THEATRUM BO-
TANICVM:

THE
THEATER OF PLANTS.
OR,
AN HERBALL OF
A
LARGE EXTENT:

Containing therein a more ample and
exact History and declaration of the Physicall Herbs
and Plants that are in other Authours, encreased by the accesse of
many hundreds of new, rare, and strange Plants from all the parts of
the world, with sundry Gummes, and other Physicall materi-
als, than hath beene hitherto published by any before; And
a most large demonstration of their Natures and Vertues.

Shewing vvithall the many errors, differences, and
oversights of sundry Authors that have formerly written of
them; and a certaine confidence, or most probable con-
jecture of the true and genuine Herbes
and Plants.

Distributed into sundry Classes or Tribes, for the
more easie knowledge of the many Herbes of one nature
and property, with the chiefe notes of Dr. Lobel, Dr. Bonham,
and others inserted therein.

Collected by the many yeares travaile, industry, and experience in this
subject, by *John Parkinson* Apothecary of *London*, and the
Kings Herbarist.

And Published by the Kings Majestyes especiall priviledge.

LONDON,
Printed by *Tho. Cotes.* 1640.

TO
THE KINGS MOST
EXCELLENT
MAIESTIE.

Aving by long paines and endeavours, composed this Manlike Worke of Herbes and Plants, Most gracious Sovereigne (as I formerly did a Feminine of Flowers, and presented it to the Queenes most excellent Majesty) I could doe no lesse then submissively lay it at your Majesties feet, to be approved or condemned, and

if thought fit and worthy a publique passage, to offer it on the Altar of your Majestyes many favours to me, to be commanded as well as commended unto all for their owne good. For as your Majesty is *Summus Pater patriæ*, the chiefe of your people under God, that not onely provideth for their soules health, that they may have the pure Word of God, whereby to live ever, wherein we justly claime the prerogative above any Nation under Heaven, and most devoutly praise God for the same, and desire religiously to live thereunder: but many wayes also for their bodily estates, by good and wholesome Lawes, that every one may live obediently and peaceably under their owne Vine and Figtree, and by protection, &c. And I doubt not of your Majesties further care of their bodies health, that such Workes as deliver approved remedies may be divulged, whereby they may both cure and prevent their diseases. Most properly therefore doth this Worke belong to your Majesties Patronage both to further and defend, that malevolent spirits should not dare to cast forth their venome or aspertions, to the prejudice of any well deserving, but that therby under God and good direction, all may live in health, as well as wealth, peace, and godlines, which God grant; and that this boldnesse may be pardoned to

Your Majestyes

Loyall Subject,

Servant, and Herbarist,

John Parkinson.

To the Reader.

He disastrous times, but much more wretched and per-verse men have so farre prevailed against my intended purpose, and promise, in exhibiting this Worke to the publicke view of all; that their extreame covetousnesse had well nigh deprived my Country of the fruition: But having at last, though long and with much adoe, broken through all obstacles opposing tandem prodiit in lucem. And although by the revolution of time it hath changed the note (that is from a Physicall Garden of Simples, to a Theater of Plants) yet not the nature, yea rather it hath gained the more matter by the overture, that intending to exclude many of those things that were not proper for it, this including a tot quot dici poterint. For finding in my Profession many slips and errors crept therein and incident thereto, it stirred up a desire in me, having rightly weighed them, seriously to consider how such a customary custome er vill be lest off and amended; yet not doubting of the effect, by the religious inclination of my Country when just reasons shall be shewed therefore, (although some delight to be obstinate, and because they were bred up in errors, they will not be wiser then their Fathers; but together live and dye in them, yea and condemne that light that others have, because they thinke their darkenesse better) both to avoyd and amend them: but to accomplish this, hic labor hoc opus erat, this was a taske lay somewhat heavy on me to undergoe, and tooke up no small time to finish, howsoever Master Iohnsons agility could easily wade through with it; and his younger yeares carry away greater burdens, for saith he, heavy taskes are worst borne by them that are least able, but his quicke speed may conclude with this adage Canis festinans coecos parit catullos: but how and in what sort it is done I leave to judicious censure, not to sharpe toothed and tongued selfe-gnawing envy, that will traduce all others workes to magnifie their owne; for mine owne part, although I boast not of great learning, such as might better have illustrated this worke, yet seeing my genius hath ever driven me to these studies, and my many yeares I thinke hath given me a little more experience, being so long verst thereof, I hope my time hath not bene ill spent if well taken both in the detection and direction, as also that it will prove more usefull and certaine in rem publicam Botanicam, then some others have gone before me, yet if any after me can without envy, having younger and clearer eyes and more settled judgement withall, amend ought that I have set amisse, or not fully declared, per me licet. I know that whosoever shall runne through so many Fields, Woods, Hills, &c. as this worke includeth, and shall trip at no time, hic erit mihi magnus Apollo, I will crowne him with such a Garland as neither his antecessors or successours ever did or shall weare; yet let not anyes presumptuous spirit malice or menace the Authour, if he have laid open some of their errors, as if they onely were free, or thinke themselves better then Theophrastus, Dioscorides, Galen, Pliny, &c. of the Ancients; or, Tragus, Matthioli, Clusius, Lobel, Bauhinus, of the Modernes, whose slips and errors I unfold likewise, who no doubt if now alive, being rightly informed, would rather embrace then spurne the stone that stroke them. One bout more with Momus in a Bookefellers shop, for more roome I must not overslip, that would teare this Worke in peeces because I have not followed Gerards method, in setting Letters to the severall vertues of the Plants, and must therefore be villified as if no other method were comparable thereto. I verily
say

say unto you that by the alteration you enjoy a double benefit, first in the bulke of the Booke which if that course had bene followed, would have enlarged it well neere halfe as much more; and made it the more unweldy, and likewise the dearer and never a whit the better: Secondly, in recompense of the time spent in looking for what you seek, you may read that which may be more helpfull and beneficiall to you: let Morrus chaps therefore be sowed up to burke no more. Among other the good uses this worke affordeth, this may be one, that it will helpe to correct the English names in all the Dictionaries to bee hereafter set forth, which have them in many ignorantly, in some contrary, in most devious, in very few true, whereby many hoping for helpe in their Dictionaries when an Herball was not at hand have bene frustrated, the blind leading the blind, which how profitable, I leave to every intelligent to consider. And lastly, although I goe not about to teach Doctors (who but little intended this practise, having enough to doe otherwayes, and yet it is as I may so say, the fundamentall part thereof, and approved by Galen in his censure of Simples, and Dioscorides Text) but to helpe their memories, and withall to shew them my judgement, that they mistake not one thing for another, or one mans plant for another, which I hope will well deserve their good liking: for the various conceites of men about Plants is for the most part according to their knowledge in them, and hath caused such mistakings and controversie, as are to be seene in their writings. Goe forth now therefore thou issue artificiall of mine, and supply the defect of a Naturall, to beare up thy Fathers name and memory to succeeding ages, and what in thee lyeth effect more good to thy Prince and Country then numerous of others, which often prove rather plagues then profits thereto, and feare not the face of thy fiercest foe: but say that while we live (although the course of the World is *Orientem semper adorare Solem non occidentem*) and *per multa discrimina rerum tendimus in Patriam supercoelestem*, if any oppose thee, or professe himselfe a Proctor for Bauhinus or any others slips, the lists shall be ready, and the controversie ex ore decided: if extinct let the judicious determine the matter. And because some may object I am somewhat too tart and quicke, my Apology to all is *Amicus mihi Plato, Amicus Seneca sed magis Amica mihi veritas*: Accept therefore in courtesie of his paines that hath onely intended it for your good, and if I have eyther slipped or overslipped, with a gentle hand amend it; so shall he still be

Thine in what he may,

JOHN PARKINSON,

Botanicus Regius.

Iohanni Parkinson Pharmacopœo Londinensi, Regis
Botanico primario. S. P.

Rodeat tandem & propitiâ Lucinâ vitali fruatur aurâ decennis illa foetura ingenii tui perspicacis, & laboris indefessi, in rimandis & aperiendis fecundæ Vestæ penetralibus, ejusque perlustranda superficie, ad Vegetabilis Regni firmamentum, cui par-tui neque ipsum *Dioscoridem* Anazarbæum pudeat obstetricari. Tam scitè, tam eleganter, tam enucleatè abs te descripta depic-taque omnia, quæ in hunc usque diem, Rei herbariæ stu-diosis innotuerunt, ut habeat abundè tua *Britannia* unde de te possit jure gloriari : In cujus opulentissimi, amoenissimi, fertilissimi regni grande decus, Mithrida-tis (maximi sua ætate Regûm) curiosam circa materiam medicam sedulitatem, Evacis Regis Arabûm, Cratevæ, Dyonyssii, Metrodori, Macri & cæterorum qui simplicium notitiâ cluerunt olim dotes eximias, cum neotericorum artificiosâ In-dagine, in unum coegisti fasciculum, daris quidem immenso disquisitionis & ob-servationum Oceano limitibus, tam laxis tamen & sequacibus, ut ad instructis-simi hujus gazophylacii supplementum, nova congeries granatim possit indies mag-na cum facilitate accrescere. Botanici ut plurimum meri sunt nomen clatores, qui præclarè se rem gessisse arbitrantur, si perlustratis variis plagis, nomina repertorum simplicium, & forsân eorum Icones redigant in volumen, quo operæ pretio arti fa-tis cautum existimant. Tu verò non prætermisâ externâ plantarum specie, earum corpora penetras medullitûs, & singularum virtutes in publicam salutem, & morta-lium solatium tam graphicè pandis, ut deinceps populares tui *Angli* (gens ad pa-cem, bellum, scientias, artes, ad omnia apta, nata) Thesauri naturæ ditissimam, mor-bisque tutò debellandis utilissimam partem, cultu donatam vernaculo, (historiam nempe Vegetabilium, virtutum assignatione nobilitatam) penitissimè nosse, atque hæc *Scæv. xlii. egs.* nudas exosculari, & sibi ipsis applicare valeant. Circa operis tui laudes volubili vel bullatâ oratione expatiari injuriosum duco : quippe Vino ven-dibili non est opus suspensâ hederâ. Suum sibi pariat Liber tuus encomium, quem nemo sanæ mentis, operum naturæ peritus, sine Authoris singulari commendati-one unquam perlecturus est. Siquis exoritur vel Momus vel Zoilus, qui Male-dicendi prurigine, aut insanabili cacoethe laborans, tua carpere audeat, ille malis avibus aggressus dormientem Herculem, cum Achemone & Passalo victus vinc-tus-que, ex victoris clavâ æternum pendeat. Imbellium catellorum inanes latratus spernunt generosi molossi; Non si se ruperit ille Par erit. Interim tu calumnia-rum securus æque & contemptor, In amplificando tuo Theatro pergitto quamdiu vixeris. Hanc imponit tibi provinciam, ejusque poscit foenus *REX CAROLVS* Dominus noster Magnæ *Britaniæ* Monarcha, cui placuit nuperrime honorificum tibi dare

dare titulum Botanici Regii Primarii, virtuti tuæ sanè non indebitum, quo fit ut in Medicam Aulæ familiam accitus, tenearis opus tuum Serenissimo Principi dedicare, cum præfatione religiosa Caii Valgii ad Divum Augustum (cui etiam lucubrationes suas botanicas offerebat illustris & eruditione spectatus vir) Vt omnibus malis humanis (præsertim fortunatarum Insularum quibus sæliciter imperat :) semper medicetur ejus Majestas : Descende audacter in arenam, in qua ut diutissime bono publico exercearis, & longissima precum vota pro Rege, Patria, probis omnibus nuncupes & fundas, atque alacriter & strenue in Botanica defudes palæstrâ, opto tibi si non Artephii Philosophi, millenarii dicti, saltem nobilis Rizotomi antiqui, Antonii Castoris (Plinio noti) sæculum, qui centesimum annum excessit, nullum corporis malum expertus, ac ne ætate quidem memoria aut vigore concussis.

Vale ex meo Museo Londini Idibus Aprilis Anno salutis, 1640.

THEODORVS de MAYERNE,
Eques auratus, Baro Albouæ, in Aula

Regiarum Majestatum

Medicus Cubicularius.

Digniffimo

Dignissimo viro Io. Parkinsono Pharnacopæo exper- tissimo, & Botanico Regio solertissimo.

Adio & gaudeo (Charissime Parkinsone) lucubrationes tuas Botanicas nunc tandem prodire in lucem, seu verius in Theatru: scripsit quide ab incude tua quam optabas prodeunt tamen hac verna tempestate opportunè cum Plantæ ipsæ hybernis compedibus expeditæ emergunt e terra, & novis vestibus amicticæ quasi summo congratulandi desiderio obviam libro tuo veniunt, fallor si quid in hoc genere viderim plenius aut limatius: nam quicquid purioris succi habent in suis lausculis veteres & novi, nostrates & transmarini Scriptores Herbarii totum ad hoc opus melluosissimum videris exuuisse. Qui jampridem in lucem proditæ Paradisus tuus aut Florilegium, totus erat conflatu ex veneribus et Gratiis effigies quædam erat videns, ludens, læseriens naturæ, serpsit quasi aut corollæ ex omni florū genere contexta, una verbuli vera erat Polyambica, Deabus medicina Hygie & Panacea dedicata: Sed istud iuuem Theatrum tanquam secundæ seges, magis frugibus quam floribus luxuriat, ipsius Æsculapii patrocinio dignius, & ad usus medicos accommodatius: hic enim medicam oconomiam instruis omnifario simplicium apparatus, tanquam fidelissimus medicina minister totam terræ opulentiam congeris in ærarium pharmaceuticam. Hic non speciosos terræ tapetes & aulae explicas ad ornatum & Majestatem universi, sed commodiora ejus utensilia ad solatium & subsidium generis humani, pro famelicis alimenta, pro ægrotis pharmaca, pro languentibus cardiaca, pro singulis morbis singula remedia ex secundo terræ sinu & gremio depromis: Ex sinu inquam terræ & gremio, non ex intima terræ visceribus & medullis, Mineralia siquidem in profundis terræ recessibus recondit, & procul a liberorum conspectu abscondit sagacissima natura parens, tanquæ cultellos aut gladios tenellis illorū corporibus nocivos: Vegetabilia vero tanquam terræ manus & ubera in summa ejus cute & exima superficie nuda propalavit: nos enim non modo dum sumus embryones, sed viri & senes adhuc vivimus vitam plantæ, & indes nutri-mur a terræ umbilico. Quæ vitam habent cedunt viventibus salicis in medicinam, sola in alimendum, quia blanda quidam natura familiaritate sensim dilabimur in eorum viscera, & insinuamur se in eorum sanguinem, illis quasi cognata sanguine: mineralia vero ipsa cum sint vitæ expertia, vitam incident, mortem inferunt viventibus, nisi innata illorum malitia in fornacibus Vulcani novis Spagyricorum artibus edomeatur. Plantarum cum hominibus tanta est similitudo, ut hominem plantam inversam Divinus Plato nuncupaverit, mineralium quia prorsus nulla est cum humano corpore similitudo, nulla erit (ut loquuntur Scholæ) assimilatio. Fuit aliquando Mide in aurum fabulosa metamorphosis, at auri in Asidam ne potearum aliquis somniavit. Neque vero solam genericam societatem ineunt plantæ cum hominibus, quia ambo in una viventium familia, sed illarum plurimæ arctiorem vendicant cum humanis partibus sympathiam & analogiam, unde aliæ capiti, aliæ oculis, aliæ pulmonibus, aliæ jecori, aliæ leni specificam dicarum operam, & ab illis quibus famulantur partibus nomenclaturæ suas derivarunt, neque nuda tantum nomina earum ferunt, sed insignia, quibus ut magnarum famuli discriminantur: nam (si Hermericis credimus) signaturas physiognomicas plantis inussit summus naturæ parens, & ipsis quasi toti emblemata & characteres insculpsit, non modo ocularum suarum virium indices & notas, sed parium quibus inferiunt figuræ, & expressas imagines, incundissima similitudine referentes, quas Quercetæus & Crollius curiosius delinearunt: gessit calamus in hoc campo liberius spatari, sed ne cancellos suos meæ transilias Epistola, revoco me ad Theatrum tuum, in quo appareat mira genii ingenique tui in re Botanica felicitas, labor indefessus, nec horarum modo sed (quod pudet dicere) minimorum tuorum sumptus non mediocres: Vereor mi Parkinsone, te non posse cum Matthiolo gloriari, te Mæcenates habuisse Imperatores, Reges, Archiduces, Cardinales, Episcopos, (ipsius uior verbis) qui auro argentoque hos conatos tuos reverint cumulati, Credo nullos imbres aureos horum tuum irrigasse, ut potius ut bono publico inservires privata defuisti, ut liberius vacares studio, Pharmacopolum deseruisti, spretoque villioris lucelli aucupio totus in hortulo tuo consenses: quid dixi, te senescere & nullane in Paradiso tuo arbor vitæ, quæ senectutem tuam retardet, nullane in Theatro tuo herbe Balsamica, ne tibi nativi restant aritres, ex quibus Medea suum antidotum composuit, magnum illud secretum, quo Æsonem ultimo confectum senio restituit juvenituti? si illarum notitia infelicitas perierit, at nostrates Iberbe quæ quotannis repullulant, revirescunt, veflorescunt, parem si non ætati tuæ, famæ quidem tuæ gratiam indulgent, & perenni gratitudine semper spirabunt sacrum nominis tui auram: mihi cum talia desunt Pharmaca, non deerunt vota, ut diu vixas & vales.

Tuus

Datum Calend
Aprilis. 1640.

Simon Baskervill
Eques Auratus. D. M.
To

To Englands chiefeft Herbarift, Master

John Parkinson.

Worthy Sir,

Have given (as was due) many thanks to my learned good friend Dr. Bainbridge, for communicating to me the sight and perusal of your chargeable, industrious, judicious, usefull, *Herculean Botanicall* labours. The Commonwealth of learning, particularly the Tribe of Physitians, Apothecaries, Chirurgians, the Court of Nobles, and Gentles, of all who love knowledge, delight, and the honour and good of their Country, owe thanks to you, a Benefactour to the publique, to your Nation, to many millions of particular persons, to the present and succeeding ages. A Triumphall evergreen Lawrell crowne is due to you, for mastering such difficulties, for conquering the great enemyes of a civill World, Ignorance and Barbarisme, for saving so many Citizens of your owne Country, from danger, diseases, destruction, by your carefull understanding directions, for proper fit remedies, in such a ratioll pleasing way. *Oxford* and *England* are happy in the foundation of a specious illustrious physicke Garden, compleately beautifully walled, and gated, now in levelling, and planting, with the charges and expences of thousands by the many wayes Honourable Earle of *Danby*, the furnishing and enriching whereof, and of many a glorious *Tempe*, withall usefull delightfull plants, will be the better expedited by your painefull happy satisfying Worke.

THO. CLAYTON, His Majesties professor of Physicke, Oxon.

To the excellent Herbarist Mr. John Parkinson.

Sir,

Am a stranger to your selfe, but not to your learned, and elaborate volumes. I have with delight, and admiration surveyed your *Theatrum Botanicum*, a specious, and statefully Fabrique, collected and composed with excessive paines, and charges, exquisite Art, and Iudgement: wherein, may at once be seene, whatsoever (worth th' observing) lyeth dispersed in the severall Botanique monuments of former Ages, and the present: It being indeed, a select Desolation of them all: enriched, and beautified with new discoveries (at home, and abroad, so far as both th' Indies) of many rare Plants, Herbes, and Flowers. It is a curious pourtrait, and description of th' Earths flowred mantle, the Botanique Pandects, and the Herbarists Oracle, a rich Magazin of soveraigne Medicines, physicall experiments, and other rarities. And which I may not omit. It is (nor without th' influence of some benigne Constellation) an Auspicious designe of our *Oxford* Garden, which being (by the Munsificence of the Honorable Founder) once finished, will be *οὐρανίου πανήγυρις*, th' eyes Rendez-vous, *ἡ ἑλίου* in of most delightfull, and ravishing objects; another Paradise. In a word, this Theater, is without Parallel, the most compleate, and absolute Worke. (in this kinde) yet knowne unto the world: and will be a perpetuall Monument of your Name, Art, and Industry. Such (Sir) is your merit, and the vote of one, that is sincerely,

Your affectionate friend,
JOHN BAINBRIDGE,
Doctor of Physique, and
Professor of Astronomy, Oxon.

(2)

To

To the Worthy Apothecary and Herbarist

Master IOHN PARKINSON.

Worthy Sir,
 You have built us a Botanicke Theater; with such excellent skill and advantage to the Spectator; that at one view he commands the prospect of both Hemispheres; and all their vegetables in the pride of beauty: ranged in their proper orders, decking the Hills, Plaines, Valleyes, Medowes, Woods, and Barkes, with such a world of shapes and colours, so delightfull to the eye, so winning upon the ratiō all Soule which feeds on rarities! that we cannot hope for a more compleate Paradise upon earth, till Nature have found out a new stocke for more variety; what can be added to this I see not; nor is it (I beleeeve) yet knowne to the best of Artists that have made search.

Ira Censuit.

Io. Speed. Med. D. Oxon.

Elogium in Theatrum Botanicum

Iohannis Parkinsoni

NE amplius nobis indet Cratævam, Andream, Dioscoridem
 Græcia, sua, suosque tantum mirari solita;
 Ecce, ex ultimo Occidente,
 Et penitus toto divisis orbe Britannis,
 Exoritur nobis jam diu ex optatus
 Sol alter Botanicorum,
 Qui alios omnes luce sua præstrinxit,
 Et, tanquam nanus humeris giganteis sublatus,
 Plus aliis vidit:
 Nec id orbi literato invidet,
 Meliore omnia ordine, methodoque accuratiore digessit,
 Quæque alii striclim, sparsumque, in unum congestis,
 Tibique, Lector, uno intuitu
 Spectanda proposuit,
 Itaque disposuit,
 Ut, quæ mole usuque maxima sint,
 Ordine & methodo quasi modica allubescant.
 Sileat ætas avorum, nostraque,
 Tragum, Matthiolum, Fuchsium, Gesnerum, Dodonæum, Lobelium,
 Alios item quocumque, qualescunque;
 Vnus instar omnium Parkinsonus,
 Columna Britannicus, cui vere inscribas licet
 Nil ultra.

In quem felice & perquam rara interuenerunt
 Tam veterum, quam recentium omnium Botanicorum animium in unum commigrasse iures.
 Hoc operi laudis vœffigal,
 Autori amicitiae tesseram,
 Et cultus testimonium,
 Non tam amoris, quam veritati obsequens
 Persolvit. L.M.

Iohannes Mauricius.

Aliud.

Salve, Salve, Venerande Senex,
Qui genius, corculum, medulla, corypheus Botanicorum cluis,
Quem natura, tuusque genius
In hæc studia impulit,
Imo vi traxit,
Industria, laborque indefessus perfectum dedit.
Nec vero tibi, musisque solis caneres,
Sed nostræ simul, posteræque ætati pie proficeres,
Opus hoc doctum, Jupiter & laboriosum
Summo studio labæque improbo dedolasti;
Spretis interim & insuper habitis vitæ omnibus fere delinimentis,
Tanquam Vlysses alter;
Obstructis anribus ad Syrenum cantum,
Scyllam Charybdinque voluptatis lucrique preternavigasti,
Quæ vere sunt mortalium, in hoc vitæ solo,
Scopuli, Syrtes, Symplegades,
Ut totum te hisce studiis immergeres.
Tanquam Alexander alter,
Controversiarum Botanicarum nodos plusquam Gordios
Aut feliciter enodasti,
Aut fortiter saltem dissectuisti.
Hinc merito Divus volitas per ora virum.
J, perge, perge Floræ supreme mysta
De re literaria bene porro mereri,
Studia hæc ad metam evehere,
Perenne nomen, decusque tuum ultra supraque invidiam provehere,
Qui priscis palmam eripuisti
Invidiam æqualium & posterorum haut facile vitabis
De opere, ut de Demosthène olim antiquitas,
Quo longius eo melius jure dixerim:
Cujus unica laus admiratio,
Idque tui maximum Elogium.
Amico de his studijs, de Patria, de se B M.
D. D. C. L. M.

Johannes Mauritius.

To my good Friend Mr. Iohn Parkinson.

MY Age of Verse is out, what then? shall I
Be silent, and not open in this cry
And generall applause? that have more cause
Then some that crowded in; nor shall the lawes
Of friendship draw me from the rigide way
Of bare and naked truth, and force me say,
In Court civility, more then what I thinke.
Such compliment is on the very brinke
Of flattery, and destroyes the very soule
And essence of true friendship, makes't a foule
Commerce of mutuall sordid ends, which is
The *Panacea* of humane miseries.
But whether now, my Muse? 'twas not my end
To treat of friendship, but to praise a friend.
This weary worke of thy unwearyed braine
Shall doe't for me, and save my further paine.
But soft, that's onely for the Authour, shall
I give nought to the Worke, which gives thee all
Whatsoere th' hast here from us, because 'tis such;
As like good wine, it doth require no bush?
It were indeed not needfull, if that all
Would enter in and taste, without a call,
And gentle invitation; as in trade
Chapmen passe by, nor enter, if not made
And ply'd, yea rudely, with a violent hand.
To such thy Customers, which come and stand,
As 'twere at gaze; I promise here good ware,
And cheape: all trees, all shrubs, all herbes, that are
In the voluminous *Discorides*,
Theophrastus, *Galen*, or *Hipocrates*;
Craterus or th' acute *Arabians*, who
Retriv'd this Art first, and all th' other too,
After the generall Deluge of the *Goths*,
And swarme of other barbarous Nations, moths,
And cankers of good Letters: nor here wants
Whatsoere the diligent Modernes have of Plants,
Omitted by the ancients, out of which
Gleanings thou here hast made a pretty, rich,
And fruitfull harvest; neither dost thou spare
To insert whatsoere the other world doth beare.
Nor temperaments, or vertues dost thou misse,
Names, faculties, or properties; and this

With such a perspicuity the while,
 Order, and method, that it does beguile
 The readers paines so charmingly, that he
 Thinks it compendious, though so vast it be;
 And calls for *London* measure, and he has't,
 And I my purpose too, saying this at last:
 If any in this subject, seeke more now,
 Nature must add to what th' hast done; not thou:

John Morris.

Ad Amplissimum doctissimum virum D.
Parkinsonium, S.R. Magnæ Britanniae Botano-
 graphum, quum absolutissimum Herba-
 rium suum ederet.

Inter res, quibus in diuina potentia ludis
 Mira modis, merito primas quis dixerit herbas.
 Quis varias formas, vires, discrimina, causas,
 Explicet aut cunctos usus distinguere possit?
 Tentatum multis, quorum monumenta supersunt,
 Sudarunt Graij atque Itali, Germania, Galli
 Angligenæ, Belgæ; nullis labor improbus illo
 Gentibus intactus: Lucem * Parkinsonius adfert
 Ingentem, posset jam persequisse videri
 In quæis deficiunt alij, paucissima restant.
 Quid tibi pro meritis tantis, Vir magne, precemur?
 Alma Ceres tibi farræ dicat, tibi dulcia vina
 Bacchus, & omnimodos fructus Pomona ministret:
 Cætera, quæ spondet jam Nomen, Rex tuus, addet,
 Posteritas famam, quantam meruisse fatetur;

* Parkinsonius.

 I. D. Leer
 Lugduni Batavorum.

To my old Friend and the Kings Herbarist

Mr. Ioh³ Parkinson, in praise of his

Theatrum Botanicum

Hecbus hath fifty times lash't through the signes,
Since thou intend'st this Iubile of lines.
And now 'tis extant; and shall swiftly scorne
Through darke oblivion to the worlds last houre.

From fragrant ashes of Antiquitie
Phoenix-like sprung, this is the last shall dye.
And if old Dodon were alive againe,
Heere would be wonder, hence more knowledge gaine.
Caspar th' Helvetian, and Mathiolus
The Tuscan, by thy Booke shall vaile to us.
Heere's more then growes in the Botavian ground;
And more then's in Patavian Garden found:
Or vernant Oxfords Plat neere Rivers side;
By which brave Maudlens Charwell still shall glide.
Montpeliers flow'ry meadowes yeeld to thee;
More in thy leaves, then on their beds we see.
Yet thy rich Worke which we peruse, and use,
Th' unwary vulgar rashly may abuse.
This was not thy intent: yet thy good paines
Prostitutes noble Physique unto Swaines.
Yet still enjoy thy Ground, and we thy Booke,
On which Posterity shall ever looke;
Lodge in the high-bed; and at thy beds feete
Thy Planes in their moist pallets all shall meete.
From them to Thee, I will transplant that name,
Semper vicum. Adieu for such must bee thy fame.

Keepe thy Hesperides; may thy herbes with thee
Still bloome; by Prester never blasted bee.
And seeing by thy hands the day is wonne,
No night of Age shall cloude bright Parke-in-sunne.

Oxonienfis, 1625

The Classes or Tribes contained in this
Woꝛke, are these:

- 1 **P**lantæ Odorata. *Sweete smelling Plants.*
  - 2 Cathartica sive Purgantes. *Purging Plants.*
  - 3 Venenosa, Narcotica, Nociva & Alexipharmaca.
Venenous, Sleepy, and Hurtfull Plants, and their Counterpoysons.
  - 4 Saxifraga Plantæ, Nephritica sive Calculum frangentes. *Saxifrages,
or Breakestone Plants.*
  - 5 Plantæ Vulneraria & Ferruminantes, id est, Consolidantes.
Vulnerary or Wound Herbes.
  - 6 Plantæ Refrigerantes & Intubacea. *Cooling and Succory-like Herbes.*
  - 7 Plantæ Calida & Acres. *Hot and sharpe biting Plants.*
  - 8 Umbellifera. *Umbelliferous Plants.*
  - 9 Cardui & Spinosa Plantæ. *Thistles and Thorny Plants.*
  - 10 Filices & Herba Capillares. *Fearnes and Capillary Herbes.*
  - 11 Legumina. *Pulses.*
  - 12 Cerealia. *Cornes.*
  - 13 Gramina, Lunci & Arundines. *Grasses, Rushes and Reedes.*
  14. Plantæ Paludosa Aquatica & Marina, Musci & Fungi.
Marsh, Water and Sea Plants, and Mosses, and Mushromes.
  - 15 Miscelanea. *The Vnordered Tribe.*
  - 16 Arbores & Frutices. *Trees and Shrubbes.*
  - 17 Exotica & Peregrina Plantæ. *Strange and Outlandish Plants.*
- Theatro Botanico Appendix. *An Appendix to the Theater of Plants.*

PLAN.

PLATE

THEATRUM BOTANICVM: PLANTÆ ODORATÆ. CLASSIS PRIMA.

Sweete smelling Herbes. The first Tribe.

FROM a Paradise of pleasant Flowers, I am fallen (*Adam* like) to a world of profitable Herbes and Plants, (*Vt Omne tulit punctum qui miscuit utile dulci*) namely those Plants that are frequently used to helpe the diseases of our bodies: In which world or sea of Simples, I have propounded to my selfe this methode; to distribute them into sundry *Classes* or *Tribes*, that so as neere as may be, and is most convenient, shall be sorted out those severall Herbes and Plants that are fit for each *Tribe*, that so they may be found in one place together: and first of the *Hyssops*.

Hyssopus. Hysope. CHAP. I.

There are sundry sorts of Hyssops, whereof the most are unknowne to many: whose descriptions, names, and properties shall follow.

1. *Hyssopus Vulgaris*. Common garden Hysope

The common garden Hysope is so well knowne to all that have a garden, or that have beene in a garden, that I shall but seeme *actum agere*, to bestow my time in describing it to be a final busny plant, that riseth up more than a foot high; with many woody branches, but tender; at the tops whereof are set at certaine distances, sundry small long and narrow greene leaves: at the tops of the stalkes stand blewish purple gaping flowers, in spiked heads one rowe above another: after which follow the seed, which is small and blackish: the roote is somewhat woody with many threddy strings: the whole plant is of a strong sweete sent.

2. 3. *Hyssopus folijs niveis*: or *folijs aureis*. White Hysope, and golden or yellow Hysope.

These two sorts of Hysope are both of the same kinde with the common Hysope, but differre onely in the party colouring of the leaves; the white having diverse leaves parted white and greene in the midst, and some all or most part white, and some wholly greene, or with some stripes in the greene: for all these sorts are seene together upon one Plant. The golden or yellow sort, hath the uppermost leaves usually wholly yellow in the summer time, parted with greene; the lower leaves often abiding without discolouring.

4. *Hyssopus folijs cineris*. Russet Hysope.

This Russet Hysope also differeth from the former in no other chiefe matter, than in the colour of the leaves, which are of a grayish or ash colour, which some call Russet; this is likely to be that sort that *B. robinus* saith was sent him from England,

5. *Hyssopus sarcocolla densis*. Double Hysope.

This Hysope groweth lower, and thicker set with slender and not so woody branches, bending somewhat downewards, and

1. *Hyssopus vulgaris*.
Common garden Hysope.

2. 3. *Hyssopus versicolor*.
Party coloured Hysope.

much

much more thicke set with leaves of a darke Greene colour : in the flower and other things it differeth not from the first.

6. *Hyssopus latifolia*, Broade-leaved Hysope.

This also differeth not from the first here specified, but in having larger and broader Greene leaves, upon more woody stalkes, keeping forme and substance.

6. *Hyssopus latifolia*.
Broad leaved Hysope.

7. *Hyssopus foliis crenatis*.
Jagged or dented Hysope.

7. *Hyssopus foliis crenatis*, Jagged or dented Hysope.

This difference of the dented leaves, maketh me to set it downe as another species hereof, as others have done.

8. *Hyssopus moschata vel de Cilissis*, Musked Hysope.

Gesner in *Hortis Germanicæ* remembereth this Hysope to differ nothing from the ordinary Hysope, but in the sent, which is so gratus and pleasant, that it commeth neereft to the sent of Muske.

9. *Hyssopus Arabum floribus rubris vel albis*.

White or red flowred Hysope.

The red or white flowred Hysope differ but a little from the garden sort, yet are distinguished from it, in that they both doe usually beare red or white flowers, all on one side of the spike, yet continue not constant in that forme, but change into the forme of the ordinary kinde.

10. *Hyssopus minor sive Hispanica*, Dwarf Spanish Hysope.

This Spanish kinde is a smaller and lower sort, whose branches rise not so high as the garden Hysope, but bend a little downwards, the leaves also being smaller and thicker, and of a sadder Greene colour, and the heads or spikes are also shorter, but the flowers are purple like the garden sort. *Lobel* calleth this, *Hyssopus parva angustis folijs*.

11. *Hyssopus Coronata sive Comosa Clusij*, Tufted Hysope.

Tufted Hysope is in leaves, flowers, and manner of growing somewhat like the common garden kinde, but a little smaller and lower, the leaves being of a paler Greene colour, and the top branches spreading a little broader, have shorter spikes of leaves and flowers growing as it were in tuftes, which hath caused the name, and noted it for a difference.

12. *Hyssopus folijs crispis*, Curled Hysope.

Curled Hysope hath the leaves curled or crampled at the edge, that each leaf seemeth to be composed of many : and herein consisteth the chiefeft difference.

9. *Hyssopus Arabum*.

10 *Hyssopus minor sive Hispanica*.

White or red flowred Hyf. Dwarf Spanish Hysope.

11. *Hyssopus Coronata sive Comosa Clusij*. Tufted Hysope.

13. *Hyssopus*

13. *Hyssopus montana*. Mountaine wilde Hyssope.

Mountaine or wilde Hyssope is very like unto the garden kinde, for the manner of growing: but that the leaves which are not so many at a joyn, are somewhat harder and rougher, and a little hairie, and somewhat narrower also, which (as *Matthiolus* saith) being brought into gardens, and there cherished; will by time put off that roughnesse, and become more milde and gentle, the taste whereof is much more bitter, and nothing so hot or sweete as the common kinde: the flowers and feedes are like the garden sort, both for forme and colour.

14. *Hyssopus angustifolia spicata*. Narrow leaved Hyssope.

Narrow leaved Hyssope is a fine kinde, and hath many slender hard stalkes, whereon are set at distances, as in the common Hyssope, many small Greene leaves, but longer and narrower than they, and ending in a longer point: the flowers likewise grow at several distances, as it were in roundles, almost from the middle of the stalke up to the topes, of a blewish purple colour like the ordinary kinde, but much smaller and so is the feede also: the branches hereof will take roote and grow being laid into the ground, the roote spreading much in the earth.

15. *Hyssopus folijs Origani*. Round leaved Hyssope.14 *Hyssopus angustifolia spicata*. Narrow leaved Hyssope.15. *Hyssopus folijs origani*. Round leaved Hyssope.

This Hyssope hath divers hard woody stalkes, whereon grow sundry small and almost round leaves, one against another, but pointed at the endes, the heads or spikes of flowers are like unto the common sort, of a blewish purple colour; the sent also differeth little from it.

Gerard hath set forth an Hyssope with the leaves of *Nummularia*, *Alonyworte*, which peradventure might bee this kinde, yet I never saw such an one with him.

The Place.

Pena saith that our common Hyssope, groweth on the hills of *Romania* about *Verona*, and neere unto Mount *Raldus*: the dwarfe kinde in *Spain*, and the mountaine wilde kind, on the hills in many places of *Germany*, and as *Matthiolus* saith, on the hill *Salvatin* in the Country of *Goritia*: the rest, with these also when they may be gotten, are nourished up in the gardens of the curious.

The Time.

They doe all flower in the summer moneths of *June* and *July*, and their feede is ripe in the beginning or middle of *August*.

The Names.

It is called in *Greece* *ὑσσωπός*, sic dicti putant quasi *ὑσσωπός* (pro *ὑσσωπός*) *ὑσσωπός*, quia super vulnus affunditur, in *Latine* *Hyssopus* & *Hyssopum*, of the *Arabians* *Cyfe*, *Isfa* and *Javes*, of the *Italians* and *Spaniards* *Hissopo*, of the *French* *Hissope*, of the *Germanes* *Isp*, of the *Dutch* *Ispen*, and of us *Hyssope*. The names of every one of them, are sufficiently expressed in the titles and descriptions of them.

But there is a great controversie among our later writers, what hearbe should be the true Hyssope of *Dioscorides*, and other the *Greece* authors; for that our common Hyssope is not it, but is the true Hyssope of the *Arabians*, as all doe acknowledge except *Matthiolus*, who doth earnestly contend, that our garden Hyssope is the same of *Dioscorides*, whose arguments are too weak, to perswade any to be of his opinion, for the description of *Dioscorides* his Hyssope hath no face or true resemblance with ours, his bearing tufted heads like *Chrysocome* or *Goldsilocks*, as he compareth it, and ours in spikes: the leaves also of his are like unto the *Origanum Onitis*, which are somewhat round like *Marjerome*, as you may see heere shortly after, and are not narrow and long, as those of our Hyssope are: therefore *Lugdunensis* setteth forth a round leaved Hyssope, which he taketh to be the true Hyssope of *Dioscorides*, but neither are the leaves thereof whitish, as those of *Onitis*, nor doe the heads much differ from the common Hyssope: *Label* also propoundeth another, that is our pot *Marjerome* to be the right, in that it hath roundish leaves like *Origanum* and tufted heads of flowers that are spread abroad like it also, this he saith, is the likeliest hearbe, comming nearest unto the true kinde, unlesse as he saith, it may be referred unto an *Origanum*: but *Fabius Columna* confuteth that of *Label* and *Pena*, as well for that the tufted heads, are more like unto wilde *Marjerome*, then unto *Chrysocome*, or garden *Marjerome*, as *Cratoeris*, *Serapio*, *Isuack*, *Mesies* and others doe compare them, as also that the leaves of *Dioscorides* his Hyssope, are whitish like unto *Origanum Onitis* which those of *Labels* *Marjerome* is not: besides this, that it is a kitchen hearbe, fit for meate and sawce, and so is our ordinary Hyssope also, and not a Physicke hearbe as *Dioscorides* maketh his to be: and lastly, that neither *Label* his *Marjerome*, nor yet our Hyssope, are equall in the properties unto that of *Dioscorides* and others, howsoever it is usually received in the feede thereof: thus saith *Fabius Columna*, and therefore by many reasons would perswade us to beleve, that our ordinary *Polium montanum* is the true Hyssope, as well for that the leaves are white, and the heades of flowers like unto *Origanum* and *Chrysocome*, as he saith, as also for that his vertues and properties by the bitterness thereof are more effectual in all the diseases, whereunto *Pliny* applies his Hyssope, which are not remembered of *Dioscorides*; and that although *Dioscorides* maketh no bitterness in his Hyssope, yet *Serapio* doth as he saith: thus much *Columna*. But let me say, seeing he himself saith, that our *Polium* is answerable in all the parts thereof, unto the *Polium* of the ancients, I see no good reason, why it should be their Hyssope also, and therefore I thinke, we may as well refuse his *Polium*, as he doth *Labels* *Marjerome*. Others also would make *Gratiola* to be the true Hyssope, which hath lesse likelihood than any of the former. *Bauhinus* in his *Pinax* would make our ordinary *Rosemary*, to be the Hyssope of the *Hebrewes*, taking peradventure his ground from the Scripture, in *Saint Johns* Gospell, the 19. chap. and 29. verse, where the Souldiers bound a sponge wet in vinegar, to the end of an Hyssope stalke, to put it

Hyssopus folijs Nummularia.

to our Savjours mouth when he was on the Crosse, in that our ordinary Hysope hath not so long a stalk, as might reach up so high: but both the Evangelists, *Matthew* and *Marke* say it was a reede, and it may bee that the Hysope stalk was bound thereunto, for *Saint Iohn* as an eye witness of what was done, calleth it as before: Now it is not likely that the Iewes had an other Hysope, divers both from the Greekes & Arabians; but rather that their Hysope was the same of the *Arabians*, being their neere neighbors, and as it should seeme, was so familiar to their Countrey, that it grew on muddie-walles, as the Scripture saith that *Salomon* spake of it: which I verily thinke *Rosemary* doth not. But Hysope is often mentioned in the Scripture, to bee used in the Iewes ceremonies, which was not without materiall signification; for as *Saint Paul* saith, all was done among them in types and figures; and to bee rightly understood and well applied, were worthe of much observation and good use, Now although the true Hysope of *Dioscorides*, and the other Greekes, is not yet certainly knowne, yet assuredly this which is knowne, and generally received, may safely be used in the stead thereof, untill the true Hysope may be knowne.

