall away every yeere, and rise againe in the spring, the woody stems abiding.

The Place.

The first foure sorts grow in woods, and copes, as well those that are shade, as open to the sunne: the first *Clusus* found in *Salamanca*, and *Valencia* in *Spain*: the sixth likewise is often found in our Country, as well on dry barren grounds, as in moorish and wet fields: the last was brought from the North-west parts of *America*.

The Time.

They doe all flower about Midsummer, and in *July*, and some of them later, and their feede is ripe in the end of *July* and *August*, for the most part.

The Names.

It called in Greeke *ἵππερος* *Hypericon*, which the Latines doe retain, and yet some have called it *Fugademonum*, superstitiously imagining, that it will drive away devills: and some call it, *Perforata*, or *Parosa*, from the many small holes, are to be seene in the leaves: but we finde that in *Dioscorides* his time, the name *Hypericum* was given unto five severall hearbs; that is, to *Ruta sylvestris*, *Onobrychis*, *Hypericum*, *Acyrum*, and *Coris* as in his Commentaries, is extant to be seene: and concerning this *Hypericum* also, he saith, that in his time it was called *Androselinum* (of the bloody colour, the flowers yeeld) and *Chamepyris* (of the resinous sent of the feede and heads) and yet all these herbes are severally described by *Dioscorides*, in severall chapters of his Commentaries. *Marcellus Florentinus*, from the Greeke word *Leucoion*, in the text of *Dioscorides*, whereunto he compareth the flowers of *Hypericum*, would thereupon interpret the flowers thereof to be white, and *Pliny* also mistaking the Greeke word in *Dioscorides*, as it is very frequent in him, where *Dioscorides* compareth the feede vessels of *Hypericum*, unto a barley corne that is somewhat long and round, he saith that the feede ripeneth at the time, when as barley is ripe. The *Arabians* call it *Reosifcon*, *Reiofaricon*, and as others have it *Henfericon* *Nelificon*; the *Italians* *Hyperico*, & *perforata*, & *herba di San Giouanni*; the *Spaniards* *Coraconcillo*: the French *Millepertuis* & *Tourcheron*: the *Germanes* *S. Iohanskraut*, and *Harshaw*: the *Dutch* *S. Iohns cruut*, and we in *English* *S. Iohns wort*. The first is generally now adayes, by all authors taken to be the true *Hypericon* of *Dioscorides*, as both the bloody colour of the flowers, and the resinous sent of the heads, and feede thereof doe declare, being two principall notes thereof: the second is thought to be *Hypericum pulchrum* of *Tragus*, and the smaller sort of *Thalys*. I cannot otherwise thinke, but that it is also, the *Hypericum Syriacum* of *Lobel*, for such a one hath beene found in many places of this Land, with many small leaves set at a joynt, in the same manner. *Bauhinus* calleth it *Hypericum minus erectum*, as I doe in the title; yet he maketh *Lobel* his *Syriacum* to be another sort: the third is the *Hypericum exiguum* of *Tragus*, the *Hypericum minus* of *Gesner* and *Dodonaeus*, *Hypericum minimum supinum* *Septentrionale* of *Lobel*, and the *Hypericum supinum tertium minimum* of *Clusus*, which *Bauhinus* calleth *Hypericum minus supinum*, vel *supinum glabrum*: the fourth is as I take it, the *Hypericum tertium* of *Tragus*, which *Bauhinus* in his *Pinax* maketh his second sort, and describeth it in his *Prodrum*, under the same name in the title: the fifth *Clusus* calleth *Hypericum supinum*, & *tomentosum Hispanicum*, which as he saith *Iohannes Plasa* of *Valencia* called *Ruta sylvestris* of *Dioscorides*, but *Ruellius* putteth that among the bastard names, *Bauhinus* calleth it *Hypericum supinum tomentosum majus*, vel *Hispanicum*, and yet maketh this to be *Lobel* his *Hypericum minimum supinum* *Septentrionale*, which he referred before to the *minus vel supinum glabrum*, but it cannot be both this and that, because the one hath smooth Greene leaves, and is lesser than the *Spanish* kinde, which is woolly, and so is not that: the sixth is the *Hypericum alterum tomentosum* of *Lobel*; but *Clusus* checketh *Lobel* in making this and his former *tomentosum Hispanicum* to be both one. *Bauhinus* calleth it *Hypericum supinum tomentosum minus vel* *Monspeliense*.

7. *Hypericum frutescens Americanum flore albo*. Indian S. Johns wort with white flowers.

Monspeliacum, and thinke it to be the *Androsæmum album Dalechampi* of *Lugdunensis*, which I see no reason, why he should so judge, in that the figure expresth an upright, and not a bending plant, and there is no description given of it: The last hath the name imposed upon it, as is fittest I thinke for it.

The Vertues.

S. Johns wort is as singular a wound herbe as any other whatsoever, cyther for inward wounds, hurts or bruises, to be boyled in wine and drunke, or prepared into oyle or oynment, bathe or lotion outwardly, for being of an hot and drying quality, with subtil parts, it hath power to open obstructions, to dissolve tumours, to consolidate or soder the lips of wounds, and to strengthen the parts that are weake and feeble; the decoction of the herbe and flowers, but of the seed especially in wine, being drunke, or the seed made into powder and drunk with the juice of Knotgrasse, helpeth all manner of spitting and vomiting of blood, bee it by any veine broken inwardly, by bruises, falls or howsoever: the same also helpeth all those that are bitten or stung by any venomous creature: And is good for those that are troubled with the stone in their kidneys, or cannot make water, and being applied provoketh womens courses: two drams of the seed made into powder, and drunk in a little broth, doth gently expell choller, or congealed blood in the stomack, and mesentery veines; the decoction of the leaves and seeds being drunk somewhat warme before the fits of agues, whether they be *tertians* or *quartians*, doth helpe to alter the fits, and by often using taketh them quite away; the seed is much commended being drunke for 40. dayes together, to helpe the *Sciatica* or Hippe Goute, Falling sicknesse and Palsie also. The herbe, that is, both the leaves, flowers and seed, steeped in wine for 12. houres, and then distilled in an ordinary Still, the water hereof being drunke with a little Sugar therein, is accounted as effectually as any decoction or other preparation, and killeth the wormes in the belly or stomacke. The oyle of *S. Johns wort*, cyther simple or compound, but the compound is more effectually, is singular good both for all greene wounds, and old sores & ulcers, in the legs or else where, that are hard to be cured, and is effectually also for crampes and aches in the joynts, and paines in the veines and sinewes, and is also good for all burnings by fire, to be presently used, or the juice of the green leaves applied; the hearbe dried and made into powder, is as effectually for wounds and sores to be strowed thereon, as the oyle or juice. The simple oyle is made of four ounces of the flowers infused in a pint of oyle Ollive, called *Sallet oyle*, and three ounces of white wine, for 10. or 12. dayes to bee set in the Sunne, and afterwards boyled in a *Balneo* or Kettle of seething water, strayned forth, and refreshed with new flowers, so set in the Sunne, and in the same manner boyled, strained forth and renewed the third time with fresh flowers, which after they have lastly stood in the Sunne a fortnight or more, are to be boyled in the sayd *Balneo* or Kettle of seething water, strayned forth, and the oyle, having some fine turpentine dissolved in it whiles it is hot, and so kept, is singular good for the purposes aforesayd. Like herunto *Gerard* hath set downe away, which is, with *Sallet oyle* two parts, white wine and oyle of Turpentine one part, set in the Sunne, with the leaves, flowers and feedes, of *S. Johns wort*, for 8. or 10. dayes, and boyled and renewed the third time, in the manner aforesayd. But the compound oyle is made of the simple oyle, after the last infusion being strained forth, there is added, *Dittanie* of Candy, *Gentian* or *Felwort*, *Cardus Benedictus*, or Blessed thistle, and *Tormentill* of each a small quantitie, and some earth wormes washed and slit, and all of them infused in the sayd oyle, and set in the Sunne, and after boyled, strayned forth, and Turpentine and oyle of Wormewood put thereto, which then is to bee reserved in some pot, or glasse close stopp'd, to be used as occasion doth require.

CHAP. LI.

Ascyrum. S. Peters wort.

For this herbe likewise formerly there hath beene but one sort knowne, and described, but wee have two other to shew, not long since found and brought to our knowledge.

1. *Ascyrum vulgare*. Ordinary *S. Peters wort*.

This *S. Peters wort* that is most common in our land, riseth up with square upright stalkes, for the most part, somewhat greater and higher then *S. Johns wort*, but browne in the same manner, and at every joynt having two leaves, somewhat like those of *S. Johns wort*, but larger, a little rounder pointed, and with very few or no holes to be seene therein, and having sometimes some smaller leaves, rising from the bosome of the greater, and sometimes a little hayrie also, as the stalkes will bee: at the toppes of the stalkes stand many yellow flare-like flowers, with yellow threds in the middle, very like unto those of *S. Johns wort*, so that but for the largenesse and height, it is hardly by many discerned from *S. Johns wort*, and that it giveth not so bloody a juice, being bruised betweene the fingers, having also such like seede, of as strong a resinous sent; the roote abideth long, sending forth new shoots every yeare.

2. *Ascyrum magno flore*. Great flower'd *S. Peters wort*.

This other *S. Peters wort* is like the former, having a round browne upright stalke, two foote high at the least, with such like, but larger leaves and round pointed, of a paler greene colour on the upper side, and whiter underneath; the flowers that stand at the end of the stalke, are of a pale yellow colour like the other, but a good deale larger, with yellow threds therein also.

3. *Ascyrum spinum villosum palustre*. Creeping *S. Peters wort* of the Marsh.

The Marsh *S. Peters wort* is like the last in the round stalkes, but that they are woolly and soft, and stand not upright, but leaning downward, taking roote at the joynts, having somewhat rounder pointed leaves set at the joynts, two for the most part together: the flowers are as yellow, and of the same bignesse as the ordinary, but give not that red juice that they doe; and these things make the whole difference from the former besides the naturall place.

4. *Ascyroides cretica major*. Great *S. Peters wort* of Candy.

This differeth from the former onely in the largenesse of the leaves and flowers, which are foure times bigger then it.

Ascyrum vulgare. Ordinary S. Peters wort.*The Place.*

The first groweth in many Groves, and small low Woods in divers places of this Land, as in Kent, Huntington, Northampton, and Cambridge shires; also neare water courses in other places: The second was found on the Pyrenian hills: The third in the Marshes of the Low Countries, and the last in Candy.

The Time.

They doe all flower in June and July, and the seede ripe in August.

The Names.

It is called in Greeke *ἀσκήριον* and *ἀσκήριον*, *Ascyrum* and *Ascyroides*, & *contrario dictum* putatur: *ὡς ἐν ἀντιθέσει* *asperitatem illi significat*: The Latines have no other name then *Ascyrum*, from the Greekes to call it. *Dioscorides* saith, it was also called *Androsæmum*, and *Hypericum* too, and *Galen* therefore accounteth it a kind of *Androsæmum*. The first is usually called by most writers *Ascyrum*, as *Marthius* doth; it is probable to bee the first *Hypericum* in *Plumetis nascens* of *Tragus*, and is the first *Androsæmum* of *Fuchsius*, and by *Dodonæus* set for *Hypericum*, in his French Edition, but called *Androsæmum alatum* by *Fabius Columna*, who yet doubted whether to call it *Hypericum* or *Androsæmum*, saying it came nearest unto *Ascyrum*, although somewhat differing from it (which it may bee is but the soyle and climate) *Bauhinus* calleth it *Androsæmum hirsutum*: the next two have their names in their titles that *Bauhinus* giveth them; yet the third is called by *Clusius*, in the *Amburarium* of his other Appendix, *Ascyrum supinum* *erectum*: the last is called by *Alpinus lib. de exoticis*, as it is in the title; all nations christned take it as another kind of S. Johns wort, and so call it, and we S. Peters wort.

The Vertues.

It is of the same propertie with S. Johns wort, but somewhat weaker, and therefore more seldome used; the seede to the quantitie of two drams taken at a time, in Meade or honyed water, purgeth, saith *Dioscorides*, *Pliny*, and *Galen* chollericke humours, and thereby helpeth those that are troubled with the Sciatica, or paine in the hippes: the leaves are used as S. Johns wort, to helpe those places of the body that have bene burnt with fire.

CHAP. LII.

Androsæmum. Tutfan, or Parke leaves.

Although our Tutfan be not the right *Androsæmum* of *Dioscorides*, &c. yet because it is so generally called, and accounted by most, let it receive his place here among some other plants called *Androsæmum*, by divers writers, that thereby you may see and know the difference betweene them.

1. *Androsæmum vulgare*. Common Tutfan or Parke leaves.

Our Tutfan hath not square but brownish shining round stalkes, crested all the length thereof, rising to be two, or sometimes three foote high, branching forth even from the bottome, but more thinly set or farther asunder, having divers joynts, and at each of them two faire large leaves standing, but more thinly set then of the other sorts, which are of a darke blewish Greene colour on the upper side, and of a yellower Greene underneath, turning reddish towards Autumne, but abiding on the branches all the winter: at the topes of the stalkes and branches stand larger yellow flowers, then in any of the former sorts, and heads with seede likewise larger, which being Greene at the first, and afterwards reddish, turne to be of a blackish purple colour, when they are through ripe, with small brownish seede within them, and then yeeld a reddish juice or liquor, of a reasonable good sent, somewhat resinous, and of an harsh or stipticke taste, as the leaves also and the flowers bee, although much lesse, but doe not yeeld such a cleare Claret wine liquor, as *Gerard* following *Dodonæus* therein, saith it hath; the roote is brownish, somewhat great hard and woody, spreading well in the ground.

2. *Androsæmum Matthioli*. *Matthiolus* his Tutfan.

This Tutfan (for other English name I know nor well, what it may have, unlesse you would call it a great S. Johns wort, because it is so like it) hath brownish round stalkes, with two leaves at every joynt, fuller of branches, else very like unto S. Johns wort, but more sparingly or thinly set thereon, much smaller and greener then the former Tutfan, and greater then those of S. Johns wort, without any hoales at all in them; the flowers are yellow likewise, and greater then they, and so are the heads with seede, but spotted with blacke streakes on them.

them: the roote is brownish and abideth, yet the stalkes perish; the leaves hereof as well as flowers, doe give a red juice like *S. Iohis* wort, whereof it may best be discerned, but because *S. Peters* wort doth the like also, therefore divers doe mistake one for another; and the rather, for that *S. Peters* wort is found to have a round stalke, although ordinarily it be square.

3. *Androsæmum alterum Apulum.* Tutfan of Naples.

This Neapolitane Tutfan is more bushie, but groweth not so high as the last, for it sendeth forth from a reddish roote, somewhat threddy, reddish, or brownish round stalkes, not much above a foote high, with two crested strakes like filmes all the length of them, and are full of branches, with two leaves at every joynt, so closely set thereunto at the bottome, that the stalkes seeme to runne through them, and yet are lesser then the last recited Tutfan, sharpe pointed, of a fresher Greene colour, and smooth on the upper side, white underneath, and having many small holes therein, almost not to bee perceived, and for the most part are greater and broader towards the toppes then they are below; the flowers at the toppes of the branches are of a paler yellow colour, many more set together then in the other, whose Greene huskes wherein they stand have blackish spots on them, which so abide when the leaves are full of feede: both leaves and flowers yeeld a blooddy or reddish juice, being builed betweene the fingers, as any of the other doe.

4. *Androsæmum fetidum.* Stinking Tutfan.

This stinking Tutfan groweth upright with hard woody stalkes, three or foure and sometimes unto five cubits high, as great as ones arme below, and of a reddish colour, branching forth upwards with divers wings of fresh Greene leaves set thereon, two at every joynt, somewhat like unto those of *Licoris*, and doe alwayes a-

2. *Hypericum m. j. s. five Androsæmum Matthioli.*
Matthioli's Tutfan.

1. *Androsæmum Vulgare.*
Tutfan or Parke leaves.

4. *Androsæmum fetidum.*
Stinking Tutfan.

bide on the branches, winter as well as Summer, in the warme countries, wherein it is naturall, but doth hardly endure our cold climate, although kept and defended with all the care wee can use: at the ends of the stalkes stand yellow flowers, like the common Tutfan, upon slender but longer focestalkes then in any of the former sorts, and the yellow threds in the middle of them longer also; which after they are past yeeld round and somewhat long heads, like unto the berries of the Turpentine tree, never falling away from the bushes of themselves, wherein lye very small feede. In Candy it yeeldeth a liquid Rosen or Turpentine that smelleth strong, more like a Goate then any Rosen, even as the leaves and all the rest of the plant doth, this yeeldeth no red or bloody juice at all, as the true *Androsæmum* and *Ascyrum* doe.

The Place.

The first groweth in many Woods, Groves and woody grounds, as Parkes and Forrests, and by hedge sides, in many places of this land, as in *Hampsted Wood*, by *Railly* in *Essex*, in the wealde of *Kent*, and many other places needlesse to recite: The second is found also about *Bristow* and *Bath*, and in other parts of the West country. The third *Fabius Columna* saith hee found on the hills *Cirinole*, which are to the Southward in *Naples*: And the last *Honorius Bellus* saith, groweth by the brookes and springs of waters in *Candy* and no where else; but it groweth upon Mount *Baldus* as *Pona* saith in the description thereof.

The Time.

They all flower later then *S. Johns* wort, or *S. Peters* wort, and the last later then any of the other.

The Names.

It is called Greeke ἀνδρόσαυον *Androsæmon* a sanguine humano cui comest succus assimilatur. *Galen* saith it was of two sorts, the one whereof was called *Dionysias* by some in his time, the other *Ascyrum*, and *Ascyroides*. The first is called by *Dodonæus* *Androsæmum*, and to it is also by *Camerarius*, *Gesner* in *hortis*, and *Lugdunensis*, and taken by *Casalpini* to be the true *Androsæmum* of *Dioscorides*, *Galen* and *Pliny*, and the *Centeria* of *Theophrastus*; but *Lobel* in his *Adversaria* contesteth against it, & saith it is the *Clymenum Italicum*, as *Anguillara* doth, and likewise *Gesner* in *hortis*, so also *Castor Durant*, and of the *Italians* in many places called *Siciliana*, or *herba Siciliana*, because as they imagined it grew no where naturally but in *Sicily*; or *Cecilianæ* as *Camerarius* hath, who also calleth it *Clymenum non Dioscoridis*, sed *Plinianum*, as *Anguillara* before him did. *Bauhinus* calleth it *Androsæmum maximum frutescens*. We call it properly in *Englisht* Tutfan, from the *French* who call it *Toussaine*, & not from the *Italians* who call it *Tutisan*, as *Camerarius* saith. Some also call it *Parke* leaves, because it is so familiar to *Parkes* and *Woods*, that it almost groweth no where else. The second is called *Androsæmum* by *Matthiolum*, as also by *Fuschius*, *Lacuna*, *Cordus* upon *Dioscorides* and *Gesner*; *Camerarius* as I take it calleth it *Androsæmum minus*, for he calleth the former *major*, and *Lobel* calleth it *Androsæmum magnum*, and *Excellentius*, because he was not persuaded that the first was worthy the name of *Androsæmum*. *Dodonæus* would have it to bee *Ruta Sylvestris* of *Dioscorides*, and thereupon calleth it *Ruta Sylvestris Hypericoides*, because *Dioscorides* writeth, that the *Ruta Sylvestris* was called *Hypericum* by some in his time; I take it to be the *Hypericum secundum Tragi in dymetis nascens*; as also to bee the *Androsæmum Campoclaresense* of *Columna*. *Bauhinus* doth impose two severall names upon this herbe in my judgement, when as it is but one, for hee calleth that of *Matthiolum*, *Cordus*, *Gesner*, and the rest, *Ascyrum* sive *Hypericum bifolium glabrum, non perforatum* and the other of *Lobel*, which *Dodonæus* called *Rutajyl*, *Hypericoides*, *Androsæmum alterum folijs Hyperici, quod aliquibus Hypericoides*. The third is called by *Columna*, as it is in the title, but by *Bauhinus* *Androsæmum persoliatum & perforatum*. The last is called by *Camerarius* *Androsæmum minus sive angustifolium secundum Tragi*, and taketh it to be *Tragium* of *Honorius Bellus* of *Candy*, called by the inhabitants *Neroisti*, as hee saith, and as it is remembered by him, in his third Epistle to *Clusius*, set forth with *Clusius* his *Historia rariorum plantarum*, whose figure as *Camerarius* thought, was not as then set forth by any; but since his time *Bauhinus* hath exhibited the figure thereof in his *Matthiolum*, by the name of *Androsæmum fœridum*, and afterwards by *Pona*, in the description of mount *Baldus*, both in his *Latine* and *Italian* Edition, when he calleth it *Tragium legitimum veterum, ab ipso Bello effigiatum*, and in the same *Latine* Edition, fol. 11. hee calleth it *Tragium Creticum Bellonij non Dioscoridis*, and so doth *Bauhinus* also: but I thinke *Bauhinus* was mistaken, to thinke that this plant, which in his *Pinax*, he formerly referreth to *Tragium* of *Honorius Bellus*, should bee also the same with *Ascyrum Legitimum*, for *Bellus* saith, that the *Cretans* called this *Agoudauro*, and the *Tragium Neroisti*, as it is before sayd, so that there are two severall plants, and called by two severall names, as *Bellus* sheweth it, who was so singular in herbarisme, that he would not fall into such an error as *Bauhinus* here doth.

The Vertues.

Tutfan moderately heateth and dryeth, yet the feede hath an absterfive qualitie, whereby it purgeth cholericke humours, as *S. Peters* wort is sayd before to doe, for therein and in all other things it makes the same effect, both to helpe the *Sciatica* and *Goute*, and to heale burnings by fire: it stayeth also the bleeding of wounds, if eyther the Greene herbe be bruised, or the ponder of the dry be applyed thereto; it is, and so hath formerly in all ages among husbandmen, beene accounted a soveraigne herbe to heale any wound or sore, eyther outwardly or inwardly as the name importeth; and therefore it was alwayes one of their singular good herbes wherewith they made wound drinckes, or lotions, Balmes, oyles, or oynments, for any sort of Greene wound, or old Ulcers and sores, in all which the continuall experience of many ages, to bee admirable good, hath confirmed the use thereof to be assured, although it be not so much in request and use as formerly it was, when as *Chirurgions* and leeches did more addict themselves to use herbes, then now they doe.

CHAP. LIII.

Bupleurum. Hares eares.

Many have reckoned the *Bupleura* fit to be placed with the *umbellifers*, because they beare tufts of flowers and feede like unto them, but in that their growing is much different; I have thought it fitter to speake of them apart.

1. *Bupleurum angustifolium* Narrow leaved Hares eares.

The narrow leaved Hares eares, riseth up with a round stiffe Greene stalk two foote high; at the severall joynts whereof, grow severall long and narrow very darke Greene shining smooth leaves, broadest at the bottome, and narrower by degrees unto the ends, with divers ribbes running thorough them, the middlemost whereof is greatest, yet nothing so narrow as grasse leaves, as divers doe compare them, as any that I have seene of this sort, which stand one above another up to the top, growing smaller and smaller, at the joynts likewise; from the middle of the stalkes at the least, upwards if it grow in any good ground, come forth small branches, but sometimes with few or no branches at all, at the tops whereof stand many small tufts or umbells of yellowish flowers, which turne into small feede, like Parsley feede, but of a darker colour, and somewhat longer; the roote is somewhat long, but small, and white on the outside, like unto a Parsley roote, with divers fibres thereat, perishing yearly with me, as the next also.

2. *Bupleurum latifolium*. Broad leaved Hares eares.

This other Hares eares groweth in the same manner that the former doth, with stalkes, branches, flowers, feede, and roote, and herein chiefly if not onely differeth from it, that it beareth broader and shorter leaves, smallest at the foote, broadest in the middle, and ending in a small point, somewhat hollow, and bowing downwards with divers long Nerves or ribbes therein, as in the former, and the middle most eminent, or raised highest.

3. *Bupleurum Angustifolium Alpinum*. Mountaine narrow leaved Hares eares.

This mountaine Hares eares, from a round thicke roote, about a foote long set with knobs or bunches instead of branches, and with a thicke barke, of a darke red on the outside, and pale within, divided at the head into many parts, arise divers long and narrow Greene leaves, lying on the ground, compassing one another at the bottome like a starre, for the forme of them like unto the first Hares eares, but narrower; from divers of these tufts of leaves, arise darke round stalkes, about an handbreadth high, bearing at the toppes many pale yellow flowers, made of seven pointed leaves a peece, and in the middle of them divers small feed set thicke together, somewhat like unto the Thorow wax, set forth in the next Chapter, or as the former Hares eares, which smell very strong; the whole plant else, tasteth like an Artichoke.

4. *Bupleurum minimum*. The least Hares eares.

The least Hares eares, is also like the first described hares eares in all things, the smalnesse of the plants, both in stalkes, narrow long leaves, and all other partes making the difference.

The Place.

The two former *Lobel* saith grew about Mompelier in France, in the dry stony places, and in Germany, as *Tragus* saith, and are also found in our Land, in divers places: the third upon Mount *Baldus*, as *Pona* in the description thereof saith: the last *Columna* saith he found in the borders of the dry fields, neare *Cirinola* in Naples.

The Time.

They all flower late, that is not untill the end of *July*, and in *August*, and their feede is ripe in *September*.

2. *Bupleurum Latifolium*,
Broad leaved Hares eares. 3. *Bupleurum angustifolium Alpinum*.
Mountaine narrow leaved Hares eares.

The Names.

It is generally taken to be the *Bupleurum*, that *Pliny* mentioneth in his 22. booke, and 22. chap. out of *Hippocrates*, and *Nicander* in *Theriacis*; and was as he there saith, used in meates in *Hippocrates* his time and others, and reckoned among sallet and pot hearbes, but used in Physicke and medecines, by *Glaucus* and *Nicander*. Divers have diversly referred these herbes, as some to the *Euprestis* of *Theophrastus*, in his 7. booke, and 8. chap. whereof *Pliny* also speaketh, in the sayd booke, and chapter before sayd: *Gesner* in *hortis* saith, that with the French, it was called *Elaphoboscum* and *Gratia Dei*. Some also tooke it to be the *Panax Chironium*, of *Dioscorides*, some to be *Ammi vulgatum*, and some *Sanamunda*. *Bauhinus* in his *Pinax* saith, that *Panax Chironium* *Plinii* doth more rightly agree unto the *Valeriana campestris* sive *lactuca agnina*, Lambes Lettice, or Corne sallet: those about *Mompelier* as *Gesner* in *hortis* and *Lobel* say, called it *Auricula leporis*, especially the *Latifolium*, for the resemblance thereof unto Hares eares. *Cordus* in his history of Plants, calleth it *Psophyllon*. *Traugot* calleth it *Herba Veneraria*, *Woundgras*, not understanding from any of his nation, by what other name they called it, and therefore he himselfe referreth it, to the *Panax Chironium* of *Theophrastus*, who saith it hath the leafe of a Docke, but that of *Dioscorides* & *Nicander* have the leaves of *Americum* or *Marjerome*. I finde a great mistake, and forgetfulnesse in *Bauhinus* as well as in *Lugdunensis*, this in setting forth, and he in admitting the error to passe concerning the *Bupleurum* which *Lugdunensis* calleth *Lapathum sylvestre* 4: genus *Dalechampi* in one place, and *Bauhinus* *Lapathum maculatum flore aureo*, and yet *Lugdunensis* saith there, that some called it *Panaces Chironium folio Lapathi flore aureo* *Pliny*, which was sufficient I thinke, to make him understand it to be this *Bupleurum*, and not a *Lapathum*, and yet both he & *Bauhinus* in their proper places, call it *Bupleurum* notwithstanding. The third is called by *Pona*, in his Latine edition of Mount *Baldus*, *Sedum petraeum Bupleurifolio*, aut potius *Bupleurum petraeum gramineo folio*; but *Clusius* in setting forth the description of the sayd Mount *Baldus*, giveth it this note, that it is *flore verius, quam folio Bupleuri*. *Bauhinus* in the sayd Latine edition of *Pona*, is set downe to call it then *Bupleurum Alpinum*, *Bupleurifolio* (which I have thought fittest to follow, as it is in the title; but afterwards in his *Pinax*, hee referreth it to the *Perfoliata*, calling it *Perfoliata Alpina gramineo folio*, sive *Bupleurum angustifolium Alpinum*, hereby judging the *Perfoliata* and *Bupleurum* to be congeneres, for in the heads of feede, the one is somewhat like the other, as any that hath seene them both may well observe. *Fabius Columna* maketh mention of the last, and calleth it, as it is in the title: and *Bauhinus* *Bupleurum angustissimo folio*.

The Vertues.

These herbes are moderately hot and dry, and therefore may well be accounted *Panaces*, or Wound herbes, and have the same properties that they have, and which *Pliny* and others attribute unto *Bupleurum*: if the feede or the roote in powder taken in wine, or boyled in wine be drunke; and so are the leaves also good against the bitings, or stings, of any serpents or venomous creatures, the hurt place also bathed with the same, and is of great efficacy to provoke Urine, and womens courses being stopped: they are also very good purpose, either used alone, or with other things, to heale wounds inward or outward, whether they be fresh and Greene, or old cancrees and sores, of evill disposition, and bad curation.

CHAP. LIIII.

Perfoliata. Thorough waxe.

Here are divers sorts of Thoroughwaxe, some greater, some lesser, some of the fields and Meddowes, other of the hills and mountaines, &c. all of neere affinitie one unto another; and with them I thinke fit to joyne another herbe, which some have referred to another family, because of the long cods with feede that it beareth.

1. *Perfoliata vulgaris*. Common Thoroughwaxe.

The common Thoroughwaxe, sendeth forth one straight round stalke, and sometimes more, two foote high and better, whose lower leaves being of a blewish Greene colour, are smaller and narrower than those up higher, and doe stand close thereto; not compassing it, but as they grow higher, they doe more and more encompass the stalke, untill it wholly as it were passe through them, branching toward the toppe into many parts, where the leaves grow smaller againe, every one standing singly, and never two at any joynt: the flowers are very small, and yellow, standing in tufts at the heads of the branches, where afterwards grow the feede; small and blackish, many thicke thrust together: the roote is small, long, and woody, perishing every yeere, after feede time; and rising plentifully of it owne sowing, if it be suffered to shed it selfe.

2. *Perfoliata flore multiplici*. Double flowered Thoroughwaxe.

This differeth in nothing from the former, but in the heads of flowers, which are thicker set together, and larger, which give no feede, but is wholly a degenerate kinde, rising from the feede of the former, spending his fruite and encrease in the plentifull heads of flowers.

3. *Perfoliata montana latifolia*. Broad leaved Mountaine Thoroughwaxe.

The leaves of this Mountaine thoroughwaxe, are somewhat larger and longer, and more pointed than the former, many growing together, from the heads rising from the roote, every one standing on a small foote-stalke; from among which rise up stalkes with shorter leaves, which compass the stalkes, that are branched at the toppes, whereon stand yellow flowers, somewhat larger than the former, many in like manner set together, in the midst of the under Greene leaves, which are as a cup to containe them, wherein afterwards stand the feede, like the former but larger: the roote is thicke and reddish on the outside, lying long wise under the face of the ground, shooting forth heads of leaves in divers places, and with small strings and fibres downward, enduring many yeeres, and not perishing like the former. *Bauhinus* maketh another sort hereof with smaller flowers, *Minor*, yet giveth no description thereof.

4. *Perfoliata Alpina latifolia minor*. The lesser broad leaved Mountaine Thoroughwaxe.

This lesser Thoroughwaxe is somewhat like the first or common sort, but that it is smaller, rising not so high, and bearing on the stalkes such like leaves but smaller, which are divided at the bottome of them into two parts, the stalkes so passing through them, but are not whole and round as the former are, and branching at the toppes.

1. *Perfoliata vulgaris*.
Common Thoroughwax.

3. *Perfoliata montana latifolia*.
Broad leaved mountain Thoroughwax.

4. *Perfoliata latifolia nigra*.
The lesser broad Mountain leaved Thoroughwax.

9. *Perfoliata filiquae vulgaris seu Bessica campestris*.
Common coddled Thoroughwax.

whereout from betwene two leaves, come forth such like pale yellow flowers, standing in tufts, with small seeds following like it also: the roote is small and reddish, perishing as it doth.

5. *Perfoliata Alpina angustifolia major*. The greater narrow leaved Mountaine Thoroughwaxe.
This greater Mountaine kinde of narrow leaved Thoroughwaxe, hath divers very long, and narrow, whitish Greene smooth leaves, spread on the ground, about a foote long, of an inch, or inch and halfe broad, with corners also about them almost like Ivie leaves, which compasse the stalkes about the bottome of them, seldome more than one at a joynt; at the toppe whereof come forth five broad leaves standing round; from the midst whereof arise fixe or seven small stalkes, some longer and shorter than others, bearing thereon small reddish yellow flowers, in the middle of small round leaves: the roote is long and thicke, covered with blackish barke, and endureth.

6. *Perfoliata Alpina angustifolia minor*. The lesser narrow leaved Mountaine Thoroughwaxe.
This Thoroughwaxe hath but one stalk, about a foote high, without any branches bearing thereon at severall distances, long and narrow leaves like the last, but shorter and lesser, compassing the stalk at the bottome, and at the toppes some few reddish flowers, standing in tufts like the common kinde, and seeds accordingly: the roote is small and reddish.

7. *Perfoliata Alpina angustifolia minima*. The least narrow leaved Mountaine Thoroughwaxe.
This least kinde is a small plant, not past an hand breadth high, with a reddish running or creeping roote, shooting forth in divers places very narrow, long, smooth, Greene leaves: from among which ariseth a stalk, parted into two branches and each of them againe into other smaller ones, with one or two leaves under them, compassing them at the bottome, where it is broadest: the flowers are small, and yellow, standing together in tufts like the other.

8. *Perfoliata minor ramis inflexis*. Small Thoroughwaxe with bending branches.
This small Thoroughwaxe hath divers leaves, arising from the roote, which are somewhat long, but shorter than those of the first Mountaine Thoroughwaxe: the stalk is small, and lyeth as it were upon the ground, bearing such like leaves as that Mountaine kinde doth, and compassing the stalk in the same manner: the flowers are yellow like the common kinde: the roote perisheth every yeere like unto it, and therein differeth from most of the other mountaine Kindes.

9. *Perfoliata siliquosa vulgaris*. Common coddled Thoroughwaxe.
The ordinary coddled Thoroughwaxe, hath weak stalkes, branching forth at every joynt, with leaves set at them, compassing them at the bottome, very like unto the first Common Thoroughwaxe, but thicker, fatter, and more pointed, and of a whiter Greene colour, most like unto Cabbage or Colewort leaves, and with square unevenness on the edges usually: the toppes of the branches are furnished with many small white flowers, standing one above another, consisting of foure leaves a peece, which afterwards turne into small long and square coddles, wherein is contained round brownish seeds: the roote is small and woody, perishing after seeds time.

10. *Perfoliata siliquosa flore purpureo*. Coddled Thoroughwaxe with purple flowers.
This other coddled Thoroughwaxe, is very like the last, having straighter, and more upright stalkes, and larger flowers thereon, of a pale purplish colour, like unto those of the white Sattin: in all the rest it differeth not from the last.

The Place.

The first, and the last save one are found oftentimes in our owne Land in many corne fields, and pasture grounds: the second, as I sayd, is but a degenerate kinde of the first, and is often found in gardens, where the first is lowen: the 3. 4. 5. 6. 7. 8. grow all upon hills, some in Germany, and the Alpes of the Swislers, and some upon the Apennins towards Spaine and France: the last also aswell as the ninth *Clusius* saith, he found in a Province of Spaine.

The Time.

They doe all flower about July, and their seeds is ripe in August.

The Names.

It took the name of *Perfoliata* (for there is no ancient Greeke, or Latine author, hath written of it) from the growing of the stalkes through the leaves, yet some have thought it to be the *Cacalia* of *Dioscorides*, and some would make it his first *Corydalis*, but neither of them agreeth with it. *Cesalpinus* taketh it to be his *Seseli Ethiopicum*, which differeth much from this: all the later writers doe generally call it, *Perfoliata*, and *Perfoliatum*: the Italians call it *Perfoliata*: the French *Persefeuille*, and the Germans *Durch wachss* and so the Dutch also: in English Thoroughwaxe or Thoroughleafe: the second is expressed by *Camerarius in horto*, as also the third from *Gesner*, who first set out the exact figure thereof, being the first Mountaine kinde here, and is the *Perfoliata longifolia Dalechampi* in *Lugdunensis* although it may seeme much to differ from it in shew: the fourth I take to be the *Perfoliata altera* of *Lugdunensis*, whereof it is likely also *Camerarius in horto*, maketh mention under the name of *Perfoliata minor*, and it may be *Bauhinus* remembreth it, under his *Latifolia minor*: the fifth *Bauhinus* maketh his *Perfoliata Alpina angustifolia major*, and he maketh another like unto it, which he calleth *Media*, and therein referreth the *Perfoliata longifolia Dalechampi* of *Lugdunensis*, when as I can finde no other *Perfoliata* in him; whereunto the *montana* is to be referred, but there is so little difference betwene his *major* and *media*, that I take them both for one; the greatnesse of the one from the other, being likely to be caused onely by the climate, and so his *major* may as well agree unto that of *Dalechampi*, as his *media*: the sixth also *Bauhinus* calleth *Perfoliata Alpina angustifolia minor*, and is very like the *Bupleurum Alpinum angustifolium*, set forth in the former chapter, yet he giveth a caution, that they should not make them both one: the seventh hee calleth *minima*, but distinguisheth it from the *Perfoliata minima Bupleuri folio* of *Columna*, which he saith also is *Odonitis lutea* of *Lugdunensis*: but I cannot otherwise think then that his *minima* is *Columna* his *minima*, also and likely to be the *Seseli Ethiopicum parvum* of *Cesalpinus*, or *Napifolia Anglorum siliquosa*, by *Lobel* in his *Adversaria* and *Prodromus*: the ninth is called *Perfoliata siliquosa*, or *Napifolia Anglorum siliquosa*, by *Lobel* in his *Adversaria* and *Observations*, and as *Tragus*, *Gesner*, *Camerarius*, *Tabermontanus*, and all or most of the Herbarists at this time doe: although divers other, from the colour of the leaves, and forme of the flowers and seeds, would referre it to the wilde Coleworts, and thereupon call it *Brassica campestris (sylvestris & agrestis) siliquosa* or *perfoliata*; but

Lobel in his *Adversaria* saith, it partaketh of the Navew, (and therefore calleth it, as is before said, *Perfoliata Napi-folia*) and Winter Cresses, as well as of the Throughwaxe, or *Perfoliata siliquosa*; the last *Clusius* calleth *Brassica campestris altera*, or *purpureo flore*, but as I did referre the other, so I doe this, and call it *Perfoliata siliquosa flore purpureo*.

The Vertues.

Throughwaxe is hot and dry, and therefore of singular good use with Chirurgions, for all sorts of bruises and wounds, either inward or outward, and old ulcers, and sores; likewise, if the decoction of the herbe made with water or wine be drunke, and the places washed therewith, or the juyce or Greene herbe, bruised and boyled, either by it selfe, or with other herbes, in oyle or *Axungia*, to be made into an oynment, to serve for all the yeere: the decoction of the herbe, or the powder of the dried herbe, taken inwardly, and the same or the Greene leaves bruised, and applied outwardly, is no lesse singular and available to cure ruptures and burstings, especially in children, before it grow to be too old, the successe still answering the commendations of it: being applied also with a little flower and waxe, to childrens navels that sicke forth, doth helpe them. *Tragus* saith that the coddred Throughwaxe, is of the same operation with the other, and worketh the like effects, for his second *perfoliata* or *minor* hath long cods, which can be no other than this, although in *Camerarij horto*, it be mistaken, and *major Tragi*, set for *minor*, for to *Gesner in horto* hath it.

CHAP. LV.

Pimpinella sive Sanguisorba. Burnet.

P*impinella* hath a double interpretation declaring two sorts of herbes, for it either signifieth Burnet, and then it is usually also called *Sanguisorba*, or it is referred to the Saxifrages, and then it is called *Pimpinella Saxifraga*, Burnet Saxifrage, of either of which kindes there are diverse sorts: but of the Saxifrage kindes, because they are umbelliferous plants, I shall speake among the other of that rancke or order, and of these Burnets in this place, whereof there is both greater and lesser, and in either of both some difference; and although I have set forth the common Burnet in my former booke, yet because I there speake of it, onely as an herbe for a Kitchen garden, and speake very little of the properties; I thought good to mention it here againe, and enlarge the vertues.

1. *Pimpinella vulgaris sive minor.* Common Burnet.

The common Ordinary Burnet groweth with many long winged leaves, spread upon the ground, which consist of divers small roundish leaves, Greene on the upper side and grayish underneath, finely dented about the

1. *Pimpinella vulgaris sive minor.*
Common Burnet.

3. *Pimpinella major vulgaris.*
The ordinary great Burnet.

edges, set on each side of a middle ribbe; among which rise up crested browne stalkes, two foote high or better with some smaller leaves, set in some places thereon, divided into sundry branches, and at the toppes small round loose heads, or knaps upon long foote stalkes, of a brownish colour; from whence start forth small purplish flowers, and after them cornered feede: the roote is small, long, and blackish browne on the outside, growing downe deepe into the ground, with some fibres thereat: the herbe hath a fine quicke sent and taste, giving a delicate relish unto wine.

2. *Pimpinella minor inodora*. Vnsavory Burnet.

This unsavory Burnet is in all things like the former, but that the leaves of this are not so round, but something longer, and have neither sent or taste in them to commend it like the other.

3. *Pimpinella major sive sylvestris*. Great or wilde Burnet.

The great wilde Burnet hath such like winged leaves rising from the rootes, but nothing so many, and each of these leaves on the wings, are twice as large at the least, as the other; and nicked in the same manner about the edges, of a grayish colour on the under side: the stalkes are greater and rise higher, with many such like leaves set thereon, & greater knaps or heads at the tops, of a brownish Greene colour, and out of them come small darke purple flowers, like the former, but greater: the roote also is blacke and long like the other, but greater: this hath in a manner neither sent or taste therein, like the common finall, or garden kinde.

4. *Pimpinella maxima Americana*. Great Burnet of America.

4. *Pimpinella maxima Americana*. Great Burnet of America.

This great Burnet is in all the parts thereof like the last, but much greater, having oftentimes all the leaves, which are of a blewish Greene on the upper side, and folded halfe way together inward, the under side of the leaves, which are grayish, shewing themselves upward, nicked somewhat deeply about the edges, with greater dents, which make them shew the more comely, and gracefully: the toppes of the stalkes carry smaller, and much longer, whitish Greene spiked heads, set thicke with knaps, each whereof when it flowreth (beginning below and so rising higher) sheweth to be foure whitish Greene leaves, having many small white long threds in the middle: after which come the feede in the same places, being cornered like the other: the roote is much greater and woody, longer also and blacker than the last: this hath little sent, but in taste is somewhat like the first, yet nothing so aromaticall.

The Place.

The first groweth wilde in divers places of this Land, in dry sandy places, but is usually preserved in gardens, to be ready at hand, when it shall neede to be used: the second was found in Spaine, as Bauhinus saith: the third is found in divers Countries of this Land, especially in Huntington and Northampton shires, in the Meddowes there, as also neere London both by Pancras Church, in two or three fields nigh unto Boobies barne, as also by a caufie side in the middle of a field by Paddington: the last was brought out of the North parts of Virginia, where it is naturall.

The Time.

All these flower about the end of June, and beginning of July, and their feede is ripe in August.

The Names.

The Greeke word *πυμπίδα* or as Gesner hath it *πυμπίδα* *Pimpinella*, is onely found in *Nicolaus Myrepsus*, and is thought by divers to be under stood of this herbe, (for it is not knowne to be mentioned by that name, in any of the old writers: but divers by good judgement doe referre it to the *Sideritis secunda* of *Dioscorides*, whereunto it answereth fully, both in forme and qualities, so that we neede not any further to doubt thereof, and the rather, because as it is sayd at this day, this herbe is called *Sideritis* by the Greekes, in the Island *Chio*, or *Sio*, divers also referre his *Sideritis* unto the other kindes of *Pimpinella*, that are umbelliferous, for there is such a confusion among many of the later writers, that it is hard to understand, which of these two kindes they meane whereof they write: Gesner in *hortis Germanie*, maketh mention of *Pimpinella minor sativa levis*, to be of the same kind with the other *sylvestris*, or wilde sort, & as he saith, not differing from it, but in the manuring, which his *Pimpinella minor sylvestris*, is the Saxifrage kind as may be plainly perceived, by his own words following; for he saith that that herbe which the *Germanes* call usually *Pimpinella* is by other people called *Saxifraga*, and by the *Italians* *Hircina*, or *Pimpinella hircina*, and yet Bauhinus maketh this *Pimpinella sativa levis* of Gesner, to be *Sanguisorba minor levis*, which is quite contrary to his mind as I think; and although by saying it is used in fallers, he might seeme to under stand this Burnet kinde, which was wont often to be so used, yet his words of *Saxifraga Hircina*, cannot be understood of this Burnet, but of the other *Saxifraga umbellifera*: the like doubt and difference there is concerning those scarlet berries, that grow upon the rootes of *Pimpinella vulgaris* (as *Frageus* maketh mention, l. 3. c. 15. which he taketh to be the *Cocchenilla*, for he there saith, that *Cocchenille* is a certaine berry brought from *Peru*, which groweth upon certaine small plants, like unto *Pimpinella vulgaris*, unto whose rootes it doth sticke, of the likenesse of wilde Grapes, which some take to be the true *Coccogonium*, and others to be the *Chermes* of the *Arabians*, which differeth from the *Coccus Baphica* of the *Gracians*; thus saith *Frageus*; all which is utterly untrue,

untrue, for *Cochenille* is neither the berry of any *Pimpinella*, nor is it the true *Coccognidium*, nor doth the *Chermes* of the *Arabians* differ from the *Coccus Baphica* of the *Gracians*, as shall be shewed in due place, but *Oviedus* truly saith that *Cochenille* groweth like berries on the underfide of the leaves of a tree in the West Indies called *Tunal*, or by others *Tunas*, which tree we call *Ficus Indica*. Now whether of the two kinds of *Pimpinella* is meant, this or that is not expressed, for some referre it to one and some to the other. Some as it should seeme call *Pimpinella*, *Pampinula*, and *Peponella*, but I rather referre all these names to the Saxifrage kindes: it is called *Sorbastrella*, and *Sanguinaria* also of divers, but most usually *Sanguisorba*, quod *sanguineos fluxus sistat* and it may be *Bipinella* or *Bipenula*, a foliorum binis ordinibus pennatim five plumatim digestis: the *Italians* call it *Pimpinella* or *Sorbastrella*, the *French* *Pimpinelle*, the *Germanes* *Hergots herlin* (id est, *Dei Barbula*) *Blutkraut*, and *Meigelkraut*, because the country people as *Tragus* saith, give it to their *Hennes*, and *Geese* when they have the *Pippe*, to cure them of it; we doe in all places I thinke in *England* call it *Burnet*: but many of our ignorant *Apothecaries* doe shamefully mistake this herbe, in using *Pimpernell* in their *Synope* of *Dealbea*, and in other their medicines instead thereof, from the nearenesse of the Latine and English names, of *Pimpinella* and *Pimpernell*, taking them to bee both one: it may be referred also as it is thought to that herbe which in *Persis* is called *Sistiepteria*, as *Pliny* saith in his 24. Booke and 9. Chap, because it causeth mirth, and *Dionysius* *symphus*, because it doth wondrously well agree with wine. The first is called *Pimpinella Sanguisorba*, to distinguish it from the other *Pimpinella Saxifraga*, and *Pimpinella minor* and *bortensis*, to distinguish it from the other *Sanguisorba*, which is called *major*, and *Sylvestris*: *Angulata*, *Gilandinus*, *Tragus*, and *Columna*, call it *Sideritis* secunda *Dioscoridis*, and to doe others since them: they also call it *Pimpinella Italica*, and is the first of *Tragus* by that name, for the third is his *Pimpinella Italica major*, and so *Lusus* calleth it also: others call it *Pimpinella five Sanguisorba major*, and *Columna Sideritis* 2. *Dioscoridis* *major*. The second *Eanthinus* onely mentioneth, and the last is not remembered by any writer before me, although *Lobel* may seeme in his *Adversarij* to point at this, where he saith, that the great wilde kind hath sometimes leaves as great as *Betony*, as this hath, but yet is not this, being a differing kind, as by the heads of flowers may well be knowne.

The Vertues.

Both the greater and the lesser *Burnet* are accounted to be of one property, but the lesser, because it is quicker and more aromaticall, is more effectually being both hot and dry in the second degree, especially the lesser (yet some say it is cold in the second degree) which is a friend to the Heart, Liver, and other the principall parts of a mans body; two or three of the stalkes with leaves put into a cup of wine, especially *Claret*, as all know give a wonderfull fine relish to it, and besides is a great meanes to quicken the spirits, refresh the heart, and make it merry, driving away melancholly: it is a speciall helpe to defend the heart from noysome vapours, and from the infection of the *Plague* or *Pestilence*, and all other contagious diseases, for which purpose it is of great effect, the juice thereof being taken in some drinke, and they either layd to sweate thereupon, or wrapped and kept very warme. They have a drying and astringent quality also, whereby they are available in all manner of fluxes of blood, or humours, to stench bleeding inward or outward, *Laskes* or *Scowrings*, the *Bloody flux*, womens too abundant courses, and the whites also, and the chollericke belchings, and castings of the stomake, and is also a singular good Woundherbe, for all sorts of wounds, both of the head and body, either inward or outward, for all old *Ulcers*, or running *Cancers* and moist sores, which are of hard curation, to bee used eyther by the juice or decoction of the herbe, or by the powder of the herbe or roote, or the water of the distilled herbe; or else made into oyle, or ointment by it selfe, or with other things to be kept: the seede also is no lesse effectually, both to stay fluxes and to dry up moist sores, to be taken in powder inwardly in steeld water or wine, that is wherein hot gaddes of Steele have bene quenched, or the powder of the seede mixed with their ointments, or injections.

CHAP. LVI.

Sideritis five Ferruminatrix. Ironwort.

AVING in the last Chapter shewed you that *Burnet* is the second *Sideritis* of *Dioscorides*, I thinke it not amisse to entreate next thereunto, of some other herbes called *Sideritides*, as being referred by many authors unto the first kinde of *Dioscorides*, leaving the third sort to bee spoken of in another place hereafter.

1. *Sideritis prima Herba Iudaica.* Jewes Ironwort.

This first *Sideritis* is a small low herbe, neither wholly standing upright, nor wholly leaning downe to the ground, but hath divers weake, rough, hoarie square stalkes not much above a foote high, full of joynts, at the severall distances whereof, grow two small leaves somewhat long, rough, or as it were crumpled, hard and hairy, not halfe so broad as *Horehound* leaves, dented about the edges, smelling and tasting somewhat strong, which spread abroad into divers branches, the upper parts whereof are replenished, with many rough small wharles of pale purplish gaping flowers, with hoary leaves at the joynts under them also, where after they are past, come small blackish seede, contained in those huskes, wherein the flowers stood before: the roote is small and woody, yet living and shooting forth a new every spring.

2. *Sideritis parva procumbens.* Small Jewes Ironwort.

This small herbe is somewhat like the former in the hairy square branches, but more trayling or leaning, and in the leaves, but somewhat larger, a little hairy, and dented from the middle of them forwards: the flowers stand compassing the stalkes at certaine distances as the others doe: the roote is small and perisheth every yeare.

3. *Sideritis altera parva Clusij.* Another small Jewes Ironwort.

This other small Ironwort hath the middle stalke upright somewhat hairy and square, spreading into many smaller branches, even from the bottome upwards, which in a manner lye on the ground, with two such like leaves as the last at the joynts, but little or nothing dented at all; the flowers are white, without spots, as farre as I remember, but gaping in like manner: the roote of this likewise perisheth every yeare.

4. *Sideritis*

1. *Sideritis prima Herba Iudaica.*
Iewes Ironwort.

2. *Sideritis parva procumbens.*
Small Iewes Ironwort.

4. *Sideritis vulgaris Clusij.*
The Germans Ironwort.

5. *Sideritis Mompeliensis Lobelij.*
Small Ironwort of Mompelie.

4. *Sideritis vulgaris Clusij.* The Germans Ironwort.
This Ironwort that is most common in Germany, as *Clusius* saith, groweth greater and higher then the other, with larger, hairy, rough, pointed leaves, set by couples one against another, at the joynts of the square hairy stalkes, dented about the edges, but set at farther distances; which branching themselves forth, are set from the middle upwards, with many wharles of gaping white flowers at the joynts with the leaves, spotted with blood red spots in the upper part of them, ending in a long spike, the seede that followeth is small, uneven and blacke, contained in five square heads: the roote is white and woody, shoothing new stalkes every yeare.

5. *Sideritis Mompeliensis Lobelij.* Small Ironwort of Mompelie.

The small Ironwort of Mompelie riseth scarce to a foot height,

heigh, having many square hoary upright hard stalkes, whereon are set at the joynts two long leaves, as hairy, hoary, and crumpled as the first Iewes herbe, and as deeply dented about the edges: the tops of the stalkes and branches have many wharles of flowers set in rough huskes, like those of Savory, in some of a purplish colour, in others of a yellowish purple.

6. *Sideritis montana Hyssopifolia*. Mountaine Ironwort.

This mountaine Ironwort hath slender round stalkes, lying upon the ground, and shooting forth rootes at the joynts, as they lyeth thereon, set with small long and narrow leaves on them, like unto those of Hyssope, very thinly by couples, and sometimes more growing out betweene them, lesser then they: the flowers are of a pale purplish colour, of the same fashion with the other, and set in such rough huskes: the roote is long crooked and hard.

7. *Sideritis montana Apula versicolor*. Mountaine Ironwort of Naples.

The Neapolitan Ironwort riseth up with a reddish, square, hoary and hard hairy stalk, a foote and a halfe high, divided into two branches, about the middle thereof, whereon are set at the joynts, two small and long pale green leaves one against another, covered with an hoary downe, and having three dents or notches on each side at the ends of them, which at the lower end of the stalk next the ground, have long footestalkes under them, but up higher at the top are without any: the flowers stand in sharpe pointed huskes and are gaping or hooded as the rest are but very small, whose head and jawes are of a darke purplish colour; the middle of the flower is yellow, and the long necke of the flower that riseth out of the huske is whitish: after the flowers are past, come foure blackish ashecoloured feede, somewhat cornered in the hairy or hoary huskes, the roote is small hard and yellowish.

8. *Sideritis Germanica parva*. Small Germany Ironwort.

This small Ironwort hath low square stalkes of a foote high, branched from the very ground, being soft and hoary as the leaves are also that stand by couples, being long and somewhat narrow without any dents at all about the edges, yet larger below then above: the branches have flowers growing about them upwards as soone almost as they shoote out, in shape as the other forts are, but they are so small, that they scarce appeare out of the huskes, of a duskie colour; the jawes and lower part on the inside being whitish: after which come blackish feede smaller then in the other, the roote is white and woody, and perisheth every yeare.

9. *Sideritis folijs Alpines Trissaginis*. Ironwort with Germander Chickweede leaves.

This Ironwort shooteth forth a square hairy stalk a foote long, spread into branches from the bottome, and those againe sending forth other smaller ones, all of them ending to the ground, like the Germander Chickweede, but much greater, whereon stand a few hairy leaves by couples, in forme like unto that Chickweede also but larger, and dented about the edges: the flowers grow at the joynts with the leaves towards the tops, like unto the other in fashion, but somewhat longer, and of a blewish colour standing in sharpe and rough huskes, wherein small round feede succeedeth, the roote is small and threddy.

6. *Sideritis montana Hyssopifolia*.
Mountaine Ironwort.

8. *Sideritis Germanica parva*.
Small Germany Ironwort.

10. *Sideritis Quernofolio*. Ironwort with Oaken leaves.

The stalk of this Ironwort is straight, and with few branches, bearing very sparsely somewhat broad and pointed leaves, unevenly cut in on the edges, set upon short footstalks by couples, which are somewhat like unto one of the kinds of Oake: the flowers are small, and stand in small rundles about the toppes, of a pale purplish colour.

11. *Sideritis Hederule folio*. Ironwort with Alehoofe leaves.

This is a small herbe not much above an handbreadth high, bearing small, broad and roundish greene leaves with round dents about the edges, like to Alehoofe, or rather unto the red Archangell leaves: the flowers are hooded small and purplish, and the seede small and blackish: the roote is small and rhreddy, perishing every year, but raising it selfe from it owne sowing abundantly enough in a garden where it hath beene once sown.

12. *Sideritis glabra oblongo splendens folio*. Ironwort with smooth long leaves.

This Ironwort hath square and joynted stalks, smooth below, but with some small hairinesse at the toppe: the leaves are smooth and thinn, set by couples, the lowermost three inches long, and one broad, not dented at about the edges: the flowers are hooded like the common sort, but white, larger then they and longer also, standing in rough huskes about the stalks, even from the bottome almost, after which come small blackish uneven seede, in heads like Plantaine but shorter.

13. *Sideritis arvensis rubra*. Meddow Ironwort with red flowers.

The roote of this herbe is very fibrous or full of threds, from whence riseth up a square browne stalk, full of branches, and thereon divers narrow long and pointed rough leaves, somewhat dented about the edges, set by couples, at the toppes whereof stand the flowers, compassing them as the others doe, of a darke red colour, and sometimes of a white colour: the whole plant is of an aultere or harsh binding taste, without smell, and perisheth every yeare.

14. *Sideritis arvensis latifolia glabra*. Broad leaved meddow Ironwort.

This other meddow Ironwort hath larger smooth greene leaves below then those above, a little dented about the edges, the square stalks are branched, and the flowers in some purplish tending to white, in others of a pale or yellowish white, set in coronets or circles about the stalks, without any sent as the others also.

15. *Sideritis Anglica strumofaradice*. Clownes Woundwort.

As a Complement to these *Sideritides*, let me adde this Woundwort as last of all, though not the least in effect, which from a countrey mans experience, hath not onely obtained the name of a Woundwort, but famoused to posteritie, for others to receive good also thereby, which else might have beene buried with him that healed himselfe therewith of a cut with a Sithe in his Legge. It groweth up sometimes to three or foure foote heigh, but usually about two foote, with square greene rough stalks but slender, joynted somewhat farre asunder, and two very long and somewhat narrow darke greene leaves, bluntly dented about the edges thereat, ending in a

11. *Sideritis Hederule folio*.
Ironwort with Alehoofe leaves.15. *Sideritis Anglica strumofaradice*.
Clownes Woundwort.

long point: the flowers stand towards the tops, compassing the stalkes at the joynts with the leaves, and encirclike in a spiked top, having long and much open gaping hoods, of a purplish red colour with whitish spots in them, standing in somewhat rough huskes, wherein afterwards stand blackish round seede; the roote is composed of many long strings, and smaller fibres, with some tuberous long knobbes growing among them, of a pale yellowish or whitish colour; yet at some times of the yeare these knobbie rootes in many places are not seene in the plant; the whole plant smelleth somewhat strongly.

The Place.

Many of these are strangers in England, growing some in Medowes, others on Mountaines; yet some are natural to our Country, besides the last which groweth in sundry countries of this Land, as in *Middlesex* neare London, by the path sides in the fields going to *Chelsey* and *Kensington*, by *Hackney* in the ditch sides of a field called the shoulder of mutton field, and in *Surry* in *S. Georges* fields, and in the Medowes by *Lambeth*, and under that tree by *Stangate*, over against *Westminster* bridge, which standeth alone upon the banke and none else: in *Kent* by *Southfleet*, and on the backside of the Church yard of *Nettlestead*, hard by *Sir John Scotts* house, and in the middle of the next field to the *Lime Kilne*, at the foote of *shooters hill*. In *Wilkes* towne in the very streete, neare a place called the *Mandline* in *Essex* by the ditch sides, and on the ditches sides on the left hand of the highway beyond *Stratford Bow*. In *Suffolke* also, *Cambridge* and *Huntington* shires more plentifully.

The Time.

They all flower in *June* and *July*, and their seede is ripe soone after.

The Names.

Sideritis in Greeke, *Sideritis* sic dicta a ferro, quasi *Ferruminatrix*, quod vulneribus ferro factis fuit medela, for that it did heale wounds made by the sword, whereof there was great use in the warres, and therefore many herbes that were conducing to this purpose, although of different formes were called *Sideritis*, as also *Stratiotes*, as *Dioscorides*, *Pliny* and others doe declare (because *militis* Souldiers had most speciall use of them) in Latine also *Sideris* and *Militaris*, who have mentioned divers sorts. The first sort here expressed is thought by most Herbarists, to be the right *Sideritis prima*, or *Herculea* *Dioscoridis*, sic dicta propter vires planè *Herculeas* (and in Germany the French sort is so accounted and called also) the rest set forth in this place are referred thereunto, as species of the same genus and most neare, and like thereunto, both in forme and qualities; (otherwise all the herbes set downe in this Classis, and many other might be called *Sideritides*, being they are *Vulneraria*, Woundherbes for that purpose.) It is also called *Tetrabil*, *Tetrabit*, and *Herba Iudaica* by divers, because the *Iewes* that exercised *Physicke* and *Chirurgie*, like the *Charletones* and *Mountebankes* in *Italy*, and the *Quacksalvers* in *Germany* had this herbe in much use with them; the second and third of mine here, are the fourth and fifth of *Clusius*: the fourth is the first of *Clusius*, which he calleth *vulgaris*, because it was best knowne and most familiar to the *Ce manes* growing amongst them. The fifth is called by *Lobel* and *Pena* in their *Adversaria*, *Sideritis Alonspeliaca* *Scordoides*, and in his *Icones plantarum*, is set floribus luteis, *Tragoriganum praesloides* *Francisci Penini*: it is also the fifth *Sideritis* herbariorum of *Tabernmontanus*, which *Bauhinus* calleth *Sideritis folijs hirsutis* profix of *Tabernmontanus*, which *Bauhinus* calleth *Sideritis Alpina* *Hysopifolia*: the seventh is by *Columna* called *Sideritis montana* a parvo flore nigro purpureo: the eighth is the sixth *Sideritis* of *Clusius*, which hee saith is familiar at *Piemont*, as his first and my fourth is also. The ninth is by *Bauhinus* so called as it is in the title: the tenth is by *Lugdunensis* so called, and *Bauhinus* followeth him, and withall saith, that such a like Plant he gathered in *Findos* garden, by the name of *Britannica*: the eleventh is of mine owne endeavours finding it wilde, and planting it in my garden, where it hath continued ever since: the twelfth is by *Bauhinus* onely set forth in his *Panax* and *Prodromus*, which he had from *Sprengerus* of *Heidelberg*: the thirteenth is called *Ladanum segetum* by *Lugdunensis*, who saith some also called it *Tetrabit angustifolium*: *Camerarius* calleth it *Sideritis arvensis flore rubro*, and *Thalius*, another congener to his first; *Cesalpinus* *Sideritis alia in vineis*: *Tabernmontanus* *Alyssum Galeni flore purpureo*, and *Bauhinus* *Sideritis arvensis angustifolia rubra*. The fourteenth is the *Sideritis secunda* *Matthioli*, as *Bauhinus* saith, although *Lobel* thinketh it to be a kind of *Cammalis spuria*, and others take it to be *Clusius* his *Marrubium Pannonicum*: it is the *Sideritis* *Herculea altera* of *Cesalpinus*, the *Sideritis arvensis flore pallido* of *Camerarius*, the *Sideritis arvensis* species altera of *Thalius*, set downe by *Gerard*, & *Tabernmontanus* under the name of *Alyssum Germanicum*; and called by *Bauhinus* *Sideritis arvensis latifolia glabra*: The last is called by *Gerard* *Panax Coloni*, from a country husbandmans cure of his owne Leg therewith, which he had cut in mowing downe a field of Pease; but why he should call it *Panax* in Latine, being not an herbe for all diseases, nor like unto any knowne *Panax* in forme, I know not, unless *Quicquid in buccam venerit*, he tooke that which came next to hand, for in my judgement it is a diff. ring *Sideritis* from any before, and therefore I have given it the title *Sideritis Anglica strumosa radice*, for the causes set downe in the description. It may seeme probable to many that this herbe was not onely knowne to divers of our moderne writers, but called also *Sideritis* by sundry of them, for it is supposed to be *Thalius* his first *Sideritis*, which he termeth *gratis admodum odoris*, *Camerarius* his *Stachys palustris* *Gesneri*, *Gesner* himselfe calling it *Betonica fetida* & *Herba Iudaica cognata*, understanding thereby the *Sideritis* or *Tetrabil* that was most common amongst them, and with *Lugdunensis* *Chymenum minus*; but I stand in some doubt thereof; first in that the leaves of theirs are shorter then of this, then that the flowers are sayd to be pale purple, and ours are very red, spotted with white: their rootes likewise are not described to have any tuberous knobbes at them, except *Thalius*. The *Arabians* call the *Sideritides* in generall *Sidrachi*, the *Italians* *Siderite*, the *French* in some places as I heare, *L'herbe Carpentaire*, the *Germans* *Gliderant*, the *Dutch* *Gliderijst*, and wee in English after the Dutch name, *Glidewort* of some, and *Ironwort* of most, for *Woundwort* is too general name, unless you will the clowne to it as *Gerard* doth.

The Vertues.

Most of these herbes are very powerfull to stay all Fluxes of blood, in man or woman, inwardly or outwardly, as also to stay rheumes and defluxions from the head, but especially the first, the fourth, and the last: the first and the fourth being nearest in forme and also in qualities, being of speciall use for the soure and cholericke belchings of the stomacke, and to heale burlings or ruptures, and the whites in women as well as the reds; for being exceeding drying and binding, and moderately hot, as wee take it, (yet *Galen* saith of halfe cold and

and moyst, and but a little bending) it not onely preserveth those parts, but is admirable good for all greene wounds, to stay the bleeding, and to heale and close up their lippes quickly without suppuration, as well as to dry up the moysture and fluxe of humors in old fretting ulcers, and caneres, that hindreth their healing; and herein as it seemeth, it hath his name *Heraclee*, by priviledge of excellency, as an *Hercules* or mastertainer of the strong: and if there be any inflammation about the parts, by the application of the herbe, juyce or decoction, it is soone taken away. The last by *Gerard* his testimony of the use thereof is singular effectuall in fresh wounds, and can be no lesse availeable in the staying of blood and humors than the others.

CHAP. LVII.

Alyssum. Madwort.

His name *Alyssum* is diversly confounded, both by the ancient and moderne writers, being referred to divers herbes, for *Dioscorides* hath one sort, and *Galen* another and *Pliny* a third, each differing from others, as it is thought, and *Matthiolus* hath a kinde of *Thlaspi*, for the *Alyssum* of *Dioscorides*, and others as *Lobel* saith, the *Bugula* or *Consolida media*, *Ruellius* a kinde of wilde or Ballard Hempe, *Cesalpinus* taketh that kind of Horehound, that is called *Cardiaca* Motherwort, to be *Alyssum Galeni*, and *Fracasorius* our ordinary Clary, *Gesner* and others take *Asperula*, or some other smaller Madder to be *Pliny* his *Alyssum*, and *Cesalpinus* *Cruciata*: but be-cause they are all improperly applyed, I meane not here to entreate of any of them in this place; but of other plants, that this later age hath found out, most neerely to represent the two sorts of *Dioscorides* and *Galen*, their *Alyssum*.

1. *Alyssum Dioscoridis*. The Madwort of *Dioscorides*.

The Madwort of *Dioscorides*, hath many hoary, hard, and rough leaves, lying on the ground, somewhat broad and round, for the first yeare of their springing, but the next yeere when the stalke beginneth to arise, they grow ther: on both greater and longer, and some what torne in on the edges, in some places, which stalke is hoary about a cubite high, and spreadeth into two or three branches, at the toppes whereof come divers pale yellow, and very small flowers standing one above another severally, on both sides of the stalkes, which turne into somewhat large and round, flat, thinne, hoary, hard, rough huskes, resembling little bucklers; or rather most like the yellow huskes with feede, of the *Lunaria major*, or *Bolbonach*, which is the white Sattin, but that these are smaller, rougher, and harder, and wherein lye small flat reddish feedes, in a double order on both sides of the thinne middle skinn, which in this is not white, like that of the sattin, but else very like: the roote is small and woody, dying every yeare, after it hath given feede, and seldome perisheth the first yeere, before it runne up to stalke.

1. *Alyssum Dioscoridis*.
Madwort of *Dioscorides*.

3. *Alyssum montanum* Columna.
Madwort of Columna.

ECC

2. *Alyss-*

2. *Alyssum alterum* Dioscoridi minus. The lesser
Madwort of Dioscorides.

This lesser Madwort hath divers long leaves, lying on the ground, a little waved on the edges, of a pale or blewish Greene colour, about three inches long and one broad, rough and hairy, but softer than the former; from among which rise slender weak rough stalkes, scarce able to stand upright, parted into sundry branches, whereon grow the leaves by couples, one opposite to another, smaller but not lesse hairy, and rough than the former, the flowers first beginne to breake forth at the toppes, and afterwards on the sides or wings, which are many set together in tufts, consisting of foure white leaves, notched in the middle, which maketh every leaf seeme like a hurt, with divers yellowish threds in the middle of them, and each standing in a Greene huske, the outside whereof have longer foote stalkes than those more inward, and each flower larger than the inner ones, which being past; there succede round feede vessels like bucklers, smaller than the former, hard and rough on the outside, in which are contained flat feede, in foure round reddish cells or partitions, divided by a certaine shining skinne, two feede lying in each cell or partition: the roote is small and long, with divers fibres thereat, and abideth, shooting forth a new, more sharpe in taste than the leaves, which are drying and altringent.

3. *Alyssum montanum* Columnæ. Mountaine
Madwort of Columna.

This other Madwort of the Mountaines, hath a small thred-dy roote, from whence spring up small and weak round reddish stalkes, lying upon the ground, shooting forth rootes at the joynts, and rayling themselves up againe, the lowest leaves whereof are small and roundish, not much bigger than ones nail, but those that grow up afterwards upon the stalkes are greater, being two inches long, deeply dented about the edges, and very rough, covered with a long hairinesse, two for the most part, set at every joynt, with long foote stalkes under them: at these joynts likewise on both sides come forth three or foure blewish flowers, each standing upon a very small hairy foote stalk, having foure small Greene leaves under them as a huske wherein they stand, and wherein afterwards groweth the feede vessels, which are two, flat, ovall or round huskes like Bucklers, joynted at the sides together, hairy at the brimmes, and containing five or sixe yellow flat feedes in each partition: the roote dyeth every yeere, and must be new sown, when any will have it.

4. *Alyssum Galeni* Clusio. Galen his Madwort according to Clusius.
Clusius his Madwort of Galen is accounted a kinde of Horehound, and riseth up with a square whitish woolly stalk, divided into branches from the very bottome, having two leaves at every joynt, somewhat like unto Horehound, but lesser, rounder, and more hoary, smaller at the bottome, broad at the ends, and somewhat divided at the edges, without sent, but bitter in taste: at the joynts with the leaves come forth the flowers, round about the stalkes like unto Horehound, but of a purplish colour, standing in hoary huskes, with points very sharpe and prickly, wherein after they are past, lye red feede, like unto those of Horehound: the roote is small and stringie, and abideth in the warme Countries, as it is probable after it hath perfected the feede; for Clusius saith he found it in Spaine in March, having both flowers and ripe feede thereon, but being sowne as he saith, in these colder Countries, it every yeere perissheth, and by the feede which it sheddeth is renewed againe.

5. *Alyssum verticillatum* foliis crenatis. Madwort with dented leaves.
This hath a small woody roote with fibres set thereat, from whence rise sundry square stalkes of a foote or more high, leaning down to the ground, set with leaves at sundry distances, the lowest being largest, somewhat like unto Horehound but longer, coming neere unto those of Germander, but hoary, with a rough hairinesse, and dented not deeply about the edges, somewhat like Berony: at the joynts of the stalkes where the leaves grow lesser upwards, rise sundry whitish purple flowers set in wharles or roundles as Horehound hath, out of prickly huskes which containe in them brownish feede: the whole herbe is in taste altringent, yet not unpleasant to the taste, and having withall a little bitternesse, and sweetenesse withall in sent.

The Place.

The first groweth in gardens both with us, and in Italy, France, and the Low Countries, the originall place being not well knowne: the second groweth about Rome, and the third upon one of the hills in Naples, as Columna saith: the fourth Clusius saith he found in one place in Spaine and no where else: the last Columna saith groweth by the pathes sides of the dry rockie hills in Naples, where there is small store of earth for it to grow in.

The Time.

These doe all flower about July and August, and the feede is ripe quickly after.

The Names.

It is called in Greeke *Αλυσσον* *Alyssum*, and *Alyssum* in Latine, so called because it cureth those that are bitten by a mad dog, yet Plutarch in *Symposia* lib. 3. q. 1. by saying it helpeth the hickock, would derive the name from *αλζον* *ingulsiore*. There is some doubt among many, whether these should be the right or true *Alyssa* of Diosco-
rides

rides and Galen: for as concerning the first, they affirme, that it may more fitly be referred unto the sorts of *Thlaspi*, or of *Lunaria Græca*, and therefore some have called it *Lunaria major*, and *Lunaria lutea*, *Cesalpini* *Lunaria Græca tertia*, and *Gesner* *Lunaria aspera*; but *Dodonæus*, *Clusius* *Camerarius*, *Lugdunensis* and *Lobel* doe all call it *Alyssum* and *Alysses*, & *Lobel* saith farther, there is no herbe to be found that better agreeth with *Dioscorides* his *Alyssum* in all things then this first doth. *Ætius* in his first booke saith, that *Alyssum* was called *Sideritis Heraclea* by some in his time, that it grew by the way sides, and bore a purple flower, and thicke leaves (which is most likely *Galens Alyssum*) some doe account it a kinde of *Leucoium*, and so do both *Columna* and *Bauhinus*; the one calleth it *Leucoium montanum lunatum*, for he saith that the *Leucoia* and *Thlaspi*, be congeneres, which I grant, but yet I thinke, that the *Lychnides* be nearer congeneres to the *Leucoia*, then the *Thlaspies* be; the other that is, *Bauhinus* calleth it *Leucoium Alyssoides clypeatum majus*. The second is called by *Columna*, *Leucoium petratum Romanum minus*, who saith it is a congener to the *Alyssum* of *Dodonæus*, which as I sayd is the first here expressed; and therefore *Bauhinus* calleth it, *Leucoium Alyssoides clypeatum minus*. The third *Columna* calleth *Alyssum Dioscoridis montanum*: but *Bauhinus* setteth it among the *Chamedries*, calling it *Chamedry spuria affinis rotundifolia scutellata*, which in my judgement is very improper, and may be set downe among the rest of his improper titles; for unlesse it bee the leaves in this plant that hath some likeness, and that is very little, there is no part therein that can agree with any *Chamedry*, eyther vera or spuria; for whoever saw a *Germander* with broad bucklerlike huskes of feede: the fourth is called by *Clusius* *Alyssum Galeni*, and saith hee never saw any plant that came nearer to the description of *Galens Alyssum* then this doth, and that notwithstanding that hee had read what *Columna* had written thereof, in his *condensatus* calling it *Planta Hispanica, Marrubio similis*, and not thinking it to be *Alyssum Galeni*, yet he was still of the same minde: and I finde that *Camerarius*, *Dodonæus*, *Lobel*, *Tabernmontanus* and *Bauhinus*, doe all follow *Clusius* herein, but none *Columna*; onely *Lugdunensis* seemeth to contrary *Clusius*, in saying that it seemed to him, that he did expresse the *Molucca spinosa* instead of *Alyssum Galeni*; the last *Columna* hath set forth in his *Phytobasanos*, calling it *Sideritis Alysson*, *Sideritis Heraclea Dioscoridis*, *Alysson Antonij Cui ex Galeno*; whereby hee seemeth to judge the *Sideritis Heraclea* of *Dioscorides*, to be all one with the *Alyssum Galeni*, and herein as it is likely confirmed, because he found *Aegina* and *Ætius* (as I sayd before) to say that some in his time called the *Sideritis Heraclea*, *Alyssum*; yet the figure that *Columna* setteth out for it, is so like (for I have not seene his plant if it differ from) the *Herba Indica*, that I thinke it the very same, whereas *Dioscorides* maketh his *Sideritis* to have longer leaves then Horehound, almost as bigge as Sage, but so is not his; but the same *Columna* in another place maketh the *Alpine Veronica folijs* to be *Alyssum* also, *Bauhinus* entitleth it, *Alyssum verticillatum folijs crenatis*, when as he called that of *Clusius* *Alyssum verticillatum folijs profunde incis.*

The Vertues.

These *Alyssa* of *Dioscorides* and *Galen*, although they differ in forme one from another, yet they doe agree as they say in this, that being taken in wine, or in broth, or in meate, or howsoever, doth cure the venome of the biting of a madde dogge, and thoroughly performe the cure, which *Galen* saith in *sexto simplicium medicamentorum*, it worketh from the likeness of the whole substance, and was found so to doe by plaine experience, without any other method, and that it would performe many other cures if any should try it, for those diseases where the faculties of drying, digesting and moderately cleansing, which are in this herbe are required; and therefore both *Dioscorides* and *Galen* doe say of each of their plants, that they cleanse the skinne from wheales and pimples, from spots and other discolourings, as the morpew, sunburning, &c. *Dioscorides* saith that his *Alyssum*, taken in drinke stayeth the hickocke if there be no ague, and that it will doe so also, if any shall but hold it in their hand or smell unto it: They are also effectuall for wounds, either inward or outward, to digest the clotted blood that is gathered by any fall, blow, or bruise, and to cleanse and heale old rotten and filthy Vleers, or creeping Cancers. And because *Dioscorides* saith it is an Amulet to expell charmes, that shall be used upon man or beast, and that tyed with a scarlet cloth to cattell that are diseased, it helpeth them; therefore divers in the ages since, have eeked this tale with the reports of farre greater things, which because they are not onely idle but prophane, I list not to insert them here: for from the forme of the feede vessells of the first here expressed, which is that of *Dioscorides*, as I sayd divers called it *Lunaria*, *Moonewort*, and went beyond the *Moone* in expressing the properties; and therefore I thinke had neede themselves to be cured of their madnesse herewith.

CHAP. LVIII.

Ulmaria sive Regina prati. Medowfweete or Medefweete.

Of this herbe there are two sorts, the one familiar to our cuntry, the other a stranger to us, and onely entertained of a few, and those the lovers of rare Plants.

1. *Ulmaria vulgaris*. Common Mede or Meddowfweete.

The stalkes of this Medefweete are reddish and easie to breake, rising to be three foote high, and sometimes to be foure or five, having at the joynts thereof large winged leaves, standing one above another at distances, which are made of many somewhat broad leaves, set on each side of a middle ribbe, being hard rough or rugged, crumpled much like to Elme leaves, wheteof it tooke the name, but having also some smaller leaves with them, even as *Agrimony* hath, somewhat deeply dented about the edges, of a sad Greene colour on the upper side, and grayish underneath; of a pretty sharpe sent and taste, very like unto Burnet, and will no lesse give a fine reddish to a cup of Claret wine if a leafe be put therein then Burnet; at the toppes of the stalkes and branches stand many tufts of small white flowers thrust thicke together, which smell much sweeter then the leaves; and in their places being fallen, come croked and cornered feedes: the roote is somewhat woody and blackish on the outside, and brownish within, with divers greater strings and lesser fibres set thereat, of a strong sent, but nothing so pleasant as the flowers or leaves, and perisheth not but abideth many yeares, shooting forth a new every spring.

2. *Ulmaria major sive altera*. The greater Medefweete.

This Medefweete groweth higher then the former, with longer winged leaves set one above another upon the

Ecc 2

erected

1. *Ulmaria vulgaris*. Common Medefweete.2. *Ulmaria major* sive altera.
The greater Medefweete.

crested brownish stalkes, having long footestalkes upon them, each being divided usually into three parts, the two lowest one against another, and every part also consisting of three or five smaller leaves then the other, separate each from the other, being hard crumpled and finely dented about the edges: at the tops of the stalkes grow the flowers in longer spikes more sparsely and not so thicke thrust together, turning downe their heads which are white like the former, and smelling very sweete also, more nearly resembling a Goats beard, whereof some have given it the name then the other: the roote is more woody, with many blackish strings which smell strong, and taste somewhat harshly: the stalkes and leaves dye wholly downe every yeare, and rise againe in the spring.

The Place.

The first groweth in moyst Meddowes that lye much wet, or neare the courtes of water, and the later is found also in shadowie woods, and places very often.

The Time.

They are found in flower, in some place or other all the three Summer moneths, that is, *June, Iuly* and *August* and their seede is ripe quickly after.

The Names.

They are not found mentioned by any of the ancient Greekes, or Latines, onely some thinke it may bee referred to *Rodora* of *Pliny*. It is called by the later writers *Ulmaria*, a foliorum *Ulm*i similitudine, of the likenesse of Elme leaves, of *Dodonæus* *Regina prati*, and *Barba*, and *Barbula Capra*, or *Barba Caprina* of *Tragus*, and by him thought also that it might be *Picnocomen* of *Dioscorides*, as *Gesner* in *hortis* and *Lonicerus* doe. *Fischerus* calleth it *Barba capri*, and *Lobel Barbi capra*. *Cordus Medesius* from the Germane word *Medesuss*, that is, Meddow-sweete. Some as *Lugdunensis* saith, tooke the later to be *Melandrium Plini*, and some also call it *Drymopogon*: *Anguillara* calleth them *Potentilla major prima* and *secunda*, and *Thaluis* the greater sort *Argentina major*, *Anguillara* saith the *Italians* call it *Christoforiana*, the *French* call it *Barbe de Cheuvre*, and *Roine des preis*, the *Germanes* *Geisbart*, and the greater *Wilde Geisbart*; and *Camerarius* saith *Wormkraut*, because as he saith the roote is often found, as if it were eaten by *Wormes*; but it is more likely for that it helpeth horties of the *Bottes*, and *Wormes*, and so he saith the country people used it; the *Dutch* *Reimette*, and as *Lobel* saith *Gheytent'ade*, and *Camecruidt*, in *English* *Medefweete* or *Meddowfweete*, and *Queene of the fields* or *Meddowes*.

The Vertues.

Being neare a little in taste and smell with *Burnet*, they are most likely to bee neare of the same facultie, yet *Tragus* accounteth them more hot and dry, they are also used in the same manner and for the same purposes, to stay all manner of fluxes, bleedings, and vomitings, and womens courses, as also their whites: it is sayd to alter and take away the fits of quartaine Agues, and to make a merry heart, for which purpose some use the flowers, & some the leaves: it helpeth also speedily those that are troubled with the *Collicke*, being boyled in wine and with a little

little honey taken warme, it doth open the belly; but boyled in red wine and drunke, it stayeth the flux of the belly, &c. it helpeth the Bortes in horses as you heard before; being outwardly applyed it healeth old Vlcers. that are cancerous or eating, and hollow or fistulous, which many have uted and much commended; as also for the sores in the month, and secreet parts: the leaves when they are full growne being layd upon the skinne, will after a small time, raise blisters thereon as *Tragus* saith: the water thereof helpeth the heate and inflammation in the eyes: the seede as *Camerarius* saith being taken, causeth paines in the head; and because both flowers and herbes are of so pleasing a sweete sent, many doe much delight therein, to have it layd in their Chambers, Parlars, &c. and *Queene Elizabeth* of famous memory, did more desire it then any other sweet herbe to strew her Chambe's withall: a leafe or two hereof layd in a cup of wine, will give as quick and as fine a relish thereto, as *Burnet* will, as I sayd before.

CHAP. LIX.

Potentilla. Wilde Tansey.

Wilde Tansey creepeth upon the ground, taking roote at the joynts, every where round about the place where it groweth, that it will quickly take up a great compasse, shooting forth sundry winged leaves made of many, set on both sides of a middle ribbe, some smaller, being set among the greater, somewhat like unto *Agrimony* or *Medesweete*, and like also unto *Tansley*, from whence it tooke the name; for it partaketh in forme with them all, and denteth about the edges,

but of a faire greene colour on the upper side, and of a silver shining white colour underneath: it beareth no stalk, but the flowers every one of them by it selfe stand upon a small short foote stalk, rising from the joynts with the leaves, which consist of five small yellow round pointed leaves, very like unto those of Cinkefoile, or Five leaved grassie: the prime roote shooteth downward like the Cinkefoile.

The Place.

It groweth almost every where wilde abroad in moist places.

The Time.

It flowreth in Iune and Iuly.

The Names.

It is called *Potentilla* ab eximijis viribus quibus pollet, and *Argentina* a foliorum argenteo splendore, some take it to bee *Stephanomichs* of *Pliny*, lib. 26. c. 13. others referre it to *Argemone*: It is also called *Tanacetum sylvestre*, or *agreste*, as *Brumfelsius* doth. *Tabermontanus* calleth it *Anserina*, *Gesner* in *hortis Germaniæ* *Argemone altera*: and so doth *Tragus*, and withall saith, it might be called also *Millifolium majus*, and some *Agrimonia sylvestris*: the *Italians* call it *Potentilla*, the *French* *Argentine sauvage*, the *Germanes* *Grenschich* and *Genferich*, the *Dutch* *Ganfericke*, wee in *Engliss* *Silverweede*, and wilde *Tansley*.

The Vertues.

Wilde Tansey is cold, and dry, and binding withall, so that it stayeth the laske, and all fluxes of blood in men or women, and some say it will doe so if the greene herbe be but worne in the shoes, so as it be next the skinne, it stayeth also spittings or vomittings of blood; the powder of the dried herbe taken in some of the distilled water, helpeth the whites in women, but more especially if a little *Corall* and *Ivory* in powder be put to it: it is also much commended to helpe children that are bursten, and have a Rupture: being boyled in water and salt; it is also said to be good for those that have bin bruised by any fall, or the like, to dissolve the blood, & as it is said doth help to break the stone, being boyled in wine and drunke, it easeth the griping paines of the bowels, and is good for the *Sciatica* and joynt aches: the same boyled in Vinegar with Hony and Allome & gargled in the mouth easeth the paines of the toothach, fastneth loose teeth, and the gums that are sore and spongie, and teteleth the *Uvula* or *Pallate* of the mouth when it is fallen downe; it clenseth and healeth those Vlcers that are therein, or in the secreet parts, and is singular good also for inward wounds, and to consolidate or close the lips of greene wounds, as also to heale the old moyst and corrupt running sores; in the legges or elsewhere: being bruised and applyed to the soles of the fecte, and to the wretches of the hands, it wonderfully cooleth the hot fits of Agues, be they never so violent: the distilled water clenseth the skinne of all discolourings therein, as morpew, sunburning, &c. as also pimples freckles and the like, and dropped into the eyes, or wet cloathes applyed unto them, taketh away the heat and inflammations in them.

Potentilla. Wilde Tansey.

CHAP. LX.

Agrimonia five *Eupatorium*. Agrimonie.

Ec have divers sorts of Agrimonie, some of our owne land, and some of others, as you shall have them here set forth unto you.

1. *Eupatorium* five *Agrimonia vulgaris*. Our common Agrimonie.

Our common Agrimonie hath divers long leaves made of many set upon a stalke, some greater, others smaller, all of them dented about the edges, Greene above, and grayish underneath, and a little hairy withall; among which ariseth up usually but one stiffe, strong, rough or hairy browne round stalke, 2. or 3. foot high, with smaller leives set here and there thereon: at the top whereof grow many small yellow flowers, one above another in long spike; after which come rough heads of seeds hanging downewards, which will cleave to any thing that shall rubbe against them, and sticke upon garments, being touched or cast thereon: the roote is blacke, long and somewhat wooddy, abiding many yeares, and shooting afresh every spring; it hath a reasonable good sent yet very finall.

2. *Agrimonia odorata*. Sweete smelling Agrimonie.

This other or sweete smelling Agrimonie is so like the other that there is hardly any difference to be discerned by the eye, but by the nose onely, except that if there be any difference, this groweth somewhat lesser, with rounder and whiter leaves then the other, and the roote of a darke red colour, but the smell herein doth much surpass the other, and so doth the taste being aromaticall and astringent; whereby it is held to bee of more excellent use to corroborate and strengthen weake parts.

3. *Agrimonoidea*. Bastard Agrimonie.

This herbe that is like to Agrimonie, and yet is none, and therefore called Bastard Agrimonie, hath divers long, soft and hairy leaves next the ground, every one upon a long reddish hairy foote stalke, which are cut and divided into many parts or leaves, seven for the most part, three on each side and the seventh at the end; but having some smaller ones betweene them, like as Agrimony hath, yet somewhat rounder then they, and all of them smaller dented, and sharper pointed, of a darker Greene colour on the upperside, and grayish underneath; among these leaves rise up sundry weake stalks, not fully standing upright, but leaning downewards, whereon are set very sparsely such like leaves, but smaller and rounder, with small peeces at the joynts of every of them; & at the tops come forth three or foure hairy Greene huskes like cups dented at the brims, out of every one whereof riseth a small yellow flower, like unto Agrimony, yet sometimes they scarce appeare above the huskes to bee seene; wherein after they are fallen and past, appeare small long and round graynes like unto the graines of

1. *Agrimonia vulgaris*.
Common Agrimony. 3. *Agrimonoidea*. Bastard Agrimony.

wheate, two standing together like two small lumps, which fall out of the huskes of themselves, when they are ripe, leaving the huske empty and gaping; the roote is small reddish and woody, abiding and not perishing in the winter.

4. *Eupatorium Cannabinum*. Hempelike Agrimony.

4. *Eupatorium Cannabinum*. Hempelike Agrimony.
The Hempelike Agrimony hath many long darke, greene, soft or woolly leaves, lying upon the ground, among which riseth up a soft whitish stalke, full of a white pith within it, to the height of two or three cubits sometimes, set full of such like leaves as grow below up to the top, where the flowers breake forth, many standing together in tufts, being very small and mossie, of a pale purplish colour, which turne into downe, and is carried away by the winde: the roote spreadeth farre, with many strings and fibres thereat: the whole plant hath a little sweete sent in it, but is very bitter, and so is the roote also.

5. *Eupatorium Cannabinum Americanum latifolium*.

The broader leaved Hempelike Agrimony of America.

This broader leaved kind of Agrimony groweth greater and higher then the former with a brownish stalke, and longer and larger leaves thereon, so that some have compared them to those of Elecampane: the flowers grow at the top of the stalke in greater number, and more sparsely with longer scaly husks being many long threds standing in the middle, of a more purplish blew colour, and the seede at their bottomes, which together are blowne away with the winde.

6. *Eupatorium Cannabinum Americanum angustifolium*.

Narrow leaved Hempelike Agrimony of New England

The other kind of American Agrimony groweth at the first with a few small long leaves upon the ground, unevenly dented in some places on the edges, and in others but little or not at all dented: the single hairy thicke round brittle stalke of two or three high foote or more, is full set on all sides, very thicke with longer and narrow leaves without

5. *Eupatorium Cannabinum Americanum latifolium*.
The broader leaved Hempelike Agrimony of America.

7. *Eupatorium aquaticum duorum generum*.
Water Agrimony of two sorts.

order,

order, some dented and some not, of 2. 3. and 4. inches long a peece, and halfe an inch broad or lesse, of a pale greene colour and soft, full of branches from the middle at the least upwards and smaller leaves on them, with very many small moslie pale threds for flowers on every branch, out of small greene fuskies or heads, which with the feede almost insensible, is carried away with the wind, that one would thinke it had no feede at all, which yet will spring very plentifully before winter of it owne sowing: the roote is a few hard sprays with small fibres at them, and perishing yeerely after it hath seeded.

7. *Eupatorium aquaticum duorum generum.* Water Agrimony of two sorts. Although all these sorts of Hempe-like Agrimony doe usually grow by watery ditch sides, and the like moist places, yet because they will also grow well in different soiles, I thinke it not a misse to joyne them all together, for the likenesse of name, forme, and qualities. Of this water Agrimony we have two sorts of our owne Land, and another also out of America or New England, being in all other things very like one unto another, but onely in the placing or setting of the leaves upon the stalkes; which in one sort hath divers leaves set together, like the fingers of an hand, all meeting together at the bottome, set by distances at the stalkes, every one not divided, but whole, yet dented about the edges, and in forme and greenesse like unto the leaves of wilde Hempe, or of the former Agrimonies but softer: and in the other, every leaf is somewhat divided, three or five upon a stalk, two at a joynt: the flowers are yellowish browne, made of many leaves like a starre, set about a middle thrum, with greene heades under them, divers standing together, thrusting forth from the joynts with the leaves, and at the toppes of the branches, which turne into long flat rugged feede, which will sticke to any garment it toucheth: the roote is made of many blacke strings and fibres, encreasing much, the whole plant is somewhat aromaticall smelling sweete, and tasting somewhat sharpe like Pepper, and so doth the roote also. We have another of this last sort, brought us from Virginia and New England, whose great hard folide, browne round stalk, of 3. 4. and five foote high, is wonderfull full of long branches from the bottome, set with joynts spotted red, on the younger greene ones, with large greene leaves on them, the lowest having five on a stalk, those upward but three yet larger than the former, as the flowers and feede is also, yet not rough but smooth flat and blackish: this hath no sharpnesse of taste in it.

America-
num.

The Place.

The first groweth in the borders of fieldes, by ditches and hedge sides throughout all the Land: the second is a stranger to us, growing with us onely in the gardens of the curious, but is naturall to Italy in many places, both the former and this growing neere one to another, or not farre distant: the third *Columna* found in Naples, and was sent to *Bauhinus* from many other parts of Italy likewise, as he saith himselfe: the fourth is found in many places that are wet, as the brinckes of ditches, and water courtes, and in the upland grounds also, where it will thrive and endure as well: the first, first h, and last came to us from New England & Virginia, the two first of the 7. grow sometimes in the very water; the last in shallow ponds and plashe of water, as also sometimes in places distant from them: the last American groweth huge and great in our garden grounds, coming first unto us out of New England, among the earth that *John Newton* a Chirurgion of *Colleton* in *Somersetshire* brought me with *Planta Cardinalis*, their little red Lillies and other plants.

The Time.

They doe all flower in Italy and August, and the feede is soone ripe after, yet the last American flowreth latest.

The Names.

The first is called in Greeke *εὐπατόριον* *Eupatorium*, and so the Latines call it also, of *Eupator* the first finder of it, as *Pliny* saith, who calleth it *Eupatoria*; and as it is thought is his *Argemonia* in *arvensis*, but *Dioscorides* sheweth that this was an error in his time, in mistaking *Argemonia*, for *Agrimonia*. Some also call it *Hepatorium* quoniam hepati precipue medetur: because it is a chiefe helpe to the Liver: it is also called *Agrimonia* of divers: some other names are also given unto it, as *Marmorella*, *Concordia*, *Lappa inversa*, and *Ferraria*. The Arabians call it, *Casul*, *Casul*, and *Gasel*: the Italians *Agrimonia*, and so doe the Spaniards, the French *Agrimonia*, and *Eupatoire*. The Germanes *Odermeing*, and *Bruchmurtz*: the Dutch *Agrimonia*; and we in English *Agrimonia* or common Agrimony. All the Apothecaries of our Land, especially of London now adayes, doe use this first kinde of Agrimony, as the most assured *Eupatorium* of *Dioscorides*: howsoever in former times, both we and they beyond the seas, did usually take the *Eupatorium Cannabinum*, which they called *Eupatorium vulgare*, for the true kinde, and either of ignorance not knowing the right, or of wilfulness in not enduring to be with drawne from their old errors, but our age hath reformed very many of these errorres, we were formerly nussed up in; and no doubt but by the diligent search of divers for the truth; both the light that hath risen hath appeared, and the darkness that remaines may be expelled, which time must as it hath done in part already, bring to passe, the pernicious wilfulness of many being the cause that it is not wholly performed as yet. *Anguilla* a first, and *Columna* after him doe make this *Eupatorium* of *Dioscorides*, to be that of *Avicenna* also, and so to be both one. *Dodonaeus* because he would not acknowledge the *Ageratum* of *Dioscorides*, to be the *Eupatorium* of *Mesues*, runneth himselfe a ground, on the dangerous shelve of two errorres, namely that the *Eupatorium* of *Mesues* and *Avicenna* doe not differ, and the *Eupatorium* of *Mesues* and *Dioscorides*, be both one; when as it is in neither of them true, for as we shewed in the Chapter of *Ageratum*, that *Ageratum* was the true *Eupatorium* of *Mesues*, which differed much from this of *Dioscorides*; so doth that of *Mesues*, from that of *Avicenna* also. which is by the most judicious now adayes, accounted to be the first *Eupatorium Cannabinum*, here set downe and as before is sayd was in former times called *Eupatorium vulgare*: yet there is some doubt therein, in that *Avicenna* saith, the flowers of his *Eupatorium* are like those of *Nemfar* or water Lilly, which the most judicious know not well how to reconcile, but doe verily suppose some error or mistake to be in the text: and although it be not the true *Eupatorium* of *Dioscorides*, the error thereof being now reformed, both their descriptions and figures inducing the same unto you, yet is it not without very speciall properties, as you shall heare by and by: the second is called *Agrimonia odorata* by *Camerarius*, and *Eupatorium alterum odoratum*, & aromaticum by *Columna*: the third is called *Agrimonia* of *Columna*, of *Bauhinus* *Agrimonia similis*, and of some *Pimpinella folio Agrimonie*: the fourth was usually called in former times beyond the Seas, as I sayd *Eupatorium vulgare*, as *Matthiolus* and others doe set it downe. *Eusebius* called it *Eupatorium adulterinum*, and *Dodonaeus* and *Thalys* *Pseudo hepatorium mas*: *Loebel* calleth

calleft it *Cannabina aquatica*, five *Eupatorium mas*. Gesner *Eupatorium aquaticum*, & *Trifolium cervinum aqua-*
ticum. Baptista Sardus calleft it *Terzola*, *Anguillara*, Gesner in hortis Germania, *Lacuna*, *Lonicum*, and *Camera-*
rum call it *Eupatorium Avicenne*. This is called in high Dutch *S. Kunigunds Kraut*, that is *Herba Sancte Kunig-*
dis & Waffersdts, of the low Dutch *Boelkencruut*: the first is called by Cornutus *Eupatorium foliis Enule*, and I
according to the title, to put a difference betweene it, have set *latifolium*, and the other of that sort which I
call *angustifolium*, and hath onely sprung with me, and hath not beene mentioned by any before: the last which
as I sayd is of two sorts, the one with divided leaves, the other with whole. are diversly named by divers; for
that with divided leaves is called by Tragus *Verbena sapina*, by Cordus upon Dioscorides *Verbenaca recta*, by Ges-
ner in hortis, *Forbesina Bononiensis*, and by some as he there saith, *Conyza palustris*, & *Verbesina* in his Appendix;
by Dodonæus *Hepatorium aquatile*, Ruellius tooke it to be *Hydropiper*, and so did Lugdunensis, but yet doth con-
fute his opinion, and sheweth the differences, as Matthiæus before hath done; by Cesalpinius *Bidens folio tripar-*
tito diviso, and by Bauhinus *Cannabina aquatica folio tripartito diviso*: the other with whole leaves is called by
Lobel, *Eupatorium Cannabinum femina Septentrionalium*, by Tabernmontanus, *Eupatorium Cannabinum Chrysan-*
themum; by Lugdunensis *Hydropiper aliud Dalechampii*; by Cesalpinius, *Bidens folio non dissecto*, and by Bauhinus
in his *Prodromus*, *Cannabina aquatica similis capitulis nutantibus*, and in his *Pinax Cannabina aquatica folio non di-*
viso: that of Virginia may well goe under the same title.

The Vertues.

The sweete *Agrimony* is held by divers to be the more excellent in all the properties of *Agrimony*; but be-
cause we cannot have it in that quantity, that may serve all mens continuall uses, our ordinary sort will serve suf-
ficiently well and effectually. *Scrapio* saith, it is hot and dry in the first degree, and as *Galen* saith, it is of thinne
parts, and hath a clensing and cutting faculty, without any manifest heate; it is also moderately drying and bin-
ding; it openeth the obstructions of the Liver, and clenseth it; it helpeth the jaundise, and strengthneth the in-
ward parts, and is very beneficiall to the bowels, and healeth their inward woundings and bruises or hurts, and
qualifieth all inward distemperatures, that grow therein: the decoction of the herbe. made with wine and
drunke, is good against the sting, and bitings of Serpents, and helpeth them that have soule, or troubled and
bloody waters; it is good for the strangury, and helpeth them to make water currantly, and helpeth also the
collicke; it clenseth the brest, and helpeth the cough: it is accounted also a good helpe to ridde a *quartaine* as well
as a *tertian* ague, by taking a draught of the decoction warme before the fit, which by altering them, will in time
ridde them: the leaves and seede saith *Dioscorides*, the seede saith *Pliny*, stayeth the bloody fluxe, being taken in
wine: outwardly applyed it helpeth old sores, cancers, and ulcers that are of hard curation, being stamped
with old Swines grease and applyed, for it clenseth and afterwards healeth them: in the same manner also ap-
plyed, it doth draw forth the thornes or splinters of wood, nayles, or any other such thing, that is gotten into
the flesh, and helpeth to strengthen members that be out of joyn: it helpeth also foule impostumed cares, be-
ing bruised and applyed, or the juyce dropped into them: the distilled water of the herbe, is good to all the
purposes aforesaide, either inward or outward. The Hempe like *Agrimony*, or *Eupatorium Cannabinum*, is of the
same temperature of heate and dryeth, for it also openeth, clenseth, cutteth and maketh thinne those humors
that are thicke and tough, and therefore is very effectuall for the dropisie, yellow laundise, obstructions of the
Liver, and hardnesse of the Spleene, fulnesse of humors, and the evill disposition or habit of the body: the juyce
hereof drunke, is commended much against the impostumes that come of a cold cause within the body, and for
those that are without, the herbe bruised and applyed outwardly: the decoction thereof taken before the fits
of long and lingering agues, doth helpe much to free any from them: the same also provoketh urine, and wo-
mens naturall courses; and boyled with Fumitory in whey and drunke, helpeth scabbies, and the itch, which
proceede of salt and sharpe humours; but the juyce mixed with vinegar, and annointed cureth it outwardly; and
cureth the Leprosie also, if it be taken in the beginning, but the juyce being drunke, is held to be more effectuall:
the juyce being clarified and dried, and the weight of a scruple taken in pills, killeth the wormes of the belly,
and the leaves steeped in drinke, and given to children doth the same. The leaves are often given by the Coun-
try people, to their cattle, and other beasts, troubled with coughes, and when they are broken winded, or have
gripping paines within them, all which it helpeth: the flowers chiefly are used to heale both greene and old
sores, but the herbe it selfe will doe so likewise: it is sayd that hunters have observed, that Deare being wound-
ed, by the eating of this herbe have beene healed of their harts: the dried herbe being burned, driveth away
by the smoake and smell thereof, all flies, waspes, and the like, and all other hurtfull and venomous crea-
tures.

CHAP. LXI.

Cannabis. Hempe.

Here are two kinds of Hempe, the tame or manured, and the wilde or baltard; of the manured kind
there are two sorts, male, and female, of which I intend to entreate in this Chapter; and of the wilde
or baltard sorts in the next.

Cannabis sativa, Manured Hempe.

The Manured Hempe, (which is of so great use, both for linnen cloath and cordage) is as I sayd of two sorts,
male and female as they are called, yet both rise from one and the same seede; and herein is somewhat like the
French Mercury, but how this change in nature should be, no man can give a reason: the male hath the stronger
stalks, and more bushie, and the leaves greater, and of a darker greene colour, and bearing seede without any
shew of flowers, and endureth longer, before it be ripe to cut downe: contrariwise, the female hath a single
stalk, for the most part, with few or no branches, and beareth flowers, but no seede followeth, and is ripe, and
must be cut downe, or pulled up before the other: they both rise up to a great height, even sixe or seven foote
high or more, with many leaves set thereon at distances, every one divided into 5. or 6. or 7. severall leaves, joy-
ned together at the bottome of them, and dented about the edges, somewhat like unto the forme of the leaves of
the

the *Palma Christi*, *Lupine* and bastard *Hellebor*, every one set upon a long foote stalk, of a darke Greene colour, and of a strong unpleasant savour; the flowers are small, and of a whitish yellow colour, standing many together, upon a long branch, which turne into dust, and are carried away with the wind, not carrying any seede after them; which being the tenderer and weaker, and the stalk hollow and not so strong, maketh the finer stuffe, to be spunne and woven into linnen cloath, fit for mens bodies, or other the like uses, and is called of some Sommer Hempe: but the other being stronger and called winter Hempe, because it is not gathered untill toward Winter, or at the least, not of a moneth after the other, beareth seede in the same manner, that the other bore flowers on long branches, which is round and contained in round heads: the rootes are made of many strong stringes which take fast hold in the ground, but dye and perish every yeare: to shew you the manner of steeping, drying, beating, and cleansing hereof, to be made into cloth or Cordage, is not my purpose, nor pertinent for this worke; besides that, it would take up too much roome and time; it is familiarly known to every country huswife almost.

*Virginica
est major.*

We have had from *Virginia* a very great kinde of Hempe, with greater stalkes, and much larger leaves and flowers, which being broken down with the wind, when it was almost at the perfection, we cannot fully expresse it as we would, and as time may doe it hereafter.

The Place.

Although *Pliny*, lib. 20. c. 23. saith that Hempe was formerly found wilde, yet know we not in these dayes, where such may be found; for in all places of the world I thinke, it is onely sowne in fieldes and places, chosen out for the purpose.

The Time.

It is sowne in the end of *March*, or beginning of *April*, and is ripe in *August* or *September*, as the two sorts grow ripe and fit to be gathered.

The Names.

It is called in Greeke *κάνναβις*, and so *Cannabis* in Latine also, from the Greeke word *κάνναβις*, saith *Lobel*, quod fonticulos parvasve scaturigines significat, quo loci libens sponte, & sata luxuriat: the *Arabians* call it *Canab*, and *Sebebedenegi*: the *Italians* *Canape*: the *Spaniards* *Cannamo*: the *French* *Chanvre*, and *Chaneve*: the *Germans* *Zamer Hauff*: the *Dutch* *Kempe*, and we in *English* Hempe.

The Virtues.

Hempe is cold and dry say *Tragus* and *Lonicerus*, but *Galen* in lib. 7. simpl. medicament. & primo de aliment facultatibus, saith it is hot and dry, and to doe *Matthiolus*, *Ruellius*, *Fuchsius*, and *Lugdunensis*, agreeing with him therein: the seede of Hempe consumeth wind, and by the much use thereof, doth disperse it so much, that it dryeth up the naturall seede of procreation, therewith: for it is hard of digestion, hurtful to the head & stomach, and breedeth ill blood and juyce in the body, yet being boyled in milke and taken, helpeth such as have adry and hot cough, as *Tragus* saith: the *Dutch* as one saith doe make an Emulsion out of the seede, and give it with good successe to those that have the laundise, especially in the beginning of the disease, if there be no ague accompanying it, for it openeth the obstructions of the gall, and causeth digestion of choller therein: but as *Matthiolus* saith, the women in *Germany* went a wrong course, to give their children the decoction of Hempe seede for the falling sicknesse, which it did rather augment, then helpe to take away: the Emulsion or decoction of the seede, stayeth askes and fluxes that are continuall, easeth the paines of the collicke; and allayeth the troublesome humours in the bowels: divers also doe stay bleedings herewith, whether at the mouth or nose, or at other places, by frying the leaves with some of the blood that hath come from them that bleed, and so given them to eat; it is held very good to kill the wormes in man or beast, as also the wormes in the eares, or the juice dropped therein, or to draw forth any other living creature that hath crept therein; and to shew the strength hereof for this purpose, *Matthiolus* saith, that the decoction thereof, powred into the holes of earth wormes, will draw them forth, and that fishermen and anglers have used this seate to get wormes to baite their hookes. The decoction of the roote is sayd to allay inflammations in the head, or any other part, the herbe it selfe, or the distilled water thereof applied performeth the like effect; the same decoction of the rootes, easeth the paines of the gout, the hard tumours, or knots of the joynts, the paines and shrinking of the sinewes, and other the like paines of the hippes: it is good to be used, for any place that hath bene burnt by fire, if the fresh juyce be mixed with a little oyle or butter. *Matthiolus* saith, that Hempe seede, given to Hennes in the winter, when they lay fewest egges, will make them lay more plentifully.

Cannabis sativa.
Measured Hempe.

CHAP. LXII.

Cannabis sylvestris five *spuria*. Wilde or bastard Hempe.

Here are two or three sorts of herbes, that are accounted by divers for wilde or bastard Hemptes, yet are none of them the true *Cannabis sylvestris* of *Diocorides*: *Bauhinus* therefore in not so accounting of them, referreth them to the kinds of Nettles, as you shall heare by and by.

1. *Cannabis spuria prima*. The first bastard Hempe.

This bastard Hempe riseth up with a reasonable great hairy square stalke, not very strong nor upright, but as it were leaning downe, with divers joynts bunching out like knees, and two leaves set at every of them, somewhat long hairy and pointed, of a fresher Greene colour then the manured Hempe, and dented about the edges: at the joynts likewise come forth divers branches joynted and set with leaves in the same manner, where about towards the toppes grow divers hooded and gaping flowers, like those the dead Nettle, but larger, and greater, of a pale purplish colour, standing in small Greene prickly huskes; therein afterwards groweth the feede, being small and round, three or foure growing together: the roote is red and white, and somewhat spreading, but dying before winter.

There is another hereof, whose flower is of a perfect white colour for the most part, or a little pale whayish, *Flora alba* which doth plainly expresse the difference.

2. *Cannabis spuria altera*. The second bastard Hempe.

This other bastard Hempe differeth not in stalke from the former, but the leaves are shorter and rounder; the flowers hereof are not so great as they, the uppermost part or hood whereof, is of a pale colour tending to yellow, and the lower part of a deeper red or purple colour: the huskes of the flowers are somewhat more prickly then the other.

3. *Cannabis spuria tertia*. The third bastard Hempe.

The third bastard hempe is in the growing much like the former, but that the leaves at the joynts are somewhat long and narrow, a little fadder and not dented about the edges in the most; the flowers hereof are hooded and gaping, but they are of a pale yellowish colour wholly, with a little or no shadow or spot therein, and are thicker about the joynts, whose huskes have longer and sharper points then the rest.

The Place.

All these doe grow as well in moyst grounds as in dry, by ditch sides, and by the path wayes, under walls, &c. and some of them will be found in gardens, to be continually pulled up as a weede, and unprofitable herbe: yet the second sort with a white flower was found by the path wayes neare *Clapham*, and in the ditches by *Rediffe*, or *Rother Hithe*.

1. *Cannabis spuria prima*.
The first bastard Hempe.

3. *Cannabis spuria tertia*.
The third bastard Hempe.

The

They flower for the most part in July.

The Time.

The Names.

Most writers call these *Cannabes spuria*, and *sylvestres*; yet as I sayd before, *Bauhinus* doth call them *Urtice facta*, *achleata*. The first is called, *Cannabis sylvestris*, by *Tragus* and *Lugdunensis*, and *Spuria altera* by *Lobel*, by *Tabermontanus* *Cannabina alba*, and by *Bauhinus* *Urtica aculeata folijs serratis*, the second is the *Cannabis sylvestris spuria* of *Lobel*, *Alyssum arvense album* of *Tabermontanus*, *Urtica aculeata folijs serratis altera* of *Bauhinus*, who thinketh it may be also the *Sideritis Cordi*, whereof *Thalys* maketh mention in *Harcynia sylva*. The third is called by *Lobel*, *Cannabis spuria facie Urtice*, by *Bauhinus* *Urtica aculeata folijs non serratis*, and is the *Sideritis altera Matthiolis*, *Lugdunensis* expresseth it.

The Vertues.

There is little use made of these herbes, eyther inwardly or outwardly, yet they are thought to bee neare the temperature and qualities of the former Hempes: *Lobel* saith they are used as an assured remedy against nodes and wennes, and other hard tumours in the flesh, when other things have failed and would do no good.

CHAP. LXIII.

Isatis sive Glastrum. Woade.

F this herbe there is accounted two sorts, the one manured, the other growing wilde; yet they are both to like the one unto the other, that as it is thought the manuring onely causeth the difference; a third sort I have added to them for the colours sake though much disproportioned in forme.

1. *Glastrum sativum. Manured Woade.*

Woade that is sown in fields for use, hath divers large, long and somewhat broad leaves, like unto those of Ribwort Plantaine, but larger thicker, and of a darker blewish Greene colour; from among which ariseth up a strong stalke three or foure foote high, and sometimes more, with divers such leaves set thereon, but smaller up to the top, where it spreadeth into divers branches, at the ends whereof grow small yellow flowers, in whole places come long flattish huskes, or cods like tongues, blacke when they are ripe, and pendulous or hanging downwards, wherein lye the feede, which if it be a little chewed or broken with moylture, will give a blew colour: the roote is white and long, growing downwards.

2. *Glastrum sylvestre. Wilde Woade.*

This wilde Woade differeth little from the tame or manured, but that it is smaller, the stalke slenderer, the leaves lesser, and the huske or cods smaller and narrower.

3. *Nil sive Anil, Glastrum Indicum. Indico or Indian Woade.*

Although *Nil* or *Indico* be not in forme like Woade, yet for the rich blew colour sake I thinke good to make

3. *Glastrum sativum. Manured Woade.*

3. *Nil sive Anil, Glastrum Indicum. Indico or Indian Woade.*

mention

mention of it here with it, not onely to shew you what it is, and how made, but to incite some of our nation, to be as industrious therein as they have been with the former Woade, seeing no doubt but it would bee more profitable. *Camerarius* and *Clusius* have both had the seede of a plant sent them under the name of *Nil*, or *Anil*, as they say, but having growne with them they have judged it rather to be another plant, then that whereof it bore the name; for *Clusius* saith, that his plant was like unto a small *Colutea*, which he afterwards as hee saith found to be *Alpinus* his *Egyptian Sesban* (and sure he guessed somewhat neare it, for if it be not the same it is very like it, as you shall heare by and by) and *Camerarius* saith his plant had leaves like unto *Barba Iobis frutex*, but larger; which comparison may hold a fit correspondence likewise; yet *Linseot* saith the true hath leaves like *Rosemarie*. But I shall here give you the description of the plant by two severall men; the one is *Francis Ximenes*, as he is set downe in *Ioannes de Laet* his description of *America*, or the *West Indies*, in pag. 330. and 331. who saith it is a shrubbe, producing many round smooth woody stemmes from the roote, about six palmes or spans high, about the bignesse of ones little finger, of an ash colour, with leaves thereon like unto *Cicers*, having small whitish red flowers, and afterwards many long Cods growing together, and hanging downwards like unto the wormes called *Ascarides* which we call *Arsewormes*, yet somewhat thicke and full of blacke seede (*de Laet* addeth in a Parenthesis, Some say the seede is like unto *Fenugreek*, flat at both ends as if it had beene cut off.) For the manner of making whereof hee saith, They cast the leaves into a brasse vessell, pouring thereon scalding hot water, or rather lukewarme (yet some allow of cold water as best) stirring them very well that the water may draw out the tincture, which they poure out into another vessell that hath an hole therein somewhat high, whereout the cleare water may passe, the thicke coloured substance remaining behinde, which afterwards they straine through a cloth or bag, setting the thicke substance in the Sunne, and make it into cakes which is then dried and hardened in pans at the fire; Thus *farre de Laet*. The other description is by *Mr. William Finch* a *London Merchant*, as it is set downe by *Mr. Purchus*, in his fourth Booke of *Pilgrims*, the 4 Chap. pag. 429. It is a shrub saith he, not above a yard high, and as bigge as a mans thumbe at the biggest; the branches are woody like unto *Broomes*, having many leaves set together on a short footstalk, in forme like *Cives* (misprinted for *Cicers*) or *Cliche* pease, or like those of *Sena*, but shorter and broader: the flower (saith he) is like unto an *Hearts ease*; the seede is inclosed in a small round cod about an inch long resembling *Fenugreek*, seede, but more blunt at both ends (such very seedes for colour also we have often had sent for *Indico* seede, yet never any sprang with us but once, and that but one plant, and over hastily plucked up before it had any forme to be discerned, yet the small threddy roote was of a pale blew colour, which I doe keepe by me to shew: the seede also while it is fresh being steeped in water gave a blewish colour.) These descriptions so like in most things and so nearly also resembling *Alpinus* his *Sesban*, but that it hath a yellow flower, perswadeth me that *Sesban* being undoubtedly a kind of *Glaux Leguminosa*, & so may *Indico* be also but differing in the Dye. The manner of making as *Mr. Finch* saith is thus (being variously described by others.) They gather the leaves (when they have cut the branches, in *August* and *September* after the raines, the seede being ripe in *November*) and cast them into a long Cesterne pouring water thereon, and presse them downe with stones that they may be overcovered, so abiding for certaine dayes, that the substance of the herbe may be drawne out into the water, which they let forth into another round Cesterne, in the midst whereof is another small Cesterne, or Center (the meaning whereof I doe not understand) and labour it with great staves, like batter or white Starch, summing of the cleare water after it is settled; then labour it afresh, and draw off the cleare water againe being settled, doing thus so often untill nothing but a thicke substance remaine, which they dry in the Sunne being spread upon cloth, and after it is a little hardened, they make it into small balls with their hands, laying them to dry on the sand, for any other thing would drinke up the colour, as also if it take raine in the drying it will lose his colour and gloss. After it is sowed it endureth three yeares: that *Indico* of the first yeare while the plant is tender, is weighty and reddish called *Natee*: that of the second yeare is rich, being very light and of a perfect violet colour (swimming on the water, and is called *Cyree*: that of the third yeare when the plant is declining (and peradventure but fabulous traditions) is a weighty blackish *Nil* the worst of the three, and called *Casteld*. The best is made saith hee, about *Biany* neere 20. miles beyond *Fesipore* in the *Mogols* country in the *East Indies*. And *Ximenes* aforesaid as *de Laet* hath it, saith, the *Indians* of the West call the Plant *Xihuiquil pitzabmac* and the *Mexicans* call the tincture made thereof *Mobuisli* and *Tlecobuisli*, but the other *Barbarians* *Tlacchoylinhuil*, and therewith colour their haire blacke. I have not heard that good *Indico* is one of the Merchandises of the West, but of the *East Indies* onely. *De Laet* having given the figure of a branch of *Indico*, I doe here likewise exhibite the same.

The Place.

The wilde kinde groweth in sundry untilld places and fields in *Germany*, as it is sayd, but the manured is sowed as well in *Germany*, *France*, and *Spaine* as in *Italy* also, in *Umbria* neare unto *Nocera*, as *Matthiolus* saith, where there is a towne called *Gnado*, of the Woade that grew there abundantly; and in the *Ilands* of *Terceris* belonging to *Spaine*: Some have sowed it in our owne land, but they have found it to be the cause of the destruction of their Bees; for it hath beene observed, that they have dyed as it were of a *Flix* that have tasted thereof: it is sayd that in some places they sow their Woade upon the same ground, that afterwards they sowed their Corne, which crop of Woade is three times cut in a yeare, and that these rootes that are not turned up with the Plough will heare seede among the Corne. The Plant whereof the *Nil* or *Indico* is made, groweth in divers places of the *East Indies*, but especially in *Guzurate*, and the best in and about *Biany* in the *Mogols* country.

The Time.

Woade sowereth in *June*, but the seede is late ripe.

The Names.

It is called in Greeke *Γόμμη*, and *Isatis* in Latine, *Glastum* also and *Gnadum* of some, after the *Iranian* word *Gnado*, whereby they call Woade. *Cesar* in his first booke, *de Bello Gallico*, maketh mention of *Glastum*, where-with the ancient Brittaines did colour themselves to seeme the more terrible to their enemies in battaile as it is thought; or that they did then as the *Savages* of the *West Indies* doe now delight in such a colour, to paint their naked skinned therewith. *Pliny* also speaketh of the Brittaines using of *Glastum* in his 22. Booke and first Chap. but divers doe diversly imagine from whence the word *Glastum* should be derived; some have imagined, that

in both those Authors the word *Vitrum* should be read in stead of *Glaſtum*; because the *Germane* word *Glaſſe*, from whence they thinke *Glaſtum* is derived, is ſignified by *Vitrum*; and ſome alſo would turne *Vitrum* into *Nitrum*; but *Nitrum* is not for ſuch uſe, for it is ver very rare or ſcarſe ſcene of any with us: the *Arabians* call it *Dili*, *Deligi*, *Chate*, *chatis*, *Alchat*, *Alden*, or *Addlen*, or as *Avicenn* in his 512. Chap. ſaith *Nil*; yet in his 306. Chap. he hath another *Nil*, which is a kind of *Convolvulus* or blew Bellflower. whereof I have ſpoken in my former Booke, which *ſerapion* calleth *Hab alnil gravum nil*: but this *Nil* (for *Nir* in the *Arabicke* tongue, as ſome ſay doth ſignifie any blew colour, ſuch as this Woade or the *Nil* or *Indico* maketh) or *Anil*, from whence was made a blew colour formerly called with us *Aneale* for the Dyers and others uſe, and was wont to be brought in round great cakes like wax, with round bottomes five or ſix packt up in double ſkinnes longwiſe, which was but a baſe or counterfeit ſort of *Indico*, (as it is probably gheſſed) made up with ſand and traſh to augment the weight; or elſe it was a worſer kinde of that *Nil* or *Anil* that grew in *Turkey*; for the beſt *Nil* *Anil* or *Indico* as is aforeſaid commerth to us from *Guzurate* in the Eaſt *Indies*; *Joſeph Salbank* his report of *Indico* in *Purchas lib. 3. ch. 9. ſec. 4. pag. 236.* (who by reaſon of ſhipwracke upon the *Maagols* countrey, with others was forced to travell over land many dayes) ſaith that at *Bienie* the beſt *Indico* is made, where are *Indico* milles and growth upon ſmall buſhes, and beareth ſeede like Cabbadge ſeede, which being cut downe lyeth on heapes for halfe a yeare to rot, and then troden out by Oxen from the ſtalke and ſo ground fine at the milles, and laſtly boiled in furnaces, refined and ſorred, the beſt there worth eight pence the pound: which laſt claue of boyling refining, &c. me thinkes favoereth ſomewhat of *Dioſcorides* text, (but you have another mans report before) *Dioſcorides* mentioneth *Indicum* in his fifth booke and 67. Chap. to be of two ſorts, the one naturall iſſuing out of *Indian* Canes or Reeds: the other a blew or purple ſcumme that riſeth on the dyſat, which is taken off and dried: this ſaith *Dioſcorides*, and peradventure was our very *Indico*, although related it may bee in this manner, which ſheweth how lame the ancients were in the knowledge of foraine doings: but we have indeede, even in theſe dayes, a certaine thing called by divers *Flory*, which the painters ſometimes uſe, and is the ſcumme of the dyſat, while the cloth is upon the dying a blew colour with *Indico* or Woade, and is a fine light powder. The *Italians* as I ſayd before call Woade *Grado* and *Glaſſo*; the *Spaniards* call the herbe while it is Greene and growing *Guada*, but when it is made up and dry, they call it *Paſſel*, forſe quia in paſſillos cogantur, the *French* *Paſſel* likewiſe, the *German* *Weijſe*, the *Dutch* *Weer*, we in *Engliſh* Woade and Wade.

The Vertues.

The faculties of Woade are binding and very drying, and ſomewhat bitter withall, but not ſharpe, and the wilde ſort much more, as uſually all wilde herbes exceede the tame in the properties, and therefore it reſiſteth putrefaction, and preſerveth therefrom more then the tame: the tame ſtancheth bleedings of all ſorts, eyther inward or outward, eyther upwards or downewards more then the wilde: the decoction of the manured, but much more of the wilde ſort, made with wine and drunke, helpeth the hardneſſe of the ſpleene; and if the region thereof be outwardly ſomented therewith alſo, it will doe the more good: the manured is much more profitably uſed for all Greene wounds then the wilde, quickly to ſoder up the lippes of them, and no leſſe profitable it is to repreſſe the corroding and malignant qualities of fowle and eating Vlcers, ſoule Cancers and the like, and healeth them alſo; as alſo allayeth and diſcuſſeth all hot inflammations, impoſtumes, *S. Antonies* fire, hard tumours or ſwellings. *Indico* (which as is ſayd, was formerly taken for the ſpumme of the dyſat, in dying a blew colour, either from Woade or *Indico*) as *Dioſcorides* ſaith is of the ſame qualities, both to cleaſe and repreſſe the malignitie of ſoule Vlcers, and to diſſolve tumours, breake impoſtumes, and to dry up and binde the fluxions of blood or humors: the juice of Woade preſerved all the yeare, or the diſtilled water of the herbe, worketh the ſame effectes that eyther the decoction or the powder of the dried herbe doth.

CHAP. LXIII.

Herba Lutea ſive Luteola. Would or Welde or Diers weede.

Thought good to joyne this plant unto the other before going, both for the dying quality and healing alſo, although not ſo notorious as the other: but although with many former writers, there hath bene but one ſort remembered, yet we have attained the knowledge of two or three other as you ſhall have them expreſſed unto you.

1. *Luteola vulgaris.* Common Would or Diers weede.

The common Would or Diers weede groweth buſhing with many long and narrow flat leaves upon the ground, of a darke blewifh Greene colour, ſomewhat like unto Woade, but nothing ſo large, a little crumpled as it were and ſomewhat round pointed, which doe ſo abide the fiſt yeare; and the next ſpring from among them riſe divers round ſtalke, two or three foote high, beſet with many ſuch like leaves thereon, but ſmaller, and ſhooting forth ſome ſmall branches, which with the ſtalke carry many ſmall yellow flowers, in a long ſpiked head at the toppes of them, where afterwards come the ſeede, which is ſmall and blacke, encloded in heads that are divided at the toppe into foure parts: the roote is long, thicke and white, abiding the winter: the whole herbe changeth to be yellow, after it hath bene in flower a while.

2. *Luteola vulgaris Cretica.* Small Would of Candy.

The ſmall Would of Candy hath likewiſe many long narrow leaves like the former, and tall high ſtalke with ſmaller leaves on them alſo: the long ſpiked heads have ſomewhat larger flowers, more ſpread open and ſtanding ſingly each by themſelves, in other things not differing from the former.

3. *Lutea maxima Cretica ſecunda.* The bearing great Would of Candy.

This great plant riſeth up in Candy, with divers great ſtalke, ſome of them as bigge as a mans arme of five, ſix, eight and ten cubits high, yet periſh in winter, bare or naked of leaves next the ground for a cubits ſpace, the loweſt leaves being without foote ſtalke joyning cloſe at the bottome, the other growing up higher up to the toppes, have all of them foote ſtalke of a ſpanne long: the leaves of themſelves are very large, made of many ſomewhat broad and long Greene ſhining ones, ſet one againſt another on the middle ribbe, and not yet alwayes directly

directly opposite one unto another, every one somewhat like unto the leaves of Hempe (whereof it is most likely to be a *species*) ragged or dented about the edges, yet none of them divided but the end leaf, which is sometimes divided, seldome into two, and sometimes into three parts, each ending in a long point; the stalkes are branched, but hath onely divers small stalkes, or long spikes of flowers thrust forth which are yellowish, green and mossie, bowing downewards, with many long and narrow leaves among them, and stand in yellowish greene huskes; wherein after the flowers are fallen, come the heads full of very small reddish feede: the roote is very great and woody, and parted into many long armes or branches, which in the naturall places, and other warme countries, abideth many yeares, but will hardly endure the winters of our cold countrey broad as we have often proved.

4. *Luteo maxima Cretica sterilis*. The barren great Would of Candy.

There is no difference in this from the other, but that as Hempe and Mercury, and such like plants, one beareth feedes, and the other doth not, so this although it beare flowers, yet no feede is seene to follow at any time after it is in the former.

The Place.

The first groweth every where by the way sides, in moist grounds as well as dry, in corners of fields and by-lanes; in some places in Kent, they use to sow their fields therewith after their Barley, which abideth untill the next year, and then is gathered; the rest are naturall of Candy, and as I sayd will hardly indure, or at the least beare in our climate.

The Time.

The first is in flower about June, but the others flower very late or not at all with us.

2. *Luteola vulgaris Cretica*. Small Would of Candy.

1. *Lutea vulgaris*. Common Would, or Diers Weede.

3. 4. *Lutea Cretica fertilis & sterilis*. The great Would of Candy both bearing and barren.

The Names.

There is not any Greeke name knowne to be given unto it. *Pliny* maketh mention of it in his 33 booke, and 5. chap. and calleth it *Lutea*, yet *Bauhinus* referreth it to the *Genista tinctorum* Greeneweede. *Vitruvius* also in his 7. booke of Architecture, and 14. chap. calleth it *Luteum*, and *Virgill* calleth it *Lutum*, in the 4. Eclog of his *Eucolickes* in these verses,

Ipse sed in pratis, aries jam suave rubenti

Murice, jam creceo, mirabit vellere Luto.

It is called also by some *Luteola*; and by some also thought to be the *Reseda* of *Pliny*, because they agree so well in divers parts. *Cesalpinius* in his ninth booke, and 35. chap. maketh it to be the *Myagrum* or *Melampyrum* of *Dioscorides*, and calleth it according to the peoples terme in his time, *Guadarella*: It tooke the name of *Lutea*, not onely of the yellow colour of the herbe and flowers, when it is dry, but chiefly from the yellow colour in the dye. *Tragus* tooke it to be *Antirrhinum*; because the seede vessels thereof have as it were holes therein. Some have taken it also to be *Phytanma* of *Dioscorides*, and some to be his *Struthium*, among whom are *Lacuna*, and *Gesner* in *hortis Germanie*: but *Mathiolus* calleth it *Pseudostruthium*: *Dodonæus* calleth it *Herba Lutea*, *Lobel*, *Luteola*, *Lonicera* and *Tabermontanus* *Catanance*. The Second is thought by *Honorius Bellus*, in his second Epistle to *Clusius*, to be the true *Struthium* of *Dioscorides*, and faith that it is called *Cumene* throughout all Greece: but *Camerarius* in *horto*, seemeth to make it and the common sort all one, the third and fourth are remembered by *Pona*, the one in his Latine, and both in his Italian Edition more exactly.

The Vertues.

Mathiolus faith, that the roote hereof, is hot and dry in the third degree, and that it cutteth tough slegme, it maketh grosse humours thinne, it doth resolve hard tumours, it digesteth raw slegme, and openeth obstructions. Some doe not onely commend it, against the bitings of any venomous creatures, to be applied as well outwardly to the wound or hurt place, as to be taken inwardly, to expell the poyson thence: but also much commended it to be used against the Plague or Pestilence: the people in some Countries of this Land, doe use to bruise the herbe, and lay it to the cuts or wounds, they chance to make in their hands, or legges, &c. the chiefe use otherwise they have thereof, is to dye cloth, either wollen or linnen, or silke, raw or woven into a yellow colour, and also to give a greene colour to those clothes or silkes, have first bene dyed with Woade, into a blue colour, which *Vitruvius* it seemeth was not ignorant of in his time, for he speaketh thereof in the aforesayd place, both booke and chapter, that a yellow colour upon a blue, is changed into greene, and for these uses, there is great store of this herbe spent in all Countries, and thereof many fields sown for the purpose.

CHAP. LXV.

Lamium. The Dead Nettle or Archangell.

The word *Lamium* which we call dead Nettle or blind Nettle, is diversly taken by divers, for some doe make it a Nettle, and number it among their kinds; others make it a kinde of *Galeosif*, as besides others *Bauhinus* who confoundeth them together, maketh those herbes to be *Lamia* that *Clusius*, and others make to be *Galeosif*, & *e converso*; some also make them to be kinds of *Scrophularia*, and some those to be *Lamia*, which others call Chickeweeds and Balme, which are all in my judgement severall herbes, and to be handled severally: for which purpose I will endeavour what in me lyeth, to distinguish them, that each shall have their owne due: and if I shall not herein perhaps satisfie every one, for *quot homines, tot sententiae*, yet I shall satisfie my selfe, who I am perswaded shall not want many partakers; and yet I cannot, nor doe challenge any prerogative of not erring in so intricate a businesse, where so many learned writers have failed before me: take therefore in good part what I here set downe, and if any finde fault with any of them to be misplaced, let them amend it, by true judgement not worthy of fault finding, and I shall soone subscribe unto them.

1. *Lamium vulgare folio subrotundo flore rubro*. Red dead Nettle or red Archangell.
This Dead Nettle, or Archangell, hath divers square stalkes somewhat hairy, at the joynts whereof standing a good distance one from another, grow two sad greene leaves, dented about the edges, opposite the one to the other, the lowermost upon long footestalkes, but without any towards the toppes, which are somewhat round, yet pointed at the ends, and a little crumpled as it were and hairy; round about the upper joynts, with the leaves which there grow close together, grow sundry gaping flowers, of a pale reddish colour, somewhat like unto Betony flowers, after which come the feedes, three or foure set together in a huske: the roote is small and shreddy perishing every yeere: the whole plant, hath a strong sent, but not sticking.

2. *Lamium Hispanicum*. Spanish Archangell.
This Spanish kinde hath darke browne square stalkes, rising halfe a foote high, bearing two small and almost round leaves at each joynt, resembling the former red common Archangell: the tops of the stalkes and branches are thicke set with flowers, spike fashion, without any leaves among them, which before they open are short and close, helmet like, but afterwards growing long and slender toward the bottome, the toppe or end becoming hooded and gaping of a purplish red colour; in the bottome huskes after wards stand foure white feedes: the roote is thicke at the head with sundry small fibres, but creepeth not as others doe, abiding many yeares: the whole plant smelleth like the ordinary Archangell.

3. *Lamium vulgare album sive Archangelica flore albo*. White Archangell.
The white Archangell hath diverse square stalkes, not standing straight upright, but leaning downewards to the ground, whereon stand two leaves at a joynt, larger and more pointed than the other, dented about the edges, and greener also, more like unto Nettle leaves also than the former, but not stinging although somewhat hairy: at the joynts with the leaves stand larger, and more open gaping white flowers, in huskes round about the stalkes, but not having such a bush of leaves and flowers, so closely set at the toppes, as in the former, wherein stand small roundish blacke feede, after they are fallen: the roote is white with many fibres thereat, not growing downe.

1. *Lanum vulgare flore rubro.*
Red dead Nettle of Archangell.

3. *Lanum flore albo.*
White Archangell.

2. *Lanum Hispanicum.*
Spanish Archangell.

6. *Lanii montani Columnæ duæ species.*
The two sorts of Mountaine dead Nettles of Columnæ.

downward, but lying under the upper crust of the earth, spreading and encreasing like unto Couch-grasse, which abideth many yeares still encreasing, this hath not so strong a sent as the former.

4. *Lamium folio oblongo flore rubro.* Long leaved red Archangell.

Of this same kinde there is one found in some places of this Land, agreeing with this last in all things, but in the flowers, which are of a purplish red colour; and another whose flowers are more pale red, and the lippes with whitish veines; but are rare to be met withall, but in some places, where there is almost no other kinde, and hath no ill sent.

5. *Lamium foliis maculatis.* Archangell with spotted leaves.

The spotted Archangell is also very like the former, in the forme of the leaves and flowers, but somewhat larger; in the manner of growing it is lower and more creeping: the chiefe difference herein is, that in all the leaves, there are certaine markes or spots, and some small short lines to be seene in them, whereby it is distinguished from the former.

6. *Lamium Plinij montanum Columne.* Archangell with white lines in the leaves.

This Archangell *Columna* hath well observed to differ from the last, first in the leaves being larger, and dented about with rounder dents, and then in the white lines therein, which in this runne straight forth, and somewhat large on each side the middle ribbe, and not spotted or straked as in the last, which white lines they will hold conspicuous many yeares, after they have bene dried, whereas the other, either fade altogether or are hardly to be discerned, within a yeere after they are dried: and lastly in the flowers which in this, are of a paler red, tending to a bluish colour. *Columna* setteth forth another sort hereof, with smaller and deeper dented leaves, whose white lines in the middle of the leaves, are not so broad nor differing in any thing else.

*Alcæum
monta-
num ejus-
dem.*

7. *Lamium luteum.* Yellow Archangell.

The yellow Archangell, in the square stalkes, and large Greene dented leaves, is like the white Archangell, but that the stalkes are more straight and upright, not bending downward, and the joynts with leaves are more separate in sunder, having longer leaves than the former: the flowers also are a little larger, and more gaping; of a faire yellow colour in moit, and in some more faint: the rootes hereof I have not found to creepe under ground, so much as the white, but else very like therunto.

8. *Lamium peregrinum Scutellaria dictum.*

Strange Archangell.

This strange gaping Archangell, shooteth forth in the beginning of the Spring, a square hayrie straight stalke, about a cubit high, at the joynts whereof, are set the leaves by couples, which are somewhat long and deeply indented about the edges, of a sad Greene colour, smooth, and a little hayrie withall, standing upon long hayrie footestalkes: about the middle of the stalke come forth divers branches on all sides, about an hand breadth long, set with narrower and longer pointed leaves, not dented at all; at the toppes whereof and the stalkes stand long spiked heads of purplish flowers, like unto the Archangells, before described, and in some white, but longer and more open, two sometimes standing in one huske, and with a hood or helmet at the head of them; wherein after they are fallen, are set foure rough feedes, round and flat, very hayrie, clammy, and sweete, sticking to the fingers, while they are fresh: at the toppes of every one whereof, there is a cleft like a mouth, and about that a crowne like unto an Helmet: the roote is yellowish and stringie not perishing.

*Flore al-
bo.*

The Place.

All these Archangells grow wilde, some of the first sorts by wall sides, and the borders of fieldes, and way sides, almost every where with us: the yellow most usually in the wet grounds of Woods, and sometimes in the dryer, in divers Countreies of this Land: those with white spots and lines, are very rare to meete with in our Kingdome, but the first in Germany as *Thalium* saith, and in Italy as *Matthiolus* and *Columna* say, very plentifully; the two sorts of the sixth in Naples onely as *Columna* saith: and the last in Candy as *Pona* saith and in Naples as *Columna* saith.

The Time.

They flower from the beginning of the spring, all the Sommer long.

The Names.

The name *Lamium* was first taken from *Pliny*, who after he had spoken of Nettles, saith that the Nettle that stingeth not, and is not hurtfull, is called *Lamium*. It is called *Urtica iners*, non mordax, & *mortua*, quia folijs non mordacibus sed mitissimis sit, and *Archangelica* of some, ab eximijis viribus; and *Lamium* fortasse a florum figura, & cinctu cucullo Larvatarum lamiam quondam representante. The first is called by *lobel*, *Urtica non mordax*, *Urtica mortua*, and *Galeopsis vulgaris* faciens purpurea; *Lugdunensis* saith, there is no other herbe that commeth nearer to the description of *Dioscorides* his *Galeopsis*, then this, which *Bauhinus* alloweth of, calling it *Lamium purpureum* fetidum folio subrotundo, *Galeopsis* *Dioscoridis*, and saith, that *Cordus* upon *Dioscorides*, *Cesalpinus* and *Tabernaemontanus*, understood this *Lamium*, to be the *Galeopsis* of *Dioscorides*, but I doe not finde that this kind was knowne unto them; but that it is the other red Archangell, with longer leaves that is more like unto the white, or the yellow.

6. *Lamium luteum.*
Yellow Archangell.

yellow Archangell which they meant; and *Clusius* as you shall heare by & by, disliked all other figures of *Galeopsis* as not truly answering unto *Dioscorides* his description, for I can finde no Author hath given a true figure hereof before *Lobel* and *Dodonæus*; whereby it seemeth that this *Lamium* is more proper to England then to other countries. *Dodonæus* calleth it *Urtica iners altera*. I would incline to thinke this kind of *Lamium* to be the true *Galeopsis* of *Dioscorides* with *Lobel* and others, if the leaves were not so round, but more like unto Nettle leaves, and that we had not a kinde, that smelleth strong, with leaves more like unto the Nettle, as you shall heare in the next Chapter. And I would rather thinke also, that the other red Archangell that hath longer leaves very like the white were the *Galeopsis* of *Dioscorides*, with *Matthioli*, *Lacuna*, *Cordus* and therest, if it had a strong sent which it hath not, so that seeing both these are defective eyther in the one or the other quality, I cannot deeme eyther of them to be right, especially seeing I can produce one that hath both these properties more answerable to *Dioscorides* his description. The second is remembered only by *Cornutus* in his history of Canada plants, and there called *Lamium Astragaloides*. The third is the first *Lamium* of *Dodonæus*, called by *Lobel* *Archangelica flore albo*, from whence came our English word Archangell, as I take it. The fourth is as I sayd, the *Galeopsis* of *Matthioli*, *Lugdunensis* and others that follow him, *Tabernmontanus* called both these sorts *Lamium purpureum & album*. *Casalpini* calleth them *Leucas*, and are his second and third; *Bauhinus* calleth them *Lamium purpureum vel album non setens folio oblongo*. The fifth *Thalium* calleth *Urtica fauca* *Dodonæus*, and is *Tabernmontanus* first *Galeopsis*, which *Columna* calleth *Urtica mortua maculosa*, *alba* *reperta*, and of *Bauhinus* *Lamium maculatum*. The six is the *Lamium* *Plinij* of *Anguillara*, *Camerarius* and *Matthioli*, and by him called *Urtica laetea*, who would faine have made it the *Galeopsis* of *Dioscorides*, but that he found *Pliny* to make mention of the white in the leaves of *Lamium*, to be especially used for inflammations, *S. Anthonies* fire and the like, which made him desist from that opinion, and conclude it *Plinies* *Lamium*. *Columna* calleth it *Lamium Plinij montanum*, and *Bauhinus* *Lamium albo lineata notatum*; and this he saith the *Italians* call *Milzadella* or *Milzarella*, which is so highly commended by them against the spleene: but *Lobel* taketh the ordinary white, or the yellow Archangell to bee it, and so doth *Lugdunensis* also, and both erroneously: The seventh is called *Lamium luteum* by *Lobel*, *Dodonæus* and others; *Galeopsis flore luteo* by *Camerarius*, and *Dalechampius*. *Casalpini* calleth it *Leucium montanum*: the last is called *Cassidishy Columna*, and *Scutellaria* by *Cornutus*, and those of *Italy*, as well at *Padoa* as at *Naples*. *Bauhinus* calleth it *Lamium peregrinum* sive *Scutellaria*, and saith that it is the *Sacerdotis secunda* *Plinij* of *Pona*, in his *Italian* description of *Mount Baldus*, which I hardly beleewe, because the flowers are not equal, according to their figures; as also that *Betonica sylvestris* of *Paulus Agineta*, that is like *Pennyroyall* and without sent, whereof I speake in the Chapter of *Betony* hereafter, by *Quadrantius* judgement is this kind of *Lamium*: the *Italians* call it *Oytica morte*, the *Spaniards* *Hertiga muerta*, the *French* *Ortie morte*, the *Germanes* *Tode Nessell*, *Taub Nessell*, and *Binsing*, the *Dutch* *Doove Nettle*, and wee in *English*, *Dead Nettle*, *Blind Nettle*, and *Archangell*.

The Vertues.

The Archangells are somewhat hotter and drier then the stinging Nettles, and are more appropriate, and with better successe used for the obstructions and hardnesse of the spleene then they, to be used inwardly by drinking the decoction of the herbe in wine, and afterwards applying the herbe hot, or the decoction unto the region of the spleene, as a cataplasme or fomentation with sponges. The flowers of the white Archangells are preserved or conserved daily to be used, or the distilled water of them is used to stay the whites, and those of the red to stay the reds in women, and is thought good to make the heart merry, to drive away melancholly, and to quicken the spirits. It is commended also against quartaine agues. It stancheth bleedings also at the mouth or nose; if the herbe be stamped and applied to the nape of the necke: the herbe also bruised and with some salt and vinegar, or with *Auxungia* that is, *Hogs Lard* laid upon any hard tumour or swelling, and that in the neck or throate, which is called the *Kings Evil* doth helpe to dissolve, or dissolve them: in the like manner applied to the Goute, Sciatica or other joynt aches or of the sinewes, doth very much allay the paines, and give ease. It is also very effectuell for all inflammations, as are percussive, and to heale all greene wounds, by drying and closing up the lippes of the wounds, and for old Vlcers also to stay their malignitie of fretting, and corroding or spreading, thereby causing them to heale the more speedily: it draweth forth splinters, or other such like things gotten into the flesh. *Pliny* highly commendeth it for many other things, as for bruises and burnings: but the Archangell with yellow flowers is most commended, for old filthy and corrupt sores or corrupt Vlcers, yea although they grow to be fistulous or hollow, and to dissolve tumors.

CHAP. LXVI.

Galeopsis. Stinking Dead Nettle.

Have here to bring to your consideration not onely the Genuine *Galeopsis* of *Dioscorides*, both in *Clusius* and my judgement, but some other plants also, which may not unfitly for their likeness thereunto, be referred unto it as I thinke.

1. *Galeopsis Genuina Dioscoridis*. The true stinking Dead Nettle of *Dioscorides*.

This kind of Dead Nettle hath divers square, soft, and hairy stalkes, rising up to be three or foure foote high, at the joynts whereof grow two leaves a peece upon long foote stalkes, very like unto Nettle leaves, but that they are soft and somewhat hoary or hairy, but not stinging at all, of a very strong sent somewhat unpleasant, especially growing in shadowy places, and nothing so strong in the open fields: at the toppes of the stalkes grow the flowers set in the rundles, foure or five at a space, and many of them one above another, in manner of a spike, every one standing in a greenish huske, like unto those of the former Dead Nettles, but not so great and are of a sad red or purplish colour; especially the heads or upper parts; but the lower labells or lippes, have some white spots in them: within those huskes after the flowers are fallen, grow small round, yet somewhat rough seede, foure for the most part standing together: the roote is composed of many strings, shooting fresh heads every year, and increasing thereby very much.

2. *Galeopsis*

2. *Galeopsis altera incana*. Hoary stinking Dead Nettle.

This other Dead Nettle hath shorter square stalkes soft and hoary, very slender and weake, creeping as it were by the ground, with two leaves set at the joynts likewise soft and hairy, and more hoary underneath, not so large as the former: the toppes of the stalkes end in a long spike or purplish flowers, set in roundles as in the other; the seede and roote is also answerable unto the other.

3. *Galeopsis lutea Dalechampij*. Yellow stinking Dead Nettle.

The yellow Dead Nettle hath square low stalkes not above a cubit high, with long leaves set thereon by couples, very like unto Nettle leaves, smaller below next the ground then up higher upon the stalkes being hairy, but not stinking, and smelling somewhat strong like the first: the flowers grow in long spiked heads in the same manner, but are all yellow when they are fully blowne, consisting of two leaves, the uppermost whereof is not so much hooded as the former, but is as it were a cover to the lower, and turneth it selfe up againe, having some yellow threds in the middle, but while it is in budde is somewhat reddish: the seede is set in huskes as the other, the roote is threddy and blackish like the former.

4. *Galeopsis altera pallida*. Pale *Galeopsis* or stinking Dead Nettle.

This hath sundry pale Greene broad leaves set on long hairy footstalkes: the stemme is square and hairy also, with such like but lesser leaves thereon, and sundry small pale yellowish flowers set together at spaces, which turne into small round and pointed heads, with small blackish feedes in them; it smelleth strong or stinketh as bad as the rest.

5. *Galeopsis maxima Pannonica*. The Dragon flower.

This I have described in my former booke whereunto I must referre you, although I give you the figure thereof here.

4. *Galeopsis altera luteo pallida*.
Pale coloured *Galeopsis* or stinking Dead Nettle. 1. *Galeopsis legitima Dioscoridis*.
Stinking Dead Nettle. 5. *Galeopsis maxima Pannonica*.
The Dragon flower.

The Place.

The first is very frequent in our land, in divers countries, as at *Hampsted* going from the towne to the Church, and many other places from *Hampsted* heath to *London*: the second and third I have not knowne grow wilde, but onely in our gardens: the fourth *Cuscuta* saith he found growing naturally in his garden at *Vienna*, and so did I like wise in my garden in *Long Acre*, not knowing otherwise of any such seede was sent me, for it grew not in any of my sowed beds, but straglingly in wast places.

The Time.

All these sorts are in flower both in *June* and *July*, for the most part, and the seede is quickly ripe after the flowers are past.

The Names.

It is called in Greeke as *Dioscorides* saith γαλιόψις, γαλιόψις, & γαλιόψιδον, *Galiopsis*, *Galeopsis*, & *Galeobdolon*, *galeata* *florum* effigie, as some thinke, or as *Matthiæus* saith, α γάλα & ψις, and then he would adapt the *Lamium* *Pliny* *maculatis* *foliis* unto it, but himselfe disclaime that deduction, and the other is not right, for the word γαλιόψιδον, which signifieth *muscula fatida*, sheweth the truer derivation as *Pliny* hath it *astorum figura, muscula faciem* & *ricium quadrantenus* experimente: It is called usually in Latine also *Galeopsis*, as *Pliny* doth more truly, when *Galiopsis*, and *Urtica mortua ferida*, & *Urtica labeo*, of the great lippes in the flowers. The first is from *Tragus* called usually *Urtica Heraclea*, or by others *Herculea Tragi*: of *Lonicerus Urtica sylvana*, of *Clusius Galeopsis legitima Dioscorides*, but by *Bauhinus* *Lamium maximum sylvaticum fetidum*: the second is the *Lamium inranum* of *Thalium*, and the *Galeopsis rubra* of *Lugdunensis*, whereof he saith there groweth plenty in the groves above *Lyons*, as well as the other yellow *Galeopsis*; whereof neither as he saith, is any *Lamium*, either stinking, or not smelling, for as he saith this red differeth from the yellow, onely in the colour of the flower, both of them bearing spiked heads like the first: the third is *Lugdunensis Galeopsis lutea Dalechampii*, called *Galeopsis flore luteo folio oblongo*, and *rectis* *caulibus* of *Camerarius* in *horto*, differing from the *Lamium luteum*, for he mentioneth it also among the other *Lamia*: the fourth *Clusius* calleth *Lamium Pannonicum secundum sive exoticum*, and is thought to be *Scrophularia flore luteo* of *Bauhinus*, as you shall finde it noted in the chapter of *Scrophularia* afterwards: but surely it hath little correspondency with the *Lamia*.

The Vertues.

The stinking Dead Nettles, any of the kinds of them, boyled in wine and drunke, doth wonderfully helpe all inward wounds and hurts, bruises, falls or the like, and are singular good also for the spleene, and the diseases thereof: but especially for the hemorrhoides or piles, when they are painefull being swollen and fallen downe: the iuyce thereof applyed warme with vinegar, both easeth the paines and draweth forth the blood: and in the same manner used helpeth the warts, and other such like hard grumes or knots, that grow in and about the fundament: as also all other manner of hard swellings, as wennes, warts, and kernels, that grow in the necke or thoroate, or in any part of the body; it is singularly commended for all manner of filthy ulcers, gangrenes, and cancers, be they corroding or fistulous.

CHAP. LXVII.

Scrophularia major. Great Figwort.

Here are two sorts of *Scrophularia* or Figge-wort, as they are so called by divers, a greater and lesser, the lesser being called *Chelidonium minus*, whereof I shall entreate hereafter: but of the greater in this Chapter, whereof there are divers other sorts that formerly were not knowne.

1. *Scrophularia major vulgaris*. The ordinary great Figgewort.

The common great Figgewort sendeth forth divers great, strong, hard, square, browne stalkes, three or foure foote high, whereon grow large, hard, and darke greene leaves, two at a joynt, which are larger, and harder than any Nettle leaves, but not stinging, very like unto the leaves of *Water Betonie*, so that they are sometimes mistaken, being somewhat hardly discerned one from the other, but that these are not so round dented about the edges, and are also smaller at the ends; at the toppes of the stalkes, stand many purple flowers, set in huskes, which are somewhat gaping and open, but not so much as any of the former dead Nettles, but closer and smaller, somewhat like those of *Water Betony*, after which come hard round heads. with a small point in the middle, wherein lye small brownish seede: the roote is great white and thicke, with divers knobbes or banches at it, growing a slope, under the upper crust of the ground, and abideth many yeeres, but keepeth not his greene leaves in the winter.

There is another sort hereof very like in leaues, but more sometimes standing at a joynt, especially the lowermost the flowers are not gaping, but made of foure reddish leaves, which usually stand at the joynts with the leaves: the seede vessels are not pointed.

Scrophularia major altera elongata.

2. *Scrophularia altera Ruta Canina dicta*. Great Figge-wort without knobbed rootes.

This other kinde of great Figge-wort, riseth up with many weake and tender stalkes, not above two foote high, whereon grow narrow, long, and somewhat thicke darke greene leaves, cut in on the edges on both sides into divers parts, making them seeme like the leaves of wilde field Poppie, smelling somewhat strong like Rue, or Poppie, and set without order, sometimes but one or two, and sometimes more standing at a joynt: the flowers are many but smaller, of a darke or sad purple colour, somewhat like the other, or like unto *Toadflaxe*, standing many together, upon severall small branches at the toppes of the stalkes, which smell as strong almost as the leaves: after which come small heads like the former, the seede whereof is not much unlike: the roote hereof hath no knobs thereat at all, but consisteth of a long, downeright bigge roote, with many small fibres growing to it.

3. *Scrophularia Cretica latifolia*. Great leaved Figge-wort of Candy.

This Figge-wort of Candy hath a square cornered greene stalke, brownish on the side next the Sunne: at the bottome whereof grow diuers large, and long winged leaves, set upon their foote stalkes, made of many parts, some

1. *Scrophularia major vulgaris.*
Ordinary great Figge-wort.

Scrophularia major altera elegans.
Another dainty great Figge-wort.

2. *Scrophularia altera Rutæ Canina dista.*
Great Figge-wort without knobbed roots.

3. *Scrophularia cretica latifolia.*
Great leaved Figge-wort of Candye.

somewhat like the last, but larger and more cut in on the edges, and each part cut in on their edges likewise, making every leaf seeme like unto a Ferne, or the leafe of the red Rattle; from the middle of the stalke, shoote forth round about it, up to the toppes almost, other branches, and they againe some smaller, having on all sides such like leaves, but lesser than grow below, set therein; and at the toppes of the stalkes and branches, are many small flowers, set somewhat like unto the first ordinary Figge-wort, but part of a deeper and part of a paler purple colour, with some yellow threds, rising out of the middle: the roote is of a fingers thickenesse, and divided into diverse other parts.

4. *Scrophularia peregrina*. Strange great Figge-wort.

This strange Figge-wort beareth divers square browne stalkes, rising from the roote about two foote high, whereon grow without any order, many soft leaves like Nettles, but not pricking or stinging at all, somewhat longer also and deeper cut in on the edges, especially in some of them, of a darke greene colour on the upperside, and greene underneath: the stalkes branch themselves into many other smaller ones, with leaves on them to the toppes, like the lower but lesser, where stand many darke purple flowers, whose upper leaves turne upwards, and the lower fall downe like lippes, each of them standing in greene huskes, that are parted into five points; wherein after the flower is fallen and past commeth a round head, divided as it were with a seame into two parts, with a little point at the end, wherein lye small brownish feede, like the common fort: this also hath a strong sent, rather worse than the last.

5. *Scrophularia peregrina alera*. Another strange great Figge-wort.

The stalke hereof is about two foote high: the leaves are of a faire greene colour, as it were winged, the flowers are yellowish, with pale threds in the middle: the seed is small in round huskes being by-forked at the ends.

6. *Scrophularia flore luteo*. Yellow Figge-wort.

The yellow Figge-wort bringeth forth diverse square browne stalkes, somewhat hayrie and soft, about two foote high, at the joynts whereof grow two large broad, round, hayrie, soft greene leaves, deeply dented about the edgess, standing upon very long footestalkes, those at the foote of the stalkes being largest, which in winter lye in a compasse upon the ground, round about the roote; and those on the stalkes lesser and lesser up to the toppes: at each joynt with the leaves commeth forth, even almost from the bottome, one small naked branch, bearing many flowers in tufts at the ends of them, which are round and yellow, somewhat like the ordinary fort, parted or cut in at the brimmes, into severall peeces, having some long yellowish threds in the middle: after the flowers are past, come larger round heads than in the former, whose point at the end is long, and a little crooked, containing within them small blacke feede: the roote is thicke and blackish, with many strings and fibres thereat, but not having any knobbes thereon at all.

7. *Scrophularia Indica*. Indian Figge-wort.

The Indian Figge-wort, hath divers thicke but weake branches, lying all about upon the ground, full of joynts.

5. *Scrophularia peregrina alera*.
Another strange great Figge-wort.

8. *Scrophularia Sambucifolia*.
Elder-like Figge-wort.

with large and long, darke greene leaves, cut in on the edges, into five long divisions, all of them dented about the edges, and from the same joynts come forth also other lesser leaves, divided and dented, and with them toward the toppes of stalkes, divers large flowers of a yellowish colour on the cut side, and lower part, but within of a reddish colour, mixt with the yellow: after which come larger and harder heads, than in any of the former by much, pointed at the end as the rest, and within them small blackish seede: the roote is thicke and bushie, but petisfeth in the winter, if it rise up to flower, else abiding.

8. *Scrophularia Sambucifolia*. Elder-like Figge-wort.
This Figge-wort riseth up with divers square hollow stalkes, two or three cubits high, with sundry winged leaves, issuing from the joynts thereof, consisting of many, set one against another, upon a middle ribbe neerer resembling an Elder leafe, and smelling strongly thereafter: the branched stalkes beare the like leaves, and at the joynts with them, and at the toppes stand many hollow flowers, hanging downe their heads round about the stalkes, of a brownish red or purple colour, after which come small round blacke seede vessels, pointed at the ends with the like small seede in them as in others: the roote is somewhat long, with divers fibers thereat.

The Place.

The first is very frequent in all places of this Land, both in moyst and shadowie woodes, and in the lower parts of feldes, and meddowes: the second *Lobel* saith, groweth not but in the warme Countiees of *Narbone* in *France*, *Ravenna*, and *Rome* in *Italy*. The third and fourth came from *Candy*: the fifth was sent out of *Italy* among other seedes: the sixth came from *Hungary*, and other parts of *Germany*: the seventh and last from *Spain*.

The Time.

They all flower about *Iuly*, yet some a moneth sooner, and the seede will be ripe within a moneth after the flowers are past.

The Names.