The Vertues.

Dioscorides saith, that Hysope boyled with Rue and Hony, and drunke doth helpe those that are troubled with Coughes, shortnesse of breath, wheezing, and rheumaticke distillations upon the lungs; taken also with Oxymel, it purgeth grosse humours by the stoole, and with hony killeth the wormes in the belly, and taken also with flesh or new figges bruised, helpeth to loosen the belly, but mote forcibly, if the roote of the Flower-de-luce and Cresses (yet some copies in stead of *Cardamon* have *Cardamomum*, which I never knew put into any purging medicine in our times, and *Maicer* his verse doth intimate Cresses thus; *Cardama si jungat his solves fortius altum*) be added thereunto: it amendeth and cheriseth the native colour of the body, spoyled by the yellow-jaundise, helpeth the dropse and the spleene, if it be taken with figges and nitre: being boyled with wine, it is good to wash inflammations, it taketh away the blew and blacke spots, and markes that come by strokes, bruises, or falls; being applied with warme water; it is also an excellent medicine for those, that are troubled with the Quinsie, or swelling in the throat, to wash and gargle it, being boyled with Figges; it helpeth the tooth-ach, being boyled in vinegar and gargled therewith; the hot vapours of the decoction, taken by a funnell in at the eares, easeth the inflammations of them, *Mefnes* saith the singeing noyse of them; *Pliny* addeth, that it is an enemy to the stomacke, and provoketh casting being taken with figges: being bruised, and salt, hony, and cummin-seede put to it, it helpeth those that are stung by serpents. *Galen* is very brieve herein and onely saith, it is hot and dry in the third degree, and of thin parts. *Mathioli* saith, that our Hysope is of thinne parts, and that it cutteth & breaketh tough flegme, it rarifieth or maketh thinne that which is thicke or grosse, it openeth that which is stopp'd, and clenseth that which is corrupt, the oyle thereof being annoynted killeth lice, and taketh away the itching of the head, it helpeth those that have the falling sicknesse, which way soever it be applied, but more especially being made into pilles in this manner. Take of Hysope, Horehound and Calistoreum, of each halfe a dragma, of the roote of Peonye (the male kinde is most proper in this disease) two drammes, of *Assafetida* one scruple, let them all bee beaten as they should be, & made into seven pilles (or more if they be too great) with the juyce of Hysope, and one of the greater, or two small ones, taken every night going to bed is appointed; the best Physitians of our tymes, assuredly doe account it, to be hot and dry in the third degree, and of thinne parts; for being sharpe and a little bitter withall, they apply it effectually, for all cold griefes or diseases of the chest and lungs, helping to expectorate tough flegme, that stufseth or oppresth them, being taken either in a *loboc* or licking medicine, or in a Syrupe, or any other way, and in a decoction thus: Take an handful of Hysope, two ounces of figges, and one ounce of Sugarcandy, boyle them in a quart of Muscadine, untill halfe a pint be consumed, which being strained, & taken morning and evening, availeth much for those that are troubled with an old cough, by causing the tough flegme the more easily to be avoided: it helpeth also to provoke vrine being stopp'd, or that is made by dropes: it helpeth to breake winde, and to cause womens monethly courses, and easeth the sharpe fits of agues; the greene hearbe being bruised and a little sugar put thereto, doth quickly heale any greene wound or cut in the hand, or else where being applied thereto.

CHAP. II.

Thymbra five Satureia, Savorie.

Here are foure or five sorts of Savorie, two most usually to be seene in many gardens, but there are three others that are more rare.

1. *Satureia vulgaris*, Winter Savorie.

The common Winter Savorie, is a smal & low bushie herbe, very like unto Hysope, but not much above a foote high, with diverse small hard branches, & hard darke greene leaves thereon, as thicke set as Hysope, & sometimes but with foure leaves set at a joynt, of a reasonable strong sent, yet not so much as the Sommer kinde: the flowers are of a pale purplish colour, set at severall distances at the toppes of the stalkes, and leaves also under them: the roote hath divers small strings thereat, and abideth with greene leaves all the winter, and is more usually encreased by slipping then sowing.

2. *Satureia Hortensis*, Sommer Savorie.

This also is a small tender herbe growing up with divers brittle branches, slenderly or sparsedly set with two long narrow leaves at each joynt, soft in handling, and of a stronger and quicker sent and taste: the flowers are small and purplish, set at the joynts with two leaves under them up to the toppes of the stalkes: the seede is of a darke colour, bigger then Tyme seede by the halfe: the rootes have fewer strings and perish every yeare, and must be new sowne every yeare.

3. *Satureia Spicata* S. *Juliani*, Rocke Savorie.

Rocke Savorie hath many slender, hard, and woody brownish stalkes about a foot long, whereon doe grow at severall spaces, many very small and narrow leaves, very like to the leaves of the true Tyme, but somewhat longer, of a sharpe quicke taste, and of a strong sweete sent: at the toppes of the branches, come forth many spiked heads of small leaves, & out of them thrust forth purplish flowers, which afterwards give a small, brownish seede, more like Tyme then Savory, the whole plant will be sometimes of a sad purplish colour, dasht over with a white meallines, as for the most part all Sea plants are: this doth seldome endure a winter with us.

4. *Thymbra five Satureia Cretica legitima*, The true Savorie of Candie.

The true Savory of Candie brancheth forth from the ground like Tyme, with many purplish square branches,

covered

2. *Satureia hortensis*.

Somer Savory.

3. *Satureia spicata*
S. Juliani.

Rocke Savory.

4. *Thymbra* frue *Satureia*
Cretica legitima

The true Savory
of Candy.

covered over with a rough or hairy downe: from the lower joynts of the stalkes come alwaies two branches, and two leaves set at them and so in like manner all along the branches two at every joynt, one against another on the contrarie side, and are very like unto the leaves of the true Tyme, but somewhat hairy, of a swete sent and sharpe taste betwene Tyme and Savory; on the toppes of the branches at certaine distantes one above another grow forth heads or tufts of greene leaves, from among which start forth many purplish flowers like unto Tyme, standing in brownish huskes: the seede is of a blackish browne colour, very like unto Tyme; the roote is somewhat long, hard and woody, with some small blackish fibers growing from it, and will as hardly winter with us as the last, although the lower branches that lie on the ground are apt to take roote, which sheweth, that in the naturall place where it feeleth no cold winter, it spreadeth and increaseth.

5. *Satureia Cretica spinosa*. Prickly Savory of Candy.

Pona, in his Italian description of Mount Baldus maketh mention of this Savory, but without any description or further relation; whereby I gather that there is small difference betwene it and the last, saving that as in the *Chamaedrys spinosa*, the branches have small prickles on them at the ends, and therefore I cannot yet give you any further knowledge of it, having not seene it. Bauhinus also hath made mention of another, received from Contarenius for *Thymbra*, and as he saith is the *Satureia Dioscoridis* by *Matthiolum*; but because I doe not thinke it to be a Savory, I forbear it here.

The Place and Tyme.

All these Savories are with us onely nourished in gardens, but they are as wilde hearbes in divers parts of Europe, especially in Groves very plentifully, and are intitled to their places; flourishing in the end of summer; some not abiding the winter.

The Names.

It is called in Greeke, *Σάτυρος* or *Σάτυρα* forte *ἀνὰ τὴν ὁσίων* ob fragrantiam, in Latine *Satureia*, alij a saturando dicta, alij, a Satyris nomen traxisse putant, eo quod, coitus marcescentes stimulat: some also call it *Thymbra* in Latine, and sometake *Satureia* & *Thymbra* to be differing plantes. The Arabians call it *Sabuter* or *Sabutar*, the Italians *Savoreggia* *Coniella* & *Peverella*, the Spanyards, *Axadrea* & *Segurella*, the French, *Savoree*, *Sauriette* & *Sadree*, the Germanes, *Kunel*, *Zwie Hylpe*, & *Sature*, the Dutch, *Kenle*, and winter *Kenle*, and we in English, *Savorye*. There is much controversie among our moderne writers, what hearbe should certainly be the *Thymbra* of *Dioscorides*, which in his time as it should seeme was most familiarly known, & therefore giveth no further description thereof, then that it was like unto Tyme, but lesse and more tender, having heads of greene flowers, and that it grew in rough and stony places. *Matthiolum* giveth us one, *Lobel* another, *Clusius* a third, and each entitle theirs

to be *Vera & legitima*: *Matthiolus*, because it was sent for it, *Pena* because he founde it growing on Saint *Indians* *Rocke* in the *Florentine* dominion, and *Clusius*, because *Honorius Bellus* sent him the feede from *Candy*, who saith, that the *Candis* *Greekes* call it to this day usually *Thymbi* & *Thymbi*: but it is certaine, that neither our winter or summer Savory doe answere unto the *Thymbra* of *Dioscorides*, for that neither of them is like, or lesse then *Tyme*, although they are familiarly eaten by divers nations being put into brothes, meates, &c. as *Dioscorides* saith of his garden *Thymbra*, which as he saith is much lesse then the wilde sort of *Thymbra*. The first is generally called with us *Satureia thymbra*, Winter Savorye and by *Camerarius*, *perennis*; by *Lobel* *Satureia* five *Thymbra altera*; by *Cesalpinus*, *Satureia Hortensis*. By *Brinsfelmus*, *Hyssopus Agrestis*; but *Thymbra syl.* by *Angulana*, by *Gesner in hortis*, *Thymbra agrestis*, & *Satureia montana*, by *Bauhinus*: The second is generally called *Satureia sativa* & *hortensis*, or *Thymbra sativa*; by most writers, but *Tabermontanus* & *Cesalpinus* only call it *Cunila*, and *Thymbra agrestis*: *Gesner in hortis*, *Thymbra vera*, and *Bauhinus*, *Satureia hortensis* five *cunila* *Plinij*: but I somewhat doubt whether *Pliny* meant this *Satureia* to be *Cunila* in his 19. booke and 8. chap. or some of the other sorts. And for the name *Cunila*, it is by him referred to divers other plants; for *Origanum Heracleoticum* is called by him *Cunila gallinacea*, Lib. 20. c. 14. and *Origanum sylvestre* *Cunila bubula* (as *Dioscorides* hath it also, as shall bee shewed hereafter) *Levisium* also otherwise called *Panaces*, is falsely called *Cunila bubula* by *Crataeus*, as *Pliny* sheweth both in the 8. chapter of his 19. booke. and in the 15. chap. of his 20. Again, in the 10. chap. of his 32. booke, he nameth an other herbe *Cunila capitata*, which in the fourth chap. of his 24. booke hee seemeth to name *Policnemum*, whereof also *Dioscorides* maketh mention; in an other place he saith, that *Cunila* is called (*unilago*: *Columella* also calleth *Satureia*, *Cunila*), but he maketh *Thymbra* and *Satureia* to be two sundry herbes, lib. 9. chap. 4. de *rustica*; as also in this verse, Et *Satureia* *Thymi* referens *Thymbra*q. *saporem*: but *Pliny* in his 19. booke and 8. chap. maketh them to bee both one. The third sort is called by *Lobel* and *Pena*, *Thymbra vera* *S. Iuliani*, *Lugdunensis* and *Tabermontanus*, *Thymbra vera* *Pena*; *Bauhinus* in his notes upon *Lugdunensis* saith, that the *Saxifraga vera* *Dioscoridis* of *Matthiolus*; is this *Thymbra vera* of *Lobel* and *Pena*; which it is very probable to be, both figure and description answering well thereunto as any that will compare them may see. The fourth is called by *Clusius*, *Thymbra legitima*, *Prosper Alpinus*, *Thymbra Cretensis*, and *Pena*, *Thymbra Legitima* *Dioscoridis*, and so doe I thinke also, no other that wee know coming neerer thereunto.

The Vertues.

Our Savory of both sorts is hot and dry in the third degree, especially the summer kinde, which is both sharpe and quicke in taste, expelling winde in the stomacke and bowels, and is a present helpe for the rising of the mother procured by winde, provoketh Urine and womens courses, and is much commended for women with child to take inwardly, and to sinell often thereunto: Some that from *Satyrus* thinke *Satureia* to be derived, say it helpeth the disease called *Satyrasis* or *Pryapismus*, and to helpe dull or decayed coition: others taking it to be derived a *saturando*, say it is in familiar use with many to procure a good appetite unto meate, and to take away all manner of loathing to the same: it cutteth tough flegme in the chest and lunges, and helpeth to expectorate it the more easily: it helpeth to quicken the dull spirits of the l e thargye, the juice being snuffed or cast up into the nostrills: the juice also is of good use to be dropped into the eyes to cleare the dull sight, if it proceede of raw thinn cold humours distilling from the braine: the juice also heated with a little oyle of Roses, and dropped into the eares, easeeth them of the noise and ringing in them and deafenes also: outwardly applied with white flower in manner of a poultis, giveth ease to the *Scatica* or hippe gowte, or paralyticall members, by heating and warming them, and taking away the paine: it taketh away also the ringing of bees, waspes, &c.

CHAP. III.

Thymum & *Scorpillum*. Tyme, and Mother of Tyme.

Have joynd both these sorts of Tyme in one Chapter, for the neere vicinity they have together, both in name and nature, yet each by themselves they having many sorts apart.

1. *Thymum legitimum capitatum*. The true Tyme of the ancients.

The true Tyme is a very tender plant, having hard and hoary brittle branches, spreading from a small woody stemme about a foote and a halfe high, whereon are set at severall joynts, and by spaces many small whitish or hoary Greene leaves, of a quicke sent and taste: at the toppes of the branches stand small whitish Greene heads, somewhat like unto the heads of *Stachas*, made as it were of many leaves or scales; out of which start forth small purplish flowers, not having any other feede (as *Theophrastus* and some other of the old authors have set it downe,) and therefore appoint the flowers only, to be sowne as if there were no feede in the heads, thinking it to spring of the flowers alone, which was an error in them by tradition not experience, for we have found it otherwise.

2. *Thymum durius vulgare*. Our common garden Tyme.

Our ordinary garden Tyme, is also a small low woody plant, with brittle branches, and small hard Greene leaves on them, well knowne to most, having small white purplish flowers, standing with some leaves in roundles round about the toppes of the stalkes; the feede is small and browner then *Marjome* feede; the roote is woody and abideth well divers winters, if they be not too violent, and the plants not growne too great or woody, which then will perish therein.

3. *Thymum durius Candidius*. Hoary Tyme.

Among the feedes of the last recited Tyme, which I sowed in my garden, came up this hoary Tyme, which is in forme like it, but that the branches are smaller, and the leaves whiter or more hoary, a little also more thinly or sparsely set on the branches; the flowers, feedes, and rootes are like the former, and so are both sent and taste, but rather more quicke.

4. *Thymum latifolium*. Masticke Tyme.

This Tyme groweth not so upright as the former, but rather lyeth and spreadeth upon the ground, small but many more branches, nothing so woody; the leaves also are not so hard but broader; the flowers are of a purplish white colour, standing in roundles as the two first sorts: this better endureth the winters, and longer, yet giveth no feede, but is propagated by slipping: the taste and sent is not altogether so quicke as the ordinary garden kinde.

5. *Thymum inodorum*. Vniavory Tyme.

This is a lowe small shrubby plant, very like unto the first kinde, with hard branches and hairy more then it: the leaves

1. *Thymum legitimum capitatum.*

The true Tyme of the ancients.

2. *Thymus durius*

Common garden Tyme.

leaves are set at distances, many growing together, but without either smell or taste utterly: The flowers are of a pale purplish colour, and grow like the common sorts, at the toppes round about the branches.

6. *Serpillum Narbonense.* French wilde Tyme.

6. *Serpillum Narbonense.*

French wilde Tyme.

This wilde Tyme groweth with many hard or woody branches, somewhat upright, leaning a little downwards, somewhat like unto our garden Tyme, set with many leaves together at spaces, which are somewhat longer then the rest, lesse sweet, & more strong and heady in sent, somewhat like unto Southernwood, & lesse hot or sharpe also in taste: the flowers grow in wharles or roundles, by spaces towards the tops of the stalkes, with some leaves at them being of a purplish colour, very like unto garden Tyme: both stalkes and leaves are of a whitish hoarines, and abide all the winter.

7. *Serpillum majus.* The greater mother of Tyme.

7. *Serpillum majus.* The greater mother of Tyme.

This greater Mother of Tyme groweth more upright then the common wild kinde doth, with two leaves for the

most part at a joynt like the other, but greater and not of so darke a Greene colour, but rather resembling Marjerom leaves; the flowers grow at the toppes of the stalkes, of a redish purple colour like unto garden Tyme, but somewhat larger as the whole plant is, and of a small, but somewhat hot sent and taste.

Floris alba There is another of this kinde, that beareth white flowers and fresher Greene leaves, else in other things like the former.

8. *Serpillum latifolium hirsutum*. Rough Mother of Tyme.

This Mother of Tyme groweth in most things like the ordinary sort, spreading on the ground in the same manner, but that the branches are more hoary or white, and the leaves somewhat rounder and rougher, or as it were hairy, smelling like unto Bitumen or hard pitch, which hath no good favour pleasing to any: the flowers and other parts thereof are like the common Mother of Tyme.

9. *Serpillum Pannonicum Clusij*. Hungarian Mother of Tyme.

This small Mother of Tyme creepeth upon the ground, taking roote as it spreadeth, with many square stalkes set with leaves, two alwaies at a joynt, but more thinly or sparsely growing on them, then the ordinary wild kinde, and are narrower and longer than they, and very smooth withall: the flowers growe at the toppes of the branches not unlike the common kinde, and hath little or no sent at all.

There is an other of this kinde little differing but in the hoariness of the leaves from the other.

10. *Serpillum Vulgare minus*. The ordinary small wilde, or Mother of Tyme.

to Serpillum vulgare minus. Ordinary Mother of Tyme

This lesser wilde Tyme spreadeth sundry hard brownish long branches rounde about the roote upon the ground, which take roote againe as they lye and spread; the leaves are small, and of a sad green colour, smelling like unto Tyme almost, but nothing so quicke either in smell or taste: the flowers grow at the toppes of the branches of a purplish or white colour, for of both sorts some are so found.

11. *Serpillum Citratum*. Lemmon Tyme.

11. *Serpillum Citratum*. Lemmon Tyme.

The Lemmon Tyme is somewhat like the common wild kinde in the manner of growing, but standeth more upright, bushing thicke with branches, the leaves are small and of a darke Greene colour like them; but have the sent of a Pomecitron or Lemmon: the flowers are more white then in the common sorts.

12. *Serpillum Moschatum*. Muske Tyme.

The Muske Tyme also groweth somewhat upright, but with fewer stalkes and thinner set with somewhat longer leaves, which are not of so sad a Greene colour, whose sent is much neere unto the sent of Muske, and therupon tooke the name.

13. *Serpillum aureum sive versicolor*. Guilded or embrodered Tyme.

In the variable mixture of Greene and yellow in the leaves of this Tyme, consisteth the chiefest difference of this sorte, from the common wilde kinde, for the Greene leaves thereof are in some striped, in others edged with a gold yellow colour, which hath caused the guilded or embrodered name.

The Place.

The first or true Tyme groweth plentifully about *Sevill* in *Spaine*, where they use and know no other Tyme, as also in *Syria*, &c. and yet as *Clusius* saith all the rest of *Spaine*, neither use it nor know it, but use our common garden kinde, which groweth in old *Castile* verie plentifully & in divers other places in *Spaine*; the fourth we plant in our gardens ordinarily by slipping, not sowing: the fift in the Kingdome of *Valencia* in *Spaine* neere the seaside at *Alikanta*: the sixt *Clusius* saith, hee found in old *Castile*, growing promiscuously with our common garden Tyme; and *Lobell* and *Pena* say it was found in *Narbonne* in *France*: the seventh is planted in the gardens of the curi-

ous and

1. *Epithymum*. The Dodder of Tyme; 2. *Cuscuta*. Dodder.

finer, as the property of the plants whereon it groweth, and the climate doth suffer, (although *Matthiolus* and others, have thought it to grow without roote) creeping and spreading on that plant whereon it fasteneth, bee it high or low, clasping the very grasse if it meete with none else. (although *Ruellius* saith it groweth not on the ground, but on hearbes) as upon some vines also in *Narbone*, as *Pena* saith he observed: these strings have no leaves at all upon them, but winde and entrelace themselves so thicke oftentimes upon a small plant, that it taketh away all comfort (as one would thinke) of the Sun from it, and ready to choake or strangle it; after these strings are risen up to that height, that they may draw nourishment from the plant, you shall scarce see any appearance of strings from the ground, they being broken off, either by the strength of their rising, or withered by the heate of the Sunne, (and if they meete with no herbe or plant whereon to spreade, they will soone perish of themselves, as I have tried my selfe, by sowing the feedes in a pot by themselves, & so observed their springing) from whence divers have imagined, that it might grow as Mousse upon trees, or like Mistleto; but I think rather as Ivie, by drawing nourishment insensibly from the plants whereon it groweth, & thereby partaketh of the nature of the same plants: upon these strings of both sorts, & upon what plants or herbe soever they grow, are found clusters of small heads or huskes, out of which start forth whitish flowers, which afterwards give small pale coloured feede, somewhat flat and twice as bigge as Poppye feede: thus much I thought good to let all others understand, by that experience and observation I have had thereof: yet after this mine owne observation, I reade much to this purpose in *Tragus*, in his chapter of *Audrosucc* or *Cuscuta*: by this which I have truly related, it may appeare plainly to any, that neither Tyme, Savory, or any other herbe, doe naturally of their owne feede bring these stringes or laces, but that they spring from their owne feede, either shed or scattered of themselves upon the ground, or comming among the feedes of other hearbs that are sowne. The plantes whereon these laces doe grow, are observed by divers, to be Vines, as *Pena* and others that have observed them in *France*, and in some places of *Turkey*, upon trees and thornes, and some other things: *Theophrastus* in the 23. chap. of his second booke of the causes of plants, doth set downe, that *Cadytis* groweth on trees and bushes in *Syria*, which *Pliny* altereth to *Cassia*: in the last chap. of his 16. booke, by which word no doubt they meant this plant, for it differeth not much from *Cassia*, as many others have it, or *Cuscuta* as it is generally called, the Arabian name being *Chassith* and *Cuscuta*: the hearbes are *Pollum*, *Dillanum*, *Germander*, *Hysop*, *Mother of Tyme*, *Marjorome*, *Steebe*, *Wallwort*, *Resemary*, and others as *Bankius* hath recorded, and also very plentifully in many places of our owne land upon Nettles, and upon Line or Flaxe, and called *Padagra lin*, and *Angina lini*, upon Tares also more abundantly in some places, where it destroyeth the pulle, or at the least maketh it much worse, and is called of the Country people *Hell-meede*, because they know not how to destroy it upon Fearn also and other hearbes upon Hampstead heath, as I lately found my selfe, the stringes & flowers being white, and upon the grasse likewise on Black-heath in Kent, on the very ground, not rising an inch or two high, being red.

The place, Tyme, and Names are sufficiently as I thinke expressed before, yet in particular, *Tragus* and *Anguilara* thinke it to be the *Androsace* of *Diocorides*, but erroneously: for *Epithymum* as *Matthiolus* sheweth out of *Etius*, *Altiarius* and others, is the threads or laces growing upon Tyme, although *Diocorides* calleth it the flower thereof: we doe generally call that *Epithymum* that groweth on Tyme, in English, laced Tyme; as the *Epithymum*, laced Savory, and so of *Epistebis*, *Epimajorant*, *Epimica*, *Epimurus*, and so the rest, laced *Steebe*, laced *Marjorome*,

rome, laced Nettles, laced Brambles: but wee call those strings generally by the name of *Dodder*, especially that which groweth on Flaxe and Tares, which are red and most frequent with us.

The Vertues.

Epithymum by *Diſcorides*, *Paulus*, *Atius*, *Aluarius*, *Mefues*, and all others, is accounted the most principall and powerfull *Dodder* growing upon any herbe. (and that upon Savory or Stoebe not to bee so effectfull) for all melancholicke diseases, and to purge blacke or burnt choller, which is the cause of many diseases of the head and braines, as also for the trembling of the heart, faintings and swoonings: it is helpefull in all the diseases or griefes of the spleene, and of that melancholy that riseth from the windines of the *Hypochondria*, which is that part of the belly under the short ribbes where the spleene lyeth. & by flying up to the braine can seth a kinde of frensy or madness: it purgeth also the reines and kidneys by Urine; it profiteeth them that have the Jaundise in opening the obstructions of the gall: *Galen* saith, it hath the properties of Tyme being hot and dry in the third degree, & as *Ruellius* bofereth from the Arabian authors, that it hath by the astringent or drying quality, a strengthening property besides the purging, as it is also found in *Rubarbe*, and that it is a safe medicine for the obstructions as well of the liver as spleene, purging the veines of flegmaticke & cholericke humours, & likewise as (*Mefues* saith, it helpeth childrens agues if a little worme feed be put to it. The *Dodder* of all other plants & herbes in like manner pertaketh of the nature of them whereon they grow, be they hot or cold, and is thought to worke more effectually for those diseases, wherunto the herbe it selfe is applyed: *Lobel* saith, that in the west parts of this kingdom where he found these laces upon Nettles, the people had good experience, that it was a soveraign remedy to procure plenty of Urine, where it was stopped or hindered, & my selfe also have understood it from those parts. But that *Dodder* which groweth upon Tares, being the most frequent about London, and wherewith our markets are onely in a manner furnished, and our Apothecaries shoppes stored from thence, taketh his propertie from the Tares whereon it groweth, and can have no effectfull quality comparable to *Epithymum*: for as *Galen* saith, Tares are hard of digestion and binde the belly, and that the nourishment of them engendereth thicke blood, apt to turne into melancholic, which qualities are cleane contrary to those of *Epithymum*, *Epithymbra*, or of other good herbes.

CHAP. V

Majorana vulgaris exotica. Common, and Strange Marjeroms.

Here are divers sorts of sweete garden Marjeroms, some growing onely in the summer; others abiding the winter, and one that groweth wilde: there are some other sorts called Marum, that I have intitled strange Marjerom, all which shall be comprehended in this chapter.

1. *Majorana vulgaris aestiva.* The ordinary garden sweete Marjerome.

Our common sweete Marjerome, that is commonly sown in our countrey, is a small low herbe, little above a foote high, full of branches, and small whitish and soft roundish leaves on them, smelling very sweete: at the toppes of the branches, stand divers small long and round sealy heads or knots (and therefore of some called Knotted Marjerom) of a whitish Greene colour, out of which come here and there small white flowers, and after them small reddish feede: the roote is composed of divers small threads or strings which perisheth with the whole plant every yeere.

Majorana tenuifolia. Marjerome gentle.

This Marjerome likewise hath divers small branches growing low, and not higher then the former, but having finer and smaller leaves, hoary and soft, but much sweeter; the heads are like unto the former, and so are the flowers and feede, the whole plant being more tender then the former, abiding but a Summer in like manner.

2. *Majorana vulgaris.* Sweete Marjerome.

3. *Majorana odorata perennis.* Winter sweete Marjerom.

Wee have also another sweete Marjerom that abideth Greene all the winter, if it bee not too violent, growing in the same manner that the first doth, whose leaves are a little smaller and greener then it, but with the like heads and knots: yet some take this to be but the ordinary Summer Marjerom, which by transplanting is made the more strong, and able to abide the winter.

4. *Majorana latifolia sive major Anglica.* Winter or pot Marjerom.

The Winter or pot Marjerom, is a small low bushing herbe growing not much higher, but spreading the branches wider, whereon doe grow broader and greener leaves, set by couples with some smaller leaves likewise at the severall joynts all along the branches; at the toppes whereof growe a number of small purplish white flowers, set together in a tuft, which turne into small & round feede bigger then sweet Marjerome feede: the whole plant is of a small and fine sent, but much inferior to the other, being also nothing

so bitter

so bitter as the sweete Marjerome, and therby the fitter and the more willingly used for meates, the roote is white and threddye perishing not in the winter, but abideth many yeares, and is to be encreased by slipping rather then sowing the feede.

5. *Majorana latifolia aurea*. Yellow Marjerom.

This Marjerome is of the same sort with the last described, differing onely in the colour of the leaves, which are in Summer wholly yellow in some, or but a little Greene, or parted with yellow and Greene, more or lesse as nature listeth to play, the sent being small like the other. We have also an other sort parted with white and Greene.

6. *Majorana sylvestris*. Wilde or fildes Marjerome.

7. *Marum vulgare*. Hearbe Malticke.

The neerer resemblance that this hearbe hath with Marjerome, then with Tyme, (as some have taken it) doth make mee joyne it in the same chapter. It riseth up with greater & more woody stalkes then any of the former Marjeroms, being two foote high or better in some places, where it liketh the ground and ayre branching it selfe on all sides towards the upper parts, leaving the stemme bare below if it be old, otherwise being yong, thinly furnishing the branches from the bottome, with small Greene leaves bigger then the leaves of any Tyme, and neere the bignes of the leaves of the Marjerome gentle: at the toppes of the branches, stand small flowers on a head, which afterwards turne into a loose tuft, of along white hoarie matter like unto soft down, with some leaves under and about them, which abide not long on the stalkes, but are blowne away with the winde: the feede is so small if it have any, that I have not observed it; the roote is threddy, the whole plant is of a sweete resinous sent, stronger then Marjerome, and abideth our winters, if it bee carefully planted and regarded afterwarde.

8. *Marum supinum*. Creeping strang Marjerome:

This strange Marjerome hath divers slender weake stalkes, lying upon the ground, and not standing upright as all the sweete Marjeroms & hearbe Malticke do, therein resembling the wild Tyme rather then Marjerome: the leaves are many

4. *Majorana latifolia sive major Anglica*. Winter or pot Marjerome.

6. *Majorana sylvestris*. Wilde or field Marjerome.

The wild or fildes Marjerome sendeth forth sundry brownish hard square stalks, with small darke Greene leaves set by couples on them, very like those of the sweete Marjerome, but harder and somewhat broader: at the toppes of the stalkes stand tufts of darke or deepe purplish red flowers, which turne into a small feede as the garden Marjerom feede, but blacker; the roote creepeth under ground, and encreaseth much, abiding from yeere to yeere: the whole plant smelleth strong.

7. *Marum vulgare*. Hearbe Malticke.

and

8. *Marum Supinum.* Creeping strange Marjerome.

and; smaller than those of *Mother of Time*, growing at several distances upon the branches, the flowers are small and purplish, growing at the tops, with leaves among them, the smell whereof is very sweet, and nearest unto *Marjerome*.

9. *Marum Syriacum vel Creticum.*

The Syrian or Candye Maltick.

This Candye or Syrian Marjerome, hath sundry upright stalkes, not so wood-

dy as the hearbe Maltick, but more tender and slender also, about a foot and a halfe high, whereon are set divers small whitish Greene leaves, very like unto the small fine sweet Marjerome, but somewhat rougher up to the very tops, which beare smaller heads or knots then the sweet Marjerome, & white flowers out of them, all the hearbe is of a most fragrant sweet smell, enduring a long time after it hath bene dried: it is very tender to keepe, and will not endure any of our cold nights that come in August or September, but will quickly perish by them.

The Place and Time.

The sweet Marjeromes grow wild on the mountaines in *Spaine*, and in other places, and the wild Marjerome, in the borders of corne fields and pastures in sundry places of this land: the rest are all nursed up in Gardens, their naturall places being not well knowne to us, saving that the last, *Lobel* saith he had out of *Syria*, and *Prosper Alpinus* saith he saw it in *Candye*. The former seven sorts doe flower in the end of Summer at the farthest, but the two last much later if they come any yeere to flower with us.

The Names.

Marjerome is called in Greek *ἑλκυνος* & *ἡνδερνος*, in Latine *Majorana* a *majori cura*, *Sampsuchum* also, and *Amaracus* after the Greeke, of the Arabians *Mersenus*, or *Morsanguis*, of the Italians *Maiorana* & *Persa*, of the Spaniards *Maiorana*, of the French *Mariolaine*, of the Germanes *Maiaou* & *Mjoran*, of the Dutch *Mariolaine*, and of us *Marjerome*, and sweet *Marjerome*. *Marum* is called in Greeke *μαρυν*, and so in Latine: *Sunt inquit Pona, qui regi Thracie cui nomen Maroni esset, Mari herba appellationem acceptum ferunt: verumamen potuit etiam ab Amaraco per apocopen dici, utpote cum Amaraci species videatur Marum.* The French call it *Marone* and *Mastick*, and wee in English *Maltick* or *hearbe Maltick*, to make a distinction betweene it and the Maltick Time. There is much controversie among the moderne Writers about these two hearbes. First whether *Sampsuchum* and *Amaracus* should be but one or differing hearbes, and whether our Marjerome should be either: for *Galen* and *Paulus Aegineta* in their records and censures of simples, mention them both in severall chapters as differing hearbs, and the suspicion hereof is encreased the more, in that *Dioscorides* himselfe in the composition of his oymments, maketh *Oleum Sampsuchinum* and *Amaracinum* to beare two names, as of two severall simples, although he had said in the chapter of *Sampsuchum* that the Sicilians and those of *Cyzicena* call that *Amaracus*, which those of *Cyprus* and *Egypt* call *Sampsuchum*: but *Dioscorides* thereby rather sheweth the diversitie of the compositions, and the more excellency of the one from the other, which hee could not doe without diversitie of names, but especially because those of *Cyzicen* being the chiefeest compositors of such oyles, according to their Country name gave it that title: Some have thought that the *Amaracus* of *Galen* is not the same of *Dioscorides* or *Theophrastus*, but *Parthenium*, because *Dioscorides* saith that by some in his time it was called *Amaracus*, and the rather because he maketh no mention of *Parthenium* in the censure of his simples: which how erroneous it is, appeareth by *Galen*'s owne words of the *Oleum Amaracinum*, which he calleth a sweet oyle, although not so sweet as *Marum*; and *Dioscorides* termeth the smell of *Parthenium*, *subvirosum* having leaves like *Coriander*: then whether the *Sampsuchum* of *Dioscorides* be our Marjerome, for I finde that *Lobel* in *Adversaria*

9. *Marum Syriacum vel Creticum.* Syrian or Candye Maltick.

saria termeth his *Marum supinum* *Sampsuchus* forte *Dioscorides*, and *Bauhinus* in his *Pinax* entitleth our ordinary *Marum* or hearbe *Mastick Sampsuchus*, five *Marum Masticken redolens*, which two authors thought *Marum* better to argue with his *Sampsuchum* then *Marjerome*, because *Dioscorides* saith that his *Sampsuchum* is an hearbe full of branches creeping on the ground with hairy round leaves, like the smaller or finer leaved *Calamint*, smelling very sweet, and in the composition of the *Oleum Sampsuchinum* hee adviseth to cluse that *Sampsuchum* that hath darke greene leaves, neither of which properties are in our *Marjerome*, nor yet in either of *Lobel*: or *Bauhinus* their *Marum*, for although *Lobel* his *Marum supinum* creepe on the ground, yet it hath not hairy round leaves but small and long, and *Bauhinus* his and our *Marum* creepeth not upon the ground, but standeth upright as *Marjerome* doth. The next controversie is, whether the *Marum* of *Dioscorides* be answerable to any of those hearbes, are called *Marum* by any of our moderne Writers: that none of them can be his *Marum*, this sheweth plainly, that he saith his *Marum* hath whiter leaves by much then *Origanum*, and a sweeter flower, and neither the *Marum supinum* of *Lobel*, no nor our ordinary *Marum* hath whitish leaves, or is sweeter then *Marjerome*. *Clusius* therefore thought good to call our ordinary *Marum*, *Tragoriganum* rather then *Marum*, and saith that the seed thereof was sent him by the name of *Ambradulcis*, and *Bauhinus* calleth the *Marum Syriacum* of *Lobel Majorana Syriaca*, and yet by *Bauhinus* leave, his *Syriacum* or *Alpinus Creticum* cometh neerer to *Dioscorides* his *Marum*, then to his *Sampsuchum*: most Writers call the sweet *Marjeromes* *Amaracus* and *Sampsuchus*, and some *Majorana vulgaris*, and the smaller or finer sort *tenuiflora*: but I doe not finde that any of them hath made mention of my living sweet sort, although both *Camerarius* and *Bauhinus* doe entitle the fourth *Majorana perennis*, as I doe the next before it, but they adde *Sylvestris* as *Tragus* and *Gesner* doe, and *Majorana major*, or *latifolia* as others doe, and *Anglica*, and *Camerarius* saith he found a sort thereof about *Bononia*, going a simpling with *Ylisses Aldroandus* that had larger and softer leaves: the sixt is called by many Authors *Origanum vulgare*, and by others *Origanum sylvestre*; *Lobel*, *Origanum Onitis majus*, and *Agrioriganum*, *Cesalpinus Origanum Italicum*; and *Gerardus Anglicum*: but I as you see number it rather among the *Marjeromes*, as a wilde kind thereof, as we usually call it in English, and as we doe the fourth and fift, this having leaves like *Marjerome*, but greener. *Pliny* as I said before calleth it *Cunila bubula*, and so doth *Dioscorides* his also. But take them here as wee usually call them, the seventh is commonly called *Marum* by most Authors, yet *Dodonaeus*, *Gesner* in *hortis*, and *Camerarius* take it to be *Clinopodium*, *Angulura* and *Lobel* to be *Helenium odoratum* of *Theophrastus*, *Clusius* to be *Tragoriganum*, and *Bauhinus* to be *Sampsuchus* *Dioscoridis*, it is called *Mastic* both by the French and us. The eight is called by *Lobel*, *Marum supinum*, by *Cesalpinus*, *Marum ex Sicilia allatum*, *Sampsuchum* *Dioscoridis*, *Lobel* in *Adversariis* calleth it *Sampsuchus* *Dioscoridis*, *Amaracus serpens*, and *Bauhinus* *Marum repens verticillatum*. The last is called by *Lobel*, *Marum Syriacum*, and so doe after him *Dodonaeus* and *Taber montanus*; but *Alpinus* calleth it *Cretense* finding it in *Candae*, and *Bauhinus* as I said before, *Majorana Syriaca vel Cretica*.

The Vertues.

Our common sweet *Marjerome* is hot and dry in the second degree, and is warming and comfortable in cold diseases of the head, stomach, sinewes, and other parts, taken inwardly, or applied outwardly: it digesteth *Matthiolum*, attenuateth, openeth, and strengtheneth: the decoction thereof, being drunke helpeth all the diseases of the chest, which hinder the freenesse of breathing: it is likewise profitable for the obstructions of the liver and spleene, for it not onely cleareth them of those humours did stusse them, but strengtheneth also and confirmeth the inward parts: it helpeth the cold griefes of the wombe, and the windines thereof, or in any other inward part: it helpeth the losse of speech by the resolution of the tongue: the decoction thereof made with some *Pelletory of Spaine*, and long pepper, or with a little *Acorus* or *Origanum*: *Dioscorides* and *Galens* *Sampsuchum* is hot and dry in the third degree of thin parts, and of a digesting quality: the decoction thereof drunke is good for those that are beginning to fall into a dropsie; for those that cannot make their water, and against paines and torments in the belly, it provoketh also womens courses, if it be put up, being made into a pessary, and applied with salt and vinegar, it taketh away the venome of the *Scorpions* sting: being made into powder and mixed with hony, it taketh away the black markes of blowes or bruises applied thereto: it is good for the inflammations and watering of the eyes, being mixed with fine flower, and laid unto them: the juyce thereof dropped into the eares easeth the paines in them, and helpeth the ringing noyse of them: it is profitably put into thole ointments and salves, that are made to warme and comfort the outward parts or members, the joynts also and sinewes, for swellings also and places out of joynt: the powder thereof snuffed up into the nose, provoketh sneezing, and thereby purgeth the braine, and chewed in the mouth draweth forth much sclegme. The oyle made thereof is very warming and comfortable to the joynts that are stiffe, and the sinewes that are hard, to molifie, supple, and stretch them forth. Our *Marjerome* is much used in all odoriferous waters, powders, &c. that are for ornament and delight. The great or pot *Marjerome* because it is more mild and lesse bitter than the former, is lesse used in Physicke, but more in meates and brothes to give a relish unto them, and to helpe to warme a cold stomach, and to expell winde: the wilde *Marjerome* is more hot than it, and therefore more effectually to heat, warme, comfort, and strengthen both inwardly and outwardly in all things whereunto it is applied: *Hearb Mastick* is more temperate in heat than *Marjerome*, and is used by our Apothecaries, in stead of the true *Marum* (which may well bee admitted untill a truer may be knowne in the composition of the *Trochisci Hedychoi* which *Anàromachus* thought fit to make a principal part of his Treacle, accounting it effectually against all poisons, especially of vipers, and other Serpents. Our daintiest women doe put it to still among their other sweet hearbs, to make sweet washing water.