This hath no Greeke appellation more then what may be taken from the Latine, for being of later invention, or use at the least, it hath obtained divers Latine names, as *Scrophularia major*, because it is available ad *Scrophulas*, and *major* to distinguish it from the lesser, (which most writers call *chelonium minus*, with what judgement you shall heare anon) *Millemorbis*, *Ficaria*, *Ferraria* and *Castrangula*, as well from the forme of the rootes, as from the many effects, the former ages more then ours did put it too, and did finde it available; the other sorts although they want those knobbes in the rootes, yet for the other likenesse have the same name imposed on them, *Fuschius Cordus*, and *Dodonæus* did take it to be *Galeopsis* of *Dioscorides*, but *Dodonæus* in his last Edition, finding his former error amendeth it saying, that this wanteth the strong sent that *Galeopsis* hath, besides other things. Some also tooke it to be *Chrysippea* of *Pliny*, which he saith, used with Figges helpeth the knots or kernells in the flesh: the *Italians* call it *Scrophularia*, the French *Grande Scrophulaire*, the Germanes *Braunmurtz* and *Gross Feigwurtz*, the Dutch *Groot Speenkruis*, and we in *English* great Figgewort, and great Pilewort, and of some great Kernell wort; the first is called *Scrophularia*, and *major* of most writers: onely *Tragus* not allowing of the name *Scrophularia*, more to be given unto this plant then unto the *Saxifraga alba*, calleth it *Ocimasrum alterum*, and *Gesner* in *hortis*, calleth it *Chymenum mas*, and as I sayd before *Galeopsis* of *Fuschius*, *Cordus*, and *Dodonæus*, in his Dutch Herbal; the other of the great kind hath not bene mentioned by any before. The second is called *Ruta Canina* of *Lobel*, *Clusius* and others, from them of *Mompelier*, but hath little or no likenesse to any *Rue*; and is called by many also *Scrophularia major absque tuberculis*. *Matthioli* setteth it forth for *Sideritis tertia* *Dioscoridis*, as *Camerarius* and *Bauhinus* say, although not well expressed; but *Lacuna*, *Lonicerus*, *Dalchampsius* and some others would make it the *Sideritis altera* of *Dioscorides*, and *Dodonæus* in his Dutch Herbal (which *Clusius* translated into French) *Galeopsis tertia*, *Cesalpinius* calleth it *Scrophularia similis planta major*, *Sideritis secunda* *Dioscoridis*, *Bauhinus* calleth it *Scrophularia Ruta Canina dicta vulgaris*: the third is the first *Scrophularia Cretica* of *Clusius*, which as he saith is very like unto the *Ruta Canina*, and therefore *Bauhinus* calleth it, *Scrophularia folijs filicis modo laciniatis*, vel *Ruta Canina latifolia*: the later *Gerard* calleth *Scrophularia Indica* but how truly let others judge. The fourth is called *Scrophularia peregrina* by *Camerarius*, who thinketh it to be the *Galeopsis* of *Anguillara*, and is the second *Scrophularia Cretica* of *Clusius*, and by *Bauhinus* called *Scrophularia folio Urtice*: the fifth hath the name in the title whereby wee received it: the sixth is called *Scrophularia flore luteo*, by *Bauhinus*; *Fabius Columba* calleth it *Scrophularia montana maxima*, and thinketh it also to be the *Lamiumannonicum* secundum *seve* exoticum of *Clusius*, but saith *Bauhinus* there is some difference, and I doe verily thinke them two several plants. The seventh is called by *Bauhinus* *Scrophularia folijs laciniatis*, and saith it was sent him by the name of *Scrophularia Hispanica*, but we received it under the name of *Scrophularia Indica*: which whether it be naturall of the *Indies* or of *Spain*, wee cannot tell, for many things are so misconferred: the last came to mee among other seedes by the same name is in the title, and by me with many other of our rarest sorts of seedes sent unto Dr. *Morre* while hee lived at *Padoa*, and by him imparted to *Alpinus*, who mentioneth it as received from him.

The Vertues.

It is very effectfull to dissolve clotted or congealed blood within the body, which happeneth by any wound or by any bruise or fall, both to be taken inwardly by the decoction of the herbe, and by applying the herbe bruised upon the hurt place outwardly: the same also is no lesse effectfull for the Kings Evil, or any other knots, kernells, bunches or wenues growing in the flesh wheresoever: it is of singular good use to be applied for the hemorrhoides or piles, when they grow painfull and fall downe, and for other such knobbes or kernells as sometimes grow in and about the Fundament. An ointment made hereof in this manner may be used at all times, when the fresh herbe is not to be had. Wash the rootes cleane, bruise them and put them into a pot with fresh Butter well mixed together, and let them stand for fiftene dayes close covered in some moyst or moorish place, which afterwards set upon a gentle fire to boyle easily for a little space, which then being strained forth let it be kept in a pot covered to use when occasion requireth: with the roots and leaves likewise bruised and boyled in *axungia* or oyle and wax, is made the like ointment, exceeding good to heale all sorts of Scabbies and Leprosy also. The distilled water of the whole plant rootes and all, is used for the same purposes, eyther to take inwardly or to apply outwardly by bathings, and serveth well also for fowle Vicers that are hollow or coroding, to stay

stay the malignitie and dry up the superfluous virulent moyſture of them; the ſame alſo taketh away all redneſſe ſpots and freckles in the face, as alſo the ſcurfe, or any ſoule deformitie therein that is inveterate, and the Leproſie likewiſe.

CHAP. LXVIII.

Betonica aquatica. Water Betony.

BEcauſe this herbe is ſo like unto the former Figwort, that many as I ſayd are miſtaken therein, and that it is called *Scrophularia aquatica* alſo by ſome; I thought it not amiſſe to joyne it next thereunto, as well as for the ſame properties that this ſerveth, eſpecially for Vlcers and fores.

1. *Betonica aquatica major.* The greater Water Betony.
The greater Water Betony riſeth up uſually higher then the Figwort, with ſquare hard greeniſh ſtalkes, and ſometimes browne, ſet with ſuch like broad darke greene leaves, as the Figwort hath, and dented about the edges, but with rounder notches whereby it may if heedfully obſerved be knowne from it, and wherein it ſomewhat reſemblieth the leaves of the Wood Betony, but much larger two for the moſt part ſet at a joynt; the flowers are many ſet at the toppes of the ſtalkes and branches, being round bellied and open at the brimmes, and divided into two parts, the uppermoſt being like a hood, and the loweſt like a lip hanging downe, of a darke red colour, which paſſing away there come in their places round heads with ſmall points in the ends, wherein lyeth ſmall and browniſh ſeede: the roote is a thicke buſh of ſtrings and threds growing from a head.

Betonica Aquatica.
Water Betony.

2. *Betonica aquatica minor.* The leſſer water Betony.
The leſſer Water Betony is in all things like the former, but lower and leſſer by three parts, for the ſtalkes are ſquare and greene; the leaves are round almoſt, but yet pointed, of the ſame darke greene colour, the flowers are of a ſad red, or purple colour, and the rootes threddy, ſo that the ſmalneſſe onely maketh the greateſt difference.

The Place.

The firſt groweth with us by ditch ſides, by brookes and other water courſes, generally throughout the land, and is ſeldome found any thing farre from the waters ſides: the ſecond alſo in wet and mooriſh grounds about Baſil as Bauhinus ſaith, and in other places of Germany, and will well abide in dryer grounds, as Lobel found in the garden of Dr. Penny at London, and Dr. Antonius at Tornay.

The Time.

Theſe flower about July, and their ſeede is ripe in Auguſt.

The Names.

It is called *Betonica aquatica* and *aquatilis* by Dodonæus, Lobel, Lugdunensis, Tobermontanus, Gerard and Turner, who yet rooke it to be *Clymenon*, as Gefner alſo did, calling this *Clymenon femina*, as he did the common *Scrophularia*, as I ſayd before *Clymenon mas*, and therefore calleth this alſo *Scrophularia majoris altera ſpecies*. Dodonæus in Dutch maketh it his ſecond *Galeopsis*, and Tragus his greater *Ocimaſtrum*. Lobel ſaith that ſome called it *Sesamoides*, and ſome *Terpenaria*; Thalius calleth it *Scrophularia major aquatica*, and ſo doth Bauhinus, the other is called by Camerarius in his *Matthiolum*, and Epitome of *Matthiolum Scrophularia femina*, and ſaith the Germans call it *Wiß Nachſchat*, that is, white Nightſhade. Lobel in his obſervations pag. 288. calleth it *Betonica aquatica Septentrionalium ſpecies minor*. The Dutch doe call it *Beekscymmeruut* and S. Antennis cruyt, we in Engliſh call it Water Betony moſt uſually, but ſome Brownewort, from the Germane *Braunwurtz*, as it is likely, which as I ſayd before is the greater *Scrophularia*, the likeneſſe of the plants cauſing ſuch interpoſition of names, and ſome alſo Biſhop leaves.

The Vertues.

Both ſorts of Water Betony are a like effectuall for all old and filthy Vlcers, being of a clenſing quality, if the leaves be but bruised and layd thereon; but is much more effectuall if the juce of the leaves bee boyled with a little honey and tents dipped therein. & the fores dressed therewith, as alſo for bruises or hurts whether inward or outward: the diſtilled water of the leaves is uſed for the ſame purpoſes, as alſo to bathe the face or hands that are diſcoloured by the Sunne, or hath any ſpots or blemiſhes thereon; as alſo for any redneſſe or high colour that commeth accidentally by being in the Sunne.

CHAP. LXIX.

Betonica. Wood Betony.

F Betony wee have foure or five sorts, differing eyther in the leafe or flower, or spiked heads of flowers one from another, as shall be shewed you.

1. *Betonica vulgaris flore purpureo*. Common Wood Betony.

The ordinary or common Betony, which because it is frequent in woods, is therefore generally called Wood Betony, hath many leaves rising from the roote, which are somewhat broad and round at the ends, roundly dented about the edges, standing upon long footstalkes; from among which rise up small square slender, but yet upright hairy stalkes, with some leaves thereon, two a peece at the joynts, smaller then the lower, whereon are set severall spiked heads of flowers, like unto those of Lavender, but thicker and shorter for the most part, and of a reddish or purple colour, spotted with some white spots; both in the lower & upper part on the inside yet there is observed a different sort from this, whose head is shorter & flowreth usually earlier then the former: the feede followeth contained within the husks that hold the flowers, which are blackish, somewhat long and uneven: the rootes are many white threddy strings, like unto those of Plantaine; the stalke perisheth, but the rootes with some leaves thereon abide all the winter; the whole plant is somewhat small and of a resinous favour.

2. *Betonica flore albo*. Wood Betony with white flowers.

This Betony differeth in no one thing from the former, so much as in the colour of the flowers which are wholly white without any spots at all in them, onely the leaves may seeme to be a little greener, and the spiked head of flowers somewhat smaller then the other.

3. *Betonica minima Alpina Helvetica*. Small Mountaine Betony.

This small Betony likewise differeth not from the former, neither in forme or colour, but in the smallnesse of leaves, stalkes and flowers.

4. *Betonica Danica*. Broad leaved Betony.

This great Betony likewise differeth not from the ordinary, in any other thing then in the largenesse of the leaves, being twice, and in some at sometimes three or foure times as large as the common sort, and of a strong almost stinking smell; and in the stalke which is stronger growing higher, and the heads of purple flowers greater also.

5. *Betonica Alopecurus montana d. d. a.* Foxtaile Betony.

This herbe that I here bring to your consideration, is accounted by *Barbinius* as a kind of Betony, or referred thereunto for the likenesse of the leaves, whom I also herein follow, and place it with them; it hath a blackish tuberous roote, with some fibres thereat; from whence rise up divers slender round stalkes, about a cubit high,

1. *Betonica vulgaris flore purpureo*. Common Wood Betony. 3. *Betonica minima Alpina Helvetica*. Small Mountaine Betony.

4. *Betonica major Danica.*
Broad leaved Betony.

5. *Betonica Alopeuro montana dista.*
Fox taile Betony.

having at the bottome of them some small long and narrow leaves, like threds or peeces as it were torne off from the rinde of the lower part of the stalke and sharpe pointed, some greene and some browne: the rest of the stalke are naked unto the middle, which from thence to the toppes at farre distances one from another, have at every joynt two broader, rounder, and shorter leaves then Betony, the middle ribbe being blackish, and dented about the edges: above the two uppermost leaves come forth a soft round spiked short head made of a number of white haire, somewhat resembling a white Fox taile, whereof it tooke the name.

The Place.

The first two sorts are frequent in woods and copses, and other such like shadowie places throughout the land, but that with the white flower is more usually found in the stiffe clay grounds, then in any other mould, and in the woods by *Bramley in Kent*; the third grow on the *Alpes of Helvetia* or *Swisserland*: the fourth was brought from *Denmarke* by *Dr. Lobel*, when he went thither with the Lord *Edward Zouche* Ambassadour from the *Queene Elizabeth* of famous memory, in the year 1592. The last as *Lugdunenſis* saith, groweth in the moyst vallies that are shadowed with trees of the high hills.

The Time.

They flower in *July*, and the seede ripeneth quickly after.

The Names.

It is called in Greeke *κεστρον* *Cestron*, a remediorum copia & varietate, yet some take it a *floris spicata & mucronata acutis verruculis preferente*, and *Λυγέροσ* *Psycotrophon*, quod in frigidis locis inveniatur: the word *Cestron* hath divers interpretations in Greeke as in *Suidas* for a kind of dart, in *Sophocles* for a pricke or pointed thing; others understand hereby bookes containing much variety of matter, and *Pliny* speaking of graving, saith anciently there were two wayes, the one in wax, the other in *Ebore Cestro*, id est, *viriculo*, set downe for *vernaculum*, which expresseth both in Greeke and Latine the sharpe pointed roote wherewith they did grave in Ivory. It is called in Latine *Betonica*, and *Vetonica*, ab inventoribus *Vetonibus* Hispanie populis as *Pliny* saith; but *Galen* seemeth in his fift booke de *sanitate tuenda*, to make *Betonica* and *Cestron* to be two herbes, in these words translated, *Conſicitur autem in vinum petroselinum, atque id solum articularibus satisfiat; ijs vero qui calculo laborant, aliquid Betonice & Cestri quod in Gallijs nascitur, vocent autem eam herbam Sarcophagon*: *Atium* also in his fourth booke and 30. Chap. reciting this place of *Galen* saith, *Ex quibus colligitur non solum latinorum Betonicam, sed etiam Gallorum Sarcophagon, Cestron nominatum fuisse. Paulus Aegineta* in his seventh Booke doth plainly set downe two sorts of Betony, the one with slender branches like unto *Pennyroyall*, but smaller, and almost without taste, growing especially in stony places (& as I said before in the Chapter of *Lamium* is taken by *Quadrangus* to be *Lamium Scutellaria dictum*) which is used in those medicines that are for the reines: the other is the Romans Betony which *Disco-*
ides calleth *Cestron*, and others *Psycotrophon* because it joyeth in cold places, and hath no likeness to the for-

mer but in the qualities and vertues, thus saith *Egineta*. It is called by the *Arabians Chastura*, by the *Italians Betonica*, but as *Pliny* saith (*lib. 25. cap. 8.* speaking of his times) *Serratula*, by the *French Betoine*, and *Betoesne*, by the *Germanes Braun Betonick*, by the *Dutch* and us *Betony*. There needeth no further declaration or explanation of the same unto you, seeing all Authors almost agree in the name. The third and fourth by their title and place are expressed whereupon they tooke their names: the last *Lugdunenſis* calleth *Alopecurus montana*, which hath Betony like leaves, and therefore *Baubin* as is before said referred it thereunto. One thing more I would advertiſe you that *Petonica* and *Betonica* are diversly taken in divers Authors for *Petonica*, although it be ſet downe in ſome Authors for *Betonica*, yet more properly and uſually it is underſtood to bee the *Caryophyllus*, our *Gilliflowers*, and then it is denominatēd *Petonica altilis*.

The Vertues.

Betonie is hot and dry, almoſt in the ſecond degree: it is ſaith *Pliny* ante cunctas Laudatiſſima, and to have others alſo ſet it forth, with admirable (and yet not undeſerved) praifes: *Antonius Muſa*, the Emperour *Auguſtus* his Phyſition, who wrote a peculiar booke hereof, ſaith of it, that it helpeth the lives and bodies of men, free from the danger of diſeaſes, and from witchcrafts alſo; but it is found by dayly experience, as *Dioſcorides* formerly wrote thereof, to be good for innumerable diſeaſes, as *Matthiolus* termeth it, for it helpeth thoſe that either loath or cannot digeſt their meate, thoſe that have weake ſtomackes, or have ſlower belchings, or continuall riſings in their ſtomacke, if they uſe it familiarly, either greene or dry, either the herbe, the roote, or the flowers, in broth drunke, or meate, made into conſerve, ſyrup, eleſuary, watter, or powder, as every one may beſt frame themſelves unto, or as the time or ſeaſon requireth, taken any of the foreſayd wayes: it helpeth the jaundite, falling ſickenefſe, the palfie, convulſions or ſhrinking of the ſinewes, the goutte, and thoſe that are declining to dropſies, as alſo thoſe that have continuall paines in their heads, yea although it turne to frenſie: it is no leſſe available the powder mixed with pure honey, for all ſorts, of coughes or colds, wheezing and ſhortneſſe of breath, diſtillations of thinne rheume upon the lungs, which cauſeth conſumptions, the decoction made with Mede and a little Pennyroyall added thereunto, is good for thoſe that are troubled with putride agues, whether quotidian, tertian, or quartan, that riſe from the ſtomack; and to draw down and evacuae the blood and humors, that by falling into the eyes, do hinder the ſight: the decoction thereof made in wine & taken, killeth the wormes in the belly; is good to open the obſtructions, both of the liver & ſpleene, & for ſtitches or other paines in the ſides or back, the torments alſo & griping paines of the bowels, and the wind Collick, and with honey helpeth to purge the belly: the ſame alſo helpeth to bring down womens courſes, and is of eſpecial uſe for thoſe that are troubled, with the falling downe and paines of the mother, and to cauſe an eaſe and ſpeedy delivery for thoſe in travaile of childbirth: it helpeth alſo to breake and expell the ſtone, either in the Kidnies or bladder; the decoction with wine gargled eaſeth the toothach: it is commended againſt the ſting or biting of venomous Serpents, and mad dogs, both uſed inwardly, and applyed outwardly alſo to the hurt place: it is ſayd alſo to hinder drunkennes, being taken before hand, and quickly to expell it afterwards: a dramme of the powder of *Betonie* taken with a little honny, in ſome Vinegar, doth wonderfully reſreſh thoſe that are overwheared by travaile: it ſlayeth bleedings at the mouth or noſe, as alſo thoſe that ſpit or piſſe blood: it helpeth thoſe that are burſten and have a rupture, and is good for thoſe that are bruised by any fall or otherwiſe: the greene herbe bruised, or the juyce applyed, to any inward hurt, or outward greene wound, in the head or body, will quickly heale it and cloſe it up, as alſo any veins or ſinewes that are cut, and will alſo draw forth any broken bone, or any ſplinter, thorne, or ſuch other thing, gotten into the fleſh: it is no leſſe profitable for old filthy ſores, and ulcers, yea though they be ſitulous and hollow; but ſome doe adviſe to put a little ſalt thereto for this purpoſe: being applyed with a little Hogges Lard, it helpeth a Plague ſore, and other biles, and puſhes: the fumes of the decoction while it is warme, received by a funnell into the eares, eaſeth the paines of them, deſtroyeth the wormes, and cureth the running ſores in them; the juyce dropped into them, doth the ſame likewiſe: the roote of *Betony* is found to be of much differing quality from the leaves and flowers, as being much diſpleaſing both to the taſte and ſtomacke, procuring loathing, vomitings, and belchings; whereas the leaves and flowers, by their ſweete and ſpicie taſte, are comfortable both in meate and medicine.

CHAP. LXX.

Chelidonium, Celandine.

Formerly therē were two ſorts of *Celandine* generally knowne, as *Dioſcorides* and others make mention, which differ in outward face, very much one from another, whereof I intend to entreate in this Chapter, but unto them I muſt adjoyne ſome other ſorts of the greater, which are of later invention.

1. *Chelidonium majus vulgare*. Common great *Celandine*.

Common *Celandine* hath divers tender, round whitish greene ſtalkes, with greater joynts than ordinary in other herbes, as it were knees, very brittle and eaſie to breake, from whence grow branches, with large tender long leaves, much divided into many parts, and each of them cut in on the edges, ſet at the joynts upon both ſides of the branches, of a darke blewish greene colour on the upperſide, like unto *Colombines*, and more pale blewish greene underneath, full of a yellow ſappe or milke, when any part is broken, of a bitter taſte and ſtrong ſcent: at the toppes of the branches which are much divided, grow gold yellow flowers, of foure leaves a peece, after which come ſmall long pods, with blackiſh ſeeds therein: the roote is ſomewhat great at the head, ſhooting forth divers other long rootes, and ſmall fibres reddiſh on the outſide, and yellow within full of a yellow ſappe therein.

2. *Chelidonium majus laciniatum*. Jagged *Celandine*.

This other great *Celandine* groweth in all things like the former, but that the leaves are thinner, and the divisions ſlenderer, and more cut in on the edges: the flowers likewiſe are of the ſame gold yellow colour, and conſiſting of foure leaves, ſomewhat larger than the other, and are each of them cut in on the edges, as the greene leaves

leaves are: this as the other by the shedding of the seeds, ifech againe before winter, and so abideth flowering the next spring, and seedling in sommer.

3. *Chelidonium maximum Canadense* *Зеленый*.
Great Celandine of Canada.

This strange Celandine hath a fleshy roote, full of a yellow juyce, smelling strong like the ordinary, from whence rise onely three large bl: with greene leaves, cut in after the manner of Vine leaves, without any foote stalke under them, or with very short ones, from among which rise a short reddish foote stalke, with a white flower on the toppe of it like unto the flower of Sowbread.

4. *Chelidonium minus*. Small Celandine or Pilewort.

Although there is no affinity in the forme hereof unto the former, as I before sayd, yet because it generally beareth the name of the lesser Celandine, and that it is of an healing quality, especially for the piles, I thought good to joyne it with the other for this worke, which else might be fevered. This small Celandine doth spread many round pale greene leaves, set on weake and trayling branches, which lye upon the ground, and are fat, smooth, and somewhat shining, and in some places, though seldome, marked with blacke spots, each standing, on a long foote stalke; among which rise small yellow flowers, consisting of 9, or 10. small narrow leaves, upon slender foote stalkes, very like unto a Crow-foote, whereunto the seeds also is not unlike, being many small ones set together upon a head: the roote is made of many small kernels, like graine of corne, some twice as long as others, of a whitish colour with some fibres at the end of them.

There is another sort hereof, which hath as it were double flowers, consisting of two rowes of leaves, in all other things not differing from the former, which *Camerarius in horto*, onely mentioneth:

2. *Chelidonium majus laciniatum*.
Ligged Celandine.

1. *Chelidonium majus vulgare*.
Common great Celandine.

Flora du-
glic.

3. *Chelidonium minus*.
Small Celandine or Pilewort.

5 Chelido.

4. *Chelidonia rotundifolia major*. A greater small Celandine.

This greater sort of the small Celandine, hath a fibrous roote, whereunto grow small round knobs: the leaves are round thicke and smooth, growing almost as large as *Asarum*, or *Asarabacca*, sometimes a little waved about the edges, each standing upon a longer foote stalk than the former, yet lying upon the ground: the flowers that stand severally as the others doe, upon longer foote stalkes, are of a pale yellow colour, and larger than they, consisting but of five or sixe leaves, cut in at the ends, unto the middle of them, and having some reddish threds in the middle of the flowers.

The Place.

The first groweth in many places by old wall sides, and by the hedges and way sides in untilled places, and being once planted in a garden, especially in some shady place, it will still be found therein, the second is not knowne where it is naturall, but is received into gardens for the varietie: the small sort groweth for the most part in the moyst corners of fields, and places that are neere water sides, yet will abide in dryer groundes, so as they be a little shadowed; the third in *Canada* as the title sheweth: the last groweth in the wet grounds about *Mompelien*.

The Time.

The two first sorts flower all the Sommer long, and the seede ripeneth in the meane time: the other flower betimes about *March*, or *April*, and is quite gone in *May*, so at it cannot be found untill it spring againe; that of *Canada* flowered late but gave no seede.

The Names.

The first and greater is called in Greeke *χελιδόνιον μέγαλον*, in Latine *Chelidonium majus*, and *Hirundinaria major*: the lesser is called *χελιδόνιον μικρόν*, and in Latine *Chelidonium minus*, and *Hirundinaria minor*: some call them *Chelidonia major* & *minor*, and tooke the name as *Dioscorides* saith, because it springeth when Swallowes come in; and withereth at their going away (which is true in neither, the greater whereof *Dioscorides* chiefly speaketh, being Greene both winter and sommer, and the lesser springing before Swallowes come in, and is gone and withered long before their departure,) *Dioscorides* likewise and *Pliny* also, say it tooke that name from Swallowes that cured their young ones eyes, that were hurt, with bringing this herbe, and putting it to them: but *Aristotle*, and *Celsus* from him, doe shew that the young ones of Partridges, Doves, Swallowes, &c. will recover their sight (being hurt) of themselves in time, without any thing applied unto them, and therefore *Celsus* accounteth this saying but a fable. The *Chimists* in former times, in mistaking the Greeke name, called the greater kinde *Cali-donium*; and thereupon did highly extoll the Quintessence drawne from it, not onely to expell many diseases, but for many their idle and fantastick transmutations: the lesser sort beside the former names, is called *Ficaria* & *Scrophularia minor* of *Brunfelsius*, of *Fuchsius* *Malacocissos minor*, whom *Mathiolus* taxeth therefore, *Guilandinus* and *Cordus* tooke it to be *Amelius Virgili*, as we shewed you in the Chapter of *Amellus* or *Aster*. *Sylvaticus* calleth it *Tesiculus sacerdotis*, and is likely to be the *Ranunculus latifolius* of *Lugdunenſis*. *Bauhinn* calleth it *Chelidonia rotundifolia*: it is thought also to be the *Strumea* of *Pliny*, whereof he speaketh among the *Ranunculi*: many doe make doubt whether this herbe be the *Chelidonium minus* of *Dioscorides* and *Galen*, because it hath not any acrimonie or sharpnesse therein, as they say is in theirs: but yet all writers doe agree, that howsoever it hath not any acrimonie, it is in forme and all other properties the same. It is as I sayd called *Ficaria* and *Scrophularia minor*, a *signatura*, from the likenesse of the rootes unto those *Strumea* called *Scrophule*, which appeare in *ano*, & *ad tonsillas*, and therefore as in many other the like, held powerfull to cure them; the greater is called of the *Italians* *Celidonia maggiore*, of the *Spaniards* *yerva de las gelondrinhas*, and *Celidrenha*: of the *French* *Chelidoine Felongue* and *Esclaire*: of the *Germanes* *Groß Scholwurtz* and *Goldwurtz*, and *Schwalbenkraut*: of the *Dutch* *Gont wortel en groot goume*: and we in *English* great Celandine, and of some Swallow-wort, and Tetterwort. The lesser is called by the *Arabians* *Memicen*, by the *Italians* *Favagello* and *Favosello*: by the *French* *Coullions de prestre*, or *petite Esclaire*: by the *Germanes* *Meinkraut* and *Klein Feigwurtzen*: of the *Dutch* *Eleyne Goume* or *specene cruut*: and we in *English* small Celandine, Pilewort, and of some Figge-wort.

The Vertues.

The greater Celandine is hot and dry in the third degree, and of a cleansing facultie; It openeth the obstructions of the Liver and Gall, and thereby helpeth the yellow laundies, the herbe or the rootes being boyled in white wine with a few Aniseedes and drunke: *Mathiolus* saith that if the Greene herbe be worne in their shooes that have the yellow landies, so as their bare fete may tread thereon, it will helpe them of it; the same also taken in the same manner, helpeth those that are inclining to the dropfie, or have it confirmed in them by often using it, as also for those that are troubled with the itch, or have old sores in their Legs, or other parts of their bodies: the juice thereof taken fasting, is held to bee of singular good use against the Plague or Pestilence, and so is the distilled water also with a little Sugar, but especially if a little good Treacle bee mixed therewith, and they upon the taking layd downe to sweate a little: the juice dropped into the eyes doth cleanse the eyes from filmes and clouds that darken them: but because it is somewhat sharpe, the hardened juice relented with a little breast milke will well allay it: it is to good purpose used in old filthy or corroding and creeping Vlcers wheresoever, to slay their malignitie of fretting and running, and to canse them to heale the more speedily: the juice often applied to tetter, ringwormes or other such like spreading Cancers, will quickly kill their sharpnesse and heale them also: the same rubbed often upon warts will take them away: the herbe with the rootes bruised, and beared with oyle of Camomill, and applied to the Navill, taketh away both the griping paine in the belly and bowells, as all the paines of the mother, and applied to womens breasts that have their courses in two great abundance stayeth them; the juice or the decoction of the herbe gargled betwene the teeth that ake, taketh away the paine, and the powder of the dried roote, layd upon an aking, hollow, or loose tooth, will as they say cause it quickly to fall out: the juice mixed with some powder of brimstone is not onely good to annoint those places that are troubled with the itch, but taketh away all the discolourings of the skinne whatsoever, be they spots or markes of bruises, stripes or wounds, the Morpew also, sunburning or any the like; and if it chance that in a tender body it cause any itching or inflammation, by bathing the place with a little Vinegar it is soone helped: the lesser Celandine, because it hath not that acrimonie with us, that it seemeth it hath in Greece, where *Dioscorides* lived, cannot have those properties, they ascribe unto their *Chelidonium minus*, which is, the juice taken

taken from the rootes, and put up into the nose purgeth the head, and a decoction thereof with a little honey put to it and gargled in the mouth, doth the same effectually, and doth purge and cleanse the brest of flegme or any other tough humors that doe offend: it also helpeth a running itch, and those nailes of the fingers and toes that grow deformed, and scabbed: thus saith *Dioscorides* and *Galen*, but it is certaine by good experience, that the decoction of the leaves and rootes doth wonderfully helpe the piles or hemorrhoides, as also kernels by the eares and throate, called the Kings Evill, or any other hard wennes or tumors.

CHAP. LXXI.

Dentaria. Toothed Violets, or Corallworts.

Here be divers sorts of these toothed Violets, differing one from another, eyther in roote or leafe or both, as you shall presently understand.

1. *Dentaria bulbifera*. Bulbe bearing toothed Violets.

This toothed Violet shooteth forth one or two winged leaves, upon long brownish footestalkes, which in their rising up out of the ground, are as it were doubled or foulded downwards, and then open themselves into seaven leaves most usually, and sometimes but five, each whereof is somewhat long, dented about the edges, and pointed, of a sad Greene colour, and set on both sides of the middle ribbe one against another: the stalk that beareth flowers riseth up in the same manner with the leaves, and is bare or naked of leaves unto the middle thereof, where it shooteth forth a leafe, and so one or two more up higher, each consisting but of five leaves, and sometimes but of three, having also the uppermost single, at each whereof cometh forth a small round Bulbe, cloven, or as it were divided into some parts or cloves, of a sad purplish Greene colour, which being ripe and put into the ground, will grow to be a roote, and beare leaves like as the Bulbes of a red bulbed Lillie; about which at the very toppe stand foure or five flowers in long huskes upon short footestalkes, opening into foure leaves, of a purplish colour, very like unto the flowers of Stocke Gilloflowers, or Dames Violets; after which come small long hornes or cods pointed at the ends, wherein lye such like seede, as are in the cods of Dames Violets, which will as soone as it is ripe, breake the podde and fall out: the roote is very white smooth and shining, made of divers small round knobbes set together not growing downwards, but lying along, and encreasing under the upper crust of the ground, having very few fibres thereat: the taste both of leafe and roote is somewhat bitter, hot and sharpe like Raddish, as all the rest of these sorts are.

2. *Dentaria Pentaphyllor*. Cinquefoile Corallwort.

The first sort of Cinquefoile Corallwort or toothed Violet, hath likewise one or two leaves rising from the roote, upon long footestalkes, consisting of five parts or leaves, each of them somewhat like the former, and dented about the edges, but they are longer, rougher and harder in feeling, and more closely set together, rising for the most part from one joynt, like as the Cinquefoiles doe: upon the stalkes also are some such like leaves, set one above another, at the toppe foure or five such like flowers, but somewhat larger, of a purplish colour, somewhat deeper then the former which turne into such like pods, with the like seedes in them, and hath no bulbes on the stalk: the roote hereof is greater, made as it were into joynts not so white as the former, and with longer fibres issuing from betweene the joynts.

3. *Dentaria pentaphyllor altera*. Another Cinquefoile Corallwort.

The roote of this Corallwort is very like the first, consisting of many round cleare white knobs but more in number, set together by peeces, with divers long fibres growing out of it, which shooteth forth a smaller and lower stalk then the former, being not above a foote high, with some leaves set thereon, as also there is some of those very like the last, but narrower; more smooth and gentle, of a paler Greene colour also: the flowers that stand at the toppe like unto the others, are of a purplish colour, after which come the like pods with seede in them, as the rest.

4. *Dentaria triphyllor*. Trefoile Corallwort.

This Corallwort sendeth forth two or three leaves consisting of three parts onely, each whereof are rounder and somewhat larger then the other sorts, dented about the edges, and of a darke Greene colour: about the middle of the stalk that beareth flowers, the lower part being bare or naked of leaves, stand three leaves each of them standing by it selfe upon a stalk, consisting of three leaves a peece, nine in all, which are narrower and longer then those below, and longer pointed: the flowers are of a pale greenish colour, hanging downe their heads, after which come such like seede, in somewhat thicker pods: the roote is composed of somewhat longer peeces, set together somewhat like unto the lesser Lungewort, which will turne blackish when it is a little dry.

5. *Dentaria Heptaphyllor*. Setfoile Corallwort.

The Setfoile Corallwort riseth likewise with two or three leaves from the roote, set upon long footestalkes like unto the first sort, consisting of seven leaves set all along a middle ribbe in the same manner, and sometime but of five leaves, of a paler Greene colour on the upper side, and more grayish underneath; the stalk hath some such like leaves thereon, but no bulbes, and the flowers at the tops are in forme like the other, but larger, and in some white, and in others purplish: the cods and seedes are like the rest, but the roote hereof is not so much parted as the former, but more thicke and tuberous.

6. *Dentaria angustifolia bulbifera*. Bulbed narrow leaved Corallwort.

This Corallwort riseth up with a stalk or two, bearing long and narrow leaves dented about the edges, of sad Greene colour, and pointed at the ends somewhat like the leaves of *Parmica sylvestris*, called wilde Pelletory every one standing singly by it selfe, and at the joynts therewith, come forth such like scaly balebs as are in the first sort, but thicker and of a darke purplish colour, but none among the flowers which grow many together, of the

1. *Dentaria Bulbifera*.
Bulbed Coralliwort. 2. *Dentaria pentaphylla* & *triphylla*.
Cinquefoile and trefle Coralliwort. 5. *Dentaria Heptaphylla*.
Setfoile Coralliwort. 6. *Dentaria angustifolia Bulbifera*.
Bulbed narrowleaved Coralliwort.

the same fashion with the other, that is, of foure leaves a peece, but they are of a whitish colour, after which come long pods with feede like the other: the roote is white and somewhat short, growing aslope as the rest doe, set together with joynts, somewhat closer and more even with some fibres at it.

7. *Alabastrites five Dentaria minima.*

The least Corallwort.

7. *Alabastrites five Dentaria minima.*
The least Corallwort.

Although I know that this plant is referred by most unto the *Ranunculi* or Crowfeet & so have I done here before, yet having gained a more perfect figure thereof, and considering the small likenesse it hath with any sort of Crowfeet, and the nearer resemblance of it unto these kindes of plants I have presumed to insert it in this place for the name sake, and likenesse of the roote, although you have the exact description thereof among the Crowfeete under the name of *Ranunculus nemorosus Moschatella diellus*.

The Place.

The first and the last have beene found in our land; the first at *Mayfield* in *Sussex*, in a wood called *Highreede*, and in another wood there also called *Foxholes*, both of them belonging to one Mr. *Stephen Perkburst* at the writing hereof; the rest in the shadowie woods of *Germany*, *Switzerland* and *Savoy*, *Naples*, *Italy*, and divers other places.

The Time.

They flower about the end of *Aprill*, and beginning or middle of *May*, and are withered and gone before *Iuly* for the most part, the rootes abiding safe under ground.

The Names.

Neither *Dioscorides* nor *Pliny*, nor any other of the ancient writers, as divers have supposed have made any mention of these plants, but being found out by later searchers are called diversly; some from the forme and colour of the rootes, calling them *Dentaria*, *Dentillaria*, *Coralloides*, and *Alabastrites* as *Lobel*, and *Dentaria Coralloid-radice*, as a difference from other *Dentarias*; and some also thereupon tooke it to be an *Aconitum*, as *Daléchampius* doth in *Lugdunensis*; some both from the roote and the flowers, that are like unto *Stocke Gilloflowers*, which were anciently comprehended under the name of *Viola*, called it *Viola Dentaria*, as *Dodonæus*, some from the effects and properties as *Cordus lib. 2. plantarum historia cap. 111.* and *Gesner in hortis, Samula alba* and *Saxifraga montana*, and saith that about *Savoy* they call it *Pulmonaria*, but *Columna* taketh it to bee *Ceratia Plinij*, and sheweth plainly that this *Dentaria* hath all the properties that *Pliny* ascribeth unto his *Ceratia*; for whereas *Pliny* saith, it hath but one leafe, so saith *Columna* this hath but one sometimes, for hee maketh that leafe to bee but one that standeth upon one stalk, howsoever divided into 3. 5. 7. or more parts, as is to be seen in the *Ashree*, *Quicken tree*, *Service* and *Walnut*, &c. the whole leafe springing forth together and falling away all together, and not one peece after another, as in others that are fingle, which is a true note how to know a winged leafe from others, as I shewed you formerly in another place. The first and sixt are called *Dentaria bulbifera*, or *baccifera*, because they onely and none of the rest doe beare any bulbies like berries upon their stalkes. They are all generally called *Dentaria*, and most of them from the number of their leaves, called eyther *triphyllus*, *pentaphyllus*, or *heptaphyllus*; but the *triphyllus* is also called by *Lobel Enneaphyllus*, onely the two last differ in some things from all the rest; the sixt being called by *Beslerius*, that set forth the great booke of *Hortus Eystensis*, *Dentaria angustifolia baccifera*, and *Baubinus* thereupon *Dentaria baccifera folijs Ptarmice*. *Cordus* in his second booke 111. Chap. of his History of Plants, setteth forth the figure thereof in my minde, but without any bulbies at the leaves, under the name of *Coralloides alia species*. *Gesner* in his scholia, at the end of that Chapter saith that the *Dentaria baccifera* was called by some *Consolida Saraenica*, and judgeth it himselfe a kind of *Aconite*: and the last as I have declared in the first division of the Crowfeete.

The Vertues.

The roote of Corallwort is drying, binding and strengthening, yet it helpeth to provoke *Vrine*, and to expell gravel and the stone, as some doe affirme: it is exceeding good to ease the griping paines of the sides and bowells, and for inward wounds that are made in the breast, longs and bowells, a dram of the powder of the roote taken for many dayes together, in red wine; the same also given to them that are bursten, or have a rupture is very beneficiall to be drunke in the distilled water of the herbe, called *Horsetaile*: it stayeth also *Laskes* and *Fluxes* that doe not proceede of hot and chollericke humours: the decoction of the herbe is good to be applied both to greene wounds, quickly to consolidate them, and for old filthy sores, to dry up their moisture and thereby to cause them heale the sooner.

CHAP. LXXII.

Leucium. Stocke Gilloflowers.

Have in my former booke shewed you many sorts of Stocke Gilloflowers, there yet doe remaine divers others which are of lesse beauty and durabilitie to be entreated of here, as I there promised. And because the word *Leucium* in Latine, is referred as well to these Stocke Gilloflowers, as to the Wallflowers with this distinction of *Leucum* onely. I will also distinguish and separate them, entreating in the next Chapter of those that beare yellow flowers and Greene leaves, which is the distinction between a Wallflower and a Gilloflower, yet I will here give you the figure of the single garden Stocke Gilloflowers.

1. *Leucium marinum maximum.* The greatest Sea Stocke Gilloflower.

This Sea Stocke Gilloflower hath divers long thicke whitish soft leaves, lying upon the ground one within another in a round compasse, and are stiffer then the other Sea kinds, or the garden kinds formerly set forth, jagged also or cut in on both sides evenly, into deepe dents like the knagges of a Bucks horne, which make it seeme the more beautifull: thus it doth abide for the first yeares growing, but the next yeare it beareth a hoary white stalke, three foote high or thereabouts, branching forth into many parts, somewhat thicke but weake, scarce able to stand upright, whereon grow narrower leaves little or nothing jagged about the edges, and a number of flowers at the toppes one above another, for a great length each of them consisting of foure broad pointed leaves a peece, but not altogether so sweete as the other Stocke Gilloflowers, yet somewhat larger, and of a pale blew with purple colour, almost like unto a Dove or Crane colour, after which come such like long pods as the rest have, with feedes lying in a double row in the same manner, larger and of a darker colour: the roote is white hard and long, spreading into many branches, which abideth not after it hath yielded feede, but perisheth as the other Sea kindes doe.

2. *Leucium marinum latifolium.* Broad leaved Sea Stocke Gilloflower.

This Sea Stocke Gilloflower hath many hoary leaves lying about the roote, shorter and broader then the other Sea kindes, harder also in feeling, and as it were rugged, more hairy and finely dented about the edges: from among which rise up divers round hairy stalkes about a foote high, bearing purplish blew flowers like the other, and small long pods with brownish flat feede in them.

3. *Leucium marinum majus.* Great Sea Stocke Gilloflower.

This Greater Sea Stocke Gilloflower hath divers long thicke hoary leaves lying on the ground for the first yeare; some of them being cut in on the one edge and some on both, with but one gash and some not at all: the stalke riseth up the next yeare about a foote high, or more spread into divers branches, yet all of them weake, and rather bending downwards then standing upright, whereon grow leaves little or nothing parted or cut in, and divers flowers on the toppes of them, of a pale purple colour, drawing neare to the colour of red wine lees; both

Leucium album vel purpureum.
Ordinary Stocke Gilloflowers white red or purple.

1. *Leucium marinum maximum.*
The greatest Sea Stocke Gilloflower.

2. *Leucoium marinum latifolium*.
Broad leaved Sea Stocke Gilloflower.

4. *Leucoium marinum minus*.
The lesser Sea Stocke Gilloflower.

both this and the next smell sweeter after the Seane is downe, then in the day time: the cods that follow are long and somewhat flat, with reddish flat seede in them, the roote is divided into many parts.

4. *Leucoium marinum minus*. The lesser Sea Stock Gilloflower.

This lesser kinde hath more upright stalkes, divided from the bottome into many branches, whereon grow soft woolly leaves, smaller, narrower, and lesser jagged than the former: the flowers that stand at the toppe of the branches, are smaller than the other, but made of foure leaves like the rest, of a fresh red or crimson colour, which upon their fading seeme to be of a deeper colour, and of a weaker sent than the other; in their places come long pods wherein are contained the like red seede: the roote is woody like the other, and perisheth after seede time.

5. *Leucoium marinum minimum*. The smallest sea Stockgilloflower.

The least Sea stock Gilloflower, hath a brownish square stalke, not above two inches high, set with five or sixe small and somewhat long round pointed hoary and hayrie leaves, on both sides thereof, bearing at the toppe one or two blewish flowers; whose footestalkes are hayrie also: the roote is small and threddy, with five or sixe very small and somewhat round pale Greene leaves, lying about it, for the first yeares increase, and flowreth the next.

6. *Leucoium marinum Creticum majus*. The greater Candy Stocke Gilloflower.

The greater Candy Stocke Gilloflower, hath a round weake stalke, branched into many parts, whereon are set divers long and narrow leaves somewhat thicke and hoary, without any dents or divisions on the edges, or with very few, and at their toppes many flowers clustering together, as it were in tufts, consisting of foure leaves a peece, whose ends are cut in somewhat deeper than others are, making the end seeme like unto a heart, as it is usually expressed, somewhat reddish upon the first opening, but of a blewish purple when they are full blownen, the bottomes of them being yellow, pointed up like a starre: the cods that follow are about two inches long, and round, containing within them, somewhat long and browne seede.

7. *Leucoium Creticum minus*. The lesser Candy Stocke Gilloflower.

This lesser Candy kind is like the former Candy sort in the growing and leaves, but that it is lesser in both; the flowers also are not above halfe so great, being fully white at their first blowing, and gathering afterwards a little purplish colour upon them, yet so as the whitenesse appeareth still.

8. *Leucoium Creticum oblongis folijs crenatis*. Long leaved Candy Stocke Gilloflower.

This third Candy kinde hath longer leaves, than either of the two last, plainly dented about the edges, from among which ariseth a round stalke, not halfe a foote high, sending forth diverse branches stord with small flowers as the last, but of a deeper blewish purple colour, than the first Candy kind.

9. *Leucoium Creticum marinum Caruleum*. The blue Candy Stocke Gilloflower.

This small Candy kinde hath many small Greene hayrie and straked stalkes, not much above an hand breadth high, having for the most part, two or three whitish soft Greene leaves, set together at a place, and some also standing singly, each of them being somewhat like the other Stocke Gilloflower, but round and broad at the ends,

ends, with long foote stalkes under them : the toppes of the stalkes are parted into small branches, each whercof sultaine sundry small flowers, somewhat long, made of foure leaves a peece, of a faire blue colour, after which come small blackish seede in long cods like the other: the roote is small and slender perishing yearely after seedetime, yet abideth a winter from the seede ; but sowne in the spring groweth quickly to flowering and so continueth in flower most part of the Summer. You have a branch hereof expresse in the table with *Leucoium truncatum utriculato semine* in the next Chapter.

10. *Leucoium saxatile Thymifolio*. Small Rocke Stocke Gilloflower.

The Rocke Stocke Gilloflower for the beauty of the flowers is not unfitly placed here among this Tribe, which elle for other respects might more truly in my judgement be put in that *Classis* of the *Thlaspi*, as the description sheweth) is a small low plant, having hairy small leaves like unto those of time ; set very thicke on both sides of the weake stalkes, which doe lye in such a round compasse that it seemeth like a small round bush, of an evill or sinking sent, but sharpe biting taste, comming nearer to the degree of a *Thlaspi* then *Leucoium*, as *Columna* saith himselve, who setteth it forth : it beareth small flowers plentifully on the toppes of the stalkes and branches, of a blewish purple colour, the middle part being of a whitish yellow with divers small threds standing in the midst of them.

The Place.

The first was brought out of the Isle of Ree by Rochel by Mr. John Tradescant when the Duke of Buckingham was sent with supplies for Monsieur Subise : the second growes by the Sea side, as the third and fourth about the Sea coasts in *Narbonne*, not farre from *Mompelien*, and on the coast of *Portugall* and *Spaine* beyond the *Straights* : the fift neare the Sea at *Terracina* : the three first *Candy* kinds *Clusius* saith hee received from *Casabon*, having brought them out of *Candy* : the ninth *Bauhinus* saith was brought out of *Signor Contareni* of *Venice* his Garden, but *Alpinus* saith from *Candy*, the tenth *Columna* found on the hills *Ualveser* in *Naples*.

The Time.

They doe all flower in the Summer moneths of *June* and *July* for a great while, and the seede ripeneth not untill *August*.

The Names.

The Greeke word *λευκόν* is given to all these wilde plants as well as to the other of the Garden, entreated of in my former booke, whether they be those we call Stocke Gilloflowers or Wallflowers : for so *Dioscorides* and *Pliny* and the rest that follow him, have distinguished the *Leucoium* (as the Latines also call them) into three colours, white, purple and yellow, for of a blew one as some copies of *Dioscorides* have it there is some doubt among many writers, in that *Pliny*, *Oribasius* and *Scrapia*, all following the Text of *Dioscorides*, and as *Marcellus* saith the Text of *Dioscorides* also in the *Sclavonian Longobardian Characters* hath no mention at all of a blew one, but this word *λευκόν* *Leucoium* that is, *Viola alba*, here is not opposed unto *μελανόν* *Melanium* (which signifieth *Viola nigra*, and are our March Violets, white or purple as the compoiture of the Greeke words import) in that properly is *Viola*, but is imposed upon these plants, as the proper names to them ; for so *Dioscorides* divideth them into severall places and Chapters, from the whitenesse of the leaves rather then of the flower as I thinke, and yet the name *Leucoium* is so variously transferred to other plants in *Dioscorides* text, that the flowers of many herbes, much differing one from another, are referred by *Dioscorides* to the flowers of *Leucoium* ; and so *Pliny* saith, that the name of Violets in his time were given to very many flowers, that were put into garlands for the beauties sake and sweete favour of the flower, custome prevailing above reason, yea many other nations in the like manner, have followed them and called them Violets, as *Viola Damascena* or *Matronalis* which are our Dames Violets or Winter Gilloflowers, & those in *Italy*, *Viola marina*, I he first hath the name in the titles as is fittest for it in my judgement. The second *Lobel* calleth *Leucoium maritimum alterum latifolium*. *Camerarius* *Leucoium maritimum aliud*, and saith *Angularia* tooke it for *Tripolium*, and *Bauhinus* *Leucoium maritimum latifolium*, and doubteth whether it be not the *Leucoium maritimum minus* of *Lugdunensis*, which as he saith some tooke to be *Hesperis*. The third and fourth are *Clusius* his *Leucoium maritimum majus* and *minus*, and so doe *Lobel* and *Camerarius* call them, *Bauhinus* calleth them *maritimum latifolium* and *angustifolium* : the fift *Bauhinus* onely mentioneth by the same name in the title : the sixt, seventh and eighth *Clusius* calleth, *Leucoium maritimum creticum primum*, *secundum* & *tertium* : the ninth *Bauhinus* thinketh to be that *Leucoium creticum pulcherrimum*, for he *Leucoium caruleum* *Dioscoridis*, that *Pona* mentioneth in his description of Mount *Baldus*, and calleth it himselve *Leucoium creticum minimum folio subrotundo*, and after a sort describeth it in his *Prodromus*, and peradventure may be his first sort there described likewise, for I finde little difference the one from the other : but *Alpinus* libro de plantis exoticis describeth it more perfectly and exactly, and calleth it *Leucoium caruleum maritimum*. The last *Columna* hath set forth by the name of *Lithoreo* *Leucoium minimum supinum*, and *Bauhinus* *Leucoium saxatile thymifolio hirsutum caruleo purpureum*, but might as I sayd be rather accounted a *Thlaspi*.

The Vertues.

These wilde or Sea Stocke Gilloflowers are of the same qualitie with those of the garden saving that they are not of so sweete a sent, and are almost esteemed as effectually as the ordinary yellow *Leucoium* or Wallflower, for so is *Galenus* judgement of them all, saying they are of a cleansing qualitie and of thinne parts: the Garden Stock Gilloflowers (for under them I comprehend the vertues of these also as I sayd) especially the dried flowers, rather then the fresh and greene boyled in wine and drunke doth rectifie the indisposition of the Liver and reines, provoketh womens courses, as also helpeth the hardnesse and paines of the mother, and expelleth the secondine or afterbirth, and the dead child also, yea and the living also saith *Galenus*, if they shall drinke of it when it is quick; a bath made for them to sit in doth the same, & the feed or the juice drunk worketh in the same manner also. If the same be drunke twice a day, it will helpe to strengthen and restore any member growne weake, loose, or out of joynt; the decoction of the rootes in vinegar, is held good for the hardnesse of the spleene, to be used outwardly, as well as inwardly. The distilled water of the flowers is available, to all the purposes aforesayd, and is sayd to cleanse the blood, to comfort the inward parts, to ease paines and to procure a merry disposition : the leaves brused with salt is used as a remedy for the Ague, to be tyed to the wristes : The juyce dropped into the eyes doth cleanse them from the mists and clouds, that seeme to hinder the sight, and such filtes or skinner, that beginne to grow over the sight to take it quite away : it is good also to gargle the mouth, with the decoction of the flowers,

flowers, and some honey put to it, and a little allome, and is found good for ulcers and fores therein, as also all other old and filthy ulcers: boyled also in Vinegar and applied warme upon the place pained by the Goute, giveth a great deale of ease, as also to the joynts and sinewes that have weakeneffe and paines, or are troubled with hard tumours, swellings, or inflammations.

CHAP. LXXIII.

Keiri seu Leucoium luteum. Wallflowers.

Have in my former booke, shewed you all or most of those Wall-flowets that carrying beautifull flowers are received as the delights and ornaments of a garden of Pleasure. I there also declared that there were some other, of no such beauty, or sent fit for that place, and therefore to be referred to this, as shall be now shewed you.

1. *Keiri seu Leucoium montanum luteum.* The Mountaine Wall-flower.

The Mountaine Wallflower riseth up with divers upright, strong, and woody stalkes, as high as any man sometimes, beset with many short Greene pointed leaves, dented about the edges: the flowers are single, but larger than of the ordinary sort, and of a faire yellow colour, consisting of foure leaves, smelling very sweete like them, the long pods that containe reddish feede, are somewhat slenderer than the other: the roote is woody disperfed under the ground into branches, and endureth long especially in the warmer Countries, where the frosts are not so extreame, as they are with us.

2. *Keiri seu Leucoium sylvestre Clusii.* Wild Wallflowers of Clusius.

This wild Wallflower, hath sometimes many, and sometimes but one head of long narrow Greene leaves, lying on the ground about the roote, somewhat like unto the ordinary Wallflower, but a little waved or sparingly dented about the edges, which to abide the first yeare for the most part; yet some the yeare of their first springing will send forth a stalk or two, of about a yard high, with many such like leaves set thereon, as grew below, but smaller and with few or no dents on the edges at all: the flowers are many that stand clustring together, as it were in an umbel, (and not in a long spike, as the ordinary Wallflower doth at the toppes) consisting of foure leaves a peece, not altogether so large as the Wall-flower, nor of such a yellow colour of little or no sent at all: after which come long slender pods, with flattish feede in them like the other: the roote is long and single, with divers fibres thereat, and perisheth after feede time.

3. *Leucoium luteum Erucæ folio.* Wallflowers with jagged leaves.

This kind of Wallflower, hath his lower leaves much more and deeper jagged on the edges, (almost like

Keiri seu Leucoium vulgare luteum vel album.
The ordinary yellow Wallflower or the white.

2. *Keiri seu Leucoium sylvestre Clusii.*
Wilde Wallflowers of Clusius.

H h b

those

those of Rocket, or of the wilde Poppie) than those upon the stalke, yet all of them very long Greene and soft and somewhat hayrie: the stalke which is round and somewhat hayrie, about two foote high, and somewhat branched, beareth many yellow flowers, like the common Wallflower, but set more closely together, as it were in an umbell, and of the smell of new Waxe: but afterwards doe more separate a sunder, when it beareth the long pods like unto the other; the whole plant hath a sharpe quicke taste.

4. *Leucoium Creticum luteum ntriculato femine*. Candy Wallflowers with roundish pods.

From a small Woody roote divided into sundry branches, rise up divers woody stalkes, about a foote high, branching forth and set at severall places, with many small whitish Greene leaves set together, lesse than those of the ordinary sort, harder in handling and set with sharpe haire: the flowers are yellow at the toppes of the branches, made of foure round pointed leaves a peece usually, but sometimes with foure or fixe, after which come yellowish roundish pods, containing many whitish feedes, like unto the ordinary but broader and greater, this abideth with some leaves Greene above ground in the winter, not perishing as many others doe.

The Place.

The first *Pona* hath set forth, in the description of Mount *Baldus*, in his *Italian* Edition, but not in the *Latine*, found growing there: the second groweth in *Germany*, in many places, as *Gesner*, *Tragus*, *Camerarius*, and *Clesius* make mention: and in *Spaine* also, for from thence hath the feedes thereof beene brought to me: the third *Columna* saith groweth in the vallies of the *Campoclare* hills in *Naples*: the fourth in *Candy*,

The Time.

They flower almost all the Summer long, and in the meane time ripen their feede.

The Names.

I have shewed you in the Chapter, next before this, the Greeke and Latine names to be *Leucoium*, and the derivation and transposition thereof, to many other herbes; whereunto I referre you, onely these yellow kinds, as well as the other set forth in my former booke, are called *Leucoium luteum*, or *aureum*, as a distinction to severthem: the *Arabians* doe properly call this yellow kind *Keiri*, or *Cheiri*, although divers doe transferre the name, to all the other sorts of *Leucoium*; but because this is more excellent and vertuous, than any of the Stocke Gilloflowers, even by *Galen* his judgement. I hold the name *Keiri*, more proper to this kinde than that: some also call it *Viola lutea*, as *Tragus*, *Feschius*, *Dodonaeus*, and *Cesalpinius*, but *Tabermontanus* *Viola petraea lutea*: The first here set downe is called by *Pona* afore sayd, *Leucoium luteum montanum serrato folio*: the second is called *Leucoium sylvestre* by most writers thereof; by *Tragus* *Viola lutea sylvestris*: it is very probable that it is the same also, that *Beslerius* in *horto Eysketensi*, calleth *Leucoium sylvestre inodorum flore flavo pallidore*, as also the *Leucoium sylvestre* of *Clesius*, although *Bauhinus* would make them two severall plants, calling the one *Leucoium luteum sylvestre Hieratii folio*, and the other *Leucoium luteum sylvestre angustifolium*: the third *Columna* calleth *Leucoium terrestre majus*, and *Bauhinus* *Leucoium luteum Eruce folio*: the fourth is onely found extant in *Alpinus de plantis exoticis* by the same name is in the title: the *Italians* call it *Viola Gialla*: the *Spaniards* *Violas amarillas*: the *French* *Violas jaunes* & *Violas des Mares*: the *Germanes* *Geell Violten*, and *Winter Violten*: the *Dutch* *Steen Violten*: we in *English* *Wall flowers*, *Wall Gilloflowers*, *Winter Gilloflowers*, and some *Bell flowers*, and yellow Stocke Gilloflowers.

The Vertues.

All writers doe attribute the most especiall vertues, of all the sorts of *Leucoium*, to the *Leucoium luteum*, which is our common Wallflower: and some of these wilde kinde here expressed, doe come to neere thereunto, although wanting that sweete sent that they may be used in their stead; for even these are somewhat bitter and hot, and conduce (but especially the ordinary or sweete kinde) unto all the purposes that are specified in the former Chapter; for *Galen* saith in his seventh booke of simple medecines, that the yellow *Leucoium* doth worke

4. *Leucoium Creticum luteum ntriculato femine* & *marinum creticum ceruleum*.
Yellow Stocke Gilloflowers with round heads, and the least Candy kinde with blue flowers.

work more powerfully than any of the other kindes, and therefore of more use in Phisicke: it clenseth the blood and freeeth the Liver and reines from obstructions, provoketh womens courtes, expelleth the secundine and dead child, helpeth the hardnesse and paines of the mother, and of the spleene also: stayeth inflammations and swellings, comforteth and strengthneth any weake part, or out of joynt; helpeth to cleanse the eyes from mistinesse and humes growing on them, and to cleanse foule and filthy ulcers, in the mouth or any other part, and is a singuler remedy for the Goute, and all aches and paines in the joynts and sinewes.

CHAP. LXXIIII.

Hesperis sive Viola Matronalis. Dames Violets.

Have in my former booke set forth two sorts of Dames Violets, both of them with single flowers, but the Presse had scarce passed that Chapter, where I mentioned them, but I did understand of two others, with double flowers, the one that was sent me from *Paris*, and yet was in *England* long before, as I understood afterwards, although I heard not of it; and another likewise nursed up with the other, in the West parts of our Land, which I meane to declare unto you here, (and may be transferred to the other single ones, when that booke shall be reprinted) together with some other sorts hereof.

1. *Hesperis sive Viola Matronalis flore albo pleno.* Double white Dames Violets.

The double white Dames Violets groweth not so great in any part thereof, nor so high as the single doth, except in the flowers, which being very thicke of leaves, of a pure white colour, and many standing in a cluster, sweeter also than the ordinary, and longer abiding, causeth it to be had in some esteeme; it hath somewhat lesser leaves of a fresher Greene colour, little or nothing snipped about the edges, and more tender; but the branches grow more plentifull, and more easie to be slipped and transplanted, than the single kinde, but giveth no seede, as many other plants doe; that carry double flowers, and is more tender to be kept in the Winter.

2. *Hesperis flore pleno purpurante.* Double purple Dames Violets.

This other double Dames Violets differeth not much in any thing from the former, but in the colour of the flowers which in this is of a fine pale purplish colour, and not fully so double as the others, nor so many clustering together.

Hesperis Melancholica.
The Melancholy Gentleman.

Hesperis Syriaea Camerarii, &c.
Sylvestris latifolia flore albo parvo.
Dames Violets of Sytia, and the small white flowered Dames Violets.

444 2

3. Hesperis

3. *Hesperis Pannonica inodora*. Unflavory Dames Violets of Hungary. This *Hesperis* is so like unto the ordinary sort, in all other things saving the sent, that there can be no difference found between them: this only hath no sent at all, neither morning, nor evening, neither day, nor night, to commend it, which maketh it to be a differing sort from the rest: and some have made another different sort hereof, (which is likely to be but a degeneration of the same) that beareth greenish flowers.

4. *Hesperis sylvestris folio sinuato*. Wilde Dames Violets with waved leaves. This Dames Violet sendeth forth an hairy, rough, crested, pale Greene stalk of about a foote high, parred at the top into divers branches, with leaves set thereon from the bottome, which are thicke, rough, and hairy, narrower and longer then the other, and waved about the edges, the lowest having footestalkes, and those above none, but stand close to the stalk: the flowers are as large, and consist of foure leaves in the same manner that the rest doe, and smelleth pretty sweete also, but of a deeper red colour then they: the cods with seede in them are like the other and perish after seede time most usually, yet sometimes abiding a third yeare of it selfe, but most certainly if it be hindered from bearing too many branches and flowers, by cutting them downe before they goe to flower.

5. *Hesperis sylvestris angustifolia flore parvo*. Small purple flowered Dames Violets. The leaves of this small *Hesperis* are narrower and longer pointed then in the common sorts, lesse rough also and deepe lined cut in or dented on the edges: it hath a stalk about halfe a yard high, branched toward the toppe with very small flowers thereon, of a purplish colour, so that one of these flowers, are not much bigger then one of the leaves of the flower of the ordinary; the pods that follow are long but much smaller.

6. *Hesperis sylvestris latifolia flore albo parvo*. Small white flowered Dames Violets. The leaves of this kinde are large and broad, small at the bottome of the stalk where it is a little parred or torne, but crumpled and dented all about the edges, a little rough hairy and woolly, but in summer more white: the stalk riseth up the next yeare after the first springing about a yard high, branching forth at the top into sundry long spikes, full of very small white flowers no bigger then the last, consisting of foure leaves a peece, which after wards yeeld very many and very long slender flat pods like the Stocke Gilloflowers hanging downe, but smaller, with very darke browne flat seedes therein on both sides like the *Leucoium*: so that it partaketh with the *Hesperis* in the Greene leaves, and with the *Leucoium* in the flat pods and seede: the roote is not very long but white and woody perishing yearly after it hath borne seede: the flowers have little or no sent in them; but the leaves have a little hot and drying taste. I have given you onely a leafe hereof, and a few flowers at the sides of the *Hesperis Syriaca*.

Because both the *Leucoium Syriacum* and *Melancholium*, that I have set forth already in my other booke, as I there call them, partake more with this *Hesperis* then with *Leucoium*, in that their leaves are Greene, and not white like them; and in that the seede in the pods of the *Melancholium* are not flat but long and round like *Hesperis*. I have given you here the figure thereof, and with the *Syracum* a leafe and some flowers of the last: I might have multiplied the sorts of *Hesperis* unto you as *Bauhinn* doth if I would follow him, who maketh that *Leucoium alterum fasciatile obsoleto flore* of *Columna* to be of a different sort from the *Melancholium*, which undoubtedly is the same, and the *Hesperis Syriaca* or *Leucoium Syriacum*, of *Camerarius*, and *Clusius* to be the *Melancholium* also, which certainly also are differing plants, and even *Bauhinn* himselfe would so have acknowledged, if ever he had seene both the plants.

The Place.

The first was as I sayd before sent me first out of France, which perishing I had both it againe and the second also by the liberalitie of Mr. Dr. Anthony Sadler a Physitian in Exeter, son to the elder Sadler an Apothecary there, who both affirmed unto me for certaine, that the white one was in many mens Gardens in the West parts, and the purple also although not so plentifull, before my booke came forth, but from whence the originall of them came is not knowne: the third as *Clusius* saith groweth in the skirts of the vineyards at the foote of the hills, that are neare Vienna in Austria: the fourth groweth as *Bauhinn* from *Burserus* relateth it, among the Rony places in Provence that are moistned with springs: the fifth also neare Mompelien, in the watery gravell grounds, on *hortus Dei*: the last grew in my garden from seede, received from some friend but I have forgotten who.

The Time.

They all doe flower in the Summer Moneths of June and Iuly chiefly, and the first abideth longest, if it stand not too much in the Sunne.

The Names.

There is some doubt among many learned, whether this *Viola Matronalis*, as it is usually called in Latine, should be the *Hesperis* of *Theophrastus*, in his sixth Booke de causis plantarum and 25. Chap. because he is so briefe therein, that there can be no more learned out of him, then that it smelleth sweeter in the morning and evening then in the day time, even as some of these and the ordinary sort doth, whom *Pliny* followeth in his 20. Booke and 7. Chapter, and thereof tooke the name *Hesperis*: It is also called of *Tragus* *Viola alba*, and *Persica Hermolai*, and taken to be *Leucoium* of *Fuchsius*; *Gesner*, *Dodonæus* and *Lugdunensis* call it *Viola Matronalis*, and *Lobel* *Viola Damascena*. Some also call it *Viola hyberna*, sive *hyemalis*, and some *Viola Moschatella*; the first and second are called *Hesperis flore pleno albo*, and *flore pleno purpurante*: the third here is the third *Hesperis* of *Clusius*, and the other two are mentioned by *Bauhinn*, the former by the name of *Hesperis sylvestris hirsuta folijs* Hieracij, the other *Hesperis sylvestris flore parvo*, to the last I have given the title as is fittest: the French call them *Violette de Damas*, and *Violette de Dames*, *Gioslee di Damas*, and *Gioslee de Dames*, the Germans winter *Violen*, as they doe the Wallflowers also in the last Chapter, the Dutch *Damas Bloemen*; we in English Dames Violets, and Damaske Violets, *Queenes Gilloflowers*, *Winter Gilloflowers*, also of some, *Rogues Gilloflowers*, but why I know not: in the West parts of this Island, from whence I had the double kinds as I am enformed, they call it double Scincey, and the single close Scincey, but *Gerard* saith close Sciences.

The Vertues.

Hesperis, all the sorts of them are hot and sharpe in taste, like unto Rocket, and therefore *Dodonæus* thinketh they may be species thereof, being so like in taste, to be also in properties: he saith that the distilled water thereof is very effectfull to procure sweating. *Clusius* further addeth, that it provoketh Vrine also, and helpeth those that have

have a cough or are short winded: it is also of a cutting quality for tough flegme, of a digesting property for aw and undigested humours, and of a cleansing nature for foule and filthy Cankers, Vicers and fores, cyther inwardly in the mouth, or outwardly in any part of the body.

CHAP. LXXV.

Lychnis. Campions.

Have given you a dosen sorts of Campions in my former booke which are all delightfome and pleasant plants fit for that worke, being A Garden of Pleasure: there are many other sorts to bee entreated of which shall be here exhibited, even to the least sort which is like Mosse upon the ground, that so you may understand all the varieties that nature hath shewed us, and because two sorts with double flowers, are come to our knowledge since the publication of my booke, which else should have bene therein inserted, and may bee at the next Edition. I will begin with them first in this Chapter, and adde unto them a smaller sort of single not there expressed, and of the rest in the other following, yet give you the Figure of the single kinde and declare the properties.

1. *Lychnis Coronaria flore albo pleno*. Double white Rose Campions.

The double white Rose Champion hath not altogether so woolly white leaves, as the other Rose Campions have, but are a little greener and smaller, the flowers grow upon the branches of the stalke in the same manner but rise not usually so high as the double Red, set in whitish cornered huskes, and consisting of two or three rowes of leaves in the same manner; this is a little more tender to keepe then the double Red, and desireth more shadow and moylture.

2. *Lychnis Chalcedonica flore albo pleno*. Double white Nonesuch.

This double Nonesuch is so like unto the other double Red, for the forme of the leaves and manner of growing, as that there is hardly any difference discerned before it come to flower, yet the leaves seeme to bee a little fresher Greene: the stalke riseth not so high, and the flower it selfe is not so large as the double red and is of a pale whitish colour.

3. *Lychnis Chalcedonica minor simplex*. The lesser single Nonesuch or flower of Bristow.

The lesser kinde riseth not so high as the other sort by the halfe, neither is the stalke so great having but a few leaves set thereon by couples like the other: the flowers that stand at the toppe likewise are fewer but of the same colour, the roote is small and fibrous and perissheth every yeare.

The Place.

These are onely nourshed up in Gardens with us, and their naturall places are not knowne.

The Time.

They both flower at the time of their other kinds.

The Names.

It is called in Greeke *λύχνις* (*Lychnis*, from *λύχνω* i. *Lucerna*) and *ἐλύχνιον* *Ellychnium quasi lucerna funiculus*.

Lychnis Coronaria vulgaris.
Ordinary Rose Champion.

Lychnis Chalcedonica vulgaris.
The ordinary Nonesuch or flower of Bristow.

lum and thereof tooke the name, for in the former times they used the leaves of the Campions, as of many other plants in their lampes instead of the wecke to burne. The single kind is called also by divers other names, as *Valeriana*, or *Ballaria*, *Genicularis*, and *Corymbe* of *Columella*, in his tenth booke, as *Ruellius* thinketh, where *Columella* hath this Verse:

Nunc veniat quamvis oculis inimica Corymbe. Vnlesse he understand *Crambe* thereby.

The Greeks also called it ἀθάνατον, i. e. *immortale*, quod diutius venustatem suam retinet, and some *Taurion* but not *Taura* or *Tora*, which is a venemous plant as I have shewed before; in Latine most usually they call it *Lychnis fativa* or *Coronaria* and *Sylvestris*, *Cordus* calleth it *Verbascum montanum*. Some have taken this to be the ἀθάνατον of *Theophrastus* in his sixth booke and seventh Chap. but that cannot be, for he reckoneth both *Lychnis*, and *Diosanthos* among the Summer flowers: some also to be his ἀθάνατον *Flamena*, but hee mentioneth that also in the same place, and cannot be both one herbe. *Pliny* in his 21. booke and fourth Chap. saith they called an herbe *Rosa Greca*, which the Greeks called *Lychnis*, and in the 11. Chap. of the same 21. booke he nameth *Lychnis* as *Theophrastus* doth among the Summer flowers: the Garden kind therefore as fittest for the uses aforesaid is held by the most judicious in these times to be the true *Lychnis* of *Theophrastus* and *Dioscorides*: the *Italians* call the *Lychnis fativa* *Lychnide ortolana*, and the wilde *Lychnide sylvestre*: the *French*, *Oeillet Dien* for the Garden kind, and *Oeillet sauvage* for the wilde: the *Germans* call the manured sort *Fraxwenzlin*, *Marienroselin*, and *Himmelroselin*, that is to say, *Dominarum Rosa*, *Mariana Rosa*, *Celi Rosa*, and *Celi flos*: they call the wilde kind *Margenroselin*, and wild *Margenroselin*; the *Dutch* call the Garden kinde *Christus cogen*, and the wild *Iennettekins*, and wee in *English* *Rose Campions* those of the Garden and the other wilde Campions, as you shall heare in the next Chapter. The other *Campion* (as well the single as double kindes) is called *Lychnis Byzantina*, *Chalcedonica*, *Constantinopolitana* of some, *flos Creticus* of others, and *flos Hierosolomitamus* of *Gesner*, who also calleth it *Ocimoides peregrinum*, and *flos Constantinopolitanus* of *Lobel*, *Lugdunensis*, and others: wee in *English* usually call it *Nonessuch*, *Flower of Brisowe*, and *flower of Constantinople*. It is thought by some to be *Sruthium* or *Lunaria*, which the *Arabians* call *Condif* because it will make water to lather like sope, and cleanse such cloathes as are washed in it: but yet notwithstanding that quality (which is also given to *Saponaria*, and thereby also thought to be *Sruthium*) it agreeth not with the descriptions of *Theophrastus* and *Pliny* (for *Dioscorides* describeth it not) which as they say is a thorny plant bearing leaves like unto an Olive, and hath a great roote, none of all which this plant hath, and therefore cannot be it. Some likewise thinke it to be *Potios* of *Theophrastus* in the same sixth Booke and last Chapter, which *Athenasius* agreeing with him saith is of two sorts, the one *Hyacintho similis*, the other *axerux*, id est, *decolor*, *non coloratus*, *vel sine colore*, and may very well agree with the severall colours of the flowers hereof. The second or lesser sort is very like to be the *flos coccineus* of *Lugdunensis*, and the *Ocimoides peregrinum minus*, or *flos ab Hierosolimis minor* of *Gesner* in his *hortis*, and not the *Muscipula Lobelij* or *Lychnis sylvestris prima Clusii* as *Bauhinus* maketh the doubt, for *Gesner* there saith, that the lesser sort endureth long and hath fewer flowers.

The Vertues.

The *Rose Campions* are of little use in Physicke now adayes with us, being chiefly used as flowers, fit to decke the Garden or the house, *Galen* saith that the seede thereof is hot in the second or third degree, and dry in the same, and *Dioscorides* saith that the seede of the *Rose Campion* drunke in wine doth helpe those that are stung by a *Scorpion*; which if it be true and so found now a dayes; I see no reason but the same might bee available for the pest, it being as speedy a poyson, apt to kill in a short space: and besides that wee have many things effectually against the Plague, which will expell also the poyson of the *Scorpion*, or other venemous beasts: the leaves applied to any old or foule Vicers in the Legs or other parts, doe cleanse and heale them. Of the *Nonessuch*, there is neither ancient nor moderne writers hath given any property, but is wholly neglected of all.

CHAP. LXXVI.

Lychnis sylvestris. Wilde Campions.

BEcause I have many sorts of *Lychnides sylvestres*, wilde Campions to declare unto you: I thinke it the fittest and most methodicall way, to distinguish them into severall Chapters, and entreate of them severally, that so both my writing and your reading be not confounded nor they with it. I meane therefore to entreate in this Chapter of those wilde sorts that beare rough leaves and stalkes, and grow high, in the next of those that are glutinous and clammy; and lastly of those that eyther bend or lye downewards to the ground, or creepe thereon, and of those that are small, or that are like Moss upon the ground.

1. *Lychnis sylvestris flore albo*. White wilde Campions.

The white wilde *Campion* hath many long and somewhat broad darke greene leaves lying upon the ground, with divers ribbes therein somewhat like unto *Ribwort Plantaine*, but somewhat hairy, broader, and not so long: the hairy stalkes rise up in the middle of them, three or foure foote high, or sometimes more with divers great white joynts at severall places thereon, and two such like leaves thereat up to the toppes, sending forth branches at the severall joynts also; all which beare on severall foote stalkes white flowers at the toppes of them, consisting of five broad pointed leaves, every one cut in on the end, unto the middle, making them to seeme to be two a peece, smelling somewhat sweete, and each of them standing in large greene striped hairy huskes, large and round below next the stalk: the seede is small and grayish in the hard heads that come up afterwards: the roote is white and long, spreading divers fanges in the ground.

2. *Lychnis sylvestris flore rubro*. Red wild Campions.

The red wilde *Campion* groweth in the same manner as the other, but his leaves are not so plainly ribbed, somewhat shorter, rounder, and more soft or woolly in handling: the flowers are of the same forme and bignesse, but in some of a pale, and others of a bright reddish colour, cut in at the ends, more finely, which maketh the jagged leaves seeme to be more in number than the other: the seede is like, and so is the roote also: the rootes of both these sorts doe not perish after seede time, but abide many yeares.

1. 2. *Lycnis sylvestris flore albo & rubro.*
The white or red wild Campion.

4. *Lycnis sylvestris c. utriculis striatis.*
Wild Campion with striped husks.

5. *Lycnis sylvestris albo minor.*
The smaller white wilde Campion.

6. *Lycnis sylvestris angustifolia.*
Narrow leaved wilde Campion.

3. *Lychnis sylvestris rubra minor*. The lesser red wild Campion.

The lesser red wild Campion, is very like the former red fort, but smaller, and lower, yet very much branched, and with darker Greene leaves: the flowers are reddish, but smaller, and not so much dented in at the ends: the huskes and feede, are like the other, but smaller, and the roote perisheth after seede time.

4. *Lychnis sylvestris caliculis striatis*. Wild Campions with striated huskes.

This wild Campion riseth up with a round joynted stalke, with two Greene leaves a peece at them, narrower and smaller pointed then those before, and branched, bearing small flowers of a fullen reddish colour, parted at the ends, standing in large hard skinnie huskes, striped or straked with white and Greene, the feede is more gray than the other: the roote is small, growing downeright, with a few fibres thereat, and perisheth every year.

5. *Lychnis sylvestris alba minor, sive Ocimoides minus album*. The smaller white wild Campion.

The smaller white Campion, is somewhat like unto the first wild Campion, but that his Greene leaves, have as it were no stalkes, and are not so full of veines or ribbes, much lesse also and narrower than they, somewhat hayrie likewise, and pointed at the ends; but those that rise up with the stalke, and stand at the joynts one opposite to the other, doe as it were compass the stalke, being lesse, and lesse, up to the toppes; where come forth small branches, with two or three or more white flowers upon them, smaller then the former, and more divided or cut in, with some white threds in the middle, which when they begin to decay, doe twine their leaves inward, after which come small grayish feede, in somewhat large pointed huskes: the roote is somewhat great and yeeldeth new shoots every year.

6. *Lychnis sylvestris angustifolia*. Narrow leaved wild Campions.

This wild Campion hath divers narrow long whitish Greene leaves, lying on the ground, from whence the next year after the springing riseth up a stalke, divided into branches from the joynts, whereon grow lesser and narrower leaves than those below, sometimes three or foure, and sometimes more set together, at the toppes whereof grow small flowers, made of five leaves a peece, notcht or cut in at the ends, white on the inside, and somewhat purplish on the outside, twining themselves before they fall, as the last doth: the huskes that containe the small grayish feede, are very hard small and round: the rootes are small, and perish after seede time.

7. *Lychnis Noctiflora*. Morpheus sweete wild Campion.

This sweete wild Campion, that smelleth sweetest in the night time chiefly, and little or nothing in the day, and in the hot Sommer onely, and not toward Autumne, is but an annuall plant, rising not a yard high, with small narrow whitish Greene leaves on the stalke, set by couples, whose flowers at the toppes, are of a very whitish bluish colour, parted at the ends as the other are, and standing in hard huskes, which will be a little clammie

8. *Lychnis sylvestris hirta major*.
The greater hayrie wild Campion. 9. *Lychnoides segetum sive Nigellastrum*.
Cockle.

11. *Lychnis sylvestris incana caliculis striatis.*
Hoary wilde Campion.

12. *Lychnis segetum Vaccaria rubra dicta.*
Corney Campion of the gardens.

in the heate of Sommer sometimes, and yet but feldome: the seede is grayish and small, and the roote perissheth every yeare.

8. *Lychnis sylvestris hirta major.* The greater hayrie wild Campion.

This hayrie Campion hath divers joynted hayrie stalkes, having two small long and narrow, hayrie and hoary leaves set at them; branching forth, and towards the toppes sending out from the joynts, severall large flowers, upon short footstalkes, of a pale reddish; or carnation colour, made of five round pointed leaves, dented or notched in the middle: the seede that followeth them is reddish, in such like heads as the rest; the roote is thick and great, yet perissheth the same yeare it beareth seede, for the first yeare it doth not.

9. *Lychnis sive Lychnoides segetum & Nigellastrum.* Cockle or Corney wilde Campion.

I had rather put this Cockle in this place among the wild Campions, whereunto both in face and other properties it is most like, than either put it with the *Nigellae* as some doe, or make a Chapter of purpose for it. It hath *Flore alba* an upright hayrie stalk, shooting forth branches on all sides, with two long hayrie, or woolly soft leaves at the joynts: the flowers stand at the toppes of the branches, in hayrie long huskes, whose ends or points, are longer than any of the former Campions, standing upright both before the flowers open, & after they are past, and laying themselves betweene the five round pointed leaves, when they are blowen, which are of a bright reddish purple, or crimson colour: the seede that followeth in hard round heads, is bigger and blacker, than in any of the former: the roote is small and woody, perishing as soone, as it hath borne seede. Some have observed a sort thereof with white flowers.

10. *Lychnis Cretica angustifolia.* Candy wilde Campions.

The wild Campion of Candy, spreadeth forth many branches, from the very bottome of the slender hayrie stalk, not above a foote high, whereon are set two leaves one opposite to another, at every joynt, which are small, long, and narrow, somewhat thicke, and woolly or hoary; at the toppe of each branch standeth one small flower, like unto the other wilde Campions, dented in at the ends, of a fine reddish colour, upon the first blowing and opening, but declining to whitish afterwards, with divers threads in the middle tip with yellow, standing in hayrie huskes, small at the bottome, and larger at the toppes, the heads and seede are like unto the garden Rose Campion: the roote is small and fibrous, perishing every yeare, yet rising of the seede, if it be suffered to shed it selfe.

11. *Lychnis sylvestris incana caliculis striatis.* Hoary wilde Campion.

This hoary wilde Campion shooteth forth five or sixe small hoary stalkes, about halfe a foote high, with two long and narrow hoary leaves set at each joynt, the flowers grow 4 or 5 together being red like to those of the sea Campion, growing out of thicke swelling straked huskes wherein after wards the seede is contained.

12. *Lychnis segetum Vaccaria rubra dicta.* Corney Campion of the Gardens.

This kinde of Campion is but an annuall plant and riseth up with one round stalk for the most part, spreading into

into sundry branches, having two long leaves set opposite at the joynts, being broad at the bottome, and compassing the stalke and branches, almost like unto Thoroughwaxe, ending in a small point of a pale greene colour: at the toppes of the branches stand sundry flowers, made of foure leaves a peece, of a pale red colour; after which come small round and hard blacke seede, contained in skinnie huskes: the roote is long white and somewhat woody: this plant for the beauty of the flowers is received among others into our gardens, and was but forgotten out of my former booke.

The Place.

The three first sorts grow commonly through our Country by fields, hedg sides, and ditches: the other sorts have beene found some by *Clusius*, and some by others, both in *Spaine* and *Germany*: the tenth in *Candy*; Cockle is too plentifull in our Corne fields: and the last in the borders of the corne fields in *Germany*.

The Time.

All these sorts flower in the Sommer, some coming earlier than others, and some abiding longer than others.

The Names.

I have shewed you in the former Chapter, the Etymologie of the name *Lychnis*, and therefore neede not to repeat it here againe. All these are called *Lychnides sylvestres*: the first is thought by *Clusius* more fitly to agree unto *Melandrium* of *Pliny*, in his 26 booke and 7. chap. then the *Papaver spumum*, which *Lobel* would referre therunto, and therefore entitleth it *Melandrium Plinii quorundam*. *Mathiolus* calleth it *Ocismastrum*, and *Ocimoides*, and so doth *Gesner*, *Durantes*, and *Dalechampi*. *Camerarius* and *Dodonaeus* doe expresse both those former sorts, by the name of *Lychnis sylvestris alba & rubra* or *purpurea*, and *Lobel* *Lychnis sylvestris flore rubelo* by the second, which *Bauhinus* calleth *Lychnis sylvestris sive aquatica purpurea simplex*: but why *aquatica* I know not, for in our Land I have not seene it grow in any watry grounds, other than ditch banks, & field sides, &c. *Clusius* calleth the third here expressed his *Lychnis syl. tertia* in his history which *Bauhinus* calleth *Lychnis sylvestris viscosa rubra altera*, and thinketh that to be the *Muscipula* of *Lobel*: but *Camerarius* in *horto* saith, that the figure is not well cut, and that he meant the *Muscipula* that is common, which he there calleth *Fiscago minor*, and is the first of *Clusius* in his history, very truly set forth. *Bauhinus* likewise maketh the *Muscipula altera* of *Lobel*, to be the *Armerius flos quartus*, of *Dodonaeus*, which is the same first *Lychnis* of *Clusius*, and is quite contrary, for *Lobel* in his *Adversaria* saith that that *Muscipula*, hath a yellowish greene flower which all know the *Ben rubrum* *Montspeliensium* or first *Muscipula* hath not, but a red flower; *Lugdunensis* calleth it *Alpine purpurea*; *Bauhinus* likewise maketh a doubt whether that *Muscipula Lobelii* called by others *Ben rubrum* *Montspeliensium*, or first *Lychnis sylvestris* of *Clusius* be not the *Flos Constantinopolitanus minor* of *Gesner* (I doe not finde him to name *Constantinopolitanus*, but *Flos ab Hierosolymis major & minor*) which otherwise he called *Ocimoides peregrinum*; the greater I verily thinke is the *Lychnis Chalcadonica simplex* as we call it; but the lesser sort surely cannot be the *Ben rubrum* or *Muscipula*, for *Gesner* there saith that they both endure the winter after the bearing of seede which this *Muscipula* doth not; and againe he saith his lesser sort hath *Rariores flores* but a few flowers, and that hath many; but I thinke as I sayd before that it may be the *Flos Coccineus* of *Lugdunensis*. The fourth is *Clusius* his second *Lychnis*, or *caliculis striatis*; the fifth is the ninth *Lychnis* of *Clusius* in his history, which *Lugdunensis* calleth *Ocimoides minus sive album*, and *Camerarius* *Odontis*, *quorundam flore candido*, being of the same kinde, I have set forth in my former booke, under the name of *Lychnis plumaria sylvestris simplex*, whereof it is likely *Tabernaemontanus* maketh mention, and *Bauhinus* putteth a quid upon it, as being a plant hee never saw or heard of before, and (whereof there is a sort that beareth double flowers) which I there say is called *Armoraria pratensis*, & *flos Cuculi*. *Clusius* setteth them both forth by the name of *Odontitis Plinii simplicis flore & pleno flore*; the sixth is the eighth *Lychnis* of *Clusius* in his history of plants, which he made the first in his Spanish observations, *Bauhinus* calleth it *Lychnis sylvestris pluribus foliis simul junctis*; the seventh is called by *Camerarius* in *horto* *Ocimoides nolliflorum*, and *Lychnis nolliflora annua*. *Besler* in the great garden booke of *Eystertensis* calleth it *Ocismastrum nolliflorum flore albo*; the eighth is *Clusius* his *Lychnis sylvestris quinta*, and with *Bauhinus* *Lychnis syl. lanuginosa major*: the lesser of this sort is the sixth *Lychnis sylvestris* of *Clusius*, as it is set downe in the next chapter save one; the ninth is called by divers diversely, some *Lychnis segetum*, *Lychnoides segetum*, *Tragus* calleth it *Githago*, and is his *Rosa mariana* 6. genus, *Dodonaeus*, *Nigellastrum*, and *Anthemion*, as *Ruellius* before him called it *Anthemion foliosum*, *Brunfelsius*, and *Lacuna Nigella vulgaris*, but very erroneously (for if it have any resemblance to *Nigella*, it is more in the blacke seede than in the flower or any thing else) and therefore *Mathiolus* calleth it *Pseudonigella*, as divers others since him; *Fuchsius* and *Corda* tooke it to be *Lolium* but as erroneously, *Bauhinus* calleth it *Lychnis segetum major*, because he maketh the *Alpine corniculata*, of *Clusius* and all others to be his *Lychnis segetum minor*, the tenth is the seventh *Lychnis syl.* of *Clusius*, which he also calleth *Cretica*, for that he had the seede from *Candy*; the eleventh *Lobel* so calleth as it is in the title, & *Lugdunensis* from him; the last is called *Isatis sylvestris* by *Lobel*, and *Vacaria rubra*, as it is also by *Gesner*, *Dodonaeus* and others; *Glossum* by *Anguillara*, *Thamecnemon* by *Cordus*, *Cendardum Plinii* by some, and *Perfoliata rubra* by others, as *Gesner* in *hortis* saith, whereupon *Bauhinus* calleth it *Lychnis segetum foliis Perfoliata*; the *Italians* call all these sorts of wild Campions *Ocimoides*, and *Basilico salvatica*, the *French* and *Dutch* men are expressed in the Chapter before.

The Vertues.

Some have used the white flowers of these herbes, to stay the whites in women, as they doe the red flowers for their red courses, but with what good successe I know not; an old tradition being potent with many, that all red flowers or white flowers, are effectually in those diseases: but it is found true by experience, that the decoction of the herbe being drunk, doth stay inward bleedings, and applied outwardly doth the like: the san e also being drunk, doth helpe to expell urine that is stopped, and gavell or the stone in the reines or kidneys: the seede drunk in wine, to the weight of two drams, purgeth the body of chollericke humors, as *Diocorides* saith, and that it helpeth those that are stung by Scorpions, or other venomous beasts, and may as I sayd before, be as effectually for the Plague; it is sayd to be so effectually against the Scorpion, that this herbe cast upon, or put unto a Scorpion, doth make him of no force to envenome any; it is of very good use in old sores, ulcers, cankers, fistulaes and the like, to cleanse them and heale them, which it worketh by the confining of moyst humours falling into them; and by correcting the putrefaction of humors offending them; but the Cockle is of especiall propertie in all the diseases afore sayd, and besides doth heale the itch, scabbies, and running sores.

CHAP. LXXVII.

Lychnis viscosa five *Muscipula*. Catchflie.

THe next ranke or order of wild Campions, is as I before sayd of those whose stalkes are glutinous and clammy, which now are to be entreated of in this Chapter: one of them I have already set forth in my former booke called *Muscipula Lobely*, and therefore neede not describe it here againe, I will onely give you the figure thereof here.

1. *Lychnis sylvestris viscosa latifolia Clusii*, five *Muscipula Cretica Auricula urfi facie*.
Clusius his Catchflie of Candy.

This wilde Champion hath many leaves lying upon the ground, which are thicke fat and hoary, white somewhat like unto the leaves of the yellow *Auricula urfi*, Beares cares or *French Cowslips* smooth on the edges, and a little pointed, which doe so abide the first yeare of the springing: the stalke riseth up the next yeare to the height of two or three cubits, with two leaves at the joynts, and spreading on both sides into branches from the ground, which are glutinous or clammy, causing every light or small thing to cleave thereunto, as flies, straws downe or the like: at the toppes whereof and the joynts next below them come forth many flowers together, standing in clusters but very small, whose small huskes containe every one of them, a small greenish yellow flower parted in two at the broad end: the feede is small and blackish in the huskes, the rootes are small and threddey.

2. *Viscaria maxima Cretica Alpini*. Great Candy Catchflie.

The roote of this Catchflie is white, long, and growing small downewards of a fingers thickeesse, bearing about it a number of long leaves which are small at the lower end, growing broader to beyond the middle, and ending in a point, from among which rise up divers stalkes a foote high, with few joynts, and two small long leaves at each of them, bearing sundry white flowers at their toppes as it were in umbells, and out of them sometimes other such like small flowers will start, all of them like the ordinary Catchflie: the feede vessells that follow are small and round pointed at the end, with small blacke feede within them; the whole plant is very clammy causing every thing to stick thereunto that toucheth it. This is not that former *Lychnis latifolia* of Clusius, as *Alpinus* saith, yet they are so like that any that shall judiciously view the figures without sight of the plants will surely account them both one, and therefore I give you their severall descriptions and figures also.

3. *Muscipula altera flore albo*. The white flowred Catchflie.

The other Catchflie shooteth forth divers branched stalkes, with small darke greene leaves set thereon by

Muscipula Lobely five *Benruthum Montpellierana*
The French Catchflie.

1. *Lychnis sylvestris latifolia Clusii*, five *Muscipula Cretica Auricula urfi facie*.
Clusius his Catchflie of Candy.

2. *Viscaria maxima Cretica Alpini*.
Great Candy Catchlie of *Alpinus*.

4. *Muscipula Salamantica minor*.
The lesser Spanish Catchlie.

couples, the tops whereof where the flowers stand, and under them also are so clammy that it will stick to the fingers of them that touch them, especially in the heate of the day, and in the hot Summer time: the flowers are small and white, made of five leaves notched at the ends, and smelling somewhat sweete, the seede is small and blackish, contained in small hard huskes: the roote spreadeth many long stringes under the ground, and abideth many yeares.

4. *Muscipula Salamantica major*. The greater Spanish Catchlie.

The greater Spanish Catchlie hath divers grayish Greene leaves lying upon the ground next the roote, which are small and so long at the bottome as if it were a footestalk, but broader toward the end and somewhat long withall, of a grayish Greene colour, from whence rise up divers round Greene stalkes, a yard high, bearing such like leaves at the joynts by couples up to the tops of them almost, but smaller where the branches beare many small tufts of greenish flowers at severall spaces round about them, and where in the heate of Summer there will be a viscous or glutinous sappe on the outside, fit to make any small light thing to stick to it: after the flowers are past, the seede sheweth it selfe of a grayish colour, contained in small hard greenish huskes: the roote is white hard and longabiding after seedetime, and springing a fresh every yeare.

5. *Muscipula Salamantica minor*. The smaller Spanish Catchlie.

The smaller Spanish Catchlie differeth so much in forme from all the other sorts of wilde Campions, that it might seeme to be none of the family: but because as *Clusius* saith, the learned of *Salamanca* did call it *Sesamoides* as they did the former, which is most fit to be of the number of the wilde Campions, hee thought it never the lesse nor unfit to joyne them together, and so doe I, untill I may know a fitter place to set it: It beareth many thicke long Greene leaves, like unto line or flax upon the slender stalkes, besides those that are at the foote of them, set thicke thereon one above another, but without any order or proportion; at the toppes whereof grow many spiked heads of small flowers of a purplish Greene colour at the first, which turne into whitish Greene threds afterwards with foute round heads in the middle, wherein when they are past grow small blackish seede: the roote is somewhat great and white, and not pettishing: *Clusius* saith hee found another fort hereof, with white flowers and woolly leaves.

Flint abo

6. *Lychnis sylvestris viscosa rubra angustifolia*. The red Germane Catchlie.

The red Germane Catchlie sendeth forth from the roote divers long and narrow darke Greene leaves, pointed at the ends, somewhat rough or rugged, and not fully smooth as many other sorts are, which lye upon the ground, and from among them rise up two or three, and sometimes but one browne stalk, a yard high bearing two small leaves at the joynts, which are much separate one from another, and which will bee clammy like the other, in the hot Summer time: the flowers have no sent and stand almost from the middle of the stalk upwards, on long branches divers set together, every one by it selfe, upon a small footestalk, of a lively deepe red colour, almost like the single red Rose Campion, made of five round leaves, parted in the middle, with a paler red circle at the bottome, set in Greene huskes, smaller at the bottome and larger at the head, wherein after the flowers are fallen, the seede groweth of a brownish colour: the roote is somewhat thicke and blackish enduring many yeares.

7. *Lychnis*

7. *Lychnis viscaria flore albo Italica, five Muscipula Italica alba.* Woolly Italian Catchflie.

This white Italian Catchflie fendeth forth a browne joynted stalke two foote high, branched therefrom in divers places, no lesse clammy towards the toppes then the others, set with two leaves a peece thereat, which are somewhat long, narrow and hairy, or as it were covered with a soft downe upon the greene and pointed at the ends; at the tops of the stalkes and branches stand many snow white flowers in long striped whitish huskes, consisting of five round pointed leaves, cut in at the ends to the middle of them, making every leafe seeme as if it were two, and in the middle of the flowers ten white threads, tipt with whitish pendants, five whereof appearing when the flowers doe open and the other five when they decay and twine themselves: after the flowers are past come grayish feede in hard huskes or heads like unto the other common sorts: the roote perisheth not, but biderb long.

6. *Lychnis viscaria rubra angustifolia.*
The red Germane Catchflie.

8. *Muscipula altera purpurascens.* Browne Italian Catchflie.

This Catchflie likewise hath woolly leaves, set by couples on the reddish greene stalks, somewhat larger then the former Italian kind: the stalkes and branches that grow up higher and especially at the toppes are more reddish or browne, and as clammy as any of the other, from whence come forth divers darke brownish striped stalkes beaing many flowers, consisting of five narrow leaves, cut into the middle of a smoakie purplish colour on the outside, and white within, with five longer threads in the middle, thicke and purplish at the ends, and five other shorter with white tiptes: when the flowers beginne to decay they twine themselves as the last doth, the heads and feede are like unto the last, and so is the roote likewise which endureth long.

9. *Muscipula Italica flore carneo.* Blush coloured Catchflie.

This blush *Muscipula* hath woolly stalkes and leaves set thereon at the joynts by couples as in the rest, where also toward the toppes on every side, at every place and joynt with the leaves cometh forth a woolly striped twolne huske, with purplish white or blush coloured flowers, of five leaves a peece, divided at the ends in the middle, with some threads therein also: the roote of this is small and perisheth the same yeare it beareth feede, which is usually the second or third after the sowing.

10. *Muscipula altera Lobely.* The other Catchflie of Lobel.

The leaves of this Catchflie are somewhat broad round pointed and of a whitish greene colour, but not woolly or hairy, not much unlike the other *Muscipula* called *Ben rubrum* set forth as I said in my former booke, and the figure also here: the stalkes have two or three joynts with leaves at them, and are glutinous towards the tops, where the flowers stand in clusters many set together being very small, and of a yellowish greene colour.

The Place.

These have their places signified in their titles, where they grow except the third, which came among other feedes unto me from a friend, the originall place being not knowne, and therefore there needeth no more to be sayd thereof.

The Time.

They all flower in the Summer moneths, and some not untill winter, especially the last.

The Names.

These kinds of wild Campions are called *Muscipule*, quia muscas capiunt, because they catch flies, &c. and *Fiscaria* and *Viscago* of *Viscum*, the clamminesse like Birdlime whereby the flies are caught. *Thalium* calleth some of them *Thalium*, which signifieth the same thing, and *Banbinus* *Lychnis sylvestris viscosa*. The first is the *Lychnis sylvestris latifolia* *Anricula* *visfacie* of *Clusius*: the second is so called by *Alpinus lib. de plantis exoticis*, as it is in the title: the third wee usually call *Muscipula perennis*: the fourth and fift are called by *Clusius* *Sesamoides Salamanticum magnum & parvum*, the greater being called by *Camerarius* *Viscago major*: the sixt is the fourth *Lychnis sylvestris* of *Clusius*: the seventh eighth and ninth are the three sorts of *Lychnis sylvestris* that sprang with *Clusius* from the feede he received from *Italy*: the last is mentioned by *Lobel* by the name of *Muscipula altera flore muscosa*, which *Banbinus* in my judgement doth much confound with the *Sesamoides magnum Salamanticum* of *Clusius*, making them to be both one, and yet as I sayd in the Chapter before, he maketh it also agree with the first *Lychnis sylvestris* of *Clusius* in his History, which is the fourth *Armerium* with *Doncus*, usually called with us *Ben-rubrum Montpellierium*, which all know are farre differing one from another.

The Vertues.

There are no especiall properties allotted to these Plants, but may be referred to those of the other wild Campions, whereunto they are likeli in face and outward appearance.

CHAP. LXXVIII.

Lychnides minores & repentes. Small and creeping wilde Campions.

The last kind of wilde Campions are these, which eyther lie downe and spread or creepe with their branches, whether they be greater or smaller, or else being small stand upright.

1. *Ocimoïdes repens.* Creeping wilde Champion.

This creeping wilde Champion sendeth forth divers slender weake trayling flexible branches, divided into others, set full of joynts, and two leaves alwayes at them which are somewhat long like unto Mirdle leaves, or as Lobel saith unto knotgrasse, but larger, that is shorter and broader: at the toppes of the branches, stand small bluish coloured flowers in hairy long Greene huskes, like the common wilde Champion, but lesser, consisting of five small round pointed leaves, cut or dented in with some threds in the middle, the roote is small and long, and disperfeth some strings and fibres under ground, abiding divets yeares.

2. *Ocimoïdes Lychnitis Columne five Lychnis incana repens.* Hoary creeping wilde Champion.

This hoary wilde Champion hath small hoary leaves set by couples upon the trayling hairy branches, which are somewhat broad comming neare unto the leaves of Bassill, and a little pointed at the ends, the flowers grow many together in hoary long huskes, like the wilde Campions.

3. *Lychnis marina repens alba.* The white Sea Champion.

This Sea Champion hath divers weake flexible branches, lying all about upon the ground (much divided into other smaller ones) two or three foote long, thicke set with small long fat and whitish Greene leaves: at the tops of every branch standeth one short, thicke, whitish, Greene huske, parted or dented at the toppe, out of which shooteth forth a small long necked white flower, very like unto that of Spatling Poppie, and as white, made of five small round pointed leaves, with some blackish threds in the middle: the feede that followeth is browne, contained in such like huskes as other wilde Campions have, the roote is slender and long, and abideth many yeares.

4. *Lychnis marina repens flore rubella.* Red flowered Sea Champion.

This red Sea Champion differeth not from the former in any thing but in the colour of the flower, which in this is of a fine dented red colour as in the other it is white.

5. *Lychnis arvensis minor Anglica.* The small white field Champion.

The lower leaves of this our small wilde Champion are small and hairy, very like unto the small Mcuscate, but those that grow upon the slender small stalke, which is sometimes single of it selfe, and sometimes many from the roote, are not above a foote high, two alwayes being set together at a joynt, smaller then those below, and spotted with white spots; from the bosome whereof, that is, betweene them and the stalke come forth two other leaves, much smaller then they, without any manifest tasle: the flowers are small and white like unto the other wilde Campions, after which come small long heads, with grayish feede in them: the roote is small and white and perisheth every yeare.

6. *Lychnis sylvestris lanuginosa minor.* The little Spanish wilde Champion.

This small wilde Champion hath a small slender upright stalke, about an hand breadth high, or little more with divers joynts, and two leaves at every of them which are hoary, somewhat long and narrow: the flowers stand single for the most part, each comming forth at the joynts with the leafe, and some also at the toppes of the stalkes and branches, set in small long hoary huskes striped, consisting of five small bright red leaves, dented at the ends in two places so making three points: the roote is small and dyeth after feede time.

7. *Lychnis sylvestris minima exigua flore.* The small flowered wilde Champion.

This wilde Champion riseth up with a small round brownish stalke, not halfe a foote high, spreading from the joynts (where there are two small narrow and pointed leaves, smaller then the last, otherwise not much unlike) very small branches somewhat rough or hairy, on the top of every one whereof standeth one purplish flower made of five leaves, so dented in at the end of every leafe, that it expresseth the forme of an hart; the feede contained in the small heads is like the other: the roote is small and endureth not.

8. *Lychnis exilis rubra.* The very small red wilde Champion.

This small Plant might rather be accounted a kind of small Pinke, if the head with feede did not gainsay it. For it hath many small grasse-like leaves at the foote of the stalke, and at the joynts of them, which stand thicke together, two or more such like leaves but smaller: the flowers stand at the toppes of the stalkes, two or three together in slender long huskes, very like unto those of that *Muscipula* or Catchfite, that is called *Ben rubrum* *Monspeliensium* of a reddish colour dented at the ends, the roote is very small and long and lasteth not.

9. *Lychnis tenuifolia altera.* The least wilde Champion.

There is small difference in this from the last in the smallnesse of the growing or leaves, or posture of them, but that this hath seldome above two leaves at a joynt, the flowers chiefly distinguish them, which are as small but growing from the upper joynts, and some at the top of the thred like stalkes, of a pale Greene colour, and without any notch or dent at the end of the leaves: the feede and feede vessells are small and like the rest: the roote is like a thred, like unto these two last.

10. *Ocimoïdes muscosus Alpinus.* Small mountaine wilde Champion.

The roote of this small Champion although small, yet is woody and of a whitish colour, not growing deepe but spreading much under ground, and shooteth forth a number of heads of small Greene leaves very thicke set together in tufts, in that manner spreading much ground, and covering it like Mofse, from the middle of each head whereof, riseth up a small bluish coloured flower, out of a small long huske, but standing upon so short a stalke above the leaves, that it is scarce to be discerned, in each part very like unto the first creeping wilde Champion; the feede is small and browne, it hath no great sent to commend it, but onely the beauty of the verdure, and bluish, so thicke intermixt like a wrought carpet to please the sight.

1. *Ocimoides repens*.
Creeping wilde Campion.

3. 4. *Lychmis maritima* *repens alba vel rubra*.
The white or red flowered Sea Campion.

6. *Lychmis sylvestris* *Lavagiosaminor*.
The lesser Spanish wilde Campion.

20. *Ocimoides ruscifolius* *Alpinus*.
Small mountaine wilde Campion.

The Place.

The first groweth on Mount *Baldus*, and in the shadowie hills and woods of *Provence*, and in other such like places: the second *Columna* saith he found in *Naples*: the third groweth by *Hurst Castle* neare the *Ile of Wight*, and in the sayd *Ile* also in many places by the Sea side: the fourth is found in some of those places aforesaid, as also about a mile from *Southampton*, in the ground of one *Mr. Gouch* a *Divine*: both of them chiefly in the South parts of this land, on the most stony bankes by the Sea side: the fifth groweth in divers grounds by *Colchester* in *Essex*, and in a field called the *Millfield*, behind the house of *St. Thomas Lucees* neare *Colchester*: the sixt as *Clusius* saith he found no where else then on the hills neare *Salamanca* in *Spain*: the seventh groweth at the foote of the hill that is by *Bontonet* neare unto *Mompier*, and in the borders of the fields neare *Florence*: the eighth and ninth in divers places of our owne Land: the last upon mount *Baldus*, as *Pona* saith, and by *Clusius* his report upon the *Alpes* of *Austria* and *Stiria*, on the highest places of them.

The Time.

They all flower in the Summer Moneths of *June*, *July* and *August*, some earlier or later then others, and their feede is ripe quickly after.

The Names.

The first is called *Ocimoides repens* by *Camerarius* and *Pona*, *Lobel* addeth *Poligoni folio Saponaria flore*. *Gesner* in *hortis* calleth it *Ocimoides Alpinus*. *Bauhinus* taketh it to be the *Cneorum* of *Matthioli*, but I thinke verily he is therein much mistaken, for that as *Clusius* saith, that *Cneorum* beareth a long white berry (a red saith *Myconus* in *Lugdunensis historia folio 1364.*) somewhat like unto the berry of *Thymalea*, with a feede therein very like unto it also, which in part was the cause that *Clusius* did referre it to the *Thymalea*, excepting the sharpe taste, and *Bauhinus* followeth him also in fol. 463. of his *Pinax*, making a Chapter peculiar of *Cneorum Matthioli*, which he there calleth *Thymalea affinis facie externa*; and if it be that, how can it be then this *Lychnis*; for this *Ocimoides* beareth a head or feede vessell somewhat like unto the other wilde *Campions*, and feede therein like unto them also: but whether *Cneorum Matthioli* should be either that of *Dioscorides* or *Galen*, or of any of the two sorts of *Theophrastus* in his sixt Booke and second Chap. is much doubted of by divers, and what plants are the true is as much controverted. *Anguilara* and others thought the *Cneorum album* and *nigrum* of *Theophrastus*, were *Lavendula* and *Rosmarinum*, our ordinary *Lavender* and *Rosemary* (as is sayd before in both the Chapters of *Lavender* and *Rosemary*) whom *Matthioli* contrarieth, shewing that neither of them can bee so as it is there declared: others thinke they might be referred to the *Chamelea* and *Thymalea* of *Dioscorides*; but in these two there can be no distinction of white and blacke, being both of them Greene, and neither of them whiter then others, and besides they doe both flower in the Spring, and not in the Autumne, as *Theophrastus* saith his doe; notwithstanding that the leaves of *Thymalea* by *Dioscorides* was called *Cneorum*, and *Pliny* saith that *Thymalea* was called of some in his time *Cnestrum* and *Cneorum*. Now how neare *Matthioli* his *Cneorum* commeth unto that of *Dioscorides* and *Galen* is to bee shewed: it is certainly held that that of *Dioscorides* and *Galen* doth much vary from those of *Theophrastus*, as *Matthioli* saith in both his Epistles to *Crato*, in his third Booke of Epistles Fol. 134. and in his fourth Booke Fol. 172. and saith that because the *Cneorum album* is sweete, therefore according to *Pliny* in his 21. Book and ninth Chap. and twelfth Chap. it was reckoned among the sweete herbes that were put into Garlands, which neither *Chamelea* or *Thymalea* doe, but is as heethere saith called *Casia* by *Higius*, which it seemeth it was also by *Virgill* in divers places of his *Georgicks* and *Bucolicks*; as first in his *Bucolick Eclogues*, he sheweth one of the *Naiades* worke in making a Garland in these Verses:

*Tunc Casia atque albis intextens suavis herbis,
Mollia luteola pingit vaccinia caltha.*

And in the second of his *Georgicks*,

Vix humiles apibus casius roremque ministrat.

And in the fourth of the same,

*Nec circum casie virides & olentia late
Serpilla, & graviter spirantes copia thymra
Floreat, irrigunmq; bibit violaria fontem.*

All which doe plainely shew that *Casia* was commonly accounted with them a sweete herbe, usually planted for Bees to feede on as well as to put into Garlands; and not that *Cassia* which is a tree like unto *Cinamon*, called of the Apothecaries *Cassia lignea*, for which cause it is very probable that *Gaza* in translating *Theophrastus* Greeke copie into Latin, put *Casia* for *Cneorum*, taking them to bee both one: for *Cneorum* as *Dioscorides* and *Galen* say, was the leafe of that plant that bare the *Coccus Ginidius*, which by all the best moderne Herbarists groweth upon *Thymalea*, being the fruit thereof, which both in face and qualitie differ much in sinder as is shewed before. Now how much it differeth from those of *Theophrastus*, resteth to bee declared, that it cannot agree with his blacke *Cneorum*, needeth no further demonstration then is shewed before: but that it commeth neare to his white most doe agree, yet some things therein are doubtfull, as first there is no shew therein, why it should be called white, secondly the branches are not so pliant and stiffe that they may serve to binde things withall as rushes are: thirdly the roote is not very great; and lastly it doth not flower after the Autumne solstice, but in the Spring. Thus farre I have digressed from the first *Ocimoides*, being drawne on by *Cneorum*, whereunto as I sayd *Bauhinus* referreth it, and calleth it *Lychnis vel Ocimoides repens montanum*, and saith also that it is the *Ocimoides Alpinum* of *Gesner in hortis*, and the *Saponaria minor* *Dalechampii* in *Lugdunensis*: the second *Fabius Columna* calleth *Ocimoides Lychnitis*, and by *Bauhinus* *Lychnis incana repens*: the third is remembered by *Lobel* and *Lugdunensis*, and *Tabermontanus* that follow him and called *Lychnis marina Anglica*, and *Lychnis maritima repens* by *Bauhinus*: the fourth is mentioned in *Gerardus Herball*, taken but by report, and is not truly written of by any before this time, that I know of: the fifth is not remembered also by any other before now: the sixth is the fixt *Lychnis sylvestris* of *Clusius* called by *Lobel* *Lychnis sylvestris hirta minima*: the seventh is very like unto it, and called by *Bauhinus* *Lychnis sylvestris minima flore parvo*: the eighth and ninth are not spoken of by any other: the last is called *Muscus floridus* by *Gesner*, and *Carpophyllum sylvestris* 9. or *pumilio Alpinus* by *Clusius*, and

nd by *Pons Ocimoid* : *muscosus Alpinus* ; by *Bauhinus Lychnis Alpina pumila folio graminos* , *seve Muscum Alpinus* *lychnidis flore*. Every one hath his English name in his title fit to distinguish them.

The Vertues.
All or most of these herbes are of later knowledge, so that there is but little sayd of their vertues, yet by their asse some of them being somewhat drying and astringent may be profitably applied to stay the fluxes of blood and humors, and thereby also conduce to the healing of old and moyst Vlcers or sores : the Sea kinds take somewhat brackish, yet not unfavory, so that they are often eaten cold as a Sallet herbe, or stewed and so eaten.

CHAP. LXXIX.

Saponaria. Sopewort or Bruisewort.

S a supplement to the wilde Campions, I have some other sorts of herbes to bring to your consideration, which both for face or forme, and for use and properties are so like unto the former, that they might well be taken as *species* of the same *genus*.

1. *Saponaria vulgaris*. Common Sopewort or Bruisewort.

Having shewed you in my former booke the double *Saponaria* and under it in a sort described the single or common kinde, it might seeme needelesse here againe to set it forth, which indeede I would not have done, but that being briefe as well in the description as in the vertues in that place, I thought good here to enlarge my selfe and therefore to insert the description thereof as well as another sort thereof with it. The roote creepeth under ground farre and neare, with many joynts therein, of a browne colour on the outside, and yellowish within shooting forth in divers places many weake round stalkes, full of joynts, set with two leaves a peece at every one of them on the contrary side, which are ribbed somewhat like unto Plantane and fashioned like the common field white Campion leaves, seldome having any branches from the side of the stalkes, but set with divers flowers at the toppe standing in long huskes like the wilde Campion, made of five leaves a peece, round at the ends, and a little dented in the middle, of a pale Rose Colour almost white, sometimes paler, and sometimes of a deeper colour, of a reasonable good sent.

2. *Saponaria Anglica convoluta folio*. Hollow leaved Sopewort.

This kind of Sopewort, which is peculiar to our owne land, in the forme and manner of the running of the roote is very like unto the former, but much smaller sending forth divers weake round stalkes, with fewer joynts then in the former, and at every one of them one leafe and seldome more, which eyther compasseth the stalke at the bottome as many of them doe, or being hollow the whole leafe like a pipe or trunk compasseth it before it open it selfe on the outside, or sometimes doth not open it selfe at all, and are ribbed like the former, somewhat

1. *Saponaria vulgaris*.
Common Sopewort.

2. *Saponaria Anglica convoluta folio*.
Hollow leaved Sopewort.

broader and rounder at the ends: these stalkes have no branches at all, but from some of the upper joynts, and at the toppes stand three or foure flowers, upon slender footstalkes in long huskes, made of five leaves for the most part somewhat broader at the ends then the former, and uneven, and many times breaking the huskes wherein they stand, on the one side or other, of a pale white colour enclining to a bluish, especially on the sides, of little or no sent at all: wee never yet observed the seede or seede vessels, being increased sufficiently by the roote.

The Place.

The first growth wilde in many low and wet grounds of this lands, by the brookes, and sides of running waters, and is brought for the flowers sake into many country gardens also, to serve to decke up their houses, the other was first found and set forth by Mr. Gerard in his Herball, and hath not beene found to grow any where else then in that little Grove called the *Spinny* which is neare unto *Liebborow* in *Northamptonshire*.

The Time.

They both flower in *July*, and usually not before, and so continue all *August* and part of *September*, before they will be quite spent.

The Names.

This Herbe is usually called *Saponaria* because it serveth in stead of *Sopè* to wash any thing withall; & therefore *Fuchius* fitt of all other writers as I take it, set it forth for the *Struthium* of *Dioscorides*, *Galen*, *Theophrastus* and *Pliny*, which commeth from the Greeke word *σπινθίζω* which significth *Canas purgare, & candidas facere*, but quite differeth from it as you shall here by and by; for although this as well as many others, may be called *Struthia*, of their scouring and cleansing quality, yet none of them have the right description of *Struthium* (which of the Latines is called *Radicula*, and *Lanaria herba*, and by some others also transferred to this *Saponaria* but erroneously) and overpassed by *Dioscorides* as too well knowne in his dayes, and therefore needed no description, and but remembered onely by *Theophrastus* in his sixth Booke and third Chap. of his history of Plants, among those herbes whose leaves are prickley. *Pliny* in his 19. Booke and third Chap. describeth *Struthium* at large: his owne words I thinke fit to set downe, and afterwards interpret them, that all may know what little care and judgement divers have shewed in referring the more obscure Plants of the ancients, in not duly comparing and examining their Authors words and declarations. At que vocatur *Radicula* (saith *Pliny*) *lavandis demum lana succum habet mirum quantum conferens candori mollitieque. Aque nascitur sativa ubique, sed sponte precipue in Asia Syriaque, saxosis & asperis locis, trans Euphratem tamen laudatissima, caule ferulaceo, tereti, & ipso cibus indigenarum expetito, & tingenti quicquid sit cum quo decoquatur, folio Oleæ, Struthium Græci vocant: flos est grato asperum verum sine odore, spinosa & caule lanuginoso semen ei nullum, radix magna que conciditur ad quem diem est usum:* which may be thus Englished, But that herbe which is called *Radicula*, hath a juice or sappe therein fit to wash clothes: it is wonderfull to see what whitenesse and smoothnesse thereby it giveth unto them. The manured sort groweth with many in divers places, but of it owne accord in *Asia* and *Syria*, in rocky and rugged places; but the chiefeft and most praise worthy groweth beyond *Euphrates*, having a small ferulous stalk, which the inhabitants doe eat with their meats, and is apt to colour or dye any thing that shall be boyled with it, and hath the leafe of an Olive tree: the Greekes call it *Struthium*. It flowreth in Summer, and is pleasant to behold but without any sent, being prickly, and the stalk woolly: it beareth no seede, the roote is great and being cut in peeces serveth for the uses aforesayd. Thus saith *Pliny*. Now if you will compare the *Saponaria* with this description, you shall finde that the *Saponaria*, hath no Olive like leafe, but rather like a Plantane, it hath no ferulous nor woolly stalk, but smooth and joynted, it hath no prickly leaves but smooth nor no great roote but small and creeping; it wanteth neyther sent nor seede, as *Pliny* saith *Struthium* doth: so that it is wonderfull that any should make them both one, for one qualities sake onely of scowring or cleansing; when so many delineations are absolutely different: and therefore doth *Matthioli* contrary *Fuchius* plainly as also those that took the *Lutea*, or *Luteola herba* to be *Struthium*, which he therefore called *Pseudo Struthium*. Divers also in taking it to be *Struthium*, called it also *Condiss* of the *Arabians*, which is thought to be the *Struthium* of the Greekes, and have applied and used it for all those purposes whereunto they have appropriated their *Condiss* unto: but *Bellunensis* giveth the description of *Condiss* in these words: It is the roote of a plant (that hath prickly leaves like a Thistle) of the thicknesse of ones thumbe somewhat yellowish on the inside and blacke without, sharpe both in sent and taste (*Scrapio* out of *Dioscorides* saith) the roote is long and round, and of a quicke sharpe taste, which words are wanting as *Lugdunensis* saith in the printed Latine copies) with the decoction thereof they use to cleanse both wooll and clothes; and the sweete oymment makers in *Damasco*, doe put it into their confections that are made of honey, and boyled wine, which giveth them such a whitenesse that they seeme as if they were made of Sugar, and Starch: with the roote cut into peeces, the *Syrians* use to wash the filth out of their garments or shirts instead of *Sopè* or *Lye*. I have beene somewhat tedious in declaring these things, that others might understand what *Struthium* and *Condiss* are, and that neither *Saponaria* nor *Luteola* can be it, for there is no heate or sharpnesse in eyther of them, besides their differing forme: the first is generally called *Saponaria* by all writers except *Tragus* who calleth it *Viola agrestis*, and *Fuchius*, who as is sayd called it *Struthium*: the other *Gerard* called *Gentiana concava*, and placed it next unto them, thinking it a species thereof, but it is plainly seene and knowne to agree with the *Saponaria*, both in rootes leaves, and flowers, and not with *Gentian* but in the bitternesse. It is usually called in *English* *Sopewort*, and of some *Bruisewort*: the country people in *Kent* and *Sussex* call it *Gill* run by the street.

The Vertues.

The Country people in divers places doe use to bruise the leaves of *Sopewort*, and lay it to their fingers, hands or legges, when they are cut to heale them up againe. Some make great boast thereof, that it is diureticall to provoke urine, and thereby to expell gravell, and the stone in the reins or kidnies: and account it also as singular good to avoyd *Hydropicall* waters, thereby to cure the disease, but their practise is not I thinke sufficient: hence it is found to doe the outward of womens treene and pewter vessels: they no lesse extoll it to performe an absolute cure in *Lue Venerea*, then either *Sarsaparilla*, *Guajacum*, or *China* can doe; which how true it is let others judge, that have judgement upon true knowledge of the truth, for my selfe, I cannot be induced to beleieve the one halfe, untill more evident proofes doe convince me.

CHAP. LXXX.

Trachelium fve Cervicaria. Throatwort.

Under the name of *Trachelium* (which is a kinde of *Campanula* or Bellflower) may all the rest of the Bell-flowers be comprehended, whereof some I have already set forth in my former booke, but because there are so many, I thinke fittest to distribute them into severall Chapters, that so they may be the better expressed by me, and apprehended and retained by you, and distinguished to all. In this Chapter I will onely mention the rest of them that have rough or hayry leaves, and in the next those that have smooth.

1. *Trachelium majus Belgarum*. Great Throatwort

This great Throatwort hath very tall and great hayrie stalkes and leaves of the fashion of the other sort, that I have set forth in my other booke, there called the greater *Canterbury Bells*, but greater than it, both in stalke and leafe, the flower is of a purplish blue colour, almost as large as those of the *Coventry bells*, in all other things it agreeth with the other.

2. *Trachelium petraeum majus globosum*. The great globe rocke Throatwort.

The greater of the two rock Throatworts, riseth up with brownish or reddish straked hayrie stalkes, about two foote high, bearing thereon divers rough or hayrie darke greene leaves on the upper side, and paler underneath, set without order, and a little dented about the edges with some smaller leaves set at the joynts with them: at the toppes of the stalkes especially, grow many flowers, clustring together in a round fashion, and some at the upper joynts also with the leaves, but not so many, and some also under them at the lower joynts, but still fewer and fewer, being all of them, of the forme of the former Throatwort, but of a white colour, and smaller than the small, or ordinary sort, and ending in five, sixe, or sometimes in seven points, having in the middle many yellowish threds, and one greater than the rest, crooked at the end when it is biggest, and which becommeth biforked, and blunt as it ripeneth, the flowers abide long before they fall, but the seede hath not bene observed: the roote is somewhat great and woody, rugged on the outside and reddish, but white within, and more astrigent than any of the rest.

3. *Trachelium petraeum minus globosum*. The lesser globe like rocke Throatwort.

The lesser of these Throatworts, hath the first leaves somewhat long and not dented on the edges but pointed, and after them rise diverse others that are round, and cut in on the edges, standing on long foote stalkes, an breadth long at the least, somewhat like unto those of *Cimbalaria Italica* *hederacea*, the Ivie like leafe, or *Italian Gondelo* but not so thicke, fuller of ribbes and veines, deeplier cut in on the edges, and of a darke greene colour, from which rise divers naked or bare slender stalkes, about halfe a foote high, which usually have one or

1. *Trachelium majus Belgarum*.
Great Throatwort.

2. *Trachelium majus petraeum globosum*.
The greater globe rocke Throatwort.

3. *Trachelium petreum minus globosum.*
The lesser Globe-like Throatwort.

6. *Trachelium saxatile spicatum.*
The rock-spiked Throatwort.

7. *Trachelium spicatum tenuifolium.*
Thinner leaved Throatwort with spiked heads.

Trachelium minus.
The small Throatwort or Canterbury Bells.

two leaves about the middle of them, with little or no stalk at all to them, somewhat deeply dented about the edges; at the toppes of these stalkes stand foure or five long and narrow greene leaves, like unto those that are about the middle of the stalkes, but lesser, narrower and more jagged compassing them at the heads, and from the middle of them start forth divers small flowers, set in a tuft together, of a darke blewish purple colour, with very short footstalkes under them, and are fashioned somewhat like a biggebellyed bottle, with a small long necke, opening at the brimmes into five points, somewhat deeply cut downe, with divers threds in the middle, one being bigger and longer then all the rest, issuing a good way beyond the necke which in the opening becommeth the feede vessell, biforked like the other: the roote is very rugged whitish and woody.

4. *Trachelium montanum majus*. The greater mountaine Throatwort.

The greater mountaine Throatwort sendeth forth from a long blackish roote, thicke at the head and growing smaller downwards, with many small fibres set thereat, and some bigger, with a number of long & narrow leaves, somewhat like those of Alkanet, set at the bottoe of the slender round reddish stalk, which is about a foote or more high, with very few leaves thereon, at the toppes whereof grow a few long flowers, somewhat like unto the ordinary sort, of a pale purplish colour, with a long Peltell in the middle.

5. *Trachelium montanum Tragopogi folijs*. Narrow leaved Throatwort.

This Throatwort hath sundry narrow long leaves lying next the ground, somewhat resembling those of Goates beard. the flowers at the toppes of the stalk are Bellfashion and somewhat small, of a bluish colour the feede that followeth is small like the rest.

6. *Trachelium saxatile spicatum*. The rocke spiked Throatwort.

This spiked Throatwort sendeth forth from a white great roote full of bunches or knots on the outside, as it doth grow old, and spreading under ground many branches with fibres thereat, sundry round and crooked hoary white stalkes, of an unequall height, some being a foote and some lesse high, with broad leaves set thereon without order, most usually but one at a joynt, but sometimes two unevenly dented about the edges, somewhat like the leaves of *Doronicum*, or of that herbe is called by some *Pulmonaria Gallorum*, by others *Pisifellamajor*, and *Chondrilla aurea*, and we in English as I have shewed you in my former book Grim the collier, but hoary, especially underneath: from the middle of the stalkes upwards, come forth some flowers at the joynts with the leaves, but especially at the toppes many together spike fashion, one above another, which are small and of a blewish purple colour, but like in forme unto the ordinary Rampions, or Throatwort: after which come such like feede vessells and browne seed in them as is in the smaller Throatwort: this as the rest giveth milke both stalkes and rootes, which is no lesse pleasant and edible then the rest, and endureth many yeares, although the stalkes dye downe every yeare.

7. *Trachelium spicatum tenuifolium*. Thinne leaved

Throatwort with spiked heads.

This thinne leaved Throatwort hath many long and narrow hairy greene leaves, somewhat like unto those of wilde Bassill, but much smaller, betweene which riseth up a strong round greene stalk, about a foote high or more, somewhat straked and of the bignesse of a finger, set with narrower leaves and longer, from the hottome to the middle of the stalk and from thence up to the toppe, come forth small whitish coloured flowers, like the others, standing at the joynts with the leaves, ending in a long spike of flowers and leaves, set thicke together very orderly: after the flowers are past commeth small heads, containing very small brownish feede: the roote is thicke and white, as bigge as ones finger, and rugged on the outside, with some bigger fibres set thereat.

8. *Trachelium umbelliferum ceruleum*. Umbelliferous

blew Throatwort.

This Throatwort groweth with a number of small fibres set at the roote, from whence riseth up a stalk about two foote high, having a few hard rough greene, and somewhat long leaves set one above another, very like unto the ordinary sort, and dented about the edges in the same manner: from the middle of the stalk upward at the joynts, it sendeth forth branches, set with such like leaves as grow below, but lesser and lesser, every branch being bare or naked of leaves for a little space next under the toppe, where there stand two small narrow leaves, and from thence rise many small perfit blew flowers, set upon little short footstalkes in manner of an umbell or tuft, all of them in a manner standing to an equall height, somewhat like to mountaine Spikenard, the heads and feede are like the rest: all the whole plant giveth milke, and is of an astringent and sharpe taste, but is very impatient of cold and therefore must have some extraordinary care bestowed on it in these colder countries, to preserve it in the winter.

9. *Trachelium pumilum Alpinum*. Small Mountaine Throatwort.

This small Throatwort hath many leaves rising from the roote, like the common small sort (whose figure I here give the description being extant in my former booke) every one standing upon a long foote stalk, among which riseth up a round stalk diversely branched, having all the leaves that grow thereon, narrower and longer pointed than those below, and without any stalk to compass the branches at their lower ends; at the toppe of every

10. *Trachelium folijs Echij*. Wilde Buglosse leaved Throatwort.

every one standeth a reasonable large flower in fashion like the ordinary, ending in five points, but of a pale blewish almost ash-colour in some, but of a deeper blewish purple colour in others: after the flowers are past the heads wherein the small whitish seede lyeth, turne downewards when they are ripe, and are three square: the roote is white and great, for the proportion of the plant, having divers heads at the toppe thereof, where the leaves shoote forth: the whole plant hath a soft doune somewhat whitish upon it, and giveth milke as all the rest doe.

10. *Trachelium foliis Echii*. Wild Buglosse leaved Throatwort.

The lower leaves of this Throatwort or Bell-flower, are many, long, very rough and narrow, lying upon the ground, like unto Vipers Buglosse but broader and shorter, whose stalks that riseth up amongst them, is about a foote high, round and rough also, set with few leaves but smaller, at the toppe whereof stand five or six blue flowers Bell-fashion, upon short footstalkes hanging downe their heads, whose brimmes as also the huskes wherein the flowers stand, have some hayrie downinesse upon them. There is a lesser of this sort as *Baubinus* saith, which hath hayrie shorter leaves and lesser flowers, found on the hills among the *Swissers*.

11. *Trachelium serotinum*, five *Viola Calathiana* forte *Gerardi*. The late flowering Throatwort. This late flowering Throatwort hath the lower leaves very like for forme unto the *Campanula Pyramidalis* or steeple Bell-flower but softer in handling, the stalkes rise a yard high being soft or almost woolly like the leaves, & divided into some branches at the tops, bearing many Bell fashioned flowers like the ordinary greater sort, but smaller and of a pale blewish or purplish ash colour, which by reason of their late flowering gave me no seede any year, the roote is thicke and bulbie.

12. *Rapunculus Scabiose capitula cernuo*. Rampions with Scabious like heads.

I was long in suspence with my selfe and unresolved, whether I should set this plant in this place or no; for finding good authors to set it forth as a Scabious, and *Columna* onely and *Baubinus* that followeth him, to dissent from them and make it a *Rapuntium*, first, because it giveth milke which no Scabious doth, and then the seede being altogether Rampion like, wherein I would judge of a plant most materially, I could not upon these reasons sily joyne it with the rest of the Scabious, but place it here according to the title with this description. It hath very many crested stalkes, brownish at the bottome, rising up to be a foote high, from a long white living roote, giving milke with many small narrow, and somewhat long leaves, whose edges are somewhat dented, or rather waved and writhed, than cut in, standing thick thereon, without order on all sides, and covered with a small soft doune or hayrinesse, unto the toppes almost, yet leaving a good space bare: the flowers stand in a round head, made of five narrow short blue leaves, the middle part formed into white starres and standing in Greene huskes cut into fixe or seven points, and a long pointell in the middle, which flowers are long at the first, and rise by degrees, some falling away when others are beginning to open themselves; all of them when they are past, and fallen, leave the Greene huske standing like a starre, in the middle whereof groweth a small head, containing such like small browne seede as the others have.

13. *Campanula Draba minoris folijs*. Bellflowers with small dented leaves.

The leaves of this Bellflower are rough or hairy, Greene and small, about an inch long, and halfe an inch broad, snipt about the edges, and pointed at the ends, standing on each side of the hairy stalkes that are scarce a foote high, without footstalkes: the flowers are but few, of a meane size, formed like Bellflowers, but ending in six corners or points, of a blewish colour set upon long footstalkes: the roote is white and long like the Rampions.

14. *Viola Mariana peregrina*. The Syrian Coventry Bells.

Unto these kind of Plants may very well sort the Coventry Bells, as being nearest unto them, and therefore I thought it not amisse to joyne this unto them, in this Chapter, set forth by divers, after *Ranwolfus* had first declared it, as he found it at the foote of Mount *Libanus* in Syria, in the shadowy woods. It hath faith he many long and narrow leaves, rising from the roote which is somewhat great and long, very like those of the small Ribwort Plantaine, but more cut in unevenly on the edges, and hairy also, but upon the stalkes those leaves are smaller, and not cut in at all, bearing the flowers at the joynts with them up to the toppes, which are larger and more open then the ordinary sort, and parted into heaven or eight corners of a pale purplish colour: the seede he could not observe, being not the time of ripening.

15. *Trachelium subrotundis folijs*. Round leaved Throatwort.

From a small creeping roote, a stalk of halfe a foote high being a little hairy riseth up, with a few somewhat round leaves set thereon, hairy or rough also, of about two inches broad, and as long, and little dented about the edges, at the toppe whereof stand a few small blew pendulous flowers like unto the others.

The Place.

These grow naturally in divers places, as some in Candy, some upon Mount *Baldus*, and others of the *Alpes*, in Germany, in Italy also and in Naples, as *Clusius* and *Columna* hath set it downe, onely the last save one in Syria as is aforesayd, and the last was sent *Baubinus* from *Helmstade*.

The Time.

They all flower in the Summer Moneths of June and July, but yet some of them flower not untill all the rest are past, and scarce perfect their seede, but are encreased by their roote.

The Names.

It is called *Trachelium* both in Greeke and Latin, or *Cervicaria*, for that it helpeth the sores of the neck and throat, either inward or outward; it is also called *Psularia*, because it helpeth the *Psula* the palate of the mouth (which hath the diminutive from *Uva*) for the likenesse unto a grape, when it is swollen and fallen downe, others call them *Campanula* of the likenesse of the flowers unto Bells, and therefore called Bellflowers; by which generall name not onely these but the others in the next Chapter, and many other plants are also called. Some also call them, *Rapunculus* genus, but improperly, and *Rapuntium* or *Rapuntium*, Rampions, because they are like unto Rampions, and many of them edible as they are. *Cesalpinius* onely as I take it, thought the great ordinty sort to be *Archangelica*: the French call them *Ganteleites* and *Gans de nostre Dame*, the Germans and Dutch *Halzkrain*, and we in English *Canterbury Bells*, and Throatwort, of some Haskewort: the first here set forth is that sort that *Lobel* calleth *Trachelium majus Belgarum*, and *Baubinus* to vary the name *Campanula maxima folijs latissimis*: the second and third is set forth by *Pona*, in the description of Mount *Baldus*; the greater whereof

whereof *Bauhinus* calleth, *Campanula Alpina sphaerocephalos* and the lesser *Rapunculus Alpinus corniculatus*, which in his *Phytopyxax*, and *Matthioli* he called *Rapunculus Alpinus spicato similis*; but having obtained a more exact knowledge thereof from *Pona*, he altered the title and gave both the description and figure more plainly: the fourth is called *Trachelium montanum* of *Lugdunensis*, which *Bauhinus* calleth *Campanula folijs Anchuse florum oblongis*: the fifth *Columna* calleth *Trachelium montanum*, and *Clusius* *Trachelium Tragopogi folijs*; but *Bauhinus* turning all the *Tracheliums* almost to *Campanulus* calleth it *Campanula Alpina Tragopogi folijs*: the sixth *Clusius* setteth forth in his *Cureposterioribus*, having received it from *Gregorius de Reggio* a *Chapuchine* Fryer of *Placentia* in Italy, by the name of *Pyramidalis villosa saxatilis latifolia*; and *Clusius* upon comparing it with others of the same kind, saith it may be called either *Rapunculus saxatilis montanus Doronici folijs*, or *Rapunculus montanus Pulmonariae Gallorum folijs*, and *Trachelii flore*. *Bauhinus* diversifieth it to *Trachelium saxatile folijs Pulmonariae Gallorum*: the seventh *Clusius* calleth *Trachelium Syriacum*, and *Thalium* in *Harcynia sylva Cervicariae major tenuifolia*. *Lugdunensis* setteth it forth by the name of *Echium montanum Dalechampii*, and saith some called it *Alopecurus montana*, but as *Clusius* there saith, that though the leaves bee like unto *Echium*, yet so are not the lowers, seede, nor seede vessels, and therefore cannot so properly be referred unto *Echium* as to *Trachelium*. *Bauhinus* calleth it *Campanula alia folijs Echii*, in the Chapter of *Trachelium*, and in the Chapter of *Echium* he calleth it *Echium Alpinum luteum*, and referreth it likewise to this *Trachelium Thyrsoides*, of *Clusius*. *Lugdunensis* figure of *Echium montanum* *Clusius* alloweth of to be his *Trachelium Thyrsoides*, but it cannot bee *Echium luteum* also, as any one may easily finde and know; but this must be accounted but one of his slips of memory (for his first *Campanula Echii folijs*, is likely to be the figure of *Lugdunensis* his *Trachelium montanum indeede*) and yet he saith it is not the same, but saith in his *Prodromus* he giveth the figure thereof because *Clusius* gave none, and yet his toppe of flowers doth not carry that shew of a *thyrus* or bush as *Clusius* saith his hath. The eighth *Pona* onely in his Italian description of Mount *Baldus*, maketh mention of by the same name is in the title, having received it from Signor *Contarini*, a *Magnifico* of *Venice*, brought to him from *Candy*, as it is thought; which *Bauhinus* calleth *Cervicaria Valerianoides cerulea*: the ninth *Clusius* calleth *Trachelium pumilum Alpinum*, and *Bauhinus* *Campanula Alpina pumila lanuginosa*: the tenth is called by *Bauhinus* *Campanula folijs Echii floribus villosis*: the eleventh *Gerard* calleth *Viola Calathiana*, the true *Calathian Violet*, upon what good ground I know not; for all Authors that have written of it since *Pliny* his time, who first gave the name have referred it to one of the Autumne *Gentians* (and himselfe doth so likewise among the *Gentians*) except *Dalechampius* who tooke the *Digitalis lutea* to be it; yet maketh the same *Gentian* or *Gentianella aestiva* to be it also, calling it *Thylacitis minor*, but I thinke he would not so have written, seeing himselfe both knew and set it downe for a *Throatwort*, had he not herein beene led by his owne or some others willfull judgement, as it is most probable. I have as you see given it another title, most answerable in my judgement thereunto, and the description most proper as it grew with me, the colour of whose flower I never saw, other then a pale blewish or purplish ascolour, and never any bright purple as he saith it is: the twelfth as I sayd, divers did take to be a small or sheepe *Scabious*, as *Gesner*, *Dodoneus*, *Camerarius*, and *Lobel*, but *Columna* contesting there against sheweth by those properties before spoken of, that it cannot be any sort of *Scabious* but a *Rapuntium*, and calleth it *Rapuntium montanum capitatum leptophyllum*, and *Bauhinus* as it is in the title: the thirteenth *Bauhinus* onely mentioneth in his *Pinax* and *Prodromus* by the same name that I do: the 14. *Ranwolffius* in his journal remembreth, & calleth *Medium Dioscoridis*, and *Mindium Rhofis*, and from him *Lugdunensis* and *Camerarius* upon *Matthioli* so call it. *Bauhinus* calleth it *Viola Mariana laciniata folijs peregrina*. The last *Bauhinus* onely mentioneth in his *Prodromus* and *Pinax*.

The Vertues.

Although the rootes of many of these be sweete in taste, and therefore eaten in Sallets, eyther raw or stewed as both the greater and smaller ordinary sorts of *Rampions*, set forth in the next Chapter, yet some of them here described as well as the greater sorts, set forth in my former booke, are not so pleasant but rather more astringent; by which qualitie they are found to be effectually, not onely in all *Vlcers* of the mouth or throat, to gargle and wash them, or for the *Voula* or the palate of the mouth, when it is swollen and fallen downe; but for all other sores, whether in the secret parts of man or woman, to be used in decoction with honey, wine and allome, or in any other part of the body; for by the faculty of drying and binding, they are very profitable for old sores, to restraîne the moist and sharpe humours which fret the place, and keepe them from healing, and for greene wounds and cuts, to close up the lippes of them speedily.

CHAP. LXXXI.

Rapunculus five Campanula glabra. *Rampions* or wild Bell-flowers.

In the former Chapter I shewed you those sorts of Bell-flowers, that had hoary, rough, or hayrie leaves, which as I sayd are usually called *Trachelia*, and *Cervicaria*: so the other whose leaves are smooth and not hayrie, or very little, are either called *Rapunculi* *Rampions*, some being of old nurfed up in Gardens, for dayly use and to be neere at hand, or growing wilde, and onely used as they may bee found, or *Campanula*. Bell-flowers, being like unto them in some things, although that quality of bitternesse and healing bee wanting, yet not to be dis-

joyned.

I. *Rapunculus esculentus vulgaris*. Garden *Rampions*.

The *Rampions* that are usually kept in gardens, are accounted a lesser kinde than many of the others that grow wilde, and lying upon the ground, with divers small and long round pointed pale greene leaves, before it runne up to stalkes, which spread divers such leaves thereon, but smaller to the toppe, where breake forth, sundry small pale purplish flowers, ending in five points like unto the former *Throatworts*, but much smaller, having also such like heads, with small brownish seede therein: the roote is small and white, and giveth milke being broken, as all the rest of the plant doth; shooting two or three branches almost of an equall bignesse, which

1. *Rapunculus esculentus vulgaris*.
Garden Rampions.

2. *Rapunculus spicatus Alopecuroides*.
Long Foxtaile Rampions,

is sweeter in taste, and therefore much used to be eaten.

2. *Rapunculus spicatus Alopecuroides*. Long Foxtaile Rampions.

The lower leaves of this Rampion are somewhat broad and round, yet ending in a point, dented about the edges, of a darke Greene colour, in some places spotted with blacke spots, and standing upon small long footestalkes, but those that grow upon the stalkes are somewhat longer and narrower, yet but sparingly set here and there, leaving the toppe bare, where standeth a small spiked head or bush of flowers, seeming like a Foxetaile whereof it tooke the name; at the first of a darke greenish colour, for so are the huskes of the flowers which breake out of them, being long and small, like unto hornes, bigger below and smaller above, ending in foure and sometimes in five points, of a blewish purple colour, in some paler in others deeper, and in some of a white colour, which being past there appeare in their places, small round heads, a little cornered, with brownish seede therein: the roote is white greater than the former, but as full of milke, and as sweete and fit to be eaten as it, especially when it is boyled, and after stewed with butter, &c

3. *Rapunculus Alopecuroides orbicularis*. Round Foxtaile Rampions.

This kinde of Rampion differeth little in shew, from the rocke Throatworts, described in the Chapter before, but that the roote hereof is more full of milke, tenderer and smaller, not so hard or woody; the round leaves at the bottome are pointed and smooth, not hayrie or hoaty: the stalke a foote high or more, somewhat crested having narrower and longer leaves on them than the lower, and fixe or seven standing together, at the toppe, under the spiked but round head of flowers, which are long and crooked, like unto rhole of the rocke Throatworts, with five pointed ends, of a deepe purple colour in some, and white in others, and some yellow threds in the middle, the heads and seede are like the other Rampions.

4. *Rapunculus sylvestris umbellatus trinum specierum*. Bush headed Rampions of three sorts.

The three differences in these Rampions are that the one having somewhat broad and long leaves, little or nothing dented about the edges, and standing one above another, upon the slender low stalkes, beare at the toppes small open flowers, like unto the garden Rampions, but of a bluer colour, many set together in a bush: another growth higher, but hath narrower leaves and more dented, and flowers at the roppes standing thicke together, but much smaller than the former, of a blewish colour also: the third is the least of all, having lower stalkes and narrower leaves thereon than any, being almost like grasse; the flowers likewise be little crooked hornes, pointed at the end, and of a pale blewish colour.

5. *Petromarula Cretica sive Rapunculus Creticus*. Candy Rampions.

The first leaves that spring up from the seede of these Rampions, are round like unto Violet leaves, little or nothing dented about the edges, which to abide the first yeare, but those that rise afterward with the stalkes are much different from them, being much cut in and deeper into severall parts, set on both sides of the middle ribbe, the end being longest, all of them dented, of a darke Greene colour on the upper side, and reddish oftentimes underneath; from among which rise up diverse crested stalkes, two or three foote high, bearing such like leaves

4. *Rapunculus lychnis umbellatus trium specierum.*
Buffheaded Rampions of three sorts.

5. *Petromarula Cretica* five *Rapunculus Creticus.*
Candy Rampions.

on them as below, but smaller from the middle of them to the toppes, stored abundantly with many reddish small purple flowers, and sometimes white, one above another in a long spike, which are very like unto Rampions, but somewhat longer, more divided in at the corners, and each part turning it selfe a little backe againe: after which come very small brownish seede in heads, both of them like unto the other Rampions: the roote is great and white, parted into many branches, giving milke as the leaves and stalkes also doe, and abideth many yeares, although the stalkes and leaves perish every yeare, fresh springing up before winter againe: this is somewhat tender, and requireth to be alittle defended and preserved in the winter with us.

6. *Rapunculus* five *Campanula Pyramidalis minor.* The lesser steeple Bell-flower.

This small Rampion or Bell-flower, call it which you will, hath from a small long white almost transparent roote, like unto that of the smaller garden Rampions, and long abiding, many long and somewhat broad leaves a little dented about the edges, set on each side of the single round stalke, rising about a yard high or more, broad bushing with leaves below, and smaller upwards bearing at the toppe a spiked head or bush with small Bell-like flowers, one above another, smaller below than above, of a fine delayed blewish colour, and a little pointed at the edges, with a long stile or pointell, growing out of the middle of every one, and smelling pretty well: the head and seede are like the other Peach leaved Bell-flowers. *Alpinus* suspected some venomous quality to be in this roote, upon the clammy taste therein, and doubted whether it might not be the *Aconitum folio Intubaceo* of *Theophrastus*, mentioned in his 9. booke, and 14. chap.

7. *Rapunculus nemorosus.* Wood Rampions.

The wood Rampion hath the lowest leaves somewhat long and dented about the edges, yet not so long as those that come after them, which are very long and dented also, standing upon short stalkes with some smaller ones at the joynts with them, the flowers are like the other Rampions, of a pale watchet colour: the roote hereof is white and long, but not so tender as the other.

8. *Rapunculus nemorosus magno flore.* Wood Rampions with great flowers.

The lower leaves of this Wood Rampion are small, somewhat long and round at the ends: the other that follow and grow after them upon the stalkes, are narrower and longer and pointed also, the flowers are longer then others, of a duskie purplish colour, with purple veines in them, many standing together like unto the ordinary Rampions and of the same fashion with five points, of a deeper colour then the flower: the roote is somewhat thicke and of a whitish colour enclining to red, full of milke, being twecte and as fit to be eaten, and more desired where it is naturall then any other.

9. *Campanula Alpina latifolia pallio flore.* Sullen broad leaved Bell flower.

This little Bellflower hath a very small slender stalke, scarce an handbreadth high, set to the middle on both sides thereof, with small broad leaves, about an inch broad, and somewhat round withall, slightly dented about the edges, of a pale Greene colour, and bare without leaves from the middle to the toppe, where usually standeth

K k k

deth

6. 17. *Campanula Pyramidalis minor* & *Rapunculus petraeus*.
Rocke Rampions, and the lesser Steeple Bell-flower.

7. *Rapunculus nemorosus*.
Wood Rampions.

deth but one flower; of a meane size, that is neither so great as many others of the following Bellflowers are, nor yet so small as the littleness of the plant might seeme to promise, of a fullen darke purplish colour: the seede and roote are answerable to the Peach leaved Bellflower, which as I sayd is extant in my former booke, and the figure thereof here exhibited.

10. *Campanula rotundifolia minima*. The least broad leaved Bellflower.

This little plant hath divers leaves rising from a small, long, white, threddy roote, which are somewhat broad and round, a little dented and hard, each set on a small footestalke, among which rise up two or three slender small reddish stalkes, not an handbreadth high, for the most part without any leaves upon them, at the toppes whereof grow usually but one small blewish flower, fashioned like the other blew Bellflowers, ending in five or six corners with a pointell in the middle: the seede is small like the rest.

11. *Campanula minor sylvestris rotundifolia*. Wilde field Bellflowers.

The lower leaves of this kind of Bellflower, that lye upon the ground are alwayes round and small, almost like unto a Violet leafe, but rounder, snipped or dented, from whence rise divers weake slender stalkes, about two foote high, set from the bottomes to the toppes, with many very small long and narrow leaves, where the flowers stand upon severall small long stalkes, very like in fashion and bignesse, unto the small Garden Rampions, but of a perfect blew colour, and sometimes white, as hath beene observed in some places, yet very feldome: the small seede followeth in small heads like those of the Rampions; the roote is small and threddy.

12. *Campanula minima sylvestris*. Small wilde Bellflowers.

This Bellflower differeth little from the last, but in the slender stalkes, which having very few leaves thereon or none at all, are not stoned with more flowers on them usually then one, but of as perfect a blew or white colour as the former, and almost as large.

13. *Campanula linifolia cerulea*. Flax leaved Bellflower.

All the leaves of this Bellflower, as well the lowest as those upon the slender weake stalkes, scarce a foote high or able to sustaine themselves, are small, narrow and long like unto Line or Flax; the flowers are of a pale blewish purple colour, like in forme unto the other of the small Bellflowers, and so are both seeds and roots.

14. *Campanula lutea linifolia*. Small yellow Bellflowers.

This is also in most things like the last, saving that the lower leaves are a little larger, yet long, and some of them a little dented about the edges: in the forme of the flowers or manner of growing this differeth not, but in the colour, which is of a pale yellow.

15. *Campanula Serpilli folia*. Time leaved Bellflowers.

This small Bellflower hath many slender weake brownish branches, rising from a small threddy roote, which creepe and shoote forth rootes as they lye upon the ground, divided into other smaller branches, very like unto Wilde Time, or Mother of Time, having many small leaves of a pale Greene colour underneath, somewhat round, set by couples one against another, along the middle ribbe, some of them being greater, like the small purple Money wort, and others like the wilde Time but dented: the flowers grow at the ends of the branches, and sometimes from the joynts with the leaves, standing upon slender short foote stalkes, sometime two together, hangin g

Campanula Persici folia.
Peach leaved Bell flower.

14. *Campanula latifolia*.
Small yellow Bell flower.

17. *Campanula minor sylvestris rotundifolia.*
Wilde field Bell flower.

25. *Campanula Serpillifolia.*
Tyme leaved Bell flower.

hanging downe their head, like in forme and bignesse unto these last Bell-flowers, but of a reddish purple colour; the whole Plant doth so resemble wild Time, that but the flowers onely can or doe distinguish them.

16. *Campanula Cymbalariae foliis*. Ivie leaved Bell-flower.

The stalkes of this Bell-flower rise up to be scarce halfe a foote high, yet leane downwards upon what standeth next it, and brancheth forth from the bottome almost, set very sparingly and without order, with round and cornered leaves, unevenly dented about the edges, like unto those of ground Ivie, or the *Cymbalaria*, which leafe is somewhat like it, every one upon a small long footestalke: at the toppes of the stalkes, and sometimes also from the sides of them, stand somewhat long blue flowers, like unto the other Bell-flowers, upon long foote stalkes.

17. *Rapunculus petraeus*. Rocke Rampons.

The roote of this Rampion is long white and of a fingers thickenesse, growing so fast into the Rockes that with much labour it can be drawne out whole, being of a sweetish and sharpe taste, often taken as a sallet: it hath divers thicke, and somewhat broad leaves, ending in a point, from whence rise two or three slender stalkes scarce a foote high, having narrower and longer leaves on them set oppositely, at the toppes whereof stand round heads, of many blewish flowers set together without smell, after which follow very small yellowish seede, as bigge as Poppie seede. There is another with thinner leaves and smaller flowers.

The Place.

Many of these are strangers to us not growing wilde in our Land that I can heare of, but some in Candy; others in Italy, and some in Germany, &c. yet some of them in divers places of this Land, as the first, second, seventh, eleventh, and twelfth.

The Time.

They flower all the Sommer long, some abiding long, and lasting untill the Autumne cold dewes doe take them away, others sooner spent.

The Names.

Some call these *Rapunculi*, and *Rapuntia*, Gesner, Dodonaeus and others call them *Rapa sylvestris*, having little likenesse at all with *Rapum*, the Turnep, but in the edibleness of the roote, although the name be a diminutive thereof. Others call them *Campanula* of the forme of the flowers, being like little Bells. *Columna* taketh the *Rapunculus minor*, to be *Erinus* of Nicander and *Dioscorides*, and the other *Rapunculi* to be kindes thereof: *Matthiolus* taketh the *Campanula persici folia*, to be *Phyteuma* of *Dioscorides*; and *Cesalpinus* calleth the *Rapunculus spicatus* five *Alopecuroides*, *Phytanma foliis Rapunculi*, chiefly because the heads with seede have holes in them, as *Dioscorides* saith the seede of his *Phyteuma* hath. The first is called *Rapunculus* and *Rapunculus minor* by *Matthiolus*, *Camerarius*, *Dodonaeus*, and others; *Tragus* calleth it *Rapunculus vulgare*, and *Lobel* *Rapuntium parvum* five *Pes locustae Avicennae*. The second is called *Rapunculus sylvestre* by *Tragus*, and by *Dodonaeus* *Rapum sylvestre majus*, and *Rapunculus Alopecuron*, by *Lobel* *Rapuntium majus Alopecuroides comiso flore*, by *Clusius* *Rapunculus Alopecuroides longa spica*, by *Thalium* *Rapunculus sylvestris spicatus*, and by *Tabermontanus* *Rapunculus nemorosus primus*: the third is called by *Clusius* *Rapunculus Alopecuroides orbiculari penes spica*, by *Columna* *Rapuntium corniculatum montanum*: the first of the fourth kinde *Thalium* calleth *Rapunculus sylvestris caruleus umbellatus minor*, and is the second *Rapunculus umbellatus* in *Camerarius* his figures, at the end of his *hortus medicus*, which *Bauhinus* calleth *Rapunculus umbellatus latifolius*: the second of the fourth kinde, is the first *umbellatus* of those three figures of *Camerarius*, and is the *Rapunculus sylvestris caruleus umbellatus major* of *Thalium*, which *Bauhinus* calleth *umbellatus angustifolius*; and the third of the sayd fourth kinde, is the seventh *umbellatus* with *Thalium*, and the third of *Camerarius* his figures, which *Columna* calleth *Rapuntium alterum angustifolium Alpinum*, and *Bauhinus* *Rapunculus umbellatus folio gramineo*; the fifth is *Petromarula*, seu *Laetia petrea Cretica*, both by *Honorius Bellus*, in his first Epistle to *Clusius*, and by *Pona* in his *Monti Baldi*, and by *Ferrantes Imperatoris* in his generall History, which thereupon *Bauhinus* calleth *Rapunculus Creticus*, seu *Pyramidalis altera*: the sixth is called by *Bauhinus* *Rapunculus Alpinus* seu *Pyramidalis minor*, and thinketh it to be the *Campanula foliis serratis carulea* of *Beslerius* in *horto Eystetensi*. The seventh is called by *Thalium* *Rapunculus Campanulatus Neri foliis tertius*, and by *Tabermontanus* *Rapunculus nemorosus*. The eighth is called by *Columna* *Rapuntium* five *Erinus magno flore*, and by *Bauhinus* *Rapunculus nemorosus magno flore minor*. The ninth and tenth are so called by *Bauhinus* as they are in their titles: *Anguillera* taketh the eleventh to be *Cantabrica Plinii*, and *Cesalpinus* *Phyteuma unico flore*, in *summis cauliculis*, and is also the *Campanula minor rotundifolia* of *Lobel*, or *Alpina rotundioribus imis foliis* of *Clusius*, which *Bauhinus* would distinguish, and thereupon hath given as he saith, a truer figure of that *Alpina rotundifolia minor*, but assuredly they cannot differ, other wise than the place may give it, for that I have seene and gathered both these sorts, with the differences specified, in one and the same ground almost. The twelfth is called by *Tabermontanus* *Rapunculus sylvestris flore ex purpureo cand. cante*, and by *Gerard* *Campanula minor, alba & purpurea* for that they grow usually on the barren dry Heath of *Hampsted*, and other grounds under the bushes. The thirteenth is called by *Bauhinus* *Campanula Alpina linifolia cerulea*: the fourteenth by *Tabermontanus* *Rapunculus nemorosus tertius*, and by *Bauhinus* *Rapunculus nemorosus angustifolius parvo flore*, and saith it is the same with *Gerard's* *Campanula lutea linifolia*. The fifteenth and sixteenth are so named as their titles demonstrate them by *Bauhinus*, who onely remembreth them: the last is remembreth by *Alpinus* in *lib. de exoticis*.

The Vertues.

The rootes of all the sorts of Rampions, and so likewise some of the Bell-flowers, especially if they have any greater rootes, than the ordinary stringie ones, are used for sallets either cold with vinegar oyle and pepper, or boyled and stewed with butter or oyle, and some blacke or long pepper cast on them; either way or any way else they are familiar to the stomacke, stirring up the appetite, and by reason of their temperate quality, causeth a good digestion, and engendreth store of milke in nurses breasts; the rootes beaten small, and mixed with some meale of *Lupines*, cleneth the skinne from spots, markes, or other discolourings. The distilled water of the whole plants, rootes and all, performeth the same, and maketh the face very splendent and cleare.

CHAP. LXXXII.

Digitalis. Foxglove.

Although I have set forth in my former booke many sorts of Foxgloves, being all of them pretty ornaments to a Garden that is kept for delight, yet there is one remaining to bee spoken of, being commonly knowne to grow wilde in our land, in every countrey almost, so that it is not thought worthy a place in our Gardens (although in other countries beyond the Seas, where it is not so familiar, it is as greatly desired as any other with us, that is common with them) but I thinke not amisse to expresse the names of them I have formerly set forth, that so you may see all the sorts in one place: *Digitalis maxima ferruginea*, Dun coloured Foxgloves, *Digitalis major flore carneo*, Blush coloured Foxgloves, *Digitalis media flore luteo rubente*, Orange tanny Foxgloves, *Digitalis major alba*, The greater white Foxglove, *Digitalis alba altera, seu minor*, The lesser white Foxglove, *Digitalis major lutea flore amplo*, The greater yellow Foxglove, whose figure I give you here with the common: and *Digitalis minor lutea, flore pallida*, The small pale yellow Foxglove.

Digitalis purpurea vulgaris. Common purple Foxglove.

This common Foxglove hath many long and broad leaves lying upon the ground, dented about the edges, a little soft or woolly, and of a kind of hoary Greene colour, among which rise up sundry stalkes sometimes, and but one very often, bearing such leaves thereon, from the bottome to the middle; from whence to the top it is steeled with large and long hollow reddish purple flowers, a little more long and eminent at the lower edge, with some white spots within them one above another with small Greene leaves at every one, but all of them turning their heads one way, and hanging downwards, having some threads also in the middle, from whence rise round heads, pointed sharpe at the ends, wherein small browne feede lyeth: the rootes are many small huskie fibres, and some greater strings among them; the flower hath no sent, but the leaves have a bitter hot taste.

The Place.

It groweth in dry sandy grounds for the most part, and as well on the higher as lower places under hedge sides, in every countrey almost of this Land.

The Time.

It flowreth seldome before *July*, and the seede is ripe in *August*.

The Names.

It was not knowne unto any of the ancient Greek or Latin writers, for it hath scarce attained a Latin name other then *Digitalis* from the hollow forme of the flowers, which are like finger stalles: Some have taken it to bee a kinde of *Verbascum*, *Cesalpinus* calleth it *Virga regia major flore purpureo*, *Alisma* also and *Damasconium*, and *Fistula pastoris*. *Tragus* calleth it *Campanula glaberrima flore purpureo*, and *flore luteo*: *Columna* taketh it to bee the *Ephemerum* of *Dioscorides*, and *Dalechamps* upon *Pliny* taketh it to bee *Calathiana Viola Plinij*, as I sayd be-

Foxglove with large yellow flowers.

Kkk

1063

fore: the *Italians* call it *Aralda* as *Camerarius* saith, the *French* call it *Gent' de nostre Dame*, and *Doigrier*, the *Germanes* call it *Fingerbuet* and *Fingerkraut*, the *Dutch* *Fingerkruid*, and we in *English* *Foxgloves*.

The Vertues

The *Italians* have an usuall proverbe with them concerning this herbe, called by them *Aralda* which is *Aralda, tutte piaghe salda*: *Aralda* salveeth all sores: for they use it familiarly to heale any fresh or Greene wound or cut, the leaves being but bruised and bound too, and sometimes also they use the juyce in old sores to cleanse them, dry up their moylture, and heale them the more speedily, which it performeth by the bitter quality therein whereby it is found to be heating and drying and cleansing withall; so that whensoever there is neede of a rarefying, or extenuating of thicke tough flegme and viscus humours troubling the chest or stomacke; the decoction or juice hereof made up with some Sugar or honey is available, as also to cleanse and purge the body both upwards and downwards sometimes, of tough flegme, and clammy humours, and to open the obstructions of the Liver and Spleene; and yet notwithstanding that these qualities are found to bee in it, there are but few Physicians in our times that put it to these use, but is in a manner wholly neglected: It hath beene found by late experience to be available for the Kings Evil, the herbe bruised and applied to the place, or the juice made up into an ointment and used thereon: And it hath beene of later experience found also to be effectually against the Falling sickness, that divers have beene cured thereby; for after the taking of the decoction of two handfulls thereof, with foure ounces of *Polipody*, of the oake bruised made in Ale, they that have beene troubled with that disease 26. yeares, and have fallen once in a weeke or two or three times in a moneth, have not fallen once in 14. or 15. moneths, that is untill the writing hereof, which I thinke may be sayd to be an absolute cure, not to be presumed that after so long stay it should returne againe.

CHAP. LXXXIII.