CHAP. VI.

Origanum, Organy, or bastard *Marjerome*.

Hierophrastus, *Dioscorides* and *Pliny* do much vary one from the other, in setting down the sorts of *Origanum* that were knowne to them in their times, for *Theophrastus* maketh but two sorts, a black that is barren, and a white that beareth seed. *Dioscorides* maketh 5. sorts, three of *Origanum*, and two of *Tragoriganum*. *Origanum Heracleoticum*, *Onitis*, and *Sylvestre*, (which yet is not that which some with us call *Sylvestre*, and is set forth in the foregoing Chapter, for his beareth a white flower, and so doth not that) *Pliny* is more confused, therefore thought not to be without error, for in divers places of his 20. and 21. bookes, he mentioneth severall

several sorts of *Origanum*, and in one place maketh three sorts of *Heracleoticum*: but leaving these, I will shew you those sorts are knowne to us in these dayes.

I. *Origanum Heracleoticum verius*. Organic, or bastard Marjerome of Greece.

This bastard Marjerome riseth up with divers hard, round, reddish Greene stalkes, spreading forth into other smaller branches, whereon are set sundry leaves by couples at the joynts, being somewhat round, and of a whitish Greene colour, very like unto Marjerome, but larger, whiter, and harder, or rougher in handling: at the toppes of the branches stand suchlike scaly heads or knots, as Marjerome hath, but longer, from whence come small whitish purple flowers, and afterwards small brownish seed. The whole plant riseth with us not much higher than Marjerome, but of a hotter and sharper scent and taste, yet somewhat pleasant withall.

2. *Origanum Onitis Matthioli*. White Organic of Greece.

This Organy differeth somewhat from the former, for it hath whiter and narrower leaves: the flowers also are white, and the heads more divided or separated into smaller tufts: this is rather more tender to keepe than the former, hardly abiding the sharpnesse of our winter, although it be as well defended.

3. *Origanum Onitis aluamajus*. The greater White Organy.

This hath larger and whiter leaves than the former, the umbels or tufts of heads are larger also, and more spread abroad than they, which beare white flowers in the like manner. This kind is somewhat more hardy, and will better abide a Winter, if there be any care used to preserve it. There is also another with somewhat longer leaves than this.

4. *Origanum Sylvestre sive vulgare*. Wilde Organy.

This kind of wilde Organy (which is the ordinary kinde brought from Candy, and other places, and usually kept in our Apothecaries shops) riseth up with divers round hard stalkes, whereon are set somewhat broader, lesser, and rougher leaves than the former; the flowers stand at the toppes of the branches in manner of an umbell, that is in smaller heads, and more dispersed than the former, of a reddish purple colour, after which come small brownish seed: the root perisheth when it hath given feed, most especially with us.

The Place.

All these kindes of Bastard Marjermes have come to us from divers places, but which of them is more proper to this or that place, hath not bene truly signified vnto us; for some have named that *Creticum* which others have *Hispanicum*, so that it is likely to be naturall in both those places.

The Time.

They flower or at least beare their toppes or heads about the end of August, or middle of September with us, so that their seed scarcely commeth to maturity in our Country.

The Names.

It is called in Greeke *ὀρίανος* vel *ὀρίανος montem* & *ὀρίανος gaudium*, quod clivosos montesque locos amat, vel *πῶς τὸ ὀρίανον* & *πῶς* id est τὸ λαμπρὸν quod visum illustret & acuat vel a *πῶς* sit *πῶς* & redundante o, *ὀρίανος* per antiphrasim, natura enim calidum est, in Latine *Origanum*. The first is called *Origanum Heracleoticum*, by *Matthiolus*, *Gesner*, *Castor Durantes*, *Lobel*, *Lugdunensis*, *Camerarius*, *Tabermontanus*, and *Dodonaeus*, & hath been sent me by the name of *Creticum*, and also *Hispanicum*. *Bauhinus* saith it is the *Cunila Gallinacea* of *Pliny*, and *Dioscorides* calleth it *Cunila*. The second *Matthiolus* calleth *Onitis*, and so doe *Gesner*, *Castor Durantes*, *Bauhinus*, and *Lugdunensis*, who saith also that some called it *Marum*, and came to me by the name *Italicum*. The third *Camerarius* calleth *Onites*, whom *Bauhinus* followeth. The fourth is the common *Origanum* as I said we have in shops, and is thought by *Ruellius* to be the *Cunila Bubule* of *Pliny*, whom *Bauhinus* followeth. *Dioscorides* saith that this (if it be his wild kinde) was called also in his time *Cunila*. But to discusse how fitly each of these sorts answered unto those of *Dioscorides*, I think it fittest to prefixe the text of *Dioscorides*, by which they may be compared. *Origanum, Heracleoticum*, (saith *Dioscorides*) which is also called *Cu-*

1. *Origanum Heracleoticum Verius*. Organy, or bastard Marjerome of Greece.

4. *Origanum Sylvestre sive vulgare*. Wilde Organy.

nila, hath leaves like unto *Hysope*, the toppes or umbels are not fashioned round, but as it were divided into many parts: the seed in the toppes branches is not great. That *Origanum* that is called *Onitis*, hath whiter leaves, and doth more resemble *Hysope*: it beareth seed in tufts, as it were joyned together, the force or vertue although it be like, yet is lesse effectually by much. Wilde *Origanum*, which some call *Panax*, *Heracleum*, and others *Cumula*, (as *Nicander Colephorinus*) hath leaves like *Origanum*, and small branches not a foot high, bearing white flowers at the toppes in umbels, like unto *Dill*: the root is small, and of no use. These bee the words of *Discorides*, whereby comparing his first two sorts, we verily thinke, that howsoever some Authors doe vary in their judgements concerning them, the first of them here set downe is the true (at least the truest hath beene knowne to be) *Origanum Heracleoticum* of *Discorides*. The two next that follow, the one of *Matthiolus*, the other of *Camerarius*, are both in resemblance so neere his *Onitis*, that we may truly say, that either of them are the same, and that both of them differing but in largesse of leaves, (which the fertility of the soyle wherein it grew might bee the cause) are but one *Onitis*. But that wild *Origanum* of *Discorides*, that hath an umbell like unto *Dill* is not to be found, unless the wilde *Origanum*, that is to be had at the Druggists and Apothecaries be his: for it is the neereft thereunto, being the strangest and quickest in taste, which by *Galenus* judgement is the best. The Arabians call it *Fandenigi*, or *Fandenigi*: the Italians *Origano*; the Spaniards, *Oreganos*: the French *Origan*, and *Marjolaine*, balstarde: the Germanes *Felgmaich*, *quast* *dicas* *anmi* *bonitatem* *vel* *lestitiam* & *Rott* *Dosen*, or *Coscent*: the Dutch *Orega*; and we in English, *Organy*, or balstar *Marjerome*.

The Vertues.

The decoction of *Organy* or balstar *Marjerome* with wine, is good for those that are bitten with Serpents, or venomous beasts, and to be taken with loddene wine, for such as have taken *Hemlocke*, or *Opium*: with *Oxymel* it is good for those that have taken poison, or the root of *Colchicum Ephemerum*. It is given with Figges to those that are fustien, or have a rupture, convulsions or cramps, or have the Dropsie. The dried hearbe taken in honied water, purgeth downwards, blacke or melancholick humors. It helpeth to procure womens courses, and taken with Honey is helpfull to those that have a cough. It profiteth those that have an itch, or are scabbed and mangy, and those that have the laundise, are much holpen by a decoction thereof taken when they are in a bath. The juyce of the Greene hearbe healeth the swellings of the almonds of the throat, and the ulcers of the mouth; it draweth forth fleagme by the nostris, if it be infused in the oyle of Flower-de-luces. It easeth the paines of the eares, being used with milke. A medicine purging by vomit is made with it, Onions, and Sumach, (such as is used to be eaten) being set in the Sunne for 40. dayes, in a copper vessel, whilst the Dogge-starre lasteth. All Serpents will avoide the place where the hearbe is srowed. The wild kinde especially, healeth all bytings of venomous beasts, if the heads and flowers be taken in wine. And to this purpose *Antigonus* an ancient Greeke Author, in his Rhapsody or huddle of inemorable reports, relateth a pretty fable of a Tortoise eating *Origanum*, when hee goes to fight with the Serpent, which when one had heedfully observed, he cut up the *Origanum* where it grew, and took it away; whereof when the Tortoise was deprived, he perished by the venomous force of the Serpent; which fable *Plutarch* in his naturall questions, relateth somewhat otherwise: that is, that the Tortoise having eaten of the flesh of a Viper, by eating the hearbe *Origanum*, was free from the danger. The same *Antigonus* setteth downe there also another fable of Ring-doves, who by putting *Origanum* into their wounds, were thereby cured. As also that if the bills of Ants were stopp'd up with *Origanum* and Brimstone, they would quickly flie away: which thing also *Palladius* reporteth. *Galen* saith all the sorts are of a cutting, rarefying, or thinning faculty, and that in the third degree, and that the *Heracleoticum* is of more efficacy than *Onitis*, and the wild stronger than either. The decoction of *Origanum* with a few Cloves and Ugar, helpeth those that have the Hickock exceedingly. The powder thereof mixed with a little Salt-peter and honey, made into the manner of a thin Electuary, and therewith the teeth being rubbed for sundry times, will make them whiter and firmer.

CHAP. VII.

Tragoriganum. Goates Marjerome.

BEcause the *Tragoriganum* is joyned next unto the *Origanum*, I thinke it fitting for to shew you them in the same manner, yet in a distinct chapter by themselves, for that their face and property is a little differing.

1. *Tragoriganum Creticum*. Goates Organy of Candy.

This small low *Tragoriganum* of Candy hath divers small low branches, not above a foot high, somewhat woody, whereon are set at severall joynts two leaves, and sometimes more, which are somewhat broader, rougher, and harder than the leaves of Candy Tyme, and somewhat like unto Summer Savory, but of a sadder Greene colour, the small hooded gaping flowers stand at the top of the branches, in severall distances about the stalkes, of a purplish red colour, the whole plant and every part thereof tasteth very hot and sharp, and smelleth very sweet, but somewhat strong and quick, soone piercing the senses, and abideth Greene all the Winter if it be carefully preserved, but left without defence, it seldome abideth, the roote spreadeth with many small fibres thereat.

2. *Tragoriganum latifolium* sive *Marum Corvusi* *Matthiolo*. Broad leaved Goates Organy, or Marjerome.

This other Goats Marjerome is a fine small bushy plant, little above halfe a foot high, whose stalkes are not so woody, but tenderer like Marjerom, with many small smooth gentle leaves, two for the most part set together at a joynt, somewhat broader than our Mallick Tyme, of so strong, hot, and quick a scent, that being a little bruised and smelled unto, it pierceth the senses more than the former, and cometh somewhat neere unto the scent of Calamint or Pennyroyall; the flowers are small and purple, growing up to the toppes of the branches, from betweene the joynts; this bideth Greene also like the former, but requirerh as much care in the preserving it in the Winter, as the former: the roote is a blackish bush of many fibres set together like Marjerome.

3. *Tragoriganum Hispanicum*. Spanish Goates Marjerome.

This Spanish kinde riseth up somewhat higher than the former, with whiter and harder stalkes, the leaves are whiter also, smaller, narrower, and longer than they, and more store usually at every joynt, smelling somewhat sweet, but nothing so strong or quick, nor tasting so hot as they: the flowers are white, and grow at severall distances towards the tops of the stalkes, but larger and more gaping, standing in brownish Greene huskes: this also abideth green in the winter, but is more hardly preserved than either of the former: the roote is more woody, and lesse bushy than they.

4. *Tragori-*

1. *Tragoriganum ibericum*.
Goates Organy of Candy.

2. *Tragoriganum latifolium* five *Marum Cortusi* Matthiola.
Broad leaved Goates Organy, or Marjerome.

3. *Tragoriganum Hispanicum*.
Spanish Goates Marjerome.

4. *Tragoriganum Matthioli*.
Goates Marjerome, with wilde Tyme leaves.

4. *Tragoriganum Matthioli*. Goates Marjerome,
with wilde Tyme leaves.
Matthiolus first set forth this plant, calling it *Tragori-*
ganum, which he saith he doth assume to be so, having
divers stalkes from a bushy root, and small leaves grow-
ing

ing thereon at severall distances, which are like unto the ordinary wild Tyme, or mother of Tyme : the flowers are purple, standing in rundles, at the toppes of the branches. This smellth somewhat like Pennyroyall.

The Place.

This first groweth in Candy and in Spaine also, as *Clusius* saith. The second is not knowne (being not set down by *Cortusius*, which sent it to *Matthiolus*) where it groweth. The third *Clusius* saith he found in the Kingdome of *Valencia* in Spaine. The last, *Matthiolus* saith groweth in the Country of *Forejulium*.

The Time.

They all flower very late with us, and some so late, that we hardly see any flowers untill October, if we see any at all.

The Names.

It is called in Greeke *τραγοριανος* (and in Latine *Tragoriganum*) quasi *hircum origanum* dicas, quod pabulo gratum sit *hircis*, ut *Onitis asinus*, potius quam, quod *hircum* faciat. The first is called by *Pena* and *Lobel* in their *Adversaria* *Tragoriganum Cretense* apud *Venetos*, by *Clusius* *Tragoriganum 3 Hispanicum*; by *Caspar Bauhinus* in his *Pinax*, *Tragoriganum Creticum*; and it is likely to be the greater Tyme of Candy, that *Prosper Alpinus* setteth downe in his Booke of *Egyptian* plants. The second is called by *Gesner*, *Tragoriganum alterum*, and so doth *Lobel*, which is that *Marrum* that *Cortusius* sent unto *Matthiolus* for *Thymum Creticum*, and by that name of *Marrum*, *Durantes*, *Lugdunensis*, and *Tabernmontanus* doe call it, and *Bauhinus*, *Tragoriganum latifolium*. The third is the second Spanish *Tragoriganum* of *Clusius*, bearing white flowers, whom *Dodonaeus* and *Camerarius* in his Epitome of *Matthiolus* upon *Dioscorides*, *Lugdunensis* and *Tabernmontanus* doe follow. The last is the *Tragoriganum* of *Matthiolus*, whom *Durantes*, *Lugdunensis*, and *Tabernmontanus* doe follow, and *Bauhinus* calleth *Tragoriganum Serpillifolium*. To show you likewise how aptly these plants are called *Tragorigana*, and how they disagree, it were not amisse to give you the text of *Dioscorides* thereon. *Tragoriganum* (saith he) is a small bush or shrub, with leaves and stalkes like unto *Serpillum*, or *Origanum*, in some places it is found more fresh and Greene, with broader leaves, and somewhat clammy. Another sort is found with slender branches, and small leaves, which some have called *Prasium*. All these Authors have delivered us these hearths here mentioned, under the name of *Tragoriganum*, as supposing them to come neere unto one or other of those of *Dioscorides*, both for their forme, sweetnesse of scent, and hotnesse in taste : and *Lobel* saith that among all the plants that are entituled *Tragoriganum*, hee could finde none that came neerer to those of *Dioscorides*, than those two sorts he alloweth of, and are the two first here set downe, the one called by the Venetians *Cretense*, and that other small low plant that *Matthiolus* setteth forth, under the name of *Marrum*, which he saith he had from *Cortusius*. But because they are more hot and sharp than I suppose *Dioscorides* his to be, for he saith the drinke made of them is both mild and pleasant, or delectable; fit to be taken of those that have loathing stomacks; and moreover, that *Galen* saith that *Tragoriganum*, besides the quality of *Origanum*, hath some astringent or binding property in it also, which in my judgement abateth of the heat of them, making it the milder, but although I cannot absolutely subscribe unto them herein, yet I deny not any of them their due praises, nor their first founders their besting honours. *Bellonius* at the latter end of the 62 chapter of his first booke of observations, saith that those of Candy and Cythera, doe call our Winter Savory by the name of *Tragorigoni*, which is *Tragoriganum*.

The Vertues.

Dioscorides saith they doe heate or warme the parts whereunto they are applyed, provoke urine, and are profitable to move the belly downward, by purging choller, if the decoction thereof be taken inwardly; as also, that a decoction made thereof with vinegar, helpeth those that are troubled with the spleene; and taken in wine, helpeth those that have taken the venomous *Ixia* (which is the roote of the black Chamæleon Thistle, having as he saith, the taste and smell of Bassill) procureth womens monethly courses, and given with honey in an Electuary, helpeth those that have a cough, and are short winded : the drinke thereof is milde and delectable, fit to be given to those that loath their meate, and have weake stomacks, or such as have sower belchings, and for those vomitings that are procured by the tossings and aire of the Sea, and also for the heart-burning. *Galen* saith in his eighth booke of simple medicines, that it hath the same properties that the *Origana* have, but withall, hath a little astringent. *Pliny* in a manner hath the same things, for he saith, it provoketh urine, dissolveth tumors or swellings, and is especially good for those that have taken the poison of *Viscum*, (for so he termeth the *Ixia* of *Dioscorides*) in drinke, and for the biting of a Viper : for sower belchings of the stomack, the heart-burning, and for coughes, Plurisies, and shortnesse of breath.

CHAP. VIII.

Ocimum. Bassill.

Here are divers sorts of Bassill, the most whereof are very great strangers to our Nation, and but entertained by a few that are curious and industrious.

1. *Ocimum vulgare majus & minus*. The great and small common Bassill.

The greater ordinary Bassill riseth up usually but with one upright stalk, diversly branching forth on all sides, whereon are set two leaves at every joyn, which are somewhat broad and round, yet a little pointed, of a pale Greene colour, but fresh, a little snipt about the edges, and of a strong heady scent, somewhat like a Pomection, as many have compared it, and therefore called it *Citrarium* : the flowers are small and white, standing at the tops of the branches with two small leaves at the joyn, in some places Greene, in others browne, after which come black seed : the root perisheth at the first approach of winter weather, and is to be new sowne every year, if you will have it. The lesser kinde called small, fine, or bush Bassill, groweth not so high, but is thicker spread with branches, and smaller leaves thereon, closer set together, and of a more excellent pleasant sweet scent by much : the flowers are white, and the seed black like the other, when it giveth seed with us, which is more seldome, for it hath not bene knowne to give ripe seed in our Country often, because it neither springeth nor feedeth so early as the former. Unto these sorts of Bassill I must adde the third, which is as it were the meane betweene them, being greater than the small one, and lesser in leaves than the great, and not growing so high, in other things differing not.

2. *Ocimum*

1. *Ocimum vulgare*. Ordinary Basil. 7. *Ocimum minus*. The small Basil. 2. *Ocimum Maximum*. The great Basil.

2. *Ocimum maximum* Citratum. The greatest Citron Basil.

This kinde of Basil differeth not in the manner of growing from the greater ordinary garden Basil: but brancheth forth like it, with leaves set by couples at the joynts, but much larger, and of a reddish colour in the hotter Countries, but not so in the colder, a little dented about the edges, of a very sweet scent, resembling a Citron pill, and therefore called *Citratum*; the flowers are white like the ordinary Basil, and the seed black like it, perishing also after it hath flowered and feeded.

3. *Ocimum caryophyllatum maximum*. The great Clove Basil.

There is another also of these greatest Basils that differeth not from the former, either in growing, or largenesse of leaves, or colour of the flowers, except that sometimes they are a little purplish, but in the smell of the whole plant, it hath a stronger and quicker scent, more neerely resembling Cloves, then the former, and is thereupon named *Caryophyllatum*.

4. *Ocimum Anisatum*. Aniseed Basil.

This Basil is of the kind of our ordinary garden Basil, and of a middle kinde, whose leaves are neither so great as the greater, nor so small as the small kinde, but of a middle size betweene them both, the difference whereof consisteth chiefly in the smell, which is like the smell of Aniseed.

5. *Ocimum Indicum*. Indian Basil.

The Indian Basil hath a square reddish Greene stalk, a foot high, or better, from the joynts whereof spread out many branches with broad fat leaves set thereon, two alwayes at a joynt one against another, as the Basils have, but somewhat deeply cut in on the edges, and oftentimes a little crumpled, standing upon long reddish foot stalkes, of a darke purple colour, spotted with deeper purple spots, in some greater, in others lesse: the flowers stand at the tops of the stalkes, spike fashion, of a white colour, with reddish stripes and veines running thorow them, set or placed in darke purple coloured huskes: the seed is greater and rounder than any of the former, and somewhat long withall: the root perisheth like the rest. The whole plant smelleth strong like unto the ordinary Basil and Camfire put together.

6. *Ocimum Crispum*. Curld Basil.

This curled Basil is of the kinde of the Indian Basil, having such like large leaves cut in somewhat deeply on the edges, and curled or crumpled as they are sometimes, as also with swelling bunches like bladders on them, but wholly of a Greene colour, without any spot on them, as the stalkes are also: the flowers hereof are likewise wholly white, without any spot in them: the smell hereof is somewhat strong, resembling the spotted Indian kinde, and is very likely to be but a degenerate kinde, risen from the seed thereof, being gathered in these colder Countries.

7. *Ocimum minus angustifolium*. Small dented Basil.

This small Basil groweth not so like any of the former Basills, or the small fine bush Basil, in the bushing branches thereof, but rather somewhat resembling the wild Basil, or *Clinopodium*, having fewer stalkes and branches, with small narrow leaves, a little snipt or indented about the edges, two alwayes set together at a joynt, but more sparsely on the branches: the flowers grow at the tops of the branches, somewhat like unto Basil of a white colour, but bending a little more backward, the smell hereof is smaller than any of the other Basills.

The Place.

These plants grow onely in Gardens with us, as also in Italy, and other places where they are cherished; their naturall being not knowne to us: onely the Indian and curld Basil are said to come first from the West-Indies into Spaine, and from thence into other places.

5. *Ocimum Indicum*. Indian Basil.

The Time.

They all flower in the heate of Summer, and some of them later.

The Names.

There is some controversie among Writers concerning this plant, in three or foure particular matters: first, for the etymologie or derivation of the word, some thinking it to be derived from the Greeke word *δωός*, and the Latine *ocymus*, that is, a *celeritate crescendi*, from the speedy springing of the seed (which is usually within three or foure dayes, if it be a hot and dry time without raine, for moisture turneth it into a gelly, as any one may see, that will looke on it after it hath taken wet) which is written with *o*. Secondly, as some thinke, from the Greeke word *ὀσμο*, which signifieth, to smell, or give a favour, as commonly taken in the worst sence, as in the best; and so would have the word to be *Ozimum*, of the sweet smell thereof. Thirdly, whether it should be *Ocymum*, as it is to be found in divers ancient Writers, or *Ocinum*. Fourthly, what *Ocymum* is of the ancient Writers, for by divers it is taken to be that kinde of graine called *Fagopyrum*, or *Tragopyrum*, in English Buckwheate, or else a kinde of medley of Corne or Pulse sowne together, as many ancient Writers have set it downe, as shall be shewed in his proper place, whereunto I shall referre you. And lastly, about the vertues as shall be shewed presently. It is called by the latter Greeke Writers, *Βασιλικόν*. *Basilicum*, because the smell thereof being so excellent, is fit for a Kings house. The first two sorts of these Basilis are by all Authors so called, as I doe. The second is the same *Ocymus* that *Trisper Alpinus* saith groweth in the Gardens of *Alexandria* in *Egypt*. The third is so called by *Lobel* and others. The fourth is onely set forth in the great Booke of the Bishop of *Eystor* his garden: the fifth is called *Hispanicum*, by *Camerarius* and *Tabermontanus*, and *Indicum*, by *Chusius* and others. The sixth is as is said in the description, a degenerate kind of the last before it. The last is so called by *Esclapens*, as is here expressed. The Arabians call it *Berandarus*, and *Badobrog*, the Italians *Basilico*; the Spaniards *Albahaca*; the French *Basilic*; the Germans *Basilgen*, and *Basilgram*; the Dutch *Basilicom*; and we in English Basil.

The Vertues.

Basill in all Countries for the most part is of little use in Physick, but rather used as a sweet smelling hearbe to sweeten or perfume any thing, or else used outwardly to comfort and warme cold members. *Discorides* saith that being eaten in any plentifull manner, it dulseth the sight, maketh the belly soluble, stirreth up wind, provoketh urine, with-draweth the milke, and is of hard digestion. *Galen* also saith it is accounted among those things that are hot in the second degree, but because it hath an excrementitious moisture joynd with it, it is not fit to be taken inwardly: and in another place, that it is an hearbe for sawce, or meate, hurtfull to the stomach, breeding ill juyce, and hard to be digested. It is held by *Crispissus* (as *Pliny* saith) who inveied bitterly against the use thereof, to be hurtfull both for the stomach, urine, and eye-sight: and besides, causeth a kinde of madnesse and lethargie, and other diseases of the liver, &c. And that those of *Affrica* say, that if any have eaten Basill, that day he is stung by a Scorpion, that he cannot be saved: which saying is quite contrary to that of *Discorides*, that saith, from those of *Affrica*, that he shall have no paine or danger, that is stung by a Scorpion, if he have eaten Basill before. *Pliny* setteth downe, that in his time it was defended from such calumnies as *Crispissus* cast upon it, and was commended to be profitable against the sting of Scorpions, and some other venomous Serpents; and found to be helpfull and wholsome for those are given to swooning, used with vinegar, and smelled unto: used with oyle of Roses, or Mirtles and Vineger, is good against the paines of the head, it is profitably applied to those are troubled with the lethargie, the jaundise and dropsie. It is good to be put into the eares of young children with a little goose-grease, to helpe them of paines thereof: the juyce or the seed bruised put into the nostrils, procureth sleeing: it is good also for the trembling of the heart, it provoketh Venery, and therefore was given to horses to make them apt to breed. Some of the ancient Writers likewise have set downe, that the seed is good to kill the wormes of the belly, to lessen the spleene, and that bruised and mixed with Oxegall, it taketh away the foule markes and scarres of ulcers, and other sores. And used with honey, it taketh away the discolourings and spots of the face. The Arabian Authors and Mesues chiefly have used the seed among other Cordiall Spices, for the comforting of the heart in the trembling thereof, and the expelling of Melancholy or sadnesse, that riseth without manifest cause. And for these causes chiefly the seed is used by our later Physicians for the most part: the fragrant smell of this hearbe so comfortable to the senses, reviving them as it were, when they are dull or distempered, may evidently declare a singular efficacy to be therein, and therefore not to be smally regarded. *Theophrastus* in his first booke, and eighth Chapter *de causis plantarū*, saith that Basill growing in a place too much exposed to the heate of the Sunne, changeth into *Serpyllum*, or wild Tyme, by the overmuch drynesse thereof, for the leafe becommeth smaller, and the scent the stronger thereby: but these Metamorphoses or changes of hearbs one into another, is very frequent both with him, *Pliny*, yea, and *Galen* too, as well as divers others of the ancient Writers, which sheweth in what errors men of judgement and learning have bene conversant and confident in. I let me yet before I leave, relate unto you a pleasant passage betweene *Franciscus Marchio*, an Advocate of the state of *Genua*, sent in Embassage to the Duke of *Millan*, and the said Duke, who refusing to heare his message, or to agree unto the conditions proposed, brought an handfull of Basill and offered it to him, who demanding of him what hee meant thereby, answered him, that the properties of that hearbe was, that being gently handled, it gave a pleasant smell, but being hardly wrung and bruised, would breed Scorpions: with which witty answer the Duke was so pleased, that he confirmed the conditions, and sent him honourably home. It is also observed, that Scorpions doe much rest and abide under those pots or vessels wherein Basill is planted.

CHAP. IX.

Clinopodium. Field Basill, & *Acinus*. Wild or Rough Basill.

Have as you see joynd both these together for the affinity, both of their name and nature unto the former Basills, and betweene themselves, for that divers of our latter Writers doe confound them, the one calling that *Acinus*, that another doth *Clinopodium*.

I. *Clinopodium minus sive vulgare*.

Field Basill, or Beds foote flower,

That *Clinopodium* that is taken by the best Writers and other Herbarists in these dayes, to come nearest unto the description

description of *Diocorides*, is a small low hearb not above halfe a foot high, having divers hard round branches, rising from a small woody root, with two small leaves set at every joynt, being somewhat like the small or fine Basill, a little dented about the edges; and in some plants, and places a little hairie and rough, and in other lesse, or not at al; the flowers grow at spaces with the leaves, like as Horsehound doth, standing in small Greene rough cuppes, which are of a purplish colour, and parted as it were into foure equall short pieces at the end, like the foure square foote of a Bed-stead, and not hooded or open with severall leaves, like other hooded flowers: the seed is small and round, growing in small swollen huskes: the plant hath some small heate, but more drynesse in the taste thereof, sweet also in scent, betweene Basill and Calamint.

2. *Clinopodium Austriacum*. Austrian wild Basill.

The Austrian wild Basill hath divers slender hard foure-square stalkes, not a foote high, whereon are set two Greene leaves at every joynt, somewhat like the former Field Basill, but smaller, being a little dented about the edges, which is forgotten in the figure: the flowers stand at the toppes of the stalkes, somewhat like unto the flowers of the former, but much larger, and of a violet purple colour, somewhat sad for the most part, (but some plants are found with white flowers) hanging downewards, and bending also backwards for the most part, in like manner as the former: the seed is enclosed in such like swollen huskes, blacke and round, three or foure together, like Calamint, or somewhat resembling the other: the rootes are many, hard and black, with divers fibres annexed unto them.

3. *Clinopodium Alpinum*. Mountaine wild Basill.

The Mountaine wild Basill groweth with divers low and creeping foure-square rough branches, having two small rough leaves at every joynt, and some smaller also between them, growing all along the stalkes: the flowers are many growing in a head together, with the leaves among them;

1. *Clinopodium minus sive vulgare*.
Field Basill, or Beds foot flower.

2. *Clinopodium Austriacum*. Austrian wild Basill;

at the toppes of the branches, very like unto the flowers of the first, but of a dark red colour: the roots are many small blackish strings, which shoot forth under ground new sprouts, thereby creeping about and increasing plentifully, abiding with his green leaves, which perish not.

4. *Acinos* five *Clinopodium* majus.
Great wild Basil, or Stone Basil.

Aliud

5. *Acinos latifolia Columna*.
Broad leaved wild Basil.

4. *Acinos* five *Clinopodium* majus. Great wilde Basil, or Stone Basil.

This wild Basil hath foure-square hard, hairie, and hoary stalkes, a foote high, or more, set with two hairie green leaves at a joynt, being covered also as the stalkes, with an hoary downe somewhat larger than any of the former, comming neere unto the bignesse and fashion of the leaves of *Origanum*: the flowers grow in rundles, in more plenty than the former, of a purplish colour, and sometimes white, the husks whereof are somewhat larger and rougher: the roots are a bush of many strings set together at the head, which shoot forth suckets round about.

Of this kinde there is also another, whose stalkes are lower, the leaves lesser, and the husks of the flowers smaller than the former, not differing in any other thing from it.

5. *Acinos Anglican Clusij*. Our English wild Basil.
The English wild Basil hath a few slender foure-square branches, not a foote long, lying on the ground, whereon grow divers small grayish green leaves, two alwayes at a joynt set together, which are not much unlike the first Field Basil, but smaller, shorter, and fuller of juyce, and not dented about the edges at all, very like unto the last wild Basil, but smaller, of a certaine sweet scent, but not heady: from the middle of the branches up to the toppes, grow the flowers in rundles or spaces about the stalkes, being very like unto the first Field Basil, but of a more bluish purple colour, with a white eye or circle in every flower, and after they are past, come three or foure small seeds like the first, in the husks where the flowers stood: it perisheth every year in my garden, and rayseth it selfe from its owne sowing.

6. *Acinos latifolia Columna*. Broad leaved wild Basil.
The great leaved wild Basil riseth from a bushy roote, with a rough or hairy stalke, spreading forth into divers other branches, whereon grow larger leaves below, and smaller upwards, two together; at the setting on of the leaves, which are also rough or hairy, very like unto the leaves of the greater Basil, but somewhat smaller and longer, ended about the edges, and each of them standing on a long stalke, towards the tops the flowers grow much, and are many, spike fashion, of a purplish colour, very like unto the flowers of the garden Basil, after which come the seed vessels, containing within them small round blackish seed.

The Place.

The first groweth most usually in the borders of fields, even among the corne, as at *Sutton in Kent*, not farre from *Dartford*, at *Thetford in Norfolk*, and in other dry sandy and untilled grounds: The second groweth upon the hills that are neere the Baths at *Baden in Austria*, as *Clusius* saith, and upon *Mount Baldus*, as *Pona of Verona* saith. The third also groweth upon *Mount Baldus in Italy*, as the same *Pona* setteth downe, in the description of the hearbes growing thereon. The fourth is found sometimes in the corne fields of our owne Countrie, but more often in the more open Woods, and in Copses that have bene feld in many places of *England*. The fifth *Clusius* saith he found likewise in *Kent*, while he staid a while at the Lord *Cobham's*, wayting for his passage over Sea, but it is found in divers other places of *Kent*, and other parts besides. The last *Fabius Columna* saith, groweth plentifully at *Naples* in their Gardens.

The Times.

They doe all of them flower about the beginning of Iune, and their seed is ripe in August, and sometimes sooner.

The Name.

Clinopodium is called in Greeke κλινωπόδιον quasi lectipes quod serculi (alijs ut *Plinio* orbiculati florum ambitus) speciem pedum lecti præbeant, in English Bedstroot flower, because the branches say some (but *Pliny* saith, the round compasse of the flowers) doe resemble the feet of a bed, whereupon I have

so entitled the first, as most agreeing thereunto *Acinos* *habros*, by *Dioscorides herba odorata coronaria, ocimo similis*. *Acinos* is a sweet herb fit for Garlands, and is like unto Basil. *Pliny* saith *Acinos* that is called *Epipetron* never flowreth, therein confounding the *Epipetron* of *Theophrastus*, which he saith never flowreth with *Acinos*, but *Dioscorides* saith no such thing, and therefore *Pliny* was much mistaken herein, as he was in many other things. The first is called *Ocimum Silvestre*, and *Clinopodium minus* or *vulgare* by *Lobel* and *Clusius*; and *Acinos* by *Fuchsius* in *Iconibus*, and by *Dodonæus*: *Clinopodium* of *Turner*, and *Anguillara*: *Clinopodium majus* of *Camerarius*; *Pulegium petraeum* of *Gesner*, *Clinopodium alterum*, or *pseudo-clinopodium* of *Matthioli*, *Ocimum* of *Fuchsius*. *Bauhinus* calleth it *Clinopodium arvensis ocimi facie*, it is the *Basilicum* 3. of *Tragus*, who calleth it also *Calamintha montana*, but of all other most improperly; in English, Field Basil, because it is chiefly found in the Fields, the Country people call this as well as the first where it groweth, Horse Time, and Poley mountaine. The second *Clusius* calleth *Clinopodium Austriacum*, and saith he might as well call it *Acinos Austriaca*. *Bauhinus* calleth it *Montanum*, in English Austrian wild Basil. The third, *Pona* calleth *Clinopodium Alpinum*, having found it onely upon *Mons Baldui*, not farre from *Verona*, but why *Bauhinus* should call it *Teucrium Alpinum coma purpureo carulea* in his Chapter of *Teucrium*, having called it *Clinopodium Alpinum hirsutum*, among the other sorts of *Clinopodium*, I see no reason, in English mountaine wild Basil. The fourth is the first *Clinopodium vulgare* of *Matthioli*, and called *Clinopodium majus* of *Camerarius*: *Lobel* and *Dalechampsii* call it *Acinos*, and *Guilandinus* *Betonica Pauli*, it is the first Calamint of *Turner*, *Pulegium montanum* of *Lonicerus*, and *Polycnemum* of *Gesner*. *Bauhinus* calleth it *Clinopodium Origano simile*, in English great wild Basil. The fifth is thought by *Clusius* to be the true *Acinos* of *Dioscorides*, *Bauhinus* calleth it *Clinopodium ocimi facie alterum*. The last is called *Acinos* of *Fabius Columna*, in his *Phytobasanos*, and saith it is generally called *Vrlicbella* of the Neapolitans, because it hath such like roughnesse and hairynesse, although not stinging as nettles have, and is an annual plant to bee new sowne every yeare. But it is much to bee doubted whether any of these herbs be the right *Acinos* or *Clinopodium*, that *Dioscorides* and *Theophrastus* have set forth, in regard their temperature and qualities doe not agree as you shall heare presently, although *Pena* and *Lobel* thinke their *Clinopodium* to be the right. The Italians call it *Clinopodio*, the Spaniards *Albahaca Sauvage*, the French *Basilicq Sauvage*, the Germanes wild *Basilich*, the Dutch wild *Basilicon*, and wee in English wild Basil, Field Basil, or as before said.

The Vertues.

Of these herbs I know no author hath set downe any tryed remedy found by them, for in regard that *Galen* saith *Clinopodium* is of thin parts; and may be accounted to be in the third degree of heate and drynesse, being somewhat sharpe in taste, and a little bitter withall, neither of which as saith *Matthioli* can be found in these, yet because they doe so neerely in face and shew resemble the true plants, they may beare their names untill they gaine truer and that the vertues are found out, whereunto they may be applied. *Dioscorides* saith that his *Clinopodium* is applied to those that are troubled with convulsions or crampes, ruptures or burstings, or strangury, that it is a remedy against the sting or byting of venomous Serpents, and that it bringeth downe the courses of women, and expelleth the dead child, and taketh away those warts that are long, and hang downe, if it be drunke for certaine dayes together. It stayeth the loosnesse of the belly, if it be given after it hath bene boyled to the thirds in wine, to them that have no feaver, and in water to them that have a Feaver. Of *Acinos*, *Dioscorides* writeth, that being drunke it stayeth both the fluxe of the belly, and the courses in women, and healeth hot swellings, and those are called *Saint Antonies fire*. Where you may observe that *Acinos* should not be *Clinopodium*, both in regard *Dioscorides* maketh them two distinct plants, and besides giveth them contrary qualities, for *Acinos* he saith stayeth the loosnesse of the belly, and the overmuch flowing of womens courses, whereas hee saith *Clinopodium* procureth the courses, and expelleth the birth, yet he saith also that it stayeth the loosnesse of the belly, and as *Galen* saith, is hot and dry in the third degree, and of thin parts.

CHAP. X.

Polium, Poley, or Polemountaine.

Although *Dioscorides*, *Galen*, and *Pliny* have remembred but two sorts of *Polium*, yet our later Writers have found out divers other sorts, which they referre thereunto, some of them grow naturally neere the Sea, and therefore called of some *Polium maritimum*, others not onely neere the Sea, but upon the hills also, and therefore may as well be called *montanum*, as *maritimum*, and others farre off from the Sea, upon hills and mountaines, and therefore called more properly *Polium montanum*, as shall be shewed in this Chapter following.

1. *Polium montanum vulgare*. Our ordinary Poley mountaine.

This kind of *Polium* or Poley mountaine, that is most frequent in our gardens, is a small low plant, having divers white or hoary round and hard branches (rising from the root, which is somewhat long and hard, with a few fibres hanging thereat, not above a foot high.) whereon are set divers long and small hoary leaves, overlaid as it were with a yellowish white downe, somewhat dented about the edges, and somewhat broader or greater than any of the others that follow, two alwayes set together on the stalkes as they grow up, at the tops whereof grow forth whitish or hoary yellowish heads, thrusting out many small pale coloured flowers, and in some places more yellow, standing in hoary huskes: the seed is small and blackish: the whole plant smelleth sweet, somewhat strong and quick withall, the branches whereof being slipt and set will grow very well, thereby sufficiently to be encreased, because in our Land it seldome giveth perfect seed to bee sowne: yet *Clusius* saith, that hee had some plants raised from the seed of this kinde; that brought forth flowers more pale than the mother plant, and some more white, especially on the outside; being pale on the inside: but *Bauhinus* in his *Pinax* addeth, that it gave some plants whose flowers were of a whitish purple colour, and is to bee accounted the fourth sort of *Clusius*, which I am sure is not to be found in *Clusius*, who in that place maketh no mention of any with a purple flower raised from seed.

2. *Polium montanum minus*. Small Spanish upright Poley mountaine.

This second or small Poley mountaine, riseth up with many small slender branches standing more upright than the

1. *Polium montanum vulgare.*
Our ordinary Poley mountaine.