Helenium five Enula Campana. Elëcampane.

Although *Dioscorides*, *Theophrastus* and *Pliny* that followeth them, did in ancient times account of divers herbes to be called *Helenium*, which were much differing one from another, and which are not so well knowne as guest at by us in these times, what they are. as that *Helenium Aegyptium* of *Dioscorides* in his Chapter of *Helenium*, and that *Helenium Comogenum*, with whose rootes *Cosus* was wont to be adulterated, as he saith in his Chapter of *Cosus*, if they be not both one; and that *Helenium* of *Theophrastus* in his sixt Booke and sixt Chapter numbred among the sweete herbes put into Garlands, which may also be the same with that *Egyptium* of *Dioscorides*; and although *Bauhinus* in these times would refferre the flor *Solis*, and the varieties thereof unto it (of some whereof I have spoken in my former booke) yet I meane not to speake of any of them in this Chapter, but of the most ordinary sort, even the first of *Dioscorides*, which is most usually called *Enula campana*, *Elëcampane*: (and of that which is thought to be *Dioscorides* his *Heleni Aegyptium* in the next:) the description of which you shall have in this manner. It shooteth forth many large leaves lying neare the ground which are long and broad, small at both ends, somewhat soft in handling, of a whitish Greene on the upper side, and gray underneath, each set upon a short footstalk; from among which rise up divers great and strong hairy stalkes, three or foure foote high, with some leaves thereon compassing them about at the lower ends, and are branched towards the toppes, bearing divers great and large flowers, like unto those of the *Corne Marigold*, both the border of leaves, and the middle thumbe being yellow. which turne into downe, with some long small brownish seede among it, and is carryed away with the winde: the roote is great and thicke, branched forth divers wayes, blackish on the outside, and white within, of a very bitter taste, but good sent, especially when they are dried, no part else of the plant having any smell.

The Place.

It groweth in the moyst grounds and shadowy places oftner then in the dry, and open borders of fields and lanes, and in other waste places almost in every countrey of the Land.

The Time.

It flowreth in the end of *June* and *July*, and the seede is ripe in *August*, the rootes are gathered for use, as well in the Spring before the leaves come forth, as in Autumne or Winter.

The Names.

It is called in Greeke *ἑλενιον*, *Helenium* also in Latine, and of some *Inula*, and *Enula*, and *Enula Campana*: some thinke it tooke the name from the teares of *Helen*, from whence it sprung which is a fable; others that shee had

Helenium five Enula Campana.
Elëcampane.

her hands full of this herbe, when *Paris* carried her away: others say it was so called, because *Hellen* first found it vailable against the bitings and stings of venomous beasts; and others thinke that it tooke the name from the Island *Helena*, where the best was found to grow: the *Arabians* call it *Iosin*, and *Rafen*, the *Italians* *L'ella*, and *Enola*, the *Spaniards* *Raiz de alla*, the *French* *Annee* and herbe *Alaine*, the *Germans* *Alant*, and *Alant-wurtel*, the *Dutch* *Alantwurtel*, and *Galanwurtel*, and we in *English* *Elecampane* generally, yet in some countries of this kingdome *Scabwort* and *Horseheale* *Anguilara* and *Corden* tooke it to be *Panax Chironium Theophraste*.

The Vertues.

The fresh rootes of *Elecampane* preserved with Sugar, or made into a syrupe or conserue, are very effectuell to warme a cold & windy stomack, and the pricking and stiches therein, or in the sides caused by the Spleene, and to helpe the cough, shortnesse of breath, and wheezing in the Lungs: the dried rootes made into powder mixed with sugar, and taken, serue to the same purposes, and is also profitable for those that have their urine or their menstrues stopped, those that are troubled with the mother, or are pained with the stone in their reines, kidneys or bladder: it resisteth payson, and stayeth the spreading of the venome of Serpents, &c. as also of putrid and peccilentia Fevers, and the Plague it selfe; for which purpose it is put into Treakles, and other medecines for that disease. *Iulia Augusta* as *Pliny* writeth in his 19. Booke and 5. Chap. let no day passe without eating some of the rootes of *Enula* condited, which it may be shced to helpe digestion, to expell melancholy and sorrow, and to cause mirth, and to move the belly downward, for all which they are also effectuell: the rootes and herbe beaten and put into new Ale or beere instead of wine, as they use in *Germany*, *Italy* and other places, and daily drunke of them that have weake and dim sights, cleareth, strengthneth and quickneth the sight of the eyes wonderfully, the decoction of the rootes in wine, or the iuice taken therein, killeth and driveth forth all manner of wormes in the belly, stomacke, or mawe, and gargled in the month, or the roote chewed fastneth loose teeth, and helpeth to keepe them from putrefaction: the same also drunke is good for those that spit blood, helpeth to remoove Crampes or Convulsions, and the paines of the Goute, and the huckle bone, or hip-goute called the *Sciatica*, the loofenesse and paines in the joynts, or those members that are out of joynt, by cold or moisture happening to them, applied outwardly as well as inwardly, and is good also for those that are bursten or have any inward bruise: the rootes boyled well in vinegar, beaten afterwards, and made into an oymtent, with Hogs Suet or oyle of trotters, & a little salt and vinegar in powder added thereto, is an excellent remedy for any scabs or itch, in young or old; the places also bathed or washed with the decoction doth the same; the same also helpeth all sorts of old putrid, or filthy sores or Cankers wheresoever. In the rootes of this herbe lyeth the chiefe effect for all the remedies aforesayd, yet the leaves are sometimes also used to good purpose: And the distilled water of them, and the rootes together is used also in the like manner, and besides is very profitable to cleanse the skinn of the face or other parts from any morpheus, spots, or blemishes therein, and causeth it to be cleare.

CHAP. LXXXIII.

Helenium alterum Dioscoridis sive Helianthemum. Dwarfie Cistus or small Sunflower.

According as many good Authors doe, I account this herbe for the second *Helenium* of *Dioscorides*, although it hath received other names by divers writers, and therefore joyne it next thereunto, and because it much resembleth some other sorts of Cistus, I thinke it fit to entreate of them in the succeeding Chapters, and not mingle them together, for of these kinds there are many sorts, some whereof I have set forth in my former booke, which are the *Camacistus Friscus*, the Dwarfie Holly Rose of *Freezeland*, and *Cistus ananur*, the Holy Rose of a yeare, which I shall not neede to describe againe in this place, but referre you thither where you shall finde them, yet I will here give you their figures.

1. *Helianthemum vulgare, sive Chamacistus flore luteo & Flos solis quorundam.*

The ordinary yellow Dwarfie Cistus or small Sunflower.

This low or Dwarfie Cistus sendeth forth from a hard woody brownish root, growing in time to be somewhat great, but not very long, and divided into small branches at the lower end, sundry small and weake, yet hard and almost woody branches, lying for the most part round about the head of the roote, upon the ground, whereon are set by couples many small and somewhat long leaves, a little soft or hairy, with other small leaves also growing betweene them: at the toppes whereof stand three or foure small pale yellow and sometimes gold yellow flowers, consisting of five round pointed leaves a peece, with some yellow threds in the middle, of a pretty sent in some places, but lesse or none in others; after which follow small round heads, containing therein small yellow feede: this dyeth not but abideth many yeares, increasing in branches, which yeld a viscus or muciliginous iuice, like unto Comfrey, and is of an austere and astringent taste.

2. *Helianthemum flore albo.* White Dwarfie Cistus or small Sunflower.

This Cistus differeth little from the former, but that it riseth somewhat higher, the leaves being a little whiter and longer, and not set so thicke together: the flower also is somewhat longer and white, in some places being a little sweete, and in others little or nothing at all, but an astringent taste like the other.

3. *Helianthemum Sabaudicum.* The Savoy small Sunflower or Dwarfie Cistus.

This is likewise one of the same kind, differing very little from them, having flexible but tough reddish branches, standing somewhat more upright, and divided into other lesser, with foure small narrow leaves usually set at a joynt contrary to all the rest, yet the flowers are like the others, being in some yellow, in others white; the feede and roote are not unlike.

4. *Helianthemum angustifolium.* Narrow leaved small Sunflower or Dwarfie Cistus.

This small low or Dwarfie Cistus is likewise a small plant, having most of the branches lying on the ground, with leaves set thereon but in a different manner from all the rest, that is confusedly, for they are very many, small and narrow, and in a manner hoary or white; at the tops of the stalkes rise up small whitish or pale yellow flowers, like in forme unto the other, with small threds in the middle: the heads that follow are small and three square, like unto those of *Line* or *Flax*, with reddish feede in them; the roote is woody and fibrous.

5. *Chamae*

1. *Helianthemum vulgare*.
The ordinary dwarfe Cistus or small Sunflower.

3. *Helianthemum Sabaudicum*.
The Savoy Dwarfe Cistus.

5. *Chamaecissus latifolia*. Broad leaved small Sunflower or Dwarfe Cistus.

Chamaecissus Friesens. The Dwarfe Cistus of Freegetand.

The small branches of this low or Dwarfe Cistus doe lye on the ground, but the leaves are somewhat broader then in any of the former, nearest in forme unto small Mirtle leaves, and pointed at the ends: above the leaves on a small stalke stand foure or five small yellow flowers like the rest; the heads for feede are three square, and the feede within them somewhat rough and reddish; the roote is like the rest abiding long.

6. *Chamaecissus hirsutus*. Dwarfe Cistus with rough leaves.

The stalkes of this low Cistus grow more upright then the former, more blacke also and more woddy, about halfe a foote in length, having so many small, rough and hairy darke greene leaves set thereon, somewhat like the last, and so thicke that they seeme to have foure at a joynt: at the toppes of the stalkes and branches for they are divided into smaller ones, stand usually but one somewhat large flower, and sometimes two, consisting but of one leafe, yet cut in so deepe that it seemeth to be five round pointed leaves, of a pale purple or light bluish colour, with a long purplish stile, or pointell in the middle, compassed about with ten small chives, tipped with blackish chives, after which come five square round heads, containing small yellow feede: the roote is woody and spreading.

7. *Chamaecissus Erica folijs*. Heath leaved Dwarfe Cistus.

This Dwarfe Cistus is likewise a small plant, having most of the branches lying on the ground, and some bearing themselves upright, which are of two sorts, the one with very short leaves, which is the lower, and in the other which riseth higher much longer, set both so small that they are most like unto the leaves of Heath, or Tamariske, with small

yellow flowers at the toppes of them, like unto the former, after which come small heads that swell out in the middle are fraked and yellowish, & containe within them small round feede like Millet, but greater: the roote is somewhat long, hard and woody, blackish on the outside with divers long fibres thereat.

8. *Chamecistus Serpilli folio flore luteo.* Yellow Dwarf Cistus with wilde Time leaves.

This Dwarf Cistus creepeth upon the ground, like unto wild Time, with such like small leaves set upon the reddish branches very thicke, or as it were in a double row, of a darke Greene colour, and a little hairy withall, but a little longer and whiter next unto the flowers, which stand three or foure together, every one on a pretty long hairy footstalk; consisting of five small yellow leaves like unto the other and somewhat sweete: the roote is very fibrous or much spread under ground.

9. *Chamecistus Serpilli folio flore carneo.* The great Dwarf Cistus with wilde Time leaves.

This other wilde Time leaved Cistus hath creeeping blackish branches, farther extended upon the ground then the other: being about a foote in length, and taking roote as they creepe, having such like but small leaves set thereon by couples, of a sad Greene colour on the upper side, and grayish underneath: at the ends of the branches stand three or foure flowers together, made of five leaves a peece, of a kind of bluish colour: the heads that beare the feede are five square, and open themselves at the toppes shewing very small feede; the roote is small and woody: all these sorts of Dwarf Cistus or Sunflowers are durable, not perishing in the Winter.

The Place.

The first and second grow in divers places of this land, but especially in Kent, in every tract thereof throughout, which in some places is greater then in others, yet that with the white flower is more rare: to finde then the others: the third according to the title in *Savoy*; the fourth *Clusius* saith he found on the hills about the Bathes of *Baden*: the fifth he likewise saith groweth plentifully on the Alpes of *Austria* and *Hungary*: the sixth also upon the snowy hills of the Alpes: the seventh on the open sunny sandy hills in divers places of *France*, *Spain*, and *Italy*: the eighth *Clusius* saith hee never found but upon the highest Alpes of *Austria* and *Stiria*; and as some thinke is that sort is most usuall with us here in *England*: the last also on the snowy hills of the Alpes.

The Time.

All these sorts of Dwarf Cistus doe flower in the Summer, some earlier and later then other by a moneth, yet most of them are so soone fading, that their flowers endure but a day or two, and perfect their feede soone after.

The Names.

I am verily perswaded that *Dioscorides* hath made mention of this herbe in two sundry places of his worke, the one in the Chapter of *Helenium* which he saith *Cratæus* called *Ἑλένιον* *Argemone Helenium Egyptianum*, and grew like *Serpillum*, unto which *Pliny* also in his 29. Booke and 10. Chap. consenteth, saying *Helenium* is sayd to grow of *Hellens* teares, and the best to grow in the Island *Helena*: it is a small shrubbe lying on the ground, with leaves like unto *Serpillum* or mother of Time, and in the 22. Chap. of the same Booke hee remembreth it againe and giveth the vertues thereof, which are differing from the other *Helenium* or *Elecampane*; for he there saith, that the juice thereof is sweete, and being drunke in wine is a furtherer of mirth, and may be held to be the *Nepenthe*, whereof *Homer* speaketh, that putteth away all sorrowes: but some thinke that this differeth from the *Helenium* of *Theophrastus*, because he numbred it still among sweete herbes that were used in Garlands, as *Serpillum*, *Sisymbrium*, and *Abrotaenum*, and therefore judge it to be *Marum*, or herbe *Masticke*: the other place in *Dioscorides* is in his Chapter of *Panax*, and called *Πανάξ ῥηγιον* *Panax*, and *Panaces Chironium*, which hee there saith hath leaves like unto *Amaracus* or *Marjerome* and yellow flowers, and a small roote; all know the leaves of *Marjerome* doe not much differ from *Serpillum* in the forme, but in the largenesse and hoary whitenesse: and therefore divers Authors doe call it diversly, some, as *Lugdunensis* calleth it *Helenium minus Dioscorides*, and others *Helenium alterum*, five *Aggyptium*, and some *Panax*, and *Panaces Chironium* as *Matthioli* and others that follow him, or *Chironia* as *Cesalpinus*: some also take it to be *Helianthe* of *Pliny*, which *Cordus* calleth *Helianthemum*, or *flos Solis*, and so doe *Lobel*, *Thalium*, *Tabernmontanus* and divers others: *Gesner* in his *hortis Germanie* calleth it *Gratia Dei*, or *Hyssopides*, for the likeness of the leaves, which deceived both him and *Tragus*, who called it *Hyssopus campestris*, and *Lonicerus* who called it *Hyssopus montana*, five *sylvestris*, who all follow the common appellations of their countries. *Cordus* saith it was called by divers in his time, *Consolida aurea* & so saith *Clusius* also, yet he would rather referre all these sorts to the family of the female Cistus, and make them of his third order of Cistus, calling them *Chamecistus*, because they are like unto them, both in face and propertie. *Lobel* in his *Adversaria* would rather referre it to the *Centaureum luteum*, whereunto as he saith it is both in face and vertue not unlike: the first which is as usuall with us as in *Germany* is called of the Germans *Heyden Yssop*, that is, *Heathen Hyssope* we may call it in *English*, and so the rest, cyther small Sunflower or Dwarf Cistus: the third is remembred by *Tabernmontanus* under the same title, it is expressed here: the fourth is the sixth *Chamecistus* of *Clusius*: the fifth is his third *Chamecistus* in his History of Plants, but are the first and second in his *Pannonicke* observations, and there called *Angustifolius* and *Latifolius*, as *Baibinus* doth also: the sixth is *Clusius* his eighth *Chamecistus*, and called by *Tabernmontanus* *Cistus humilis Austriaca*, by *Baibinus* *Chamecistus hirsuta*: the seventh is called by *Lugdunensis* *Erica Chrysanthemos*, and by *Baibinus* *Chamecistus Erica folio luteus*, who judgeth it to bee the *Cori similis frutex in maritimis* of *Cesalpinus*, and the *Cori Dioscoridis* of *Guilandinus*: the eighth is the second *Chamecistus* of *Clusius*, which *Tabernmontanus* calleth *Cistus humilis Serpillifolia*, and I thinke may bee the *Helianthes species rara*, in the *Adversaria* of *Pena* and *Lobel*, which *Lobel* afterwards in his *Icones* calleth *Cistus majoranae foliis*; and *Baibinus* maketh to be a *Cistus femina*, numbring it among them: the last *Clusius* in his *Pannonicke* observations, was not well resolved by what name to call it, as partaking both with *Cneorum Matthioli*, & *Chamecistus*, and therefore left it there as an *Anonima*, without name, but considering afterwards better upon it, he setteth it forth in his history of Plants for his seventh *Chamecistus*, *Baibinus* calleth it *Chamecistus Serpilli folia floribus carnis*, and taketh it to be the *Rosa Alpina altera folijs minimis* of *Gesner* in his *hortis*, and the *Alpina altera* of *Lobel*.

The Vertues.

All these sorts are drying and binding or astringent, with some bitternesse joyned thereto, especially in some mote then in others, and not without some small sent also: the decoction of this herbe and roote, is singular good
for

for them that spit blood, and to stay all bleedings, eyther inward or outward, as also all fluxes or lakes, and the abundance of womens courses: the same also is very effectuell to wash sore mouches, and the Vlcers that happen in the privy parts of man or woman: it is no lesse profitable in other Vlcers of the body or legges, which are long kept from healing, by a defluxion of moist and sharpe humours falling upon them, which it consumeth and dryeth up, thereby causing the sores to heale the more speedily: it likewise fodereth and closeth up the lippes of greene wounds, for it is very powerfull in consolidating, binding, and strengthening any part, and is as effectuell as any Comfrey for burstings, the strengthening of weake joynts, or any other binding propertie, whereunto any Comfrey may be applied: being bruised and applyed to the biting or sting of any venomous creature, it stayeth the venome from further spreading, and healeth the party quickly; especially if they take also of the juice, or the decoction thereof in wine: the distilled water of the herbe is held to beautifie the skinne of the face, or any other part of the body.

CHAP. LXXXV.

Cistus mas. The male Holly, or Sagē Rose.

BEcausē I entreated in the last Chapter of the small or Dwarfed *Cistus*, which upon good ground as I take it I referred to the *Helenium alterum* of *Dioscorides*; I thinke it not amisse here to prosecute the other kinds of *Cistus*, whereof there are two principall, one that beareth the sweete Gum *Ladanum*, and another that doth not, according as some doe distinguish them; or as others doe into male & female; yet some make three kinds, and the *Cistus Ledon* to be the third, but it may bee comprehended under the female kind, in that it beareth white flowers as the female doth, the male alwayes bearing red flowers: but because there is so much varietie in every of them, I will distribute them into their severall Chapters, not intending to speake of those here, I have spoke of in my former booke, which is one of cyther of the two first sorts, and two or three of the last, yet if I give you their figures, it shall be to shew you their differences.

1. *Cistus mas angustifolius.* Narrow leaved male *Cistus*.

This small *Cistus* groweth like a small shrubbe or bush, with divers woody branches therēon, set with leaves on each side two together, which are longer and narrower, softer also, and not altogether so hoary or woolly as that sort which I have already set forth, else not differing from it, for the flowers are like unto those of the wild Eglantine or Brier Rose, of a fine delayed reddish colour, like unto the other, as the heads and seede are also; this roote is woody and groweth not deepe: this is somewhat more tender to keepe, and will lesse abide the injuries of our Winter frosts then the former.

2. *Cistus mas folio subrotundo.* Round leaved Male *Cistus*.

This other *Cistus* is somewhat more woolly then the former, and his leaves are larger, rounder, and more rough

Cistus mas vulgaris
The more ordinary male *Cistus*.

1. *Cistus mas angustifolius.*
Narrow leaved male *Cistus*.

then it: the flowers also are somewhat larger and of a deeper colour, and the heads of feede bigger, hard and hairy as the other, with reddish feede in them, and herein consisteth the chiefeſt differences from them.

3. *Cistus mas folio brevior.* Small leaved male Cistus.

This small Cistus for to I may call it, as well in respect of the growth being lower, and the branches slenderer, then in any of the other, as in that the leaves hereof are smaller and shorter then in the first here set forth, and are also greener, and rougher and more clammy and sweeter also then any male Cistus: the flowers are of a paler colour like in forme unto the other, but somewhat larger and sweet, which is not found in any other of this sort, and abide longer in their huskes before they fall; in other things it differeth not.

4. *Cistus mas humilis.* The low male Cistus.

This Cistus groweth lower, bending downe his many branches from the roote almost to the ground, not much above halfe a yard long, the leaves that are not set by couples, as in the other sorts of Cistus are small and crumpled, unevenly waved as it were on the edges white and hoary: the flowers that stand at the end of the branches are many set together of an equall height, in forme of an umbell, or tuft, or nosegay, but smaller, yet of a brighter reddish purple, then are in the second sort here set forth: the heads which containe blackish feede, are smaller then in the other, and are almost hidde in the small huskes that hold them.

The Place.

All these sorts grow in Spaine and Portugall, and some of them in France and Italy.

The Time.

They all doe flower in May in their naturall places, but about Midfomer with us, and sometimes earlier.

The Names.

It is called in Greeke *κιστος* and *κισθος*, *Cistus* and *Cisthus* which the Latines also doe hold, not having any other name whereby to expresse it: some also call it *κισθαργυ* and *κισθαργυ*, *Citharon* and *Cissaron*, as peradventure derived from *κιστος* *Cistus* *Hedera*, which causeth *Pliny* his error; for in writing of *Hedera* in his 16. Booke and 34. Chap. hee saith it is of two sorts, male and female, &c. which in his 24. Booke and 10. Chap. hee saith the Cistus hath: but it may bee *Pliny* was herein deceived by a false copy of *Theophrastus*, which bee followed which had *κιστος* instead of *κισθος* for *Quina* in translating of *Theophrastus*, doth fall into the same error with *Pliny*, making *Hedera* to bee male and female, with flowers like Roses but assuredly unlesse the copies were falsely written, which bred that error, we cannot judge that *Theophrastus*, who had written to exactly in another place of the severall sorts of Ivie, should be so much forgotten in this, to say Ivie hath flowers like Roses, &c. Some call it *Rosa Sylvatica*: the Arabians call it *Rumil* *Alibet*, or *Thaibet*: the Italians *Cisto maschio*: the Spaniards *Corynacos* and *Estopa*: the Portugalls *Rosella*: the French and Dutch *Ciste*, and we in English male Cistus likewise or the Sage Rose, because the leaves of the one sort are rugged and hoary like Sage leaves, and the flowers like single Roses, but why *Gerard* should call it the Holly Rose I see no reason, having no resemblance unto Holly, but because that name hath beene long imposed upon it. I will let it so passe. All these sorts of Male Cistus, with the other set forth in my other booke, are remembered by *Clusius* in his History of Plants, and neede not further amplification.

The Vertues.

The Male Cistus is drying and astringent, and nor without some little heate, yet some thinke it to bee cold, and is very profitable to stay bleedings at the mouth or nose, vomitings, and weakenesse of the stomacke, and fluxes of blood or humours in man or woman, as the Laske, the Bloody flux, and all other extraordinary scowings or loosenesse of the belly, and womens inordinate courses: the flowers saith *Dioscorides* and *Galen* are the most effectfull for those purposes, to be drunke in red wine, yet the leaves and young shoots or buddes may bee used with good successe: and these applied in a ferote to any scalding or burning of fire or water doth heale them quickly: they also bruised and layd to any greene wound, closeth the lippes thereof and restraineth the bleeding: the leaves also and the young shootes boyled in wine, and filthy or old Vlcers washed with the decoction thereof, yea although they be cankrous, eating or spreading Vlcers, will wonderfully and quickly stay the fretting moyst humors, and dry and heale them: the distilled water of the leaves and flowers is of the like efficacie, and in all things where there needeth drying, binding and strengthening, this is to vry good purpose applied.

cistus mas brevior folio.
Small leaved male Cistus.

CHAP. LXXXVI.

Cistus femina. The female Cistus.

The female Cistus as I sayd before is distinguished from the male, in that it beareth not red flower like it, but white or yellow, whereof there are many sorts as the succeeding descriptions doe declare not intending to set downe in this place that sort that is expressed in my former booke, and the first of *Cistus* in his History of Plants, although I shew you the figure thereof.

1. *Cistus femina folio Halimi major*. The greater Sea Purflane leaved Cistus. This kinde of Cistus groweth up with slender hoary brittle branches, two or three foote high usually at the most plentifully flored with thicke hoary leaves, very like unto Sea Purflane; somewhat round pointed, two alwayes set at a joyn, one opposite to another as is usuall in most of the sorts of Cistus; the tops of the branches are furnished with many yellowish flowers lesser then those of the first female Cistus, with some yellow threds in the middle of them, after which come somewhat long and three square heads containing within them small brownish feede.

2. *Cistus femina folio Halimi minor*. The lesser Sea Purflane leaved female Cistus. This other Cistus riseth up more high and upright then the former, but no lesse hoary, and set with somewhat narrower and longer leaves then the former, and more pointed at the ends, the middle ribbe at the backe of the hoary leaves, being greater then in the other, yet both of an austere, sharpe, and binding taste, the flowers have not beene observed by *Clusius* who first set it forth and from whom all others have expressed it.

3. *Cistus femina folio Sampsuchi*. Marjerome leaved Cistus. The slender weake branched stalkes of this Cistus are thicke set with many small hoary leavēs, very like unto Marjerome, but somewhat lesser, and with a thicker ribbe on the backe of every leafe, two together as is usuall in the rest: the flowers are small and white, composed of five round pointed leaves, with a darke purplish spot at the bottome of every leafe, with divers yellow threds in the middle; the feede hereof is grayish, that followeth in small three square heads.

4. *Cistus femina Lavendula folio*. Lavender leaved Cistus. The chiefest difference in this Cistus from the last is in the leaves, being small and long like unto Lavender, yea so like that as *Clusius* saith, he verily thought them plants to be Lavender that he first saw, and so neglected them untill seeing the flowers upon them which were wholly white, without any spot in them, he plainly then saw, that it was a kind of Cistus.

5. *Cistus femina folio Thymi*. Thyme leaved Cistus. The stalkes of this Cistus are brownish and woody, rising a foote high for the most part without any leavēs.

Cistus femina vulgaris.
The ordinary female Cistus.

1. *Cistus femina Halimi folio major*.
The greater Sea Purflane leaved female Cistus.

2. *Cistus Halimifolius minor.*
The lesser Sea Purflane leaved fernale Cistus.

Cistus annuus flore gattato.
Spotted annual Cistus.

6. *Cisto similis frutex exotica.*
The Cistus like strange shrubbe.

7. *Cistus annuus folio Salicis.*
Willow leaved annual Cistus.

upon them but toward the toppes: there stand many small Greene leaves at a joynt, very like unto those of Time the flowers are smaller then in the other, and wholly white like unto the rest.

6. *Cisto similis frutex exoticus.* The Cistus like strange shrubbe, I must needs joyne this shrubbe unto the rest, seeing *Lobel* who first set it out did so account it, and all other that have mentioned it since him doe referre it thereto, although it have small likenesse but in the leaves unto any of them (for as I have sayd before, and the rule is most certaine, the flowers and seede of any plant doe best demonstrate under what *genus* any *species* is to be referred, which in this is farthest remote, having round woolly heads) and I thinke none of us ever saw the plant, but as *Lobel* saith it hath woody branches like unto a Cistus, with rugged long leaves thereon, like unto those of Sage or Mints, and round woolly heads at the toppes like unto Plane tree heads.

7. *Cistus annuus folio salicis.* Willow leaved annuall Cistus.

The Willow leaved Cistus of a yeare (for I have given another of this sort in my former booke whose figure I here give you) hath divers small hairy leaves lying upon the ground, somewhat like in forme to Olive or Willow leaves, but much smaller, among which rise up hairy stalkes about a foote and a halfe high, set with two leaves at a joynt, much smaller then those below, at the toppes whereof grow many small pale yellow flowers, and sometime more white one above another without any spots on the leaves, as in that other is set forth already, which do scarce abide a day but suddenly fall, the seede vessels that are skinny and three square, containing small seede appeare quickly after.

8. *Cistus annuus folio Ledi.* Ledum leaved annuall Cistus.

This other Cistus riseth higher with greater stemmes but not lesse hairy then the other, having two or three leaves set at the severall joynts, longer and narrower then the last, and smaller pointed, somewhat rough, and of a deeper Greene colour: the flowers fade as quickly, and grow singly towards the toppes, with the leaves as large as the last, and of a faire pale yellow colour: with heads and seede succeeding in the like manner and yearly perishing also, yet it hath sometimes abidden a Winter in my Garden when it hath not flowered with me in the Summer before.

The Place.

Some of these grow in *Spaine*, and some upon the cold *Alpes* and *Mountaines* in *Germany*.

The Time.

They flower some in *Aprill* and *May*, or sooner in their naturall places, but not untill *June* with us, or in *Iuly*.

The Names.

Their names are sufficiently expressed in their titles, as they are used to be called of those that have written of them; onely I would give you to know thus much, that the *Spaniards* as *Cistus* and *Lugdunensis* from *Miconus* doe say, doe call the annuall Cistus, as well that which hath spots, as that which hath none on the flowers, by the name of *Turmera*, from *Turmas* which signifieth *Tubera*, those *Spanish* or outlandish puffs that are edible or fit to be eaten; because where that shrub groweth they usually finde those puffs doe breede, and therefore *Lugdunensis* calleth it *Tuberaria*, and both *Cistus* and he doe thinke it may be the *Hydnophyllon* of *Pamphilus* in *Asbe-neus*, because it shewed where those puffs doe grow.

The Vertues.

The female Cistus are no lesse drying and astringent then the male, and are used with as good successe, for all the purposes before recited, whereunto the male kinds are applied, and therefore it shall not neede to repeat the same things againe.

CHAP. LXXXVII.

Cistus Ledon. The sweete Gum Cistus.

Here are more varieties of this sweete or Gum Cistus then of both the other sorts before, chiefly differing in growth & leaves, yet all of them smelling somewhat sweet of that viscous or clammy dewines that is upon them. Vnto them also are to be referred some other plants for the likenesse and nearnesse, some whereof I have expressed in my former booke, and therefore neede not here againe describe them.

1. *Cistus Ledon latifolium.* Broad leaved sweete Cistus.

The broad leaved sweete Cistus riseth up with divers woody branches five or six foote high, spreading many other smaller branches, whereon are set two leaves at a joynt one against another, somewhat broader then that in

in my former booke, comming neare to the forme of Bay leaves, of a darke shining Greene colour on the upper side, and grayish underneath, which are clammy in feeling as the young shoots and stalkes are also, and of a strong sweet sent to be felt a great way off, especially in the hot Summer time, & in the naturall places, much more then in these contries: at the toppes of every branch come forth single white flowers, made of five broad round pointed leaves, sometimes without any spots in them, as is also to be seene in that other with narrow leaves formerly described, and sometimes having a darke purple spot at the bottome of every leafe pointed upwards, which in some are greater in others lesser, with divers yellow threds in the middle: after the flowers are past there come in their places somewhat round great hard heads, conteining within them small brownish seede; the root is woody, and spreadeth many branches but not very deep. *Lobel* maketh mention of a sort hereof which hee calleth *Larifolium* or *Myrsifolium*, which hath sundry leaves comming forth together in other things little differing from the former.

*Myrsifolia-
um seu La-
rifolium
Lobelij.*

2. *Cistus Ledon Populnea fronde major.* The greater sweete Cistus with Poplar like leaves. This greater sweete Cistus riseth not so high as the formér, but about three foote, the brittle branches have leaves set on them, in the same manner that they are in the former, that is two at a joynr one against another, but are larger then in any sort of Cistus, being like unto the leaves of Ivie, or the blacke Poplar tree, broadest at the stalke, and pointed long at the end, Greene on the upper side and grayish underneath, somewhat thicke and rough in handling, not having while they are young any clamminesse or sweerenesse on them at all, but onely when they are growne old: the flowers are wholly white, and smaller then in cyther of the former, yeelding five square pointed heads, with small blackish seede in them.

3. *Cistus Ledon Populnea fronde minor.* The smaller sweet Cistus with Poplar leaves. This other Cistus is in all things like the last, but that it groweth much lower, and the leaves although of the same forme, yet much smaller.

4. *Cistus Ladanifera Cypria.* The sweete Gum bearing Cistus of Cyprus. This Candy kinde of sweete Gum Cistus groweth with his blackish spreading branches not much above two foote high, whose blackish Greene leaves are not so large as the first here set forth, nor so narrow as that kind which is expressed in my former booke but betweene them both, plentifully stored (no doubt) in the naturall countrey with that sweete clammy dew or gum that is in the others of this kind, although nothing so much in these colder Transalpine countries: the flowers are white like unto the second sort here expressed, and so are both heads and seede.

5. *Cistus Ledon hirsutum sive quantum Cissi.* The sweete Gum Cistus with hairy leaves. The leaves of this Cistus are softer then in others, and somewhat hairy, being long and narrow, but round pointed, set on the slender weake branches that are scarce two foote high, but as full of that clammy gumminesse, as in any other, as well when they are young as old: the flowers are small and white like unto those of the female Cistus: the seede that followeth them in great skinny heads is black but larger then in any of the rest.

Cistus Ledon angustifolius.
Narrow leaved Gum Cistus.

Cistus Ledon Myrsifolium Lobelij.
Lobel his broad leaved sweete Gum Cistus.

2. *Cistus Ledon Populea fronde major.*
The greater sweete Cistus with Poplar like leaves.

3. *Cistus Ledon Populea fronde minor.*
The smaller sweete Cistus with Poplar leaves.

5. *Cistus Ledum hispidum five quarum Clusi.*
The sweete Gum Cistus with hoary leaves.

6. *Cistus Ledon Olea folijs.* The sweete Cistus with Olive like leaves.

This Cistus hath stronger woody blackish branches then the rest, whose flat and clammy leaves are long and narrower then those of the Olive tree; the flowers here of are white, but the smallest of any of this kind, the feede is small and browne.

7. *Cistus Ledon angustis folijs.* Narrow leaved sweete Cistus.

This sweete Cistus is very like the first, but that the leaves are narrower then they and the white flowers larger; the branches and leaves have such sweete Gum on them, as is on the others of this kinde.

8. *Cistus Ledon septimum Clusi, five Rosmarinis hispids folijs.*
Sweete Cistus with hoary rough leaves.

The many branches of this sweete Cistus are of an ash colour, plentifully stord with long and narrow leaves like Rosemary, all hoary, and rough withall, yet clammy with that sweet Gum upon them as is in the former: the flowers are many small and white like the rest.

9. *Cistus Ledon ollavum, five Rosmarinis folijs subtus incanis.*
Hoary Rosemary leaved sweete Cistus.

The branches of this Cistus are not much greater but more spread abroad then the last: the leaves are thinner but long and narrow, Greene above and whitish underneath, like as the ordinary Rosemary hath, as clammy with that sweete Gum as others; the flowers are many, small and yellow that stand all along on the stalkes, and the toppes of the branches: the seed is of a blackish gray colour.

10. *Cistus Ledon Rosmarinis folijs subtus non incanis.*

Rosemary leaved sweete Cistus not hoary.

As the small narrow leaves of the last were Greene above and gray under, so this Cistus hath them wholly Greene, and not gray on the under side, but are somewhat larger then it, and more thinnely or

sparsedly.

7. *Cistus Ledum angustifolij.*
Narrow leaved sweete Cistus.

10. *Cistus Ledon Rosmarinis folijs subtus non incanlis.*
Great Rosemary leaved sweete Cistus.

12. *Myrtocistus Pennai.*
Dr. Penny his Mirtle like Cistus.

13. *Cistus Ladanifera Cretica vera & Pseudo cisti Leda duo.*
The true sweet gum Cistus of Candy and a Ballard sort also.

sparsedly set on the dry saplesse branches, which are lower then it and more Gummy whereon the flowers stood.

11. *Cistus Ledum foliis Thymi*. Time leaved sweete Cistus.

This Cistus beareth small leaves not much unlike Time leaves on the clammy blackish small branches, of about a foote high; the flowers hereof were not seene no more then in the last, but the heads of this were many standing together upon long footstalkes, without any seede in them.

12. *Myrto Cistus Pennesi*. Dr. Penny his Mirtle like Cistus.

The Mirtle like Cistus of Dr. Penny his finding, is a shrubbe of foure or five foote high, whose stalkes and brantes are covered with a rugged barke, set as it were with knobbes or bunches, which quickly fall away from the elder branches; the leaves are very like Mirtle leaves, and are no lesse rugged then the barke, yet grow smooth in time. and are set one against another at every joynt, bedewed with that sweete clammy moisture as in others, the flowers are small and yellow, consisting of five long leaves, with many yellow threds in the middle, after the flowers are past, come somewhat long five square heads with small seede therein.

13. *Cistus Ladaniifera Cretica vera*. The true sweete Gum Cistus of Candy.

Although I sayd in the beginning of the Chapter of male Cistus that the male kind onely boare red flowers, and the female white, including the Ledum under them, which as I sayd alwayes bore white flowers, yet this generall rule admitteth some exception, as in this plant I here doe shew you, which groweth in Candy most abundantly; and from whence also onely the Candians gather *Ladanum* as *Bellonius* being there truly observed, and not from the other sorts of *Ledan*; and *Alpinus* saith the same by the relation of others, who hath thus described it: It groweth to a cubits height or more, with sundry long woody branches, with two and sometimes more leaves set thereon together at severall spaces one against another, being greater then those of the male Cistus, somewhat like unto Sage leaves, and bedewed very much with that sweete clammy humour or Gum, called *Ladanum* especially in the Summer time, the flowers that grow at the toppes of the branches are like the male Cistus, and of a purplish colour, but greater then they, after which come small long and round, hard, blackish heads, containing small seede within them. *Alpinus* joyneth hereto two other sorts of bastard *Cistus Ledum*, the one whereof is not as he conceiveth fit to be called Cistus, having little or no resemblance to any, having slender stalkes and branches with a few small long leaves like unto Privet, set at certaine long distances one from another, with white flowers at their toppes, much lesser then those of Cistus, without any sent, and small seede in blacke pods afterwards. The other bastard sort hath many soft stalkes with soft woolly leaves thereon, in forme like Mirtle leaves or lesser, two or foure standing at a place by distances, the flowers are white and small; the seede vessels be of the bignesse of Ciche pease, and the small seede yellow within.

The Place.

All these sorts of Cistus grow onely in the warmer countries of France, Spaine, Porengall, Italy, Candy and the other Easterne parts, and not in any of these colder countries that ever I could learne: the twelfth Mirtle like Cistus Dr. Penny a famous Physitian of London in his time, found in the Island Majorca, and shewed to *Clusius* the dried plant, which he kept by him and gave him the description of it, which he published with the other in print; the last and the two bastard sorts grow in Candy, from whence we had the knowledge of them.

The Time.

All these sorts of sweete Cistus doe flower earlier by much in their naturall countries then they doe in ours, for they never are in flower in our countries untill July or August, and seldome doe give any ripe seede.

The Names.

It is called in Greeke *λιδιον Ledon*, and *λιδιον Ladon*, quia (for) *sen* folia non levia aut nitida sunt, sed potius squabra & pannosa, the Latins keepe the Greeke name, and call it *Ledum*, because they all have that clammy sweete humour on them more or lesse, and *Ladum*, from whence cometh the name of *Ladanum*, which is that sweete gumme is gathered from the leaves and branches of but one sort as *Martholus* and *Cesalpinus* seeme to avouch, and *Bellonius* averreth in his first booke of observations and seventh Chap. but others say from many of them, and is most used now adays in perfumes to smell unto, and to burne, yet sometimes Physically also: the manner of gathering whereof in these dayes is somewhat like one of those wayes was used in *Discorides* and *Plinies* times, which was that they used to fasten long Ropes, but wee now long Thongs of raw or untanned Leather to a long poale or sticke made like a Rake, without teeth, which by drawing them over the bushes, gather that dew or gum that is upon them, and in the heate of the day, and Sun, they scrape it from those Thongs, and make it up into balls or lumps: the other was to combe of that sweete gum from the beards and haunches of the Goates, that browsed and rubbed themselves on those bushes that grew in the Isle of Cyprus: the Arabians call the tree *Chafus*, and the gumme *Leden* and *Laden*, the Spaniards call the first sort *Xara*, *Xarguna*, and *Xagnarca*, and some *Xaraestepe*, as *Clusius* saith: but the fourth kind of *Clusius* which is the fifth here. he saith they call *Ardivioja*: all other Christian nations I thinke follow the Greeke and Latine name, with such diversitie as their Dialect affordeth; wee as I sayd may call it *Ledum* as others doe, or the sweete Cistus, or sweete Gum Cistus whether you will: it needeth not to make any long repetition of references of every one of these, seeing the most of them are *Clusius* his relations, and may easily bee found by any which is which.

The Vertues.

Because all or most of these sweete Cistus are more hot then the former sorts, yet not lesse drying and binding then any of them, they are used to warme and dry up all cold defluxions of the braine, and *Calen* saith that the gum *Ladanum* is hot in the end of the first degree, almost entring into the second, and hath some astringent also in it: furthermore it is of a thinne substance, whereby it is mollifying and moderately digesting, and thereby very effectually in the hardnesse and other diseases of the mother, to ease the paines thereof, and to heale those Vicers that happen therein; by the taking of the fume thereof underneath, or applying it in the substance: being made up with *Storax* and honey, in a *Loboch* or Eleatuary, it is very profitable for the Cough, if it be old or in the Longs: being taken inwardly it provoketh Urine, and stayeth the lake or flux of the belly, and easeth the gripping paines thereof proceeding from chollerick sharpe humours, & is very good for all fower belchings or riftings: being used in an oyntment with Mirrhe, oyle of Mirtles and Wine, it stayeth the falling of the haire, and baldnesse thereupon: it helpeth also the paines in the eares, being used with some oyle of Roses: being dissolved in wine, and the places washed therewith that have any scarre or deformities thereon, it doth wonderfully alter the colour

Ficus-
cistis alijs
duo.

colour and evill fight thereof, and maketh them to be well coloured againe : eyther the gumme or the leaves and branches boyled in lye, and the head washed therewith doth cleafe it from scabbies, scurfe, or dandriffe growing thereon, and cureth also old running and watering sores and Vicers in the Legges or other parts of the body : the oyle made thereof worketh to the like effects.

CHAP. LXXXVIII.

Hypocistis. The Undergrowth or Excrecence of the Cistus.

Thinke it fittest to entreate of this Excrecence proper onely to the sorts of Cistus by it selfe, and not termix it with the history and descriptions of them, or among the other Rapes or excrecences of other Plants : it is of divers colours according to the kinds of Cistus, under which and from whose rootes it groweth and springeth as the Broome Rape, and other excrecences doe from the abundance of superfluitie of moisture, causing putrefaction ; but this is of a peculiar fashion : It riseth up (as well from the rootes of the male Cistus as female ; as also from many sorts of the *Ledum* or sweete Cistus) with divers upright stalkes, covered with small leaves thicke set thereon (eyther neare or under the stemme of the Cistus, or some what further off, in divers places as the rootes doe spread) scarce a foote high, having many flowers growing at the toppes full of juice, the whole plant rising from the male Cistus at the first springing up, being of an orient bright crimson colour, but much paler afterwards, and the flowers whitish at the last, which stand many together at the toppes of the stalkes, are every one fashioned somewhat like unto the buds and flowers of the Pomgranat tree, or rather like unto the wooden nosell of a Candlesticke, which passe away, leaving seede as small as dust in the hard heads or leade vessels, which are unprofitable to produce the like plant, as the berries of the Mistletoe are, being as it is but an excrecence, growing as I sayd from superfluitie of moisture and putrefaction. That which riseth from the rootes of the female Cistus, especially that with Sea Purslane leaves, is of a yellow colour. And that which springeth from the *Ledum* or sweete gum Cistus, is of divers colours, being intermixt with purplish and Greene stalkes or veines, in the pale coloured stalkes of leaves and flowers, as Clusius hath observed and set it downe, but such as *Dioscorides* relateth to bee some white or Greene, especially Greene hee observed not in any.

The Place.

It alwayes groweth from the rootes of the Cistus in the natural places, and not in any Gardens whereunto they are transplanted.

The Time.

It abideth fresh many Winters after it is risen, but is in its chiefest beauty at the Spring, and in his full strength in the beginning of Summer, when is the fittest time to gather the juice.

The Names.

It is usually called in Greeke *ὑποκίστις* *Hypocistis*, but *Dioscorides* saith that some called it in his time *Rhabethrum* and *Cytinus Clusius* calleth that kind which groweth on the *Ledum alvobasor*, five *Cynomorij* genus, and *Dodonaeus Limodori* quoddam genus : the Latines keepe the Greeke name, and call both the plant and the juice drawne from it *Hypocistis* : but as *Matthiolus* saith the *Arabians* were the cause of the error of the Apothecaries and others in former times ; who calling Cistus by the name of Goatesbeard, induced them to beleeeve that *Hypocistis* was made of the juice of the rootes of *Tragopogon* called *Barba Hirci*, or Goatesbeard, so that such counterfeit *Hypocistis* was usually sold for true, untill they came to understand the true *Hypocistis*, and to gather the juice from it, which is performed two manner of wayes. The best way is to expresse the juice from the fresh herbe when it is in full strength : the other is to steepe the dried stalks and boyle them, which after they are pressed is to be condensare (eyther juice or decoction) by evaporation in the Sunne, or by the fire, in the same sort that *Lycium* was wont to be made, as *Dioscorides* saith. *Fuchsius* tooke the *Hypocistis* to be a Fungus or Mushrome, but *Matthiolus* taxeth him for it, and sheweth how it springeth.

The Vertues.

The hardned juice called *Hypocistis* is much more binding then any other part of any Cistus : it is a most certaine, sure, and safe medecine to stay all fluxes of blood or humours, that is to say the spitting of blood, womens extraordinary courses, the laske and bloody flux : it is mixed with those things that are applied to the stomacke to stay vomitings, and to strengthen it when it is grown weake, as also with those things that strengthen the Liver, to be used eyther inwardly or outwardly : it is also available for clammy moist humours that fall upon the joynts or sinewes, thereby causing a weakenesse of nerves, and a solution of them ; to use this therefore in pillles inwardly doth wonderfully helpe to dry, and binde, and corroborate the parts ; it is put into great Antidotes against poyson, and the pestilence, not for any speciall properitie it hath to resist the venome, but to con-

temperate

Hypocistis. The undergrowth or Excrecence of the Cistus.

temperate and strengthen the body: it is held to be a very good substitute for *Acacia*, which all Christian countries doe much want through their owne negligence, for if they would not so much affect substitutes they might have the true but it is binding and drying more then it.

CHAP. LXXXIX.

Jacoea. Ragwort.

We have two sorts of Ragwort growing wilde with us in many places, but *Clusius* hath found out some other plants which he referreth thereunto, and there are also some of this sort growing by the Sea side, which I thinke fit to adjoyne to the rest.

1. *Jacoea vulgaris major*. The greater common Ragwort.

The greater common Ragwort hath many large and long darke Greene leaves lying on the ground, very much rent and torne on the sides into many peeces, from among which riseth up sometimes but one, and sometimes two or three square or crested, blackish or brownish stalkes three or foure foote high, sometimes branched, bearing divers such like leaves upon them at severall distances unto the toppes, where it brancheth forth into many stalkes, bearing yellow flowers, consisting of divers leaves set as a pale or border, with a darke yellow thrum in the middle, which doe abide a great while, but in the end growing full ripe are turned into downe, and with the small blackish gray feede carried away with the winde: the roote is made of many fibres, some greater and others lesser whereby it is firmly fastned into the ground, and abideth many yeares.

2. *Jacoea vulgaris minor*. The lesser common Ragwort.

This Ragwort is very like the precedent, so that many that are not skilfull or curious in the observation of plants do overpasse it, as judging it but the same with the former: the chieft differences are these: it usually riseth not so high, the leaves are not so finely jagged, nor of so sad a Greene colour, but rather somewhat whitish, soft and woolly, and the flowers are usually paler, yet in many alike.

3. *Jacoea latifolia Pannonica prima*. The first Hungarian broad leaved Ragwort.

The first leaves of this Ragwort that lye next the roote upon the ground are round almost, and larger then those that grow upon the stalkes, which have many small peeces or jagges at the bottomes of them, whose ends are longer and not so round, and still more jagged as they grow up higher, and the highest most jagged, very like unto the highest leaves of the Ragwort, yet all of them notched or dented about the edges, at the top of the stalk which is about two foote high, breake forth many branches of flowers greater then in the former, but yellow in the same manner, and give such feede that is carried away with the downe: the roote is great and white, with many fibres, abiding as well as the first.

1. *Jacoea vulgaris*.
Common Ragwort.3. 3. *Jacoea angustifolia & latifolia Pannonica*.
Hungarian Ragwort of two sorts. 4. *Jacoea*.

6. *Jacobaea rotundifolia incana*.
Round leaved hoary Ragwort.

7. *Jacobaea marina* sive *Cineraria vulgaris*.
The common Sea Ragwort.

8. *Jacobaea marina altior* seu *minor*.
The lesser Sea Ragwort.

9. *Jacobaea maritima* sive *Cineraria latifolia*.
Broadleaved Sea Ragwort.

4. *Iacobaea latifolia Pannonica altera*. The other broad leaved Hungarian Ragwort. This Ragwort is somewhat like the other as *Clusius* saith, but greater, having larger leaves and more pointed whitish or hoary underneath and with fewer peeces of leaves or eares at the bottome of them, and more indented about the edges: the flowers are large and yellow like the other.

5. *Iacobaea angustifolia Pannonica non laciniata*. Smooth leaved Ragwort. This unjagged Ragwort hath somewhat broad and long leaves, lying next the roote, not jagged or divided all, but slightly dented on the edges, of a pale Greene colour, soft and a little woolly withall: but those that grow on the crested cubit high stalks are narrower and longer compassing it at the foote of them: the highest leaves are the smallest and narrowest, where the flowers standing above them are set as it were in a tuft or umbell, foure or five together, which while they are buds, and not blowne open, are of a darke reddish colour, but being blowne open the pale or border of leaves are of a yellowish red or orreng colour on the upper side, and reddish underneath, parted or dented at the ends, the middle thum being of a faire gold yellow colour, which turne into downe and together with the feede is carried away with the winde: the roote is like the other and continueth alio.

6. *Iacobaea rotundifolia incana*. Round leaved hoary Ragwort. The roote of this Ragwort is brownish, and composed of long strings as the other sorts are, from whence rise divers thicke and somewhat round leaves, Greene on the upper side, but very hairy, and hoary white underneath of two inches long a peece, and an inch and halfe broad, with a short footstalk underneath and dented about the edges: the stalk which is about a foote high, hath but few leaves thereon, and those very narrow and long; at the toppes whereof stand large yellow flowers, like unto the *Scorfonera* or Vipers grasse: the feede hath not bene observed.

7. *Iacobaea marina sive Cineraria vulgaris*. The common Sea Ragwort. The Ragwort that groweth in our land neare the Sea side, hath hard crested stalks about two foote high, all hoary or white, whereon grow hoary white leaves, much jagged or cut into divers parts, yet each part, of them broader then any of our wild Ragworts, and somewhat stiffe, but yet soft in handling: the toppes of the stalks are furnished with divers flowers, whose cups or huskes are hoary as the rest of the plant is, but the flower it selfe is of a pale yellow colour, with a brownish thum in the middle, which turne into downe, and with the feede is carried away with the wind: the roote is long and more woody then the other, with divers small fibres thereat.

8. *Iacobaea marina altera seu minor*. The lesser Sea Ragwort. The other sea Ragwort groweth lesser and lower then the former, yet the leaves are longer and much divided, or cut into many jagged leaves, each jagge being rounder pointed then the other, of a grayish or ashe colour Greene above, and very white underneath, the flowers are many that grow at the toppes of the hard woody hoary white stalks, which are three or foure foote high sometimes, and branched, but smaller and of a dun or darker yellow then the other, and the middle thum browner also, which abide in flower two whole months at the least, before they fall away, turning at the last into downe as the other: the roote is somewhat great and woody like the other.

9. *Iacobaea maritima sive Cineraria latifolia*. Broad leaved Sea Ragwort. This Sea Ragwort sendeth from the roote divers round stalks about a foote and a halfe high, very hoary and woolly, divided into divers branches; the lower leaves whereof are somewhat round and jagged as a Colewort, each part being as it were waved about the edges, and each leafe being about foure inches broad, and a foot long together with the footstalk, of a darke Greene colour on the upper side, and hoary white underneath & soft in handling, the flowers grow at the tops of the branches upon longer and slenderer footstalks, whose cups or huskes are hoary, and the flowers themselves greater and paler then in the former sorts, the middle thum being of a gold yellow colour, which after they are ripe are turned into downe, and with the feede blowne away with the winde.

The Place.

The two first sorts grow wilde in pasture and untilld grounds in many places, and both together in one field oftentimes; the three next grow in Hungary and Austria, the sixt grew in some parts of France, but it is not expressed where, the seventh groweth on our owne coasts, not farre from the Sea, in the Isles of Sheppie and Tenet, and along the Kentish shore in many places: the eighth groweth on the Mediterranean Sea shore of Italy, and other places, but *Dodonaeus* saith by the Sea side in Zeland, the last is not mentioned by *Bauhinus* where it groweth.

The Time.

These flower in June and Iuly and the feede is ripe in August.

The Names.

Being an herbe of later knowledge, it is not mentioned by any ancient Greeke or Latine Author, unlesse you would as some doe, referre it to the *Helioscopus*, *Erigeron* of *Dioscorides*, which the Latines call *Senecio*, and therefore *Lobel* calleth it *Iacobaea Senecio*. *Tragus*, *Matthiolus* and others call it *Flos Sancti Iacobi*, and *Herba Sancti Iacobi*. *Dodonaeus* *Iacobaea*, *Camerarius* and others *Senecio major*, *Gesner* in *hortis* calleth the fourth Hungarian *Iacobaea* of *Clusius* *Conyza Alpina* genus, and *Conyza montana* in another place. Some have taken the sea kind to be *Arthemisia marina*, or a species of it, because the division of the leaves is somewhat like the *Arthemisia vulgaris*, others call it *Cineraria* and *Argemone* from the whitenesse of the leaves which shew like silver, or as though they were covered with ashes, and is usually with us called *Iacobaea marina*, and *maritima*: the first is common as well in other countries as in this: the second is not remembred by any author that I know, unlesse it bee the first *Iacobaea Pannonica* of *Clusius*: the third is *Clusius* his *Iacobaea Pannonica tertia*, sive *latifolia prima*, as the fourth is his *Iacobaea Pannonica quarta*, and *latifolia secunda*: the fift is his *Iacobaea Pannonica secunda*: the sixt is *Bauhinus* his *Iacobaea latifolia incana*: the seventh is the *Cineraria* of *Dodonaeus*, and *Iacobaea marina* of *Lobel*, *Pena*, *Lugdunensis* and others, and the *Achaeanabias* or *Arthemisia marina*, of *Alpinus* lib. de plantis *Aegypti*, and *ErUCA cinerea* of *Lugdunensis* as *Bauhinus* thinketh, but surely then the figure is farre awry: The eighth is the *Cineraria* of *Lobel*, and is called by most Herbarists *Cineraria altera*, and *Iacobaea altera marina* of *Dodonaeus* and *Lugdunensis*: the last is called by *Bauhinus* *Iacobaea maritima* sive *Cineraria latifolia*. It is called by the Italians *Senecio maggiore*, *Cardus*.

Carduncello, and *Spelliciosa maggiore*: by the Spaniards *Bomaron mayor*: by the French *L'herbe S. Iagues*: by the Germans *St. Jacobs blume*, and *St. Jacobs crant*: by the Dutch *S. Jacobs cruyt*, and *Ascherenried*, and we in English *S. Iamefwort* and *Ragwort*.

The Vertues.

Ragwort is hot and dry in the second degree as some thinke, with some bitterneſſe joyned therewith, and therefore clenſeth, digeſteth, and diſcuſſeth: the decoction of the herbe is much commended to waſh the mouth or throat that have Vicers and ſores therein, and for ſwellings, hardneſſe or impoſtumations, for it thoroughly clenſeth and healeth them, as alſo the ſquinte and the Kings Evil: it doth helpe to ſtay catarrhes, thinne rheumes and deſluxions from the head into the eyes, noſe or lungs: the juice is found by continuall experience to bee ſingular good, both to heale greene wounds, and to clenſe and heale all old and filthy Vicers, as well in the privities and in other parts of the body, and inward wounds and Vicers alſo, and ſtayeth the malignitie of fretting or running Cankers and hollow Fiſtulaes, not ſuffering them to ſpread further: it is much commended alſo to helpe aches and paines either in the fleſhy parts, or in the nerves and ſinewes, as alſo the Sciatica or paine of the hippe or hucklebone, to bathe the places with the decoction of the herbe, or to annoint them with an ointment made of the herbe bruised and boyled in *Axungia* or old Hogs Suet, with ſome Maſtiche and *Olibanum* in powder added unto it after it is ſtrayned forth and not before as *Gerard* ſaith, for ſo it were to no purpoſe to put them in: it is held alſo to be a certaine remedie to helpe the Staggers in Horſes.

CHAP. LXXXX.

Senecio. Groundſell.

D*ioſcorides*, *Galen* and *Pliny* and the other ancients have made mention, but of one ſort of *Senecio* or Groundſell, but this later age hath found out divers other ſorts as ſhall be preſently declared; but in that I ſet it here which might elſe have bene placed among the *Intabacea* or *Cichoreacea*, whereof it is a ſpecies, it was to joyne it with the *Jacoba* going before, whereunto it is likeſt in name face and property.

1. *Senecio vulgaris*. Common Groundſell.

Our common Groundſell hath a round greene and ſomewhat browniſh ſtalke, ſpread toward the toppe into ſome branches, ſet with long and ſomewhat narrow greene leaves cut in on the edges ſomewhat like unto Rocket, or rather an Oaken leafe, but leſſer and round at the ends, at the toppes of the ſtalke and branches ſtand many ſmall greene knappes or heads, out of which grow ſmall yellow threds or thrums which are the flowers, which continue many dayes blowne in that manner before it paſſe away into downe, and with the ſeede is carryed away in the winde: the roote is ſmall and threddy and ſoone periſheth, but from the ſeede that is ſhed it ſoone riſeth up againe, ſo that it may bee ſeene many moneths in the yeare, both greene and in flower and ſeede, for it will ſpring and ſeede twice in a yeare at the leaſt if it be ſuffered in a Garden.

1. *Senecio vulgaris*. Common Groundſell.

ſaith

2. *Senecio montanus*. Mountaine Groundſell.

Of this kind there is another ſort that groweth not altogether ſo high, whoſe leaves are greater and more cut in on the edges, in all things elſe like the ordinary ſort.

3. *Senecio folio non laciniato Myconi*.

Myconius Spaniſh Groundſell.

The leaves that grow upon the hard ſtalke of this Groundſell are whole and not divided or cut in on the edges as the reſt are, but onely dented like unto German ſage leaves, and grow ſingly one above another thereon: the flowers are larger but yellow, and as ſoone fading and turning into downe as the other, the roote is ſaid to be more hard and woody.

4. *Senecio incanus ſive Erigeron tomentosum*.

Cottony Groundſell.

This Cottony Groundſell hath much larger leaves, and more divided or torne on the edges then the other mountaine ſort, of a grayiſh or aſhcolout ſoft and hairy or rather hoary all over: the ſtalke are higher and greater, but with ſuch like yellow flowers upon them and as ſoone fading and turning into downe almoſt as the other; the roote is ſmall and full of fibres.

5. *Senecio fetidus*. Stinking Groundſell.

This ſtinking Groundſell hath many faire large and long leaves lying next the ground very much cut in on the edges into many diviſions, ſomewhat like unto thoſe of Mugwort, whereupon ſome have called it *Arthemifia fetida*, but ſoft, and in handling very hairy, bedewed with a fatie clammineſſe, ſo that the leaves will ſticke to the fingers of them that touch them, and one leafe alſo unto another, hardly to be pulled aſunder, ſmelling ſomewhat ſtrong and of an ill ſcent, (not unpleaſantly

3. *Senecio folio non laciniato Myconi.*
Myconus Spanifh Groundfell.

5. *Senecio fetidus.*
 Stinking Groundfell.

saith *Clusius*, but as others say like *Scrophularia* or *Ebulus*, from among which rise up hairy crested stalkes; about a foote and a halfe high, divided into sundry branches, bearing at the toppes fewer flowers, lesser and of a paler yellow colour then the common fort, and upon longer footestalkes, which quickly fade and turne into downe like the other: the roote is very fibrous yet lasteth not after seede time, but perisheth as the first doe, and springeth againe of the shed or fallen feede.

6. *Senecio odoratus.* Sweet smelling Groundsell.

This Groundsell is somewhat like the last sort in the soft and woolly leaves, but not so much torne on the edges as it, whose smell is somewhat sweete like unto *Ambrosia*, or Oake of *Cappadocia*, or the middle *Coniza* or *Fleabane*, the flowers are like the rest, and as soone growing old and hoary as downe.

The Place.

The first is found every where almost, as well on the toppes of walls as at the foote among rubbish, and in untilld grounds but especially in Gardens; the second is found upon hills and mountaines: the third was found by *Myconus* in *Spaine* and sent to *Lyons*: the fourth groweth by wood sides, the borders of fields, and upon old walls in many places: the fifth groweth in lopped woods of *Hungaria* and *Austria*, as *Clusius* saith, and in barren and untilld places: the last was sent to *Camerarium* out of *Italy*.

The Time.

The time of the first to be in flower is already set downe in the description, which is almost every Moneth: the second and fourth doe both come somewhat neare unto the other, but are not so quicke in their decaying: the fifth and sixth doe flower onely in Summer.

The Names.

It is called in Greeke *ἑλυσσόν* *Erigerum quia vere senescit*: the Latins call it *Senecio*, *quia cito senescit*. *Tragus* rooke it to be the *Aphaca* of *Theophrastus*, in his seventh booke and seventh and eighth Chapters, especially the cotrony kind, which is more bitter and called *Petrela* by *Manardus Ferrariensis*, as he saith, numbring it among the *Intubacea* or *Cichoreacea*, the Succory like herbes, which it doth in some fort well resemble for the manner of flowering and perishing: but I finde in the seventh and eighth Chapters of his said seventh booke, *Senecio* named as well as *Aphaca*, which plainly convinceth *Tragus*, that *Senecio* cannot be *Aphaca*, for there they are set downe for two herbes: and besides *Dalechampsium* in *Lugdunensis* hath given us an *Aphaca* among the other *Cichoreacea*, even the *Hedipnos* sive *Cichorium flore luteo Dodonaei*: *Simon Ianvensis* tooke it to be *Carduus benedictus*, and *Brunfelsius* to be *Verbena*, but *Tragus* refuted the one and *Matthiolus* the other: the *Italians* call it *Carduncello Senecione*, and *Spelliciosa minore*: some also for the often flowering of it *Fior di ogni mese*: the *Spaniards* call it *jerva can*, *Cardo montano*, and *Bonviaron*: the *French Senesçon*: the *Germans Creutzwuritz*: the *Dutch Cruiszonij*, and wee in *English* Groundsell and Grunsell: The first is called by all Authors *Senecio*, and *Senecio* (and minor with some, because as I said they call the *Incobea Senecio major*) & *Erigeron*; some also after the Italian name *Carduncellus*, which I verily beleave, should be that herbe was appointed to be put into the composition of the *Unguentum Marcialium*.

ram, and not *Cardus Benedictus*, as it is appointed in the *Pharmacopœia Londinensis*: the second is the *Senecio* 2. *vel montanus* of *Tabernaemontanus* and the first *Erigerum* in the old *Gerard* very well expressing it: the third is set downe by *Lugdunensis* under *Miconus* name: the fourth is the second *Senecio* with *Tragus*; *Lobel* his figure of *Erigerum tomentosum*, as also the *Erigerum tertium* of *Dodonæus*, as not the true figures of this plant, as *Dodonæus* himselfe acknowledgeth, but rather as others called it *Cichorium fatidum*, and *Lugdunensis* hath observed it likewise; for this differeth chiefly from the common fort but in the hoariness and largeness as well of the whole plant as of the leaves: the fifth is called by *Lobel* *Erigerum tomentosum alterum*, by *Thalium* *Erigerum fatidum seu majus*, by *Gesner* in *hortis* and by *Lugdunensis* *Senecio fatidus*, by *Clusius* *Iacobea Pannonica prima* as *Bankius* thinketh, & by him *Senecio incanus pinguis*: the last is mentioned onely by *Camerarius* in *horto*, who saith he received it by the name of *Senecio flore odorata* from *Ioseph de Casa bona*, the great Duke of *Tuscane*, or *Florence* his Herbarist.

The Vertues.

Groundsell is cold and moist as *Tragus* saith, and therefore seldom used inwardly. *Galen* saith in 6. *simpl.* it hath a mixt quality both cooling and a little digesting: the decoction of the herbe saith *Dioscorides*, made with wine and drunke helpeth the paines in the stomacke proceeding of choller (which it may well doe by a vomit, which our daily experience sheweth, the juice hereof taken in drinke, or the decoction of the herbe in Ale gently performeth) *Pliny* addeth from others report that it is good against the Jaundies and falling sicknesse, being taken in wine, as also to helpe the paine of the bladder, that is in making water when it is stopped, which it provoketh, as also to expell gravell in the reins or kidneyes, a dram thereof given in *Oxymel*, after some walking or stirring the body: it helpeth the Sciatica also and the griping paines in the belly, or the Collicke: some also eate it with Vinegar as a Sallat, accounting it good for the sadnesse of the heart, and to helpe the defects of the Liver: it is said also to provoke womens courtes, and some say also that it stayeth the whites, which as *Matthiolus* saith cannot be beleaved to be so, in that the one quality is contrary to the other: The fresh herbe boyled and made into a Poultice, and applyed to the breasts of women that are swollen with paine and heate, also to the privy parts of man or woman, the Seate or Fundament, or the Arteries, Ioynts and Sinewes, v. they are inflamed and swollen doth much ease them; and used with some salt helpeth to dissolve the knots or kernells that happen in any part of the body: the juice of the herbe or as *Dioscorides* saith, the leaves and flowers with some fine Frankincense in powder, used in wounds, whether of the body or of the nerves and sinewes doth singularly helpe to heale them. The downe of the heads saith hee used with Vinegar doth the like, but if the same downe be taken in drinke it will choake any: the distilled water of the herbe performeth well all the aforesayd properties, but especially for the inflammations of the eyes, and watering of them: by reason of the defluxion of the rheume into them. *Pliny* reporteth a ridiculous fable to helpe the toothach, to digge up the plant without any Iron tooke, and then to touch the aking tooth five times therewith, and to spit three times after every such touch, and afterwards to set the herbe againe in the same place, so that it may grow will ease the paines: another as fabulous and ridiculous as that, is this, which some have set downe, that glasse being boyled in the juice of Groundsell, and the blood of a Rammie or Goate, will become as soft as wax, fit to bee made into any forme, which being put into cold water will come to be hard againe.

CHAP. XCI.

Tripolum. Sea Starrewort.

lthough *Dioscorides* and *Galen* knew but of one *Tripolum*, yet because *Lobel* hath set forth another that is lesse, and *Camerarius* accounteth another herbe also to be a little sort thereof, I thinke it not amisse to make mention of them also in this place, and some others of later knowledge.

1. *Tripolum majus sive vulgare.* The greater Sea Starrewort.

Our ordinary Sea Starrewort hath many long and somewhat broad leaves, rising from the roote next the ground, smooth, fat and thicke, and of a blewish Greene colour, somewhat like unto the leaves of *Dorad* Woundwort, but much lesse, from among which riseth up a smooth herby or fleshy Greene stalk, two or three foote high, branched towards the toppes into divers smaller branches, with such like leaves on them as grow below but lesse: the flowers that stand at the toppes of them are somewhat larger and greater then of the other Italian Starrewort, here before set forth among the *Asters* and almost of the same colour, having a blewish purple border of leaves standing about a yellow middle thrum, which after it hath done flowring, turneth into downe, and the small seede therewith is blowne away at the will of the winde: the roote hath divers greater strings, and many smaller fibres thereat, which grow deepe and thicke fast in the mudd of the marshie ditches where it groweth.

2. *Tripolum minus.* The lesser Sea Starrewort.

The small Sea Starre is in all things like the greater, but lesse and lower, both in roote, leafe stalk and flower, and in the naturall places observed not to exceede the greatnesse of the small *Conyza* or Fleabane.

3. *Tripolum minus Germanicum.* Small Sea Starrewort of Germany.

This also is very like unto the last, but lesse then it, having a shorter stalk and narrower leaves, the flower also is small and of a more purplish colour.

Lobel maketh mention that *Montanus* had in his Garden one hereof with yellow flowers, but I rather thinke it was another kinde of herbe, and therefore I make no further mention of it here.

4. 5. *Tripolum Lychnidis Coronarie folio & alterum Ferula folio.* Starrewort with Rose Campion like leaves, and another with Fennell like leaves.

The seede of both these sorts of Starreworts I received from Signor Boel from *Lisbone*, but they sprang not with me: but it may be that with Fennell like leaves was the *Ageratum ferulaeum* of *Lugdunensis*.

The Place.

The first groweth as I sayd before in the ditches of the salt Marshes, neare the Sea coasts in many places of this Land, so that you shall hardly misse it in any salt Marsh in some place or other if you looke well for it: the second

cond groweth as *Lobel* saith neare the mouth of the River *Poo*: the third saith *Cordus* groweth in the salt Marshes that are nigh unto the Lake of brackish water, which is by *Staffurt* in *Germany*, and so doe the other two as hee saith also.

The Time.

They flower in *June* and *July* for the most part.

The Names.

It is called in Greeke *τριπόλιον* *Tripolium*, which name the Latines keepe and change not, and as *Dioscorides* relateth was so called, because the flowers did change their colours three times a day, which was but a false information or a negligent consideration. *Serapio* called it *Turbith*, but *Lobel* and *Pena* disprove it, as I sayd before in the Chapter of *Tithymales* or *Spurges*: for the roote of this purgeth not say they, either the juice or decoction: *Pliny* in mistaking *Tripolium* maketh *Polium* to have the same facultie, that *Theophrastus* in his ninth Booke and 21. Chap. giveth to *Tripolium*: and *Gaza* following *Pliny* his errour, translateth it *Polium* also; the first is called *Tripolium* of all that have written thereof, except *Cordus*, who in *Observationum* (he calleth it *Anthyllis major*, as he doth the second *Anthyllis minor*, and the last *Anthyllis brevior*, and *Columna* who calleth the first *Amelli species palustris*, as *Lobel* before him gave him the occasion, who saith it doth more significantly expresse the *Amellus* of *Virgil*, then that *Aster Italorum*, or *montanus purpureus* which we doe account to be it: yet I may say by *Lobels* leave. that the *Aster* before said doth more properly grow prope *flumina* as *Virgil* saith his *Amellus* doth, then in *agris vel scrub. bus* as *Tripolium* doth.

The Vertues.

Dioscorides saith that the roote is sweete in smell, and hot in taste, that two drammes thereof given in wine to drinke purgeth the belly, (which as is before sayd *Pena* and *Lobel* doe deny) from watery humours, and by *Vrine*. *Galen* saith the roote is sharpe in taste and hot in the third degree. *Dioscorides* further addeth that it is put into Antidotes against venome and poyson. It is found by later experience to be singular good to heale all fresh wounds, the leaves onely bruised and bound to the place, or the juice dropped into them; as also for other hurts or inward bruises, and as effectuell also as any other wound herbe almost whatsoever, for any old Ulcers or sores.

CHAP. XCII.

Verbena. Vervaine.

His herbe hath bred much doubt among many of our moderne writers, what it should be that *Dioscorides*, *Galen* and *Pliny* make mention of, some supposing one herbe, some another, as you shall heare by and by; but unto those two sorts that *Dioscorides* speaketh of, and *Pliny* calleth *mas* and *femina*, and others *recla* and *supina*, wee are to adde one or two more knowne in these later times, and set forth by some.

1. *Verbena mas seu recla & vulgaris*. Common or upright Vervaine.

The common Vervaine that is familiar to our Countrey hath divers somewhat long and broad leaves next the ground, deeply gasht at the bottome of them, the other part being deeply dented about the edges, and some onely deeply dented, or cut all alike, of a blackish Greene colour on the upperside, and somewhat gray underneath: the stalke is square and branched into divers parts, rising to bee about two foote high, especially if yee put thereto the long spike of flowers at the toppes, which are set on all sides thereof one above another, and sometimes two or three together, being small and gaping, of a purplish blew colour, and white intermixt; after which come small round feede, in small and somewhat long heads: the roote is small and long and of no use.

2. *Verbena supina sive femina*. Bending or female Vervaine.

This other Vervaine hath divers smaller and weaker square stalkes, leaning or tending downe to the ground, and almost lying thereon, not standing upright like the other, parted into many more and smaller branches, and having such like leaves growing on them at the severall joynts, but much smaller, and more divided or cut in, making them seeme to be many leaves, set on both sides the middle ribbes, of a grayish Greene above and more gray underneath: the flowers grow in the same manner that the other doth, in small long spikes, being of a deeper blew colour then the other, otherwise in forme not unlike: the feede that follow is like it also and so is the roote, both perishing after feede time, and raising it selfe of its owne sowing.

3. *Verbena Peruviana*. Vervaine of *Perna*.

This Vervaine is like unto the last Vervaine, but growing greater, and abiding Greene in Winter as well as Summer, as many of those Accidental plants doe, which will not in these European parts, yea it hath bene observed

erved that those plants that naturally abide not greene
in Winter in these parts, being carried thither have
continued greene all the Winter, contrary to their
course here.

1. *Verbena repens nodiflora*. Round headed Vervaine.
The round headed Vervaine hath from a small fibrous
roote a small square, smooth trayling joynted stalke,
whereat grow small leaves almost round, yet pointed
at the ends, and dented from the middle of them for-
wards, at each joynt also with the leaves come forth
other small branches, and a bare small stalke, bearing
at the toppes a scaly round head, from whence start
forth such like small flowers as are in the other sorts,
and such like seede also following them.

The Place.

The first groweth generally throughout the Land in
divers places, by the hedges and way sides, and other
waste grounds: the second is not found in our Land,
although Gerard saith so, for it will not indure a Win-
ters blast before it seede with us: the third is of the
West Indies, and the last is naturall of Naples.

The Time.

The first flowreth about July, and the seede is ripe
soone after, and so doth the last sometimes; but the
other as I sayd doth seldome flower before the Winter
with us, and therefore cannot bring his seede to per-
fection, for in the naturall places it flowreth not untill
the end of July, and in August.

The Names.

It is called in Greeke *ἱερὰ βοτάνη*, *Hiera botane*, id est,
herba sacra, and *Peristemon* quod Columbe in
salubriter versantur, and *sacra herba* teste Plinio, quod
ea olim apud Romanos domus purgabatur, *familia lustra-*
bantur, *Iovis mensa* ad sacrificium & *epulas verrebatur*,
& *scitosis* in sacris legationibus illa coronabatur, vel ut
Dioscorides inquit, quod in expiationibus suspensa, & illi-

Latour

2. *Verbena supina seu femina*.
Bending or female Vervaine.

gatur mire utilis sit. It was also called *Sagminalis herba*, hoc est gramen vel herba ex arce, cum sua terra *Consilia* evulsum, quod in pacis bellique ritibus habebatur, & *Sagmina* in publicis remedijs fuisse adhibita. It is called in Latine *Verbena* quasi *Herbena*, or *herba bona*, *Maritima*, *Verbenaca*, and *Columbaria*, or *Columbana*, *Europæa*, *Maritima*, and *Herculanica*, as also *Ferraria* from the Germane word *Eisenkraut*, or *Eisenherb*, as I take it. The Italians call it *Berbena* and *Verminacola*, the Spaniards *Urgebaom*, the French *Verveine*, the Dutch *Iscruifje* and *Iserhart*, and wee in English *Vervaine*, and in some countries Pigeons grasse, and Holy herbe, as also in others *Mercuries* moist blood, and *Iuno's* teares. These two first sorts of *Vervaine* have beene much controverted, as I sayd before by the later Herbarists, and writers, some doubting whether they should be any peculiar herbes, in that they thinke that any grasse or herbe that was cast on the Altar, was called *Verbena*, and for it they alledge *Terence* in *Andrea*, where he saith *Ex ara Verbenas hinc sume*, wherein *Terence* speaketh after his country phrase (for *Alexander* hath *Myrtles*, out of whom this was translated) and understandeth such herbes as lay there, and not *Vervaine* onely. Some also as *Eusebius* and *Tragus* make *Erysimum vulgare* five *trio* to be *Vervaine*: *Gesner* as *Tragus* saith called one kind of *Prunella*, *Verbena*; and *Tragus* himselfe maketh his third *Verbena supina* to be the *Cambabina aquatica folio triparsito*. *Dodonæus* formerly made the two sorts of wilde *Germander* to be the *Hiera botanica*, *mas*, and *femina*, and *Cesalpinus* tooke the *Sideritis prima Marthioli*, or *Marrubium aquaticum*, to be *Verbena alterum genus*, who also called it *Verbena femina*, which all others call *mas* and *vesta*, for the *supina* is called *femina* by them all.

The Vertues.

Vervaine is hot and dry, bitter and binding, and is an opener of obstructions, clenseth and healeth: for it helpeth the yellow laundies, the Dropie and the Goute, as also the defects of the Reines and Lungs, and generally all the inward paines and torments of the body: the leaves being boyled and drunke, the same is held to be good against the birings of Serpents and venomous beasts, and the Plague or Pestilence, against both *tertian* and *quartane* Agues, killeth and expelleth the Wormes in the belly, and causeth a good colour in the face and body, strengthneth as well as correcteth the diseases of the Liver and Spleene, is very effectuell in all the diseases of the Stomacke and Lungs, as Coughes, shortnesse of breath and wheezings, and is singular good against the Dropie, to be drunke with some Piony feedes, bruised and put thereto, and is no lesse prevalent for the defects of the Reines and Bladder, to cleanse them of that viscous and slimy humour which ingendreth the stone, and helpeth to breake it being confirmed, and to expell the gravell: it consolidateth and healeth also all wounds, both inward or outward, and stayeth bleedings, and used with some honey, healeth all old Vicers, and Fistulae in the Legs or other parts of the body, as also those Vicers that happen in the mouth, or used with old Hogs grease, it helpeth the swellings and paines of the secret parts of man or woman, as also for the piles or hemorrhoides: applyed with some oyle of Roses and Vinegar unto the forehead and temples, it helpeth to ease the inveterate paines and ache of the head, and is good also for those that are fallen into a frensy: the leaves bruised or the juice of them mixed with some Vinegar, doth wonderfully cleanse the skinne, and taketh away all morpew, freckles, pustulae, or other such like inflammations, and deformities of the skinne in any part of the body: The distilled water of the herbe when it is in his full strength, dropped into the eyes, clenseth them from filmes, clouds or mist that darken the sight, and wonderfully comforteth the opticke veines. The said water is very powerfull in all the diseases aforesayd, eyther inward or outward, whether they bee old corroding sores, or greene wounds. The female *Vervaine* is held to be the more powerfull for all the purposes before spoken of, but that of *Peru* goeth farre beyond them both, for *Monardus* reporteth divers very admirable cures which that herbe hath performed in the *West Indies*: as of a certaine noble woman, who having used the helpe of divers Physitians in vaine, an *Indian* Physitian very skilfull in herbes, gave her the juice of that *Vervaine* to drinke with some Sugar mixed therewith, for to allay somewhat of the bitternesse thereof, by whose use shee avoided in a few dayes a thicke long worme (which shee called a snake) being hairy, of a foot in length, and double forked at the taile, after which shee grew well; the same noble woman commended the same medicine to another noble woman in *Peru*, who had not bene well of a long time, who having taken it in the same manner for certaine dayes, avoided many small and long wormes, and among the rest, one very long, like unto a long white girdle, after which time shee became well againe. Which medicine was by advice given to many others that complained of Wormes, and they were all soone holpen by avoyding wormes, either more or lesse, and some also routes or balls of haire, and other things: it is held also to bee no lesse effectuell against all poyson, and the venom of dangerous beasts and serpents, as also against bewitched drinks or the like. Many other examples of cures *Monardus* setteth downe which are too long here to recite, seeing these are sufficient to shew how prevalent that herbe is for many diseases.

CHAP. XCIII.

Hedera terrestris. Ground Ivie or Alehoofe.

Unto the common Ground Ivie, which is not found to vary with us, yet observed by others, to yeeld some differences, I must adde another sort set forth by *Lobel*, which agreeth very well thereto in the face and outward forme, whatsoever it doe in the inward qualities.

1. *Hedera terrestris vulgaris*. Common Ground Ivie or Alehoofe.

This common and well knowne herbe lyeth spreadeth, and creepeth upon the ground, all about, shooting forth rootes at the joynts of the cornered tender stalkes, set all along with two round leaves at every joynt, somewhat hairy and crumpled as it were, and unevenly dented about the edges, with round dents at the joynts likewise with the leaves toward the ends of the branches come forth hollow long flowers, gaping at the ends, of a blewish purple colour, with small white spots upon the Label or lippes that hang downe, as also in the mouth or jawes: the roote is small with fibres.

2. *Hedera terrestris minor*. The lesser Alehoofe.

The lesser Alehoofe is altogether like the former sort, but that the trayling branches creepe not so farre about, being

being shorter, and growing somewhat more upright: the leaves also are somewhat smaller, and the flowers of a paler blew colour.

3. *Hedera terrestris montana*. Mountaine Alehoofe.

As the last Alehoofe was smaller then the ordinary fort is, so this is larger in all the parts thereof, as branches, leaves and flowers, the leaves also being more rough and hairy, and the flowers of a deeper purple colour.

4. *Hedera terrestris saxatilis* Lobelij.

Stone Alehoofe.

The Stone Alehoofe creepeth also and spreadeth with his slender weake branches, all about upon the ground, with such like round leaves, set at the joynts by couples, as in the former, but larger, and more unevenly dented or rather waved at the edges: the flowers that stand at the joynts with the leaves, are larger and longer, and of a paler purplish colour then the former.

The Place.

The common kind is found under the hedges, and sides of fields and ditches, under house sides, and in shadowed lanes, and other waste grounds in every part of the Land almost: the second is found at the feete of old trees in some countries of Germany: the third is found to grow on hills and mountaines: the last in Narbone, and Province in France, and in some places of Summersetshire, as Lobel quoted it among his papers which came to my hands.

The Time.

They flower somewhat early, and abide so a great while, the leaves keeping their verdure unto the Winter, and sometimes abiding if it be not too vehement and sharpe.

The Names.

It is thought to be the *χρυσάνθος* Chamacissof of Dioscorides although there be some doubt in the Text, by the transposition of a letter, and the resemblance, both which are easily reconciled, and this plant by the opinion of the most judicious is accounted the true and right Chamacissof of Dioscorides, no other being found that can come so neare it in face and propertie, besides the nearnesse of the name, for the Latines *Hedera humilis* is the same with Chamacissof, and *Hedera terrestris* is not farre from it. Some call it *Corona terra*, because it spreadeth and is like a Garland upon the ground. All writers generally call it *Hedera terrestris*, yet Cordus in his history of Plants calleth it *Chamaclena*, and Brunfelsius mistaking it, made it his fourth *Elatine*. *Lugdunensis* out of the *Geoponicus* calleth it *Malscoccifos*, id est, *mollis hedera*, which most properly agreeth unto this, and some also call it *Hedera plumbica*, but for what cause I know not. Lobel calleth the last *Asarina* and *Hedera saxatilis*, and *Asarina sterilis* Savona, and *Narbonensis agri*. The Arabian Serapion putteth it under *Cissus* the Ivie, and calleth it *Cacos*. The Italians *Hedera terrestris*, the French *Lierre terrestre*, the Germans *Gündelrebe*, or *Gründerebe*, that is *hum repens*, the Dutch *Onderhaue* and wee in English according to the severall countries appellations, Gill creepe by the ground, Catsfoote, Haymaides, and Alehoofe most generally, or *Tunnehoofe*, because the country people use it much in their Ale, and ground Ivie as frequently although Lobel judgeth the *Hedera helix*, or barren Ivie, more properly to deserve that name as you shall heare by and by.

The Vertues.

Ground Ivie is quicke, sharpe, and bitter in taste, and thereby is found to be hot and dry, it openeth also, clenseth and rarefieth. It is a singular good wound herbe for all inward wounds, as also for exulcerated Lungs or other parts, either by it selfe or with other the like herbes boyled together, and besides being drunke by them that have any griping paines of windie or chollerike humours in the stomacke, spleene or belly, doth ease them in a short space: it likewise helpeth the yellow laundies by opening the obstruction of the Gall, Liver and Spleene, it expelleth venome or poison, and the Plague also: it provoketh Urine and womens courses, and stayeth them not as some have thought, but the decoction of the herbe in wine being drunke for some time together by them that have the Sciatica or Hippe Goute, as also the Goute in the hands, knees, or feete, helpeth to dissolve and disperse the peccant humours, and to procure ease: the same decoction is excellent good to gargle any sore throat or mouth, putting thereto some Honey and a little burnt Allome, as also to wash the sores and Vicers of the privy parts in man or woman; it speedily healeth greene wounds being bound thereto: and the juice boyled with a little honey and Vardigreffe doth wonderfully cleanse fistulaes, and hollow Vicers, and stayeth the malignitie of spreading or eating Cancers and Vicers: it helpeth also the itch, scabbes, wheales, and other eruptions or exulcerations in the skinne in any part of the body: the juice of *Celandine*, field Baies and ground Ivie clarified, and a little fine Sugar dissolved therein, dropped into the eyes is a soveraigne remedy for all the paines, rednesse, and watering of the eyes, the pinne, and webbe skinned or filmes growing over the sight, or whatsoever might offend them: the same helpeth beasts as well as men: the juice dropped into the eares doth wonderfully helpe the noyse and ringing of them, and helpeth their hearing that is decayed. The country people doe much use it, and tunne it up with their drinke, not onely for the especiall good vertues therein, but for that it will helpe also to cleare their drinke: and some doe affirme that an handfull put into drinke that is thicke, will cleare it in a night, yea in a few houres say they, and make it more fit to be drunke.

CHAP. XCIIII.

Hedera, Ivie.

He Ancient Greeke and Latine writers of herbes, as *Dioscorides*, *Theophrastus* and *Pliny* have set downe many varieties of Ivie, (besides the *Hedera spinosa* which is *Smilax aspera* described before in this worke) which were observed in their times, partly in the leaves and flowers, but chiefly in the berries, yet make but three principall kinds, *alba*, *nigra* and *helix*, and yet more exactly two sorts, *una que in altum attollitur*, and *alia que humi repit*, which division as most proper, they subdivided each of them againe into their *species* or sorts, whereof we know but few, for that onely which climeth upon trees, walls, &c. and beareth black berries, and the other barren kind that creepeth upon the ground, yet with the clasping branches will take hold of whatsoever is next unto it, are best knowne to us; the others with white or yellow berries are seldome scene in these Christian parts, yet I will shew you in this Chapter those diversities that *Theophrastus* speaketh of which they had in former times, joyning thereto some later found out kinds.

1. *Hedera arborea sive scandens & Corymbosa nigra*. The ordinary Climing Ivie.
The climing Ivie groweth up with a thicke woody trunk or body, sometimes as bigge as ones arme, shooting forth on all sides many woody branches, and groweth sometimes alone by it selfe into a pretty bush or tree, as *Lobel* saith he saw such in this countrey, but usually climeth up by trees, and as the branches rise sendeth forth divers small rootes into the body, or branches of the tree whereby it climeth up, or into the chinkes or joynts of stone walls, whereon it runneth so strongly, fastning them therein, that it draweth the nourishment out of the tree and thereby killeth it by consuming the life and moisture thereof, and by choking it with the abundance of shadow and moisture of his branches, and evergreene leaves (which may seeme to be an ornament thereto when it is leaflesse, but is in the end the bane and utter ruin of it) which branches also having thus fastned their rootes into the tree or wall will live thereby upwards, if any shall cut away the trunk or body below, as well as if it were not taken away at all, but by fastning the roots into the wall, and there growing great, they often so cracke it that it will in time also ruine it utterly: while the tree is young the leaves of most will be cornered, but when it groweth elder, it hath no corners on the sides, and onely round or somewhat longe, and pointed at the end, the young leaves that spring forth from the branches, keeping oftentimes the same order, and are of a darke shining greene colour above, and somewhat of a yellowish greene underneath; striped with white and sometimes with red spots, abiding fresh and greene Winter and Summer: from the joynts of the stalkes and toppes of the branches, grow forth upon short stalkes small mossie yellow flowers, standing in an umbell or close round tuft; after which come small round berries, greene untill they grow ripe, and then turning blacke, with a small point at the end of every one, in which is contained usually foure seedes three square in a manner, but

1. *Hedera arborea nigras*.
Our ordinary Ivie.

3. *Hedera Dionysias sive Chrysocarpus*.
Yellow berried Ivie.

round on the one side. It yeeldeth in the hot countries a kind of reddish Gum of a strange sent which is dangerous to be used in Physicke inwardly, being causticke or burning, but is used for outward remedies chiefly.

2. *Hedera corymbosa alba*. White berried Ivie.

This Ivie groweth in the same mannert that the other doth, without any great diversitie that hath bene observed in our time, and is chiefly distinguished in that the leaves are thinner and finer, and of a lighter greene colour, and the berries of a whitish or grayish colour, and not blacke when they are ripe.

3. *Hedera Dionysias sive Chrysocarpus*.

Yellow berried Ivie.

The leaves of this Ivie are seldome cornered on the edges, but smooth, and onely pointed at the ends, of a fresher greene colour, or not so blacke as the first, thicker also and fuller of veines, and more thinly or sparsedly growing on the branches: the berries are greater then in others, and of a gold yellow colour, declining to bee more browne when they are ripe.

4. *Hedera helix*. Barren Ivie.

The barren Ivie sendeth forth divers slender weake woody branches, trayling upon the ground, and for the most part lying thereon, but sometimes it is found to winde it selfe, and clime up the bushes and hedges under which it groweth, with the small tendrells it shooteth forth at the severall joynts of the branches, where the leaves come forth, being somewhat lesser then the former, and of a darken shining greene colour, usually formed into three corners, yet sometimes into five: & at the joynt with the leafe underneath, thrust forth also small white fibres or rootes, whereby it taketh hold as it creepeth: this beareth neither flowers nor seede.

5. *Hedera trifolia Virginensis*. Trefoile Ivie of Virginia.

The rootes of this plant doe shoote underground, and

6. *Hedera Virginensis trifolia & quinquefolia*.
Virginean Ivie of three and five leaves.

4. *Hedera Helix*. Barren Ivie.

7. *Hederateis folijs planta Lobelij*.
Lobelz Ivie leaved plant.

send forth young woody stalks whereof some will stand upright, others lye downe and take roote againe as they spread, as also in any wall they stand nigh unto, like unto our barren Ivie: the leaves are broad and large, three alwayes set together upon a long footestake: at the joynts with the leaves come forth the pale flowers in a loose tuft or cluster, which turne into pale yellow berries, with small, hard, round as coloured feede in the dry wrinkled skinnie or huske, without any moisture at all in them, this plant yeeldeth a white milke without any taste, being broken in any part thereof, which after it hath abidden a while will change to bee as blacke as Inke, and is therefore held fit to colour the haire or any other thing.

6. *Hedera quinquefolia Virginensis*. *Virginian Ivie*.
I have described this in my former booke under the title of *Vitis* (scu potius *Hedera Virginensis*), so exactly that it were needlesse labour to doe it here againe, I must therefore referre you thereunto for it; I onely shew you the figure of a branch thereof with the other.

7. *Hederaceis folijs planta Lobelij*. *Lobel's Ivie leaved plant*.
Not finding a fitter place then this, let me with *Banbinus* set it with the Ivies for the leaves sake, although *Lobel* calleth it *Cyclaminos hederaceis folijs*. This plant (saith he) hath stalks about a cubit long or better which are soft and slender having Ivie like leaves upon them; the flowers are long and hooded, of a pale purple colour. This hee found on the hills in passing through Italy.

The Place.

The first is well knowne to every child almost, to grow in woods upon the trees, and upon the stone walls of Churches, houses, &c. or sometimes to grow alone of it selfe, as is before sayd, yet very seldome: the second is sayd to grow in France and some places of Turkey, and some say in Naples also: the third *Pena* and *Lobel* say grow in Campania and Apulia, and yet sower in gardens of Italy and also of Germany: the fourth groweth in moyst and shadowie places for the most part, under hedges and the corner of waste grounds, lanes and the like, the two next grow in the Northwest parts of America, where our English Colonies are planted, the last as is before recited.

The Time.

Our Ivie flowreth not untill *Iuly*, and the berries are not ripe usually untill about *Christmas*, that they have felt the winter frosts: of the other two wee can say no more, then that wee have little acquaintance with them, yet *Gesner* in *hortis* saith, that he saw that with yellow berries in Germany; the American sorts are very late with us.

The Names.

It is called in Greeke *κισσός* and *κισσός* *Cissus* and *Cittus*, quem a Cisso dictum fabulantur Graeci, p'sone Citti sive *Liberi* patris sultanis in *Hederam* ab illo ver[o]; *Athenienses* enim *Cittum* *Bacchum* ipsum vocant, adeoque cum illo coronabatur, quia ut ille semper juvenis ita hac perpetuo viret: but *Pena* and *Lobel* say they thinke it is rather deduced from *κίς*, id est, *Curculio*, qui triticum bordenumque terebrat: etenim importuna amasia radicatis propagationibus, arbores amplexu encat, & exedit ut verum triticum, or from *κίς* *coris* *pumex* sive porcus lapis, quia ut ille aquam, ita hoc lignum textura porosa, & spiraculis innumeri pervia vinum transmittit, unde *Caton* & *Varroni* *Cissimbon* poculum *hederaceum* est, and *Costas* from these it is likely saith, that a cup made of Ivie wood will not hold any wine therein, in Latine *Hedera*. *Hederam* vero *Pompeius* dictum censet quod hereat, vel potius edita petat, vel quia id cui adhaeserit edit & encat: the Arabians call it *Cissus*, the Italians *Hedera*, the Spaniards *Edera*, the French *Lierre*, the Germans *Eggen*, the Dutch *Veyl*, and we in English *Ivie*: The first is called of all writers either *Hedera* simply, or *Hedera arborea*, (especially that which groweth alone by it selfe, which therefore the ancients called *Orthocissos*) *Hedera retta*, of some *Corimbosus*, (as of *Pliny* *Hedera rigens* and *scandens* by some to distinguish it from the other sort of Ivies) or *nigra*, to shew the difference from the second called *alba*, white or gray: such saith *Lobel* in his *Adversaria* were shewed me at *Pisa*, which *Theophrastus* (speaking of the diversities in his time observed, and *Pliny* from him say differ, some having white leaves as well as berries, which made *Virgil* to say *Candidior cygnis hedera formosior alba*, then *Swarne* more lovely, or then the white Ivie, some also having rounder and thicker bunches of Berries which he called *Corymbi*, or *Hedera Corymbia*, and some having greater berries and thinner branches called *Salenitium*: the third is called as *Pliny* saith *Nissa* and *Bachica*, of the Athenians *Acharnica*, and of the Grecians *Chrylocarpes*, which *Dioscorides* and *Dalechampius* as *Lugdunensis* saith call *Dionysias*, where-with the Poets were wont to be crowned, and yet the blacke berried Ivie, whereof it is a species, is in some Authors called *Dionysia* also: the fourth is called *Hedera Helix*, and *sterilis* by all our moderne writers, and *Lobel* *Provoluta Hedera Helix*, and taken to be the *Helix* of *Dioscorides*, *Theophrastus*, *Pliny* and the rest, which they make the third species of their climbing kinds, but we have not seene it to climbe up in that manner, as the other doth in our country, lying as I sayd for the most part on the ground, although sometimes it riseth up (and therefore *Pena* & *Lobel* in *Adversaria* say that it should more properly be called *Hedera terrestris* then the former taken to be *Cissamecissus* of *Dioscorides*: (but it is but his bare opinion without good advise) yet *Iohannes Thalius* in *Harcynia sylva*, saith that he there found it climbing as well upon trees, as creeping upon old walls & stones: Of this sort *Theophrastus* and *Pliny* record divers sorts, some whole leaves were white, some greene, & others of divers colours, which is called *Thracia*: some also to differ in the length of the smaller branches, (saith *Theophrastus*) in length of the spaces, betweene the joynts saith *Pliny*: and in each of these againe are certaine differences, as in the greene sort, some had longer, some thicker & some thinner leaves, and in others smaller, and in the white sort, some that had greater & others lesser leaves; and in the party coloured sort, some whose leaves were thicker or thinner, or more or lesse parted, yet in this it chiefly differeth not say they, that it is barren in all, not bringing any fruit, which yet some said was rather for want of age, in that in time it did beare, and turne into the other sort, thus say *Theophrastus* and *Pliny* with many more things too long to infer here: they that are disposed to reade the Authors themselves may be informed of the particulars. *Banbinus* maketh the *Hederula* of *Tragus* to be a differing sort from others, calling it *Hedera humis repens*, which yet *Tragus* himselfe distinguisheth not, saying that that Ivie, which while it is young bringeth no fruite, when it is growne older doth, and there is no difference in his two sorts of *Hedera* and *Hederula* but in the age: the two American sorts are so termed by us as they are in the titles.

The Vertues.

Galen sheweth that Ivie is of divers qualities, some sharpe and hot, others hot, and some moist, others cold, dry and astringent; being therefore such an inconstant *Plermes*, it is the more carefullly to bee applied and especially in causing barrenesse in man or woman, if they shall take too often thereof, and procureth a weakenesse

and trouble in the braines, and senses: A Pugill of the flowers (that is as much as one may take up with their three fingers together) which may be about a dramme, saith *Dioscorides*, drunke twice a day in red wine, helpeth the Laske and bloody flux. It is an enemy to the nerves and sinewes being taken much inwardly, but is very helpfull unto them being applied outwardly: *Pliny* saith that the yellow berries are good against the Jaundies, and taken before one be set to drinke hard will keepe him from drunkenesse, and helpeth those that spie blood, and that the white berries being raken inwardly killeth the wormes of the belly, or applyed outwardly: the juice of the roote is good to be taken against the biting of the *Phalangium*, or deadly Spider: the berries are held by many Empericks Quackfalsers and Chirurgions to be a singular remedy both to prevent the Plague or pestilence, before it be taken, as also to free them from it, that have got it; by drinkeing the berries made in powder for two or three dayes together: they being raken in wine do for certaine helpe to breake the stone, provoke urine and womens courses as *Tragus* saith, yea so powerfull they are in those parts, that a bath made of the leaves and berries for women to sit in, or over the fumes, or a pessarie made of them and put up doth mightily prevaile to bring them downe, and to draw forth the dead birth and secundines or afterbirth, but this is to be cautelously used, and not but upon necessitie, or extremite: the leaves of Ivie while they are fresh, boyled in Vinegar, and applyed warme to the sides of those that are splenericke, or troubled with the Spleene, ache or stich in the sides doth give them much ease; the same also applyed with some Rosewater and oyle of Rotes to the forehead and temples, doth ease the headach although it be of long continuance; the fresh leaves boyled in wine, and old filthy sores and Vicers that are hard to bee cured washed therewith, doth wonderfully helpe to cleanse and heale them, as also effectually for greene wounds to heale them quickly and soder up the lippes thereof: the same also is effectually to heale scaldings of water, and burnings by fire, and the exulcerations that happen thereby, or upon the sharpnesse of salt flegme, and hot humours in other parts of the body: the juice of the leaves or berries being snuffed up into the nose purgeth the head and braine of thinne rheume, which maketh defluxions into the eyes and nose, and cureth the Vicers and stench therein: the same dropped into the eares, doth helpe the old and running sores of them: five of the yellow berries bruised and heated with oyle of Roses in a Pomgranet rinde and dropped into the eare of such as have the toothache, on the contrary side of the paine easeth them thereof: the berries or the leaves used causeth the haire to grow blacke. The fresh leaves are commonly used to bee layd upon issues wheresoever, in the armes legges, &c. to keepe them open, and to draw forth the humours that fall thither: the Gum of the Ivie, which in the hot countries is gathered from the body and branches, is exceeding sharpe and hot, burning and exulcerating the skinn, yet it is used being dissolved to take away superfluous haire in any place, and to destroy Nits and Lice wheresoever: the same dissolved in Vinegar and put into hollow aking teeth doth ease the same, and being often used will cause them to fall out: Some doe use it as a baite with other things to kill fish: the wood made into a cup, and those that are troubled with the Spleene shall finde ease, and be much holpen thereof, if they continually drinke out of it, so as the drinke may stand some small time therein before it be drunke. *Caro* writeth an experiment how to finde out the deceit of Vintners and others that put water to their wine, which is this, that if you suspect your wine, you shall put some thereof into such a cup that is made of Ivie wood, and that if there be any water therein it will remaine in the cup, and the wine will soke through; for the nature of Ivie wood saith he and *Varro*, is not to hold any wine, so great an antipathy there is betwene them: the fume of Ivie branches being burned driveth away Gnattes and Battes, and all other hurtfull and noysome creatures.

CHAP. XCV.

Cymbalaria Italica Hederacea. The Italian Gondelo or Ivie like leafe.

His small herbe creepeth on the ground with slender threddy branches all about, taking hold on walls or any thing it meeteth, by small fibrous rootes, which it shooreth out at the joynts as it runneth: at the severall joynts grow small broad, and almost round leaves, cut in on the edges into corners, somewhat like unto a cornered Ivie leafe, each standing upon a very small and threddy stalke: at the joynts like wise stand severall small flowers upon slender footstalkes, fashioned like unto a Snapdragon or Fluellen flower, with a taile or spur behind it, mixed of yellow whitish and purple colours, and the spur as it were washed over with a purplish also; in whose places after they are fallen come small round heads, containing small blackish feede.

The Place.

It groweth naturally in divers places of our Land, although formerly it hath not bene knowne to bee but in Gardens, as about *Hatfield* in *Hartfordshire*, both in their Gardens and other places that are shadie upon the ground, for theret it will alwayes best like to grow, as also upon the thatched houses in the North parts, as I am given to understand, and most abundantly in *Lancashire*, and in my Garden where it runneth up from the ground on the wall a pretty height.

The Time.

It flowereth seldom untill the end of *Iuly*, and in *August*, but continueth with mee in flower untill the great frosts destroy it, and the feede is ripe soone after the flowers doe shed.

The Names.

This never as I thinke met with a Greeke Author to give it a name, although the name *Cymbalaria* by the Latines is derived from the Greeke word *κύμβα* *Cymba*, a boat; or from the herbe *κυμβάριον* *Cymbalion*, which *Dioscorides* saith was a name given to his *Cotyledon*, or *Umbilicus Veneris* alter, whereof divers would make this to be eyther it or a species of it, and thereupon gave it the name of *Cymbalaria*, or *Cymbalaris*: the Apothecaries of *Venice*, *Padoa*, and divers other places in *Italy*, where it familiarly groweth upon their mudde walles, &c. take it (either by ignorance not knowing the right, or by penury not having the right) for *Cotyledon* or *Umbilicus Veneris*, and so use it instead thereof in *Unguento Populeon*, as *Matthiolus* saith, and therefore *Lonicern* calleth it *Umbilicus*.

Umbilicus Veneris officinarum. Lobel calleth it *Cymbalaria Italica hederaceo folio*, and *Columna Linaria hederæ folio*; for he in this as in all other herbes saith, the flowers and seede doe most truly demonstrate the species of every genus, which I hold to be the best iudicium an Herbarist can use, and therefore I would make it a species of the *Elatine* that is *veronica famina*, rather then *Linaria*, every part herein, and not one as in *Linaria* being answerable thereunto: wee may call it in *English* cyther Iviwort or the Ivi like leafe as it is in the title, or from *Cymbalion*, the *Italian Gondelo*, untill a more fit name may bee given it.

The Vertues.

It is held to be cold and moist (and therefore the *Italians* thought it a fit substitute for *Umbilicus Veneris* (which I hold is farre better then that kind of *Ranunculus*, called *Coryledon aquatica*, which our Apothecaries use in stead thereof, because it is hot sharpe and exulcerating, which are quite contrary to the qualities of that herbe they use it for, although the forme of the leafe being round, caused the name of *Coryledon* to bee given it) yet hath it some astringition also, whereby as *Matthiolus* saith it is very profitable for women that have the whites, to stay them, being eaten often in Sallats, as the manner of the *Italians* and other Nations is, more then of ours, and therefore a Conserve made of the leaves, or Syrupe made of the juice, we may use instead of their Sallats: It is held as *Matthiolus* saith with divers, to have some properties that the true *Umbilicus Veneris* hath, which you shall finde related in the due place: this is with many held, and some found by good experience to cure wounds, and to stay the bleeding of them, the juice thereof being dropped into them, or tents dipped therein and put into them: the herbe bruised and applied outwardly ripeneth Impostumes: The distilled water of the herbe serveth well for all the uses aforesayd.

Cymbalaria Hederacea. The Ivi like leafe.

CHAP. XCVI.

Leontopetalon. Lyon leaved Turnep or blacke Turnep.

THe roote of this herbe is tuberous, somewhat like a Turnep or Sowbread, or great Earth Chesnut roote, being of a blackish gray colour, with divers small bunches or knobtes on the sides, from whence spring up divers large and long leaves, much divided or cut into divers parts (*Dioscorides* saith like unto Coleworts or Poppies, *Penn* and *Lobel* say more like unto Peony leaves, but wee finde that they are more jagged or cut in of a darke yellowish Greene colour (with us, but it may be of a darker yellow colour in the naturall places, neare unto the colour of a Lyons haire, and thereof rose the name of Lyon leafe, as I take it:) from whence riseth up a straked stalke, spotted with pale purplish lines and strakes, divided into many branches, set at the joynts with smaller leaves and lesser cut in; on the toppes whereof stand divers small flowers, made of five leaves a peece, of a darke or brownish yellow colour (red like an Anemone, and therefore called of some *disquiva* saith *Dioscorides*, and those that follow his Text onely) on the outside, and yellow on the inside: after which come small podes, thicker and shorter then those of *Radix Cava*, or *Fumaria bulbosa*, Hollow roote, else somewhat like as the whole plant doth in some fort resemble it, with small round seede therein.

The Place.

It groweth in the fields about *Aleppo* in *Syria*, in *Græcia* also, *Candy* and *Naples*: the roote and seede have bene sent sometimes to us, but we could seldome have it to live above a Summer, or the greater roote once to winter with us.

The Time.

It flowreth in the Winter time in *Candy* as *Bellonius* saith; but very late if at all with us.

The Names.

The *Greekes* call it *λεονπیتالον*, and the *Latines* *Leontopetalon*

Leontopetalon. Lyon leaved blacke Turnep.

also, for the cause shewed in the description as I thinke : divers other Greeke names it hath needlesse to be remembered here, and Latine also, as *Rapeum*, *Papavericolum*, *Semen Leonium*, *Brumaria*, and *Pes Leonius*, and *Pata Leonis* ; but yet there is another *Pata Leonis* called *Alchymilla*, as wee have shewed before. *Camerarius* from *Rauwolfius* saith, that they about *Aleppo* call it *Astrib*. *Apuleius* calleth it *Leontopodium*, and so doth *Atius* also, in ascribing the same qualities to his *Leontopodium*, that *Dioscorides* and *Galen* doe, unto the *Leontopetalon* : *Oribasius* also saying that *Leontopetalon* was called *Leontopodium* in his time. We may call it in *English* either as it is in the title; or according to the forme, *Blacke Syrian Codded*; or *Syrian blacke bulbed Fumitory*, for both *Anguilara* and *Casalpini* doe make the *Radix Cava* or *Fumaria bulbosa*, to be *Leontopetalum alterum*, and *Leontopetalum geminum* quibusdam, haud planè ineptè, to distinguish it from the next that is like it also.

The Vertues.

Galen saith it is hot and dry in the third degree, and that it hath a digesting quality therein also; *Dioscorides* saith that it is the most powerfull remedy speedily to helpe those that are bitten by any Serpent, if the roote bee taken in wine : the same also is very effectually to helpe the *Sciatica*, not onely to be put into glisters that are made for that purpose, but also to be applied outwardly, and by the digesting faculty is effectually to cleanse and heale old and filthy *Ulcers*. *Rauwolfius* in his *Hoedoporo*, or *Journal* of the East Countries, reporteth that the inhabitants about and in *Aleppo* doe use the powder of the old and greater roots of this herbe, to take out spots out of their garments by rubbing them therewith.

CHAP. XCVII.

Chrysogonum. Oaken leaved blacke Turnep.

His Plant so like unto the last hath caused me to joine it next unto it, whose description according to the best authors that have seene it and set it forth, and mine owne observation of their figures, you shall have in this manner. It hath a tuberous roote like unto *Leontopetalon*, or the Earth Chestnut, called *Balanocastanon*, or *Bulbocastanum*, of a browne colour on the outside and very red within, sending forth three or foure long winged leaves, lying on the ground, *Rauwolfius* saith he never ob-

served to few as three, standing upon a very small and slender stalk or ribbe, and are made of many leaves, standing opposite one unto another, at spaces or joynts, and some at the ends, every one whereof is small at the bottome, and broad at the point, where it is cut into some divisions, making them seeme like unto Oaken leaves, but much lesser (*Rauwolfius* figure there of seemeth to expresse but two leaves at a space, *Alpinus* figure five or six yet smaller) of a very darke Greene, from among which leaves riseth up a stalk a cubit high, without any leaf upon it, divided at the toppe into many small sprigs or branches, bearing every one a yellow flower, made of five leaves a peece, larger then those of the last : after which come small short pods, small at the further end, with a little round knobbe, wherein lye the feede (like the other as I thinke.)

The Place.

It groweth in the fields among the corne in *Syria*, as *Rauwolfius* saith, who there found it.

The Time.

The time of the flowering is not expresse, but it is likely it being so like the former, should flower about the same time.

The Names.

Dioscorides onely of the ancient Greeke Authors maketh mention of it, and calleth it *χρυσόγονον* *Chrysogonum*, which the Latines also follow, and if wee descant upon the name or Etimologie, it is a yellow knee or joynt, which it is likely although it be not expresse in the description the stalks have. *Rauwolfius* onely and *Pona* in his *Italian Baldus* of the late writers have set forth the figure of it, for *Durantes* hath nothing but the text of *Dioscorides*; *Lugdunensis* in his Appendix hath the Text of *Rauwolfius*; and *Bauhinus* hath it from them, and *Pona* who had it from *Padre Malocchio*, President of the Garden at *Pisa* : I have in this as in the former given it an *English* name, according to the forme that in my minde it beareth, eyther of which may stand untill a more proper may be given it.

The Vertues.

This as the former is appropriated by *Dioscorides* (for I cannot finde that *Galen* hath made mention of it) to heale the bitings of venomous beasts, and especially the Shrew or poysonfull Moule : and thereby may bee conjectured to bee of the same facultie in the other things with the former.

Chrysogonum. Oaken leaved blacke Turnep.

CHAP. XCVIII.

Leontopodium. Lyons foote, or Mountaine Cottonweede.

BEcause the *Leontopetalon* was called *Leontopodium* also by divers, I thinke it fittest to bring it next to consideration, and because it is a kind of Cottonweede or Cudwort, I will in the next Chapter speake of the other sorts of Cudworts, Golden Tufts, and Moufearre, as being nearest in forme and vertues unto another.

1. *Leontopodium majus.* The greater Lyons foote or Mountaine Cottonweede.

This greater (for so I call it in regard of the next which is smaller then it) Lyons foote or Mountaine Cottonweede, hath divers small and somewhat narrow leaves lying upon the ground, hoary or woolly all over, yet more hairy white underneath then above: the stalkes rise up about halfe a foote or more high, set with such like leaves thereon unto the toppes, where standeth one great browne head apeece, compassed about with many woolly or hoary white leaves, representing the hairy foote of a Lyon, Hare or Dove, or such like beast, whereof it tooke the name; out of which head come forth many short threds, which make the flowers seeme to have holes therein, wherein lyeth afterwards small brownish feede, wrapped in so much downe, that it is hardly to be found or scene: the roote is small and long and somewhat woody, with divers strings and fibres thereat.

2. *Leontopodium minus.* The lesser Lyons foote.

The lesser Lyons foote riseth up with one small stalke for the most part, with divers leaves thereon, somewhat longer, but not broader then the former, at the toppes whereof stand divers woolly leaves, and in the middle of them three or foure or more heads of flowers, like unto the other small Cudworts consisting of thrums, of a pale yellow colour, with some blacke haire among them: the feede is like the other, and so is the roote also.

The Place.

The first is found on the Alpes of Germany, and *Baldus* of Italy: the second on divers mountaines in Germany and Italy also.

The Time.

They flower in July and sometimes in August.

The Names.

It is called in Greeke λεοντοπόδιον *Leontopodium*, and so in Latine also, which is as much as *Pes Leoninus* Lyons foote, for the causes declared in the descriptions, and ρήμα *Cemos*, as it is among the other names were given it as *Dioscorides* saith; yet some affirme that the title of *Leontopodium* is not found in some copies of *Dioscorides*, but *Cemos* or *Camos*, so that *Cemos* and *Leontopodium* be one thing, and therefore *Pliny* in his 27. Booke and 8. Chap. speaking of *Catanance*, which was onely used about love matters, saith, that for the same cause *Cemos*

1. *Leontopodium majus.*

The greater Lyons foote or mountaine Cottonweede.

2. *Leontopodium minus.*

The lesser Lyons foote.

being

being so used he would say nothing of it. There is much controverſie alſo among writers about *Leontopodium* which ſhould be the right, ſome accounting one plant and ſome another, and ſome accounting none that are extant to be right: *Matthiolus* and *Lobel* ſet forth theirs, which is the firſt here expreſſed, which *Cluſius* reſuſeth, accounting it but a kind of *Gnaphalium*, or Cudweede, calling it *Gnaphalium Alpinum* (as though *Leontopodium* were ſo much differing from *Gnaphalium*, that there were little or no likenesse betweene them :) *Lonicerus* hath his *Leontopodium*, which is the *Echium Scorpoides palustre* of *Bauhinus*, or *Myosetis Scorpoides* of *Lobel*. *Apuleius*, *Ætius*, and *Oribasius* ſay as I ſhewed before in the Chapter of *Leontopetaton*, that it was called *Leontopodium*. *Brunfelsius* maketh the *Aichymilla*, which the ſhops beyond Sea called *Pata Leonis*, to bee *Leontopodium*, which *Matthiolus* noteth as an error in him. *Joſephus de Caſa bona* as *Cluſius* ſaith in his Hiſtory of Plants, ſent him ſome dried plants received out of Candy, by the name of *Leontopodium*, which hee judgeth rather to belong to the kinds of ſmall Plantaines, yet *Cluſius* himſelfe ſetteth it forth under the name of *Leontopodium Creticum*; which plant alſo as he ſaith *Cortius* ſent him, for *Catanance*. *Honorius Bellus* as *Cluſius* ſaith there alſo ſent him ſome plants, and the figure alſo drawne of the ſame or the like herbe, which hee calleth *Leontopodium Creticum alind*, which as the other he judgeth but a ſpecies of the Ribwort Plantaine all which ſorts of *Cluſius* are here before expreſſed in the twelfth Chap. of this Claſſis. *Baphinus* ſetteth downe no herbe peculiar for the true *Leontopodium* of *Diſcorides*, but together with *Lugdunensis* thinketh that *Pliny* his *Leontopodium* doth much differ from that of *Diſcorides*, and maketh the *Leontopodium* of *Matthiolus*, *Lobel* and others, to be but ſpecies of *Gnaphalium*; yet becauſe I cannot ſee but that the firſt may as properly belong unto *Leontopodium* of *Diſcorides*, as unto *Gnaphalium*, I have as you ſee ſet it downe by it ſelfe, ſum cuique judicium eſto: the ſecond is the *Leontopodium parvum* of *Lobel* and others, which *Dodonæus* calleth *Pitofella minor altera*, and is *Gerard* his *Gnaphalium Alpinum*.

The Vertues.

The taſte hereof being aſtringent and drying with ſome bitterneſſe in it alſo, doth teſtifie it is very available for all fluxes of blood or humors, as alſo effectually for all ſores, cyther greene wounds or old ulcers, and condu cible for whatſoever cures, the other Cudweeds may performe: but becauſe I have no author that expreſſeth the pro perties, nor any experience of my owne or others to what diſeaſe or greefe it is a remedy, I forbear to play the Phyſition, and appoint the practice any further: *paucæ ſapienti*.

CHAP. XCIX.

Gnaphalium. Cudweede or Cottonweede.

Here be divers ſorts of theſe Cudweedes or Cottonworts ſome of much beauty (whereof I have given you the knowledge of in any former booke, as the *Gnaphalium Americanum*, Live long, or Life everla ſting. *Gnaphalium montanum flore albo & purpureo*, White and Purple Catsfoot; *Gnaphalium Roſe um*, the Cotton Roſe, which I joyned to other plants of like beauty, forme and quality, whereof I ſhall not neede to make further mention) others that are of more vertue then beauty I meane to entreate in this Chapter, onely the figures of ſome of them I ſhall here inſert.

1. *Gnaphalium Anglicum vulgare majus*.

Our greate Common Cudweede.

The common Cudweede that groweth every where almoſt in this Land, eſpecially in dry ſandy grounds, riſeth up but with one ſtalke ſometimes, and ſometimes two or three, thicke ſet on all ſides with ſmall long and narrow whitish or woolly leaves, from the middle of the ſtalke almoſt up to the toppe; with every leaſe ſtandeth a ſmall flower, of a dun or browniſh yellow colour, or not ſo yellow as others; in which heads after the flowers are fallen, come ſmall ſeede wrapped up with the downe therein, and is carried away with the winde: the roote is ſmall and threddy.

2. *Gnaphalium majus Germanicum*.

The greater Germane Cudweede.

Nm

Gnapha

4. *Filago minor*. The lesser Cudweede.6. *Gnaphalium supinum oblongo folio*,
Small leaning Cudweede. 2. *Gnaphalium majus Germanicum*. The greater Germane Cudweede.

This is in all things like the former, but that it groweth larger in stalks, leaves, flowers and roote: And there is another sort also of the same sife that beareth the flowers not all along the stalks, as the former doe, but at the toppes onely, not differing else in any thing, except the leaves may seeme to be somewhat shorter and a little mote white and hoary then they.

Alterum.

3. *Gnaphalium minus seu herba Impia*. The lesser Cudweede or herbe Impions.

The lesser Cudweede groweth up with a shorter stalke, and set with shorter leaves also, but somewhat more white or hory, and a little broader; at the toppes whereof standeth a larger and more open flower then in the former, and of a paler yellow colour, from the sides of this stalke spring forth divers short branches, set with such like but smaller leaves then those that grow below, with such a like yellow flower as the other, which branches with their flowers doe alwayes rise higher then the middle stalke, and the flower upon it: sometimes also the branches will have other small branches spring from them, bearing leaves on them, and flowers on the toppe of each, and these also rising above the branches with their flowers in the said manner, that the first branches did unto the maine stalke: the seede that followeth these flowers is carryed away with the winde as the rest are.

4. *Filago minor*. The lesser Cudweede.

This small Cudweede shooteth forth a small hoary stalke, full of branches from the very ground almost, with divers smaller shorter and narrower leaves thereon, of a more duskie hoary colour then the former sorts, some standing singly, and some more at a space, or joynt, the flowers hereof stand at the toppes of the stalks and branches onely, and not all along as some of the former sorts, or one branch above another as in the last, but all of them rising almost to an even height, and are of an overworne yellow colour: the seede and roote are like the other.

5. *Gnaphalium minus latioribus folijs*. The lesser broad leaved Cudweede.

Somewhat like unto the last is this small Cudweede, whose stalke brancheth forth upwards, with some leaves thereon toward the bottome without order, and on the joynts of the branches two or three, which are all somewhat broad, soft and hoary, compassing the stalke at the bottome, and at the joynts with them stand divers small hoary yellow heads of flowers, some in tufts upon a short stalke, and some close to the joynt, and some at the toppes of the branches wherein is contained small seede, which falling away, springeth up againe every yeare, for the roote perisheth after seede time.

6. *Gnaphalium supinum oblongo folio*. Small leaning Cudweede.

This small leaning Cudweede springeth forth with divers round hoary stalks, not much above an handbreadth high, some whereof stand upright, and others leane downe to the ground, as though they would roote therein as they lye; whereon grow divers hoary, soft, and long leaves one above another without order, compassing the stalks at the bottome, and small pointed at the ends: the toppes of the stalks are stored with many small hoary heads, standing in tufts together, with a yellow thrumme in the middle.

7. *Gnaphalium*

7. *Gnaphalium minimum repens*. Small creeping Cudweede.

This little Cudweede (which is sometimes found not above two or three inches high) hath a small hoary stalk full of branches, about halfe a foote high or lesse, whereon grow smaller leaves then in any of the former, even almost as small as Southernwood leaves, but hoary as the rest are: the flowers are small and yellow in small hoary heads.

8. *Gnaphalium maritimum* sive *Cotonaria*. Sea Cudweede or Cottonweede.

The Sea Cottonwort riseth up with divers small and very hoary white stalkes, about halfe a foote high, set with divers somewhat thicke, and somewhat long leaves, but very soft and hoary, or woolly all over, as though they were nothing but Cotton, bearing at their toppes some small hoary heads, with a yellow thrum breaking out of them, whose seede within is somewhat longer then the other: the roote is somewhat long and woody, but perissheth not yearely as divers of the other sorts doe.

The Place.

The first, the third, and fourth doe grow in barren dry sandy and gravelly grounds, in most places generally of the Land: the rest are found in the like places beyond the Seas, onely the last is found upon the west Sea coasts of our Land in divers places, as well as in others, although smaller, which maketh it seeme another sort.

The Time.

They doe all flower about *Iuly*, some earlier and some later, and their feede is ripe in *August*.

The Names.

It is called in Greeke *γναφάλιον* *Gnaphalium*, and so likewise in Latine *quod illi αἰνυγνάφalon pro tomento utuntur*, and *γνάφον* *illud est vellere carpere lanae*. It hath also divers other Latine names, as *Centunculus* and *Centuncularis*, *Tomentaria*, *Tomentum* and *Tomentitia*, *Cottonaria* sive *Bombax humilis*, especially the Sea kind, *Filago* and *Herba impia*, *Herbe Impious*, especially the third sort here set forth, for thar as *Pliny* saith, the branches and flowers thereon rise above the middle stalk, or else as he saith, because no beaſt or other creature tasteth thereof: he also saith that it was also called *Chamezelen* (as the copies have it) or rather *Chamezylon*, the low Bombast or Cotton plant, and *Albinum* from the whitenesse. The first is called by *Matthiolus* *Leontopodium alterum vulgare*, and *Pseudoleontopodium*. By *Lobel* *Gnaphalium Anglicum vel Belgicum folio longiore*: by *Tragus* *Heliochryſos sylvestris*, by *Lugdunensis* *Chrysocome lanuginosa*, and *Impie species*, by *Johannes Thalius* *Gnaphalium vulgare majus*, by *Dodonæus* *Filaginis species altera*: the second is called by *Lobel*, *Filago*, and *Chrysocome Germanica*, and by *Durantes* *Chrysocome* and *Chryſitis*: It receiveth also with the Germans the same names that the former doth: the third is generally called with us *Herba Impia* and *Filago*, a foliorum inuſitata ſuperbia, and is the *Gnaphalium* of *Eusebium*, and *Matthiolus* (although he disprove him for ſo calling it) *Lobel*, *Lugdunensis* and others; of *Anguillara* *Cartaſilago*. The fourth is the *Gnaphalium vulgare* with us, which *Dodonæus* and *Lobel* call *Filago minor*, and *Tabermontanus* *Gnaphalium medium*; the great Germane kind, which is the second here described, is a species hereof, but growing somewhat larger with them: the fifth is the third *Gnaphalium* of *Cluſius*, or the second of *Plateau*, which *Bauhinus* calleth *Gnaphalium minus latioribus folijs*: the sixth is *Cluſius* his second *Gnaphalium*, or first of *Plateau*, called by *Bauhinus* *Gnaphalium majus lato oblongo folio*: the seventh is called by *Lobel* *Gnaphalium minimum*, by *Tabermontanus* *Gnaphalium minus*, and by *Bauhinus* *Gnaphalium minus repens*: the last is generally called *Gnaphalium maritimum* and *maritimum*, and *Legitimum* of *Cluſius*: by *Lugdunensis* *Gnaphalium maritimum tomentosum*, because hee hath another *Gnaphalium maritimum Dalechampij*, which *Bauhinus* taketh to be the *Stachas citrina altera inodora* of *Lobel*, and he himſelfe calleth it *Elichryſum ſylveſtre flore oblongo*, as I ſhewed you before among the *Stachades*: the Italians call the *Gnaphalium*, *Gnaphalio*, *Filago*, and *Cartaſilago*: the French *Petit cotton*, the Germans *Ruckkraut*, and *Hijnsckraut*, the Dutch *Ruckruit* and *Roomelijſe cruyt*.

The Vertues.

Theſe Plants are all aſtringent, or binding and drying, and therefore are profitable for defluxions of rheume, from the head into any other part, and to ſtay fluxes of blood whereſoever, eyther at the noſe or mouth, or by ſeige, which is the bloody ſlix, and eaſeth the torments that come thereby, the decoction being made into red wine and drunke, or the powder taken therein: it ſtayeth alſo the immoderate courſes of women, and is alſo good for inward or outward wounds, hurts and bruiffes, as the Weſterne country people doe daily finde by experience, and helpeth children both of burſtings and the wormes, and the diſeaſe called *Tenaſmus*, which is an often provocation to the ſtoole and doing nothing, to be either drunke or injected or otherwiſe: the Greene leaves bruiffed, and layd or bound to any Greene wound, ſtayeth the bleeding and healeth it up quickly: the decoction or juice thereof doth the ſame, and doth helpe all old and filthy Ulcers quickly: moſt of them alſo ſerve for a weeke in Lampes, &c. to burne, but eſpecially that which groweth by the Sea ſide. *Pliny* ſaith that the juice of the herbe Impious taken in wine and milke, is a ſoveraigne remedy againſt the Mumpes and Squinſie, and further ſaith, that it is marvelous what is reported of it, that whoſoever ſhall take it ſhall never be troubled with thar diſeaſe againe, and therefore they give it their ſwine for the ſame purpoſe, and that which ſoever of them will not take it, will aſſuredly die thereof.

CHAP. C.

Chrysocome. Golden Tufts.

BECAUSE in the laſt Chapter there was mention made of *Stachas Citrina* and *Helichryſum* called *Chryſocome* by me in the firſt *Clasſis* of this worke and 23. Chapter where I related the doubt what herbe ſhould be the true *Chryſocome* of *Dioſcorides*, and the controverſie betwene *Lobel* and *Molinetus* thereabouts; I intend in this Chapter to ſhew you the true *Chryſocome* of *Dioſcorides*, in my judgement and ſome other famous Herbariſts, or at the leaſt the trueſt yet publiſhed by any before them and me.

Chrysocome verior sive Coma aurea Germanica & Neapolitana.

The truer Goldilocks of *Dioſcorides*.

This plant which in my judgement ſeemeth to be the neareſt unto the *Chryſocome* of *Dioſcorides*, ſhooteth forth ſundry

Chrysocome id est *Coma aurea* Germanica & Neapolitana.
The truer Goldilocks of *Discorides*.

8. *Chrysocome* sive *Stachas Citrina* & *Cytica*.
candy golden Tufts.

9. *Chrysocome patens* sive *Coma* sive *Cytica altera*.
Spanish or Candy wilde golden Cassidony or Tufts.

12. *Stachas Citrina* sive *Stachas*.
Wilde yellow Cassidony.

sundry hard, round stalkes halfe a yad high, somewhat thicke set unorderly with narrow, long greene leaves up to the toppes, where they branch forth into divers small sprigs. with smaller and shorter, leaves thereon then below, and bearing round heads of flowers composed of gold yellowthredds rising from the middle of a few greene leaves which are as a huske to each of them, and abiding a long time in flower, and in their beauty, but *Columna* saith not a moneth till in the end they turne into downe, which with the small yellow seede, grayish saith *Columna*, flyeth away in the winde: the roote is hard and woody at the head shooting thence many, blackish fibres into the ground: the stalkes die downe yearly, and new ones rise againe in the Spring.

The figures of these three following were overslipped to be inserted in their due place, which is the 23. Chap. of the first Classis in this booke, and therefore I thought it fitter to give you them here, and referre each of them by their number where into they doe belong then quite to neglect them and leave them out.

8. *Chrysocome sive Stechas Citrina Cretica*. Candy golden Cassidony or Goldilocks.
The figure of this pertaineth to the eighth description and number in the said 23. Chapter of *Stechas Citrina* in the first Tribe of this Booke.

9. *Chrysocome peregrina secunda Clusii, sive Cretica altera*. Spanish or Candy Cassidony or Tufts.
The figure of this belongeth to the ninth number in the said Chapter, for the ninth there is misset for the tenth and eleventh.

12. *Stechas Citrina sylvestrior*. Wilde yellow Cassidony.
Let this be referred also to the same place, and to be the twelfth in Number.

The Place and Time.
This first groweth in divers places of Germany, in the moist sandy borders of unmanured fields as *Tragus* saith, in Narbone also as *Lobel* saith, and in Naples as *Columna* saith, and flowreth in July and August or later.

The Names.
Tragus maketh it his third kind of *Linaria* and supposeth it to be the *Helicrysos* of *Dioscorides*, calling it in his owne Language *Gross Rheinblumen*, id est, *Amaranthus luteus major*, and is called by many other writers since *Linaria aurea Tragi*, by *Camerarius Linaria Anstriaica*, by *Clusius Oxyris Anstriaica*: by *Lobel Linosyris nuperorum*, but *Guilandinus* and *Columna* take it to be *Chrysocome* of *Dioscorides* and *Pliny*, as you see I do here, for comparing all the parts, I cannot finde any other authors plant to come so neare to the right as this, & two so famous & worthy judicious Herbarists being my guides, make me the more confident in my opinion. Let who will compare *Dioscorides* his Text and the delineaments thereof, with *Columna* his *Animadversaria* and amend it if he can: *Guilandinus* also tooke it to be the *Hyssope* of *Dioscorides*, and therefore called it *Hyssopus umbellifera*, but erroneously, for he saith the leafe of *Origanum* is like unto *Hyssope*, but *Origanum* leaves are small and round like *Marjerome*, and not long and narrow as this.

The Vertues.
This saith *Lobel* is sharpe in taste, glutinous or clammy, and somewhat bitter like unto *Sena* and neare unto *Thymelae*. *Tragus* writeth thus of it: the herbe with the flowers boiled in wine and drunke expelleth loves enchantments and all other poisons, and helpeth Crampes and Ruptures, as also to discusse congealed blood in the body: it procureth womens courses and expelleth the afterbirth: two drams of the dried flowers in powder taken in wine fasting, stayeth the cold Catarrhes or Distillations from the head: a bathe made of the flowers to sweate therewith, or to sit over the warme fumes, giveth much ease to those that are troubled with the stone in the Kidneys, with paines of the mother, or the Sciatica: it is also layd in Chests and Wardrobes to preserve Vêtements, &c. from Moaths.

CHAP. C I.

Pilosella sive Auricula Maris. Moufearc.

Have also in my former booke given you the knowledge of some of the Moufearcs, as they may be most properly called, under the name of *Gnaphalium montanum album* and *purpureum*, white & purple Catsfoote, and *Gnaphalium Roseum*, the Cotton Rose, both which shall not againe bee described here, although I will shew you the figures of them.

1. *Pilosella minor vulgaris repens*. The common small creeping Moufearc.
The common Moufearc that is more hairy then the other, is a low herbe creeping upon the ground by small strings like the Strawberry plant, whereby it shooteth forth small rootes, whereat grow upon the ground many small and somewhat short leaves set in a round forme together, hollowish in the middle, where they are broadest, of a hoary colour all over as well above as below, and very hairy, which being broken doe give a white milke: from among these leaves spring up two or three small hoary stalkes about a spanne high, with a few smaller leaves thereon: at the toppes wherof standeth usually but one flower, consisting of many pale yellow leaves, broad at the points, and a little dented in, set in three or foure rowes, the greater outermost, and the smaller inward, very like a Dandelion flower, and a little reddish underneath about the edges, especially if it grow in a dry and not moist ground, which after they have stood long in flower, doe turne into downe, which with the seede is carried away with the winde.

2. *Pilosella Indica odorata*. Sweete Indian Moufearc.
This Moufearc hath a fleshy roote creeping under ground, not growing deepe, with many fibres thereto, from whence shoote divers somewhat long leaves, set with very long haire: the hairy stalke that riseth from them, groweth to be halfe a foote high, at the toppe wherof stand 7. or 8. faire flowers like the ordinary Moufearc, but of a deeper yellow or Orange colour, smelling very sweete like Muske.

3. *Pilosella media vulgaris erecta*. Common upright Moufearc.
This other Moufearc is very like the former, the difference betweene them consisteth in this, that the leaves are longer and greener on the upperside, and somewhat hoary underneath, softer in handling, and not so much hairy.

1. *Pilosella vulgaris* cret.
 The common small creeping Moufcaie.

2. *Pilosella media* vulgaris cret.
 Common upright Moufcaie.

4. *Pilosella alba* cret.
 Vprighe Moufcaie.

Gnaphalium montanum sive *Pet. Carl.*
 Mountain Cudweede or Catsfootie.

Gnaphalium Roseum.
The Cotton Rose.

6. *Pilosella maxima Syriaca.*
Assyrian Moufear.

7. *Myosotis Scorpioides hirsuta.*
Blew Moufear.

8. *Myosotis Scorpioides repens.*
Small creeping blew Moufear.

hairy, the stalkes of flowers standing more upright and higher, this doth give milke if a leafe or stalke be broken as the former doth.

4. *Pilosella minima*. The smallest Moufeare. This also is in all things like the last, but that it creepeth not by strings as the first doth, and is smaller by the halfe both in leafe and flower.

5. *Pilosella altera crella*. Another upright Moufeare. This upright Moufeare hath a few hoary and hairy broad and long leaves lying upon the ground, among which riseth up a slender hairy stalke, bearing longer and narrower leaves thereon, and at the toppe two or three small pale yellow flowers, like in fashion unto the former, which turne into downe as they doe: the roote is small tough and fibrous.

6. *Pilosella montana parva flore*. Mountaine Moufeare with many small flowers upon a stalke. The roote of this Moufeare groweth not downewards, but lyeth under the upper crust of the ground, shooting forth divers long white fibres therein, whereby it is fastned; it hath those leaves that lyce next to the roote shorter then those that come up after, Greene on the upper side, but with very long white haire therein, making them seeme rough and underneath white, but lesse hairy, from among which riseth up a long round hollow Greene stalke three foote high, smooth at the bottome and hairy at the toppe, having two or three such leaves but lesse thereon: at the toppes whereof stand many small flowers, as it were in an umbell, but every one on a very long foote stalke being yellow, and like in forme unto the former Moufeares, as the feede is also which is carried away with the downe: this giveth milke likewise in the same manner that the others doe.

7. *Pilosella maxima Syriaca*. Assyrian Moufeare. I have so little acquaintance with this Moufeare, that I can tell you no more of it, then *Lobel* hath set downe, whom I must follow line by line. And he saith it hath greater leaves then the former, many set together at the roote, being thicke and hoary white, feeling like Velvet; it sanderth forth three or foure square joynted stalkes, about a foote high, the flowers were not scene; the roote is hard and woody with fibres thereat.

8. *Myosotis Scorpioides hirsuta*. Blew Moufeare with a turning toppe. Let me joyne unto these Moufeares three other small wilde plants, because they are generally called Moufeares, although as you shall heare by and by, divers authors have diversly entituled them. This riseth up with one stalk most usually, and seldome with any more, which is round hairy, and about halfe a yard high, or better, at the bottome whereof grow somewhat long and broad hairy leaves, very like both for roughnesse, shape and colour unto the wilde Borrage leaves: the stalke is sometimes also branched and sometimes not, with divers such like leaves but lesse and lesse thereon up to the toppes of flowers, which turnerh or widerh ir selfe inward, like unto a Scorpions taile, or the herbe *Heliotropium* the Sun turner: the flowers which consist of five small round leaves apeece are of a pale blew colour, very much resembling the flowers of Buglosse or wilde Borrage, with a yellow spot or eye in the middle, and stand all on one side of the stalke and branches: after they are past there come in their places small rough flat heads, wherein the feede is contained: the roote is small and threddy.

9. *Myosotis Scorpioides repens*. Small creeping blew Moufeare. This other is very like the last Moufeare, but that it is smaller, most usually having lesse leaves and flowers on the branches, which doe not stand so upright, but trayle or creepe on the ground: the flowers also stand not on one side, but on both and open by degrees: the turning top (which is like the other) doth grow up and dilate it selfe, and are of a blew colour, and some more purple, with a yellow eye in the middle.

10. *Myosotis Scorpioides minor flosculis luteis*. Small Scorpion Moufeare with yellow flowers. The stalkes of this Moufeare are very small and hairy, not above an hand breadth high, with little long leavēs thereon upon long foote stalkes: the roppes with flowers doe twine themselves like the two last, each of them consisting of five leaves a peece, and are of a gold yellow colour wholly. The numbers in the figures must be altered from the first according to these of the descriptions.

The Place.

The first and third grow promiscuously on ditch banks and sometimes neare or in the ditchēs, if they be dry, and in sandy grounds: the second in *America*: the fourth upon dry barren heathes, especially upon *Hampestead* heath in that plenty that one can hardly set a foot but upon the heads of it: the fifth is more rare and but now and then to bee met with in our Land, but more easily in *Germany*: the sixt *Fabius Columba* found upon the hills *Equicoli* in the kingdome of *Naples*: the seventh was brought out of *Syria* unto *Lobel* as hee saith: the eighth and ninth grow in dry and barren grounds in many places of this kingdome: the former of the two I found in the backe close of *St. Iohn Tunstall* his house a little beyond *Croydon*. The last *Banbinus* saith groweth by *Compeleur* on the moist Vallies of *Hortus Dei*.

The Time.

They doe all flower about *June* and *July*, and abide Greene all the Winter.

The Names.

Mosses in *Gecke* is *Auricula muris* in Latine, from whence these herbes are generally called *Myosotis*, especially two of the last, which are thought to be somewhat answerable to *Dioscorides* his *Myosotis*, because both of them have blew flowers: *Lobel* calleth them *Alpine Myosotis*, *Auricula muris*, and *Myosotis Scorpioides*, referring them to the kinds of Chickweeds. *Dodonæus* calleth the former of the *Scorpioides*, *Myosotis Scorpioides*, and maketh it his third kind. *Banbinus* confoundeth the two sorts of *Myosotis Scorpioides* together, taking the land kinds to bee those of the water, whereof *Gesner* his *Scorpioides aquaticum*, and *Thalium* his *Echij palustris altera species* is one, but he is therein deceived, he calleth this *arvense* and the other *palustre*. *Casalpini* doth call it *Heliotropium minus alterum*, because the head twining with flowers is so like thereunto, and *Gesner Heliotropium crellum*. *Columba* calleth it *Echium minimum*, vel *Buglossum*, which caused *Banbinus* to call them *Echium Scorpioides*, referring them rather unto that kindred, then unto any other. *Tragus* maketh the former of the three last his third *Auricula muris*, *Pilosella sylv.* also, and *Euphrasia quarta* as he doth the other also, *Euphrasia cerulea*, because as hee saith, some in his time would perswade him they did belong to that family. The moderne writers call the former sorts *Pilosella* from the hairnesse of the leaves and stalkes, and *Auricula muris*, both from the forme and hairnesse of them: some doe call the first & third *Pilosella major*, because their *Pilosella minor* is the *Gnaphalium montanum*.

num flore albo and *purpureascent*, some also call them *Pileifella minor*, in regard of the greater kinde that is called *Chondrilla aurea*, or *Auricula muris major* by *Tragus* and others, which is set forth in my former booke, and among the *Hieratium* in this. *Lacuna* called the first *Holostium*, *Coruntum* the second as it is in the title, and saith that some did call *Hieratium Indicum*; and *Camararius in horto* calleth the third *Lactucella sylvestris repens*: *Taber-montanus* mentioneth the fifth and *Columna* the sixth and last: the *Italians* call it *Pelofella* and *Pelofina*, the *French* *Pileofelle* and *Oreille de raufouris* *Piluette* and *Veluette*, the *Germanes* *Nagelkraut* and *Mensfor*, the *Dutch* *Naghel-cruijs*, and *Muysooren*, and we in *English* *Moufear*.

The Vertues.

The ordinary *Moufear* is hot and dry, although some write that it is cold, but the bitter taste therein sheweth it is hot and of a cleansing, binding and consolidating quality: the juice hereof taken in wine, or the decoction thereof drunke doth helpe the laundies, although of long continuance, to drinke thereof morning and evening and abstayning from other drinke two or three houres after; it is often used as a speciall remedy against the stone and to ease the torments that arise thereof, as also other tortures or griping paines of the bowells, the decoction thereof with *Succory* and *Centory*, is held very effectually to helpe the dropsie, and them that are enclining thereto, and the diseases of the milt and spleene: it stayeth the fluxes of blood, eyther at the mouth or nose, and inward bleedings also, for it is a singular wound herbe, for either inward or outward wounds: it helpeth the bloody flux, and stayeth the abundance of womens courles: the juice or decoction of the herbe taken before the fit of a quartane Ague, is sayd to keepe backe or much to lessen the fit, and by the use of it to take it quite away. There is a Symplice made of the juice and Sugar, by the Apothecaries of *Italy* and other places, which is of much account with them, to be given to those that are troubled with the cough or tisse, which is a consumption of the whole body, as well as of the lungs; the same also is singular good for rupures or burstings: the greene herbe bruised and presently bound to any fresh cut or wound, doth quickly soder the lippes thereof, and the juice, decoction or powder of the dried herbe is most singular to stay the malignitie of spreading or fretting Can-cers or Vicers wheresoever, as well those in the mouth as secret parts of men or women: the distilled water of the plant is available in all the diseases aforesaid, and for wounds and sores that are outward to wash them therewith, and to apply tents or cloths wet therein. It is sayd to be so powerfull to harden iron or Steele, that if any edged or pointed tooles shall be often quenched in the juice thereof, it will cut all other iron, Steele or stone very easily, without turning edge or point. The old All-go-misfe, I should say Alchimists did much commend the juice of this herbe, that it would congeale and fix Mercury, but all these fancies are in these times quite disperfed and driven away I thinke. Many skilfull Shepherds in the country doe avoyd as much as they can, to suffer their Sheepe long to feede in any such pastures and places where *Moufear* groweth in any plenty; least they being bound therewith should grow sicke, and leane, and die quickly after. It is said that if it be given any way to an horfe it will cause that he shall not be hurt by the Smith that shoeth him.

CHAP. CII.

Stratiotes Millefolium & Achillea Sideritis. Yarrow and Achilles Woundwort.

Might I confesse have fitly set these herbes next unto the *Sideritides* or Ironworts for their neare affini-tie in name and nature, but accept them in this place seeing they are not placed there.

1. *Millefolium vulgare.* Common Yarrow or Millfoile.

The ordinary Yarrow hath many leaves spread upon the ground which are long, and finely cut into many small parts that it excelleth the fine leaves of Tansey, among which rise two or three round greene stalkes with such like winged leaves as grow below, but smaller and finer up to the toppes, where stand many small white flowers in a Tuft or Umbell close together, each flower consisting of five small round pointed leaves with a little yellowish thrumme in the middle, and smell somewhat strong, yet not unpleasant being rubbed in the hand: the roote is made of many long white strings spreading deepe and far. There is some varietie observed in the flowers hereof, some being more white then others, as also thicker set together, and greater or smaller then others, one also with a round or tuberous roote, as bigge as an Halse nut, wherein hath beene found a worme so small that the sight was scarce able to discern it.

2. *Millefolium majus album.* Great white Yarrow or Millfoile.

The great white Yarrow differeth not much in the forme of leaves or flowers from the former wilde Yarrow, but in the largenesse of the stalkes and leaves, the greene leaves being as large almost as those of Tansey, and in the flowers being greater standing in a larger umbell, the smell whereof is a little more strong then in the ordinary.

3. *Millefolium rubrum vulgare.* Common red flowered Yarrow.

This Yarrow differeth not in leaves from the first or common fort, nor in the manner of growing but in the colour of the flowers, being of a deeper or paler red, or almost bluish colour, yet with a yellow spot or thrumme in the middle.

4. *Millefolium flore rubro maximum.* Great red Millfoile.

This greater red Yarrow hath as large and great winged greene leaves as the great white Yarrow, but more finely cut in on the sides: the stalkes are as great and high branching forth at the toppe, and stord with large umbells of flowers like unto them, but of a faire bright reddish colour, and in some paler, with pale yellow thrums in the middle which are of a fine small sent.

5. *Achillea Sideritis lutea.* Achilles yellow Woundwort.

This yellow Woundwort riseth up somewhat high and creepeth not, the leaves whereof are long and very finely cut into many peeces, somewhat like unto Sothern wood but more sappy and hoary also: the flowers stand in tufts like the other, but of a faire gold yellow colour: the seede is small and long like unto Tansey, and herein consisteth the difference betweene this and the two next yellow sorts.

6. *Millefolium luteum five Achillea lutea.* Yellow Millfoile.

This yellow Millfoile or Yarrow hath hoary and short stalkes scarce a foote high sometimes, creeping along by

1. *Millefolium vulgare album vel rubrum.*
Common Yarrow or Millefoil, with white or red flowers.

6. *Millefolium luteum.*
Yellow Millefoil.

5. *Achillea Sideritis lutea.*
Achilles yellow Woundwort.

8. *Stratiotes mellefolia cretica.*
White Candy Yarrow.

the ground and taking roote as it creepeth, the hoary leaves are long and much divided, but smaller and softer than the common white kinde: the flowers at the toppes of the stalkes are of a pale yellow colour, as well the inner leaves as inner thrum, standing many together in tufts, and rising out from hoary white huskes: the roote is small and long with divers fibres thereat.

7. *Millefolium incanum Creticum*. Yellow Candy Millfoile.

The Candy Millfoile groweth with round hoary stalkes a foote high, whereon are set long, narrow, hoary, pointed leaves somewhat like unto the leaves of Lavender cotton, the toppes of the stalkes branch forth into many loose tufts of pale yellow flowers of a fine small sent: the roote is stringy and creepeth as the last.

8. *Stratiotes millefolia Cretica*. White candy Yarrow.

This Millfoile riseth up from a long white roote, with many long stalkes, a little bending downe, covered with hoary downe, having divers winged leaves set at spaces, each whereof consist of small long leaves set thicke together on both sides of the ribbes, which are hoary also, but not so much as the stalkes, at the toppes whereof stand small umbells of white flowers somewhat like to those of Tansey.

9. *Achillea Sideritis sive nobilis odorata*. Achilles sweete Woundwort.

This woundwort (or Yarrow for thereunto it is most like) hath many large thinn cut leaves next the ground, more finely and deeply cut in unto the middle ribbe, and each part divided also, which maketh it to differ from the first, from whence rise up more and taller stalkes with divers finer leaves set thereon. and at the toppes many flowers in tufts together, being both more in number and larger then the first or common sort, of a whitish or reddish colour and yellow in the middle: the whole plant smelleth very sweet: the roote perisheth every yeare after seedetime, and requieth a good ground and a rich to prosper in.

10. *Millefolium Alpinum incanum*. Small mountain Milfoile.

This small Millfoile hath many small winged leaves, as finely cut in on the edges as the last, and somewhat hoary also, set on the stalkes that spread on the ground, and there take roote againe, among which rise up short stalkes not above a foote high, with some finer leaves on them to the toppe, where they beare many tufts of small flowers thicke thrust together, of a pale reddish or shining bluish colour: the roote creepeth like the common sort.

The Place.

The first with the varieties except that with a tuberous roote is very frequent in pastures meadowes &c. The third also but much more rare: the second *Matthiolus* saith groweth in Italy and so doe many of the other: *Pena* saith the fifth is found onely upon the high hills in *Narbone*, and *Clusius* saith he found the last on the hills in *Stiria*.

The Time.

They doe all flower in the end of Summer and in August.

The Names.

Yarrow is called in Greeke *εγγυλιον* & *χρησιν* & *Stratiotes Chilibyphlos*, that is *Stratiotes* or *Militaris millefolia*, and the eighth is called in Greeke *Αχιλλεια* & *medicinis* *Achillea Sideritis*: *Stratiotes* or *Militaris* because it was of much use in the Campes of Souldiers to heale their wounds, and *Pliny* saith in the third Chap. of his 25. Booke that *Achillea* tooke the name from *Achilles* the scholler or follower of *Chiron* who healed her with the wounds of *Telephus*: it is called *Millefolium* in Latine a *foliorum multitudinem*, *Supercilium Veneris* also, *Acrum* and *Acrum sylvaticum*. The Arabians call the *Achillea Egilot*, the Italians *Achillea* and the *Millefolium Millefoglio*, the Spaniards *Milhoys yerva*, the French *Millefeuille* and *L'herbe Militaire*, the Germans *Garb*, *Garben*, *Garwen* and *Schaffripp*, the Dutch *Gerwe*, and we in English Millfoile, Yarrow, and of some Nosebleede from making the nose bleed it is put into it, but assuredly it will stay the bleeding of it. Divers doe thinke that *Achillea* and *Millefolium* is but one herbe, because divers authors have promiscuously called them so. The first is called *Millefolium album* and *vulgare* by some, and *Stratiotes terrestris*, *Stratiotes Millefolia*, *Achillea* and *Militaris* by others; the second is mentioned by *Matthiolus*, *Lugdunensis* and *Bauhinus*: the third is that of our Land and differeth from the fourth which is greater and redder, set forth by *Clusius* under the name of *Millefolium rubro flore*, and by *Matthiolus* and others *Millefolium maximum*: the fifth is called by *Pena* *Achillea montana* *Arthemissa tenuifolia facie*, by *Matthiolus*, *Camerarius* and others, *Helichrysum*, and *Eliochrysum* by others. and in Candy *Lagochimithia*: the sixth is called by *Clusius* *Stratiotes millefolia flavo flore*, by *Gesner* and *Camerarius* *Millefolium floribus luteis*, by *Matthiolus* *Helichrysum Italicum*, and by *Bauhinus* *Millefolium tomentosum luteum*, who thinketh it to be the *Tanacetum lanuginosum* of *Lugdunensis*, but as I sayd in the Chapter of Tansey he is therein much deceived as I thinke: the seventh is called by *Honorius Bellus* that sent it from Candy to *Clusius* *Stratiotes millefolia*, and saith it cometh nearest to the description of *Discozides*, called by the Candians *μενσυριον* *Miriophyllo*: the eighth is called by *Tragus* *Millefolium nobile* and *Stratiotes vera*, by *Gesner* in *hortis* *Stratiotes* and *Millefolium Stratiotes*, by *Tabernaemontanus* *Achillea sive Millefolium nobile*, by *Matthiolus* and *Lacuna*, *Cordus* on *Discozides* and in his history, of *Thalium* and *Durantes*, *Achillea*, by *Lugdunensis* *Achillea Sideritis*, by *Dalechampius* upon *Pliny* *Scoparia* *Plinii*; but *Bauhinus* taketh it to be the *Tanacetum minus flore albo* of *Dodonaeus*, calling it *Tanacetum minus album odore camphorae*, and *Lobel* before him *Tanacetum minus candidis floribus*, but surely the seede that was sent mee out of Italy by the name of *Achillea nobilis odorata*, and grew with me had no face or sent of Tansey, and evidently differing from Yarrow also: The last is *Matthiolus* his *Millefolium minus* and *Clusius* his *Millefolium Alpinum* and *Stratiotes millefolia minor*.

The Vertues.

As the face and forme of these two *Millefolium* and *Achillea* and all their varieties are very neare in resemblance one unto another, so their vertues even by *Discozides* and *Galen* are set downe to bee both alike, and no doubt but either of them that was next at hand, was applied for the same purpose that the other should: for *Discozides* saith that his *Achillea* stoppeth or closeth bleeding wounds and preserveth them from inflammations, and stayeth the flux of blood in women being applied in a pessary, as also if they sit over the decoction thereof while it is warme, and is drunke against the bloody flux. Millfoile or Yarrow hee saith is of excellent use to heale both old and greene wounds, to stay bleedings and to heale Fistulaes: the powder of the dried herbe taken with Comfrey or Plantaine water doth also stay inward bleedings, and put into the nose as I said before will doe the same: the juice thereof put into the eyes taketh away the blood and rednesse therein, the oyle made thereof stayeth the shedding

shedding of the haire : the decoction thereof made in wine and drunke is good for them that cannot retaine their meate in their stomack : it is accounted a good remedy for a quartaine Ague to drinke a draught of the decoction warme before the fit, and so for two or three fits together : the juice of the herbe and flowers taken either in Goates milke or in the distilled water of the herbe, stayeth the running of the reines in men and the whites in women, but it will be the more effectual if a little powder of Corall Amber and Ivory be put thereto. *Matthioli* doth wonderfully commend the powder of the dried herbe and flowers against the pissing of blood, so as to an ounce of the herbe a dram of fine Solarmonacke bee put, and taken three dayes together fasting in a draught of milke : the roote or the Greene leaves chewed in the mouth is said to ease the paines in the teeth.

CHAP. CIII.

Polygonatum sive Sigillum Salomonis. Salomons Seale.

Here are divers sorts of *Salomons Seale*, some anciently knowne and set forth, others of later knowledge and invention, both from *Virginia* and *Brasil*, as shall be specified in this Chapter following.

1. *Polygonatum vulgare.* Common *Salomons Seale*.

The common *Salomons Seale* riseth up with a round stalke, about halfe a yard high, bowing or bending downe the toppe, set with single leaves one above another, which are somewhat large, and like unto the leaves of the Lilly Convally, or May Lilly, and of the same colour, that is, with an eye of blewishnesse upon the Greene, with some ribbes therein, and more yellowish underneath ; at the foote of every leaf almost from the bottome up to the toppe of the stalke, come forth small long white and hollow pendulous flowers, somewhat like the flower of the May Lilly, but ending in five longer points, for the most part two together, at the end of a long footestalke, and sometimes but one, and sometimes also two stalkes with flowers at the foote of a leaf, which are without any sent at all, and stand all on the one side of the stalke; after they are past come in their places, small round berries Greene at the first, and blackish Greene tending to blewnesse when they are ripe : wherein lie small white hard and stony seede : *Camerarius* in his *Epitome* citing *Matthioli* as his Author saith that it is sometimes found with red berries and with purple : the roote is of the thicknesse of ones finger or thumbe, white and knobbed in some places with a flat round circle, representing a Seale whereof it tooke the name, lying along under the upper face of the ground and not growing downward but with many fibres underneath.

2. *Polygonatum majus.* Great *Salomons Seale*.

This other *Salomons Seale* is in all things like the former, but in the bignesse of the leaves and height of the stalkes, having larger flowers upon shorter footestalkes, and more flore set together at a leaf, and larger roots.

3. *Polygonatum majus flore majore.* The great flowred *Salomons Seale*.

This great flowred *Salomons Seale* hath shorter stalkes, not above a foote high, and standing more upright and

The greater ordinary *Salomons Seale*, and that with greater flowers.

6. *Polygonatum latifolium ramosum sive quartum Clusii.*
Broad leaved branched *Salomons Seale*.

somewhat

somewhat flatter then the former, the leaves are shorter and rounder then it, but stand thicke together, the flowers are larger then in any of the former, and sweeter, smelling like Hawthorne flowers, more also standing at each leaf: the berries that follow are large like the last, and so is the roote also, especially if it grow in good ground, or else smaller.

4. *Polygonatum maximo folio*. The greatest leaved Salomons Scale.

This Salomons Scale groweth in the same manner that the former sorts doe, with a stalke rather greater and higher then the last, but not so upright, the leaves hereof are larger by halfe then it, almost as great as the leaves of *Eleborus albus* or the white Neefewort, of a paler Greene colour, and not so whitish or yellow underneath: the flowers are white, standing upon long stalkes like the first, but usually more together, and without sent like them: the berries that follow are like the first, and so are the rootes.

5. *Polygonatum latifolium minus*. Small Salomons Scale.

This small Salomons Scale hath a lower stalke, scarce a foote high, not bending downe so much as the first, but having such like leaves thereon, and in the same manner, yet somewhat harder or stiffer: the flowers come forth at the foote of the leaves in the same fashion, but are larger, standing upon short footestalkes, and but one upon a stalke, without sent like the first, the berries and roots differ not also from the first.

6. *Polygonatum latifolium ramosum sive quantum Clusii*. Broad leaved branched Salomons Scale.

This branched Salomons Scale riseth up usually with a crooked or bending stalke, about a foote or more long, having one or two or three branches sometimes issuing out from the sides thereof, at the joynts whereof stand severall leaves as in the former sorts, and somewhat like them also, being somewhat large and long, but tenderer and softer and not hoary underneath, compassing the stalke at the lower end where it is broadest, like the leaves of Thoroughwax: underneath every leafe & at the sides of them also at the joynts commeth forth one white flower, ending in six corners, spotted with blackish spots on the inside, standing on a crooked long and pendulous foot-stalke which smelleth pretty and sweete: after the flowers are past there come in their places three square berries Greene at the first, which when they grow ripe are somewhat longer then before, and equall a small berry of the *Cornus mas* or the Cornell Cherry in bignesse almost, and of a reddish colour, having many whitish kernells within them: the roote is not tuberous like the former sorts, but slender and knotty, and of a paler colour, shooting forth into many nodes or knots, which divers long fibres and strings fastned thereto, the stalkes dying yearly and new rising up in the Spring.

7. *Polygonatum Virginianum*. Salomons Scale of Virginia.

This Salomons Scale, differeth from the former in three principall parts, that is first in the rootes, which are in these slender, long, and creeping like as most of our *Virginian* plants are, and shooting up stalkes round about, and not tuberous as in the former; then in the flowers, which in this are not set at the foote of the leaves as in the other (yet the leaves are of the same fashion, and stand one above another, upon a single upright stalke, and

7. *Polygonatum Virginianum*.
Salomons Scale of Virginia.

8. *Polygonatum racemosum Americanum*.
Cluster like Salomons Scale of America.

branched about a foote or halfe a yard high, but not of so sad a Greene colour not discoloured underneath) but at the very toppe of the stalke many being set together, which are whiter and smaller, and nothing so long and pendulous, ending in fine small pointed leaves: and lastly in the berries which in this are smaller then in any of the former, and of a most orient red or scarlet colour, (which made them at the first to bee taken for Chermes or Scarlet berries where they are naturall, and thought fit to dye withall, but found unprofitable) which while they are white, and before they become ripe have six blacke strakes on every of them equally distant, but are quite worne out being ripe, within which are contained white, hard, stony graines or feedes like the other: *Jacobus Cornutus* of Paris in his *Canadensium plantarum historia* maketh hereof two sorts, one he calleth *Fertile*, the other *Sterile*, when as they are both but one sort; however happening one may be more apt to beare berries then another, for that which I have in my Garden that never bore berries, rose from the feede of those berries that were brought us from *New-England*.

8. *Polygonatum racemosum Americanum*. Cluster like *Salomons Scale* of *America*.

This plant shooteth up a round brownish single stalke, and sometimes parted or branched, about two or three foote high, set with many very faire broad leaves, some ribbes being of a reddish others of a sad Greene colour, harder then others, and compassed about the edges with a rougher and darker lilt: at the toppes of the branches stand in open clusters many small pale coloured threds like unto the Vine Blossomes, which passing away there succede fundry small berries, composed like a cluster of Grapes, and each of the bignesse of a Juniper berry, yellowish before they be ripe, and finely spotted with blood red speckles, which after they have long so abidden are worne out by the ripening of them, and change red like a Cherry, whose pulpe or juice is sweete, and containe within them small white roundish feedes: the roote is thicke, white, tuberous, long and joynted as it were by distances, with fundry fibres thereon.

9. *Polygonatum perfoliatum Brasiliannum*. *Salomons Scale* of *Brasill*.

The *Salomons Scale* of *Brasill* hath an upright straked stalke, about a cubit high, whereon are set leaves one above another, very large, about foure inches long and two inches broad, of a pale Greene colour, full of ribbes, tender and not hard, which compasse the stalke at the lower end, where it is broadest like unto *Thoroughwax*, that the stalke seemeth to goe thorough them: the flowers also (which stand in the same manner that the ordinary sorts doe) are much larger then any of the former, consisting of five narrow white leaves two inches long a peece, standing at the ends of very small and long footstalkes: the berries and rootes are not set forth by mine author.

10. *Polygonatum ramosum perfoliatum flore luteo majus & minus Americanum*.

The greater and lesser thorough leaved yellow *Salomons Scale* of *America*.

This *Salomons Scale* hath a slender smooth stalke or two, halfe a foote high, parted about the middle into two branches, and each of them againe into others, the greater sort having faire, broad and long very pale Greene ribbed leaves, compassing the stalke wholly at the bottome, the smaller sort much narrower and smaller: at each of

10. *Polygonatum ramosum perfoliatum flore luteo majus et minus Americanum*:
The greater and lesse thorow leaved yellow *Salomons Scale* of *America*,

11. *Polygonatum Angustifolium*.
Narrow leaved *Salomons Scale*.

the joynts with the leaves, and at the toppes also stand the flowers singly in each sort, composed of six long and arrow yellow leaves hanging downe wards, in the middle whereof is a crooked head or horne, compassed with x yellow threds or chives; when the flower is past, the footestalke thereof riseth up, bearing that crooked or turned three square thicke skinny cod on the end, having whitish seede within it: the roote is nothing so thicke or white as the eight, but fastned by many strings in the ground.

11. *Polygonatum angustifolium*. Narrow leaved Salomons Seale.

The narrow leaved Salomons Seale shooteth forth divers upright stalkes, about a foote high, bending downe wards at the toppes without any branches at all upon them, whereon stand at severall joynts and spaces, foure or five and sometimes six long and narrower Greene leaves then they of the former, being smooth and ribbed or full of veines: at the said joynts with the leaves come forth two or three short stalkes, with whitish Greene flowers at the ends of them, like unto the first, after which come round berries red when they are ripe, more pulpie or juicie then the last, containing hard white kernells within them like the rest: the roote is tuberous like the former ordinary sorts, branching forth at the sides like them.

12. *Polygonatum angustifolium ramosum*. Branched small Salomons Seale.

This small Salomons Seale is in most things like the last, as in rootes, leaves, flowers and berries, the chiefest difference consisteth in this, that it brancheth forth at every joynt on the maine stalke on both sides thereof, and hath the leaves somewhat smaller and narrower, yet set in the same manner, and the flowers somewhat smaller also, standing on short footestalkes.

The Place.

The first is frequent in divers places of our Land, as beside those that Gerard hath named, it groweth in a wood two miles from Canterbury by Fishpoole hill, as also in a bushie Close belonging to the Personage of Almerberry neare Clarindon, two miles from Salisbury, the next Close thereunto is called Speltes, and in Chesson wood, on Chesson hill, betweene Newington and Sittingburne in Kent: the other six following it, and the two last grow in Germany, Austria, and the parts thereabout: the seventh was brought both out of Virginia and New-England, by some Marriners that had thought they had beene the Scarlet or Kermes berries as I sayd before, from whose seede sprang with me first, as I thinke in this kingdome, and brought such plants as I have expressed in the description: the eighth and tenth were brought from Canada by the French: the ninth groweth in Brasseill, and from thence brought and communicated to Bauhinus by Dr. Burserus.

The Time.

They flower about May, and the Virginia, Brasseill and American sorts not untill June and July, the berries of the European sorts are ripe in September, and continue on the stalkes untill the frosts rot the stalkes, and they fall downe, and perish with all above ground, the roote abiding safe, and shooting a new every year: the Virginian sort hath such red berries as are expressed in the description, but it never bore berries in our Land that I know of: but the other Americans beare berries about September.

The Names.

It is called in Greeke *πολυγονατον* *Polygonatum*, and so in Latine also, *Aradici geniculorum frequentibus nodis*, of the many nodes and knots in the roote: it is usually called *Sigillum Salomonis*, for the causes set downe in the description of the first, and of some *Scala cali*. Ioannes Monardus tooke it to be *Secacul* of the Arabians, but without all shew of reason almost: the Italians in some places call it *Polygonato*, and *Ginochetto* in others, and in *Hetruria* or *Florence* *Frassinella*, but for what respect I know not, not having any likenesse or affinitie with *Fraxinus*, from whence the name should be derived, the French *Genicoliere* of som, and *Seate*, or *Signet de Salomon* of others: the Germans *Weisswurtz*, id est, *radix alba*, of the Dutch *Salomons Seghel*, and wee in English *Salomons Seale* most usually, but in some countries the people call it *Ladder to Heaven*, according to the Latine name *Scala cali*, which was anciently knowne in the Apothecaries shoppes, from the forme of the stalke of leaves, one being set above another. The first is called *Polygonatum* generally by all writers almost, some calling it *Latifolium*, some *maius* and some *vulgare*, and some *Sigillum Salomonis*. *Angulara* *Cesalpinus* and *Castor* *Durantes* following their owne country name, call it *Frassinella*, confounding it with the *Distamnus albus*, which is called *Fraxinella*: the second is the first *Polygonatum latifolium* of *Clusius*, which *Camerarius* in *horto* calleth *Polygonatum Pannonicum*, the third is *Clusius* his second *Polygonatum latiore folio*, which *Cordus* in his History of plants calleth *Polygonatum angulosum*: the fourth is the third *Polygonatum latiore folio* of *Clusius*, which *Bauhinus* calleth *Polygonatum latifolium Ellebori albi folijs*: the fifth *Bauhinus* in his *Pinax* and *Prodromus* calleth *Polygonatum latifolium minus flore majore*. The sixth is diversly called; *Matthiolum* setteth it forth for *Laurus Alexandrina*, whom *Camerarius* citeth and *Clusius* reproveth in that it answereth not thereunto, as you shall heare more amply in the next Chapter, both by the description and explication. *Iohannes Molinens* that set forth the great Herball of *Dalechampsii* generally called, *Lugdunensis*, taketh it to be *Hippoglossum* of *Dioscorides*; whom *Clusius* also taketh for it, shewing that howsoever the Text of *Dioscorides* (if corrupted) be amended, yet this cannot be it, because it wanteth those *ligule* small tongues, that are growing upon the leaves of *Hypoglossum*, as you shall heare by and by, and that this is not perpetually Greene as the *Hypoglossum*, but dyeth downe to the roote every year, shooting forth new stalkes in the Spring, and therefore *Clusius* saith that it cannot be better referred then unto the kinds of *Polygonatum*, unlesse as he saith it might be the *Idea radix* of *Dioscorides*, wherein as he saith because he is so briefe, nothing can be affirmed for certaine; yet I certainly thinke it answereth very fitly thereunto, both in face and vertues: *Lobel* calleth it in his observations *Polygonato Affinis planta*, and *Cesalpinus* *Rusco affinis tertia*, Gerard hath two figures hereof, and two descriptions, as if they were two severall plants, which are his fourth and fifth, by the name of *Polygonatum ramosum* and *acutum*, the one being the figure of *Matthiolum* his *Laurus Alexandrina*, and the other of *Clusius*, for they expresse but one plant, no other diversitie thereof to be found that I can learne. *Bauhinus* calleth it *Polygonatum latifolium ramosum*: the seventh is as I sayd of mine owne nursing and naming: the eighth and tenth are so called by *Cornutus* as they are in the titles: the ninth *Bauhinus* in his *Pinax* and *Prodromus* calleth *Polygonatum latifolium persoliatum Brasilianum*: the eleventh is called *Polygonatum minus* by divers, and generally *Polygonatum angustifolium*, and *tenuifolium* by all others. *Thalium* calleth this *Polygonatum tenuifolium majus*, as he doth the last *tenuifolium minus*, which *Clusius* and *Bauhinus* call *Polygonatum angustifolium ramosum*.

The Verrues.

The roote of *Salomons Seale* is of chiefest use, and hath a mixt property as *Galen* saith, having partly a binding, and partly a sharpe or biting quality, as also a kinde of loathsome bitterness therein, hardly to be expressed, whereby it is of little use in inward medicines; which sharpness and loathsomeness we hardly perceive in those that grow with us: yet some authors doe affirme that the powder of the herbe or of the seede purgeth flegme and viscous humors very forcibly, both upward and downward; it is said also that the roote chewed in the mouth draweth downe much rheume out of the head, and put up into the nostrills causeth sneezing: but it serveth as he and *Dioscorides* both say, and all experience doth confirme, for wounds, hurts and outward sores, to heale and close up the lippes of those that are greene and fresh made, and to helpe to dry up the moisture and restrain the flux of humors of those that are old: it is singular good to stay vomitings and also bleedings wheresoever, as also all fluxes in man or woman, whether it be the whits or reds, or the running of the reins in men; also to knit any joynt that doth grow by weakenesse, to be often out of place, or by some cause stayeth but small time therein when it is set; as also to knit and joyne broken bones in any place of the body; the roots being bruised and applied to the place, yea it hath by late experience beene found that the decoction of the roote in wine, or the bruised roote put in wine or other drinke, and after a nights infusion strayned hard forth and drunke, hath holpen both man and beast whose bones have beene broken by any occasion, which is the most assured refuge of helpe to the people in divers countries of this Land, that they can have: it is no lesse effectually to helpe ruptures and burstings, to be both inwardly taken, the decoction in wine, or the powder in broth or drinke, and outwardly applied to the place: the same also is available for inward or outward bruises, falls or beatings, both to dispell the congealed blood, and to take away both the paines and the blacke and blew marks that abide after the hurt: the same also or the distilled water of the whole plant used to the face or other part of the skinn, cleanseth it from morpew, freckles, spots or marks whatsoever, leaving the place fresh, faire and lovely, which the *Italian* dames as it is said doe much use.

CHAP. CIII.

Laurus Alexandrina. The Laurel of *Alexandria*.

Here hath beene so great varietie of opinions among our moderne writers concerning the Laurell of *Alexandria*, what plant should be the right of *Dioscorides*, some shewing one and some another, and scarce one the true, that I much doubt whether this that I shall here shew you in this Chapter, will be taken and judged to be the genuine plant by many, who peradventure concerning my opinion may thinke me sooner to erre and be deceived, then so many learned men before me, that have had contrary opinions, but notwithstanding the diversity of conceits in many, I will endeavour to enrich the treasury of the Physicall Commonwealth, with my small two poore mites, (*cupiat qui capere potest*) reading and knowledge

1. *Laurus Alexandrina* genuina.
The true Laurell of *Alexandria*.

2. *Chamaedaphne vera* *Dioscoridis*.
The true Dwarfed Laurell of *Dioscorides*.

by the daily conversation among plants, the chiefeft I can get to enable my judgement. I must likewise in this Chapter shew you another plant being like unto it, which *Matthiolus* setteth forth for another sort of *Laurus Alexandrina*, but I entitle *Chamedaphne vera Dioscoridis*, being much controverted also, for such reasons as you shall heare by and by.

1. *Laurus Alexandrina genuina*. The true Laurell of *Alexandria*.

The true Laurell of *Alexandria* is very like the *Hippoglossum* of *Dioscorides*, Horse tongue or double tongue, for the manner of growing, rising up from an hard stringy roote, knotted at the head, with many greene stalkes of leaves standing on both sides thereof, the lower being larger then the upper, which are somewhat broad and round yet pointed at the end with many ribbes therein, and of a paler greene colour then the Horse tongue, but almost as hard in handling: from the middle rib of the leafe about the midst of it on the upper side, there shooreth forth a small whitish greene flower starre fashion, standing upon so short a footestalke that it seemeth to have none, which being past a small round berrie succeedeth in the place, which will bee very red when it is ripe, wherein is contained a white hard feede like unto those of the Butchers Broome.

2. *Chamedaphne vera Dioscoridis*. The true Dwarf Laurell of *Dioscorides*.

This dwarf Laurell groweth up with divers stalkes and leaves set thereon one above another in the same manner that the former doth, but the leaves hereof are not so broad and short as they, but longer and narrower, and of a little deeper greene colour on the upper side, and paler underneath, full of ribbes or veines also, without any small leafe or tongue such as the Horse tongue hath, else somewhat like to it: this hath flowers and red berries in the middle of the leafe, and upon as short a stalke as the former, but on the under side of the leafe for the most part, which may well make it seeme another sort of the *Laurus Alexandrina*; and for that cause I thinke *Dioscorides* joyneth the *Ruscus*, and *Chamedaphne* so neare unto the *Laurus Alexandrina*, the one before it the other after, for the likenesse the one unto the other.

The Place.

Both these grow naturally on certaine hills in *Italy*, and for their raritie and use brought into their gardens there, from whence we have received them: the first I had by the meanes of Dr. *Flad*, one of the Physicians of our *London Colledge*, who among many other rare plants he gathered in the garden of the great Duke of *Florence* at *Pisa* and else where had this also: the other I had by the meanes of my good friend Master *John Tradescant* with whom it groweth, having longer and not so broad round leaves as the former.

The Time.

They scarce beare flower much lesse fruit in our Land, but in the warmer countiees, they flower in *June*, and the berries are ripe in the end of *September*.

The Names.

Dioscorides calleth the first in Greeke Δάφνη Ἀλεξανδρεῖα καὶ Ἰδαία. *Daphne*, *Alexandria* and *Idea*, and the Latines therefrom *Laurus Alexandrina* and *Idea*, because it is likely it grew upon the mount *Ida*, which is nigh unto the *Alexandria* of *Troas*. *Marcellus* thought it tooke that name from *Alexander* the great, who at his victories wore it on his head; but that is but his bare opinion without ground or reason: the *Idea radix* is another differing herbe set before this many Chapters, which I have shewed you in the last Chapter, most fitly to agree with the *Polygonatum latifolium quartum Clusii*. Divers have thought that the *Laurus Alexandrina* and *Hippoglossum* of *Dioscorides* were both one plant, among whom *Cordus* on *Dioscorides* is one, but *Matthiolus* and *Cornarius* doe both confute that opinion, first for that it were a needlesse thing in *Dioscorides* to write two Chapters of one herbe, then that *Dioscorides* maketh no mention of tongues in the *Laurus Alexandrina*, which hee speaketh of in the *Hippoglossum*, yet *Matthiolus* falleth into as foule an errour himselfe, in taking that plant to be *Laurus Alexandrina*, which *Clusius* calleth *Polygonatum latifolium quartum*, as is shewed in the Chapter before, but *Clusius* sheweth that whether he meane his *Polygonatum* or any other plant by the figure which he exhibiteth for it, it cannot be *Laurus Alexandrina* which by *Dioscorides* his Text is a plant whose berries grow in the middle of the leaves (and *Matthiolus* quotheth his owne Copie in the Margent to bee so) which that plant hath not, but *Theophrastus* lib. 1. cap. 16. and lib. 3. cap. 17. expresteth it more fully by the Greeke word ἀμφοδέναντες: the figure of this *Laurus Alexandrina* is extant in no other author that I know of, but in *Lobel* his Appendix to the *Adversaria*, who as he there acknowledgeth had it from me (as he had many other plants also) which he there set forth, and I am verily perswaded is the true *Laurus Alexandrina* of *Dioscorides*, who maketh the leafe thereof to be like those of *Ruscus*, whereunto the leaves of this is more like then of the next: the second which I here set downe for the *Chamedaphne vera* of *Dioscorides*, is the *Laurus Alexandrina altera* of *Matthiolus* and *Laurus Alexandrina* of *Columna*, whom *Lugdunensis*, *Tahermontanus* and *Clusius* follow, and *Banbinus* calling it so also, thinketh that of *Lobel* and this to be both one, which his eyes might bee judges, the one having a rounder the other a longer leafe are divers. The *Matthiolus* of *Banbinus* sheweth for *Chamedaphne* that plant which he calleth in his *Pinax* *Lyfimachia Chamenion dista latifolia* or *Delphinium baccinum* of *Lobel*, but quotheth it there to bee misse set. *Camerarius* his Epitome of *Matthiolus* setteth forth another figure for his *Chamedaphne* which is much suspected by divers to be counterfet, a fiction of *Matthiolus* owne braine (many such tricks he useth in his workes) no such plant being knowne. *Celsapinus* calleth it *Rusco affinis altera*. *Guilandinus* and *Columna* tooke *Chamedaphne* of *Dioscorides* and his *Laurus Alexandrinus* to be both one, when as his descriptions doe evidently vary, expressing two severall herbs; the leafe hereof he compareth to a Bay leafe, whereunto it hath more resemblance then the former, for this is not so broad and short as it, but longer and narrower as the bay leafe is: further *Dioscorides* saith, it beareth *fructum annexum folijs*, which cannot be better understood to bee joyned to the leaves, then growing upon them. I doe confesse that in my former booke I did somewhat adhere to *Lobel*'s opinion, that *Chamaelea* or *Mesereon* might be the *Chamedaphne* of *Dioscorides*, yet I there shewed some let therein why it should not, but now upon better consideration and examination of the particulars, both forme and vertues, I cannot finde any plant to agree better with *Dioscorides* his *Chamedaphne* then this: Let the criticke carper examine this animadversion, but let the judicious convince me and I will yeeld.

The Vertues.

Galen in 6. simpl. medic. saith that *Laurus Alexandrina* is of a hot temperature sharpe and somewhat bitter in tast, which being drunke provoketh Urine and womens courses, *Dioscorides* saith it hastneth the hard and sore travailes

of women in childbearing: a decoction made of the herbe and rootes in wine, is very good for women to sit over the hot fumes, as also to have it injected, or the places bathed for the falling downe of the mother, to settle it in the right place againe: the said decoction, or the powder of the herbe and rootes are accounted singular good to dry up the moisture of old Vicers of long and hard curation, to cleanse them and the more speedily to performe their healing: the faculties of the other are by *Galens* judgement like to those of the former, and *Disco-rides* saith it easeth the paines of the head, and the heart burning, as also the torments of the belly, being drunke with wine, and provoketh urine and womens courtes.

CHAP. CV.

Hippoglossum sive Bilingua. Horse tongue or double tongue.

He Horse tongue or double tongue is very like unto the former two plants, set forth in the last Chapter, for the manner of growing, for this shooteth forth divers hard stalkes with leaves on them, one above another as they doe, and much about the same length: the leaves likewise for the forme are but a little differing, being somewhat harder in handling, narrower & longer, and sharper pointed, with ribs running through them: but this hath a smaller leafe or tongue, growing upon the greater from the middle ribbe, and about the middle of the leafe on the upper side, which maketh it to differ from all other plants that grow upon the ground that I know, and from thence tooke the name of double tongue: under the smaller leafe at the bottom where it joyneth to the greater, cometh forth one small whitish Greene flower, and sometimes two, standing upon short footstalkes, where afterward stand the berries, which when they are ripe are very red, very like unto the berries of the Yew tree, wherein is a white hard seede like the other: the roote consisteth of many long hard whitish strings growing from a head. *Fabius Columna* maketh mention of another sort with larger tongues upon the leaves then the former, which is as he saith much more rare to finde.

Majoribus liguis.

The Place.

It groweth upon hills and in woods in divers places both of Italy and Germany, but is onely cherished in gardens with us.

The Time.

It flowreth in June, and the berries are ripe in the end of September, in the naturall places as in the warmer countries, but I could never learne that any hath seene it beare his fruit in our Land.

The Names.

It is called in Greeke *ἵππογλῶσσο* *Hippoglossum*, *ἰππογλῶσσο* *sepiissime* *magnis plantis datur, vel quia equi a linguam imitatur vel grande*, but others think it should be more truly called *ἰππογλῶσσο* *Hippoglossum*, because of the small leaves like small tongues, growing upon the greater: the Latines keepe the name and call it *Hippoglossum* or *Hypoglossum*, and some to expresse the Greeke name more fully in Latine *Bilingua*, two tongues or double tongue, some *Lingua Pagana*, and of *Apuleius Victoriola*: it is called also *Bonifacia* by *Angularia*, and *Uenularia* by *Brumfelijs*, *Lonicerus*, *Tabernmontanus* and others. *Fuchius* calleth it *Daphne Alexandrina*, and *Laurus Alexandrina*, as *Tragus* and divers others doe, and *Clusius* himselfe confesseth he knew no other *Laurus Alexandrina*, untill *Simon de Tovar*, a Spanishe Physition did send him a branch, with the berries of the right *Laurus Alexandrina* to see, which had no tongues or small leaves at all, and was as I take it the *Chamadaphne* I have shewed you before, and therefore he called this *Laurus Alexandrina* *Theophrasti secunda*, *Casalpinius* calleth it *Rusco affinis prima*, *Columna* maketh it to bee *Idea radix* *Disco-rides*, and *Dalechampsius* to bee *Laurus Taxa* of *Pliny*, which to be so, he contendeth very seriously, as it is set downe by *Lugdunensis*, that *Pliny* in his 15. Booke and 30. Chap. numbred up the severall sorts of true Bayes, and then mentioneth those that are so called, cyther of the Greeke or Latines from some likenesse of the leaves, as *Laurus Tinus*, *Laurus Taxa*, *Chamadaphne*, *Daphnoides*, and *Laurus Alexandrina* but *Monardus* thinketh that in stead of *Laurus Taxa*, *Laurus Fraxinea*, or *Fraxinus Laurena* should be read, against which he contesteth, and sheweth that no author ever made mention of any such Bay, and that *Pliny* in the place before cited, giveth a speciall note of *Laurus Taxa*, that is to bee fit for trailes or borders in Gardens, and that it hath a small leafe like unto a jagge or torne peece of a leafe growing in the middle of the other leafe: and further that the appellation or name doth fitly agree therewith, being called a Bay from the forme of the leafe, and *Taxa* from the red berries like unto those of the Yew tree called *Taxus*. This I have related to shew his judgement and reasons, that others may allow or disallow thereof, as they shall see cause, but for mine owne part, I thinke that *Pliny* in this as in divers other plants giveth two names and two descriptions of one and the same herbe, following the severall authors hee read, as *Disco-rides*, *Theophrastus* and others, and often confoundeth them, and of en also addeth or detracteth of his owne minde, or the opinion of others in his time what he thought good, for in his 27. Booke and 11. Chapter hee maketh mention of *Hippoglossum*.

glossum, which he saith hath leaves like unto the wild Mirtle having a small leafe like a tongue issuing from them, which describeth this *Hippoglossum* as plainly as may be, and as I said before there is not knowne any herbe but this, that hath such small leaves or peeces of leaves growing upon the greater; *Lugdunensis* sheweth that *Dalechampsius* tooke it to be the *Chamedaphne* of *Dioscorides*, upon this ground peradventure that *Dioscorides* maketh no mention of *Hippoglossum*, but if he had so meant, he could not have forgotten these small leaves or tongues upon the greater: the *Italians* call it *Biflingua* and *Bonifacia*, the *Spaniards* *Lengua de cavallo*, the *French* *Biflingua*, the *Germans* *Zapfinkraut*, the *Dutch* *Tonghenbladt*, and wee in *English* *Horse tongue* and *double tongue*.

The Vertues.

Horse tongue is thought to be hot and dry in the second degree. It is held to be the most powerfull herbe that is, to helpe the suffocations and others diseases of the mother, to take the powder of the dried leaves or roots in wine, broth, or other drinke, for it will speedily give ease: three or foure drammes of the said powder taken in sweet wine procureth a speedy delivery, and driveth forth the afterbirth, provoketh the courses and Urine when they are stopped, and expelleth the stone in the reines and kidneys: if a dramme or two of the said powder be given to drinke in wine or broth for some certaine dayes together, it will helpe those that have a rupture or are bursten, and for this purpose it is accounted by divers that there is no helpe better, but although it may bring some paines at the first takings, yet by continuance it will knit and heale the part, yet they must use their truffle for a good while after, as well as during the cure: it is also good for those that have some imperfection in their speech, so as it be not naturall: it helpeth also the sores in the mouth and throat, and to settle the palate of the mouth in its place, that is subject often to fall downe by reason of too much moisture: it is likewise of singular good use in old and filthy ulcers, in any part of the body, to dry up the moisture, and to bring them on the more speedily to be healed, either the powder of the leaves or rootes to be used alone, or with other things put unto them, or the decoction to wash them or inject into them.

CHAP. CVI.

Geranium. Cranesbill or Storkes bill.

Dioscorides setteth forth but two sorts of Cranes bills. *Pliny* addeth a third, *Matthiolum* hath six, others have encreased the number still more and more; but our age hath found out many more, whereof I have shewed you in my former booke divers sorts, such as are of most delight and beauty, fit to furnishe such a garden as you there finde them; of none of these doe I intend to speake againe, having given you their descriptions, &c. in that place, I will onely give you some of their figures which shall suffice. There are many other fit to be knowne, which shall follow in this place, and because I would observe the same method I

1. *Geranium bulbosum* *Dioscori Pennai*.
Doctor Penny his bulbous Cranes bill.

2. *Geranium nodosum*.
Knotted Cranes Bill.

have formerly done, I will distribute them into three ranks or orders, the first shall be of those that beare broad leaves, like the Aconites or Crowfoot : the next shall be of such as have round leaves like unto Mallows, and the last of those that have their leaves much cut in and jagged.

Gerania Batrachia. Crowfoote Cranes bill.

1. *Geranium bulbosum Pennae five grumosa radice.* Doctor Penny his bulbous Cranes bill.

This Cranes bill hath for the roote many small long bulbos or kernells issuing from a long whitish roote, and divers small fibres set both above them and at their ends : the stalke is about a cubit high, with joynts or knees in severall places, at each whereof come forth small short and pointed leaves, as also two great leaves upon long footstalkes, divided into five parts, each of them cut in somewhat on the edges; at the toppes of the stalkes and branches, and from the upper joynts likewise come forth divers flowers together, each standing on short footstalkes, consisting of five leaves a peece, of a reddish purple or rose colour, not so large as those of the Crowfoote Cranes bill.

2. *Geranium nodosum.* Knotted Cranes bill.

The knotted Cranes bill sendeth forth certaine leaves upon long footstalkes from the roote, which is knotted and jointed, with divers long fibres growing therefrom, among which rise up two or three slender stalkes a foote high, with great joynts like knees standing forth, and reddish; toward the bottome there usually stand two leaves upon long footstalkes at a joynt cut into three parts, yet shewing to be five, for that the two lowest are cut in a little : from the uppermost joynt of leaves come forth two flowers for the most part and no more, standing upon longer footstalkes made of five leaves a peece, dented in the middle like a Mallow, of a purplish colour, with veines of a deeper purple running there through, having a reddish umbone in the middle, cut into five parts at the toppe, which being past there come in their places long beake heads, somewhat great at the bottome, whereon the feeds are set, as in the other sort of Cranes bills.

3. *Geranium pullo flore.* Darke red Cranes bill.

The darke red Cranes bill hath divers broad spread, soft, and somewhat hairy leaves rising immediatly from the roote, upon long footstalkes cut into five or six or seven deepe gashes or divisions, with a blackish spot at the bottome of every one of them, and dented also about their edges : the stalke riseth up about two foote high, spotted with many bloody spots, and is strong somewhat hairy, and parted into three or foure branches with such like leaves on them but lesser, and at their ends two or three flowers a peece, each of them consisting of five leaves cut in on the edges (which is a fashion different from all other Cranes bills) of a deepe red colour almost blackish, and in the middle a long stile with many writhed threds about it: the feede that followeth is browne, & like unto the other sorts : the roote hath great reddish heads above, and many long strings and fibres descending from it.

4. *Geranium Batrachoides minus.* Small Crowfoote Cranes bill.

This Crowfoote Cranes bill is somewhat like the other described in my former booke, having large rough and hairy leaves upon long footstalkes, cut in more deeply on the edges, and dented also round about, the stalke is a

3. *Geranium pullo flore.*
Red Cranes bill.

Geranium fuscum.
Spotted Cranes bill.

5. *Geranium Moscoviticum purpureum*.
Purple Cranes bill of Muscovy.

6. *Geranium Batrachoides alterum longius radicatum* Labelij.
Long rooted Crowfoot Cranes bill.

footē and a halfe high, branched into divers parts, with lesser divided leaves at the joints up to the toppes, where the flowers stand very like unto the other, but lesser, and of a reddish purple colour: the feede that followeth is like the other, but standeth upright and turneth not downewards: the roote is somewhat thicke and reddish at the head with divers strings and fibres thereat.

5. *Geranium Moscoviticum purpureum*. Purple Cranes bill of Muscovy.
This purple Cranes bill hath broad leaves divided into five parts or divisions for the most part, and dented likewise about the edges, somewhat resembling *Geranium fuscum*, but not fully so large, or rather like the *Geranium Romanum versicolor* but of a deeper Greene colour, and with some blacke spots also like them at the bottome of the divisions of the leafe, the stalkes riseth about two foote high, with sundry tufts of large purplish blew flowers tending to red, the feede that followeth is almost as small as that of the *Roman* striped kinde: the roote shooteth forth divers heads whereby it is increased, but looseth all his leaves in winter which the others doe not.

6. *Geranium Batrachoides alterum longius radicatum* Labelij. Long rooted Crowfoot Cranes bill.
The leaves of this Cranes bill are somewhat large but yet lesse then the other *Batrachoides*, else very like, among which rise sundry stalkes bearing faire and beautifull red flowers of a more excellent red colour then those of the bulbed Cranes bill, smelling very sweet like Muske, and feede succeeding like the other: the roote is very long and great, with small fibres thereat.

7. *Geranium parvum Salmanticense*. Small Spanish Cranes bill.
This small Cranes bill hath leaves like the ordinary Crowfoot, and small purple flowers, with great heads like the Candy Cranes bill, and a small fibrous roote.

The Place.

The first as *Clusius* saith grew in Denmarke in the countrey of *Hafina*: the naturall place of the second is not expressed: the third as *Clusius* saith groweth in some parts of *Hungary*: the fourth in other places of *Germany*: the fifth in *Muscovy* brought to us by Mr. *Joh. Tradescant*: the sixth on Mount *Baldus*, and the last on the stony and barren hills of *Salamanca* in *Spainie*.

The Time.

They all flower in *June* and *July*, and their feede is ripe quickly after.

The Names.

The Greekes call it *Ραγνιον* *Geranium*, and so doe the Latines also, but to expresse it the more plainly *Grimalis*, *Rostrum gruis* or *geranium* & *Rostrum Ciconia*. from the forme of the feedes like a Storke or Cranes bill: the *Italians* call it *Girano*, and *Rostro di grue*, the *Spaniards* *Pica di ciguana*, the *French* *bec de cigogue*, the *Germanes* *Storckenschnabel*, the *Dutch* *Oijenaeis beck*, and we in *English* *Storkes bill* or *Cranes bill*. The first is *Clusius* his fourth *Geranium*, which he calleth *Geranium bulbosum* *Pennet*, and *Baibinus* *Geranium grumosa radice*: the second is *Clusius* his *Geranium nodosum*, and *tuberiferum* *Plateau* also, for they are both but one plant, as he sheweth himselfe, and I thinke is very like, if not the same with the *Geranium Romanum versicolor* sive *striatum*, which is set forth in my former booke: the third *Clusius* calleth *Geranium pullo flore*, which it is likely *Gesner* in *Appendice* maketh

maketh mention of: the fourth *Camerarius* and *Clusius* call *Geranium Batrachoides minus*, and *alterum*: the fifth hath not beene published by any that I know, although we have had it long time in our Gardens: the sixth is called by *Lobel* *Geranium Batrachoides longius radicans*, which *Camerarius* calleth *Geranium Macerbyson*, and called *Statice* *Pliny* by some as he saith, of *Dodoneus* *Batrachoides alterum*: the last is called by *Clusius* *Geranium veltum vel Salmanticense rostratum*, but *Bauhinus* *Geranium parvum folijs Ranunculi*.

The Vertues.

All these Cranes bills are drying, binding, and a little hot withall, and are found to be effectuall both in inward and outward wounds, to stay bleedings, vomitings and fluxes, eyther the decoction of the herbe, or the powder of the leaves and roots used as the cause requireth.

CHAP. CVII.

Gerania Malvacea. Round or Mallow leaved Cranes bills.

The second kind of Cranes bills to be entreated of, is of those that beare round or Mallow like leaves, which shall follow.

1. *Geranium tuberosum minus Camerarii*. Small tuberous Cranes bill.

This small Cranes bill hath divers round leaves very like the ordinary Doves foote, but much lesse: the flowers likewise are very small and reddish like therunto, and so are the beake heads with seede also: the roote is round, of the bignesse of an Halse nut, without any fibres growing from it, drawing the nourishment out of the earth by certaine little rootes, which are like small hollow parts therein, not abiding to be taken out of the naturall place of its growing, which is in mud walls to be transported into gardens, for as *Camerarius* saith having often tryed it, it will decay by little and little.

2. *Geranium Columbinum vulgare*. The common Doves foote or Cranes bill.

The common Doves foote or Cranes bill hath divers small round pale Greene leaves, cut in about the edges much like unto Mallows, standing upon long reddish hairy stalkes, lying in a round compasse upon the ground, among which rise up two or three or more reddish joynted, slender, weake and hairy stalkes, with some such like leaves thereon but smaller, and more cut in up to the tops, where grow many very small bright red flowers, of five leaves a peece, after which follow small heads, with small short beakes pointing forth, as all other sorts of these kinds of herbes doe, whereby they are knowne to be of this family, how variable soever their face or forme of leaves, &c. be.

3. *Geranium Malacoides laciniatum sive Columbinum alterum*. The other Doves foote.

Of this kind there is another sort, whose leaves are greener, not so round, and somewhat more cut in on the

2. *Geranium columbinum vulgare*.
The common Doves foote or Cranes bill.

Geranium bulbosum vulgare.
The common bulbed Cranes bill.

6. *Geranium Althæodes majus.*
The greatest Marsh Mallow leaved Cranes bill.

9. *Geranium Saxatile.*
Rockie Cranes bill.

edges, making the leaf seeme of divers parts more then the former, or like the Vervaine Mallow but somewhat lesser, other wise like it in flowers, weake leaning stalkes, &c.

4. *Geranium Malacoides seu Columbinum minimum.* The least Doves foote.

This is another also very small, not rising above two or three inches with his stalkes; the leaves also flowers, and feede are of a size equal to the rest, that is very small.

5. *Geranium Malacoides seu Columbinum tenuius laciniatum.* Doves foote with thin cut leaves.

This also is but a small plant not above an handbreadth high, whose leaves are round of the bignesse of ones mayle, cut in at the edges into foure divisions, and each of them somewhat cut in also, standing upon long foote-stalkes; the flowers are small, two for the most part and no more standing together, small and reddish like the other, and so is the feede and roote.

6. *Geranium Althæodes majus.* The greatest Marsh Mallow leaved Cranes bill.

The first leaves of this Cranes bill are more round then the other that follow, which are somewhat long, with the roundnesse like unto the Marsh Mallowses, somewhat roundly but a little deeply cut in on the edgs, soft also and of a whiter Greene colour almost woolly, the stalkes are more upright and hairy, with such leaves thereon, but smaller longer and a little more cut in on the edges, on the toppes whereof stand small purplish flowers, and after them small beake heads like unto others: the roote is somewhat long and woody dying every year, and rising againe of it owne sowing.

7. *Geranium Althæodes minus.* The lesser Marsh Mallow leaved Cranes bill.

This other Cranes bill is like the other in all things but smaller and lower, the leaves being a little whiter, the flowers small and so likewise the feede, that oftentimes wee scarce finde it.

8. *Geranium Alcea vesicariae folijs.* Venice Mallow leaved Cranes bill.

This Spanish Cranes bill spreadeth it selfe very farre with long slender branches, whereon are set at certaine distances many leaves like unto the Venice Mallow but more divided, the flowers are small and purplish, after which followeth the feede contained in small vessells; the roote perisheth every yeare. This and the third among a number of other seeds were brought me by Guillaume Boel which he gathered in Spaine upon my charge; however Mr. Goodier getting the seeds from Mr. Coys, caused it and divers other things to bee published in his name: notwithstanding I told him the charge was mine that procured it and many other.

9. *Geranium Saxatile.* Rockie Cranes bill.

The rockie Cranes bill is a lesser plant then the ordinary Doves foot, having many small leaves, somewhat cut in on the edges, very Greene & shining so like unto a small Sanicle leaf, that it may deceive one, set on reddish stalks; lying on the ground all the Autumne, Winter and Spring untill the Summer, that the stalkes rise up about a span high, or somewhat more, bearing a few leaves on them, and very small purplish red flowers, brighter and redder then

then the Doves foote, which gives very small feede, but of the fashion of the rest; yet *Camerarius* addeth to *Thalium* description that the feede is yellow like *Chamaele* English Wormefeede, but without any taste, wherein surely he is much mistaken, for how could it be *Geranium* then, as both hee and *Thalium* call it; and moreover *Columna* in describing it sheweth what manner of bills or beake heads it beareth: the roote is small and yellowish, yet abideth and periseth not, but encreaseth plentifully enough of the feede in my Garden.

The Place.

The first groweth as *Camerarius* saith out of mud walls in divers places of *Germany*, the second commonly in pasture grounds, and by the path sides every where, and will be in many gardens also: the third is found in some pastures also, but not frequent: the fourth in the fields about *Rhotomagus* or *Roan* in *Narbone*: the fift in woods about *Mompelieri*: the sixt on Mount *Baldus*, about *Mompelieri* also, & in other places: the seventh in *Spaine*, from whence I had feedes brought me: the last in stony grounds in *Harcynia sylva*, as *Camerarius* and *Thalium* say; and about *Naples* as *Columna* saith, but found also in our owne countrey by Mr. *Iohn Gordier*, a great lover and curious searcher of plants; who besides this hath found in our countrey many other plants, not imagined to grow in our Land. I wish there were many more of his minde, that not hindering their affaires at spare times, would be industrious to seatch out and know what the ground bringeth forth, where their occasions are to be.

The Time.

They all flower in the Summer moneths of *Iune*, *Iuly* and *August*, some more early then other, and their feede is ripe quickly after.

The Names.

The first is called by *Camerarius* *Geranium tuberosum minimum*: the next two sorts are called generally *Pes Columbinus*, and *Geranium Columbinum*, and some *Rostum Gruis* and *Grinum*, and *Rostum Ciconia*, *Storkes bill*, yet some as *Camerarius* and others note it, call it *Geranium Malvacum*, and *Balsaminum*, and *Momordica* from thence as *Camerarius* saith, especially the greater sort as *Mathiolus* saith, from the *Balsamine* of healing properties as it is likely above the other sorts, although *Lobel* taxeth him for so saying. where himselfe is more worthy of reproofe, in mistaking the second sort for the first here expressed. The common Doves foote is generally held to be the second *Geranium* of *Dioscorides*, although *Brasavola* as *Mathiolus* noteth it was mistaken therein: the *Italians* call it *Rostro de ciconia*, and *Geranio*: the *Spaniards* *Pico ai cigneha*: the *French* *Bec de grue*, and *bec de cogue*: the *Germans* *Storkenschnabel* and *Skarterkraut*: the *Dutch* *Duyvenvoet*, and wee in *English* Doves foote, *Cranes bill*, and *Storkes bill*: the fourth and fift are of *Banbinus* addition by the same title they beare here: the sixt is called *Geranium Malacoides* of *Lobel*, and *Altheodes* of *Camerarius*, wherein as I said before he was mistaken in taxing *Mathiolus*; of *Tabernmontanus* *Geranium Moschellacum*, and of *Banbinus* *Geranium folij Alibae* and saith that it may most fitly agree with the second *Geranium* of *Pliny* (who followeth *Dioscorides*) which hath as he saith more white or woolly leaves then a Mallow: the seventh and eighth are of mine owne nursing up from the *Spanish* feede. and being of neare affinitie receive also their names correspondent: the last is called by *Camerarius* *Geranium Saxatile*, and not knowne as he saith before his time. *Thalium* mentioneth it in *Harcynia sylva* by the name of *Geranium yegexomizum* and *Columna* *Geranium alterum montanum saxatile rotundifolium*, and *Banbinus* *Geranium lucidum saxatile*.

The Vertues.

The ordinary Doves foote is found by good experience, and *Lobel* and others note it also to bee singular good for the winde Collicke and paines thereof in the lower belly, as also to expell the stone and gravell in the Kidneys, the decoction thereof to be drunke, or to sit as in a bath therein, or to be fomented therewith: the decoction thereof in wine is an exceeding good wound drinke for any to take that have either inward wounds hurts or bruises, both to stay the bleeding, to dissolve and expell the congealed blood, and to heale the parts, as also outward sores ulcers or fistulaes perfectly to cleanse and heale them, and for Greene wounds, many doe but bruise the herbe and apply it to the place wheresoever it bee, and it will quickly heale them: the same decoction in wine fomented to any place pained with the Goute giveth much ease: it doth the same also to all joynt aches or paines of the sinewes. *Gerard* bis experience to be singular in ruptures or burstings (but not as of his owne invention) is knowne to be most certaine, whether you take the powder or the decoction of the herbe, for sometimes together, and helpeth as well young as old folkes, if they continue it the longer.

CHAP. CVIII.

Gerania laciniata. Cranes bills with jagged leaves.

He third and last kind of Cranes bills, is as I ordered it at the first, of such sorts that have their leaves more jagged then the former, as shall be shewed.

1. *Geranium moschatum*. Muske Cranes bill.

The Muske or sweet smelling Cranes bill hath divers long, winged darke Greene leaves lying upon the ground, yet somewhat whitish by the haire that are thereon cut into many parts or leaves, and each of them cut in on the edges, among which rise up weake tender stalkes, scarce able to stand upright, usually not a foote high, with some such like leaves upon them as grow below, but smaller and finer cut in at the toppes, and among the upper leaves sometimes also grow divers very small red or crimson flowers, after which come very small and long beakes or bills with feede at the bottome, as all the rest of the Cranes bills have, which twine themselves as most of them doe: the roote is somewhat long with divers fibres thereat: the whole plant and every part thereof above the ground, hath a pleasant fine weake sent, which some resemble to Muske, whereof came the name, but the sent of true and good Muske is much differing from it.

2. *Geranium moschatum inodorum*. Vnsavoury Muske Cranes bill.

There is little difference to be discerned betweene this and the former Cranes bill, eyther in growth or bignesse, or forme of the leaves or flowers, but chiefly differing in this that it hath no sent at all wherein resteth the chiefest, if not the onely difference: Of this sort also one hath bene found to beare white flowers, differing in nothing else.

3. *Geranium*

Flore d'bo.

1. *Geranium Moschatum*.
Muske Cranes bill.

4. *Geranium fetidum*.
Strong fented Cranes bill.

3. *Geranium Apulum odoratum*. Italian Muske Cranes bill.

The Italian Muske Cranes bill hath divers long leaves, and somewhat hairy lying on the ground, cut in on the edges somewhat like the divisions of the lower leaves of the Candy Cranes bill, standing upon reddish footstalks, the two lowest jagges being greater then the rest, but those that rise up with the stalke are more cut in, somewhat like unto the lower leaves of Coriander, or Fetherfew, but with rounder dents, of a sweete sent, as the first, whereof it is thought to bee a species of: the stalke is jointed and kneed, with two such like leaves at them, but more finely jagged, and at the toppe divers small flowers, of a pale blewish purple colour, each standing in a Greene hairy huske, wherein afterwards stand the heads of feeds very like unto the Candy kinde, great below and small above: the roote is small and yellow, lifting the head a little above the ground.

4. *Geranium fetidum*. Strong fented Cranes bill.

This Cranes bill hath divers hoary Greene leaves, finely cut in on the edges into many parts from among which rise two or three slender hairy stalkes set at the joynts with a few small leaves, and three or foure somewhat large reddish flowers above, like unto the other sorts, smelling somewhat sweete in our Gardens by the transposition, but strong in the naturall warmer places, after which come the feede somewhat long, strong and stiffe: the roote groweth downe deepe, of a reddish colour on the outside and white within, which smelleth much stronger then leaves or flowers, and shooteth forth sundry heads of leaves at the toppe.

5. *Geranium triste* five Indicum noctu olens. Sweete Indian Cranes bill.

The rootes of this Cranes bill are tuberosus or Aphodill like, from whence rise foure or five long and large sad Greene leaves, diversly cut into many parts, each part jagged on both sides somewhat resembling the leaves of *Filipendula* but softer, the middle ribbe being reddish and the rest sad Greene: the stalke is jointed or kneede with the like leaves rising with it, and at the toppe a tuft of many flowers, like for forme unto those of other Cranes bills, but of a boxlike yellow colour, each leafe having two purple spots on them, which being fallen there come such like long beakes as are in the former with reddish feede on them, the flowers smell very sweete like Muske in the night onely, and not at all in the day time, as refusing the Sunnes influence, but delighteth in the Moones appearance: it tasteth somewhat fower, and both rootes and leaves are Lertice for the Indians lippes.

6. *Geranium Monspeliacum laciniatum*. French jagged Cranes bill.

The French jagged Cranes bill riseth up with sundry rough hairy stalkes, three or foure foote high, joynted and branched in divers places, with divers leaves thereon cut on both sides, very like unto those of the Muske Cranes bill: the flowers that stand at the toppes of the stalkes and branches are small, of a pale purple colour, after which come the feede, out of the same huske wherein the flowers stood before, as is common to all the kinds whatsoever, but the beake beads hereof are very long and hairy, even five inches long, which twine themselves when they grow ripe and so fall upon the ground.

7. *Geranium Alpinum longius radiculatum* Pona. Mountaine Cranes bill with long roots.

This Mountaine Cranes bill hath a very long downeright roote, parted upward into two or three branched great heads, sending forth many leaves, divided into five or six parts, each whereof is dented with three deepe gashes at the end, soft also and woolly, standing on very long footstalkes, covered with silver like downe, the flowers stand at the toppes of naked stalkes, two or three together somewhat large and round, yet a little round at the ends, of a pale purplish colour with divers reddish lines therein, and divers threds in the middle: the feede is small and standing on short beake heads.

8. *Geranium Robertianum vulgare*. The common herbe Robert.

The herbe Robert that is most common with us, riseth up with a reddish stalke, usually two foot high, having divers leaves thereon, upon very long and reddish footstalkes, divided at the ends into three or five divisions, and each of them cut in on the edges, some with deeper cuts then others, and all dented likewise about the edges which,

5. *Geranium triflorum* seu *Indicum* vulgo dicitur.
Sweete Indian Cranes bill.

Geranium Creticum.
Candy Cranes bill.

7. *Geranium Alpinum longius radiculatum* Pons.
Mountaine Cranes bill with long rootes.

8. *Geranium Robertianum* vulgare.
The common Herbe Robert.

which oftentimes turne reddish : at the toppes of the stalke come forth divers flowers, made of five leaves, much larger then the Muske Cranes bill or Doves foote (Lobel maketh a difference in the flowers some to be larger then others) and of a more reddish colour : after which come beake heads as in others, which are not small nor very great : the roote is small and threddy, and smelleth as the whole plant else doth, very strong almost stinking.

9. *Geranium Robertianum majus*. The greater herbe Robert.

This herbe Robert riseth up with divers slender hairy reddish stalkes three foote high, at the joynts whereof stand leaves upon shorter yet reddish footstalkes, divided at the ends most usually but into three parts, as large or rather more then the former, and turning red likewise : the flowers are purplish red, and of the same bignesse and so are the feede and beake heads, the roote is wholly red both within and without, not smelling so strong as the former.

The Place.

The two first grow wilde in many places of this Land, as well in meadowes as wast grounds, the first is cherished for the sent in Gardens, more then the other, which is found sometimes upon Heaths, and dry gravelly places, but much smaller then in the better grounds : the third was found by *Columna* in *Naples* upon the hills there : the fourth at the North side of *Mont lupus* by *Mompelier* : the fifth in the *Indies* : the sixth by *Mompelier* also : the seventh on mount *Baldus* : the eighth is frequent every where by way sides, upon ditch banks and waste grounds wherefoever one goeth, but the last is not so frequent as the other, yet often seene and found.

The Time.

They flower in *June* and *July* chiefly, and their feede is soone ripe after.

The Names.

This is called *Geranium Moschatum*, *Acus moschata*, and *Acus pastoris* of some, although the *Scandix* or *Peeten Veneris*, is so called also, of some also *Rostrum Ciconia*, and taken to be the *Myrrhida* *Pliny* : *Matthiolus* maketh it his third *Geranium* in his last Edition, but the first in his former by the name of *Cicuta folio*, *Dodonæus* *Geranium supinum*, and *Bauhinus* *Geranium Cicuta folio Moschatum* : the second is called *Geranium gruinum* by *Dodonæus*, and minus by *Tragus* and *Tabernmontanus*, and by others *vulgatum inodorum*, and *Moschatum inodorum* : the third is called by *Columna* *Geranium Apulum Coriandri folio alterum odorum* : the fourth is called by those of *Mompelier* as it is in the title : the fifth *Coronatus* calleth *Geranium triste* : the sixth is called by *Bauhinus*, *Geranium Cicuta folio acis longissima* : the seventh is called by *Pona* *Geranium Alpinum longius radicans* : the eighth is generally called *Geranium Robertianum* and *Rupertianum*, and herbe *Roberti* or *Ruperti*, *Anguillara* calleth it *Panax Heracleum* : it is certainly taken of many the best of our moderne writers to be the *Sideritis tertia Dioscoridis*, which *Crævus* he faith called *Heraclea*, whose leaves are like those of *Coriander*, yet *Columna* taketh the *Dispensia Sanicle* to be it : the last is called by *Lobel* *Geranium Robertianum altera species*, by *Dodonæus* *Geranium gruinale*, and is the *Geranium Violaceum* of *Gerard*, and *Tabernmontanus* whom he followeth, the *Germanes* call this *Bludwurcz*, id est, *Sanguinaria radix*.

The Vertues.

These kinds of Cranes bills are neare the temprature of the former, and may performe all the properties found in them, but the two first sorts here expressed are held more available for the mother to settle it in the place when it is fallen downe. Herbe Robert is not onely commended against the stone, but to stay blood, where or howsoever flowing, and so is the last also, as also speedily to heale all greene wounds, and is effectually also in old ulcers, in the secret as well as in the other parts.

CHAP. CIX.

Tabacco Anglicum. English Tabacco.

Have in my former book given you the knowledge of divers sorts of Tabacco, such as for their flowers sake might be fit to be nourished up in gardens : there remaineth one sort more, which is planted more for the use of Phisicke and Chirurgery then for any other respect whereof I meane to speake in this Chapter. It riseth up with a thicke round stalke, about two foote high, whereon doe growe thicke, fat and fleshy greene leaves, nothing so large as the other *Indian* kinds, neither for breadth or length, somewhat round pointed also and nothing dented about the edges : the stalke brancheth forth, and beareth at the toppes divers flowers, set in greene huskes like the other, but they are nothing so large, scarce standing above the brims of the huskes, round pointed also, and of a greenish yellow colour : the feede that followeth is not so bright but larger then it, contained in the like, and as great heads : the rootes are neither so great or woody, and perish every yeare, with the deepe frosts in winter, but riseth generally of the feede that is suffered to shed it selfe.

The Place.

This came as it is thought from some part of *Brassile*, and is more familiar to our countrey then the other *Indian* sorts, early giving ripe feede when as the others seldome doe.

The Time.

It flowereth from *June* sometimes unto the end of *August* or later, and the feede ripeneth in the meane time.

The Names.

The name *Petum* whereby it is called, is properly from *Brassile*, as I am given to understand, and yet some have affirmed that this herbe is not the right herbe, the *Indians* there to called, wee received it by that name which is continued. It is thought also by some that *John Nicot* the French man, being agent in *Portugall* for the French king, sent this sort of Tabacco and not any other to the French Queene, and is called thereupon *herba Regina*, and from himselfe *Nicotiana*, which is probable because the *Portugalls* and not the *Spaniards* were masters of *Brassile*.

at that time : the *Indian* names of *Picels* and *Perebecenne* are more proper as I take it to the other *Indian* kinds we doe usually call it in *England* English Tobacco (not that it is naturall of *England* but) because it is more commonly growing in every countrey garden almost, and better endureth then the other: *Lobel* and others accounted it, as well as the other sorts an *Hysocyamus*, and called it *Hysocyamus luteus*, and *dubius*, and thereupon some have called it in *English* yellow Henbane.

The Vertues.

This kind of Tobacco although it be not thought so strong, or sweeter for such as take it by the pipe, (and yet have knowne *St. Walter Raleigh*, when he was prisoner in the Tower, make choise of this sort to make good Tobacco of, which he knew so rightly to cure as they call it, that it was held almost as good as that which came from the *Indies*, and fully as good as any other made in *England*;) nor yet so effectuell for inward diseases, because it is not so much used as the other, yet it is available by good experience for to expectorate tough slegme out of the stomacke, chest and lungs, that doth offend them: the juice thereof being made into a Syrupe, or the distilled water of the herbe drunke with some Sugar, or without as one will, or else the smoake taken by a pipe as is usual, but fasting. The same also helpeth to expell wormes in the stomacke and belly, as also to apply a leafe to the belly, and to ease the paines of the head, or the Megrime, and the griping paines in the bowells, although to some it may seeme, to bring or cause more trouble in the stomacke and bowells for a time: it is also profitable for those that are troubled with the stone in the kidneyes, both to ease paines, and by provoking urine to expell gravell and the stone engendred therein, of that viscous matter, and to heale the parts; and hath beene found very effectuell to suppress the malignitie and expell the windy and other offensive matters, which cause the strangling of the mother: the feede hereof is much more effectuell to ease the paines of the toothach, then any Henbane feede, and the ashes of the burnt herbe to cleanse the gummes and teeth and make them white: it hath beene thought not to have beene safe for weake bodies and constitutions, nor for old men, but of both sorts I have seene the experience that it hath bin profitable being taken in a due manner, that is fasting, and to bed ward and before meate. *Thevet* saith that the Women in *America* forbear the taking of Tobacco, because that they have beene taught that it will hinder conception and bodily lust: the herbe bruised and applyed to the place of the Kings Evill, helpeth it in nine or ten dayes effectually: it is said also to bee effectuell to cure the dropie, by taking foure or five ounces of the juice fasting, which will strongly purge the body both upwards and downewards. *Morardus* saith it is an *Alexipharmacum* or Counterpoison, for the biting of any venomous creature, and to apply the herbe also outwardly to the hurt place. The distilled water is often given with some Sugar before the fit of an Ague, both to lessen the fits and to alter them and take them quite away in three or foure times using; which water above many other will taste of the sharpenesse of the herbe it selfe, but will yeeld no oyle or unctuous substance, as most other herbes will doe, although divers have boasted to make an oyle thereof; if the distilled feces of the herbe having beene bruised before the distillation, and not distilled dry bee set in *fimo calido*, to digest for 14. dayes, and afterwards hung up in a bagge in a wine Sellar, that liquor that distilleth therefrom is singular good to use for Cramps, Aches, the Gout and Sciatica, and to heale itches, scabbes and running Vlcers, Cankers, and foule sores whatsoever: the juice also is good for all the said greeces, and likewise to kill lice in childrens heads: the Greene herbe bruised and applyed to any Greene wound is commonly knowne to country folkes, to cure any fresh wound or cut whatsoever: and the juice put into old sores both cleanseth and healeth them, for which purpose many doe make a singular good salve hereof in this manner. Take of the Greene herbe three or foure handfulls, bruise it and put it into a quart of good oyle of Olives, boile them on a gentle fire untill the herbe grow dry and the oyle will bubble no longer, then streine it forth hard and set it on the fire againe, adding thereto Wax, Rosen and Sheepes Tallow, or Deares Suet which you will, of each a quarter of a pound, of Turpentine two ounces, which being melted put it up for your use: Some will adde hereunto of the powder of *Arisaema rotunda*, round Birthwort, and of *Olibanum* that is, white Frankincense of each halfe an ounce, or six drams, which are to bee put in when it is nigh cold, and well stirred together: this salve likewise will helpe impostumes, hard tumors, and other swellings by blowes or falls.

Tabacco Anguicum. English Tobacco.

CHAP. CX.

Pedicularis sive Fistularia. Rattle grasfe.

Of the Rattle grasfe there are two especiall kinds, the one with red flowers, the other with yellow, and of each severall sorts as shall be shewed.

1. *Pedicularis pratensis rubra vulgaris*. Common red Rattle.

This hath sundry reddish hollow stalkes and sometimes Greene rising from the roote, lying for the most part on the ground, yet some growing more upright with many small reddish or greenish leaves set on both sides of a middle rib, finely dented about the edges: the flowers stand at the toppes of the stalkes and branches of a fine purplish red colour, like small gaping hoods after which come flat blackish feede in small husks which lying loose therein will Rattle with shaking: the roote consisteth of two or three small whitish strings, with some fibres thereat.

2. *Pedicularis major Alpina*. The greater mountaine Rattle grasfe.

This riseth up neare halfe a yard high with a thicke crested stalke set somewhat thicke, with long stalkes of winged leaves made after the manner of Ferns, notched about the edges one above another, the flowers are like the former but of a whitish colour growing in a long spike, after which doth follow broader huskes containing flat feede therein like unto Madwort: the root is long, thicke and blacke.

3. *Pedicularis minor Alpina*. The lesser mountaine red Rattle.

This smaller sort groweth much lower then the last, and with fewer leaves on the stalkes, which are slender also but hollow like unto them: the flowers likewise are smaller and set on a shorter spike, but of a brave shining red colour: the huskes that follow are greater then the first, with long beakes at their ends, having cornered feede within them: the roote is long and white of the bignesse of ones finger, with some great fibres thereat.

4. *Pedicularis sive Crissa galli lutea*. Yellow Rattle, or Coxcombe.

The common yellow Rattle hath seldome above one round Greene stalke rising from the roote about halfe a yard or two foote high, and with but few branches thereon, having two long and somewhat broad leaves at set a joynt deeply dented or cut in on the edges, resembling therein the crests or combe of a Cocke, broadest next to the stalke and smaller to the end: the flowers grow at the toppes of the stalkes with some shorter leaves with them, being hooded after the same manner that the others are, but of a faire yellow colour in most, or else in some paler and in some more white: the feede is contained in large huskes, and being ripe will rattle or make a noyse with lying loose in them: the roote is small and slender perishing every yeare.

5. *Pedicularis Alpina lutea*. Mountaine Yellow Rattle.

The stalke herof groweth halfe a yard high, set with long winged leaves, composed of many small finely

1. *Pedicularis pratensis rubra vulgaris*.
Common red Rattle. 4. *Pedicularis sive Crissa Gallii lutea*.
Yellow Rattle, or Coxcombe.

dented leaves up to the toppes of them, where they are bare of leaves and beare long spikes of gaping and hooded yellow flowers, which yeeld afterwards small long huskes like those of Snapdragon with small seede in them: the roote is made of divers long blackish fibrous strings.

6. *Crista galli lutea umbellata*. Yellow Rattle with flowers in tufts.

This hath but few and narrow leaves of an inch long a peece, rising from a slender small roote and a stalk from among them little more then an handbreadth high, having many yellow flowers set together at the toppe as it were in an umbell or tuft, fashioned like the other, but three times longer then those of the common sort, and with great broad huskes containing the seede after them.

7. *Crista Galli angustifolia montana*. Mountaine narrow leaved yellow Rattle.

This yellow Rattle hath two long and narrow pointed Greene leaves dented about the edges, set one against another upon the stalk, which is a cubit high, from betweene which rise other smaller leaves and a small stalk likewise an inch or two long, with very small leaves thereon, and small pale yellow flowers like the ordinary sort but smaller, with flat seede in small huskes following them.

The Place and Time.

Some of both these kinds grow in our medowes and woods generally through the land, where they are rather a plague or annoyance to it, then of any good use for the cattle, but the rest in Germany except the sixth which is of Spaine; and are in flower from Midsummer untill August be past sometimes.

The Names.

The later writers (for none of the ancients have remembred any of them as farre as can bee understood) call them *Pedicularis* and *Pedicularia*, because that sheepe feeding thereon will breede lice, it is called also *Fistularia* of the hollownesse of the stalkes and *Crista Galli* or *Gallinacea*, because the flowers as some thinke stand like a Cocks Combe at the toppes of the stalkes: others thinke it to be so called of the leaves especially, of the yellow whose dentings on the edges resemble the Combe or crest of a Cocke: some also call them *Alectorolophus* of *Pliny*, whose description commeth nearest unto this, above any other herbe that is knowne: some also referre it to the *Mimulus herba* of *Pliny*, lib. 18. cap. 28. which as he saith is the worst herbe in a field, but some thinke the word of *Pliny* should rather be *Nummulus* for *Nummularia*. The first is called by all these names by the sundry authors that have written thereof, and *Lugdunensis* besides calleth it *Crista galli altera* sive *Phthirion*: the second is called by *Lugdunensis* as I doe in the title *Pedicularis major Alpina*, and *Bauhinus* *Pedicularis Alpina Filicis folio* major as he doth the third *Filicis folio minor*, and is the *Alectorolophus minor* of *Clusius*: the fourth is called *Pedicularis pratensis lutea* vel *Crosta Galli* by *Bauhinus*; and *Campestris* by *Tragus* or *Crista galli* or *Gallinacea* by *Donatus*, *Lobel*, *Clusius*, &c. the fifth is called by *Lugdunensis* *Filipendula Alpina*, and *Pedicularis Alpina lutea* by *Bauhinus*: the sixth and last are mentioned onely by *Bauhinus* with the same names are in their titles. The French call it *Cresse decoe*, the Germans *Bravv rodel* and *goel rodel*, and some *Lenckraut*, the Dutch *Ratelen*, and we in English red or yellow Rattle, and Rattle grasse, Cocks combe and Loufewort.

The Vertues.

The red Rattle is accounted profitable to heale up Fistulaes and hollow Vicers, and to stay the flux of humours to them, and also the abundance of womens courses, or any other flux of blood, to be boiled in harsh or red wine and drunke. The yellow Rattle or Cocks Combe is likewise held to bee good for those that are troubled with a cough or with dimnesse of sight, if the herbe being boiled with beanes and some honey put thereto bee drunke or dropped into the eyes: the whole seede being put into the eyes doth draw forth any skinnie, filme or dimnesse from the sight without trouble or paine. Some hold it to be of a cold and drying propertie.

CHAP. CXI.

Balsamina mas. The Male Balsame Apple.

Have in my former booke given you the knowledge of the female Balsame, it resteth in this to shew you the male, which for the excellent healing properties of this as well as the other, deservedly have received the name of a Balsame, and therefore I thinke it not amisse to give you the figure also of the female and male altogether: the male may either be reckoned among the climbers for the manner of the growing, or for a kind of Cowcumber as some authors doe, for the forme of the flowets and fruite. It springeth up with divers slender reddish stalkes and branches, shooting forth many clasping tendrells like a Vine, whereby it taketh hold of any poale or other thing that standeth neare it (yet had neede of some binding thereto least the winds blow it downe) having leaves thereon cut in on the edges into sundry divisions, like unto a Vine leafe, or the white Bryony, but much smaller, tenderer and more divided: the flowers are yellowish white, like unto those of Cowcumber, cumming forth in the same manner, at the joints with the leaves; after which come the fruite which is somewhat long and round, pointed at both ends, at the joints with the leaves; after which come the skin it selfe being smooth and very red, almost blacke when it is ripe, having a reddish pulpe, within which lye divers rough and hard flat reddish seede, but of a grayish blacke colour, being dried, somewhat like unto Citrull feedes for the forme and bignesse: the rootes are small and stringy, perishing with the first cold nights it feeleth, and the whole herbe withereth presently.

The Place.

Wee have alwayes had the seede hereof from Italy, where also they nurse it up in their gardens, the naturall place of the growing being unknowne to them.

The Time.

It flowreth late with us and seldome or never giveth ripe fruit, our cold nights being over eatly, for it to ripen before it feele them.

The Names.

This never found any Greeke appellation that I can heare of, but is called in Latine *Balsamina mas*, to distinguish it from the other that is called *femina*, and tooke the name from the *Balsamine* or healing properties are in it,

Balsamina mas. The Male Balsame Apple.*Balsamina femina.* The female Balsame Apple.

it, yet is thought by some to be the plant that *Pliny* in his 20. booke and 3. Chap. saith the Grecians called *Cucurbita Somphos*. Some calleth it *Viticella*, from the shew of a small vine it beareth; *Cordus* in his history of Plants calleth it *Cucumis puniceus*, *Gesner* *Balsamina pomifera*, *Lobel* *Balsamina Cucumerina punicea*, the *Italians* call it *Balsamina*, and *Caranza* (from whence came the name *Carantia*) and *Momordica* (yet differeth as *Matthiolus* noteth it from the greater kind of *Geranium*, with Mallow like leaves so called also, whereof is spoken before) and some *Pomo di Hierosolima*, *Pomum Hierosolymitanum*, the *French* *Merveille* & *Pome de Merueille*, *Pomum Mirabile*, the *Germans* *Balsampffel*, and *Balsamkraut*, the *Dutch* *Balsame appel*, and we in *Englishe* the Male Balsame Apple, and of some Apples of *Hierusalem*.

The Vertues.

The Balsame Apple is dry in the second degree, and temperately cold, a decoction of the leaves in wine, or the powder being drunke is sayd to ease the griping paines of the bowells, and the collicke passion, as also of the mother if it be injected with a Syringe for the purpose: the powder of the leaves taken in the distilled water of Horsetaile or Plantane, is a singular remedy for the Rupture or bursting in children: the chiefest manner of using it in *Italy*, is to make an oyle of the fruit thereof, when it is ripe by infusing the Apples, the seede being first taken forth (and yet some make an oyle out of the inner kernell of the seede, by expression, in the same manner that oyle is expressed from Almonds) in oyle Ollive and set in the Sunne for certaine dayes, or digested in *Balneo*, or *Fimo Equino* which is effectually not onely for inward wounds or hurts whatsoever being drunke, (the powder of the leaves also is effectually) but for all other outward wounds, be they fresh and greene, to foder the lips of them and heale them, or old and inveterate Vlcers to dry up the superfluous moisture, and defluxion of humours hindring their healing, and to heale them quickly: the same oyle also is very profitable for all prickles or hurts in the sinewes as also for crampes and convulsions, if the places bee therewith annointed, and to heale the Vlcers of the secret parts in man or woman, or womens breasts that are sore or swollen: it helpeth also to ease the paines of the piles: it cureth also scaldings or burnings by fire or water: it taketh away the scarres that remaine of wounds and hurts being healed, it doth also take away the paines of the stings of Bees and Waspes: it is said likewise to be very profitable for women that are barren by correcting the superfluous humidity of the mother, which might be the cause thereof, and thereby to make them fit to conceive.

CHAP. CXII.

Trifolium odoratum. Sweet Trefoile.

He name of Balsame mentioned in the last Chapter, causeth me to joine this herbe next thereunto, being so called also of many, and the properties well worthy of that name, whereunto I thinke meete to joine two or three other Trefoiles thereunto, this being of knowne properties, the other of likely.

1. *Trifolium*

1. *Trifolium odoratum* five *Lotus Urbana*. Sweet Trefoile or Balsame.

The sweete Trefoile riseth up with one strong round whitish stalke, three or foure foote high, spreading forth many branches on all sides, whereabout are set many leaves upon long footestalkes, three alwayes set together, of a whitish Greene colour, very soft, and somewhat dented about the edges, of the sent of *Fennigreek*, which is thought to alter seven times a day, and is but a fancy, at the toppes of the branches stand many flowers closely set together, each of them like unto those of *Mellilot* but larger, and of a bleake, or pale, watchet, blew colour: after which come round white heads containing darke yellowish coloured seede: the roote is small white and threddy, perishing every year, and raising it selfe from the seede that sheddeth, or being sown in the Spring.

2. *Trifolium Asphalites* five *bituminosum*. Strong smelling Claver.

This kinde of Trefoile or Claver hath his first leaves somewhat larger and rounder then those that grow upon the stalkes, three alwayes standing together upon a long footestalke, of a darke Greene colour almost shining, set with some hairinesse thereon: the stalke is strong round and hairy also, rising to the height of two foote or better, whereon grow the leaves, more long and pointed then the lower, branching from the bottome most usually to the toppe, where grow many large flowers in a bush or tuft, thicke set together, of a blewish purple colour and somewhat hairy or hoary withall especially the huskes containing the flowers, which afterwards turne into hairy brownish broad cods containing every one but one seede, which is somewhat broad, rough and pointed at the one end: the roote perisheth with us every year, but abideth in the hotter countries where it is naturall. The smell of the leaves and whole plant is somewhat strong almost like Rue, or Herbegrace, especially while they are young, but much stronger when they are growne old, even of *Bitumen* whereof it tooke the name: but although it retaineth his sent in his naturall and hot places; yet with us I have observed the strong sent waxeth weaker every year then other, and after the second year sowing to be almost without any sent at all; so much can doe (in this as in many other plants) the temperature and moisture of our country.

3. *Trifolium Bituminosum Americanum*. Strong smelling Claver of America.

This other bituminous Claver hath a slender, darke red, cubit high stalke, branching from the bottome to the toppe, set with long leaves which are hairy and clammy, three alwayes together on a long footestalke, not smelling so strong being bruised as gently touched, the young shoots smelling like Rue or Herbegrace, the elder like a Goate or Bitumen: the ends of the branches have purplish flowers on them like *Scrophularia*, the great Figwort with three leaves standing out, and one turned inward, but white within: the Greene pods that follow have the like hairy clamminesse with the leaves, being of a fingers length, and a small purplish tippe at the ends, wherein lye Kidney like seede: the roote is long and fibrous, whose taste is almost as sharpe as the *Anemone*: being annuall as *Cornutus* saith it is to be yearly sown (but if it be *Galega Americana flore purpureo* as hee there saith some called it, and whereby *Robinus of Paris* sent mee a plant long since, it dyeth not but abideth many

1. *Trifolium odoratum*:
Sweete Trefoile. 2. *Trifolium bituminosum*.
Strong smelling Claver.

years.

3. *Trifolium bituminosum Americanum.*
Strong smelling Claver of America.

4. *Trifolium Americanum.*
Trefole of America.

yeares yet did never come to flowting since I had it) In his booke likewise he laboureth sprightly to prove that this plant commeth nearer to the description of *Dioscorides* his *Trifolium Aspalathite*, then that other last described which is accounted the trust with all writers, his greatest reason being grounded from the colour of the flower, which in this received is not purple like the *Hiacinth* which is *Galens* note.

4. *Trifolium Americanum.* Claver of America.

This strange Claver bringeth forth many round stalkes, leaning to the ground, spreading forth into many branches, whereon are set in divers places three leaves upon long footstalkes, each whereof is somewhat round like the *Bituminosum* but larger, of a darke greene colour, more dented about the edges, but of a strong sent, much like thereunto; at the toppes of the stalkes and branches stand long spikie eares of whitish flowers, being somewhat smaller then those of that recited strong smelling Claver, after which come in their places small round and flattish feede: the roote is small and stringy, spreading divers wayes.

The Place.

The first groweth not wilde in *Italy*, *France* or *Germany*, but with them all is onely sown in their Gardens, and so it is with us; and even *Dioscorides* saith it grew in Gardens in his time, as not growing wilde in *Greece* or other places that he had heard of. The second groweth about *Mompelier* and *Marseilles* as *Pena* and *Lobel* say, and is a stranger at *Venice* and other places of *Italy*, as well as in *Germany* and withus, and onely to be found in the Gardens of those that are curious conservers of rare plants. The two last come from the *West Indies* called *America* as it is thought.

The Time.

The first flowreth in *June* and *July*, and doth alwayes perfect his feede, but the others because they flower later, doe often misse to give good feede, whereby we are often to seeke for them againe.

The Names.

The Greeke *Noris* seemeth to be taken a voluptate, for so *Homer* saith it serveth *Deorum voluptati*. The first is of most of the best writers taken to be the *Noris* of *Dioscorides* in Latine *Lotus sativa* or *Urbana*, yet *Matthiolus* taketh it to be his *Noris azele*, *Lotus sylvestris*, and so doe *Anguillara* and *Castor* *Durantes*, but *Fuchsius*, *Cordus*, *Gesner*, *Camerarius* and *Dodoneus* call it *Lotus sativa*, *Lacuna*, and *Turner* *Lotus urbana*; *Tragus* calleth it *Trifolium Dioscoridis*, for so *Dioscorides* saith his *Lotus sativa* was called. *Dodoneus* calleth it *Trifolium odoratum*: *Lobel* calleth it *Lotus hortorum odora*, onely *Tabernmontanus* calleth it *Melilotus vera*, *Banhus* calleth it *Lotus hortensis odora*, and is the *Melilotus singularis Alpini* by *Pena*, in the description of *Mons Baldus*. Most now a dayes call it *Trifolium odoratum*, and the *Germanes* of old time called it *Siben gezeit* (as *Tragus* and others set it downe) that is heaven times sweete; supposing it lost his sent and gained it againe so many times in a day, which is but a fancy as I said before, but being gathered and kept dry in the house it doth keepe his sent a little, but will smell stronger against rainy weather, whereby many desire to lay it in their chambers, to be as it were their Almanacke to shew them faire

faire and foule weather. It is called of many women now a dayes Balsame for the singular healing properties it hath: The other is called by all Authors *Trifolium Alpathicum*, or *Asphaltites* or *Bituminosum*, *Gesner in hortis Germanie* calleth it *Oxytriphylum*, as *Dioscorides* saith some used to call it in his time and *Menianthes*: The third is mentioned by *Jacobus Cornutus* in his booke of *Canada* plants. The last hath his name in his title, as much as is convenient to know it by: yet *Bauhinus* taketh it to be the *Loti sylvestris* genus *latifolium* ex *Armenia* that *Cesalpinus* mentioneth.

The Vertues.

The juice of the sweete Trefoile as *Dioscorides* saith is used with hony to be dropped into the eyes to heple the Vicers that happen therein, and taketh away all manner of spots, as pin or haw, as also all skinnes that grow over them to hinder the sight. *Galen* saith it is of a temperate quality, and that it is of a meane vigour in digesting, so it is of a meane propertie betweene heate and drynesse. The oyle made of the leaves and flowers hereof, in the same manner as I sayd of the flowers of white Melilot, is so soveraigne a salve (many women calling it a Baulme) for to dissolve all hard swellings, bunches or wenues in any part of the body, as also to repress moderately all inflammations, and helpeth to digest all corrupt and rotten sores full of corruption, bringing them to maturitie, and healing them perfectly that it is to be admired: as also to heare what properties they say it hath. and how wonderfully they extoll it, for all sorts of Greene wounds as well as old Vicers, as also to ease the paines of the Goute: It is said to be good for bruises and burstings of young children, for stiffenesse and lamenesse of joynts and sinewes, crampes, stiches, Aches, and generally all other the like outward diseases, whether they proceede of heate or cold. The distilled water is good to wash childrens heads that are broken out with scurfe or scabbes. They use to lay it in Chests and Presses to keepe Mothes from garments. The strong smelling Claver is of a stronger and hotter temperature, the decoction thereof made in wine and drunke, caseth the paines of the sides comming by obstruction, and provoketh Vrine as *Hippocrates* saith, it helpeth women who after their delivery are not well purged or cleared of the afterbirth, it provoketh their courses also, and helpeth to expell the birth. *Dioscorides* saith it is very effectuell against all venomous creatures, as Serpents or other, and as it is reported saith hee, the decoction of the whole plant taketh away all the paines thereof, if the place be washed therewith, but if any that hath a sore shall wash it with that decoction, which hath helped them that have bin bitten or stung, it causeth the same paines in that party, which he had that was stung or bitten, and was cured thereby. *Galen* reporteth this matter a little other wise, for hee saith that the decoction of the herbe Trefoile that is like unto an Hyacinth, taken in the Spring time when it is fresh, and boiled in water cureth those that are bitten and stung by Serpents and other venomous creatures, if the places be washed therewith; but if any that are found and not bitten shall bee washed with any of that decoction, (and doth not say as *Dioscorides* those that have a sore or that are washed with the same part of the decoction that the other that was bitten was washed with) they shall feele the same paines that he that was bitten felt; and further saith, the effect hereof is worthy of admiration that the same herbe should cure them that are bitten or stung, and cause a sound body or place to be alike evill affected, as if it were stung or bitten. *Pliny* also in his 21. booke and 21. Chapter saith, that he is led to beleve, that it is venomous to a sound party to be washed therewith, because *Sophaerles* the Poet saith so; and that *Simus* an excellent Philition affirmeth that the juice or decoction thereof applied to one not bitten or stung, procureth the same paines that he that is bitten or stung doth feele, and therefore perswadeth it not to be used but to those are bitten or stung by Serpents, &c. the flowers, leaves or feede cyther all together or each severally by it selfe being boiled in venegar, and a little hony added thereto being drunke is a speciall remedy for them that are stung or bitten by any venomous creature: the feede is of most force with *Galen* who appointeth it to be put into Treackles that he caused to be made for divers persons: the feede also boiled in honied water and drunke is singular good for the Plurisie, provoketh Vrine and allayeth the heate thereof, and is good for the Strangury: it helpeth those that have the falling sicknesse, and is singular good for women that have the rising and strangling of the mother, whereby they often seeme to be dead: the same decoction is also good for those that have the Dropisie, and taken before the fit of either tertian or quartaine Ague, it lesseneth the fits both of heate and cold, and by often using it doth quite take them away: three drammes of the feede, or foure of the leaves powthered and given in drinke provoketh womens monthly courses effectually. The second Claver of *America* by reason both of the forme of the leaves, and smell so neare thereunto may seeme to be of the same property, but I have not knowne any that have made triall of the effects.

CHAP. CXIII.

Melilotus. Melilot, or Kings Claver.

He *Lotus Urbana* mentioned in the last Chapter causeth mee to joine the Mellilots next thereunto both for the forme name and nature, being no lesse effectuell in healing then the other, and unto the more common and knowne sorts to adde some more unknowne to close up this *Classis*.

1. *Melilotus vulgaris.* Common Melilot.

This Mellilot which is most knowne and growing wilde in many places of this kingdom, hath many Greene stalkes two or three foote high, rising from a tough long white roote which dyeth not every yeare, set round about at the joynts with small and somewhat long, strong, well smelling leaves, three alwayes set together unevenly dented about the edges: the flowers are yellow and well smelling also, made like other Trefoiles but small standing in long spikes one above another, for an hand breadth long or better, which afterwards turne into long crooked cods wherein is contained flat feede somewhat browne.

2. *Melilotus flore albo.* White flowered Melilot.

This Mellilot is very like the former, but hath more woody stalkes rising up higher, greater, and with smaller Greene leaves, smelling neare unto the former, but weaker: the flowers likewise grow in longer spikes and more in number, of a white colour and lesser also, which turne into small round heads and not crooked like the other: the

the roote is tough whitish and slender, perishing usually after it hath given seede but rayseth it selfe againe of the shed seede, flowering the next yeare after the springing usually or after the seedling.

3. *Melilotus Italica*. Italian Melilot.

The Italian Melilot hath seldome more then one stalke rising from a roote which quickly groweth whitish and somewhat woody, set here and there with three leaves at a joynt which are much larger then the former, and the end leafe larger then the other two, somewhat unevenly waved or cut in on the edges, of a sent almost as strong as the first, yet somewhat more pleasant: at the toppes of the stalkes stand many flowers spike fashion, but of a more deepe yellow colour, and somewhat larger also then the first which turne into round whitish heads greater then the last, wherein usually is but one seede contained: the roote is small long and woody, perishing every yeare, and seldome riseth of the shed seede, but must be new sown every spring.

4. *Melilotus Syriaca*. Assirian Melilot.

The Assirian Melilot riseth up with divers stalkes about two foote high, set with joynts, at every one of them three leaves somewhat larger then the first, but not so large as the last, and a little dented about the edges: the stalkes branch forth toward the toppes, whereon stand many pale yellow flowers set in order one above another as in the former, which turne into small long and somewhat flat cods, a little crooked or bending at the end like an Hawkes bill, wherein the seede is contained: the roote is woody and peristeth every yeare after it hath given seede: the whole plant as well flowers as leaves and seede did smell very sweete at their first bringing into Europe, but by degrees grew every yeare weaker, so that as it seemeth it hath not now neare halfe so good a smell as formerly it had: this kind as *Pena* saith is used in Italy in stead of the true Melilot, whereof they have small store growing with them.

5. *Melilotus Aegyptiaca*. Egyptian Melilot.

This small low Melilot riseth up with many slender weake stalkes, rather lying or leaning downe to the ground, then standing upright; whereon grow at the severall joynts thereof, two small Greene leaves, and from the joynt likewise a small long stalke, bearing three small Greene leaves at the end; the stalkes branch forth diversly, having many small flowers standing at the toppes of them spike fashion like the rest, and of a deepe yellow colour; after which come small cods a little crooked at the ends, wherein is contained small round brownish seede, smelling some what like unto Melilot, and of a Stipticke and somewhat bitter taste: the roote is small with some fibres set thereat.

6. *Melilotus Hispanica folijs maculatis*. Spanish Melilot.

This Spanish Melilot hath divers small branches little more then a foote high, at the joynts whereof stand two small Greene leaves, and likewise in the bosome thereof a small long footestalke, bearing three small darke Greene leaves at the end somewhat round pointed, and having many white lines like veines running through every one of them: the flowers are small, of a pale yellow colour, standing at the toppes of the branches, like the other but smaller, the roote is small and stringy: this hath a small sweete sent somewhat like unto a Melilot, which hath caused it to be referred to that tribe or family.

1. 2. *Melilotus vulgaris vel flore albo*.
The common yellow or white flower'd Melilot.

3. *Melilotus Italica*.
Italian Melilot.

7. *Melilotus Indica Orientalis.*
East Indian Melilot.

The East Indian Melilot is a small low plant, scarce rising above halfe a foote high, with small slender brownish stalkes beset in severall places with very small Greene leaves, three alwayes growing together like the rest, little or nothing dented about the edges: the toppes of the stalkes being not branched at all, are furnished with many very small flowers, of a deepe yellow colour; after which come small round heads, somewhat like unto the Italian Melilot, before spoken of, wherein is contained small brownish blacke seede, which hath a strong smell of Melilot, which the other sorts of Melilot have not, the herbe and flowers hereof having but a very small or no sent thereof; the roote is small and perisheth every year, and must be new sown in the Spring every year that you will see it.

The Place.

The first as I said is found in many places of this Land plentifully, as in the edge of *Suffolke*, and in *Essex* in divers places, as also in *Huntington* shire and in other places more sparingly, but most usually either in corne fields, or in corners of Medowes, and in worse places sometimes. The second groweth not in any place of this Land naturally but is very frequent in *Germany*, and is onely nuried up in Gardens with us: The third came to us from *Italy*, and by that *Italian* name wee hold it still: The fourth is said by *Pena* and *Lobel* to come first from *Aleppo* in *Syria* to *Venice*; where being sown it was found to be of an excellent smell, as I said before, but degenerated successively by degrees: The fifth *Prosper Alpinus* saith is peculiar onely to *Egypt*, where they use no other sort of Melilot, as not having any others growing with them: The sixth *Bauhinus* saith was found on the Mountaines of *Casile* in great plenty. The last hath beene sent us from *Italy*, among divers other strange seedes by that name, and therefore wee must imagine untill it can bee disproved, that they came from the Easterne parts of *Asia* major, which usually wee call the East Indies.

The Time.

They doe all flower in the Sommer Moneths of *June* and *July*, and their seede is ripe quickly after.

The Names.

It is called in Greeke *μυλίσκος* quasi *Mellita lotus*, a *Lotus* that smelleth sweete like Honey. In Latine anciently it was called *Serjula Campana*, because the flowers growing in the fields of *Campania* were used to bee put into Garlands, and *Corona regia*, because the yellow flowers doe crowne the toppes of the stalkes. Some also have called it *Trifolium odoratum*, but we have another garden Trefoile, more properly called by that name, as you heard in the former Chapter. Some also call it *Trifolium equinum*, or *Caballinum*, because it is good pasture for horses, wherein they delight and thrive well with it; in *English* wee call it generally Kings Claver as the chiefeft of all other three leaved grasses, generally called Clavers or Claver grasses, and Melilot after the Latine name to be the more easily understood, yet in some places they call it Harts Claver, because if it grow where Stagges and Deere resort, they will greedily feede thereon. And in some places of *Essex* they call it Hartwort, because as they thinke the seede thereof happening into their bread caused paines in the stomacke and chest, which they usually call the Heart burne or paines of the heart. The first is called by most Authors *Melilotus* after the Greeke name; the old Latine name of *Serta* or *Serjula Campana*, being quite left; *Tragus* calleth it *Melilotus major vulgaris*, *Camerarius*, *Dodonaeus* and *Lobel* call it *Melilotus Germanica*, and *Thalium* & *Dodonaeus* *Trifolium odoratum*, *Matthiolus*, *Durantes* and *Lugdunensis* call it *Lotus urbana* and *sativa*, *Fuchius* and *Lonicerus* *Saxifraga Lutea* and *altera*. The second is scarce mentioned but under the other, and is called by *Tragus* *Melilotus major candida*, and of *Dalechampius* *Lotus sylvestris flore albo*. The third *Camerarius* calleth *Italica*, and *Bauhinus* *Melilotus Italica folliculis subrotundis*. The fourth is called by *Tragus* *tertia species Meliloti vulgaris*, who saith it is most likely to be *Serapio* his Melilot: *Fuchius*, *Gesner*, *Dodonaeus* and *Matthiolus*, make it to be *Melilotus Italica*, but we have another more true species, called *Melilotus Italica* here set downe the next before this: and *Lobel* as you heard before called it *Melilotus Syriaca odora*, and that because it came from *Aleppo* as hee saith it was much used in *Italy* for the true Melilot, and therefore called *Melilotus Italica*. *Bauhinus* calleth it *corniculis reflexis major*. The fifth *Prosper Alpinus* saith is called in *Egypt* *Alchimelech*, and is the onely Melilot they use. *Bauhinus* calleth it *Corniculis reflexis minor*. The sixth *Bauhinus* onely giveth the name, being brought to him out of *Spaine*. The last hath his name in his title as it hath beene sent to us; which as I said doth still continue. There hath beene some controversie among our later writers, what herbe should be the true *Melilotus* of *Dioscorides*, some taking a kind of *Cytisum* to be it, others a *Medica* or *Lagopus*, and others a kind of wild *Lotus* without sent, and some also doubting of his Melilot, holding it rather to be *Dioscorides* his *Lotus urbana*: for as *Dodonaeus* saith, all the Apothecaries in *Germany* were wont to use no other Melilot then the *Trifolium odoratum*, but time by degrees hath worne out all these opinions, and settled a more constant of this, and is to now general y accepted; for in forme

mer times almost every country had a severall Trefoile with yellow flowers to be their *Melilot*. The *Arians* call it *Alchilemelich*, and the *Italians*, *Spaniards*, and *French Melilote*, the *Germanes* *Edlersteinkelee*, the *utch Groote Steenclayeren*, and *Ghermayne Melilot*; and in *English* as I have said before.

The Vertues.

Dioscorides saith, it hath an astringent or binding qualitie. It mollifieth all hard tumours and inflammations, it happen in the eyes or other parts of the body, as the seate or fundament, and the privie parts of man or woman, being boyled in wine and laide to the place, and sometimes the yolk of a roasted egge, or the powder of Fenegreke or Linseede, or fine flower, or Poppie seede, or Endive is added unto it. It healeth those impostumes that are fresh being applyed with *terra sigillata* and wine, and the spreading ulcers also in the head, being washed with lye made thereof. It easeth the paines of the stomacke, applied either fresh, or boyled with any her of the aforementioned things. It helpeth also the paines of the eares being dropped into them, and steeped in vinegar or Rosewater it mitigateth the headach: Thus saith *Dioscorides*. *Galen* saith in his sixth Booke of simple Medecines, that Melilot is of a mixt qualitie, for it hath a little astringent facultie in it, and yet it doth digest: or the warming or hot qualitie is more abundant therein then the cold. The *Arabian* Physitians doe appoint the seeds and feede, to be used in medicines, and make no mention of flowers. The *Greekes* contrariwise doe will the flowers onely to be used, and never make use of feede or codds; and therefore as *Mathioli* saith, it is no wonder that the compound plaister of Melilot, which the Apothecaries make, not having any of the meale of the feede of the true Melilot therein, doth not worke that effect that the Physicians doe expect, for this compound plaister is appointed to be used, to dissolve hardnesse, windinesse, tumours and swellings, both of the spleene, liver and belly, as also mightily to ease the paine of them all, and to heale the *Hypochondria*, or forepart of the belly, about the shortribs, when it is stretched or crackt by the swelling thereof; but there is another plaister called Melilot, which is much used, to draw and heale all sores and wounds that neede cleansing, and is made of the juice of the greene young Melilot, boyled with Rosen, Waxe, Sheepe tallow, and some Turpentine, which if it be well made, will be almost as greene as the herbe it selfe, and smell very strong thereof, although it be two or three years old. The flowers of Melilot and Camomill are much used to be put together into distillers that are given to expell winde, & to ease paines, as also into pultoses that are made for the same purpose, and to assuage swellings or tumors that happen either in the spleene or other parts, by the mollifying or dissolving qualities that are in it. It helpeth also inflammations whether in the eyes or face, or other parts of the body. The juyce dropped into the eyes is a singular good medicine to take away any filme or skinn from them, that groweth as a cloud to dimme the eyesight. It is effectually to be applied to those that have sodainly lost their senses by any paroxysme, as also to strengthen the memorie, to comfort the head and braines, and to preserve them from paines, and the feare of the Apoplexie, if the head be often washed, with the distilled water of the herbe and flowers, or a lye made therewith. The water also distilled serveth as a perfume, to wash course gloves or other things. The flowers and herbe of the white flowered Melilot, steeped in oyle Olive, and set into the Sunne to digest for some time, and after being boyled in a Balneo of hot water, and strained forth, and other fresh flowers and herbes being put thereto, and Sunned, as before and strained, and so used at the second or third time, is accounted a most soveraine Balme, both for greene wounds and old sores, for swellings, inflammations, crampes, convulsions, paines, or aches whatsoever in any part of the body, whether it be in any fleshy or muscullous part, or among the sinewes and veines. The *Italian* Melilot, is as effectually as any of the other, and by some accounted to be of more efficacie and vertue. The *Egyptian* Melilot, as *Alpinus* saith, the feede thereof onely is used by them, being boyled, and the places greaved, fomented and bathed with the warme decoction against paines of the sides, the Pleurisie and *Peripneumonia*, as also the paines of the collicke and winde in the belly, the windinesse or strangling of the mother, or any griefes thereof to sit in the decoction thereof; and if Fenegreke and Linseede, and Camomill flowers be added thereto, it helpeth all tumors or hard swellings thereof, and doth helpe to provoke the monethly courses, and to open the obstructions of the veines, and afterwarwards to strengthen the parts. The *Indian* Melilot, if wee would use the feede, which as I said before smelleth stronger than the rest of the plant, hath no doubt the same qualitie that the former have, the smell and taste perswading plainly thereunto.

Divers other herbes there are that might be referred to this Classis, some whereof are set forth in my former Booke, and some you shall finde specified as well in the precedent as subsequent Chapters of this Worke, which you may observe in the Vertues as you read them.

PLANTÆ REFRIGERANTES

ET INTVACEÆ.

COOLING AND SVCCORY
LIKE HERBES.CLASSIS SEXTA,
THE SIXT TRIBE.

CHAP. I.

Portulaca, Purslane.

NTO the cooling Herbes let me, I pray adjoyne the *Intubaceæ* or *Cichoreaciæ* whereunto they may more fitly in my minde be added, then to any other, not withstanding the bitterneſſe in ſome that argues ſome heate.

I have ſet forth the Garden Purslane in my former Worke, there remaine ſome other to be ſpoken of here, and firſt of the wilde Purslane.

1. *Portulaca Sylveſtris*. Wilde Purslane.

The Wilde Purslane ſpreadeth upon the ground ſappie reddiſh ſtalkes ſet with thicke fat ſhining greene leaves like in all things unto the garden kinde but ſmaller at the joynts, with the leaves toward the end of the branches, come forth very ſmall ſtarre-like yellowiſh greene flowers ſcarſe to be diſcerned, and as quickly falling away as the Garden kinde, and hath ſuch like hard huſkes wherein the like blacke

ſeede is contained : the rootes are threedes, and periſh with the firſt cold nights that come : this is ſomewhat more aſtringent in taſte (as for the moſt part all wilde herbes are) then the Garden kinde.

2. *Portulaca exigua Camerarij*. *Camerarij* his ſmall Purslane.

This ſmall Purslane alſo is like the other, but much ſmaller then it, having alwayes two leaves ſet together, of a paler yellowiſh greene colour on the thicke round ſtalkes and branches which ſtand a little more upright and bend downe to the ground againe : the flowers are like the former, and ſo is the blacke ſeede, but the huſkes open themſelves before the ſeede is ripe, and ſtand upon ſmaller and longer footſtalkes, this hath little or no taſte but wateariſh or herby.

3. *Portulaca Cretica*. Candy Purslane.

The Candy Purslane (which in my judgement might rather be referred to the kindred of the ſmall Houſeleekes, as *Camerarij*, *Columna* and *Basilini* doe, but that, I would keepe the name whereby it was ſent, for his ſake that ſent it) is a very ſmall low berbe not paſt two or three inches high, having many ſmall heads of leaves ſtanding round together, ſomewhat like the head of a ſmall Houſelecke, but each leaſe ſet further in ſunder and not cloſing which are very ſmall at the bottome, and ſodainly grow broad and round at the point, yet ſo ſmall as no leaſe is bigger than the naille of ones little finger, and of a pale greene colour, which ſo abide for the moſt part the firſt Winter after the ſpringing up, if the extremitie thereof doe not utterly rot it : in the Sommer following it ſhooteth forth into branches with ſomewhat longer leaves on them, and at the upper joynts and toppes ſtand divers ſmall whitith flowers, and after them appeare long pods a little crooked or bending upwards ſet together in forme of a ſtarre, wherein is very ſmall blackiſh ſeede contained ; the roote is ſmall and fibrous, and periſheth after ſeede time.

The Place.

The firſt groweth in Vineyards, Orchards, Gardens, and other rockie and ſtony places alſo where it is ſo apt to abide from it owne ſowing, that it will hardly be rid out againe : the ſecond *Camerarij* ſaith in *Herio Medico*, that he firſt before any other found it about *Lipſwicke* : the laſt was ſent me from *Hieronymus Winghe*, a Canon of *Tournay in Flanders*, who it is likely, either received it himſelfe or ſome other friend that gave it him from Candy.

The Time.

The two firſt doe abide all the Summer, from the Spring that they riſe, which yet is late, untill the cold nights doe nippe them, and cauſe them to periſh : the third, as I ſaid before, abideth the firſt Winter of it be not too violent, and ſeedeth the next Summer after the ſpringing.

The

2. *Portulaca sativa* & *sylvestris*.
Garden and wilde Purslane.

3. *Portulaca cretica*.
Purslane of Candy.

The Names.

It is called by *Dioscorides* in Greeke *ἀνδράχνη* *Andrachne*, and by *Theophrastus* *ἀνδράχνη* *Andrachne*, and so each of the m also call the *Arbutus* or Strawberry tree, which some call *Portulaca arbor* in Latine, as they also call this herbe *Portulaca herba*, of the *Arabians* *Bakle ancha*, and *Bachele albanica*, the *Italians* *Porcellana* and *Porchachia*, the *Spaniards* *Uerdolagus* and *Baldroegas*, the *French* *Pouypier* *Perchailles* and *Porcellaine*, the *Germanes* *Burzel*, *Burzel*, & *Poufelnant*, and *Grenzel*; the *Dutch* *Porcelayne*; and we in *English* *Purslane*: The first is generally called *Portulaca sylvestris*: *Gesner* and *Camerarius* call it *Portulaca minor*: *Cesalpini* and *Bauhinus* *Portulaca angustifolia*; and *Cordus* upon *Dioscorides* saith that *Cepa* is no other than the wilde Purslane: the second is called by *Camerarius* *Portulaca exigua*, and by *Bauhinus* *Portulaca arvensis*: the last was sent me by the name of *Portulaca cretica*, which as I said I am not willing to alter, although I know that *Camerarius* hath set it forth by the name of *Arzon peregrinum*, and *Columna*, by the name of *Sempervivum tertium Dioscoridis*, refusing that of others so accounted, and *Bauhinus* doth thereupon call it *Coryledon stellata*.

The Vertues.

Garden Purslane is cold in the third degree, and moist in the second as *Galen* saith, & is therefore good to coole any heate in the liver, blood, reins and stomach, and in hot agues nothing better: it staith also hot and collicke fluxes of the belly, as also of womens courses, the whites & gonorrhoea, the distillations from the head & the paines therein proceeding of heate, want of sleepe, or the frenzie: the seede is more effectuell then the herbe, and is of singular good use to coole the heate and sharpenesse of urinc, and the outrageous lust of the body, venereous dreames and the like, in so much that the over frequent use thereof extinguisheth the heate and vertue of naturall procreation: the seede being bruised and boiled in wine, and given to children that have the wormes expelled them; some doe more commend the seede of wilde Purslane for the wormes then the other: the juice of the herbe is held as effectuell for all the purposes aforesaid, as also to stay vomitings and taken with some Sugar or Hony helpeth an old and drie cough, shortnesse of breath and the tiskeke, and to stay an immoderate thirst taken upon extreame heate. The distilled water of the herbe is used by many as the more pleasing to the palate taken with a little Sugar and worketh to the same effect. The juce also is singular good in the inflammations and ulcers of the secret parts in man or woman, as also of the bowells and hemorrhoids when there are ulcers or excoriation in them. The herbe is sufficiently knowne to be used in fallers in the heate of the yeare, to coole and temper the blood and hot and fainting stomacks, and is good for them to use that have the falling sicknesse: the herbe bruised and applied to the forehead and temples, allaieth excessive heate therein causing want of rest and sleepe; and applied to the eyes taketh away the rednesse and inflammations in them, and those other parts where pusses, wheales, pimples, *Saint Antonies* fire, and the like, breake forth, especially if a little Vineger be put to it, and being laid to the necke with as much of Galls & Linseed together taketh away the paines therein, and the cricke in the necke: the juce also is used with oyle of Roses for the said causes, or for blasters, lightning, or planets, and for burnings by Gunpowder, or other wise, as also for womens sore breasts, upon the

the like hor causes, and to allay the heate in all other sores or hurts: it is said also to stay the spreading of venomous serpents bitings, and to draw forth the poyson; applyed also to the Navell of children that sticke forth it helpeth them, it is also good for sore mouthes and for sore gums when they are swollen, to fasten loose reeth, and to take away their paine when they are set on edge by eating fower things: *Camerarius* saith that the distilled water used by some tooke away the paine of their teeth when all other remedies failed, and that the thickened juice made in pilles with the powder of gum *Tragacanth* and *Arabeck*, and taken prevailed much to helpe those that made a bloody water: applyed to the Goute it easeth the paines thereof, and helpeth the hardnesse of sinewes, if it bee not caused by the crampe or in a cold cause. The wilde Purslane is used as familiarly in sallets and meates in many parts beyond the Seas where it groweth plentifully, as the Garden kinde, and they finde it no lesse effectuall a remedy for most of the diseases aforesaid, onely it cooleth not so strongly, but is more astringent and drying for fluxes and the like.

CHAP. II.

Portulaca marina. Sea Purslane.

He Sea Purslane might be entreated of with the other Sea plants in the proper place, but that I thinke it not meete to sever it from the other going before, and herunto for the neare likenesse and resemblance to joyne two other sorts of *Halimus*, which may be called Sea Purslans as well but growing in a hotter climate.

1. *Portulaca marina nostras*. Sea Purslane of our country.

The Sea Purslane hath divers hoary and grayish purple stalkes somewhat woody, rising from the roote about a foote or more long, lying for the most part upon the ground, bearing thereon many small thicke fat and long leaves of a whitish Greene colour set without order, at some joynts more and at some lesse, branching forth here and there, and bearing at the toppes many long sprigges or spiked stalkes, set round about with greenish purple flowers, which turne into whitish star rhinne feedes like unto those of the Sea *Arrache*, the roote is somewhat woody, with divers long strings joyned thereto and abideth with the leaves on the branches all the Winter.

2. *Halimus latifolius* sive *Portulaca marina incana major*. The greater outlandish or hoary Sea Purslane.

This hoary Sea Purslane sendeth forth divers thicke and woody hoary & brittle stalkes, foure or five foot high, whereon are set many thicke leaves, without any order somewhat short & broad, so hoary white that they almost glister: the flowers grow at the tops of the stalkes on divers long sprigges, being mossie like the Olive blossome, but of a purplish colour; after which come broad and flat whitish feedes like unto those of *Arache*: the roote is long hard and woody enduring many yeares in the naturall places, but must bee somewhat defended in the

Portulaca marina,
Sea Purslane,

2 *Halimus latifolius* sive *Portulaca marina incana major*.
The greater outlandish or hoary Sea Purslane.

Winter with us if you will have it preserved, yet bringeth not forth the leaves so hoary white with us.

3. *Halimus tenuisfolius* sive *Portulaca marina incana minor*. The lesser outlandish or hoary Sea Purslane.

This other hoary Sea Purslane hath very slender, weake, and somewhat hoary stalkes about two foote long, scarce able to stand upright, but for the most part fall downe and lye upon the ground, the leaves that grow on them being set in the same manner, that is without order, are narrower, longer and not so hoary white: the flowers are like the former, but of a more greenish colour growing at the toppes of the stalkes, and afterwards yeeld such like seede as the former, but somewhat lesse: roote is woody and endureth like the other.

4. *Halimus minor Germanicus*. The lesser sea Purslane of Germany.

This hath a small hoary stalke an handfull high, rising from a small threddy roote leaning divers wayes, branching forth a little above the roote, set with small and somewhat round leaves, and those up higher with a gash on each side, of an ash colour, the flowers are small greenish and mossie, yet yellow within, set on long stalkes, after which come square huskes with small gray seede like unto kidneys in them.

The Place.

The first groweth in the salt marshes of the Sea coasts of our owne land, in Kent and many other places: the second *Clusius* saith he found about *Lisbone* in *Portingall*, and the third as well in the kingdome of *Valentia* in *Spaine* as not farre from *Mompelien* and *Marselles* in *France*, and in the upland places about *Tholouse* as *Lugdunensis* saith, if his *Halimus* be this as you shall heare by and by, the last about *Northusa* in *Germany*.

The Time.

They flower in *Italy* and their seede is ripe in *August*.

The Names.

Diocorides, *Galen* and *Theophrastus* call it in Greeke *Ἀλῖς*. *Halimus* with an aspiration, because it is a sea plant, and talseth somewhat saltish, whom *Pliny* followeth and yet saith, a certaine herbe used to be eaten is so called also, as though it were differing from *Halimus* which as *Diocorides* and *Galen* say is used to bee eaten. *Solinus* and others call it *Ἀλῖς*. *Alimos* without an aspiration, and say the name was taken from the effect it worketh which is to expell hunger, for saith *Solinus*, the people in *Candy* say that that day they eate thereof they shall not be hungry, if you will belevee them. Divers herbes have bene taken for *Halimus* by divers writers, as the *Atriplex marina* by divers, the *Ligustrum* or *Privet* by *Lacuna*, and *Periclymenum rectum*, upright Woodbine by *Tragus*. *Lugdunensis* setteth forth a plant by the name of *Halimus vera Dalschampi*, the true *Halimus* of *Diocorides*, and saith it better agreeth thereto then those of *Clusius*, or any other, to whom *Clusius* scarce giveth credit, in that hee saith hee sheweth the fruit thereof to bee like unto *Ribes*, whom *Bauhinus* followeth, and saith that he knew not what plant it should be, but reading the place in *Lugdunensis* I finde *Clusius* to be much mistaken, for in the description thereof he setteth downe these words *Semen producit latum, candidum, in summis ramis copiosum*, which broad white seede can no wayes agree with *Ribes*. And for *Lugdunensis* to make it a different plant from *Clusius* his second *Halimus* whereunto himselfe saith it is like, I see no such great cause, more then that it grew in the upland countries, and that his Figure sheweth the leaves to grow many clustering together at a joyn. I have you see set the *Portulaca marina* with the *Halimus*; for in my judgement it differeth not so much from it, neither in forme of leaves or seede, which is (with me) a chiefe note of agreement or difference, not yet in place, but that it may very well be accounted the *Halimus* of our countrey, and other these Northerne parts, the climates chiefly making the distinction if any be, and hereunto I am the more induced because *Matthiolus* his first *Portulaca*, and *Clusius* his last be by them called *Halimus* which *Dodonaeus* and *Bauhinus* call *Portulaca marina*. *Lobel* and *Pena* affirme that the description of *Portulaca marina* doth better agree with the *Critthum* of *Diocorides* then the *Feniculum marinum* doth; first for that the leaves of *Critthum* are sayd to be white which in *Sampire* are Greene, next they are compared to Garden Purslane leaves but thicker longer, and broader, which cannot agree to *Sampire* being small long and somewhat round, and againe *Critthum* of *Diocorides* is said to be of a cubits height, but *Sampire* is little above an handbreadth or two high, these things considered did put some doubt in them and some others since whether our *Sampire* which is generally supposed to be the right *Critthum* of *Diocorides* be so or no: but hereof I shall entreate more hereafter when I shall speake of *Sampire* in the Classis of Sea Plants, *Ruellius* Lib. 1. Cap. 85. taketh that plant to be *Halimus* with which the French in divers places make their hedges, and call it *Blanche putain*, but he is therein much deceived, that being *Viburnum*; for I thinke he doth not make the *Viorne* to be it which yet they so call also: *Matthiolus* saith that the Arabians call *Halimus* *Molochia*, and that *Serapio* speaking thereof, saith that in *Babylon* it is carried by handfulls and cryed in the streets, but I thinke *Matthiolus* is herein deceived, for it is the true *Molochia* and not this herbe that *Serapio* saith they cryed in the streets: the last is called *Halimus minor* in his *Pinax* and *Prodromus*. The Italians as *Matthiolus* and *Lugdunensis* say call it *Bidone*, and *Clusius* saith the Spaniards call it *Marrisma*, and the Portugalls *Salguideiras*, and the French especially about *Tholouse* *L'herbe du Maselon*, id est, *Herba Colica*, the Collicke herbe for the properties sake: we call it Sea Purslane, as the Dutch doe so likewise.

The Vertues.

The *Halimus* or *Portulaca marina* (for as their formes so their properties are alike) is used to be eaten as other Saller Herbes are in all the places of their growing, for tasting somewhat saltish of the naturall soyle, being transplanted into other grounds, it much pleaseth the pallate, having a little astringent relish withall, whereby it is found as *Galen* saith to bee of different qualites, as well temperately hot sufficient to dissolve winde in the lower belly and guts, and the paines of the Collicke speedily, by drinking of the decoction of the leaves in wine, or of the juice put into wine and being boyled and eaten with oyle or butter, looseth the body, and yet by the astringent qualitie doth strengthen the loose or fluxible parts: the same also helpeth those that are troubled with Crampes or are bursten inwardly: it causeth also plenty of milke, not onely to Nurser for their children, but in Cattle also that feede thereon, or to whom it is given: it encreaseth also naturall seede: but that which *Diocorides* attributeth to the roote is found sufficient effectual in the leaves, the roote in these dayes being seldom used that I know.

CHAP. III.

Telephium sive Crassula. Orpine.

Here be divers herbes exhibited by divers authors for the true *Telephium* of *Dioscorides*, some great, some small, some tall some low, some of one fashion, and some of another, and yet none doth truly answer in all things the description thereof; but because all or most of them have given the name of *Telephium* to these herbes here expressed; let mee also if they have erred erre with them, and yet I shall shew you which of them cometh nearest unto the truth or true *Telephium*.

1. *Telephium sive Crassula major Hispanica.* The great Spanish Orpine.

The great Spanish Orpine hath divers weake round fappie stalkes rising two foote high, whereon are set at distances two large and thicke broad leaves, very like unto the common Orpine, but much larger and browner of colour oftentimes, and somewhat unevenly dented about the edges: at the toppes of the stalkes stand tufts of flowers, larger and more spread then in the ordinary fort, which consist of five small whitish leaves a peece, after which come small chaffie huskes with feede like dust in them: the rootes are thick, white, and tuberous, bigger and longer then those of the ordinary Orpine which abide all the Winter with the greeneleaves on their stalkes that have not as yet flowered.

2. *Telephium sive Crassula major vulgaris.* Common Orpine.

Common Orpine tiseth up with divers round brittle stalkes, thicke set with flat and fleshy leaves without any order, and little or nothing dented about the edges, lesser then the former, and of a paler greene colour, the flowers grow in lesser tufts, and are white or whitish in all that ever I saw, which afterwards beare such like feedes as the former: the rootes are divers, thicke, round, white, glandulous or tuberous clogges like the former but lesser: This proveth smaller in divers fields and woods sides where it is found wilde.

3. *Telephium floribus purpureis.* Purple flowered Orpine.

This Orpine differeth little from the last in manner of growing, but that the stalkes are more flexible and weake, and the leaves which stand without order are more finely dented about the edges, and the tufts of flowers at the toppes of the stalkes are of a reddish purple colour consisting of five small leaves a peece like the former, the roote is also tuberous like the last for the most part.

This also is found smaller in all the parts thereof not otherwise differing then in that the stalkes with all the leaves utterly perish every yeare to the roote, which every yeare sendeth forth new branches.

4. *Telephium minus repens sive Cypripedium.* Small creeping Orpine.

This small creeping Orpine sendeth forth divers weake round stalkes lying on the ground, and easily raking roote againe as they lye, thicke set with thicke fat leaves very like unto Purslane, but smaller and smaller upwards, of a darke or rustie greene colour, from among which rise bare or naked weake stalkes, without any, or with

*Stinus
sylvestre.*

*Stinus
florepur-
pureo.*

1. *Telephium sive Crassula major Hispanica.*
The great Spanish Orpine.

2. *Telephium sive Crassula major vulgaris.*
Common Orpine.

3. *Telephium floribus purpureis.*
Purple flowered Orpine.

4. *Telephium minus repens* five *Cepaea Panch.*
Small creeping Orpine.

5. *Telephium legitimum Imperati.* Imperatus of Naples his true Orpine.

but few leaves thereon, at the toppes there of stand small tufts of purplish flowers like the other, the rootes hereof are not tuberous but stringie, yet doe endure with the Greene leaves on them the greatest extremitie of Winter although it lose some of the lower leaves of the branches.

5. *Telephium legitimum Imperati.* Imperatus of Naples his true Orpine.

This small *Telephium* of *Imperatus* spreadeth upon the ground, with many small and long trayling branches a foote or more long, whereof those that will not flower that yeare have smaller and somewhat longer leaves on them, and thicker set together, but those that will beare flower are set sparsely without order to the toppes, and are lesser in forme, and lesse thicke and fappie then any of the other before, and of a fad blewish Greene colour: at the toppes of the stalkes stand thicke clusters of white flowers of five leaves a peece, and after them small cornered heads containing small brownish feede, the roote is small and long of a fingers length or two with divers branches and small fibres abiding with some branches of Greene leaves thereon, although those that have flowered and seeded doe perish.

6. *Cepaea Matthioli.* Matthioli his small Orpine.

The small Orpine of *Matthioli* hath a small weake stalke scarce a foote long lying almost upon the ground parted into sundry branches, and they againe into other smaller ones, set with small thicke long leaves with-

out

our any order, and somewhat like unto Purslane: at the toppes of the branches stand many small white flowers in tufts, but more thinly or sparsely set then in the former, consisting of five leaves a peece, after which come small heads like unto the Orpines containing small dustie seede, the roote is long and fibrous smelling somewhat sweete like the Rosewort roote as *Camerarius* saith, and perishing every yeare, so that if it rise not of the shed seede (which usually it doth if it be suffered to fall) it must bee new sowne every yeare.

The Place.

The first *Clusius* saith hee found as well in *Spaine* as in *Hungary* upon the *Alpes*: the second of both sorts, the greater and the lesser is frequent almost in every country of this land, the greater being generally cherished in Gardens, but yet is as I take it the same with the lesser sort, that groweth as I sayd in the shadowie sides of fields and woods: the third is often found in divers places of *Germany*, as *Tragus*, *Camerarius*, *Clusius* and others set downe: the fourth was sent out of *Italy* by *Alphonsus* *Pancius* a worthy Herbarist and Philistion of *Ferrara*: the sixth came from *Imperius* of *Naples*, from *Cortusius* and *Iosephus de Casa bona*, of whom *Clusius* saith he received the seede: the last is chiefly noursed up in the Gardens of those that are lovers of rare plants, and was first communicated from *Padoa*.

The Time.

They doe all flower about *Iuly*, and their seede is ripe in *August*.

The Names.

These herbes are referred to the *Telephium* of *Dioscorides* for the forme sake, and so taken by divers writers although none of them are found to have that cleansing facultie that *Dioscorides* and *Galen* attribute unto their *Telephium*: it tooke the name as it is thought from *Telephus*, the King of *Misia* whose wounds received from *Achilles*, and growne almost past cure were healed herewith, and from hence the medicines appointed for such purposes were called *Telephia*. The first is called *Telephium Hispanicum* of *Clusius* and others, and *Crasula major Hispanica* of *Lobel* and others: the second is called *Scrophularia media* vel *tertia* of *Brunsfelsius*, *Fabaria*, *Faba crassa* and *Faba inversa* by divers, and so also by *Lobel a foliorum fabe similitudine* and *Craustudine*, and *Crasula* or *Crasula major* by divers also, as well as by *Dioscorides a foliorum crassitie*, *Corium* upon *Dioscorides* calleth it *Acetabulum alterum* and *Columba* taketh it to bee *Coryledon* alterum of *Dioscorides*, *Gesner* in *hortis Germania* taketh it to be *Anacampteros*, and *Matthiolus*, *Dodonaeus*, *Clusius* and divers others call it *Telephium & vulgare*, because it is most common in all these parts: the third is called *Scrophularia* (sen *Portulaca major*; by *Tragus* *Telephium forficaria* by *Lobel* and others, *Acetabulum alterum purpureum* by *Fuchs* in his *Icones*, and is the *Telephium quintum* of *Clusius*, who thinketh his not to differ from that of *Lobel*, notwithstanding that the rootes thereof be expressed without tubers: *Casalpinius* calleth it *Crasula montana*, and *Columba* refusing it to be any *Telephium* saith it is a *Rapuntium*, and thereupon calleth it *Rapuntium umbellatum*: the fourth is the *Telephium sextum* of *Clusius* who taketh it more nearely to resemble the true *Telephium* then any other, and called by him and *Camerarius* also *Cepaea Pancij*, by *Dodonaeus*, *Lobel* and others *Telephium minus* and *repens*, and *semper vivens*: wee usually call this in *English* *French Orpine*: the fifth is called by *Clusius* *Camerarius* and all others that have scene or had it *Telephium Imperati*, and *Telephium legitimum Imperati*: the last is called *Cepaea* by *Matthiolus* and by some *Cepaea marina*, but generally by all that since have written of it *Cepaea Matthioli*. The *Italians* call it *Fabagrassa*, the *French* *Orpin*, *Fève grasse*, *Fève espaisse*, and of some *Reprise* and *Jonbarbe des vignes*; the *Germans*, *Wunderkraut*, *Dusenkraut*, *Fotzwein*, and *Fotzwang*, the *Dutch* *Schmerwortele* and wee in *English* *Orpine*, and of some *Livelong*, because a branch of the greene leaves hung up in any place will keepe the verdure a long time, which made *Tragus* to judge it the *Chrysosome* of *Dioscorides* or else an *Aizoon*.

The Vertues.

The qualities of our Orpine are as I sayd before differing from the *Telephium* of *Dioscorides*, in that they are cooling as Purslane is, especially the leaves, for the roote is more enclining to heate, and by reason of the mucilaginesse therein it is somewhat astringent also, whereas the true *Telephium* as *Dioscorides* and *Galen* say is somewhat hot, and of a cleansing drying qualitie, so that used with Vinegar it taketh away the Morpew, Leprey, and all other deformities in the skinne, and is good also for old foule Vicers and sores to cleanse and heale them. thus say *Dioscorides* and *Galen* of their *Telephium*, but divers have thought that the difference in qualitie may happen from the Climate as it doth in *Arum* which in some places of *Asia* and *Cilicia* as *Galen* saith is not sharpe and biting, as it is in these places of *Greece*, *Italy* and all *Europe*, and as it is found also in the lesser *Celandine*, which as they say is sharpe in some places but is not so found with us. Orpine is seldome used in inward Medicines with us, although *Tragus* saith from his country *Germanes* experience, that the distilled water thereof is profitably taken of those, that have any gnawings or excoriations in their stomacke or bowells, or have Vicers in their Lungs or Liver or other inward parts, as also in the matrix or mother, and doth helpe all those diseases, being drunke for certaine dayes together, and that it stayeth the sharpnesse of humors in the bloody flux, as also stayeth other

other fluxes of blood in the body or in the wounds: the roote thereof also performeth the same effect. It is used outwardly to coole any heate or inflammation upon any hurt or wound, and easeth the paines of them, as also to heale scaldings or burnings, the juyce thereof beaten with some greene sallet oyle and annointed, the leafe also bruised and laid to any greene wound in the hands or legges, doth heale them quickly, and as it is said, being bound to the throate of them that hath the Quinsie, doth helpe it very much: it helpeth ruptures or burstings, and from thence, as *Tragus* saith, the *Germans* call it *Bruch warts* and *Knabenkraut*. The leaves are much used to make Garlands about Midsommer with the corne Marigold-flowers put upon strings to hang them up in their houses, upon bushes and May-poles, &c. *Tragus* sheweth a superstitious course in his country, that some use after Midsommer day is past, to hang it up over their chamber doores, or upon the walles, which will be fresh and greene at Christmas, and like the *Aloe* spring and shoote forth new leaves, with this perswasion, that they that hanged it up, shall feele no disease so long as that abide th greene.

CHAP. IV.

Rhodia five *Rhodia radix*. Rosewort.

BEcause this plant is so like unto an Orpine, both in leafe, flower, and manner of growing, I thinke it fit to joine it next therunto. It sendeth forth divers stalkes which are upright, thicke round and greene, about a foote thicke set with leaves up to the toppes, and are somewhat long and narrow, like unto those of Orpine, but smaller, yet as fat or thicke, and of the like pale greene colour, dented about the edges: the flowers are many small and yellow, set in a tuft or cluster, but smaller than Orpine, with feede in heads like unto it also: the roote is thicke and tuberous or knobbie at the head, and branched out, rising oftentimes above the ground, whereas it groweth somewhat reddish, and is long downward, with divers fibres annexed unto it, which being a little broken or bruised with it, is fresh, much more than when it is drie smelleth like a Rose, from whence it tooke the name. Some doe account that there is, an other sort hereof whose leaves are not dented, and the flowers more purplish than the other.

The Place.

It groweth in the North parts of *England*, and no where else wilde in our Land as I can heare of, as upon the mountaines of *Pandle* and *Ingelborough*, oftentimes on the very raggiest places and most dangerous of them scarce accessible and so steepe, that they may soone tumble downe that very warily doe not looke to their footing, from whence hath bene sent me some rootes for my Garden.

The Time.

It flowreth about *July*, and the stalkes and leaves perisheth to the ground springing every yeare anew from the roote, which abideth firme in all extremities of cold.

The Names.

It is called in Greek *Ροδια ριζα*, *Rhodia radix*, not from the *Iland Rhodes*, but from the Rose, as I said, for the sent thereof: it hath no other name with all authors than *Rhodia radix* or *Rosea radix* that I know.

The Vertues.

It is found by good experience to be cold and not hot, as some have taken it to be, and as *Galen* placeth it almost in the third degree of heate: for even as red Roses, so this by the coldnesse is profitable to assuage the headache, arising from an hot cause, and both *Dioscorides* and *Galen* appoint it for paines in the head, the juyce thereof with a little Rosewater applied to the forehead and temples which *Gerard* vindicateth to his owne invention.

Rhodia radix. Rosewort.

Alta.

CHAP. V.

Aizoon *Sedum* five *Sempervivum majus*. The greater Houfleeke.

HERE are so many sorts of Houfleeckes properly and improperly so called both great and small, with whole or with divided leaves, some cooling and others heating or exulcerating, that without some methodicall division, I can neither expresse them conveniently, nor yon apprehend them effectually; which that I may do, I will digest them into five Rankes and orders, that is to say, of all the great ones in this Chapter, and of the smaller ones in the severall Chapters following, which because they are of much varietie, I must intreate of those that grow upon muddie stone walles or houses, and upon drie sandie banks and places in the next: thirdly, of these that grow upon rockes and mountaines or in stony places, and fourthly, of such as beare divided leaves, and lastly, to accomplish the history of all the sorts of Houfleeckes, I should set forth

forth the sorts of *Coryledon* or Kidney Worts, but having entreated of many of them in my former Booke, I will here shew you the rest that remaine.

1. *Sedum Majus legitimum*. The true great Houfeleeke.
The true great Houfeleeke groweth great to the forme of a shrubbe or woddy plant, of the height of two or three foote or more, sometimes in the naturall places which are the warme countries, whose stemme or trunk below is of the bignesse of foure fingers, and the other branches of ones thumme, of a grayish colour on the outside spotted as it were round about, but they are the markes of the old leaves that are fallen, the like whereof may be seene in the stalke of the Wood Spurge, spreading limber smaller branches on all sides, and leaves at the ends of them, standing in a compasse like the heades of common houfeleeke but nothing so close, every leafe formed somewhat like a tongue, small at the bottome and broader toward the end where it is broadest, finely dented about the edges, and as it were a little hollow like a Spooone, thicke and full of juice, and of a pale Greene colour, from the toppes of some of the branches thrusteth forth a long stalke divided into many twigges, with some few small leaves on them, and at the ends of them divers starrelike flowers, consisting of many small leaves of a pale yellowish colour, with sundry small threds in the middle of them, the greater stalke becommeth drie and smooth as the heads, with small blacke seede in them, grow ripe and utterly perishing after seedetime: but the other heads of Greene leaves abide fresh all the yeare, which send for the flowers the next yeare after, and may be taken before hand from the maine stocke to be planted, and will take roote being put into the ground. *Matthiolus* hath set forth the figure hereof in another manner with more store of branches and leaves, but it is the same plant growing peradventure in a warmer and more temperate climate.

2. *Sedum majus marinum Anglicum*. Great English sea Houfeleeke.
This kind of Houfeleeke is like the former whose stemme is woddy, but neither so high nor with so many branches, the leaves also, although somewhat like unto them, yet not so thicke or sappie, in the rest not much differing from the former.

3. *Sedum majus vulgare*. Our common great Houfeleeke.
Our common Houfeleeke sendeth forth on all sides divers heads of pale Greene thicke fat broad leaves pointed at the ends, lying circlewise one close unto another upon the ground from the middle of some of the heads of leaves, riseth up a streight stalke two foote high, all covered with smaller and longer Greene leaves than those below, which often drie and fall away before the toppe thereof hath perfited the flowers which grow on long branches bending their ends downewards, with a single leafe at the foote of every one of them, and consist of many leaves starre-fashion, of a darke reddish colour, after which come heads with small blackish seede in them: the roote is small and stringie, creeping all about, and from small strings multiplieth into many heads of leaves round about, taking up thereby a good compasse.

4. *Sedum majus alterum flore Atlante*. An other smaller Houfeleeke like the common.
This Houfeleeke groweth in like manner as the common doth, with such heads of thicke and pointed leaves compassing one another, but they are dented a little about the edges, and are much smaller than they, standing

1. *Sedum majus legitimum*.
The true great Houfeleeke.

2. *Sedum majus Marinum Anglicum*.
Great English sea Houfeleeke.

3. *Sempervivum majus vulgare.*
Our common great houselecke.

5. *Sedum rubrum tomentosum.*
Netted or woolly Houselecke.

6. *Sedum majus angustifolium.*
Great narrow leaved Houselecke.

7. 8. *Vermicularis arborescens* & *fruticosa altera.*
Tree Houselecke with small leaves, and Shrubby Prickmadam.

rato.*

upon longer stalkes that thrust out from the roote : from the middle of the greatest and eldest head, shooteth up a stalk scarce a foote high, thicke set with small leaves like the other, bearing flowers in the same manner, but larger, and consisting of fixe leaves, onely of a white colour, after which come fixe cornered heads, containing small blackish feede : the roote is small and like the other, yet a little thicker. *Clusius* maketh mention of another sort hereof, with lesser leaves and more dented in on the edges in little else differing. There is of this kinde an other alike in all things, saving the flowers which are of a brighter red colour than the common sort.

5. *Sedum rubrum tomentosum*. Nieried or Woolly Houfeleeke.

This rare Houfeleeke in the Autume and Winter hath the hoary or ash coloured heads of leaves, smooth, plaine, and open, like unto the ordinary sort, but when the Spring commeth on, it groweth overspread with a number of hoary or woolly threades like unto a net, that it draweth the leaves together, and sheweth divers formes, as triangles, quadrangles, quinquangles, & sexangles, the leaves themselves being smaller and longer than the ordinary sort but thicke and fleshy : in Summer when the stalk riseth to be halfe a foote high, they grow pointed up Pyramis fashion, thicke covered with that woolliness : upon the stalk are set many smaller and narrower leaves up to the toppe, which parteth into two, bearing on each sundry large spread flowers, of a deepe red Rose colour, ending in tenne points, as if they were so many leaves, but before they open to be like a starre, are plaited into ten plaits, each plait or fould being of a deeper colour, having twenty threads in the middle tipt with yellow, standing about the middle umbone which becommeth the feede vessell, and each flower set in a paler hairy huske pointed also : the roote is very small and thready, yet thrusteth it selfe into the chinks of the rockie and stony places, where scarce any earth is to be found.

6. *Sedum majus angustifolium*. Great narrow leaved Houfeleeke.

This kinde of Houfeleeke hath sundry circles of leaves somewhat like the former fort, but the leaves are narrower and longer, and a little rough or hairy withall ; the stalk that riseth from some of the heads is brownish, and about a cubit high, set thicke with narrower and red pointed, far thicke undented leaves up to the toppe, where it brancheth forth into some few, bearing each a flower of tenne or twelve long and narrow leaves, laid open like a starre, of a reddish purple colour ; the feede that followeth in so many small heads, as there were leaves in the flowers, is as small almost as dust : the roote is reasonable thicke, with divers strings fastened thereto.

7. *Vermicularis arborescens*. Tree Houfeleeke with small leavēs.

This kinde of Houfeleeke or Prickemadam, riseth up to be five or sixe foote high, as I have observed it when it groweth in Gardens, plentifully stored with branches from the bottome to the toppe, and set thicke with small long and round Greene leaves without any taste, very like to those of the small Houfeleeke called Stonecroppe, or Prickemadame, (although *Lobel*, as I thinke saith it hath a saltish taste) but lesser and greener, the flowers grow at the toppes of the branches, smaller than in the next that followeth, and of a pale yellowish colour : the rootes are long woody and spreading in the ground : the branches hereof slipped and put into the ground will quickly take roote and grow.

8. *Vermicularis fruticosa altera*. Shrubby Prickemadam.

This other shrubby plant groweth nothing so high as the former, not being above a foote high full of branches, covered with an ash coloured barke, as limber and pliant as it, the leaves hereof are somewhat greater and larger than the other, of a more saltish taste, and of a darker Greene colour : the flowers at the toppes of the branches are larger, but fewer, and of a yellowish colour, the roote is hard and woody.

The Place.

The first groweth in Greece, Italy, Portugall, Spaine, Illyria or Slavony, and some of the Isles in the Mediterranean sea, as Scitily, Sardinia, Corsica, &c. where it groweth naturally, but in divers places of Italy, Portugall and Spaine, it is kept, as *Clusius* saith, in pots, and carefully preserved in the Winter, & in Lisbon, as he saith, upon the houses as our common Houfeleeke, but will not endure the cold of these more Northern countries of Europe, with all the care that may be without a stove, such as they use in Germany and other places more Northerly ; yet *Lobel* saith, he found it in the Iland of Holmes by Brisflow : the second groweth by the sea side in many places of this Land, and in the Ile of Holmes not farre from Brisflow : the third groweth naturally on divers hills in Germany, but with us onely where it is planted upon house sides, &c. and that in clay especially, for therein it will best thrive. The fourth, *Clusius* saith, he found very common on the hills neare Vienna in Austria : the fifth *Columna* found in Naples : the sixth *Clusius* saith, he found on the Alpes neare Salzburg in Germany, the two last groweth by the sea side, and further off likewise where the last will take brackish as well as neare the sea side.

The Time.

The first flowreth in Portugall, as *Clusius* saith, in November and December, but never with us : the second flowreth by the sea side in August : the third, fourth, and sixth, in July ; the fifth in May ; and the two last sorts very late also.

The Names.

It is called in Greeke *Αιζων* or *αϊζα*, *Aizoon magnum* or *majus*, of the everliving and greenenesse thereof, and therefore *Gaza* translateth it out of *Theophrastus Sempervivum*, which is the same in signification ; it hath likewise divers other names, for as *Pliny* saith, it was called *Bupththalmum* *Zooththalmum*, and *Steigethron*, and *Hypogeson* ; some called it also, as he saith, *Oculus* and *Digitellus* : it is called by *Apuleius*, *Vitalis* and *Iovis karba*, but usually, *Sedum majus* ; the Arabians call it *Bejakalalem* and *Heialbale* ; the Italians *Sempervivum maggiore* ; the Spaniards *Semperviva herba puntera* ; the French *Grande Ioubarbe* ; the Germans *Hanswurtz* and *Donderbaer* ; the Dutch *Donderbaert* and *Huislook* ; we in English generally Houfeleeke ; yet some call it *Stengreene*, *Aigreene*, and some *Iupiters Eye*. Bullocks eye, and *Iupiters beard*. *Clusius* and others doe certainly affirme, that our ordinary great Houfeleeke is the *Coryledon altera* of *Dioscorides*, and no one can disprove their Judgements therein. The first is the true *Aizoon magnum* of *Dioscorides* ; and others, and there is no doubt made thereof by any. *Matthiolus* and others call it *Sempervivum arborescens*, and *Sedum arborescens* and *Aizoon arborescens* : *Clusius* calleth it *Sedum majus legitimum* : the second *Lobel* maketh a kinde thereof, and calleth it *Sedum Portlandicum* : the third is most common with us, and is generally called *Sedum majus*, and *Sempervivum majus vulgare*, which as I said, *Clusius* calleth *Coryledon altera* *Dioscorides* ; some also call it *Accabulum*.

lum majus, which peradventure is more proper to the first sort, and *Angulara*, *Umbilici veneris species altera*, *Cesalpinus*, *Cassia lignea similis frutex tertius*, who also thought it to be the *Selago* of *Pliny*, *Lobel* saith it may be *Chamaepence* of *Pliny* that is, *Picea humilis*; but *Selago* was called *Camphorata* by the learned of *Montpelier* from the smell of *Camfyre*, which the leaves being bruised give, but this hath no such smell, and therefore I thinke cannot be the *Selago* of *Pliny*, which is a different plant from this whereof I have spoken before, but it is probable that this plant is that which *Bauhinus* calleth *Sedum montanum Ericoides* as he saith himselfe; the last *Lobel* calleth *Sedum minimum arborescens vermiculatum*, *Bauhinus* maketh some doubt whether it might not be the *Polygonum masculum fruticosum* of *Thalins*, who saith he never saw the flowers, but saith it is not the *Polygonum alterum Serpillifolium Anglorum*, meaning *Lobel* and *Pena*, for so hee calleth them, because their *Adversaria* was printed in England.

The Vertues.

Our ordinary *Houfeleeke* is cold in the third degree, moderately drying and binding, and is good for all inward heats as well as outward, and in the eyes or other parts of the body: a Posset made with the juice of *Houfeleeke* is singular good in all hot agues, for it cooleth and tempereth the blood and spirits, and quencherh the thirst, and is also good to stay all hot defluxions of sharpe and salt rheume into the eyes, the juice being dropped into them, or into the eares helpe them, it helpeth also all other fluxes of humors into the bowells, and the immoderate courses of women: it is sayd also to kill the wormes, and to remedy the biting of the *Phalangium Spider*: it cooleth and restrayneth also all other hot inflammations, *Saint Antonies* fire, and all other hot eruptions in the flesh, scaldings also and burnings, the shingles, fretting ulcers, cankers, tetters, ring wormes and the like, and easeh much the paine of the gout, proceeding of an hot cause: the juice also taketh away warts and cornes in the hands or feete being often bathed therewith, and the skinn of the leaves being layd on them afterwards: it easeh also the headach, and dis tempered heate of the braine in frensyes or through want of sleepe, being applied to the temples and forehead: the leaves bruised and layd upon the crowne or scame of the head stayeth bleeding at the nose very quickly. The distilled water of the herbe is profitable for all the purposes aforesaid: the leaves being gently rubbed on any place stung with Nettles or Bees, or bitten with any venomous creature doth presently take away the paine.

CHAP. VI.

Aizoon Sedum seu Sempervivum minus. Small *Houfeleeke*.

He next rank of *Houfeleeks* that I am to entreate of, are of those smaller sorts that grow with us else where upon mudde and stone walls, or on dry sandy bankes or places, &c. whereof some are of a contrary qualitie, being hot, sharpe and exulcerating, whereunto I must adjoyne one other that groweth in moist meadowes, because it is so like them in the outward face.

1. *Vermicularis* & *Cassula minor vulgaris* seu *Illecebra major*.

The ordinary *Prickmadam* or *Stoncrop*.

The common *Stoncrop* groweth upon the ground with divers trayling branches, set with many thicke, fat, and somewhat round whitish or yellowish Greene leaves, a little pointed at the edges: the flowers stand at the toppes of the branches, many set together, yet somewhat loosely and not in a thicke tuft or cluster as the *Orpines*, of a yellowish colour, the rootes are very small creeping in the ground, and send forth stalkes with leaves here and there all abouts.

2. *Vermicularis Scorpoides*. *Stoncrop* with turning heads.

This other *Stoncrop* or *Prickmadam* hath such like stalkes with leaves thereon as the former, that it is hard to distinguish them untill they come to flower, which then may be discerned to differ onely in the turning toppes, of yellow flowers bending or turning like the taile of a *Scorpion*, or those herbes that are resembled unto it: the rootes in like manner creepe and shoote forth in divers places. Of this sort there is another whose head of flowers turneth not, which *Lobel* calleth *Hamatodes*.

Hamatodes.

3. *Vermicularis minor*. Small *Stoncrop*.

The small *Stoncrop* hath small and long leaves like the other, set upon short stalkes, not past an handbreadth long which are not so thicke but more flat, and of a more slipticke taste, the flowers are of a paler yellow colour and greater then the first, else standing in tufts in the same manner: the roote is like it also creeping about: this looferh both stalk and leafe in the Winter.

4. *Vermicularis flore albo*. white flowred *Stoncrop* with round pointed leaves.

The white flowred *Stoncrop* creepeth upon the ground in the same manner that the others doe, with slender stalkes and long round leaves upon them, of a blewish Greene colour, not sharpe but round pointed, seeming like wheate cornes or pine apple-kernels, being sparsedly set thereon: at the toppes whereof stand small white starre like flowers in small tufts or sparfed umbells: the roote creepeth like the rest, and the leaves perish with the stalkes every yeare like the last.

5. *Vermicularis dasiphylon*. A smaller white flowred *Stoncrop*.

This other *Stoncrop* groweth lower and hath more store of such small round leaves like wheate cornes, thicker set thereon then the other: the flowers are white also like the last, and in no other thing differeth from it.

6. *Sedum arvense* seu *palustre flore rubente*. Marsh or Field *Stoncrop*.

This Field *Stoncrop* hath divers reddish stalkes set with small fat long leaves, somewhat hairy, and much greener then any of the former: the flowers are small standing like starres, many in a tuft together, of a pale red or carnation colour: the roote is like the rest, sending forth divers shoots: this abideth Greene all the Winter, and hath as little taste as the former.

7. *Illecebra minor* seu *Sedum tertium Dioscoridis*. Wall Pepper.

This wall Pepper is almost the smallest of all these, and groweth like the former with very many and slender stalkes, and small round leaves thicke set upon them, at the toppes whereof grow small pale yellow flowers

1. *Vermicularis* sive *Crassula minor vulgaris*.
Prickmadam or Stonecrop. 2. *Vermicularis Scorpoides*, & non *Scorpoides*.
Stonecrop with turning heads and without. 3. *Vermicularis minus*.
Small Stonecrop.6. *Sedum arvense* sive *pachyrrhizon rubrum*.
Marsh or Field Stonecrop.

in tufts as the others doe: the roote in like manner creepeth about, sending forth many stalkes, which as they lye upon the ground take roote and spread farre: the taste hereof is very sharpe and hot upon the tongue, which chiefly distinguisheth it from all the rest, but it may also bee distinguished by the forme, being small and thicke, set with round leaves.

8. *Illecebra inspida*.

Unfavorie Wall-Pepper.

This Wall-Pepper is as small a plant as the last, growing altogether like it in leafe, stalke, and flowers, being yellowish likewise, but the taste onely distinguisheth it from the other, which in this is nothing biting, but utterly unfavorie and without taste.

9. *Sedum minus aestivum*.

Summer Houfeleeke or Stonecrop.

This Summer sort hath many thicke round long leaves set together without order, on the small stalkes which branch themselves into ma-

7. *Illecebra minor* five *Sedum tertium* Dioscoridi.
Wall-Pepper.

8. *Illecebra infida*.
Unfavorie Wall-Pepper.

ny, stored with many yellow flowers at the toppes : the roote is small and perishing.

The Place.

Although these sorts grow cyther on mudde or stone walls, or among rubbish, and in other sandy or gravelly places, and oftentimes also upon the sides of old tiled houses and penthouses, especially the two last sorts saving one; but the first onely groweth in moyst Medowes and Marshes.

The Time.

They all flower in June and July and sometimes sooner, the leaves of many of them continuing greene all the Winter.

The Names.

These kinds of Houseleekes are called in Greeke *Αἰζών* to *μικρὸν* *Aizoon minus*, that is, *Sempervivum minus*, in that they are alwaies greene, and are lesser then the former, yet some do call both kinds *Aithales*; for that they are ever living, *Pliny* calleth this lesser kind *Triubales quater floreat* (but *Brunfelsius* referreth that name to the greater) and *Eritibales* or *Eristibales* and *Chrysothales*. The Italians call the first *Sempervivum minore* & *Pignola*, the French *petite lonbarbe* and *Triguemadame*, the Germans *Klein Hanfwurtz* and *Klein Donderbaer*, the Dutch *Bladerloosen* and *Pape culleken*, and wee is English *Prickmadam*, *Stonecrop*, or great *Stonecrop* (because we call two of the last sorts small or little *Stonecrop*) *Stonehore* and *Moufetaile*: The Wall-Pepper or country Pepper is called by the Italians *Granelleto* and *Grafala*, the French *Pain d'onscan*, the Germans *Maurpfesser* that is *Piper maritimum*, and *Catzenreubel*, that is, *Fua felium* or *felina*: the Dutch *Muerpepper*. The first is called by *Lobel* in his *Adversaria Vermicularis* of the likenesse of the leaves unto wormes, and *Classula minor officinarum* five *Illecebra major*, it is the *Sempervivum minus primum* of *Dodonæus*, the *Sedum minus* of *Fuchsius*, and the *Sedum minus Hematodes* of *Tabernaemontanus* and *Gerard*: the second is called by *Lobel* in his *Icones* and Dutch *Herball*, *Aizoon Scorpioides*, and is the fourth *Sedum minus* of *Clusius*, and of *Camerarius* *Aizoon minus flore luteo reflexo*: the third is the sixth *Sedum minus* of *Clusius*, the *Sempervivum minus aestivum* of *Lobel*, and the *Aizoon medium* of *Thalium*: the fourth is the *Vermicularis flore albo* of *Camerarius*, the *Sedum minus fernina* of *Fuchsius*, *Lugdunensis* and others, *Sempervivum minus album* of *Brunfelsius* and others, and is the first *Sedum minus* of *Clusius*: the fifth is the seventh *Sedum minus* of *Clusius*, called by *Lugdunensis* *Aizoon Dasiphylon* five *densifolium*: the sixth is the third *Sedum minus* of *Clusius* called

9. *Sempervivum minus aestivum*.
Small Summer Houseleek or Stonecrop.

called by him *Sedum palustre*, and is the fourth *Sedum minus* with *Tragus*, which *Bauhinus* calleth *Sedum arvense flore rubente*; although he would make it a differing sort from it: the seventh is the eighth *Sedum minus sive Causiticum* of *Clusius*, called *Illecebra minor* by *Lobel*, and *Sempervivum minimum*, and is taken by *Anguilara* to be the *Gramen 3*, *Plinij*; and of *Columna* to be his *Dallylon 2. vel 3*; and because of the different qualitie, he judgeth it not fit to be accounted an *Aizoon* which are all cold; *Cordus* calleth it *Aizoon acre*, and *Thalins* *Aizoon minus servidi gustus*, who also calleth the eight *Aizoon minus* and *Vermicularis infipida*, and by *Cordus* *Aizoon minimum*; the last is onely mentioned by *Lobel*.

The Vertues.

All these kinds of small Houseleekes or Stonecrops, except the seventh are cooling like unto the other greater Houseleeks, and in their qualities are referred thereunto being somewhat astringent withall whereby they are no lesse powerfull to stay the fluxes and distillations, bleedings inward and outward, eruptions in the skinne, cancerous and fretting sores and ulcers, and generally can doe and performe whatsoever is said of the greater kindes, and therefore in the want of the one, the other may safely and effectually be used; onely the last save one is fervent hot sharpe & exulcerating (as I said before) the skin, and raising blisters if it be laid thereupon but a while, as forcibly as *Ranunculus* or Crowfoote will doe, and therefore it becometh all that shall have occasion to use any of the cooling Stonecrops, that they doe not mistake this for some of them whereunto it is so like; yet it is not without some other good properties, whereof good use may be made, for it is said to procure vomiting, the juyce thereof taken with vinegar and some other drinke, and thereby driveth forth thicke flegmaticke and collicke humours whe eby quartaine agues, and other of long continuance may be cured. And that taken in the same manner, it doth expell any poyson, or the force of venemous herbes, and of the *Aconites*, which yet is referred by some to the greater kindes: but *Caveat qui sumpsit*. *Dioscorides* saith, that being outwardly applied with *Assurgia*, that is Hoggs suet, it will take away knottes and kernells, as well in the necke and throat, which is called the Kings evill, as in any other part of the body, and applied by it selfe, or boyled in oyle of Roses, and the sore piles annointed therewith, doth ease the paines, and cure them of the griefe.

CHAP. VII.

Aizoon, Sedum sive Sempervivum minimum petraeum & montanum.
Rockie and Mountainous small Houseleekes.

He third kinde of small Houseleekes that I am to entreate of here, are of such as grow on Rockie, stony, and mountainous places (of many whereof I have in my former Booke given you the knowledge) which are the left of all the rest formed into circles or eyes, as the common Houseleek is, and as the sorts of *Coryledon altera* are also, wherunto they might be as well referred, but because other Authors have set them forth by the name of *Sedum minus*, I am content to let them so passe also.

1. *Sedum minimum Alpinum Muscoides*. Small Mosslike mountaine Houseleek.

This small Houseleek spreadeth with the many round circling heads of leaves like Houseleek, a great deale of ground so thicke lying thereon, as the Mosse it selfe doth which leaves are very small, thicke, and of a blewish greene colour: from the middle of divers of which heades spring up small slender stalkes, not above two or three inches high, bare or naked of leaves, for the most part unto the toppes, where stand two or three small white flowers made of five leaves apeece, and some yellow threds in the middle of them: the roote is small and thready, but multiplieth it selfe into a number of heads.

2. *Sedum minimum Alpinum villosum*. Small hairy mountaine Houseleek.

This is as small an Houseleek as the former, growing in the same manner, and about the same height, but the

1. *Sedum minimum Alpinum Muscoides*. Small Mosslike mountaine Houseleek. 2. *Sedum minimum Alpinum villosum*. Small hairy mountaine Houseleek. 4. *Sedum montanum gramineo folio alterum*. Another grasslike small Houseleek.

aves are somewhat greater and longer, and set with small haire round about the edges; the stalkes also are airy, and beare fixe or seven flowers a peece at the toppes which are white like the other, with a yellow bottom.

3. *Sedum minimum Alpinum gramineifolio*. Grasslike small Houselecke.

This Houselecke groweth not much higher than either of the former, the leaves of whose heads are somewhat longer than the last, flatter also and greener, very like unto the leaves of grasse, from among which riseth up a stalk or two, very small smooth and tender, about three inches long, bearing one flower, and sometimes two at the toppe, consisting of five white leaves, somewhat larger than the former, and their round ends dented in the middle, making every leafe seeme like a heart painted on the Cardes, the bottome of the flower being yellow.

4. *Sedum montanum gramineo folio alcerum*.

Another Grasslike small Houselecke.

This other small Houselecke differeth little from the last in the manner of growing, smallnesse of the leaves, or height of the stalkes that beare flowers, but different in these points, that it beareth more flowers at the tops of the stalkes, not heartlike pointed, but whole, and of a pale yellow colour.

5. *Sedum petraeum montanum luteum*.

Small rocke Houselecke with yellow flowers.

This small rocke Houselecke hath divers heads of leaves lying upon the ground like the other, but harder, narrower, pointed also and somewhat hairy: the flowers being foure or five that stand together, above on the naked stalkes about three or foure inches high, consist of foure small yellow leaves apeece, after which come long pointed flat coddies, somewhat like unto a Thlaspi, wherein is contained small brownish flat seede.

6. *Sedum Alpinum grandiflorum*.

Small mountaine Houselecke with great yellow flowers.

This small Houselecke hath many small heads, of lesser leaves than those of the last, with small stalkes under them, from among which rise slender stalkes set with leaves up to the tops, where stand foure or five pale yellow flowers, larger than the smallnesse of the

5. *Sedum petraeum montanum luteum*.

Small rocke Houselecke with yellow flowers.

6. *Sedum Alpinum grandiflorum*.

Small Houselecke with great yellow flowers.

7. *Sedum Alpinum flore pallido*.

Small mountaine Houselecke with pale yellow flowers.

8. *Sedum minus montanum flore rubro*.

Small mountaine Houselecke with red flowers.

11. *Sedum montanum perpusillum luteolis floribus*.

The least mountaine Houselecke with yellow flowers.

13. *Sedum minimum Alpinum villosum alterum.*
Another small mountaine hairie Houfeleeke,

Sedum montanum ferretum guttato flore.
The Princes feather fet forth in my former Booke.

plant might seeme to give, being almost as great as those of the white Saxifrage consisting of five leaves a peece, the roote runneth in the ground and spreadeth with many heads.

7. *Sedum Alpinum flore pallido.* Small mountaine Houfeleeke with pale yellow flowers. The neare resemblance of this small Houfeleeke unto the small Stonecrops in the last Chapter, might justly have challenged the company: but because it is a mountaine kind, I thought better to place it here: It creepeth upon the ground with a number of small sappie branches of a hand breadth high, furnished round about with small long and pointed leaves, very like unto Stonecroppe, but somewhat flatter and not so thicke, and of a very stipticke taste, up to the toppes where stand many somewhat great flowers, yet much lesser than the last, of a pale yellow colour: the roote spreadeth much, whereby it greatly encreaseth.

8. *Sedum minus montanum flore rubro.* Small mountaine Houfeleeke with red flowers. This red flowred Houfeleeke hath many small narrow and long leaves lying on the ground, among which riseth up a stalke about three or foure inches high, with a few leaves thereon, being longer and more pointed than those are below, and at the toppe divers large flowers made of many narrow and pointed leaves in a rare fashion, of a reddish colour and yellow in the bottome, with a white line at the bottome of each leaf, which are sweeter in smell than in any other sort.

9. *Sedum saxatile hirsutum purpureum.* Small hairie purple flowred Houfeleeke. This small plant hath sundry small hairy leaves set together, each whereof is lesser than those of Lentills, the stalke that riseth is slender and hairy, as the leaves that grow on them to the toppe are also, which is divided into small branches bearing every one a small purplish flower: the roote is small and thready.

10. *Sedum Saxatile avorulentibus floribus.* Rocke Houfeleeke with darke red flowers. This small Rocke Houfeleeke shooteth forth some slender stalkes, about two inches high, with small long leaves, set opposite thereon, and sundry flowers at the toppes of them, of a very darke red colour standing many together, as though they stood round in an umbell: the roote is small and long.

11. *Sedum montanum perpusillum luteolis floribus.* The least mountaine Houfeleeke with yellowish flowers. This least sort groweth into sundry small heads, very thickly flored with fine small leaves like Mofse on the ground, from which rise small slender stalkes scarce appearing with their heads above the leaves, each of them bearing but one pale yellow flower thereon apeece, rising from out of a large Greene huske: the roote is long and slender, with many small fibres thereat, the whole plant above ground scarce attaineth unto two inches of height.

12. *Sedum saxatile variegato flore.* Small rocke Houfeleeke with discoloured flowers. Like unto the last small one is this variable coloured Houfeleeke being as small as it, the leaves of whose heads also like Mofse upon the ground are small flat somewhat round, and of a pale Greene colour: the stalkes are many that rise from among them, bearing every one a small flower of foure leaves apeece, diversely striped with white purp'e and darke red colours very delectable.

13. *Sedum minimum Alpinum villosum alterum.* Another small hairy mountaine Houfeleeke. This small Houfeleeke hath many heads of small long leaves set with small haire about the edges, among which rise up small stalkes three or foure inches thicke, set with the like leaves, and three or foure small whitish flowers at the toppes.

Most of these sorts grow upon the Alpes and Pyrenean Mountaines in divers places, but withall very hardly endure the transplanting into Gardens.

The Time.

They flower in June and July in their naturall places, but earlier in Gardens when they will there abide.

The Names.

All these have bene lately found out, and are not mentioned by any of the ancient, but later Writers, and that you

you may know whose each of them are, I will shew you their Authors: The first is the ninth *Sedum minus* of *Clusius*, the second his tenth, whereof *Gesner in hortis* maketh mention: *Bauhinus* thinketh it is the *lesne montana* of *Lugdunensis*: the third is *Clusius* his eleventh *Sedum minus*: the fourth hath not beene exhibited by any before, the fifth is the twelfth *Sedum minus* of *Clusius*, and called *Sedum petraeum montanum* by *Lobel*, *Lugdunensis* setteth it forth for *Phyllon Arrhenogonon Dalechampi*, but both *Lobel* and *Clusius* take him for it: and *Gesner* also misliketh their judgement that would make any of these small *Seda* to be *Phyllon* of *Dioscorides*: *Columna* also misliketh that this should be accounted a *Sedum*, because the forme of the flowers and seede vessells doe differ from all the other sorts of *Sedum*, which although they be both great inducements and especially the seede vessells being as I have shewed in many places of this worke a precise note to know unto what *genus* the *species* of any herbe may best belong, yet in regard the manner of growing of these *Houfeleekes* is so differing from all other herbes, and that this in the heads of leaves is so like unto them, I doe not see but that it may better bee referred to a *Sedum* then to a *Leucoium* as *Columna* doth, who calleth it *Leucoium luteum Aroides montanum*, making it a *Wall-flower*; and indeede *Clusius* observing the difference, giveth a note thereof, and saith that it agreeth not in all parts unto the small *Houfeleekes*, and therefore leaveth it to other mens judgements, to call it by some fitter name if they can: the sixth is the *Sedum minus tertium* of *Lobel*, *Dodonaeus* calleth it *Sedum serratum* as *Bauhinus* thinketh as also to be the *Sedum Alpinum quartum* of *Columna*, but calleth it himselfe *Sedum alpinum Saxifrage alba flore five grandifolium*, the seventh is the *Sedum minus sextum* of *Clusius*: the eighth is called *Arizon montanum* by *Lugdunensis*, and by *Bauhinus* *Sedum Alpinum rubro magno flore*: the ninth and tenth are remembred onely by *Bauhinus* and I from him: the eleventh hath not beene set forth by any Author that I know before: the twelfth is called by *Bauhinus* *Sedum saxatile variegato flore*, but is not that *Sedum flosculus partim candidis partim purpureis* that *Gesner in hortis Germanie* maketh mention of, for that I shall shew you by and by to be a *Cotyledon* with such flowers, which are all greater Plants then any of these *Sedum minima*, the last also hath not beene remembred by any before. *Bauhinus* maketh mention of some more sorts of these small *Seda*, which I thinke are comprehended under some of the other sorts, and therefore not fit to be double repeated.

The Vertues.

All or most of these small *Houfeleekes* being in taste drying and astringent, and some of them a little bitter withall doe testifie that they will well serve to helpe defluxions and to stay laskes and fluxes of blood or humors as powerfully as any of the other sorts, but are not so cooling: but because I have no author that hath set downe the properties of any of them in Physicke, either for inward or outward diseases, this therefore may bee sufficient for our nation (that are not likely to have much experience of any of them in our land) to have said thus much.

CHAP. VIII.

Sedum laciniatis folijs. Small Houfeleeke with divided leaves.

Cannot be brought to be of *Bauhinus* judgement, to make many sorts of this kinde of *Houfeleeke*, for in my minde he forcibly draweth in other herbes to beare this title, which cannot fitly agree thereunto, as by the description of them in the precedent discourse, both in the second Chapter of the fourth Classis, and in the 40. Chapter of the fifth Classis of this booke, and in other places you may more plainly perceive.

1. *Sedum Alpinum laciniatis Ajuga folijs.* Small Mountaine Houfeleeke with jagged leaves.

I cannot finde any more plants fitly in my minde to beare this title but this and another, and therefore I must give you the descriptions of these onely and leave *Bauhinus* or any one that will undertake to be his champion herein, to maintaine his other sorts as he can. This first shooteth forth on all sides many small heads of leaves from small strings like to the *Houfeleekes*, each leaf whereof is long and narrow, cut in deeply into three divisions, one on each side and the end longest, somewhat like the leaves of the sweete Groundpine, but smaller and greener, nor having any hoariness on them, astringent and drying also in taste as much as any of the other: the stalkes are reddish, very slender and not two inches high (saith *Clusius*, but they were higher with us) bearing every one of them one small flower but somewhat large with us) made of five leaves a peece, of a pale Greene colour (so saith *Clusius*) but that which wee had from Mr. *Hesket* out of *Lancashire* bore pale whitish flowers with some yellow threds compassing a middle round umbone: the roote is small but spreadeth much.

2. *Sedum Montpelienfe & Pyreneum laciniatum.*

The French jagged mountaine Houfeleeke.

This other jagged *Houfeleeke* hath likewise divers heads of very small Greene leaves, each whereof is deeply cut into two, or more usually into three parts, and seldome into more, from among which rise one or two small stalkes three or foure inches high, with some few leaves set thereon, parted very often into some branches, at the tops whereof stand foure or five flowers of five leaves a peece, of a pale colour, with divers threds in the middle: the roote is blacke and small, creeping about.

The Place.

The first saith *Clusius* groweth on the Mountaine called *Sneberg* or *Snowhill* among the stones, but on the Mountaine

taines of Lancashire with us as Mr. Hosker told us, the other both upon Mount Lupus and Calcar neare Mem-
pelier, and on the Pyrenean hills likewise.

The Time.

The first flowreth in August saith Clusius, within a while after that the snow is dissolved, but in the end of
April and beginning of May with us, although somewhat later in the naturall places, and the other much
thereabouts.

The Names.

The first is mentioned by Clusius who in his Pannonicke observations maketh it his seventh *Sedum Alpinum*
Ajuge folio, and in his History of Plants setteth it for his *Sedum decimum tertium*: the other Bauhinus setteth forth
by the name of *Sedum tridactylites Alpinum minus* and referreth it to the other sort of *Sedum Alpinum tertium* of
Gregorius de Reggio, remembered by Columna, but so it cannot be, for he saith that that sort hath not leaves com-
pact together as the other Seda but disperfed.

The Vertues.

You have heard before of the taste, and therefore you may judge of the qualities of these herbes, for I have no
more to say of them, but that it is likely they be as effectfull for those causes that the last small sorts of House-
leekes are.

CHAP. IX.

Cotyledon primus sive Umbilicus Veneris. Kidneywort or Wall Pennywort.

He last kinds of Houseleek whereof I am to entreat, so to accomplish the whole family is of the
Kidney worts, whereof the first sort of *Dioscorides* being different from the other I will first speake
of, and then of the rest that I have not mentioned in my former booke.

1. *Umbilicus Veneris vulgaris.* Our ordinary Kidneywort or Wall Pennywort.

The great Kidneywort or Wall Pennywort that groweth with us hath many thicke flat and round
leaves growing from the roote, every one having a long foote stalk fastned underneath about the middle thereof,
and a little unevenly waved sometimes about the edges, of a pale Greene colour, and somewhat hollow on the
upper side like a spoone or sawcer, from among which rise one or more tender smooth hollow stalkes halfe a
foote high, with two or three small leaves thereon usually not round as those below but somewhat long and di-
vided at the edges; the tops are sometimes divided into long branches bearing a number of pendulous flowers,
set round about a long spike one above another, which are hollow and like a little bell, of a whitish Greene co-
lour, after which come small heads containing very small brownish seede, which falling on the ground will
plentifully spring up before winter if it have moisture; the roote is round somewhat like the full roote of an

1. *Umbilicus veneris vulgaris.*
Our ordinary Kidneywort or Wall Pennywort.

3. *Cotyledon altera minor folio subrotundo.*
Small Kidneywort with roundish leaves.

Orchis or Doggestone, most usually smooth yet sometimes rugged or knobbed, grayish without and white within, having small fibres at the head of the roote and bottome of the stalke, altogether like an Orchis whereunto I would more nearly resemble the rootes then unto Houfeleeke, but I must (not be singular although I speake my minde) herein follow others. Of this kinde wee have received from Doctor Boelus at Lisbon a greater Major Loz
fort, with paler greene leaves very beautifull, which Mr. Tradeſcant keepeth at Lambeth. *Major Loz*
fuancu.

2. *Cotyledon sive Sedum montanum latifolium serratum guttato flore.*

Spotted Kidnywort, or the Princes feather.

This pretty kind of Houfeleeke, or Kidnywort call it which you will is described in my former booke, where I call it the Princes feather, and therefore needeth not to be here againe repeated although I give you the figure of it among the rest: you shall finde the Figure hereof in folio 738.

3. *Cotyledon alter minor folio subrotundo.* Small Kidnywort with roundish leaves.

This other small Kidnywort hath much rounder and smaller leaves in the heads then the former, not so bigg as the nayle of ones finger, of as pale a greene colour as it, or more white and dented at the edges in the same manner, of an astringent taste like the other Houfeleekes, from the middle of some of the heads yearly rise up slender but hard and rough stalkes about an handlength high, set with a few smaller and longer leaves thereon, at the toppes whereof appeare small flowers upon long footestalkes, consisting of five and sometimes of six leaves a peece, sometimes wholly white, and sometimes spotted with red spots, and sometimes having three purple lines running downe the backe of every leafe, so that it maketh the whole leafe seeme purplish, in their places follow small heads with small seede: the roote is small and fibrous like the rest, setting of heads of the like leaves round about it.

4. *Cotyledon alter versicoloribus floribus.* Small Kidneywort with party coloured flowers.