2. *Polium montanum minus.*
Small Spanish upright Poley mountaine.

the next, and not leaning downwards to the ground like it, nor much higher; whereon are set many hoary leaves, smaller than the next that followeth, and some small ones together with them, a little dented about the ends onely, and as hoary or rather more than it: at the toppes whereof stand longer and smaller heads of whiter flowers than the next, coming forth of hoary cuppes, larger and more spread than it also: the seed is blackish and small, yet greater than the former, although the plant be smaller; the roote is hard and woody like the former; the smell hereof is much more sweet than it.

3. *Polium montanum Monspeliacum.* Small French Poley mountaine.

This third and small Poley mountaine is very like the former, but that the branches stand not so upright, but leane more downwards, the leaves likewise are not fully so large, but as white and hoary, dented a little more about the edges: the hoary heads of flowers which are white, are smaller, and more closely compact, in other things this differeth not from the last.

4. *Polium maritimum Sapium.*
Creeping purple Poley mountaine.

5. *Polium montanum Sapium minimum.*
The smallest creeping white flowered Poley mountaine.

4. *Polium maritimum* *Supinum*. Creeping purple Poley mountaine.

Creeping Poley mountaine hath divers small weake hoary branches lying upon the ground, which as they spread take roote at the joynts, being not a foot long, whereon doe grow many small and long leaves, as white and hoary as any, a little dented also about the edges, but not easily to be seene, unlesse one marke them well, and in the younger growne not at all: at the toppes of the branches grow smaller heads of hoary huskes, out of which come purplish flowers, and after them small and blackish seed like the former.

Of this kinde there is another found, bearing white flowers, not differing in any other particular from it.

*Flora
albo.*

5. *Polium montanum* *Supinum*. The smallest creeping white flowered Poley mountaine.

This small kinde hath many small weake branches, not halfe a foot long, lying creeping on the ground, shooting forth fibres at the joynts as they spread, in the same manner as the last doth, whereon are set in the same order, two leaves one against another, all along the branches, being smaller, harder, narrower, and greener than any of the rest, without any denting at all about the edges: at the ends of the branches come forth, three or foure small white flowers, like unto the other for forme and fashion, but much smaller: the seed is not unlike the other: this hath little or no scent at all.

6. *Polium montanum* *lavendulae folio*. Spike leaved Poley mountaine.

This Poley mountaine from a hard woody roote, spreading out many small fibres sendeth out divers weake branches, not fully able to stand, but rather lying downe, whereon are set many small long leaves, two together, one against another, as in all the former, which are somewhat greene on the upper side, and hoary underneath, somewhat like unto the leaves of Rosemary or Lavender, and not a whit snipt about the edges; at the toppes of the branches stand forth many flowers, not bushing as in many of the former, but loosely spread, which are of a white colour, not differing in forme from the other, but coming forth of a grayish huske, not so hoary as some of the former: the seed is black like the rest: this kinde hath a small sweet scent, nothing so pleasant as most of the other: *Lobel* saith it hath little or no scent at all: *Matthiolus* saith that it smelleth well, though not so pleasant as his former, and that it is of lesse vertue and efficacy than it.

7. *Polium latifolium* *incanum* *Creticum*. Candy Poley with hoary broad leaves.

The branches of this Poley are round and hoary, about a foote high, spread into other smaller branches, set with two leaves at each joynt, which are somewhat broad and round, and dented at the edges like Germander, or the Ivie leaved Chickweed, of a yellowish greene on the upper side, and hoary underneath, without any manifest taste: the flowers have not beene observed.

8. *Polium angustifolium* *Creticum*. Vpright narrow leaved Candy Poley.

This Candy Poley groweth almost two foote high with up-right hard round woody stalkes, whereon are set small and long leaves almost round pointed, very like unto the common *Polium*, but much smaller, & not dented about the edges at all: the flowers and seed are like the common sort, the whole plant is very sweet.

9. *Polium montanum* *pumilum* *tenuifolium* *Africanum*. The small African dwarf Poley.

This small creeping Poley, hath many very small and hoary white leaves, set together at a joynt all along the stalkes by distances, the flowers are small and yellowish growing at the toppes: the roote is somewhat woody as all the rest of the plant is, and somewhat sweet also.

The Place.

The first as I said being the most common in this Land, *Clusius* saith he found in the Kingdomes of *Granada* and *Valentia*. The second *Clusius* saith he onely found growing upon the hills in *Spaine*. The third he likewise saith groweth as well in the Kingdome of *Valentia* in *Spaine*, as at *Mompelier* in *France*. The fourth groweth also in a Province of *Spaine*, and neere unto *Venice* also, upon the Adriatick shore. The fifth groweth neere *Vienna* in *Austria*, and on the hills in *Savoy*, neere the Lake *Lemanus*. The sixth groweth in divers places of *Germany*, as upon the hills of *Hamborough*, the hills neere *Turin*, and neere *Noremberg* also, as *Camerarius* saith. The seventh as *Bauhynus* saith came to him from *Honorius Bellus* out of *Candy*, where the eight also groweth all along the Sea side, and upon Mount *Baldus* also, as *Pona* saith: the last was gathered neere *Tunis* in *Barbary*, by *Boelius*, and brought to Doctor *Lobel* and us.

The Tyme.

They doe most of them flower in Iuly and August, yet some later than others.

The Names.

Polium is called in Greeke *πολιον* sic dictum propter canitatem *πολιος enim canitatem vel canum significat, quia capitulum habet canorum hominis instar capillatum*; because it is like unto the hoary haire of a mans head: but this is referred to the toppes or heads, and not so directly to the leaves as *Pliny* would have it, although the leaves also are somewhat white and hoary; in Latine *Polium*, & thereafter all other Nations call it according to their dialect. The first is called *Polium montanum vulgare*, and *Polium montanum Incanum* by *Lobel* and *Pena* in their *Adversaria*, as also in his observations.

8. *Polium angustifolium* Creticum.
Vpright narrow leaved Candy Poley.

9. *Polium montanum pumilum tenuifolium* Africum.
African dwarf Candy Poley.

servations, for they answer one another, so that by the name of *Lobel* (where I name him alone thorowout all this booke) I doe not drown the name of *Pena*, nor the name of *Lobel*, when I name *Pena* alone: but for brevities sake name one in stead of both. It is the first of *Dodonaeus* in his History or *Pemptades* in Latine, which I use onely here also: And the third of *Clusius* in his History of more rare plants, which I chiefly meane, when I cite him through all this worke, because both his Spanish and Pannonick observations are included therein, unlesse I recite his particular observations. The second is the second kinde of *Clusius*, in his Spanish observations, and the first with *Martholus*. The third is the first with *Clusius*, and the second with *Dodonaeus*, called *minus* and *mediterraneum* of *Lobel*, and *montanum album* of *Bauhinus* in his *Pinax*. The fourth is the fifth and sixth kindes with *Clusius*, the one with a purple, the other with a white flower, and called of *Lobel* also *Venetum*, of *Bauhinus* in his *Pinax*, *Maritimum supinum venetum*. The fifth is the eighth fort with *Clusius*, the fourth with *Dodonaeus* called *repens*, and so likewise by *Bauhinus*, and *montanum supinum minimum* of *Lobel*. The sixth is the seventh with *Clusius*, and called *folium retentiorum semina lavendulae folio* of *Lobel*, and is the second of *Matthioli*, and called *Polium lavendulae folio* of *Bauhinus*. *Bauhinus* first mentioned the seventh, and *Pena* in his Italian *Baldus* the eighth, and taketh it to be the second *Polium* of *Dioscorides*, the last is not mentioned by any Author before. *Fabius Columna*, as I shewed you in the first Chapter, would faine make *Polium* to be the true Hysope of *Dioscorides*, but I know not that any doth consent unto that opinion, for by the judgement of the best, this hearbe is the true *Polium* of all the ancients, as well in face as qualities, and therefore cannot be Hysope, besides, the taste hereof is very loathsome to the stomach, which *Dioscorides* also remembreth, but Hysope as he saith doth helpe to expectorate flegme, &c. and no pectorall hearbe that I know doth trouble the stomach, by the loathsome bitterness thereof, as this doth.

The Vertues.

The decoction of this hearbe drunke while it is warme, as *Dioscorides* saith, helpeth those that are stung or bitten by venomous creatures, yea as he saith, the fumigation or smoke thereof driveth them away, and so doth the hearbe being strowed or layd in Chambers: and although it trouble the stomach, and cause some paines in the head, yet it helpeth the Jaundise, and those that are hydropick, or are troubled with the diseases of the spleene, it moveth the belly, and bringeth downe the feminine courses, and doth consolidate or soder, or close the lips of cuts or wounds. *Galen* thus saith of *Polium*, in his eighth Booke of simples. It is bitter in taste, and sharpe or quick on the tongue also, and therefore it freeth the inward parts from all obstructions, and provoketh both urine and the feminine courses: being greene and applied to great cuts or wounds, it closeth them, especially that greater kinde; and being dry it healeth grievous sores or ulcers, and this the lesser kinde doth best performe. The lesser *Polium* which we use in Antidotes, or Counter-poysons (as *Mithridatum*, *Venice Treacle*, and such like) is the more sharpe and bitter, and is accounted to be dry in the third degree, and hot in the second.

CHAP. XI.

Dittamnus, Dittany, & *Pseudodittamnus*, Bastard Dittanie.

Have thought good in writing of the true Dittany, to make mention of the Bastard kindes thereof, in the same Chapter, both becaufe the face of them, that is the forme and colour of the leaves are very like, and that other good Authors doe the like, reckoning them as kindes thereof.

1. *Dittamnus Creticus*. Dittany of Candy.

Dittany of Candy hath divers hard and brownish, yet somewhat hoary stalkes rising from the roote, set full of leaves, two standing together one against another, all along the branches, which are broad and thick, and almost round, so hoary, white, and covered over with a woolly downe, that they have no shew of greenesse in them, as most other hoary or woolly hearbes have, at the toppes of the branches come forth scaly heads, made as it were of many thin leaves like unto scales, purplish on the outside, and paler on the inside, from among which come forth gaping flowers, of a pale purplish colour, and after them small brownish seed: the roote consisteth of many blackish strings or fibres, from a harder long roote: the whole hearb is of a quick or fry scent, especially if it be fresh, and likewise of a hotter taste, being new, then old, for it much decayeth in keeping: this is very tender, and hardly to be kept a winter in these colder Countries, so that it seldome commeth to shew any flower, but if you doe transplant some of the branches by slipping and setting them in August, they will better endure the following winter, with a little coverture, and may happen to give flowers the year following.

2. *Pseudodittamnus*. Bastard Dittany.

Bastard Dittany riseth up much higher than the former; the branches are a foote and a halfe long many times, as I have observed in mine owne Garden, whereon are set such like hoary and round leaves, as the true hath, but neither so thick in handling, nor so thick set on the branches, but more sparsedly, yet two alwayes together one against another: from the middle of these branches to the toppes of them, come forth the flowers round about the stalkes at the joynts with leaves, which are gaping like the former (and as Penny-royall, Mints, Calamint, and divers the like hearbs have) of a delayed purplish colour, standing in hoary huskes, after which come the seed, which is greater and blacker than the former, the roote hereof is not so black, but more hard and woody, shooting downe deepe into the ground, with divers sprays spreading from it: this hearbe is somewhat hot and sharpe, but not by halfe so much as the former: this doth well endure with us in our Gardens, if the Winter be not too violent sharpe and long, or if there be some care taken of it at such a time; it groweth very well also of the slips being put into the ground about the middle of Aprill, and a litle defended from the heate of the Sunne, for a time after the setting, and now and then watered in the meane time.

3. *Pseudodittamnus alter Theophrasti Pona*. Another Bastard Dittany.

This other bastard Dittany riseth up with many square hoary stalkes more than a foote high, set with two leaves at a joynt like the other, but somewhat larger and longer, toward the toppes whereof with the leaves come forth hoary huskes, like unto those of *Melissa Mollucca levis*, the great Assirian Balme, but shallower, out of which starre gaping flowers mixed of white and red: the foote spreadeth many fibres: this smelleth reasonable sweet, and abideth the Winter as the other, and is in like manner increased by slipping.

As for that hearbe which is called by many *Dittamnus albus*, and *Dittamnus album*, and by *Matthiolus*, *Baubinus* and others, placed with these kindes of Dittany together, although they doe all acknowledge that it hath no face or resemblance unto them, and is called *Fraxinella*, which hath some diversitie therein, as I shall shew you in another place.

The Place.

The Ile of *Crete* or *Candy* hath beene thought by the elder Writers, to be the onely place in the whole world, where the true Dittany did grow, and that not generally through the whole Ile, but in one corner of Mount *Ida*, called *Dittaea*, which supplied the uses of all parts, as *Theophrastus* at large hath set downe, in his ninth Booke, and sixteenth Chapter, the knowledge whereof was utterly lost, and perished with our fore-fathers, and but within a small space of time, or few yeeres since revived and restored to us againe: for *Monardus* of *Ferrara* writeth, that in his time it was not knowne, as he setteth it downe in his ninth Booke and third Epistle; his words are these, *Dittamno nisi rursus Venus ab Idasylva deporter omnino deficiamus*: but *Clusius* saith in his Appendix altera (which is joyned with his bookes of Exoticks) that it was signified unto him, that it was found also in the Ile of *Sardinia*, having lesser and whiter leaves than that of *Candy*, and exceeding sweet

2. *Pseudodittamnus*.

Bastard Dittany.

3. *Pseudodittamnus alter Pona*,
Another Bastard Dittany.

withall. The first Bastard Dittany groweth in many places, as *Dioscorides* saith, and as *Lobel* saith he understood by some Italians on *Monte negro* neere *Pisa* and *Ligorne* in the Florentine Dominions. It is sufficient frequent in many places of *Italy* in their Gardens, for we have had the seed thereof among others very often from thence, and abideth well in our Gardens also: the last, as *Pona* in his Italian *Baldus* saith, groweth in the Iland *Cerigo*, and brought from thence to *Signor Contareno* to *Padoa* to furnish his Garden.

The Time.

The true Dittany (as I said) hardly flowreth with us at all, and when it doth, it is very late, not bringing any seed, but *Dioscorides* (as it is found in the old Copies extant) writeth that it beareth neither flower nor seed, even as he had said before of *Nardus montana*, but *Matthiolus* defendeth him, saying, that it was most likely to be the slippe or errors of the Writers that set downe οἶον for εὐοῖον that is fert or profert, for confert, as thus, nec flores, nec fructum, vel semen fert, or profert, for nec flores, nec fructum, vel semen confert, for *Theophrastus* saith, lib. 9. cap. 16. *Plus foliorum non ramorum nec fructus est*, and *Virgil* and others (although *Pliny* following the corrupted text of *Dioscorides*, saith it beareth no flowers, nor seed, nor stalke, whereof it is a wonder, having borrowed so much out of *Theophrastus*, which acknowledgeth it) doe remember the flowers of Dittany, and so doth *Galen* also in the *Emplastrum de Dittanno*, whereof *Damocrates*, as he saith, gave him the receipt. The first Bastard Dittany flowreth with us all the latter part of the Summer, but seldome giveth us any good seed. The last hath not as yet bene seene in *England*.

The Names.

It is called in Greeke γλῆκον ἀγρία *Pulegium sylvestre*, by *Dioscorides* δίκταμον, by *Theophrastus* δίκταμον, some also δίκταμος and δίκταμος, in Latine also *Dittamnus* and *Dittamnium*, ἀπὸ τοῦ τίτλου *Cornario dici* videtur, quod τιτρινόσων γυναικῶν βολεῖται *mulierum faciles partus promittat, aut dolores penitus sedat* *Dioscorides* & *Theophrasto*: the first is called by all Writers *Dittamnus* or *Dittamnus Creticus*, or *Dittamnium*, or *Dittamnium Creticum*: the second likewise is called by all Writers *Pseudodittamnus*, or *Pseudodittamnus*, or *Pseudodittamnium*: *Anguiltra* saith it is called by the Greekes now a dayes *Calva martha*: *Pona* would make it to be the *Gnaphalium* of *Dioscorides*: the last is onely set out by *Pona*, who taketh it to bee the *Dittamnium alterum*, of *Theophrastus* and *Dioscorides*. The Arabians call it *Mejestransfir* *Anagen Araba* or *Buri*, the Italians *Dittamo*, and other Nations much thereafter according to their Dialect, and we in English Dittany, but not Dittander, as some too foolishly would make it.

The Vertues.

It is available as *Dioscorides* saith, for all the purposes that the planted or garden Penny-royall is used, but with farre more efficacy, for it not onely expelleth the dead child being drunke, but being applied unto the place (as in a Vesicary) for the fumes thereof taken hot, or burnt, and taken underneath: the juyce hath a purging quality applied with Barley meale: It draweth forth thornes out of the feete, or any other part of the body being applied to the place: for as it is reported that the wild Goates in *Candy*, being wounded by the Hunters with arrowes, doe by eating this herbe drive them forth, and are thereby cured. It is held to be very profitable for those that are troubled with

with the spleene, by lessning the swelling thereof. It halstneth on the birth, and as *Theophrastus* saith, causeth speedy delivery, or at least easeth much of the paines in travaile: and the juyce thereof drunke in Wine is a present remedy for those that are bitten by any venomous Serpent. The hearb is so powerfull against the poyson of all beasts that are venomous, as that it doth drive them away by the very smell, and killeth them if they touch it where it is hung: the juyce thereof is also a present remedy for all wounds made with Iron, if after the putting of it into the wound, some of it also be taken in drinke. The Balsard Dittany is used for all the purposes that the former is, but with much lesse effect. *Pliny* setteth downe in a maner all that is formerly said in severall places of his books: that it procureth the monthly courses of women, and is so effectfull to expell the dead birth, that it is dangerous to bring it into the chambers of women that are with child.

CHAP. XII.

Pulegium. Penny-royall.

Here are divers sorts of Penny-royall, some that grow wilde in many places of this Land, yet are nursed every where in Gardens; the other more rare, and therefore preserved onely by those that are curious.

1. *Pulegium vulgare.* Common Penny-royall.

This common Penny-royall is so well knowne to all, that I shall not need to spend much time in the description of it, having many weake round stalkes divided into sundry branches, rather leaning or lying on the ground, than standing upright, whereon are set at severall joynts small roundish darke greene leaves: the flowers are purplish that grow in Gardens for the most part, yet some that grow wilde are white, or more white than purple, set in rundles about the toppes of the branches: the stalkes shoot forth small fibres or rootes at the joynts as it lyeth upon the ground, fastning it selfe therein quickly, and overspreading any ground, especially growing in the shade or any moist place: and is increased by breaking of the sprouted stalkes and thrust into the earth.

2. *Pulegium regium vulgare majus.* Great Penny-royall.

There is a greater kinde than the ordinary sort, found wild with us, which so abideth being brought into Gardens, and differeth not from it, but in the largenesse of the leaves and stalkes, in rising higher, and not creeping upon the ground so much; the flowers whereof are purple, and growing in rundles about the stalkes like the other.

3. *Pulegium densifurculis.* Thick or double Penny-royall.

This sort differeth little from the former, the leaves are somewhat smaller and thicker set on the stalkes, and the branches grow closer together.

4. *Pulegium mas flore albo.* White flowred Penny-royall.

This Penny-royall groweth more upright with his stalkes than the former, and sometimes a foot higher also, having leaves thereon set by couples like it, and in some places other smaller leaves likewise growing with them, the flowers also grow in rundles or wharles round about the stalkes at severall joynts, but are wholly white, and so abide being planted in gardens, the smell whereof, the taste and use is altogether like the other: the rootes likewise creepe under ground, as the former.

5. *Pulegium angustifolium sive Cervinum.* French or Harts Penny-royall.

This fine Penny-royall hath creeping rootes under ground, but shoot forth longer sprouts than the former, from whence spring forth many tall upright hard stalkes, whereon are set at equall distances many small long and narrow leaves, all along the branches up to the toppes: the flowers grow round about the stalkes at the joynts with the leaves, at many places up to the toppes, of a pale purplish colour; the smell and taste hereof is much more pleasant and stronger also.

6. *Pulegium folijs Nummularia.* Round leaved Penny-royall.

This round leated Penny-royall groweth almost as upright as the last, with slender stalkes, having the leaves set by couples at each joynt, and are small and round like unto those of Hearb two pence, but farre lesse: the flowers stand in rows compassing the stalkes as the other doe, of a pale bluish colour: the smell hereof is much more pleasant than the common sort.

The Place.

The first is common in many moist and watry places of the Land, and for the use kept in Gardens. The second is found wild in *Essex*, in divers places of the highway betweene *London* and *Colchester*, and thereabouts, more abundantly than in other Countries, and from thence brought and planted in many Gardens of *Essex*. The third

1. *Pulegium vulgare.* Common Penny-royall.

4. *Pulegium* was flore albo.
White flowered Penny-royall. 5. *Pulegium angustifolium* sive *Cervinum*.
French or Harts Penny-royall.

hath beene also found in some places of our Land, and brought into Gardens. The fourth *Pena* saith he found not onely upon a plaine in *Piemont*, on the borders of the highway betwene *Riolio* and *Taurium*; but in divers other places also. The fift groweth in abundance in the wet fields and moorish grounds about *Mompelher*, where they use almost no other sort, although they have them in plenty also. The last grew in the Garden of *Padoa*, but where naturally, we have not understood.

The Time.

They doe all flower in the later end of Summer, about the moneth of August and sometimes later.

The Names.

It is called in Greek $\gamma\upsilon\lambda\alpha\gamma\alpha$ & $\beta\alpha\lambda\alpha\tau\upsilon$ a $\beta\alpha\lambda\alpha\tau\upsilon$, quoniam dum florēt, a pecore & capris gustatum balatum concitet, vel ut scribit *Pena*, *Plinio* & *Dioscoride* authoribus, quod pulmonibus pituitam crassam farctumque extundat, that is, from bleating, because it causeth Sheepe and Goats to bleat when they are eating of it; but *Pena* saith, rather from the effect of causing thick flegme, to be expelled out of the lungs which stuffed them: in Latine *Pulegium* and *Pulegium* also, quod flos recentis herbe incensus pulvis necat odore; because it killeth fleas being burned. The first is well knowne every where: but the second being not knowne in other Countries, as I thinke hath no other name then that which is set downe in the title. The third is as little knowne out of our Country I thinke as the former. The fourth is the *Pulegium* mas *Plinij*, which he saith hath white flowers, as he calleth the ordinary *famina*. The fift is called by them of *Mompelher*, and by *Gesner* *Pulegium Cervinum*, and of *Dodonaus* *Pulegium alterum folijs oblongis*, of *Lobel* *Angustifolium sive Cervinum Mompeliense*, *Bashinus* calleth it *Pulegium angustifolium*: the last *Bauhinus* onely maketh mention of in his *Pinax* and *Prodromus*. The Arabians call it *Alnam* & *Alnegan*, the Italians *Pulegio*, the Spaniards *Poleo*, the French *Pouliet*, the Germanes *Poley* and *Hartz Poley*, the Dutch *Poley*, and wee in English Penny-royall, Pudding grasse, and Pulioll-royall, and in the West parts, as about *Exeter* Organs.

The Vertues.

Dioscorides saith that Penny-royall rarifieth or maketh thin thick flegme, it warmeth the coldnesse of any part whereunto it is applied, and digesteth raw or corrupt matter, being boyled & drunk, it provoketh womens monthly courtes, expelleth the dead child and after-birth, and stayeth the disposition to vomit, taken in posset, that is water and vinegar mingled: it allayeth the gnawing of the stomack; being mingled with Honey and Aloes and drunke, it causeth flegme to be avoyded forth of the lungs, and helpeth crampes, (which place is observed by *Coronarius* in his third Booke, and 31. Embleme to be erroneous, for who ever used Aloes in any medicine that was to expectorate flegme, but in stead of *usla ardens* it should be written *usla ardens*, and so *Pliny* expresseth it in lib. 20. cap. 14. *Hepaticis cum melle & sale bibendum datur, pulmonum vitia excreabilia facit*, with honey and salt, it is a safe and good medicine for the lungs) it avoydeth melancholy by the stoole: drunke with wine it helpeth such as are bitten or stung with venomous beasts: applied to the nostrils with vinegar, it reviveth those that are fainting or sounding: being dried and burnt, it strengneth the gums: it is helpfull to those that are troubled with the gowt, applied of it selfe to the place untill it wax red: applied in a cerot or a plaister, it taketh away spots or markes in the face; it much profiteth those that are spleenick or livergrowne being applied with salt: the decoction helpeth those that have itches, if the places affected bee washed therewith: being put into bathes for women to sit therein, it helpeth the swelling and hardnesse of the mother, and when it is out of its place. Some copies doe adde that if the greene hearbe be bruised and put into vinegar, it clenseth foule ulcers, and causeth the matter to digest, it taketh away the markes or bruises of blowes about the eyes, which we call blacke and blue eyes, and all discolourings of the face by the fire, yea and the leprosie, being drunke and applied outwardly: being boyled in wine with

with honey and salt it helpeth the toothach: it helpeth the cold griefes of the joynts, taking away the paines, and warming the cold parts, being fast bound to the place after a bathing, or having beene in a hot house. *Pliny* addeth hereunto that Mints and Penny-royall agree very well together in helping faintings or swoonings being put into vineger, and put to the nostrils to be smelled unto, or a little thereof put into the mouth. It easeth the head-ach, and the paines of the brest and belly, stayeth the gnawing of the stomach, and the inward paines of the bowels, being drunke in wine provoketh vrine, and womens courses, and expelleth the after-birth and dead child: it helpeth the falling-sicknesse being given in wine: put also into unwholsome and stinking waters, that men must drinke (as at Sea in long voyages) it maketh them the lesse hurtfull; it lessneth the fatnesse of the body being given with wine, (but here *Pliny* is supposed to have mis-interpreted the Greeke word, translating it *Salutudines corporis* for tis thought to be *ardor*: that is *anxietate*, which *Hippocrates* in *Aphorism* 56, lib. 7. saith, is taken away by drinking it in an equall proportion of wine and water) it helpeth crampes or the convulsions of the sinewes being applyed with honey, salt, and Vineger. It is very effectuall for the cough, boyled in milke, and drunke, and for the ulcers or sores of the mouth. Thus saith *Pliny*, *Galen* saith that being sharpe and somewhat bitter, it heateth much, and extenuateth also. And in that it heateth, much may be knowne by this, that it maketh the place red where it is applyed, and raiseth blisters if it be suffered to lie long upon it: And that it doth extenuate, is sufficiently seene by this, that it doth cause thick and rough flegme to be avoyded forth of the lungs and chest, and that with ease: as also that it procureth the feminine courses; *Matthiolus* saith (and so doth *Castor Durantes* also) that the decoction thereof drunke helpeth the jaundise and dropsie, and all paines of the head and sinewes that come of a cold cause, and that it helpeth to cleare and quicken the eye-sight. It was used as *Durantes* saith, in stead of *Distamus Cretensis* (for it should seeme in his time also the true *Distamus* was not knowne, which was in Anno 1585.) who saith, that bruised, and with vineger applyed to the nostrils of those that have the falling-sicknesse, or the lethargie, or put into the mouth, helpeth them much, and applyed with barley meale it helpeth burnings by fire; it bringeth the loosned matrix to its place, and dissolveth the windinesse and hardnesse thereof, easeth all paines and inflamations of the eyes, and comforteth and quickneth the eye-sight being put therein, as also put into the eares easeth the paines of them.

CHAP. XIII.

Mentha. Mintes,

Here are many sorts of Mints, some chiefly nourished up in Gardens, others growing wilde, either on the mountaines (which for their rarity and diversitie are brought also into Gardens) or the wet and overflowne marshes, or the Water it selfe.

1. *Mentha Romana angustifolia sive Cardiaea*. Hart Mint, or Speare Mint.

This Mint hath divers round stalkes, and longer and narrower leaves set thereon, than the next Mint, and groweth somewhat lower and smaller, and of a darker greene colour than it; the flowers stand in spiked heads at the tops of the branches, being of a pale bluish colour, the smell or scent hereof is somewhat neere unto Basil. It encreaseth by the root underground, as all the others doe.

2. *Mentha Cruciata*. Crosse Mint.

The Crosse Mint hath his square stalkes somewhat hoary, and the leaves thereon hairy also, rougher, broader, and rounder than the former, which stand on all sides thereof one against another, two at a joynt, so that they represent a crosse, thereby giving it the name: the flowers stand in spiky heads, of a purplish colour, somewhat deeper than it.

3. *Mentha fusca sive vulgaris*. Red or Browne Mints.

This Mint hath square brownish stalkes, with somewhat long and round pointed leaves, nicked about the edges, of a darke greene, and sometimes reddish colour, set by couples at the joynts, and of a reasonable good scent: the flowers are reddish, standing by spaces about the tops of the stalkes: the roots runne creeping in the ground as the rest doe, and will as hardly be extirped as the rest.

4. *Mentha Crispa*. Cripple or Curld Mint.

The greatest difference in this kinde of Mint from the last, consisteth first in the leaves, which are almost as round as the last, but more rough or crumpled, or as it were curld: then in the flowers which are purplish standing in rundles about the toppes of stalkes: and in the smell hereof which cometh neere unto Balme.

5. *Mentha Crispa Danica aut Germanica speciosa*. The great Curld Mint of Germany.

This brave Mint creepeth with his rootes as the others doe, having divers high stalkes rising from them, which

1. *Mentha Romana angustifolia sive Cardiaea*.
Hart Mint, or Speare Mint.

foone

3. *Mentha Cruciata*. Crosse Mint.4. *Mentha Crispa*. Crispe or Curled Mint. 5. *Mentha Crispa Danica* aut *Germanica speciosa*.
The great Curled Mint of Germany. *Mentha-
strum ni-
vum An-
ticum.*
Party co-
lored
Mints.

soon divide themselves into branches with two leaves at every joyn, somewhat broad and large, but more deeply cut in at the edges, and as it were curled or crumpled together, especially the lower leaves, for those that rise up with the stalks are not so much torne or cut in on the edges, but are a little deeper dented than the former: the flowers stand in somewhat larger and rounder spiky heads than others, of a pale purplish colour: the scent whereof is pleasant, but not so quicke or hot as some of the former.

6. *Mentastrum hortense* sive *Mentha sylvestris*. The Ma-
nured wild Mint.

This wilde Mint that is nurfed up in Gardens hath creeping rootes as other Mints have, and square stalkes which are hoary, and a little hairy also, whereon are set larger and rounder leaves than in the former, of an hoary white colour covered as it were with downe: the flowers stand at the toppes of the branches, in longer and more slender spiky heads than any of the former, and are of a pale purplish colour, the scent hereof is more strong, full, and heady, but nothing so pleasant as the others.

Of this kinde is the party coloured Mints which are kept in Gardens, having divers leaves parted, white and Greene, some more or lesse than others.

7. *Mentastrum folio longiore*. Long leaved Wild Mints.

This Wild Mint hath square brownish stalkes, and somewhat broad, but longer leaves growing on them than the last, and nothing hoary at all, but rather of a dull Greene colour: the flowers stand at the tops of the branches in rounder tufts, of a pale purplish colour: the scent hereof is somewhat more pleasant than the other.

8. *Mentastrum montanum* sive *Pannonicum*. Hungarian
Wild Mints.

This Hungarian kind hath square stalkes, and somewhat large leaves set thereon by couples at every joyn, as the other

6. *Menthastrum hortense*, five *Mentha Sylvestris*.
The Manured wilde Mint.

6. *Menthastrum nrocam Anglicum*,
White Mints, or Partly coloured Mints.

7. *Menthastrum montanum* five *Pannonicum*.
Hungarian Wild Mints.

thers are, which are more green than the last, & dented about the edges also: the flowers are more white than the last standing about the stalkes at several spaces, and ending in small long spikes: the root is hard, shooting forth many strings, more like unto *Nep* than Mint, as the whole face thereof doth resemble, according to the minde of *Clusius*, and is of an hot and sharpe taste, smelling somewhat like the wild Mints.

9. *Menthastrum tuberosum* *Clus.* *Clusius* his knobbed Wilde Mint.

This kinde of wild Mint hath square hairy greene stalkes full of joynts, with two leaves set thereat, which are long rough dented about the edges, and somewhat hoary, or of a whitish greene colour, and of an unpleasant smell, the toppes of the branches doe end in spikes of hoary leaves, among the which the flowers stand at distances, with two leaves at a space, of a whitish colour, after which followeth small black seed, the root is somewhat like a reddish root, brownish on the outside, having certaine tuberous heads joynted thereunto, which being separated, will grow into plants.

10. *Menthastrum geniculata radice*, Wilde Mints with joynted roots.

This kinde of Mint hath his roote somewhat thick, and set with joynts or knees at certaine spaces, and shooting forth fibres thereat; the stalke riseth not a foot high, being somewhat hard, rough and square, whereon are set at the joynts two long darke greene leaves being soft in handling, but a little wrinkled and dented about the edges: the flowers stand at the tops of the branches in short tufts or spikes like unto *Nep*, of a pale purplish colour: after which come small round sweet smelling seed like unto the whole plant.

9. *Mentastrum tuberosum* Clusij.
Clusius his knobbed wild Mints.

11. *Mentastrum hirsutum*.

Hairy wild Mints.

This wild Mint hath square hairy stalkes with many branches rising from the roote, higher and greater than the ordinary wilde Mint, having hairy long leaves set thereon at a joyn, and many purplish flowers at the tops.

12. *Mentastrum rotundifolium minus*.

Small round leaved wild Mints.

The stalke hereof is square, hairy, and reddish, about a foote high, having two leaves at a joyn, somewhat long and round, soft, hairy, and dented about the edges, of a sadgreene on the upper side, and hoary under-neath: from the joyns rise some branches set with the like leaves, and round heads of flowers at the toppes, of a purplish colour: the scent hereof is not very pleasant, but rather strong and heady.

The Place.

The first foure sorts are onely found planted in Gardens with us, and the fift found first wilde both with us, and elsewhere, but for especiall respects brought into gardens. The other sorts were likewise wild by nature in their places, but now are cherished with the lovers of plantes in many places.

The Time.

All the sorts of Garden, as well as wild Mints, flower not untill the beginning of August for the most part, but the garden Mints for the most part seldome doe give any good feed, but recompence the defect by the increase of the root, which is so plentifull, that being once planted in a garden, they are hardly rid out againe, every small piece thereof being left in the ground increasing fast enough.

The Names.

Mentha was called by the old Græcians *μινθῆ* as *Pliny* recordeth, but of the later Greekes *ἀδύσκητος* ab odoris bonitate vel jucunditate, because it is so sweet. The Arabians call it *Nabat nabo*: the Italians *Mentha*: the Spaniards *Terva buena*: the French *Menthe*: the Germanes *Muntz*: the Dutch *Mint*, and so doe we. The first of these garden Mints is called *Romana angustifolia* sive *Caradaca*, and called by *Baibinus* *Mentha hortensis verticillata ocimi odore*, (but how truly I cannot see, because it beareth spiked heads) who saith also, it is the *Ocimoide repens* that *Gerard* hath set out, for that no other *Ocimoide* of any other Author agreeth thereunto. The second is called *Cru-ciata* of *Lobel*, & *rotundifolia altera spicato flore*, in English *Crosse Mint*. The third is usually in our gardens by the name of red Mints: the fourth is called *Mentha crispa*, and *Balsamita* of *Camerarius*, and *Sisymbrium hortense* of *Matthioli*, and called by *Baibinus* *Mentha crispa verticillata*, and is the *vulgata serpens rotundiore folio* *Pulegi flore* of *Lobel*, in English *Curld* or *Crispe Mint*. The fift is the best and truest *Curld Mint*, which *Lobel* shewed, but did not set forth. The sixt is that kinde of wild Mints which is planted in gardens, and called of some *Horfe Mint*; (from whence hath come our white or party coloured Mints, to be seene in many gardens) and as I thinke is called by *Lobel* *Sisymbria Mentha agrestis*, for it answereth very well thereunto, although *Lobel* saith, it is all one with the *Mentha cruciata*. The seventh is called by *Lobel* *Mentastrum aliud* & *Mentastrum Campanse* of *Lugdunensis*, it is the *Sisymbrium sylvestre* of *Matthioli*, very well set forth in his small *Icones*. The eighth and ninth *Clusius* hath set forth, calling the eighth *Montanum*, or *Pannonicum*, and the other *Mentastrum tuberosa radice*, but referreth it rather to a kinde of *Cattaria tuberosa*, and by that name I have often received it among other seeds from Italy and other places, whereunto it doth most fitly agree. The tenth *Baibinus* hath written of, and set the description thereof in his *Prodromus*, by the name of *Mentha geniculata radice*, and saith, hee received it both by the name of *Mentha tuberosa*, and *Nepeta angustifolia odorata*, from severall places. The eleventh is called by *Lobel* *Calamintha tertia Dioscoridis*, & *Mentastrifolia aquatica hirsuta*, by *Lugdunensis* *Mentastrum minus spicatum*, by *Camerarius* *Mentastrum aliud hirsutum*, and by *Baibinus* *Mentha palustris folio oblongo*: The last is called by *Baibinus* *Mentha rotundifolia palustris minor*.

The Vertues.

The garden Mints in generall, yet the sweeter sorts, that is, the Speare Mint, and Hart Mint, are more usually taken for all the uses whereunto Mints doe serve; *Dioscorides* saith it hath an heating, binding, and drying quality, and therefore the juyce taken with vinegar stayeth bleeding. It stirreth up venery or bodily lust, and as hee saith killeth the round wormes, which hath not usually bene knowne to take effect with any, two or three branches thereof taken with the juyce of sowre Pomegranats stayeth the hickock, vomitings, and allaieth choller, it dissolveth impostumes being layed to with barley meale: it is good to repress the milke in womens breasts when they are swolne therewith, or otherwise, for such as have swollen, flagging, or great breasts, applyed with salt, it helpeth the byting of a mad Dogge, with Meade or honied water it easeth the paines of the eares: applyed to the privie parts of a woman before the act of generation, hindreth conception, which is contradicted as you may read a few lines below, and rubbed upon the tongue, taketh away the roughnesse thereof. It suffereth not milke to curdle in the stomack, if the leaves hereof be steeped or boyled in it before yee drinke it. Briefly, it is very profitable to the stomack, and in meares is much accepted. It is of especiall use to stay the feminine courses when they come too fast, as also to stay the whites, for which purpose no other hearbe is more safe and powerfull. for by taking it often it hath cured many. Applyed to the forehead or the temples of the head it easeth the paines thereof. It is also good to wash the heads of young children therewith, against all manner of breaking out therein, whether sores or scabs: and healeth the chaps of the fundament. It is profitable also against the poison of venomous creatures. The distilled water of Mints is available to all the purposes aforesaid, yet more weakely: but if a spirit thereof bee rightly and chymically drawne, it is more powerfull than the hearbe it selfe, in regard the spirit and strength of a great deale is brought into a small proportion; foure ounces thereof taken as *Marshallus* saith, doth stay bleeding at the nose, which may be thought incredible to a great many. It is much commended to be available in venereous causes, although *Pliny* in his lib. 20 cap. 14. doth write to the contrary: but *Galen* in his sixt Booke of Simples, doth render a reason of the faculty hereof very worthily, where he saith, some doe call that *Mentha odorata*, sweet Mint, which by others is called *Nervus Hedyosmus*: but there is another Mint which is not sweet, which they call *Calamintha*: both of them are sharpe in taste, and hot in quality, yea even in the third degree of heat, but *Mentha odorata* is weaker and lesse heating, so that I may well say that the one seemeth to be as it were the tame, and the other the wild: wherefore by that humidity it hath gained by manuring, it provoketh to Venery, which thing is common to all hearbes that have in them an humidity halfe digested and windy: by reason of which temperature being mingled with Barley meale it is used to ripen impostumes, which you cannot doe with *Calamintha*, because it heateth and digesteth more, then such things as should ripen impostumes doe require. It hath also in it a little bitternesse, and some tartnesse, by reason of the bitternesse it killeth the long wormes of the belly, and by the tartnesse it stayeth the vomiting of blood: while it is fresh, if it bee taken with *Oxycratum* (which some take to be fower milke, and others to be *Posca*, that is vinegar and water mingled together.) It is of as great tenuity as any hearb whatsoever: these are *Galens* words. *Simeon Sethi* saith it helpeth a cold liver, and strengtheneth the stomack and belly, causeth digestion, stayeth vomitings and the hickock, is good against the gnawings of the heart, and stirreth up the appetite, it taketh away the obstructions of the liver, and stirreth up bodily lust; but thereof too much must not be taken, because it maketh the blood thin and whayish, and turneth it into choler, yea, and causeth the blood which is of very thin parts, after it is separated, to become thick and melancholick: and therefore cholerick persons must abstaine from it: it is a safe medicine for the byting of a mad Dogge, being bruised with salt and laid on; the powder of it being dried and taken after meate, helpeth digestion, and those that are splenetick, taken with wine it helpeth women in their hard and fore travels in child-bearing: it is also thought to be good for bleare eyes applyed to them; and that the decoction of them being drunke, doth helpe the bleedings at the mouth speedily, or presently. It is good against the gravell and stone in the kidneys and strangury. It is also comfortable for the head and memory, not onely to be smelled unto, but chiefly to be applyed unto the head and temples, and easeth the head-ach: the decoction thereof cureth the gums and mouth that is sore, if it bee gargled therewith, and mendeth an ill favoured breath, as also with Rue and Coriander, causeth the uvula or palate of the mouth that is downe, to returne to its place againe, the decoction thereof being gargled and held in the mouth. *Aristotle* and other in the ancient times forbade Mints to be used of Souldiers in the time of warre, because they thought it did so much incite to Venery, that itooke a way, or at least abated their animosity or courage to fight. Divers have held for true, that Cheeses will not corrupt, if they be either rubbed over with the juyce or the decoction of Mints, or they laid among them. And some againe, that if the juyce of Mints be put into the milke whereof you meane to make Cheese, that although yee put rennet thereto, it will never draw to curds whereby to become Cheese. The vertues of the wild Mints are more especially to dissolve winde in the stomack, to helpe the chollick and those that are short-winded, and are an especiall remedy for those that have venereous dreames and pollutions in the night, used both inwardly, and the juyce being applyed outwardly to the testicles or cods; the juyce thereof dropped into the eares easeth the paines, and destroyeth the wormes that breed in them; they are good against the venomous bytings of Serpents, and as it is said, killeth them by the fume thereof, or by the scent of them being layd in any place, the juyce laid on warme helpeth the Kings-evil, or kernels of the throat, the decoction, or the distilled water helpeth a stinking breath, which proceedeth from the corruption of the teeth, and snuffed up into the nose purgeth the head. *Pliny* saith, that in the time of Great Pompey, it was found out by experience of one, to cure the Lepre by eating the leaves, and applying some of them to his face, and to helpe the scurfe or dandriffe of the head used with vinegar.

CHAP. XIII.

Calamintha. Calamint, or Mountaine Mint.

Although divers Authors doe confound Calamint (calling it Catmint) with Nep, which is more properly called Catmint, yet I thinke it better to intreat of them a part, then to joyne them both in one Chapter.

1. *calamintha vulgaris*. Common Calamint.*Altera minor.* 1. *Calamintha vulgaris*. Common Calamint.

The ordinary Calamint that groweth usually abroad in the dry grounds with us, is a small herbe seldome rising above a foot high, with square hoary, and woody stalkes, and two small hoary leaves set at a joynt, about the bignesse of Marjerome, or not much bigger, a little dented about the edges, and of a very fierce and quick scent; as the whole herbe is: the flowers stand at severall spaces of the stalkes, from the middle almost upwards, which are small and gaping like unto those of Mints, and of a pale bluish colour, after which follow small round blackish seed: the root is small and woody, with divers small sprigs spreading within the ground, and dyeth not, but abideth many yeares.

There is another of this sort which is like unto it in all things, but somewhat lesser, differing chiefly in the flowers which are not so large by the halfe, which noteth it to be a differing species.

2. *Calamintha montana prestantior*. The greatest Calamint, or Mountaine Mint.

This sweet Calamint riseth up to be a foot and a halfe high, with his square hard, and hoary stalkes, which are many, and slender than those of the wild Mints, whereon are set at every joynt two small and somewhat round leaves deeply dented about the edges, yet larger than those of the former wilde kinde, being somewhat hairy, and not so hoary, but rather of a salt greene colour, of a very sweet scent, not strong or heady as the other: the flowers are gaping, and like the other, but larger, and of a purple colour, after which commeth the seed, which is black, small, and round, somewhat like unto Purslan seed, the root is woody, but abideth and shooteth forth new branches every yeare.

3. *Calamintha altera odore Pulegij folijs maculosis*. Spotted Calamint.

This spotted Calamint differeth not much from our ordinary wild Calamint, but that it groweth not so great and high, having square hard hoary stalkes, and hoary leaves thereon like it, but smaller, and of a pale purplish colour.

4. *Calamintha minor incana*. Small Calamint.

This hoary small Calamint hath small low and slender hoary stalkes not above a foot high, whereon are set two leaves at a joynt, as in the other sorts, but smaller and more hoary, even smaller than the least bush Basil: the flowers are very small, but like the last, and of a lesse heady scent.

5. *Calamintha arvensis verticillata sive aquatica Belgarum Lobely*. Field Calamint with whorled coronets. This small Field Calamint sendeth forth divers square hoary stalkes full of joynts, and two small and almost round hoary leaves set thereat up to the toppes, somewhat like unto the leaves of Penny-royall, of a quicke and sharpe, yet sweet scent like thereunto also: towards the toppes of the stalkes and branches stand with the leaves many purplish flowers divers set together in a whorle or coronet: the root is small and abideth long, not perishing after seed time.

The Place.

The first groweth on heaths and upland dry grounds in many places of the Land: the second on the Euganean hills neere Padova, and on the hills neere Vicenza in Italy, and on the Rocky shadowie cliffs of Sevena in Province of France, as also in Germany, and other places, and in England also, as Lobel saith hee observed. The third Pena saith he found on certaine Hills in Lombardy, and in sundry places of our owne Land, yet seldome spotted. The fourth Camerarius saith he had the seed from Candy. The last groweth in divers fields of our owne Land, as well in moist meadows, as plowed grounds.

The Time.

They doe all flower in Iuly, and their seed is quickly ripe afterwards.

The Names.

It is called in Greeke *καλὴνθρον* *quæstbona vel utilis Menta*, a good or profitable Mint. The first is called *Calamintha vulgaris* & *montana vulgaris* by most Authors: and the lesser of this sort Bauhinus calleth *Calamintha vulgaris exigua flore*. The second is called of Lobel, Camerarius, and others *Calamintha montana prestantior*, as the best of all the sorts of Calamints, in English as it is in the title, Gerard giveth the figure of this for *Scordonia*, or *Salvia agrestis*.

2. *Calamintha montana presantior*.
The greatest Calamint, or Mountaine Mint.

4. *Calamintha minor incana*.
Small Calamint.

5. *Calamintha arvensis verticillata* sive *aquatica* Bel.
Field Calamint with whorled coronets.

agrestis, for hereunto that figure is nothing like. *Bauhinus* calleth it *Calamintha magno flore*. Pona in the description of *Morus Baldus* in many places doth take it to be the *Melissophyllum Fuchsi*. The third is called by *Lobel* as it is in the title. *Matthioli* and *Camerarius* call it *Calamintha altera*, and say that the Italians doe call it *Nepotella*. *Cordus* upon *Dioscorides* calleth it *Nepeta agrestis*, and *Bauhinus* also calleth it *Calamintha Pulegij odore* sive *Nepeta*. *Gerard* giveth the figure of *Calamintha montana presantior* for this: in English Spotted Calamint, for a distinction from the others, although it hath but sometimes small shew of spots with us. The fourth is called by *Lobel* *Calamintha secunda incana*, and by *Camerarius* *Calamintha Cretica*, but by *Bauhinus* *Calamintha incana cimi folijs*, in English Small Calamint, because it is the least of all the rest. The last is called by *Lobel* *Calamintha aquatica Belgarum* or *Polycnemum quasi multibibia*. *Calamintha aquatica* *Matthioli* by *Lugdunensis*. *Calamintha arvensis* by *Gesner* in *hortis*, & *Tabernaemontanus*: by some *Mentha aquatica exigua* & *Pulegium sylvestre*, and by *Bauhinus* *Calamintha arvensis verticillata*.

The Vertues.

Calamint is very hot and sharpe, the hearbe onely is used, the root is unprofitable. The decoction thereof drunke, bringeth down womens courses, and provoketh urine. It is profitable for those that are bursten, and those that are troubled with convulsions or crampes, with shortnesse of breath, and with cholerick torments and paines in their bellies and stomacks, it helpeth the yellowjaundise also, and stayeth vomiting being taken in wine, taken with salt and honey it killeth all manner of wormes in the body. It helpeth such as have the leproy, either taken inwardly drinking Whey after it, or the greene hearbe applyed outwardly: if it be applyed in wooll as a pessary to the privie parts of a woman, it draweth downe the courses, and easeth paines of the mother, but killeth the birth, and therefore to bee refused of women with child. It driveth away venomous Serpents, being either burned or strewed in the chamber. It taketh away black and blue spots and

markes in the face, and maketh black scarres to become well coloured, if the Greene hearb and not the dry be boyled in wine. and laid to the place, or the place washed therewith being laid to the huckle-bone or haunch where the paine of the Sciatica resteth, by continuance of time it so healeth the place, that it draweth forth and spendeth the humours that were the cause of the paine. (This was a course held in *Dioscorides* time, but our Physicians and Chirurgeons doe not so use it now adayes.) It killeth the wormes of the eares if the juyce be dropped into them, the leaves boyled in wine and drunke provoketh sweate, and openeth the obstructions both of the liver and spleene; it helpeth also them that have a tertian ague (the body being first purged) by taking away the cold fits that come before it: the decoction hereof with some Sugar put therto afterwards, is very profitable for those that be troubled with the overflowing of the galle, and that have an old cough, that are scarce able to breathe by the shortnesse of their winde, that have any cold dislemperature in their bowels, and are troubled with the hardnesse of the spleene; for all which purposes both the powder called *Diacalammenthes*, and the compound Syrupe of Calamint, which are to be had at the Apothecaries are most effectuell.

CHAP. XV.

Nepeta. Neppe or Calamint.

Here are divers sorts of Neppe, some vulgar, and others more rare, which I intend to bring to your knowledge, which are these.

1. *Nepeta major vulgaris*. Common Garden Nep.

The Common garden Neppe shooteth forth hard foure-square stalkes with an hoarinesse on them, a yard high or more, full of branches, bearing at every joynt two broad leaves, for forme and largenesse, somewhat like unto Balme, but longer pointed, softer, whiter, and more hoary, nicked also about the edges, and are of a strong sweet scent, not offensive to any, but very pleasing to Cats, who will rub themselves thereon all over: the flowers grow in large tufts at the toppes of the branches, and underneath them likewise on the stalkes many together, of a whitish purple colour: the rootes are composed of many long strings and fibres, fastning themselves strongly in the ground, and abide with Greene leaves thereon all the Winter.

2. *Nepeta media*. Middle sized Neppe.

This other Nep hath likewise square hard stalkes, not so great as the former, but rather more in number, and sometimes as high: the leaves are smaller by almost the halfe, harder, greener, and nothing so strong in scent, set by couples upon the stalkes, which branch not in that manner: the flowers are fewer, smaller, and growing onely by spaces along them up to the toppes, of a faint purplish colour, gaping like the other, and after them such like small round seed in the huskes, the rootes are greater, longer, and more woody, abiding many yeares in the ground, but holding no Greene leaves thereon in the winter.

3. *Nepeta minor*.
Small Neppe. 3. *Nepeta minor*. Small Neppe.

This small Neppe hath divers foure-square hard and hoary stalkes rising from the root, which dye not after seed-bearing, but shoote fresh branches not above a foote high, with two small long and narrow leaves, snipt or dented about the edges, and hoary also, of a stronger scent than the common, and of a hotter taste, the stalkes shoote forth into many branches, at the toppes whereof stand many small gaping white flowers, spike fashion like the ordinary, after which come small blacke seed like the other.

Cassius Bauhinus in his *Prodromus Theatri Botanici* setteth downe a small Neppe, which he saith doth differ from this of *Clusius*, but the description thereof doth so neereley resemble it, that I am more than halfe perswaded it is the very same.

4. *Mentha Cataria minor Alpina*. Small Mountaine Neppe, or Catmint.

In the same place he setteth downe another Neppe, smaller than his former, with square brownish stalkes of a foote height, branching forth, whereon are smaller leaves set then the former, being somewhat broad, almost three square and hoary; the flowers are small and whitish, set or placed spike fashion at the toppes, like unto the common kinde.

5. *Nepeta peregrina latifolia*. Strange Neppe with broad leaves.

This strange Neppe hath a square hoary stalke, spreading into branches on all sides from the bottome to the toppe, set with two leaves at every space, which are broader than the next that followeth, but yet are not much broader, but longer than the ordinary Neppe, dented about the edges, and of an hoary Greene colour: the flowers stand in spaces about the toppes of the stalkes, almost of a pure white colour like in forme unto the common Neppe, but larger: after which commeth the seed which is blacke like it also; the smell of the whole plant is stronger and sharper, but more pleasing than it.

6. *Nepeta*

5. *Nepeta peregrina latifolia*.
Strange Neppe with broad leaves.

6. *Nepeta peregrina angustifolia*. Strange Neppe with narrow leaves.

This other Neppe is of the same kind with the former, and differeth from it onely, in that the leaves are smaller and narrower, but neither in colour or smell, or any other thing differing.

The Place.

The first and second growe wild in other Countries, but are nurfed up onely in Gardens in ours, as all the rest are : the third, the fift and the fixt doe grow in *Spaine* : for from thence the seed came that brought forth these goodly plants. The fourth *Bauhinus* saith groweth upon some hilly grounds about *Naples*, from whence hee received seed.

The Time.

They doe all flower in July, or thereabouts, with the ordinary sort.

The Names.

The ordinary garden sort is called of some *Cattaria*, and *Cattaria*, and of others *Mentha Cattaria*, and *Mentha felina*, because as I said before, Cats delight both to smell and eate thereof, and gladly rub themselves against it, but of most with us *Nepeta*. *Gerard* saith that our *Nepeta* is called *Pulegium sylvestre*, but hee is therein much mistaken, for *Dioscorides* saith that the Latines did call that in his time *Nepeta*, which he calleth his second *Calamint*, and was called also of some *Pulegium sylvestre*, but *Dioscorides* his 2. *Calamint* is not our *Nepeta* used in these dayes, as any of judgement may loone perceive, that readeth and marketh *Dioscorides* his description thereof. And *Matthioli* also taxeth *Brasavolus* who fell into the same errour, he being chiefly deceived by the mistaking of the name ; for the Italians call that manured kind of *Calamint* *Nepotella*, as *Matthioli* saith, which was derived from the *Nepeta*, and *Brasavolus* would fasten it upon this hearbe which they call *Herba Gattaria*. The first of these is the *Herba gattaria* of *Matthioli* : *Gesner* in *hortis* tooke it for a kinde of *Calamint*, *Trauts*, *Cordus*, and others call it *Nepeta*, *Lobel* *Cattaria*, and *Mentha Cattaria*, and generally with us *Nepeta*, in English *Nep*, or *Cat Mint* : the second I doe not finde mentioned by any Author, but it is continued in my Garden to this day under that name. The third : *Iussus* calleth *Cattaria tenuifolia Hispanica*, and *Camerarius* *Nepeta minor*. *Bauhinus* *Mentha Cattaria minor*, in English small *Neppe*, or *Catmint*. The fourth he calleth *Mentha Cattaria minor Alpina*, in English Small mountaine *Nep* or *Cat Mint*. The fift is called by *Lobel* *Mentha Cattaria peregrina latifolia* of *Tabernaemontanus* *Mentha felina satvia latifolia* ; of *Gerard* *Cattaria altera*, and of *Belesius* in his garden of the Bishop of *Exstot*, *Nepeta peregrina*, in English strange *Neppe* with broad leaves. The last is called by *Lobel* *Mentha Cattaria peregrina angustifolia*, of *Dodonaeus* *Cattaria folio longiore* : of *Gerard* *Salvia Romana*, for the figure thereof answereth therunto, and not unto any *Cattaria* : of *Bauhinus* himselfe *Mentha Cattaria angustifolia minor*, in English as it is in the title.

The Vertues.

Neppe is generally used for women to procure their courses when they are stayed, to use inwardly, or outwardly, to bathe them in the decoction of it, with other hearbes convenient for the purpose, or with it alone, or to sit

over the hot fumes thereof, for it not onely warmeth and comforteth the coldnesse, but dryeth the overmuch moisture of the mother, which may be one cause of sterility or barrennesse, and by the frequent use of it, to cause them to be more fruitfull that were hindered, and also for the wind and paines of the mother, or rising of it. It is also used in paines of the head that come from any cold cause, as catarrhes and thin rheumes, and for swimnings and giddinesse thereof. It is also of especiall use for the windnesse of the stomack or belly. It is effectfull for any cramps or cold aches to dissolve the cold and wind that affecteth the place, and to bring warmth and comfort thereunto afterwards. It is used for colds or coughes, and shortnesse of breathing. The juyce thereof drunke in wine is profitable for those that have caught some bruise by any accident. The greene hearbe bruised and applyed to the fundament, there abiding for two or three houres easeth the sharpe paines of the piles, the juyce also is effectfull for the same purpose, being made up into an oyntment and applyed. A Decoction thereof also is commended to wash the head, to take away the scabs thereof, and may be effectfull for other parts of the body also. *Lobel* saith the two greater sorts of strange Neppe are more effectfull to all the purposes than the ordinary kinde is used for. The virtues of the former two lesser sorts are not certainly knowne, but are thought to conduce to the like effects.

CHAP. XVI.

Melissa. Balme.

Esides the ordinary which usually groweth in all our gardens, there are some other sorts of Baulme, as they are entituled by divers Authors for the sweet scent of them comming nearest, is that of our ordinary Baulme, of all which I meane to entreate in this place.

1. *Melissa vulgaris*. The common garden Baulme. 1. *Melissa vulgaris*. The common Garden Baulme.

The common garden Baulme hath divers square greene stalkes, with round hard darke greene leaves pointed at the ends, and a little dented about the edges, set by couples at the joynts, of a sweet smell, comming nearest to a Citron or Lemmon, the flowers are finall and gaping, growing at the toppes of the stalkes, of a pale Carnation colour, almost white: the rootes fasten themselves strongly in the ground, and endureth long, the leaves and stalkes dying downe yeerely.

2. *Melissa Turcica flore caruleo*. Turkey Baulme with a blue flower.

This Baulme riseth up with one square brownish greene stalke, two foot high at the least in any good ground and higher sometimes, spreading with two branches from every joynt where the leaves are set, up almost to the toppe: the leaves are narrower and longer than those of the ordinary Baulme, and more dented in about the edges, of as sweet a Lemon scent, or rather more than it, rough also, and of as sad a greene colour: the flowers are gaping or hooded, growing at the toppes of the branches, at certaine distances, of a blue or purplish blue colour, standing in rough sharpe pointed huskes, after which commeth the seed which is black and roundish, with a white spot in every of them, plainly to be seene while they are fresh, but not so easily discerned when they are dry. The root perisheth every yeare, and must be sowne a fresh in the Spring time, if any bee desirous to have it.

3. *Melissa Turcica flore albo*. Turkey Baulme with a white flower.

This other Baulme differeth not from the former, either in growing, or height, or forme of leaves and flowers, or in the good smell thereof, or in the durability, for it is equall thereto in all these properties: the onely difference is, in that the leaves hereof are of a fresher greene colour, and that the flowers are of a perfect white colour; the seed whereof doth not degenerate as in many other hearbes it hapneth, but keepeth

constantly his kinde, for any thing I could observe in it these twenty yeeres and upwards, since I first had it and sowed it.

4. *Melissophyllum Fuchsii*. Vnpleasant Baulme.

Vnto the kindred of Baulmes I thinke good to adjoyne this plant more for the formes sake of the leaves from whence *Fuchsius* first gave it the name, then for any other correspondence it hath therewith, but as it is at this time, take it with this description. It hath divers hairy square browne stalkes rising from the roote, halfe a yard high whereon are set two leaves at severall spaces, at the contrary sides of them, ever up to the toppes of the stalkes, which are broader and somewhat longer than the ordinary Baulme, and of a sad greene colour, betweene which leaves at every joynt with them, from the middle of the stalke upward on each side thereof, commeth forth larger flowers, and longer than in Baulme, more like unto those of the yellow *Lamium*, or dead Nettles, as some compare them, or unto those of mountaine Calamint, as others doe, of a pale purplish colour on the lower part, and

2, 3. *Melissa Turcica flore albo*, Turkey Baulme with blue and with white flowers.

4. *Melissophyllum Fenchij*, Vnpleasant Baulme.

and whitish above, this hath no such good scent therein as the Baulme hath, but is rather of a stronger unpleasant scent, for which cause I have so entituled it.

5. *Melissa Molucca levis* five *Syriaca levis*. Great Affirian Baulme.

This hearbe *Matthiolum* and others make a kinde of Baulme from the forme of the leaves chiefly: it riseth from seed with a round hollow stalke out of the ground, to bee two foote high or thereabouts, branching forth diversly on all sides up to the toppe, whereon are set shorter and rounder leaves, at the end of long foote stalkes, somewhat lesse dented about the edges then in the common Baulme, and not at all sharpe on the edges, as in the next: at the joynts of the stalke from the middle thereof upwards, come forth round about it, certaine hard whitish skins small and round at the bottome, and wide, open at the brims like unto a bell, having five corners for the most part: from the bottome of each of these commeth forth one flower somewhat sinall, and like unto the flower of common Baulme, almost white, or with a small shew of bluish therein, and after they are past, in the bottome of the same skinny bells grow the seed (but seldome one of ten commeth to be ripe with us) which is whitish and cornered: the smell hereof is nothing like Baulme, but rather fullsome, the taste thereof is bitter: the roote perisheth every yeare.

6. *Melissa Molucca asperior* five *Syriaca asperior*. Prickly Affirian Baulme.

This other Affirian Baulme riseth a little higher, and groweth somewhat greater than the former, but after the same fashion; the leaves hereof are somewhat longer and sharper on the edges, the huskes likewise in which stand these skinny bells, at the corners of them are sharpe pointed, and of a paler white colour: the flowers and seed are all alike, and perisheth likewise at the first approach of any cold night: this hath a little better scent to commend it than the former.

7. *Cardiaca*. Motherwort.

As these three last had little likenesse with Baulme, more than in the forme of the leaves, and the properties as you shall heare anon; so this, besides the properties answerable to the rest in comforting the heart, hath no shew of affinity, no not in the leaves: but because some have put it to the kindred of the Baulmes, and others to Nettles, and others to Horehound, I have thought it best for the vertues sake (whereunto none of the Nettles or Horehounds are answerable) to set in the end of the Baulmes, and to be as it were a bridge to passe from them to the Horehounds, whereunto in face it hath the more resemblance. It hath a hard square brownish rough strong stalke, rising to bee three or foure foote high at the least, spreading into many branches, whereon grow leaves on each side with long foote stalkes, two at every joynt, which are somewhat broad and long, as it were rough or crumpled, with many great veines that shew themselves therein, of a sad Greene colour, and deeply dented in about the edges, and almost torne or divided: from the middle of the branches up to the toppes of them, which are very long and small, grow the flowers round about them at distances, in sharpe pointed rough hard huskes, which are more purple or red than in any of the former Baulmes, or in any Horehound, but in the same manner and orme, and roughnesse as the Horehounds: after which come small round blackish seed in great plenty: the roote

5. *Melissa Molucca levis* five *Syriaca levis*.
Great Affrican Baulme.

6. *Melissa Molucca asperior* five *Syriaca asperior*.
Prickly Affrican baulme.

7. *Cardiaca*. Motherwort.

sendeth forth a number of long strings, and small fibres, taking strong hold in the ground, of a darke yellowish, or brownish colour, and perisheth not as the other, but abideth as the Horehound, the smell likewise is not much differing from it.

The Place.

The first is onely to be found in gardens; the two next growes naturally in *Moldavia*, which is under the Turkish Dominion. The third at the foote of divers hills both in *Germany* and *Narbone* in *France*. The fourth and fifth as *Matthiolus* thought in the *Molucca* Ilands which are in the East-Indies, but therein he was much mistaken, yet he saith they came from *Constantinople*, others and that more truly say, that *Martinellus Sequinus* an Italian sent them to *Venice* out of *Syria*. The last groweth among rubbish, and by the sides of walls and hedges in many places beyond the Seas, but not with us that I have knowne or heard, but onely in Gardens where it hath bene once sowne or planted.

The Time.

The three first and the last flower somewhat earlyer in the Summer, than the two Affrican kinde, which flower very seldome before the middle of August, so that it hardly giveth any good seed, although the two former and the last doe plentifully.

The Names.

Balme is called in Greeke *μελισσιν* or *μελισσιν* *Melisso-* *phyllum*, or *Meliphyllum*, id est *apum folium*, quod *apes* eo valde delectantur, in Latine *Melissa*, & *Citrage*, ab odore *Citri*, *Apistrum* quod *apibus* sit gratissima, & *Melissophyllum*, of the effect being good for Bees. The first is called *Melissa*, or *Melissophyllum* generally by all writers: the second and third are called *Melissa Moldavica* & *Turcica* by most Writers; *Banbinus* calleth it *Melissa Turcica peregrina folio oblongo*: the third *Cordus* and *Fuchsius* take to bee the true

true *Melissophyllum*, & thereupon it is generally called *Melissa*, or *Melissophyllum Fuchsij* by most writers, although it have not the smell of Baulme, nor good to rub hives withall, as the true Baulme: *Lugdunensis* saith it is the *Calaminta presantior* which *Pena* and *Lobel* have described and set forth more exactly: but he is therein much deceived, for *Fuchsij* saith his hath blacker and larger leaves than Baulme, & that *Calamint* hath smaller and whiter: only *Bauhinus* and *Clusius* referre it to the *Lamia*, *Bauhinus* calling it *Lamium Montanum Melissa folio*, and saith withall, that the varying thereof may be referred, to the variable sorts of the *Lamia Pannonica* of *Clusius*: it is called in English as it is in the title, untill a more exact & truer name may be given it, for I cannot consent to *Bauhinus* and *Clusius*, to call it *Lamium*, seeing so many Authors call it *Melissa*. The fourth *Matthiolus* calleth *Melissa Constantinopolitana*, or *Melissophyllum Constantinopolitanum* & *Leve* is added by *Dodonaeus*, for hee maketh no mention of any prickles in that, which grew in the Emperours Garden, but that which *Alphonſus Pontius* of *Ferrara* sent him as he saith, the leaves were prickly: assuredly that kind that I have had growing in my garden at severall times, had no prickles either on leafe or huske, although *Bauhinus* saith hee never saw any that was without some sharpe thornes, and therefore it should seeme, that *Lobel* maketh the one kind lesse sharpe or thorny than the other, and calleth it *Cardiaca Melica* sive *Molucca minus aspera*, & *Molucca Syriaca*. *Bauhinus* calleth it *Melissa Moluccana odorata*, as he doth the fifth *Melissa Moluccana farida*, making the one to be sweeter, and the other stinking. *Lobel* calleth it *Molucca asperior Syriaca*, and saith moreover that it is called *Mascluc* of the Turkes: *Casalpinius* would referre both these kindes unto the *Alissum* of *Dioscorides* and *Pliny*; and *Bauhinus* saith they are like to the *Alissum* of *Galen*. They have their English names over their heads. The last is called *Cardiaca* of most of our later Writers, for it is likely it was not knowne to them of ancienter ages, yet *Dodonaeus* formerly tooke it to be a *Sideritis*. *Tragus* to be a wilde Baulme. *Brunfelsius* to be *Marrubium mas*, *Anguillara* to be *Licopsis* or *Branca lupina*, & *Bauhinus* calleth it *Marrubium forte primum Theophrasti*: *Casalpinius* thinketh that it is the *Alissum* of *Galen* and *Aetius*. We doe call it Motherwort in English, as truly from the effects to helpe the Mother, as they call it *Cardiaca* from the effects to helpe the heart, as you shall heare by and by: the Arabians call Baulme *Bederengie*, *Bedarungi*, *Cederenzegum*, *Turingen* or *Trungian* and *Marmacor*: the Italians *Melissa*, *Codrovela*, and *Aranciata*: the Spaniards *Torengil* & *yerva cidrera*: the French *Melisse* & *Poncirade*: the Germanes *Melissen*, *Binenkrantz*: and the Dutch *Melisse* & *Honichbaum Conſille degreyn*, and we in English Bawme, from the singular effects therein, in imitation of the true naturall Baulme.

The Vertues.

The Arabian Physicians have extolled the vertues of Baulme, for the passions of the heart in a wonderfull manner, which the Greekes have not remembered: for *Serapio* saith, it is the property of Baulme, to cause the minde and heart to become merry, to revive the fainting heart falling into swoonings, to strengthen the weaknesse of the spirits and heart, and to comfort them, especially such who are overtaken in their sleepe, therewith taking away all motion of the pulse, to drive away all troublesome cares and thoughts out of the minde, whether those passions rise from melancholly or black choller, or burnt flegme, which *Avicen* confirmeth in his booke of medicines proper for the heart, where he saith that it is hot and dry in the second degree, that it maketh the heart merry, and strengtheneth the vitall spirits, both by the sweetnesse of smell, austeritie of taste, and tenuity of parts, with which qualities it is helpfull also to the rest of the inward parts and bowels. It is to good purpose used for a cold stomack to helpe digestion, and to open the obstruction of the braine. It hath a purging quality therein also saith *Avicen*, and that not so weake, but that it is of force to expell those melancholly vapours from the spirits, and from the blood, which are in the heart and arteries, although it cannot doe so in the other parts of the body. *Dioscorides* saith that the leaves drunke in wine and laid to, is a remedy against the sting of Scorpions, and the poison of the *Phalangium*, or venomous Spider, as also against the bytings of Dogges, and commendeth the decoction thereof, for women to bathe or sit in to procure their courses, and that it is good to wash the teeth therewith when they are full of paine, and that it is profitable for those that have the bloody fluxe. The leaves also with a little *Niter* are taken in drinke against a surfet of *Mulshrooms*, it helpeth the griping paines of the belly, and is good for them that cannot take their breath, unlesse they hold their necks upright, being taken in a Lohoc or licking Eleatuary: used with salt it taketh away wennes, kernels, or hard swellings in the flesh or throate, it clenseth foule sores, and is an helpe to ease the paines of the gowt. *Galen* saith in his seventh Booke of Simples, that Baulme is like unto Horehound in qualities, but weaker by much, and therefore few will use Baulme when Horehound is so plentifull, and neere at hand to be had every where. *Pliny* saith in *lib. 20. cap. 11.* that in *Sardinia* it is poyson, wherein it is very probable that he was much mistaken, and for *Sardonias herba*, which is called offome *Apium risus*, and of *Apuleius* *Apiaſtellum*, he tooke this *Apiaſtrum* or Baulme: the juyce thereof used with a little honey is a singular remedy for the dimnesse of the sight, and to take away the mistinesse of the eyes. It is of especiall use among other things, for the plague or pestilence, and the water thereof is used for the same purposes. It is also good for the liver and spleene. A Tancie or Caudle made with egges, and the juyce thereof while it is young, putting some Sugar and Rosewater unto it, is often given to women in child-bed, when the afterbirth is not thoroughly avoided, and for their faintings, upon, or after their sore travels. It is used in bathings among other warme and comfortable hearbes for mens bodies or legges in the Summer time, to comfort the joynts and sinewes; which our former age had in much more use than now adayes. The hearbe bruised and boyled in a little wine and oyle, and laid warme on a Bile will ripen and breake it. There is an ordinary *Aqua-vita* or strong water stilled, and called Baulme water used generally in all the Land, which becauſe it hath nothing but the simple hearbe in it which is too simple, I will commend a better receipt unto you. Take two pound of Baulme while it is young and tender, of Mints and Sage, of each one pound, bruise them well in a stone-morter, and put them into a pot or Limbeck, and put thereto of Aniseeds foure ounces; of Cloves of Nutmegs, of Cinamon, of Ginger, of Cubebes, and of Galanga, of each one ounce, being all a little bruised and put into two gallons of good Sacke if you will have it excellent good, or else into foure gallons of Ale, and so still it as *Aqua-vita* is distilled, and let it distill as long as you shall finde any strength in the water, yet so that the latter water bee not so weake, to make all the rest white: whereunto put a pound of Sugar, shaking it well before you set it away, and after it hath rested so one moneth, you may use of it as occasion shall require: for it is of especiall use in all passions of the heart, swoonings and faintings of the spirits, and for many other purposes, whereunto this hearbe is here declared to be available.

The hearbe is often put into oyles or salves to heale greene wounds, and it is very probable the name of Baulme, was given to this hearbe, from the knowledge of the healing properties of the true and naturall Baulme. It is also an hearbe wherein Bees doe much delight, both to have their Hives rubbed therewith to keepe them together, and draw others, and for them to suck and feed upon; and is a remedy against the stinging of them. The Turkey Baulme is of as good effect to all the purposes aforesaid, as the ordinary. The Asirian Baulme is of excellent vertue to expell any poison or venome, as also against the plague or pestilence used inwardly and outwardly, it killeth the wormes, and helpeth the jaundise, and the paines of the Mother. for it openeth obstructions, warmeth the cold parts, rarifyeth and clenseth. Motherwort is held of the later Writers, to bee of much use for the trembling of the heart, and in faintings and swoonings, from whence it tooke the name *Cardiaca*: the powder thereof to the quantity of a spoonefull drunke in wine, is a wonderfull helpe to women in their fore travels, as also for the suffocations or risings of the Mother, and from these effects it is likely it tooke the name of Motherwort with us. It also provoketh urine, and procureth the feminine courses, clenseth the chest of cold flegme oppressing it, and killeth the wormes of the belly. It is of good use to warme and dry up the cold humours, to digest and disper them that are settled in the veines, joynts, and sinewes of the body, and to helpe crampes and convulsions, &c. se

CHAP. XVII.

Marrubium. Horehound.

Horehound is divided into two sorts by *Dioscorides*, *Theophrastus*, and *Pliny*: that is, into black Horehound, which they call *Ballote*, our stinking black Horehound, and into white, which is the ordinary Horehound that is in use in our Apothecaries shops, & with all others: but there are some other sorts found out, which doe well agree with them in the outward face, and peradventure in the vertues also, whereof I meane to entreate in this place, referring some of the other hearbs unto that *Classis*, that is, proper for them, where they shall be remembered.

1. *Marrubium album vulgare*.
Common Hore-hound.

1. *Marrubium album vulgare*. Common Horehound.

Common Horehound groweth up with square hoary stalkes, halfe a yard or two foot high, set at the joynts with two round crumpled, or as it were rough leaves, of a fullen hoary greene colour, of a reasonable good scent, but of a very bitter taste, the flowers are small, white, and gaping, set in rough hard prickly huskes, round about the joynts with the leaves, from the middle of the stalkes upwards, wherein afterwards is found small round blackish seed: the root is blackish, hard and woody, with many flings thereat, which dyeth not, but abideth many yeares.

2. *Marrubium Hispanicum Candidum*. White Spanish Horehound. This Spanish Horehound hath divers foure-square stalkes, more white and hoary than the ordinary Horehound, whereon are set the leaves by couples, which are somewhat longer, thicker, whiter, & more woolly also than it, & a little dented about the edges: the flowers grow towards the toppes of the stalkes in rundles, at the severall joynts with the leaves, which are of a pale purplish colour like the common sort, standing in the like rough huskes: the seed is blacke like it also, and so are the rootes: the whole plant is of a stronger and better scent than ours. *Gerard* hath set forth this Horehound, and is the second with him: but his description doth wholly answere to his fourth, which is the Horehound of Candy.

3. *Marrubium Creticum*. Sweet Candy Horehound.

Candy Horehound hath more crooked and slender stalkes than the last, being round and not square, whereon doe grow sometimes broader, and at other times and places, smaller, longer and narrower leaves than it, for these are accounted but one kinde, more dented about the edges, set by couples, more white or hoary than the former Horehounds, as the stalkes are also, which branch forth into many slender branches, having flowers at spaces like the former, but smaller and set in smaller and sharper huskes, which are purplish also like it; the seed is like it also, and the root bueth forth with many fibres: the scent of this is

much better than ours, and equall, if not beyond the other.

4. *Marrubium Creticum angustifolium inodorum*. Vnsavory Candy Horehound.

This Candiot differeth from the last only in these particulars: it hath shorter, narrower, and rounder pointed leaves than the former, and is without any good smell.

5. *Marrubium album villosum*. French Horehound.

This small Horehound riseth not up above a foot high, with his woody round, white, hoary stalkes spreading into divers branches, whereon are set thick leaves in the same manner as the former, but smaller and rounder, a little notched at the edges, and so white, smooth and woolly underneath, as no Cotton weed is more, but somewhat

what blackish and rugged on the upper side: the flowers stand at distances at the toppes of the branches, of a pale purplish colour, in the like rough huskes,

6. *Marrubium album Crispum*. Curld White Horehound.

Curld Horehound hath hard round white woolly stalkes: the leaves are smaller than the last, a little crumpled and curld at the edges, and a little dented also, of a grayish colour on both sides, but not so woolly as the last: the flowers stand in the same manner as the rest, in prickly huskes, but whiter than any of the former.

7. *Marrubium nigrum Hispanicum, vel Ocinastrum Valentinum Clusii*. Spanish black Horehound.

There are two other sorts of hearbs, which although they be no Horehounds, yet for their likeness are referred by others therunto, as not knowing better unto what other Tribe or Family they should be joyned. The first of them riseth up with square hairy stalkes a foote high, the leaves grow by couples at the joynts, somewhat long and round pointed, thinner and fuller of veines than the wild blacke Horehound; like unto the middle kinde of Basil saith *Clusius*, but *Lobel* saith like unto black Horehound, but longer, and of no scent at all (saith *Clusius*, but *Lobel* saith of the smell of *Stachados* or *Cassidony*.) The flowers grow at the toppes of the stalkes in wharles or rondels, of a white colour saith *Clusius*, standing in prickly huskes; but *Lobel* saith of a purplish colour (if that of *Lobel* be the same with this of *Clusius*, whereof I am in some doubt, in regard both the smell of the leaves, and the colour of the flowers, which are two especial parts of the plant: are so differing one from another) the seed is black like the other, and growing in the like prickly huskes; the roote is small, and with long strings like unto the wild Nettle, or the white Archangel.

7. *Marrubium nigrum Hispanicum, &c.*
Spanish black Horehound.

3. *Marrubium Creticum*.
Sweet Candy Horehound.

8. *Marrubium nigrum longifolium, &c.*
Black French Horehound with long leaves.

8. *Marrubium nigrum longifolium, five Herba Ventri Rondeletij & Monspeliensum*. Blacke French Horehound, with long leaves.

This other plant that is referred by some to the black Horehounds, hath many square rough stalkes, rising to the height

2. *Stachys major Germanica.*
Great Dutch Bala Horehound.5. *Stachys Lusitanica.*
Portugall Bala Horehound. 6. *Stachys Spingja.* Thorny Bala Horehound.

ches, ending all of them in sharpe thornes, whereof the middlemost is the biggest and strongest: the flowers are of the bignesse, forme, and colour of the flowers of Spanish Germanander, or rather of Sage, but somewhat paler, and the upper part thereof somewhat more bowed downeward, standing thinly scattered on the branches, very quickly fading and falling away: it seldome beareth seed, in regard it flowreth so late with us, but when it doth, it is black, and somewhat uneven or rugged, and not round: the roote is very great for the finalnesse of the plant, and woody, dispersing it selfe into many sprays under ground: the whole and every part thereof, hath no good scent to commend it.

The Place.

The first groweth plentifully in Italy, as *Matthiolus* saith: and in the fields about Rome, as *Castor Durantus* saith: and in Germany also, as others have set it downe. The second is naturall of Germany, as *Tragus*, *Lonicerus*, *Camerarius*, *Thalius*, *Gesner*, and others doe set it downe. The third from the seed that came out of Candy, did the plant spring. The fourth groweth upon a small hill in Germany, called *Wasserfall*. The fifth groweth in Portugall, as *Lobel* first relateth it. The sixth and last *Honorius Bellus* found in Candy, and sent the seed to *Clusius*, who saith that hee had the figure and some notes thereof also sent him from *Jacobus Plateau*, who had not thought that *Clusius* had seene any such plant before.

The Time.

The foure first doe all flower about the middle or end of July, but the other two are very late, not flowering for the most part untill September, whereby no hope of seed could be expected.

The Names.

The first *Matthiolus* in his latter Edition calleth *Stachys*, and judgeth it to be the true *Stachys* of *Discorides*, although in the former editions he had set forth the second with an opinion that it had bene the right, and *Dodonæus*, *Lugdunensis*, *Tabernmontanus*, and *Gerard* call it *Stachys*, also *Camerarius* calleth it *Stachys minor*. *Gesner* calleth it *Stachys floribus grati ioris odoris*. *Lobel* calleth it *Stachys lychnitis*, & *Stachys spuria Flandorum*. *Casalpini* calleth it his *Salvia sylvestris tertia*, and *Bauhinus* *Stachys Italica minor*, in English the lesser, or Italian base Horehound. The second is called by *Matthiolus* *Pseudo-Stachys*, and so doth *Lugdunensis*, but divers others call this *Stachys*, and judge it contrary to *Matthiolus* his last opinion to be the truer *Stachys* of *Discorides*. *Gesner* calleth it *Stachys Germanica*, and *Camerarius* major five *Germanica*. *Casalpini* calleth it *Salvia sylvestris*, *Thalium* in *Harcynia sylva*. *Marrubium montanum album*, *Fabius*, *Columna*, *Sideritis Heraclea*, and *Bauhinus* *Stachys minor Germanica*, in English Great Base Horehound. The third is called by *Bauhinus* *Stachys*, and *Pseudo-Stachys Cretica*, and saith it was sowne for *Marrubium Creticum*. The fourth is called by *Lonicerus* *Sphacelus forte Theophrasti*. *Casalpini* calleth this *Salvia sylvestris nigrior*. *Tabernmontanus* and *Gerard* call it *Salvia Alpina*, and *Bauhinus* *Pseudo-Stachys Alpina*, in English Mountaine Base Horehound. The fifth *Lobel* calleth *Stachys Lusitanica*, and *Lugdunensis* doth the like, in English *Portugall Base Horehound*. The sixth from *Candy*, was sent unto *Clusius* by the name of *Gaiderothymo*, which signifyeth *Aster Time*, whereunto it hath no correspondency. *Clusius* first called it *Stachys spuria*, and *Bauhinus* *Stachys spinosa Cretica*, in English Thorny Base Horehound.