This small Kidnywort groweth with many heads of small leaves circlewise like unto the last Kidnywort (whereof it is a peculiar sort) greater then the smallest and smaller then the greatest, each whereof is somewhat long and narrow of a whitish greene colour dented as it were about the edges, or rather set with silver white spots about the edges making them seeme like white teeth (or as Gesner compareth them to the silver like fins of Fishes) very pleasant to behold, for in the Winter when no flower appeareth this and the last (and the first that I have expressed in my former booke, being all of one genus) giveth as much delight as when it is in flower, which are many standing on severall footestalkes, each leafe whereof is part white and part purple, variably diversified in every one of them.

The Place.

The first groweth very plentifully in many places of this kingdom, but especially in all the west parts of this land, upon stone and mud walls, upon rockes also, and in stony places upon the ground, at the bottome of old trees, and sometimes on the bodies of them that are decayed and rotten: the other of that sort in Portugall as is sayd; the second on the Pyrenian hills, the other two grow upon the rockes and among the very stones where there is scarce any earth for the rootes to abide, on the Alpes of the Helvetians or Switzers, and upon the hill called *Hortus Dei* neare Mompeliev.

The Time.

The first doth usually flower sooner then the other, as at the beginning of May, and the seede ripening quickly after sheddeth it selfe, so that about the end of May usually the leaves and stalks are withered dry and gone untill September that the leaves spring up againe and so abide all Winter: the second about the middle of May, the other two sometime flower not untill June and July, and their seede is ripe in August, those heads that bare stalks usually, perishing together, and the other that bare not abiding all the extremity of the Winter.

The Names.

The first is called in Greeke *κοτυληδών* *Cotyledon* ab *acetabuli* sive *umbilici* figura, and therefore the Latines call it *Acetabulum* as well as *Cotyledon* or *Umbilicus Veneris*: it hath also divers other names. as *Seatum cali*, *Scutellum*, *Terra Umbilicus*, *Hortus Veneris* and *Herba Coxendicum*: the Italians call it *Ombilico di Venere*, and some *Cuparivole*, that is *pot covers*, the Spaniards *Scudetis*, that is *Shields*, the French *Escuilles* and *Nombril du Venu*, the Germanes *Loffelkrant* and *Navelkrant*, the Dutch *Navelcruyt*, and we in English of some Navelwort, or great Navelwort, Wall Pennywort, Hipwort, Kidneywort, *Venus-Navell* and *Navell* of the earth. The other is called of some in Greeke *κοτυληδών* *Cotyledon* and *στυλιον* *Scytalium*, but they are rather referred to the former great Houfeleeke, which I have shewed you before, and is the true *Cotyledon* alter of *Dioscorides* by the judgement of *Clusius* and others, the second is usually called *Sedum serratum* with most Herbarists: I have as you see joyned it here as fittest I thinke, but the other two last sorts have obtained that name of *Cotyledon* from *Matthiolus* who first called them so, and is still kept and held currant with many, yet confounded also with many others for the likeness unto *Sedum minus*, as with *Cordus*, *Gesner*, *Camerarius*, *Dodonaeus* and *Barbinius*, who often call them *Seda*, and very properly, for there is no herbe can so properly be called a *Sedum* as that which hath the leaves placed circlewise, one within another as they have, but because the *Cotyledon* is of that fashion it is I said justly termed a *Sedum*.

The Vertues.

The Wall Pennywort as *Galen* saith is of mixt qualities, that is, of moist and cold, somewhat astringent and a little bitter withall, whereby it cooleth, repelleth cleneth and discuffeth, and is very effectuell for all inflammations and unnaturall heates, either inwardly to coole a fainting hot stomacke or an hot Liver, or the bowels or the mother, to drinke the juice or the distilled water, or else outwardly for pimples, rednesse, Saint *Antho-nies* fire and the like heates and inflammations, to apply the bruised herbe or to bathe the place with the juice or the distilled water: the said juice or water helpeth much also to heale sore kidneys, torne or fretted by the stone or exulcerated within and causeth the paines: it provoketh Vrine likewise, and is available for the dropie: it helpeth also to breake the stone, and to coole the inflamed parts by the paines thereof, and other wringing paines of the bowels and the bloody flux: it is singular good for the painefull piles or hemorroidall veines, to coole and temper their heate and the sharpnesse of blood in them, and to ease their paines, to use the juice as a bathe unto them, or made into an ointment by it selfe or with Myrrhe or other things conducible thereunto: it is no lesse effectuell to give ease of paines to the hot gout, the Sciatica and the inflammations and swellings in the cods, and bringeth

bringeth againe the prepuce : it likewise helpeth the Kernells or knots of the necke and throate called the Kings Evil : it healeth Kibes and Chilblanes if they be bathed with the juice, or annointed with an ointment made thereof, and some of the skinn of the leafe laid upon them : it is used also in greene wounds to stay the blood and to heale them quickly : The lesser sorts are held to be cooling and somewhat more binding then the greater, and thereby available for those diseases whereunto those qualities are proper.

CHAP. X,

Acetosa sive Oxalis. Sorrell.

Sorrell is accounted a Docke, and called the soure Docke, and therefore might have bene brought under the generall title of the Dockes : but because none of the other Dockes are so cooling, nor planted in Gardens, I shall speake of those sorts severally hereafter, that I have not made mention of either before in this Worke, or in my former Booke. The sorts of Sorrell are many more found out of late by the industrious searachers of Natures varieties, than formerly hath bene knowne, some growing naturally in our fields, some in our woods, some also in other countreys. Of the ordinary Sorrell nursed in Gardens, which yet groweth also wilde in our fields and medowes throughout the Land, I have already entreated of in my former Booke, and shall not neede to speake thereof againe here, but of the other sorts, yet of the wood Sorrell, I shall speake in the next Chapter, although for their forme sake, they might have bene joyned with the rest of the Trefoiles, whereof they are species.

1. *Acetosa maxima Germanica.* Great Sorrell of Germany.

The great Sorrell of Germany groweth in the same manner that the ordinary Garden sort doth, but the leaves thereof are much larger, and sometime a little curled at the edges, the joynts of the stalkes are great and tuberous sticking out like knots, which being taken from the stalke and put into the ground, will take roote, and bring forth leaves like the mother plant, the seede and so all other things are large answerable to the proportion of the leaves. *Joanna Thalius* in *Hircynia sylva*, maketh mention of a greater sort of Sorrell than ordinary: & *Camerarius* in *horto*, of a great one received from Spaine, but neither of them speake of any tuberous joints they should beare, so that it is probable, it is but onely the climate and soyle that produceth the tubers.

2. *Oxalis sativa Franca sive Romana rotundifolia.* Round leaved Sorrell.

In the leaves of this Sorrell consisteth a cheefe difference which are short and almost round in some, and in others they will have somewhat round pointed peeces on both sides, of a paler greene colour then the former, the stalkes are weaker not standing upright, but the flowers and seede differ not from the ordinary sort : the roote is small and threddy creeping about and shooting up heads of leaves round about : the

Acetosa vulgaris.
Or ordinary Sorrell. 1. *Acetosa maxima Germanica.*
Great Sorrell of Germany.

2. *Oxalis sativa Franca* five *Romana rotundifolia*.
Round leaved Sorrell.

3. *Oxalis tuberosa radice*.
Tuberous rooted Sorrell.

7. *Acetosa Cretica serine aculeata*.
Candy Sorrell.

11. *Acetosa vesicaria Americana*.
Indian Sorrell with swollen husks.

taste is of a much more pleasant sharpnesse then the other, and therefore more desired of any that formerly haue used it.

3. *Oxalis tuberosa radice*. Tuberous rooted Sorrell. The cheefe differences in this consist both in leaves and rootes, the leaues hereof being formed somewhat like the ordinary but larger and not so broad next the stalke, the stalks, flowers and feede are answerable to the forme but the rootes are many tuberous clogs fastened by strings to the head whence the leaves spring forth.

4. *Oxalis bulbosa montana maior*. The greater bulbous Sorrell. This bulbed Sorrell hath large Greene leaves somewhat like the garden kinde, but more round at the further end, and more forked at the lower part next the stalke, that it seemeth almost three square like unto an Ivie leaf in the rest it agreeth with the ordinary sort but that the rootes are round and bulbous.

Bulbosa minor.

There is another like hereunto, but that the leaves are lesser and rounder, the whole plant smaller and lower also.

5. *Oxalis rotundifolia Alpina*. Small Mountain round leaved Sorrell. This small Sorrell hath five or six small leaves standing upon very long and slender footstalkes, each leaf being no bigger then the nayle of ones hand, and in a manner as round as the Violet leaf: the stalke riseth halfe foot high, bearing such like chaffie huskes and reddish, wherein the like feede unto the ordinary sort lyeth.

6. *Oxalis scutellarioides repens*. Creeping Sorrell with small broad leaves. This creeping Sorrell hath slender weake joynted branches trayling on the ground, foure or five inches long whose leaves are small, of a nailes breadth, and of the fashion of a pointed shield, and pointed also at both ends, with very long footstalkes under them, the leaves being almost as long as the stalkes, in the taste it is like the other small Sorrells.

7. *Acetosa Cretica semine aculeato*. Candy Sorrell. The Candy Sorrell hath weake bending stalkes and sometimes but one, branched forth on all sides, the leaves are small and long not broad or forked at the lower end as divers other Sorrells are, having long footstalkes under them: the toppes of the branches end in a long spike of small mosse flowers, which afterwards turne into small thinne pricking huskes or skinnies wherein the feede lyeth, every one fastned with a crooked footstalk.

8. *Acetosa Neapolitana Ocimi folio*. Sorrell of Naples. This Sorrell of Naples shooteth up a stalke set with smaller thicke mealy leaves thereon than those below, which are broadest in the middle, and smaller at both ends like the last, the toppes of the stalke endeth in a spike of greenish yellow flowers which turne into skinnie huskes, somewhat representing, as *Columba* saith, the head of an Oxe with hornes standing up, and eares hanging downe, wherein lie the small feede.

9. *Acetosa Zaccynthina Calthefolio*. Marigold leaved Sorrell. This Sorrell also hath no other difference therein from other Sorrells, but in the leaves which are broad pointed and somewhat long like a Marigold leaf without those eares or points that the common Sorrell hath.

13. *Acetosa minor lanceolata*.
Sheepe Sorrell.

15. *Acetosa angustifolia elatior*.
Tall narrow leaved Sorrell.

10. *Acetosa Indica*.
Indian Sorrell.
This Indian Sorrell riseth up with a slender weake hollow stalke, with a few long thicke leaves thereon, somewhat smaller than those at the foot thereof next the ground, small at both ends, and of a pale Greene colour, of a delicate small sharpe taste: at the toppe of the stalke grow sundry brownish smooth skinnies, with small feede in them, the roote perisheth yearly.

11. *Acetosa vesicaria Americana*.
Indian Sorrell with swollen huskes.

The Indian Sorrell hath slender straked stalkes, of a cubite high, leaning downe to the ground, spreading into many branches, somewhat reddish towards the toppes: the leaves are smooth and thicke of a reasonable size, somewhat like a Garden Sorrell leaf, but that the lower points are not so long, but rather short like an Arrache leaf

of a pale Greene colour and somewhat mealy withall every one upon a very long foote stalke, and of a more sharpe soure taste than our Sorrell: at the toppes of the stalkes and branches stand the flowers in a long spike, like our ordinary Sorrell, but greater and of a greenish red colour: after which come round yet cornered skinnie wollen huskes hanging downwards, of a reddish colour, striped with redder veines, very beautifull, wherein are contained two or three cornered browne and shining feede: the roote is small and thredde, perishing for the most part every yeare.

12. *Acetosa Cambro-Britannica Montana*. Mountaine Welsh Sorrell.

The Welsh Sorrell groweth up with small stalkes branched forth diversly with round leaves set thereon, as also growing at the bottome of them every one upon a long foote stalke, in shape somewhat like the Wall Penny-worte, but that they are cut in at the lower part with ends on both sides, the flowers hereof are whitish, and not red like others but the huskes with feede that come afterwards are reddish, and containe browne shining three square feed like the rest, the roote is small and thredde, abiding many yeares.

13. *Acetosa minor Lanceolata*. Sheepes Sorrell.

This is a small Sorrell well knowne to many (growing in many meadowes with us) not to differre from other small Sorrells, but in the leafe which is somewhat small and long broadest in the middle, and pointed at the further end, with two small eares at the lower end of a pale Greene colour somewhat whitish.

14. *Acetosa minima*. The smallest Sorrell.

The smallest Sorrell that groweth most usually on drie barren grounds is all together like the last, but smaller in each degree.

15. *Acetosa angustifolia elatior*. Tall narrow leaved Sorrell.

This Sorrell may by the figure soone declare the variation, whose stalke is slender and tall, and the leaves narrow and long, yet formed like a Sorrell, as both flowers and feede.

The Place.

The most of these Sorrells beare in their titles or descriptions the places where they have bene found.

The Time.

All of them flower and feede in May and June, except the Indian sort, which flowreth not untill Iuly for the most part, and the feede is ripe in August.

The Names.

It is called in Greeke *ὄξαλις Oxalis* of the sharpe taste, many of the Latine Writers keepe that name, in Latine also *Acetosa*, and of some *Acetula* of the sourenesse thereof, others call it *Rumex hortensis*, and Galen calleth it *ὀξύλατον Oxylapathum*, id est, *Lapathum acidum*, soure Docke, yet with *Discorides*, *Oxylapathum* is *Lapathum Acutum*, that kinde of Docke whose forme of leafe is more sharpe and pointed than others, and not for the sharpe taste to cause that name, the Sheepes Sorrell, is called *Lapatholum* and *Acetofella* by divers. *Celsus* maketh mention of the first great sort, and *Loebel*, *Dodonæus* and others of the second, *Loebel* gave first of all others knowledge of the third, and *Columna* of the fourth, *Banhusius* of the fift, sixt, and seventh *Columna* of the eight, *Prosper Alpinus* in his Booke of Egyptian plants of the ninth, of the tenth and last none hath made any mention before now *Beslerius* in *horto Eysletensi* (speaketh of the eleventh, by the name of *Acetosa vesicaria peregrina*, which *Banhusius* calleth *Acetosa Americana folijs longissimis pediculis donatis*; but of the twelfth sort (if it be not the same with the second, whereunto it is very like) no author ever made mention before now, and scarce is it knowne to any but the Gentleman of Anglesey called Mr. Morris Lloid of Pristlerworth that found it on a mountaine in Wales, and shewed it to Dr. Bonham in his life: the thirteenth is called by *Mathiolus* *Tenuifolia*; and so by *Lonicerus*, *Gesner*, *Tragus*, &c almost all other writers of herbes in our later age, and called *Oxalis vervecina* of *Loebel* and *Ovina* of others, and *arvensis lanceolata* by *Banhusius*; the fourteenth is remembered by *Montanus*, *Gerard*, and *Banhusius*. All of them deservedly have the name of Sorrell, because howsoever they are somewhat different in leafe or roote, yet they all agree in the sourenesse, although some more or lesse than others. The Arabians, as *Serapio* saith, call it *Humalh*; the Italians *Acetosa*; the Spaniards *Azederas* *Azederilha* and *Agrethas*; the French *Azeille* or *Oseille*, *Saltette*, *Surelle* and *Aigrette*; the Germanes *Sawrampffer*; the Dutch *Surckele* and *Surinke*; and we in English Sorrell.

The Vertues.

Sorrell is cooling and drying in the second degree, and is prevalent in all hot diseases to coole any inflammation and heate of bloud in agues pestilentiall or chollericke or other sicknesses and fainting, rising from heate, and to refresh the overspent spirits with the violence of furious or fiery fits of agues, &c. to quench thirst, and to procure an appetite in fainting or decayed stomacks; for it resisteth the putrefaction of the bloud, killeth wormes, and is as a cordiall to the heart which the feede doth more effectually, being more drying and binding, and thereby also stayeth the hot fluxes of the menstrues, or of humours in the bloudy flux, or fluxe of the stomacke: the rootes also in a decoction or in powder, is effectfull for the said purposes: both rootes and feede, as well as the herbe is held powerfull to resist the poison of the Scorpion, so that he that shall eat thereof shall feele no paine being stung: the decoction of the rootes is taken to helpe the jaundise, and to expell gravell, and the stone in the raines or kidneyes: the decoction of the flowers made with wine and drunke helpeth the blacke jaundise, as also the inward ulcers of the body or bowells. A Syrupe made with the juyce of Sorrell and Fumiterrie is a soveraine helpe to kill the force of those sharpe humours that cause the itch: the juyce thereof with a little Vinegar, serveth well to use outwardly for the same cause, and is also profitable for frettings and gallings of the skin in any part, and for tetters, ring wormes, &c. it helpeth also to disusse the scrophules or kernells in the throat, and the juyce gargled in the mouth helpeth the sores therein: the leaves wrapped up in a Colewort leafe, and roasted under the embers, and applied to an hard empostume, botch, bile, or plague sore, both ripeneth and breaketh it: the juyce of Sorrell dropped into the eares of such as are hard of hearing helpeth oftentimes: the distilled water of the herbe is of much good use for all the purposes aforesaid. The lesser wilde Sorrell, and so all the other are of the same qualitie, and are no lesse effectfull in all the diseases before spoken of.

CHAP. XI.

Oxys, Alleluja five Trifolium acetosum. Wood Sorrell.

Here are two sorts of Wood Sorrell, the one familiar enough in many places of this Land, the other a stranger as farre as I can learne, and onely cherished in the Gardens of those that are curious, I have as I said brought these two sorts from their family, where they might otherwise be ranked that among the Trefoiles for their proprietie and name also in part.

1. *Trifolium acetosum vulgare.* Common Wood Sorrell.

The common Wood Sorrell groweth low upon the ground without any stalke rising from it having a number of leaves comming from the roote made of three leaves like a Trefoile or Three leaved grassie, but broad at the ends, and cut in the middle, of a faint yellowish Greene colour, every one standing on a long footestalke, which at their first comming up are close folded together to the stalke, but opening themselves after wards, and are of a fine soure relish, more pleasing than many of the former Sorrells, and yeelding a juyce, which will turne red when it is clarified, and maketh a most daintie cleare Syrup: among these leaves rise up divers slender weake foote stalkes not growing above them, with every one of them a flower at the top, consisting of five small and pointed leaves starre fashion, of a white colour in most places, or in some dasht over with a small shew of bluish, and in some but on the backe side onely: of any other colour (although some have set downe that it beareth deepe coloured flowers) I have not seene: after the flowers are past, follow small round heads, with small yellowish seede in them: the rootes are nothing but threads or small strings fastened to the end of a small long peece, all of them being of a yellowish colour not perishing every yeare, but abiding with some leaves thereon in the Winter.

2. *Oxys luteo flore.*

Wood Sorrell with yellow flowers.

This Wood Sorrell shooteth forth divers slender weake reddish stalkes trailing upon the ground, and taking roote at the joynts as they lie, spread into many branches with many leaves on them, standing singly one above another, and made of 3. leaves cut in at the ends like the former, but are much smaller, and of a paler Greene colour: at the joynts with the leaves come forth three or foure small flowers together, at the end of a long foote stalke, yet each separate from other, consisting of small and pointed leaves like the other, but of a yellow colour: the seede that followeth is brownish like the other, but contained in smaller and longer heads like cods or hornes, yet not crooked but pointed small which quickly fall away being touched when they are ripe, and spring up againe all about where it grew; it abideth the Winter without perishing, if it be not too violent, else they will rot and perish, & must be new sowne againe.

The Place.

The first, as I said, groweth plentifully in many places of our Land, in Woods, and Wood sides where they may be moist and shadowed, and in other places that are not too much open to the Sun: the other groweth in divers shadowie places about *Sevill* in *Spaine*, and in Gardens at *Mompelier*.

The Time.

The first flowreth early in *Aprill* and *May*, the other after *Midsummer*, and so continueth in flower untill the *Autumne* colds perish it, and the seede is ripe in the meane time.

The Names.

It is generally taken to be the *Oxys* of *Pliny*, whereof he speaketh in his 27 Booke, and 12. Chapter, but not the *Oxytriphyllum*, although *Tragus* and *Lacuna* did so call it, because the name did somewhat agree thereto, but that it is an other herbe whole sharpe pointed leaves, and not the sharpe taste caused this name, for the Greeke

1. *Trifolium Acetosum Vulgare.*
Common Wood Sorrell.

2. *Oxys luteo flore.* Wood Sorrell with yellow flowers.

reek word doth signifie both sharpenesse in forme and in taste, It is called *Trifolium acetosum* of divers, which is the same in signification as I said with *Oxytriphylum*, and of some *Panis Cuculi*, Cuckowbreade, eyther because the Cuckowes delight to feede thereon, or that it beginneth to blossome when the Cuckow beginneth to utter her voyce; it is called by the Apothecaries in their shoppes *Alleluja* and *Lujula*, the one because out that time it is in flower when *Alleluja* in ancient times was wont to bee sung in the Churches, the other because corruptly from *Iuliola* as they of *Calabria* in *Naples* doe call it, as *Scaliger* upon *Theophrastus de causis plantarum* saith, yet it is there set downe *Alleluja*, but I thinke it rather should be *Lujula*. The other is called *Oxysure* Inteo of *Clusius*, and *Oxysurea corniculata repens* of *Lobel*, and of *Bauhinus Trifolium acetosum corniculatum*. The *Italians* call it *Trifolium acetoso Panis cuculi* and *Alleluja*, the *French* *Pain de coque*, the *German* *Samerklees*, the *Dutch* *Cockgoezbroet*, and we in *English* *Wood Sorrell*, *Wood fower*, *Stabbewort*, and *Sorrell du Bois*.

The Vertues.

Wood Sorrell is cold and dry as the other *Sorrells* are, and serveth to all the purposes that they doe, being as effectuall if not more, especially in hindring the putrefaction of blood and ulcers in the mouth and body, and in cooling and tempering distempered heats and inflammations, to quench thirst, to strengthen a weak stomach, to procure an appetite, to stay vomiting, and most singularly excellent in any contagious sicknesse or pestilentiall Feaver, the Syrupe made of the juice is effectuall in all the causes aforesaid, and so is the distilled water of the herbe also: Spunges or linnen clothes wet in the juice and applyed outwardly to any hot tumors and inflammations doth exceedingly coole and helpe them: the same juice taken into the mouth and there gargled for some time, and after spit forth and fresh taken, will wonderfully helpe a stinking foul Canker or Ulcer therein: it is also singular good in wounds, punctures, thrusts and stabbes into the body, to stay the bleeding and to cleanse and heale the wounds speedily, and helpeth well also to stay any hot defluxions or catarrhes upon the Throat and Lungs.

CHAP. XII.

Atriplex sylvestris. Wilde Arrache.

He two sorts of garden Arrache are already set forth in my former booke, there remaine divers other sorts to be declared, as well such as for their raritie and beauty wee nurse up in our Gardens, as grow wilde, whereunto I would also joyne the Sea plant to set them all together.

1. *Atriplex baccifera rubra*. The red berried Arrache.

This beautifull small plant sendeth forth divers slender branches somewhat woody, about a foote high, or more or lesse as the place where it groweth will produce, with a small cornered leafe like the broad leaved wilde Arrache, set at the joynts one above another, and at every of the said joynts with the leafe from the lowest almost standeth a small red berry, cluster fashion, that is many small graynes set together like a Mulberry, cleare and almost transparent, full of an excellent juice, as red as blood or Claret wine, which being bruised upon the backe of the hand while it is fresh will seeme as if you had drawne blood out thereof; which berry being dry groweth blackish, and containeth within it small blackish feede, and will still spring up every yeare, if it be suffered to shed: the roote is small and fibrous perishing after seede time.

2. *Atriplex sylvestris lappulas habens*. Wilde Arrache with small berries.

This Arrache likewise is small even smaller then the other, whose branches doe not exceede an hand breadth or halfe a foote at the most, set with such like small cornered and pointed leaves as in the other, every one standing upon a short footestalke, at every joynt with the leafe even almost from the bottome cometh forth two very small berries or burres, of the bignesse of a Coriander feede, containing therein small blacke feede like the last: the roote is small and woody perishing every yeare after seede time. Of this kind there is another that beareth greater burres, leaves, and stalkes, not differing in any thing else.

3. *Atriplex sylvestris fructu compresso roseo*. Wilde Arrache with flat Roselike berries.

This other wilde Arrache hath a whitish hard round stalke, about a foote and a halfe high; spreading forth into many the like branches, and they againe shooting forth other smaller ones, which bow themselves downe a little, whereon are placed small hoary or mealy leaves, no bigger then the nayle of ones finger, waved and cut into corners on the edges, like the wilde Arrache called Goosefoote, every one closing the stalke and branches without any footestalke; at every of these leaves cometh forth a most dainty broad and flat coloured fruite, made as it were of leaves, rayed up a little in the middle, having foure other eminences at the brims or edges, yet so set as that the brims or edges are betweene them somewhat like unto the folding of the leaves in a Rose as it is painted, in every one of which foure aforesaid eminences is contained one flat feede of a reasonable bignesse.

4. *Atriplex marina repens*. Creeping Sea Arrache.

This Sea Arrache creeperth upon the ground with many hoary white branches and mealy white leaves set on them without order, cut in on the edges or nere at the bottome, and pointed at the ends, somewhat like unto a small Goosefoote leafe; at the toppes of the branches grow divers slender hoary yellowish spikes of feede set close together like clusters: the roote is great with many strings and perissheth not, and is of a saltish taste although bred up in a Garden, sometimes it will turne reddish like the Garden red Arrache and sometimes nothing to mealy but rather Greene.

5. *Atriplex maritima angustifolia*. Narrow leaved Sea Arrache.

It groweth up with an hoary and woody stalke a foote high, spread at the toppe into many small branches spotted with blacke spots, which end in long yellow spikes of clustering feede like the former, the leaves that grow below are somewhat long and narrow about two inches long, of a darke Greene colour with some corners about the edges but smaller as they grow higher.

6. *Atriplex sylvestris vulgarior smuta*. The greater common wild Arrache.

The greater common wild Arrache hath strong round hard stalkes and branches, with large leaves on them like those

1. *Atriplex baccifera rubra*.
The red berried Arrache.

4. *Atriplex marina repens*.
Creeping Sea Arrache.

6. *Atriplex sylvestris vulgatis sinuata major*.
The greater common wilde Arrache.

7. *Atriplex sylvestris angustifolia*.
Narrow leaved wilde Arrache.

what thicker also than the Garden kinde; in other things it differeth little from it: neare the sea this hath a brackish taste, but nothing so much being transplanted.

3. *Beta lutea Syriaca*. The yellow Beete.

There is also from some parts of *Syria*, brought unto us and nursed up in some curious gardens, a yellow Beete whose roote is of a paler yellow colour than a Carrot, the leaves also being of a yellower Greene than those of the ordinary white Beete.

4. *Beta platycaulis*. Flat stalked Beetes.

Sometimes there hath beene seene a degenerated kinde of Beete, whose stalke was broad from the middle to the toppe branching forth on all sides, and foure inches broad at the highest, all the leaves being smaller than ordinary and so thicke set thereon upwards, that the stalke could scarce be seene, especially at the toppes where the seede stood.

The Place.

Their places are specified in their titles or descriptions, yet *Gesner in hortis* saith, that hee had it from credible persons, that the yellow kind is found about the cities *Durachium* and *Alexium* in *Macedonia*.

The Time.

They doe all flower in the beginning of *July*, and their seede is ripe in *August*.

The Names.

Beetes are called in Greeke *πυλωνα* and *σουλωνα*, *Tentlon* and *Sentlon*, *ab impulsu quod facile excrescat*, in *Latine Beta*, *quoniam figuram literæ B dum semine turget referre videtur*, which *Columella* in his tenth booke remembreth in these Verses.

*Nomine cum Graeco, seu litera proxima prime,
Pangitur in terra docti mucrone magistri,
Sic & humo pingui ferrate cuspide ictu
Deprimitur folio viridis, pede candida Beta.*

It is called by the *Arabians* *Dock* and *Calb*, by the *Italians* *Bietola*, by the *Spaniards* *Aselgas*, by the *French* *Bete Iove*, and *Poerce*, by the *Germans* *Mangolt* and *Pieffen*, by the *Dutch* *Beete*, and wee in *English* *Beete*: the white Beete was called in former times *Sicula*, and in the later *Sicla*: there hath beene some doubt among many what Beete the ancients meant by the blacke Beete, some thinking the Greene Beete being of a darke Greene colour should be it, but others take the common red Beete to be it, which by the darke red colour commeth nearest thereunto, which opinion I take to be the more certaine. Beetes were onely planted in Gardens, and no wilde kinde found with the ancients, as *Galen* saith, for although *Pliny* might thinke that *Limonium* was a kinde of the wilde Beete, yet *Dioscorides* did not so account it, but made it another quite differing kinde of herbe, and gave thereto other manner of properties: yet at this time, as you see in this Chapter there are three sorts set forth growing wilde of their owne nature. Divers doe call the first *Blitum spinosum*, because the leaves doe as neere resemble a Blite as the Beete. *Lobel* maketh mention of the sea kinde, *Camerarius* in *horto* of the yellow, and so doth *Gesner in hortis Germanie*, who saith that in *Syria* it is called *Skandar*, and that *Ebenbitar* the *Arabian* numbred it among the sorts of Rapes or Turneps; and that *Bellunenſis* likewise mentioneth it upon his Glosses or Comments on *Avicen* in the Chapter of *Sicla nigra*. *Lugdunensis* calleth the last as it is in the title. The *Spinache* which I have here joyned with the Beetes, is called by most *Spinachia*, and by some *Spinaceum olus*: some of the later Greekes doe call it *σπιναχία*. *Spanachia* a raritate in usu medico; and some *Spanachia* in *Latine*, as *Matthiolus*, and those that follow him, who I thinke first so called it, because *Tragus* called it *Olus Hispanicum*, supposing as many others doe that it first came from *Spaine* to us.

The Vertues.

Simeon Sethi and divers of the ancients have set downe in their writings that Beetes have an hurtfull qualitie in them for the stomacke, and breede many diseases: they have indeede a more nitrous qualitie whereby they provok more to the stoole than *Arrache*, *Lettice* or *Mallows* doe, especially the white: for the red Beete is held good to stay the bloody fluxe, womens courses, and the whites, and to helpe the yellow jaundise; the white being more clensing, digesting, and provoking urine also, and the red more astringent, especially the roote: the juyce or the roote put into the nostrils purgeth the heade, and helpeth the noise in the eares, as also the tooth ach: the juyce of the white Beete openeth obstructions, both of the liver and spleene, and is good for the head ach, the swimming therein, and the turnings of the braine, and is effectually also against all venomous creatures: the juyce of white Beetes applied upon the temples staeth the inflammation in the eyes, the same also helpeth burnings being used without any oyle, and if a little *Allome* be put unto it, it is good for *Saint Antonies* fire: the same also is good for all wheales, pushes, and other blisters and blanes in the skinne: the herbe being boyled and laid upon chilblanes on the hands, or kibes on the heeles helpeth them: it healeth the itch also if the places be bathed with the decoction of the herbe in water and some vinegar: the same doth likewise clense the head of dandriffe, scurfe and drie scabbies; and doth much good also for fretting and running sores, ulcers and cankers in the head, legges or other parts; it is much commended also against baldnesse and shedding of the haire. The wilde Beetes that are here set downe have not beene applied to any use that I know as yet; neither did I ever heare or reade of any Physicall properties of the Spinage.

CHAP. XIV.

Blitum, Blites.

N^O the Beetes doe the Blites requirẽ to be next joyned, of divers whereof I have spoken in my former Booke, namely of the Garden sorts white and red besides the *Amaranthus*, or Flower gentle of divers sorts, whereof I meane not further to relate here, although I may give you some of their figures: but of some other sorts nor there remembred.

1. *Blitum album sylvestrum minus*. The small wilde white Blite.

The small wilde white Blite groweth small and low, with smaller whitish Greene leaves set in the stalkes, than the

the greater sort of the garden : the flowers and seede are like it also, and the roote but smaller in every part.

2. *Blitum rubrum sylvestre minus*. The small wilde red Blite.

The leaves of this sort are sometimes and in some places more red than in other, and giving a fine red juyce as it to write with (being ordered accordingly) as the red incke made of Brassill, this is in all other things like unto the greater garden red kinde.

3. *Blitum Polyspermon*. Wilde Blites with much seede.

The lower leaves hereof are very like unto the leaves of the former wilde sort, yet a little rounder and smaller also on the stalkes that are much branched, at the toppes whereof grow long and spikie greenish heads of seede very thicke set together seeming to be all seede, whereof came the name *Polyspermon* and is like unto the others : the rootes are wholly white and somewhat long.

4. *Blitum Virginianum majus*. The greater *Virginian* Blite.

This *Virginian* Blite riseth up with one great thicke round, yet almost square tall stalk five or sixe foote high, full of small branches on all sides from the bottome to the toppe, set with larger leaves than in any of the garden kindes, and of a sad Greene colour, else so like them, that they plainly declare themselves : the seede groweth in small spikes, at the toppes of the stalk and branches which being ripe is small blacke and shining like the rest.

5. *Blitum Virginianum minus* *Amaranthi species*. The smaller *Virginian* Blite.

The smaller sort of *Virginia* is very like the last sort but much smaller and lower, having stalkes and leaves somewhat reddish with the Greene, branched also but lesse, and with small long tufts of reddish soft scales as it were, and small blackish somewhat shining seede afterwards, but neither so blacke nor shining as the last : the roote is small and fibrous perishing every yeare, yet often is raised againe from its owne sowing.

6. *Amaranthus coccineus elegans maximus*.

The greatest scarlet Flower gentle.

This great Flower-gentle riseth up with very great thicke round tall stalkes, rather higher and greater than the most ordinary great red Flower-gentle, with as large great leaves on it, or rather bigger, but both the stalkes and they are of a fresh yellowish pale Greene colour, with very little or no rednesse in them at all (and this is one proper marke to know this sort from others before it come to flower), the flowers stand at the toppes of the stalk and branches more spread at the bottome into sundry parts, the middle being longest, and usually when it is in the perfection hanging downe like a tassell, the other parts like shorter spikes compassing it round which even for the proportion is very beautifull, but much more for the colour which is of a more excellent bright scarlet red colour, which being gathered in the prime will hold the colour a good while before it decay, especially if it be kept from the Sunne and windie aire : the seede inclosed in these tufts is almost as white and small as the great red sort, yet a little redder whereby it may be knowne to differ. The descriptions of the other sorts of *Amaranthus* are extant in my former Booke.

The Place and Time.

Some of these grow in our owne land in divers wast places, and in gardens also as a weede, namely the three first sorts ; the other sorts are brought us from sundry parts beyond seas, as the first from *Virginia*, & the last from *Brassill*, or some other part of *America*, and seede in August & September.

The Names.

All our moderne Writers (for none of the ancients have made any mention of them) doe agree in calling them *Blita sylvestria minora*, and the first two sorts *Blitum sylvestre minus album & rubrum* ; yet *Tragum* calleth the red sort *nigrum*, and saith it is called *Sanguinaria* by some, which word *Sanguinaria*, is as he saith referred to five severall sorts of herbes, every country having their proper *Sanguinaria*, which are this wilde red or blacke Blite, *Tormentill*, *Shepherds*

1. *Blitum minus album sylvestre*.
The small wilde white Blite.

2. *Blitum minus sylvestre rubrum*. The small wilde red Blite.

purse,

3. *Blitum Polyspermon*.
Wilde Blües with much seede.

Amaranthus tricolor.
Variable Flower-gentle.

Amaranthus Coccineus.
Scarlet Flower-gentle.

6. *Amaranthus coccineus elegans maximus*.
The greater scarlet tufted Amaranthus or Flower-gentle.

Purfe, Knotgrasse, and the Cockes foote grasse : the third is taken by *Anguillara* to be the *Polysporon* of *Cassianus Bassianus*, and by *Lobel* and *Lugdunensis Polyspermon* : the three last sorts have not bene remembred by any author before me.

The Vertues.

The generall tenet of most as well in these plants as in all other is that those which have red flowers feedes or roots, are good to stay the red courses in women, and all other fluxes of blood in man or woman, and those that be white will stay the whites in women or the *Gonorrhoea* in men, which although it may fall out right in some things, yet that it should hold good in all, I am not certaine my selfe, nor can I assure any other, yet the qualities of all these being cooling, drying and binding, doe by *Hippocrates* testimony serve to restrain the fluxes of blood in man or woman. *Cassianus* hath set it downe for an experiment, and *Anguillara* confirmeth it, that Fishes are much delighted with the third sort here expressed, and by that baite are usually taken.

CHAP. XV.

Viola. Violets.

Have given you in my former booke all the sorts of Violets and Pansyes either single or double that are fit to furnish a garden of delight and pleasure : there are yet some other wilde ones of both sorts to be entreated of, which I have set downe together in this Chapter.

1. *Viola surculata purpurea*. Vpright Violets.

This Violet groweth about a foote high or more, with hard upright stalkes, which yet bend downe againe their tops, having two leaves somewhat round set at each joynt but longer and more dented about the edges

1. *Viola surculata purpurea*. Vpright Violets.

then the Garden kinds, at which joynts with the leaves on both sides of the stalkes commeth forth a larger flower and more spread open then it, being more like a Pansye, but of a pale purplish colour, almost as sweet as the Violet as *Matthiolum*, but without sent as *Lobel* saith : *Dodonaeus* maketh mention of this sort as I take it, but he describeth it with varietie of colours like a Pansye and therefore calleth it *Viola assurgens tricolor*, and saith *Matthiolum* set it forth to grow on Mount *Balus*, but *Matthiolum* declareth no varietie of colours in his but purple : after the flowers are past follow longer feede vessells then either the Violets or Pansyes have, wherein is contained as small seed as that of the Pansyes but whitish, the roote consisteth of strings which abide not after seedetime, but riseth of the fallen feede.

2. *Viola montana pumila angustifolia*.

Small narrow leaved Violets.

This small Violet sendeth forth divers long and narrow leaves, somewhat like unto Rosemary leaves for the narrownesse and length also almost, among which come flowers every one singly on a small long footstalk very like unto a Violet, and of a whitish colour but without any sent at all, the roote is somewhat thicke like unto Violets with divers fibres set at them.

3. *Viola montana laciniatofolia*. Mountaine Violets with jagged leaves.

This jagged Violet bringeth out five or six leaves from the roote, every one upon a long footstalk, more cut in on the edges then the common sorts into five or eight divisions, like unto a Crowfoote leafe or rather unto a broad leaved Anemone, betweene which leaves rise severall small stalkes and flowers on them, but of what colour is not yet knowne but there were small round heads found which had contained the feede like unto the feede vessells of Violets : the roote was somewhat great and of a fingers length.

4. *Viola lutea Virginiana*. Yellow Violets of Virginia.

The Virginian yellow Violet is very like our yellow Violet remembred in my former booke, and so is the small yellow flower.

5. *Viola rubra striata Eboracensis*. Yorkshire striped red Violets.

Master Stonehouse a reverend Minister of *Darfield* in *Yorkeshire* assured me he found a kind of wilde Violet neare unto his habitation, whose leaves were rounder and thinner then of others, and the flowers reddish with sadder veines therein.

6. *Viola sylvestris*. Wilde Violets.

The wilde Violet is altogether like the garden Violet, but that the leaves are fewer in number, somewhat thinner also and smaller and a little longer or not fully so round, the flowers also are larger and of a very pale purplish blew colour neare unto a watchet, not having any smell at all or very little.

7. *Viola tricolor sylvestris*. Wilde Pansyes or Hearts ease.

There are two or three sorts of these wilde Pansyes not differing one from another, or any of them from the Garden kinde in forme of leaves, flowers or manner of growing, but in the colour and largenesse of the flowers.

Viola tricolor major & vulgaris.
Greater and lesser Pansyes or Hearts ease.

7. *Viola sylvestris tricolor.*
Wilde Pansyes or Hearts ease.

all of them for the most part being smaller then those of the Garden, and of as small a sent, that is none at all, but in the flowers, the colours are divers, yet scarce a flower among many hath three colours in them for they are chiefly white and pale blew, more or lesse marked and spotted, and sometimes some yellow in the bottome.

The Place.

The first as is before sayd was found upon Mount Baldus as also upon the *Vegancan* hills in *Narbone*: the second was found in *Spaine* by *Guillame Boel* as excellent an Herbarist as any in his time, who shewed it both to *Clausius* as he saith himselfe among many other rare plants hee brought from thence: the third *Clausius* saith hee had from *Docter Mera* who gathered the plant in his returne from *Italy*, and shewed it dry to *Clausius*: the fourth came from *Virginia*, and the fift from *Torke* as is sayd in the description, the two last grow wilde in our owne Land plentifully enough, the wild Violets in woods and Orchards and under bushes upon heaths and such like shady places, the wilde Pansyes in the Corne fields and in such as lye Ley, and in the borders of others fields.

The Time.

All these flower after the Garden Violets, and as the Pansyes untill the end of *Iuly*.

The Names.

The Garden Violet is called in Greeke *ἡ πορφυρεῖα Viola purpurea* by *Dioscorides* and *ἡ μέλας Viola nigra* and *μελανίον Melanium* by *Theophrastus* beleaved by the ancient Greekes (for so set downe in their writings) to be so called of *Io*, who was transformed into a Cow by *Iupiter*, the earth being caused to bring forth that herbe for cattle to feede on: or as *Hermolaus* reporteth *Nicander* to say in his *Geoponicks*, that the Violet was called *Ἰον* of certaine Nymphes of *Ionis*, who first gave of those flowers to *Iupiter* as a present: the Latines doe call it, *Viola Martia*, and the herbe *Violaria*, *Viola quasi vitula* by putting the Letter *i* in imitation of the Greekes, which made *Servius* to thinke that *Viola* was *Vaccinium* of the Latines, citing *Virgill* in his second Eclogue *Alba lignustra cadunt Vaccinia nigra leguntur*. But *Virgill* in his tenth Eclogue sheweth he did not mean them, for hee nameth them both as different herbes in these words *Et nigrae Viole sunt & Vaccinia nigra*: but I have shewed what is the true *Vaccinium* of *Virgill* in my former booke in folio 127. and 128. *Vitruius* also in his seventh booke of Architecture distinguisheth *Viola* from *Vaccinium*, by shewing the different colours they gave in dying of cloth &c. whereof came *Ianthinus* colour, A Violet or purple colour, some others thinke that *Ἰον* came ἀπὸ τοῦ ἰόντος, quasi ire, aut provenire, aut primum prorumpere: veris enim prævia est Viola. The Arabians call it *Senessigi*, *Senessigi* or *Beneffigi*: the Italians *Viola porporea* and *Pavonazzo* and *Viola mamulo*: the Spaniards *Violetta*: the French *Violette de Mars*: the Germanes *Mertzen Violein*, the Dutch *Violetten*, and we in English Violets, March Violets, and purple Violets: The Hearts ease is called by us Pansyes from the French word *Pensees*, as also love in idleness, call me to you, and three faces in a hood, and in Latine *Viola tricolor*, and *Viola flammea*, for so, that is *flamma*, *Gaza* translateth *ῥαδίς* or *ῥαδίων* (some copies have) of *Theophrastus* lib. 6. c. 6. some also call it *Viola multicolor* *Herba Trinitatis*, *Flos Trinitatis* and *Viola Trinitatis* of the three colours herein: *Matthiolus* also saith it was called *Iacea*, but there is another *Iacea* called *nigra*, whereof I have largely entreated before, and some call it

Herba

Agba Clavellata: the Italians call it *Lacea Fior di Giove* and *Minuti pensieri*, the French as I said before *Penfces* and *Penfces minuts*, the Germans *Freychemkraut*, the Dutch *Penfeen*. The first is called by *Matthiolus Viola arborefcens*, by *Gesner Viola fruticofa*, by *Clufius Viola elatior*, by *Lobel Viola Martia furrellis canticulis*, by *Dodonæus Viola affur-rens tricolor*, by *Lugdunenfis Maser violarum*, and by others *Viola elatior* and *arborea*: the fecond is called by *Clufius* in his *Cure pofteriores folio 59. Viola montana pumila*: the third by him in his history *Viola montana laci-niata*: the fourth and fifth have not bene remembered by any before: the two laft are reckoned under the generall name of *Viola tricolor* with the addition of *glveftrin* to fhew their diftinctions.

The Vertues.

The Garden Violets and fo likewife the wilde kinds are cold and moift while they are fresh and greenz, and are used to coole any heate or diftemperature of the body, eyther inwardly or outwardly, the inflammations in the eyes in the mother or in the fundament when they are fallen downe & are full of paine, Impoftumes alfo and hot swellings, to drinke the decoction of the leaves or flowers made with water or wine, or to apply them poultis wife to the grieved place, it likewife eafeth paines in the head, which are caufed through want of fleepe, or in any other place arifing of heate applied in the like manner, or with oyle of *Rofes*: a dram weight of the dried leaves of the flowers of Violets, (but the leaves more strongly) doth purge the body of chollerick humors, and affwageth the heate being taken in a draught of wine or any other drinke: the powder of the purple leaves of the flowers onely pickt and dried, and drunke in powder with water is faid to helpe the Quinfic and the Falling fickneffe in children, efpecially in the beginning of the difeafe, the flowers of the white Violets ripeneth and diffoleth swellings: the feede being taken refisteth the force of the Scorpion: the herbe or flowers while they are fresh, or the flowers when they are dry are effectuell in the Plurifie and all other difeases of the Lungs, to lenifie the fharpneffe of hot rheumes and the hoarfenefle of the throate, the heate alfo and fharpneffe of urine, and all paines of the backe or reynes and the bladder: it is good alfo for the Liver and the Jaundies, and in all hot Agues helping to coole the heate, and quench thirft: but the Syrupe of Violets is of moft use and of better effect being taken in fome convenient liquor, and if a little of the juice or Syrupe of Lemons be put to it or a few drops of the oyle of *Vitrioll*, it is made thereby the more powerfull to coole the heate and to quench the thirft, and befides the effect giveth to the drinke a Claret wine colour and a fine tart relifh pleasing to the tafte. Violets taken or made up with hony doth more clenfe then coole, and with Sugar contrariwife: the dried flowers of Violets are accounted among the Cordiall flowers and are used in cordials, drinckes powders and other medicines, efpecially where cooling cordials, as *Rofes* and *Saunders* are used: the greene leaves are alwayes used with other herbes to make Cataplafmes and Poultices for inflammations or fwelings, and to eafe paines wherefoever arifing of heate and for the piles alfo being fryed with Yolkes of Eggs and applied thereto. Panfyes or Hearts eafe is like unto Violets in all the parts thereof, but fomewhat hotter and dryer, yet very temperate, and by the viscous or glutinous juice therein doth fomewhat mollifie, yet leffe then *Mallows*: it is conducing in like manner as Violets to the hot difeases of the lungs and chefts, for agues, for convulfions, and the falling fickneffe in children: the places alfo troubled with the itch or scabs being bathed with the decoction of them doth helpe much: it is faid alfo to foder greene wounds, and to helpe old sores to use the juyce or the diftilled water: *Lugdunenfis* feteth it downe that many facks full of the flowers and herbes are transported from *Marseilles* in France unto *Alexandria*, and other parts of *Egypt* where they use them boyled in water, which onely by their religion they are enjoyned to drinke, not onely thereby to make it the more wholefome to be drunke: but are perfwaded alfo that it helpeth the difeases of the lungs and cheft, and the falling fickneffes.

CHAP. XVI.

Fragaria, Strawberries.

IN my former Booke I have fhewed you not onely moft of the edible Strawberries, but one wild fort alfo that was fit to furnifh that Worke, the figure of one which will decipher all the rest I give you here; there are fome other forts to be entreated of fit to be eaten, which were omitted, and others that are wilde without edible fruit, and therefore called by fome barren or without fruit.

1. *Fragaria minor bifpido folio*. Small Strawberries with hard leaves.

This Strawberry groweth like to other Strawberries both in leaves, flowers, and fruit, but leffe in all of them; and to diftinguifh it the more certainly from the other forts, the leaves hereof are hard rough and hairie, grayifh as well on the upper as underfide: the berries when they are ripe are fmall but fufficient pleafant to eate, red on the one fide, and white on the other, as if they were equally divided.

2. *Fragaria Alpina fructu compreffo*. Flat Strawberries.

There is no difference in this kinde from our ordinary Strawberry, but in the fruit which is more flat than round, and hath a ftrake or lift, every berrie of a tafte neare a *Raspis*: this alfo ufually beareth fruit againe in the Autumne.

3. *Fragaria Helvetianana*. Dwarfie Strawberries.

Divers may judge that this Strawberrye smallneffe commeth by the barrenneffe of the foyle wherein it groweth, but that is not fo: for it is well knowne to moft, that thofe hills of the *Swiffers* have no barren ground upon them: this hath very fmall triparted leaves next the ground, clofer fet together upon fhort foote ftalkes than any other, and thofe that are fet on both fides of the long branch, not above foure inches long, which leeth creeping on the ground, grow leffe and without ftalke: the flower standeth at the end of the branch many times, but one at a place, which confifteth of five round leaves like a Strawberry, but larger then agreeth with the proportion of the plant, and is of a yellowifh colour; what fruit this beareth we have not yet feene or knowne certainly. This commeth neare unto the description of the *Fragaria affinis sericea planta* of *Banbinus*, his brother formerly fo calling it, which as he faith is the *Leucas Diofcoridis Adversariorum*, and giveth thereunto a fmall head containing fmall feede therein: but this was brought us from the *Alpes* by one *Flefeher* a *Silefian*, a young Doctor in Phyficke but very skillfull in fimples, who perished in *Virginia* by tafting fome

poysenfull herbe, and therefore I thinke it should beare a Strawberry like head, whereunto I am the rather perswaded, because that as *Bauhinus* citeth, although wrongfully, as I thinke, for I cannot finde it in him. *Gesner* in *hortis* that he should call one *Fragaria parva flore luteo*: the rootes are cold and stringie.

4. *Fragaria minime vesca*.

Barren or unprofitable Strawberries.

This Strawberry is in the growing altogether like the ordinary kindes, with leaves triparted standing on severall stalkes and flowers, in the same manner but smaller, the fruite onely maketh the difference betwixt them, which being small and many set together, are sere and drie without sappe and of an harsh unpleasant taste.

The Place.

The three first plants grow upon divers of the *Alpes*, and other places of *Germany*, and the last in our owne Land in most woods and the fields sides neare unto them, in *Cornemall*, as *Lobel* saith, but in other places also.

The Time.

They flower in *May*, when the other sorts doe for the most part or somewhat later, and the fruite is ripe quickly after.

The Names.

The whole plant is called in Latine *Fragaria*, and the berries *Fraga* a *fructus fragrantia odoris & gustu*, for it hath no certaine Greeke name that I know, unlesse as *Tragus* thinketh it may be referred to the *νεκυνδος* of *Dioscorides*, or as others thinke to the *βουαγγυ* *Comaron* of *Apuleius*, but neither of them is likely: others suppose that *Dioscorides* did understand this plant under his *νεκυνδος*: some have called it *Rubus Idæus non spinosus*, but there is a shrubbe like unto the *Raspis* that beareth no thornes, as I have shewed in my former Booke. *Pliny* maketh mention of *Fraga*, lib. 25. c. 9. *Servius* calleth them *Morasterestria*, and therefore some would referre it to the *Chamaebatus*: the *Italians* call the plant *Fragheria*, and the berries *Fraghe* and *Fragole*; the *French* *Fraisier* and *Fraises*, the *Germans* call the fruit *Erdbeer*, and the *Dutch* *Erdbeefen*, and we in *English* Strawberries. The first here set forth is the third *Fragaria* of *Tragus*, which he saith the people about *Spires* in *Germany* doe call *Harbeer*; and *Gesner* in *hortis Germanicæ* calleth *Fragaria species minor*: the second is called by *Casparinus* *Fragaria genus in Alpihus*; and *Bauhinus* *Fragaria bis fructum gerens*: the third is likely to be the *Fragaria flore luteo* of *Bauhinus* who citeth *Gesner* in *hortis*, as I said in the description, to call it so; and I thinke it may as well agree unto the *Leucas* of *Lobel* which *Bauhinus* seemeth to make another plant differing therefrom, calling it *Fragaria affinis sericea incana*, for the descriptions are very correspondent: the last is that which *Lobel* calleth *Fragaria sylvestris minime vesca sive sterilis*, but is not that which *Gerard* calleth *Fragaria vesca sive sterilis*, which is another plant, as I have shewed before.

The Vertues.

These Strawberries that are here set forth and fit to be eaten, are of the same qualitie with the other garden kinds expressed in my former Booke, the leaves of them all being cooling in the first degree, and yet some say hot and drying in the second, the roote is more drying and binding, the berries while they are greene are cold and drie, but when they are ripe they are cold and moist: the berries are excellent good to coole the liver, the blood and spleene, or an hot chollericke stomacke to refresh and comfort the fainting spirits, and to quench thirst: they are good also for other inflammations, yet it behoveth one to be cautelous, or rather to refrain them in a fever, least by their putrefying in the stomacke, they encrease the fits and cause them to be the more fierce: the leaves and rootes boiled in wine and water and drunke, doe likewise coole the liver and blood, and asswage all inflammations in the raines and bladder, provoketh urine, and allaieth the heate and sharpenesse thereof: the same also being drunke staith the blondy fixe and womens courses, and helpeth the swellings of the spleene: the water of the berries carefully distilled, is a soveraigne remedy and cordiall in the palpitations of the heart, that is, the panting and beating of the heart, and is good for the overflowing of the gall, the yellow jaundie; the juyce dropped into soule ulcers, or they washed therewith or with the decoction of the herbe and roote, doth wonderfully cleanse them and helpe to cure them. All lotions and gargles that are made for sore mouthes or ulcers therein, or in the privie parts, or else where are made with the leaves and rootes hereof, which is good also to fatten loose teeth, and to heale spungie soule gummies: the same also helpeth to stay catarrhes or defluxions of rheume into the mouth, throate, teeth or eyes: the juyce or water is singular good for hot and red inflamed eyes, if some thereof be dropped into them, or they bathed therewith, the said juyce or water is also of excellent propertie for all pusses, wheales, and other eruptions of hot and sharpe humours into the face or hands, or other parts of the body to bath them therewith, and helpeth to take away any rednesse in the face, and spots or other deformities of the skinn, and to make the skin cleare

Fragaria vulgaris. Common Strawberries.

3. *Fragaria Helvetica nana*. Dwarfie Strawberries.

are and smooth: some use thereof to make a water for hot inflammations in the eyes, and to take away any filme on the skin that beginneth to grow over them, or other defects in them that any outward medicine can helpe in this manner: Take what quantitie of Strawberries you please, and put them into a brasie vessell, with a little salt cast on them, which being covered, set into a wine cellar for eight dayes, in which time the berries will be dissolved into a greene water, which being cleared from the rest, keepe in a glasse close stopp'd to use when you neede: droppe or two put into the eyes serveth for the purpose aforesaid: some in milking both salt and brasie for the eyes, make a water both for the eyes and for the deformities in the skinne, be it morpew, leprey, or the like in this manner: Into a large destillatory or body of glasse, they put so many Strawberries as they thinke meete for their use, if a few, the lesser glasse body will serve, which being well closed, let it be set in a bed of hot horse dung for twelve or fourteene dayes, and after distilled carefully and the water kept for your use.

CHAP. XVII.

Alfne. Chickweede.

Here are so many sorts of Chickweedes, some chiefly growing in moist and watery places, others upon drie mountaines, some in the Fields, others in the Woods, some worthy of ones paines to plant in a Garden, others of no such respect that I must severre them, and intreate of some, in an other Classis where they are fitt to be spoken of; you shall therefore have those expressed in this Chapter, and the two next that follow that I thinke fitt for this place.

1. *Alfne repens baccifera*. Great spreading Chickweede.

This great Chickweede bringeth forth many flexible branches full of joynts, rising higher than a man if it stand by bushes, or other things where it may take hold, otherwise through weakenesse lying on the ground, it seemeth not so long, at every of the joynts stand two leaves one against the other, somewhat like unto the ordinary Chickweede leaves, but much larger, coming somewhat neare unto those of Pelletory of the wall, and of a fresh greene colour: at the joynts likewise on both sides of the stalkes come forth other branches, joynted and set with leaves in the same manner, and at the ends of them large greene round huskes ending in five points, with whole flowers growing out of them, consisting of five and sometimes of fixe white leaves apeece cut in at the ends, in which huskes after the flowers are past stand small round heads like berries, greene at the first, and blackish when they are ripe, containing within them many flat blackish purple seed: the roote is white and long, creeping much under ground, and shooting forth in divers places every yeare new shootes, the old dying downe every yeare: this hath no taste, but herbye as the ordinary Chickweedes have, and therefore is by the judgement

1. *Alfne repens baccifera*.
Great spreading Chickweede.2. *Alfne maxima*.
The greatest Chickweede.

of the best Herbarists referred unto them, yet *Lugdunensis* saith it hath a stinking and most unpleasant taste, -
 2. *Alfne maxima*. The greatest Chickweede.

This Chickweede which is the greatest of all the ordinary sorts riseth up with sundry stalkes, a foote high or more, and lye not on the ground as the smaller sorts doe, bearing two leaves usually at a joynt larger then in any other that follow, but somewhat narrower then the former, it beareth plenty of white flowers; of six leaves a peece, standing in long Greene huskes, which containe likewise the head or seede vessell, after the flowers are fallen, with small yellowish seede in them; the roote is white and threddy like the rest.

3. *Alfne major*. Great Chickweede.

This great Chickweede is in all things like the last both in leafe and flower, but smaller, the stalkes stand not fully upright but doe a little bend downwards, and needeth no other description to caule it to be knowne. There is another sort hereof differing in nothing else but the smalnesse of the whole plant.

Minor.

4. *Alfne Batica*. Spanish Chickweede.

The Spanish Chickweede riseth up very often with a single upright reddish stalke, not branched at all, and sometimes with many, about a foote or more high, full of joynts, at each whereof grow two smooth and darke Greene leaves, narrower then the last, a little broader at the bottome next the stalke, and small pointed at the ends, the middle ribbe on the backside being somewhat great and raised up: the flowers stand at the end of the stalke many set together in heads or huskes like those of *Symphitum petreum*, of a purplish colour; the roore is small white and long.

5. *Alfne recta triphylos sive laciniata*.

Upright Chickweede with jagged leaves.

This jagged Chickweede groweth upright, with a stalke for the most part branched into three or foure smaller sprays about a foote high, set at the severall joynts, with small long leaves, cut into three and sometimes foure parts, even to the middle ribbe almost, so that they seeme like severall leaves spread like so many fingers to the hand: the flowers come forth at the toppes and uppermost joynts, consisting of five small blew and round pointed leaves, with some threds in the middle, and standing in small greenish huskes, wherein after the flowers are withered and gone, appeare small flat heads divided as it were into two parts, wherein lye small whitish seede: the roote is small and long, set with many fibres and perisheth every yeare after feedetime, and springeth againe of the seede that is shed.

The Place.

The first as *Clusius* saith groweth in divers places of Spaine and Germany also, and I have sometimes found it by hedge sides in our own Land: the second and third is usually found in moist and watery places, by wood sides also oftentimes and in many other places, the fourth *Clusius* found in Spaine: the last groweth in sundry grounds and among rubbish sometimes.

The Time

They flower about June, and their seede is ripe in July.

The Names.

Chickweede is called in Grecke *αλφν* quod lucos, quos *αλφν* nominant, & umbrosa loca amat, and *Alfne* also in Latine, *Dioscorides* and from him *Pliny lib. 27. cap. 4.* saith *Alfne* quam quidam *Myosotin* appellant nascitur in lucis unde & *Alfne* dicta. The first is called by *Clusius* *Alfne repens*, and so it is also by *Camerarius* and *Dodoneus*, *Lobel* calleth it *Planta Alfinis majoris facie baccis Solani* *Cacubalum* *Plinij*, but some would make the *Solanum hortense* to be *Cacubalum*, led by the false coppie of *Dioscorides*, which hath divers names to herbes which is generally reported to be none of his worke, because the confusion of names taketh away the knowledge of the true one, *Lobel* in *Adversarijs* calleth it *Alfinis majoris facie planta baccis Solani*, and maketh a doubt whether it be *Cacubalum* *Plinij* quasi maleficum. *Lugdunensis* also calleth it *Cacubalum* *Plinij* sive *Ocimoides repens*, *Lucas Glinus* taketh it to be *Cyclamini altera*, but *Pena* and *Lobel* say that therein hee sheweth himselfe not well exercised in plants, *Bauhinius* calleth it *Alfne scandens baccifera*, the generall name among Herbarists is *Alfne baccifera*: for although the second which is the greatest Chickweede next unto it beareth heads of seede somewhat like it, yet they are nothing so great nor the seede within them, and is the *Alfne maxima* of *Lugdunensis*, which *Bauhinius* calleth *Angustifolia*: the third is the *Alfne maior* of *Lobel*, the second *Alyssus gallinus* of *Tragus*, the *Alfne maior* of *Camerarius*, *Dodoneus*, *Lugdunensis* and others, and is called by *Casalpinius* *Centunculus viticulus orbitalibus*, and *Bauhinius* *altissima nemorum*: the fourth is the *Alfne alia* and *Batica* of *Clusius*, which *Bauhinius* calleth *Alfne* herb he might referre it, divideth a name according to the forme of the fingers of ones hand as he took it to be like, & calleth it in his own language *Handlekrant cernicis floribus* (for this other of that kind with a white flower is the *Paronychia rupeo folio* *Lobelij*) and thereupon giveth it the name of *Dactylobotanon caruleo flore*, *Lugdunensis* maketh it to be an *Elatine* and calleth it *Elatine triphylos*, and *Columna* as I take it meaneth this plant which hee calleth *Alfne tenuifolia altera sive terrestris altera tricochyllon*, but not *Lagina spargula* as *Bauhinius* saith, for as all

agreg

The Virtues.

CHAP. XVIII.

1. *Alysia montana hederacea maxima* Columna. Columna his great Ivie leaved Chickweede.

2. *Alfine Hederula folio major Lobelij.* Lobel his greater ground Ivie leaved Chickweede.

3. *Alsine hederula folio minor.* The smaller ground Ivie leaved Chickweede.

4. *Alfine folijs subrotundis Veronica.* Speedewell Chickweede.

T t t 3

1. *Alfne montana hederacea maxima.*
Great Ivy leaved Chickweede.

2. *Alfne hederula folio major.*
The greater ground Ivy leaved Chickweede.

3. *Alfne folio hederula minor.*
The lesser ground Ivy leaved Chickweede.

4. *Alfne folijs subrotunda Veronica.*
Speedewell Chickweede.

five blew leaves, after which come small flat seede vessels like pouches, wherein is contained small round yellowish seeds: the roote is small and threddy, and perisheth not in Winter.

5. *Alfne montana capillacea folio.* Small narrow leaved Chickweede.

This small Chickweede hath divers small branches but rising a little above the ground, with small somewhat long and narrow smooth whitish leaves, set by couples at the joynts, from between which rise smaller branches, with the like leaves on them, and at their ends two or three small white flowers made of foure leaves a peece, the seeds that followeth is small and browne contained in round heads: the roote is small and threddy.

6. *Alfne repens angustifolia flore suave-rubente.*

Blush narrow leaved Chickweede.

This Chickweede creepeth with the branches upon the ground, bearing such like small long and whitish leaves, set by couples as in the last, but both branches and leaves are bigger then they: the flowers grow at the ends of the branches of a blush colour, which give long and pointed seede vessels, wherein is contained small seeds like the common Chickweede.

7. *Alfne Petrea.* Rockie Chickweede.

This is a small Chickweede but groweth so full of small upright branches thicke set, and enterlaced one within another, that it seemeth like unto a small bush, the leaves are small and pointed, and the flowers small and white like other small Chickweedes, bearing round heads like unto Line or Flax, wherein the small seede is contained: the roote is small and threddy.

8. *Alfne Alpina glabra.* Smooth leaved mountaine Chickweede.

This Mountaine Chickweede is like unto the other small Chickweedes, rising up with the branches scarce halfe a foote high, set with small long and smooth leaves like those of Line or Flax, of a pale greene colour, but shorter and sharpe pointed, the flowers are white, Starre fashion like others standing upon small long foote stalkes: the heads and seeds are like the rest and so is the small fibrous roote.

9. *Alfne Alpina minima glabra.* The smallest mountaine Chickweede.

This other mountaine Chickweede is smaller then the last, but more beautifull in regard of the flowers which are made of foure leaves a peece, either white or whitish, spotted with small prickles or spots of a deeper red colour standing three or foure together, each severally upon a small foote stalk and they all upon small branches scarce foure inches long set with the like pale greene narrow leaves, yet bare toward the toppes neare unto the flowers.

10. *Alfne Alpina linceo folio.* Rush leaved mountaine Chickweede.

The Rush leaved Chickweede groweth little above an handbreadth high, spreading from the stalke a couple of branches which are divided againe into smaller, whereof some onely and not all doe beare a flower or two at the end, somewhat large for the proportion of the plant, made of five white leaves standing in small greene cups, the leaves on the branches are very narrow, small, and very greene, hard also in handling, and set without order.

11. *Alfne nodosa Gallica.* French Chickweede with knotted heads of seeds.

This small Chickweede groweth sometimes a foote high, having many long and narrow leaves lying next the ground, from whence rise divers upright stalkes set with smaller leaves without order, from the middle upwards one above another: at the joynts standeth one small white flower a peece, composed of five white leaves, after which come small heads of seeds standing one above another, as if they had beene strung upon a string, and somewhat crested or furrowed: the roote is small and full of fibres of a yellowish colour on the outside.

The Place.

All these sorts of Chickweedes grow upon hills and mountaines in divers places, some in Italy, Spaine and France, &c. and many of them in our owne Land:

The Time.

They doe all flower in June and July except the sixt, which flowreth not untill Autumne.

The Names.

The first is so called by *Columna* as it is in the title, who saith it was not mentioned by any before him: the second is the *Alfne folio Hederule altera* of *Lobel*, the third is called by *Lugdunensis* and *Thalys Elatine prior*, by *Dodonaeus Alfne spuria prior*, by *Camerarius Alfne hirsuta*, by *Lobel Alfne gallina folio hederula*, thought to be *Hippago Plinij* by *Anguilara*, and called *Centunculus hirsutus* by *Cesalpinius*; but generally *Alfne hederacea*, and *hederula folio*, & *minor* I have added to distinguish it from the greater: the rest have their denominations by *Eauhinus* as they are set downe in their titles.

The Vertues.

All these herbes being but lately found out and to be referred to the family of Chickweedes, are not of such experienced use, as these of an ancienter knowledge; but it is most probable that being in taste somewhat agreeing unto the common sort, their qualities are not much differing, and therefore untill wee have learned some certaine properties whereunto they are effectuall, let this be sufficient at this time to have given you the knowledge of their being.

CHAP. XIX.

Alfines spuria alia parve. Small Bastard Chickweedes.

Hére are some other Chickweedes to be entreated of that pertaine to this Classis, and grow in severall soyles which shall be shewed in this Chapter.

1. *Alfne Viscosa.* Clammy Chickweede.

This clammy Chickweede standeth more upright then the last, with rough, hairy and clammy leaves somewhat like the other, but of a more blewish Greene colour: the flowers hereof are white and small, scarce opening themselves but in the hot time of the day, standing at the toppes of the stalkes, which from the middle upwards are so clammy, that they will sticke to the fingers of any that touch them, whereby they are apt to hold flies, and such other small things as light upon them.

2. *Alfne Mucosa.* Mosse like Chickweede.

This creeping and spreading Chickweede scarce sheweth it selfe above the Mosse and other herbes among which it groweth, with very slender small stalkes and small fine but thicke leaves thereon, and small white flowers of foure leaves a peece at the ends turning into long and round heads like unto the other small Chickweedes, the rootes are nothing but threads.

3. *Alfne nodosa Germanica.* Knotted Chickweede of Germany.

This knotted or great joynted Chickweede, thereof tooke the name because the stalkes which are part leaning and part upright an handbreadth long, have the joynts more knotted or bunched out then in others, the Greene leaves that grow at them are very small and long like threads, many set together, from whence likewise spread small branches bearing small white flowers of five leaves, set in great huskes that end in five corners every one on a long footestalke.

4. *Alfne folio Triflaginis.* Germander leaved Chickweede.

This small Chickweede spreadeth sundry small weake branches upon the ground, three or foure inches long, set with small somewhat round leaves dented about the edges, and pointed at the ends, by couples one against another, at the joynts whereof towards the toppes come forth small blew flowers, and sometimes white, consisting of five round pointed leaves, after which succede small round seede vessells, two alwayes joynted together, having small round seede within them; the roote is composed of many threads, and abideth the Winter.

5. *Alfne corniculata Clusii.* Clusius his horned Chickweede.

This Chickweede riseth up a spanne high, with one tender hairy stalk full of joynts, and two small long somewhat hairy leaves set at them, towards the toppe divided into some branches, where and at the joynts also come forth small white flowers in Greene huskes, and after them small and long thinn transparent hornes, as it were like to Cockes spurres, and clammy withall, wherein lye small blacke seede: the roote is small and annuall.

4. *Alfne folio Triflaginis.*
Germander leaved Chickweede.

5. *Alfne corniculata Clusii.*
Clusius his horned Chickweede.

The Place.

These Chickweedes grow in Fields as well tilled as untilled, and by the wayes sides, &c.

The Time.

They flower in Sommer, some a little earlier or later than others, and their seede is ripe quickly after.

The Names.

The first *Banbinus* calleth *Alfne hirsuta altera viscosa*, and *Camerarius Alfne viscaria*, *Dodonæus Alfne spuria quarta*, and *Gesner in collatione stirpium Alfne species glutinosa*, yet this is not the *Lycbinis viscosa* or any sort thereof, although for the propriety it might be called *Muscaria*: the second *Lugdunensis* calleth *Alfne muscosa*: the third is called by *Banbinus Alfne nodosa Germanica*, and differeth from the *nodosa Gallica*, whose heads of seedes are like knottes upon a thread or string, as is shewed in the Chapter before: the fourth is the third *Morsus Galline* of *Tragus*, the *Alfne spuria altera* of *Dodonæus*, called by *Lobel* and others *Alfne folio Triflaginis*, taken to be *Anthriscum* *Discoidea* by *Cesalpinius*, and by *Banbinus Alfne Chamedrifolia flosculis pediculis oblongis insidentibus*: but surely it ever he saw any whose flowers had long stalkes, I did never: the last is so called, first by *Clusius*, and after him by all others, as it is in the title, yet some supposed it might be a kind of *Nigellastrum* or Cockle.

The Virtues.

There is little use in Physicke of these Chickweedes, yet the two first are of the taste of Burrage, and the rest of Chickweede.

CHAP. XX.

Borrago & Buglossum. Borrage and Buglosse.

Although I have given you in my former Booke the knowledge of the Garden Borrage and Buglosse, and some other sorts of them, yet there doe remaine some others both of the Garden and wilde kinde, whereof I meane now to speake.

1. *Buglossum minus sativum*. Small Garden Buglosse.

This Garden Buglosse is very like the ordinary garden kinde for the manner of growth, but that it is smaller in all the parts thereof, the leaves are narrower and shorter, the flowers are smaller, some of a blew colour, and some purple: (and *Lobel* mentioneth one with a red flower, which he stileth *Echij facie*, *Buglossum minus flore rubente*: the seede is likewise blacke but smaller: the roote perisheth not, and is like the other.

2. *Buglossum sylvestre majus flore nigro*. Great wilde Buglosse.

This kinde of Buglosse differeth not from the last in any thing but in the greatnesse, being greater in every part, and in the colour of the flowers which are of so deepe a purple colour, that it is called blacke, and that it is found growing naturally in some places of *Italy*, and the other not but in Gardens.

3. *Buglossum sylvestre minus*. Small wilde Buglosse.

This other wilde Buglosse hath somewhat broad short and rough leaves, smaller than either the garden or the last wilde kinde, and somewhat more unevenly cut in on the edges: the flowers grow at the toppes of a blewish purple colour but smaller, and the seede groweth three or foure together like it, and blackish also: the roote is small and long.

4. *Buglossum sylvestre minus alterum*.

The rougher wilde Buglosse.

This rougher kind differeth from the last in these particulars: the leaves are much rougher than it, and sharper or smaller at the ends also: the flowers on the toppes of the branches are more like the flowers of *Galiopsis*. Stinking dead Nettle than of any of the former sorts of Buglosse, some plants being of a blewish purple, colour and some white, and not of both these colours in one plant.

5. *Buglossum dulce ex Insula Lancastrie*.

Lancashire Buglosse.

Lancashire Buglosse shooteth forth many slender stalkes of a cubite high, some more, some lesse, the lower leaves whereof next the ground are much lesser than those of Borrage, and of a whiter Greene, somewhat rough, but those that grow on the stalkes are lesse, having the flowers set at the joynts with them, whose buds before they are blowen are of a reddish colour, but when they are open, are of a blewish purple, somewhat like those of *Vipers* Buglosse, or betwene them and Borrage flowers, of a very sweete taste like hony, the roote groweth great and blackish on the outside, divided downwards into some great fanges.

6. *Borrago minor sylvestris*. Small wilde Borrage.

This small Borrage is very like the garden kinde, but that it is much smaller and slenderer, the leaves also are much smaller, narrower, shorter, rougher and more prickly, and of a paler Greene colour, thinner set likewise upon the stalkes, for it hath but few branches: the flowers grow at the joynts with the leaves from the middle of the stalke upwards, three or foure set together, and are blew like the other, but more pale and roue-

Buglossum minimum Echij facie floribus rubentibus
Small Buglosse with red flowers.

der

1. *Euglossum minus sativum.*
Small garden Buglosse.

2. *Euglossum sylvestre majus flore nigro.*
Great wilde Buglosse.

5. *Euglossum dulce ex Insula Lancastria.*
Lancashire Buglosse.

7. *Borago minor herbaceum.*
Small creeping Borage.

der pointed, and so small that they scarce shew themselves out of the huskes wherein they stand or rather hang, for they turne downe their heads and quickly fall away; in the said huskes are found foure small flat feedes somewhat like unto *Echinum*, or the wilde Buglosse: the roote is small and long, and perisheth as soone as it hath borne seede which is very early.

7. *Borrage minor herbariorum*. Small creeping Borage.

This small Borage shooteth forth many leaves from the roote very like unto the leaves of *Pulmonaria maculosa*, spotted Cowslips of *Ierusalem*, every one upon a long foote stalke (but not spotted) of a darke Greene colour, and lesser than they: the stalkes are small and slender not above halfe a foote high, with very few leaves thereon, and at the toppes come forth the flowers made of five blew round pointed leaves, more like Buglosse than Borage, without any threads in the middle, every one upon a long foote stalke, the roote is composed of many long blackish strings more like unto *Avena* than Borage: in the leaves is a certaine acrimony or sharpnesse, joynd with the mucilaginousnesse when they are tasted.

The Place.

The first is onely nursed up in gardens, even in *Italy* from whence the seede was brought unto us and unto other countries also: the second, third, and fourth grow wilde in divers countries, and are sometimes found in our owne: the fifth groweth in one of the Isles about *Lankashire*, there found by Mr. Thomas Hesketh: the sixth in *Germanie* as *Lobel* saith, and in *Naples* as *Columna* saith, and in our owne Land if I be not much deceived, for I thinke I have seene such a one in divers fields in *Kent* as I have passed through them: the last *Lobel* saith he saw in the garden of the Low countries with those that were lovers of rare plants, and prospereth well in our owne gardens.

The Time.

They doe all flower in the month of June and July, yet *Lobel* saith that the last flowreth both in the Spring and in August, and their feede doth ripen quickly after, both ripe feede and flowers, may at one time be gathered from many of them.

The Names.

Our Garden Borage is called by the Greekes, as *Pliny* saith, *Εὐεσών* *Euprosion* ab efficienda voluptate; and by the judgement of the best of our moderne Writers is the true *βορραγοσ* or *βυρραγοσ* of the ancients, most truly imitating an oxe or neates tongue, which is *Lingua bubula* or *Bovino*, & so it seemed it was called by *Cato* in *lib. de re rustica* c. 40. when he adviseth to take a leafe or a branch of *lingua bubula* to cover a stocke when it is grafted, to keepe away the raine from abiding in the cleft, for which purpose these leaves of Borage being broader than those of Buglosse is more fit. *Apuleius* saith, that *Buglossum* (meaning our Borage) was called by them of *Luca*, *Corrago quod cordis affectibus medetur*, which by the alteration of one letter is *Borrage*, & from thence I thinke came the name of *Borrage*, which is not found in any of the ancient Writers. Our Buglosse is called by some *Buglossa* and *Buglossum* by most, yet some doe call it *Buglossum Hispanicum* and *Italicum*. It were an advise not to be condemned, that our Borage should be used for *Buglossum*, where it is appointed in any medicine, especially in *Syrupo Byzantino*, for if the juyce of our Buglosse be taken to make it, the juyce is so slimie that it will never make a good syrrupe as it ought to be, unless that after the brusing of the herbe it be set in a ceilet or cold place before the juyce be pressed. The first here expressed is called by *Fuchsius* and *Lonicerus*, and from them *Lugdunensis* *Cirsium Germanicum*, for they did account all the sorts of Buglosse to be *Cirsia* or *Echia*, as *Tragus* doth also, and calleth this *Buglossa minor*, *Fuchsius* likewise calleth it *Echium lanuginosum primum*. *Gesner* in *hortis* calleth it *Buglossus minor*, and *Lugdunensis* *Buglossum minus sativum*, *Lobel*, as I said in the description, calleth that sort with red flowers, which is a species hereof *Echii facie* *Buglossum minimum*, and thereupon *Bauhinius* calleth it *Buglossum angustifolium minus*: the second *Matthioli* calleth *Buglossum sylvestre* and *altorum flore nigro*; *Thalium* *Buglossa sylvestris nigra*, and *Bauhinius* thereupon *Buglossum sylvestre majus nigrum*: the third is called by *Dodonaeus* *Buglossa sylvestris* and *fruticosa*, and *Lycopis sylvestris*; by *Lobel* *Buglossum erraticum asperum Echoides*, by *Fuchsius* *Echinum Germanicum spinosum*, it is the *Borrage sylvestris* of *Tragus*, and called by *Bauhinius* *Buglossum sylvestre minus*: the fourth is called by *Tragus* *Buglossa sylvestris*, by *Lonicerus* *Lycopis*, by *Cordus* in *historia Anchusae minor*, by *Lugdunensis* *Buglossum sylvestre minus*, and by *Bauhinius* *Buglossum sylvestre minus alterum*, and is likely to be the *Cynoglossum* of *Tragus* and *Fuchsius*, for that it was formerly used among the Germanes for *Cynoglossum*, and is called *Anchusa altera* of *Cordus* upon *Discorides*, the first hath not bene related by any before: the first is called by *Lobel* *Alyssum Germanicum Echoides*, by *Thalium* *Buglossa sylvestris species*, and taken by *Tabernmontanus*, and others to be the *Aparine* major *Plinij*: but *Cesalpinus* calleth it *Crucialis quaedam*, and *Dodonaeus* in his *Dutch Booke* *Asperugo spuria*; *Columna* *Borrage minor sylvestris*, and *Bauhinius* *Buglossum sylvestre caulibus procumbentibus*: the last is called by *Lobel* *Symphytium puniolum repens Borrageinis facie*, sen *Borrage minima herbariorum*, which *Bauhinius* putteth among the *Symphytia*, and calleth it *Symphytium minus Borrageinis facie*. The Arabians call the Borage and Buglosse *Lesen arthaor*, the Italians *Boragine* and *Buglossa*, the French *Borache* and *Buglosse*, the Germanes *Buerres* and *Ochsenzunge*, the Dutch *Bernage* and *Offentonghen*.

The Vertues.

Because I was so briefe in my former booke in setting downe the properties of the Garden Borage and Buglosse, I thinke it convenient to expatiate their vertues under these wilde sorts. The Garden kindes are temperate and accounted rather hot and moist in the first degree then cold, and yet for their cordiall porperities are often used among other cold herbes as conducing to the like effect. *Discorides* appropriateth them with oyle against *Erysipilas* or Saint *Antonies* fire, and to cure Greene wounds: The leaves or rootes are to very good purpose used in all putrid or pestilentiall Feavers, to defend the heart, and to helpe to resist and expell the poison or the venom of other creatures: the feede is of the like effect and also helpeth Nurses to have more store of milke, for which purpose the leaves are much conducing: the leaves, flowers and feede, all of them or any of them are very cordiall and helpe to expell pensiveness and melancholie, that ariseth without manifest cause, whereof came the saying, *Ego Borrage gaudia semper ago*, and as I layd before called *Corrago*: it helpeth also to clarifie the blood and mitigate the heate in feavers: the juice made into a Syrrupe prevaileth much to all the purposes aforesaid, and is also put with other cooling opening and clensing herbes to open obstructions, and to helpe the yellow Jaundies, to coole and clense the blood and temper the heate and sharpnesse thereof, especially with *Fumitory* and thereby to helpe the Itch, Ringwormes or Tettors or other spreading scabbes or sores that arise from aduft and sharpe humors

humors and for that purpose is put into the *Syrupus Byzantinus*, which worketh to the same effect: the Conserve made of the flowers, or the flowers candid are helping also in all those causes, but are chiefly used as a Cordiall, and good for those that have been long sicke and feeble or in a Consumption, to comfort the heart and spirits, and thereby good for those that are troubled with often swoonings or passions of the heart. The distilled water is no lesse effectually to all the purposes aforesayd; and the eyes washed therewith helpeth the rednesse and inflammations of them: the dried herbe is never used but the Greene, yet the ashes thereof boyled in mede or honied water is available against inflammations and Vicers in the mouth or thoroate, to wash and gargle it therewith: the rootes of Buglosse are much more clammy and glewish then of Borrage and therefore by some good Physitions not held so convenient to be used in opening decoctions: for it is thought by the tenacious mucilagines in them, they rather helpe to binde then open obstructions, but may be effectually in a Loboc or Licking Electuary for the cough, and to helpe to condensate thin flegme and rheumaticke distillations upon the Lungs. These other sorts of wilde Borrage or Buglosse are somewhat hotter and dryer, and are very neare unto the proprietie of *Echium Vipers* Buglosse whose Vertues I shall not neede here to reiterate, I shall rather referre you to their Chapei to be informed in the particulars thereof.

CHAP. XXI.

Cucurbita, Gourdes.

Here is so great a likenesse of Gourdes, Melons or Pompions, Muskemelons, Cowcumpers, and Citrinilles one unto another, both in their manner of growing, and qualitie of cooling, that the ancient Greekes, and others have much confounded them together, yet they doe each notably differre one from another, both in the forme of their fruites and seede, besides their life and colour. I have in my former Booke set forth the sorts, both of Muskemelons, and garden Cowcumpers, whereof I shall not neede to speake againe here, although I may give you some of their figures: of the wild Cowcumber, as also of the wilde or bitter Gourde called *Colocynthis*, I have spoken in the second Classis of this Worke before: divers sorts of Gourdes remaine to be entreated of, whereof the Pompion is a peculiar kinde, and having spoken of the garden kinde thereof also in my former Booke, I intend not to repeat it againe, but of some strange wilde kind: I must here comprehend under the Gourds, although their seedes doe differ *Citrulli Citrinilles*, which are accounted by divers to be kinde of Cowcumpers, but I doe rather referre them also to the Gourds, because their seedes have hard shells, such as neither Melons nor Cowcumpers have, which two are of so neare affinitye, that their seede is very hardly distinguished. Of Citrullus I shall enreat in the next Chapter, and of the Gourds in this, and with them some such strange fruites as have come to our sight or knowledge from forraigne parts, whereof we tooke the figures, and that after I have given you some of their descriptions to save many repetitions.

1. *Cucurbita lagenaria major*. The greater bottle Gourde.

This great Gourde groweth as all other of these kinds of herbes do, spreading many great, rough and hairy armes and branches, with severall great and broad leaves, soft and almost round, yet pointed at the ends, and sometimes dented about the edges set upon long footestalkes and long clasping tendrills like a vine, set at other joynts whereby it climeth, taking hold and winding it selfe about whatsoever poles, arbours, trees or other things that stand next unto it, or else not having whereon to cline and raise it selfe, it lyeth on the ground spreading a great compasse as the Pompion doth, at the severall joynts likewise with the leaves come forth severall flowers in the same manner as Pompions, Cowcumpers or Melons doe, but are very large hollow bells ending in five points or corners with a round Greene head under each of them that will beare fruit, for many flowers wither and beare no fruit, not having that round Greene head under the flowers which should grow to be the fruit and will be full and ready to come forwards with the short stiffe stalk under it, the colour of the flowers are either white, or pale white, or pale yellow, the fruit when it is ripe hath an hard outer rind or shell, yellowish, large and round bellied, flat at the bottome like unto a bottle and smaller up to the necke, above which is a small round tormented head whereunto the stalk is fastned, and sometimes without any small head, being pendulous or hanging downe not standing forth or upright, within which fruit lye dispersedly many seedes, having smooth hard woody shells, flat and broad at the upper end or head, and somewhat pointed below, wherein lyeth a sweete white kernell: the roote consisteth of many long stringes spreading much within the ground but perisheth usually with the first frosts.

2. *Cucurbita lagenaria minor*. The lesser bottle Gourde.

This differeth from the former in nothing but that it is smaller in every part as well leaves stalkes flowers as fruit, which is of the same forme but smaller.

3. *Cucurbita longa*. The long Gourde.

This Gourde also differeth little but in the fruit and seede from the former, for the fruit groweth long and sometimes crooked or bending like a horne, almost of an equall size all the length which in some places groweth to be of an incredible length, especially when the fruit hangeth downe from some high place, other wise lying on the ground it never attaineth to halfe that length, whose outer Rinde is yellowish in the hotter climates as the other sort is, but with us whitish, and seede therein, somewhat whitish with us, and not so broad at the head nor so hard.

4. *Cucurbita chryseiformis sive laciniata*. The Buckler or Simnell Gourde.

There is a manifest difference not onely in the fruit of this Gourde from the rest but in the manner of growing also, for it groweth upright with great hollow rough hairy crested stalkes, to the height of three cubites, and runneth not along on the ground as the rest, having greater leaves rough and hairy set thereon, of a sad Greene colour, and more cut in or divided on the edges: the flowers are bell fashion like the others, of a faine yellowish colour standing upon the head of the fruit which growing to ripenesse is somewhat big and round toward the stalk but flat forewards, with a crumpled verge or brim, somewhat cut in or ended, and thinner there then in any other place, the forme doth much resemble those sodden baked cakes that are made in Lent time which wee call

1. *Cucurbita lagenaria major*.
The greater round bottle Gourd.

3. *Cucurbita long*. The long Gourd.

4. 5. *Cucurbita Chrysiformis* & *verrucosa*
& *Auguria Aegyptiaca*.
The Simnell and the rugged Gourd, And the
Egyptian Citrull or watery Melon.

Cucurbita Indica, Ovalis, Pyriformis
& *sepe rotundus*.
Indian Gourds, Oval, Peare fashion, and
almost round.

call Simnells, which thereupon I have so entituled, or else Bucklers as others do thinke which you please: the pulpe or meate within is firme & cutteth like an Apple, without any hollownesse in the middle but where the seede lyeth, which is somewhat like unto the Kernell of an Apple, but greater, broader, and flatter at the head.

5. *Cucurbita verrucosa*. Rugged Gourds.

The difference herein consisteth onely in the round fruit, whose shell or barke is not smooth as in others, but rugged, set as it were with knobbes and warts.

V u u

6. *Cucurbita*

6. *Cucurbita hyemales*. Winter Gourds or Millions.

These Gourds differ little in forme of growing from the other sorts before mentioned but in the maturitie and durabilitie of their fruite: for there are of them that are greater then others, and of different colours, as some yellow others Greene or of other colours: but all of them doe ripen later, and doe better endure the first approach of Winter then the others, for they are not full ripe and fit to be eaten before they are hung up in a Chamber after they be gathered.

7. *Cucurbita Indica rotunda & diversi formes*.

Round Indian Gourds, or Millions, or Pom pions, and of other formes.

There is very great varietie of these Gourds (or Millions as some call them, or Pom pions, as I may call some of them) that come out of America or the West Indies, from sundry places, both farther South among the Spanish Colonies, and nearer hand in our owne of Virginia, New-England, &c. Some whereof in their forme are as round as long, some longer like a Pearce, some more long then round, and some flat at the bottome: some also as great as our Pom pions, some as small as an Apple, and some of divers other sises, meaner or greater or lesfer, some with much moysture or water that is very sweete and pleasant in them, and some having little or no meate, or moysture: some againe discoloured on the outside, Greene, with whitish or yellowish stripes in them, or spotted so finely that they give great delight to behold them, some also reddish spotted or striped, and some of a deepe yellow colour, the feedes in these likewise are variable in divers, some more like unto the ordinary Gourd seed, but blacker or browner, or red, in others white, either like the long Gourd, or like to our Pom pions, yet few so large as our Pom pion, and others as small almost as the Cowcumber feede, so that to give you an ample declaration of every one of them were a worke of curiositie, and of more travell then profit, and therefore I must leave it for them that can intend it, and will gather them all together and publish such a peece, I must convert my pen to other parts which I hope shall proove more beneficiall to the Common wealth.

Divers other sorts of Gourds or Millions, or Pom pions, or whatsoever else you please to call them, are growing and have bene brought us from sundry places, both Syria and the East Indies differing from many here expressed, some being as red as blood both within and without, and much pleasanter in eating then in any of these Countries, whereof to write more largely were almost superfluous, the diversitie being so great that we yearly almost see some sort not before seene of us, and therefore who so will may quote those they like in the margin or end hereof.

The Place.

All these Gourds are strangers and brought from severall places, some out of the Levant, as Egypt, Syria, &c. others as I said before out of America, both further off and nearer to us, as in Virginia, &c.

The Time.

They are all to be planted of the feede in the Spring, and in very good ground that must not want plenty of moysture, or else the heate of our owne Country will not serve to ripen them.

The Names.

The Gourde is called in Greeke *κολοκύνθη* or *κολοκύνθη ἰνδική*, *Colocyntha edulis*, to shew the difference from the other *κολοκύνθη* or *κολοκύνθη αἰγία* or *κολοκύνθη αἰγία* or *κολοκύνθη αἰγία*, the wilde or bitter Gourde called *Colocynthis* or *Coloquintida* before spoken of: in Latine *Cucurbita aconitum* (as it is thought) *quod facile siquid obsteret quo minus extendatur incurvescat*: the Antients as I sayd in the beginning have bene very variable in their denominations of Gourds, Cowcumbers, &c. for they have by the word *αἰνία* which is *Cicumis*, called divers other sorts of these fruits. *Athenicus* setteth it downe in his second booke that *Enthydamus* called the Gourde *Cucumis Indicus*, because as he there saith, the feede was first brought out of India, and that *Mendotus* made the Gourd to be of two sorts, the one of India called *αἰνία cucumis*, the other called *κολοκύνθη colocyntha*, *Pliny* also in his 19. Booke and fift Chapter maketh the Pepo or Pom pion, a kinde of Cowcumber, saying *Cucumeres cum magnitudine excesere Pepones vocari*, but *Galen* saith lib. 2. *alimentorum* that *αἰνία* (which signifieth *αἰνία* or *αἰνία*) ripe and may be appropriate to all fruits) is yet given to one peculiar, but then it is called *αἰνία αἰνία* *Pepo cucumeralis*, but hereof I shall speake a little more in the next Chapter. *Pliny* hath two sorts of Gourds, the one he calleth *Cucurbita Cameraria*, because it was planted or placed neare unto Chambers and windowes to be a shade and coole refreshing from the heate, which by climbing up and leading it which way they pleased it did performe, for as he saith it is *sublimitatis avida*: the other he called *Cucurbita plebeia*, which lay upon the ground and climbed not, which I doubt whether it be any of those sorts here spoken of, for all of them except the *Clypeiformis* will clime if they have any high thing stand neare them whereon they may rise. The Arabians call them *Hara*, *Charha* and *Harakarha*, the Italians *Zucca*: the Spaniards *Calabassa*, the French *Courge* and *Concourde*, the Germans *Kurbiss*, the Dutch *Cauworderen*, and wee in English Gourds. The two first are called by *Lobel* and *Engdramensis*, *Cucurbita lagenaria major & minor*, and *Cameraria major & minor*: the third is called *Cucurbita oblonga* by almost all Authors except *Dodonaeus*, *Lobel* and *Gerard*, who call it *Cucurbita anguina*: the fourth is called *Cucurbita stellata & sessilis* by *Camerarius* and *Gesner* in hortis: by *Tabermontanus* *Cucurbita capitata*, by *Gerard* *Cucurbita sylvestris fungiformis*, *Pepo Indicus fungiformis*, and *Pepo maximus clypeatus*, for all these his three figures expresse but this one sort of Gourd, and by *Dodonaeus* *Pepolatus*: the fift is called *Cucurbita Indica* by *Matthioli*, *rotunda* of *Casparinus* and *Engdramensis*, and *Indica major or minor* of *Tabermontanus*: *Zucca major rotunda* of *Cordus* and *Citrullus maior* and *Pepo maior sylvestris* of *Gerard*, which although he expresse these as he did the former for sundry plants yet they are not so: of this kinde *Matthioli* and others have made mention of much varietie which they saw in their time, and wee I thinke in ours many more as I have declared before: the sixt is mentioned by *Engdramensis* onely by the name of *Cucurbita verrucosa*: the last some call *Cucumeres hyemalis*, but I had rather call it *Cucurbita hyemalis* partly for the reasons before set downe, but chiefly for the feede sake which is more like a Gourd then a Cowcumber. What I said before concerning the variableness of the ancient Authors in these things, I may as well say of our moderne writers in confounding *Pepo*, *Melopepo* and *Cucurbita* so promiscuously, that it is not possible to finde out the distinct certaintie of them all, for some make that to bee *Pepo* that others call *Melopepo* and others *Cucurbita*. And *Bauhinus* who taketh upon him to refine all other mens writings and distinguish of them, in making *Pepo*, *Melopepo*, and *Cucurbita* severall kinds of plants, doth so huddle and confound them together, as any that will read him advisedly and compare him may soone see that he giveth severall names to one and the same plant in divers places; which error and the prolixitie about them

ou see I have endeavoured as much as I can to avoyd. But to give you one note worth the observation to know the severall varieties of these and the other sorts of Millions, Citrulls, Cowcumbers, &c. is diligently to marke the forme of the feedes, for the feede of the ordinary bottle Gourds are formed quite differing from all the other sorts, and therefore whatsoever strange feede shall come to your hands formed somewhat like unto them, you may certainly conclude them kinds of Gourds, so likewise of the Pompions or Millions which are flat, white, and greater then either Muske Melon or Cowcumber: in like manner the Citrull hath a thicke hard shelled blacke barcke and rounder then the Gourd, and therefore what feede is nearest thereto in likeness you may include them under their family, the Muske Melons and Cowcumbers are very like one unto another, and therefore would conclude them both under one *genus*, yet if you will well observe them you shall soone know their difference by the yellower and harder shell of the Melon, & greater also when as those of the Cowcumber are whiter, smaller and tenderer shelled: I know none other of these kinds of fruites but may be most truly referred by their feede especially, but not either by forme, colour or taste, to one of these foure foresheved sorts. Some other things more, before I leave this narration I thinke good to shew you, namely, the divers errors both of *Pliny* and others, both ancient and moderne, who thinke that all or most of these varieties of Gourdes have come from the feede of one kinde, *viz.* that the feede that lyeth in the necke of the Gourde will give long Gourdes, those in the middle round like Gourdes, and those in the bottome or lowest parts, flat or bottle like Gourds, and that the variety of formes in them is also caused by the Art of Gardiners, who by mouldes and such like, doe bring them into what forme they please, which forme, say they, they will continually keepe afterwards each from their own feede, which is found utterly untrue, for howsoever they may by mouldes, &c. bring them in their growing to the forme of the mould, yet the feede thereof assuredly will give no other forme than the first naturall, unless it be forced againe. Another error or opinion possesseth many that by the standing of water in a pot three or foure foot off from the place where it groweth, it will shoote and spring wondrous fast, and that if oyle be set neare it, it will shrinke in as fast: and againe, that if women when they have their courses shall touch any part of them, it will hinder their growing: and lastly, that to make them come without feede, is to keepe the feede in oyle of *Sesamum* before you set it, all which are as erroneous as the former.

The Vertues.

All these sorts of Gourdes how ever different in forme, yet are of one qualitie, that is, cold and moist in the second degree: they are eaten in the hot countries with much delight, kept and preserved with great care, art, and paines to be spent almost all the yeare after, and have there, as I said before, a farre more sweete and pleasant relish than in these colder climates, where being more waterish, they are the more unfavorie, at the least more inipide: they are eaten boyled or stewed, but much better being fried whereby they give the better nourishment to the body: for by their moisture being boiled or stewed, they are the more lubricke, and make the body the more soluble, and so they doe also being pickled up as many use to doe: Wine also kept in a fresh Gourde all night, after it hath beene clenfed from the loose inward pulpe and feede and drunke in the morning will cause the body to be soluble. They are conveniently given to hot & cholericke bodies to coole the heat and inflammation of the liver and stomacke: but the distilled water of them before they are through ripe drunke with some Sugar, doth wonderfully helpe to assuage thirst, and the hot fits of agues. For want of a Still to make water, you may make some effectuall in this manner. Put a whole Gourd when you have cut off the upper head and clenfed it from the feede, into an Oven with a batch of bread, in the middle whereof there will be gathered a fine cleare water, which being powred out, may be kept to use as neede requireth: the leaves and young branches are conveniently applied to all the hot humors, empostumes and inflammations, and to assuage paines of the headach, the rednesse and heat in the eyes, the paines in the eares, and the paines of the gout, if either the juice of them, or the water be applied in clothes and sponges wet therein: the same applied to womens breasts pained with the abundance of milke easeth them by cooling and restraining the hot qualitie and quantitie thereof: the water or juice being drunke or outwardly applied to the privie parts of man and woman, restraineth the immoderate lust of the body: the ashes of burnt Gourds are used of many to clenfe and heale old ulcers and sores, as well in the genitories, as other parts of the body, and to helpe scaldings or burnings by fire or water: they are accounted as good for macilent lean and weake bodies to feede on, as they are hurtfull to such as have the winde cholicke, to whom they are not to be given at any hand. The feedes of Gourds are one of the foure greater sorts of cold feedes used very much in Physicke, and are very available in decoctions, Iuleps, Emulsions or Almond milkes to coole the heate of the liver, the reins or backe and urine, and to give much ease to them that are troubled with the stone or gravell in the kidneys, and the ulcers or sores of the inward parts and bladder. The Simnel Gourd being of a firmer substance dressed any good way, is both more acceptable meate, and is no lesse effectuall in medicine. The *Indian* sorts are some more waterish, others more solide, and accordingly are more or lesse fit for meate or medicine.

CHAP. XXII.

Anguria sive Citrullus. The Citrull or *Turkie* Million.

THe Citrull or *Turkie* Million hath also some varieties being a fruit different from the other, as well in the forme thereof as of the feed, which much leadeth me to distinguish of them, or joyne them together, yet because some doe account them kindes of Cowcumbers, I will give you the figures both of some sorts of Cowcumbers and Muske Melons also.

1. *Anguria sive Citrullus vulgarior.* The ordinary Citrull or *Turkie* Million.

This kinde of Million groweth like as other Melons and Cowcumbers doe with rough trailing branches, the leaves whereof are hairy, longer and narrower than in any other, and more divided into severall parts, and hath small clasps and yellow flowers, but the fruit is greater than a Melon, somewhat neare the fashion of a Pompon, with a smooth greenish barke which will change yellow by time, having some ribbes thereon, the meate

Cucumis sativus.
The ordinary Cucumbers.

Cucumis anguria flexuosus.
The long bowed Cucumber.

Melo Indicus parvus.
A small Indian Melon.

1. Anguria seu Citrullus vulgarior.
The ordinary Citrull or Turkie Melon.

or inner substance is waterish, in some sweeter, in others a little tart or soure, the seede whereof is smaller, rounder, blacker and harder shelled than those of the Gourd, the roote spreadeth and dieth like the rest.

2. *Anguria Americana versicolore pelle.* The discoloured Indian Million.

This other sort of Million varieth little from the former in growing, leaves or flowers, in the fruit is the chiefe difference, which is as great as a middle sized Pompion with a discoloured barke very variably spotted and striped with white spots and markes upon the Greene, the inner substance whereof is waterish, yet somewhat firmer than of the former, and will keepe found for a good while after it is ripe and gathered, as the others also will, the seede within this is like the other, but longer, greater, redder, and more smooth and shining.

3. *Anguria Egyptiaca.* Egyptian Citrulls or Millions.

Some of these Egyptian fruites are greater than others, even so great as *Bellonius* saith that foure or fixe will load a camell, and one a man; the outer rinde being yellow, the inner meate or substance very little and almost empty, filled in the middle with much water that is very sweete, much desired and drunke by them of the more respect, with Rosewater, Muske and Amber, and is the present they offer to strangers whom they will chiefly entertaine; it hath a few smaller seedes within it than in the former, in other things there is little difference. I have given you the figure of this fruit in the former tripartite table in the foregoing Chapter.

4. *Anguria carne lignosa.* Hard or Woody Millions.

Cesalpinus maketh mention of this sort as of a kinde of Cowcumber (for so the *Italians* doe call these sorts of fruits that growing wilde or manured in other countries are nurfed up in *Italy* for delight and raritie) whose fruit is so hard and woody, that it will not breake being let fall upon the ground, but will rebound againe like a ball that is let fall: Hereof I have no further knowledge than his relation, that is, *testis sibi dignus*.

The Place.

The first groweth generally throughout *Turkie*, and so likewise in all *Italy* and many other hot countries, where they doe account it for their best of Cowcumbers: the second was given me among others rarities that came out of *America* or the *West Indies*: the third is naturall to *Egypt*, as *Prosper Alpinus* saith in his Booke of *Egyptian* plants; and *Bellonius* in his second Booke of Observations, and 75. Chapter: the last is not knowne or not mentioned where it is naturall.

The Time.

They flower and beare their fruit about the same season that the others doe.

The Names.

It is thought by divers that this kinde of fruit was not knowne to the ancient Greeke or Latine Writers, and that *Atius* did first make it knowne by the name of *Anguria*, from whom *Matthiolus* and others doe call it: others doe suppose that it is the *Pepo* of *Dioscoridis*, *Galen*, and *Pliny*; but I thinke it not amisse here to relate the words of *Galen* in 8. *simpl. medicament.* *Voüersa Peponum natura frigidior, cum larga humiditate existit: sed habent quoque quandam abstergens vim: atqui Melopepones minus humidi, quoniam Pepones sunt;* by which words one may more than halfe ghesse which of these sorts of fruites come nearest unto *Pepo*, and *Melopepo* of *Galen*, and those of his time, unlesse our climate alter their substance or propertie. It is generally called *Citrullus* or *Citrullus* a citreo colore & forma, and *Cucumis Citrullus* by divers, to distinguish it from the other Cowcumber. In the Chapter before you have *Pliny* alledged to account the Cowcumbers that grow over great, to be called *Pepones*, and here you have that these *Citrulls* be accounted *Cucumeres* as *Cesalpinus* and all *Italy* over doe account them commonly: so that you see how various mens opinions are in these sorts of fruites, none knowing directly which of them is most truly the *Pepo* or *Melopepo* of the ancients, nor which is their *Citrullus*, whether this that beareth that name as the *Italians* take it, or our ordinary *Cucumis* commonly so called with us: *Alpinus* in his Booke of *Egyptian* plants, saith, that the *Egyptians* have divers of these sorts of *Citrulls* differing one from another which they distinguish by the severall names of *Chate*, *Abdolavi*, *Chajar* &c. Of the *Arabians* it is called *Batec*, and *Barecha*, and as it is thought is the *Dulhaba* of *Serapio*; but *Bellonius*, in the place before alledged, saith, that the *Egyptians* call it *Copous*, and that *Anguria* signifieth a Cowcumber, and is not this plant: of the *Italians* *Cocomero* and *Angoria*; of the *Spaniards* *Cogombro*, of the *French* *Citrullus*, of the high and low *Dutch* following the Latine name *Citrullus*, and so wee in *English*; as also *Turkie* Million or Cowcumber, because that others doe call it *Cucumis Turcicus*.

The Vertues.

The *Citrull* is of the same temperature with the *Gourde*, that is, cold and moist: the seede is most of use in the Apothecaries shoppes, and reckoned one of the foure greater cold feedes, being used as *Gourdes*, *Millions*, and *Cowcumbers* to coole the heate of the fits of agues, and the distemperature of the liver and bloud, to quench thirst, and to take away the drinesse and roughnesse of the tongue caused thereby, and is as available for the stone, the heate of the raines, and the sharpnesse and stopping of urine as any of the rest. It is thought more convenient for macilent bodies, and that are growne feeble and weake by long sickness, in regard of the greater sweetnesse more than in the *Gourde*, as aforesaid: and generally both leaves, branches, iuyce and distilled water hereof, is as effectually applied for all those diseases that the *Gourdes* before mentioned are, and therefore neede not againe be repeated. I shall referre you to the Chapter going before for the rest.

CHAP. XXIII.

Intubacea plantæ. Endive or Succory like herbes or plants,

Under this generall name of *Plantæ Intubaceæ* Succory like herbes, is comprehended to great a varietie, that to expresse them in some methodicall manner, I must distribute them into severall Chapters under their principall heads or titles, wherunto they are to be referred, which are, *Endivia*, *Cichorium*, *Dens Leonis*, *Chondrilla*, *Sonchus*, *Lampfana*, *Hieracium*, *Lactuca*, *Senecio*, and *Iacobæa*; of some of which I have spoken both in my former Booke, namely of all the sorts of Garden Lettice, and in this Worke of all the sorts of *Iacobæa* and *Senecio*. First then to beginne with *Endive*, the kinds whereof also I have shewed

Endivia sativa.
Garden Endive.

Intubus sive Endivia minor angustifolia.
Small Garden Endive.

you in my former Booke, and therefore I will make no further description of them, but give you the figure of the small garden kinde, and expresse a wilde sort here, but withall set out the Vertues of them more amply than formerly I have done.

Intubus sive Endivia minor angustifolia. Small garden Endive.

This small Endive hath many very long leaves lying on the ground, narrower than the first garden Endive, and somewhat more bitter: the stalk is slenderer, more full of branches, and lower than the other, bearing at the tops small blew flowers like the common Endive, after which follow the like seeds also, and the roote perishing in like manner.

The Place.

This is onely planted in Gardens, as well beyond the seas as in our country as the other sorts are.

The Time.

It flowreth and perisheth with the other sorts if it be sown in the Spring, but if at Midsummer it will then abide the beginning of Winter, and will well serve to be used as the others be.

The Names.

The Greek word *Σίσις* as the Latine *Intubus*, *Intubus* or *Intubum*, doth denominate as well Endive as Succory, and therefore both they and the kinds thereof are called after the Greek *Serides*, or *Intubacea* after the Latine: *Dioscorides* maketh two kinds of *Seris*, the one tame, the other wilde, and of each two sorts, of the tame, he saith the one hath a broad leafe like unto Lettice, which is our ordinary garden kind, and called by *Mattiolus* *Intubus major*, and of others *Intubum sativum*; the other hath a narrow leafe, and is somewhat bitter in taste, which is this Endive here set forth by the judgement of the best moderne writers, and is called by *Mattiolus* *Intubus* and *Endivia minor*, by *Lacuna* *Intubus hortensis alter*, by *Gesner* in *hortis* *Intubum angustifolium Scariola aliquibus*; by *Clusius* in *historia plantarum* *Cichorium sativum*; by *Lobel* *Seriola aut Endiviola*, who saith that the name of *Scariola* given to this Endive, was but the corruption of the times, which should have beene called *Seriola quasi parva Seris*, and therefore wheresoever *Scariola* is appointed in any medicine, this sort of Endive is intended thereby and should be used. Endive is called by the Arabians *Dumbebe* *Anubebe* or *Endeba*, by the Italians *Endivia*, and this small kinde *Endivia minore* (and in the Apothecaries shoppes beyond the seas *Scariola domestica*) by the Spaniards *Endivia*, by the French *Endivie*, by the Germanes *Endivien*, by the Dutch *Endivie*, and by us in English Endive, and this sort small Endive.

The Vertues.

All the garden Endives are cold in the second degree at the least, but are more moist and lesse drie than Succory or the kinds thereof which is more bitter, and serveth well to coole the excessive heate in the liver and stomacke, and in the hot fits of agues, and all other inflammations in any part of the body, to use the decoction of the leaves or the juyce or distilled water: the same also helpeth to coole the heate and sharpenesse in the urine, and the excretions in the uritorie parts: the seeds is of the same propertie, or rather more powerfull, and besides is available for the faintings and swoonings and passions of the heart: outwardly applied they serve to temper the sharpe

harpe humours of fretting ulcers, hot tumors and swellings, and pestilential fores; and wonderfully helpeth, not onely the rednesse and inflammations in the eyes, but the dimmenesse of the sight also: they are also used to allay the paines of the gout. They are all used in sallats familiarly both Summer and Winter, when as being whited, they are the more tender and delicate very pleasing to the stomacke, and refreshing the weake and fainting spirits.

CHAP. XXIII.

Cichorium. Succory.

OF the Succories there are many sorts, some accounted tame or of the Garden, others wilde or of the fields, &c. of the most usuall Garden kinde I have spoken in my former booke, and of the other sorts I am to entreate here, but because I should pester one place too much to set them forth all in one Chapter, I must handle them severally, and speake of those kinds of Succory here in this Chapter that beare blew flowers or come nearest the Garden kinde and of others that beare yellow flowers in the Chapter following.

1. *Cichorium flore rubello*. Red flowered Succory.

The red flowered Succory is in the long leaves a little more divided on the edges in the tall and high round stalkes, in the forme of the flowers and seede and in the long white roote, abiding yearely like unto the Garden Succory, the onely difference hereof consisteth in the colour of the flowers, which in this are of a pale red delayed colour, which will degenerate as I have often observed in my Garden, turning to bee blew, I meane those plants that rise from the seede of the red, and not the same plants that have borne red flowers.

Of this kinde likewise there is one that beareth white flowers, not differing else, but that the seede hereof as *Flors alba*, well as the other will give blew flowered plants.

2. *Cichorium sylvestre*. Wilde Succory.

Wilde Succory hath divers long leaves lying on the ground very much cut in or torne on the edges, on both sides even to the middle ribbe ending in a point, sometimes it is found to have a red ribbe or veyne downe the middle of the leaves, from among which riseth up a hard round woody stalke spreading into many branches, set with smaller and lesser divided leaves on them up to the toppes, where stand the flowers, both for forme and colour like unto the Garden kinde that is of a blew colour, after which come the seede like thereunto also: the roote is white but more hard and woody then the other: the whole plant is exceeding bitter.

3. *Cichorium spinosum Creticum*. Thorny Succory of Candy.

This Thorny Succory hath the lower leaves next the ground somewhat long and narrow, cut in somewhat roundly on the edges like the ordinary Succory into many short not deepe cuts; the crested Greene stalke that ri-

Cichorium sativum vulgare.
Ordinary Garden Succory.

1. *Cichorium sativum flore rubello*.
Garden Succory with red flowers.

2. *Cichorium sylvestre*. Wilde Succory.3. *Cichorium spinosum Creticum*.
Thorny Succory of Candy.

seth from among them is hard and woody, spreading many such like branches from the very bottom all about, making it seeme a round bush set with many narrower leaves, and without any cut or division on the edges which quickly fall away leaving the stalks bare or naked, and each branch ending in one, two, or three sometimes long forked thornes at the joynts with the leaves, which towards the toppes abide a little longer, come forth small fealy huskes, and out of them the flowers which are made of five leaves a peece broade at the ends, and cut into two or three dents of a blewish colour like unto Succory with some yellow threds in the middle: the seede that followeth is like the ordinary fort, and so is the roote, but somewhat thicker and shorter; and abideth as the Succory doth.

The Place.

The first fort is found wilde in some places of *Italy* from whence I had the seede, and the white one in *Germany*: the second is found in many places of our Land in waste, untilld, and barren fields: the third by the Sea coasts and other sandy grounds in *Candy*.

The Time.

The two first sorts flower in the time that the other common fort doth, but the last not untill *August*, and hardly then, so that in our Country it doth give no seede, neither will well indure our Winters.

The Names.

Σείσις in Greeke as I said before in the last Chapter, and *Intubum* in Latine doe signifie Succory as well as *Endive*, and the wild sort of Succory is called *σείσις μυελίστις* *picris* because it is more bitter then the rest. Some take *Hieracium* and some *Lactuca sylvestris* to bee *Seris* or *Intubum sylvestre*, but *Matthiolus* contesteth against them, in Latine also *Cichorium sylvestre*. *Pliny* lib. 22. cap. 8. saith that this *Intubum sylvestre* or *Picris* or *Cichorium erraticum* was called by some in his time *Ambugia*, but *Celsus* and some truer copies have *Ambucia*, *Theophrastus* calleth it *μαρμαριον* *μαρμαριον*. *Horace* hath *Cichoreum* or *Cichorea*, where he saith,

Atque pascunt Olive,

Atque Cichorea, leuissimæ Malve. *Tragus* also hath *Cichorea*.

Of the first with red flowers I finde *Tragus* (to note one that hath *partim candidum partim roseum florem* and from him *Bauhinus*) to make mention, and *Thalium* in *Hercynia sylva* of that with white flowers: the second is called by *Lobel Seris picris*, *Cichorium* & *Seris sylvestris*, by *Gesner Intubum sylvestre* and *Cichorium sylvestre*, and *agreste* by *Lonicerus*, by *Lugdunensis Hypocheris Dalechampi*, whereof *Theophrastus* maketh mention in his seventh Book and 11. Chap. among the *Cichoriaceæ*, which *Gaza* untowardly translateth *Porcellia*, *Brunnfelsius* calleth it *Solsequium*, and *Gerard* putteth the figure hereof under the title of *Hieracium latifolium*, and *Bauhinus* noteth it: the third was first mentioned by *Honorius Bellius* in his fourth Epistle to *Clusius* by the name of *Cichorium spinosum*, and *Scamagati* id est, *Hydris spina* by the *Cretans*: *Clusius* in his history of Plants calleth it *Chondrilla elegans genus flore caruleo*, and afterwards both by *Pona* in his Italian description of Mount *Baldus*, and by *Bauhinus* in his *Matthiolus* and *Prodromus Cichorium spinosum Creticum*: the *Italians* call Succory *Girasole*, *Radichio*, *Scariola* and *Cicorea*, and the wilde

wilde kinde *Cicorea saluatica*: the Spaniards *Almenera* and *Cicoria saluaja*, the French *Cichoree sauvage*, by the Germans *Wegwart*, by the Dutch *Cichorrey*, and by us in English Succory, and wilde Succory.

The Vertues.

Garden Succory as it is bitter is more dry and lesse cold then Endive, and thereby more opening also. An handfull of the leaves or rootes hereof boyled in wine or water, and a draught thereof drunke fasting driveth forth cholericke and flegmaticke humors: the same also openeth the obstructions of the Liver, Gall and Spleene, and helpeth the Yellow Iaudies, the heate of the Reines and of the Vrine, the Drop sic alto, and those that have an evill disposition in their bodies by long sicknesse, evill dyer, &c. which disease the Greekes call *καχεξία Cachexia*, a decoction thereof made with wine and drunke is very effectuell against long lingering Agues: and a dramme of the seede in powder drunke in wine before the fit of an Ague doth helpe to drive it away, the distilled water of the herbe and flowers performeth the same properties aforesaid, and is especiall good for hot stomacks, and in Agues either pestilentiall or of long continuance, and for swooundings and passions of the heart, for the heate and headach in children, and to temper the distemperature of the blood and Liver: the said water, or the juice or the bruised leaves applyed outwardly allayeth tumors, inflammations, *S. Anthories* fire, pushes, wheales and pimples, especially used with a little Vinegar, as also to wash pestiferous sores: the said water is very effectuell for sore eyes, that are inflamed or have any rednesse in them, and for Nurfs sore breasts that are pained by the abundance of milke. The wild Succory as it is more bitter, so it is more strenghtning to the stomack and Liver.

CHAP. XXV.

Pseudo-cichoria sive Cichoria sylvestria floribus luteis. Bastard or wilde Succory with yellow flowers.

Here are divers other herbes which are accounted kindes of wilde Succory for their neare resemblance in forme but not in qualitie thereunto, some whereof shall be set forth in this Chapter, especially such as beare the title of *Cichorium* Succory: For the *Dens Leonis*, *Dandelion* and the *Chondrilla*. Gum Succory that be kindes of Succory also so like unto it, that many have mistaken the one for the other shall follow in their order.

1. *Cichorium pratense luteum asperum.* Rough yellow field Succory.
This rough yellow Succory hath longer and rougher leaves then those of the former wilde Succory, in one sort with few or no cuts at all, in others like unto it with deepe cuts and divisions: the stalkes grow to bee three, or foure foote high, rough and crested, divided into sundry branches with smaller leaves on them, and lesse jagged bearing small yellow flowers like unto an Hawkeweede. at the ends of every one, which when they are ripe turne into downe, with a small long yellowish seede fastned thereat, and are both carried away with the winde: the roote is hard, rough and unprofitable.

2. *Cichorium pratense luteum Hedypnoi distum.*
Smooth yellow Succory.

4. *Cichorium vesicarium pratense.*
Blistered yellow Succory.

2. *Cichorium pratense* *luteum* *Levius*. Smooth yellow Succory.

This other yellow Succory hath long and large leaves, as smooth as Succory, but of a whiter greene colour, cut in on the edges, but not so much nor so deepe as the former: the stalkes rise not up so high nor are so much branched, the leaves thereon are lesse cut in, and up higher little or nothing at all: the greene heads that stand at the toppes of the branches are greater, and the flowers that spring out of them are larger and more double, somewhat like those of Dandelion of a yellow colour, which turne into downe, and the feede therewith blowne away with the winde: the roote is full of a bitter milke.

3. *Cichorium sylvestre* *Hispanicum* *pumilum*. Dwarf Spanish yellow Succory.

Of this last kinde *Guillaume Boel* found a dwarf plant neare the Sea in the Ile of *Calce* in *Spain*, which by mine owne sight and *Clusius* judgement, as he recordeth it in his *Cyru* *Posteriores* differeth not in any thing from the last but in growing lesse in every part. Why *Bauhinus* should make this a *Dens Leonis* rather then the former, (which for their feedes sake may be so accounted) as he setteth it downe in his *Pindax*, I cannot see any just cause for sure I am he never saw the plant, & *unus oculatus testis*, &c.

4. *Cichorium vesicarium* *pratense*. Blistered yellow Succory.

This kinde of Succory is in forme of leaves, bignesse, and colour so like unto the ordinary Garden Succory that it is often taken for the same, especially in the Winter and the beginning of the Spring time, before it beginneth to shoote up stalkes, for during that time it spreadeth his many leaves round upon the ground, sometimes broad and whole, almost without or with very few divisions or jagges, and sometimes also somewhat hairy or rough, in others smooth and more divided, of a shining greene colour: from the middle of them groweth a skinny bladder, out of which in the Spring riseth up a round hairy stalk parted into many branches, somewhat rough and crested, set with lesse divided but shorter and broader leaves then those below, at the toppe whereof out of the skinny bladder doe the flowers breake forth many standing together, each upon a foote stalk, each rising out of a long greene huske like unto those of Hawkeweede and consist of many yellowish leaves, somewhat purplish underneath with sundry threds as a thrumme in the middle, which turne into downe, and with the feede is carryed away at the will of the winde: the roote is somewhat long and slender, blackish on the outside, and white within, yeelding a bitter milke as the rest of the plant doth.

5. *Cichorium dulce* *Neapolitanum*. Sweet yellow Succory of Naples.

The sweete Succory is in the forme and divisions of the leaves very like unto the usuall wilde Succory, yet not so deepe gashed, but thicker in feeling, covered with a fine soft hairinesse not rough at all, and of a darke greene colour: the stalkes riseth to be two foote high or more, round, firme and whitish because of the hoarinesse thereon, sometimes breaking out into branches toward the toppe, set with shorter somewhat broader and more divided leaves then below, closing the stalkes at the bottomes, having at their toppes greene hairy heads or huskes and gold yellow flowers in long hairy huskes like unto the Hawkeweedes, which growing greater when they are ripe within them is contained very small long brownish feede, with a fine white downe on them, and both carried away with the winde, the roote is long and blackish on the outside and white within, so full of a sweet

5. *Cichorium dulce* *Neapolitanum*. Sweet yellow Succory of Naples.8. *Zacynthia* *frut* *Cichorium* *verucarium*. Warted Succory.

milke without any bitterneſſe at all and ſo iſt the reſt of the plant, that it will grow hard like a gum if it bee not rubbed away but ſuffered to abide.

6. *Cichorium montanum aſperum*. Rough Mountaine Succory.

This mountaine Succory hath divers long narrow leaves next the ground very ſharply dented about the edges but not divided or cut in at all, rough alſo all over: from among which riſeth up a ſtalke branched forth with ſuch like leaves ſet thereon and divers large double yellow flowers like unto thoſe of Dandelion at the toppes, which turne into downe as the reſt and blowne away: the roote conſiſteth of many long ſtrings.

7. *Cichorium tomentosum fetidum*. Strong or ill ſented hoary Succory.

This kind of ill ſented hoary Succory from a thicke roote ſendeth forth ſundry weake, round, hairy or hoary ſtalkes about two foote or more high, having divers large long hairy or hoary leaves next the ground, deeply gaſhed in on both ſides, ſomewhat like to Succory leaves, parted into many branches with leſſer leaves thereon, then thoſe below, and leſſer cut alſo, at the toppes of whom ſtand many pale yellow flowers in greene huſkes, like unto Groundſell which quickly fade in like manner turning into downe, which with the ſeede is carried away in the winde: this herbe hath ſomewhat an ill or ſtrong ſent with it, yet more in the hotter time of the year then elſe, which procured it the denomination of *fetidum* ſtinking.

8. *Zacyntha ſive Cichorium Verrucarium*. Warted Succory.

The warted Succory ſpreadeth ſundry long and ſomewhat hairy greene leaves next the ground, cut or divided on the edges into deepe dents, but not deepegafhes, ſomewhat reſembling Succory leaves: the ſtraked ſtalkes divide themſelves into ſome leſſer branches with a ſmall long leafe at every joynt broad below and compaſſing it about at the bottome: the flowers grow ſeverally at the toppes and upper joynts of the branches upon ſhort footſtalkes being ſmall and yellow, compoſed of divers ſmall yellow leaves, broad pointed and nicked in, which turne not into downe as the other ſorts before doe, but into ſmall round and flat hard heads, parted at the brims into ſundry bunches or knobbes like unto warts with a little tuft or crowne in the middle, in each bunch whereof is contained a kernell or ſeede: the roote is ſmall and ſtringy dying every year after ſeedetime, and never abiding a Winter unleſſe it ſpring up from the ſeede in Autumne.

The Place.

The firſt two ſorts and the ſixt are many times found in our medowes and other moiſt grounds taken by moſt for kinds of Hawkeweeds and ſo the leſſe regarded: the fourth and fiſt *Columna* found on the hills in Naples; the ſeventh is often found in ſandy grounds and by woods and hedges ſides: and the laſt is thought to grow in the Iſland *Zacyntha* from whence it was brought into Italy, and thence into other parts, but *Pena* ſaith it groweth in divers places in Italy.

The Time.

They doe all flower and ſeede about the ſame time of the other Succories, except the ſecond, which flowreth earlier then the reſt.

The Names.

All theſe herbes are accounted ſeverall ſorts of Succory by many writers, and ſome of them (that iſt thoſe of Naples as *Columna* ſaith) are uſed in the ſtead of the true Succory with good ſucceſſe, but as I ſaid before they are but baſtard ſorts which their ſeedes declare, being rather Hawkeweeds as I doe thinke: The firſt is called by *Gefner* in *Colleſione ſtirpium Hieracium pratense aſperum*, by *Tabermontanus* and *Gerard* *Cichorium luteum*, by *Thalius* *Intubus ſylveſtris ſive Cichorium ſylveſtre flore luteo*, *Tragus* maketh it his *Cichorea 3. flore luteo*, and *Ceſalpinus* calleth it *Lactariola altera*: the ſecond is the *Cichorium luteum pratense* of *Lobel* in *Adverſarijs* and *Hedipnus* *Pliny* and *Aphaca Theophrasti* in his *Observations*, as *Dalechampius* before him had done, and as *Lugdunensis* ſetteth it downe for *Aphace Dalechampi*, *Ceſalpinus* calleth it *Endivia ſylveſtris*, and *Gerard* *Dens leonis*, *Cichorizata*, *Dodonaeus* and *Tabermontanus* make it their third kind of *Dens leonis*, and *Bauhinus* calleth it *Cichorium pratense, luteum levius*; the third is ſufficiently expreſſed in the deſcription: the fourth and fiſt *Columna* maketh mention of, the one under the name of *Cichorium ſylveſtre verrucarium pratense*, and the other of *Cichorium ſylveſtre aſperum amens, ſive Cichorium dulce*, which *Bauhinus* numbred among the Sow Thistles and calleth it *Sonchus lufifolius leviter hirsutus*: The ſixt is *Tabermontanus* ninth ſort of *Hieracium*, which he calleth *Hieracium Intabaceum aſperum*, and *Gerard* *Hieracium eſperum*: the laſt was fiſt called by *Matthiolus* *Zacyntha ſive Cichorium verrucarium* and ſo doth *Cluſius* alſo: but *Lobel* in his *Observations*, Fol. 116. (incalling it *Chondrilla verrucaria*, *Chondrilla prior* *Diſcoridis* *Cleſi* *Zacyntha Matthioli*) doth ſoulely confound the two plants of *Matthiolus* and *Cluſius* together, for he there giveth the thicke woolly leaves of *Cluſius* his *Chondrilla* to this *Zacyntha* of *Matthiolus* which hath greene leaves, and maketh it fiſt to have creſted heads of ſeede as the true *Zacyntha* hath, and afterwards ſaith the flower is yellow, &c. flying away in downe utterly contrarying himſelfe, which *Cluſius* tooke knowledge of and found fault with him for it, and thereupon ſet forth the true figure and deſcription of it in his hiſtory of plants: *Gefner* in *hortis* calleth it *Verrucaria Seridis ſpecies*, and *Ceſalpinus* *Condrilla ſpecies in rudribus*, whereupon *Bauhinus* putteth it among his *Chondrillas*, and calleth it *Chondrilla verrucaria folijs Intubaceis viridibus*: the Italians call it *Mazzo di Cavalliero* and *Mazza ferrata*.

The Vertues.

Theſe kinds of Succories except the Neapolitane and the laſt are not uſed in Phyſicke that I know but they, that iſt the Neapolitane kinds as *Columna* ſaith are there uſed in ſtead of the true Succory, being ſo like it that as I ſaid in the deſcription they ſoone deceive one, miſtaking one for another yet uſed with good ſucceſſe whereby we may judge of the others not to be much diſſering, and therefore untill ſome further and more certaine experience bee made of them, let this adviſe ſerve for the preſent. *Matthiolus* hath given us fiſt knowledge of the propertie of *Zacyntha* or warted Succory, from *Calzolari* of Verona, who by praſtiſe had found it to be available to take away warts from the hands by once eating the leaves as a Sallet; and *Matthiolus* ſaith that by his owne experience a dram of the ſeede in powder taken for certaine dayes together in white wine to bedwards tooke away the warts from ones hands that was wonderfully peſtered with them: but *Pena* denying that the once eating of the leaves will doe any good, but yet ſaith that if the juice of the leaves bee uſed to bathe the warts, it will extirpate them moſt certainly as he and divers other found by their experience, the ſame alſo taken in wine helpeth the biting of a mad Dog.

C H A P. XXVI.

Dens leonis. Dandelion.

He Dandelion is assuredly a differing kinde of wilde yellow Succory, and therefore I thinke it meete to expresse it before the *Chondrilla* Gumme Succory which is also an other kinde: hereof there are more differences and varieties found out of late than have formerly beene knowne, which shall be set forth here together.

1. *Dens leonis vulgaris*. Common Dandelion.

Our common Dandelion is well knowne to have many long and deeply gashed leaves lying on the ground round about the head of the roote, the ends of each gash or jagge on both sides looking downward to the roote againe, the middle ribbe being white which being broken yeeld abundance of bitter milke, but the roote much more from among the leaves which alwayes abide greene, arise many slender weake naked foote stalkes, rather than stalkes, every one of them bearing at the toppe one large yellow flower, consisting of many rowes of yellow leaves broad at the points and nicked in, with a deepe spot of yellow in the middle, which growing ripe the greene huske wherein the flower stood, turneth it selfe downe to the stalke, and the head of downe becommeth as round as a ball with long reddish seede undernath bearing apart of the downe on the head of every one which together is blowne away with the wind, or with the blast of ones mouth may be blowne away at once: the roote groweth downwards exceeding deepe, which being broken off within the ground will notwithstanding shoote forth a new againe, and will hardly be destroyed where it hath once taken deepe rooting in the ground.

2. *Dens leonis angustioribus folijs*. Dandelion with narrow leaves.

This Dandelion is in all things like the other, but that the leaves are narrower, yet hath not fewer gashes or divisions on the edges, so that by this one note it may be distinguished.

3. *Dens leonis tenuissimo folio*. Fine jagged Dandelion.

This Dandelion hath a thicke reddish roote full of fibres, tending forth sundry most finely cut very greene leaves, each of a hand breadth long and two inches broad, deeply jagged, and divided againe into two or three other small rents or divisions, ending in a fine small point: the flowers are much smaller that stand at the tops of naked stalkes and yellow, turning into downe as the other.

4. *Dens Leonis minor radiatis folijs sive Trinciarella Italorum Camerarij*. Sweete Dandelion.

This Sweete Dandelion (called by *Camerarius* *Trinciarella Italorum*, hath many leaves spread on the ground of three inches long and halfe an inch broad, cut in on the sides into sundry deepe gashes, whose ends have each of them three very deepe dents, and each having divers points standing like a starre or spurre, the foote stalkes, whereof are a little hairy, among which rise up many smooth slender naked stalkes, one whereof standeth upright scarce an hand breadth high, the rest are lower and bend downward, each of them bearing a small yellow

1. *Dens leonis vulgaris*.
Common Dandelion. 5. *Dens leonis Montipalensium sive Asphodelis bulbula*.
Bulbed or clogged Dandelion.

flower

power like unto other Dandelions turning into downe, and flying away with the wind carrying the seede with it, which is somewhat long and broad with hard haire like beards at the tops: the roote is small and blackish without and white within, very sweete in taste as the leaves are also, and so tender to keepe that it perisheth with the first cold it feeleth: and must therefore be housed, which then will endure many years giving seede yearly.

5. *Dens leonis minor aspero folio.* Small rough Dandelion.

The small rough Dandelion sendeth forth sundry small leaves lying round about the roote of two or three inches long and one inch broad, divided or torne in on the sides, each of them set with small smooth sharpe prickles or haire like as the prickly Sowthistle hath: the stalkes are about two inches high, and beare each of them a large pale yellow flower like the rest and turned into downe: the roote is small and whitish.

6. *Dens leonis Monspeliensium sive Asphodeli bulbilis.* Bulbed or clogged Dandelion.

This Asphodel rooted Dandelion spreadeth many large and blewish Greene hairy leaves upon the ground unevenly waved or cut in on the edges but not deeply gashed, as the common Dandelion is of a bitter and sharpe taste like unto it, from which rise sundry bare or naked stalkes with severall flowers, at the toppes of them larger and more double than it, and of a paler yellow colour which passe into downe like the rest: the rootes are sundry long tuberos and slender clogges like unto those of the Asphodill but smaller, shorter, and more pointed at the ends.

7. *Dens leonis Gadenfis.* Dandelion of Cadix in Spaine.

This plant so like in face unto a little Dandelion hath made me contrarie unto others opinions place it in the same ranke with them. It hath a number of long leaves a spanne long or more rising from a long white tender roote: the middle ribbe of the leafe is bare from the roote to the halfe length of the leafe, and then it hath many rents or cuts on each side, very much resembling the leafe of the ordinary Dandelion but smaller and narrower: the flowers likewise stand upon long foote stalkes as the Dandelion doth being small and yellow. and doe turne into downe that is carried away in the winde, with the seede which is small long, and reddish like unto some of the Hawkwweed. It groweth in the Island of Gades, which wee call Cales or Cadix as Guillaume Bôel saith, who brought it us out of Spaine, and called it *Cichorium Gadenfe*: Clusius it seemeth not well marking the plant being drie, and never having seene it Greene or growing, tooke it from Bôel, and calleth it in his *Cure posteriores Cichorium sylvestre pumilum sive Hedyspis*, and saith it is altogether like unto it though lesse: but how like it is, upon this description truly set downe as before, I leave it to any judicious to determine. It flowreth in July, August and September, and the seede is soone ripe after the flower is past; the roote liveth all the Winter if it be milde; or else it perisheth with the hard frostes.

The Place.

The first is too frequent in all medowes and pasture grounds, but the second is more rare, yet often to be met with: the third groweth in Austria: the fourth in Italy as it is suspected, because it came from thence: the fifth and sixth about Mompeliar, as also about Florence, and in other parts of Italy especially the sixth, and the last in Spaine.

The Time.

They flower in the Summer moneths, yet as is well knowne the first is found in some place or other in flower every moneth in the yeare.

The Names.

The Dandelion is not certainly intituled by any Greeke denomination, for it is certaine it is not *χονδριλλα* *Chondrilla*: but hath divers Latine names, as *Dens leonis*, *Urinaria*, *Corona* and *Caput monachi*, *Rostum porcinum*; and as *Angulana* thinketh *Chondrilla a Galei*: the first is usually called of most of the later writers *Dens leonis*, but *Tragus* tooke it to be *Hieracium majus*, and *Cordus* in *historia*, to be *Hieracium parvum*; *Gesner* in *hortis Hieracium minus*, *Thalium* and *Dodonæus Chondrilla altera*, and *Cesalpinius* (as divers others also doe) to be the *Aphaca* of *Theophrastus*, in *lib. 6. cap. 7. and 10.* among the Wortes: divers also take it to be *Hedyspis* *Plinij lib. 23. c. 8.* but the most judicious rather take the former *Cichorium* *Interim* to be it: *Fuchsius* calleth it *Hedyspis major*, and *Lugdunensis Hedyspis Dalechampij*; *Lonicerus* calleth it *Taraxacon minus*, and is generally held to be the true *Taraxacon* of *Scrapius* and *Avicenn*, and so used with us in all compositions whereunto *Taraxacon* is appointed: the second *Cesalpinius* calleth *Aphaca angustifolia* *folij*: the third is called by *Columna Hieracium fatidum*: and *Camerarius* calleth the fourth *Trinciastilla*: the fifth is also of *Banbinus* mentioned by the name in the title: the sixth is called by *Matthiolus Cichorium Constantinopolitanum*, because, as hee saith, hee received it from *Angerius de Busbeque* the Emperours agent at *Constantinople*: but *Lobel* and *Pena* say that hee needed not to extoll this plant as a stranger, being to be had plentifully in his owne country of *Siena* and *Tuscane*, *Liguria* and other places of *Italy* whereof he was ignorant, as also about *Mompeliar*, whereupon they called it *Dens leonis Monspeliensium Asphodeli bulbilis*, and withall suppose it to be the *Chondrilla altera* *Dioscoridis*, or *Perdion* (rather *Perdicion*) of *Theophrastus*, which hath more rootes than leaves: *Tabernmontanus* calleth it *Dens leonis altera*; the last is mentioned sufficiently in the description: the *Italians* call Dandelion *Dente de leon*; the *Spaniards* *Diente de leon*; the *French* *Dent de Lyon* and *Pisse en liè*; the *Germanes* *Pfaffenblat*, *Korkkrant* and *Pfaffenrorlin*; the *Dutch* *Papencruyt* *Hontsroosen* and *Caukerbloemen*; and we in *English* *Pisse a bed* and *Dandelion*.

The Vertues.

Dandelion is neare in proprietie unto the wilde Saccory, and by the bitternesse doth more open and cleanse, and is therefore very effectfull for the obstructions of the liver, gall and spleene, and the diseases that arise from them, as the jaundise and the *hypochondriack* passion, it wonderfully openeth the uritorie parts, causing abundance of urine, not onely in children whose meteraicall veines are not sufficiently strong to containe the quantitie of urine drawne in the night, but that then without restraint or keeping it backe they water their beds, but in those of old age also upon the stopping or yeelding small quantitie of urine; it also powerfully clenseth apollumes and inward ulcers in the uritorie passages, and by the drying and temperate qualitie doth afterwards heale them, and for those purposes the rootes being buried a while in sand and whited (which taketh away much of the bitternesse, and maketh them the more tender) being eaten as a sallet are more effectfull than the leaves used in the same manner, or who soare not accustomed to such raw sallets may take the decoction of the rootes or leaves in white wine, or the leaves chopped as pot herbes with a few Allisanders boiled in their broth. And who so is macilent drawing towards a consumption, or hath an evill disposition of the whole body, ready to fall into a *Cachexia* by

the use hereof for some time together shall finde a wonderfull helpe, not onely in clenſing the malignant humor but ſtrengthening the good, and preſerving the body ſound in all his functions : it helpeth alſo to procure reſt and ſleepe to bodies diſtempred by the heate of ague fits or otherwiſe : the deſtilld water alſo is effectfull to drinke in peſtentiall fevers and to waſh the ſores.

CHAP. XXVII.

Chondrilla, Gumme Succory.

IN *Dioſcorides* time there were but two ſorts of *Chondrilla* knowne, both which are much controuerted in our time, diuers herbes being aſſimilated unto them, and ſcarſe any agreeing in all things with them, but this age hath found out ſundry plants, which for the reſemblance are referred to *Chondrilla*, and called by that name, whereof ſome beare blew flowers, and diuers yellow. Of thoſe with yellow flowers I ſhall entreate in this Chapter, and of the other in the next.

1. *Chondrilla prior Dioſcoridis legitima Cluſij.*

The former true Gumme Succory of *Dioſcorides* according to *Cluſij* his minde.

This Gumme Succory hath many long and ſomewhat broad hoary leaves lying upon the ground covered with a thicke downe, cut in on the edges ſomewhat like thoſe of Succory, from among which riſeth up an hoary ſtalke, a foote high or more parted into a few branches with ſmaller and narrower leaves ſet without order, whereon are ſometimes found yellowiſh graine like unto ſmall peeces of Gumme, which grow quickly to be hard : at the toppes of the branches ſtand ſingly yellow flowers like thoſe of Camomill, which when they are ripe turne into downe, and with the ſeede is carried away with the winde. the roote is of a fingers thickneſſe blackiſh on the outside with ſome fibres thereat, and parted at the toppe into ſome heads, which bring forth leaves, &c. it is full of iuyce which is yellowiſh when it is drie.

2. *Chondrilla viminalis virgis*. Gumme Succory with twigge-like branches.

This twiggy Gumme Succory ſhooteth forth ſundry ſlender tough and flexible branches or twigge-like ſtalke very clammy in handling, ſet with many narrow and ſhort leaves, but thoſe that grow at the foote of the ſtalke next the ground are larger and longer, cut in on the ſides into diuers long gaſhes, when thoſe ſtalke grow toward flowering, the greater leaves begin to wither and die, ſo that being in flower they are quite gone and withered, the toppes whereof are furniſhed with ſmall yellow flowers, which in time turne into downe and paſſe away with the winde : the roote is long and ſlender, full of milke as all the reſt of the plant is if any part be broken.

3. *Chondrilla viminea viſcoſa Monſpelica*. French twiggy Gumme Succory.

This French kind of Gumme Succory hath a white round ſtraked clammy ſtalke two cubits high, ſpreading into

diuers

4. *Chondrilla viscosa humilis*.
Clammy dwarfed Gumme Succory.

5. *Chondrilla saxatilis viscoso caule*.
Galens Gumme Succory.

6. *Chondrilla Bulbosa*.
Bulbed Gumme Succory.

divers clammy branches pliant and easie to bend, whose leaves at the bottome are smooth like Willow leaves of fixe inches long, and halfe an inch broad, sometimes having a gash or two on them, but those that grow up higher are somewhat like unto the lower leaves of the last Gumme Succory divided into many and very fine parts: the flowers are small and yellow like the last which passe into downe and are blowen away, the roote is long and yellowish on the outside.

4. *Chondrilla viscosa humilis*.
Clammy dwarfed Gumme Succory.

This low Gumme Succory sendeth forth from a small long white roote sundry slender rough clammy, and bending stalkes about a foote high with a few long and narrow leaves without any dent thereon, especially from the middle upward, where at the joynts with the leaves stand severall small long and yellow flowers turning into downe like the rest, but the lower leaves, and those on the lower part of the stalke are long and narrow, some whole without any dent, and others with one or two on the sides.

5. *Chondrilla saxatilis viscoso caule*.
Galens Gumme Succory.

This rare Gumme Succory (which as *Columna* saith was not set forth before) hath a long roote so fast set on the rocke where it groweth, that without breaking the rocke it cannot be got out, and being broken yeeldeth store of thicke viscos milke as every part else of the plant doth, which will hardly be washed off where it sticketh to the hands, &c.

and quickly groweth into hard graines: the leaves are many that grow below, and are very much torne on the sides into many deepe and crooked gashes like unto Dandelion: it seldome hath more than one stalke, and seldome also any branch, which is slender white and round, about a cubite high, set from the middle upward with long and narrow leaves not cut in or dented at all but parted at the bottome where it compasseth the stalke, and the most part of the length of the leafe cleaving thereto, that almost none of the stalke can be seene being as a hose or buskin thereon (which caused *Columna* to give it the name of *κωνιαδον*) at the joynts with the leaves come forth

forth two or three or more flowers in long huskes, with short footstalkes, yellow on the inside and whitish without, flowering by degrees, so that some will be ripe and blowne away when others are new blowne or in the bud: the taste hereof is bitter: the upper part hereof in the forme of the flowers and posture of them is very like unto the wilde Lettice, whereunto *Galen* resemblanceth *Chondrilla* lib. 2. alimentorum, and so may be referred to his *Chondrilla* or that of *Dioscorides* for it hath some resemblance with each.

6. *Chondrilla bulbosa*. Bulbed Gum Succory.

The bulbed Gum Succory hath divers small leaves lesser then Succory, with small divisions on the sides set up on slender stalkes, among which spring up many slender weake stalkes on them, and at the toppes of each, one small yellow flower like unto Dandelion which turneth into downe as the rest: the rootes are divers small round and bulbous, cleare, and of a purplish white colour, every one fastned to the head with a long string: the whole plant both roote and leafe is of a bitter taste.

7. *Chondrilla bulbosa Syriaca angustifolia*. Bulbed Gum Succory of Syria.

This Syrian plant hath many long grasslike leaves lying upon the ground, among which rise divers small stalkes set with small leaves, from the joynts whereof breake forth small branches bearing one flower a peece, which is large double and yellow like unto the great Moufear: the roote is as big as ones little finger at the head, and about a span long growing smaller downwards smooth and of a brownish yellow colour, having a small round bulbe hanging at the end thereof of the bignesse of a Chestnut, full of milke being never so little touched or broken.

8. *Chondrilla bulbosa Syriaca altera latiore folio*. Another Syrian bulbed Gum Succory. This other Succory is both in roote and flower altogether like the last but differing onely in the leaves which are broader, more hairy and of a grayer colour.

The Place.

The first *Clusius* saith he found in divers places of *Spain* in wast places: the second he saith he not onely found in the Corne fields about *Salamanca* in *Spaine*, but in divers places of *Germany* and *Hungarie*: the third is found by the way sides, and about *Mompelien* in Mount *Lupus*: the fourth about *Bassile* in *Switzerland*: the fifth upon the Rockes in the Kingdome of *Naples*: the sixth not onely under the hedges about *Naples*, and in the wayes from thence to *Puteoli*: but towards the Sea side about the Fishermens cottages in *Narbone*, and the low Marches of *Mons Cetus* and thereabouts: the two last *Ranwolffius* in his Peregrination found about *Aleppo* in *Syria* the one in the plowed fields and the other in stony places.

The Time.

All these sorts of Succory doe flower later then the rest, many of them not untill *August* in their naturall places, and are so tender that they quickly perish with the cold of these colder climates.

The Names.

Gum Succory is called in Greeke *χονδρίδα* *Chondrilla*, so called as it is thought from *χονδρίς* which signifieth that drop or Gum-like Masticke that groweth upon the herbe and stalk hereof, originally taken from the likenesse with that kind of graine prepared for pultage which was used in auncient times, called *Chondrus* or *Alica*, as I shall shew you more fully in the proper place, when I come to speake of Cornes and the severall sorts of Pultage and Pisanes the auncient times made of them: some saith *Dioscorides* called it *Cichorion* and some *Ieris*, and for that the leaves were like unto Succory, they accounted it a kinde of wilde Succory. The first is taken by *Clusius* and others since him for the true *Chondrilla prima Dioscoridis* and calleth it *Chondrilla prior Dioscoridis legitima* (*Banbinus* and divers others doe account *Matthiolus* his *Chondrilla prior* to bee but *figmentum ex Cichorio*, but I verily beleieve that it is *Cichorium luteum*, for *Matthiolus* expresseth not the colour of the flower, and I am sure the Figures are transposed or misset, for the first Figure answereth the second description, and the second Figure to the first description, which *Lacuna* it seemeth well observed in making that his first which in *Matthiolus* is the second *Lobel* and *Lugdunensis* from him doe call it *Chondrilla verrucaria* but as I have shewed in the description of *Cichorium verrucarium*, he mingled this and that together, *Tabernmontanus* calleth it *Chondrilla Græca*, and *Banbinus* *Chondrilla folij Cichorei tomentosi*: the second *Clusius* calleth *Chondrilla viminalibus virgis*, and *Lobel* *Chondrilla viminea viscosa vinearum*, *Cordus* upon *Dioscorides* *Chondrilla altera*, *Dodonæus* *Cichorium sylvestre luteum*, *Cesalpinus* *Chondrilla species in collibus & vicinis*, *Tragus* *Cichorea procera vel quinta*; *Columna* taketh it to be *Chondrilla prior Dioscoridis* as *Banbinus* doth also, and withall thinketh it to be *Aphaca* of *Theophrastus*, *Tabernmontanus* and *Gerard* call it *Chondrilla Iuncea*: the third is called by *Banbinus* *Chondrilla viminea viscosa Monspelica*: the fourth also from *Banbinus* taketh the name of *Chondrilla viscosa humilis*: the fifth *Columna* so calleth as it is in the Title: the sixth is called by *Lobel* *Chondrilla pusilla marina lutea bulbosa*, and may be as he saith *Perdion* of *Theophrastus* (but rather *Ferdion*, lib. 1. cap. 11. for *Perdion* is not read in him) of *Clusius* *Chondrilla altera Dioscoridis* and so doth *Columna*, by *Cesalpinus* *Herba terre crepols similis*, by *Caster* *Durantes Hemorrhoidale*, *Lugdunensis* setteth it forth by the name of *Cichorium bulbosum Dalechampij*, and of *Cichorium strumosum Myconi* as *Banbinus* thinketh: but I rather take *strumosum* to be that sort of *Chondrilla* which *Ranwolffius* found in *Syria* with the larger leaves and is the last here expressed which *Banbinus* calleth *Chondrilla bulbosa Conyse facis*, and referreth the *Conyza marina* of *Lugdunensis* thereunto, wherein he is much mistaken in my judgement, for that *Conyza* hath no such bulbous roote, which causeth a great difference, besides the difference in the heads of flowers: *Clusius* from *Imperatus* of *Naples* saith that they about *Naples* call it *Herba dilatata*, and account it to bee *Scrophularia minor*, *Pandelarius* calleth it *Stridula*. The Arabians call *Chondrilla* *Condarel Cadaron*, and *Amiron*, the Italians *Condrilla*, and *Terra crepola*, the Spaniards *Leitugas* and *Leichagas dentro los planos*, but *Clusius* saith they call it *Terva di S. Guiteria*, and that by the same name they call *Phyllum*, and that they call the second *Condrilla* *Unqualina*, and *Ajunjera*, the French *Leiteron*, the high and low Dutch *Condrille*, and we in *Englifo* Gum Succory, because of the Gum is found upon it.

The Vertues.

Gum Succory is of the same propertie with wilde Succory but more bitter and more dry, and is thereby the more effectuell in opening obstructions, and by the drying qualitie stayeth the loosnesse of the belly, if the juice of the roote be taken in wine: the Gum used with Myrrie in the forme of a pessarie draweth downe womens courses that are stayed, the juice of the roote or the herbe and roote together made into powder and drunke in wine,

wine, helpeth the biting of the Viper and all other venomous Serpents and destroyeth field mice also; *Pliny* writeth that one *Dorotheus* in his verses sheweth that it is beneficiall to the stomacke, and helpeth digestion, and further saith that some did account it hurtfull to the eyes and to hinder generation both in men and women, and yet he numbeth *Chondrilla* among other sallet herbes that were used to bee eaten: the juice of the herbe but more effectually of the roote dropped from the point of a needle or other such small thing, taketh away by the rootes the superfluous haire of the eyebrows, the same also used with a little niter cleareth the skinne from all freckles, morpew, spots or any discolouring thereof. The bulbous Gum Succory is much commended against the swellings and kernells of the throat called the Kings Evill, and so is the distilled water thereof: the rootes preferred are found to be wonderfull effectuell, if the use be continued for some time together.

CHAP. XXVIII.

Chondrilla purpurea. Purple Gum Succory.

Here are other sorts of Gum Succory to be entreated of, differing from the former in many notable parts as well as in the flowers which are quite of another hew, as shall be shewed in this Chapter.

1. *Chondrilla caerulea flos purpurea*. Purple flowered Gum Succory.

This Gum Succory shooteth forth in the beginning of the Spring sundry long winged or rather jagged leaves, consisting of many long and narrow jagges, cut in on both sides to the middle ribbe, and equally almost set one against another of a blewish Greene colour very tender and full of milke being broken, among which rise up weake and tender stalkes three or foure foote high, scarce able to stand upright, very brittle also and apt to be broken, as full of milke as the leaves, which divideth it selfe towards the toppes into a few other smaller branches, with smaller and lesse jagged leaves upon them, and small blewish purple flowers at the ends and sometimes white, consisting of ten or twelve small narrow leaves standing round about the middle, which when they are ripe fall away of themselves: the rootes grow deepe downe and spread into many corpulent branches like Dandelion, blackish on the outside and yeelding much milke in every part that is broken, which are so apt to grow that every little peece in the ground will spring againe and beare leaves, &c.

2. *Chondrilla caerulea latifolia*. Purple Gum Succory with broader leaves.

This other Gum Succory is very like unto the former in all things, but that the leaves are somewhat shorter and broader, and the gashes also larger wherein chiefly consisteth the difference.

3. *Chondrilla purpurascens fetida*. Stinking Gum Succory.

The stinking Gum Succory hath divers long and somewhat narrow leaves growing next to the ground some being waved or torne somewhat deeply on the edges, the footestalkes being sometimes reddish, in the middle of whom riseth up sundry browne stalkes a little hairy, and about a cubit high, having but very few branches and

1. *Chondrilla caerulea flos purpurea*.
Purple flowered gum Succory.

2. *Chondrilla caerulea latifolia*.
Purple gum Succory with broader leaves.

they bare or naked of leaves from the joynts to the toppes, where every one of them sustaine a flower consisting of sixteene small leaves or more, dented at the edges, of a purplish red colour compassing the middle, wherein afterwards are contained long brownish feede lying in downe, which together are blowne away with the winde, the roote hereof perisheth every year after feedertime, but recovereth it selfe by the fallen feede, the leaves as well as the flowers have a strong unpleasent sent.

4. *Chondrilla varia purpurea Crupina Belgarum dicta.*

The bearded Creeper.

I have two other plants to shew you which have passed by the names of *Chondrilla*, either of which hath small affinity with them as I thinke, onely excepted by *Columna*. yet give me leave to insert them in this place, although I shew you my mind of them. This first hath the first leaves that spring up, nothing so much cut in or divided as the others that follow, but rather somewhat resembling the leaves of Groundsell, and are roughly dented about the edges, the next are very much cut and divided into many small parts somewhat rough or hard in handling, and somewhat sharpe at the points of the cuts, from among which spring sundry slender whitish and hairy stalkes about a foote and a halfe high, with two or three branches and smaller but not lesse divided leaves upon them to the toppes, where stand three or foure flowers in scaly heads, the points whereof are purplish, consisting of five leaves, of a purplish blew colour as the border, and many purplish thrums in the middle, some whitish threads also in the midst: the feede that followeth inclosed in the heads is like the feede of a Iacea or Knapweede or Matfellow but somewhat greater blacke and shining, with divers thiffe staring haire like a beard at the head

4. *Chondrilla varia purpurea crupina Belgarum dicta.*
The bearded Creeper.

3. *Chondrilla purpurascens foetida.*
Stinking gum Succory.

5. *Chondrilla sesuvioidea dicta.*
Strange gum Succory.

of every one, which will not abide or be still either in ones hand or in paper, &c. if it be never so little stirred, but will as it were creepe or thrust it selfe forwards by the stiffe haire (whereupon I have given it the *English* name as it is in the title) the roote is long and white and perisheth every time it beareth seede, yet abideth the first Winter after it springeth in the Autumne, for it hardly abideth a Winter if it rise in the Spring although it doth neither flower nor seede.

5. *Chondrilla Sesamoides* dista. Strangē Gumme Succory.

This other plant referred, as I said, to the *Chondrillae*, hath many long and narrow rough leaves, pointed at the ends, and jagged in two or three places on the edges, sometimes more or lesse lying on the ground, resembling very much, the leaves of *Cerionopus* or Bucks horne Plantane, but with fewer greater and longer cuts or jagges, the branched stalkes are set from the middle of them, with such like leaves, but narrower, some without any jagge, and some but with one or two, bearing at the toppes every one upon slender bare long stalkes, a small whitish silver-like scalyhead, out of which breaketh forth faire double flowers consisting of many purplish blew leaves dented or cut in at the broad ends, with some yellow threads in the middle of them (*Matthiolus* hath very badly set this forth with the heads of *Psallaris* Canary grasse) after which commeth small seed like unto *Sesamum*, as it is compared, and from thence tooke the name of *Sesamoides*, but as I thinke more fitly unto a *Cyanis* Cornflower or Blew-bottle but browner: the roote is small and long, yeelding a milke: both these plants may in my mind be better referred to the *Faceas* than unto any other herbe, they doe in leaves not much varie, nor yet in heads and flowers, but in seede especially come nearest thereunto, and not unto the *Chondrillae*, whose seede is much differing having downe on the heads of them, and sile away together with the winde.

The Place.

The first (as well as the second, for I account them both as one) groweth, as *Matthiolus* saith, in many places of *Italy*, as well as *Tuscane* in wast grounds, by ditch sides, and the way sides in fields and pastures; and as *Cordus* saith in the Vineyards about *Gena*: the third *Bauhinus* saith he onely saw in *Zuingerus* garden and his owne: the fourth in *Spain* *Narbon* in *France*, and *Naples* also: the last is not certainly knownen from whence is the original but is nursed up in gardens.

The Time.

They doe all flower in the Summer moneths, and yeeld their seede soone after.

The Names.

They are all accounted *Chondrilla* species by divers, whereunto for the former three I may well agree being in face not much differing from wilde Succory; the first being called by *Lobel* *Chondrilla cerulea Belgarum*, by *Dodonaeus* *Chondrilla altera*, by *Cordus* upon *Discorides* *Chondrilla prima Sicborio similis*, and in his History *Chondrilla tenera*; by *Camerarius* *Chondrilla cerulea flore*; who saith the *Italians* call it *Caccia lepore*; *Lugdunensis* maketh it to be *Apat* *Dalechampi*, and saith the *Italians* call this *Terra crepola*, by *Tabernmontanus* *Chondrilla cerulea* and *alba*, as *Cordus* before him did: *Gerard* giveth two figures hereof, which *Bauhinus* noteth, and calleth this first *Chondrilla cerulea altera Cichorij folijstis folijs*: the second is that which *Matthiolus* setteth forth as an *hysteron proteron*, as I said before, calling it *Chondrilla altera*, and *Lacuna Chondrilla prima*, observing, as it is likely his error, and by *Bauhinus* *Chondrilla Cerulea latifolia laciniata*: the third *Bauhinus* mentioneth in his *Phytopynx*, *Pinax*, and *Prodromus* by the name of *Chondrilla purpurascens fatida*, and *Besler* in *horto Eystetensi* *Chondrilla rubra fatida*: the fourth is called by *Lobel* *Chondrilla rara purpurante flore semine nitido deciduo*, and *Crupina Belgarum*, and findeth fault with his owne mistaking in calling it formerly *Superba recentiorum*; wishing it to be blotted out: *Lugdunensis* calleth it *Chondrilla purpurea Lobelij*, and *Tabernmontanus* *Chondrilla Hispanica Narbonensis*: *Columna* finding it in *Naples*, could not well tell to what *genus* he might referte it, and therefore called it *Senetio Carduus Apulus*, and *Bauhinus* to varifie his title from all others, calleth it *Chondrilla folijs laciniatis serratis, purpurascens flore*: the last is but one sort, although *Bauhinus* maketh it to be two, because *Camerarius* first set forth the plant with the flower spread open that it might be the better knowne, yet is the same that *Matthiolus* calleth *Sesamoides parvum*, not rightly expressed, and from him *Cassio* *Dierantes*, *Camerarius*, *Tabernmontanus* and *Columna* doe so entitle it, yet *Columna* thinketh it may be *Cyanis* *Plinij*. *Lobel* calleth it *Sesamoides parva Discoridis*, but *Gesner* in collectione stirpium *Coronopus quidam flore ceruleo*, *Dodonaeus* maketh it his *Chondrilla tertia species*. &c. *Lugdunensis* *Catanance quorundam*: *Bauhinus*, as I said, to make two sorts hereof entitleth his first *Chondrilla cerulea Cyani capitulo*, and the other (which as I said *Camerarius* in his *Matthiolus* setteth forth, with the title of *Sesamoides parvum flore magis completo*, and *Eystetensis* *Chondrilla Sesamoides dista ceruleo flore completo*) *Chondrilla cerulea Cyani capitulis altera*. *Cordus* saith that the *Germanys* call this first *Chondrilla Klein Sonnen werbel*, and as is said before, the *Italians* *Caccia lepore* and some *Terra crepola*.

The Vertues.

Matthiolus saith that the people in *Italy* where the first sorts doe grow doe eat them in their sallets as Succory is, being accounted of the same propertie, but I have no other Author that giveth any speciall instance of the vertues therein, and therefore you may as I referre them to the kindred of the Succories, and be perswaded of the like effects to be found in them, neither have I any more certainty to speake of the rest.

CHAP. XXIX.

Hieracium. Hawkeeweke.

IO set forth the whole family of the Hawkeeweeds in due forme and order, is such a world of worke, that I am much in doubt of mine owne abilitie, it having lyen heave on his shouders that hath already waded thorough them, and will be as heave to me, although he be a guide for me to follow: If I therefore (as he before me no doubt hath done) slippe or goe awry, let it be pardoned in me, as it must be in him, or let them that too critically find fault amend it by assured knowledge if they can themselves, and I will give them thanks. For such a multitude of varieties in forme pertaining to one herbe is not to be found againe, in rerum natura, as I thinke. That I may therefore so set them forth, that ye may apprehend them rightly, as I shall endeavour to expresse them aptly and methodically, I must distribute them into

into sundry formes and orders after such a manner, as I thinke meete to dispose them, and in severall Chapters according as you shall finde by the titles at the heads of every of them.

Ordo primus. The first Ranke or Order.

Hieracia Dentis leonis folijs acuta. Sharpe pointed Dandelion-like Hawkeweedes.