The Vertues.

Discorides and *Galen* both speaking of this kinde of Horehound, called *Stachys*, say it is of a hot and sharpe quality, a little bitter, and in the third degree of heat: and therefore the decoction thereof is profitable to procure womens courses, and to expell the after birth, and that it causeth abortion in women, that is, to miscarry in child-bearing; or to come before their time: it also provoketh urine being stopped, if the parts be fomented with the decoction thereof, or the party doe sit over the warme fumes.

CHAP. XIX.

Salvia. Sage.

Have to shew you herē many differences of Sage worthy of observation, because other Authors have recorded some of them to other hearbes.

1. *Salvia major vulgaris*. Ordinary Garden Sage.

Our ordinary Sage is reckoned to bee of two sorts, white and red (yet I thinke they both rise from one and the same plant slipped and set) both of them bearing four-square woody stalkes, in some whiter Greene, in others redder, as the leaves are also, standing by couples at the joynts, being somewhat long and broad, rough and wrinkled. of a strong sweet scent: at the tops of the stalkes come forth the flowers set at certaine spaces, one above another, which are long and gaping, like unto the flowers of Clary or dead Nettle, but of a bluish purple colour, after which come small round seed in the huske that bore the flower: the roote is woody, with divers strings at it: it is more usually propagated by slips, pricked or thrust into the ground in the Spring time, than of the seed. Of this kinde are the two sorts of party-coloured Sage, the one white and Greene: the other whitish red and Greene in most of the leaves.

2. *Salvia maxima sive latifolia*. Great white Sage.

This great Sage differeth not from the common or ordinary great Sage for the manner of the growing, or the colour of the leaves, or sweetnesse of the whole plant, the chiefe differences consist first in the leaves, which are much larger, and a little dented about the edges, and sometimes much more, making them seeme curled; divers of the leaves being foure inches long, and three inches broad; and in the flowers, some plants bearing purplish flowers like the ordinary, and others milke white flowers which is the more rare.

3. *Salvia major Cretica latifolia*, & *angustifolia aurita*, & *non aurita*, *pomifera* & *non pomifera*.

Great Sage of Candy with broad and narrow leaves, and bearing eares and apples, and that beare none.

This great Sage hath many square hard hoary stalkes, especially when they are young, but turning almost round when they grow old, rising both greater and higher in the hot Countries than with us, whereon are set two leaves at a joynt, one against another, in some like our ordinary Sage but larger, in others somewhat smaller and longer; in many plants of both sorts there will bee small pieces of leaves growing on both sides at the bottome of the leaves, and in some plants or places there will be none of these pieces or eares to bee

1. *Salvia major vulgaris*. Ordinary Garden Sage.

Verficolor.

bee seene, (which hath caused severall Authors to give severall figures) which are very hoary underneath, and more greene on the upperside, having as it were the hoarynesse rubbed off from them, of a much stronger scent than the common : the stalkes branch forth on all sides, towards the toppes whereon stand the flowers at distances, like unto the flowers of ordinary Sage, but of a pale or whitish purple colour : after which come great heads of seed standing in the same huskes or cuppes that bore the flowers before, which are so much swollen, that they seeme to be berries, with three or foure great seeds in them. These kindes likewise beare in the hot Countries of *Egypt, Candy, &c.* at the joynts, and sometimes betwene the joynts of the stalkes, certaine excrecences like unto small Apples or berries bigger than Pistack nuts, of an inch thicknesse at the least, and covered with much downe or cotton, somewhat rough in handling, of a taste not so hot, but more binding than the Sage, and not unpleasent, which the people usually eate with bread, but in other colder Countries it never beareth any.

3. *Salvia pomifera.*
Sage bearing apples.

4. *Salvia minor pinnata.*
Sage of Vertue.

*Flore
albo.*

4. *Salvia minor, five pinnata.* Small Sage, or Sage of Vertue.

This lesser Sage groweth like unto the first great white Sage, but that the branches are long and slenderer, the leaves also whitish, and never red, and much smaller or narrower, having for the most part at the bottome of each leafe, on each side a small piece of a leafe, which maketh it seeme like finnes or eares : the flowers also are of a bluish purple colour, but lesser. Of this kinde there is one that beareth white flowers, differing in nothing else from the other.

5. *Salvia minor aurita odoratissima Hispanica.* The sweetest small Spanish Sage with eares.

This Spanish small Sage is in most things so like the ordinary small Sage with eares, called Sage of Vertue, that unlesse it bee well heeded or marked, it will bee thought all one with the other, but herein consisteth the difference, it feldome groweth to be so great, the leaves are somewhat smaller and greener, or not so white, it is more tender to keepe, and doth quicker perish in the Winter, unlesse it be better defended than the other; and the smell hereof is farre more milde, sweet, and pleasent, yet somewhat quicker wirhalp than the former, which is easily discerned by any that can judge of scents; and lastly, some kinde hereof beareth white flowers, another blue.

6. *Salvia Cretica angustifolia non aurita.* Small Candy Sage without eares.

This small Candy Sage riseth up with divers hard stalkes, of a brownish colour, having the leaves set thereon by couples, which are much narrower than in any other Sage, and without any eares at all set unto them, of a whitish greene colour like the small Sage, and a little dented or crumpled about the edges; this brancheth forth plentifully, bearing purple flowers at the toppes in spikes, without any leaves among them, the roote is hard and woody, spreading under ground diversly.

7. *Salvia minor altera flore rubente.* Small red flowered Sage.

This small Sage differeth little in the forme of growing or bignes, or colour of the leaves from the ordinary small Sage, but that it hath not eares so frequently with the leaves as it hath : the chieft difference from all others is that the flowers are red, and that both smell and taste are like unto Woortewood.

8. *Salvia lanuginosa angustifolia.* Small woolly Sage.

This woolly Sage hath divers round stalkes a foote and a halfe high, so hoary and woolly, that they are soft therewith, though underneath they be woody, which spread into many branches, with leaves set thereon like the other, which are thick, narrow, short, and very hoary, white and rough, of two inches long, and halfe an inch in breadth, smelling like unto Tanseye : the flowers stand in spikes at the toppes of the branches, of a purplish colour, like unto the flowers of dead Nettle or Archangell, with many small long threads in the middle.

9. *Salvia folio subrotundo.* Round leaved Sage.

This Sage hath many square hoary stalkes with leaves set thereon in such manner as the others are, which are rough or crumpled like the leaves of ordinary Sage, but thinner, and much whiter, round also like unto the leaves of Violets, or round rooted Birthwort, yet ending in a point: in other things it differeth not from the ordinary common Sage.

10. *Salvia fruticosa late a angustifolia, five Phlomis Lychnitis Dioscoridis Clusio.* The greater yellow wilde Sage with narrow leaves.

This kinde of Sage (for thereunto I thinke it fittest to referre it, and not to any Mullein as others doe. for which I shall shew you the reason presently hereafter) hath many very hoary and woolly leaves, the lower sides especially more than the upper, longer and narrower also than those of the small Sage, among which rise up square hoary and hairy stalkes about a foote high, whereon doe grow such like long hoary leaves as grow below, two alwayes set together one against another at the joynts, where the flowers stand at spaces, about the toppes of the stalkes with two leaves under them, broad at the bottome, and compassing the stalkes, being shorter than the rest : the flowers are large, open, and gaping, like unto Sage, or somewhat more like unto those of the dead Nettle, or Archangell, of

6. *Salvia cretica angustifolia non aurita.*
Small Candy Sage without eares.

10. *Salvia fruticosa lutea angustifolia sive Phlomis heliopsis, &c.*
Yellow wilde Sage with narrow leaves.

of a yellow colour coming forth out of hoary woolly huskes, covered with pale coloured haire, the toppes by reason of the length and weaknesse bending a little downewards, after which come brownish seed inclosed in woolly huskes: the root is blackish and woody.

11. *Salvia fruticosa lutea latifolia sive Verbascum sylvestre quantum Matthioli.* French or yellow wilde Sage with broad leaves.

Although divers Authors doe account this hearbe a *Mullein*, and so doe number it among the kindes thereof, yet I thinke it more proper to put it among the Sages: for *Lobel* and *Pená* in their *Adversaria* say, that it is called wilde Sage in the Gardens of *Italy*, *France*, *England*, and the *Netherlands*: and in regard that the leaves and flowers both of this; and the precedent doe rather resemble Sage than *Mullein*, this the greater Sage, and the former the lesser, I see no reason why these should be called *Mulleins*, or referred unto them rather then unto Sage, seeing none of the *Mulleins* that are properly so called, have hooded or gaping flowers like unto Sage, *Archangel*, and the like: but all of them are composed of five leaves, laid open like unto the *Campions*, and many other such like flowers. Take therefore the description thereof here in this manner. It hath divers square woody hoary stalkes, whereon grow at severall spaces, rugged, hoary, broad, and almost round pointed leaves, many set together, very like unto the great Sage, but greater: the flowers grow likewise in rundles or spaces towards the toppes of the stalkes, very like also unto the flowers of Sage, or *Archangel*, but of a yellow colour: the seed is greater than of any Sage, somewhat brownish and round like the last: the root is woody, with divers strings and fibres fastned unto it: the whole plant smelleth somewhat strong and heady. *Gerard* setteth downe another sort hereof, which hee saith is more sweet, but I mervaille where he had any relation of another, there being but one sort that ever I could heare of, or know.

12. *Salvia minor lutea cretica.* Small yellow Sage of Candy.

This small Sage groweth with three or foure stalkes that are hard, square, and hoary, about a foote or more high, parted into other smaller branches, at whose joynts being separate farre in sunder, come usually two, and sometimes three or more, rough small hoary leaves, very like unto the small Sage leaves, and at them likewise towards the toppes of the stalkes, stand divers small gaping flowers very like unto those of Sage, but of a gold yellow colour, the seed is small, black, and somewhat long: the roote is woody and slender, the whole plant is of little sweet scent, but stiptick or astringent in taste. *Alpinus* calleth this *Verbasculum satyriifolium*, and differing in the smallnesse from the other *Salvisolum*, which is foure times bigger, and would referre it to *Dioscorides* his *Verbascum sylvestre*, amending the text which is somewhat faulty, in saying *ramos habet circum virgas veluti Marrubium*: but *Marrubium* hath not *ramulos*, but *flores circum virgas*: and so it is most likely the text should runne, but I suppose it is most like unto a small Sage, whereunto I therefore referre it, because no *Verbascum* hath gaping flowers.

The Place.

The first groweth in *Spain* and *Narbonne*, &c. and so doe the fourth and fift. The second groweth well in *England* with

11. *Salvia fruticosa lutea latifolia* five *Verbascum styacifolium*, &c.
French or yellow wild Sage with broad leaves.

12. *Salvia minor lutea Cretica*,
Small yellow Sage of Candy.

with many that have it, and is likely to be that sort which *Clusius* saith he found in *Austria* with white flowers, and may also be *Gerardus* his *Alpina*, but that the figure doth better represent an *Horminum* than Sage. The third as is said, is naturall to the hot Countries of *Egypt*, *Candy*, &c. but will not abide with us, nor ever beare those apples. The fourth is in many of our gardens, and as *Clusius* saith, groweth plentifully in *Spaine*, and so doth the fift. The fift came out of *Spaine*, and is the sweetest of all other, yet it differeth as I said, from the former small Sage, which groweth in *Spaine* likewise abundantly. The sixt was raised from the seed that came out of *Candy*, whereof *Clusius* maketh mention, that he received the figure thereof set forth to the life in colours, from *Jacobus Plateau*, as it grew with him. The seventh *Barbinius* saith he first saw in an Apothecaries Garden in *Bassl*, and afterwards in the Duke of *Wittenbergs* Garden at *Mont Belgard*, but from whence it was brought to them, he doth not declare. The eighth *Barbinius* saith he received from Doctor *Nendorfferus*, and saith no more. The ninth hee saith likewise hee had from an Apothecarie at *Smalcald*: the two next throughout *Spaine* and *Portugal* plentifully: and the eleventh about *Mompeliev* also: the last grew in *Candy*. All these sorts will grow by the slippes taken from them, and planted in March or April.

The Time.

Most of these sorts of Sage doe flower in July, or about the time of the ordinary Sage, yet some of them flower not untill August. All of them also doe beare seed, but the small ordinary Pigge Sage, or Sage of vertue, which although I doe acknowledge to give seed in some places, and in some yeares, yet most commonly, and with many it doth not, nor the sweet small Spanish kinde.

The Names.

Sage is called in Greeke *Βασιλικον*. The pale ash-coloured dry and withered deformity of the leaves of Sage, especially on the dry and burnt hills in the hot Countries where it groweth naturall, was the cause to give it that name, as if you should call it, scorched or consumed by blasting, for *καυεν* doth signifie *intorquere*, and *contrahere* to bee drawne together, or wound within it selfe, and *σεν* or rather *σεν* doth signifie that disease in plants, which the Latines call *sideratio*, a blasting, that is, when the hearbe or tree by the extreame heate of the Sunne in the Dog-days, or otherwise piercing into it, and drying up the moisture that nourished it, seemeth to grow faint and dry, or as it were scorched. It might saith *Pena* be fitly so named, from the helpe this hearbe giveth to those parts of a mans body, that seeme to be as it were dead by some blasting, in restoring the naturall heat and vigour to the part, in which quality it excelleth, giving a friendly and beneficiall comfort to the vitall spirits; and therefore the Latines called it *Salvia*, quia *salvos* homines & incolumes efficit, because it maketh men safe and sound in health. And the Latine versifier from hence tooke his occasion to say, *Cur moritur homo cum Salvia crescit in horto*. And Sage in English, from the property in comforting and strengthening the head and memory, to make men sage or wise, of the French word *Sage*; or from the Latine *Salvia*, to say safe, and altered into Sage. *Pliny* in his 21. Booke, 16. chap. hath foulely erred in mistaking the Greeke word *σεν*, and translating it *σεν* which is *Leus*, for he there saith, that

that *Eliliphacos*, with the Greekes is *phacos* with others. The one is more gentle than the manured lentell, with a lesser, dryer, and sweeter leaf; and the other kinde that is wilde, is of a more grievous scent, &c. too much here to recite and set downe, and to little purpose. The first is generally called *Salvia major* & *latifolia*, by almost all Authors: the second *Clusius* saith he first saw in *Austria*, and *Bauhinus* that he had it first from *England*, and called it *Salvia latifolia serrata*: the third is called *Salvia pomifera* & *baccifera*, or *baccata* & *Cretica*, or *Cretensis*, to shew the kinde, *Lobel* calleth it *Coccifera*, *Mathioli* *Salvia fructum instar galle ferens*, and *Anguilara* *Salvia Græca*, which he saith they usully call *ῥαδενωμενα* *Phlacomela*: the fourth is called *Salvia nobilis* by *Gesner* & *minor*, by *Mathioli* and divers others, *angustifolia*, and *tenuifolia* by some others, *aurita* also, or *auriculata*, or *pinnata* by others: the fifth *Camerarius* calleth *Salvia Hispanica odoratissima*, but *Bauhinus* *Salvia folio tenuiore*, the old *Gerard* calleth it *Salvia Indica*, but his *Correter* confoundeth it with the seventh following as you shall heare: the sixth *Clusius* setteth forth with this title, *Salvia Cretica angustifolia*, and *Bauhinus* *Salvia angustifolia serrata*: the seventh *Bauhinus* onely hath remembered unto us by the name of *Salvia minor altera*, and I adde therunto *flore rubente*, to make it the better knowne, for it is scarce knowne to many: this is that Sage that I said before *Master Iohnson* that corrected *Gerard* hath erred exceedingly, in confounding this with the fifth, which is the same that *Master Cannon* shewed him and gave me, whose scent is farre sweeter than the small Pigge Sage, and much differing from the scent of Wormewood, if he had as duly enformed his smell thereof, as hee did his sight of the flower: the eighth *Bauhinus* also giveth the name of *Salvia angustifolia Lemingosa*, and in English small woolly Sage: the ninth likewise hath his name in the title, *Bauhinus* giving the Latine, and I the English: the tenth is called by *Clusius* *Phlomis Lechnitis*, and referreth it to the *Lechnitis* called also *Thryallis* by *Dioscorides*, and by the Castilians in *Spain* *Candilera*, and those of *Granado* *Menchera*: *Lobel* calleth it *Verbascum sylvestre folijs salvia tenuifolia*, and *Bauhinus* *Verbascum angustifolium salvia folijs*, who saith it is also called of some *Angarathi*: but *Gesner* in *hortis Germanie* calleth it *Salvia sylvestris Monspeliensium*, and therefore I have placed it in the number of the Sages, and altered the title in Latine, and call it thereafter, in English, the greater yellow Sage with narrow leaves: the eleventh is called by *Mathioli* also *Verbascum sylvestre*, being his fourth, and from him *Anguilara*, *Castor Durantes*, *Clusius*, and others do call it *Verbascum* 4. *Mathioli*: *Camerarius* *Verbascum sylvestre folijs salvia*, and *Lobel* *Verbascum frutescens lignosum & flore luteo*, who saith as I shewed you in the description, that it is called a wilde Sage in *Italy*, *France*, the *Low-Countries*, and *England*, for we call it French Sage, and why then he and they should call it, as the next going before this, *Verbascum Mullein*, I see no cause more than that the leaves in both are woolly like Mullein, and may serve as a wecke for Lampes, as the Spaniards doe with the last before this, and as Mullein leaves may doe, but that is not a sufficient cause in my judgement, to make them of the tribe of Mulleins, other things not concurring as the flowers whereof I have spoken before. Let others of knowledge bee judges herein. It is called in English as I said, French Sage, and woody Mullein, and this may as fitly bee called the great yellow wilde Sage with broad leaves, as the former is called the greater yellow wilde Sage with narrow leaves: The last is called *Verbascum salvisolium* by *Prosper Alpinus* in his Booke *De plantis exoticis*, but because the flowers of this are more like a Sage than a Mullein, as in the former I have rather referred it to these than to them. *Bauhinus* would seeme to make our ordinary Sage to bee the *Sphacelus* of *Theophrastus*, (for *Dioscorides* maketh no mention of *Sphacelus*) set downe in his 6. Booke and 2. Chapter: whereof he speaketh in this manner, *Sphacelus* & *Salvia*, differ one from another; as if you would call the one the tame manured Sage, and the other the wilde: the leafe of *Sphacelus* is smoother and narrower, and lesse unseemely, or not so ill-favoured: but Sage is more rough. *Lugdunensis* doth make the ordinary small Sage to be it, and *Mathioli* seemeth to say the same: *Guilandinus* as is set downe in the Chapter going before, thinketh the great *Stachys* to be it. *Dodonæus* judgeth the *Salvia agrestis*, or *Scorodonia*, Wood Sage to be it, and some others thinke *Colus Iovis*, or *Jupiters* distaffe, a kinde of wild Clary set downe in the next Chapter to be it. So that among such variety of opinions among learned men, it is very hard for me to set downe which is the truest: yet I will make bold to scan them all a little, and lastly shew you my judgement. First, for *Bauhinus* that seemeth to judge our ordinary Sage to bee the *Sphacelus*, which if it should be so, I would faine have him set downe; what sort should be his Sage, that must be by *Theophrastus* judgement more rugged than *Sphacelus*; for I thinke none of the Sages is more rugged than the ordinary: For *Dalchampsius* and others that thinke the small Sage to bee *Sphacelus*, and say it is peculiar to the *Sphacelus* to have eares; surely I thinke that if *Theophrastus* had meant that Sage, he would not have forgotten to specifie the eares, which is such a manifest distinction from the other, and from all other hearbes almost, that he might soone have put it out of all question, if he had but so set it downe, besides his *Sphacelus* hath a smoother leafe, and not so ill-favoured as the Sage, but the leafe of the small Sage, is almost as unfitly for the smallnesse as the greater: for *Guilandinus* that taketh the great *Stachys* or bafe Horehound to bee *Sphacelus*, the greatnesse of the leaves and whole plant, and the resemblance more neare an Horehound than a Sage, will make any the more to decline from this opinion; for it seemeth by *Theophrastus* that *Sphacelus* should be a kinde of Sage, in that it should no otherwise differ from it, but in the seemeliness, smoothnesse, and smallnesse of the leafe. For *Dodonæus* who would make the *Scorodonia* or *Salvia agrestis* to be *Sphacelus*, and strengthneth his opinion with these reasons, that the leafe of the *Sphacelus* is more narrow or small, (for so I translate the word *contractus*) and lesse unseemely than Sage, such as the woody Sage hath, and maketh the Greeke word *ῥαδενωμενα* to signifie a more grievous smell, as well as a more rugged or crumpled leafe, that he might make the Wood Sage to bee answerable unto *Sphacelus*, and to be lesse grievous in smell, as well as lesse rugged in forme to the Sage: but although it be called *Salvia* & *agrestis* with him, and *sylvestris* with *Tragus* and others, yet it is also referred by the best Authors unto the second *Scordium* or *scordotis*, water Germander of *Pliny*, and of *Valerius Cordus*, called *Scorodonia*, of the smell of Garlicke, whereof this wood Sage hath a smack, which even *Dodonæus* himselfe describeth to have larger, but shorter leaves than Sage, both which I thinke cannot agree unto *Sphacelus*, for it is said to have smaller leaves than Sage, and the smell hereof cannot be said to bee lesse grievous than that of Sage. Now for those that would have *Colus Iovis* to be *Sphacelus*, their opinions have farre lesse shew of reason than any of the other going before, for the forme and largenesse of the leaves and stalkes is greater than Sage, and is differing from any good scent, drawing neerer unto a wild Clary, (whereof good Authors make it a kind) than to any Sage. Now to shew you my opinion, which of these come nearest to the truth, I must a little before hand scan the words of *Theophrastus*, which you may read in the same Booke and Chapter within a few lines after it; for in describing the next hearbe *Marrubium*, Horehound to be of two kinds; when hee hath

shewed you the first, he saith of the second, *alterum rotundius squallensque vehementer sicut Sphaceli, &c.* which is, the other kinde, hath a rounder leafe than the former, and of an exceeding foule unseemely, or ill-favoured forme or colour (for the word *squallens* may be referred to both) like unto *Sphacelus*: so that it seemeth that the leaves of the other Horehound should be as unseemely in shew as the *Sphacelus*, which words seeme to contradict the former concerning *Sphacelus*, to be smooother, smaller, and lesse unseemely than Sage, for thereby the leaves of *Sphacelus* should have a neater forme and colour than Sage, and hereby they should bee worse, or as bad in shew as Horehound, which all know to be of no good colour or shew: to reconcile these descriptions it is necessary, seeing an Author of so great learning and judgement, should not vary in his owne writing (but this is not observed or remembered by any Author that I have read) therefore it is the best way to say, that even *Sphacelus* is very deformed and unseemely, but in comparison of Sage, which is more dry and deformed, *Sphacelus* is smooother and lesse deformed. So that considering all these hearbes that the severall Authors doe make to be *Sphacelus*, I find none that can be more fitly referred thereunto than the *Salvia minor*, the lesser Sage: notwithstanding that *Theophrastus* hath omitted the eares, and that *Dodonæus* contrarieth it, for that it is as deformed as the greater Sage, for both *Matthioli* in his last Edition upon more mature deliberation no doubt, and *Dalechampi*, or the Author of *Lugdunensis* hath expressly set it downe so, and *Theophrastus* may be excused for not remembering the eares, and *Dodonæus* answered that by *Theophrastus* judgement even *Sphacelus* according to the Greeke name before shewed, which is *Sideratio* in Latine, is exceedingly deformed, or unseemely, as well as the great Sage, though in comparison of the one with the other, the greater Sage is the more dry and rugged. Sage is called by the Arabians *Aclisfacos* and *Elisfacos*, by the Italians *Salvia*, and *Salva* by the Spaniards, as well as *Salvia*: by the French *Sauvage*: by the Germanes *Salbey*: of the Dutch *Savie*, and by us in English, Sage.

The Vertues.

A decoction of the leaves and branches of Sage made and drunke, saith *Dioscorides*, provoketh urine, bringeth downe the feminine courses, helpeth to expell the dead child, and is a remedy against the prickles of the Pusken or Fokfish, and causeth the haire likewise to become blacke: it stayeth the bleeding of wounds, and cleaseth foule ulcers or sores: the decoction of the leaves and branches made with wine, doth take away the itching of the cods, if they be bathed therewith. *Galen* saith it is of a manifest heating quality, and a little binding, and *Etius* saith the same also, but he further saith, that some report that the fumes thereof being taken when it is burnt, doth stay the immoderate fluxe of womens courses, and all other fluxes of theirs: *Agrippa* saith that if childing women whose wombes be too moist and slippery, not able to conceive by reason of that default, shall take a quantity of the juyce of Sage, with a little salt, for foure dayes before they company with their Husbands, it will helpe them to conceive, and also for those that after they have conceived, are subject often to miscary upon any small occasion, for it causeth the birth to be the better retained, and to become the more lively: therefore in *Cyprus* and *Aegypt*, after a great plague, women were forced to drinke the juyce of Sage, to cause them to be the more fruitfull. *Orpheus* saith, that three spoonfulls of the juyce of Sage taken fasting with a little honey, doth presently stay the spitting or casting up of blood: For them that are in a consumption, these Pills are much commended. Take of Spiknard and Ginger of each two drammes, of the seed of Sage a little tosted at the fire eight drammes, of long pepper twelve drammes, all these being brought into fine powder, let there bee so much juyce of Sage put thereto, as may make it into a masse, formable for pills, taking a dramme of them every morning fasting, and so likewise at night, drinking a little pure water after them. *Matthioli* saith, that it is very profitable for all manner of paines of the head, coming of cold and rheumaticke humours, as also for all paines of the joynts, whether used inwardly or outwardly, and therefore it helpeth such as have the falling sicknesse, the lethargie or drowie evil, such as are dull and heavy of spirit, and those that have the palsey, and is of much use in all defluxions or distillations of thin rheume from the head, and for the diseases of the chest or brest. The leaves of Sage and Nettles bruised together, and laid upon the impostume that riseth behind the eares, doth assuage and helpe it much: also the juyce of Sage taken in warme water, helpeth an hoarinesse and the cough: the leaves sodden in wine and laid upon any place affected with the Palsey, helpeth much, if the decoction be drunke also. Sage taken with Wormewood is used for the bloody fluxe; *Pliny* saith it procureth womens courses, and stayeth them coming downe too fast; helpeth the stinging and bytings of Serpents, and killeth the wormes that breed in the eares, and also in sores. Sage is of excellent good use to helpe the memory, by warming and quickning the senses, and the conserve made of the flowers is used to the same purpose, as also for all the former recited diseases: they are perswaded in *Italy* that if they eate Sage fasting with a little salt, they shall be safe that day, from the danger of the byting of any venomous beast: they use there also never to plant Sage but with Rue among it, or neare it, for feare of Toades and other Serpents breeding under it, and infecting it with their venomous spittle, &c. the danger whereof is recorded in *Boccace*, of two Friends or Lovers, that by eating the leaves of that Sage under which a Toade was found to abide, were both killed thereby, and therefore the Poet joyneth them both together to have wholesome drinke, saying; *Salvia cum ruta facine ribi poenula ruta*. Sage hath bene of good use in the time of the plague at all times, and the small Sage more especially (which therefore I thinke our people called Sage of Vertue) the juyce thereof drunke with vineger. The use of Sage in the Moneth of May, with butter, Parsley, and some salt, is very frequent in our Country to continue health to the body: as also Sage Ale made with it, Rosemary, and other good hearbes for the same purpose, and for teeming women, or such as are subject to miscary, as it is before declared. Gargles likewise are made with Sage, Rosemary, Honifuckles, and Plantaine boyled in water or wine, with some Honey and Allome put thereto, to wash cankers, sore monthes, and throats, or the secret parts of man or woman as need requireth. And with other hot and comfortable hearbes to be boyled, to serve for bathings of the body or legges, in the Summer time, especially to warme the cold joynts or sinewes of young or old, troubled with the Palsey or crampe, and to comfort and strengthen the parts. It is much commended against the flitch or paines in the side coming of winde, if the grieved place be fomented warme with the decoction thereof in wine, and the hearbe after the boyling be laid warme also thereto.

CHAP. XX.

Horminum. Clary.

Here are divers sorts of Clary, some manured onely, called Garden Clary, others growing wilde wherof I shall here shew you many, collected from sundry parts.

1. *Horminum sativum vulgare sive Sclarea*. Garden Clary.

Our ordinary Garden Clary hath foure-square stalkes, with broad, rough, wrinkled, whitish, or hoary greene leaves, somewhat evenly cut in on the edges, and of a strong sweet scent, growing some neare the ground, and some by couples upon the stalkes. The flowers grow at certaine distances, with two small leaves at the joynts under them, somewhat like unto the flowers of Sage, but smaller, and of a very whitish or black blue colour: the seed is brownish, and somewhat flatt, or not so round as the wild, the rootes are blackish, and spread not farre, and perish after the seed time: it is most usuall to sow it, for the seed seldome riseth of it owne shedding.

2. *Horminum genuinum sativum Dioscoridis*. The true garden Clary of *Dioscorides*.

This small Clary riseth up but with one square hairy stalk, about halfe a yard high, (as farre as ever I could yet observe) divided into severall square branches, whereon are set at every joynt two leaves one against another, which are somewhat broad and round, a little rugged like unto Horehound, but more greene than white, and of a reasonable good and small scent; at the toppes of the stalkes stand divers leaves, one row under another, of a very fine deepe purple violet colour, yet the lowest are paler than the uppermost, and seeme a farre of to be flowers, but nearer observed are discerned to bee but the toppe leaves, the flowers comming forth under them at spaces about the stalkes, of a whitish purple colour, smaller than any of the sorts of Clary, standing in brownish purple huskes, which after the flowers are past, while the seed ripeneth, turne themselves downward, whereby the seed is lost, if it be not gathered in fit time: the roote is small and perisheth every yeare, requiring to bee new sowne in the Spring, for it seldome commeth of the seed that it shed, the Frosts and Winter most likely killing it.

3. *Horminum Syriacum*. Affirian Clary.

Affirian Clary is somewhat like unto Garden Clary, having a square stalk about two foote high, very little hairy, divided towards the toppes into smaller branches, whereon doe grow at the joynts two rough leaves, those below being larger than those above, and somewhat smoother, as long and large as a mans hand, unevenly waved about the edges: the flowers are like unto Garden Clary, for the gaping forme, but smaller, and of a white colour, after which come small flat grayish seed, having red ribbes and black lines on them, when it is in flower, it smelleth pretty and sweet, but else not.

4. *Horminum Germanicum humile*. Low Germane Clary.

This small low Clary of *Geymany* hath square and somewhat hairy stalkes, a cubit high, whereon doe grow large leaves, very like unto our garden Clary, two growing at a joynt on the contrary part thereof, one unto another, which are very rough and hairy, somewhat torne in on the edges, and deeply dented likewise, both lesse hoary, and of a lesse strong scent than it; the flowers grow at spaces about the stalkes to the toppes, bowing their spiky heads, which are of a purple colour, not much bigger than Lavender flowers, after which come small blackish seed; the roote is of the thickest of a mans thumbe, blacke on the outside, with divers fibres set thereto, which perisheth not, but abideth many yeares.

5. *Horminum sylvestre vulgare*. Our ordinary wild Clary, or *Oculus Christi*.

The wild Clary (that groweth in many places of this Land) hath many square stalkes, two or three foote high, whereon doe grow broad darke greene leaves, dented about the edges, somewhat rugged and hard in handling, the flowers grow along towards the toppes of the stalkes, like unto the gaping or hooded flowers of the garden Clary, but smaller, and of a black blue colour, after which come round brownish seed: the roote is long, tough, and black, with divers fibres annexed to it, whereby it taketh fast hold of the ground: this hath a strong smell therein, but nothing so quick as our garden Clary. There is another kinde hereof, the toppes of whose stalkes are purplish, with flowers of a deeper purple colour, and somewhat larger leaves. And another likewise hereof, differing onely in that the tops of the stalkes are green, and not purple, the flower of a pale blue colour, and the leaves a little torne in on the edges.

6. *Horminum sylvestre incanum flore albo*. Hoary wild Clary with a white flower.

This white Clary differeth little from the former, but onely that this hath more hoary leaves than it, a little deeper indented into the edges, and the flowers are wholly white.

7. *Hormi-*

1. *Horminum sativum vulgare sive Sclarea*.
Garden Clary.

3. *Horminum genuinum sativum* Dioscoridis.
The true garden Clary of Dioscoridis.

4. *Horminum Germanicum humile*,
Low German Clary.

7. *Horminum sylvestre italicum*. Italian wild Clary.

7. *Horminum sylvestre italicum*. Italian wild Clary.

This Clary groweth with such like square high stalkes as the former, whereon grow in the like manner two leaves at a joynt, which are Greene, but more rugged or fuller of wrinkles, & somewhat longer, ending in a longer point: the flowers likewise stand at the toppes of the stalkes and branches, in spaces or distances like the other, and hooded or gaping as they are, but smaller, and of a red colour: the seed is small and blacke, standing in the brownish huskes, that contained the flowers, in the like manner as all the rest doe: the roote is living, and perisheth not after seed bearing.

8. *Horminum sylvestre Lavendula flore*. Wild Clary with Spike flowers.

This wild Clary groweth like unto the ordinary wilde Clary, with square hairy stalkes as high as it, set with harder nartower and smother leaves, deeplier endented about the edges, and rounder pointed, the flowers are much esse than they; and neither in bignesse or colour, much differing from the flowers of Spike or Lavender, growing in spaces as the rest doe: the seed and rootes differ not, nor the smell hereof much, from the other wild indes.

9. *Horminum sylvestre salvisolium*. Sage leaved wild Clary.

The Sage leaved Clary hath low square stalkes, not much above a foot and a halfe high, whereon grow two hard rugged leaves at a joynt, very like unto Sage leaves, but not hoary at all, of a darke Greene colour, dented about the edges: the flowers grow at spaces round about the stalkes, of a faire purple violet colour in some, and more pale in others, or almost of an ash-colour in others: the seed is black, and so is the root without, but yellow within, and abideth without perishing, as most of the wilde kindes

8. *Horminum sylvestre lavendulae flore*.
Wilde Clary with Spike flowers.

9. *Horminum sylvestre satyriifolium*.
Sage leaved wilde Clary.

kindes doe, the smell hereof is more pleasing and lesse heady than most of the others.

There is another of this kinde that differeth chiefly from it, in that it groweth much higher, and hath thicker stalkes, larger and thicker leaves also, spotted with divers white strakes, and spots therein, else in forme and colour both of leaves and flowers, there is no difference.

10. *Horminum supinum Creticum*. Low Candy Clary.

▼ The low Clary of Candy hath divers leaves lying upon the ground, having every one a long foote-stalke somewhat small toward it, and growing broader to the middle, ending in a small point, and three or foure inches long, rough or rugged, or snipt about the edges: the stalkes are somewhat cornered, on which doe grow such like leaves, set by couples as in the rest, and towards the toppes white flowers, very like for forme and colour unto the flowers of Garden Neppe, yet without any sweet scent to commend it.

11. *Horminum angustifolium laciniatum*. Torne and narrow leaved Clary.

This Clary is small and low also, growing not above a foote high with his stalkes, which are square and hairy, seldom divided into branches; the leaves that are set thereon by couples, as in the other sorts, are somewhat small and hairy, about one inch in breadth, and three in length, torne in deeply on the edges, especially the lowest; but those that grow up higher are but onely waved, or grosely endented like the leaves of *Scolopendrium*, or Milt waste, the flowers are small and white, standing in rundles about the toppes of the stalkes, ending in a long spike, which bendeth downewards with the length: after which come black seed.

12. *Horminum luteum sive Colus Iovis*. Yellow wilde Clary, or Jupiters distaffe.

This kinde of yellow wilde Clary, hath divers large hoary, or whitish Greene leaves, dented about the edges, standing upon long foote-stalkes, rising from the roote, which are broader at the bottome, smoother also, and somewhat fat or clammy in handling, as the square stalkes also are, and somewhat hairy, that arise from among them to the height of two or three foote, whereon are set by couples such like leaves as grow below, but somewhat lesser: at the toppes of the stalkes the flowers come forth, set at spaces, which are gaping, and like unto Clary, but of a faint yellow colour, after which come brownish black seed; the roote is composed of many long strings, whereby it taketh strong hold in the ground, and abideth many yeares: both leaves and flowers smell somewhat strong.

13. *Scalaria Ethiopica sive Ethiopis laciniatis, & non laciniatis folijs*. Plaine and jagged Ethiopian Clary.

The nearer resemblance that both these Ethiopian hearbs have, the one being set forth in my former Worke, under the name of Ethiopian Mullein, hath made me upon more mature cogitation and deliberation, to what *genus* or kind they ought to be best referred, rather to joine them to this tribe of the Claries, and especially to our common garden Clary, than to the *Verbascum Malleins*, as all Authors before me have done; for although they may be Wollens in regard of their woollines, yet the whole forme and frame of leaves, flowers and feed are more like unto the garden Clary, as also the time of abiding and persishing, as the Clary doth after seed-bearing, which few of the other wild Claries doe: and surely Mulleins they cannot properly be, in regard of their hooded or gaping flowers, which no Mulleins properly so called have, as I have shewed more largely in the Chapter of Sage going before, and

12. *Hormium luteum* fœe *Colis Jovis*.
Yellow wilde Clary, or *Jupiters dillisse*.

13. *Sclarea Aethiopica* fœe *Aethiops* or *Laciniata*.
Flame Aethiopian Clary.

12. *Colis Jovis* fœes.
The flowers thereof.

in this. The description hereof is in this manner. Each of them have divers very large leaves spread upon the ground, every one nigh a foote long, and almost halfe a foote broad, ending in a point, in the one smooth, and in the other very much torne in on the edges on all sides, and dented thereabouts, both also of a whitish hoary Greene colour, with much white hoariness or wooliness upon them: in the middle whereof riseth up a hoary square stalk, divided toward the toppe into sundry small branches, whereon are set divers smaller leaves, and at the toppes divers large white hooded flowers, the one like the other, set at distances about the branches: after which come the seed, two alwayes joynted together in one seed vessel, which are brownish, the one like the other also. The plants doe both die after seed time, which is usually the second yeare after the springing.

The Place.

The first is planted onely in Gardens, and so is the second in these Western parts of Europe, both on this side and beyond the Alpes, by the judgement of the best Authors. The third was first brought by *Caladanus* into these parts out of Syria. The fourth is wilde in many places of Germany. The fifth is wild in our owne Country, almost every where by the way sides, and so is the other of this kind with the purple stalkes, but the other with Greene stalkes groweth in Hungary, and divers other places in Germany. The sixth *Clisius*, first found in the Medowes neare *Sopronium* in Hungary. The seventh was sent out of Italy, and as it is likely is originally of that Country. The eighth grew with *Clisius*, of the seed hee received out of Spain, but yet as he saith he found it likewise neare the riding place at *Greenwich*. The ninth groweth in Hungary almost every where in their Vineyards, and by the way sides. The tenth grew of the seed was sent out of Candy. The eleventh both at *Mompelien* and in Candy. The twelfth through-

throughout all *Hungary* in great plenty; and in *Austria*, &c. in many other places. The last as *Dioscorides* saith, on Mount *Ida* in *Phrygia*, and in *Misena*, but of late dayes gathered from some of the Hills of *Greece* and *Illyria*, that are neare the Sea, but is chiefly kept in Gardens.

The Time.

They all flower in the Summer Moneths of June and July, yet some a little later than others, and their seed is ripe in August, or thereabouts.

The Names.