1. *Hieracium majus Sonchites.* Great Hawkeweede with Sow-thistle leaves.

THis great Hawkeweede hath many large hairy leaves lying on the ground much rent or torne on the sides into divers gaffes and jagges, somewhat like unto Dandelion, but with greater parts, more like unto those of the smooth Sow-thistle, from among which riseth a hollow rough stalke, two or sometime three foote high branched from the middle upwards, whereon are set at every joynt, where it brancheth longer leaves, little or nothing rent or cut in, bearing at their tops sundry pale yellow flowers, consisting of many small narrow leaves broad pointed, and nicked in at the ends, set in a double row or more, the outermost being larger than the inner, which forme most of the Hawkeweedes doe hold in all the sorts, which turne into downe and with the small brownish seede is blowne away with the winde: the roote is long and somewhat great with many small fibres thereat: the whole is full of a bitter milke.

2. *Hieracium majus Creticum.* Great Candy Hawkeweede.

This Candy Hawkeweede hath the first leaves little or nothing dented, but somewhat like Endive, yet those that follow are cut in on the sides, not so much as the Sow-thistle, else not much unlike, which are more tender yet larger than the former as the stalkes are likewise, bearing on the branches greater huskes wherein the yellow flowers grow, which passe into downe with rough crooked seede lying therein, and are both dispersed by the winde: the whole plant is bitter, and perisheth at the first approach of Winter being luted up, and to be new sown every yeare.

3. *Hieracium magnum Hispanicum.* Great Spanish Hawkeweede.

This Spanish Hawkeweede hath a round hollow crested stalke somewhat hairy, about a cubite high or more, whose bottome leaves are long and large like Dandelion, very much cut in and hairy on the edges, each being about a foote in length, and an inch and a halfe in breadth; those on the stalkes are divided at the bottome into two parts like eares, compassing them about, as they grow higher they are lesse jagged, and the highest a little waved onely at the edges; at the toppe of the stalke groweth a double flower like the Dandelion, and of the same bignesse, but of a paler yellow colour which passeth into downe as the rest doe.

1. *Hieracium majus Sonchites.*
Great Hawkeweede with Sow-thistle leaves.

4. *Hieracium folijs & floribus Dentis leonis bulbosi.*
Bulbed Dandelion-like Hawkeweede.

4. *Hieracium asperum* folijs & floribus *Dentis leonis* bulbosi. Bulbed Dandelion-like Hawkeweede.

The rough leaves of this Hawkeweede that lie upon the ground, are much cut in on the edges, like unto those of the bulbed Dandelion each rent or gash looking downeward to the bottome of the leafe, amongst which riseth up an hairy ore or naked stalk, bearing a large Dandelion-like yellow flower which turneth into downe, and is carried away with the winde: the roote is somewhat great and long with some fibres thereat.

5. *Hieracium Dentis leonis folio asperum.*

Rough Dandelion-like Hawkeweede.

This small Hawkeweede hath divers long and narrow hairy leaves, reddish at the bottome next the roote, deeper waved or torne on the edges, being about two inches long, from which rise one or two or more bare or naked stalks rough or hairy, bearing each of them a double yellow flower like unto the Hawkeweedes passing into downe: the roote is small somewhat like a finger, with a few fibres hanging thereat.

6. *Hieracium minus glabrum.*

Small Hawkeweede with smooth shining leaves.

This little Hawkeweede riseth little above a spanne high, with smooth fresh Greene stalks, branched forth into others, set with few, but smooth shining Greene leaves long and narrow, being little torne on the edges, compassing the stalks at the bottome, and eared as the third: the flowers that grow at the toppes are of a faire gold yellow colour, lesser than any other Hawkeweede, each standing on a foote stalk, about an inch long, which as the rest, doe passe away with the winde: the roote is small, long, and whitish.

7. *Hieracium hirsutum fere umbellatum.*

Small Hawkeweede with umbel-like flowers.

This small Hawkeweede hath five or sixe small leaves lying upon the ground, waved or cut on the edges like unto the common Hawkeweede, having a soft downe like haire on the upper side of the leaves, and smooth without haire underneath fall of a bitter milke, from among which riseth up a slender hairy stalk about a foote high or more, bearing at the toppe divers small flowers set together as it were in a tuft or umbel, of a gold yellow colour like in forme unto others, as also in the downie heades: the roote liveth long, being composed of many small white stringes, which shooteth forth and spreadeth it selfe also into many heads above ground, which shoot forth branches, rooting also in the ground as they lie.

The Place.

The first groweth in divers places about fields sides, and the path wayes in dry grounds: the second is of Candy: the third of Spaine: the fourth of Italy: the fifth in our owne Land, as well as about *Mompelier*, *Naples*, and *Spaine*: the sixth about *Basil*: the last about *Vienna* in *Austria*.

The Time.

They doe all flower and flie away in the Sommer moneths.

The Names.

It is called in Greeke *ἱεράκιον* of *ἱερά* accipiter an Hawke, Sic dictum volunt quod accipitres sibi huius succo *acium oculorum acutere dicuntur* (as divers other herbes tooke their names, some from beasts as *Elaphoboscum* a *Cervus*, others from birds, as *Chelidonium* ab *Hirundine*, *Perdicion* a *Perdice*,) in Latine also *Hieracium*, and of some *Accipitina*: and because they doe partake of Sow-thistles as well as of Succory, I have placed them betweene them both: the *Italians* call it *Hieracio*, the *French* *L'herbe d'esservier*, the *Germanes* *Hawke kraut*, the *Dutch* *Havickscruyde*, and we in *Engliffe* *Hawkeweede*, and of some yellow *Succory*: the first here set forth is the *Hieracium majus* of *Matthiolus*, *Fuchsius*, *Podonius*, *Lobel* and others, the *Taraxacon majus* of *Loeuerus*, *Intubus secundus* of *Tragus* as it is thought, and *Hieracium Sonchites* or *Sonchi folio* of divers, but of *Lugdunenſis Hieracium minus*, because he setteth forth the *Chondrilla prior Dioscoridis* for *Hieracium magnum*, as I shewed you in the last Chapter save one: the second *Gesner* and *Camerarius* onely make mention of, the one as *hortis Germanie*, the other in *horto Medico*, by the name of *Hieracium Creticum pro Endivia lutea missum*, and there sheweth why hee called it *Creticum*, even because he found the like seede among *Epithymum* that came from *Candy*: the third *Bauhinus* setteth forth by the name of *Dentis leonis latifolius arborescens*, saying it came to him out of *Signor Contarinos* of *Padua* his garden, by the name of *Hieracium Hispanicum*; and therefore I have so called it, and placed it here, and not among the Dandelions, as hee doth in his *Pinax*: the fourth *Lobel* in his *Dutch Herball*, and *Icones* calleth *Hieracium folijs & floribus dentis leonis bulbosi*, because being very like it, yet differeth in the long roote: the fifth *Bauhinus* maketh of two sorts, calling them *Hieracium dentis leonis folio hirsutie asperum magis laciniatum*, and *minus laciniatum*, but I thinke they are both one, and therefore doe not distinguish them; *Columna* calleth it *Hieracium alerum saxatile montanum*: the sixth *Bauhinus* calleth *Hieracium minus glabrum*: and the last *Clusius* describeth for his ninth *Hieracium*, but the figure he setteth for it, is much differing from the description thereof, but answereth well the description of the eleaventh, and it may be was but the Printers fault in transposing the letter I, being set

best re

before the X, that should have beene set after, thereby making it XI. when it is set IX.

The Vertues.

Hakeweede, saith *Dioscorides* is cooling, somewhat drying and binding, and therefore is good for the heate of the stomacke, and for inflammations, and the hot fits of agues and gnawings of the stomacke: the quantitie of a scruple of the dried iuyce, saith *Pliny*, taken in *Posea* Posset, that is vinegar and water mixed purgeth the belly, yet he saith in another place, that a small quantitie bindeth the belly: the said iuyce taken in wine helpeth digestion, discusseth winde, and hindereth any crudities to abide in the stomacke, it helpeth also the difficultie in making water: the same likewise taken in wine helpeth the bitings of venomous Serpents, and of the *Phalangium*, and the sting of the Scorpion, if the herbe also be outwardly applied to the place; and helpeth also all other poysons, except that of *Cernissa*, or those that hurt the bladders or that kill by strangling: a scruple of the dried iuyce given in wine and vinegar, is profitable for those that have the dropsie: the decoction of the herbe taken with hony digesteth thinne flegme in the chest or lungs, and with Hyslope, doth helpe the cough: the decoction thereof, and of wilde Succory made in wine and taken, helpeth the wind collike, and those that are melancholike or have hard spleen: it procureth rest and sleepe, it hindereth venery and venereous dreames, cooleth heates, purgeth the stomacke, encreaseth blood, and helpeth the diseases of the reins and bladder. Outwardly applied it is singular good for all the defects and diseases of the eyes used with some womens milke: it is also used with good successe in fretting or creaping ulcers, especially in the beginning: the Greene herbe bruised, and with a little salt applied to any place burnt with fire before blisters doe arise, doth helpe them, as also inflammations, Saint *Anthones* fire, and all pushes and eruptions of heate and salt flegme: the same applied with meale and faire water in manner of a pultis to any place affected with convulsions, and the crampe, or such as are out of joynt doth give helpe and ease. The distilled water is of good use in many of the diseases aforesaid, and the face washed therewith clenseth the skinne, and taketh away freckles or spots, the morphew and other blemishes in the skin, and helpeth to take away wrinkles in the face also. The fit is by the relation of Mr. *John Morrice* Gentleman of *Ipselworth* beyond *Brainford* unto me by good experiments from others, singular good to helpe the Pleurisie, onely by taking the iuyce thereof in drinke.

CHAP. XXX.

Hieracia Dentis leonis folio obtuso. Dandelion-like Hawkeweede with blunt pointed leaves.

Ordo secundus. The second ranke.

1. *Hieracium longius radicaum.* Long rooted Hawkeweede.

He leaveth of this Hawkeweede that lie upon the ground are long and narrow much torne and jagged on the edges somewhat like unto Dandelion, but cut into many short round pointed peeces, and of a darke Greene colour, the stalkes that rise from among the leaves are smooth and blackish scarce a foote high, bare or without leaves on them unto the toppes, but at the upper joint, from whence spring sundry flowers each standing on a long foote stalk, which are yellow like unto other Hawkeweeds and turne into downe as they doe: the roote is white small and long, running downe as deepe into the ground, saith *Lebel*, as the stalk is high, that which I and many others have taken for it, have more and shorter rootes.

2. *Hieracium dentis leonis folio obtuso minus flore magno.*

Small Dandelion-like Hawkeweede with round pointed leaves.

This small Hawkeweede hath sixe or seven thicke rough leaves lying on the ground, about two inches long, and halfe an inch broad, round pointed and jagged about the edges, after the fashion of the former, but not with such deepe jagges, among which riseth a bare hollow smooth stalk, whereon is set a large pale yellow flower, which turneth into downe, the roote is small and fibrous.

3. *Hieracium tomentosum Hispanicum.*
Spanish woolly Hawkeweede.

This Hawkeweede hath divers hoary soft woolly leaves lying on the ground, cut in on the sides like Dandelion, every one standing upon a small long foote stalk, being of three or foure inches long, and halfe an inch broad, the stalk is hoary likewise, and branched about a spanne high having smaller leaves thereon, with smaller divisions, at the tops stand very yellow flowers on very short foote stalkes, shooting out of very fine hoary huskes pointed at the brimmes with many points: the roote is white on the outside.

4. *Hieracium dentis leonis folio floribus parvis.*

Dandelion Hawkeweede with small flowers.

The roote hereof is small, white, woody and fibrous, the stalk is round, a foote high, and somewhat hoary, at the bottome whereof grow a few rough leaves, bitten in, as it were about the edges, about three inches long, and halfe an inch broad, having but few leaves thereon and those about the middle, which are but only dented and compasse at the bottome, bearing many very small yellow flowers together, upon very short stalkes at the toppes thereof.

1. *Hieracium longius radicaum.*
Longrooted Hawkeweede.

5 *Hieracium*

7. *Hieracium medio nigrum.*
Small blacke spotted Hawkeweede.

8. *Hieracium asperum Hypochaeris five Porcello dictum.*
Swines Hawkeweede with rough leaves.

9. *Hieracium minimum Clapp.*
Clappe his least Hawkeweede.

10. *Hieracium parvum Creticum.*
Small Hawkeweede of Candy.

5. *Hieracium dentis leonis folio bulbosum*. *Asphodill* rooted Hawkeweede.

This Hawkeweede hath for the roote a few long clogges, like the *Asphodill* roote, the stalke that riseth from thence is about a cubite high, bare of leaves from the bottoome to the middle, smooth and crested, about the middle separated into one or two branches, of a foote long apeece, each whereof sustaineth a small yellow flower like the others in this kinde, which passe away in like manner; the leaves that lie upon the ground are rough on the upper side, and smooth with a certaine wollinesse underneath, cut or torne on the edges very like unto *Dandelion*, being about three inches long and one broad.

6. *Hieracium medio nigrum Boeticum majus*. The greater blacke spotted Hawkeweede of *Spaine*. This hath foure or five small, long, and narrow smooth whitish Greene leaves lying on the ground, bluntly cut in on the sides, but not very deepe, the midde ribbe being whitish all the length thereof, from these springeth up usually but one small stiffe whitish Greene striaked stalke branched into sundry parts, about a foote and a halfe high, with a few smaller leaves thereon at the joynts, and few or no dents upon them: the flowers grow at the toppes and from the joynts of the branches thicke and very double, but one on a head or joynt like a small Hawkeweede, of a very pale yellow colour, with a blackish purple spot in the middle, which turne into very short downe, that with the small browne seede flieth away: the roote is short and woddy perishing every yeare that it feedeth.

7. *Hieracium medio nigrum Boeticum minus*. The smaller blacke spotted Hawkeweede of *Spaine*. This is altogether like the last, both in stalkes, leaves, and flowers, with the like purple spot in the middle, but they are in every part three times smaller.

8. *Hieracium asperum Hypocheris sive Porcellia dictum*. Swines Hawkeweede with rough leaves. This small Hawkeweede (rather than Succory, as *Gerard* calleth it, and his Corrector so letteth it passe) hath divers somewhat long and rough leaves lying on the ground, smaller at the bottoome, and broader towards the end, unevenly waven at the edges: the stalkes are somewhat rough, slender, and bare of leaves branching into sundry long stalkes, about halfe a foote high, bearing every one a large yellow flower like unto Hawkeweede: the roote is small and long. There is another of this sort, whose leaves are smooth and narrower, differing little in any thing else.

*Hieracium
g. aru. huc
Porcellia
angustifo-
lia.*

9. *Hieracium Clusij, Hyoseris Tabernmontani & Gerardii*. *Clusius* his least Hawkeweede. This small Hawkeweede of *Clusius* hath divers small leaves upon the ground, somewhat like unto *Daylie* leaves but longer, and unevenly dented or waved about the edges, from whom riseth up a stalke or two, or sometimes more, halfe a foote high, naked, hollow, and reddish at the bottoome, and sometimes branched towards the toppe, reddish also at the joints, which grow bigger above than they are below, contrary herein to all, or most other plants, bearing on each of them a small yellow flower like others, and turning into downe that is blowne away as the rest. *Clusius* maketh mention of another sort hereof, was brought him by *Gulielmus de Alera*, a Physician, whose flowers passed not into downe, but the seede being long and somewhat blackish, did still abide in the heads.

*Minimum
alterum.*

10. *Hieracium parvum Creticum*. Small hawkeweede of *Candy*. This *Candy* Hawkeweede being an other sort of the last described, hath divers leaves spread upon the ground, smaller at the bottoome, and growing broader to the ends, cut in with a deepe cut or two where it is broadest, and all the rest of the edges unevenly waved, the middle ribbe being reddish, from among which rise two or three slender bare stalkes, about a foote high, branching forth into two parts, with a smaller leaf at the joynt, more divided than any below, bearing on each of them a larger flower than answereth well the proportion of the plant in forme like other Hawkeweedes, but pure white on the upper side, and of a bluish colour underneath: the roote is long and small with some fibres thereat.

The Place.

Divers of these Hawkeweedes grow abroad in the fields, wast grounds, and lanes in divers places of our owne country, as well as in other: but the sixth and seventh came to me from *Spaine*.

The Time.

They all flower and fall in the Summer time, and some abide untill the Autumne coldes cause them to perish, and will rise againe of their owne fallen seede.

The Names.

The first is called by *Lobel* *Hieracium longius radicans*, and *microphyllon* by *Tabernmontanus*; *Dodonaeus* in his *French* Booke calleth it *Hieracium minus primum*, and *Lugdunensis* *Apargia* *Dalechampi*, whereof *Theophrastus* speaketh, l. 7 c. 9. in *ter. eno. eno. ad terram solias plantae*; and *Bauhinus* *Hieracium dentis leonis folio obtuso majus*: the second *Bauhinus* calleth, as it is in the title, *Hieracium dentis leonis folio obtuso minus flore magno*: the third he calleth *Hieracium tomentosum Hispanicum* in his *Prodromus*, which hee omitted in his *Panax*: the fourth hee doth likewise call *Hieracium dentis leonis folio floribus parvis*: the fifth he calleth *Hieracium dentis leonis folio bulbosum*; the sixth and seventh are as I said *Hieracia* raised from the *Spanish* seede I received, and are the same that *Clusius* mentioneth in his *Curis posteriores* without description: the eighth is the *Hypocheris sive Porcellia* of *Tabernmontanus*, & *Gerard*, which he putteth among the *Chondrillas*, & calleth it in *English* Swines Succory, as he doth the next hereunto Male Swines Succory, they being both certainly kindes of *Hieracium*, *Bauhinus* calleth it *Hieracium minus dentis leonis folio subaspero* (and maketh some doubt or question whether it should not be the *Hieracium minus* of *Columna*) and the other of this kinde *Hieracium minus dentis leonis folio oblongo glabro*, and is the *Hyoseris altera vel angustifolia* of *Tabernmontanus*: the ninth is the *Hieracium minimum* of *Clusius*, the figure whereof is falsely quoted IX. for XI. and is the *Hyoseris latifolia vel mascula* of *Tabernmontanus* and *Gerard*, which *Bauhinus* calleth *Hieracium minus folio subrotundo*: the last *Clusius* setteth forth in his first *Appendix* that is joyned to his History of plants, and is the last there by the name *Hieracium parvum Creticum*, which *Bauhinus* calleth *Hieracium minus flore albo carneo*. *Pona* in his *Italian* Booke of *Mount Baldus*, calleth it *Hieracium inubacem non ramosum*.

The Vertues.

All these small Hawkeweedes, or the most of them, being of the like bitter qualitie to the former, doe no doubt performe the same effects, although peradventure in a weaker manner: but because I have not any peculiar propercie

properties to relate of any of them, I referre you to the former Chapter to be informed of their qualities, and to what diseases they may be conduible.

CHAP. XXXI.

Hieracia Chondrilla folijs. Gumme Succory-like Hawkweedes.

Tertius Ordo. The third Ranke.

1. *Hieracium maximum asperum Chondrilla folio.*
The greatest Gumme Succory-like Hawkweede.

1. *Hieracium maximum asperum Chondrilla folio.*
The greatest Gumme Succory-like Hawkweede.

His great Hawkweede hath a great round rough straked stalke, bigger in one place than another, almost three foote high, branched towards the toppe into short branches, with great long leaves set there-on one above another, much torne in on both sides, to the middle ribbe almost, about three inches long, very hairy and rough in handling: the flowers are great and yellow like unto other Hawkweedes.

2. *Hieracium folijs & facie Chondrilla Lobelij.*
Lobel his Gumme Succory-like Hawkweede.

This kinde groweth not so high as the former, and hath the leaves thicker jagged, but not so large, each jagge somewhat dented also and somewhat hairy: the flowers are yellow, but not so thicke or double, but more growing in a tuft together, which being ripe and turned into downe, are blowne away with the winde as others are.

3. *Hieracium Chondrilla folio glabrum.*
Deepe jagged Hawkweede.

This Hawkweede differeth not much from the last, but that the leaves hereof are smooth, very much, and very deeply gashed even to the middle ribbe, each jagge being small, narrow, and pointed; the stalkes and flowers, &c, are like thereunto.

4. *Hieracium minus premorsa radice.*
Small Hawkweede with bitten rootes.

The leaves of this Hawkweede are many that lie next the ground somewhat long and narrow cut in on the edges, into small and short pointed gashes: the stalkes are small and grow to be scarce a foote high, parted into a few branches with some leaves here and there upon them that have no division on the side: at the toppes whereof stand the flowers much separate in sunder each upon a long stalke, and doe consist of fewer leaves or lesse double, of a gold yellow colour which turne into downe, &c, the roote is made of many stringes like a Plantane roote, but the middlemost that is greatest, is short, as if it had bene bitten off like the Devills bit: the whole plant, and every part thereof, is very bitter rather more than any other.

The Place.

All these but the first grow plentifully enough in our Land in many places, and that about *Mompelier*.

The Time.

They flower with the rest, that is in *June* and *July*.

The Names.

The first is called by *Bauhinus*, who onely doth make mention of it, *Hieracium maximum asperum Chondrilla folio*: the second is called by *Lobel* *Hieracium folijs & facie Chondrilla*: the third *Bauhinus* calleth as it is in the title, and saith it is *Tabermontanus* his first *Hieracium* which he called *Aphaca*: the last is the *Hieracium minus* of *Matthioli*, *Tragus*, *Fuchsius*, *Gesner*, *Tabermontanus* and others: *Lobel* calleth it *Hieracium minus premorsa radice*, and is *Tragus* his *Succisatertia*, and *Laetitia leporina*: *Lugdunensis* calleth it *Picris Dalechampij*, because of the bitternesse, and *Bauhinus* *Hieracium Chondrilla folio succisa radice*, whereof he maketh a *major* and a *minor*, yet saith hee himselfe, that they may well be accounted but as one, differing onely in the greatnesse and smoothnesse of the leaves, and therefore I include them both in one.

The Vertues.

These Hawkweedes are no doubt as effectuell as the greater sorts in every degree, and therefore whatever hath bene said of them, may safely be applied to these, and therefore to avoid a tautologie, I referre you to them.

2. *Hieracium folijs & facie Chondrilla Lobelij.*
Lobel his Gumme Succory-like Hawkeweede.

4. *Hieracium minus proserpinae radice.*
Small Hawkeweede with bitten rootes.

CHAP. XXXII.

Hieracia intubaceæ folijs.
Garden Succory-like Hawkeweedes.

Quartus Ordo. The fourth Ranke.

1. *Hieracium intubaceum flore luteo.*
Yellow garden Succory-like Hawkeweede.

T His kinde of Succory Hawkeweede riseth up with a slender smooth stalke about a foote high, yet somewhat leaning downewards, spread into many branches, at the foote whercof grow smooth long darke greene leaves, about foure inches in length, and one and a halfe in breadth, some of them without divisions, and others especially, those that grow upwards very much, each of the stalkes and branches, being about an hand breadth bare unto the toppes, where eachof them carrieth a yellow flower of a middle size which turne into downe, and is carried away at the will of thewinde.

2. *Hieracium intubaceum flore magno albido medio luteo.*
White garden Succory-like Hawkeweede.

This other Hawkeweede is very like unto the former, but that the leaves are somewhat larger and broader, and more cut in or jagged on the sides: the flowers also are whitish and more yellow in the middle, and somewhat reddish underneath.

3. *Hieracium intubaceum flore carneo.*
Blush garden Succory-like Hawkeweede.
The blush Hawkeweede hath divers long and somewhat narrow rough leaves lying next the ground, very much torne in on the edges, from among which rise five or sixe, or more slender short browne and hairy stalkes, about a foote high or more, spreading a branch or two, with lesser,

and

lesse divided leaves thereon up to the toppes, where there are severall large flowers, consisting of two or three rows of leaves, of a deepe bluish colour, of somewhat a strong Opium-like sent, broad pointed and bearded at the ends, the outermost row being larger than the inner, standing in rough scaly huskes, wherein afterwards the slender long browne seede is contained, which lying among much downe, are carried away together with the winde: the roote is composed of a downeright string, with other fibres thereat, which perish after seede time.

The Place

All these Hawkeweeds have come to us from Italy, where it is likely they are naturall.

The Time

They flower from the middle of Summer to the end of August, and the seede ripeneth in the meane time.

The Names

The first is called by *Bauhinus Hieracium Intubaceum flore luteo*, which he quoteth in his *Pinnax* to be the eighth in his *Prodomus*, mistaken for the tenth; and the second *Hieracium Intubaceum flore magno albo*, this is there also mistaken for the eleventh: they have both come from Italy, and Boet likewise from Lisbonne, by the name of *Hieracium Aphacoides*, and *Sonchus Hieracifides*: the last is called by all Writers of it *Hieracium Intubaceum*, and *ore carneo*, and *ramosum* by *Pona* in his *Italian Mount Baldus*, for he accounteth the *Hieracium parvum Creticum* of *Clusius*, to be *Hieracium Intubaceum non ramosum*, as I shewed you in the Chapter next save one before this: is also assuredly the *Hieracium Apulum flore suaverubente* of *Columna*.

The Vertues

These kindes of Hawkeweeds are, of the like temperature with the former, and may performe as much in their operation as they, and therefore I will referre you unto them to be informed of their qualities which may safely be transferred to these.

CHAP. XXXIII.

Hieracia Cichoriacea. Wilde Succory-like Hawkeweeds.

Quintus Ordo. The fifth Ranke.

1. *Hieracio folio Hedypnoidis*. Yellow Succory-like Hawkeweede.

His Hawkeweede hath a few leaves next the ground, somewhat long and narrow, waved or unevenly dented about the edges, in some more, in other lesse, and sometimes hairie withall, yet planted in Gardens hath little or none at all: it sendeth forth a great many slender stalkes, with a few leaves set dispersedly upon them, smaller than those below, and branching at the toppes whereat stand several green scaly huskes with yellow flowers in them, hanging downe their heads before they are blowen, wherein grow crooked seede lying in the downe, and are scattered where it pleaseth the winde: the roote is long and white, with some small fibres fastened thereto.

2. *Hieracium falcatum sive stellatum*. Starre-like Hawkeweede.

The lower leaves of this Hawkeweede are somewhat long and narrow, with but three or foure dents on the sides ending in a point: the stalkes are branched from the middle upwards, and at every joint a leafe under it bearing at the joynts and toppes severall pale yellow small flowers, which turne into heads of divers crooked seede like small round and hard hornes or hookes, set all most round and starre fashion, some of the seedes being longer by halfe than others: the roote is milkie small and stringy perishing every yeare after seede time.

3. *Hieracium falcatum barbatum*. Herbe Impious like Hawkeweede.

This impious Hawkeweede (not that it hath any hurtfull qualitie therein, but because the side branches rise higher than the middlemost, like the herbe *Impia* or *Impious* Cottenweede) hath the lower leaves of two or three inches long, and one and a halfe broad, of a darke Greene colour, and with but few dents on the edges: the stalkes are small not a foote high, bearing but few leaves on them, and at the tops one small flower, of a pale yellow colour, somewhat browner in the middle, compassed about with divers rough hornes which grow hairy or bearded and

1. *Hieracium facie Hedypnoidis*. Yellow Succory-like Hawkeweede.

Yyy 2. Sharpe

sharpe pointed when they are ripe, from the bottome of this head riseth one and sometimes two small branches, about foure inches long with very narrow Greene leaves set on them, and a flower at the toppe made after the same manner, and having sometimes a small branch or two rising from the head thereof in like manner as the other.

4. *Hieracium minimum* seu *marianum falcatum*.

The little sea Hawkeweede.

This little Hawkeweede riseth not a above halfe a foote high, and from a small long reddish roote, sendeth forth verie small thread-like stalkes spreading into branches, bearing very small pale yellow flowers, which are compassed about with such like crooked hornes, sharpe pointed as are in the last: the leaves at the bottome are as small and narrow as they, hut a little more dented about the edges.

The Place.

The first and second grow naturally both at *Mompelier* in France and in *Italy* also: the third at *Naples*, and in the wood *Gramuntium* which is hard by *Mompelier*: the last by the sea shore not farre from *Mompelier*.

The Time.

They keepe the same time that the rest doe.

The Names.

The first is called by *Cesalpinus Rhagadiolus*, and by *Clusius Hieracium folio Hedypnoidis*: the second is called by *Lobel* and *Lugdunensis Hieracium Narbonense falcata siliqua*, by *Cesalpinus Rhagadiolus alter*, by *Tabermontanus Hieracium Mompeliacum*, and *Narbonense*, of some *Italians Sonchus stellatus*, by others *Chondrilla stellata Hieracium falcatum* and *Hieracium Caltheae semine*: the third is called by *Columna Hieracium calyce barbato*, & by *Bauhinus Hieracium proliferum falcatum*, who thinketh it may be the *Hieracium minimum altitum* of *Clusius*: the fourth is remembered onely by *Bauhinus* by the name of *Hieracium minimum falcatum*.

The Vertues.

The Vertues of these Hawkweedes are a like unto the former sorts, and therefore there needeth not the same things to be spoken againe here which are there set downe.

2. *Hieracium falcatum* seu *stellatum*.
Starrelike Hawkeweede.

CHAP. XXXIV.

Hieracia Montana glabra.
Smooth Mountaine Hawkweedes.

Sextus Ordo. The sixt Ranke.

1. *Hieracium Montanum latifolium glabrum majus*.
Great smooth Mountaine Hawkeweede.

His mountaine Hawkeweede hath divers faire great leaves, somewhat narrow at the lower ends, and broader to the middle where it is broadest, and ending in a point unevenly dented or waved about the edges, and compassing the stalkes as they rise up, which branching themselves beare three or foure flowers, as it were in an umbell together, which seldome appeare open, but when they doe they are yellow like unto others passing into downe, and then into the winde as others doe.

2. *Hieracium Montanum latifolium glabrum minus*.
Small smooth Mountaine Hawkeweede.

This other Mountaine Hawkeweede hath his leaves and flowers in all things like the last but smaller, and the whole plant lower and leslier, in other things it doth not differre.

3. *Hieracium Alpinum pumilum Chondrilla folia*.
Small Mountaine Hawkeweede with Gumme Succory leaves.

This small Hawkeweede hath a few leaves next the ground about foure inches long of a pale Greene colour, and scarcely dented or divided on the edges at all, every

1. *Hieracium latifolium montanum glabrum majus*.
Great smooth mountaine Hawkeweede.

one upon a long footstalk : but those that grow up higher are of an inch long a peece upon the stalk which is not above an handbreadth high, and divided at the toppes into two or three small branches, bearing every one a reasonable large yellow flower like the others, and are more divided on the edges like unto the leaves of Garden Succory: the roote is small, blackish without, white within, and abiding after seedetime.

4. *Hieracium Alpinum angustifolium*. The narrowest mountaine Hawkeweede.

From the roote of this Hawkeweede which is reddish and somewhat woody spring forth divers very long and narrow grasse like leaves being about an handbreadth long, smooth and of a darke Greene colour, among which riseth up a smooth round straked stalk about a foote high or more bearing a few small and shorter leaves thereon, and divided from the middle upward into sundry branches having on each of them a small yellow flower which passe into downe and then into the winde.

5. *Hieracium Tragopogonis folio*. Goates-beard Hawkeweede.

This mountaine Hawkeweede hath for his roote divers white strings issuing from a small blackish roote, and from it sendeth forth divers long and narrow leaves like unto those of Goates-beard, each of them of a fingers length guttured or halfe hollow all the length, of a grayish Greene colour giving a bitter milke as others do, from among which riseth a small tender stalk not a foote high, with some few leaves sparsely set thereon smaller then the others, divided into some branches bearing small yellow flowers like the others, out of scaly Greene huskes passing into downe, that when it is ripe is with the small feede carried away with the winde.

The Place.

All these sorts of Hawkweedes grow upon the Alpes, mount Baldus and others in Germany from whence they have beene brought to furnish the gardens of the curious.

The Time.

They keepe the same time of flowering and feeding that the rest doe.

The Names.

The first is the *Hieracium montanum majus latifolium* of *Tabernmontanus*, whose true figure *Gerard* hath set forth under the name of *Chondrilla Hispanica*, but the description pertaining thereunto is not answerable: the second both *Tabernmontanus* and *Gerard* from him set forth by the name of *Hieracium montanum latifolium minus*: the third *Bauhinus* hath set forth in his *Pinax* and *Prodromus* (but hath mistaken the numbers in his *Pinax* in setting downe the seventh for the ninth in his *Prodromus* and so almost in all the rest of the numbers following) by the name of *Hieracium Alpinum pumilum Chondrilla folio*: the fourth is not numbred by *Bauhinus* in his *Pinax* but in his *Prodromus* by the name of *Hieracium Alpinum angustissimo oblongoque folio*, which I therefore here quote that the reader be not mistaken therein: the fift or last *Clusius* in his *Pannonicke* observations formerly set forth under the title of *Scorsonera quarta*, but better considering that the roote answered not to a *Scorsonera* altered the title in his history and maketh it his seventh *Hieracium humile*.

The Vertues.

You may likewise referre the vertues of the former to these sorts of Hawkweedes for they are thought to be no lesse effectual then they in all the qualities and properties pertaining to them, for of any other particular qualitie in any of them I have not yet heard or read.

CHAP. XXXV.

Hieracia montana hirsuta. Hairy mountaine Hawkeweede.

Septimus ordo. The seventh ranke.

1. *Hieracium montanum Rapifolium*. Turnep leaved Hawkeweede.

His Hawkeweede sendeth forth a few leaves standing upon long and rough reddish footstalkes next the ground somewhat like unto Turnep leaves being rough and torne in very much on the sides into round pointed jagges, among whom riseth up a rough reddish straked stalk more then a cubit high, with one or two small short leaves thereon, divided toward the toppe into many small branches, on every one whereof standeth one flower for the most part, or sometimes two, of a meane bignesse and yellow which turne into downe as the rest: the roote is somewhat long and stringy of a reddish yellow colour.

2. *Hieracium montanum folijs dentatis flore magno*. Dented Hawkeweede.

The leaves of this Hawkeweede lye for the most part all on the ground, being foure or five inches long, and one broad, a little woolly, and finely dented about the edges, of a sad Greene colour: the stalk that riseth up to be a foote high is in a manner bare of leaves, rough and hollow, bearing one reasonable large, deepe yellow flower at the top, standing in a fine scaly huske which turneth into downe as the rest.

3. *Hieracium ramosum magno flore*. Great flowered Hawkeweede.

This large Hawkeweede hath a round rough stalk two cubits high parted into many branches, on every one whereof standeth a large gold yellow flower like unto Dandelion: the leaves are an handbreadth long and three inches broad with a great ribbe in the middle, and many veines running through it, of a pale Greene colour, and somewhat rough, waved about the edges, and set thereabout with small haire, and many veines running from it.

4. *Hieracium Alpinum non laciniatum flore fusco*. Mountaine Hawkeweede with darke red flowers.

This mountaine Hawkeweede riseth up with a hairy stalk two foote high bare of leaves from the middle upwards, and with a few hairy darke Greene leaves at the bottome an hand breadth long, and three inches broad, pointed at the ends, and with a little freefe about the edges: the flowers are of a red colour set many together which being ripe are turned into downe, and with the feede are blowne away: this is very like the *Pilosella major* set forth in my former booke, but is not the same.

Xyy 3

5. *Hieracium*

5. *Hieracium pumilum* Alpinum praeorsariae diez.
Dwarfie mountaine Hawkeweede.

8. *Hieracium montanum* virgatum minck.
Small hairy Hawkeweede.

9. *Hieracium Alpinum latifolium villosum* magno flore.
Broad leaved mountaine Hawkeweede with a large flower.

10. *Hieracium montanum* Dentis leonis foliis magno.
Mountaine horry Dandelion like Hawkeweede.

5. *Hieracium pumilum Alpinum praeorsu radice.* Dwarf mountain Hawkeweede.

This dwarf mountain Hawkeweede hath a short blackish roote, bitten as it were halfe off with some other rings set thereat likewise, sending forth sundry hairy long leaves about three or foure inches long and halfe an inch broad, with long footestalkes under them, cut in on the edges in three or foure places on each side, among which rise up divers hairy slender stalkes, not above an handbreadth high without any leafe thereon except it be one or two at the most bearing one flower a peece, of a pale yellow colour.

There is some varietie observed in this sort, one bearing shorter and rounder leaves without any footestalkes *Altera dicitur* under them: another that hath the stalke branched forth diversly.

6. *Hieracium montanum lanuginosum laciniatum parvo flore.* Mountain woolly Hawkeweede.

This mountain woolly Hawkeweede hath from a long darke red roote many thicke woolly long leaves of a darke Greene colour, as it were spotted, and deeply torne in on the edges about three inches long, and one and a halfe broad, yet some narrower, each of them upon a footestalke, among which riseth up a small soft stalke an handbreadth high, bearing a few small yellow flowers at the toppes.

7. *Hieracium Alpinum pumilum lanuginosum.* Small mountain woolly Hawkeweede.

This is smaller then the last and hath more hairy or woolly leaves of a fingers length and halfe the breadth: the stalke is about foure inches long, bearing a yellow flower like unto the rest, the roote is thicke and hath blackish strings.

8. *Hieracium montanum hirsutum minus.* Small hairy Hawkeweede.

This small Hawkeweede hath a few small leaves about an inch long and somewhat hairy, cut in or waved on the edges, the stalke is without branch or leafe, or seldome any appearing (and somet me by the abundance of nourishment it receiveth growing bigger in the middle) bearing a small pale yellow flower like unto a Sow-thistle and with such a Greene huske under it.

9. *Hieracium Alpinum latifolium villosum magno flore.*

Broad leaved mountain Hawkeweede with a large flower.

This broad leaved Hawkeweede hath the lower leaves long and somewhat narrow covered with a long hairy downe almost hoary, but those that grow up higher upon the hairy stalke which is about a foote high are somewhat shorter but three times broader then they, pointed at the ends and lesse hairy: the stalke is branched into two or three parts, every one bearing one flower usually, yet sometimes two or three out of woolly huskes of the forme and colour of other Hawkeweeds.

10. *Hieracium montanum Dentis leonis folio incano.* Mountain hoary Dandelion like Hawkeweede.

The rootes of this Hawkeweede lye longwise under ground with divers fibres shooting downwards, and sending divers heads of leaves upwards, which are not all of an equall length, but some longer and shorter then others as of one two or more inches long, and halfe an inch broad, with a great or thicke middle ribbe, covered over with a soft hairy downe or cotten, the lower part of them being narrower & much torne in on the sides, and the upper part broader and but onely dented: from among which rise two or three stalkes of a foote long, with-

12. *Hieracium montanum angustifolium.* Clusius his narrow leaved mountain Hawkeweede. 13. *Hieracium latifolium Pannonicum.* Broad leaved Hawkeweede of Hungary.

out any leaves, and bearing one large flower at the toppe, of a deeper yellow colour then in many others.

11. *Hieracium Britannicum* (*Clusii Conyzaefolio*). Fleabane like Hawkeweede.

This Hawkeweede riseth up with round straked reddish Greene stalkes halfe a yard high, set with somewhat large rough leaves like unto those of Fleabane without order, but not so fat or thicke and dented about the edges, compassing them at the bottome, and pointed at the ends: the flowers are yellow like other Hawkeweedes, set in hairy huskes upon long footestalkes which turne into downe, and with the whitish long feede is blowne away with the winde: the roote is composed of many blackish strings which perish not but abide many yeares.

12. *Hieracium montanum angustifolium* sive *sextum Clusii*.

Clusius his narrow leaved mountaine Hawkeweede.

The narrow leaved mountaine Hawkeweede of *Clusius*, yeeldeth from the long and thicke blackish root, divers heads of long and narrow sharpe pointed leaves somewhat hoary upon the Greene, from among the leaves of every head start up naked hard stalkes about halfe a foote long, bearing one large yellow flower at the toppe like unto others, and flying away in downe in the same manner.

Alterum.

This kind is found to vary sometimes, having the leaves a little waved about the edges, and sometimes lesse hoary, and of a darke Greene colour.

13. *Hieracium latifolium Pannonicum* sive *primum Clusii*.

Broad leaved Hawkeweede of Hungary.

This Hawkeweede of Hungary hath divers large hoary leaves lying next the ground sometimes a little waved other whiles torne on the edges, sometimes with blacke spots on them and sometimes without any, among which riseth up an hairy stalke with very few leaves thereon, parted at the toppe into two or three other branches, with every of them a large yellow flower like the great Hawkeweedes.

Unto this ranke or order is also to be referred the *Buglossum luteum* vulgare of *Camerarius* and *Gerard*, which is our *Laugdebecse* called by *Lobel Buglossum Echioides luteum Hieracio cognatum*, and by *Tabernmontanus Hieracium Echioides luteum*, and by *Bauhinus Hieracium Echioides capitulis Cardus Benedicti*, but that I have expressed it in my former booke.

The Place.

All these sorts of Hawkeweedes are growing upon hills and mountaines in severall places of Italy and Germany, &c. and are also found many of them in divers places of our owne Land.

The Time.

They doe all flower in the Summer when the other sorts doe.

The Names.

The first three sorts and the sixt *Bauhinus* onely hath made mention of by the severall names are in their titles: the fourth *Columna* calleth *Hieracium Germanicum fratris Gregorii*, and the fift *Hieracium pumilum quintum ejusdem* (*sc. fratris*) *Bauhinus* maketh them the 17. and 19. in his *Prodromus* by the titles here expressed; the sixt is his twentieth; the seaventh is likewise called by *Columna Hieracium pumilum secundum*, and the eighth *Hieracium montanum asperum*: the ninth is called by *Clusius Hieracium quintum villosum*, and by *Tabernmontanus Hieracium latifolium montanum*: the tenth is the eighth *Hieracium folio Hedyroides* of *Clusius*, which *Tabernmontanus* calleth *Hieracium montanum angustifolium folijs Cichoraceis*: the eleventh is called by *Clusius Hieracium Britannicum*, and is his fourth kind: the twelfth is as is said in the title; the sixt sort of *Clusius* called by *Tabernmontanus Hieracium montanum angustifolium secundum*: the last is the first *Hieracium latifolium* of *Clusius* called by *Camerarius Hieracium latifolium Pannonicum*, and as he saith by some Italians *Costa*, or *Herba Costa*, and by others *Ingrassa di porci*, and by *Tabernmontanus Hieracium Thymoides*.

The Vertues.

There is no doubt but that these sort of Hawkeweedes are as effectual as any of the former, both their form and bitter taste expressing their qualities, yet the last hath bene found by many in our Land to have a particular propertie, but set downe by no other Author then *Camerarius*, who saith concerning it, that it is singular good for the Tisicke or consumption of the Lungs, to be taken either made into a Syrupe or Conserve, or the powther of the dried herbe taken with hony, or as he saith they doe in *Mysia*, put it into their Sallets, broths and meates for the same purpose, and is available for the plurisie also without any helpe of blood letting as it is affirmed by many credible persons.

CHAP. XXXVI.

Hieracia pratensis. Meadow Hawkeweedes.

Octavus ordo. The eight ranke.

1. *Hieracium profunde sinuatum pubescens*. Meadow Hawkeweede with deepe cut leavens.

This Hawkeweede hath divers long and narrow leaves next the ground deeply cut in or torne on the edges, and pointed at the ends with long footestalkes under them, and covered with a soft downy hairinesse as all the plant else is: the stalke is hollow, round and three foote high, having a few such like deepe cut leaves thereon and branched diversly, whereon stand gold yellow flowers on severall long footestalkes which passe into downe like the rest: the roote is blackish and woody.

2. *Hieracium pratense non sinuatum majus*. The greater uncut meadow Hawkeweede.

The many and divers rough leave that lye about the roote of this Hawkeweede upon the ground are of five inches long a peece, and one and a halfe broad, without any gash or dent on the edges being very Greene, and ending in a round point, from among which riseth up one single straight and crested stalke about a cubit high, wholly naked or destitute of leaves, bearing at the toppe a number of small yellow flowers, set close together as it were in a tuft every one upon a short footestalke, which doe as the rest turne into downe and then into the wind: the roote is small and blacke with divers long strings fastned thereto.

3. *Hiera-*

3. *Hieracium pratense non sinuatum minus*. The lesser uncut Medow Hawkeweede.

This other and lesser Hawkeweede hath many lesser leaves & uncut next the ground, of an inch and a halfe long, and one broad, being almost round and rough: the stalke that riseth from the middle of them standeth upright, and is crested, bearing at the toppe a few such like flowers as the former turning into downe: the roote is somewhat long and of a meane size.

The Place.

These doe grow in the fields and meadows, and by woodes sides that lie open to the Sunne.

The Time.

They flower and seede when the former doe.

The Names.

Bauhinus giveth the name of the first, as it is in the title: the second and third *Tbalus* maketh his ninth and tenth *Intubus*, calling them *Intubus aquidungus major* and *minor*, and *Bauhinus Hieracium pratense non sinuatum majus* and *minus*.

The Vertues.

These being Hawkweedes as their face and outward forme sheweth them to be, the vertues of the Hawkweedes may be in some sort appropriated unto them.

CHAP. XXXVII.

Hieracia fruticosa. Bushie Hawkweed.

Novum Ordo. The ninth Ranke.

1. *Hieracium fruticosum latifolium glabrum*. Bushie Hawkeweede with smooth broad leaves.

His first bushie Hawkeweede sendeth forth from a blackish fibrous roote, some round straight hairie stalkes three foote high, set here and there without any order, with soft hairie or woolly leaves dented, or as it were bearded about the edges, foure or five inches long, and one and a halfe broad, of a darke Greene colour and pointed at the ends: the toppes of the stalkes runne into short sprayes bearing every one a small pale yellow flower.

4. *Hieracium fruticosum angustifolium majus*.
The great bushie Hawkeweede with narrow leaves.

Hieracium murorum Bauhiniquod est *Pulmonaria Gallorum* Lobelij.
Bauhinus his more hairy Hawkeweede of the walls, which is
Lobels French *Pulmonaria*.

2. *Hieracium*

2. *Hieracium fruticosum folio subrotundo*. Round leaved bushie Hawkeweede.

The stalke hereof is about a cubit long, straked, round, and somewhat rough, divided at the toppes into sundry branches, three or foure inches long a peece, every one upholding a pale yellow flower, the leaves that compass the stalke at the lower end are somewhat round, about an inch and a halfe broad, yet ending in a little point dented about the edges, and of a light Greene colour somewhat hoarie.

3. *Hieracium fruticosum latifolium hirsutum*. Bushie Hawkeweede with rough broade leaves.

This broad leaved Hawkeweede hath divers broad and somewhat long hard rough darke Greene leaves, lying on the ground without any incisions or dents on the edges; the stalke that riseth up among them is two or three foote high, thicke set with such leaves but lesse unto the toppes, where stand a few yellow flowers consisting of fewer leaves than in others, being but of one row of leaves bordering a middle thrumme which turneth into downe: the roote is wholly composed of strings and small fibres, which yeeldeth milke as most of the Hawkeweedes doe: sometimes this is found to varie with lesse rough, or rather with soft leaves, and sometimes with broader and shorter.

Varietas.

4. *Hieracium fruticosum angustifolium majus*.

The greater Bushie Hawkeweede with narrow leaves. This other bushie Hawkeweede groweth very like the last, but hath longer and narrower leaves, somewhat rough and dented or waved about the edges: the stalke is more branched at the toppes where the flowers are more and thicke, of faire yellow leaves, the roote is whitish very long and deeply spreading into the ground possessing a great deale of ground quickly, for every little peece will grow being broken, and not easie to be rid out againe.

5. *Hieracium fruticosum minus*.

The lesser bushie Hawkeweede.

This lesser buskie Hawkeweede riseth up with a single single stalke halfe a yeard high, set about with diver shorts and smooth leaves in some places, and with almost round rough leaves in others, dented about the edges, bearing divers yellow flowers upon short foote stalkes, at the toppes like unto the last: the roote is short, and as it were bitten off without any fibres at it.

6. *Hieracium Murorum angustifolium*.

Narrow leaved Hawkeweede of the walles.

From a thicke reddish roote riseth up a round rough stalke almost two foote high, set with a few short and narrow leaves disperfed thereon, at the toppes whereof stand many small yellow flowers as it were in a tuft or umbell close set together, every one on a small long foote stalke: the leaves that grow at the foote hereof, and next to the ground, are many long and narrow of fixe inches long, and scarce halfe an inch broad, covered with a soft downe or freefe, which grow shorter as they rise higher on the stalke: this is found much smaller about Padua as *Bauhinus* saith.

The Place.

Although these are set downe by *Bauhinus* and others to grow in severall places in Germany, &c. yet some of them have bene found in our owne Land, as I have oftentimes gathered in the way to *Hampstead Heath*, and backe againe, especially the third and the fourth.

The Time.

These keepe the same time of flowering and seeding or rather later.

The Names.

The first is called by *Bauhinus* as it is in the title, & is the second *Hieracium latifolium* of *Clusius*: the second is so called also by *Bauhinus*, as I have here downe: the third is taken to be the *Erinus Matthioli*, yet no way answering to his figure as *Lobel* saith, being much bigger than it, and as it is thought by divers that the figure is but a figment, for it is not certainly knowne what herbe among all we have should be the right *Erinus* of *Dioscorides*, in that none doth answer it in all points: *Lobel* in his *Adversaria*, would referre both the *Esula dulcis* *Tragi*, hereunto, and his *Esula sylvestris* also, because they give milke, and their leaves doe neatest resemble *Basill* whereunto *Dioscorides* compareth the leaves of *Erinus*, and therefore as it should seeme *Cassor Durantes* calleth *Erinus*, *Mattholi Basillium aquaticum*: *Gualandinus* calleth this *Hieracium Militaris Galeni*, and *Laetarius Plinii*, who being demanded what herbe *Matthiolus* his *Erinus* should be, shewed this *Hieracium*, *Hortus Eystetensis*, calleth it *Hieracium fruticosum latifolium polyanthos*, & called also by some *Hieracium Sabaudum latifolium*, as the fourth is called by *Lobel* *Hieracium Sabaudum angustifolium*, and *Hieracium alterum grandius*, for he maketh them to be both one, although the description of their leaves be much differing, it is the third *Hieracium* of *Clusius*, for as he saith himself it hath great affinity unto *Lobel*, if it be not the same, *Dodonaeus* maketh it his first *Hieracium*, *Cervard* maketh it his *Hieracium Intubacium*, and *Bauhinus* calleth it *Hieracium fruticosum angustifolium majus*, as he doth the fifth *Hieracium fruticosum minus*: the last is added to this ranke not having any other of that sort to ranke with it, (for *Bauhinus* his other sorts of *Hieracium murorum*, the one is our *Pilosella major*, called *Auricula muris major* *Tragi*, of some *Chondrilla aurea* and *Palmonaria Galorum*, or *Gallica* which *Lugdunensis* very unfitly calleth *Corchorus Dalechampi*, but is not *Coffea Camerarij*, as *Bauhinus* seemeth to suppose, for *Camerarius* referreth it to the *Hieracium latifolium Pannonicum* of *Clusius*, as I said before in the last Chapter save one, and his other is the *Palmonaria Gallica* *femina* of *Tabernmontanus* if they be severall (being noted to be *Laciniatum*) and not one and is called by *Bauhinus* *Hieracium murorum angustifolium non sinuatum*. I have given you that figure here of *Lobel* which hath narrower leaves to be compared with this of *Bauhinus*.

The

The Vertues

There is none of these Hawkweedes inferiour to any of the former in their qualities as farre as may be judged by their taste for we have no further experience set downe by any, and therefore if yee will so take them yee neede not a repetition of the same things againe that have beene delivered, but I will referre you to the first ranke of Hawkweedes, to peruse the vertues there appropriated to them and transerre them if you please hereunto. And so much shall serve to have spoken of the whole family of the Hawkweedes.

CHAP. XXXVIII.

Sonchus. Sow-thistle.

Dioscorides and the other ancient writers have set downe but two sorts of Sow-thistles, dividing them into rough or prickly and smooth, *Pliny* into blacke and white, *Theophrastus* mentioneth onely the rough kind: but since their time there have beene sundry other herbes found out, which doe so nearely resemble them, that they are therefore referred unto them as shall bee presently shewed: but because there are so many that beare that title I thinke good to avoid confusion to distribute them into sundry Chapters as you shall finde them mentioned.

Sonchus asperus. Prickly Sow-thistles.

Ordo primus. The first ranke.

1. *Sonchus asper major non laciniatus*. The greater prickly Sow-thistle with whole leaves.

This prickly Sow-thistle hath somewhat long and broad leaves of a whitish Greene colour, unevenly dented, but not gashed or torne on the edges, and every dent set with a sharpe and short pricke somewhat hard, and sometimes prickly also along the middle ribbe on the under side, yeelding a more bitter milke in every part where it is broken then the smoother kind: the stalke is somewhat tender and as it were winged with a filme running upon it, rough and sharpe, set with such like leaves as grow below, diversly branched, with small pale yellow flowers at the toppes which turne into downe and are blowne away: the roote is long yellowish and somewhat hard when it is growen up with a stalke with a number of small fibres set thereat.

2. *Sonchus asper minor non laciniatus*. The lesser prickly Sow-thistle with whole leaves.

The lesser Sow-thistle is in all things like the other but lesser in every part, having a rounder stalke seldome above a foote high, somewhat firmer and not so tender, with smaller leaves but as sharpe and prickly as the former, some because this doth more usually grow in the fertile grounds, doe account it to be the cause that the leaves are whole and not rent, which is but an opinion with small reason therefore.

1. *Sonchus asper major non laciniatus*.
The greater prickly Sow-thistle with whole leaves.

4. *Sonchus asper laciniatus Creticus*.
Prickly Sow-thistle of Candy.

3. *Sonchus*

3. *Sonchus asper laciniatus*. Common prickly Sow-thistle.
This common Sow-thistle hath the leaves very much cut or torne on the edges into three or foure parts much separate asunder one from another, and smaller peeces of leaves set betweene them of a whitish Greene colour like the former, and having prickles on the dented edges like wise: the stalke groweth very high sometimes, rough and prickly, with such leaves thereon as are below, branched at the toppe, where grow such like pale yellow flowers turning into downe: the roote is like the other.

4. *Sonchus asper laciniatus Creticus*. Prickly Sow-thistle of Candy.
This Candy Sow-thistle hath the first leaves little or nothing divided on the edges of an handbreadth long and more, but those that rise up with the stalke are very much torne on the edges into great and deepe gashes, set with some prickles like wise; the stalke is rough, straked and hollow, halfe a yard high, branched from the middle upwards, with such like leaves but smaller set at the joynts, at the toppes whereof stand large yellow flowers in rough Greene huskes upon long footstalkes which turne into downe as the other.

5. *Sonchus asper subrotundo folio major*.
The greater round leaved prickly Sow-thistle.
The greater of these two round leaved prickly Sow-thistles riseth up with a round hollow stalke not a foote high, set with many short prickles at the bottom, whereabout grow a few leaves that are somewhat round and an inch and a halfe long, some whereof are waved about the edges, and all of them a little prickly as well on the edges as on the backes, the stalke is branched at the toppe into two or three parts, every one with a small pale yellow flower like unto an Hawkeeweede, which afterwards is turned into downe and into the winde: the roote is small and long with fibres set thereat.

6. *Sonchus asper subrotundo folio minor*.
The lesser round leaved prickly Sow-thistle:
This is a smaller sort by many degrees having small threadlike rootes and two small stalkes about foure or six inches long, bearing onely one small yellow flower at the toppe, the leaves that lie on the ground being six or seven in number are small and round pointed, and dented about the edges.

7. *Sonchus fruticosus petreus Africanus spinosus*.
Thorny shrub Sow-thistle of Africa.
This kinde of Sow-thistle groweth somewhat high, with woody stalkes and branches much spread at the toppe, and every twigge ending in very sharpe prickles or thornes, the lower leaves are much jagged and prickly, the upper smaller and little or nothing jagged, the flowers are small, single, and pale yellow, whose feede succeeding is with the downe as the rest carried away with the winde.

The Place.
These Sow-thistles grow in unmanured as well as in manured soyles, some in Orchards and Gardens where the leaves are usually lesser and lesser divided then in the rough and unmanured grounds: the last as the title declareth among the rockes and stony grounds about Tunis and Sapphi, found by Boel and brought to us.

The Time.
They doe all flower and shed their feede from Midsummer or thereabout all the Sommer long, and sometime untill August be past, but the last hardly endureth a Winter with us.

The Names.
It is called in Greeke Σόνχος ἀσπὲρ τῶν ὄρων, quod salubrem fundat succum: the Latines also call it *Sonchus*, and this kind is called *Asper*, *asperior* or *sylvestris* to put a difference betweene it and the next which is *lavis* or *levior*. The first is called by *Tragus* *Intubus sylvestris seu erraticus acutis folijs*, and by *Cordus* in *historia* *Sonchus asper major*, by *Lobel* *Sonchus tenerior aculeis asperior aut horridiuscula*, by *Dodonaeus* and *Lugdunensis* *Sonchus asperior*, by *Cesalpina* *Sonchus alter in rudibus*, and by *Banbinus* *Sonchus asper non laciniatus*: the second is called by *Cordus* in *historia* *Sonchus asper minor*: the third is the *Sonchus asper* of *Matthiolum*, *Fuchsius*, *Gesner* and others, by *Ericius* *Cordus* *Cicerbita asperior*, by *Anguilara* *Sonchus spinosus* and by *Lugdunensis* *Andryala major*: the fourth *Banbinus* onely mentioneth by the name of *Sonchus asper laciniatus Creticus* as it is in the title: the fifth and the sixth hee likewise to calthe, *Sonchus asper subrotundo folio major & minor*: the last hath his name in his title as it is fittest for it.

The Vertues.
The properties of these rougher or more prickly Sow-thistles are alike with the next, which are the smoother, and therefore because they are more generally used I shall give you the vertues of these under them, and comprehend them both in one to bee the more succinct, and to avoid a tautologie, or needesse repetition of one thing to twise.

CHAP. XXXIX.

Sonchi levis. Smooth Sow-thistles.

Ordo secundus vulgaris. The second ranke.

1. *Sonchus levis.* Common Sow-thistle.

His common Sow-thistle is well knowne to rise up with a round hollow stalke three or foure footē high or more sometimes, if it grow in good grounds and in gardens as usually it doth, set with many long and much torne leaves of a whitish Greene colour, not having that roughnesse or those sharpe prickles on them as are in the former kind, branching forth towards the toppe into divers branches bearing pale yellow flowers which passe away into downe & with the feed into the wind, the roote groweth downe right, and hath many fibres thereat perishing likewise every yeare, and raising it selfe of its owne sowing, and is as plentifull in giving milke as the former, which is somewhat pleasanter and not so bitter.

2. *Sonchus levis alter parvis floribus.* The lesser smooth Sow-thistle.

This lesser Sow-thistle groweth not so high nor hath so many leaves set on the stalke, but are long and more torne on the edges, else not unlike to the former, the many branches of the stalke have fewer and smaller leaves on them, and the flowers are much smaller, yet of the same pale yellow colour in most, which passe away into downe as the rest, &c.

3. *Sonchus levis latifolius flore albo.* Broad leaved Sow-thistle with white flowers.

The leaves of this are like the last but somewhat larger and broader and with fewer divisions on the edges; the flowers hereof are white, which with the forme of the leaves make the difference.

4. *Sonchus levis angustifolius.* Narrow leaved Sow-thistle.

This Sow-thistle hath but few and those very long and narrow leaves whose lower parts are narrowest and have no incisure at all, but from the middle almost forwards they are broader and have divers gashes on both sides, some greater and deeper and others smaller especially towards the ends where they are broadest: the stalkes grow somewhat low and divided but into one or two branches, set sparingly with leaves, the uppermost whereof are long but not divided or very little compassing the stalke, at the foote bearing one large yellowish flower upon a long straked toppe branch, which being ripe flyeth away: the roote giveth milke as the whole plant else beside, and is long and slender with a few fibres.

5. *Sonchus levis valde laciniatus.* Sow-thistle with fine cut leaves.

The leaves of this Sow-thistle that grow lowest are long and divided into many slender jagges, but those that

1. *Sonchus levis vulgaris.*
Common Sow-thistle.

2. *Sonchus levis alter parvis floribus.*
The lesser smooth Sow-thistle.

3. *Sonchus levis latifolius flore albo.*
Broad leaved Sow-thistle with white flowers.

4. *Sonchus levis angustifolius.*
Narrow leaved Sow-thistle.

are set at the joynts of the slender smooth Greene and high stalk where it brancheth, are somewhat greater and not so finely cut in on the edges, at the toppes are yellowish flowers like the others, of a middle size which grow into downe.

6. *Sonchus angustifolius maritimus.* Sea narrow leaved Sow-thistle.

This Sea Sow-thistle from a slender long roote wanting fibres, rise many long darke Greene leaves, some of foure and some of six inches long and scarce one inch broad, a little rough, with small prickles about the edges which give milke as the others doe, and among them one slender stalk about a foote or lesse high, with two or three leaves thereon which compasse it at the bottome, and beare one or seldome two yellow flowers at the top of a reasonable bignesse, which passe away into downe &c.

The Place.

The first, and second sometimes also, grow in Gardens and manured grounds, and sometimes by old walls the pathides of fields, highways, but the third and the fourth in Germany: the first about Montpellier and Florence also, where they eate it familiarly as the common: the last is found in the Island of Lio in the Venetian territory and by Montpellier also.

The Time.

They doe flower quickly after they are sprung, for it is late before they rise out of the ground, and abide untill August.

The Names.

It is called *Sonchus levis* in Latine to distinguish the one from the other as is sayd before: some call it *Cicerbita* as the Italians doe to this day. *Apuleius* calleth it *Lactuca leporina*, and the Germans thereafter, *Hafen Lettuce*, some also *Hafen Koll*, that is, *Brassica leporina*: it may well be accounted as a kind of wilde Lettice it is so like it, others therefore call it *Lactucella* and *Lactucanes* from the French *Laiterons*, *Tragus* calleth the first *Intybus sylvestris sive erratica tertia*, *Lonicerus Endivia sylvestris*, *Lugdunensis Andryala minor Dalechampi*, *Cordus in historia Sonchus levis seu levis*, all other authors *Sonchus levis*, or non aspera, or vulgaris, or laciniatus folijs the second *Matthiolus* calleth *Sonchus levis alter*, and *Lobel* *Sonchus alter profundis lacinijs sinuato hederaceo*, *Clusius* *Sonchus levis vulgaris secundus*, *Tabernmontanus* *Sonchus sylvaticus quartus*; *Anguilara* calleth it *Scariola sylvestris Lactuca species Galeni*, *Gesner in horti Germanie Lactuca sylvestris flore luteo*, which although it doth in the outward face resemble somewhat, yet it is much more bitter, and never eaten as the other sorts of faller herbes; and *Casalpini* *Lactuca murorum*, *Bauhinus* calleth it *Sonchus levis laciniatus muralis parvis floribus*, the third *Tabernmontanus* and *Gerard* have set forth by the same name is in the title, and *Bauhinus* *Sonchus levis minor paucioribus lacinijs*; the fourth *Lobel* setteth forth in his Dutch Herball by the name of *Sonchus levis Matthioli*, *Gesner in Hortis* calleth it *Sonchi genus terracrispa*, and *Casalpini* saith they call it *Terra crepola* in *Neotruis* or *Florence*, *Lugdunensis* setteth it forth for *Crepis Dalechampi*, and *Bauhinus* calleth it *Sonchus levis angustifolius* the fifth and sixth are set forth onely by *Bauhinus* by the names of *Sonchus levis in plurimas & tenuissimas lacinijs*

divifus and *Sonchus angustifolius maritimus*: the Italians doe call it *Soncho lifcio*, and *Cicorbita gentile*; the Spaniards *Serraya* and *Sevalla*; the French *Latlerones*, and *Palais au lieure* from the Latine *Palatium leporis*, and as some have it *Leporum cubile*; the Germans *Gens difell*, *Sow-difal* and *Dudifell*; the Dutch *Ganfen diftel* and *Melke weye*; and we in Engliſh generally Sow-thiſtle, and of ſome Hares-lettice.

The Vertues.

Theſe as well as the former Sow-thiſtles are cooling and ſomewhat binding, and are very fit to coole an hot ſtomacke, and to eaſe the gnawing paines thereof, they are uſually eaten as ſalet herbes in the Winter and Spring, while they are young and tender by thoſe beyond the ſeas familiarly, but the rootes are much more eſteemed by them being very tender and ſweete: the herbe boyled in wine is very helpfull to ſtay the diſſolutions of the ſtomacke, and the milke that is taken from the ſtalke when they are broken given in drinke, is beneficiall to thoſe that are ſhort winded and have a wheeſing withall: *Eraſiſtratus*, ſaith *Pliny*, did therewith cauſe the gravell and ſtone to be voided by urine, and ſaith, that the eating thereof helpeth a ſinking breath: the juyce thereof to the quantitie of three ſpoonfulls taken in white wine warmed, and ſome oyle put thereto, cauſeth women in travell of child to have to eaſe and ſpeedy delivery, that they may be able to walke preſently after: the ſaid juyce taken in warme drinke helpeth the ſtrangurie or piſſing by dropes, and paines in making water: the decoction of the leaves and ſtalke given to Nourſes cauſeth abundance of milke, and their children to be well coloured, and is good for thoſe whoſe milke doe curdle in their breſts: the juyce boyled or throughly heated with a little oyle of bitter Almonds in the pill of a Pomegranate and dropped into the eares, is a ſure remedy for deafeneſſe and ſingings and all other diſeaſes in the eares, it is ſaid that the herbe bruifed and bound upon wartes will quickly take them away: the herbe bruifed or the juyce is profitably applied to all hot inflammations in the eyes, or whereſoever elſe, and for puſtules, wheales, bliſters, or other the like eruptions of heate in the ſkinne, as alſo for the heate and itchings of the *hemorrhoides* or piles and the heate and ſharpenelle of humours hapning in the ſecret parts of man or woman: the diſtilled water of the herbe is not onely effectull for all the diſeaſes aforeſaid, to be taken inwardly with a litle Sugar, which medicine the daintieſt ſtomacke that is will not reſuſe it, or outwardly by applying cloathes or ſponges wetted therein: but is wonderfully good for women to waſh their faces to cleare the ſkinne and to give a luſtre thereunto.

CHAP. XL.

Sonchi Montani. Mountaine Sow-thiſtles.

Tertius Ordo. The third Ranke.

1. *Sonchus Alpinus ceruleus*. Blew flowered mountaine Sow-thiſtle.

His mountaine Sow-thiſtle hath divers broad and long leaves much cut in to the middle ribbe, and dented alſo on the edges, the end peece being the broadest, of a greene colour on the upper ſide, and grayiſh underneath, coſſing the ſtalke at the bottome, which is round, rough, and ſet with hard reddiſh haire about

three foote high branched at the toppe, with leſſer and leſſe divided leaves on them: the flowers ſtand many together in ſmall hairie greene tufts upon purpliſh hairie foote ſtalke, everie one conſiſting of twentie and more ſmall narrow leaves, broad at the ends and nicked in of a purpliſh blew colour like unto Succory, which turne into downe as other ſorts doe, & are blowne away; the maine roote is great, thicke, white and hard, very intricately ſoulded with long ſtrings faſtened ſtrongly in the earth, which periſheth not but abideth many yeares by the ſhew of the dry ſtalke: this giveth milke in as plentifull manner as the others doe and is very bitter. There is another of this ſort, whoſe leaves are more divided into ſmaller parts, yet the end peece is longeſt like the other, and ſo are the flowers but more ſparſely ſet at the toppes ſomewhat leſſer alſo, and of a fairer blew colour.

2. *Sonchus arboreſcens*. The greateſt Sow-thiſtle.

This Sow-thiſtle groweth to the height of any man, with a ſtrong ſtalke of the bigneſſe of a mans thumme, ſmooth ſtraked and without any pricke whereabout are ſet many leaves, parted into foure and ſometimes into five diviſions placed on each ſide one againſt another, and compaſſing it about at the lower end, where they have ſmall peece ſticking forth beyond the ſtalke, the upper leaves have no diviſions nor prickles on the backes but on the edges upon the dents, and are greene on the upper ſide, and grayiſh underneath and full of milke: the ſtalke is parted at the toppe into ſundry branches, bearing at the toppes many flowers ſet together, as it were in an umbell, all of them being ſet to an even height, ſmall in compariſon of the tallneſſe of the plant, elſe not much unlike thoſe of the

1. *Sonchus Alpinus ceruleus*.
Blew flowered Mountaine Sow-thiſtle.

Alia.

1. *Sonchus Alpinus caeruleus alter.*
Another blew flwyred Mountaine Sow-thistle.

3. *Sonchus Dendroides Dalechampij.*
Tall Sow-thistle without branches.

2. *Sonchus arvensis.*
The greatest Sow-thistle.

4. *Sonchus montanus laciniatus minor.*
The lesser Mountaine Sowthistle.

the common Sow-thistle, composed of many yellow leaves cut in at the ends, compassing a middle thrumme which is more yellow, which when they are ripe passe into downe with grayish striped seede therein, both which are carried away with the winde: the roote is great and whitish set with many great fibres, and perisheth not, but yearely encrease.

3. *Sonchus Dendroides Dalechampij*. Tall Sow-thistle without branches.

This other tall Sow-thistle which *Dalechampius* found, and *Lugdunensis* hath set forth, hath a great blackish root with divers strings fastened thereto, from whence rise divers strong, tall, round stalkes, two cubits high or more without any branches at all, but thicke set with broad leaves from the bottome to the toppes on both sides, waved or cut in on the edges, smaller at the bottomes and broader toward the ends which are pointed: from the toppes of the stalkes, and likewise from the joynts with the leaves come forth short foote stalkes, with three or foure small Lettice or Sow-thistle-like flowers on them, which turne into downe, and so into the winde as others doe.

4. *Sonchus Montanus laciniatus minor*. The lesser Mountaine Sow-thistle.

This lesser Mountaine Sow-thistle hath the stalke next the ground for a small space smooth and round, somewhat thicke and woody, which then breaketh out into branches, and riseth to the height of two foote or thereabouts, set about with divers leaves farre in sunder one from another of an inch and a halfe long, and cut in on the sides into severall peeces, and pointed at the ends, the flowers stand at the toppes of the stalkes and branches, many set one above another, as it were in a spike, being small and yellowish, which being ripe is turned into downe, and carried away with the winde as all the rest are, the roote is somewhat blacke

The Place.

All these (but the second which groweth among Willows and Reedes, and yet I have here inserted for the tallnesse thereof) grow upon the hills in *Austria* and other places, and for their raritie are nursed up in Gardens.

The Time.

These in their naturall places flower somewhat late, but transplanted are in flower about *Italy*, and their seede ripeneth as they flower.

The Names.

The first is called by *Camerarius* upon *Matthiolus* *Sonchus caruleus* and *Sonchocichorium*, by *Thalys* *Sonchus* *μακρόπους* *Hieracynica*; the other of this sort is *Clusius* his *Sonchus levior Austriacus ceruleo flore*; the second is the fifth *Sonchus* of *Clusius*, which he calleth *Sonchus levior Austriacus altissimus*; the third is, as I laid, called by *Lugdunensis* *Sonchus Dendroides Dalechampij*; the fourth *Banbinus* setteth forth by the name of *Sonchus montanus levis laciniatus minor*.

The Vertues.

These Sow-thistles are of the like qualitie and operation with the former, and therefore whatsoever hath bene said of the other before may be transferred to these to save a repetition of the same things.

CHAP. XLI.

1. *Sonchus villosus luteus major*.
The greater woolly Sow-thistle.

Sonchi hirsuti sive villosi.

Hairy or woolly Sow-thistles.

Ordo quartus. The fourth ranke.

1. *Sonchus villosus luteus major*.

The greater woolly Sow-thistle.

He greater woolly Sow-thistle hath divers very woolly long rough and somewhat narrow leaves lying on the ground pointed at the ends, and unevenly waved at large distances on the edges, with a white middle ribbe in them, from among which riseth up a woolly comered stalke a cubit high set with such like woolly leaves thereon but lesser and lesser up to the toppe where it breaketh forth into some few branches, with soft woolly heads on them, out of which come gold yellow flowers, like in forme unto the ordinary Sow-thistle, and like it also, is blowne away being ripe: the whole plant yeeldeth milke as the *Succories* doe, and is almost as bitter: the roote is very long, white and slender, with divers small fibres thereat.

2. *Sonchus villosus luteus minor*.

The lesser woolly Sow-thistle.

This lesser sort hath from a small reddish long root almost without fibres, two or three round woolly stalkes halfe a foote high, parted at the toppe into two or three branches, whereon grow very narrow leaves about an inch long, little or nothing divided on the edges, but those that grow lower and at the ground are narrow and about foure inches long, with some rents or divisions upon them set farre a sunder one from another, the flowers are of a deepe gold yellow colour standing in small huskes, covered with a very soft and woolly downe which passe into downe, and are blowne away with the winde.

The place.

Both these plants are found in the woods about *Mompelier* in *France*, and in some other places of *Spain* and *Italy*.

The Time.

They flower in the moneth of *June* and *July*, and the seede ripeneth quickly after, even with the other flowers.

The Names.

The first is called by *Lugdunensis* *Sonchus lanatus* because of the whitenesse, like unto wooll, and some as hee saith did call it also *Mollugo* from the soft woollinesse thereof, but yet is not the *Mollugo* *Pliny*. *Bauhinus* calleth it *Sonchus villosus luteus major* or as he doth the other *Sonchus villosus luteus minor*, and is called also by some *Hieracium tomentosum*, and therefore might be referred to that family, but that I follow my author herein:

The Vertues.

These also are somewhat bitter more like Hawkeweede then Sow-thistles, and therefore may be applyed accordingly, for there is no author hath written any thing more particularly hereof.

CHAP. XLII.

Lampfana. Nipplewort.

L Was almost indifferent whether I should set this plant next after the Hawkeweedes and before the Sow-thistles or after, in regard it commeth so neare unto both of them; but let it take place here now, as partaking more with those than these in my opinion, yet whereas all former writers have made but one sort thereof, *Bauhinus* hath added thereunto another that commeth very neare it, as you shall heare by and by; and I am bold to adde a third, which in my opinion may well be accounted as one of them.

1. *Lampfana vulgaris*. The ordinary Nipplewort.

This herbe *Lampfana* (which I have entituled Nipplewort for the reasons hereafter declared) sendeth forth sundry, hard upright stalkes, whereon grow darke Greene leaves from the bottome to the toppes, but lesse still the higher. in some places whole without any dents on the edges, and in others with a few uneven cuts therein somewhat like a kinde of Hawkeweede: the toppes of the stalkes have some small long branches which beare many small starrelike yellowish flowers on them which turne into small seede: the roote is small and threddy, this yeeldeth a bitter milke as the others doe.

2. *Lampfana Austriaca*. Nipplewort of *Austria*.

This other herbe (which I hold may be accounted as one of this kinde) hath slender smooth and solid stalkes not easie to breake, a cubit high or more, whereon are set without order somewhat long and narrow leaves broadest in the middle and sharpe at the ends, waved a little about the edges and compassing them at the bottome, yeelding a little milke: from the upper joynts with the leaves grow forth small firme branches, yet a little bending bea-

1. *Lampfana vulgaris*.
The ordinary Nipplewort. 2. *Lampfana Austriaca*.
Nipplewort of *Austria*.

ing each of them foure or five long greene huskes and in them small purplish flowers of five leaves a peece ticked in at the broad ends, with some small threds in the middle, which turne into downe and so into the rinde: the roote is small and fibrous lasting many yeares.

3. *Soncho affinis Lampfana syluatica*. Wilde or wood bastard Nipplewort.

This wilde or wood kinde is like into the first sort, but with somewhat broader leaves, and more flore of branches, else in flowers and other parts not so much differing.

The Place.

The first groweth upon the banks of ditchés and the borders of fields almost every where: the other *Clusius* saith hee found in *Hungarie* and in *Saxoniae Marcynia sylua* and other places: the last is found neare woods sides and hedges rowes.

The Time.

They flower in the Sommer, and their seede ripeneth soone after.

The Names.

The first is taken by many to be the *καυκλάν* of *Dioscorides* *καυκλάν* quod lambere significat, quia foliorum mollitie caduca decubitu ue in humum eam lambere uideatur, and thereupon some call it *Lapsana*: but I see no reason of this definition: the Latines keepe the same name of *Lampfana* or as some have it *Lapsana*, but I make some doubt thereof, for although *Dioscorides* giveth no description thereof as being well enough knowne in his time yet hee maketh it to be a salter or potherbe whereon the poorer sort of people did feede, as being the meanest and cheapest of all others (which out of *Pliny lib. 19. c. 8.* may also be gathered, when as *Julius Caesar* Souldiers at *Dirrbachium* complained of the parcimony of their allowance in diet for their service by feeding on *Lampfana*, and sang verses thereof in sport: the same *Pliny* also saith it was of the old Romans called *Napum quasi Napum syluestre*, which was the cause of *Matthiolus*, *Anguilara*, *Gesner*, *Lobel* and *Lugdunensis*, their opinion that tooke for it a kinde of *Rapistrum* or *Charlocke* with pods, as all their figures expresse it, and as shall be shewed more amply in the proper place where I shall entreate of their kinde) but this herbe hath no probabilitie to be the right, being never received by any that we can heare of to be as foode to feede upon: *Gerard* hath foulely faulted in a double manner first in setting forth a false figure to that *Lampfana*, which he usually shewed to all that went in company with him abroad in Simpling, which even this that is here set forth and generally with all Herbarists in these times called *Lampfana* which differeth much from a *Charlock* that hath long pods: and then in giving it the name of *Dock Cresses* as though it were some wilde kind of *Cresses*, when as more truly as *Lobel* in *Adversariis* saith it may be referred to an *Hieracium* or as I say to a *Sonchus*. The first is called *Lampfana* by *Lobel* and *Dodonaeus* in his last Edition (for in his former he tooke it to be *Erysimum*) and *Lugdunensis* who all give one and the same true figure of this herbe as also by *Thalins* and *Camerarius* who saith that in *Prussia* they call it *Papillaris*, because it is good to heale the Vicers of the Nipples of womens breasts, and thereupon I have entituled it *Nipplewort* in English: by *Gesner* in *hortis* it is called *Sonchis cognatum* and in bello de collectione stirpium *Cichorium*: vel *Sonchi* genus. *Gerard* his Figure of *Sonchus syluaticus* doth more truly represent this *Lampfana* then his Figure he giveth for it. The second is called by *Clusius* *Sonchus levior Pannonicus quartus purpureo flore*, but I have entituled it *Lampfana Austriaca*, supposing it may more fitly agree thereunto, then unto a wilde Lettice as *Banhus* doth, who calleth it *Laetuca montana purpureo flore*: *Columna* as I sayd before saith that this of *Clusius* was like his *Sonchus montanus purpureus* but differed in some things and so doe I also, as first in the roote, *Columna* his not being so strinie as this of *Clusius*, and the flowers hereof having five leaves and his but foure, and therefore I rake them to be diuers plants: If I have erred herein I referre me to his censure that can confute mee by prooffe: the last is *Tabermontanus Sonchus syluaticus secundus*, which *Banhus* calleth *Soncho affinis Lampfana syluatica*.

The Vertues.

We have no properties to shew you of this *Lampfana*, more then what *Camerarius* as I sayd before hath given us to understand, which is that they in *Prussia* from the vertues to heale womens breasts, and their nipples when they are sore or exulcerated call it *Papillaris* which may induce us to thinke that it hath an especiall healing qualitie therein, and that it is temperate in heate and drinesse, with some tenuitie of parts able to digest the virulency of those sharpe humors that breake out into those parts.

CHAP. XLIII.

Laetuca Sativa. Manured or Garden Lettice.

Here are two kinds of Lettice, the one of the Garden, the other wilde. Of the Garden kinds I have in my former booke given you the knowledge of so many sorts, that it might seeme there had bene no more to have bene set forth, for I there shewed you eleven severall sorts besides that small Sallet herbe called Lambes Lettice or Corne Sallet, which although it be no kind of Lettice as all know well enough, yet performeth the office of Lettice in a Sallet, whose Figure I here give you, and the ordinary Garden kinde also, but upon further search I have two other sorts to bring to your consideration which shall be declared in this Chapter, and the wilde kinds in the next to close up this Classis.

1. *Laetuca folio oblongo acuto*. Sharpe pointed Garden Lettice.

This Lettice differeth not in stalkes, or flowers, or manner of growing from other sorts of open Lettice that doe not cabbage, but in the leaves onely, which are about foure inches long and two inches broad, dented about the edges and ending in a small point, the middle ribbe being great that runneth through the leafe.

2. *Laetuca Italica laciniatis folijs*. Italian jagged Lettice.

This Italian Lettice also differeth not from the ordinary sort but in the leaves which are cut into many small parts, of a pale greene colour, very tender and pleasant to eate.

The Place.

These sorts come from *Italy* and are there nourished up in the Gardens of the curious, but scarce knowne to us as yet.

Lactuca sativa.
Garden Lettice.1. *Lactuca oblongo folio acuto.*
Sharpe pointed Garden Lettice.

The Time.

Their time of flowering, feeding, and spending is the same with the common sort.

The Names.

Lettice is called *Σπινάρ* *Thridax* in Greeke, and in Latine *Lactuca a latiss copia*. The first is taken by *Bauhinus* to bee the *Lactuca Gallica* of *Castor Durantes* and calleth it himselfe *Lactuca folio oblongo acuto*, the other also is called by him *Lactuca Italica laciniata*, and we in *English* thereafter *Italian* jagged Lettice, the *Arabians* call Lettice *Cras* and *Cherbas*, the *Italians* *Latruga*, the *Spaniards* *Lechuga* and *Alfalfa*, the *French* *Laittue*, the *Germans* *Lattik*, the *Dutch* *Lattoune*, and we in *English* Lettice.

The Vertues.

Although these sorts of Lettice doe differ in forme from the other & each of them also one from another in the forme of their leaves, yet in qualitie they are alike, and acceptable to an hot stomacke troubled with choller. yielding good nourishment to the body, as both *Serapio* and *Galen* testifie of the experience thereof on themselves, and *Pliny* also sheweth that the learned Physician *Musa* did by Lettice ease *Augustus* of the violence of his disease. *Galen* sheweth that the eating of boyled Lettice at night when hee went to bed procured him rest and sleepe, who should have had none if hee had bene without it, having used himselfe to watching from his yonger dayes: the same is found effectually also with divers, or the juice thereof mixed or boyled with oyle of *Roses* and applied to the forehead and temples, both to procure rest and sleepe and to ease the headach of any hot cause: being eaten raw or boyled it helpeth to loosen the belly, and the boyled more then the raw, which eaten last performeth it the better and was generally so used in ancient dayes which made the Poet *Martiall* move this question seeing the contrary course held in his time.

Lactuca agraria.
Lambes Lettice or Corne Sallot.

*Claudere quæ canas Lætifica solebat avorum,
Dic mihi cur nostras inchoat illa dapes.*

Which may be thus,

Lettice that earst our Grandfathers meales did close,
Why it begins, pray tell me whence it growes.

helpeth digestion, quencheth thirst, helpeth to encrease milke in Nourfes, and easeth all griping paines of the stomacke or bowels that come of Choller: it abateth bodily lust, and therefore both it and Rue are commended for Monkes, Nunnes and the like sort of people to eate, and use to keepe them the chaster: it represseth also generous dreames, and applyed outwardly to the Cods with a little Camfire, abateth the pride and heate of lust, which some call the Coltes evill; applyed also in the same manner to the region of the Heart, Liver, or Reynes; by bathing the said place with the juice or distilled water, wherein some white Saunders and red Roses are put so, is not onely a repercussive medicine to slay and repress the heate and inflammations therein, but doth also comfort and strengthen those parts: the same also tempereth the heate of Urine, *Galen* adviseth old men to use with spices to conserve the radicall moisture, and that where spices are wanting to adde Mintes, Rocket, and such like hot Sallet herbes, or else Citron, Lemon, or Orrenge seedes, or the young shootes of them, to abate the cold of the one and the heate of the other. The feede and the distilled water of the Lettice worke the like effects in all things: but the use of the Lettice is chiefly forbidden those that are short winded or have any imperfection in their Lungs or doe use to spit blood; *Galen* saith it did hurt his teeth and some say it hurteth the sight.

CHAP. XLIIII.

Lætifica sylvestris. Wilde Lëtice.

F the wilde Lettice there are two or three sorts to bee declared in this Chapter, wherewith I shall close and finish this Classis of cooling herbes.

1. *Lætifica sylvestris Endivie folijs odore viroso.* Broad leaved wilde Lettice.

This wilde Lettice riseth up with foure or five somewhat long and large leaves, smaller at the bottome and broader at the ends being round pointed, unevenly dented about the edges but not cut in or torne at all, of a pale or whitish Greene colour, and very like unto the Garden Lettice, or Garden Endive leaves so that it will soone deceive one that never saw it before, which doe soe abide the first winter after the sowing, whether in the Spring or Autumne of the shed feede: but in *May* following it beginneth to rise up to a stalk, and then those lower leaves will have the middle ribbe on the backe side set full of small sharpe prickles: the stalk hath risen in my Garden to be eight foore high at the least, and as bigge as the thumbe of any mans hand at the lower joynt, somewhat browne and spreading into divers very long branches, whereon are set large leaves like the other but more crumpled, the lower and so to the middle of the stalk set with prickles in the manner of the bottome leaves, but lesser, and higher, somewhat more jagged or divided on the edges, all and every part yeelding plenty of milke being broken, which smelleth strong, very like unto Opium or bitter in taste: the flowers are very small and single somewhat like unto Lettice, but smaller and paler yellow, scarce opening themselves, and scarce abiding also halfe a day open, but turne into downe with small blacke feede therewith very like unto blacke Lettice feede, and is carryed away with the winde: the roote is white long and woody when it beareth feede and perisheth presently after.

2. *Lætifica sylvestris lacinata.* Wilde Lettice with jagged leaves.

This other wilde Lettice groweth like the last but not so high or great, the first leaves are of a grayer Greene colour, smaller and narrower then the other, which soe abide and afterwards gaine thornes or prickles on their back-sides as the other hath: those that follow are much more jagged then the others, and set with sharpe prickles also, yeelding milke as plentifull being broken and as bitter as the former, but doth smell as strongly of Poppie or Opium as the other: the flowers and feede are like it flying away with the winde, but the roote hereof abideth after feede when as the other doth not.

3. *Lætifica sylvestris purpureo flore.*

Wilde Lettice with purple flowers.

This great plant sometimes in moyst grounds riseth up to be foure or five cubits high but usually two or three with a strong great stalk set on each side with leaves smallest at the bottome, and larger as they rise up higher, being largest about the middle of the stalk, and then grow smaller againe up to the toppe, all of them unevenly waved about the edges, and compassing it at the bottome, of a darke blewish Greene colour on the upper side and grayish underneath yeelding a milke when it is broken: the flowers stand upon small long stalkes issuing from the joynts with the leaves from the middle upwards, with many flowers on them, consisting of foure darke purple coloured leaves with divers threds in the middle, tipped with a yellow dust & a three forked stile in the midst, which standeth in long purplish Greene huskes hanging downe their heads and turne into

1. *Lætifica sylvestris Endivie folijs odore viroso.*
Broad leaved wilde Lettice.

Downe

2. *Lactuca sylvestris laciniata*.
Wilde Lettice with jagged leaves.

3. *Lactuca sylvestris purpurea flore*.
Wild Lettice with purple flowers.

Downe with smooth grayish feede among it flying away with the winde : the root is thicke and set with nodes in divers places not growing downewards, but spreading forwards, and having long fibres shooting from it which perish not.

The Place.

The two first grow in divers places of our owne Land as well as beyond Sea, the first in the borders of fields and by the hedges and lanes sides of Buckinghamshire, the other on a high banke by the footway going downe Grays. Inne-lane unto Bradford bridge and in many other places, the last is found upon hills and mountaines in divers parts of Germany mentioned both by Gesner, Thalus and others, and in Naples also as Columna saith.

The Time.

They doe all flower about *Iuly*, and their feede ripeneth and is blowne away while it is in flower and hath young buds on it.

The Names.

It is called in Greeke *Θαλακκιν* Thridacine, and *Σελδακ* *ἀγρία* by Dioscorides derived as it is thought *από τῆς δειᾶς* *quæ uti folio ficulneo lactis non expertia sunt*, some saith Pliny, lib. 19. cap. 8. called it *Endochion*, in Latine *Lactuca agrestis* and *sylvestris* a *lactis copia*, because it giveth more store of milke then any of the Endives or Succory doe, or because it causeth milke in women. There is a controversie among our moderne writers what plant should be the true *Lactuca sylvestris* of Dioscorides, Theophrastus and Galen, some allowing of one that others disprove, for that which Matthiolum setteth forth, Lobel findeth fault withall, calling it *Seris domestica*. The first is called by Tragus *Endivia major*, as hee calleth the other *Endivia vulgaris*, yet hee calleth the same plants in another place of his booke *Lactuca sylvestris prior* and *altera*, his later sort being the first here, and his *Prima* the other. *Bambinus* in my minde hath erred in missetting Tragus his *Endivia major*, both making it a Garden Lettice, calling it *Lactuca Endivia folio*, and a *Lactuca sylvestris* also, but how can it be both a Garden and a wilde Lettice, the one not having any bitterness therein nor prickles on the leaves, and the other having both. Lobel calleth it *Lactuca sylvestris Scariola hortensis folio lactuce flore Opij odore*, *Longdunensis* setteth it downe in the Chapter of Lettice for *Lactuca sylvestris vera Dalechampi*, and in the 14. Chapter of the same Booke calleth this first *Theison Dalechampi*, whercof Pliny out of Theophrastus maketh mention. *Camerarius* calleth it *Lactuca sylvestris Anglica odore Opij*. The second is called *Lactuca sylvestris* by Matthiolum, Eucherius Dodonæus, Casalpini, Thalus and others, *Brunfelsius* and Tragus as I sayd call it *Endivia vulgaris*, because generally in all Germane Apothecaries shops it was so accounted and used, taken from the *Italians*, whose Physicians not knowing any other permitted the error, Lobel calleth it *Seris domestica altera lactucina* Dioscoridis and *Ericius Cordus Scariola* and *Serriola* according to the received opinion thereof in their time to be Endive. The last is called by Gesner in *Hortis* *Lactuca sylvestris flore purpurea*, and *Sonchus arborescens puniceo flore*, *Thalus* *Lactuca sylvestris flore purpurea* and

and Columna, *Sonchus montanus purpureus integerrimus*, *Tabermontanus* maketh it his third *Sonchus*, and taketh it to be the *Libanotis sterilis* of Theophrastus which Gerard setteth forth under the title of *Erysimum sylvestre*, and Bauhinus calleth it *Lactuca montana purpureo cœrulea major*, because he maketh that to be the minor hereof which I call *Lampfana Austriaca*. The Italians call this wild kind *Lattuga salvatica*, the Spaniards *Lechuga salvaja* and *Alfalfa salvaja*, the French *Laitue sauvage*, the Germans *Wilder Lettick*, the Dutch *wilde Laitouwe*, and wee in English *Wilde Lettice*.

The Vertues.

The wilde Lettice is neare the same propertie of cooling that the Garden kinde is, although the bitterneffe therein maketh it the more opening, but not heating even as it is in Succory, Poppie, Opium & the like, whose bitterneffe doth rather open a way for the qualities to worke the better, no cold qualitie being powerfull of it selfe, and therefore as Succory, Poppie, or Opium it is more availeable to procure sleepe then the Garden kinde, and to ease them that are given to much watching, which by the feede, the juice or the distilled water drunke or outwardly applyed performeth well, the milke of the wilde Lettice gathered and dried in the Sunne and given in Vinegar distilled is sayd to purge the water of the Dropfie, to provoke womens courses, and to helpe the sting or poyson of the Scorpion and Spider *Phalangium*: the distilled water of the whole herbe is singular good to quench the thirst in any burning or pestilentiall fever: the said juice dissolved in white wine and a little hony mixed therewith being dropped into the eyes doth wonderfully strengthen the sight, and cleareth them from mists, clouds filmes or skins growing over them. And as some are of opinion that it may be used in stead of the Garden kinde for any the physcallyl purposes before mentioned.

PLAN.

PLANTÆ CALLIDÆ ET ACRES.

HOT AND SHARPE BITING PLANTS.

CLASSIS SEPTIMA, THE SEVENTH TRIBE.

CHAP. I.

Eruca, Rockēt.

From the cooling herbes I am now come to those that are hot, sharpe, and biting upon the tongue, especially such as are not umbelliferous or more properly belong to another Classis.

There are divers sorts of Rockēt, some growing in gardens) whereof I have set forth one in my former booke, which is the most common with us, and called by *Camerarius* in *horto Eruca tertia Anglica*, as I take it:) some wilde growing in divers differing places, others that grow neare the sea side: to speake of them severally in divers Chapters is the best way, and not to cloy one Chapter with too many sorts.

1. *Eruca sativa alba*. White or *Romane* garden Rocket with white seede.

The *Romane* Rocket is a smaller plant than our garden kinde, having somewhat broad leaves cut in on the edges, but not so much nor so deepe, each part being rounder, and round at the end, nothing so hot also or sharpe in taste: the stalke hath some leaves thereon, lesser, and lesse jagged, and beareth white flowers at the toppes, made of foure somewhat long and round pointed leaves, after which come short pods somewhat long and round with a small peece at the end, wherein is contained whitish round seede: the roote is small & perisheth presently after the seede is ripe. We have an other very like in leaves unto the former, whose stalke riseth three or foure foote high, branched into many parts with the like leaves on them, and large whitish flowers at the toppes of foure leaves apeece, also round pointed, with a blackish line in the middle, of each leafe having slender long pods with small blackish browne seede therein: the roote perishing in like manner.

2. *Eruca latifolia*. Great Garden Rocket.

This large Rocket hath broader and larger divisions at the leaves, and smaller at the ends than our ordinare garden Rockēt, and each part more unevenly dented about the edges, the flowers hereof are more yellow and inclining to a gold colour, and the seede smaller and darker in smaller and longer pods.

3. *Eruca maxima Americana*. Great Rocket of *America*.

This fruitfull herbe riseth up to a mans height, with a number of rough hairy stalkes branching forth on all sides, and set with divers long and pointed leaves unevenly dented about the edges, somewhat like unto those of *Lysimachia* Loose strife, but having a small downy hairnesse upon them tasting somewhat sweete at the first but sharpe afterwards, the flowers are many that stand at the ends of the stalkes and branches, consisting of foure yellow leaves apeece, which turne into slender long pods, containing small seede that are sweetish, and therefore I have rather placed it here for the mildnesse than with the wilde sorts.

The Place.

Both these former kindes of Rockets are nursed up in gardens in all places and countries, their naturall place being not well knowne, yet it is thought that the first is originally from the sea side in some country: the other of that sort came to us from *Boelby* by the name of *Eruca Aragonica*: the last from that part of *America* which the *French* possesse called *Canada*.

The Time.

They doe flower about *June* and *July*, and their seede is ripe in *August*.

The Names.

It is called in Greeke *ῥαβδωδὴ* *obscuritatem in condiendis obscuris*, and *Eruca* in *Latine*, *quod vellicando linguam quasi erodat*: the *Arabians* call it *Iergir* and *Ergir*: the *Italians* *Ruchetta* and *Rucola gentile*: the *Spaniards*: *Oruga* and

Altera s. raine nigrescente.

Eruca sativa alba. Garden Rocket with white seede.

3. *Eruca maxima Americana.* Great Rocket of America.

and, *Aruga* : the French *Rognette* : the Germans *Rauken* and *Rockelen* : the Dutch *Rukette* : and we in English Garden Rocket, *Romane* Rocket, Rocket gentle, and white Mustard seede. The first is called by *Tragus Eruca sine Rucula marina major*, by *Cordus in historia Erucula major*, yet he giveth thereunto long blacke seedes which cannot agree to this, and quoteth *Tragus* to agree with his, which hath yellowish seede : of *Lugdunensis Sinapi hortensis & album*; and *Lobel Sinapi sativum semine albo duplo quam Thlaspi vulgaris majore* : there is no other that I know hath exprest this sort, for *Matthiolus* and others have set forth a garden kinde that beareth yellow flowers, and small browne seede in slender long pods, which *Camerarius* calleth *Eruca Anglica* : we doe usually call this *Eruca flore & semine albo*, to put a difference betweene it and the other; the second is called by *Bauhinus Eruca latifolia*, and mentioned by no other : the last is set forth by *Cornutus* among his *Canada* plants.

The Vertues.

This Rocket gentle so called from the *Italians* who by that title of Gentle, understand any thing that maketh one quicke and ready to jest, to play, or to Venerie as this herbe doth, or that it is more pleasant and gentle in taste, than the wilde kinde; it is seldome eaten alone but among Lettice, Purslaine, or some other cold herbes to temper each others cold and heate: for as it is said by *Galen* it procureth head-ach if it be taken alone: it is in a manner wholly spent as a sawfe or condiment to meate, to quicken the appetite and to please the palate, or to encrease sperme and Venerous effects, for which purposes *Martiall* sheweth the effects in these Verses.

Et Venerem revocans Eruca morantem.

Iamque Eruca salax fecundo provenit horto.

Nec minus Eruca jubeo vitare salaces.

And *Columella* thus,
And *Ovid*

But as for any Physicall qualitie I know not any it is employed upon, for that the wilde Rockets, as you shall heare by and by, are used for all such purposes, except in the want of the one the other may be taken, but as it is more milde and gentle in taste, so it is also in operation.

CHAP. II.

Eruca sylvestris. Wilde Rocket.

OF the wilde Rockets that are more seldome used for sallets or sawfe except unto churlish stomackes, and are most spent in Physicall uses, there are divers sorts, as shall be here declared in this Chapter, and the other three that follow.

1. *Eruca sylvestris vulgarior.* The more common wilde Rocket.

This common wilde Rocket hath longer and narrower leaves much more divided, and into slenderer cuts and jagges on both sides of the middle ribbe, of a sad over-worne greene colour, from among which riseth

seth up divers stiffe stalkes two or three foote high, sometimes set with the like leaves but smaller, and smaller upwards, branched from the middle into divers stiffe stalkes, bearing sundry yellow flowers on them made of foure leaves a peece as the others are, which afterwards yeeld small reddish feede in small long pods, of a more bitter and hot biting taste than the other, as the leaves are also.

2. *Eruca sylvestris minor parvo flore.*

Small ill smelling wilde Rocket.

This small wilde Rocket doth not much differ from the last but in the smellnesse of the leaves, branches, flowers, and pods, for in all it is lesfer, and the leaves, although as much divided, yet into smaller parts, and smelleth nothing well.

3. *Eruca sylvestris minor Bursa pastoris folio.*

Small wilde Rocket of Mompelier.

This is a very small Rocket, the stalke not growing much above an hand breadth high, and somewhat rough withall parted into small and short branches with a few leaves upon them at the joynts, which are little or nothing divided, but those that grow at the foote of the stalke next the ground, are somewhat long and more cut in on the edges into divers parts, much like the leaves of *Shepherd's purie*, and rough likewise; the flowers are somewhat large and yellow standing upon long foote stalkes, after which come small feede in small and short pods.

4. *Eruca sylvestris minor incana.*

Small hoary wilde Rocket.

The hoarie wilde Rocket riseth up with divers hoarie or whitish Greene stalkes halfe a foote high, and sometimes lower, branching forth at the toppes into short sprigges of an inch long, bearing many small yellow flowers which turne into very slender and short pods with feede: the leaves at the bottome are many very small cut and jagged, and hoarie over the whitish Greene, as those upon the stalkes growing on each side one above another are also.

5. *Eruca c. erulea.* Blew flowered Rocket.

6. *Eruca sylvestris angustifolia.* Narrow leaved wilde Rocket.

5. Er

5. *Eruca cerulea*. Blew flowered Rocket.

This kinde of Rocket hath the lowest leaves cut in on both sides somewhat like a Rocket, but more like Groundsell in my mind, from among which rise up divers hairy straked stalkes scarce a foote high, bearing rough hairy leaves on them, lesse jagged, and some not at all, shorter also and narrower: at the toppes stand the flowers one above another of an excellent purplish blew colour made of foure leaves, after which come small long smooth pods with small reddish sharpe feedes therein: the roote is long slender and reddish with some fibres thereat.

6. *Eruca sylvestris angustifolia*. Narrow leaved wilde Rocket.

This plant is doubtfull whereunto it might be referred, in that it participateth of divers plants, namely of the leaves of Tarragon long and narrow of the colour of Rocket; the yellow flowers of wilde Rocket upon stalkes a cubite high with cods of Mustard or Cresses and hot sharpe feede, and the whole face of *Erysimum* Bancke Cresses, yet the taste of Rocket.

The Place.

Many of these are found wilde in divers places of our Land, although they are recorded by divers Authors to grow in others, yet some of them are strangers to us, and therefore imparted to furnish the gardens of the curious.

The Time.

They keepe the same time to flower and feede that the others doe.

The Names.

The first is called *Eruca sylvestris* by *Matthiolus*, *Lobel*, *Dodonaeus* and others: the second is called by *Gesner* in collectione stirpium *Eruca sylvestris fatida*, by *Tabernaemontanus* *Eruca palustris minor*, by *Lucdunensis* *Eruca sylvestris*, and *Erysimum verum*, and by *Gerard* *Sinapi palustre*; the third and fourth *Bauhinus* hath set forth by the same names are in the titles: the fifth *Bauhinus* hath set forth in his *Matthiolus* and *Phytopynia* by the name of *Eruca palustris cerulea*, and in his *Pinax* by the name of *Eruca cerulea in arenosis crescens*: the last is the *Eruca sylvestris angustifolia* of *Lobel* which *Bauhinus* calleth *Eruca angustifolia Austriaca*.

The Vertues.

The wilde Rockets are hotter and dryer than those of the garden, more strong and effectuell also to encrease sperme and Venerous qualities whereunto the feede is no lesse effectuell than the herbe; it serveth also to helpe digestion, and to provoke urine exceedingly: the feede is used to cure the bitings of Serpents, the Scorpion, and the Shrew-mouse, and other poysons, and expelleth wormes and other noysome creatures that engender in the body. *Pliny* writeth (but that it is too superstitious to relate) that if one gather three leaves of Rocket with their left hand, and bruise them, and drinke them in mede or honied water, it shall cure the jaundise, and that he that should suffer whipping or beating, by drinking hereof in wine, shall not have any sence thereof or feele any paine, but I wish that *Pliny* had bene a true relator hereof by his owne experience first, that others might have beleevd him the better: the herbe boyled or stewed, and some Sugar put thereto helpeth the cough in children being taken often: the feede also taken in drinke taketh away the evill smell of the arme-holes or pits, and of the rest of the body, and encreaseth milke in Nurles breasts, and waleth the spleene: the feede of wilde Rocket mixed with hony and used on the face cleneth the skinne from spots, morpew, and other discolourings therein, and used with Vinegar taketh away freckles and other rednesse hapning in the face or other parts, and used with the gall of an Oxe it amendeth foule scarres, blacke and blew spots, and the markes of the small poxe restoring the skinne to its owne colour againe. As both these Rockets, and the former are forbidden to be used alone, in regard their sharpnesse doth fume into the head, there causing each and paine, so they are no lesse hurtfull to hot and cholericke persons, and to be forbidden them for feare of inflaming their bloud, and therefore for such we may say a little doth but a little harme.

CHAP. III.

Barbarea. Winter Cresses, or rather Winter Rocket.

Unto the Rocket (and not unto the Cresses as the name hereof commonly giveth doth import) by the judgement of the best Herbarists in these dayes pertaineth this *Barbarea*, whereof there are two sorts more, although untill very lately one onely was knowne.

1. *Barbarea simpliciflora*. Common Winter Rocket or Cresses.

The Winter Cresses or Rocket whether he will, hath divers somewhat large sad greene leaves lying upon the ground torne or cut into divers parts somewhat like unto Rocket or Turnep leaves & nothing like, Cresses with smaller peeces next the botome, and broad at the ends which so abide all the Winte (if it spring up in Autumne when it is used to be eaten either greene or stewed) from among which riseth up divers small round stalkes full of branches, bearing many small yellow flowers of foure leaves apiece, after which come small long pods with reddish feede in them: the roote is somewhat stringie, and perisheth ever after the feede is ripe.

2. *Barbarea flore pleno*. Double flowered Winter Cresses.

The double flowered Winter Cresses differeth not from the former but in the greatnesse of the stalkes which are bigger and crested, yet shorter in the leaves being an inch long cut in on the edges in the same manner, and in the flowers which are double and somewhat larger but yellow as the single, and in the roote which perisheth not but abideth many yeares.

3. *Barbarea minor*. Small Winter Cresses.

This smaller sort hath blackish greene leaves somewhat jagged or torne on the sides resembling Moth-Mullein, the flowers are yellow and lesse than the former, and so are the cods like wise: the roote hereof perisheth like the first.

The Place.

The first groweth oftentimes of its owne accord in gardens and in the fields also by the pathes and wayes side

in divers places, and by name in the next Pasture to the Conduit head behind *Gages Inne* that bringeth water to Mr. *Lambes* Conduit in *Holborne*: that with double flowers was found in the province of *Berne* among the *Switzers*, and the last in Gardens onely both with us and in *Germany*.

The Time.

They doe all flower in *May* and the single ones doe seede in *June* and then perish, but the double abideth greene both Sommer and Winter.

The Names.

It hath no Greeke name that I know except it should be the *Pseudobunium* of *Dioscorides* which *Lobel* thinketh should rather be *Pseudobunias*, for having shewed the difference betweene *Bunium* and *Bunias*, the one that is *Bunium* to bee *Bulbocastanum*, Earth Nuts, or Earth Chestnuts, and *Bunias* the *Nawew*: this herbe in the forme of the leaves flowers and seede is like unto the *Turnip* or the *Nawew*, which is called *Bunias Bunias* or the wilde kinde of eyther: the Latines call it *Barbarea*, *Sancti Barbara herba*, *Nasturtium Barbaricum*, and of some *Nasturtium hybernium* from whence came our *English* name of *Winter Cresses*, but as I said being nearer both in forme and qualitie unto a *Rocket* then unto *Cresses*, the most judicious have hereunto referred it. *Gesner* in *horis* calleth it *Nasturtium palustre*, and *Lugdunensis* *Eruca palustris*, *Camerarius* *Bunium adulterinum*, *Dodonaeus* *Pseudobunias*, *Anguilara* *Scoparegia*, and *Fuchsius* *Sideritis latissima*, *Tragus* maketh it his *Sinapi* 5. genus, and *Bauhinus* calleth it *Eruca lutea latifolia* five *Barbarea*: the second *Bauhinus* onely hath writen of and calleth it *Eruca lutea* five *Barbarea flore pleno*: the last *Lobel* calleth *Barbarea minor* *Herba Sancti Alberti Bononiensis*, and so doth *Cassalpianus* also. *Bauhinus* putteth it among his sorts of *Erysimum* and calleth it *Erysimum foliis levis laciniata floribus luteis*. The *Italians* and *Spaniards* are scarce acquainted herewith being more peculiar to these colder climates, The *French*, high and low *Dutch* and we doe follow the Latine names, some of *Saint Barbary* and some of *Winter Cresses*, or as I sayd before more properly to be called *Winter Rocket*.

The Vertues.

This is somewhat sharpe in taste and withall somewhat binding, whereby it may easily be knowne to bee hot and dry, and is profitable to provoke urine, and helpeth the strangury and to expell gravell and the stone: it is also of good effect in the *Scorbute* or *Scurvey*, and may be used for it to very good purpose: it is also found by good experience to be a singular good wound herbe both to cleanse inward wounds, the juice or decoction of the herbe to be drunke, or outwardly applied to wash fowle ulcers and sores, cleansing them by the sharpenesse and abating the dead flesh growing therein, or hindering it from growing therein, and healing them by the drying qualitie: It is used as *Rocket* or *Cresses* eaten in Winter when varietie of *Sallets* are not to be had with as great desire and content as any other for that time.

CHAP. IIII.

Eruca marina. Sea Rocket.

F the Sea Rockets there are three or foure sorts, with notable differences as you may perceive in the succeeding Chapter.

1. *Eruca marina Anglica.* English Sea Rocket.

The *English* Sea Rocket (for so I call it for distinctions sake, and that this sort and none of the other groweth on our coasts, although it grow in other countries also) hath divers stalkes, some trayling upon the ground others standing more upright (but brought into Gardens it somewhat varieth the face both in stalkes and leaves) scatteringly set with small long leaves thereon waved as it were on the edges like *Ground-fell* or *Rocket* (but longer and lesser in the Garden) at the toppes of the stalkes grow the flowers, of a pale purplish colour of the fashion of the flowers of *Raddish* composed of foure leaves, after which come seede fashioned like a wheate Corne (such also it beareth in the Garden) but greater, which are somewhat spongie and not solid, not two joyned together as it is set downe to have by the Sea side, but every seede single by it selfe.

2. *Eruca maritima Cretica.* Candy Sea Rocket.

The Sea Rocket of *Candy* hath divers short and narrow rough greene leaves next the roote, cut and divided on the edges into small parts: the stalkes are straked and crooked about halfe a foote long bearing flowers at the toppes (which *Bauhinus* who giveth us the knowledge thereof hath not set downe) but if it be the same that *Lugdunensis* setteth forth by the name of *Eruca maritima*, which as he saith *Alyconus* sent out of *Spaine* as I am verily perswaded it is, it hath purplish flowers, and three square pods with seede, and after them divers rough crooked and joyned pods three or foure inches long, containing small reddish seede: the plant is hoary all over both stalkes and leaves.

3. *Eruca*

1. *Barbarea simplex.*
Common winter Rocket or Cresses.

1. *Eruca marina Anglica.*
English Sea Rocket. 3. *Eruca Monspeliaca siliqua quadrangula.*
Square coddled Rocket. 3. *Eruca Monspeliaca siliqua quadrangula.*
Square coddled Rocket.

This square coddled Rocket hath the lower leaves small, long and narrow, hairy, rough and waved or cut in on the edges like Groundsell or Rocket, from whence rise two or three stalkes that are round, rough and reddish at the bottome set with some lesser leaves, lesse divided then those below, and when it is full of flowers almost not at all: the stalkes are branched at the toppes bearing many small yellow flowers of foure leaves a peece after which succcede small square smooth pods, hard when they are ripe, with a rough sharpe point at the end, and open into two parts, with one brownish seede lying in each part or side, and is turned like a snaille pointed at the ends, and sharpe in taste upon the tongue: the roote is somewhat thicke and white, with some fibres fastned thereto.

4. *Eruca maritima Italica.* Italian Sea Rocket.

The Italian Sea Rocket hath some long and narrow leaves growing next to the roote, very much and finely cut into divers small parts, having the stalke branched diversly, and set with the like leaves but lesser and lesse divided still up to the toppes, where the flowers being purplish consisting of foure leaves, stand one above another in small huskes, with two points a peece wherein when the flowers are faded and gone stand small pointed heads fashioned like a Speares point wherein is contained a white kei nell: the roote creepeth under ground with some strings but perissheth after it hath borne seede.

The Place.

The first groweth on our owne Sea coasts in many places both of Kent and Sussex especially, yet it is not proper onely to our coasts but is found in the like places in divers Countries: the second was sent by Honorius Bellus from Candy unto Bauhinus as hee saith the dried plant with seede thereto but no flowers, and therefore I could not expresse them but as I sayd in the description it is very probable to be the same that *Lugdunensis* saith *Myconus* sent from Catalonia in Spaine where it grew, to Lyons:

the third groweth about *Mompelier* : and the last about the Sea coasts of *Italy*, both *Venice* and other places.

The Time.

They doe all flower and feede in the Sommer moneths, for they are all but annuall plants and are to be sowne in Gardens in the spring of the yeare.

The Names.

The first is called by *Lobel* *Eruca marina* *Kakile* *Serapionis*, and so it is also by *Anguilara*, *Camerarius*, *Columna* and *Lugdunensis*; the second is called by *Bauhinus* *Eruca maritima cretica siliqua articulata*, and is likely as I said to bee the same of *Myconus*, which *Lugdunensis* calleth *Eruca maritima* having three square cods of feede which is a manifest difference from the former : the third is called also by *Bauhinus* *Eruca Mompeliaca siliqua quadrangula echinata* which *Lugdunensis* calleth *Sinapi echinatum* : the fourth is called by *Bauhinus* *Eruca maritima Italica haste cuspidi simile*, and withall maketh the *Kakile* *Serapionis*, the *Eruca maritima* of *Lugdunensis*, and his *Nasturtium maritimum* to be all one with it, for which I can see no reason, in that having given the figure thereof in his *Predromus*, every one may plainly see it to differ very much in the forme of the leaves from the other, it may well be his *Nasturtium maritimum* for thereunto it answereth very well as also unto his *Eruca cinerea* in some part that is in the leaves.

The Vertues.

The Sea Rocket is in the same degree of heate and drynesse with the wilde kinds but saltish and are effectuall for the same diseases : moreover *Anguilara* saith that *Kakile* (which I call the *English* Sea Rocket) purgeth exceedingly, and *Myconus* affirmeth that his *Eruca Maritima* doth wonderfully helpe those that are troubled with the Collick, and those that are grieved with the stone or gravell in the Kidnies or Bladder, if they drinke the quantitie of foure ounces of the distilled water warme at a time.

CHAP. V.

Reseda. Base wilde Rocket.

Resides the two sorts of this kind of Rocket the greater and the lesser set forth by sundry Authors wee have some others which for their neare affinitye and likenesse are fit to be joyned and entreated of together.

1. *Reseda major*. The greater base wilde Rocket.

This greater kind riseth up with divers crested bending stalkes about two foot high, set with many and much divided leaves thereon somewhat like unto the lowest leaves of Rocket, of a piercing sharpe sere and taste like unto Cresses and many such like leaves also bushing together at the foot of them : at the toppes of the stalkes grow yellow flowers in long spikes thicke bushing together, which opening by degrees at the bottome, spread themselves farther in sunder, and afterwards upon the said short footstalkes come small skinnie cornered swollen cods turning downwards, wherein are contained very small feedes : the roote is long and woody with divers fibres thereat, and abideth many yeares.

2. *Reseda minor seu vulgaris*.

Common base wilde Rocket.

This other *Reseda* groweth more upright and not so high, with whiter Greene leaves, deeply cut in or torne on the edges, but each division is broader then the former, the flowers are small and yellow growing on such spikes but shorter.

3. *Reseda Linariae folijs*. Narrow leaved base wild Rocket.

The stalk of this *Reseda* is straight and round, about a cubit high, parted into sundry branches, compassed about with long and narrow Greene leaves like those of *Linaria* or Tode Flax : the flowers grow at the toppes of the branches spike fashion, of a yellow colour, after which come cornered feede vessels double forked at the toppes, full stord with pale coloured feedes.

4. *Reseda alba minor*. Small white base wilde Rocket.

This small *Reseda* shooteth forth divers whitish Greene stalkes not fully a foote high, bearing divers long and narrow hoary leaves lesser then those grow neare the ground, or at the foote of the stalk, which are somewhat broader but not lesse hoary : the flowers are white growing on the like spikes many clustering together, with small Greene heads in the middle of every one, wherein afterwards there is small blackish feede contained : the roote is small long and white with fibres adjoining unto it.

5. *Reseda affinis Phytumma Mompeliensium dicta*.

Loves plant of *Mompelier*.

The lowest leaves of this small plant are small long and somewhat narrow, of a whitish Greene colour, and very like to those of Lambs Lettice, the others that grow afterwards and upon the stalks which are weake and tender, about halfe a

foote

2. *Reseda minor seu vulgaris.*
Common base wilde Rocket.

5. *Reseda affinis Phyteuma Montpelienfium.*
Loves plant of Montpellier.

foote high and doe almost lie on the ground are cut in, some on the sides a little, and others more divided at the ends resembling a small *Valerian* leafe: the flowers grow towards the toppes of the stalkes one above another, but not in any spike with a small leafe at the bottome of every one, and are composed of divers white narrow leaves like threads, with many small threads also in the middle set in Greene full huskes, the heads of feede are cornered, broad above and smaller below, wherein is contained whitish feede with a shew of a hole or dent in every one of them: the roote is white and somewhat long, divided into sundry small stringes which die every yeare, and raising it selfe againe from the shed feede.

The Place.

The two first are commonly growing in our owne Land in divers waste grounds, both neare *London* and further off: the others grow on the *Pyrenean* hills and about *Montpelier*.

The Time.

They doe all flower about *June*, and some of them all the Sommer long.

The Names.

Reseda in *Latine* a sedendis doloribus collectiones & inflammationes discutere nomen traxit: for it hath no *Greece* name that I know: yet is thought by most to be that *Reseda* of *Pliny* which he saith grew about *Aviminum*, for as *Camerarius* in *horto* saith, both the two former sorts grow there now frequently: the first is called by *Lobel* *Reseda maxima*, and *Reseda major* by *Thalium* and *Tabermontanus*, *Reseda lutea* by *Lugdunensis*, by *Camerarius* *Reseda retia*, by *Gesner* in *hortis* *Reseda que Sesamoides majus Ghino*, *Sesamoides magnum*, by *Lacuna*, and *Sesamoides alterum* by *Cesalpinus*, and *Pycnocomon* by *Anguilara*: the second is called by *Lobel* *Reseda Plinii Neotericorum Eruca peregrina Italica* and *Cantabrica*, by *Camerarius* *Reseda supina*, by *Tabermontanus* *Reseda latifolia*, by *Cesalpinus* *Sesamoides primum*, and by *Columna* *Eruca vulgaris*: the third is described by *Bauhinus* by the name of *Reseda linariae folijs*, and by him thought to agree with the *Reseda candida* of *Lugdunensis*, and with the *Sesamoides Salmanticum alterum* of *Clusius*: the fourth is called by *Bauhinus* *Reseda alba minor*; and by him said to be *Clusius* in his *Sesamoides parvum Salmanticum*, and so doe *Lobel*, *Tabermontanus* and *Lugdunensis*; but as I noted before in the 77. Chapter of the *Classis of Vulnerary herbes* which is of the *Lychnides viscosa*: *Bauhinus* hath much forgotten himselfe in setting downe these small *Sesamoides* of *Clusius* making them there to be *Lychnides*, and here to be *Reseda*, and therefore I have referred them to these, to whom in my judgement they better agree: the last is called by *Lobel* *Phyteuma Montpelienfium*, and *Narbonenfium* by *Lugdunensis*, *Sesamoides parvum* by *Lacuna*, and *Sesamoides tertium*, by *Cesalpinus*, and as *Bauhinus* saith *Eruca Apula Columna*, but the description thereof in *Columna* doth not fitly agree thereto in my opinion. *Gerard* calleth the two first sorts (for he knew none of the rest) in *English*, *Italian*, *Rocket* and *Crambling Rocket*, but I thinke it better to call them base wilde *Rockets*, in that being referred to the *Rockets* they are base and wilde herbes but clammer not.

The Vertues.

None of our later authours have mentioned any knowne properties, these plants are endued withall more than what may be gathered from the definition of the name which is to ease paines, and to discusse swellings and inflammations for *Pliny* his old wives spell or charme wee daine it not worthy the reciting, but the taste thereof coming somewhat neare *Rocket* may induce some such like properties.

1. *Nasturtium hortenfe latifolium Hispanicum.*
Great Spanish Cresses.

2. *Nasturtium hortenfe crispum latifolium & angustifolium.*
Curd'd Cresses with broader and narrower leaves.

tooth-ach : the leaves bruised and applied take away all spots and markes of the body, helpeth the itch, and easeth the paines of the *Sciatica*, and of the loynes, draweth forth bones, splinters and thornes, stayeth the corroding and creeping ulcers : the seede chewed in the mouth helpeth the palsie in the tongue provoketh sneezing, raiseth lethargicke persons and such as are drouisie and heave by quickning. their bloud and spirits : being boyled with vinegar and applied to the kernells of the throate healeth the Kings evill, and healeth also the scabbes and fores of the head if they be anointed with it and Goote grease mixed together : it ripeneth also plague fores, and breaketh them, and taketh away the deformities of the nayles.

CHAP. VII.

Nasturtium pratense five *Cardamines*. Ladies smockes or Cuckow flowers.

Noto the kindes of Cresses must of necessitie these herbes appertaine called Ladies Smockes, or Cuckow flowers, both for the nearenesse in name in forme and qualitie whereof there are some varieties as shall be shewed here, yet that sort which beareth double flowers, I have set forth in my former booke, which shall not be further entreated of here more than the figure, nor those of the water, which are reserved for another place.

1. *Nasturtium pratense majus* five *Cardamine latifolia*. Great Ladies Smockes.

The great *Cardamine* or Lady Smocks shooteth forth divers long stalks of winged leaves, that is many together, somewhat broad and round tender darke greene leaves set one against another upon a middle ribbe, the greatest being at the ends, among which rise up divers tender weake round greene stalkes somewhat straked, with much smaller and longer leaves thereon, very like the smallest divided leaves of Garden Cresses, at the toppes whereof stand divers flowers made of foure leaves apeece, somewhat large, and almost like a Stocke-gilliflower, but rounder and not so long neither, whitish or somewhat dastie over with blush, and many times but at the edges onely, each of them standing in a greene huske, after which come small powches containing reddish seede somewhat sharpe and biting in taste as the herbe it selfe is also, comming neare to Cresses : the roote is composed of many white threads or fibres.

2. *Cardamine altera minor*. Small Ladies Smockes.

This is in all things like the former but smaller in every part not bushing with so many leaves or stalkes, the poddies of seede being somewhat longer, than in the former.

3. *Cardamine altera parvo flore*. Small flowered Ladies Smockes.

The leaves of this *Cardamine* are most usually smaller and longer, and yet round sometimes also, growing in the

Cardamine flore pleno.
Double flowered Ladies Smocks,

2. *Cardamine altera minor.*
Small Ladies Smocks,

the same manner that the others doe: the flowers also are like them but smaller, and the pods of seeds somewhat longer.

4. *Cardamine odorata graviflora*, Tuberous rooted sweete Ladies Smocks.

The greatest difference in this from the second sort here expressed consisteth first in the rootes, which among the small fibres have many small kernelly rootes growing, and then the flowers, which although they bee white or bluish like them in colour and forme, yet smell sweeter then they all together or any of the rest.

5. *Cardamine minor laciniatis folijs*, Small jagged Ladies Smocks.

The chiefeft difference in this from the third sort resteth in the leaves which are more jagged then any of the former comming somewhat neare unto the forme of the lower leaves of the Garden Cresses the flowers are white and small like that sort.

The Place.

The three first are found in divers places of our Land in moist Medowes, and neare unto brookes sides or the small Rilles of water that passe through the low grounds, the others are of Germany.

The Time.

They flower somewhat early in the Spring about April or May at the farthest, and abide with the lower leaves all the Winter.

The Names.

They are called by divers writers *Cardamine* as deduced from *Cardamon Cresses* (as *Helleborine* from *Helleborus*) because they are like thereunto, some also call it *Sium alterum* and *Nasturtium aquaticum*, but there are other herbes more properly so called, and therefore others call them *Nasturtium pratense*, as *Tragus* and *Gesner*, *Fuchs* calleth it *Nasturtium agreste*, and *Lonicerus sylvestre*, *Cordus* upon *Dioscorides* *Lepidium minus*, *Bruselsius* and *Dozonius* *Flos cuculi*: from the Germans *Ganch blumen*, whereby they so call them, *Matthiolus* *Sylvestrium aquaticum alterum*, and so doth *Tabermontanus*: *Lacuna* and *Lugdunensis* call them *Sylvestrium Cardamine*, *Fuchs* *Hiberis*, and *Thalys Iberis*, and *Agriocardamum* sive *Cardamantica Nasturtij folio*, *Clusius* *Cardamine altera* and so doth *Lobel*, *Besler* in *Horto Eysletensi* calleth it *Nasturtium aquaticum simpliciflore*, and *Barbinius Nasturtium pratense magno flore*: Of the third and of the last *Barbinius* onely doth make mention, and of the fourth we have another *Flos cuculi*, Cuckowflower differing from this, accounted among the Campions as I have declared in my former Booke) the Dutch *Winter Kerffe* and *Cockgeeks bloemen*, and we in English Cuckow flowers and Ladies Smocks.

The Vertues.

These herbes are seldome used eyther as sawce, or sallet, or in Physick, but more for pleasure and to decke up the Garlands of the country people, yet divers have reported them to be as effectuall in the Scorbute or Scurvey, as the Water Cresses, and may serve in stead of them where they are wanting and not to be had.

CHAP. VIII.

Nasturtia Montana five *Cardamine Alpina*. Mountaine Ladies Smocks.

Here is another kinde of Cresses to be entreated of which grow upon mountaines, hills, and dryer grounds which shall follow here, yet one of them I have declared in my former book called *Cardamine Alpina trifolia*, which shall not be described here againe although I will give you the Figure thereof.

1. *Cardamine tenuifolia montana*. Thin leaved mountaine Ladies Smocks.

This mountaine *Cardamine* or Ladies Smocks hath divers long winged stalkes of smaller and narrower leaves then in the former, a little dented about the edges, from whence spring up sundry stalkes with smaller leaves on them to the toppes, where stand many small yellow flowers in clusters, and afterwards small long pods with small yellowish feede in them, which opening themselves fall out: the roote is small and fibrous creeping upon the ground.

2. *Cardamine Alpina minor Reseda folijs*. Small mountaine Ladies Smocks.

This small *Cardamine* sendeth forth from a small long white roote divers weake and leaning stalkes, some a little branched and others not at all, set in many places with long stalkes of leaves divided into three foure or five parts or round leaves, somewhat like unto those of *Reseda*, the base wild Rocket, the flowers that stand at the toppes are small and white, and afterwards give long and slender round pods an inch and a halfe long.

3. *Cardamine Alpina media Clusii*. Clusius middle sized Ladies Smocks.

The leaves of this mountaine kind lye in a round compasse upon the ground, very formally being two inches long, made of divers small leaves like unto the other Ladies Smocks, but of a middle size and more rough and hairy then the other, of a grayish colour on the upper side and Greene underneath, the stalke riseth to bee halfe a foote or more high, bearing many white flowers like the others at the toppes, where afterwards stand long pods with feede in them; the roote is white and fibrous.

4. *Cardamine Alpina minima*. The smallest mountaine Ladies Smocks.

This is a very small and tender plant whose stalkes are not much above an inch long, bearing umbells or tufts of small white flowers on them of foure leaves a peece, the Greene leaves are very small, five or seven, set upon a small foote stalk on both sides of a middle ribbe as in the rest, very sharpe in taste.

5. *Cardamine Alpina insepida*. Unflavory Ladies Smocks.

This hath small long leaves rough and hairy and jagged like the field Mustard, but without any sharpenesse or taste at all in them: the stalke is small and hairy bearing small white flowers, and afterwards small cornered and prickly huskes with very small feede therein: the roote is small and long with few fibres thereat.

6. *Plantula Cardamines alterius amula Clusii*. The Ladies Smocke-like plant.

This small plant hath six or seven small leaves lying upon the ground, not much unlike the leaves of the small wilde Daïse, but much more tender, having a little sharpenesse in them: from the middle whereof riseth up a small tender stalke an hand breadth high or little more, with very few and they smaller leaves and small

Cardamine Alpina trifolia.
Mountaine three leaved Ladies Smocks.

2. *Cardamine Alpina minor Reseda folijs*.
Small mountaine Ladies Smocks.

white

6. *Plantula Cardamine alpeyria amula Clusii.*
The Ladies Smocks-like plant.

7. *Nasturtium petraeum.* Rocks Cresses.

white flowers at the toppes, after which cometh pods which are somewhat larger and greater then the smallness of the plant might seeme to give, with small reddish feede therein somewhat sharpe in taste: the roote creepeth under ground shooting forth in sundry places.

7. *Nasturtium petraeum bursae pastoris folio.* Rocks Cresses.

In the leaves of this Cresse consisteth the greatest difference from the others which is small and jagged or cut in on the edges like the leaves of Shepherds purse, for the flowers are small and white, and the feede vessels small and flat like to *Thlaspi* or Treakle Mustard.

8. *Nasturtium pumilum vernalum.* Small Cresses of the Spring.

The first leaves of this small plant are somewhat round, two or three being set one against another about a middle ribbe as the others are, but those that follow are somewhat longer and more in number: the stalk is scarce an handbreadth long, bearing such small white flowers that they are scarce discerned, after which come very small short and round pods with very small yellowish feede, the roote is small and fibrous: the whole plant is sharpe in taste.

9. *Nasturtium Alpinum capsula Nasturtij hortensis.* Mountaine Cresses.

This mountaine Cresses hath small and narrow thicke leaves smaller then the nayle of ones hand, and stalkes not above two inches high, with such small white flowers on them, and somewhat large powches like to those of Garden Cresses: the roote is somewhat woody and fibrous.

10. *Nasturtium Alpinum Bellidis folio majus.* Daisie leaved mountaine Cresses.

The stalk hereof is smooth and round about a cubit high, branched from the very bottome, the leaves are very thin but of foure inches long, somewhat like to Daisie leaves, those on the stalkes are somewhat waved about the edges and without footstalkes compassing the branches at the bottomes, the flowers are white and stand on a long spike one above another of six inches long, after whom succede long and slender pods three inches long, containing within them flat round reddish feede.

11. *Nasturtium folijs Barbareae.* Winter Rocket-like Cresses.

The stalkes of this Cresse are very small, tender and bowing downwards somewhat hairy and divided into some branches of an handbreadth long, some twice that length, and some a cubit high, having many very small and slender Greene leaves lying at the bottome of them, divided after the manner of the Winter Cresses or Winter Rocket as I called it before, but with fewer divisions, those on the stalkes are fewer, smaller and lesse divided; the flowers are very small and white, and the pods very slender and long: the roote is small white and threddy.

The Place.

Most of these plants grow upon the Alpes and other hills and mountaines in Germany, yet some of them in Naples as *Columna* hath made mention.

The Time.

Some of them flower earlier in the Sping then others, and some later.

The Names.

Columna of Naples calleth the first *Sium alterum aquaticum luteum* seu *Cardamine tenuifolium montanum*, and *Bauhinus* *Nasturtium montanum luteum*: the second is called by *Bauhinus* *Nasturtium Alpinum minus Resedifolium*: the third *Clasius* calleth *Cardamine Alpina media*, and *Bauhinus* *Nasturtium Alpinum minus folijs in orbem sparsis*: the fourth is called by *Clasius* *Cardamine Alpina minima*, by *Gesner* in *Epistolis* as *Clasius* mentioneth it *Nasturtium* and *Lagdenensis* *Thlaspi montanum minimum*, by *Columna* *Cardamine pusilla saxatilis montana discoides*, and by *Bauhinus* *Nasturtium Alpinum tenuissime divisum*: the fifth is called by *Columna* *Cardamine Alpina insipida*, and

and by Bauhinus *Nasturtium Alpinum inspidum*: the sixth is called by Clusius *Plantula Cardamines alterius emula* & *Sinapi pumilum Alpinum*; and by Bauhinus *Nasturtium Bellidis folio minus*; the seventh is called by Tabermontanus and Gerard *Nasturtium petreum*, and by Bauhinus *Nasturtium petreum folijs burse pastoris*: the eighth is called by Bauhinus *Nasturtium pumilum vernum*: the ninth is called by Bauhinus *Nasturtium Alpinum capsula Nasturtij hortensis*: the tenth and last he also calleth as they are in their titles.

The Vertues.

There hath not beene any especiall triall made of any of these herbes that I know, but most of them being somewhat sharpe in taste, they are adjudged to be neare of the same qualitie with the former, or rather stronger in that they are mountainous plants, but I have nothing to affirme for certaine, and therefore let this suffice untill wee can say more of them.

CHAP. IX.

Nasturtia sylvestria. Wilde Cresses.

Here is a wilde kinde of Cresses yet to be handled whereof there are not many sorts, one of them is to be found almost in every field, which although it be accounted a very foule weede in a garden, yet it is not amisse as I thinke to place it with the rest.

1. *Nasturtium sylvestre Oxyridis folio.* Narrow leaved white Cresses.

This wilde Cresse bringeth forth many small round and hard stalkes, with divers small round and narrow leaves set without order thereon, branched from the middle upward into many parts, at the toppes come forth a number of small white flowers (yet some have beene found with yellow flowers) one standing above another spike fashion, after which appeare huskes containing small seede: the roote is woody and perisheth after seede time.

2. *Nasturtium sylvestre Valentinum.*

Spanish wilde Cresses.

Spanish wilde Cresses groweth up with a round Greene, rough, and hairy stalke about a foote high spreading into branches from the very ground at every joynt whereof stand long winged leaves very much divided like unto the ordinary garden Cresses but yet more small parted and sharpe in taste like Cresses: the flowers are many, and of a pale whitish yellow colour standing in long spikes at the toppes, and afterwards small short powches divided into two parts which stand not upright but hang downwards wherein is contained small reddish seede like unto Cresses: the roote is long and slender, and perisheth every yeare.

3. *Sophia Chirurgorum* sive *Pseudonasturtium sylvestre.*

Flixe weede.

There is no doubt but that this herbe pertaineth to the family of wilde Cresses, although a bastard sort of them rising up with a round upright hard stalke foure or five foote high spread into sundry branches, wherein grow many grayish Greene leaves very finely cut and severed into a number of short and almost round parts, the flowers are very small and yellow growing spike fashion, after which come very small long pods, with verie small yellowish seede in them: the roote is long and woody perishing every yeare.

Whereof there is an other sort with somewhat broader leaves and in no other thing differing: they have a strong evill savour being smelt unto, and are of a drying taste.

The Place.

The first and the last grow wilde in the fields by hedge sides and wayes, and among rubbish and many other places: the second was found onely in the kingdome of Valencia in Spaine.

The Time.

They flower and seede quickly after, namely in June and Iuly.

The Names.

The first is *Thlaspidi* genus, and *Nasturtium* 5. Tragi, *Thlaspi angustifol.* of Fuchsius and Lugd. *Thlaspi minus hort. vulg.* *Oxyridis folio acerrimum album* & *luteum* of Lobel, *Nasturtium syl.* of Thalius, *Bursa pastoris minor* of Brunfelsius, and *Nasturtium sylvestre Oxyridis folio* of Bauhinus, and may in my minde be accounted a *Thlaspi* much better yet participareth of both: the second is called by Clusius *Nasturtium sylvestre Valentinum*, and so doth Lugdunensis in following him; but Lobel in altering that title called it *Eruca Nasturtio cognata tenuifolia*, and is reprehended by Clusius for so doing; by Lugdunensis also *Eruca cinerea*, as Bauhinus thinketh, who maketh it also to be the *Sacoba marina*, as is before said, and called this *Nasturtium sylvestris Eruca folio*: the last is called by some *Pseudonasturtium sylvestre*, by Fuchsius and Gesner in hortis *Nasturtium sylvestre*, by Tragus *Scribium Germanicum*, and by Lonicerus *Scribium absinthium* (but very erroneously not having any affinitie with Wormewood) by Dodonaeus in his French Booke, by Gesner in hortis, by Cordus, Lugdunensis, Thalius and Tabermontanus *Thalietrum* or *Thalistrum* but not truly: but by Dodonaeus in his Latine Booke, by Lobel and Gerard *Sophia Chirurgorum*, by

B b b b

which

2. *Nasturtium sylvestre* Valentinum,
Spanish wilde Cresses.

3. *Sophia Chirurgorum*,
Flizeweede.

which name it is now generally called and knowne, by *Cesalpinus Accipitrina*, who maketh two sorts thereof, as *Tabernaemontanus* doth of his *Thalicttrum*, viz. *latifolium* and *angustifolium*, *Bauhinus* calleth it *Nasturtium sylvestre tenuifolium divinum*. *Lobel* putteth a doubt whether it be not the *Eruca Gelatina* of the *Italians*: the *Germanes* call it *Wellfamen* as they doe *Wormeseed*, and *Sophiakrantz* after the *Latine*; the *Dutch* *Fiecrayt*, and wee in *English* *Flizeweede* from the effect.

The Vertues.

The two sorts of wilde Cresses are neare the qualities of the other Cresses; but both the herbe and the seede of *Flizeweede* is of excellent use to stay the fluxe or laske of the belly being drunke in water, or water wherein somegads of Steele being heated have bene often quenched, and is found also no lesse effectually than *Planrane* or *Comfrye* for the said purpose, and to restraine any other fluxe of blood in man or woman, to consolidate also broken bones, or out of joynt; the juyce thereof drunke in wine, or the decoction of the herbe drunke doth kill the wormes in the stomacke or belly, as also the wormes that grow in putride and filthy ulcers, and made into salves doth quickly heale all old sores how foule or malignant soever they be: the distilled water of the herbe worketh the same effect although somewhat weaker yet is a faire medicine, and more acceptable to be taken.

CHAP. XI.

Sinapi, Mustard.

Here be divers that make some of the *Rockets* to be kind of *Mustard* as you have heard before, and there be many also that make some kinds of *Mustard* to be *Rocket*: I will endeavour as neare as I can to give each their due title and place, yet of these kinds I have in my former Booke set forth that which is most frequently used to make sawse in this Land, whereof I shall not neede to speake againe.

1. *Sinapi sativum Rapi folio*, Broad leaved Mustard.

This Mustard hath large and broad rough leaves very much jagged with uneven and unorderly gashes, somewhat like a Turneppe leafe but lesser and rougher; the stalke riseth to be more than a foote high and sometimes two, being round, rough, and branched at the toppe, bearing such like leaves thereon as grow below, but lesser and lesse divided, and divers yellow flowers one above another at the toppes, after which come small rough pods with small lancke flat ends, wherein is contained round yellowish seede greater than Turneppe seede, sharpe, hot, and biting upon the tongue: the roote is small, long and woody when it beareth stalkes and perisheth every yeare.

2. *Sinapi sylvestre minus*, Small wilde Mustarde.

This Mustard is somewhat lesser than the former not rising above a foote high with small jagged leaves more

more orderly placed somewhat like those of the Shepherds purse, but more smally gashed, the flowers are yellow and the feede brownish like the former but not so sharpe.

3. *Sinapi parvum Montpelienfe*. Small Mustard of *Montpelier*.

This small Mustard is the least of them all growing not above a spanne high, with small bending branched stalkes and small pale yellowish flowers at the toppes, which afterwards give small long and slender rough pods winged on the sides or edges, with very small feede therein: the lower leaves are somewhat broad, cut into many parts, but those on the stalkes have very small cuts lesser than the smallest leaves of Rocket somewhat hot and sharpe in taste.

1. *Sinapi sativum Rapifolio*.
Broad leaved Mustard.

2. *Sinapi sylvestre minus*.
Small wilde Mustard.

4. *Sinapi agreste Neapolitanum*.
Wilde Mustard of *Naples*.

This *Neapolitane* Mustard from a small whitish fibrous rootē shooteth forth many rough greene leaves cut into divers parts, somewhat like unto the leaves of the greater *Celandine*, but lesser and more pointed at the ends: the square stalke is divided into sundry branches, bearing at the toppes divers small purplish flowers consisting of foure leaves apeece set together as it were in an umbell or tuft; after which rise small pods of two inches long a peece, with yellowish feede within them, which quickly breake their vessels and spill, not onely by ones touch, but by the shaking of the winde, so that it is hard to gather the ripe feede.

5. *Sinapi marinum Egyptium*.
Sea Mustard of *Egypt*.

I call this a Mustard (saith mine Author) because it hath larger leaves than Rocket, and might seeme to be the *Eruca maxima Miconi* of *Lugdunensis*, but hath not any bitteresse therein as his hath: nor is it the *Rakile Serapionis* commonly called *Eruca marina* which hath a nitrous taste in it when as this hath a very sharpe taste: the roote hereof is long, white, slender and woody; having one or two reddish round stalkes, not standing upright but a little bending, branching forth into other, with a few winged leaves thereon, that is made of many fine long sappie leaves on a side, a little dented about the edges, in both colour and smell, comming nearest to Rocket; at the toppes of the stalke come forth blewish flowers in fashion of *Stocke-Gillowflowers* which turne into small long pointed pods,

Bbb 2

5. *Sinapi marinum Egyptium*.
Egyptian Sea Mustard.

containing

containing small smooth round seede of a very sharpe taste and smelling like Rue. This is very like the *Eruca* carulea set forth before.

The Place.

The first is not found wilde with us but in Gardens onely, but the second, as well as that which is spoken of in my other booke, are found often in the borders of fields, as also in the low rilles and furrowes of them; the other three are strangers to us, the one being of *Mompelier*, the other of *Naples*, and the last of *Egypt*.

The Time.

All these Mustardes are but annuall plants flowring in *July*, and their seede ripe in *August*.

The Names.

It is called in Greeke *σινάπι* *Sinapi*, and so doe the *Latines* call it also, and *Sinapis*; but *Athenians* saith that the *Athenians* called it *νάρυ*, and *Aristophanes* in *Equiti* saith of *Cleomenes* when he was angry,

Καὶ σινάπης νάρυ, καὶ νάρυτος ἀνέκρουσεν.

Conspexit Sinapi & frontem contraxit.

The *Arabians* call it *Cardel*, the *Italians* *Senape*, the *Spaniards* *Mostarde* and *Mostaza*, the *French* *Senue* and *Mos-flarde*, the *Germanes* *Seness* and *Senff*, the *Dutch* *Mostaerte*, and we in *English* *Mustard*. The first is called of *Label Sinapi sativum* *Eruca* aut *Rapifolio*, of *Cordus* upon *Dioscorides*, and of *Lugdunensis Sinapi hortense*, of *Dodonæus Sinapi sativum* prius, of *Camerarium Sinapi album* differing from *Eruca semine albo*, of *Bauhinus Sinapi rapifolio*, *Sinapi Dioscoridis & Theophrasti*, *Sinapi alterum* *Plinij*: the second is called by *Label Sinapi sylvestre minus burse pastoris folio*, by *Dodonæus* and *Lugdunensis Sinapi sylvestre*, and is the third *Sinapi* of *Matthioli*, *Durantes*, and *Cesalpinus*, *Tragus* calleth it *Eruca five Rucula marina minor*, and *Sinapi novum*; *Fuchsius* *Eruca sativa*, *Turner* *Eruca hortensis*, and *Gesner* in *hortu* *Eruca sylvestris*: the third is called by *Bauhinus Sinapi parvum siliqua aspera*: and the fourth *Columna* calleth *Sinapi alterum agreste nostras*: and *Bauhinus Sinapi umbella purpurea*: the last is so called by *Alpinus* as is in the title.

The Vertues.

Mustard seede especially the common sort is hot and drie in the fourth degree (but the white seede and the other small sorts are not so hot) and hath the vertue of heating, diffusing, rarefying and drawing forth (splinters of bones or other things out of the flesh). The condiment or sawce is of great use, for in a manner the whole encase of the ground is spent thereabout to season or sharpen the meats, both of fish and flesh that are eaten either by the rich or poore: the said Mustard is of good effect to bring downe womens courses, and for other hystericall diseases, and for those that are Epilepticke or Lethargicke, that is troubled with the falling sicknesse or lethargie, drouse, forgetfull, evill, to use both inwardly and outwardly to rubbe the nostrills, the forehead and temples, to warme & quicken those dull spirits that are as it were asleepe or almost dead; for by the fierce sharpenesse it pierceth to the braine and purgeth it by sneezing and drawing downe rheume & other viscus clammy humors which by their residence doe much offend, or by their diffillation upon the lungs and chest procure coughing, and therefore with some honny added thereto doth much good therein. Our ancient forefathers even the better sort in the more simple, and as I may say the more healthfull age of the world, were not sparing in the use hereof, for without doubt they found it much conducing to their health by warming the stomacke and helping digestion, by cleansing the braine, lungs and breast of rheume and flegme: but now adayes it is seldom used by their successors being accounted the clownes sawce, and therefore not fit for their tables; but is transferred either to the me, ny or meaner sort, who therefore reape the benefit thereof. The decoction of the herbe, but the seede is the more usuall and effectuall made in wine and drinke provoketh urine, resisteth the force of poison, the malignitie of Mustardes, and the venom of the Scorpion or other venomous creatures, for it suffereth not the virulencie thereof to pierce to the heart, and vitall spirits, thereby to overthrow life, but mastereth it in the way if it be taken in time: the same also taken before the fits of agues doth by warming the blood and spirits, keepe backe and lessen the cold fits, thereby altering the course and curing the disease: the seede also taken either by it selfe or with other things, either in an Electuary or drinke doth mightily prevaile to stirre up bodily lust, being taken also in the same manner it helpeth the spleene and paines in the sides and gnawings in the bowels, and used as a gargle, it helpeth the *Phula* or pallate of the mouth when it is fallen downe and fasteneth it, and also dissolveth the tumours & kernells about the throate in the Kings evill, especially if it be also applied outwardly thereto: being chewed in the mouth it oftentimes helpeth the tooth-ach: the outward application hereof upon the pained place of the *Sciatica* doth much helpe to disperse the humours, and to ease or lessen the paines, as also for the goure and other joynt-aches, and is much and often used to ease paines in the sides or loynes, the shoulders or other parts of the body, upon the applying thereof to raise blisters, and by drawing the paines to the place from the inward or more remote, cureth the disease or diverteth it to those outward places where locall medicines may helpe: it is also used to helpe the falling of the haire: the seede bruited mixed with honny and applied, or made up with waxe, taketh away the markes and blacke and blew spots and bruises of beatings or the like, the roughnesse or scabbednesse of the skin in any place, as also the leprosie, and lowse evill: it helpeth also the cricke in the necke, or that disease when one cannot turne their heads, but they must turne their whole body with it. The distilled water of the herbe when it is flower, is much used both inwardly to drinke to helpe in any the diseases aforesaid, or to wash the mouth for the *Phula*, or the kernells and tumours of the throate, but outwardly also for the scabbe, itch, or the like infirmities, and cleanse the face and skinn from freckles, spots, morpew, or other deformities thereof. The *Italians* use to keepe a drie condiment or sawce made of Mustard seede to use upon all occasions, suddenly made fit to be eaten, which it is likely they learned from *Dioscorides* who taught his to keepe *Rocket* seede good for a long time, by beating it and making it up with vinegar and milke into balles to be dried: for they much after the same manner appoint two ounces of Mustard seede to be taken, and halfe an ounce of good Cinamon well beaten to be made up into balles or cakes with honny and vinegar, which being dried in the Sunne are to be kept untill use be to be made thereof, which then relented with a little vinegar is made into sawce presently, very delicate and pleasing to the palate and stomacke.

CHAP. XI.

Iris sive Erysimum. Hedge Mustard.

Here are divers sorts of this Hedge Mustard more knowne at this time then formerly hath bin, being found out by divers diligent and experienced searchers of herbes, as you may perceive in the succeeding discourse.

1. *Iris sive Erysimum vulgare.* The common wilde Hedge Mustard.

The common *Erysimum* groweth up usually but with one blackish Greene stalk, rough or limber, easie to bend but not to breake, branched into divers parts, and sometimes with divers stalkes, set full of branches whereon grow long rough or hard rugged leaves very much cut in or torne on the edges into many parts, some bigger and some lesser, of a durtie Greene colour: the flowers are small and yellow that grow at the tops of the branches in long spikes flowering by degrees so that continuing long in flower, the stalkes will have small round cods at the bottome, growing upright and close to the stalk, while the toppe flowers yet shew themselves, in which are contained small yellow feede, sharpe and strong as the herbe it selfe is also: the roote groweth downe slender and woody, yet abiding and springing therefrom every yeare.

2. *Erysimum alterum siliquis Eruce.* Broad leaved hedge Mustard.

This hedge Mustard riseth up with two or three darke Greene stalkes, somewhat like the former but not so much branched, set on all sides with large darke Greene leaves, cut into three or foure parts, with almost equall leafes on each side, but the end is the largest, somewhat unevenly waved or dented about the edges thereof: the flowers are small and yellow, yet greater then the former, whose spikes are not so long, neither doe the long and round pods of yellow feede stand so close to the stalkes, nor are so small but shorter like to those of Rocket: the roote is not so long or woody but more fibrous continuing but a yeare.

3. *Erysimum verum sive montanum.* The true hedge Mustard.

The leaves of this *Erysimum* are of a fresher Greene colour then either of the former, smaller also, and cut in on both sides into more but smaller parts, resembling the divisions on the leaves of Dandelion but very small, each part or corner looking downewards, from among which rise up sometimes two or three stalkes, but more usually but one, round, and about halfe a yard high, thicke set with such leaves but smaller and full of branches to the toppes, all along which come forth very small yellow flowers with smaller leaves with them, after which follow whitish yellow small cods growing close to the stalkes, containing within them small yellow feede, nothing so strong or sharpe as the first, yet somewhat quicke upon the tongue: the roote is small and perisheth after seede-time, but by sowing it selfe never misserth to be in the ground where it hath once feeded.

4. *Erysimum latifolium Neapolitanum.* Broad leaved hedge Mustard of Naples.

This Neapolitane hedge Mustard hath many small long and smooth Greene leaves lying in a compasse upon the ground, divided or cut after the manner of the wilde Rocket (which we call our ordinary Garden Rocket) but with smaller and lesser divisions, the middle ribbes being white, the stalk that riseth from among them, for it

1. *Iris sive Erysimum vulgare.*
The common wilde hedge Mustard.

3. *Erysimum verum sive montanum.*
The true hedge Mustard.

4. *Erysimum latifolium Neapolitanum*.
Hedge Mustard of Naples.

6. *Erysimum simile hirsuta planta*.
An hairy hedge Mustard with uncut leaves:

seldome beareth more then one is about two foote high, set with the like leaves but lesser and lesse divided up to the toppe, and with longer ends more pointed, of a strong sent and bitter sharpe taste, the flowers are many set together, small and yelow, with longer spikes more like to Mustard then Rocket, after which come longer and thicker cods about two inches long, small and round not closing the stalke like the last, but spreading somewhat further off, wherein is small yellow seede, nothing so sharpe as the leaves: the roote is long and white, stronger and hotter then either leaves or seede and most neare unto Mustard.

5. *Erysimum angustifolium Neapolitanum*. Narrow leaved hedge Mustard of Naples.

The lower leaves of this hedge Mustard are long and narrow, somewhat hairy but soft, of a pale greene colour, cut in or torne on the edges, and pointed very like unto the common hedge Mustard here first set downe, but those that grow up higher upon the stalke, which is seldome more then one about a yard high and rough, are smaller and with fewer divisions branched from the middle upwards, and sometimes from the very bottome, bearing the smallest yellow flowers at the toppes of all the rest, after which come small long pods set on all sides of the branches and standing upright, thicke and blunt at the toppes with small yellowish seede in them not very sharpe.

6. *Erysimum simile hirsuta planta*. An hairy hedge Mustard with uncut leaves.

This hairy hedge Mustard-like plant hath many leaves lying on the ground clustering together, each whereof is rough, hairy, and whitish, an inch and a halfe long, unevenly dented about the edges, and some a little more deeply cut in, from whence rise up sometimes many stalkes, and sometimes but one, rough, hairy and reddish at the bottome, with some few lesser leaves set thereon compassing them at the bottomes: the flowers stand spike fashion at the toppes of the stalkes, which are sometimes branched made of foure small white leaves, and after them rise straight long cods with small seede in them.

The Place.

The first is very frequent in our Land by the wayes and hedge sides and sometimes in the open fields: the second is more rare to meete with, yet is sometimes found but still in the better grounds which maketh it so large: the third is found wild in Italy as *Matthiolus* saith in the like places with the first: the fourth and fifth are of Naples as *Columna* saith: the last groweth upon stones and rubbish, and upon old mudde walles at *Bassit*, *Mompeller* and other places.

The Time.

These doe flower sometimes late and sometimes earlier, but most usually in *July* or thereabouts.

The Names.

The Greeke name is *ἐρύσιμον* *Erysimum* ἀπὸ τοῦ ἐρύειν a foliorum multiplici sectione sic dictum a quibusdam putatur ab alijs βελανω quasi pretiosum, neither of which seemeth so likely as ἀπὸ τοῦ ἐρύειν quod ob suam caliditatem attrahendi facultate prae dictum est: in Latine also *Erysimum* and *Iris* quod acrimonia sua irritat in gustum. This is the *Erysimum* of *Dioscorides* and not of *Theophrastus*, for hee placeth his *Erysimum* inter fruges among the sorts of Cornes or Graynes

Graynes as shall be declared both when we come to speak of them, & somewhat also in the Chapter of *Myagrista* following: *Galen* doth acknowledge both sorts, for of this kind he speaketh in 6. *simplicium medicamentorum*, and of the other in *primo de alimentorum facultatibus*: *Pliny* also speaketh of them *Lib. 18. cap. 7.* and *lib. 22. cap. 25.* but in the end confoundeth them both together: for in the former place he saith *Esiva frumenta diximus Sesamum, Miliun, Panicum*, and after *huic scilicet Sesamo similis est in Asia Græciaque Erysimum*, idemq; erat nisi pungius esset, quod apud nos vocant *Irionem*, medicaminibus potius annumerandum quam frugibus. And in the other place he saith *Irionem inter fruges Sesame similem esse diximus*, and a *Græcis Sesamum vocari: est autem fruticosum folijs Eruce angustioribus tamen, semine Nasturtij*, this being the description of *Dioscorides* his *Erysimum* and the other of *Theophrastus*. The first is called *Hierobotane* *femina* of *Brinsellius*, *Verbeua* *femina* and *Senapi* *sepsimum* of *Tragus*, *Sinapi* alterum *sylvestre* of *Fuchs*, *Erysimum Sinapi sylvestris* species of *Gesner* in *hortis*. *Irio* of *Matthioli*, *Cordus* in *Diosco*. *Lonicerus*, *Lugdunensis* and *Cesalpinus*, *Erysimum* verum of *Lobel*; *Cleome* *Ottavij* *Horatij* of *Angulara*, and *Erysimum vulgare* of *Bauhinus*: the second is *Tabermontanus* his second *Erysimum* whose Figure *Gerard* hath placed for *Eruca sativa*, *Bauhinus* calleth it *Erysimum alterum Eruca siliquis*: the third is the *Irio* alter of *Matthioli*, *Lugdunensis* and *Camerarius*, *Erysimum verum* of *Angulara*, *Dentillaria alia Irio* aliquibus of *Gesner* in *Hortis*, *Irionis* *tertia* species of *Cesalpinus*, and *Saxifraga Romanorum* of *Lugdunensis* according to his description, but the figure is transposed to a contrary place under the other title of *Saxifraga aurea*, *Bauhinus* calleth it *Erysimum polyceratum vel corniculatum*, but is generally called by most *herbaristes* with us *Erysimum verum* *sive montanum*: the fourth is called by *Columna Irio levis Apulus Eruca folijs*, and by *Bauhinus* *Erysimum latifolium majus glabrum*, and was sent him as he saith by the name of *Rapistrum Hispanicum non descriptum*. I have entituled it *Erysimum latifolium Neapolitanum*: the fifth is called by *Columna Rapistrum montanum Irionis folio*, but by *Bauhinus* *Erysimum angustifolium majus*: but in this as in many other, *Bauhinus* doth much forget what he had written but two or three leaves before in his *Pinax*, for he setteth this for a *Rapistrum* among the other sorts of *Rapistrum* but it cannot be an *Erysimum* and a *Rapistrum* both, for so to doe were to make a confusion unsufferable and too farre unfit so worthy a man as he was, or any other that would be accounted of any worth in his judgement. The last is called by *Bauhinus* *Erysimum similis hirsuta non laciniata alba*, and was called as he saith *Barbarea muralis* by his brother *John Bauhinus*. The *Italians* call it *Erisimo* and *Irione*, the *Spaniards* *Rinchaon*, the *French* *Velar* and *de la tortille*, the *Germans* *Hedericke* and *Wilder Senff*, the *Dutch* *Edel Rakette*, and in *English* by *Gerard Banke Cresses*, but because I finde the most judicious to make it a kind of wild Mustard, I have thereupon entituled it wild Hedge Mustard.

The Vertues.

The three first sorts of *Erysimum* as the most in use and effectually doe temperately heate, consisting of a thinnē substance, cutting and clesning with some moyst parts joynd therewith, whereby it doth not dry the thicke and viscous flegme but maketh it easie to be spit forth, for it is singular good in all the diseases of the Chest and Lungs, hoarsenesse of the voyce, and by the use of the decoction thereof for a little space those have bene recovered perfectly well, who had utterly lost their voyce and therewith their spirits also almost: the juice thereof made into a Syrupe or Lohoc with hony or Sugar, is no lesse effectually for the said purpose, and for all other coughes wheefings and shortnesse of breath: the same also is profitably taken of those that have the Jaundies, the Plurisie, paines in the backe and loynes, and for torments and wringings in the belly or in the Colon, which is called the Collicke being used also in Glitters: the seede is held to bee a speciall remedy against poyson and venome. It is singular good for the paines in the hippes or hucklebones, called the hippe Goute or Sciatica, the Goute also and all joynt aches, as also for Fistulaes, hollow Vlcers, and eating or running Cankers, and for Apofstums, fores, and Cankers in the mouth or throate or behind the eares, and no lesse also for the hardnesse and swelling in womens breasts or in the testicles or stones.

CHAP. XII.

Thlaspi. Treakle-Mustard.

Unto the Cresses, Rockets, and Mustards pertaineth these herbes called *Thlaspi*, Treakle-Mustard as comming nearest unto them both in forme and qualitie, whereof there are found at this day so many sorts more then the former ages ever knew, that I must with these as I have done with many other such herbes that yeld a plentifull varietie, distribute them into sundry rankes or orders, that so they may be both better described and apprehended.

Thlaspi arvense. Treakle Mustard of the Fields.

1. *Thlaspi Draba folio*. Treakle Mustard with broad flat Powches.

This kinde of *Thlaspi* riseth up with a hard round stalke about a foote high, parted into some branches, having divers soft Greene leaves somewhat long and narrow set thereon, waved but not cut in on the edges, broadest towards the ends and somewhat round pointed: the flowers are white that grow at the toppes of the branches spike fashion one above another, after which come large round powches, parted in the middle with a furrow, having one blackish browne seede in eyther side somewhat thicker and larger then in any other of the *Thlaspies* that I know, somewhat sharpe in taste and smelling of Garlick, especially in the fields where it is naturall, but in Gardens, neither so sharpe nor smelling of Garlick as others have expressed it, for any thing I could ever perceive by it my selfe: the rootes are small and threddy perishing every yeare.

2. *Thlaspi Mithridaticum sive vulgarissimum Vaccarie folio*. Mithridate-Mustard.

This *Thlaspi* groweth higher then the former spreading more and longer branches, whose leaves are smaller and narrower sometimes unevenly dented about the edges; the flowers are small and white growing on long branches, with much smaller and rounder seede vessells after them, and parted in the middle in the same manner with

1. *Thlaspi Draba folio.*
Treakle-Mustard with broad flat poyches.

3. *Thlaspi majus.*
Great Treakle-Mustard.

2. *Thlaspi Vaccaria folio.*
Mithridate-Mustard.

6. *Thlaspi villosum capsula hirsuta.*
Hairy Treakle-Mustard.

with smaller browne feedes therein then in the former, and much sharper in taste : the roote perisheth after seede time but abideth the first winter after the springing.

3. *Thlaspi majus*. Great Treakle-Mustard.

The great Treakle-Mustard hath larger, smoothen and broader leaves then the last, somewhat pointed at the ends : the flowers are small and white like the other, standing at the toppes of the stalkes which are two or three foote high, with divers branches on them : the feede vessells are round, and set with browne seene therein : the whole plant is of a strong unpleasent sent and taste.

4. *Thlaspi Vaccaria folio Monspeliacum*. French Treakle-Mustard.

The leaves hereof are somewhat like the leaves of the second kind being smooth and of a darke greene colour, the flowers are small and white also that grow on the stalkes which are about halfe a yard high : the feede vessells are somewhat broad at the head like unto those of Shephards-purse but greater.

5. *Thlaspi vaccariae incano folio minus*. Small hoary French Treakle-Mustard.

The creeping or bending branches of this *Thlaspi* are all hoary over, scarce rising a handbreadth high, whose leaves are hoary also some what long and narrow without any footstalk unto them but set thereon without order on each side, having small white flowers on a short spike and small feede vessells following.

6. *Thlaspi villosum capsulis hirsutis*. Hairy Treakle-Mustard.

The stalke of this *Thlaspi* is about a foote long round and hairy, at the bottome whereof grow divers hairy leaves somewhat long and broad set upon long foote stalkes, but those that are upon the stalke have no foote stalk but compasse it at the bottome, being pointed at the ends and somewhat dented about the edges, the flowers stand at the toppe spike fashion made of five white leaves a peece, after which succede flat hairy powches parted as others are with reddish sharpe feede within them.

7. *Thlaspi arvense persiliatum majus*. The greater Treakle-Mustard with Thoroughwax leaves.

The lower leaves hereof that lie upon the ground are small and somewhat round like those of *Basil*, but yet a little rent or torne on the edges at the bottomes, where they are smallest and a little dented about the other part, of a grayish greene colour, every one upon a small foote stalk, among which riseth up a round stalke purplish at the bottome about a foote high sometimes spotted, whereon grow single leaves one above another at the joynts by certaine distances, which compasse it at the bottome in the manner of Thoroughwax leaves, and whereat likewise come forth other smaller leaves upon short branches, whereon and at the toppes of the stalke stand divers small white flowers that break forth out of reddish huskes, after which appeare small flat powches like unto those of Shephards purse parted in the middle, as is usuall with most of the *Thlaspies*, on each side whereof lye small flat yellowish feede : the roote is long white and woody, the whole plant is more milde or lesse sharpe then others.

8. *Thlaspi persiliatum minus*. The smaller Treakle-Mustard with Thoroughwax leaves.

This other *Thlaspi* hath a few leaves lying on the ground, which are of a grayish greene colour, like both for

7. *Thlaspi arvense persiliatum majus*.

The greater Treakle-Mustard with Thoroughwax leaves.

8. *Thlaspi persiliatum minus*.

The smaller Treakle-Mustard with Thoroughwax leaves.

9. *Thlaspi arvense minus luteum*.
Yellow field Treacle-mustard.

12. *Thlaspi incanum maritimum Hispanicum, Eruca peregrina Clusio*.
Spanish hoary Treacle-Mustard.

formē and colour unto the leaves of *Brassica campestris* Codded Thoroughwax, but much lesser, those that grow up higher upon the stalke, which is scarce a foote high, and but a few set thereon are smaller, pointed at the ends, and broad at the bottomes compassing it like the last, the flowers are small and white and the feede vessells flat like the Candy kind, somewhat sharpe pointed.

9. *Thlaspi arvense minus luteum*. Yellow field Treacle-Mustard.
This hath sometimes but one stalke and at other times many set thicke with small long hoary and hard leaves, with a great long tuft of yellow flowers at the toppe, made of five leaves apeece, after which follow flat round yellowish powches, swelling in the middle, containing within them browne feede: the roote is small and long and dyeth every yeare.

10. *Thlaspi spanospermum Americanum*. The spare bearing *Thlaspi*.
This *Thlaspi* brancheth from the roote divers wayes somewhat thicke, set with long fat greene leaves somewhat like that of Mechlin: the toppes of the branches are without leaves, but stored infinitely with small yellowish flowers of foure leaves which endure onely one day, falling away for the most part without bearing fruit or feede or very sparingly, so that on the whole plant there will be scarce foure or five huskes of seeds gathered any yeare which are flat and a little long like to those of the manured Woade, with a sharpe tasted feede within, the root is hard with many fibres thereat, and tasteth sharpe like Creses.

11. *Thlaspi incanum maritimum Hispanicum, Eruca peregrina Clusio*. Spanish hoary Treacle-Mustard.
This small Spanish (or Italian) plant sendeth forth sundry slender round hoary stalkes about two foote high with many long and narrow leaves at the bottome, a little unevenly waved about the edges, narrowest at the bottome and broader to the ends, of a grayish greene colour or rather hoary, with a great ribbe in the middle of a sharpe taste, the upper leaves on the stalkes being smaller then the lower, with some pale yellow small flowers at the toppes, made of foure leaves apeece dented in the middle, after which succede somewhat round and full feede vessells parted in the middle as many other sorts of *Thlaspi* are, with a small point at the end, containing therein many browne reddish flat shining sharpe feede: the roote is white and somewhat long, thick at the toppe with many fibres downwards.

The Place.

Divers of these sorts of Mustard have beene found in sundry places of our owne Land, especially the first and second, as halfe a mile from *Hasfield* by the river side under an hedge as you travell to *Hasfield*, and in the streete of *Peckam* on *Surrey* side, &c. the other sorts grow some in *Germany*, some at *Mompelier*.

The Time.

They flower and feede some earlier and later then others, even from *May* unto *August*.

The Names.

The *Gracians* call it *Ordam* and *Ordam* *Thlaspi* and *Thlaspe*, quod fructus quasi infractus, and also *Ordam* or *Thlaspidion*.

pidion quasi fructum clypeatum and *sinapi agreste quod sinapi acrimonia refert*: the Latines keepe the Greeke name for the most part and call it *Thlaspi*, yet some do call it *Capfella* and *Scandul acutum*, *Nasturtium tectoru* and *Sinapi rusticum*: the Italians call it *Thlaspi*: the French *Seneve Savage*: the Germans *wilde Kerse*: the Dutch *Borrens Kerse*: and we in English *Treacle-Mustard*, or *Mithridate-Mustard*, because the second sort, especially above any other is that *Thlaspi* that the best do allow for the truest *Thlaspi* to be used in *Treacle* and *Mithridate*. The first is called by *Lobel Thlaspi Dioscoridi Drabe* and *Chameline folio*, & *Scorodo-Thlaspi* by *Decandus* and *Lugdunensis*; and is the second *Thlaspi* of *Matthiolus*, called *Platycarpon* by *Camerarius*, and by *Bauhinus Thlaspi arvense filiquis latis*: the second *Lobel* calleth *Thlaspi vulgatifimum Vaccarie folio*, whose figure is the same with the first of *Matthiolus*, and differeth much from that which *Bauhinus* setteth forth in his *Matthiolus* by the name of *Thlaspi vulgatum*: *Camerarius* calleth it *Thlaspi verum cuius semine utimur in Theriaca*: by *Cordus* in *historia Thlaspi Cardamoides*; by *Tragus Thlaspi*, and *vulgare Thlaspidion*, and by *Bauhinus Thlaspi arvense incano folio majus*: the third is the *Thlaspi majus* of *Tabernmontanus* and *Gerard*, which *Bauhinus* first setteth forth by the name of *Thlaspi arvense Vaccarie lato levis; folio*, but afterwards in his *Errata* appointed it to be amended & made *Acetose folio* in stead thereof: the fourth is called by *Bauhinus Thlaspi Vaccarie folio bursae pastoris filiquis*: the fifth is also called by him *Thlaspi Vaccarie incano folio minus*: the sixth is also called by him *Thlaspi villosu capitulo bursatu*: the seventh is called by *Lugdunensis*: *Thlaspi primum Dalechampii*, by *Tabernmontanus Thlaspi oleraceu*, because it is almost without taste, by *Bauhinus Thlaspi arvense perfoliatum majus*, who quoteth it to be *Columna* his *Thlaspi alterum minus rotundifolium bursae pastoris fructu*; and yet *Columna* in his description thereof maketh no mention of perfoliating in the leaves, *Gerard* also hath mistaken this in calling it *Thlaspi incanum* which belongeth to *incanum Aechlinense*: the eight is called by *Clusius Thlaspi pumilum*, and *Thlaspi montanum minus*, but by *Bauhinus Thlaspi perfoliatum minus*: the ninth is called *Alyssum* by *Matthiolus*, and *Angulara*, & *Alyssum Matthioli* by *Lugdunensis* and *Camerarius*, by *Lobel Thlaspi Gracum*: by *Lugdunensis Alyssum minus Dalechampii*, by *Tabernmontanus Thlaspi minus clypeatum*, by *Beslerius* in *horto Eystetensi Polium Alpinum flore lateo*, *Bauhinus* maketh two sorts thereof calling them *Thlaspi Alexandrinum campestre majus & minus*, and yet saith they are so like that they may be both accounted one sort. You see I have referred it rather to the *Thlaspi* than any other as nearest resembling it, and to this ranke of field *Thlaspi* which is the proper place of the growing: the tenth is so called by *Cornutus* in his history of *Canada* plants: the last is called by *Clusius Eruca peregrina*, and so doth *Lugdunensis*. but *Lobel* inverteth the name calling it *Leucoium marinum Patavinum*, but *Clusius* mistaking it, holdeth it still his owne, and *Bauhinus* more enclining to *Lobel* than him (for his loves fake to *Padoa* as it seemes) calleth it *Leucoium incanum utriculo rotundo*: but because both herbe and feede is hot and sharpe, and so are not the *Leucoia* generally, I have thought it more fit to joine it to the *Thlaspi*s.

The Vertues.

The most of these sorts of Mustards are hot and drie in the fourth degree, or very neare like unto Cresses, for they are sharpe and quick in taste, and are heating, rarefying, attracting and purging: It is set downe by some authors to purge the body both upward and downwards, and that if any exceede a due proportion it will scoure unto blood, but how truly I know not in that I never heard of any to make triall thereof in that manner: it is said to procure womens courses so forcibly that it suffocateh the birth: being taken inwardly it breaketh inward apopleums and used in glisters helpeth the *Sciatica*, the feede applied outwardly doth the same. It is an especial ingredient into *Mithridatum* and *Treacle*, for it is held to be of it selfe an antidote resisting poyson, venome and putrefaction besides the acrimony it addeth to the composition. It is also available in many of those causes that Mustard is used but somewhat weaker.

CHAP. XIII.

Thlaspi Umbellatum. Umbelliferous Treacle-Mustard.

Other kind of Treacle-Mustard beare their flowers in tufts and round umbells, and not in spikes, of some whercof I have spoken in my former booke, that is, the *Thlaspi Candia*, *Candy* tufts, both with white and purplish flowers, as also a *Spanish* kinde not set forth by any before.

1. *Thlaspi Creticum album umbellatum majus*. Great white Candy Mustard.

This *Candian* plant hath divers hard and small stalkes, bearing a few long and narrow pointed smooth leaves, set on them one above another up to the toppes, where the white flowers grow in broad round tufts, somewhat larger than in that sort is expressed in my former booke: the feede vessels that follow are greater also with a pointell in the middle of them: the roote is small and thready, and endureth divers yeares not dying as the other doth.

2. *Thlaspi umbellatum arvense Iberidis folio*. Variable flowered Mustard.

The leaves hereof are somewhat long and narrow, cut in or deeply dented about the edges, more than those of *Candy* Mustard: the flowers grow in tufts or umbells like thereunto but of mixed colours, that is white and purple usually, and sometimes wholly white, and in others yellowish but much more rare: the feede is like the *Candia* kinde.

3. *Thlaspi umbellatum Creticum flore albo odorato*. Sweete Treacle Mustard with a white flower.

This white *Candy* Mustard is smaller, and groweth lower than the first, bushing thicke with smaller and narrower leaves dented onely at the ends; the flowers are white but smaller than they, and smelling very sweete, after which follow such like powches with yellowish feede in them: the roote perisheth yearly.

4. *Thlaspi umbellatum Nasturtii folio Mompeliaum*. *Mompeliers* umbelliferous Mustard.

The stalkes of this Mustard are many and greater than in the other before, bearing many more jagged leaves on them resembling those of the common garden Cresses: the flowers are white in spikie rundles or umbells at the toppes which give smaller feede than the others but as sharpe as any of them.

The Place.

Some of these grow about *Mompelier*, and the greater number in *Candy*, and but in gardens with us.

The

1. *Thlaspi Creticum album umbellatum majus.*
Great white Candy Mustard.

2. *Thlaspi umbellatum arvense Iberidis folio.*
Variable flowered Mustard.

3. *Thlaspi umbellatum Creticum flore albo odorato.*
Sweet Treacle-Mustard with a white flower.

4. *Thlaspi umbellatum Nasturtij folio Menziesii.*
Nasturtium umbelliferous Mustard.

The Time.

They flower and feede about the same time that the Candy kindes doe, expressed in my former booke, which is usually not untill Iuly.

The Names.

The first *Bauhinus* calleth *Thlaspi Creticum flore albo majus*, and I thinke it to be the *Thlaspi Narbonense* *Cenunculi folio* of *Lobel*, which as he saith the *Italians* and *Matthiolus* accounted an *Alyssum*: the second is taken to be the *Thlaspi Allobrogicum* of *Clusius*, and the *Thlaspidi aliud genus vel tertium Tragi*, the *Thlaspi amarum* of *Tabermontanus* and the *Nasturtium sylvestre* of *Lugdunensis*, which *Bauhinus* entitleth *Thlaspi umbellatum arvense Iberidis folio*, as I doe: the third is the fourth *Thlaspi* of *Clusius* called *parvum odorato flore*, which *Bauhinus* calleth *Thlaspi umbellatum Creticum flore albo odor minus*: the last is called by *Lobel* *Thlaspi alterum minus umbellatum Nasturtij hortenstis folio Narbonense*, which *Lugdunensis* and *Tabermontanus* doe both remember, the one by the name of *Thlaspi aliud umbellatum Pena*, and the other by the name of *Thlaspi Narbonense umbellatum*.

The Vertues.

The vertues of these herbes are to be referred to the former, for being almost as sharpe they cannot but worke the like effects, yet in a weaker manner, and therefore thus much shall be sufficient for them.

CHAP. XIII.

Thlaspi Montanum. Mountaine Treakle-Mustard.

The next kinde of Treakle-Mustards that are to be spoken of, are those that grow upon high hills and mountaines and in rockie sonie places.

1. *Thlaspi montanum Glastifolio majus*: *Clusius* his Hungarian Treakle-Mustard.

This *Thlaspi* riseth up with divers small but strong stalkes a foote or more high, set at distances with long and somewhat broad leaves, compassing it at the bottome as the *Brassica campestris* doth, and neare unto the same colour, Greene above and grayish underneath smelling somewhat like unto Garlike, as those also doe that lie upon the ground: the flowers are many and white plentifully growing at the toppes without any sent, which after wards give hard and flat powches, not parted as others are but whole and round sticking forth in the middle like a buckle, in the middle whereof lieth but one seede, the roote is bushie and full of strings and fibres that continue many yeares.

2. *Thlaspi montanum Glastifolio minus*.

The small Treakle-Mustard of *Baden*.

This hath a great many small leaves lying on the ground round about the roote, very like unto the blew Daycie, full of juyce, and of a darke blewish Greene colour, among which rise up divers stalkes about a foote high, bearing thereon many leaves longer and more pointed than the lower, and at the toppes sundry white flowers one above another, which afterwards bring flat powches like those of Shepherds purse: the roote is long white and fibrous.

3. *Thlaspi montanum semper virens*.

Evergreene Mountaine Mustard.

The stalke of this *Thlaspi* is somewhat great and woody, covered from the roote upwards to the branches, with a brownish rugged barke set with divers long white leaves at spaces, somewhat like to those of Stocke-Gillflowers but smaller and very quicke and sharpe in taste: at the toppes of the branches which are many and much dispersed stand tufts of white flowers, after which come such like husks as are in the common *Thlaspi*, and such like seede in them very hot and sharpe: the roote spreadeth it selfe into many branches and periseth not, but abideth with the stemme also above ground uncorrupted many yeares.

4. *Thlaspi saxatile rotundifolium*.

Mountaine Treakle-Mustard with round leaves.

This mountaine *Thlaspi* hath rising from a small long yellowish roote many small weake bending stalkes a foote high, shooting forth fibres at the joynts as they lie next the ground, where the leaves grow small and somewhat round, from the upper joynts spring forth small naked branches an hand breadth long, bearing a few pale coloured flowers, and after them small pods upon very slender foot stalkes, wherein is contained very small seede.

5. *Thlaspi alpinum minus capitulo rotundo*. Small mountaine Mustard with round heads.

This small mountaine *Thlaspi* hath from among many small short leaves, that grow next the ground being pointed at the ends, lightly dented about the edges, and every one on a short foote stalke, divers tender stalkes rising up about a foote high, branched at the toppes, and bearing a few narrow long leaves on them, and small white flowers above them, after which follow small round seede vessells divided by a small skinne into two parts, standing upon very slender foote stalkes with small yellowish sharpe seede within them: the roote groweth somewhat great at the toppe and smaller downwards.

Cccc

6. *Thlaspi*

2. *Thlaspi montanum* Glaberrimum minus.
The smaller Treacle-Mustard of Baden.

5. *Thlaspi Alpinum* minus capitulo rotundo.
Small mountain Mustard with round heads.

3. *Thlaspi montanum* semper virens.
Evergreen mountain Mustard.

4. *Thlaspi montanum* luteum majus.
The greater yellow Thlaspi.

13. *Thlaspi Peronicæ folio.*
Treakle Mustard with Speedwell leaves.

14. 15. *Thlaspi montanum Vermiculato acuto folio;*
et alterum carnosæ rotundæ folio.
Treakle Mustard with very small and pointed leaves,
and another with small thicke leaves.

6. *Thlaspi Alpinum majus capitulo rotundo.* The greater mountaine Mustard with round heades.

The greater kinde hath divers heads or tufts of somewhat longer leaves next the ground, from the middle of each whereof riseth up a bigger stalke, set with narrow leaves up to the toppes, where they branch forth and beare such like white flowers and round heades with feede, as the lesser kinde doth but larger: the roote likewise is somewhat great.

7. *Thlaspi Alpinum repens.* Creeping mountaine Treakle Mustard.

This small *Thlaspi* hath many small branches creeping by the ground of foure or five inches long with some few leaves that are somewhat round set without order on them, and at the toppes many white flowers somewhat large and great, in whose places afterwards come small flat powches, containing feede in taste like unto Rocket: the roote is small and long.

8. *Thlaspi parvum saxatile flore rubente.* Small reddish flowered Treakle-Mustard.

The roote of this *Thlaspi* is white and long, from whence come three or foure round upright yet weake stalkes, with very small thicke and round leaves at the bottome, not much broader than the fruit or feede vessels themselves, of a pale Greene colour, and those that grow up higher smaller and narrower up to the toppes, where the flowers made of foure leaves apeece, stand in tufts many set together of a pale reddish or bluish colour, striped with veins of a deeper red rising out of reddish Greene huskes being the outer flowers, which as a crowne compass the tufts, for from the middle rise other flowers afterwards upon long foote stalkes, and flat feede-vessels after they are past with sharpe feede in them, but the rootes and leaves are bitter.

9. *Thlaspi saxatile Polygala folio.* Mountaine *Thlaspi* with Lentill-like leaves.

The stalkes of this *Thlaspi* rise to be about a foote high having small leaves on them, in forme like unto *Polygala* or Milkewort, but much smaller or rather like unto those of the pulse we call Lentills (and in some countries Tilles) that is somewhat longer than round: the flowers are many small and white peeling on the toppes of the stalkes, which afterwards give small round feede vessels, parted in the middle with very small feede therein.

10. *Thlaspi montanum luteum majus.* The greater yellow *Thlaspi*.

From a small long roote spring forth sundry weake branches scarce able to stand upright, set with divers small long and somewhat narrow leaves a little hoary without order, somewhat like unto *Scopillum* Mother of Time: at the toppes grow many small yellow flowers set together in a tuft or umbell something large, where afterward stand small feede vessels with very small feede in them.

11. *Thlaspi montanum luteum minus.* The lesser yellow *Thlaspi*.

The leaves of this *Thlaspi* are small somewhat long and narrow, pointed at the ends like unto the last, but smaller, rough and hoary withall, the stalkes are browne leaning downe to the ground rough and hoary likewise, bearing many flowers at the toppes of them somewhat larger than the last, and

of a deeper yellow colour almost like the Wall-flower, every leaf being round pointed, and cut in in the middle making them seeme like hartes which doe not stand in round tufts or umbells but in short spikes, after which come rough and hoary round seede vessels, with a pointell sticking forth in the middle of every one of them, and containing one flat round yellowish seede in them: the roote is small and long and springeth new leaves and stalkes every yeare: this hath but little sharpnesse in it.

12. *Thlaspi Veronica folio*. Treakle-Mustard with Speede-well leaves.

This *Thlaspi* hath divers leaves lying next the ground rough or hairy and almost round, of the bignesse of the nayle of ones thumbe, and of a deepe greene colour every one upon a short footstalk, somewhat resembling the leaves of Speedewell: the stalke is hairy halfe a foote high branching usually from the bottome, and sometimes without branches, set with very few leaves that compasse them at the bottomes and bearing at the toppes many small white flowers and after them small round and long pods upon small footstalkes one above another spike fashion, containing in each a small brownish yellow seede somewhat sharpe in taste: the roote is white and long.

13. *Thlaspi montanum vermiculato acuto folio*. Treakle-Mustard with very small and pointed leaves.

From a great white hard roote rise sundry thicke and short riveld stalkes above a span long, thicke set with very small leaves without order, being narrow and almost round, & pointed at the ends, somewhat hairy about the edges and of a sad greene colour, but smaller upwards unto the flowers at the toppes which grow many busling together in a large umbell, consisting of foure white or somewhat reddish leaves, the under couple being greater then the upper with some yellow threds in the middle: the seede followeth in broad round flat pouches, hollowed in the middle like a Spoon on that side next the stalke and bunching or bellying forth on the outside, flat also at the head, with a seame in the middle as is seene in many sorts of these *Thlaspies* which is flat and yellow in both the sides.

14. *Thlaspi montanum carnosum rotundo folio*. Treakle-Mustard with small thicke leaves.

The roote of this small *Thlaspi* is long, smooth, white and hard, from whence spring divers reddish stalkes, thick with small leaves that are fleshy, and not much broader then the pouches with seede, of a blewish greene colour, yet smaller and narrower up to the toppes, where the flowers stand in a small round tuft of a bluish colour striped with reddish lines or streakes: after which come smaller flat pouches a little dented at the toppes and purplish with small seede in them like the other but lesse.

The Place.

All these Mustards grow on hills and in rocky stony places in severall Countries, yet some of them are found in our owne Land in the like stony places.

The Time.

They all for the most part flower and give their seede in the Sommer moneths, yet some sooner or neare the Spring.

The Names.

The first of these is called by *Lobel*, *Camerarius*, and *Tabermontanus* *Thlaspi Pannonicum Clusii*, by *Clusius* himselfe *Thlaspi primum vel montanum pelatum*, and by *Bauhinus* *Thlaspi montanum Glasii folio majus*: the second is the second *Thlaspi montanum* of *Clusius*, called also by him *Thlaspi Baderse*, by *Lobel* and *Tabermontanus* *Thlaspi album supinum*, *Columna* mentioneth it under the title of *Thlaspi montanum primum bursa pastoris fructu*, which *Bauhinus* calleth *Thlaspi Alpinum Glasii folio minus* according to his correction in his Appendix: the third is *Lugdunensis* his *Thlaspi montanum candidum*, and called by *Bauhinus* *Thlaspi montanum semper virens*: the fourth *Bauhinus* onely maketh mention of by the name of *Thlaspi saxatile rotundifolium*: the fifth is called by *Camerarius* in his Epitome upon *Matthiolus* and in *horto*, *Thlaspi tertium saxatile*, and by *Bauhinus* in his *Matthiolus* *Thlaspi saxatile minore folio*, but in his *Pinax* and *Prodromus*, *Thlaspi Alpinum minus capitulo rotundo*, and by *Pona* in his description of Mount *Baldus* *Thlaspi petraeum Azyagroides*: the sixth is the third *Thlaspi saxatile* of *Matthiolus*, which *Lugdunensis* and *Thalins* doe also mention, but *Thalins* his description thereof is much differing from it, and *Camerarius* upon *Matthiolus* saith hee never found that sort among rockes and stony places, but in the fields and under hedges and therefore in his *Matthiolus* he setteth forth that figure of that which grew with them, and omitted the other of *Matthiolus*, *Bauhinus* afterwards saith that such an one as *Matthiolus* set forth was brought him out of Italy and therefore he giveth the figures of them both in his *Matthiolus* and *Prodromus* by the title of *Thlaspi Alpinum majus & minus capitulo rotundo*, the seventh is called by *Bauhinus* onely *Thlaspi Alpinum repens*: the eighth is the *Lithothlaspi quarum carnosum folio* of *Columna* and called by *Bauhinus* *Thlaspi parvum saxatile flore rubente*: the ninth is called by *Bauhinus* *Thlaspi saxatile Polygalae folio* according to the correction in his Appendix, folio 19. at the latter end of his *Pinax*, but is among his *Thlaspies* folio 107. *Vermiculato folio*: the tenth is *Lobel* his *Thlaspi supinum luteum* which *Bauhinus* entitleth *Thlaspi montanum incanum luteum Serpillifolio majus*, as he doth the eleventh *Thlaspi saxatile incanum luteum Serpillifolio minus*, and is the *Ionthlaspi luteo flore incanum montanum* *Dracopis* of *Columna*: the twelfth is called by the learned of *Mompelien*, *Thlaspi Veronica folio*, and as *Bauhinus* saith is the *Draba minima muralis Discoloris* of *Columna*, and yet hee maketh it to be a *Bursa pastoris* also, calling it *major loculo oblongo*, but *Columna* saith it hath a sharpe taste like a *Draba* but so hath not *Bursa pastoris*: the thirteenth and the last are mentioned by *Columna* under the same titles here expressed.

The Vertues.

These sorts of *Thlaspi* also as they are all or the most of them of the like sharpnesse in taste unto the former, so they may bee of the same qualities in operation but no speciall properties being set downe by any author that have made mention of them nor other private experience, I cannot speake further concerning any of them.

CHAP. XV.

Thlaspi clypeatum. Buckler-like *Thlaspi* or Treacle-Mustard.

Fourth kind of *Thlaspi* is to be spoken of, whose difference from others consisteth chiefly in the seede vessels which are formed somewhat like a buckler, and thereof taketh the name, of which we have not many to entreat, but as they are they shall here follow.

1. *Thlaspi clypeatum Hieracifolium majus*. The great Buckler-Mustard.

This *Thlaspi* hath divers long leaves lying next to the ground, somewhat like unto those of common Hawkeweede, but lesser and unevenly dented or rather waved about the edges, and a little hairy also, among which rise up two or three weake trayling stalkes, with a few leaves thereon much smaller then those below, without any dent or incision in them at all, at the toppes they spread a few branches, whereon are set many pale yellow flowers made of foure leaves a peece, which afterwards give flat round powches divided as it were into two round parts like bucklers, the footstalk standing betweene them; and ending in a small pointell, in each side whereof is contained one seede of little or no sharpe taste at all: the roote is small and slender perishing every yeare.

2. *Thlaspi clypeatum asperum minus*. The lesser Buckler-Mustard.

This other or lesser Buckler-Mustard hath lesser leaves but more rough and hairy then the former, deeply dented about the edges, and from them riseth a small weake stalke, divided at the toppe into two or three branches, set with narrow leaves and small yellow flowers, made of five leaves a peece at the toppes one above another spike fashion, where afterwards stand small Buckler-like heads, and pointed in the same manner as are in the former but smaller as the seede is also: the roote is small and perisheth.

3. *Thlaspi bifidum villosum flore calcarato*. Spurre flowered Buckler *Thlaspi*.

The leaves of this *Thlaspi* that lye on the ground next the roote are about two inches long & halfe an inch broad, cut in on the edges into deepe gathes being hairy and of a light hoary greene colour: the stalke is likewise hoary and hairy of a cubit high, set with such like torne leaves but lesser and compassing it about at the bottome branched at the toppe and bearing large pale yellow flowers consisting of foure leaves a peece, with a small beele or spurre behind like unto those of Todeflaxe, with a small pointell and some threads about it in the middle standing in rough huskes, after the flowers are past appeare such like buckler-like seede vessels as are in the former, parted into two sides, with a pricke in the middle betweene them standing forth: the roote is thicke and long of the bignesse of ones little finger of a taste betweene sweet and sharpe, but the leaves and seede much more sharpe and biting upon the tongue.

4. *Thlaspi clypeatum minus Serpillofolio*. Small Buckler-Mustard with wild Time leaves.

This is a very small herbe not above foure or five inches high whose lower leaves are as small as those of Mother of Time, of a whitish yellow greene colour, those on the stalkes are like the other but smaller, and thickly

1. *Thlaspi clypeatum Hieracifolium majus*.
The greater Buckler-mustard.

5. *Thlaspi clypeatum arborescens Creticum*.
The great Buckler-mustard of Candy.

set thereon, the flowers are small and yellow like the last, and so are the seede vessells but cleare and transparent like cleare Parchment somewhat yellowish: the taste whereof is small like the first.

5. *Thlaspi clypeatum arborescens Creticum*. The great Buckler-*Thlaspi* of Candy.

This hath the lower part of the stalk thick short and woody, the branches rising from thence are of cubits length and woody also, with two hoary thick leaves set all along the branches, many of them turning one way, bearing at the toppes sundry small white flowers, and after them round flat huskes, resembling old fashioned Bucklers among the *Venetians*, with small round flat seede within them, and somewhat sharpe: the roote is thicke, short and woody, with divers strings and fibres thereto.

The Place.

Some of these sorts are naturally growing about *Mompelie* and the parts not farre off, some also about *Naples*, as *Column.* relateth, and the last in *Candy* as *Alpinus* saith.

The Time.

They flower and give their seede about the same time that the others before set downe doe, or somewhat later.

The Names.

The first is called by *Lobel* *Thlaspi parvum Hieracifolium* five *Lunaria lutea Monspelienſium*, by *Clusius* *Thlaspi clypeatum*, by *Camerarius* *Thlaspi biscutatum vel Lunaria bifurcata*, by *Lugdunensis* *Lunaria lutea Dalechampii*, by *Thalium* *Leucoium montanum primum*, by *Columna* *Leucoium Alyssoides umbellatum montanum*, by *Taber montanum* *Thlaspi clypeatum minus*, but in *Gerard* the figure is misset, the greater instead of the lesser as the descriptions declare, and by *Bauhinus* *Thlaspi biscutatum asperum Hieracifolium majus*: the second *Columna* calleth *Iondraba Alyssoides Apulaspicata* and by *Bauhinus* *Thlaspi biscutatum asperum minus*: the third *Columna* calleth *Leucoium montanum flore pedato*, referring it rather to *Leucoium* then to a *Thlaspi*, although the seede vessells are farre differing, but *Bauhinus* contrariwise maketh it a *Thlaspi* as it doth most fitly therunto agree, and calleth it *Thlaspi biscutatum villosum flore calvi donata*: the fourth is called by *Lobel* *Thlaspi alterum minus Clypeatum Serpillifolium*, by *Lugdunensis* *Thlaspi minus clypeatum Penn.*, by *Columna* *Thlaspi minimum spicatum lunatum*, by *Cesalpinus* *Lunaria Græca quarta*, and by *Bauhinus* *Thlaspi clypeatum Serpillifolium*: the last is so named by *Alpinus* in his booke of exoticke plants as it is in the title.

The Vertues.

There is none of these herbes of halfe that fiercenesse or sharpenesse that many of the others before are, neyther is any of them used in Physicke that I know for any purpose, but serve onely as varieties in nature to please the curious.

CHAP. XVI.

Thlaspi fruticosum. Shrubby, bushie, or woody Treakle-Mustard.

Fift kind of *Thlaspi* is of those that grow greater then the rest and more woody like a small bush, whereof there are some varieties here to be expressed.

1. *Thlaspi fruticosum Leucoij folio latifolium*.

The broader leaved woody Treakle-Mustard.

This broad leaved woody *Thlaspi* riseth up with a woody round stalk halfe a yard high bearing thereon long pale Greene leaves like unto those of the Stock-Gillflower but shorter, and narrower the flowers that stand at the toppe are somewhat large and of a pale whitish yellow colour, after which follow seede vessells made like shields parted into two parts, as many other of the former sorts are.

2. *Thlaspi fruticosum Leucoij folio angustifolium*. Narrow leaved woody Treakle-Mustard.

This other woody *Thlaspi* spreadeth with many branches thicke set with narrow long leaves, very like unto the lesser Sea *Leucoium*: the flowers at the top are white standing many together in short spikes, which turne into small flat seede vessells like unto the rest: the roote is white long and woody spreading much under ground.

3. *Thlaspi fruticosum Hispanicum*. Spanish woody Treakle-Mustard.

This *Thlaspi* shooteth forth many weake hard and woody stalkes, scarce able to stand upright, thicke set on all sides with rough hairy leaves like unto Savory up to the toppe where grow many small white flowers in short spikes and after them small flat powches with seede in them: the roote is hard and woody perishing every yeare.

4. *Thlaspi fruticosum spinosum*. Thorny Treakle-Mustard.

This thorny *Thlaspi* riseth up with divers hard woody stalkes branching forth diversly, set in divers places with short and sharpe thornes, the leaves are disperfed on the branches without any order, at some places one or two together and at others more, which are small and long, pointed at the ends, and hoary as it were all over especially on the under side: the flowers are white standing thicke together at the first, but afterwards grow into long spikes where come small seede vessells like unto the smaller sorts of *Thlaspi*: the roote spreadeth divers wayes, yet abideth not but perisheth as the rest doe.

5. *Thlaspi incanum Mechliniense*. Hoary *Thlaspi* of *Machlin*.

This *Thlaspi* of *Machlin* groweth first with many long and whitish hoary leaves lying on the ground, and afterwards bushing thicke upon the slender weake stalkes, beare a number of small white flowers at the toppes in tufts, and afterwards spread more in length, where follow small round seede vessells a little pointed at the ends, containing small seede therein, and lesse sharpe then any others: the roote is long and white perishing after seede time every yeare, but rayling it selfe againe of the shed seede. Sometimes I have seene this kind to give double flowers but no seede neither did it endure long after in my Garden.

1. *Thlaspi fruticosum foliis Leucoj angustifolium.*
Narrow leaved woody Treacle-mustard.

3. *Thlaspi fruticosum Hispanicum.*
Spanish woody Treacle-mustard.

4. *Thlaspi spinosum fruticosum.*
Thorny Treacle-mustard.

5. *Thlaspi incanum Macedonicum.*
Hoary Thlaspi of Maccedonia.

The Place.

These sorts grow in severall countries, some in France about *Marfelles* and *Mompelier*, some in *Spaine* and *Italy*, and some in the *Low Countries*, the same also that were thought proper to some countries have beene found also in others.

The Time.

They all flower in Summer, and give their ripe seede shortly after, but few of them abiding after the seede is ripe.

The Names.

The first is called by *Bauhinus* *Tblaspi fruticosum Leucoij folio latifolium*, as it is in the title: the second is called by *Lobel* in his Observations *Tblaspi fruticosum folio Lencioij marini minoris*, whom *Lugdunensis* and *Tabernmontanus* doe follow, but *Bauhinus* calleth it *Tblaspi Leucoij folio angustifolium*; and *Camerarius* *Tblaspi sempervirens biflorum*: the third is called by *Lobel* *Tblaspi fruticosum alterum*, and so doe *Lugdunensis* and *Tabernmontanus*; and as *Clusius* thinketh is his *Tblaspi sextum Hispanicam albo flore*, by *Bauhinus* *Tblaspi fruticosum folio Thymbræ hirsuto*: the fourth is called by *Lobel* and other since him *Tblaspi fruticosum spinosum Narbonense* or *Tblaspi spinosum*: the fifth is called by *Lobel* and *Clusius* *Tblaspi incanum Meechliniense*, by *Bauhinus* *Tblaspi fruticosum incanum*, who taketh it to be *Tblaspi incanum fruticosum Franconie* of *Camerarius* of *Camerarius* in *horto*, as also the *Iberis* of *Tabernmontanus* which *Gerard* hath expressed under the title of *Tblaspi fruticosum*.

The Vertues.

Some of these sorts as are sharpe as any of the former which therefore may be judg'd as conduceable for the greekes the first sorts were appropriate as they: the others that are little or nothing sharpe are held to be unprofitable.

CHAP. XVII.

Tblaspi exoticum, Strange fashioned *Tblaspi*.

He last kinde of these Treacle-Mustards are such as are in forme of leaves, or growing farre differing from all the other kinds and not from the strange countries where they grow.

1. *Tblaspi hederaceum*, Ivie leaved Treackle-Mustard.

This *Tblaspi* shooteth up with many weake tender stalkes leaning downwards, and rather creeping upon the ground, than raising it selfe to be much above a spanne high, disperfiedly set with small broad leaves, thicke and short, broad at the bottome, cornered about the middle, and pointed at the end, somewhat resembling Ivie leaves: the flowers are small and white growing spike fashion at the toppes of the branches, which after wards yeeld small round seede vessells parted at the ends containing small seede and sharpe, like *Tblaspi*: the roote is small, long and fibrous perishing every yeare.

2. *Tblaspi aliud Lunatis folijs* five *Lunaria* Majorum Arab. in *Lobelij*.
Ivie leaved Treackle-Mustard.3. *Tblaspi aliud Lunatis folijs* five *Lunaria* Majorum Arab. in *Lobelij*.
Strange Moonewort-like Treackle Mustard. 3. *Tblaspi*.

Thlaspi aliud Lunarij folijs five Lunaria Magorū Arabum Lobelio. Strange Moone worke-like Treakle-Mustard. Although it be not determined by *Lobel* to what genus this plant is to be referred, yet I have presumed to place it next unto the lyie leaved kind untill it can be otherwise disposed, his description thereof being briefe thus. It shooteth forth in March from an ash coloured bending woody roote divers leaves somewhat like unto a *Lunaria*, or like unto the new sprung leaves of the French round leaved Sorrell, and almost like also to those of the lyie leaved Treakle-Mustard, hee neither saw flowers nor fruit: he found this hee faith onely in *Savoy*, in the valleys that are betwene that high hill called *Mons Seny*, and *Saint Iean de Morienne*.

3. *Thlaspi Alexandrinum.* Levant *Thlaspi* or of *Alexandria*.

This is a small plant but very beautifull, scarce halfe a foote high, from whose roote which is long and slender riseth vp divers branched stalkes, at each joint whereof where it brancheth groweth a large round leafe compassing the stalk on both sides, round like unto those of *Thoroughwaxe*, from the toppes of the branches come forth many flowers, and after them small round feede vessells ending in a point, parted in the middle by a skinne, in each whereof lie finall seede.

The Time.

The first *Lobel* faith hee found in *Portland* which is an Island belonging to *Cornwall* nor farre from *Plimouth* in the West of *England*, and in divers of the sea coastes thereabouts: the second he likewise found he faith in *Savoy* as it is set downe in the description: the last came from *Alexandria* and other parts of *Syria*.

The Place.

The first slowreth and seedeth plentifully both in the naturall places, and whether it is transplanted in the Summer moneths: but the second, as is said was not knowne: the last as coming out of an hotter climate is somewhat more tender and hard to be kept a Winter, for it beareth not the first year, and hardly the next but very late.

The Names.

The first is called by *Lobel* *Thlaspi hederaceum*, and so doth *Lugdunensis*, and others that have made mention thereof since; *Bauhinn* calleth it *Thlaspi repens hederæ folio*: the second is called by *Lobel* *Lunaria Magorum Arabum*, as he faith the *Italians* doe call it: *Bauhinn* calleth the last *Thlaspi Alexandrinum* being so called by *Cornutus* who sent the seede.

The Vertues.

There hath no triall beene made of any of these sorts by any that I know, and therefore thus much shall suffice to have spoken of both of those and the others before, for I intended not to invent receipts of those things I mention, but to relate what I have read or knowne to be practised.

CHAP. XVIII.

Draba five Arabis. Arabian Mustard.

Nearest both in forme and qualitie unto the *Thlaspi* is this herbe *Draba* which I have Englished *Arabian Mustard* for want of a fitter name, for although the Latine or Greeke name (whether ye will, or neither if ye will) may seeme to urge an *Arabian* originall, yet we find that it is as an adulterate a Greeke name as a Latine, and not thought to be of *Dioscorides* his owne setting downe, but intruded by others into some copies of his, because others that are more authenticke have it not at all: the ancients have mentioned but one sort, but these later times have produced divers others, which have beene so called of the likenesse in some parts, unto the most knowne and common.

1. *Draba vulgaris.*

The more common or knowne *Arabian Mustard*.

This *Arabian Mustard* from a creeping white roote shooteth up in divers places many straight straked stalkes set about with grayish Greene leaves, somewhat broad and not very long, a little pointed at the end, and broad at the bottome compassing them, but those that grow at the foote of them have every one a short foote stalk and dented unevenly about the edges: the toppes of the stalkes are spread into many branches, all of them rising to an equall height, with many small white flowers set thereon of foure leaves apeece, forming a large tuft or umbell, where after they are past stand finall round feede vessells, divided into two parts like some of the former *Thlaspies* with a small pointell at the end, containing in each part one feede somewhat sharpe as the leaves are a litt'e also: this by the creeping rootes maintaineth it selfe in the Winter and perisheth not.

2. *Draba minor capitulis orbicularibus.*

The smaller *Arabian Mustard*.

This smaller sort hath divers hairy leaves rising from the roote somewhat dented about the edges, and standing upon long foote stalkes, from among which spring up a small slender stalk about an hand breadth high, having a few leaves much longer and narrower set thereon, and from the middle thereof plentifully stored with small branches and round heads on them (for the flowers have

1. *Draba vulgaris.*
The more common or knowne *Arabian Mustard*.

not been observed) parted by a thinne skinne containing one feede in each part: the roote is reasonable great for the smallnesse of the plant, with small fibres annexed thereunto and living many yeares.

3. *Draba tenuifolia*. Thinne leaved *Arabian* Mustard.
From a small long white roote rise brittle short stalkes about a foote long, with small branches towards the toppes, set with a few pale Greene leaves of two inches long and one broad, dented about the edges and compassing them at the bottome, of a fierie hot and sharpe taste: the flowers stand at the toppes as it were spike-fashion, small and white, which afterwards give small round heads every one set upon a long foote stalk.

4. *Draba alba filiquosa repens*. The more creeping coddled *Arabian* Mustard.
This more creeping square coddled *Arabian* Mustard sendeth forth many heads of leaves compassing one another circlewise, thicke full of juyce somewhat broad, dented about the edges and of a darke Greene colour, sharpe and pricking upon the tongue, and from the midst of them severall weake stalkes a foote or more long, upon whom grow smaller leaves and broader at the bottomes where they compass them, set at severall distances, at the toppes whereof come forth divers white flowers in a small tuft standing one above another, more separate as they flower, making a long spike, and give small long and round coddles, which parting into two parts, shew the small reddish feede within them cleaving to each side: the roote is small and creepeth spreading farre about.

5. *Draba alba filiquosa minor*. The lesser coddled *Arabian* Mustard.
This smaller sort hath divers branches of leaves rising from the roote which lying on the ground or a little covered with earth shoote forth small fibres whereby it creepeth farre about: the leaves are broad at the point and smaller at the bottome, dented into some deepe dents or notches, the greatest whereof are lowest, of a grayish Greene colour which so abide the first Winter, and then somewhat early before the beginning of Summer following, from among them rise sundry upright slender hairy stalkes halfe a foote high, set with lesser leaves which compass the stalkes at the bottome, after which come slender long and round coddles, like to those of the ordinary Mustard, containing within them in a double row small reddish feede: the roote is small and white, sending forth such like branches of leaves yearly abiding all the Winter after.

6. *Draba Erysimi flore & filiquis*. Bastard *Arabian* Mustard.
This small plant hath divers such like branches of hairy whitish leaves lying about the roote, slightly dented about the edges, every one on a small foote stalk, from among which rise up weake and slender stalkes, set with the like leaves and sundry small yellowish flowers at the toppes, whom small long coddles doe follow, containing small sharpe feede: the roote is of the bignesse of a finger, white and long, set without, or with very few fibres.

7. *Draba lutea*. Yellow *Arabian* Mustard.
The last plant is not so small as this is great, shooting forth square, but weake stalkes, four or five foote long or more, not able to stand upright, but lie on the ground, oftentimes, set orderly with long and somewhat broad Greene leaves, a little hairy and dented about the edges, spreading many long branches, all of them stored

4. *Draba alba filiquosa repens*.
The more creeping coddled *Arabian* Mustard.

5. *Draba alba filiquosa minor*.
The lesser coddled *Arabian* Mustard.

6. *Draba Erysimi flore & siliquis.*
Bastard Arabian Mustard.

7. *Draba lutea.* Yellow Arabian Mustard.

with very small yellow flowers, growing scatteringly at the toppes with some small leaves among them, which turne into very slender and limber long pods, with very small yellowish feede in them very sharpe and biting upon the tongue: the roote groweth to be very great and somewhat woody, very strong and fierce both in smell and taste, abiding under ground many yeares, but loosing all stalkes and leaves above ground every yeare.

8. *Draba flore ceruleo galeato.*

Hooded Arabian Mustard with blew flowers.

For some likenesse unto *Draba* is this plant referred thereunto, although in many things much differing: the roots consist of many long white strings and store like unto the *Asclepias* Swallowwort, of an hot but aromaticall and spicy taste, which usually sendeth forth but one stalke, yet sometimes two, straight smooth and straked, about halfe a yard high, spread into some few branches, bearing hooded blew flowers like those of *Orchis* or *Dogs* stones of an inch long, standing on each side of them to the toppes: the lower greene leaves are about two inches long and scarce one broad smooth and dented about the edges, but those that grow up higher and but few upon the stalkes are narrower and more pointed.

The Place.

The first *Clusius* saith he found as plentifully about the borders of the fields at *Vienna*, as others have done in other places, and so likewise the fourth and fift, the second being not mentioned where it grew; the third was found about *Bononia*: the sixt *Lobel* saith groweth not farre from *Mompelur*: the seaventh at *Tubing* neare the river *Neccar* about *Heidelberg* and *Bornia* in *Rhatia* among the *Switzers*: the last is naturall in certaine places of *Narbonne* in *France*.

The Time.

They doe all flower in the moneths of *June* and *July* and their feed ripeneth in the meane time.

The Names.

It is called in Greeke *δραβή* *Draba* and some in Latine *Arabis* and *Draba* but from whence deduced it is not yet found out, although *Lobel* and *Pena* doe ghesse much thereabouts: for divers writers have observed, that this herbe was never knowne to *Dioscorides* nor mentioned by him, but thrust into the text as I said before by some later writers, for neither *Galen* nor *Oribasius* who both followed *Dioscorides* method, and wrote most of the same things make any mention thereof at all, no more doe *Atius* nor *Paulus Aegineta* who in the same manner and order write of the same herbes with *Dioscorides*, no nor *Pliny* neither who wrote out of *Dioscorides* the most of his plants, yet *Cordus* thinketh that *Pliny* meaneth this plant under the name of *Driophanon*: besides it is twise set downe in some Greeke copies that are manuscripts, first in the Chapter next unto *Thlaspi* in his second booke, and then at the end of the same booke betweene *Glastrum* and *Telephium*, yet howsoever it is, the herbe so named is now well knowne now a dayes, and accepted by that name among all the moderne writers of herbes, and although *Dodonæus* mistook this and thought the *Thlaspi creticum* to be it, yet others soone found his error & avoided it. *Scrapia* calleth it *Nasturtium Orientale*: the first is generally called *Arabis* and *Draba vulgaris* by all Authors, and *Nasturtium Babilonicum* by *Lobel*, *Banhusius* calleth it *Draba umbellata*, vel *Draba major capitulis orbicularibus*: the third is called by *Banhusius* led by *Clusius* *Draba minor* and by *Banhusius* *Draba minor capitulis orbicularibus*: the fourth is called by *Lobel* *Draba vel Arabis altera* and so by *Lugdunensis*, *Draba tenuifolia veluti spicata*: the fourth is called by *Lobel* *Draba vel Arabis altera* and so by *Lugdunensis*, and *Eruca muralis* by him also, by *Clusius* *Draba tertia succulento folio*, and by *Banhusius* *Draba alba siliqua repens*, who thinketh it may be the *Planta siliquifera Thlaspeos generibus cognata* of *Thalium*, but *Thalium* himselfe thinketh it may agree with *Lobel*'s *Sinapi* and *Thlaspi media planta*: the fift is *Clusius* his *Draba secunda* which *Banhusius* calleth *Draba alba siliquosa*: the sixt is that *Sinapi* and *Thlaspi media Provincialis* planta of *Lobel* whom *Lugdunensis* followeth & *Banhusius* calleth *Draba Erysimi flore & siliquis*: the seventh is mentioned by *Camerarius*, both in his *Epitome* upon *Matthiolum* & in his *Hortus medicus* also by the name of *Arabis quorandam* by *floribus luteis*, and saith it may more fitly agree thereunto then unto the *Solidagines*, by which name he received it out of *England*, which maketh me much to suspect that this *Draba lutea* is the same herbe that wee doe usually

here

here in England call *Solidago Sarafenica* and *Germanica siliquosa*, it doth so nearely answer it in every part, which was also well knowne to *Gerard* in his time, although mentioned by him in a contrary place from the *Solidago Sarafenica*, namely in the Chapter of *Epimedium* Barren-wort, where hee compareth the cods of *Epimedium* unto the cods of *Sarafens* consumed, meaning this plant and not that which he had described before for *Solidago Sarafenica*, whose feede he saith is blowne away with the winde. *Bauhinus* in his *Martholus* calleth it *Draba lutea*, and in his *Pinax* *Draba lutea strictissimis siliquis*: the last *Bauhinus* hath onely mentioned by the name of *Draba flor. ceruleo galeato*, which as I sayd doth hardly or very little agree unto any *Draba*.

The Vertues.

The *Arabian* Mustard being as sharpe in taste as any *Thlaspi*, is accounted to be hot and dry, and thereby to be as effectual to all the purposes that *Thlaspi* or *Cresses* serve unto, and as it is in *Dioscorides* if the Chapter be his is used in stead of Pepper to put among broths and meats, and also being boyled with *Prifane*, is available to cure rough siegme that ticketh in the breast and lungs, causing it to be easily expectorate and spit forth.

CHAP. XIX.

Turritis sive *Territa*. Towers Mustard.

If this herbe there are two or three sorts mentioned by some writers, whereof some of them referred them as *Bauhinus* doth unto the kinds of wilde Coleworts, to whose censure I cannot so readily agree, in that the herbe in part but the feede chiefly is as hot and sharpe in taste as the *Thlaspi* or *Draba*, and therefore fittest to be joynd next thereunto as comming nearest unto their family.

1. *Turritis vulgarior*. The more common Towers Mustard.

This more common sort of Towers Mustard hath many rough hairy leaves full of sappe or juicē, of a deepe Greene colour about two inches long and more then one broad, pointed at the ends and broadest in the middle, little or nothing dented about the edges, lying round about the head of the roote upon the ground, from among which rise up divers rough and hairy stalkes neare two foote high, set orderly with such like leaves one above another on all sides thereof, but compassing them at the bottome which are narrower & longer pointed then those below: at the toppes of the stalkes which are feldome branched, grow many very small white flowets as it were in a tuft together, but flower by degrees the lowest first, and bring forth long slender cods presently after, which standing upright round about the stalkes before the highest flowets are blowne, the whole stalkes seeme like *Pyramides*, Steeples or Towers from whence it tooke the name, in which cods are contained small browne and sharpe biting feede: the root is composed of many white fibres or strings feldome abiding after it hath given feede thereof,

1. *Turritis vulgarior*.
Common Towers Mustard.2. *Turritis major*.
The greater Towers Mustard.

being fled, there doth spring up divers plants before winter, and so abide to flower and seede the next Sommer.

2. *Turritis major*. The greater Towers-Mustard.

This greater sort spreadeth many leaves upon the ground somewhat greater & longer, and not so rough or hairy as the former, somewhat crumpled and waved about the edges, and of a paler or whiter Greene colour, almost of the colour of the field Coleworts (which onely thing in my opinion cauled *Bauhinus* and others to referre the parts unto the wilde Coleworts) the stalkes rise higher and more branched, the leaves on them compassing them at the bottomes, much more than the former, bearing small whitish yellow flowers at the toppes, and long slender pods like unto the other after them, but somewhat longer more crooked, and not growing up so straight about the stalkes, but more loosely or sparsedly, containing within them somewhat larger seede and not altogether so fierce and sharpe: the roote is white and thicke with fibres growing about it, which perisheth and is raised againe in the same manner.

3. *Turritis Alpina*. Mountaine Towers-Mustard.

This small mountaine Towers Mustard groweth up with a small smooth round stalke little above a spanne high, having divers small leaves at the foote thereof slightly waved about the edges, and of a pale Greene colour, longer also than those that grow upon the stalke which are not many, and they smaller and shorter and without foote stalkes; at the toppes whereof stand many small white flowers so clustering that they forme a short spike, every one standing on a long foote stalke: the coddles have not bene well observed: the roote is small and white.

The Place.

The first delighteth to grow more on the open Sunnie hills, and the second more in the woodes and shadowye places, and both in *Austria* plentifully as *Clusius* saith where the last was found also.

The Time.

These flower early for the most part sometime in *Aprill* but usuall in *May*, and the seede is ripe in *June*.

The Names.

These herbes have not bene knowne to any of the ancient Herbaristes either Greeke or Latines, neither yet to many of our moderne Writers, for I finde none of them to make mention thereof by the name of *Turritis* or *Turrita*, but *Lobel* in his *Dutch Herball*, *Clusius*, *Tabernmontanus*, and *Gerard* from him whose figures were used for his Herball, and *Bauhinus* last of all, who yet, as I said in the beginning of the Chapter referreth them rather to the kindes of *Brassica sylvestris* wilde Coleworts. The first is called by *Clusius* *Turrita vulgarior*, and *Turritis* by *Lobel*, *Tabernmontanus* calleth it also *Vaccaria*, and *Bauhinus* *Brassica sylvestris folijs integris & hispidis*: the second is called *Turrita major* by *Clusius*, but *Thalium Brassica sylvestris proceræ*, and *Bauhinus* following *Thalium* rather than *Clusius* calleth it *Brassica sylvestris ramosa tota pene glabra*: *Bauhinus* calleth the last *Brassica sylvestris Alpina*, although as he saith it was sent him by a skilfull Herbarist by the name of *Turritis Alpina*.

The Vertues.

The fierce sharpenesse of these herbes, and especially the seedes doe plainly declare them to bee congeneres to the Mustards, Cresses, *Thlaspi*, and the like, and no doubt will worke the same effects, although I have no author from whom I might declare any speciall properties in them, and therefore I leave them to every ones practise to experiment their vertues.

CHAP. XX.

Iberis Cardamantica, *Sciatica* Cresses.

Citica Cresses are of two sorts, of both which *Matthiolus* entreateth but in severall places, the one in the end of the first booke under the title of *Iberis*, the other under *Lepidium* in the second booke.

1. *Iberis Nasturtij folio*. *Sciatica* Cresses.

This *Iberis* riseth up with a round stalke about two foote high spread into divers branches, whose lower leaves are somewhat larger than the upper, yet all of them cut or torne on the edges, somewhat like unto Garden Cresses but smaller: the flowers are small and white growing at the toppes of the branches, where afterwards grow huskes like unto Cresses, with smaller brownish seede therein than in the other, very strong and sharpe in taste more than the Cresses: the roote is long, white and woody.

2. *Iberis latiore folio*. *Sciatica* Cresses with larger leaves.

This other hath the lower leaves whole, somewhat long and broad not rent or torne at all, but onely somewhat deeply dented about the edges towards the ends, very like unto those of *Thlaspi Creticum* set forth here before among the *Thlaspi*s, but thole that grow up higher are lesser: the flowers and seede are like the former, and so is the roote likewise, and both roote and seede as sharpe as it.

The Place.

These grow by the wayes sides in untilld places, and by the sides of old walles, &c.

The Time.

They flower in the end of *June*, and their seede is ripe in *July*.

The Names.

It is called in Greeke by *Dioscorides* *ἰβερὶς καὶ καρδαμάντις*, *Iberis sive Cardamantica quod Cardamo, id est, Nasturtium simili est* (and *ἰβερὶς καὶ καρδαμάντις Nasturtium sylvestre*) if the text be *Dioscorides* his owne, which is plainly convinced not to be by good reasons, because by the testimonie of *Galen* *Iberis* and *Lepidium* are all one (for in his tenth Booke *De comp. medicam secundum locos*, from the authority of *Hygienus Hippareus*, hee saith thus: *Si coxendicium dolores levare est animus, herbam Iberidem quam aliqui Lepidium vocant, aut Nasturtium sylvestre colligito*, &c. and *Dioscorides* hath a Chapter in his second Booke intituled for *Lepidium*, so that he would not speake of one herbe in two places, besides this *Iberis* is thrust into the end of his first Booke, which doth not in qualitie sort with the rest of the herbes there set downe before. *Galen* also in his booke *De simplicium censu*, doth never intreate of them severally as of two herbes, but still as of one. *Paulus Aegineta* likewise saith that *Lepidium* was called *Iberis*, being hot in the fourth degree and neare unto

1. *Iberis nasturtii folio.*
Scitica Cresses,2. *Iberis Cardamantice latiore folio.*
Scitica Cresses with larger leaves.

Cresses in the properties: and in his third Booke and 77. Chapter, speaking *De Ischiadis curatione*, he saith, *In totius ischiadicos sanitati restituit Iberidis herba usque quam Lepidium quoque vocant*; they therefore that separate them and make them different herbs are in an error, but the said *Paulus Aegineta* in the same Booke and place sheweth that there is another *Iberis* saying, *Iberis fruticosa quae apud nos nascitur Lauri folijs similibus & multo amplioribus respondere multis testimonio testantur, non solum in coxarum sed in alijs quoque duris usibus*; which *Iberis* or *Iberis altera* is very likely to be the *Lepidium* of *Pliny* in his 19. Booke and 8. Chapter, whereof he saith thus, *Exit Lepidium in cubentem altitudinem folijs Laurinis*, which *Lepidium*, by the judgement of the best of the later Writers is that herbe which some call *Piperitis*, and some *Raphanus sylvestris*; in *English* *Dittander*, whereof I shall speake in the next Chapter. *Damocrates*, as *Galen* sheweth first, called it *Iberis*, because he cured a friend of his in *Iberia* with this herbe, which he learned of another who knew not the name thereof, and therefore *Damocrates* in a Booke of his called *Chiricus* setteth downe in *Iambicke Verses* both the forme of the herbe, and the place of growing, that others might know it, and the manner of the cure also for others to follow, which here to recite were too tedious. *Pliny* calleth it *Iberis* mistaking the accent over the *Iota*, as it is likely. It is thought also by some that it is the *Gris Apuleij*. *Matthiolus* giveth the figure of the first in his greater figures, and of the other in his lesser: *Anguilara* calleth the first *Lepidium campestre*, *Tabernmontanus* *Iberis secunda*, *Durantes* *Iberis*, and *Cervard* *Iberis Cardamantica*, but *Bauhinus* *Iberis Nasturtij folio*: the other is called *Iberis* by *Lugdunensis*, *Dodonaeus*, *Lacuna*, *Gesner* in *hortis* and *Cesalpinus*, who yet saith it is *Lepidium forte Columella*; by *Anguilara* *Lepidium hortense*; by *Lobel* *Iberis Cardamantica* *Lepidium Iberias Pauli*; and by *Bauhinus* *Iberis latiore folio*: the *Arabians* call it *Seitragi* and *Haulab*: the *Italians* *Iberide* and *Lepidio*; the *Spaniards* *Mustuerfo montesino*; the *French* *Pusserage suauge* and *Nasturt*; the *Germanes* *Wilderkerff*; the *Dutch* *Scitica Kers*; and we in *English* likewise *Scitica Cresses*.

The Vertues.

The leaves, but especially the rootes while they are fresh taken in the Summer time, beaten and made into a pulvis or salve with old *Axungia* or Swines grease, and applied to the place pained with the *Sciatica*, to continue thereon for foure houres in men, and two houres in women, the place afterwards bathed with wine and oyle mixed together, and then wrapped with wooll or skinnes after they have sweate a little, will assuredly cure, saith *Galen* from *Damocrates*, not onely the said disease in the hippes and hucklebone, and others of the joynts, such as is the gout in the hands or feete, but all other old griefes of the head, as inveterate rheumes, or in any other part of the body that is hard to be cured, and saith also that *Damocrates* cured hereby all those diseases wherunto were *Sinapi mes* used or *Thapsia* applied: *Pliny* reciteth the same method and manner that *Damocrates* useth in his Verses, and saith that if any part of the griefe remaine, the same medicine after 20. dayes, is to be applied againe: the same also is effectual in the diseases of the spleene: and applied to the skinnie it taketh away the blemishes thereof, whether they be scarres, or leprosie, or scabbes, or scurf, &c. which although it exulcerate the part, yet that is to be helped afterwards with a salve made of oyle and waxe. *Diocorides*, and *Pliny* from him say, that if the roote be hung about the necke, or tied to the arme it will ease the paines of the tooth-ach.

CHAP. XXI.

Lepidium five *Piperitis*. Pepperwort or Dittander.

Having shewed you in the last Chapter that there is another *Lepidium* differing from *Iberis*, I thinke it meete to shew you which it is, and place it next thereunto, and together with it expresse some others, that for their likenesse and properties have obtained the same name.

1. *Piperitis* five *Lepidium vulgare*.
Dittander or Pepperworthe.

Our common Pepperworthe called Dittander, sendeth forth somewhat long and broad leaves, of a light blewish Greene colour finely dented about the edges and pointed at the ends, standing upon round hard stalkes three or foure foote high, spreading many branches on all sides, and having many small white flowers at the toppes of them, after which follow small seede in small heads: the roote is slender running much under ground, & shooting up againe in many places, and both leaves and roote are very hot and sharpe in taste like unto Pepper, for which cause it tooke the name.

2. *Lepidium Monspeliacum* *Dentellaria distum*.
French Dittander or Scarre-worte.

This herbe which is usually called *Dentellaria Rondeletij* five *Narbonensium*, sendeth forth a number of long and limber stalkes, reddish at the bottome, and lying downe upon the ground, and not standing upright by reason of the length, which in my Garden became five or sixe foote long set with leaves on all sides of them, being somewhat narrow, long, and smooth, of a sadde Greene colour smaller at the lower end, and compassing the stalkes about, but

2. *Lepidium Monspeliacum* *Dentellaria distum*.
French Dittander or Scarre-worte.

1. *Piperitis* five *Lepidium vulgare*.
Pepperwort or Dittander.

3. *Lepidium annuum*.
Annuall Dittander or Scarre-worte.

Dddd

lesser

lesser still up higher to the toppes, where they are a little branched, and doe break forth into divers darke purplish flowers set together, consisting of five small pointed leaves a peece standing in rough brownish huskes, wherein afterwards is contained small round and blackish seede very sharpe in taste, exulcerating the skinne and burning it being layd thereon as the leaves doe also; the roote is composed of man great strings with a woody pith in the middle, running downe deepe into the ground and abiding many yeares, although both stalkes and leaves perish every yeare gaining fresh in the Spring.

3. *Lepidium annuum*. Annuall Dittander or Scarcewort.

This Dittander or Scarcewort hath stalkes more upright then the last, three or foure foote high, set with such like leaves as the last but somewhat larger and compassing them at the bottomes: the flowers are white, and stand upon small branches spike fashion one above another, which afterwards give small round and pointed huskes like some of the *Thlaspi*, wherein the seede is contained no lesse hot and fierce in taste, and exulcerating the skin then in the former the roote is small and fibrous perishing yearely.

The Place.

The first is found naturally growing in many places of this Land, as at *Clove in Essex*, neare *Exeter* also, and upon *Rockes* Common in *Kent*, at *Sawle Abbey* neare *Wharley* in *Lancashire*, and in other places, but is usually kept in Gardens: the other two are found about *Mompelien* in *France*.

The Time.

The first flowreth in the end of *June* and in *July*, but the second very late with us in *August*, and never gave ripe seede in *England* that ever I knew: the last flowreth in *July* and the seede is ripe in *August*.

The Names.

Aspidon *Lepidium* in *Greece* is so called as it is thought *quod Aspidon id est, maculas & squamas in cute delent*, or as others thinke *and tūdem quod acrimonia tūcti ulceret* *Lepidium* also in *Latine*, yet this is not the *Lepidium* of *Diocorides* and *Galen* which is a smaller herbe even the same I shewed you in the last Chapter, but is that *Iberis frutescens* of *Paulus Aegineta*, and *Pliny* his *Lepidium folijs laurinis* also, as I shewed you before: The first is called *Piperitis* by *Fuchsius* and *Loniceras*, by *Tragus*, *Matthiolus* and *Camerarius* *Lepidium* sive *Piperitis*, and *Lepidium magnum* by *Fuchsius*, *Turner* and *Cordus* in *Historia*, *Angulara* tooke it to be *Lepidium Diocorides*, it is *Lepidium Plinij* by *Lobel* and *Dodonaeus*, and *Lepidium Pauli & Plinij*, by *Matthiolus*, *Lugdunensis* and *Cesalpinus*, by *Lobel* *Raphanus sylvestris officinarum*, and by *Bauhinus* *Lepidium latifolium*: the second is called *Demellaria Mompeliaca*, by *Gesner* in *hortis* and *Flammula*, who saith it is called at *Rome* *Herba Sancti Anthonij*, by *Lobel* and *Lugdunensis*, *Dentellaria* and *Dentaria Rondeletij* and *Narbonensium*, *Molybdæna Plinij* by *Angulara* and *Camerarius*, who also saith it is called *Crepauella* by the *Italians*, *Clusius*, *Durantes* and *Tabernmontanus* call it *Plumbago* and *Plumbago Plinij*; *Belonius* saith that they of *Candy* call it *Saxiphago* they of *Lenno* *Phrocalida*, and they of *Lesbos* *Marroina*, *Cesalpinus* calleth it *Glastrum sylvestre* and *Bauhinus* *Lepidium Dentellaria dictum*, the last is called by *Lobel* *Lepidium annuum*, and so also by *Lugdunensis*, but by *Bauhinus* *Lepidium glastrifolium*. Wee usually call the first in *English* Dittander and Pepperwort, but the other two may be called in *English* from the *Greece* etymologie *Scarcewort*, eyther because it will make a marke in the hand of them that shall hold it a while, or that it will take away markes and scates of wounds, sores, or burnings in the flesh.

The Vertues.

All these herbes are as hot and fiery sharpe as the last, and worke the same effects, for both *Paulus Aegineta* and *Pliny* say, that they are effectuall for the *Sciatica* or *Hip-gout* or any other gout or paine in the joynts, or any other inveterate greefe, the leaves hereof to bee bruised and mixed with old *Axungia*, and applied in the same manner, and used in the same order that the *Sciatica* *Cresses* are appointed be ore: the same also amendeth the deformities or discolourings of the skinne, and helpeth to take away markes, scates, and scabbes or the fowle markes of burnings with fire or *Iron*. The women of *Bury* in *Suffolke* doe usually give the juice thereof in Ale to drinke to women with child to procure them a speedy delivery in travaile. The others are judged by the learned men at *Mompelien* to be also of the same effect, for some of them tooke that of *Rondeletius* to be the right *Lepidium* of *Diocorides*, whereunto such vertues are attributed by *Rondeletius*, who made as good use thereof for the tooth ach as he did of *Pelletory* of *Spaine*, and moreover by holding some of the leaves in their hands that had the toothach did give them ease, and withall raise a marke or wanne discolouring in the palme of the hand, and leave it so after it was cast away.

CHAP. XXII.

Hydrociper sive Persicaria. Arsmart.

Ecause the last herbe was called *Piperitis* I thought good to joyne these, and although in former times there were onely two sorts of Arsmart knowne to all Herbarists, yet since then *Lobel* hath added a small one, *Bauhinus* a fourth, and we to increase their number are to joyne divers others unto them.

1. *Persicaria vulgaris acris sive minor*. Ordinary quicke or sharpe Arsmart.

The quicke or sharpe Arsmart groweth not so high or great as the mild sort doth, but with more store of branches and leaves, somewhat like unto *Peach* leaves, and are long and somewhat narrower then the other, and most usually without any spot at all upon them, yet sometimes it hath bene found with reddish markes upon the leaves: at the greater joynts as well towards the toppes of the stalkes, as at the toppes also come forth small spikie heads of bluish coloured, and sometimes more red or white flowers mixed or clustering together, which falling away, blackish flat seede come in their places: the roote is somewhat long with many fibres thereat, which as well as the rest of the plant is of a very sharpe and quicke taste, biting the tongue more then *Pepper*.

2. *Persicaria vulgaris mitis sive maculosa*. Ordinary spotted Arsmart.

This other Arsmart hath somewhat broader leaves set at the great red joynts of the stalkes, with semicircular blackish markes on them usually yet sometimes without: the flowers grow in somewhat longer spikes usually, eyther

either bluish or whitish with such like seede following: the roote also is of the same fashion and both perishing yearly: this hath no sharpe taste at all, but rather softer like Sorrell, or else a little drying or without taste.

3. *Persicaria Angustifolia*. Narrow leaved Arismet.

This small Arismet hath reddish stalkes of a cubits height, with much narrower leaves at the joynts then the former, and at their toppes such cluster-like heads of bluish flowers but lesse by a great deale: the roote is blackish and threddy.

4. *Persicaria pusilla repens*. Small creeping Arismet.

This other small Arismet standeth not upright at all as the former doe, but leaneth downewards with the weaker branches, which together with the small long narrow leaves are not by the halfe so great as either of the two first, and differeth not but in the finallesse from them with sometimes white and sometimes purplish flowers.

5. *Persicaria acris Virginiana*, Sharpe Arismet of Virginia.

This Arismet of Virginia is in most things like the first, with long narrow leaves, but the flowers grow on more slender and long spikes and wholly white.

6. *Persicaria frutescens maculosa Virginiana, flore albo*.

Shrub spotted Arismet of Virginia with white flowers.

This sort of Virginia Arismet riseth up with sundry hard round Greene stalkes with the like great joynts on them as the others have, and faire large broad darke blewish Greene leaves with small long points on them, spotted oftentimes like the common sort, and often also without markes, in many six inches long or better, and three and a halfe broad, with sundry compassing veines from the middle ribbe, and others lesser and transverse: at the toppes of the stalkes and from the joynts with the leaves likewise, spring branches of spiked white flowers, like close graines as in the

4. *Persicaria pusilla repens*. Small creeping Arismet.

1. 2. *Persicaria vulgaris crena* & *mitis* *fere maculata*. Ordinary quicke or sharpe Arismet, and the spotted or mild sort.

6. 7. *Persicaria frutescens maculosa Virginiana* *flore albo* & *flore carnea*.

Shrub spotted Arismet of Virginia, with white and with bluish flowers.

other but greater, succeeded by the like blacke and flat shining seede: the roote consisteth of a great bush of long blacke stringes and threads which petrish not yearely as the former doe, but abide from yeare to yeare, yet oftentimes the stalkes with leaves above ground dye downe and rise afresh in the Spring.

7. *Persicaria altera frutescens longifolia maculata Virginiana flore carneo.*

This other *Virginia* Arsmart groweth up with straight round stalkes, much higher than the last, with much longer and narrower leaves, marked also oftentimes in the like manner, and often also without: this is more plentiful in branches of flowers, which are shorter spikes but thicker set, with fine bluish coloured flowers, much larger than in any of the former, but gave no seede with the Gentleman Mr. *John Morrice* of *Ipselworth*, that had it risen from the seede that was sent him from a friend in *Virginia*: the roote is greater and more woody than the last, and perished with the extremitie of the hard winter frost.

The Place and Time.

The former two sorts grow almost every where with us in watery plashes, ditches, and the like, that for the most part are drie in Summer: the third in *Germany*: the fourth in the like places about *Antwerpe*, as *Lobel* saith: the three last sorts came from *Virginia*: the former sorts flowering in *June*, and their seede being ripe in *August*: but the other sorts flower much later with us, and scarce perfect their seede except the first.

The Names.

It is called in *Greece* *ὑδρὶς*, id est, *Piper aquaticum*, many doe call it also *Hydropiper* in *Latine*, and generally *Persicaria a foliorum forma*, yet some distinguish them, calling the milde or gentle sort *Persicaria* simply, and the other *Hydropiper* or *Persicaria urens*, as *Lobel* doth, or *mordax* as *Thalim* doth: some as *Lugdunensis* saith would make the spotted sort to be *Plumbago Plinij*, because of the leaden-like spots on the leaves, but they are much deceived: some also call it *Britanica Plinij*, but they are as farre wide as the other: *Lacuna* calleth it *Cratogeomomum*, and *Anguillara* calleth the sharpe sort by that name of *Cratogeomomum*, and by some *Zingiber caninum*: the third is onely remembered by *Bauhinus*, the fourth by *Lobel*, and the three last by no other before: the *Italians* call it *Persicaria*, the *Spaniards* *Muncha*, the *French* *Cufrage*, the *Germans* *Wasser pfeffer*, and *Muckenkraut*, the *Dutch* *Water poper*, and we in *Englis* *Water pepper* and *Arsmart*, and in some countries *Red-knees*.

The Vertues.

The milde *Arsmart* is of a cooling and drying qualitie, and the other contrarie is hot and drie: the first is very effectually for putrid ulcers, either in man or beast to kill the wormes, and cleanse the putrified places: the juice thereof dropped in, or otherwise applied, it likewise consumeth all cold swellings, and dissolveth the congealed blond of bruises by strokes, falls, &c. a peece of the roote, or some of the seede bruised and held to an aking-tooth taketh away the paine: the leaves bruised and laid to the joint that hath a felon thereon taketh it away: the juice dropped into their eares that have wormes in them destroyeth them quickly: if the herbe be strowed in a chamber it will soone kill all the Fleas therein: and if the herbe or juice thereof be put to horses or other cattelles sores, it will drive away the Flies that will sticke thereto, even in the hottest time of Summer: a good handfull of the herbe put under a horses saddle, will make him travell better, although hee were halfe tired before. The milde *Arsmart* is held to be good against hot empoistumes and inflammations at the beginning, and to heale greene wounds.

CHAP. XXIII.

Piarmica vulgaris. Common field Pelletory or Sneefewort.

NExt unto Dittander should follow Tarragon called *Tarchon* and *Dracunculus hortensis* & *esculentus* being of the like hot and sharpe biting taste, but that I have entreated thereof in my former Book, as also of the garden Dragons, whose figure I herewith shew you, & must in this Chapter shew you the *Piarmica vulgaris*, ordinarily called wilde Pelletory and Sneefewort, of which kinde also I have set forth one with double flowers in my former Booke. *Pyrethrum* also *vulgare*, called by us Pelletory of *Spaine*, although set forth in my former Booke. Vnto this I must adde an other stranger scarce knowne so much as by name to our Nation. This common Pelletory shooteth forth divers brittle stalkes a yarde high and more spread into sundry branches, whereon are set narrow long leaves pointed at the ends, and finely dented about the edges standing one above another up to the toppes, where grow many white flowers in a round rust together, somewhat like unto those of Yarrow or Millsoyle, with a very small yellowish thrumme in the middle, bordered about with very short whitish leaves dented in at the broad ends, which passing away leave behinde them small heades with chaffie seede therein: the roote is long and whitish joyned at severall distances, creeping farre about under ground: both leafe and roote are of an hot sharpe biting taste, like unto the true Pelletory of *Spaine* whereof it tooke the name.

2. *Pyrethrum vulgare officinarum.* Pelletory of *Spaine*.

This is a small low plant bearing many finely cut long leaves upon the stalkes lying on the ground, much larger than Camomill, bearing at the toppes of each one single large flower having a pale or border of many leaves, white on the upperside, and reddish underneath set about the middle yellow thrumme, but not standing so close joyned at the bottome as the Camomill flowers doe, but more severed one from another: it beareth small whitish seede which is hardly found and discerned from the chaffie: the roote is long growing downeright of the bignesse of a mans finger or thumb in our countie, but not halfe so great where it groweth naturally, with divers fibres from the sides, of a very hot, sharpe, and biting taste, drawing much water into the mouth being a while chewed after it hath bene dried, but nothing so much while it is fresh and greene: the plant is very tender with us not enduring our Winter, unlesse it be very carefully preserved.

3. *Piarmica Alpina* sive *Dracunculus Alpinus Scabiosa folio.* Wilde Pelletory with Scabious leaves.

This mountaine Pelletory hath round stalkes about a foote high, spreading some branches towards the toppes, whereon are set divers long pale greene leaves on both sides one above another as in the former; but jagged or deeply cut in on both sides, somewhat like unto a Scabious leafe: at the toppes of the stalkes and branches stand the

Ptarmica vulgaris. Common field Pelletory or Scaesfwort.

Dracunculus major vulgaris. Ordinary Dragons.

the flowers somewhat larger than the other, else not much unlike having a border or pale of white leaves, set about a middle thrumme: the roote hereof is more stringy and fibrous than the other.

The Place.

The first groweth in fields and meadows by the hedge sides and path ways almost every where, and in lanes also and wast grounds, the other in Spaine and divers other countries: the last was found in the mountainous fields of Helvetia or Switzerland and other parts thereabouts.

The Time.

The first and last flower in the end of June and in July, and the second not untill August with us, and seldome giveth ripe seede, unless carefully preserved in the Winter.

The Names.

It is called in Greeke *Πταρμικά* *Ptarmica*, quod est *Sternutatoria*, or *Sternutamentoria*, as it is also in Latine from the effect of provoking sneezing. The first is diversly called by divers. *Tragus* calleth it *Tanacetum album* sive *acutum*, & *Millefolium primum*, *Gesner* in *hortis* *Tarhon sylvestre* vel *aquaticum*, & in collect. *stirpium* *Draco aquaticus*, *Brunfelsius* *Pyrethrum*, *Cordus* on *Dioscorides* *Pyrethrum sylvestre*, *Dodonæus* *Draco sylvestris* sive *Ptarmica*, *Bauhinus* referreth it to that plant which *Lugdunensis* calleth *Mentha Sarafensis species altera Myconij*, and yet maketh it also a kinde of *Costmarie*; *Thalius* *Ptarmica sylvestris Germanica*, *Clusius* *Ptarmica pratensis*, *Lobel* *Ptarmica folio Taraconis* vel *Sternutamentoria*, *Matthioli*, *Fuchsii*, *Gesner*, and others *Ptarmica*, and *Bauhinus* *Dracunculus pratensis serrato folio*: the second is called by all Authors *Pyrethrum*, and of some *Salicaria*, but *Gesner* in *hortis* addeth *Germanicum*, as it is thought *Matthioli*, *Lugdunensis* and all other alterum, *Lobel officinarum*, and *Bauhinus* flore *Bellidis*: the last is set forth onely by *Bauhinus* who calleth it *Dracunculus Alpinus folio Scabiosa*: it is called by the *Arabians* *Macarcaraba*, or *Hacharcharba*, by the *Italians* *Piretro*, by the *Spaniards* *Pelitre*, by the *French* *Pie d'Alexandre*, by the *Germans* and *Dutch* *Bertram*; it is called in *English* wilde Pelletory, or wilde Pelletory of Spaine, as the second is called the true Pelletory of Spaine.

2. *Pyrethrum vulgare officinarum*. Pelletory of Spaine.

The

The Vertues.

Wilde Pellitory is hot and dry in the second degree while it is fresh and greene, but in the third degree when it is dry. An ounce of the juice hereof taken in a draught of Muscadine an houre or two before the fit of an Ague and presently layd to sweate, will assuredly drive away the Ague at the second or third time taking at the farthest: the herbe dried or the roote chiefly chewed in the mouth draweth downe from the head much flegme and is thereby avai'eable to ease the paines in the head and teeth, and to draw forth cold rheume, catarrhes and defluxions upon the Lungs or distillations into the eyes, it mightily also purgeth the braine from those humours that are the cause of the Appoplexie and Epilepsie or falling sicknesse: it helpeth also to consume the superfluous moysture of the head and braines, that falling into other parts of the body is the cause of many diseases and much trouble thereunto: the powther of the dried herbe or roote put up into the Nostrills procureth sneezing, which oftentimes doth ease the head-ach, the leaves or flowers bruised and made into a salve or poultis with old Hoggs greafe, being applyed taketh away blacke and blew spots that come by stroakes or falls or bruises, as also all other sores or blemishes in the skinne, and is also good for the Goute and Sciatica. The true Pellitory of Spaine is most commonly used for the toothach, by the roote it selfe or with other things to bee chewed in the mouth, Galen saith it is to be used with oyle, and rubbed on the parts that have shaking fits of Agues.

CHAP. XXIII:

Raphanus Rusticanus. Horle Reddish.

He kinds of Garden Reddish I have declared in my former Book, & therefore need not to describe the againe, but onely to shew you their Figures and with them the Horle Reddish, whose first leaves that rise up before Winter are about a foote and a halfe long, narrower and very much cut in or torne on the edges into many parts, of a darke greene colour with a great rib in the middle, but after these have bene up a while others follow which are greater, rougher, broader and longer, whole and not divided as the first, but onely somewhat roundly dented about the edges: the stalke when it doth beare flowers as it doth but seldome is great, rising up with some few lesser leaves thereon to the height of three or foure foote, spreading at the toppe many small branches of whitish flowers made of foure leaves a peece, after which come small pods like those of the lesser Shepherds purse, but seldome with any seede in them: the roote is great, long, white and rugged, shooting up divers heads of leaves which may be parted for increase, but it doth not creepe within the ground, nor run above ground, and is of a strong sharpe and bitterish taste almost as Mustard.

The Place.

It is found wilde in some places of this Land, but is chiefly planted in Gardens where it joyeth in a moist and shadowy place.

The Time.

It flowreth as I sayd but seldome, but when it doth it is in July.

The Names.

It hath no Greeke name that I can finde, for if Dioscorides his Copies bee true it cannot bee his *Raphanus sylvestris*, called by the Romans *Armoracia*, for hee maketh the roote thereof to bee small, and the leaves tender and fit to bee eaten which cannot agree hereunto, yet *Tragus* is confident that it is the *Armoracia* of *Pliny*, and thinketh withall that it is the *Thracia rad.* and *Liothalassion* of *Theophrastus* lib. 7. cap. 4. which *Pliny* referreth to the Turneps: It is called *Raphanus Rusticanus* by *Lobel*, and *Raphanus vulgaris* and *Rusticanus* by *Matthiolus*, by *Dodonæus* *Raphanus magna* and *Radicula magna*, *Armoracia* aut *Raphanus major* by *Brunfelsius*, *Raphanus major* by *Tragus* and *Gesner*, *Cordus* upon *Dioscorides* and *Lonicerus* call it *Thlaspi majus* and *magnum*, and *Bauhinus* doth in part so judge of it also, for he calleth it *Raphanus Rusticanus Thlaspi alterum* *Dioscoridi* lib. 2. cap. 13. But *Pliny* in his 19. booke and 15. Chap. hath faulted much, in reciting the kinds of Reddish with the Græcians to make three which he taketh out of *Theophrastus* lib. 7. c. 4. where he by the word *ῥαβδαν* doth not understand Reddish but Cabbage as the learned doe well know that reade him, and that *ῥαβδαν* with him is as it is thought *Raphanus Reddish*, whereof in the same Chapter he mentioneth five sorts, *Corinthia*, *Cleonæa*, *Liothalassia*, *Beotia* and another wild sort with Rocket-like leaves which *Athenæus* calleth *Amorbea*, and *Pliny* inverting the word *Raphanus* to

Raphanus rusticanus. Horle Reddish.

Raphanus vulgaris. Ordinary Garden Reddish.

Raphanus niger rotundior radice.
The rounder rooted blacke Reddish.

to *Napus*, calleth *viridis*: the *Corinthia* saith *Theophrastus* is the greatest, whose roote is hare above ground, growing upwards and not downewards as the rest doe, *Litholafia* called of some *Thracia*, doth best indure the cold; *Buxia* is sweetest, the forme being small and round, when as the *Cleonea* is somewhat long. Now let any one referre all these sorts rightly, to the kinds of Reddishes knowne to us, & erit mihi magnus Apollo. The *Italians* call it *Ramoracia*, the *French* *Grand raphaim* and *grand rai fort*, the *Germans* *Merrettich*, (and thereupon *Tabernmontanus* calleth it in Latine *Raphanus marinus*) and some *Krein* or *Kren*, the *Dutch* *Meerradijs* and wee in *Englisch* *Horse Reddish*, *Mountaine Reddish*, and in the North greene Reddish, but better I thinke *Clownes Mustard* for it is too strong for any tender stomacke.

The Vertues.

Horse Reddish is hot and drie in the third degree: with the roote salt and vinegar is made a Mustard, much used with country people, and strong labouring men in some countries of *Germany*, &c. and in our owne land also; but as I said it is too strong for tender and gentle stomackes, for as *Matthiolus* saith, to those that use it, it hurterh the head, and causeth sharpe and foure belchings, but it is of much good use in the paines of the raines, bladder, and stone, provoking much urine and helping to separate the gravell from the stone and to expell it, being boyled with hony and vinegar into an *Electuary*: it is also a good remedy in strong bodies, both for the Cough, the Tisicke and other diseases of the lunges, as also to procure womens courses that are stopped: the same also by provoking vomiting and sweating, is often given before the fit of the *quartane* ague to alter the course: the juyce given in drinke is held to be very effectfull for the scurvey: it killeth the wormes in children being drunke, as also being laid upon the belly: the roote bruised and laid to the place grieved with the *Sciatica*-gout, joynt-ach, or the hard swellings of the spleene and liver, doth wonderfully helpe them all: the distilled water of the herbe and rootes is more familiar to be taken with a little Sugar for all the purposes aforesaid.

CHAP. XXV.

Rapistrum. Wilde Rape or Charlocke.

IN this Chapter I shall shew you the sorts of wild Rape called Chadlocke or Charlocke with us, whereof there are more sorts knowne at these times then formerly were to the ancient writers.

1. *Rapum sylvestre non bulbosum.* The wild Rape or Turnep.

The leaves hereof are very like the garden long Turnep, but growing thicker and more plencifullly from the roote, and more crumpled and rough in handling, the roote is long and slender, in the rest it differeth not from it.

2. *Rapistrum*

2. *Rapistrum aliud sylvestre non bulbosum.*

Another wilde Turnep.

This other sort hath smaller leaves at the bottome not jagged, but those that follow are larger and somewhat jagged and waved, the flowers are yellow and the feede flat, and of a whitish yellow colour in small long pods somewhat sharpe.

3. *Rapum sylvestre sive Rapistrum arvenum.*

Wilde Charlocke.

This wilde Rape hath many long and broad rough leaves hairy and Greene, lying upon the ground round about the roote, somewhat deeply gashed in on the edges and round pointed; from among which riseth up one slender and haity stalke feldome many, branched from the middle upwards into many parts, with divers lesser leaves on them up to the toppes where stand divers yellow flowers of 4. or 5. leaves a peece after which follow somewhat long and rough pods, not very slender with divers round small reddish browne feede therein like unto Mustard feede but larger, as quicke and sharpe in taste but more bitter then it: the roote is long and white, and growing woody when it runneth up to stalke and perisheth after feedetime.

4. *Rapistrum alterum arvenum.*

Another wilde Charlocke.

This other wilde Charlock hath large leaves waved in but not cut or jagged as the former, the upper leaves being whole and smaller, the flowers hereof are pale yellow and the pods following are not more smooth, with a shew of divisions in them, and is annuall also.

5. *Rapistrum album articulatum.*

White wilde Charlocke.

This Charlocke groweth up with fewer, smaller and rougher leaves in some little or nothing jagged in others more: the stalks are rougher and lower then the others, the flowers likewise grow not so many together, neither are so great or yel-

Spanish one grained Charlocke.

*Flores
purpureo.*

yellow, but eyther pale yellow or more white, after which come smaller rough pods with joynts or divisions in them, with smaller brownish feede nothing so fiery hot as the other: the roote is small and long in some, in others somewhat thick and rounder neare unto a small long rooted Turnep. Of this kinde also some are found with a purplish flower.

6. *Rapistrum album nigris lineis.* Charlocke of Naples.

The Neapolitane Charlocke hath the greene leaves next the ground like unto those of the Garden Reddish, cut in or torne on the edges in the same manner but harder and rougher, the ribs on the under side being hard and rough, but those that grow upwards on the stalkes which are two foote high, are lesse divided, and those up higher and next the flowers long and narrow, without any incisure at all: the flowers are white with blackish veines in them, and the pods that follow are small and long with small feede in them, nothing so hot or sharpe as the former: the roote is white and long, sharper in taste then the leaves, which are in a manner herby without sharpnesse.

7. *Rapistrum parvum Massiliense.* Charlocke of Marfelles.

This small Charlocke groweth not above foure or five inches high, with small rough leaves with few divisions in them of an inch long, and dented about the edges, the flowers are small and of a pale blew colour like unto the Sea Stocke gilliflower, the pods that follow are small and long containing small feede within them, the roote is small and white.

8. *Rapistrum monospermon.* One grained Charlocke.

The lower leaves of this Charlocke are somewhat large thick and hairy, of a very fresh greene colour torne on both edges at the bottome, but broader at the ends where they are onely waved, the stalkes also are a little hairy about a foote high or more, set with a few such leaves as the lowest, but smaller and branching forth into long spikes of gold yellow flowers the length of ones hand, in whose places come small round striped heads or huskes with a small point at the end, containyng in every one of them but one feede from whence itooke the name: the roote is long, and white, and somewhat fibrous.

9. *Rapistrum maximum rotundifolium monospermon Hispanicum.* Spanishe one grained Charlocke.

This Spanishe kinde differeth from the former French or Dutch sort set forth by Bauhinus, in that it groweth higher, with larger leaves divided into parts, the end peece great, round, and more hairy: the branches more, the flowers large and white in yellowish huskes without any threds in the middle: the feede also rounder and not pointed at the ends.

The Place,

The first is found wilde in fundry places, but for the profit of the feede is sowen in fields in divers countries of this Land: the second I found going from Shorditch by Bednall Greene to Hackney, the third, fourth and fift are found as well in Corne fields as in the Pastures, and in the borders and hedges of them, as also on ditch bankes, and untilld and waste grounds: the sixt is of Naples, the seventh of Marfelles in France, the eighth in divers places of Germany as well as at Montpellier, and the last in Spaine.

The Time.

They doe flower and feede the one or the other all the Sommer long.

The Names.

They are diversly named by divers, for some would make them to be sorts of *Erysimum*, others of *Sinapi*, and others referre them to the *Lampfana* of *Dioscorides*, but they tooke their name *Rapistrum* a similitudine *Rapifoliorum* for the most part, and therefore some would name them all wilde Turneps. The first is the *Rapum sylvestre* of *Matthiolus*, *Lugdunensis* and *Tabernmontanus*, and *Rapum non bulbosum* of *Lobel*; the second is not extant in any author before, the third and fourth are called *Rapistrum* by *Brunfelsius*, *Dodonaeus* and *Gesner* in *hortis*, and *Rapistrum arborum* by *Lobel*, *Matthiolus* calleth it *Lampfana*, and so doth *Anguilara*, *Gesner* in *hortis*, *Lonicerus*, *Lugdunensis* and *Gerard* their figures declaring it, *Lugdunensis* maketh it to be *Lampfana vera*, and *Tragus* maketh it his fourth *Sinapi agreste*, *Fuellsius* and *Turner* call it *Irion*, *Camerarius* and *Castor* *Durantes Erysimum*, and *Bauhinus* *Rapistrum flore lateo*: the fift is the third *Sinapi agreste* of *Tragus*, *Lampfana* of *Turner* and *Casalpini* who also calleth it *Radix sylvestris*, *Rapistrum flore albo Ernice folijs* of *Lobel*, of *Gerard* *Rapistrum arborum*, and yet his figure of *Raphanus sylvestris* is agreeable unto this rather then unto *Dittander*, for which he setteth it, the rootes chiefly declaring it which are not made to be small and creeping, of *Tabernmontanus* *Armoracia quibusdam Rapistrum album*, and *Rapistrum purpureum*: and of *Bauhinus* *Rapistrum flore albo siliqua articulata*: the sixt is called by *Columnna* *Lampfana Apula Plinii & Dioscoridis*, and by *Bauhinus* *Rapistrum flore albo lineis nigris depictis*, which in my title is *Rapistrum album nigris lineis*: the seventh *Bauhinus* onely hath set forth by the name of *Rapistrum floribus Leucoij marini*, but I have entituled it *Rapistrum parvum Massiliense*: the eighth *Bauhinus* hath mentioned in his *Matthiolus*, *Physopanax*, *Pinax* and *Prodromus* by the name of *Rapistrum monospermon*: the last is mentioned in *Corneus* history of *Canada* plants: the Germans call it *Guttedrick* and *Hederick*, the Dutch *Hedericks*, and we in English *Charlocke*, *Chadlocke* and *Kedlocke*.

The Vertues.

The feede of the Rape that groweth naturally wilde is hotter then that which is manured and sowen and more bitter also, whereof some doe make use in stead of Mustard feede, or mingle it therewith, but the oyle pressed out of the feedes is that Rape oyle that is used in Lampes, and therefore called Lampe oyle, and is much better for that purpose then the Traine oyle which is made of the Whale, which Rape oyle in divers Countries of Germany, and ours serveth to make Sope withall in the stead of Oyle Olive, as also to fry t^eir I fish, &c. it is little used in Physicke, but is in a manner wholly spent for the uses before sayd, or to feede small birds. The other Charlocks have as little life in medicines as the former, and therefore untill I can learne some properties I shall forbear to set downe any unto you.

CHAP. XXVI.

Bunias sive Napus sylvestris. The wilde Navew.

He Navew differeth little from the Turnep either in leafe flower or seed that they are hardly known asunder, of both which being garden herbes, whole rootes are to be eaten and therein chiefly to be distinguished, I have spoken in my former booke; of the wilde kinde hereof I am to speake in this Chapter, which differeth almost as little from his owne kinde of the Garden, as the Garden kinds themselves doe: unto whom I must adde one stranger not well knowne to many.

1. *Bunias sive Napus sylvestris nostras.* Our wilde Navew.

Whosoever saith *Lobel* hath scene and knowne the manured Navew, may soone upon the sight hereof say it is the wilde sort of it, because it is so like therunto in the long smooth and not hairy leaves, more or deeplier jagged then the Garden kinde, the flowers also are yellow, and the seede in small pods like it but more sharpe hot and biting: the roote likewise is somewhat tuberous, round and long withall of the bignesse of ones thumbe or thereabouts, with fibres at the bottome.

2. *Napus sylvestris Greeca.* Candy wilde Navew.

The Candy wilde Navew hath divers rough leaves of the length of ones hand, somewhat like unto the leaves of the white flowered Charlocke, or the wilde hedge Mustard, divided into eight or ten gashes on both sides, and each of them dented about the edges, the stalk is white round & rough, divided into sundry branches each of them ending in a sharpe point: the flowers stand not at the toppes but on the sides, at the joynts with the uppermost leaves whose colour is not exprest, but the cods that follow them are very slender and small, about two inches long.

The Place.

The first is often found wilde by the hedges and wayes sides, and upon ditch banks likewise, and in clay grounds especially, and seldom in any other: the other was sent from Candy.

The Time.

These doe flower about the same time that the Charlocks doe.

The Names.

As the manured Navew is called *Bunias* in Greeke and *Napus* in Latine, so this wilde kinde is called *Bunias agresta*, *Bunias* or *Napus agresta* or *sylvestris* in Latine, significatione a tumente radicis figura deducta, sed rapis hoc nomen magis competere videtur, quam *periphrasis*: but *Galen* putteth no difference betweene *Buniadas* and *Gongylidas*, as indeede there is little but in the forme and greatnesse of the roote and sweetenesse also. *Pliny* hath much erred herein, for in his 20. Booke and fourth Chap. he saith, that the Greekes made two sorts hereof, the one they called *Bunium* which it seemeth hee referred to the manured, and *Bunias* to the wilde sort, which by the judgement of the learned cannot hold true, for that *Bunium* is a farre differing plant as I shewed you before, and *Dioscorides* also declareth it plainly, entreating of *Bunias* in one place, and of *Bunium* in another. *Pliny* againe in lib. 19. cap. 5. maketh *quinque genera Naporum*, five kinds of Navewes mistaking the Greeke word *periphrasis* mistaking it to be *Napus*, for it is evident that hee taketh this division from *Theophrastus*, who lib. 7. cap. 4. maketh foure sorts *ῥάβη παρὰ δὲ τῶν, Raphanorum* and not *Napum*. There is a great controversie among divers learned men, whether of the sorts of *Bunias* or *Napus sativus* or *sylvestris*, the seede should be taken that is appointed to be put into the *Theriaca Andromachi*, some following the Greeke verses of the Father, wherein the composition is described and translated into Latine verses, extant in *Galen's* Latine workes, who mentioneth the seede of *Bunias dulcis*, which all doe understand to be the manured kind, and which *Dioscorides* commendeth (for hee mentioneth no wilde kind thereof) to be good against venome and poison; and some following *Andromachus* the sonne, who in a continued stile or prose in setting downe the said receipt, saith, the seede of *Bunias sylvestris* which many of our moderne Physitions doe better allow of, because they have more acrimony in them, whereby they are thought to be more vigorous then the tame kinde, which is more sweete, even as the *Thlaspi* that hath the more sharpnesse in it is taken for that composition, and for *Mithridate* also, before that which is milder. *Galen* also lib. 1. de *Antidotois*, examining the ingredients into *Andromachus* Treacle saith, the seede of *Napus sylvestris* that cometh from Candy is to be taken in that place. The first is called by *Tragus* *Rapum sylvestre* which some might thinke did better appertaine unto the first wilde Turnep, but that in his description thereof he maketh the leaves softer then the manured Turnep, and used to be eaten of the poore while they are young, and that the roote is tuberous which this rape is not. *Turner* calleth it *Napus agresta*, *Lugdunensis* and *Dodoneus*, *Napus sylvestris* and to doth *Banbinus*, *Lobel* calleth it *Bunias sylvestris*, and *Napus*, and *Casalpinius* *Rapa sylvestris*. The other *Banbinus* had it sent him from *Honorius Bellus* in Candy, yet by the name of *Bunias sylvestris*.

¶

sylvestris and called by the *Cretanes* *Scilobronbes*, the *Italians* call it *Navone salmatica* and *Napofalatico*, the *French* *Navette*, the *Germans* *wilde Steckruben*, the *Dutch* *wilde Steckrape*, and we in *English* *wilde Navew*.

The Vertues.

This wilde *Navewe* as it is hotter and drier, especially the seede than the tame, so it is more effectual to provoke urine and womans courses, helpeth the crudities of the stomacke and torments of the bowells, and put into the decoction wherein *Horehound* is boyled and taken it helpeth the yellow jaundise: the same effect that *Discozides* and others give unto the seede of the manured *Navewe*, which is to expell venome and poyson, not suffering them to doe any harme; the same *Galen* it seemeth giveth to the wilde sort brought from *Candy*, and where-as *Matthiolus* saith, that the seede of the garden sort taken in a decoction of *Maiden hare* or *Lentilles*, doth not onely drive forth the venome and infection of the small pockes, but of all other spotted or infectious fevers and diseases, and also defendeth the heart and spirits from being infected with those contagious and malicious vapours, so the seede of this wilde sort is found to be as effectual if not more forcible.

CHAP. XXVII.

Pastoria bursa. Shepheards purse.

Have yet two kinds of herbes to entreate of, that some referre to this Classis, which I therefore bring in the end, because that in not pleasing my selfe in so doing, I know not how I shall please others that are judicious, for I doe not finde either of them to have that acrimony in them that the rest have, for else this might be referred to the kindes of *Thlaspi*, it is in many other things so like them. Hereof there are many more sorts knowne now than formerly have beene, of which I shall speake in this Chapter, and of the other in the next.

1. *Bursa Pastoris major vulgaris*. The greater common Shepheards purse.

The common Shepheards purse hath divers small and long leaves, somewhat deeply cut in on both sides into severall parts of a pale green colour, among which riseth up a small round stalke parted into some branches, having smaller and lesse divided leaves on them to the toppes, where grow many white flowers one above another, after which follow flat whitish powches or seede vessels, small at the bottomes, broad at the heads and parted like the *Thlaspi*, in each side whereof lieth a small brownish yellow seede: the roote is small and white, and perisheth after seede time, there is no sharpenesse, and but a very little heate either in herbe or seede of this; although some attribute therunto a little acrimony, but is drying and astringent.

2. *Bursa pastoris major folijs non sinuatis*. Great Shepheards purse with whole leaves.

This other great Shepheards purse hath a small root with some fibres thereat, from whence riseth usually but one small stalke a span long, branched into two or three parts, whose lower leaves are whole without division, having long footstalkes to them, and those upon the stalke compasse them at the bottomes, the flowers are white and the seede vessels flat like the former.

1. *Bursa pastoris major vulgaris*.
Common Shepheards purse.

3. *Bursa pastoris minor*.
The smaller Shepheards purse.

3. *Bursa pastoris minor*. Small Shepherds purse.

This small one is in all things like the first, but that it is lesse in every part thereof. And there is also another *Minor folio integro*.
 small one that is in all things like the second, having no division on the leaves.

4. *Bursa pastoris Alpina hirsuta*. Hairy Mountaines Shepherds purse.

This samll Shepherds purse hath many small leaves lying in a round compasse upon the ground soft and hoary or hairy, of the bignesse of Lentilles, slightly dented, and sometimes not at all, matting or ipreading many heads of leaves, and from thence many slender naked stalkes, bearing white flowers, and small long and yellowish bouches, greater than the common, with small reddish seede within them: the roote is small and threddy.

The Place.

The greater and lesser sorts that have cut leaves are frequent in every place with us, but the other two with whole, I have not seene to grow wilde, but in *Germany*, *Mompelier*, and *Italy*, as *Bauhinus* and *Thaluis* say.

The Time.

They flower and seede all the Summer long, yea so quicke some of them are, that they flower and seede twice in every yeare.

The Names.

It hath no *Greeke* name, and all that have written hereof do call it in *Latine* *Bursa* or *pera pastoris*, except *Gesner*, who calleth it *Tblaspi sativum* & *Castor* *Dranantes Herba Cancris*, *Bauhinus* maketh particular relation both of the second and the last: and *Thaluis* of that small one with whole leaves: the *Italians* call it after the *Latine* name *Bursa di pastore*, the *French* *Taouret* & *bourse de bergier*, the *Germanes* *Sickelkraut*, and *Teschelkraut*, the *Dutch* *Borsekens*, and we in *English* Shepherds purse or pouch, and in the North, Picke purse and Caweweede.

The Vertues.

Some doe hold that Shepherds purse is cold and binding, others finding a little heate upon the taste of the flowers and seede, doe judge it not to be cold at all but drying and astringent, and by that onely quality worketh so powerfully in staying all fluxes of bloud, either in inward or outward wounds, as also the fluxes or laskes of the bellie, the bloody fluxe, and the abundance of womens courses, or the pissing of bloud, the juyce or the decoction of the herbe with some Plantane being drunke, or any other way taken: some doe hold that the greene herbe bruised and bound to the wrels of the hands, and soles of the feete will helpe the yellow jaundise: the herbe bruised and laid pultis wise upon inflammations, *Saint Antonies* fire, or the like represseth them: the juyce dropped into mattering or running eares helpeth them: it closeth the lippes of greene wounds, and is of great effect being made into a salve for wounds in the head.

CHAP. XXVIII.

Myagrum. Gold of pleasure.

He other plant that I intend here to set forth, and therein also not pleasing my selfe to bring them into this Classis is *Myagrum*, Gold of pleasure, whereof there are more sorts come to our knowledge in these dayes than formerly hath bene.

1. *Myagrum sativum*. Garden gold of pleasure.

This golden seeded plant riseth up with one or more upright round stalkes about two foote high, set with sundry long and somewhat narrow leaves, of a whitish greene colour, somewhat deeply dented about the edges, or deeply waved, compassing them at the bottome, spread from the middle upwards into sundry branches, bearing at their tops very small yellow flowers, where when they are fallen, come small flat seede vessels, with gold yellow coloured seede within them, somewhat long and small, the roote is small and long, perishing still after seede time.

2. *Myagrum sylvestre* sive *Pseudomyagrum*. Wild gold of pleasure.

This plant that is much found among the fieldes of flaxe, springeth up but with one round stalke, almost a yard high, set about with long and somewhat narrow leaves, resembling those of Woade, but longer and smaller pointed, broad at the bottome where they compass the stalkes about with a point end sticking out on each side, shooting forth many branches from the very bottome almost, at whose toppes come forth divers whitish flowers verie like unto those of flaxe, after which rise round small heades, with a small point at the toppe, very like in fashion unto the *Myagrum* with one seede therein, but these are full of small yellowish feedes like unto Cresses, but sweete in taste without any acrimony when it is dry, and exceeding bitter when it is fresh as the herbe being greene is also.

3. *Camelina* sive *Myagrum alterum amarum*. *English* Wormseede.

The *English* Wormseede groweth very like the last, with a taller upright stalke, branching toward the top, but thicker set with long and narrow greene leaves, somewhat like unto those of the single Wall-flowers, but smaller, and of a whiter greene colour, and very like unto the leaves of *Clusius* his *Leucoium sylvestre*, that it is often mistaken for it, but that the leaves of this are somewhat smaller and not of so fresh a greene colour, at the toppes of the stalkes and branches come forth many very small pale yellow flowers made of foure leaves apeece, very like also unto those of that *Leucoium*, but much smaller, even more than halfe, which afterwards give small long cods, containing within them very pale coloured seede, bitter in taste, the roote is small and woody, perishing every yeare after seede, but rising againe of the shed seede.

4. *Myagrum fetidum*. Stinking gold of pleasure.

The stalkes of this *Myagrum* rise to be about two foote high being rough, round, and greene, bearing rough pale greene leaves on them, set here and there one above another, being foure or five inches long, and one and a halfe broad, very lightly waved about the edges: at the tops of the branched stalkes stand divers small pale yellow flowers upon long foote stalkes in a thicke tuft together, where unto succede small round huske containing small seede: the leaves and flowers hereof, not onely bruised but growing, have somewhat a grievous or evill sent.

5. *Myagrum monospermon majus*. The greater one grained gold of pleasure.

The first leaves hereof that lie upon the ground are long and narrow, round pointed, and cut in on the odges like unto Succory leaves, with a white line in the middle of every one, and of a pale greene colour, but those that

Eccc 2

grow

2. *Myagrum sylvestre* seu *pseudomyagrum*.
Wilde gold of pleasure.

3. *Camelina* seu *Myagrum alterum amaram*.
Engish Wormseed.

5. *Myagrum monospermon majus*.
The greater one-grained gold of pleasure.

7. *Myagra similis* *silqua rotunda*.
Round podded like *Myagrum*.

grow upon the whitish bending hard stalk, which groweth to be a yard high or more, spreading branches from the bottome are little or nothing waved about, but compassing it at the joynts where they stand, the toppes whereof are stored with small yellowish flowers on a long branch one above another, after which come round hard and white heads, small at the bottome, and broader at the toppes with three corners and a small middle point sticking up in each, whereof is contained but one feede which is long and reddish whereof it tooke the name: the roote is white, long and woody perishing after the feede is ripe.

6. *Myagrum monospermon minus*. The lesser one grained *Myagrum*.

This lesser *Myagrum* hath much smaller leaves, the lowest whereof are two inches long and one broad, waved about the edges, standing upon foote stalkes, and of a pale greene colour, from whence rise one or two slender stalkes about a foote high, with a few very narrow leaves set on them, compassing them at the joynts: the flowers are small and white, standing at the toppes in a round tuft together, where afterwards grow small round heades with one kernell apeece within them: the roote is white and thready but perisheth in the like manner.

7. *Myagrum similis filiqua rotunda*. Round podded like *Myagrum*.

This plant hath a stalke a cubit high, hairy, brittle, and spread into branches, whose bottome leaves are about six inches long, and one and a halfe broad, rough, hairy, and sappy, not dented at all about the edges, a little sharpe in taste with some clamminesse also, but those that are set at the joynts of the branches, and compass them about are nothing so great, and the higher they grow, smaller and narrower, the flowers stand spike fashion on small branches, being small and of a white colour, after which come small round rugged heads with a pricke at the toppe, every one on a small long footestalke, greene at the first, and blacke when it is ripe, with an oylie yellow kernell within them.

The Place.

The first groweth in some places of Italy wild, but yet both they and we doe sow it in gardens for pleasure, and in the fields for the feedes sake, whereout is pressed an oyle that serveth the poore for meate, and the rich for their Lamps: the second is frequent in Germany most usually in all their flaxe grounds, which being in stalke like it, but not of that use is accounted a weede and cast away except of such as will save the feede to give to small birds, whereon they will feede when it is ripe, and growing upon the stalke most greedily: the third groweth in many places of our owne country, and being once brought into the garden, and there suffered to shed the feede, it will come up yearly againe of it selfe: the fourth groweth in the sandy grounds about *Basil*: the fifth on the *Engene* an hills by *Padoa*: the sixth not farre from *Mompelir*: and the last neare *Lunella* that is also hard by *Mompelir*.

The Time.

All these flower in the Summer moneths, and their feede is ripe about August.

The Names.

It is called in Greeke *μαγρον* *Myagrum* and *μελεμπερον* also *Melampyrum* as *Dioscorides* saith, and some *μυζαρον* *Myagrum*, *Paulus Aegineta* hath two sorts of plants of an oily substance, *μυζαρον* quod impurum aut sordidum significat, cuiusmodi est *Melampyrum*, & *μαγρον* quod muscipulum sive muscarium significat, quia insidentes sive preter volantes muscas glutine suo implicat. Some (saith *Matthiolus*) take the first sort here set downe to be the true *Myagrum* of *Dioscorides*, which he saith, it cannot be because this hath the leaves of Rocket, but *Dioscorides* his should have the leaves of Madder. Others againe as he saith would have the second sort to be it, which he disalloweth also, because the leaves are liker Woade than Madder, and therefore calleth it *Pseudomyagrum*, yet by the judgement of the best is the true one. Some there be also that take them both to be but one plant: but *Bauhinus* misliketh of their judgement, because they are described to be so different both in leaves and flowers, and therefore hee judgeth them to be two distinct plants as they are indeede. *Dodonaeus* setteth downe this first *Myagrum* to be that plant which the Germans call *Flachsdotteren*, and *Leyndotteren*, which *Tragus* saith is proper to the second. *Dodonaeus* also taketh this to be that kinde of graine which both *Galen* in primo de aliment. facultat. and *Theophrastus*, lib. 8. 1. 3. &c. call *Erysimum*, which *Gaza* translateth *Trionum*, and is like unto *Sesamum*, as both he and *Pliny* say, but not the *Erysimum* of *Dioscorides*, although *Pliny* confoundeth them both together, as you may reade here a little before, in the Chapter of *Erysimum*, whereunto I agree, but not that the *Erysimum* of *Theophrastus* is our *Tragopyrum* Buckwheate, as some would have it, for thereunto it is utterly unlike, in that the feede of *Theophrastus* and *Pliny*, their *Erysimum* is oily, which that of Buckwheate is not, nor is fit to be used for Lampes, as you shall heare further, when I come to speake of Buckwheate. *Tragus* taketh it to be, although not the true *Sesamum* of Egypt, yet to be very like it, as *Pliny* & *Theophrastus* before him did, and calleth it *Sesamum Germanicum*, the oyle of whose feede is not onely like the true oyle of *Sesamum*, but is of divers, and may safely be used in the feede thereof both for meate and medecine, and therefore some have called it *Sesamum minus*. The first is that *Myagrum* that *Matthiolus* mistook in *Ruellius* and others, that they should so call it, and saith his country people did call it *Droda*, *Drodella*, and *Dorella* having leaves like Rocket as he saith, and therefore calleth it *Pseudomyagrum*: *Lobel* in *Adversariis* calleth it *Myagrum Germanis* & *Cameline Gallis*, and in his *Icones* *Cameline Myagrum*, the French as *Ruellius* and *Dodonaeus* say, call it *Cameline* and *Camelinum*; *Bauhinus* in his *Matthiolus* and *Pinax* calleth it *Myagrum sativum*. *Dodonaeus* *Camelina* sive *Theophrasti Erysimum* & *Myagrium Dioscoridis*, and so it is indeede: the second is the *Linaria quinta* of *Tragus*, which he also calleth *Sesama*, and of the Germans *Flachsdotter*. *Cordus* upon *Dioscorides* saith, some pertinaciouly insisted that it was the true *Sesamum* of *Dioscorides*, but he there disproveth them, and saith his people called it *Schwaden* (which *Gesner* in his note thereupon saith, that some did interpret to be *Leyndotter*) whose toppe branches with the feede resembled the Juba of *Milium*, *Gesner* in *hortis Germanie* sheweth, that neither *Schwaden* nor *Myagrum Dioscoridis* (thereby judging them to be two severall plants) are *Sesamum*: *Matthiolus* calleth it *Pseudomyagrum* with the leaves of Woade, and *Bauhinus* in his *Matthiolus* giveth a more exact figure of it than *Tragus* doth, yet in imitation of it: *Bauhinus* notwithstanding that he hath given the figure of both, and saith, as I said before, that they doe import two plants, yet in his *Pinax* hee confoundeth them as if they were but one, bringing in the authors both of the one and the other, as *Lugdunensis* and others under his title of *Myagrum sativum*: the third is the *Cameline Myagrum alterum Thlaspi effigie* of *Lobel*, the second *Myagrum Tabernmontanus*, and his third *Erysimum* also: *Gerard* hath two figures hereof which *Bauhinus* noteth, the one by the title of *Cameline*, and the other of *Eruca angustifolia*: *Tragus* calleth it *Violalutea sylvestris*, for as I said in the description, it is very like to the *Leucoium sylvestre* of *Clusius*, and in my judgement is the

Thlaspi amarum of *Lugdunensis*, as who so will well compare them shall finde: the fourth is *Bauhinus* his *Myagrūm fetidum*: the fifth *Bauhinus* saith was sent by the name of *Eriocrotes*, and that *Alpinus* called it *Pseudoisatis* but calleth it himselfe *Myagrūm monospermon latifolium*: the sixth he also calleth *Myagrūm monospermon minus*: the last *Bauhinus* saith grew with his brother *Iohn Bauhinus* at Mount *Belgrade* by the name of a *Myagrūm*, and therefore he calleth it *Myagrūm similis siliqua rotunda*, but saith it was called a *Lepidium* at *Montpelier*, and that Doctor *Doldius* sent it him from *Norimberge* by the name of *Thlaspi*.

The Vertues.

The oyleinesse of the seede of *Myagrūm* serveth as *Dioscorides* saith, to make the skinne smooth that is rugged in any part of the body, and *Galen* saith that the seede being oyle hath an emplasticke or clammy quality therein, *Pliny* saith and *Ruellius* as it should seeme from him, that the oyle thereof helpeth the Vicers of the mouth, if it be therewith annointed: the oyle of the seede is of much use in *Germany* and other places where they sow many fields therewith, and is used as I said both for the poore mens tables and rich mens Lampes, and serveth also with a lye made of ashes to make Sope, for which purposes it is most used; the oyle thereof being as I said so like unto the true oyle of *Sesamum* being hot and causing thirst if it bee drunke as the true oyle of *Sesamum* doth, may safely be used in the stead thereof, and no doubt will performe the like effects or very neere that the true oyle will. The second sort is in qualitie very neare the former, and although the herbe as the seede also while it is greene, is so bitter that no creature will taste thereof, yet when they are dry they loose their bitternesse, and the seede especially becommeth so sweete as no other can bee more acceptable to small birds as *Linets*, *Finches* and the like to feede upon: the third being called in many places *Worme seede*, and I thereupon calling it *Englissh Worme seede*, but by *Gerard Treake* *Worme seede* is much used by the countrey people where it groweth to kill the wormes in children, the seede being a little bruised and given in drinke or any other way. The other sorts I have not knowne to be used to any purpose, either inward or outward for meate or medicine, and therefore let this suffice untill we can understand with what vertues they are endued to be related.

CHAP. XXIX.

Cepaceum genus. The sharpe Onion rooted kindes.

C *Epe, Porrum, Allium, Onions, Leekes and Garlicke* as under one kind, are to be referred unto this Classis, of many whereof I have amply entreated in my former booke, of which I shall say little here, but of some others not there specified, namely of other sundry sorts of *Garlicke*, yet I thinke good to recite some of the names of the other, and give you some of their Figures.

Of Onions (comming very likely of the Latine *Unio*, because the roote is single, not giving off-sets or encrease as other bulbous rootes doe) there is the ordinary round white one, the flat and the long both sharpe and sweete, and the greater and lesser red flat, some onely on the outside, others red quite through: the *Squill* or *Sea Onion*, I have there shewed to be no Onion: Of the ordinary sort of *Leekes*, there is a greater and a lesser, called *Ampeloprasum* the *French* or *Vine Lecke*, Cives called *Schenoprasum* which are the smallest, and *Scallions*, accounted by some, to be of the kindes of Onions rather then *Leekes*, because they are called *Cepe Ascalonica*, or *Ascalonitides*, and may be the *Gethyum* of *Theophrastus*, which some call *Gethyllis*, *Lobel* taketh it to be *Bulbus Setanius* of *Theophrastus* and *Pliny*. Besides these, *Lobel* mentioneth a wilde *Lecke*, without sent or taste, which is like the *Garden kinde*, but smaller.

*Radiorum
syriacum.*

And *Tabermontanus* one of *Syria* with large leaves.

Of the tame or *Garden Garlicke*, as well as of the wilde; I have given the descriptions of divers, both *Allium Ursinum* *Ranifous*, and *Moly* of sundry sorts, as *Moly Indicum bulbiferum* sive *Caucasum*, *Moly Homericum vel Theophrasti*, *Moly Pannonicum bulbiferum* of two sorts, *Moly Serpentinum*, *Moly caule & folijs triangularibus*, *Moly Narcissinis folijs*, *Moly montanum latifolium luteo flore*, *Moly Pyrenaicum purpureum*, *Moly latifolium purpureum Hispanicum*, *Moly purpureum Neapolitanum*, *Moly pyxidatum argenteum Hispanicum*, *Moly serotinum Coniferum*, *Moly Dioscorideum & alterum Hispanicum*, and *Moly Moschatum vel Zibetinum Montepeliense*: The rest are here to follow.

1. *Allium sylvestre*.
Crow *Garlicke*.

The *Crow* or wilde *Garlicke* is of two sorts, each of them hath sundry narrow long leaves like grasse, the one softer, and the other stiffer and harder, from among which rise up one or two slender bare stalkes, bearing a tuft of purplish flowers, and blackish seede after them: the roote is long and round with three coates, or severall peelings,

Moly Indicum Lobelii.
Indian Moly.

Moly Theophrasti sive *Homeri*.
The Great Moly of Theophrastus or Homer.

Moly serpentinum.
Serpents Moly.

Ampeloprasum.
Vine Leekes.

1. 2. *Allium sylvestre* & *Allium anguinum*.
Crow Garlike, and spotted or Snake-like Ramsons.

the outermost whereof is whitish in the one, with sundry fibres under it, and reddish in the other and encreaseth by the offets, but is not parted into cloves as the garden Garlicke is, so strong smelling of Garlicke that the milke of Kine that feede thereon will taste thereof.

2. *Allium anguinum*. Spotted or Snakelike Ramsons.

This kinde of Ramson hath somewhat broader leaves then the other Ramson, somewhat like to Lilly Convally leaves but spotted oftentimes with blacke spots as the slender stalkes, are which beare many small white flowers on the head: the roote is bulbous but longer then the other, covered with a brownish outward skinne or coate somewhat netted as it were like *Gladiolus*, with a tuft of fibres thereto; it is called by Herbarists as *Clusius* saith *Usciorialis longa* because the *Gladiolus* is called *rotunda*.

3. *Scorodoprasum*. Great Turkey Garlicke.

This great Garlicke shooteth forth sundry great long leaves much bigger then the ordinary Garlicke, and after divers years abiding a great long stalke three or foure foote high with some lesser leaves thereon naked from the middle up to the toppe, where it beareth a large tuft of flowers encloted at the first in a thinne skinne, of a paler colour then those of *Homers Moly* or rather whitish, with three square huskes and blacke feede in them like the rest: the roote is great white and almost transparent at least shining, and feldome giveth of sets for encrease. There is another with looser fealy and yellower rootes, and narrower leaves.

Allium.

4. *Scorodoprasum alterum bulboso & convolato capite*.

Great Turkie Garlick with a bulbed and twining head.

This other great Garlicke groweth after the same manner but larger in each part: the stalke riseth sometimes halfe a yard higher, having at the toppe a large head of bulbes like to the *Indian Moly*, wrapped in a thinne skin, with a long point growing above it being smaller to the end, which bulbes in time breake that outer skinne and shew the bulbes to be at the first purplish, but growing whiter afterwards, having also some flowers among them: the head with the toppe of the stalke at the first doth winde or twine it selfe like a Snake or Serpent, which when the bulbes grow to ripenesse standeth upright: the roote is as great and white as the last, and more ready to part into Cloves like the ordinary sort of Garlicke: both of these doe smell somewhat lesse strong then Garlicke, partaking of Leekes, from whence rose the Greeke name as *Dioscorides* saith.

5. *Moly Pannonicum latifolium primum Clusii*. *Clusius* his first leaved *Hungarian Moly*.

This *Hungarian Moly* hath divers long and somewhat broad leaves rising from a white round roote that hath sundry small bulbes growing thereto: the stalke riseth two or three foote high with those leaves thereon, but naked or bare from the middle to the top, where it beareth a round tuft of purplish flowers, after which commeth blackish feede in three square huskes.

3. *Scorodoprasum*.
Great Turkey Garlicke.

3. *Scorodoprasum alterum Lobelij*.
Another sort of great Turkey Garlick with narrower leaves.

4. *Scorodoprasum alterum convolvuto capite.*
Great Turkey Garlicke with bulbed and twined heads.

5. *Moly montanum latifolium primum Clusij.*
Clusij his first broad leaved Hungarian Moly.

6. *Moly Pannonicum odorato flore.* Sweet smelling Hungarian Moly.

This sweete kinde is very like unto the last, but with lesser leaves and fewer stalkes bearing at the toppe a long tuft of pale coloured flowers upon longer footestalkes hanging downe their heads, of a pretty fine fresh sent which abideth not long, but quickly vanisheth, the three square heads that follow bring blackish seede somewhat like to those of Pinkes or Gilloflowers, the round roote hath some bulbes growing thereto.

7. *Moly montanum capite rotundo purpureo.* Purple round headed mountain Moly.

This purple mountain Moly hath a few long narrow Greene leaves set on the stalke like unto the other, and a large tuft of delicate purple flowers on short footestalkes, never fully opening themselves, and smelling somewhat strong of Garlicke: the round white roote hath some bulbes thereat.

8. *Moly Africanum umbella purpurascens.* Purplish headed Moly of Africa.

This African Moly hath sometimes but one stalke of halfe a yard high or thereabout, and sometimes two or three, with a few somewhat broad and long leaves, pointed at the ends, and a little hairy about the edges: the tuft of purplish flowers at the toppe consist of five leaves set on long footestalkes.

9. *Moly Italicum album caule triangulo.* The small Italian white Moly.

This little Italian Moly hath one or two long hollow leaves, somewhat broad likewise, and ending in a point: the stalke is three square, growing to be halfe a foote high, with sundry small white flowers at the topes: the roote is small and round, of a shining purplish colour smelling like the rest of Garlicke; Pons in his Italian Baldus mentioneth this.

The Place and Time.

These sorts of bulbous are peculiar to divers countries as Germany, Hungary, France, Spaine, Italy, Turkey and our owne Land also, flowering in Summer and feeding after.

The Names.

The names of them all are sufficiently expressed in their titles, all authors that have written of them not much diversifying their names from those here set downe, and therefore I shall not neede further to insist upon them.

The Vertues.

Onions are flatulent or windy, yet doe they somewhat provoke the appetite encrease thirst and ease the belly and bowells, provoke urine and womens courses, helpe the biting of a mad Dog, and of other venomous creatures, to be used with a little Hony and Rue, and encrease Sperme, especially the seede: they also kill the Wormes in children if they drinke the water fasting wherein they have beene sleept all night: being roasted under the Embers, and eaten with Hony or Sugar and Oyle, they much conduce to helpe an inveterate Cough, by cutting the tough slegme and causing it the easier to bee expectorate: the juice being snuffed up into the

the Nostrills, purgeth the Head, and helpeth the Lethargie, yet the often eating of them is said to procure paines in the Head: it hath beene held with divers country people a good preservative against infection to eat Onions fasting with bread and salt, as also to make a great Onion hollow, filling the place with good Treacle, and after to roast it well under Embers, which after taking away of the most outermost skinned thereof, being beaten together is a soveraigne salve for cyther Plague sore, or any other putred Ulcer: the juice of Onions is good for scalding or burning by fire, water or Gunpowther, and used with Vineger taketh away all blemishes, spots, and marks in the skinne, and dropped into the eares caseth the paines and noyse in them: applied also with Figges beaten together helpeth to ripen and breake Impostumes and other sores. Leekes are much about the same propertie that Onions be, yet not altogether so effectually; they are a remedy against a Surfer of Moshromes, being baked under the Embers and taken, and helpeth the Piles boyled and applyed warme; to avoyd tautologie I referre you to what hath beene said before of Onions. Garlick the garden kinds as the best, and the other as meaner are hotter then Onions or Leekes, and is more effectual to all the purposes aforesaid, being anciently accounted the poore mans Treacle, for that it is a remedy for all diseases or hurts, for besides the properties whereunto Onions are conduible, it hath a speciall qualitie to discusse the inconveniences by corruptagues or minereall vapours, or by drinking corrupt and stinking waters as also by taking off Woolfes bane, Henbane, Hemlocke, or other poisonfull or dangerous herbes: it is held good also in hydropick diseases, the Jaundise, Falling sicknesse, Crampes, Convulsions, the Piles or hemorrhoides and other cold diseases: but to alter the strong sent thereof and cause it to be lesse offensive, divers have set downe divers things, as some to eat Rue, or herbe Grace, some to eat a raw Beane after it, others to take of a Beete roote roasted under the Embers and others say by eating a few Parsley leaves.

VMBEL

VMBELLIFERÆ.
VMBELLIFEROVS PLANTS.
CLASSIS OCTAVA,
THE EIGHT TRIBE.

CHAP. I.

Ferula. Fennell giant.

In this Classis I am to intreat of all the kindes and sorts of umbelliferous herbes; such I meane as are generally so called, for there are many other herbes that beare their flowers and feede or berries on the toppes of their stalkes in manner of an umbell as those doe, as you may observe through the whole passage of the Booke, which cannot properly belong hereunto. Now because there be many sorts of these herbes, I thinke it fit to distribute them into three Rankes or Orders: the first shall be of those which beare fine leaves like *Ferula*: the next shall be of such as have fine and thinne cut leaves like Carrots or Parsley: and the last shall be of such as have broad leaves like *Panax* or *Angellica*, that s^o under these three rankes, I may comprehend the whole Family or Tribe, of these umbellifers; yet I must entreate

you to beare with the passages of some of these, if for names sake I insert sometimes into one forme, such as might be placed in an other, the vicinitie of the names constraining that effect.

Of these *Ferulas* there are two or three sorts plainly to be discerned to be differing one from another as shall be shewed.

1. *Ferula tenuiore folio*. Fine leaved Fennell giant.

This fine leaved Fennell giant bringeth forth sundry large hollow fungous thicke branched stalkes, of very light fine thinne (for substance but thicke set) leaves together, and bushing more than the next, both greener, finer, and shorter than it also, placed out of order, sometimes two or three or foure leaves together, the bottome of the stalkes being as thicke as ones finger, but compassing one another with broad thinne hollowish skinnies, at the bottome, from among which riseth up a strong upright stalke eight or ten foote high, sometimes as bigge as a great cudgell, set with divers such fine leaves thereon, one above another, compassing the stalke at the bottome out of the bosome whereof come forth severall small branches towards the toppes, the toppe also being divided into sundry parts, forming a large umbell of small yellow flowers, which turne into blackish flat feedes, but yellowish, as they have beene observed in the gumme, two alwayes joyned together by the little foote stalke, whereon they stand, as is usuall in all these umbelliferous plants; the two inner sides being somewhat hollow, and the out-sides round with the longesse: the roote groweth very great and never decaieth, branching forth many wayes of a blackish browne on the outside, and somewhat white within, yeelding a thicke juyce being broken in any part, which doth quickly condensate and grow into a yellowish gummie substance, not smelling any thing strong in our country, as I have often proved, and nothing so much as the Gum *Sagapenum*, which is supposed to be gathered from the roote of this plant.

2. *Ferula latiore folio*. The broader leaved Fennell giant.

This other Fennell giant groweth in the like manner in all things, and as high, or rather higher, whose branched stalkes of leaves are more sparred or thinner set than the former; and the leaves themselves of a darker Greene colour, bigger also and longer: the flowers are yellow, and the feede somewhat larger: the gummie juyce that issueth forth from the roote of this smelleth a little more, even with us, than the former, although nothing so strong as the *Galbanum*, which we have in our shops, and said to be taken from this plant in the hot countries and climates of *Africa*, &c.

3. *Ferulago seu Ferula minor*. Small Fennell giant.

This small sort groweth nothing so high as the former, but abideth much lower than the ordinary Fennell, having leaves nothing so great or branched, yet larger than those of Fennell, as the tufts at the toppes, which give smaller feede than either of the two former, but somewhat like them and blackish: the roote is much smaller and whiter than either of them, with but few fibres thereat.

The Place and Time.

They are all found growing as well in *Narbone* in *France* among the rockes that are corrupted with the Sunne
all

1. *Ferula tenuiore folio.*
Finer leaved Fennell giant. 2. *Ferula latiore folio.*
The broader leaved Fennell giant.

all day, as in divers places of *Italy*, *Apulia* and *Florence*, and divers other places, but yeeldeth little gumme in *Europe* that I can here of by any: they flower in *June* and *July*, and the seede is ripe in the beginning or end of *August*.

The Names.

The Greeke call it Νάσσος, and the least rapshion which *Gaza* translateth *Ferula* and *Ferulago*; the Greeke name signifying *Thyrsum*, *virgultum*, *bacillum*, as the *Latine* name is deduced a feriendo quod illius scapi pedamenta fruticibus & senibus baculi & scipiones suis: *Martiall* calleth them *Ferulas tristes*; because they were *Sceptra* *pedagogorum*, wherewith he smote the hands or heades of his truant Schollers. The first is the *Ferula* of *Martholus*, *Coridus*, *Lebel*, *Dodonaeus*, and others, which *Cesalpinus* calleth *Ferulamas*; as he doth the other *famina*: the second is calledd by *Lobel*, and others from him *Ferula galbanifera*; but *Banbinus* *Ferulago*, who thinketh it to be the same that *Gesner* and *Camerarius* calleth *Ferulaga*; but I am in doubt he was therein deceived, for both those sorts, as I said, are every yeare the one as high as the other with me, but *Ferulago* which is my last, importeth a diminutive, as *Dioscorides*, *Theophrastus*, and all others have called it, *humilis Ferula*, and so doe *Lucdunensis* and *Tebermontanus* call it *Ferulago*, *Narthecium* *Theophrasti*.

The Vertues.

At the first springing up every yeare of the *Ferula*, before the leaves bréake forth, there riseth up from the roote a great yellowish head like to the yolke of an egge, which the Shepheards there gather and rost under the hot Embers, being first wrapped in double wet papers or cloathes, and after eate them with Pepper and Salt, and this is a meate not onely pleasant and delightfull unto them, but mightily provoketh Venerie, as they say. *Dioscorides* writeth that the inner pith of the stalkes while they are Greene, being drunke with wine, helpeth those that spit blood, or bleede at the nose, and are stung by the Vipers: the seede being drunke doth ease the griping torments of the belly and the chollicke. *Pliny* saith that the stalkes being boiled are pleasing to the stomacke, and so taken with new wine or with honey, but if any doe eate many of them, they will cause the head-ach: the juyce saith he of *Ferula* being taken to the quantitie of a beane looseth the belly, it doth helpe the falling sicknesse, being taken at severall times of the Moone: the fresh juyce of the roote dropped into the eyes cleareth the dimmesse of the sight. *Pliny* setteth downe this observation, that as *Ferula* is most deadly to Lampreyes, so it is a most acceptable foode to Asies, but a present poison to other cattell. *Galen* briefly sheweth the properties hereof in this manner: the seede, saith he, doth heate, and rarifie, the pith of the stalk is of a binding qualitie, whereby it helpeth the spitting of blood, and those that are troubled with the chollicke. The gummes that issue from these plants are much better than the rest of the herbe; for *Sagapenum* is hot and drie in the third degree, which being dissolved into the juyce of Rue and taken, doth wonderfully helpe to breake the stone in the bladder, provoketh urine and womens courses, expelleth the dead child, and strengtheneth the weak sighted eyes: being dissolved in wine and taken doth much helpe the cough, and the distillations of thinn rheume called Catarrhes: being dissolved in oyle and applied, doth strengthen the members that are out of joynt, or the overstretched joynts, and mightily

mightily openeth the obstructions of the Mother: *Mesues* saith it purgeth tough flegme, and other clammy humours, and is helpfull to all the cold diseases of the braine, breast, and lungs, the joynts, aches also be they never so far remote: taken in what manner soever, it doth wonderfully expell the water of the dropie taken with yellow Myrobalanes, it abateth the hardnesse of the spleene, and expelleth the windinesse thereof being drunke, and dissolveth the nodes, knots, and hard tumours being dissolved in Vinegar and the juyce of Capers, *Galbanum* doth more heate, draw, and discusse humours than *Sagapen*, and is more powerfull and availeable for the breast and lungs, and for hardnesse in breathing, for burblings, cramps, and convulsions: it is more powerfull to resist poysons being taken in wine with *Myrrha*, and easeth the risings of the mother, the giddinesse in the head, the paines in the sides, and the falling sicknesse: a little of the gumme spread like a plaister will breake and draw any bile or hard sore, being laid thereon, especially if a little Turpentine be put to it: it is also of great good use in many plaisters and salves, to helpe to warme those places or joynts that are cold, to discusse the humours gathered to the places, and to bring to maturitie contumacious sores, and to heale them afterwards. Because I have said that *Galbanum* and *Sagapenum* are gathered from the rootes of these *Ferula's*, and that I shall shew you in divers places hereafter, that other gummes are taken in like manner from other plants. I thinke it fittest to shew you the manner of drawing out, and gathering the gummes from the rootes of all sorts of herbes which is in this manner. After that you have digged an hole on one side of the roote of any plant in manner of a small trench, and the bottome and sides cleared from loose earth and stones, that they be not mixed with the gumme; wound or cut the roote on that side is open, or make an hole therein, that so the gumme issuing out, be not stopped by a small orifice or cut, and so let the juyce or gumme distill forth of it owne accord, but this must be done in the hottest and driest time of the yeare, that no raine or moiture take it for spoiling it, and to have the place or trench the clearer, it were necessary to lay some flat smooth stones, or the like in the bottome to keepe it the clearer; if the juyce or gumme come out in droppes and doe not runne together of it selfe it is accounted the better. Some also wound the lower part of the stalke, and take the juyce that commeth from thence, but that is nothing comparable to the other, this being called *Scaparium*, and the former *Radicarium succus*.

CHAP. II.

Thapsia. Scorching Fennell.

Although there is but one true *Thapsia*, yet for the resemblance of other plants so neare thereunto, *Clusius* hath referred some unto it, and entitiled them *Thapsia*, which *Lobel* and others have called by other names.

1. *Thapsia faniculi folio*. The true *Thapsia* or scorching Fennell.

The true *Thapsia* hath a smaller and lower stalke than *Ferula*, with somewhat broader and shorter leaves then it also, and nothing so much winged or branched, the flowers are yellow that

ffff

hand

stand at the toppes in umbells, and the seede is more like unto *Siler montanum* than *Ferula* or *Thapsia*, but much greater than it, and lesse than *Ferula* or *Thapsia*, the roote is of the thicknesse of ones thumbe, brownish on the outside, and much whiter than *Ferula* within, with a thicke barke, and a slender tough pith, yeelding forth a yellowish milkie juyce, being broken, which being condensate is somewhat gummie but hard and drie: at the toppe of the roote there groweth a small bush of short haire, whereby this plant is knowne from *Ferula*, which else would scarce be discerned: the taste of the herbe is somewhat sharpe and unpleasant, but the roote much hotter and offensive to the taste and stomacke, moving vomite, and in the Greene more than dry.

2. *Thapsia latifolia* Hispanica.

Spanish broad leaved Thapsia.

The leaves of this Thapsia are somewhat like unto Fennell giant, Greene, but covered over with a little woolly hairnesse, spread round about on the ground, of an unpleasant taste: the stalk that riseth up among them, groweth to be a cubite, and sometimes to be two cubits high, of a fingers thicknes, with a few joynts and leaves at them like the lower but lesse, at the top whereof stand somewhat bread umbells of yellow flowers, which while the seed is in ripening changeth the forme to be round as a ball: the seede is broad & winged as it were, the middle part whereof which sprouteth out the leaves is long and narrow: the roote is somewhat like the former, thicke, long, and broader at the toppe, with a blackish thicke barke full of a milkie juyce which is most bitter and sharpe in taste, provoking vomiting and white within.

3. *Thapsia maxima* Hispanica.

The greater Spanish Thapsia.

This Thapsia shooteth forth stalkes three or foure fingers thicke, like to a *Ferula*, and exceeding any mans height, having branched winged leaves like the last, but larger, and spread on the ground like it: the flowers and feedes are like it also: the roote is greater.

4. *Thapsia Carota folio*. Carrot Leaved Thapsia.

This was the most usuall Thapsia that the shoppes of those

Seniun Thapsie s. genera cum folio & radice latifolia.

Five sorts of Thapsia feedes, with a leafe and a roote of the broader leaved one.

4. *Thapsia vulgaris* Carota effigie.
Carrot leaved Thapsia.

Thapsia Carota folio summitate.
The toppes of the Carrot leaved Thapsia.

parts of Europe knew, and tooke to be right, untill learned and judicious men scanning it better, found it to be much differing, having large winged leaves lying upon the ground, more like unto the wilde or tame Carrot, than unto *Ferula*, whereunto the true is compared: the umbell of flowers is yellow, but smaller, as is both the steele and roote than the *Ferula*: *Matthiolus* set this forth first for *Thapsia*, but is disproved by all: it smelleth somewhat strong.

5. *Thapsia fetidissima*. "Stinking Thapsia.

In the country of *Salamanca* in *Spaine*, saith *Clusius*, groweth a certaine *Ferulous* plant with leaves like *Laba* and *Lotis* herbe *Francumfence* spread upon the ground, bedewed alwayes with a clammy moisture, of a deepe Greene colour and shining: the stalke is said to be small and straight, bearing an umbell of flower almost as round as a ball.

Wee have had the feedes of a *Thapsia* brought us out of *Spaine* by *Boel*, whose rootes were short and tuberous, *Thapsia* but the late springing, and small time of the abiding of them in my garden, by the early frostes coming there- *Thapsia* upon tooke them away so quickly, that I can give you no further relation of them: but he called it *Thapsia tuberosa* *Thapsia* *radice*, which whether it were a speciall kinde, or but the youngnesse of the rootes I cannot tell, never having the like opportunity to get of the seele againe.

The Place and Time.

The first, as *Dioscorides* saith, groweth in *Thapsia* one of the Isles of the *Sphorades*, and in the countie about *Athenes*, as *Theophrastus* saith, and as *Lobel* saith about *Mompelien*, and the way to *Frontignacke*; all the rest grow plentifully in sundry parts of *Spaine*, and doe flower there, as he saith somewhat late.

The Names.

It is called in *Græke* *Θαψία*, and *Thapsia* also in *Latine*, from the *Iland* of that name, as *Dioscorides* saith; but as *Lobel* & *Pena* say, it may as well be so called from the fierie heate, wherewith it scorcherh or burneth the bare parts of the body, even a farre off, if they stand in the winde or breath of it that gather it; and therefore *Dioscorides* adviseth not to gather it, but in a quiet day free from winde, and to be on the leefside thereof for feare of exulcerating the face and hands, &c. The first is the true *Thapsia* of *Lobel* and *Pena*, and *Lugdunensis* so entitleth it; and the second *Thapsia* of *Clusius*: the second is the first *Thapsia* of *Clusius* which *Lobel* and others setting forth for *Seseli Peloponense majus* is taxed by *Clusius* for so doing, saying, that their so easie sliding to errour, ariseth from their want of due consideration of all the parts thereof, and the sight of the true plant, and onely led by weake conjectures upon the sight of the figure, and as he saith, is called *Cumillo* by those of *Murcia* in *Spaine*: the third is *Clusius* his third *Thapsia*, which some, as he saith, would call *Cicutaria maxima Lobely*, for which he blameth them likewise; the fourth is *Clusius* his fourth also, which as he saith the *Spaniards* call *Tuero*: the last is that *Thapsia* that *Matthiolus* *Angulara* and *Cesalpinus*, because it is most frequent in *Italy* tooke to be the right, but is since knowne to differ much from it: *Lobel* in his *Observations*, pa. 45: in the title over it, maketh some doubt whether this plant should be not the *Sagapenniferia Ferula*, for all do account these *Thapsias* to be kinds of *Ferula*, & so the *Italian* name which is *Ferulacoli* doth import as much; but as I shewed you in the Chapter before, that I have gathered some gum from the *Ferula* in my garden, that hath bin in shew as pure and good gumme *Sagapenum* as any we have in our shoppes, and therefore I doe not thinke any gumme *Sagapen* was ever taken from this or any other *Thapsia*: the *Arabians* call it *Iantum* and *Dryx*; the *Italians* *Thassia*, and those of *Naples* *Siciba*, and other parts *Ferulacoli*: the *Spaniards*, as *Clusius* saith, call this *Canabeja* promiscuously with *Ferula* and *Libanotis*, making no distinction betwene them: the *French* call it *Turbit blave*, and *gris* by others: the *High* and *Low Dutch* little knowing them, have scarce given them any name, but as the *Latine* doth: *Gerard* calleth them stinking and deadly Carrots, which how fitly it agreeth with any of them, but that of *Matthiolus*, let others upon due consideration judge: I have called the true *Thapsia* according to the nature, burning and scorching Fennell, which if any can alter and give a better, I shall be well content: the rootes of the first *Spanish* kinde are accounted for *Turbith* with them, but they differ much from the right, and therefore are called *Thapsia turbith*.

The Vertues.

Thapsia, or the scorching Fennell, as *Dioscorides* saith purgeth choller strongly both upwards & downwards, two scruples of the barked of the roote, as well as halfe a scruple of the juyce thereof drunke with mede or honied water, and if more be taken it is dangerous; this manner of purging is fit for those that are astmaticke, or short winded, or are troubled with paines in their sides and spitting of bloud, but saith *Lobel* this manner of purging thereby is quite left of, and that worthily in respect of the danger to the inward parts, for more harme oftentimes came thereby. than helpe, by the grievous torments it used to stirre up: *Galen* briefly setteth downe the properties thereof in these words; *Thapsia* hath a sharpe and strong heating facultie joyned with some moisture, and therefore it violently draweth from sarre, and digesteth what it draweth: but much time is required to effect this, for being full of much moisture, it is the fault thereof to be quickly corrupted. Outwardly applied it hath most usually better succeeded, for as *Pliny* reporteth, *Nero* by anointing his beaten face with the juyce hereof, and very equal *Francumfence* and Waxe mixed together at night, shewed the next day his face to be free and cleare, contrary to expectation, wherby it hath bene found to take away all blacke and blew spots, bruises, marks, and blemishes in the skinn whatsoever, yea the morpheu, leprye, scabbes, scurfes, wheales, pusses, or the like, yet caution must be used not to suffer it to lie too long on the place, that is not much longer than two houres, and then to be washed with salt or sea water warmed: it is used likewise being dissolved into an ointment with good effect to the sides or breast for the griefes therein, or for the paines in the feete or joynts: it serveth also to gather againe the prepuce in whom it is naturall to want it, by raising a tumour, and after mollified and supplied with fat things, supplieth the part of a prepuce: it serveth likewise to cause haire to grow apace where the places wanted it, or were deprived thereof. The rootes of the second and third, but of the last especially in former times were gathered, by impostors in *Italy* and *Spaine*, and dressed like *Turbith* that is pared and pitched, and so sold in stead thereof, untill diligence add experience to know the right, and refuse the false, had prevented the future deceit; and *Matthiolus* declaiming against *Fuchsius*, who tooke these rootes to be the true *Turbith* sheweth it was so taken in *Germany*; but I have shewed you before in the Chapter of *Alipum*, the many errors of former times in taking the *Tithymalis Scamony* for the true *Turbith*: the old women Leeches of *Salamanca* in *Spaine*, saith *Clusius*, use the rootes of the third or greatest *Spanish* kinde of *Thapsia* to procure womens courses,

and to purge the body which it doth with that violence both upward and downward that they are oft brought into great danger that take it.

CHAP. III.

Peucedanum. Sow-Fennell.

Wee have three sorts of Sow-Fennell to offer to your consideration in this Chapter.

1. *Peucedanum majus Italicum*. Great Sow-Fennell of Italy.

The great Sow-Fennell hath divers long branched stalkes of thicke and somewhat long leaves, three for the most part joyned together at a place, among which riseth a crested straight stalke, neare as bigge as Fennell with some joynts thereon, and leaves growing thereat, and towards the toppe some branches issuing from thence, likewise on the toppes of the stalke and branches stand divers tufts of yellow flowers where after grow somewhat flat thinne and yellowish seede twise as bigge as Fennell seede: the roote groweth great and deepe with many other parts and fibres about them, of a strong sent like hot brimstone, and yeelding forth a yellowish milke or clammy juyce almost like a Gum.

2. *Peucedanum vulgare*. Common Sow-Fennell.

The common Sow-Fennell groweth in the same manner that the former and hath no other difference but that this is lower and smaller by a fourth part, and the smell thereof as strong as the former.

3. *Peucedanum minus*. Small Sow-Fennell.

As the first Sow-Fennell was larger then the second, so this is lesse then it, having smaller and shorter leaves of a blewish Greene colour, of a little bitter taste but almost no smell, the stalke is slender and round, about halfe a yerd high, parted into divers branches, whereon stand small tufts of white flowers in an umbell, which are succeeded by thicke short seede almost like to Parsley, but of an ash colour, and bitter sharpe taste: the roote is of the bignesse of ones thumbe, sometimes greater or lesser, with a bush of haire at the toppe, blackish or brownish on the outside, with a thicke barke of a pleasant sweet taste at the first and afterward sharpe.

The Place and Time.

The first groweth naturally in Italy in divers places: the second in good plentie in the salt low Marshes a little by Feverham in Kent: the last was found on Saint Vincents Rocke by Brisfom, by Lobel as hee setteth it downe in his *Adversaria* pag. 331. and in Hungary and Austriaby Clusius. They all flower and seede in the end of Sommer, that is in July and August.

The Names.

It is called in Greeke *πικνιδαν* and in Latine *Peucedanus* and *Peucedanum*, some take it of the pitchy sent

1. *Peucedani majoris Italicum summat.*
The toppes of the Italian Sow-Fennell.2. *Peucedanum vulgare.*
Common Sow-Fennell.

carryeth, and others of the Pine tree whose leaves are like it. *Apuleius* calleth it *Pinaſtellum*: the first is the *Peda-*
cedanum of *Matthiolus*, *Angulata* and others, and *Pencedanum majus Italicum* by *Lobel* and *Lugdunensis*: the se-
cond is called by *Bauhinus* *Pencedanum Germanicum* and *Pencedanum* simply without any other addition by *Tra-*
gus, *Fuchsius*, *Dodonæus* and others: it is called also *Faniculum porcinum* but by *Tabermontanus* *Canda porcina*: the
last is called by *Lobel* *Pencedani facie perpusilla planta*: it is called by *Clusius* *Pencedanum Panonicum* and is proba-
ble as *Clusius* and *Bauhinus* say to be the second Saxifrage of *Matthiolus*: the *Arabians* call it *Harbatum*, the *Ita-*
lians *Pencedano* and vulgarly *Finocchio porcino*, and by some also *Pinaſtello*, by the *Spaniards* *Fenicho del porco*: by the
French *Fenouille de Pourceau*, by the *Germans* of some *Harſtrang*, but commonly *Semfenchel* or *Schebelwurts*, of
the *Dutch* *Verkens Venekell* and we in *English* *Sow-Fennell*, *Hog-Fennell*, *Sulphurwort* and *Horſſtrange*.

The Vertues.

The juice of *Sow-Fennell* say *Dioſcorides* and *Galen* uſed with *Vinegar* and *Rosewater*, or the juice with a lit-
tle *Euphorbium* put to the noſe, helpeth thoſe that are troubled with the *Lethargie*, the *Phrenſie*, the turning of
the braine or diſſineſſe in the head, the *Falling ſickeſſe*, long and inveterate *Headach*, the *Paliſie*, the *Sciatica*
and the *Crampe*, and generally all the diſeaſes of the *Nerves* and *Sinewes* uſed with oyle and *Vinegar*: the juice
diſſolved in wine or put into an *EGGE* is good for the *Cough* or ſhortneſſe of breath, and for thoſe that are trou-
bled with winde and tormenting paines in the body: it purgeth the belly gently and diſſolveth the winde and
hardneſſe of the *Spleene*, it giveth eaſe to thoſe women that have ſore travaile in child birth, and eaſeth the
paines both of the bladder, and reins, and wombe alſo: a little of the juice diſſolved in wine and dropped into
the eares eaſeth much of the paines in them, and put into an hollow tooth eaſeth the paines thereof. The roote
worketh to the like effect, but more ſlowly and leſſe, and is to be boyled in water and the decoction thereof
drunke: the dried powder of the roote being put into ſoule Vlcers of hard curation clenſeth them thoroughly, re-
mooveth any ſplinters of broken bones or other things in the fleſh, & healeth them up perfectly, & likewise bring-
eth on old and inveterate ſores to cicatrizing: it is alſo put into ſuch ſalves as ſerve to heate and warme any place,
the roote is hot in the ſecond degree and dry in the third, but the juice is ſtronger. *Pliny* recordeth the vertues
hereof in divers places: the roote being drunke in wine with the ſeeds of the *Cypreſſe* tree in powder eaſeth the
ſtrangling of the mother, but ſome uſe to burne it and by the ſmell thereof give eaſe thereunto: the juice helpeth
the burſtings of children and their Navells when they ſticke forth: the roote is of ſo great force in greene wounds
and ſores, that it draweth out the quittance from the very bones.

CHAP. IIII.

Libanotis, Herbe Francumſence.

Here be divers ſorts of *Libanotides* as both the old and new Authors have recorded, ſome whereof
beare broad leaves, others fine and like *Fennell*, of which I meane to entreat in this Chapter, and
reſerre the other to the laſt order of theſe Umbelliferous plants, which containe thoſe with broad
leaves.

- I. *Libanotis Ferula folio ſive Cachryſera ſive Cachrys veri*,
Fennell leaved herbe Francumſence.

This herbe Francumſence is a worthy, goodly, and rare plant, ſhooting forth divers buſhy great reddiſh ſtalkeſ
of leaves of a freſh greene colour, being ſomewhat thicker and longer then thoſe of the *Ferula* but ſhorter then
of *Pencedanum* *Sow Fennell*, yet often and in many places ſet three together, of a quicke aromattick ſent and
taſte comming ſomewhat neare a *Lemmon*: from among theſe leaves riſeth up ſometimes but not every yeare
with me a good bigge ſtalke, but neither ſo great nor halfe ſo high as the *Ferula*, and not much above a yard high,
nor much higher then the ſtalkeſ with leaves, branched into very many ſundry parts, bearing yellow flowers
which are ſucceeded by pretty good big whitish yellow ſeeds, round and a little long withall, ſomewhat cre-
ſted on the outſide two joyned together as is uſuall in moſt ferulous plants, which maketh one ſide flat, the ſmall
foote ſtalke running betweene, and is ſayd to be cauſticke or burning; which cauſed the name *Cachrys* to be gi-
ven to it: the roote groweth deepe and ſpreadeth much and with many branches in the ground, bigger then a great
Paſſenep at the toppe, and white on the outſide as well as inſide, with a pith in the middle, but ſo brittle that
one muſt handle it very tenderly if he doe not breake it, and yeeldeth forth a clammy pale juice, of ſo fine a ſharpe
ſent that I compare it to the *Lemmon*, and endureth many yeares.

2. *Libanotis ferula folio & ſemine, ſive Panax Aſclepium Ferula facie Lobelij*,
Lobel his *Eſculapius*, *Woundwort* or *Allheale*.

Divers learned men have ſet forth each almoſt a ſundry herbe, for the *Panax Aſclepium* of *Dioſcorides* and
Theophraſtus, and every one ſuppoſing his to be the right, and becauſe they all ſeeme to be worthy plants fit to be
knowne, I thinke it meete to ſhew you them all with their differences, and wherein they come neareſt or are fur-
ther off from the true, and firſt to beginne with that of *Lobel*, which groweth nothing ſo high or great as the
Ferula, with fine leaves like unto it and yellow flowers alſo: but the ſeeds that followeth is broad not ſo ſmall
as *Fennell* but more like unto *Ferula* of a little quicke taſte or ſent: the roote is ſmall and not growing deepe,
nor abideth after it hath given ſeeds, the ſent and taſte being not much refinous or ſharpe.

3. *Panax Aſclepium Matthioli*, *Matthiolus* his *Eſculapius Allheale*.

Although *Pena* being very ſpleneticke againſt *Matthiolus* in many things doth thinke and ſo doth *Columna*
alſo that this *Panax Aſclepium* is no other herbe then a *Ferula*, yet ſurely I thinke they are much miſtaken
therein both for that *Matthiolus* had ſet forth the *Ferula* before and deſcribed it at large, and although he had
not deſcribed his *Panax* as he did the *Ferula*, I preſume the chiefe cauſe was that hee had onely the dried
plant ſent him without a deſcription and therefore ſo let it paſſe, not intending to coyne a deſcription of that
which hee never ſaw growing, as alſo becauſe *Bauhinus* doth number it among the other ſorts as a differing
ſpecies, and *Lugdunensis* giveth his Figure alſo which is divers from the *Ferula* in my opinion having finer, ſmal-
ler

1. *Libanotis cadyryfera* sive *Cadyrys vera*,
Fennell leaved herbe Francumfence.

2. *Panax Asclepias Ferula folio* Lobelij.
Lobel his Esculapius Woundwort or Allheale.

ler and shorter leaves then *Ferula*, and a smaller umbell of flowers, the roote likewise is small and no way answerable to a *Ferula*.

4. *Panax Asclepium Apulum* Columna.
Columna his Esculapius Allheale of Naples.

Fabius Columna saith that this his *Panax Asclepium* is the truest of any other, hath bin described by any other author, growing frequently in *Apulia*, answering it in every part according to the descriptions thereof in *Dioscorides* and *Theophrastus*. For it hath a small slender roote with a bush of haire at the toppe of the bignesse of ones thumb, with a thicke rugged barke of a whitish yellow colour on the outside, and spungie white and woody pith within, full of a clammy white milke hardening quickly into a Gum which is bitter and sharpe in taste and unpleasant but yet aromaticall: the stalkes of leaves which are spread next the ground, in a round forme at the head of the roote, are cut into severall long haire as it were thicke set together, somewhat like unto common Yarrow and hairy withall, which is not seene in the other sorts, or rather like unto Fennell leaves but bigger, having seven winged leaves set on a pretty big stalke, five bigger and two smaller which are next the hairy stalke, being Greene at the first, but changing yellow when it groweth toward flowering, which with the leaves is halfe a yard long: fro among these doth rise up but one maine of stalke, which is slender two or three foot high sometimes, having some joynts but no leaves thereon to the toppe, whereat usually stand but one or two small tufts or umbells of yellow flowers and seldome three, but spread a little largely and growing closer and rounder as it turneth to seede which are flat and winged on both sides two growing together as is usuall in all other umbelliferous plants, whereon as also on the stalke is often found a sweete smelling Gum as cleare as Turpentine or Gum Arabecke, which is hardly dissolved in water without heate, the like also is taken from the roote cut in peeces, but that it is yellower because it must be forced by the fire.

5. *Panax Asclepium Apulum* Columna.
Columna his Esculapius Allheale of Naples.

5. *Panax Asclepium Dalechampij.* The French Esculapius Allheale.

The French kind *Dalechampius* found about *Mompelier* having a white roote like Parsly, slender, sharpe and well smelling, and leaves also like Parsly, or rather like Coriander then Fennell and somewhat hairy with umbells of yellow flowers of an absolute roundnesse.

6. *Panax Asclepium Anguilare & Camerarij.* Esculapius Alheale of Candy.

This *Panax* which *Anguilare* and *Camerarius* have remembered, saying that in Candy it is usually called *Seseli* and in *Sicilia* *Peucedanum* though both falsely, riseth up with a round fennell-like stalke foure or five cubits high, with divers joynts thereon divided into branches of leaves, larger then Fennell and smaller then *Ferula*, of a darke greene colour on the upper side and of a blewish greene underneath, with large umbells of yellow flowers at the toppes turning into broad flat winged seede of a resinous sent and taste, the leaves being much more milde, and yeelding a whitish milke nothing so hot or strong in smell as *Ferula*.

7. *Libanotis minor umbellacandida.* Small herbe Francumfence.

This small herbe Francumfence hath sundry leaves lying upon the ground, much cut and divided into longer parts than *Peucedanum*, and narrower than the greene *English Saxifrage*, the stalke hath but few joynts and leaves on them, bearing small umbells of white flowers like *Meum*, and small seede after them, almost like the seede of *Anmi*, Bishops weede: the roote is great and white, divided into sundry branches, and with a bush of haire above.

8. *Libanotis ferulacea Germanica.* Germane herbe Francumfence.

The herbe Francumfence of Germany hath a blackish long roote, as thicke as ones finger, full of a resinous juyce, sharpe and well smelling, set with a bush of haire at the toppe, from whence spring stalkes of fine Fennell-like leaves, but shorter than they: the stalke riseth to halfe a yard height, on the toppes whereof stand bowing umbells of white flowers smelling sweete. There is of this kinde a lesser sort also, not differing from the former in any thing, but in the smallnesse.

The Place and Time.

All these kindes of *Libanotides* have beene found growing in sundry places of *Italy* and *France*, except the sixt, which as is said hath beene found in *Sicily* and *Candy*, and the last in *Germany*, and doe all flower and seede, if the yeare be kindly, in the end of Summer.

The Names.