These are called in Greeke *ομαλον αριον* quod *αριον* τινος ενδοναν παροικια ad venerem stimulat, as *Dioscorides* saith: for *ομαλον* significeth impetu quodam ferri quemadmodum in venerem prout: because it provoketh to venery. And *Gaza* that translated *Theophrastus* into Latine, translateth the word into *Geminalis*, from the fruitfulness it causeth most likely in bearing twinned, in Latine also *Horminum*. We call it in English Clary, of the Latines *Scarlea*, or *Scarlea*, which as *Anguillara* saith, is so called of the Ethiopians, and is alwayes taken for our ordinary Garden Clary, *quasi* Cleere eye. The first ordinary Clary is *Clusius* his first kinde of wild Clary: with *Matthiolus*, *Camerarius*, *Gesner* and others called *Scarlea* and *Scarlea hortensis*, with *Lobel* *Scarlea*; with *Tragus* *Gallitricum* *sativum*, and with *Lugdunensis* and *Gerard* *Gallitricum*, *Horminum*, and *Orminum* with *Cordus* and others: but *Ruellius* and *Fuchs* take it to be the Garden *Horminum* of *Dioscorides*, which *Matthiolus* contrarieth, and *Dodonaus* taketh it to be *Horminum* *sylvestre* of *Dioscorides*, and *Dalechamps* upon *Pliny*, *Scordium alterum* *Pliny*: by *Frascastorius* *Sideritis* *Heraclea*; of *Dodonaus* and *Durantes* *Orvula*, and is called likewise by some others *Centrum* *Galli*, and *Matrisalvia*. It is taken of some to be the *Scoparia* whereof *Pliny* maketh mention among the *Sideritides* and some his *Tussilago* altera; others take it to be *Phorbia* of *Galen* or *Baccharis* of *Dioscorides*, & some *Alectorolophus* of *Pliny*: *Pliny* as I shewed you before in the Chapter of *Horehound*, mistaketh every where the Greeke word *αριον* which is *Horehound*, as if it were *αριον* *porrum* *Leekes*, for here he saith that Clary hath the leaves of *Leekes*, reciting the words of *Dioscorides*, when as he should have said like unto *Horehound*. The second kinde here set downe, is called by *Matthiolus* *Horminum* *domesticum*, and by *Lacuna*, *Anguillara*, *Dodonaus*, *Lobel*, *Casalpini*, *Castor* *Durantes*, *Lugdunensis*, *Camerarius*, *Tabernmontanus*, and *Bauhinus*, *Horminum* or *Horminum* *sativum*, or *Horminum* *verum*, (although *Gerard* against the authority of so many worthy and learned Writers saith, they are deceived without shewing his reasons how, and calleth it wild Clary with purple leaves) in English The true Garden Clary of *Dioscorides* and others. The third is called *Horminum* *Syriacum*, both by *Camerarius* and *Bauhinus*, and was brought out of *Syria* by the name of *Bisarmar* or *Risermar*, and called also *Aman* by some, in English *Assirian* Clary. The fourth is called by *Clusius* in his *Pannonick* observations, *Horminum* *sylvestre* *latifolium* *Pannonicum* *primum*, and is his third *Horminum* *sylvestre*, in his History of plants: in English *Germany* Clary. The fifth is our ordinary wild Clary called *Oculus* *Christi*, and *Horminum* *sylvestre* *vulgare*: of *Fuchs*, *Cordus*, *Gesner*, *Lonicerus*, *Turner*, *Lobel*, *Camerarius*, *Lugdunensis*, *Clusius*, and others. *Gerard* his figure of *Colus* *Iovis* is the true figure of this wilde Clary. *Brunfelsius* calleth it *Salvia* *agrestis*: and *Besler* that set forth the Garden of *Ejstot*, *Salvia* *agrestis* *flore* *purpurea*. *Tragus* and *Gesner* *Salvia* *sylvestris* & *vera*. It is likely also to bee *Dodonaus* his fourth *Orvula* *sylvestris*. *Casalpini* saith, it is the common *Gallitricum* in Italy. *Tabernmontanus* calleth it *Scarlea* *sylvestris*. And some would make it to be *Pliny* his *Alectorolophus*, and others to be a kinde of *Verbenaca* *recta*, upright *Vervaine*: and of *Bauhinus* *Horminum* *pratense* *folijs* *ferratis*. The sixth is called by *Clusius* *Horminum* *sylvestre* *a. niveo* *flore*, and is the other sort of his fourth wild kinde in his History of plants. *Gerard* his figure of *Horminum* *sylvestre*, is the true figure of this plant. *Tabernmontanus* calleth it *Scarlea* *sylvestris* *flore* *albo*, and the great Booke of *Ejstetensis* *Salvia* *agrestis* *flore* *albo*, in English hoary wild Clary with a white flower. The seventh is the fourth sort of the fourth kinde of wild Clary by *Clusius*, of *Bauhinus* *Horminum* *maius* *folijs* *profundius* *incisis*: in English Italian Clary with a red flower. The eight is *Clusius* his first sort of the fourth kind of wild Clary which hee had from *Spain* by the name of *Baccharis*, and groweth at *Greenewich* also. *Tabernmontanus* calleth it *Scarlea* *Hispanica*, and *Gerard* *Gallitricum* *alterum*, of *Bauhinus* *Horminum* *sylvestre* *lavendula* *flore*: and *Clusius* saith it is the *Sideriti*, *querns* *folio* of *Lugdunensis*, in English wild Clary with spike flowers. The ninth is the *Horminum* *sylvestre* of *Matthiolus*, *Casalpini*, *Castor* *Durantes* and *Lugdunensis*, *Tragus*, calleth it *Salvia* *sylvestris* *adulterina*, of *Lobel* it is called *Verbascum* *nigrum* *salvisolium* *purpureo* *flore*: and so also of *Lugdunensis*, it is *Dodonaus* his *Orvula* *altera*, and *Clusius* his fifth kinde of wilde Clary, whereof there are two sorts, the one greater than the other, as is set downe in the descriptions. *Bauhinus* calleth them *Horminum* *sylvestre* *salvisolium* *maius* & *minus*. The tenth is *Clusius* his sixth kinde of wilde Clary which he called *Horminum* *minus* *supinum* *Creticum*, and in English Candy Clary. The eleventh is called by *Bauhinus* *Horminum* *angustifolium* *laciniatum* & *folijs* *Scolopendria* at *Alompelier*, it was as hee said, sent him likewise by the name of *Horminum* *Creticum* *album*. The twelfth is called by *Lobel*, *Clusius*, *Camerarius*, *Lugdunensis*, *Ejstetensis*, and *Gerard* *Colus* *Iovis*. *Dodonaus* calleth it *Orvula* *tertia*. *Casalpini* *Melinum*, *Dalechamps* and *Lugdunensis* *Galeopsis* *lutea*, and is *Clusius* his second wild Clary. Some call it *Camphorata*, some *Sphacelus*, and others thinke it to be *Stachys* *Plinij*, *Bauhinus* calleth it *Horminum* *luteum* *glutinosum*. Some others also call it *Horminum* *luteum*, and *Horminum* *Tridentinum*. The thirteenth is of two sorts, the one called *Ethiopsis*, and the other *Ethiopsis* *altera*, and by *Bauhinus* who onely hath written thereof, *Ethiopsis* *laciniato* *folio*, which I have called in Latine *Scarlea* *Ethiopica* *laciniata*, as I doe the other *Ethiopsis* *five* *Scarlea* *Ethiopica* *non* *laciniata*, for the reasons before alleaged: in English *Plaine* and jagged *Ethiopian* Clary: The Italians call Garden Clary *Scarlea*, *Scarleggia*, & *Schiaria*, and *herba* *S. Giovanni*, and thereon in Latine *herba* *S. Ioannis*, and the white Clary *Horminio*: the French call the garden kinde *Orvale* & *toute* *bonne*, and the wilde sort *Orvale* *Sauvage*: the Germanes call the one *Scarlack*, and the other wilder *Scarlack*: the Dutch *Searley*, and wild *Searley*: in English Clary, and wild Clary, and *Oculus* *Christi*.

The Vertues.

Our garden Clary (as I said before) that *Dodonaus* thinketh to be the right wilde Clary of *Dioscorides*, because it is of greater scent and vertue than any of the other sorts, which are called wild Clary, for *Dioscorides* saith that the wild kinde is more effectuall than the tame or garden kinde) is of most use in all Christian Countries, I thinke for any inward cause, for the true kinde of *Dioscorides*, and the rest of the wild Kindes here set downe are lesse used, as I thinke, and to lesse effect: but the seed thereof chiefly, as well as of our garden Clary, is used to be put into the eyes

eyes to cleare them from any moates, or other such like things are gotten within the liddes to offend them, as also to cleare them from white or red spots in them. The Mucilage of the feed of either sort made with water and applyed to tumors or swellings, purgeth and taketh them away, and also draweth forth splinters, thornes, or other things gotten into the flesh, the leaves used with vinegar either by it selfe, or with a little honey, doth helpe hot inflammations, as also Biles, Felons, and the hot inflammations that are gathered by their paines, if it be applyed before they be growne too great. The powder of the dried leaves put into the nose provoketh sneefing, and thereby purgeth the head and braines of much rheume and corruption. It provoketh to venery, either the feed or the leaves taken in wine. It is in much use with men or women that have weake backs, to helpe to strengthen the reines, either used by it selfe, or with other herbes that conduce to the same effect, and in tanies often, or the fresh leaves fried in butter, being first dipped in a batter of flower, egges, and a little milke, served as a dish to the Table, is not unpleasant to any, but specially profitable for those, for whom, as I said, it is convenient. *Lobel* and *Penna* saith; that some Brewers of Ale and Beere in these Northern regions (I thinke they meane the Netherlands, for so *Dodonaeus* meaneth) doe put it into their drinke to make it the more heady, fit to please drunkards, who thereby according to their severall dispositions, become either dead drunke, or foolish drunke, or madde drunke. It bringeth downe womens desired sicknesse, and expelleth the secondine, or after birth. It is used in *Italy* to bee given to women that are barren through a cold and moist disposition, to heate and dry up that moisture, and to helpe them to be fruitfull, and stayeth the whites, it helpeth also a cold stomacke oppresse, with cold flegme, purgeth the head of rheume and much corruption, the overmuch use hercof offendeth the head, and is hurtfull for the braine and memory. Yellow *Clary*, or *Lupsters* distaile is hot and drying, and the juyce is of especiall good use to cleanse and heale foule ulcers. The Ethiopian *Clary* is commended for the roughnesse of the throat, and to helpe to expectorate the rotten and purulentous matter in the Pluresie, or in other coughes, either the decoction of the roote drunke, or made into an Eleatuary with honey. *Discozoides* saith also, it is good for those that are troubled with the Scitica.

СНАР. XXI.

Verbascum. Mullein.

MAny of the *Verbascæ* Mulleins that are properly so called, doe grow wild in diuers and severall places in our owne Country, and therefore are not usually brought into gardens, yet because some of them are more rare, and seldome met withall, I thinke it not amisse to shew you all of them here, with those also that have beene sent us from beyond Sea.

1. *Verbascum album vulgare* sive *Tapsus barbatus communis*.
Common Mullein.

1. *Verbascum album vulgare* five *Tapsus barbatus communis*.
Common Mullein.

The common white Mullein hath many faire large woolly white leaves lying next the ground, somewhat longer than broad, pointed at the ends, and as it were dented about the edges: the stalke riseth up to bee foure or five foote high, covered over with such woolly leaves as the lowest, but lesse, so that no stalke can bee seene for the multitude of leaves thereon up to the flowers, which come forth on all sides of the stalke, without any branches for the most part, and are many fet together in a long spike, in some of a gold yellow colour, in others more pale, consisting of five round pointed leaves, which afterwards give small round heads, wherein small brownish seed is contained: the roote is long, white and woody, perishing ever after it hath borne seed.

2. *Verbascum Danicum humile*. Dwarf Mullein of Denmark.

This small Mullein groweth like the ordinary Mullein with yellow flowers, having such like woolly leaves growing thick together at the bottome, but much smaller : the stalke riseth not up above a foote high at the most, set with some leaves thereon from the bottome : the flowers are very large for the proportion of the plant, and yellow like the ordinary, differing in no other thing from it.

3. *Verbascum mas folijs longioribus.* White Mullein with long leaves.

This Mullein hath many thicke white woolly leaves lying upon the ground, like unto the common white Mullein, but that they are somewhat narrower, and thereby seeming longer: from among which riseth up a round hard woolly stalk, about three foote high, fet with the like leaves, as grow below, but smaller unto the middle thereof, where it beginneth to give flowers, and in some plants and places to divide it selfe into branches, whereon be many flowers, growing round about the stalkes or branches thicke together, confisting every one of five round pointed leaves, of a whitish colour, and in some plants and places more yellow, those places afterwards come round hard seed vessels, very like unto

unto the seed vessell of Foxe-gloves, or Finger-flowers, but not so long, wherein is contained very small and brownish seed: the roote is somewhat long, thicke and hard, but not woody, with divers long fibres set thereunto.

4. *Verbascum femina flore albo vel pallido.* Sweet white Mullein.

The sweet white Mullein hath white hoary and woolly leaves like the other, but longer, narrower, and more indented about the edges, and not so many growing below on the ground; the stalke is woolly, and riseth higher than the former, having greater flowers growing at the toppes, much sweeter also than it, and of a white colour; wherein sometimes some reddish lines are to be seene therein: in other things this differeth not from the former.

5. *Verbascum nigrum vulgare.*
Ordinary blacke Mullein.

5. *Verbascum nigrum vulgare.* Ordinary black Mullein.

Our ordinary black Mullein hath leaves nothing woolly or hairy, but of a darke Greene colour somewhat large, longer pointed, and dented unevenly about the edges, the stalke riseth almost as high as the common white Mullein, and usually parted at the toppes into some branches, bearing long spiky heads of gold yellow flowers, and in some tending to purple like the other, with some threads in the middle, which are reddish in some, and purplish in others: the seed is like the other: the roote perisheth after seed time as the other doth: the whole plant hath a stronger or more grievous smell in it than the white kinde.

6. *Verbascum nigrum odoratum.* Sweete black Mullein.

This black Mullein hath foure or five leaves lying upon the ground somewhat long and broad, ending in a long point, somewhat hard, and as it were crumpled, of a darke Greene colour, without any manifest dents or notchings about the edges: from among which riseth up a round hard Greene stalke three foote high, oftentimes without any branches, but more often divided into two or three branches, whereon grow many yellow flowers smaller and thicker set together, that is, two or three at a place; than in any other, and smelling pretty sweet, which fall away without giving of seed in the most that I have observed, or very seldome bearing small seed in round small heads: the roote is somewhat great and long, with divers fibres annexed unto it, and perisheth not, but abideth many yeares.

7. *Verbascum laciniatum.* Jagged Mullein.

This jagged Mullein hath large and long leaves unevenly cut in on the edges, seeming to be waved, somewhat like the leaves of Horned Poppy, of a darke Greene colour, and a little hairy withall: the stalke is small and Greene, but high, and branched diversly, bearing smaller yellow flowers, and more sparsely set than in the other blacke sorts, the seed and roote are not unlike the others. *Lobel in Adversaria* should seeme to set out this plant as *Bauhinia* and other doe intimate, and as himselfe doth demonstrate it to be *Verbascum alind Matthioli*: but his description both of the order, forme, and colour of the flowers in his, is much differing from this: for he saith the flowers are set under the stalkes, as Sage or wild Clary are, and of the same forme and colour, and thereupon giveth it the title of *Verbascum purpureum Erueasolium*, as it is to be amended: and in his observations, *Verbascum sylvestre salviae* *fiorum laciniatum*.

8. *Verbascum Salvisfolium exoticum Cistoides.* Sage-leaved Mullein.

This strange Mullein hath from a woody roote, divers white hoary leaves like unto Sage leaves, but whiter, thicker, and rounder pointed, every one having a long foote stalke, from among which rise up divers hoary white round stalkes, set here and there with such like whitish leaves, but a little smaller and narrower: at the toppes of the stalkes stand divers flowers, one above another, consisting of five round pointed leaves, of a yellow colour, with a few reddish threads thereon.

9. *Verbasculum falsis Salvia tenuifolia Syriacum.* Small Sage-leaved Mullein of Syria.

Although I never saw this plant, yet because *Lobel* who first set it forth, entitleth it *Phlomis*, and placeth it among the *Verbascum* Mullins, I can doe no lesse then shew you it also with them, with this my note of *Verbasculum*, rather than *Verbascum*, from the posture of the flowers differing from all the other. Take therefore this short description of *Verbascum*, untill a more exact may be given. It hath long, narrow, and pointed leaves like unto the lesser, or Pigge Sage, all hoary as the square stalkes are, which have also much woolliness on them: the flowers are yellow, many standing together, at their toppes somewhat like to those, of the wild Campion, or Flower of *Bristen*, called by divers Nonesuch.

The Place.

The first groweth by the side wayes and Lanēs in many places in this Land: the second in the fields betwene *Cronenberg* and *Hafnia*, neare *Elfenore* in *Denmarke*, there observed by *Lobel*. The third and fourth doe grow but in some places of our owne Country, so that one shall hardly finde a plant in a great way. The fifth in many places likewise, both in *Kent*, *Surrey*, *Essex*, and elsewhere. The sixt is sometimes also to be found wild abroad, but

7. *Verbascum laciniatum*.
Jagged Mullein. 8. *Verbascum Salicifolium exoricum Cistoides*.
Sage leaved Mullein. 9. *Verbasculum folijs Salviae tenuifoliae Syriacena*.
Small Sage leaved Syrian Mullein.

yet scarcely to be met with, and indeed unless one well exercised in the knowledge of plants, doe light upon it, and know it, it will scarce be regarded of a great many others. The seventh *Lobel* saith he found neare the ruines of an old Church, by the Bathes at Bathe in England. The eight is a stranger to us, we have onely the knowledge that it groweth at *Padoa*, or thereabouts, in a garden of a Signor *Clarissimo* of Venice, called *Centareni*. And the last is a greater stranger than it.

The Time.

All these Mulleins doe flower about Iuly, except the eighth and the last of whose time we are as yet ignorant, but hope shortly to be so well informed that we may informe others.

The Names.

Verbascum is called in Greek *ορβη* from *ορβη* *ουρο* & *ορβη* *ορβη* *flamma*, for that it served as a weeke to put into lampes to burne; and of the Latines *Candela regia* and *Candelaria*, because the elder age used the stalks dipped in Suet to burne, whether at Funeralls or otherwise, and so likewise the English name Higtaper, for Hightaper, the h being left out, used in the same manner, as a Taper or Torch. It hath also some other names in Latine, as *Thapsus* *Thlapsus*, and *Tapsus barbatus*, and *Lanaria*, in English also some call it Torches, some Bullockes longwort, some Hares beard, and some *Impetens* staffe: The first is called *Verbascum mas*, and *Verbascum mas latifolium* of most Writers. The second hath no other name than is in the title. The third is called by some *Verbascum mas* and by some *Famina* & *e converso*, *Lobel* calleth it in his observations *Verbascum famina*, and in his *Icones*, he calleth it *Phlomas alter*, *Verbascum lychnite* *Matthioli*: of *Eusebius* it is called *Verbascum candidum mas*: of *Dodonaeus* in French, of *Turner* and *Gesner*, in hort, it is called *Verbascum album famina*: and of *Dodonaeus* in Latine *Verbascum angustius*; in English, white Mullen with long leaves. The fourth is called by *Lobel* *Tapsus barbatus maximus odoratus meridionalium* (and not *Septentrionalium* as *Bauhinus* hath it)

it) *flore albo*, in English Sweet white Mullein. The fift is called *Verbascum nigrum* of all others. The sixt is not set forth by any other Author that I can finde than by *Bauhinus*, who onely remembreth it, as a kind of his first yellow *Blattaria*, or peradventure that *Blattaria* of *Pliny* with many branches: for the common blacke wilde Mullein is not this, but another plant, and therefore the name in the title is sufficient for it. The seventh is called by *Matthiolum* *Verbascum alud*, and *Lobel* so faith also, and may be his *Erucifolium*, or *Salvisolium laciniatum*, as I said in the description. *Lugdunensis* calleth it *Verbascum laciniatum* *Matthioli*, and *Camerarius* *Verbascum folio papaveris cornuti*. The eighth *Lobel* calleth *Verbascum sylvestre salvisolium exoticum*, and *Bauhinus* *Verbascum subrotundo salvia folio*, and faith he had it out of *Contarenius* his garden, by the name of *Verbascum Cistoides*: in English I have called it Sage, leaved Mullein, because I judge it may be a Mullein, in regard the flowers are *Cistus* fashion which is answerable to the rest of the right Mulleins. The last is called by *Lobel* *Phlebos lychniis altera Syriaca*, *Lugdunensis* & *Bauhinus*, *Verbascum folio Salvia tenuifolia*. It is called by the Italians *Verbasco*, and *Tasso* *barbasso*: by the Spaniards *Verbasco*: by the French *Bovillon*: by the Germanes *Wulfgant*: by the Dutch *Woolle cruyde*: and we in English Mullein, &c. as is above said.

The Vertues.

Mullein is commended by *Diascorides* against laskes and fluxes of the belly, if a small quantity of the root be given in wine: the decoction thereof drunke is profitable for those that are burthen, and for those that have crampes and convulsions; and likewise for those are troubled with an old cough: the decoction thereof gargled, easeth the paines of the toothache. If the seed and flowers hereof, together with the flowers of Camomill, and the powder of dried Venice Turpentine, be cast upon a few quick coales in a chafing-dish, or such like other thing set into a Close-stoole, and the party sitting bare over the fumes, that is troubled with the piles or falling downe of the fundament, or any the paines of that place, doth give much ease and helpe: as also for those that have a great desire to goe often to the stoole and can doe nothing, especially to such as have the bloody Hixe. An oyle made by the often infusion of the flowers, is of very good effect for the piles also. The decoction of the roote in red wine, or in water, if there be an ague, wherein red hot Steele hath bene often quenched, doth stay the bloody Hixe. The same also openeth the obstructions of the bladder and reines when one cannot make water. A decoction of the leaves hereof, and of Sage, Marjerome, and Camomill flowers, and the places bathed therewith, that have their veines and sinewes starke with cold, or with crampes, doth bring them much ease and comfort. It is said that there is not a better remedy found out for the hot gowt then to drinke three ounces of the distilled water of the flowers every morning and evening for some dayes together. *Arnaldus* faith, that if two drams of the juyce of the rootes of Mullein before it beare stinke, be taken in a draught of Muscadine at every time, for three or foure times one after another, an houre before the fitt of the quartane ague commeth upon any, it shall surely helpe them. The juyce of the leaves and flowers being laid upon rough warts, as also the powder of the dried rootes rubbed on, doth easily take them away, as *Matthiolum* faith, although it will doe no good to those that are smooth: and that the powder of the dried flowers is an especiall remedy for those are troubled with belly aches, or the paines and torments of the collick. The decoction of the root hereof, and so likewise the leaves is of great effect to dissolve the tumors or swellings, as also the inflammations of the throat. The seed and leaves boyled in wine, and after laid to any place that is prickt with a thorn, hath a splinter, or such like thing got into the flesh, draweth the forth speedily, easeth the paines, and healeth them also. The leaves being bruised wrapped in double papers, and covered with hot ashes and embers, to bake a while, and then taken forth and laid warme upon any botch or boyle that hapneth in the groine or share, by filthinesse or otherwise, doth dissolve and heale them. The seed hereof bruised, boyled in wine, and laid upon any member out of joynt after it is set in againe, taketh away all swellings and paines thereof. The leaves and toppes of the lesser white Mullein boyled in water, and laid upon the places pained with the gowt, doth wondrously ease them. The distilled water of the flowers hereof dropped into the eyes, taketh away the watering of them, as also taketh away that rednesse of the face, is called in Latine *Gutta Rosacea*, and in English, the Rose, if it bee washed therewith often, having a little Camphire dissolved in it. The water is likewise used against running or creeping sores, or any other deformity of the skin. The flowers bruised and made up into an ointment with the yolke of an egge, a few crummes of bread, and the juyce of leekes laid upon the painefull piles when they swell, doth ease the paines exceedingly, and helpe to bring them into their right place. Country men doe often give their Cattell that are troubled with coughes, the broth of the hearbe to drinke with good successe, as also to those that by casualty, or through loosenesse and weakenesse, voyd out their guts behind them. The leaves also a little bruised, and laid or bound to a Horse foote that is grievously prickt with shoeing, doth wonderfully heale it in a short space. *Diascorides* faith it was a report in his time, that if dried figges were lapped in the leaves of female Mullein, which is that with large and white flowers, they will not putrifie at all. The golden flowers of the blacke Mullein boyled in lye, dyeth the haire of the head yellow, and maketh them faire and smooth. The leaves boyled in wine and a litle honey put to it, is fit to wash and cleanse foule ulcers, and boyled in vineger, doth helpe greene wounds. Taken also with Rue it is a remedy against the stinging of Scorpions.

CHAP. XXII.

Blattaria. Moth Mullein.

Blattaria is certainly a kind of black Mullein, and therefore to follow next, whereof there are sundry varieties as shall be shewed.

1. *Blattaria lutea odorata*. Sweet yellow Moth Mullein.

This sweet Moth Mullein hath sundry grayish Greene leaves lying on the ground, somewhat long and broad, and little or nothing snipt about the edges, but pointed at the ends: the stalkes are two or three foote high, with some smaller leaves on them, branching forth from the middle upwards into many long branches, stord with many small pale yellow flowers, of a small sweet scent, yet stronger than in the others, and seldome giveth seed, but abideth in the roote, which few or none of the other doe.

1. *Blattaria lutea odorata*.
Sweet yellow Moth Mullen.

Flora vi-
ridi.

3. *Blattaria flore luteo*.
Yellow Moth Mullen.

5. *Flore albo*.
and White.

Flora ca-
rulea.

2. *Blattaria lutea major five Hispanica*. The greater yellow Moth Mullen.

This Spanish kinde hath longer and greener leaves than the former, rounder also at the ends than the next that followeth: the stalke is stronger and higher than it also, whereon besides the leaves grow toward the toppe many gold yellow flowers, consisting of five leaves a piece, as all the rest doe, not so thicke set as the former, but a good deale larger, with some purplish threads in the middle, formed somewhat like unto a flye, after which come in their place: round heads, two or three, or more sometimes together, but most usually one, wherein lye small dusky seed: the roote is not great, or full of fibres, but perisheth every yeare, after it hath given seed, except that it abide sometime in a milde winter.

3. *Blattaria lutea minor five vulgaris*. The ordinary yellow Moth Mullen.

This yellow Moth Mullen (that is most frequent in our gardens) hath such like long leaves as the last, but narrower and roundly dented about the edges: the stalke is usually single, and without branches, whereon stand such like gold yellow flowers, but lesser, with the like purple threads in the middle: the seed vessels are single, and the seed small, both so like the last, that they cannot be distinguished: the roote likewise perisheth every yeare after seed time.

4. *Blattaria flore luteo purpurascens*. Cloth of Gold Moth Mullen.

The greatest notes of difference betwene this and the last described, consisteth first in the flower, which is a yellowish purple, or the ground yellow, overshadowed with a bright crimson colour, which is of much delight: the threads in the middle are not so purple red as in the former, but neare unto the colour of the flower: secondly, it seldom beareth seed: thirdly, it doth longer abide in the roote, although in a hard Winter it will perish like the two last: this out of doubt hath bene raised from the seed of the last. *Lobel* setteth forth a sort hereof with Greene flowers which I never saw.

5. *Blattaria flore albo*. White Moth Mullen.

The leaves of this Moth Mullen are of a little fresher green colour, and sharper dented about the edges, in other things it differeth not from the ordinary yellow, but that the flowers are pure white, and hath the like purple threads like flies creeping up as it were in the middle of the flowers.

6. *Blattaria flore purpureo*. Purple Moth Mullen.

The leaves of this purple Moth Mullen are broader, shorter, and of a grayer Greene colour than the former, and without any denting for the most part, yet pointed at the ends: the stalke riseth not so high as the former, but sometimes branched, bearing such like flowers: of a faire deepe blue or purple colour, tending to rednesse, the threads in the middle of the flower being yellow: the seed vessels hereof are smaller than in the former: the roote is long, thick, and blackish on the outside, abiding sundry yeares, and riseth plentifully from the shedding of it owne seed.

The blue Moth Mullen differeth in nothing from the last, but in the colour of the flower, which is of a paler bluish violet colour.

7. *Blattaria Cretica incana rotundo laciniato folio*. Hoary Candy Moth Mullen with round torne leaves.

This Candy Mullen hath round hoary stalkes, rising up to the height of a foot and a halfe, whereon are set divers leaves without order, which are long, and as it were torne into smaller leaves, for every leafe hath small pieces of leaves, set on each side of the middle ribbe thereof, separated from the end leafe, which is somewhat broad, round, and a little dented about the edges, the whole leafe is very hoary, covered as it were with a woolly downe (especially in the hot Country where it groweth, but here it is hoary, white, and not so woolly) from the middle of the stalke upwards it breaketh forth sometimes into branches, whereon doe grow yellow flowers, very like unto the flowers of the yellow *Blattaria*, but

6. *Blattaria flore purpureo*.
Purple Moth Mullein.

7. *Blattaria Cretica incana rotundo laciniato folio*.
Hoary Candy moth Mullein with round pointed leaves.

but smaller : after which come small round heads, containing small browne seed, both heads and seed being smaller than those of the other Blattaries : the root perisheth with us at the first approach of winter, and seldome giveth ripe seed, because it flowreth so late, whereby we are to seeke of new seed every year.

8. *Blattaria Cretica incana longiore laciniato folio*. Hoary Candy Mullein with long leaves. This other Candy Mullein is in manner of growing, hoariness of leaves, yellow colour of the flowers, and in other things like unto the former, the onely difference, in this from the other is, in that the end leaf hereof upon every stalk is more long than the former, (which is as broad as long, making it seeme almost round) and the heads of seed are somewhat longer also.

9. *Blattaria altera folio rotundo flore luteo*. Round leaved Moth Mullein. The first leaves of this Mullein are somewhat long and pointed at the end, but those that are set upon the stalkes, are all round pointed, and not so long every one, compassing the stalk at the bottome of the leafe, and are of a darke greene colour on the upper side, and grayish or hoary underneath : at the setting on of every leafe unto the stalk, come forth likewise two other smaller leaves, and from the middle of them shoot forth two or three flowerers upon small long foot-stalkes, which are yellow, with purple threads in the middle of them, like unto the other Blattaries : the heads and seed are small like unto the other, and the roote perisheth after seed time, as most of them also doe, and often groweth by the shedding of it owne seed.

10. *Verbascum frutescens spinosum, sive Blattaria Cretica spinosa*. Thorny Moth Mullein of Candy. I was in some doubt with my selfe whether this plant should belong to the *Verbasca*, as some would have it, or to the Blattaries, but finding it more agreeing with these than with the m, although it bee woody or shrubbie. I have here placed it in his proper place, as I thinke. It riseth up with many small hoary hard and woody branches, spreading round about the roote, not above a foote and a halfe high, dividing it selfe into many slender branches, which are tender and greene while they are young, but quickly after turne hard and hoary, every sprigge of the branches ending in a sharpe thorne ; the leaves are many set together at spaces of the stalkes and branches, somewhat like unto the leaves of the Sea-stockgilloflower ; but much smaller and shorter, a little torne about the edges, but towards the toppes smaller and smaller, and not cut in at all, and of an hoary colour : towards the toppes of the branches also come forth many flowers, disperfedly set thereon (and not as the Blattaries or *Verbascum* doe, in a long spike) but consist of five round pointed yellowish leaves, with some purple threads in the middle of them, like unto the *Blattaria* : after which come such like round hard heads, containing small browne seed like unto them also : in Candy and other warme Countries, when it is growne old, it beareth a great bushy and thorny head, as it is here expressed : the roote is hard, long and woody, spreading much under ground, and abideth many yeares in the naturall places of those warme Countries where it groweth, but must have some coverture or defence with us against the extremities of our Winters, else it will hardly endure.

10. *Blattaria Cretica spinosa.*
Thorny Moth Mullen of Candy.

10. *Summitates Blattariae spinosae cum jam adoleverit planta.*
The tops of the thorny moth Mullen when it is grown old.

The Place.

The first, third, and fifth sorts have been found in severall places of our Land, as well in *Kent* on *Black-beath*, and neare *Derford*, as in other places: the other 3. of the first fixe sorts are onely nursed up with us in gardens, their naturall place being not knowne, but the other sorts that follow, except the ninth, doe grow in *Candy*, and from thence have beene sent by *Honorius Bellus*, an Italian Physitian, in his time abiding in *Candy*, to divers persons in *Italy*, as to *Iohannes Vona* of *Verona*, and others there, and to *Clusius*, and *Plauteau* in the Low-countries, and to *Bauhinus* and others: The ninth *Bauhinus* saith he onely found in his Apothecaries garden in *Basil*.

The Time.

They all flower in Summer, and give their seed presently after.

The Names.

The name *Blattaria* in Latine hath beene imposed hereon from *Blattis in se contrahentibus*, as *Pliny* saith (for it hath no Greeke name.) The first fixe or seven sorts have their names in their titles, as most Authors call them, but the seventh being the first *Candy* kind, *Honorius Bellus* first wrote of, and called it *Auturus*, or *Arcturus*, and saith he is bold so to doe, not knowing better whereunto to referre it, (although it doth not thoroughly agree to the *Auturus*, or *Arcturus* of *Dioscorides*) which he sent to *Clusius*. I finding it better to agree with *Blattaria*, than any other plant, have put it under that tribe, and have given it an English name, according to the rest of the *Blattarias*, Hoary Candy Moth Mullen with round pointed leaves. *Bauhinus* in his *Pinar* calleth it *Verbascum humile Creticum Lucinatum*, and the Italian *Pona*, *Verbascum fruticosum auriculatum*. *Columna* saith it was sent unto him with the name of *Marum Creticum*, but he calleth it *Verbascum Brassica folio*, and referreth it to that *Verbascum* of *Dioscorides*, that hath the leafe of a Colewort. The eighth *Pona* in his Italian *Baldus* calleth *Arcturi secunda species*. The ninth *Bauhinus* calleth *Verbascum folijs subrotundis flore Blattaria*, and I in English Round leaved Moth Mullen. The last is called in *Candy* *Galastivida quasi lactea stirida*, as *Honorius Bellus* saith, that sent it to *Clusius* (but *Bauhinus* calleth it *Glastrivida*) who thereupon finding the leaves to be like unto Sea Stockgillflower, called it *Lexcoium spinosum Creticum*, but withall saith it is in flower differing from them, because all the kindes of Stockgillflowers have but foure leaves in every flower, and this hath five. Some others therefore would give it a more proper name as they thinke, and call it *Verbascum frutescens spinosum Creticum incanum*, from the hoariness of the leaves and stalkes, but I thinke it may more fitly be raunged with the *Blattarias*, as I said before, for the reasons there expressed, in English Thorny Moth Mullen of *Candy*.

The Vertues.

I can finde no Author hath spoken of any other properties belonging to any of these *Blattarias*, then those *Pliny* doth ascribe to the ordinary sort, that is, to gather Mothes unto it, wherefoever it is layed.

CHAP. XXIII.

Stachas. Cassidony.

Here are two kinde of *Stachas*, one with a purple flower, the other with a yellow, of each whereof there are divers sorts; *Heliochrysum* also is added unto them, by *Bashinus* and others, that entitle many sorts of *Chrysocome* with that name, but I doe not so thinke it fitt.

1. *Stachas Vulgaris*.

The ordinary Cassidony or French Lavender.

1. *Stachas vulgaris*. The ordinary Cassidony or French Lavender.

The common Sticadove as we call it in some places, or French Lavender that groweth with us, is a more tender plant than lavender, and more like an herb, than a bush or shrub, not above a foot and a halfe high, having many narrow long whitish Greene leaves like unto Lavender, but softer and smaller, set at severall distances about the stalkes, which spread into sundry branches, at the tops whereof stand long and round, and sometimes foure-square heads, of a darke greenish purple colour, compact of many scales, from which come forth the flowers of a bluish purple colour, after which follow seed vessels, which are somewhat whitish when they are ripe, containing blackish browne seed within them: the roote is somewhat woody, and will hardly abide our cold Winters, except in some places, or before it have flowered: the whole plant is somewhat sweet, but nothing so much as Lavender.

2. *Stachas vulgaris flore albo*. White flowered Cassidony.

This Cassidony differeth not from our ordinary garden Cassidony in any other thing so much as in the flowers, for although the leaves grow thick together upon the branches, being a little greener, and not altogether so white, and the heads short likewise, yet the flowers starting from among the scales, are larger than in the other, and of a pure white colour, which is very rare to meete with.

3. *Stachas longioribus ligulis*. Cassidony with long leaved heads.

This Cassidony likewise differeth very little from the ordinary kinde: the chiefest differences noted betweene them are these; the toppes of the branches are bare, without leaves upon them, for an hand breadth in length or more, unto the heads: and the heads of these are not fully so large as in the other, but longer, and have divers hard, stiffe, and longer skinny purplish leaves rising above the heads of them, than at any time seen in the other, which in some places have a shew of some short pieces like unto thinne skinny leaves, of a purple or blue colour, the flowers, seed, and rootes are alike, and so is the smell.

4. *Stachas serrata folio*. Cassidony with dented leaves.

This dented Cassidony hath such like square brittle slender hoary branches, whereon are divers long narrow leaves set, many growing together, which are dented or notched about the edges, and as it were curled or crumpled, Greene on the upper side, and hoary underneath, of a hot taste, somewhat bitter: the toppes of the branches end in somewhat long square stalkes, naked, and without leaves unto the spiky heads, which are scaly, slenderer and longer than in the other; the flowers are like unto the other, but of a more purple colour; at the toppes of the heads stand such like skinny leaves, of a bluish purple colour as the former hath, the seed and rootes doe not differ.

5. *Stachas viridis Dalechampi*. Yellow Cassidony with Greene heads.

I doe place this Cassidony betweene both these sorts, because it doth in some things partake with both, the description whereof is in this manner. It hath many Greene stalkes, and woody like the rest, whereon grow the leaves at spaces, many set together, whereof the two outermost are longer than the other, all of a pleasant Greene colour, at the toppes of the branches stand such like scaly heads as the former, but longer, from which come forth yellow flowers round about the heads, at the toppes whereof stand two long Greene leaves.

6. *Stachas Rosmarini facie Cretita*. Candy Rosmary like Cassidony.

From the seed sent out of Candy by the name of *Stachas rose* this fine plant, so like in face or forme unto the ordinary *Stachas*, or Cassidony, that any at the first sight would surely say it were the same: rising up with a stalke, not much higher than Cassidony, divided from the very ground into divers branches, and they againe and againe into many lesser, leaning downward a little, beset at every joynt, sometimes with two, and sometimes with three or foure small and narrow long leaves, of a grayish Greene colour, smelling somewhat sweet: at the joynts with the leaves toward the toppes of the branches grow forth small flowers, very like unto Rosemary, both for colour, forme, and bignesse, after which succeed small round heads, or seed vessels, no bigger than Pepper-cornes, wherein are contained small seed: the roote is slender and woody, divided into severall sprays: the whole plant is of an obscure gray colour, and smelleth somewhat like *Stachas*, but more weakely, tasting a little bitter, with small hear, but more astringency.

7. *Chrysos*

3. *Stachas longioribus ligulis*. Cassidony with long-leaved heads.

4. *Stachas serrato folio*. Cassidony with dented leaves.

6. *Stachas Rosmarini facie* Cretica. Candy Rosemary like Cassidony,

7. *Stachas Citrina* (ex Coma aurea). Golden or yellow Cassidony.

7. *Chrysosome sive coma aurea & Stachas citrina vulgaris.* Golden tufts, or golden Cassidony.

This golden Cassidony hath sundry hoary branched stalkes, with long and narrow whitish leaves, dispersedly set thereon unto the toppes, where the flowers appeare in umbels, each branch bearing a large tuft of scaly yellow flowers, like a loose or sparfed umbell, keeping their colour long before they wither, and being gathered in a fit dry time when they are in their perfection, will so abide, and be kept a long time after: the seed is red, smaller than Marjerome, and sharper: the roote is small and black: the whole plant is of a strong sweet scent, not unpleasent.

8. *Chrysosome sive Stachas Citrina Cretica.* Candy golden Cassidony, or Goldilocks.

This Candior groweth very like the former, but with smaller long leaves, all hoary, the flowers are in larger umbels, greater also, and of a more shining pale gold colour, which will abide, being gathered in the beauty as the other. There is another sort called *Elichrysom Orientale* by *Banhusius*, differing little from this last sort, but in the scaly heads of flowers, which are greater and longer than they, and in the whole plant which is taller and more hoary. *Elichrysom Orientale.*

9. *Chrysosome Cretica altera sive Hispanica.* Spanish Golden Cassidony.

9. *Chrysosome Cretica altera sive Hispanica.* Spanish golden Cassidony.

This other Candior or Spaniard, which you will, groweth sometimes but with one stalke, or else with more, halfe a yard high, covered with an hoary downe, having sundry long and narrow leaves on them, sometimes dispersedly set, and sometimes more together, Greene on the upper side, and hoary underneath: at the toppes grow small branches, bearing one or two scaly long heads of yellow flowers, somewhat like to those of Maudeleine, consisting of many threads or thrums.

10. *Stachas citrina altera odora.* Sweet yellow Cassidony.

The yellow sweet Cassidony is a small low plant, not rising above a foote and a halfe high at the most, with divers slender branches somewhat hoary, whereon are set small long and narrow leaves, of a darke or more sullen hoary colour, then those of the former golden Cassidony, at the toppes of the long divided stalkes, stand single heads of yellow scales, nothing offo lively a yellow colour as they, nor so round, but a little longer than round, with a few threads or thrums at the tops, which bring forth small browne seed, wrapped in some downe: the roote is black, but smaller and slenderer than it: this hath a lesse heady scent than the other, yet not unpleasent.