Libanotis in Greeke is derived from *λίβανος*, which is *Thus* or *Olibanum* Francumfence, because the smell of the herbes is compared to the smell thereof, and *Libanotis* likewise in Latine: but because this later age hath found out divers herbes which may be referred for the forme, or for the smell, unto some of the ancients; *Theophrastus*, *Dioscorides*, and *Galen* (who yet in their writings, acknowledged that there are many more sorts than they have set downe) I have here onely the wed you those kindes that have fine leaves, whereof the *λίβανος ἀνθηφόρος*, or *ανθώδες λιβανότιον* may well be accounted as one of them, both for forme and smell, taking the name from *Esculapius*, who ended his life by a fall from of a ladder, as it is set downe by *Pliny*. The first is called *Libanotis* seu *Rosmarinum* by *Matthioli* and others (and indeede many Writers have interpreted the *Libanotis* to be *Rosmarinum*, and thereby confound the two names together, for the *λίβανος στεφανοειδής*, *Libanotis Stephanomictis*, id est *Coronaria* onely is the fourth sort of *Libanotis* with the ancients, which is properly the *Rosmarinum* of the Latines, and was, and is usually put into Garlands, &c. and therefore so called *Coronarium*, when as none of the other *Libanotides* being ferulous plants can fitly be called *Rosmarinum* in that sense, or serve for that use) and is the first *Libanotis* of *Dioscorides*, *Theophrastus*, and *Galen*, whose seede is called *Cachrys* or *Canchrys*, as it is in some coppies, because it is fiery in taste. *Camerarius* calleth it *Libanotis cachryfera*, *Lobel Cachrys verior Libanotis Galeni*, and *Cesalpinius Libanotis Candida*. This word *Cachrys* or *Cachrys*, is of divers significacions, and it is the pill or ball where with they use to burne the skin to make an escarre, from whence also the seed had the name, having the like qualitie: and *Cachrys* is understood to be a scaly tuft (which some also take to be the catkins of sundry trees) of leaves growing in Winter, and falling away, say some, in the Spring; but others thinke that it is but the germen or bud, which spreadeth into branches with leaves after Winter, when the Spring is come on: the second hath his name in his title, as *Lobel* and *Banhus* call it, and is the *Panax Asclepium* of *Dodoneus* and others: the third is called *Panax Asclepium* by *Matthioli*, *Lugdunensis* and others, and by *Banhus* *Libanotis secundae similis*, *Panax Asclepium primum*: the fourth is so called by *Columna*, as it is in the title, and by *Banhus* *Panax femine folioso*: the fift is the *Panax Asclepium alterum* of *Dalechampius* in *Lugdunensis*, which *Banhus* calleth *Panax Asclepium umbella latea*: the sixt is the *Rosmarinum alterum ferulaceum* *Dioscoridis* by *Lobel*, and by *Arguilara* and *Camerarius* *Panax Asclepium*, for so it was entialed unto them by *Dodoneus*, and *Tabernmontanus Libanotis secunda*, and by *Cesalpinius Libanotis nigra*: the seventh is the *Libanotis Septentrionalis* herbariorum of *Lobel*, and the *Libanotis minima* by *Lugdunensis*: the last is called by *Thalys* in his *Harcynia sylv.* *Libanotis raphanoides* whereof he maketh a major and a minor, and I have thereupon called it *Libanotis ferulacea Germanica*. The *Arabians* call the *Libanotis* *Xaier Almarian*, *Aspinatsach*, and *Calchala*, or *Cachola*: other Nations doe follow the erroneous name of *Rosmarinum*, and thereafter call this as well as the Latines *Rosmarinum*, which is our ordinary *Rosmary* by one and the same name: but wee have more fitly distinguished them, by calling this kinde, hence Francumfence from the Greeke appellation.

The Vertues.

Dioscorides saith that the leaves of all the sorts of herbe Francumfence doe usually stay the bleedings of the hemorrhoidal veines, and easeth the heate, inflammations, and swelling of the fundament, if they be bruised and applied unto them, and doe digest the kernells and empostumations of the body, wherefoever they are hard to be cured: the dried rootes mixed with honey cleanse foule ulcers, and ease the paines and torments of the body or bowells, and being taken in wine helpeth the biting of venomous Serpents, and provoketh both urine and womens courses: the same also helpeth to disperse ancient tumours or swellings being laid on them: the juyce of the herbe as well as the roote mixed with honny and annointed on the eyes quickneth the sight, the seede being drunke doth the like, and helpeth those that have the falling sicknesse, or have old paines in their breasts or stomackes: it helpeth also the Kings evill, if it be taken with pepper in wine: it provoketh sweate being put into oyle and annointed, it helpeth those that are burthen; that have crampes or convulsions or the gout, if it be beaten with

with the meale of darnell, and mixed with vinegar, and laid to the places: the same also mixed with sharpe vinegar, cleanseth the leproy, morpew, and the like deformities in the skinne: that seede that is burning, called *Cachrys*, is not to be used inwardly, for it is too sharpe, and will exasperate the throat: the greene roote is a great healer of all wounds being bruised and laid thereto, but saith *Dioscorides*, the seede called *Cachrys* is of a heating and mightie drying qualitie, and therefore is good to be put into washing balls, or such things as cleanse the skin, and being annointed on the head helpeth the distillations and rheumes of the eyes, but it must be rubbed off the third day. *Esculapins Panax* or Allheale, as the said *Dioscorides* saith, hath in the flowers and seede an helping power to heale ulcers, fretting or running cankers, and likewise wheales, pushes, or the like breaking out in the skinne, being bruised with hony and applied to them; the same also is profitably both drunke in wine against venomous Serpents, as also to have the places annointed with it, and oyle mixed together.

CHAP. V.

Feniculum, Fennell.

Although I have in my former booke given you the knowledge of two or three sorts of Fennell, yet because there are some others not there spoken of, I thinke it not amisse to shew you them all in this place together, and the rather, because therein I did not so amply insift on the vertues, as they did require.

1. *Feniculum vulgare*. Common Fennell.

Common Fennell is well knowne to rise up with sundry round stiffe stalkes, foure or five foote high, bearing at severall joynts long stalkes, of fine small long leaves, smelling somewhat strong, but not unpleasant, and at the toppes on severall branches, tufts, or umbells, of yellow flowers, which turne into small round bitterish greenish seede, two alwayes together, as in the other umbellifers, and being ripe and drie become somewhat sad coloured; the roote is long and white, running downe deepe into the ground with divers branches thereat: some doe make two sorts, one with greene leaves wholly, an other with reddish greene leaves not differing in ought else.

2. *Feniculum dulce*. Sweete Fennell.

Sweete Fennell groweth no otherwise than the former doth, having both rootes, leaves, stalkes, and flowers, after the same manner, saving that this, neither beyond sea, nor in our country doth rise so high, and hardly endureth the sharpenesse of our Winters; the seede is larger, yellower, and sweeter in taste, neare unto Anniseede then the former, which so continueth in the hot countries, but will not hold either colour, largenesse, or sweetness, long in our countrie, but each of them decay yearly, so that the third yeares sowing, yeldeth as bitter small, and sad coloured seede as any in any other garden or country of this land, so that you may hereby certainly know that it is the climate onely that changeth it to be either larger or smaller, longer or shorter, yellower or paler than others, & also giveth the taste to be sweeter or bitterer, which divers have thought to be differing sorts: some also thinke that the *Cardus Fennell*, as the *Italians* call it, is a divers sort of Fennell from the other sweet sort, when as it is onely the art in ordering it, by transplanting and whitening it that maketh the leaves grow so thicke bushing together more than the ordinary, and the whitening giveth it a sweeter relish, and a shorter crispe taste in eating.

3. *Feniculum semine rotundo minore*.

Small round Fennell.

There is a small kinde of Fennell which differeth not from the common sort, either in taste or smell, but in being lower and smaller than it, and that the umbells at the heads of the stalkes are white, and the seede that followeth is lesse than the ordinary sort, being somewhat more like unto *Carum* Caraway seede.

4. *Feniculum sylvestre*. Wild Fennell.

The wild Fennell groweth up with great, but fewer stalkes than the common of the garden, having also but few leaves, and those very thinly set thereon, but somewhat stiffer or harder in handling, and shorter also; the seede is small and somewhat round, which followeth after the small umbells of yellow flowers.

5. *Hippomarathrum creticum*. Great Fennell of Candy.

This great Fennell hath fine, but shorter leaves than the ordinary sort, the stalke is crested and round, two or three cubits high, of the bignesse of ones finger, divided into sundry branches, bearing yellow flowers at the toppes, and great large, almost round seede alterwards, the roote is great and whitish.

6. *Hippomarathrum pharoccephalum*.

Great round headed Fennell.

The stalkes of this Fennell are three cubits high, with large Fennell-like leaves, and round globe-like umbells,

1. *Feniculum vulgare*. Common Fennell.

whose flowers are of a purplish violet colour and large seedes like Fennell, but of a strong sent almost stinking : the roote is long and white enduring long : this is not the last called *Hippomarathrum Cresticum* and *Cachryferum* for that hath yellow flowers and seede like *Cachrys*.

The Place and Time.

These sorts of Fennell grow in hot countries as in their titles and descriptions is declared, for the coldnesse of our climate altereth even the best and sweetest is sown with us : the wilde sort was brought mee out of *Spain* among other seeds by *Boel* : they all flower and seede in the end of Autumne if the yeare be kindly, I meane the strange sorts.

The Names.

It is called in Greeke *καρδον*, and *Feniculum* in Latine, and both from one signification, *quod quasi fœnum in hyeme arefactum & marcidum reponatur, vel quod magno cum fanore semen reddat, & cum inaruerit ad condienda multa plurimum sit usus*. The first is the most common both in our Land and both the Germanies, which they call *nostrum vulgare* as well as we, *Cesalpinus* calleth it *syvestre*, and *Camerarius* in *horto* saith that some took it to be *Hippomarathrum* : the second is the *Feniculum dulce* of *Matthiolus* and divers others, and called *vulgare* by *Lugdunen-sis* which all *Germane* authors say doth as well alter in their countries as in ours, but holdeth more sweete still the hotter the country is wherein it groweth : the third *Bauhinus* onely hath made mention of in his *Pinax* : the fourth *Lobel* calleth *sponsa virens* in *agri Narbonensium* and I may say as well *Hispanorum*, *Matthiolus* calleth it *Erraticum*, and *Angulata* doubteth whether it may not bee *Hippomarathrum* : the fift is very probable to bee the *Hippomarathrum* of *Honorius Bellus* of *Candy* whereof he maketh mention in his first Epistle to *Clusius* which is extant in the end of *Clusius* his history of plants, who saith the *Candians* call it *Platecumino*, whose seede as he there saith is as great as those of *Cachrys*, *Bauhinus* in his *Prodromus* seemeth to aime at this having but a branch thereof sent him out of *Signor Contarini* his Garden at *Venice*, but could not demonstrate the whole plant : the last is remembered by *Alpinus libro de exoticis*. The *Arabians* call it *Raienizi*, the *Italians* *Finocchio*, the *Spaniards* *Hinoio* and *Funcho*, the *French* *Fenouil*, the *Germans* *Fenchel*, the *Dutch* *Venkel*, and we *Fennell*.

The Vertues.

Fennell as *Galen* saith is hot in the third degree, and dry but in the first, and put to many uses, the leaves seede and rootes being both for meate and medicine, the *Italians* especially doe much delight in the use thereof, and therefore as I sayd before transplant it and whiten it, to make it the more tender to please the taste, which being sweete and somewhat hot and comforting the stomacke, helpeth to digest the crude flegmaticke qualitie of Fish, and other viscous meats which they much inure themselves unto. We use it to lay upon Fish or to boyle it therewith and with divers other things, as also the seede in bread or other things : the physcall use thereof is to breake winde to provoke Urine and to ease the paines of the Stone and helpe to breake it : the leaves or seede boyled in Barley water and drunk is good for Nurses to encrease their milke, and to make it the more wholsome for their Nurse Children to take : the leaves being boyled in water but much more the seede stayeth the hickocke, and taketh away that loathing which often happeneth to the stomacks of sicke or feaverish persons, and alayeth the heate thereof, the seede boyled in wine is good for them that are bitten by Serpents or have earen poysonfull herbes or mushrooms, the seede and the rootes much more helpeth to open the obstructions of the Liver, Spleene and Gall and thereby much conduceth to all the diseases arising from them as the painfull and windie swellings of the Spleene and the yellow Jaundies : as also the Goute and Crampes, the seede is of good use in pectorall medicines, and those that helpe the shortnesse of breath, and wheezing by obstructions of the Lungs : it helpeth also to bring downe the courses and to cleanse the partes after delivery : the rootes are of most use in Physicke drinks and brothes that are taken to cleanse the blood, to open obstructions of the Liver, and to provoke Urine and to amend the evill colour or complexion in the face after long sicknesse, and to cause a good colour and a good habit through the whole body : Fennell both leaves and seedes or rootes are much and often used in drinks or brothes, for those that are growen fat to abate their unwelldinesse and make them more gaunt and lanke : the distilled water of the whole herbe is likewise commended for the same purposes, as also to be dropped into the eyes to cleanse them from all enormities risen therein, but the condensate juice dissolved or as some take it, the naturall juice or Gum that issueth out thereof of it owne accord in hot countries, doth cleanse the eyes from mists and filmes that hinder the eye sight : some for this purpose take the greene stalkes of Fennell, and holding them to the fire in Autumne while they are greene, cause a certaine juice or liquor to drop from them, which they apply to the eyes, as holding it to bee more effectuell then cyther condensate juice or the naturall Gum. And some yet more neatly make a water to cleare the eye sight in this manner : they powther some fine white Sugar Candy very finely, and put that powder into the hollow greene stalke of Fennell while it groweth a foote above the ground, so that it be betwene two joynts, which after it hath remained therein a day two or three, and the hole covered and bound close over that no raine get in in the meane time, they open it at the lower joynt, having first placed a good peece of soft wax made a little hollow gutture wise under the hole, which may serve as a gutter or quill to carry the liquor (from falling downe by the stalke) into a vessell or thing set of purpose thereto to receive it. The sweete Fennell by reason of the sweetnesse is much weaker then the ordinary, which is better to all the physcall purposes afore sayd, and therefore they doe but deceive themselves and others, that use the sweete Fennell seede in compositions as thinking it the better when as it is much the weaker, by want of the bitternesse, which is the most operative : the juice of Fennell dropped into their eares that have wormes breeding in them, killeth the wormes : The wilde Fennell is stronger and hotter then the tame, and is therefore most powerfull against the Stone, but not effectuell to encrease milke, for it is dryer : *Honorius Bellus* saith that the women of *Candy* use to boyle the great seede of the *Hippomarathrum* of *Candy* in Lye to dye their haire yellow.

CHAP. VI.

Anethum. Dill.

Although formerly we have been acquainted but with one sort of Dill, and that *Theophrastus* saith there are many sorts but expresth none of them, yet in these later times two other sorts more have been found out, which we will shew you together here.

1. *Anethum hortense sive vulgare*. Common garden Dill.

The common Dill groweth up with seldome more then one stalk, neither so high nor so great usually as Fennell being round and with fewer joynts thereon, whose leaves are sadder and somewhat long, and so like Fennell that it deceiveth many, but harder in handling and somewhat thicker, of a stronger sent also and unpleasant, the toppes of the stalkes have fewer branches and smaller umbells of yellow flowers, which turne into small seede somewhat flatter and thinner then Fennell seede, and of a stronger and more unpleasant taste: the roote is small and woody perishing every yeare after it hath borne seede, and is unprofitable, never put to any use.

2. *Anethum sylvestre majus*. Great wilde Dill.

This great kinde differeth not from the former in any notable part but in the greatnesse both of stalkes, leaves, flowers and seede and that it is found growing naturally wilde in *Sicilia* as *Cesalpinius* saith.

3. *Anethum sylvestre minus*. Small wilde Dill.

As the last was greater in all parts then the first so this is much lesse then it growing but a foot high, the leaves are fine and small on the stalkes, and the flowers yellow like it, and the seede small and long, thus in roote as well as the rest being smaller maketh the difference, for both these last are but annuali as the first.

The place and Time.

The first is most usually sown in Gardens and grounds for the purpose, yet it is found wilde withins in some places: the second as is sayd hath been found in *Sicilia* as the last, and sent by *Columna* to *Bauhinus*, and by *Boel* from *Lisbone* to us.

The Names.

It is called *Ανιθον* in Greeke *μεγ. η. ανιθον* quod cito crescat say some, or as others thinke *quasi ανιθον*, id est, invillum quia cibi appetentiam excitat: as also *ανιθον* quod est congressus & coitio veneria ad quam laceffit *Anethi* us ut antiqui prodiderant, tametsi plurimo usu genituram tandem exhauriat. The first is simply called *Anethum* by all authors, or *Anethum hortense* as *Bauhinus* doth: the second is onely mentioned by *Cesalpinius* and *Bauhinus* out of him, and the last by *Bauhinus* from *Columna*, and we from *Boel*: the *Arabians* call it *Zebet* or *Seber*, the *Italians* *Aneto* the *Spaniards* *Eneldo*, the *French* *Anet*, the *German* *Dyllen* and *Heckkraut*, the *Dutch* also *Dille* and we *Dill*.

The Vertues.

Dill is hot in the third and dry in the second degree, especially being Greene, but when it is dried it is hot and dry in the third, digesting then, more then before: it is good to breede milke saith *Di scorides*, but *Galen* in the Fennell before seemeth to gainsay it, for being so dry it stayeth milke and engendreth it not, and to ease swellings and paines being boyled and drunke: the same also stayeth both the belly and the stomacke from casting: the decoction thereof helpeth women that are troubled with the paines and windinesse of the mother, if they sit therein: it provoketh Urine, it slayeth the hickock, being boyled in wine and but smelled unto tyed in a cloth, and dulseth the eye sight, and being much taken extinguishteth ventry, for it mightily expelleth winde, and dryeth up naturall sperme: the seede is of more use then the leaves, although they bee much used to relish condiments, and is more effectuell to digest raw and viscous humors, yet more unpleasant then Fennell, and is used in all medicines that serve to expell winde, and ease torments and paines thereof: the seede being toasted or fried and used in oyles or plaisters, dissolveth the Impostumes in the fundament, and dryeth up all moylt Vicers especially in the secret parts: the oyle made of Dill is effectuell to warne, to resolve humours and Impostumes whether soft or hard tumors, to ease paines and to procure rest.

1. *Anethum hortense sive vulgare*.
Common garden Dill.

CHAP. VII.

Cuminum. Cumin.

Cumin is not knowne to most of our best latter writers and Herbarists to be of any more sorts then one, but wee have had the relation of other sorts, but not those of the ancients, as eyther *Syriacum*, *Aegyptium* or *Africanum* which are but one and the same as many good Authors thinke, and but onely differing by the soyle and climate where they grew as shall be shewed.

1. *Cuminum vulgare*. Ordinary Cumin.

Ordinary Cumin groweth up with slender and low stalkes not above halfe a yard high, growing white at the last and brancheth out more, having store of leaves which are small and long like unto Fennell, the flowers are somewhat reddish at the tops of the stalkes, which turne into small whitish yellow seed somewhat long and almost round, crested or straked on the pander side and smelling strong, the roote is small long and white perishing yearly.

2. *Cuminum Melitense dulce*. Small sweete Cumin of Malta.

This small Cumin whose seede is small and like unto Anne-seede, but as sweete as sweete Fennell, is usually sown in the Ile of Malta to put into their bread or other meates, as also to trade with to other parts; for exchange of other commodities, as as I am given to understand as small and low a plant as the Cumin and much like it in leaves and growing, the seede onely is observed to be differing.

3. *Cuminum sativum acre Melitense*. Great sharpe Cumin of Malta.

This other hath greater feedes then the ordinary Cumin longer also and pointed at both ends, crested likewise on the rounder side, and of a deader colour smelling more unfavourably and tasting hot quicke and sharpe, almost like Cubebes or Pepper: and it is probable (for we never saw it Greene) groweth greater then the ordinary, although like it in all other parts.

The Place and Time.

All these sorts grow familiarly in the hot countries as Spaine, Italy, the Iles in the Mediterranean Sea, whereof Malta is one, and in Syria, and the other East countries where it is sown: in our Land it seldome commeth to good, unlesse in a kindly yeare, and sown in the middle of the Spring, so that it must be late with us (though nothing so with them) before it can be ripe.

The Names.

It is called in Greeke *κυμινον*, and in Latine also *Cuminum* and *Cymium*: the ancient authors as *Dioscorides*, *Theophrastus*, &c. made hereof many kinds, calling them by the sundry countries where they grew, as *Aegyptium*, *Galatium*, *Syriacum*, &c. when as it is confidently held they were not differing in specie but in loci prærogativa, for although one sort of seede was rough or hairy and white and called *Cuminum Ethiopicum* which *Hippocrates* called *Regium* as the best, another not rough or hairy called *Aegyptium*, yet they were not severall sorts but one was better than another according as the countrey gave it goodnesse or excellencie. As for *Dioscorides* his wilde kinds of Cumin, I have entreated of them before in the third Classis of this worke. The first is called by most writers *Cuminum sativum* or *Cyminum*, yet *Cesalpinus* taketh it to be *Cuminum sylvestris* primum genus *Dioscoridis*, *Guilandinus* calleth it *Cuminum Ethiopicum* and *Cordus* in *Dioscor.* *Cyminum Romanum*. The two last are onely touched by *Barbini* in his *Pinax* and called by those of Malta *Cuminagero* that is wilde Cumin and the sweete kinde *Cuminagero dulce*. The Arabians call it *Camun* or *Kemun*; the Italians *Cumino*, the Spaniards *Cominobos*, the French *Comin*, the Germans *Kimmell*, the Dutch *Comijn*; and we Cumin, and the seede Cuminseede.

The Vertues.

The seede of Cumin is not onely most used with us who have little or none of the herbe growing, but every where else also, and both was and yet is in sundry places used both in bread and meate to give a reilish to them as we doe with Pepper, and was pleasing as well to the stomach as the taste: *Galen* saith it is in the third degree of heate, and in the same degree almost of drynesse, and as *Dioscorides* saith, it heateth, bindeth and dryeth, but *Dodonæus* insiltheth thereagainst. shewing that Cumin seede by attenuating and digesting doth dissolve humors and doth not represseth them by binding or attraction, as in the swellings of the cods by winde or a waterish humor. Cuminseede used in a Poulitis doth quickly take it away, and so it doth all other paines and swellings, being boyled and Barley meale put unto it and so used: it also dissolveth winde in the body and easeth the paines and torments thereof by the Collicke, being boyled in wine and drunke, and is used as a corrector of any windy meats: in the same manner also taken it helpeth those that are bitten by Serpents: the seede also taken in broth or drinke or *Pocca* as *Dioscorides* hath it, is good for those that are short winded, or are otherwise troubled with an old cough, or the dis ease of the breast to boyle the seede with Figges in wine: the same seede beaten and mixed with Vineger and applyed to the nose that bleedeth doth stay the bleeding, and boyled in water and the lower parts bathed

thed therewith stayeth the abounding courses of women : Cumin feede bruised and fryed with an hard Egg and bound to the backe part of the head easeeth an old head-ach, and stayeth the rheume that falleth into the eyes or are blood shotten, or else the powder mixed with wax into the forme of a plaister and applyed warme to the eyes will soone helpe it, and take it away. Cumin feede is sayd to make any one looke pale that useth it inwardly, or applyeth it outwardly.

CHAP. VIII.

Meum. Spignell.

Meum the ancients likewise knew and described but one kind, although it was entituled by divers names of the places where the best grew : but we have in these latter times beene acquainted with three or foure other plants which may not unfitly be referred also thereunto, as by their descriptions you shall soone understand.

1. *Meum vulgatum*. Common or ordinary Spignell.

The rootes of common Spignell doe spread much and deepe in the ground, many strings or branches growing from one head which is hairy at the top of a blackish browne colour on the outside and white within, smelling well, and of an aromaticke taste, from whence rise sundry long stalkes of most fine cut leaves like haire, smaller then Dill, set thicke on both sides of the stalke and of a good sent : among these leaves rise up round stiffe stalkes with few joynts and leaves at them, and at the toppes an umbell of fine pure white flowers at the edges, where of sometimes will be seene a shew of reddish or bluish colour especially before they bee full blowne and are succeeded by small somewhat round feede bigger then the ordinary Fennell, and of a browner colour, divided into two parts and crested on the backe as most of the umbelliferous feedes are.

2. *Meum alind minus*. Small Spignell.

The small Spignell hath a good big roote a foote long into the ground blacke on the outside and white within without any branches downewards, but parted into severall heads upwards, each whereof sendeth forth sundry short slender stalkes of most fine short leaves set by small tufts together : among which rise up a few low stalkes not above a foote high, bearing white umbells of flowers and very small feede after them as small as Parsley, but blacker of colour, the sent whereof is most quicke sharpe and very pleasing as is the rest of the plant.

3. *Meum Alexiterium Creticum*. The preservative Candy Spignell.

The stalke hereof is about two foote high, as thicke as that of Dill and greene, with many long winged leaves thereon as finely cut as the former Spignell : the umbells of flowers are white and small, and very small long

1. *Meum vulgatum*.
Common or ordinary Spignell.3. *Meum Alexiterium Creticum*.
The preservative Spignell of Candy.

4. *Meum spurium italicum*.
Italian Bastard Spignell

5. *Meum Alpinum Germanicum illis Muttelina dictum*.
Mountain Spignell of Germany.

Sweete smelling feede follow them : the roote is slender long and white of a fingers thickeffe, smelling well and of a sharpe taste : Our author *Alpinus* saith hee had another sort from the *Bassan* hills, but this hee holderch for the truest.

4. *Meum spurium italicum*. Italian bastard Spignell.

Bastard Spignell is somewhat like unto the true, yet more like unto Dill with longer and thicker leaves : the stalkes rise as high as the first with white umbells of flowers, and larger feede on them : the whole plant and every part whereof is of more strong and unpleasant sent and taste then the former, but the roote especially which spreadeth branches like the true Spignell, but smaller somewhat like Sow or Hogge-Fennell.

5. *Meum Alpinum Germanicum illis Muttelina dictum*. Mountain Spignell of Germany.

This Spignell hath but few stalkes of winged leaves rising from the roote, somewhat broader then the leaves of the ordinary Spignell and shorter, and are betweene *Carum* and *Meum*, among which riseth a slender straked stalk like a foote high bare of leaves for the most part to the toppe, where are set two or three small umbells of purplish flowers each consisting of five small leaves a peece, bearing feede afterwards that is somewhat long and reasonable great, the roote is of a fingers length covered with a rugged blackish barke, and but few fibres adjoyning thereunto, and a bush of haire at the toppe, of a smell somewhat sharpe like the ordinary Spignell but much weaker.

The Place and Time.

The first groweth in many places wilde in the North countries of this Land, as in *Lancashire* and *Yorkshire* yet it is planted also in Gardens, the second in *Savoy*, the third in *Candy*, the fourth in *Italy*, the last in *Austria*, and at the bottome of *Saint Vincents Roocke* by *Brissow*, right against the hot water which is not to bee seene but at a low water as it hath bene affirmed to me by some : but I doubt it will prove *Lobel* his *Pencedani facie pusilla planta* : when it is better growne up with me I shall the better judge of it.

The Names.

It is called in Greeke *μῆον* and *μῆον*, in Latine also *Meum*, and by some of the ancient authors *Athamanticum*, either from *Athamas* the son of *Acolus* who is thought first to have found it, or from the mountaine *Athamantes* which is in *Thessalia* where the best grew : *Pliny* nameth it *Macedonicum* and *Hispanicum*, not as though they were severall sorts but as was usual with them in many other plants, they named the places where the best was gathered in their time : for the same *Pliny* saith that in his time *Meum* was onely sownen in *Italy* by some few Phytitions, when as it is now knowne to grow wilde in many places of *Italy*. The first is generally taken for the true *Meum* of the ancients, & so called by most of the moderne authors, yet *Tragus* and *Fuchsius* took it to be *Daucus Creticus* and *Cordus* in *Dioscoridem* and *historia* to be *Tordylion*, some also called it *Anethum sylvestre*, & as *Ruellius* saith the French *Anethum tortuosum*, and *Dodonaeus* saith some tooke it to be *Libanotidu* genus and others *Fanicululus porcinus*, *Fuchsius* calleth it *Seseli Creticum* and *Bauhinus* calleth it *Meum folijs Anethi*, because he calleth the second *Meum Dauci Cretici facie*, which *Lugdunensis* calleth *Meum aliud*, the third is onely remembreed by *Alpinus*, & the fourth by *Mathiolus* that it is more like Dill then the first but not described, and therefore *Lobel* in his Obser-

vations giveth a very briefe touch thereof, and the figure withall, calling it *Meum spinum alterum Italicum*, *Bauhinus* and *Tabernmontanus* call it *Meum adulterinum*; the last is first remembred by *Gesner* in *hortis*, and then by *Comerarius*, who call it *Mutzelina*, from the name *Mutry* or *Mutieren*, whereby the *Germanes*, *Helveticans*, and others did call it. *Bauhinus* in his *Matthiolus* and *Pinax*, calleth it *Meum Alpinum umbella purpurascens* and maketh a doubt if it be not the *Daucus Montanus* of *Clusius*, which in my mine opinion it cannot be, for that *Clusius* saith, the leaves of that *Daucus* is like *Seseli pratense*, and the seede is as small as Parsley, in both which this *Mutzelina* differeth from it, although it seeme to agree in the purplish umbell, and somewhat in the roote: the *Arabians* call it *Me*, the *Italians* *Meo* & *Imperavix* as *Matthiolus* saith, but that name is given by the vulgar *Italians* to *Angelica*, and many other plants that are of any especiall vertue, as *Lobel* saith: the *Spaniards* *Pinello*, and *Sistre* of some, the *French* *Meum*, the *Germanes* *Beerwaris*.

The Vertues,

Galen saith that the rootes of Spignell are hot in the third degree, and dry in the second, whereby it is available to provoke urine and womens courses, and the paines in the kidnies and bladder; but if more thereof be taken than is fit and convenient it causeth head-ach, for by sending the hot vapours to the head, it is thereby moved and hurt; the rootes of *Meum* or Spignell (for no part elle of the plant is of use unto us, and yet the seede is very aromaticall) boyled in wine or water and drunke, helpeth the strangury, and stoppings of the urine. the winde, swellings and paines in the stomacke, the paines of the mother, and all joynt-aches: if the powder of the rootes be mixed with honey, and the same taken as a Lohoc or licking medicine it breaketh tough siegme, and orieth up the rheume that falleth on the lungs: the rootes are accounted very effectuell against the sting or biting of any venomous creature, and is one of the ingredients into *Mithridatum* and *Theriaca Andromachi*, which are especiall antidotes for the same, and many other effectuell purposes.

CHAP. IX.

Gingidium. Strange Chervill.

Have two sorts of this Chervill that properly belong to this Division or Order, and there are two more which might be referred to the other Divisions of these umbelliferous plants which I distinguished in the beginning, yet for the names sake, I would not willingly exclude them the family, but let them keepe company with the rest at this time.

1. *Gingidium verum sive Syriacum*. The true *Gingidium* or strange Chervill.

The true *Gingidium* that *Ramusius* saw in *Syria* groweth up with an upright stalk somewhat rough, branching forth from the very ground almost, whereto are set sundry stalkes of fine cut leaves, smaller than Fennell, especially those on the stalkes and branches, for the lowest are a little broad-

Visnaga *Gingidium appellatum*.

4. *Gingidium latifolium Syriacum*. Broad leaved Chervill of *Syria*.

der; at the toppes where of grow great broad umbells of white flowers, a little purplish in the middle, which umbells before they flower hang downe their heads, and after the flowers are past, the umbells doe contract or draw themselves rounder, the outer part being higher than the middle, which then is so hollow, that it representeth a birds nest, somewhat like to the umbell of feede in the wilde Carrot, and beareth plenty of very small feede, the roote is not great, but long, white, and woolly, perishing every yeare that it beareth feede, which is usually the same yeare it is sowed, or else springing late and not shooting up in stalkes for feede, it will abide a Winter: the whole plant hath a little resinous taste and smell to my senses.

2. *Gingidium Hispanicum*. Spanish Toothpicke Chervill.

The Spanish Toothpicke Chervill groweth rather greater than the former, but with smaller and slenderer stalkes and tenderer leaves at the joynts, thicker and more finely cut at the toppes, whereat stand large umbells of white flowers, divided into many parts, and standing upon long stalkes, which when the seepe groweth ripe waxe hard, being long and slender, and serve well for tooth pickes: the roote is long and white: the whole plant is of a bitter taste.

3. *Gingidium Charesfolij folijs*. Another strange Chervill.

This other strange Chervill hath divers stalkes of winged leaves, very like unto the ordinary Chervill, but not divided into so many parts, the stalk is round, straked, and blackish, halfe a yard high, with joynts and leaves like the others: the umbells of white flowers are compassed about with smaller and finer cut leaves, which when the flowers are past are contracted together somewhat like the first, and are somewhat clammy, wherein lie small feede: the roote is long, white, and bitterish.

4. *Gingidium latifolium Syriacum*. Broad leaved Chervill of Syria.

This Syrian Chervill hath but few stalkes of winged leaves, somewhat like to Parsneps, but that every divided leafe is broad and round but lesser, the stalk is somewhat hairy, crested, small, low and naked of leaves to the toppe, where grow divers long stalkes with small umbells of white flowers, and two or three small long leaves with them: the smell and taste is like unto the first.

The Place and Time.

All these here exprest, are said to be brought out of Syria, but the second groweth also plentifully in Spaine, from whence it hath beene brought and sent to friends: they all flower late, and therefore the feede is much later, so that if the yeare be not hot and kindly, the feede will hardly ripen with us.

The Names.

It is called in Greeke *ψιδιον*, and *Gingidium* in Latine; *Dioscorides* saith it was also called in his time *Lepidium*, but that name doth more fitly sute to another plant, as is shewed before: the old *Romans* were wont to call it *Biscuta*, and the *Syrians* *Visnaga*. The first, as I said, *Rauwolfius* in these later times first made knowne to the Christian world, having gathered it in Syria, giving it the name of *Gingidium Dioscoridis*, which it doth most truly represent, for *Dioscorides* compareth *Gingidium* to *Pastinaca sylvestris*, which as it is finer in leafe so is it most like in the head of feede, and *Camerarius* in *hortis* thereupon calleth it *Syriacum*: the second is the *Visnaga* of *Matthiolus*, *Lobel*, and others; yet *Matthiolus* would faine have it to be *Pastinaca sylvestris major*, because it groweth so great, *Tragus* calleth it *Seseli*, and *Fuchsius* *Seseli Massiliense*, *Cesalpinus* *Cuminum sativum alterum genus*: the third is the *Gingidium* of *Matthiolus*, *Lugdunensis*, and *Tabernmontanus*: the last is called by *Lobel* *Gingidium folio Bauciae Syriacum*, and is the first *Gingidium* by *Dodonaeus*; yet as he sheweth in the Chapter of *Pastinaca latifolia*, *Jacobus Mantius* taketh *Baucia* to be the *Pastinaca tenuifolia* of *Dioscorides*.

The Vertues.

These herbes are more used as nutriment than medicine, both in former times and now also where they grow, for *Dioscorides* and *Galen* speake more of the edible propertie, that they are by their bitteresse welcome and agreeable to the stomacke, being eaten raw or boyled, or divers other wayes ordered, as those times and mens wills led them to take them: but in that *Galen* saith in one place, that they are rather medicinable than nourishing, it is because he sheweth that they have a temperate qualitie betwene heat and cold, but have a manifest bitter and binding property, by both which they are so commodious to the stomacke, that they are of the nature of a medicine, to cleanse and dry up the moist humours that by their abounding doe much offend the stomacke, and by it the liver and other parts: the other medicinable qualities also therein rising from thence, are to be profitable for the diseases of the bladder, and to provoke urine being boyled in wine and drunke.

CHAP. X.

Pyrethrum umbelliferum. The true Pelletory of Spaine.

Here are in mine opinion two sorts of this *Pyrethrum*, the forme of their leaves being different, inducing me so to thinke, although there be nothing else as shall be shewed.

1. *Pyrethrum umbelliferum primum*. The first Pelletory of Spaine.

This *Pyrethrum* hath divers stalkes of fine cut leaves, the forme and divisions whereof doe somewhat resemble the forme of May weede, being short, and not long like Fennell, or like wilde Carrots, as *Dioscorides* compareth them, from among which riseth up some stalkes, with few or no leaves on them, branched into two or three parts, bearing a round umbell of white flowers, after which follow somewhat round darke coloured seed bigger than Anniseede: the roote groweth sometimes as great as two thummes together, but often of a thummes bignesse, and a foote or more deepe, of a brownish yellow colour on the out side, and whitish within, of a very sharpe and heating taste, drawing forth water into the mouth, more plentifully and quickly than the common Pelletory of Spaine, which hath a Daisie-like flower (as my taste if it deceive mee not, hath informed me) howsoever some authors have set downe the contrary, and endured after feede time, if it be somewhat carefully defended in the Winter time.

2. *Pyrethrum umbelliferum alterum.*

The other Pelletory of Spaine.

This other Pelletory groweth somewhat lower, the leaves are somewhat longer and finer, resembling Dill; the stalkes are slenderer and full of leaves, the umbells of flowers are white, but not so great: the roote is slenderer and single, and herein consisteth the chieft difference.

The Place and Time.

The first groweth more usually in the hotter countries, of Italy, Spaine, &c. the other on some mountaines in Germany, and often among the rockes whereon there is but a crust of earth, so that the rootes grow in the chinkes: they flower and feede toward the end of Summer.

The Names.

It is called in Greeke *πυρεθρον*, *ob radicis igneum fervorem*, and *Pyrethrum* in Latine, as also *Salivaris*, from the quality to draw spittle into the mouth: the first is the *Pyrethrum veyrum* of Matthioli, and *alterum* of Lobel and others, *Camerarius* callith it *Pyrethrum Diofcoridis*, *Cesalpinius* doubted to call it *Pyrethrum*, for untill it was well examined by the learned, they were loath to admit it as *Dodonaeus*, who would rather find a fault in the description of *Diofcorides*, and suppose it to be a kinde of Saxifrage, than admit it for true *Pyrethrum*. The other is called by *Engdunensis Pyrethrum Gesneri*, because *Gesner* sent it to *Dalechampius*, and as I said, is most probable to be a differing sort from the former; for I rather thinke this to be it that *Tragus* found on the mountaines, and called *Faniculum montanum*, than the former, as *Bauhinus* doth, who also noteth it in his *Pinax*, that the *Pyrethrum*, that hee saw in the *Padua* garden, varied in having yellow flowers from this, which hath growne with us and is white.

The Vertues.

This Pelletory is hot and drie in the third degree: the roote taken with hony is effectually against all cold diseases of the braine, as the Apoplexie, falling sicknes, the vertigo, or turning of the braine, and others of the like nature: it helpeth also the defluxions of rheume from the head to the teeth being bruised and heated in some vinegar, and the mouth gargled therewith, or the roote it selfe chewed in the mouth, doth often ease the furious paines of the tooth-ach if it proceede from rheume; it is effectually put also into all those oyles or ointments that are used to warme and heate any part of the body, or the sinewes that are benumbed with cold, or the dead or shaking palsie: for which purpose, some doe much commend an oyle drawne from the greene rootes, to be anointed, yea though the parts be drawing to a gangrene: assuredly, it much helpeth all cold griefes either inward or outward.

1. *Pyrethrum umbelliferum primum.*
The first Pelletory of Spaine.

CHAP. XI.

Nucula terrestris sive Bullecafannum, Earth Chestnut.

F the Earth Chestnut there is two sorts, a greater and a lesser in each part.

1. *Nucula terrestris major.* The greater Earth Chestnut.

The great plant bringeth forth divers long stalkes of leaves immediately from the roote which are finely cut in and divided somewhat like unto the leaves of Parley, that grow on the middle or top of the stalkes, as *Dodonaeus* compareth them; yet larger than the next or small Earth-nut, among which riseth up a slender stalk about a foote high, bearing at the toppes many small white flowers in an umbell, which turne into blackish small long feede, smelling somewhat sweet: the roote is not fully round or smooth, but bunching out in one place or other, and somewhat rough, of a blackish browne colour on the outside, and white within, of a pleasant taste, betwene a Chestnut and a Parsnippe, which is often eaten by women and children, after they have roasted them by the fire or under the embers.

2. *Nucula terrestris minor.* The lesser Earth-nut or Chestnut.

This smaller Earth-nut hath a small roundish browne roote like the former, but lesser, from whence riseth up a long slender whitish string or stalk, whethersoever you will call it, within the ground, not alwayes rising straight up from the roote, which groweth foure or five inches deepe in the earth, but foulding or crumpling it selfe to and fro unto the toppes of the ground, from whence it riseth a little bigger naked or bare of leaves for an inch or two, and then sendeth forth from the sides of the same stalk, sundry small stalkes of very fine cut leaves, little bigger than haire, of a sad greene colour, and at the toppes whereof sundry branches of white flowers in umbells, and such like small long feede, as in the former, but lesser, and somewhat sharpe in taste.

The Place and Time.

The first is as frequent in the upper and lower Germany, and in France and Italy, and the lesser more frequent in our country than theirs, although, as *Camerarius* saith, it groweth by the Rheyne also, and flower in the beginning of Summer, seeding quickly after.

The

The Names.

It hath no Greeke name, but what is acquired from the Latine, which is *Ascyron*, when as the Latines by a corrupt word doe call it *Bolbocastanum*, or *Bulbocastanum*, but by a better *Nucula terrestris*, as *Lobel* doth, but *Guinterius* & *Goupius* thinke that the word should be rather *Balanocastanon*, which is as strange as the other, and but formed together to shape it a coat futable to the wearing: *Dodonæus* in his former workes tooke it to be *Bunium* of *Dioscorides*; but it seemeth upon better advice, he changed his opinion, and maketh no mention thereof in his later, or *Pemptades*: which *Lobel* also seemeth to stumble at, not knowing, as he saith in *Adversaria*, fol. 71. any other plant that may represent *Dioscorides* his *Bunium* if this be not it: but the description of *Bunium* in *Dioscorides* doth so much vary from this, and hath so little resemblance, that I wonder judicious and learned men should so erre, for if one or two words herein doe correspond unto the *Bulbocastanum*, all the rest contrarieth it quite, for besides that *Dioscorides* maketh no mention of the roote to be bulbous, or otherwise, which was not fit to be omitted, and giveth an especiall knowledge of the plant; there is in this Earth-nut no square stalke, nor of a fingers thickness, nor in the true coppies, as *Lugdunensis* nor eth, is there any mention of Parsley-like leaves neare the rootes, but on the stalkes, nor are the flowers like Dill, which are yellow, nor is the seede smaller than Henbane, the properties also of each, being different, Thus have I shewed you that *Bolbocastanon* cannot be *Bunium*, but what *Bunium* is, by the judgement of *Dalechampius*, I shall shew you a little herealter among the wild Carrots. *Matthiolus* maketh the first here, to be his first *Oenanthe* in fol. 627. of *Bauhynus* edition; Doctor *Turner* tooke it to be *Apios*; and *Cesalpinius* calleth it *Panacæolus*, and as *Camerarius* saith, *Geranium primum* *Dioscorides*, but he saith that the *Italians* call it so; because the vulgar eate it in stead of bread and cheefe. *Lugdunensis* calleth it *Bulbocastanon grandius*, as *Camerarius* in *horto* also acknowledgeth it, and doth call it *Bulbocastanum* *Tralliani*, but *Lugdunensis* by that name understandeth the lesser sort calling it *mas*, because he would make *asce* *mina*, which is a quite differing plant from this, as I shall shew you among the *Oenanthes*, *Gesner*, *Dodonæus*, *Tabernaemontanus* and others, doe generally call it *Bulbocastanum*. The other is, as I said even now, called by *Lugdunensis* *Bulbocastanum mas* *Tralliani*, and *Bulbocastanum alterum minoribus folijs & bulbis* by *Camerarius*, *Lonicerus* understandeth this plant, which he calleth a species of *Ornithogalum*. The French Savoyards call it *Faverotte*, the Germans *Erdkersten*, and *Erdnuss*, the Dutch *Erdnoten*, and wee Earth-nuts; Earth Chesnuts, Gronnd nuts, and Kipper nuts.

The Vertues.

The roote is hot and drie, and somewhat binding, yet all moderately, but the seede is more in both, yet hath an opening propertie to provoke urine: the roote is said to be good for those that either spit or pisse blond: they that use to eate of them doe finde them nourishing as Chesnuts, and no other wise profitable in any especiall respect.

Nucula terrestris major vel minor.
Earth-nuts or Chesnuts.

CHAP. XII.

Oenanthe recepta herbariorum. Dropwort.

Although I know that none of these plants described in this Chapter, is the right *Oenanthe* of *Dioscorides*, yet because the common vote of these times passeth so upon them, and that I could not so well joine them to the *Filipendulas* here before set forth, unto whom they are in some sort like in that they were *umbellifers*, let me place them here to beginne this second division of the *umbelliferous* plants, which are of such as beare rhinne cut leaves, like Carrots or Parsley, and that in the last Chapter it was shewed you, that some did call the *Nucula terrestris*, *Oenanthe*, as well as the ordinary *Filipendula*.

1. *Oenanthe Apifolio major.* The most ordinary great Dropwort.

This great Dropwort, hath for rootes, many red and white and somewhat long Asphodill like clogs, joynted together at the toppes, and ending in small fibres, from whence rise many Greene winged leaves, made of many paris, cut in to the forme almost of Smalage leaves, but much smaller, and from among them two or three stiffe round stalkes, halfe a yard, or sometimes two foote high, leet with some such leaves as grow below, and at the toppes sundry spokes or umbells of white flowers, converted after wardes into Fennell-like feede, but smaller, and of a darke whitish colour.

2. *Oenanthe Apifolio minor duarum specierum.* Two smaller sorts of the former Dropwort.
These two sorts of small Dropworts have their winged leaves very like in the divisions unto the former, but both smaller

3. *Oenanthe Cretica stellata.*
Candy Dropwort with starre-like heads.

5. *Oenanthe angustifolia* Lobelij.
Lobels narrow leaved Enanthe or Dropwort.

smaller by much & more green, yet the one of them also smaller than the other, and the lesser a little finer jagged, which plainly sheweth the difference as well as the seede, which is smaller almost by the halfe, and rounder than the greater of these, which is somewhat like unto Dill seede, but somewhat smaller and white, the flowers in either being white, but differing in greatnesse: the rootes likewise are much alike: yet still greater or lesser the one than the other, and each consisting of sundry small tubers, with many strings or fibres among them.

3. *Oenanthe Cretica stellata.*
Candy Dropwort with starre-like heads.

After many yeares standing, this sendeth forth an upright stalke, scarce a foote high, without any leafe thereon, and with foure and five heads or tufts of white flowers, upon long foote stalkes, encompassed with eight or tenne somewhat long and pointed leaves like a starre, after which follow small seede somewhat like to the *Indian Scabious*: the leaves that grow below are winged, that is many small ones set at distances upon a long foote stalke, very like, both for forme and bignesse, unto the bigger of the last two recited sorts which fall away in the Winter, and springing a fresh in the Spring from the roote, which consisteth of sundry Asphodill like clogs, but lesser, somewhat hard and blackish.

4. *Oenanthe Cretica prolifera.*
Candy Dropworthe with fruitfull heads.

Very like unto the last is this Candiot, yet differing first in the leaves, which are larger and not cut into so many parts, then in the heads of flowers, which though white and clustering together like it, yet in stead of the long pointed leaves set thereabouts, this hath sundry small heads of the like white flowers, after the manner that many other plants have, namely Marigolds, Daylies, &c. which we call childing or fruitfull, or as some doe, Jacke-Anapes a horte backe, and againe in the seede, which is like to the water or Marsh kinde, and lastly, and most especially in the rootes, which are not glandulous like the other, but wholly composed of a number of white fibres

6. *Oenanthe Cretica foetida* Lobelij.
Lobels Hemlocke like Enanthe or Dropwort.

and threds : this also upon the first springing thereof from the seede hath but three leaves upon divers stalkes, and those after gaine more.

5. *Oenanthe angustifolia* Lobelij. Lobels narrow leaved Enanthe or Dropwort.

This Enanthe of Lobel is sayd to be like the first, but with much narrower and finer cut leaves, and not to differ greatly in any other particular.

6. *Oenanthe Cicuta facie* Lobelij. Lobels Hemlocke like Enanthe or Dropwort.

The leaves hereof are more like the meadow Rue then Smalage having many small ones set together of a fowle darke greene colour, and somewhat like Hemlocke in colour as also in the flowers but more in effect, troubling and overturning the braine and senses being eaten as Lobel saith, the rootes are white and glandulous, or Asphodill like soft and tender but sharpe and unpleasant in taste, yeelding a whitish milke at the first, and turning yellow after, which is poisonous, virulent and exulcerating.

7. *Oenanthe palustris sive aquatica*. Marsh Dropwort.

The lower leaves hereof are much divided into many smaller parts then the former sorts, but those that grow upon the hollow stalkes are much finer and smaller : the spikie umbells of flowers are white as the other, and the seede like Hemlocke : the rootes are many small tubers fastned by strings and other fibres among them.

8. *Oenanthe Moschellaca major & minor*. French Dropwort a greater and a smaller.

The greater of these two French plants of Dalechamps as *Lugdunensis* remembreth them, hath a thicke crested stalk like unto a foote high and leaves thereon like unto Carrots, the umbells of flowers are white, and somewhat long seede succeeding : the rootes have many somewhat long and blackish tubers with other fibres among : The lesser sort hath a thicke handhigh stalk, and the like Carrot-like leaves : but the seede thereof is flat like *Arachis*, wherein hee saith, as also in that it groweth in stony places, it cometh nearer then the other unto the right *Oenanthe* of *Dioscorides* although the other in all other things is nearest thereunto : the rootes hereof also are small and tuberous like the other.

9. *Oenanthe Inucoides minima*. Small Rushlike Enanthe or Dropwort.

Although I here give you the lesser figure of Lobels *Oenanthe aquatica* in want of the right, whereunto this doth come very neare, yet the description shall amende that defect : For it hath sundry very fine and small divided greene leaves lying on the ground all the Winter and some as small and fine as *Meum Spignell* : but those upon the hollow greene Rush like stalkes which are about halfe a yard high are finer by much, yet very few, and at the upper joynt with the leafe and not at the top of the stalk come forth a few very small white flowers which turne into very small feede : the heads or tubers that bee dispersed among the small haire like fibres, are as small as reasonable big Pins heads, which abide and perish not encreasing yearely, but best in a moist and shadowie place.

10. *Oenanthe tenuifolia altera Africana*. Fine small Dropwort of Africa.

I have yet one other of these *Oenantes* to shew you which Boel gathered on the Barbary coasts and brought to us, having a small slender broad stalk with very fine cut leaves thereon as fine as either Dill or Spignell, set at distances with divers branches of umbel-like white flowers at the toppes, changing into very fine white feede : the roote being small and tuberous like the last.

The Place and Time.

All save the second two sorts, and those particularly entituled grow in our owne Land, which second and last have not beene remembered by any other before, flowering and feeding in the end of Summer.

The Names.

Dioscorides hath by *Matthiolus* judgement recorded three sorts of *ενανθη* *Oenanthe*, derived *ενανθη* & *ενανθη* a vino & flore quasi flos vinosus, quod florum decore, odore et quadantenus colore non sint viri dissimiles : vel etiam *Leucanthos* appellari a florum candore scribit, yet *Theophrastus* in the last Chapter of his sixt Booke maketh mention but of one sort not to be excluded from the number of flowers yet sowed of seede, which all doe interpret to be the bloomings of the wild Vine, and as *Matthiolus* saith *Dioscorides* implyeth that wild Vine that beareth Grapes as well as that which is barren. Divers authors have diversly judged of *Dioscorides* his *Oenanthe*, *Matthiolus* contradicting *Fuchsius*, who first and Lobel after him that strove to maintaine his opinion, that the common *Filipendula* was it : yet notwithstanding Lobel his opinion, *Matthiolus* his reasons stand for good arguments thereagainst. And although as I sayd in the beginning of this Chapter, I here shew you many diversities of *Oenanthe* as they are so accounted, yet we cannot be assured that any one is the genuine and right plant : and howsoever as you heare *Fuchsius* and Lobel would maintaine *Filipendula*, *Lugdunensis* his smaller *Mompeliar* *Oenanthe*, *Alpinus* also as much insisteth that his is the right, yet still there is somewhat defective in each of all these, namely cyther in the rootes or stalkes, or feedes : but because I cannot absolutely determine this controversie, I must leave every one to his owne judgement, touse them that are found most vertuous. For the names the first doe most truly deserve the name of *Apj folio*, which our country women herbe gatherers, and sellers most fally call white Peony rootes, because the rootes are white and cloggy, somewhat like unto the female Peony rootes : the rest have names according to the titles their authors give them, yet except the first, the third and the sixt they have all roots more like unto *Filipendula* : *Bauhynus* in my opinion hath much mistaken himselfe in quoting *Columna* his *Cymnium bulbosum* *Pliny* to bee *Oenanthe Apj folio* which may plainly bee seene to bee the *Nucula terrestris* or *Bulbo castanum* which is *Matthiolus* his first *Oenanthe* after *Filipendula*, and not *Oenanthe Apj folio* which is his second.

The Vertues.

Lobel onely brandeth his *Oenanthe Cicuta facie* to be virulent and venomous, from the relations of the North country people, whereas he saith it chiefly groweth, and contesteth against *Matthiolus* that approved it beneficiall in Hystericall, Epilepticall, Analepticall and Cephalicall diseases, as also the Strangury or hard making of water ; yet holdeth the other to be by some singular prerogative available in the same cases, *Alpinus* also commendeth his *Candy Oenanthe stellata* to be good for them that have the strangurie.

CHAP. XIII.

Daucus, Dauke or wilde Carrots.

Although there be many sorts of these Daukes or wilde Carrots, yet because I cannot well tell how to separate them, I must packe them all into this one Chapter.

The true Candy Dauke hath sundry stalkes of winged leaves, as finely cut as Fennell but shorter, set at distances one against another, of a whitish or hoary colour smelling somewhat sweete, from among which rise divers slender branched stalkes a foote high, bearing at their tops small umbells of white flowers, and after them small hoary grayish feede, somewhat long and round of a quicke sent and taste: the roote is small, long and white, almost as quicke and sharpe both in sent and taste as the feede, but will not abide our Winters with all the care we can use.

1. *Daucus Creticus versus Dioscoridis*. The true Dauke of Candy.

2. *Daucus Alpinus Cretico similis*. Mountaine leaved Dauke.

This fine Dauke differeth little from the former which is in that it groweth in colder places, the leaves being somewhat longer and greener then the former, nothing so hoary or white, and grow not so many or thicke together. the umbells of flowers are white and the feede like also, but a little longer and not so hoary, but somewhat neare both in taste and smell: the roote also is quicke and sharpe as the other.

3. *Daucus montanus Panonicus*. Mountaine Dauke of Hungary.

This Dauke of Hungary which *Clusius* calleth *Saxifraga Panonica*, and *Banbinus* *Daucus montanus multifidus brevique folio*, hath sundry long stalkes of fine cut leaves and short, somewhat like unto the leaves of Fumitory, of a strong sent and taste, and somewhat sharpe withall; among which rise up joynted stalkes about a foote high with the like leaves on them, and at their tops umbells of white flowers: the roote is but short and blackish tasting quicke and sharpe, drawing water into the mouth upon the chewing, and hath a bush of haire at the toppe.

4. *Daucus montanus pumilus*. Low or dwarfe mountaine Dauke.

This Dwarfe kind hath a few small stalkes with fine cut leaves longer then the last, and but thinly or sparingly set thereon, somewhat resembling Sow-Fennell but seldome exceeding fiftene leaves on a stalke: from among which leaves riseth up a short thicke stalke not a foote high, branched from the bottome upwards with the like leaves on them, but seldome exceeding nine on the stalke, broadest below and of the smell and taste of Carrots; the toppe of each branch and stalke is furnished with many small umbells of white flowers without any sent at all, unto which succede small feede like Parsley: the roote is small and short, browne and rugged on the outside, and white and spongie within having a bush of haire at the head: *Clusius* calleth this *Selinum montanum pumilum*, but *Banbinus* referreth it to the wilde Carrots and calleth it *Daucus montanus multifidus folio Selini semine*.

1. *Daucus Creticus versus Dioscoridis*.
The true Dauke of Candy.

2. *Daucus Alpinus Cretico similis*.
Mountaine fine leaved Dauke.

3. *Daucus montanus Pannonicus.*
Mountain Daube of Hungary.

4. *Daucus montanus pumilus.*
Low or dwarf mountain Daube.

7. *Daucus tertius Dioscoridi Bello.*
Coriander leaved Daube.

5. *Daucus Selinoides major.*
The greater Parsley leaved Daube.

5. *Daucus Selinoides major*. The greater Parsley leaved Dauke.

The greater of these Daukes which hath large stalks of somewhat broad pale green leaves bigger then Parsley and with divisions of the same fashion and manner next the ground, hath somewhat bigger stalkes almost two foote high with the like leaves at the joynts but shorter, and at the toppes spokie rundles of white flowers which turne into long crested feede bigger then ordinary Fennell feede, and of a yellow browne colour: the roote somewhat great, thicke, long and white, with a bush of haire at the head as many other umbelliferous plants have, and of a hot and sharpe taste as the feede is also. There is another sort hereof as *Lobel* in his observation saith, somewhat lesse then the former but else agreeing therewith in all parts, which hee found in the wood by *Narveum*.

6. *Daucus Selinoides maximus*. The greatest Parsley leaved Dauke.

This greatest kinde called by *Clusius Sefeli alterum Pannonicum* yet putteth the figure of the last for it, hath a roote sometimes as great as ones arme, or being young of the bignesse of ones thumbe, parted into severall branches at the bottome, and covered with a rugged blacke barke of a clammy taste at the first, but sharpe afterwards and causing spitting, having at the toppe many hairy heads, from whence spring sundry very large and great winged leaves, much divided and dented about the edges somewhat like the last but larger, of a faint Greene colour somewhat shining on the upper side, and of a grayish ashe colour underneath: among which riseth up a large great crested stalke of a fingers thicknesse, with some joynts and leaves at them, and with branches also from betweene them, at the tops whereof stand small umbells of whitish flowers, and somewhat larger but like feede as the last. Both these two last sorts may well be referred to the second *Daucus* of *Dioscorides*, whose leaves are like *Selinum* or Parsley before any other.

7. *Daucus tertius Dioscoridis Bello*. Coriander leaved Dauke.

This Dauke which *Honorius Bellus* saith groweth in *Candy*, and is referred by him to the third *Daucus* of *Dioscorides*, and both leafe and roote eaten by the *Candiot*s as a familiar Sallet heire hath sundry stalkes of fine cut leaves somewhat like to *Corianders* but lesser and thicker, the stalkes are neare two foote high, with great and swollen joynts (and therefore called by some *Sefeli nodosum*, but by *Bauhinus* *Daucus Creticus nodosus umbella lutea*) and smaller leaves at them, at the tops whereof grow yellow umbells of flowers but white with me, which turne into bigger feede then Fennell: the roote is great, thicke and short, perishing yearly, the whole being aromatically.

8. *Daucus montanus Apij folio flore luteo*. Mountaine Dauke with yellow flowers.

This yellow flowered Dauke hath a crested smooth stalke branching forth into sundry parts, having leaves like unto Smalage but shorter and not dented at all about the edges, set on both sides of the crested ribbe, the flowers are small that grow at the toppes and yellow.

9. *Daucus pratensis Apij folio Bauhini*. Meadow Dauke of *Bauhinus*.

The rootes of this Dauke are long and reddish on the outside smelling and tasting like Carrots, being hairy at

8. *Daucus montanus Apij folio minor*. Mountaine Dauke with yellow flowers.11. *Daucus scutellus Dalechampi*. The French wilde or field Dauke.

at the toppe, from whence rise stalkes with many winged leaves on both sides, cut in on the edges and dented also round about, somewhat like unto the salt, but much smaller and of a pale Greene colour, betwene which riseth a slender straked stalke a foot high or seldome higher, with few joynts and leaves, parted into some branches with umbells of white flowers at the toppes of them, which turne into blackish long teede smelling well.

10. *Daucus Hispanicus*, Spanish Dauke.

The Spanish Dauke hath a thicke long roote, parted into thicke long strings hairy at the head, from whence rise great winged stalkes of leaves, parted into divers other winged or divided leaves set one against another on a middle ribbe, of a fullen Greene colour, among which riseth one or two stalkes as high as a man being somewhat reddish, crested and joynted with the like leaves at them, but lesser branching forth diversly, and bearing large umbells of yellowish flowers, after which come flat and somewhat thinned round seede. This came to me by the name of *Daucus Hispanicus*, but doth very well answer the *Daucus Alsaticus* of Bauhinus in his *Prodromus* in every part which hee saith doth well agree unto the *Apium palastre* of Dodonæus, and to the *Thyselinon Plinij* of Lobel, but that it giveth milke which this doth not and that this riseth much higher then that: the smell and taste of this is wholly like unto a Carrot.

11. *Daucus securidus* Dalechampi.

The French wilde or fiede Dauke.

This kinde of field Dauke hath a long round white root, like unto a small long Carrot, sweet and somewhat hurpe, hairy at the head, with long slender stalkes of winged leaves rising from it, which are whole and somewhat thicke, not gashed or cut in on the edges but dented, resembling Parsnep leaves but much smaller, seven for the most part set together one against another somewhat close, and the odde one at the end, the stalke is a cubit high or higher, with finer leaves at the joynts then grow below

12. *Daucus tortuosus* Dalechampi.
Another French wilde Dauke.

16. *Daucus Alsaticus*. Dauke of Germany.

15. *Daucus stellatus*. Starce headed Dauke.

with store of white flowers in umbells, and small long feede after them, somewhat sweete in smell and sharpe in taste.

12. *Daucus tertium Dalechampi.* Another French wilde Dauke.

This other French wild Dauke hath a whitish yellow roote short and slender with haire at the head: the stalkes of leaves that grow next thereunto are somewhat broad like unto the lower leaves of Corianders, but those grow higher on the stalkes are smaller and smaller, being as small as Fennell at the highest, the flowers are white and the feede somewhat long like in taste unto Dill or Cummin that is sharpe.

13. *Daucus pratensis Dalechampi.* Wilde Dauke with water Milfoile leaves.

This fine leaved Dauke hath divers long stalkes of most fine leaves set many together at spaces one against another, very like unto the water Yarrow or Milfoile, being soft and of a fresh Greene colour: the stalkes hath some few joynts and fine long leaves like Fennell set at them with branches rising from thence, likewise bearing large umbells of flowers which are reddish at the beginning and white when they are open, somewhat bitter and sharpe but, well smelling.

14. *Daucus Petroselinii vel Coriandri folio sive Bunium Dalechampi.* Rockie wilde Dauke.

The wilde Dauke that groweth in rough and rockie or stony places riseth up from a small white branched well smelling roote, hairy at the head with sundry long stalkes of leaves so nearly resembling Parsley that many are deceived at the first sight untill they better heede it, the stalkes is square, tall and of a fingers thickness, with finer leaves then like the finer leaves of Corianders and umbells of flowers like Dill, the feede is smaller then Henbane feede of a good sent.

15. *Daucus stellatus.* Starre headed Dauke.

This Dauke hath sundry leaves, at the ground are somewhat like unto Parsley, but smelling well like the Candy Dauke and tasting hot: the stalkes hath sundry branches set with the like leaves at them, and yellow umbells of flowers which are succeeded by small feede vessells, having five small leaves like thornes under them, representing little starres five or six small threds rising from the bottome to the toppes making every head seeme like a Cone, each standing separate by it selfe on its owne footstalk, smelling sweet and aromaticall in taste: the roote is thicke and long like unto a Parsley or Parsnep roote, and eaten familiarly by the Natives either raw, or boyled, and held good to procure Urine, womens courses and Venerie.

16. *Daucus Alsaticus.* Dauke of Germany.

This Germane Dauke hath a thicke root somewhat long, with sundry great strings thereat, and at the head many haire, from whence come divers large winged leaves made of many parts, set one against another, among whom one or two reddish stalkes, seldome more doe rise to a mans height, divided into many branches and they into lesser with the like but smaller leaves at the joynts, and at the toppes stand large umbells of yellowish flowers and somewhat flat feede succeeding them.

The Place and Time.

The two first sorts grow not onely in Candy but in many places and countries, the shorter, thicker set and more hoary leaves in the warmer, and the longer, thinner set and lesse hoary in the colder countries of Germany, Switzerland and Savoy; most of the rest are declared in their titles or descriptions: many of them flower and feede somewhat earlier then others, yet all before the end of Autumne.

The Names.

The Greekes call it *Δαυκος*, and the Latines also *Daucus*, *Daucum* and *Daucium*. *Dioscorides* made three sorts thereof, the first he named *Creticus* the second *Selinoides* that is with leaves like Parsley, and the third with leaves like *Coriander*, which severall sorts hath caused many learned men to suppose divers herbes to be the same, which are since found much differing, and yet the certainetie of the two last is not fully assured, but that some doe justly question those are held to be the truest. For as for the first it is in these times, and so hath bene for a good while in Italy, France, Germany, &c. well knowne and onely used now a dayes in all the compositions wherein *Daucus* is appointed to be put: whereas formerly the common wilde Carrot (which is in most things like the matured, except the roote which is more hard and woody, and more physcally and not edible as it is) was wholly used of all in stead of the true Candy kinde: but to come to the declaration of these here set downe. The first is now well knowne to be the true *Daucus Creticus* of *Dioscorides*, as *Lobel*, *Matthioli*, *Gesner* and others have observed it and so set it downe: the second also is acknowledged to be so like the first, that the climate and country onely maketh the difference as I sayd before, and so say *Gesner*, *Camerarius*, *Lobel* and others: the third and fourth I have shewed in their descriptions to whom they belong and how they called them: the fifth is diversly named, for *Tragus* and *Matthioli* call it *Dioscorides* his second *Daucus*, and *Dodonaeus* the other kinde of *Libanotis* of *Dioscorides* and *Theophrastus*, *Camerarius*, *Gesner* and *Fuchius* to be *Seseli Peloponense*, *Lobel* saith it is *Saxifragia Venetorum*, and *Clusius* as I sayd giveth the figure of this for his *Seseli montanum alterum*, whose description doth expresse the next or sixt here set downe, which *Bauhinus* in his *Pinax* entitleth *Daucus montanus apii folio albicans*, but I have for the neare resemblance unto the former *Selinoides* called it *maximus*, because it is greater then it: the seventh is exprest to be from *Honorius Bellus* of Candy, as it is set downe in his first Epistle to *Clusius*, and by *Pona* in his *Italian Baldus* in the same words: the eighth and ninth are remembered onely by *Bauhinus* in his *Pinax* and described in his *Prodromus*, the foure next unto them are exprest in their titles or descriptions as much as is fit for them: the fourteenth is as I sayd in the title called *Bunium Dalechampi* by *Lugdunensis*, which *Bauhinus* calleth as it is in the title also *Daucus petroselinii vel coriandri folio*: but concerning this *Bunium* I must say something thereof here as I promised before in the Chapter of *Bulbo castanum*, that is to shew you that this *Bunium Dalechampi* is referred by *Bauhinus* to the kinds of *Daucus*, the description and figure thereof are both so answerable thereunto: but yet I must withall give you my opinion thereof which is, that I thinke this herbe is rather forced then yielding freely of it selfe to take upon it this title, the compofure of the description being so punctually applied to every part of *Dioscorides* his description moving that doubt in me: yet I would bee loth to derogate cyther from the accurate judgement or sinceritie of so learned an Herbarist as *Dalechampi* was. The Arabians call it *Dauco* and *Gieser*, the Italians and all other nations doe for the most part follow the Latine as neare as their Dialect will permit, or else following the French Carot Savage as some doe with us, to call them wilde Carrots, or rather as is more fit Dauke according to the Latine, because there is another herbe more properly called wilde Carrot.

The

The Vertues.

Although the herbe of the true Dauke is by the watery moisture therein lesse effectually then the seede, as Galen saith, which hath that powerfull heate therein that it is a principall medicine to helpe the strangurie, to provoke urine and womens courses, to expell the dead birth and helpe the suffocation of the mother, yet the herbe is of a temperate qualitie, and will helpe to digest humors by exhaling them by the pores, if it bee applyed thereunto yet lesse then the feedes, which is powerfull to discusse griping paines, torments and wounds in the body or bowells, and especially profitable for those that are bitten by the *Phalangium* or deadly Spider, and the rootes as well as it effectually against any other venomous beast, or any other venom, or poyson or pestilence being drunke with wine: the same also put into pulcesses doth ease tumors and swellings in any part, being mixed with hony it helpeeth old and inveterate Coughes.

CHAP. XIII.

Pastinaca tenuifolia. Carrots.

Having shewed you in the last Chapter all the sorts of *Daucus* which some for want of a more proper name have called wilde Carrots, I will in this shew you all the rest whether tame or wilde that so they may stand together.

1. *Pastinaca tenuifolia sativa lutea*. Common yellow Carrots.

The common Carrots I might well have spared to describe here, having shewed you all the sorts of them in my former booke, but seeing I am to speake of some wilde sorts which are like unto the manured, it shall not be impertinent to set them forth againe that so the wilde sort may bee knowne wherein they differ. This is well knowne to have divers large spread leaves made of many thin cut deepe Greene leaves divided into many parts, among which riseth a round stalke three or foure foote high bearing large tufts of umbells of white flowers which doe close together and spread not much, and turne into small whitish rough or hairy feedes holding one to another, the roote is somewhat great and yellow, big above and small pointed below, without any fangs or twines of a pleasant sweete taste, and therefore wholly spent for foode. There are other sorts as I have shewed in my former booke, whereunto I referre them that are desirous to know, but I have seene this garden yellow kinde by sowing it selfe sometimes the roote to become white.

2. *Pastinaca tenuifolia sylvestris*. Wilde Carrots.

The wild groweth in a manner altogether like the tame but that the leaves are somewhat whiter and rougher & so are the stalkes likewise which beare large spokie tufts of white flowers, with a deepe purple spot in the middle which are contracted together when the feede beginneth to ripen that the middle part being hollow and low, and the outer stalkes rising high maketh the whole umbell shew like unto a birds nest, as I shewed before in the Chapter of strange Chervills the *Gingidium verum* useth to doe, the roote is small long and hard, unfit for meate, being somewhat sharpe and strong, although *Dioscorides* seemeth to say it was used to be eaten.

3. *Pastinaca sylvestris Apula Columna*. Wilde Carrots of Naples.

This Neapolitane Carrot is so like in leaves and stalkes unto the last that they can hardly be distinguished one from the other before it be in flower or feede, for although the whole winged leafe seemeth to be lesse and the parts fewer, yet therein is small or no difference: but being in flower the umbells are larger, the flowers darke purple, with a reddish yellow spot in the middle, and the feede (wherein lyeth the chiefest difference) long and small, with a little white hairinesse upon them, and not rough as Carrots, being more like to the true *Daucus*, but of a reddish colour being Greene and fresh, and of a bitter and little aromaticke taste: the roote is somewhat long, white, hard, sweet and aromaticall.

4. *Pastinaca echinophora Apula*. Prickly wilde Carrots of Naples.

The roote of this kinde of Parsnep or white Carrot is of a fingers thicknesse and a cubits length, equall alike, like unto *Eryngium* or the Sea Holly roote, somewhat yellow on the outside and white within, the barke being thicke and of substance, with a small pith of a taste somewhat sharpe and sweetish bitter, not unpleasant, especially the younger rootes, the leaves that lye upon the ground are like unto those of ordinary Carrots, yet not altogether so large and broad, but are finely cut and as it were betwene it and the Sea kinde, of a whitish Greene colour with some hairinesse: the stalke is thicke and full of branches and leaves which bend a little downewards and make them globe fashion, being smaller, lesse divided, harder and rougher thereon up to the toppes, where the umbells of yellow flowers stand, which have six thicke sharpe pointed small leaves at the bottome of them, the middle umbell first

Pastinaca sativa altera tenuifolia atrorubens. Common red Carrots.

flowing

1. *Pastinaca tenuifolia sativa lutea.*
Common yellow Carrots.2. *Pastinaca tenuifolia sylvestris.*
Wilde Carrots.

flowering, and the rest at the sides afterwards: after they are past the feede appeareth which is of an oval forme, long and round, hard and straked, with six lines pointed at the toppes and yellowish, whose inner kernell is brownish, and of an aromaticall favour. This faith *Columna* differeth from the usuall *Pastinaca marina* both in the large spreading and manifold fine divisions of the leaves, and in the pleasanter taste and greatnesse of the roote, resembling rather a Parsnep although their feedes are alike.

5. *Pastinaca sylvestris hirsuta caule.* Wilde Carrots with hairy stalkes.

The roote of this Carrot is white and often a foot long, sometimes single and sometimes divided into two or three parts, very like both in sent and taste to a Parsley roote, but hotter in the mouth for a long time, from whence riseth up a stalke a foote and a halfe high as thicke as ones little finger at the bottome, being somewhat round but crested or cornered very plainly, exceeding hairy and full of joynts, whereat grow large crested stalkes of winged leaves compassing the stalke at the bottome, a foote in length, divided into sundry leaves, and they againe into other smaller parts very rough and hairy also, and of a yellowish Greene colour, from betwene which leaves and the stalkes at the joynts, come forth other crested stalkes and the like leaves at their joynts but lesser, and doe very well resemble the leaves of our garden Carrots but larger and soft if one handle them hard, but rough both on the backe and edge being gently touched: from every one almost of these joynts both of the stalke and branches ariseth a certaine long huske, consisting of six small long leaves close set together which when it openeth sheweth forth a small tuft or close umbell of white flowers, and sometimes yellowish somewhat sweet, after which doe follow somewhat round feede, two alwayes joyned together and very prickley, on the backside, the inner side being flat and more yellow then Carrot feede, else somewhat like.

The Place and Time.

The first kindes are alwayes sown in Gardens or in the fields chosen out for that purpose, the rest grow wilde: the first plentifully in our owne Land by the fields side and in untilld places: the last in the like places of *Germany*: the rest in *Naples* and doe all flower and feede in the end of Summer.

The Names.

Σάουρις in Greeke derived (as is most likely) from *σαυρ* the grape when it is almost ripe whose purplish colour the one sort hereof doth resemble and not from *σάουρα*, the stalke of Bryonie as some thinke doth answer both to the tame and wilde sorts of *Pastinaca* in Latine as *Dioscorides* sheweth in the said Chapter, but usually *Staphylinus* simply is taken for the wilde Carrot if *ήυος* be not joyned with it to expresse the tame but *Pastinaca*, which in Latine seemeth to take the name *a pascendo cum corpus alar*, is now a dayes divided into two sorts that is into *latifolia* which is the Parsnep whereof I shall speake hereafter, and into *tenuifolia* which is the Carrot called also *Carota* by divers from the *Italians* who doe so call it, but *Dodonaeus* thinketh the word was deduced from the *German* Carrot which is *topum rubens* but I doe not so thinke, and *Daucus niger* as it is thought, by *Theophrastus*, whereof yet there is some doubt whether the word should not be *μαύρος* which is yellow, as it is in most true copies, rather then *μαύρος* which is blacke as it is but in few. *Galen* also seemeth to call it *Daucus*, but with

an addition of *sevelis* *Pastinaca*, that others might know he did distinguish it from the true *Daucus*, but hercupou in all the Apothecaries shops beyond the seas, and with us, the first wild sort was usually in former times taken for *Daucus*; and so used, and the use continueth with many to this day; and *Dioscorides* the weth that *Staphylinus* beareth a purple spot in the middle of the white umbell, whereby it may be knowne to differ much from any *Daucus* which doth not so, besides that he speaketh of them in severall Chapters. The first is the *Pastinaca sativa*, or *teuifolia sativa* by most Authors, yet some following the Greeke name, call it *Staphylinus primus* & *secundus*, according to the colour of the roote yellow or red, as *Tragus* and some others, and *Matthiolus*, *Lacuna*, and *Tabermontanus* *Sifer*, and *Sifer alterum*, or *Carota*, as *Gailandinus*, *Casalpinius*, *Catserarius* and *Lobel*; *Camerarius* saith in *horto*, that some do not much amisse that take the rootes of the red and yellow Carrot for the *succedaneum* to *Ben album* and *rubrum*: the second is called *Pastinaca sylvestris* by *Matthiolus* and others; and *sylvestris tenuifolia*, and *genuina* *Dioscoridis* by *Dodonæus* and *Lobel*, *Pastinaca erratica* by *Fuchsius*, *Cordus* and *Tabermontanus*, *Staphylinus sylvestris* by *Tragus* and *Casalpinius*, and *Daucus agrestis* by *Galen* in *lib. de alimentis*; *Daucus vulgaris*, and *officinarium* by *Clevisius* and *Lobel*: the third is called by *Columna* *Pastinaca sylvestris Daucoides Apula*: the fourth is by him also called, as it is in the title: the last is the *Daucus nagegala* of *Thalium*, that is to say *hirsuto caule*, and may be the *Daucus angulosus* of *Cordus* in *historia*, although he findeth some defects and differences therein from his. The *Italians* call it *Carotta*, and by some *Pastinaca*; the *Spaniards* *Canahoria*, as they call the Parsneppe; the *French* also *Pastenades*, but they adde *james* to distinguish it from the Parsneppe, and the wilde kinde *Pastenade sauvage*; the *Germanes* *Geel Ruben*, and *Mohren*, and the wild Carrot *Vogelneest* as the *Dutch* doe, and the the manured kind *Geel pooten*, and *geel wortelen*; and we in *English* wilde Carrot.

The Vertues.

The manured or garden kinde is somewhat windie with the sweetnesse, and therefore in the nourishing stirreth up bodily inst, but doth not expell winde as some have thought, for so it should worke contrary effects which is not found herein: the wilde kinde indeede, is more physcail, and besides that it breaketh winde, and stiches in the sides, it provoketh urine and womens courses, and helpeth to breake and expell the stone: the seede also of the same worketh the like effects, and is good for the drop sicke, and those whose bellies are swollen with winde, helpeth the cholicke and the stone in the kidneyes, and the rising of the mother being taken in wine, or boyled in wine and taken, and helpeth conception: *Dioscorides* saith, that it is so powerfull to helpe the bitings or stings of venomous creatures, that if it be taken before hand their bitings shall not hurt them; the leaves also he saith, and *Galen* doth the like, being applied with honey to running ulcers or sores doth cleanse them.

CHAP. XV.

Seseli. Hart-wort.

BEcause there are many sorts of *Seseli*, much differing in forme one from another, some having fine leaves like Fennell, others like Hemlockes, or other herbes they might peradventure seeme fit to some to be referred to the severall Orders here appointed, but I thinke it better to place them all together.

1. *Seseli Massiliense Feniculi folio, quod Dioscoridis censetur.*

The true *Seseli* or Hart-wort of *Marselles*, as it is thought.

The true *Seseli Massiliense Dioscoridis*, as it is taken by the most judicious Herbarists of our times hath a very long white slender roote like unto Fennell, but smelling better, and tasting hotter and sharper, having but few leaves thinly set on the stalkes, thicker and shorter, and harder than Fennell leaves, turning downwards, of a grayish or ash colour, as all the rest of the plant is (especially in the hotter countries, for in some places they are thicker or longer or shorter than in others, as *Bauhinus* saith is observed) the middle stalke riseth not above a foote high, bowing to and fro sometimes, having many branches from the bottome with the like leaves on them, and each bearing umbells of white (most usually and seldome purplish) flowers, after which come small long seede more like to Anniseede than Fennell, somewhat pleasant in taste, yet sharpe and hot.

2. *Seseli Massiliense alterum.*

Another Hart-wort of *Marselles*.

This other *Seseli Massiliense* hath likewise Fennell-like leaves, but thicker and shorter divided, greene and hard, but with white points, whose winged stalkes are large and more spread than Fennell: the middle stalke is two cubits or more high, of a fingers thickness, crested, jointed, and branched into divers other smaller parts, each of them carrying umbells of white flowers on their toppes which turne into flat seede, not much unlike to Angelica seede, and bigger than Dill, hot in taste, and very aromaticall, the roote is thicke, long, and white, with divers strings and fibres thereat encircasing carely.

Hhhh z

2. Seseli

2. *Seseli Massiliense alterum.*
Another Hart-wort of Masseller.

3. *Seseli pratense Monspeliensum.*
Meadow Hart wort of Montpellier.

4. *Seseli pratense nostras.*
Our English green Saxifrage.

6. *Seseli palustre laetifolium.*
Milkie Marsh Hart-wort.

3. *Seseli pratense Mossipelicium*. Meadow Hart-wort of *Mossipelicium*.

The roote of this Hart-wort is blacke without and white within, parted into many strings with fibres at them increasing well, from whence riseth a stalke two or three foote high, with divers large spread stalkes of winged leaves, very finely cut into many parts, each being like unto Fennell, but larger, harder, and of a darke greene colour, set at the joynts, and branching forth towards the toppes, bearing umbells of white flowers, and after they are past, small, long, and somewhat flat seede, larger and blacker than Fennell, and neare unto *Mentum Spig-nell*, of little sent, and a small sharpe taste.

4. *Seseli pratense nostras*. Our *English* greene Saxifrage.

The likenesse of this our *English* greene Saxifrage unto the last *Seseli* described, hath made me joyne it next thereunto, although I might have put into the Classis of the Saxifrages, but that being an umbelliferous, I would place it among the same Tribe or Family, which hath stalkes rising nothing so high, somewhat crested, and thereon stalkes of winged fine cut leaves, but nothing so largely spread, yet somewhat like them in greenesse, harshnesse and forme, or somewhat lesse; the umbells of flowers are smaller, paler, or somewhat tending to a yellowish whitenesse, and the seede after them like unto common Fennell seede, both for forme and greatnesse, but of a browner colour and small taste.

5. *Seseli pratense tenuifolium*. Meadow Hart-wort of *Germany*.

This *German* Hart-wort hath a round crested or straked stalke above two cubits high, with divers joynts and leaves at them, very like for the forme and divisions unto the wild Carrot leaves, but smooth, and not rough, and of a deepe greene colour, branching forth into sundry parts, bearing umbells of whitish yellow flowers, after which follow small long seede somewhat like Fennell and Carraway, or betwene them both, and somewhat aromaticall: the roote is as thicke as ones finger, and very long, blacke without, and white within, of a sharpe and somewhat bitter taste.

6. *Seseli palustre lactescens*. Milkie Marsh Hart-wort.

This milke Hartwort riseth up with a round stemme or stalke three cubits high, with joynts and long stalkes of well spread leaves set at them, the divisions whereof are very small, and much cut in, almost like to those of Carrawayes, or betwene them and Fennell, at the toppe of the stalkes it breaketh forth into branches, and they beare small umbells of white flowers, after which follow thinne, flat, and winged seede: the roote is long and browne on the outside, of an unpleasant taste, with no small heate joyned therewith, which inflameth the throat, but being planted in a Garden, it looseth much of the evill taste of the burning qualitie becoming more milde: the whole plant, or any part thereof being broken, there issueth from it a certaine milke, as many other umbelliferous plants doe.

7. *Seseli Creticum majus*. The greater Hart-wort of *Candy*.

This greater *Candiot* kinde hath round and hairy round stalkes, about two or three foote high, set with long stalkes of winged leaves, much resembling Parsneppe leaves, both in forme and greatnesse, yet somewhat longer and narrower, dented about the edges, and pointed at the ends, being rough and hairy likewise, and turning themselves a little backward to the stalke, towards the toppes of the stalkes they branch forth and have smaller leaves set at the joynts than grow below, bearing umbells of purplish white flowers, whereon after they are fallen, grow flat whitish round seede, circled about, as it were, with a border, and cut in round about it also with round dents, of little or no smell or taste: the roote is white, somewhat long and woody after it hath sceded, and perisheth, rising from the sowing of its owne seede againe plentifully.

8. *Tordilium* sive *Seseli Creticum minus*. The lesser Hart-wort of *Candy*.

The lesser *Candiot* Hart-wort hath such like stalkes of winged leaves, but smaller, rounder, and shorter, somewhat hairy and whitish: the stalkes are lesser and lower, fuller of branches, bearing paler purplish flowers in umbells and seede after them, of the same fashion, but somewhat sharper and quicker, as the herbe is also, and therefore more accepted and used as a salter herbe with the *Italians* and others: the roote is as unprofitable and perisheth as the last.

9. *Seseli Creticum majus luteum*. Great *Candy* Hart-wort with yellow flowers.

This Hart-wort groweth very like the first greater kinde, having the like leaves on the stalkes, but somewhat broader and shorter, a little sharpe in taste, and not above two or three couples together, set on the like stalkes, but smaller of branches, and bearing umbells of yellow flowers like Dill, without any leaves under them as the others have: after which follow such like whitish flat buckler-like seedes ringed and dented about the edges like them, but larger and smoother, and divided in the middle with a brownish stroke or line, making the seede seeme like unto a kinde of *Thlassi* or Treacle-Mustard seede: this flowered and seeded at *Naples* in *May*, as *Columna* saith, and that onely in gardens, and not wilde,

10. *Seseli Apulum Creticum minimum*. The smallest Hart-wort of *Candy*.

This smallest kinde is very like unto the lesser *Candy* sort that is eaten in sallets, but with leaves like the lower leaves of Corianders, soft but a little hairy; the first leaves being of an inch and a halfe long, and an inch broad, and dented about the edges with round dents: the second leafe is of two inches long; the third hath a longer stalke, with two leaves set thereon, smaller and rounder than the other, about halfe an inch broad, and a bigger leafe at the end, yet smaller and longer than the first leafe, the next are lesser and longer, the stalke is naked of leaves below, being small, hard, hairy and straked, and carrying thicke umbells of white flowers, with yellow threds in the middle, and under set with long hairy leaves. the outer flowers being larger than the inner, thereby making the umbell resemble that of the wilde Carrot, after which come such like seedes as the former have but not halfe so great, the middle part being of a darker colour, before they are ripe they looke of a purplish greene colour, but white when they are full ripe, of an aromaticall taste, somewhat bitter, and somewhat sweete in sent: the roote is small, white, hard, and a little heating in taste. *Columna* saith, that the *Gangidum Syriacum folijs Bauciae* of *Lobel* is like unto this plant, if the figure be not imperfect.

11. *Seseli montanum Cicula folio glabrum*. Mountaine Hart-wort with smooth Hemlocke-like leaves.

This mountaine Hart-wort hath large spread leaves, divided into many smaller parts, somewhat like unto Hemlockes or *Seseli Peloponense*: the stalke is hollow, and riseth a cubit and a halfe high, dented into branches bearing.

7. *Seseli Croticum* five *Tordilium majus*.
The greater Hart-wort of Candy.

8. *Tordilium* five *Seseli Croticum minus*.
The lesser Hart-wort of Candy.

11. *Seseli montanum Cicutæ foliis glabris*.
Mountain Hart-wort with smooth Hemlocke-like leaves!

12. *Seseli montanum Cicutæ folio hirsutum*.
Hairy mountain Hemlocke Hart-wort.

13. *Seseli Peloponnesiacum recentiorum.*
The most usuall received *Seseli* or Hart-wort of *Peloponnesus*.

14. *Seseli Ethiopicum frutex.*
Shrubbe Hart-wort of *Ethiopia*.

bearing small smooth long leavēs, more finely divided at the joynts, and larger umbells of white flowers at the toppes, which turne into yellowish crested feede, two joyned together of an aromaticke and hot taste.

12. *Seseli montanum Cicuta folio sub-hirsutum.* Hairy mountaine Hemlocke Hart-wort.

This other Hemlocke Hart-wort from a thicke roote, sendeth forth broad Hemlocke-like leaves, or like to the greater sweete Chervill, of a darke greene colour, and some what rough and hairy, especially the foote stalkes of the leaves, in the middle of whom riseth up a thicke hollow, crested, hairy and joynted stalke, about two foote high, divided into severall branches, with few leaves thereon but lesser: at the toppe whereof standeth a large umbell of white flowers, which are succeeded by long, sharpe pointed feede, two joyned together.

13. *Seseli Peloponnesiacum recentiorum.* The most usuall received *Seseli* or Hart-wort of *Peloponnesus*.

This *Grecian* Hart-wort hath a great roote, blackish on the outside, and white within, growing deepe into the ground like *Fennel* or *Thapsia*, somewhat sweete in smell and hot in taste, the stalke riseth two foote high or better, as thicke as ones finger, with divers large spread leaves at the bottome as great as Hemlocke, but crumpled, rough and hairy; the stalke and branches beare large tufts or umbells of yellow flowers, which after yeeld broad flat winged feede, of a pale yellow colour, somewhat like unto *Angelica*, but greater, and nothing so thicke, of a very sweete sent as the *Seseli Ethiopicum* hath. This, saith *Lobel*, the chiefe learned and most judicious Herbarists of *Mompelier*, acknowledged upon due consideration thereof to be the true *Seseli Peloponnesi* of *Dioscorides*, although formerly they tooke it to be a kinde of *Thapsia*, but saith he, the true *Thapsia* is much differing, both in forme and colour from this, so that none there doubteth of the truth thereof.

14. *Seseli Ethiopicum frutex.* Shrubbe Hart-wort of *Ethiopia*.

This Hart-wort of *Ethiopia* (to keepe his fellowes company for name sake is fittest to be placēd here, although shrubbe and everliving) shooteth forth sundry woody rough stems, covered with a blackish bark, divided into many branches two or three cuits long, beset with many faire, large, thicke and hard, smooth and pale greene leaves, being long, and somewhat like unto *Woodbind* leaves, but not so broad, smooth on the edges, and not snipt or dected at all, on the toppes of the branches stand small tufts of yellow flowers, which afterwards beare brownish round and long feede, bigger and larger than sweete *Fennell* feede: the root is great and woody, having divers smaller parts set with fibres issuing from it, abiding many yeares, if it be defended from the cold: the whole plant smelleth very well, and the feede best being of an aromaticke taste somewhat bitter and sharpe withall, which is commended by *Dioscorides* for the best of the *Seselies*, and beyond the *Misilensis*.

15. *Seseli Cretense nodosum.* Great joynted Hart-wort of *Candy*.

This *Seseli* riseth up with foure or five hard round, and rough, or rather prickly stalkes, about two foote high, whose joynts are great, and bunched out like knees, with a rough large winged leafe, or two at each of them, some of three, and others of five parts, and every of them also divided into severall parts, of a sad or dead greene colour, changing reddish at the seed time; the stalke is rough and crested, and the sundry branches hereof do carry small tufts of white flowers, which turne into great, long, and round, rough feede: the roote is composed of divers slender, long, white woody strings, perishing yearely.

The Place and Time.

Most of these *Seselies* grow about *Mompelier*, and in *Narbone* in *France*, yet some in *Germany*, other in *Italy* and *Candy*.

Candy, and some in our owne country; and although some of them be entituled of *Candy*, yet that is but to answer that kinde which *Dioscorides* doth so call, as likewise that of *Peloponnesus* in *Greece*, and that of *Ethiopia*: and most of them doe beare ripe seede with us before the end of Summer, if care be had in the ordering and keeping of them.

The Names.

Silva in *Greece*, is likewise called *Seseli* in *Latine*, and of some *Sile*. The first is taken by *Lobel* to be the true *Seseli Massiliense* of *Dioscorides*, because there is not about *Marselles* & *Mompelier*, any other herbe that answereth to truly unto the description thereof by *Dioscorides* as this doth, and *Clusius* also consenteth hereunto, and so calleth it. *Lobel* saith also that formerly it was called by the students, and others there, *Faniculum turuosum*, because the stalk groweth seldome upright but crooked: the second is the other *Seseli Massiliense* of *Lobel*, which he calleth *Ferula aut Dauci* (*Cretici facie*, & the *Seseli Massiliense* of *Matthioli*, against whom *Lobel* contesteth for affirming that it grew on the hills by *Trent*, where he saith, it is not to be found, nor yet on *Baldus*, which is more fruitfull in rare plants than they are, and but onely to be found about *Mompelier*, and at the foote of Mount *Fiascone* in *Italy*, which is in the way from *Rome* to *Sienna*, *Camerarius* calleth it *Seseli Massiliense nonnullorum*, and saith *Lucas Gbinius* affirmed to have seene twentie sorts of herbes called all by that name. *Gesner* in *horto*, *Lugdunensis* and others, doe meane this kinde that they call *Massiliense*: the third *Lobel* also calleth *Seseli pratense Monspeliensum*, which *Gesner* in *horto* thinketh is the *Ligusticum* of *Matthioli*, *Dodonaeus* calleth it *Siler alterum pratense*, *Bauhinus* thinketh it may be the *Silaua* *Plinij* in lib. 26. c. 8. and withall saith it is the *Pastinaca nigra* of *Cordus* in his history, which in my judgement differeth much from it, for that of *Cordus* hath divided leaves like wilde *Cartota*, and this like *Fennell*, that hath yellowish flowers, this white, and the seede likewise seemeth to be more sharpe, which is not found in this, although growing in a hotter climate. *Tabernmontanus* calleth it *Hippomarathrum*: the fourth *Lobel* calleth *Saxifraga Anglorum facie Seseli pratensis Monspeliensum*, for although it be somewhat like to it, yet it is not the same as he there sheweth: the fifth is called by *Bauhinus* *Seseli pratense tennisfolium* sive *Daucoides pratensis tennisfolium* described in his *Prodromus*, as though none had exprest it before, when as it is the very same *Pastinaca nigra* of *Cordus* spoken off before, as any that will compare them together shall easily finde: the sixt *Camerarius* in *horto* described, but *Bauhinus* in *Prodromo* giveth the figure of it, which none had done before: the seventh is called *Tordylion* sive *Seseli Creticum majus* by *Lobel* and *Lugdunensis*, and *Seseli Creticum majus* by *Camerarius*; *Cesalpinus* saith, that in *Italy* it is called *Pimpinella Romana* alterum genus *syriacae*: the eight is the *Ordilion* *Nicandri*, and *Tordylion* *Dioscoridis* by *Anguilara*, *Tordylion* and *Gordilion* by *Dodonaeus*, *Gesner*, and others, and *Seseli Creticum* by *Lobel*, *Dodonaeus* and others; *Cesalpinus* and *Columna* saith, this is commonly called in *Italy* *Pimpinella Romana*, and familiarly eaten as a salter herbe, and *Bellonius* saith, that this is the *Cas-calitra*, that is *Caucalis* which is used in *Candy* and *Greece*, as *Honorius Bellus* sheweth in his first Epistle to *Chalcidius*: the ninth is set forth by *Columna*, by the name of *Tordylion majus alterum luteum*: and the tenth is *Tordylion minimum Apulum alterum* by him also: the eleventh is rhought by *Bauhinus* to be the *Levisicum alterum* of *Lobel* and *Lugdunensis*, *Ligusticum secundum herbariorum* of *Tabernmontanus*, but I thinke it doth better agree unto the next, and is the *Seseli primum montanum* of *Clusius*, called by *Bauhinus* *Seseli montanum folio Cicuta glabrum*, and thinketh it may be the *Seseli Peloponnesiacum* of *Dioscorides*: the twelfth is set forth by *Bauhinus* as it is in the title: the thirteenth is the true *Seseli Peloponnesiacum* sive *Cicuta Dioscoridis*, as *Lobel* saith, and so taken by the learned at *Mompelier*, as I shewed before, and therefore thought fit to set it forth with them, although his *Peloponnesiacum* is placed with the *Thapsias*: the fourteenth is also taken at *Mompelier* for the true *Seseli Ethiopicum* *Dioscoridis*, as *Lobel* saith, all other authours acknowledge the verity thereof, onely *Matthioli* maketh a doubt whether his *Seseli Ethiopicum* (which is an herbe and no shrubbe, and well knowne now to be the *Libanotis Theophrasti*) or this *Ethiopicum*, which he calleth *alterum* should be the truer, for that as he saith they both resemble it very well, but *Lobel* taxeth him too bitterly for it: the last hath his name in his title as I received it, and is not the *Daucus Creticus nodosus* before.

The Vertues.

The true *Seseli Massiliense* is commended by *Dioscorides* to helpe the strangury, and the straightnesse of breath, as also the suffocations of the mother, provoketh their courses, and expelleth the dead child, helpeth also the falling sicknesse, old coughes, and all other inward griefes, either the roote or the seede being taken in wine: the seede drunke in wine doth helpe digestion, expelleth winde and the paines in the bowels: it helpeth those that have taken cold in their journey, if they drinke it in wine with some pepper: it is given to Goates and other cattle to facilitate the delivery of their young. *Pliny* saith that women use it before their delivery of child (being taught by *Hindes* that eat *Seseli* to speede their delivery, as *Aristotle* did declare it before) to helpe them at that time, *Galen* sheweth that the rootes of *Seseli*, speaking in generall of them all, are so powerfull in heating that they provoke urine, and are of thinne parts, that they helpe the falling sicknesse, &c. the other *Seseli*, saith *Dioscorides*, have the same facultie and operation: the *Candy Seseli* is good to provoke urine, if it be stopped or hindered, and womens courses also: the juyce taken with the seede in wine for tenne dayes together helpeth the paines of the kidneyes, and driveth forth the stone engendered therein: the roote being taken with honey is good to breake the flegme in coughes, and to cause it easily to be spit forth; *Paulus Aegineta* saith, that *Tordylion* taketh away bruises, and the blacke and blew spots that come by stroakes or otherwise if one part of *Terra Samia* be put to two parts thereof, and laid to with hony. Our *Englishe Seseli* or *Saxifrage* is well experimented and much used by country people, either the juyce or the decoction or the distilled water or the seede in powder, and drunke in wine, to helpe to breake and expell the stone, to provoke urine, and to expell wind, and the chollicke in old or yong, and is much given to sucking children for the frets, as women call it, which is winde in their bodies and stomackes. The *Ethiopian Seseli* is preferred for the singular vertues therein, beyond all the other sorts of *Seseli*, and therefore most fit of all other to be used in medicines especially those two notable great compositions, *Mithridatum* and *Theriaca Andromasbi*, and *Lobel* sheweth that he gathered about *Mompelier* at a time so much, that he sent thereof to *Venice* and other places sufficient for them to use in the said compositions: the rest of them are little or not at all used to any physickall purpose.

CHAP. XVI.

Ligusticum verum five *Siler montanum*. Libisticke or Sermountaine of Liguria.

OF this *Ligusticum* I have two sorts to bring to your consideration both of them in face nere corresponding one another, and first of that which is held to be truest.

1. *Siler montanum* vulgo *Sisels*. The true Libisticke or Sermountaine of Liguria.

The true Sermountaine of Liguria riseth up with a round joynted stalk two or three foote high bearing both at the bottome and at the joynts large spread winged leaves, divided into many sundry and small leaves whose small footstalks beare usually two leaves and sometimes foure, set one against another, and three alwayes at the end, each being much broader and shorter then Sow-Fennell leaves, almost equall to Mellilot, of a small sweete sent if they bee a little rubbed, and spreading at the toppes into a few branches bearing very large umbells of white flowers and after them long, thicke, full brownish yellow seede larger by halfe then Cumin seede, two alwayes joynted together, striped on both sides and winged, with yellow shining wings at the edges, and of a quicke sharpe hor sent and taste: the roote is long great and whitish on the outside, of a hot sharpe sent and taste likewise abiding long.

2. *Siler montanum angustifolium*. Narrow leaved Sermountaine.

The stalk of this Sermountaine is small about a cubit high divided into branches, which beare small umbells of white flowers: the leaves are few separated into many thinne small leaves like unto Sow-Fennell but much shorter, and those towards and at the toppes more finely cut like haire.

The Place and Time.

The first is found plentifully growing on the Appenine hills in Liguria, whose chiefe Citie is Genua: and the other in Austria, and doe seldome beare ripe seede with us unlesse in a warme kindly season.

The Names.

It is supposed by the most judicious writers of these times that it is the true *Λιγυμίδιον* of Dioscorides or *Αλβανίδιον* of Galen by changing one letter, and tooke the name from Liguria the Countrey where the best and most store groweth, and there they call it *Sier montano*, in Latine it is also called *Ligusticum* but not *Levisticum*, which is our Lovage much differing from this as may soone be discerned: but this is also the same that *Matthiolus* calleth *Ligusticum*, and after him *Lugdunensis* *Cassor* *Durantes* and others. *Tragus*, *Lobel*, *Dodonaeus* and *Clausius* call it *Siler montanum* as was used in the Apothecaries Shoppes, and *Sisels* also, because in former times they knew none of the true *Sisels*, but as *Lobel* saith this error was tollerable, because they tooke a seede that had more sharpenesse and was of more efficacie then *Sisels*, although as *Gesner* saith it is like none of the *Sisels*, *Cesalpinius* calleth it *Sier montanum* and *Peloponense*. *Pliny* sheweth that *Siler* tooke the name from *Sila* whereby

1. *Siler montanum* vulgo *Sisels*.

The true Libisticke or Sermountaine of Liguria.

2. *Siler montanum angustifolium*.

Narrow leaved Sermountaine.

they

they used the feede for *Seseli*: and antiently they used to call *Seseli* by the name of *Sili* and *Seli*: *Pliny* saith that *Cratæus* used to call it *Cunila bubula*, and some *Panaces*: the last is remembred onely by *Bauhinus* in his *Pinax*, and set downe in his *Prodromus*, I have called it in *English* Libisticke, or Ser mountaine, as the fittest to expresse it.

The Vertues.

This Libisticke or Ser mountaine is of a warming and digesting qualitie both roote and feede, and helpeth inward gripings and paines, swellings and winde, especially in the stomack, it provoketh urine also and womens courtes being drunke or the roote outwardly applied, and is used against the bitings of venomous beasts and Serpents, and therefore is put both into Mithridate and Treacle, and for the propertie to brake winde is used among other things tending to the same purpose: the *Ligurians* among whom it groweth use the feede familiarly in their meats, to season and relish them as others doe with pepper.

CHAP. XVII.

Carum. Caraway.

Lthoug with most writers there hath beene but one kind of Caraway formerly remembred, yet because there are two other herbes that nearly resemble it, I will put them together.

1. *Carum vulgare.* Ordinary Caraweyes.

The ordinary Caraway is well knowne to beare divers stalkes of fine cut leaves lying on the ground, somewhat like to the leaves of Carrots, but not bushing so thicke, of a little quicke taste in them, from among which riseth up a square stalke, not so high as the Carrot, at whose joynts are set the like leaves but smaller and finer, and at the toppe small open tufts, or umbells of white flowers which turne into small blackish seed lesser than the Annefeede, and of a quicker and hotter taste, the roote is whitish small and long, somewhat like unto a Parsnep, but with a more wrinkled baike and much lesse, of a little hot taste and quicke, and stronger then a Parsnep, and abideth after seedetime.

2. *Carum Alpinum.* Mountaine Caraway.

This mountaine Caraway is a small plant and smooth, shooting forth from a long blackish aromaticall roote sundry long stalkes with leaves on them like unto the former Caraway, but the devided leaves are somewhat broader and of a pale greene colour, from among which riseth one or two slender stalkes halfe a foote high, from the middle upwards bare or without leaves and thence spreading five or six small sprigges to forme an umbell, each of them bearing at the toppe a few small flowers in a tuft as it were together, of a reddish yellow colour.

3. *Carum pratense.* Meadow Caraway.

The Meadow Caraway groweth greater and higher then the ordinary kinde, with leaves somewhat like also unto it but larger, the spokie umbells of white flowers are likewise larger, and the feede like unto Cumin feede but much larger: the roote is small and slender of a sent somewhat strange or like unto Dauke, of an hot and sharpe taste yet not so much as the feede.

The Place and Time.

The first groweth as *Tragus* saith in Germany in many places in the fields, and by the way sides, it is usually sown with us in Gardens: the second was found on the Pyrenian hills, and the last in the fields and meadowes of Germany, as *Tragus* saith also: they flower in June or July and feede quickly after.

The Names.

Kdps in Greeke is *Caros*, and *Carum* in Latine or *Carui*, as it is in the Apothecaries shoppes, *Simeon Sethi* calleth it *Carnabadiou*, and tooke the name as *Discorides* saith from the Countrey of *Caria*, from whence it was first brought. All Authors doe generally call the first *Caros* or *Carum* and some *Careum* and some *Carvum* as it is in shoppes, *Bauhinus* calleth it according to his owne country name *Carum pratense*: the second *Bauhinus* hath onely exprest in his *Pinax* and described in his *Prodromus*: the last *Tragus* calleth *Cymium equinum* after the high Dutch name as they call it there *Roskimmel*: *Bauhinus* referreth it to the *Feniculum erraticum* *Loniceri* and *Hippomarathrum* of others, as if it were a Fennell when he himselfe calleth it onely *Caruifolia*. The Arabians call it *Karvia*, *Karavia* or *Carvi*, the Italians *Carro*, the Spaniards *Caravea*, and *Alcaravea*, the French *Carvi*, the Germanes *Wisenkummell* that is, *pratense Cuminum*, and of some *Mothkummell*, the Dutch *Carve*, oft *Smicker peen*, and we in *English* Caraway.

The Vertues.

Caraway feedes are hot and dry as *Galen* saith, almost in the third degree, and have withall a moderate sharpe qualitie, whereby it breaketh winde and provoketh urine, and that not the feede onely but the herbe also and the roote thereof is better foods then of the Parsnep, and is pleasant and comfortable to the stomacke helping digestion:

tion: the seede is conducing to all the cold greefes both of the head and stomacke, the bowels or mother, as also the winde in them, and helpeth to sharpen the eye sight: the powder of the seede put into a poultis taketh away blacke and blew spots of blowes or bruises: the seede is much used in Bread, Cakes, &c. to give a rellish and warming qualitie to them as of a spice, and in Confits, to cate with fruit to breake the windinesse of them: the herbe it selfe or with some of the seede bruised and fryed layd hot in a bagge or double cloth to the lower part of the belly doth ease the paines of the winde Chollicke.

CHAP. XVIII.

Anisum. Anise.

Anise is a small low herbe seldome a yard high, having the lower leaves broader then those above, few upon the stalkes, seldome divided, but dented on the fore part, of a whitish Greene colour, and of a good sweet taste and smell, the stalk is rounder and not spread into branches saving at the toppe, where the white umbells of flowers doe stand, which afterwards give small round whitish seede very sweete, yea more then any unbelliferous seede and pleasant taste, and smell yet somewhat quicke withall: the roote is small and perisheth every yeare, and is to be now sown

in the Spring.

The Place and Time.

It is every where sown even in the East Countries as Syria, &c. or else where, and not knowne where it is naturally, but is very fruitfull and plentiful in hot countries, being sown and gathered within three or foure moneths at the most.

The Names.

It is called in Greeke *ανισον* quasi *ανικτον* vocavere, quia cibi appetentiam praestaret, & forsan sic dictum in *ανισον* το *εμπν* *εμπν* *εμπν* *εμπν*, quod tensiones flatulentias internas & externas remittat laxaret: it is generally called *Anisum* of all authors, and almost by all nations according to their dialect, onely the Spaniards call it *Matabalna* and *yerva dulce*.

The Vertues.

Galen hath erred very much in relating the temperature of Anise seede, saying it is hot and dry in the third degree, and burning withall, by reason of the sharpenesse and bitternesse: when as it is well knowne it hath no such acrimonie therein that it should come neare to any burning qualitie: for the sweetenesse doth so temper the sharpenesse therein that it doth not excede the second degree in heate nor the first in driness: but the chymicall oyle drawn from the seed exceedeth much these degrees, the spirits being contracted must needs be the more fierce: The seede being often taken helpeth a stinking breath and to breake winde in any part of the body, bee it the head, stomacke, spleene, bowels or mother, and to provoke Urine and sleepe to them that want it: they helpe Nurset to store of milke for their children, to cate the feedes comfited fasting and last at night, and is very good also for teeming women or with child; they helpe those that are short winded, or have a Tificke or Consumption, to take the decoction of them with Figs & Licorice, &c. they helpe also to expectorate flegme in them that have a Cough or straightnesse in the breasts, and is very conduicible to the stomacke, and being boyled in wine and taken it helpeth the obstructions of the Liver assuredly, and the Dropsie that commeth threby: the same also stayeth the hickocke and helpeth digestion: the chymicall oyle taken in broth or in wine three or foure dropes at the most for a time doth wonderfully helpe the giddinesse of the head, the straightnesse and paines in the brest and stomacke, or the crudities and belchings therein, the much desire to cast, and the rising of the mother, as also all other griefes and paines inwardly that rise of cold or winde: if Anise eyther Greene or dry be beaten and laid to their eyes that have any hurtfull thing fallen into them it will soone draw it forth and likewise take away the venome of any hurt by the bitings of venomous creatures, and healeth them quickly: the herbe or seede boyled in oyle of Roses and dropped warme into the eares easeth the paines and noyle in them: the bruised seede and storax mixed together, and the fumes thereof taken being cast on quicke coales, so the head be covered over, that the fumes may penetrate the better, will soone ease the continuall headache: The *Italians* have this saying, *Qui terranno in mano nna piant a d'aniso, non saran molestati dal mal caduco*; that is to say, he that holdeth a plant of Anise in his hand shall not be troubled with the Falling sicknesse: but although this may seeme somewhat too easie to helpe so grievous a sickenes, yet assuredly the distilled water of the herbe, or more effectually the chymicall oyle, or I would say and use rather, the Quintessence thereof made as I shall shew you presently will give much ease to those that are franticke or distempered in their braines, especially if also there be an outward application with the herbe or seede and other conduicible things to the forehead and temples: the same likewise is very effectfull for old folkes as well as young children that have the Falling sicknesse, or are troubled with

Anisum. Anise.

with Spasms and Convulsions. The Quintessence is made in this manner, having infused the seede bruised a little (what quantitie every one please) for 24. houres in good spirit of wine, let it stand as long in an hot Balneum then let it bee pressed forth and distilled or vapoured gently in glasse, the residue in the bottome when it is come to the thickest of thinn honey, keepe it for your use as aforesayd.

CHAP. XIX.

Ammi. Bishops weede.

Though we have not the true *Ammi* of *Dioscorides* and the ancients in all the Christian world, yet growing or to be seene with any Apothecarie or Druggist, yet wee have two or three herbes that learned men have called by that name which we will here set forth unto you.

1. *Ammi vulgatum*. Common Bishops weede.

Common Bishops weede riseth up with a round straight stalke, sometimes as high as a man, but usually three or foure foote high be set with divers small long and somewhat broad leaves, cut in in some places, and dented about the edges, growing on both sides of the long footestalke one against another, of a darke greene colour, somewhat like unto Skirret leaves, having sundry branches on them, and at the toppes small umbells of white flowers which turne into small round and browne feede, little bigger then Parsley seed, and not so bigge as Annefeede, of a quicke hot sent and taste, the roote is white and fibrous perishing every yeare after it hath feeded, and riseth usually of it owne sowing againe.

2. *Ammi creticum*. Bishops weede of Candy.

This *Ammi* sendeth forth divers slender stalkes of fine cut leaves, somewhat like unto those of wilde Carrots, smelling somewhat quicke, from which rise slender stalkes with some joynts, and the like leaves set thereon, and at the tops umbells of white flowers, which turne into small feede like unto Smallage, of a sweet sharpe sent and quicke taste: the roote is somewhat great and browne on the outside, with sundry fibres thereat.

3. *Ammi parvum folijs Faniculi*. Small Bishops weede.

This small *Ammi* hath rising from a small roote two or three small and slender stalkes, about a foote high branched towards the toppes, and set with divers very fine small leaves finer then Fennell, bearing small umbells of white flowers, and very small blackish feede after them like to Parsley feede, somewhat pleasant but sharpe and a little quicke withall: the roote is small and white, perishing after feedetime.

The Place and Time.

The first is found growing wilde in many places in *England* and *Wales* also; as by the hedge side of the next field beyond *Greene hils* on the way as you goe to *Gravesend*, &c. the second hath bene sent from *Candy*, and

1. *Ammi vulgatum*.
Common Bishops weede.

2. *Ammi creticum*.
Bishops weede of Candy.

groweth likewise, as Matthiolus saith, from *Angulara* on mount *Gargani* in Italy: the last was brought from *Alexandria* in Egypt, but groweth in *Arabia*, and do all flower & seed reasonable well with us, if the yeare prove kindly, or else not.

The Names.

It is called in Greeke *ἀμμή* and *ἀμμή*, *Ammi* and *Ammium* in Latine also, *Ammi* and *Ameos* in shoppes, and is used in stead of the true in most shoppes: the first is called *Ammi* & *vulgare* or *vulgatum* by all authors, yet *Tabernmontanus* calleth it *Ammioselinum*, and some tooke it to be *Beupleuron* *Plinij*, as *Lugdunensis* saith, and some to be *Bubonium* *Hippocratis*, as *Lobel* doubteth: but as I said in the beginning, the true *Ammi* of *Dioscorides* is not knowne; and although *Dioscorides* doth not describe it, as in many other herbes that were commonly well knowne in his time he doth the like, yet from some notes thereof from him, from *Pliny*, and from *Galen*, it is plainly desciphered especially the feede, to be much smaller and whiter than *Cuminum* seede smelling like *Origanum*, and therefore was called *Cuminum* *Ethiopicum*, and *Hippocrates* called it *Regium* from the excellencie; yet as both *Dioscorides* and *Pliny* say, some opposed it in their times, raking the *Ammi* to be of a different nature wholly, because it is smaller and whiter than *Cumin*: but yet saith *Pliny* the use of this feede in Egypt, both in their bread and meate, is like unto that of *Cuminum* *regium*, or *Ethiopicum*. Now none of these seeds, nor of any other that have bene shewed for *Ammi*, or used by the Apothecaries, have the smell of *Origanum*, or can be compared with *Cumin*: I have onely once seene a feede that was brought out of the *East Indies*, and obruded for the true *Ammi*, whose smell was strong, somewhat neare to *Origanum*, but the other notes and markes agreed not with it, for it was larger and browner also than *Cumin* feede, which I sowed in my Garden, but sprang not, and therefore can say no more thereof: the second is the *Ammi* of *Angulara* sent to some, *Matthiolus*, *Caspar*, *Lugdunensis* & *Camerarius*, who all call it *Ammi* *Matthioli*, and *Camerarius*

Creticum also, as both one; *Lobel* calleth it *Ammi* *Creticum aromaticum*: the last is called *Ammi* *aletrum parvum* by *Dodonaeus*, and as he saith divers suppose it may rather be taken for *Sisan* than *Ammi*. *Ammi* *verum* by *Gesner*, and *Ammi* *perpusillum* by *Lobel*, and *Ammium* *primum Alexandrinum* by *Tabernmontanus*. The *Arabians* call *Ammi* *Nanoach* *Nanachue* and *Nanazue*; the *Italians* and all other Nations *Ammi*, or neare thereupon, but we *Bishops* weede, I meane these sorts here exprest: peradventure the true *Ammi* may be the *Cuminum* *syvestre* before set downe, and would be better considered.

The Vertues.

The true *Ammi* is commended by *Dioscorides* and *Galen*, being of an heating and drying property in the third degree, and of thinne parts, a little bitter in taste, and sharpe withall, whereby it digesteth humours, provoketh urine and womens courses, dissolveth winde, easeth paines and torments in the bowells being taken in wine; and is good against the biting of Serpents: it is used to good effect in those medicines that are given, to hinder the poysonfull operation of *Cantharides* upon the vitriory parts which they chiefly affect: being mixed with hony and applied to blacke and blew markes or spots by blowes and bruises, it doth take them away, and being drunke or outwardly applied, it abateth an high colour, and maketh it pale, and the fumes thereof taken with *Roslin* or with *Raisins* clenseth the mother. *Dodonaeus* doth much commend the common sort here first set downe, that it hath all the faculties exprest of the true *Ammi*: The *Egyptian* or *Arabian* feede is said to be very powerfull to provoke venery, for which purpose the *Egyptians* doe much use it.

CHAP. XX.

Sison vulgare sive Anomum Germanicum. Small wilde Parsley of Germany.

FOr some resemblance of this herbe, with the first in the last Chapter, I thinke good to joyne it next thereunto: this riseth up with a tall slender stalke scarce able to stand upright without helpe, thinnely set with winged leaves on the branches, the lower leaves being largest, and divers being set on a stalke on both sides, each whereof is as small almost as the former *Ammi* leafe, some whereof will be cut in on the edges more or lesse, and some not cut in at all, but all of them dented about the edges, at the toppes whereof loose small umbells of white flowers, which turne into small blackish feede, lesser than Parsley, but of a strong sent, and quicker hotter taste: the roote groweth downe much, and spreadeth every way, whereby it holdeth fast in the ground, and abideth long.

2. *Sisum odoratum.* Sweete wilde Parsley.

This plant I have entituled *odoratum* to distinguish it from the former sort called *Sisum*, although peradventure it is not the right *Sison* of *Dioscorides*: it beareth a single stalke about two cubits high, with long Pennell-like

1. *Sifum vulgare* five *Anomum Germanicum*.
Small wilde Parsley of Germany.

2. *Sifum odoratum*.
Sneete wilde Parsley.

like leaves at the joynts, which swell sweete betweene Dill and Fennell : the nmbells are small thin set and white, and the seede small blacke well smelling, but bitterish, somewhat like Smalage : the roote is long, white and slender : some have taken this to be *Seseli Massiliense*, but erroneously.

The Place and Time.

This was formerly taken to be a forraigne plant, the seede being to be had in the Apothecaries shoppes onely in Germany, but afterwards divers found it wilde with them, as *Gesner in hortis* sheweth, and we have done the like with us, growing neere hedges by moist ditches almost every where, and flowreth in July, the seede being ripe quickly after.

The Names.

Dioscorides calleth it in Greeke *Sizon*, and so doth *Galen* & *Simon* a so, but *Hippocrates Simon*, and *Pliny* doth the like, so that *Sifon* and *Simon* be both but one plant, as *Cordus* also doth acknowledge : *Tragus*, *Gesner*, and other German Writers doe testifie, that the seede hereof was called in the Apothecaries shoppes of their country, *Anomum*, and used in the stead thereof, so great ignorance was spread over the face of the world for many yeares, that not onely the knowledge of herbes, but of good literature was in a manner buried, or at least neglected and lost : and therefore it is still called by many *Anomum Germanicum* : *Fuchs* calleth it *Petrofelinum Macedonicum*, and *Dodonaeus* maintaineth it, taking it to be the truest was extant before others : in the Chapter next going before this, I shewed you that he liked of their judgement that called the *Ammi perpusillum* to be *Sifon*, and now since this is knowne to be the true *Sifon*, and called so by *Tragus*. *Camerarius* and *Lugdunensis*, he would make it to be *Macedonian Parsley*, but surely this cannot be referred to any of the *Selinum*, the compofure thereof, as well as other things contradicting it ; *Alpinus* hath onely mentioned the other.

The Vertues.

The properties given to *Sifon* are all found to be effectuell in this plant, that it is good against the diseases of the spleene and fitches in the side, against the strangury and difficulty of making water, and womens courfes when they are stopped : it likewise helpeth digestion, and is therefore used as Pepper in broths, meates, and sawces.

CHAP. XXI.

Cerefolium. Chervill.

F the Chervills, there is both tame and wilde, which shall be here declared, but some doe account *Scand. x* to be a kinde thereof, which although it doe in some sort resemble, yet I thinke good to sever them, and to speake of it, and the other kindes thereof in the next Chapter.

1. *Cerefolium sativum*. Garden Chervill.

This garden Chervill at the first doth somewhat ressembl Parsley, but after it is better growne the leaves are very much cut in, and jagged resembling Hemlockes, being a little hairy, and of a whitish greene colour, and sometimes turning reddish in Summer with the stalkes also : it riseth little above halfe a foote high, bearing

1. *Cerfolium sativum*.
Garden Chervill.

2. *Cerfolium sylvestre*.
Wilde Chervill.

bearing white flowers in spok'd tufts which turne into long and round seede point'd at the ends, and blackish when they are ripe, of a sweete taste, but of no smell when as the herbe it selfe smelleth reasonable well: the roote is small and long and periheth every yeare being to be sown a new in the Spring for seede, and after *Iuly* for Autume fallers:

2. *Cerfolium sylvestre*. Wilde Chervill.

The wilde Chervill groweth two or three foote high, with yellow stalkes and joynts set with broader and more hairy leaves devided into sundry parts, nicked about the edges, and of a darker greene colour, which likewise grow reddish with the stalkes, at the toppes whereof stand small white tufts of flowers, and afterwards smaller and longer seede: the roote is white and hard and as I suppose enduring long: this hath little or no sent.

The Place and Time

The first is sown in Gardens to serve as a saller herbe: the other groweth wilde in their Vineyards and Orchards beyond Sea, and in many of the medowes of our owne Land, and by the hedge sides, as also on heathes: they flower and seede early and thereupon are sown againe in the end of Sommer.

The Names.

Columella calleth the first *Cherophyllum* and is likely to be the *Cerephyllum* of *Pliny* which he saith the Greekes called *Paderota*, but because he is so briefe nothing certaine can be affirmed, some also take it to be the *idamides* of *Theophrastus* lib. 7. c. 7. which *Gaza* translateth *Enthusium*, all authors doe call it *Cerfolium* or *Cherfolium*, &c. onely *Angularia* and *Cesalpini* thinke it may bee *Oreofolium* which it cannot bee. *Tragus*, *Matthiolus*, *Cesner* and others also leaning to that opinion, *Fuchs* and *Lobel* take it to be a kind of *Gingidium*: the *Italians* call it *Cerfoglio*: the *French* du *Cerfueil*, the *Germans* *Korffol* and *Korbelkraut*, the *Dutch* *Kervell*, and wee *Chervill*.

The Vertues.

The Garden Chervill by reason of the good relish it hath, is willingly put among Saller herbes to make them taste the better as also into Loblollies of stewed herbes which the *French* & *Dutch* doe much delight in, for it doth moderately warme the stomacke: it is a certaine remedy saith *Tragus* to dissolve congealed or clotted blood in the body, and so doth it likewise the blood by bruises, falls, &c. the juice or distilled water of it drunke, and the bruised leaves laid to the place it is taken also by divers to be good to provoke urine, and to expell the stone in the Kidneys and womens courses, taken eyther in meate or drinke, and moreover to helpe the Plurisie and prickings of the sides: wilde Chervill will helpe to dissolve any tumors of swelling in any part of the body, as also to take away the spots and marks in the flesh and skinn of congealed blood by bruises or blowes in a short space, by applying it to the place.

CHAP. XXII.

Scandix. Shepherds needle.

Here are three or four sorts of Shepherds needle that I am to shew you in this Chapter, some of which are revived and referred to those of the ancients, and some never knowne before

1. *Scandix vulgaris* five *Pecten Veneris*.
Common Shepherds needle.

The common Shepherds needle hath sundry long hard large, Greene stalkes of leaves, more divided, and into many more parts, and of a sadder browne Greene colour than Chervill, and of no sent, the stalkes grow a foote high, bearing small tufts of white flowers, and after them five, or sixe, or more or lesse long seeds, somewhat round pointed at the ends, and a little rough, as if they were dented, all of them coming from one head or stalk. with a few small leaves under them: the roote is very small and threddy.

2. *Scandix altera capite glomerato*.
Round headed Shepherds needle.

This kinde of Shepherds needle hath stalkes of larger leaves than the wilde Carrot coming somewhat neare to Parsley, smooth, and of a pale Greene colour, those that grow at the joynts of the stalkes come forth out of a broad filme or skinne, as is seene in many fernulous and umbelliferous plants, and bearing at the top a round head, of many greenish white thredes set close together: the roote is like the wilde Parsnippe, and of a bitter and sharpe taste.

3. *Scandix Cretica minor* five *Anthriscus*.
Small Shepherds needle of Candy.

The small Shepherds needle of Candy hath sundry stalkes of very fine cut leaves, not bushing thicke like

4. *Scandix Cretica major*.
The greater Shepherds needle of Candy.

the first, but more sparfed and thinne, comming somewhat neere to Camomill, but finer and a little hairy, of a pleasant both sent and taste, among which rise slender short stalkes, somewhat hairy or hoary, with but few joynts or leaves on them, at the toppes whereof stand five or six small white flowers close set together consisting of five leaves a peece, in the middle whereof is a darke purplish stile or leafe longer then the rest, spreading forth like a blazing starre, after which follow long feedes like the first but smaller, bigger below and ending above in two small points, whose edges are more rough and seeme more dented, and bee a little purplish as the young ones are before they be ripe, which are the feedes themselves: the roote is small long and white. This hath bene observed to have a better sent that groweth in untilld voyde and gravelly grounds then that which groweth in the fields.

4. *Scandix Cretica major*. The greater Shepards Needle of Candy.

The greater kinde hath a crested small stalke a cubit high, parted into divers branches, a little hairy at the very joynts having the lower leaves broad and somewhat round, divided like unto the lesser Burnet Saxifrage one set opposite to another, standing upon long stalks, which together with the leaves are a little hairy: but those that stand at the joynts are much more finely cut in, and like unto the leaves of the first, the umbells are a little spread and small, yet greater then the first, which are succeeded by more store of long rough dented feede then the last, having each of them two small prickles at the end: the roote is small and fibrous.

The Place and Time.

The first groweth plentifully in our owne Land among Corne: the second in France, the third both in Candy and Naples also, and the last in Candy: they flower early and feede accordingly.

The Names.

The Greekes call it *σκανδίκη* and the Latines *Scandix* also, and *Pellen Veneris*, *Acus Veneris*, and *Acus pastoris* or *Acula* and some call it *Scanaria*. There is much doubt and controversie among our later writers, first what herbe the *Scandix* of *Dioscorides*, *Galen* and *Pliny* should be, that was so common a Saller herbe for the people to feede on and growing wilde with them, so that *Aristophanes* merrily taunted *Euripides* the Poet, that his mother told not a true wort but *Scandix*, which was accounted the meanest or vilest of all others, for our *Pellen Veneris* is not taken to be the true *Scandix* in Candy, as *Honorius Bellus* sheweth in his first Epistle to *Clusius*; for he there saith the *Candians* eat it not, calling it *αγρια σκάνδα*, and hath no smell, but another which they call *σκανδίκη* *Scandix*, and *σκανδίκη* smelleth well, but moveth nothing to Venerie: divers therefore doe thinke that the *Gingidium* of *Matthiolus* should be *Scandix* as *Lugdunensis* setteth it downe, *Columna* taketh the *Caucalis echinato nodoso seminibus* *Bauhinii* to be *Scandix*, which how farre they are from veritie or almost any shew of reason this one thing doth declare, that neither *Matthiolus* his *Gingidium* nor *Bauhinus* his *Caucalis* were ever used to bee eaten as *Scandix* was, nor is likely to grow so familiarly in Greece as *Scandix* so wilde a wort: but if I might spend my opinion in the matter, I should sooner beleieve *Bellus* his judgement hereof that lived long among the Græcians, (for I account the *Candians* in speaking Greeke and using the Greekish rites, to be as it were the off-spring of the Greeks) and from both their denominations of herbes, and the use of them besides his owne both reading and observation, holding the ancient Greeke words although somewhat corrupted, who sheweth that *Scandike* as they usually call an herbe that they ate should be the true *Scandix*, then eyther *Matthiolus* or *Columna*, whose opinionative conceits that he had found out the genuine plants of the ancients, made him runne farre awry in many things, as may be seene in his *Hyssope*, *Polium* and divers others the like: so that my opinion is that our *Pellen Veneris* is not the true *Scandix* of the ancients, but a kinde of wilde Chervill, and not used to be eaten with them or us, as the properties also do declare: but that *Scandike* which they in Candy (and as it is likely throughout all Greece also) doe take and use for their foode is the true *Scandix* which we have seldome seene or knowne: next what *Anthriscus* of *Pliny* should be, whether this of *Honorius Bellus* sent to *Clusius*, or that of *Columna* in his Chapter of *Scandix*, which I take to be our *Pellen Veneris*; and whether *Bellus* his correction of *Pliny* his description be not true which explaneth the matter thoroughly. *Anthriscus* saith *Pliny* were the same that *Scandix* is, if it had thinner and sweeter leaves, which reading being admitted, *Anthriscus* is an herbe that hath broader leaves and not so sweete in smell as *Scandix*, which *Columna* as it should seeme would have to be the *Scandix* of *Dodonæus*, and is our *Pellen Veneris*, which *Columna* commendeth him so much for his true description thereof, and so would make our *Pellen Veneris* to be the true *Scandix* of the ancients, which is neither sweete nor used to be eaten, and all this is I suppose because he would have his *Anisomarathrum* to be a new plant of his owne finding, and not the *Anthriscus* of *Pliny*, as others before him had judged it to be. when as his description of *Anisomarathrum* sheweth it must be a species of the *Scandix* by the manner of growing and the forme of the seed: but admitting *Bellus* his correction of *Pliny* that *Anthriscus* were the same, but that it hath finer and sweeter leaves, it endeth the whole controversie, putting all things without doubt. I am somewhat more ample and tedious in the explanation of these things then I thought to be, because they are intricate and various: the first here is called *Scandix* by divers authors, and *Pellen Veneris* by others without doubting or questioning whether they were true or no: the second *Lugdunensis* remembreth, and the last *Bauhinus* onely hath made mention of: the other I have I hope sufficiently expressed it to be called and taken to be the *Anthriscus* of *Pliny* which *Bauhinus* calleth *Scandix cretica minor*.

The Vertues.

Both *Dioscorides* and *Galen* say that *Scandix* is somewhat sharpe and bitter, being hot and dry in the third degree, and thereby is good both for the stomacke and belly being eyther eaten raw or boyled: being made into drinke and taken it is good for the Liver, backe and bladder, provoketh Vrine mightily and freeth the inward parts from obstructions: it also bindeth a loose body, the feede being taken with vinegar presently stayeth the hickock, and used in an oymntment it helpeth the parts that are burnt with fire: *Pliny* saith that the roote of *Pellen Veneris* beaten with Mallowes draweth forth splinters or any other thing sticking in the flesh. *Honorius Bellus* that the *Anthriscus* is used in Candy by the people with great delight, not onely because it is pleasant to the taste, but because it mightily provoketh to Venerie and helpeth those persons that are weake or spent therein, and helpeth women to conceive in that it clenseth the seminary parts.

CHAP. XXIII.

Coriandrum. Coriander.

He ancients formerly knew and set forth but one sort of Coriander, and sayd that it had no diversitie but the later writers have added two more unto it as shall be shewed.

1. *Coriandrum vulgare*. Ordinary Corianders:

When Coriander first springeth up the leaves are somewhat broad very like unto Parsley, but after it is growne up into a stalke which is three or foure foote high, being full growne they are smaller and finer every one then other up to the toppe, where stand small loose umbells of white flowers, turning into round striped hollow feede of a whitish yellow colour when it is ripe: the roote is small and perisheth every yeare after feede time: the whole plant. feede and all while it is Greene and growing hath a strong and loathsome favour scarce to be endured, but when the feede is full ripe and dry it is of a reasonable good sent and taste without offence.

2. *Coriandrum minus odorum*. The lesse sweet Coriander.

This Coriander hath the lower as well as the upper leaves all finely cut in and jagged, the stalkes grow lower not halfe a foote high and lying almost on the ground, with white flowers on them and round feede as the other but fuller and greater, and two alwayes joyned together.

3. *Coriandrum alterum fetidissimum*. The stinking Coriander.

This other Coriander hath sundry small stalkes that are five square being firme, and not hollow, nor growing high, all the leaves whereof are as fine as the uppermost of the first: at the toppes of the stalkes stand such like small umbells of purplish white flowers, after which come round feede like the other, but two alwayes joyned together: the roote is great dying yearly as the other, the smell hereof is more strong and offensive then the other to the head and senses.

The Place and Time.

The two first are onely sown in Gardens as well now as in ancient times, for Pliny saith it is not found wilde; their naturall places being not knowne: the last was sent from *Barcinona* to *Lyons* by *Alyconus* to *Molinum*, who hath set it forth in *histeria Lugdunensi*: they doe all flower in *Iuly* and ripen in *August*.

The Names.

It is called in Greeke *κόριανδρον* and *κορίαννον*, and so in Latine also *Corion* and *Corianon*, but usually *Coriandrum*, and derived from *κόρις*, which is that kinde of noysome flie or worme that is called *Cimex* in Latine, a wall Louse or Punie in English, whose stinking smell Coriander doth much imitate. There hath beene formerly some controversie betweene *Avicen* and *Galen*, and others also about Coriander, some condemning the use as hurtfull and dangerous by reason of the grievous smell, and that it maketh the voyce hoarse, procureth a kind of frensie

1. *Coriandrum vulgare*.
Ordinary Coriander. 2. *Coriandrum alterum minus odorum*.
The lesse sweet Coriander.

like unto drunkenesse, and that the juice thereof being drunke causeth death, and that it is very cold, all these properties the *Arabian* Physicians give it: the correction therefore of the seede they appoint to bee by steeping it all night in Vinegar, and dried up againe to be safely used: but *Lobel* seemeth to relute this preparation, saying that the coldnesse of the Vinegar can draw forth none of the foule and stinking spirits from it, but rather the drying of it of it selfe or by the fire, as it is used when they are made into Comfits, without any other preparation and then is not found hurtfull but rather comfortable to the stomacke, &c. as also by the continuall use of it in meates and medicines among many countrey people of it selfe without preparation: and some commending the use because when the seede is dry it hath a warming, sweete and no noysome smell or taste: the noysome vapours subsisting onely in the moysture and not in the drying, as wee may see in many fruits which being not ripe are so hard and harsh that scarce one can eate them without harme, but being ripe are both mellow and sweete, heate onely working this effect: the hotter countries for the most part giving the mellowe and sweeter fruit: The first is called by all writers *Coriandrum*, the second is mentioned by *Lobel*, and *Dodonaeus* giveth the figure without description, *Lugdunen* onely remembreth the last. The *Arabians* call it *Casberra* and *Elcesbur*, the *Italians* *Coriandro*, the *Spaniards* *Culantro*, the *French* *Coriandre*: the high and low *Dutch* *Coriander*, and we in *English* *Coriander* and *Coliander*.

The Verines.

First for greene Coriander and the cooling qualitie thereof: the juice as is before said being drunke killeth them that take it: outwardly applied it dissolveth knots and kernells, being mixed with Wheate or Barley Flower, as also Saint *Anthonies* fire being used with bread, and running and fretting sores, wheales, pusses and carbuncles, and botches rising in the skinn or flesh, and taketh away the swelling and inflammation of the cods, either the juice of greene herbe applied: the juice thereof made into an ointment with *Ceruse*, *Litarge* Vinegar and Oyle of *Roses* doth the like, Now for the dried seede of Coriander which is most in use, and being taken in sweete wine killeth the Wormes in the body and encreaseth coiture: it is also good against the Serpent that is called *Amphisbena*, eyther drunke or layd to the bitten place: it is very comfortable to the stomacke, by heating and drying, the cold and moisture thereof helpeth digestion and represseth the vapours therein that rise upwards, and resisteth forcible paines of the winde chollicke and the stopping of Urine: and being a nourishment of a temperate qualitie it helpeth to encrease both blood and Sperme.

CHAP. XXIII.

Caucalis. Bastard Parsley.

Of these *Caucalides* I have above a dozen sorts to expresse here in this Chapter, some whereof have small fine cut leaves, others are larger and broad, some well knowne of a long time to many, and others of later invention.

1. *Caucalis vulgaris floribus albis.* The common Bastard Parsley.

This Bastard Parsley riseth up with a short stalke, not above halfe a yard high, set at the joynts with whitish rough diversly cut leaves smaller then Parsley, furnished at the toppes with small sweete umbells of white flowers, the outermost being the greatest, after which succede divers rough prickly round seede, two alwayes joyned together, which maketh them but halfe round when they are parted.

2. *Caucalis Hispanica.* Spanish Bastard Parsley.

This *Spanish* kind hath divers crested rough stalkes and leaves very like unto the former, but the umbells of white flowers are smaller and growing more round together as it were into the forme of a round head, and the seede which followeth is greater very much striped and rough but not prickly as this, it being broken in any part giveth a sweete milke: the roote perisheth after seede likewise but giveth no milke.

3. *Caucalis major flore saturo rubente.* Deepe red flowered Bastard Parsley.

This red flowered kinde hath larger winged leaves then the former, being divided and cut in after the manner of the lesser Burnet Saxifrage leaves: the flowers hereof are larger then of the first and of an equall bignesse, but of a deepe red colour.

4. *Caucalis maxima.* The greatest Bastard Parsley.

This greatest kinde bringing forth many upright tall stalkes three or foure foote high or more sometimes, being crested and hollow within with divers joynts on them, and the stalkes of the long and large winged leaves compassing them at the bottome, which leaves are large almost like *Angelica* leaves, set by couples on the middle rib and an odde one at the end, all of them finely dented about the edges, and of a darke greene colour: at the toppes of the stalkes grow large umbells of white flowers, somewhat purplish or of a bluish colour underneath, after which come very large and flat rough seede, with a double point at the head and prickley, round about: the roote is white and woody.

5. *Caucalis Anglica flore rubente.* English Bastard Parsley with reddish flowers.

This *English* kinde groweth about two foote high, of an Olive greene colour, with a strong round crested rough and hairy stalke, set at the joynts which are two or three inches in sunder, with leaves three or foure inches long, consisting of seven or nine narrow hairy leaves set by couples, somewhat deeply dented about the edges, the foote of the stalke being a broad thinne skinn or filme, and from betweene it and the stalke come forth lesser stalkes of leaves, towards the toppe parted into three or foure branches, which at three inches distance doe each of them from one center, shoote forth foure, five or six equall stems about an inch and a halfe long apeece, having a thinne skin running all the length of them, and the two innermost strings, being of a darke red colour composing a spokie umbell: at the toppes of each stemme grow five or six long rough hairy small knaps or bottomes crowned with flowers of a pinkie red colour, consisting of five leaves a peece, the outermost whereof sheweth like two by the folding of it inward, and the inner foure with five chives and a double pointell shew not halfe so big as it when they are full blown: in the center of the flower lye six or seven such like small flowers: the leaves give milke being broken of little or no taste: after the flowers are past come the seede which are rough burres, sticking

to any thing they touched, like the seede of Hounds tongue, within which are contained two browne seeds like unto hulled Oates but bigger: the roote is small and long, white and hard, perishing every yeare after seede time. It flowreth in June and the seede is ripe in August. This may seeme to be the *Caucalis rubro flore folio latiore* of Lobel, and the *Caucalis rubello flore* of Clusius set forth without description, but the leaves of theirs are la ger.

6. *Caucalis tenuifolia purpurea.*

Fine leaved Bastard Parsley.

I find in *Columna* one other very like unto this last also which he calleth *Echinophora leptophyllon purpurea*, out that the leaves as he saith are most finely cut into sundry parts like unto the wilde Carrots, and the umbells of flowers, and to the seede after them stand by three and three at a place, whose kernell or seede within is somewhat like unto hulled Barley.

7. *Caucalis arvensis latifolia purpurea.*

Broad leaved bastard Parsley with red flowers.

This Parsley hath sundry stalkes of hard rough leaves, divided into five parts, each leafe being three inches long and an inch broad, deeply dented in on the edges somewhat like unto Oaken leaves: the stalk is rough and hoary, two foote long, so crested that it seemeth square bearing such like umbells as in the last standing 3. together but their small stems are shorter and thicker, the flowers are red like the former, but greater, having small leaves like beards under them: after which followeth the seede being smaller then the former and not so rough, containing such like seede within them but smaller and aromaticall: the roote is white, hard and aromaticall.

8. *Caucalis magno fructu echinato.*

Bastard Parsley with great prickley seede.

The leaves hereof are divided somewhat like unto those of the greater Parsley leaved Dauke, set forth before in the

1. *Caucalis vulgaris albis floribus.*
The common Bastard Parsley.

5. *Caucalis Anglica flore rubente.*
English Bastard Parsley with red flowers.

6. 7. *Caucalis Echinophora major & minor & purpurea Columna.*
The greater and lesser Bastard Parsley with prickly seedes.

Chapter of *Daucus* and hairy underneath : the stalk is two foote high, and somewhat rough, having the like leaves at the joynts upwards but smaller, bearing small umbells of whitish flowers standing three together and perfecting usually but two feedes on them which are twice as big as others and more rough and prickly, having a large flat kernell within it : the roote is small and white but somewhat sweete both in taste and smell.

9. *Caucalis minor flore rubente.* Small Bastard Parsley with reddish flowers.

This small Parsley hath a smaller and short rough stalk, whose leaves are divided somewhat like unto Hemlock leaves but each of them broader, and the end leafe longest and hairy, all of them dented deeply about the edges, and of a darke greene colour, at the upper joynts of the stalkes come forth slender branches bearing sparsed small umbells of reddish flowers, and sometimes more white, and after them small round, rough feede : the roote is small and white.

10. *Caucalis nodoso echinato femine.* Small Bastard Parsley with knotted burres.

This other small Bastard Parsley lyeth on the ground with long rough trayling branches, some longer then others set at severall distances, with long winged leaves divided in the same fashion almost as the last, but somewhat lesse, being rough or crumpled, but not hairy, and of an overworne or evill greene colour : at every joynt almost close unto it, and round about it come forth small whitish flowers out of rough huskes which are after the feede, very sharpe prickly and hard : the roote is small and perisheth every yeare, the seed rising by the falling of, in the fields or gardens whereinto it is brought.

11. *Caucalis folio Feniculi.* Fennell leaved Bastard Parsley.

This is both in stalk and leafe very like unto Fennell, but rising seldome above a cubit high, bearing white sweete smelling flowers in umbells at the toppe, set close together, which afterwards give feede that is not rough like the former : and therefore *Lobel* that first set it forth saith, that although *Anguilara* in his time did call it a *Caucalis*, yet hee liked of the others better then of this : the roote is white growing deepe, and of the taste of a Parsnep.

12. *Caucalis tenuifolia montana.* Small Mountaine Bastard Parsley.

The roote hereof is somewhat thicke and from it riseth a stalk of a foote long, divided from the bottome into small round smooth branches, and they againe into lesser, whose smallest branches even neere the roote as well as the others, beare small umbells of very small white flowers, and afterwards small long striped feede : the leaves next unto the roote are divided into very fine and small leaves, but those above on the stalk much more small like haire.

13. *Caucalis pumila Hispanica.* Dwarf Bastard Parsley of Spaine.

This Dwarf kinde which *Barlus* brought out of Spaine with a number of other fine seeds riseth not with us halfe a foote high and lower in Spaine, whose leaves are very small and much divided on the stiffe stalkes, bearing small umbells of whitish flowers and after them small rough whitish feede : the roote is small and annuall ; I never saw this beare but once, which was from the first feede I received from *Boel*, which was thorough ripe.

9. *Caucalis minor flore rubente.*
Small Bastard Parsley with reddish flowers.

11. *Caucalis folio Feniculi.*
Fennell leaved Bastard Parsley.

The Place and Time.

These sorts of Parsley grow in the severall countries of Germany, France, Spaine, Italy, &c. and divers of them in our owne Land likewise; and particularly the first was found in Lincolnshire, on the North descent of the North field of Witham nigh to Bourne; and doe all, save the last, flower and feede reasonable well, but that worst, as I said.

The Names.

It is called in Greeke *καυκαλίσ*, and *Caucalis* also in Latine, either of the hemisphericalle feede, or from the noise that the feede will make when it is dry, being shaken with the winde, or from narrow mouthed pots, such as the feed is like, that make a noise at the powring of the liquor out of them: the first here exprest is the *Caucalis albis floribus* of Lobel, the *Lappa agrestis* of Tragus, the *Lappula Canaria* Plinij of *Anguilara*, the *Caucalis alia vulgaris*, and *Myrrhū Lappa Dalechampi* of *Lugdunensis*, the *Caucalis* of *Dodonæus*, *Gesner*, and others, and the *Echinophora major* of *Columna*: the second is the *Caucalis Hispanica* of *Clusius* and *Camerarius*; and the third the *Caucalis sativa rubente flore* of *Clusius*; the fourth likewise is his *Caucalis major*, which *Bauhinus* calleth *Caucalis maxima aculeato semine*: the fifth is of our owne country not published exactly before, although *Gerard* seemeth to have *Spondan* had a hint of it: the sixth is the *Echinophora leptophyllon* of *Columna*: the seventh his *Echinophora major platyphyllos purpurea*: and the eight his *Echinophora altera asperior platycarpus* also, which *Bauhinus* calleth *Caucalis Monspelici acuminato magno fructu*, and is the *Lappa boaria* Plinij by *Lugdunensis*, and the *Daucus Xanthi* *carpos* of *Thalium*: the ninth is figured by *Bauhinus* in his *Prodromus* but the description is of his *nodoso echinato semine*, which is the tenth, as may soon be perceived, if they be but compared, and are both growing wild in our own land: the tenth is also the *Daucoides minor* of *Cordus* in his *historia*, and of *Thalium*: the eleventh is the *Caucalis* of *Anguilara*, as *Lobel* saith in his *Adversaria* which *Lugdunensis* calleth *Caucalis Pena*, and *Bauhinus* *Caucalis folio Penedani*: the twelfth is *Bauhinus* his *Caucalis tenuifolia montana*; and the last I had from *Boel* by the name of *Caucalis marina* *Barica*. The Italians usually doe call *Caucalis Petrosello salvatico*; and the Germans, as *Tragus* hath it, *Feldt oder Ackerkletten*, and we in English *Bastard Parsley*, rather than wilde Parsley, as the Italians doe.

The Vertues.

Discorides in regard that *Caucalis* was a familiar sallet herbe, and therefore used more as meate than medicine giveth no other propertie belonging to it than to provoke urine, but our later Writers have found out and published divers others, as *Mathiolus*, who saith it is comfortable to the heart, and helpeth the obstructions of the liver and spleene, cleneth the raines and kidneyes, of the siegme and niter, gravell and the stone which ingendereth in them, if the juyce thereof be taken: the feede being drunke sharpeneth the eye-sight, and procureth women's conffes: it is likewise given to men with Miltwaist, and the feede of *Agnus castus* against the running of the raines: it also causeth fruitfulness in barren women, being drunke in wine, and helpeth the bitings of the Trigon (we understand it to be the Thornebacke) the *Draco marinus*, which is called a *Quaziver*, and the sea Scorpion being applied to the wound; if the whole herbe be taken with vinegar after a vomit, it purgeth the belly and stirreth up a fainting appetite, taking away the evill of loathing ones meate: all the parts of the herbe, as well feede as juyce, or decoction being taken, is helpfull to melancholicke persons, and therefore is good to be given against a quartaine ague, and the itch and scabbes, as also for the great French disease.

CHAP. XXV.

Selinum sive *Apium*. Parsley.

Under this title of *Selinum* or *Apium*, is contained divers and sundry sorts of heibes, for with the ancients, besides the *Σελίνιον* *Apium hortense*, they had *Βαλυδάπιον* *Baludapium* *ὑποσύνιον* *Apium montanum* *ὑπερσύνιον* *Petrapium* or *Petroselinum*, *ὑποσύνιον* *Hipposelinum* *σύνιον* *ὑπερσύνιον* *Apium sylvestre* and others, of all which I must give you the knowledge, and therefore I thinke it fittest to distribute them into severall Chapters, and to comprehend under each all the species and sorts that pertaine to that genus or kinde: and first to beginne with the *Apium hortense*, which by an usual received opinion is our *Petroselinum*, Garden Parsley, whereof I shall say more in its due place.

1. *Petroselinum vulgare*. Common Garden Parsley.

Common Garden Parsley is well knowne to have many stalkes of fresh greene leaves devided into sundry parts, first into three parts or leaves, and then each of them into three, somewhat round and finely snipt about the edges: the stalke riseth much higher in some places than in others, according to the soile wherein it groweth with divers smaller leaves at the joynts, and still finer cut, and long like Fennell at the toppe, that one would not thinke them to be the leaves of Parsley; the flowers are white growing in umbells, and the feede small and of a hot and sharpe taste: the roote is white and long, with somewhat a rugged barke perishing after feede time, and aromaticall as the herbe is also and very pleasant to the taste and stomacke.

2. *Petroselinum crispum*. Curld Parsley.

The curld Parsley differeth not in any thing from the former but in the leaves, which although they grow after the same manner, yet they are finely curled, or crisped, or folded in on the edges, seeming like a Ruffe or the like.

3. *Petroselinum majus* sive *Virginianum*. Virginia Parsley.

Virginia Parsley groweth after the very same manner that the Garden Parsley doth, but larger, having greater stalkes of leaves, set by three and three as in the former, but much larger, even as large as Smallage, and of a paler or yellower greene colour, the stalkes, flowers, and feede are alike, but still larger, the feede being twife, if not thrife as bigge as the common, the roote is greater and shorter, but perisheth like it.

4. *Petroselinum creticum*. Candy stone Parsley.

This Parsley of Candy is very like to the ordinary parsley, but lesser in every part, having leaves made and cut into such like divisions, but lesser and somewhat thicker, the stalks are like, but shorter than Parsley, bearing tufts of white flowers, after which follow smaller feede than that of Parsley, but blacker: the roote is alwayes single

3. *Petroselinum majus* sive *Virginianum*.
Virginia Parsley.

that is but one, of the thicknesse of ones thumbē, long, and covered with a thinne blacke barke or rinde that may easily be rubbed off with ones finger, being white underneath, and of a sweetish taste, like unto the Earth Chefnut, being often eaten by the Natives, and liveth after seede time, shooting forth a new every year. There is an other of this kind which differeth in nothing from it, but in the colour of the roote, which is reddish on the outside, and not blacke as the former: this flowereth and seedeth earlier than others, and is called *Agriopastica* by the country people in Candy, that is, *sylvestris Pastinaca*, but hath no likenesse to a Pastinippe, but in that it is fit to be eaten. Others there, as *Honorius Bellus* saith, doe call it *Saxifraga*, and use it as Saxifrage: but he himselfe saith it doth come nearest unto the *Buselinon* described by *Pliny* in lib. 20. c. 16. especially that with the red roote, and hath the same vertues that the ordinary hath.

The Place and Time.

These doe all grow in gardens onely in our Ladd; the naturall place of the first being not certainly knowne, but the second is of the Iland of *Sardinia*, and the third, as the name sheweth, was sent out from *Virginia*; the last in Candy: they perfect their seede in *August*, but the last earlier.

The Names.

It is, as I said, by a continuall received opinion held by most, that this Parsley is the *ῥησινον* *Apium hortense* of *Dioscorides* and other the ancients; first, because there cannot be found another herbe that can answer both the forme and the properties given thereunto, to be so pleasant and to be eaten familiarly in all countries; and next that the use of this Parsley is continued to this day, as a salter herbe among the Greekes and Turkes, and called also *Petroselinum Macedonicum* by the vulgar Greekes usually, whereby there groweth some doubt with many whether this should not be the *Petroselinum Macedonicum* of the ancients, as *Isidorus* and *Platina*, *Marcellus Virgilius*, and *Quatremus* did take, seeing, as *Belonius* saith, it is so used and called throughout all *Macedonia*, *Epirus*, *Thessalia*, &c. and in Candy, and with all the Greekes, and that all Christian Nations also according to their *Dialect* doe follow the Latine *Petroselinum*; but because the seede is not bitter, as *Galen* saith the true sort is, wee as many other doe refuse it, and doe not hold it for the right *Petroselinum Macedonicum*. It is also called by all Writers *Apium veterum* or *hortense*, or *domesticum*: yet *Fuchsius* took it to be *Oreoselinum*; the last is declared sufficiently in the description: the *Arabians* call it *Charss Chares*, or *Charss*, the *Italians* *Petrosello* and *Apio domestico*; the *Spaniards*, *Perexill*, the *French* *du Persill*, the *Germanes* *Petersilgen* and *Peterlin*, the *Dutch* *Peterseli*, and we Parsley, or garden Parsley. There is some caution to be used concerning this herbe that it is usually called *Apium* simply, if it be to be used in any of the Greeke Authors medicines, for so *Selinon* is translated, but the *Arabians* *Apium* is our Smalage, which they held to be hurtfull to the eyes, and the use therof to bring the falling sicknesse.

The Vertues.

This Parsley is much used in meate and broths, &c. in all countries, as hath beene aforesaid, being of so milde a taste, and so comfortable to the stomacke, that no other is more, and besides doth helpe to provoke urine and womens courses, and to breake winde, both in the stomacke and bowells, and doth a little open the body, but the roote much more, and openeth the obstructions, both of the liver and spleene, and therefore is usually put among those

those herbes and rootes that move the belly downewards, and is one of the five opening rootes, but doth binde the body as *Dioscorides* hath it, and hereby also is profitable for the yellow Jaundies and Dropſie: and *Galen* commendeth it againſt the Falling ſickneſſe, and to provoke urine mightily, eſpecially if the rootes be boyled and eaten like *Parſneps*: the ſeede is held by moſt to be the moſt effectuell part of the plant, yet ſome doe thinke the roote to be ſtrongerſt: but the ſeede is effectuell to provoke urine and womens courſes to expell winde, to breake the ſtone and to eaſe the paines and torments thereof, or of any other part in the ſtomacke and body procured by winde, and is alſo effectuell againſt the venome of any poiſonfull creature, and is put therefore into counter-poiſons for that purpoſe, as alſo againſt the danger that commeth to them that have taken *Litharge*, it is alſo appointed among other things that ſerve for the cough: The leaves of *Parſley* eaten after Onions, Leekes, or *Garlick* taketh away the offensive ſmell of them, ſuppreſſeth the vapours that may offend cyther the head or the eyes: they uſe alſo to caſt the herbe into their Fiſh ponds if there be any ſicke among them to clenſe them. The diſtilled water of the herbe is a familiar medicine with nurſes, to give their children when they are wrung in the ſtomacke or belly with wind, which they call the frets, and is no leſſe available then the water of *Saxifrage* for that purpoſe, and is effectuell alſo for them that are of greater yeares. The leaves of *Parſley* laid to the eyes that are inflamed with heate or are ſwollen doth much helpe them, if it be uſed with bread or meale: and being laid to womens hard breaſts that come by the curding of their milke doth abate the hardneſſe quickly if it be fryed with butter and applyed, and doth alſo take away the blacke and blew ſpots or markes by bruiſes, falls, &c. the juice thereof dropped into the eares with a little wine eaſeth the paines. *Traqu* ſetteth downe an excellent medicine to helpe the Jaundies and Falling ſickneſſe, the Dropſie, and ſtone in *Keynes* or *Kidneyes* in this manner; Take ſaith he of the ſeeds of *Parſley*, *Fennell*, *Aniſe*, and *Carawayes*, of each an ounce, of the roots of *Parſley*, *Burnet*, *Saxifrage* and *Carawayes*, of each one ounce and a halfe: let the ſeeds be bruiſed and the rootes waſhed and cut ſmall; let them all lye in ſleepe in a pottle of white wine, and in the morning boyled in a cloſe earthen veſſell untill a third part or more be waſted, which being ſtrained and cleared, take foure ounces thereof at a time, morning and evening firſt and laſt, abſtaining from drinke for three houres after: this doth open the obſtructions of the Liver and Spleene and expelleth the Dropſie and Jaundies by Urine.

CHAP. XXVI.

Petroſelinum Macedonicum. Macedonian ſtone *Parſley*.

DIvers authors have ſet forth divers ſorts of herbes for the true ſtone *Parſley* of *Macedonia*, every one ſuppoſing that to be the right which they propoſe: of them all I intend not to entreate in this Chapter but ſeverally as they fall out. I will onely in this Chapter ſhew you that kinde, which now a dayes goeth currant under that name, and joyne thereto another which *Lugdunenſis* calleth *Petroſelinum Dalechampi*.

1. *Petroſelinum Macedonicum quibuſdam*.

The firſt ſuppoſed ſtone *Parſley* of *Macedonia*.

This *Parſley* of *Macedonia* hath divers ſtalkes of leaves next the ground, divided much like to the garden *Parſley*, but with greater, broader and rounder leaves, dented round about and in ſome places more deeply cut in or gaſhed, of a bright pale Greene colour, among which riſeth a ſhort thicke and ſomewhat hairy ſtalke about halfe a yard high or better, full of joynts and leaves, and branches at them that it ſeemeth a ſmall thicke buſh, bearing ſmall umbells of whitish flowers and ſmall rough darke grayiſh ſeede after them, ſomewhat like unto ordinary *Parſley* ſeede, eſpecially after the roughneſſe is rubbed from them, yet ſomewhat longer and darker, of an aromaticke and ſharpe taſte, and of an unflavoury bitterneſſe laſt of all like *cumin* ſeede: the roote is ſomewhat thicke ſhort and white perriſhing after it hath given ſeede, eſpecially with me in our country, but as I have heard not ſo in the warmer.

2. *Petroſelinum Macedonicum ſorte Dalechampi*.

The ſecond ſuppoſed ſtone *Parſley* of *Macedonia*.

This other *Parſley* taken to be the true *Parſley* of *Macedonia* by *Dalechamps* and not much gainſaid by *Columna*, hath a ſhort roote (a long roote ſaith *Columna* like ordinary *Parſley*) blacke on the outſide, with a tuft of haies at the head thereof, neither ſharpe nor ſweete which is wonderfull (but *Columna* ſaith it is both more ſharpe and bitter then the common *Parſley* roote) from whence riſeth up ſundry ſlender ſtalkes, with divers very thinne cut leaves thereon, all of them like the uppermoſt (and not the undermoſt) leaves of *Parſley*, or like unto *Dill* of a blew Greene colour, having three of the leaves alwayes ſet together at the end of the winged ſtalke as *Parſley* hath, and ſmelling ſo like unto *Parſley* as both *Lugdunenſis* and *Columna* doe ſay, that if any ſhould ſmell it when it is a little bruiſed that were blinde and did not ſee it, or having his ſight did not plainly perceive a difference in the leaves, hee would ſurely ſay it were very *Parſley*: at the toppes of the ſtalkes ſtand ſmall umbells of pale reddiſh or bluſh coloured flowers: after which follow ſmall ſeede like unto that of *Parſley*, ſome-

3. *Petroſelinum Macedonicum quibuſdam*.
The firſt ſuppoſed ſtone *Parſley* of *Macedonia*.

what

what blackish furrowed or guttered likē unto Cumin seedē, of a very sharpe taste almost burning the mouth, and of a sweete sent, but so bitter withall that it may well bee accounted the most bitter of all the kindes of Parsley.

The Place and Time.

The first is thought originally to come from Candy unto Venice where they have sowed it, and taking it to be the *Macedonia* Parsley, have used it in their dispensations for *Mithridatum* and *Thriaca Andromachi*, and have so much esteemed of it that they are loath to let any good seede come from them that might grow in any other place, besides the unreasonable price hath bene set upon it hath made it the more esteemed and sought after, yet I have had it growing in my garden and from it have gathered good store of seede in one year, but the first rootes perishing I could not get againe any to spring from the seede that I gathered, being as it should seeme not sufficient ripe, nor could I get any outlandish seede since to grow with me againe: the other groweth as *Lugdunensis* saith on the rockie hills of *Gratianopolis*, and as *Columna* saith on the hills of *Campoclaensis* and *Agnicoli*: they seede late with us.

The Names.

Fabius Columna hath much commented upon these two kindes of Parsley, concerning the first hee laboureth to prove it to be the second *Daucus* of *Dioscorides*, from the forme of the leaves thereof like unto *Apium agreste* as he compareth his second unto, and not to the seed as the qualities of sweetnesse, sharpenesse and heate might import: but in the description of this Parsley *Columna* assimilateth the leaves unto *Apium vulgare* (and not to *Apium agreste* as *Dioscorides* doth, which is that herbe *Sardinia* called *Apium rusus*, for other *Apium agreste* is not set downe by *Dioscorides* in any place that I can finde) our common Parsley which although it doe, yet other authors have as likely herbes as this, and as agreeable to the second *Daucus* of *Dioscorides* in all things I thinke, but because neither *Dioscorides* nor any other ancient author hath given any description of the leaves, &c. of the *Petroselinum Macedonicum* more then of the seede, and that *Pliny* saith it differeth in the kinde, it is a hard matter to determine any certaintie upon so short a relation, all being but conjectures that can be said in it, which may as likely misse as hit. Concerning the other he saith that the *Napoliens* where it groweth call it *Aucellum sylvestre*, and others *Saxifrage* from the effects. But that the first should be *Petroselinum Macedonicum*, *Matthiolus*, *Lobel*, *Dodonaeus*, *Castor Durantes*, *Lugdunensis* and *Tabernmontanus* doe all call it as it was in their time held to be, and still continue the same opinion and not undeservedly as I thinke, both the forme of the leaves flowers and seed, so nearely resembling the other kinds of *Selinon* or *Apium* declaring it, but especially the qualitie of the seed being answerable to the properties that *Galen* doth appropriate it. And for the other it also cometh neare unto that relation of *Pliny* concerning *Petroselinum*, that it was another kinde, differing from the other *Apia* Parsleys as this doth, in the forme of the leaves being finer cut then any of them, but somewhat more like in the sharpenesse and bitternesse of the seed, and therefore saith *Columna* it may be used in the want of a better in stead of the true *Petroselinum Macedonicum* or untill a truer may be had out of *Macedonia* or *Epirus*. But *Bauhinus* calleth it *Apium montanum folio tenuiore*.

The Vertues.