11. *Stachas Citrina odora.* Unfavory yellow Cassidony.

This small Cassidony hath divers low hoary stalkes, not above a foote high, whereon doe grow small long hoary leaves, broader and larger than the last: at the toppes of the stalkes stand most commonly two heads, yet sometimes but one, which are greater and longer than the last, and the scales likewise longer, and somewhat of a brownish Greene with the hoariness, from whence rise many pale yellow threads or thrums, which when they are past, the seed ripening, is inclosed in downe, and blowne away with the wind: the roote is lesse than the last, and blackish, but not lesse woody: this whole plant and every part is utterly without any scent to bee perceived in it.

12. *Stachas Citrina sylvestrior.* Wilde yellow Cassidony.

This wilde Cassidony (for thereunto I referre it) hath a round hairy stalke, stored with most pure white wooll, divided at the toppes into severall short branches, the leaves that stand on them are somewhat longer and larger than the last; Greene on the upper side, and grayish, hoary, and woolly underneath, and a little endented about the edges, the ends of the branches are naked without leaves, for foure inches long, bearing at the toppes of every of them one scaly head, with divers yellow threads or thrums in the middle, like unto the last, but somewhat larger.

13. *Stachas Citrina Cretica flore amplo.* Candy unfavory yellow Cassidony with large flowers.

This brave silver-like plant groweth very high and tall, having a straight round stalke that is white or hoary, and of a fingers thicknesse, spreading sundry branches, so thick set with small long and hoary leaves, many together at spaces, that they cover and hide the branches almost wholly, and are more like unto Cassidony than Lavender-cotton leaves, whereunto *Alpinus* doth liken them, but not dented about the edges: the upper part of the stalkes divide themselves into small sprigges, bearing each of them, on a long slender stalke, a large yellow flower, like unto a single Marigold standing in a Greene huske, wherein after the flower is withered and past, groweth small long seed like unto Sow-thistle seed: the roote is long, white, and tender: this plant hath neither scent or taste much to be perceived in it, saving a little bitternesse, whereby the Natives finde it effectuell to kill the wormes, to provoke urine, to open obstructions, and to helpe the jaundise, and the powder of the dried hearbe, or the juyce thereof, to cleanse and heale foule ulcers and sores.

14. *Stachas purpurea odorata.* Sweet purple Cassidony.

I doe acknowledge that I doe not please my selfe, but others, in the placing of this plant in this place, and by this name, for although it hath a face or shew in some things like unto the yellow unfavory Cassidony, yet in other things it so farre differeth, that I might in my judgement, more truly place it with the *Lacens* Knapweeds, than with these, as the description following will shew to any that will duely consider it, which is thus. It riseth to the height almost of a cubite, leaning or bending downe the branches, whereby it spreadeth in compasse more than in height, from a long hard blackish root, shooting forth woody and hoary branches, whereon doe grow many long and narrow leaves, of a darke Greene colour on the upper side, and a little hairy withall, but of an hoary white on the under-

13. *Stachas Citrina* Cretica flore amplo.
Candy unfavour yellow Cassidony with large flowers.

14. *Stachas purpurea odorata*.
Sweet purple Cassidony.

Ilands called *Stachades* where it groweth, which are over-against *Marselles*, yet *Marselles* is two dayes journey from the Sea, and those Ilands doe lyene unto the Country of *Olbia*. *Galen* saith it groweth in every Country, and as well in *Candy*, as the Ilands *Stachades*, in English it is called *Sticadove*, *Cassidony*, and French *Lavender*, but the *Stachas Citrina* is so called upon the correspondency and likenesse of the properties and temperature, as well as of the forme of leaves and heads : it is also called *Coma aurea*, *Chrysocome*, and *Tinearia*. Old *Gerard* was very confusid in the figures of the two chaptets of *Elichrysium*, and *Stachas Citrina*, or *Chrysocome*. For his *Coma aurea*, is *Matthiolus* his *Elichrysium verum*, and his *Stachas Citrina* *Matthiolus* his *Elichrysium Italicum*, which is *Clusius* his *Stratiotes Millefolia flore luteo* : his *Chrysocome*, or *Amaranthus luteus*, is *Stachas Citrina vulgaris* : his *Amavanthus Galeni*, is *Stachas Citrina altera odorata* of *Lobel* : the description of most are according to *Lobel* : in English also they have divers names as golden Tufts, Goldilocks, Golden flower, gentle Golden flower of life, and yellow *Cassidony*, by which I rather entitle these plants, then by the others. The first is called *Stachas purpurea*, and *Arabica*, or *Stachas* by *Matthiolus*, the second *Bauhinus* onely mentioneth, *Clusius* calleth the third *Stachas longioribus ligulis*, and *Lobel* *Stachas nudus cauliculis summis*, *Lugdunensis* *Stachas capitulis foliatis*, and *Bauhinus* *Stachas caulis*

underside, and very woolly, and a little dented about the edges : at the toppes of the branches come forth sometimes hut one, but more often two long heads together, composed of many scales, at the toppes whereof stand the flowers, which are nothing but long threads or thrums, of an excellent purple colour, as sweet in scent, as pleasant to the sight : after the flowers are past, in those scaly heads grow the seed wrapped in downe, which is somewhat like unto the small Pine Thistle seed.

The Place.

The first *Cassidony* or *Stachas* which is used by Apothecaries and others in Physick, groweth in *Arabia*, as well as in *France* or *Spain*, or upon Mount *Garganus* in *Italy*, which is called in the Italian tongue *Alamo Santo Angelo*. The second was found in *Morena*, a place in *Cassile* or *Spain*. The third is found in many places, both in *France* and *Spain* promiscuously among the other common sorts. The 4. *Clusius* saith is very rare to meet with, for that he onely found naturall on the toppe of the *Calpe*. The fifth *Dalechampius* only hath set forth, without naming the place where it grew. The sixth as *Lobel* saith groweth in the Province of *France*, in *Spain* also, and nigh the *Rhine* in *Germany*, but lesse sweet : the seventh and eighth in *Candy* and *Spain* likewise : the ninth and tenth *Lobel* setteth forth to grow about *Mompelier* in *France*, and *Clusius* saith hee found them in *Spain* and *Portugal*. The eleventh grew on the Hills neare *Terracinum* in *Italy* : the 12. was found among the low Skarlet Okes and Strawberry trees in the Mountaine *Catius* neare *Mompelier* : the 13. in *Candy* : and the last in *France*.

The Time.

Although divers of these have beene observed to bee in flower in March and Aprill, according to the climate where they grow naturall, yet in our Gardens of these more Northerly countries, the former three sorts flower not untill May or Iune, and the rest flower not untill August for the most part, if they doe abide, for they are all of them very tender, and must bee kept with great care and looking to.

The Names.

It is called *sands* in Greeke, and *Stachas* in Latine, and most commonly *Stichados* by the Apothecaries, and *Stachas Arabica*, because the best was brought out of *Arabia*. *Dioscorides* saith it tooke the name *Stachas* from the

culis non foliatis, in English Cassidony with long leaved heads. The fourth is called by *Clusius Stachas crispifolia*, by *Dodonæus* and *Bauhinus Stachas folio serrato*, of *Gerard* and his Corrector *Stachas multifida*, but the figure is that of *Lavandula multifida folio*, as *Clusius* giveth it, for there are not two *Stachades* with divided leaves. *Lugdunensis* setteth it downe for *Succadus* of *Avicenna*, according to *Myconius* judgement, in English Cassidony with dented leaves. The fifth besides the name in the title, is called by *Bauhinus Stachas viridis capitulo oblongo*. The sixth is called by *Alpinus lib. de plantis exoticis Rosmarinum Stachadis facie*, but because it doth come nearer to *Stachas* than to *Rosemary* in my opinion, I have referred it thereunto. The seventh is called *Stachas* by *Citrina* by most Authors, by *Lobel Chrysocome*, and *Coma aurea* sive *Amaranthus luteus* by *Fuchsius* and others, and taken by those of *Mompelier* to be the right *Chrysocome* of *Dioscorides*, excepting one small word wherein there might be a fault also, *Casalpini*, and *Bauhinus* entitle it *Elichrysium*, whereas *Dioscorides* his *Helichrysium*, differeth from his *Chrysocome*, in having Southernewood like leaves, (and therefore I referre *Helichrysium* rather to the *Milfoiles*, as you shall finde it there among them. The eighth is called *Elichrysium* by *Honorus Bellus*, and the other sort thereof, *Elichrysium Orientale* by *Bauhinus*, and by *Camerarius* in *Epitome*, *Stachas Citrina comis grandioribus*. The ninth may be as well the *Chrysocome peregrina secunda* of *Clusius*, as his quinta *Cretica*, for he saith they are very like. The tenth is the *Stachas Citrina altera*, and altera odora of *Lobel*, by *Clusius Chrysocome peregrina prima*, by *Lugdunensis Ageratum aliud quorundam*, and by *Bauhinus Elichrysium sylvestre angustifolium capitulis conglobatis*. The eleventh *Lobel* calleth *Stachas Citrina altera inodora*, and is *Clusius* his *Chrysocome peregrina tertia*, which *Lugdunensis* setteth downe, for *Gnaphalium marinum Dalechampi*, and *Bauhinus* calleth *Elichrysium sylvestre flore oblongo*. The twelfth *Bauhinus* calleth *Elichrysium sylvestri flore oblongo similis*, in English it willd yellow Cassidony. The thirteenth *Alpinus lib. de exoticis plantis*, calleth *Sanulina Cretica*, but I, as it is in the title, for the reason expressed in the description. The last was sent by *Pilliterius* from *Mompelier*, by the name of *Stachas purpurea odorata*, who said it was to be referred to the *Stachas Citrina altera inodora*, because it was so like it, but yet was a differing sort from it: the causes that make me dissent from that opinion, whereof I said something before in the description, I will here set downe: by the description you finde it hath a scaly head, and purple thrummes rising in the midst of it, which is the flower (and such have the flowers of all the *Jaceas*) and the seed likewise inclosed in the heads among the downe, are like unto the seeds of the small low Pine Thistle, which are like the seeds of other Thistles, that is flat, hard, and shining, and such are most of the seeds of the *Jaceas Cyanus*, and some others: but none of the *Stachades* have thrummes for their flowers, and none of the other *Stachades purpurea*, or *Citrina*, have such like seeds, and these two things cause me to thinke it fitter to be referred to the *Jaceas* whereunto it is like both in flower and seed. There is a controversie betweene *Molinus* the Author of the great Herball named *Lugdunensis*, and *Pena* and *Lobel* which should be the true *Chrysocome* of *Dioscorides*. *Lobel* and *Pena* in their *Adversaria*, striving to make *Stachas Citrina vulgaris*, called *Coma aurea*, and of some *Tinearia* and *Amaranthus luteus*, and taken of *Dodonæus* to be *Elichrysium* of *Theophrastus*, and *Ageratum* of *Dioscorides*, to be the true *Chrysocome* of *Dioscorides* and *Molinus*, in folio 780. contradicting and confuting them. *Lobel* and *Pena* in the description of *Stachas Citrina*, say that the golden yellow toppe or head of tufted flowers thereof hath caused the name of *Chrysocome*, which our age could not hitherto know, in wanting the knowledge of the true *Hisope*, unto whose tufted toppes it was by *Dioscorides* compared: but now that the true *Hisope* is declared and set forth (which they make to be the Winter or Pot-Marjerome of our Country, as I have shewed you in the first Chapter of this Booke) with whose tufted toppes or umbell of flowers, they compared the flowers of the yellow Cassidony, they are perswaded that the *Stachas Citrina* is the true *Chrysocome* of *Dioscorides*, but yet afterwards they say that one word or two in *Dioscorides* description of *Chrysocome* doth hinder it, and that is that the rootes of *Chrysocome* (saith *Dioscorides*) are small like unto the rootes of Black Hellebor, and the taste thereof resembling *Cyperus*, of a sweet, but austere taste, for which they thinke there may be some fault in the text of *Dioscorides*. Thus you see the scope and drift of their reasons to be, that because few did know what herbe was the true *Chrysocome* of *Dioscorides* (who compared the tufted heads of flowers thereof unto *Hisope*) & that thereby it was manifest, that our *Hisope* not having any tufted head or umbell of flowers, but a spiked head was not the true *Hisope* of *Dioscorides*, and therefore they having shewed what was the true *Hisope*, would also declare this yellow Cassidony, whose tufted head of flowers is like unto that of their *Hisope*, to be the true *Chrysocome* of *Dioscorides*: Unto all which allegations *Molinus* thus answereth. That first he would examine whether our ordinary *Hisope* be the true *Hisope* of *Dioscorides*, and what part thereof is compared or referred to the *Chrysocome*, and then whether this *Stachas Citrina* be the true or no. There are saith he, two sorts of *Hisope* well knowne to us, the one tame, or of the garden, with a spike of blue flowers, which is the more bitter: and the other wilde with a red flower, which is lesse bitter. Now they that deny either of these to be the true *Hisope* of *Dioscorides*, are led by this reason: that the leaves of each of them are long and narrow, not like unto any of the kindes of *Origanum*, which are round, and by *Dioscorides* compared to the leaves of *Marjerome*, *Pennyroyall*, and *Dittany*. This saith he, hath troubled many that did not know a third kind, (which is the round leaved *Hisope* (declared in the first Chapter of *Hisope*) set forth by him, and like the other two sorts, but that the leaves are round like unto *Origanum* or *Marjerome*. If this kinde of *Hisope* had beene knowne to them, they would not have called for an herbe out of *England*, to supply the place of the right *Hisope*, seeing it hath a place of it owne, even among the sorts of wild *Origanum* or *Marjerome*, whereunto it is like, but somewhat altered by manuring from that which is common. But this their *Hisope* or Pot-Marjerome hath no corymbi tufts or umbells, they are rather a heape of flowers gathered together, as the wild *Origanum* or *Marjerome* hath, for no man did ever attribute any such heads or tufts as are called corymbi, unto any of them. This knot being untied, it followeth (saith he) that we try whether the *Stachas Citrina* be *Chrysocome*. In this their plant there is no likenesse of leaves, of neither of the sorts of *Hisope* to be scene, to wit, either of the long or of the round leaved sort, besides the bushy toppe of leaves and stalkes of flowers of this *Stachas Citrina*, loosely set together, is not a close tuft of heads, such as *Corymbus* (which is a close umbell or tuft of heads or seeds, such as the *Ivie* hath) is usually said to be; but are onely a few yellow golden round shining bullets, or heads at the toppes: the roote also thereof hath no thicke and small strings as *Helleborns niger* hath; nor is like to *Cyperus*, nor hath an austere sweet taste, all which *Chrysocome* hath: He therefore (I meane the foresaid *Molinus*) saith that hee hath often in revolving these doubts, suggested to those Herbarists that have knowledge in plants, that herbe which the French call *Targou*, and some in Latine *Targus*, *Tarchon*, *Tragum*, and *Dracubortensis*, in English *Tarragon*, and which *Ru-*

ellius too credulous of fables, thought was produced from the seed of Flaxe put into the roote of an Onion to bee very agreeable to the description of *Chrysocome*, in the toppes set with many corymbi or tufted heads: in the leaves like unto the ordinary long leaved Hifope: and in the roote branching as *Helleborus niger*, of the colour of *Cyperus*, of a taste not unpleasant, which is somewhat austere with the sweetnesse, by which quality it is profitable to the diseases of the liver and lungs. This (saith he) seemeth probable to me, and therefore I could not bee silent therein, setting forth the nature of *Chrysocome*, leaving it to the judgement of those that are more learned. I have, I confesse beene a little too prolix or tedious in this narration, but I was rather willing to set forth the whole minde of the man, then to abridge any of his reasons, that comparing both his negatives and affirmatives, yee may agree or dissent from them: For my owne part seeing *Clusius* and others, doe account the *Stachas Citrina*, to be *Chrysocome* of *Dioscorides*, and mis-like of this opinion of *Targum*; I can doe no lesse, and thinke there is farre lesse reason in any to suppose *Targum* to be *Chrysocome*, than *Stachas Citrina*. for *Dioscorides* in the description thereof, mentioneth no likenesse of leaves, but of the toppes of tufted heads to be like unto Hifope, and the small rootes unto those of *Helleborus niger*, equalling *Cyperus*. The Arabians call *Stachas Asfochodes*, and *Asfochodes*: the Italians *Stacha* and *Stachade*: the Spaniards *Cantueso*: the French *Stichader*: the Germanes *Stichas kraut*: the Dutch *Stichas cruist*: and we in English *Sticadove* *Cassidony*, and French *Lavender*. The *Stachas citrina* is called by the Italians *Amarantio giallo*, by the Germanes *Morten blumen*, and *Rhein blumen*.

The Vertues.

The decoction of our garden *Cassidony* is as effectually as *Hifope* for the diseases of the breast, that is, for coughs and colds. It is put into Antidotes, that is such medicines, as are remedies against infection and poison. It is of a mixt temperature, as *Galen* saith, to wit, of a small earthly cold essence, from whence it hath the quality of binding; and of another more earthly extenuated, from whence it is bitter, by the mixture of both which, it openeth obstructions, and freeth the body from them, it extenuateth, cleanseth, and strengtheneth all the inward parts and bowels, as also the whole frame of the body. *Mesues* saith it cleanseth, purgeth, and resolvethe all obstructions of the liver, spleene, and of the other inward parts; it hindereth putrefaction, and correcteth their intemperature: by that small astrigent quality that is in it. It strengtheneth the braine and sinewes, the heart, and all the other inward parts: It purgeth black choller and flegme, as well from the head and braine, as the sinewes, and other the instruments of the senses, and comforteth them also. It is very effectually in all cold griefes, used in drinckes, baths, or fomentings. An oyle made therewith and fomented, giveth as it were life to the braines and sinewes, by warming and comforting them. Taken with vineger of Squilles, it helpeth the falling sicknesse, and swimming of the head, and is helpfull for all other paines of the head and stomack; with *Lapis Cyaneus*, or *Sal Indicum*, it helpeth those that are melancholick, whom feares and terrours doe accompany. Taken with the juyce of Buglosse and of Pipins, it helpeth the sadnesse of the heart, and melancholy; it easeth the paines of the sinewes, arteries, muscles, and joynts, taken in what manner you will: the fumes thereof taken into the nostrils, openeth them when they are closed: Taken in a Syrupe or any other forme, it helpeth the quartane ague, and all other day agues, especially in those that are flegmatick. It is especially hurtfull to those that are hot, dry, and cholericke, because it troubleth the stomack, and provoketh both thirst and fainting: but because it worketh slowly, some *Sal gemma* is added unto it to quicken it, or else sometimes the *Myrobalani Indi*, or *Chebuli*, to make it the more forcible, and sometime Squilles are added, especially in the griefes of the head; It is made the stronger, if it be steeped or boyled in whey: it is the lesse hurtfull if it be boyled with wine, the juyce of Pipins, and a few Raisons of the Sunne. *Cassidony* and a little Spike or Lavender, steeped in old oyle, is of much good use, and of great effect for all the cold causes aforesaid. The heads of *Cassidony* are of more force than the leaves; *Pliny* saith it provoketh womens monethly courses and urine: It is of especiall good use for the cold griefes of the mother, and for women with child. The other yellow *Stachas* or *Cassidony*, is much about the same temperature and vertues, serving very well for most of the affects before specified, as you shall heare: It is somewhat bitter and binding, and therefore it warmeth, dryeth, openeth and cleanseth, where cause requireth. The toppes or flowers steeped or boyled in wine, openeth all obstructions of the liver and gall, and therefore helpeth the jaundise and dropisie; and is very profitably taken of those that have the falling sicknesse, and for all other the diseases of the braine, proceeding of a cold cause, as catarths, rheumes, and distillations, and also all old griefes of the head, that are continuall; and the Palsie also, whether yee take the decoction of the hearbe, or the powder thereof in Oxymel or Rhodomell; it likewise killeth the wormes of the belly. It being boyled in lye is very profitable for all those diseases of the head, to wash it therewith, and besides cleanseth the head of scurffe, dandriffe, and such other things as offend it, and killeth lice therein. The decoction of the hearbe openeth and cleanseth the reynes, and uritory parts, causing abundance of urine, especially in them whose urine was stopped before. The flowers are very profitably used in all those bathings, that are applied to the obstructions, and cold griefes of the mother. *Pena* saith he hath by good experience found it effectually in the diseases of the liver, which proceed from the bad concoction therein, by reason of clammy humours, and thick vapours, that passe thorow the tunicles thereof; it is not without danger given to those whose lungs are enflamed: but is especially good for all thin, sowre, and salt flegme oppressing them. *Clusius* saith that they of *Spain* used the decoction of the Spanish fort against the wind collick with good effect.

CHAP. XXIIII.

Lavendula, Lavender.

Here are two sorts of Lavender or Spike, or Lavender Spike, that is a lesser and a greater, of each whereof there are some diversities, as shall be shewed.

1. *Lavendula major sive vulgaris*, Garden Lavender.

Our ordinary Lavender riseth up with a hard woody stemme above the ground, parted into many small branches, whereon are set whitish long and narrow leaves by couples, one against another, from among which rise up naked square stalkes, with two leaves at a joynt, and at the toppes divers small huskes standing round about them, formed in long round heads or spikes with purple gaping flowers springing out of each of them: the roote is woody,

woody, and spreadeth in the ground: the whole plant is of a strong sweet scent, but the heads of flowers much more, and more piercing the fences, which are much used to bee put into linnen and apparell. There is also a kinde hereof that beareth white flowers, and somewhat broader leaves but it is very rare, and kept but with a few with us, being more tender, and not so able to endure our cold Winters.

2. *Lavendula minor* five Spica. Small Lavender or Spike.

The Spike or small Lavender is very like unto the former, but groweth not so high, neither is the head or spike so long, but shorter and smaller, and the flowers of a deeper purplish blue colour: the leaves also are a little harder, whiter, and shorter than the former: the scent also is somewhat sharper and stronger. This is nothing so frequent with us as the first, and is nuried up but with few, that take delight in rare hearbes and plants, and kept in a warmer place.

3. *Lavendula minor flore albo*. Small white Lavender or Spike with a white flower.

This small Lavender is in all things like unto the other small Lavender, but that the whole plant is smaller, and the flowers are white, which maketh it to differ from the other.

4. *Lavendula folio multifido*. Jagged Lavender.

This small Lavender riseth up with square rough and hoary branches, to the height of a foote and a halfe, bearing thereon many hoary whitish leaves, very much jagged or torne on the edges, into many parts unto the middle ribbe, and each part cut or jagged, of a sharpe taste, and a pleasant scent, yet much weaker than in the other small Lavender: from among which rise foure-square hoary stalkes, without any leaves on them unto the toppes, where they beare small spikes of purple flowers, like unto the small Lavender or Spike, but that the flowers seeme to stand square, or in foure parts or corners: the roote is hard and woody like unto the other.

The Place.

The three first sorts are found naturally in many places of *Spain* and *Narbon* in *France*, where the other groweth, although both sorts with white flowers, are much more rare, and seldome, and nuried up as I said with us in their Gardens that are curious. The last was found by *Clusius* both about *Malaca* in *Spain* and *Murcia* in the Realme of *Granado*: it groweth also sometimes in the gardens of those that are curious of all rare hearbes and plants.

The Time.

These all flower about the end of June, and beginning of July, and although *Clusius* saith hee found the last about *Malaca* in flower in February, and in March about *Murcia*, yet it doth not flower in these colder Countries untill June at the soonest, or July.

The Names.

Lavender is called in Latine *Lavandula*, and *Lavendula*, and of some *Lavanda*, quia *lavacris* expetitur, because it was much used in washings. The ordinary great Lavender is called by *Matthiolum*, *Nardus Italica*, and *Pseudonardus*. *Tragus* calleth it *Spica*, *Nardus Germanica*, but most other Authors *Lavendula major* mas, as they doe the smaller, *minor* & *femina*. *Dalechampius* upon *Pliny* would make it to bee *Cassia alba*, as hee would also have *Rosmary* to be *Cassia nigra*, and of some to be the *Iphium* of *Theophrastus*. It is thought of many, to be the *Cneorum* that *Pliny* saith *Higinus* called *Casia*, which was frequently planted in the gardens of *Italy* for their Bees to feed on, and was also used in garlands, whereof *Virgil* in his *Georgicks* and *Bucolics* maketh mention, before *Higinus* or *Plinies* time, in these verses.

Tum Casia, atque alijs intexens saavis herbis
Mollia luteola pingit vaccinia caltha, and againe
Fix humiles apibus casias, roremque ministrat. and
Nec circum casia virides, & olentia late
Serpilla, & graviter spirantis copia thymbræ
Floreat, irrigumque bibat violaria fontem,

1. *Lavendula major* five culgeris.
Garden Lavender.

Flore
albo.

4. *Lavendula folio multifido*. Jagged Lavender.

Aquil-

Anguillara is of opinion that Lavender should be the *Cneorum album* of *Theophrastus*, and that Rosmary should be his *Cneorum nigrum*, which *Matthioli* confuteth sufficiently, from the description of the parts, which can be no wayes like them; viz. that both sorts of *Cneorum* have flexible branches, fit to binde other things withall, which neither Lavender nor Rosmary can doe; that the one sort of *Cneorum* hath a good scent, and the other without scent, although *Anguillara* would pervert the word, to make the blacke have a good scent, as well as the white, which cannot stand with the scope of the text; and that both of the *Cneora* doe flower after the Autumne quarter, which Lavender doth not; and Rosmary, although it doe so, yet it flowreth first in the Spring; and lastly, that the rootes of *Cneorum* descend deepe into the ground, whereas neither Lavender nor Rosmary doe so. The tagged Lavender is called by *Clusius*, as it is in the title, and others since his time, doe so entitle it likewise, yet, as I said before, the figure of *Stachys multifida* in *Gerard*, both old and new, is the true figure of this *Lavendula folio dissecto*, as *Bauhinnus* calleth it, and therefore I meruaile that *Maister Johnson* did not see, or would let passe such an error, that had corrected farre lesse.

The Vertues.

Lavender is of especiall good use for all the griefes and paines of the head and braine, that proceed from a cold cause; as the Apoplexie, falling sicknesse, the drowie or sluggish malady, crampes, convulsions and palsies, as also those that are given to faint often. It strengthneth the stomach, and freeeth the liver and spleene from obstructions, provoketh womens courses, and expelleth the dead child, and the secondine or after-birth. The flowers of Lavender steeped in wine, helpeth them to make water that are stopp'd; as also that are troubled with the winde or collick, if the places be bathed therewith. A decoction made with the flowers of Lavender, Horehound, Fennell, and Asparagus rootes, and a little Cinamon, is very profitably used, to helpe the falling sicknesse, and the giddinesse or turning of the braine. It is good to garble the mouth with the decoction of the flowers, against the paines of the teeth. Two spoonefulls of the distilled water of the flowers taken, doth helpe those that have lost their speeche or voyce, restoring it them againe. It helpeth also the tremblings and passions of the heart, and the swoonings and faintings thereof likewise, not onely drunke, but even applied to the temples, or to the nostrils to be smelt unto, as also tyed to the arteries: but where the body is replete with blood and humours, it is not safe to use it, because of the hot and subtil spirits wherewith it is possessed. The lesser Lavender is much commended in all the diseases of the mother, as the strangling or suffocation, the dislocation or displacing, &c. for women to be bathed therewith, as also to helpe forward their travaile; The oyle chymically drawne from Lavender, which is usually called oyle of spike is of so fierce and piercing spirits, that it is to bee used with great respect, and but some few drops used with other things, either for inward or outward griefes.

CHAP. XXV.

Rosmarinum. Rosmary.

There was formerly but one sort of Rosmary knowne, but we have now more diversity, than hath beene extant before, which shall be declared in this Chapter.

1. *Libanotis coronaria sive Rosmarinum vulgare.*
Ordinary Rosmary.

1. *Libanotis coronaria sive Rosmarinum vulgare.* Ordinary Rosmary.

Our ordinary garden Rosmary is so well knowne I thinke, to all manner of persons being continually in their hands, that I shall scarce need to describe it, yet not to passe it over so slightly. It is well observed in our owne Land in divers places (as Noblemens gardens, &c.) where it hath stood long, as well as in the naturall places, that it groweth in time to a great height, with a great and woody stemme, of a close firme substance, and whitish (fit to make Instruments of, &c. being cut into long thin boords for the purpose) branching forth into sundry armes, and from them againe into many other smaller branches, at the joynts whereof, are set at severall distances, many long and very narrow leaves, greene above, and grayish underneath, and with them all along the stalkes towards the toppes, divers small gaping flowers, of a pale bleake bluish colour, standing in whitish huskes: the seed is small and reddish, but seldome doth any that is sowne in our Country endure the first Winter without extraordinary care, and therefore is usually encreased by slipping: the whole plant doth smell exceeding sweet.

2. *Rosmarinum striatum sive anreum.* Gilded Rosmary.

This Rosmary differeth not from the former in any thing but in the leaves, which are edged or striped, or pointed with a faire gold yellow colour, which so continueth all the yeare throughout, yet fresher in Summer than in Winter.

3. *Rosmarinum latifolium.* Broad leaved Rosmary.

This also groweth like the former, but wee have not seene it growne so great in our Country, nor with such woody branches, and is more tender to keepe: the leaves are larger, and of a more deepe shining greene colour on the upper side, and little or nothing whitish underneath, more thinly also or sparsely set on the stalkes: the flowers likewise differ not from the precedent.

4. *Ros-*

4. *Rosmarinum flore duplici*. Double flowred Rosemary.

The double flowred Rosemary thus farre differeth from the former, that it hath stronger stalkes while it is young then the last, or not so easie to breake, fairer also, and larger leaves than the first, and the flowers double like as the Larkes heele or spurre; and all this narration is but by information, not sight.

5. *Rosmarinum sylvestre Matthioli*.
Matthiolum is wild Bohemian Rosemary.5. *Ledum Silesiacum Clusii*.
Wilde sweete Silesia Rosemary. 5. *Rosmarinum sylvestre Bohemicum Matthioli* sive *Ledum Silesiacum Clusii*. Wild sweet Silesia Rosemary.

This wild sweet Rosemary of *Silesia* riseth with woody ash coloured branches, two foote high or more, which shoote forth other branches of a purplish colour covered with a brownish yellow hoariness, on which are set many narrow long Greene leaves, like unto those of Rosemary, but covered with the like hoariness as the stalkes are, especially in the naturall place, but not so much, being transplanted and folding their sides so close together, that they seeme nothing but ribbes or stalkes, of an excellent pleasant and sweet scent: at the ends of the branches grow certaine brownish scaly leaves, out of which spreadeth a tuft of many flowers, consisting of five white leaves a peece, with ten white chives or threads in the middle, and in some plants with fixe leaves and 12. threads or chieves, after which follow long and five square heads, spotted with silver like white spots while they are Greene, but grow brownish when they are ripe, and turne downe their toppes, opening their huskes at the stalkes, lest the seed which is as small as dust, should suddenly fall out: the roote is woody with short sprays.

6. *Rosmarinum sylvestre* *Lincol.* Unflavory wild Rosemary.

Because this plant doth so nearely resemble Rosemary, I have thought it meete to joine it with the rest, although it be not sweet like them: It groweth above a foote high, having divers reddish branches which divide themselves into other smaller, of a whitish colour, set confusedly with long and narrow leaves, Greene on the upper side, and hoary underneath, like those of the dwarfe willow, of no pleasant scent at all, but of an astringent taste: at the toppes of the branches stand divers heads, composed of many short scales, out of which thrust forth sundry flowers, standing on long foote stalkes made of five leaves a peece, of a fine delayed reddish, or fleshy colour, after which rise short five square heads with blunt points, containing small pale coloured seed.

7. *Rosmarinum sylvestre minus nostras*. Our wild Rosemary.

Our wilde North-Country Rosemary groweth not so high, with smaller leaves, nothing so great and long as Rosemary leaves, but thicker and shorter, of a darke Greene shining colour above, and somewhat yellowish Greene underneath, set very sparsely on very slender and pliant blackish Greene twigges, at the toppes whereof grow the flowers, not out of scaly heads as in the former, as farre as I could perceive by those plants, that were sent me and others out of *Lancashire*, of a reddish colour; the whole plant hath as little scent as the last, which is none at all that I could perceive.

6. *Rosmarinum sylvestre* Læv. G.
Vniuersally wilde Rosemary.

7. *Rosmarinum sylvestre minus nostras*.
Our wilde Rosemary.

The Place and Time.

The ordinary Rosemary groweth in Spaine abundantly neare the Sea side, the scent whereof is many times felt by those in the Shippes that passe by, many leagues off from the Land, in Province also of France; and sundry other those hot Countries, but will not abide (unlesse kept in stowes) the Winter in diuers places of Germany, Denmarke, and those other Northerly Regions: the fift in Silesia, Bohemia, and the parts there abouts: the sixt in the same places with the fift, the last in diuers places of Lancashire, and Yorkshire, bordering there. The first flowieth in Aprill and May with us, and sometimes in August againe, the others not untill August.

The Names.

It is called in Greeke *Libanotis*, & *serapiotica* *Stephanomastica* is added thereunto, to distinguish it from the other *Libanotides*, that are umbelliferous plants; in Latine *Rosmarinus* & *Rosmarinum quasi Rosa marina*. *Cordus* on *Dioscorides* calleth it *Libanotis Coronaria* according to the Greeke: *Nalechampsius* on *Pliny* taketh it to be the *Cassia nigra* of *Theophrastus*, and *Anguillara* to bee the *Cassia* of *Hyginus* acceptable to Bees, and therefore sowne neare their Hives, as also to be the *Cneorum nigrum* of *Theophrastus*, and Lavender to be his *album*, but *Matthiolus* hath confuted that error, as is shewed in the Chapter before: some as *Bauhinus* noteth it, would make it to bee the Hebrewes *Hisope*, as if their *Hisope* differed from the *Hisope* of all other Nations, but without true judgement. *Cesner* in *hortis* calleth the fift *Rosmarinus minor sive tenuis folius*, as he doth the third *Rosmarinus alter ignobilior*, and *Cordus* in *historia*, *Rosmarinus syl. seu major*: the fift is called *Rosmarinum sylvestre* & *Bohemicum*, by *Matthiolus* *Rosmarinum sylvestre*; by *Dodonæus* in his *Dutch Herball*, *Ledum Silesiacum* by *Clusius*; *Ledum folijs Rosmarini alterum* by *Lobel*, and *Chamepence* by *Cordus* on *Dioscorides*, and in his *History* also, because the narrow long leaves being folded together, do represent the Pine or Pitch tree leaves. The sixt is called by *Clusius* as it is in the title: the last is not remembered by any before. The Arabians call it *Elkigaber*, the Italians *Rosmarino*, the Spaniards *Romero*, the French *Rosarin*, the Germanes *Rosmarin*, the Dutch *Rosmarijn*, and we in English *Rosemary*.

The Vertues.

Rosemary is an hearbe of as great use with us in these dayes, as any other whatsoever, not onely for Physicall, but civill purposes: the civill uses as all know, are at Weddings, Funerals, &c. to bestow upon friends: the Physicall remedies, both for inward and outward diseases are many and worthy, for by the warming and comforting heats thereof it helpeth all cold diseases, both of the head, stomack, liver, and belly: the decoction thereof in wine helpeth the cold distillations of the braine into the eyes, &c. and all other cold diseases of the head and braines, as the giddinesse or swimming therein, drowinesse or dulnesse of the minde and senses like a stupidnesse, the dumbe palsey, or losse of speech, the lethargic and falling sicknesse, to be both drunke, and the temples bathed therewith: it helpeth the paines in the gummies & teeth by rheume falling into them, or by putrefaction causing an evil smell from them, or a stinking breath: it helpeth also a weake memory by heating and drying up the cold moistures of the braines, and quickning the senses: it is likewise very comfortable to the stomack in all the cold griefes thereof, and to stay the pronenesse to casting, causing the stomack the better to containe and to digest the meate, either the decoction or powder taken in wine: it is a remedy for the windinesse in the stomacke or bowels, and expelleth it power-

powerfully, as also the hypochondriack passion, and winde in the spleen: it helpeth also those that are liver-grown, by opening the obstructions thereof, by warming the coldnesse extenuating the grossnesse, and afterwards binding and strengthening the weaknesse thereof: it helpeth dimme eyes, and to procure a cleare sight, if all the while it is in flower, one take of the flowers fasting with bread and salt: both *Dioscorides* and *Galen* say, that if a decoction be made thereof with water, and they that have the yellow jaundise, doe exercise their bodies presently after the taking thereof, it will certainly cure it, the flowers and the conserve made of them, is singular good to comfort the heart, and to expell the contagion of the pestilence, to burne the hearbe in Houses and Chambers in the time of the infection to correct the aire in them: both the flowers and the leaves are very profitable for women that are troubled with the whites, if they be daily taken: the dried leaves shred small and taken in a Pipe like as Tobacco is taken, helpeth those much that have any Cough or Tisick, consumption, by warming and drying the thinn distillations, which cause those diseases: the leaves are much used in bathings, and made into ointments or oyles, is singular good to helpe cold benumbed joynts, sineves or members. The chymicall oyle drawne from the leaves and flowers, is a soveraigne helpe for all the diseases aforesaid, to touch the temples and nostrils with a drop, two or three for all those diseases of the head and braines, spoken of before, as also to take a drop two or three, as the cause requireth for the inward griefes, yet must it be taken with discretion, lest it doe more harme than good, for it is very quick and piercing, and therefore but a little must be taken at once. There is another oyle made by insolation in this manner: take what quantity you will of the flowers and put them into a strong glasse close stopped, and digest them in hot Horie dung for 14. dayes, which then being taken forth and unstopped, tye a fine linnen cloth over the mouth, and turne the mouth downe into another strong glasse, which being set in the Sunne, an oyle will distill downe into the lower glasse, to be preserved as precious for divers uses, both inward and outward, as a soveraigne Baulme to heale the diseases before spoken of, to cleare a dimme sight, and to take away spots, markes and scarres in the skin. The Rosmary of *Silesia* is by often experience found to bee good for the shrinking of the sineves, for the Patient to sit often in the decoction thereof, and to bathe the affected parts.

CHAP. XXVI.

Ledum Alpinum five *Rosa Alpina*. The Sweet Mountaine Rose.

1. *Ledum Alpinum* five *Rosa Alpina*.
The Sweet Mountaine Rose.

BEcause both *Clusius* and others, referre this plant for the sweetnesse thereof, to the family of the *Cistus Ledum*, as he did the last in the foregoing Chapter, and called it *Silesiacum*, neither of which I dare doe, not thinking them (although sweet) to belong thereunto, else I had not placed them here, but with the other sorts of *Ledum*. I thinke it meet to speake herof among the sweet hearbs, whose description is thus. It hath sundry slender hard stalkes, 2. foot long or thereabouts, lying for the most part on the ground; covered with an ash coloured barke, at the ends whereof are set without order many hard leaves, like unto those of the Italian dwarf Bay of a shining Greene colour on the upperside, and paler underneath, sometimes pointed, and sometimes round at the ends, and somewhat hairy about the edges as the young shot ones are likewise, of an astringent taste; at the ends of the branches breake forth a tuft of hollow flowers like Bells hanging downe their heads, and divided at the brimmes into five parts, of a deepe red colour on the outside, sprinkled with many silver-like spots, as the stalkes of them are also, but of a paler red colour on the inside with divers threads in the middle, and of a pretty sweet scent, after which come five parted heads, containing within them very small brownish seed like dust, which being rubbed while they are Greene, are of so strong a scent that they offend the senses: but *Lobel* saith his beareth red berries like Asparagus, which *Clusius* saith his doth not: the root is long, hard, and woody: the branches doe often take roote as they lye on the ground, and abide Greene all the Winter. There is another of this kind, as *Clusius* saith he observed, that had fewer, but greater leaves, harder and longer pointed, not hairy on the edges, and of a yellowish darke rusty colour underneath, and the like flowers, not else differing: Vpon these branches & the leaves sometimes are found certaine small excrescences or knots, like Pearle, or sometimes as bigge as Hasell Nuts, rugged or uneven on the outside, of a reddish or sometimes paler colour and spongie, white within, astringent in taste, which supplieth the office of galls.

The Place and Time.

Both these sorts are found on the toppes and on the declining of sundry Hills in *Germany* and *Austria*, among the stones as *Clusius* saith, and on the Hills neare *Trent* and *Verona*, as *Lobel* saith. They flower in June and Iuly, their seed is ripe in the end of August.

The Names.

These plants being lately found and made knowne to us, have received sundry names, as every one in his opini-

on thought fittest, *Vlisses Aldrovandus* calleth it *Nerium Alpinum*, *Gesner* and *Camerarius* in *horto*, *Balsamum Alpinum*, and so doth *Lobel* also, who also calleth it *Chamerhododendros Alpina odora*, as hee doth the other sort hereof. *Chamaelea folio five leutisci folia minus odora*; *Clusius* *Ledum Alpinum*; *Casalpini* *Rhododendron Alpina quibusdam*. *Gesner* himselfe calleth it in his Booke de *lunarijs Nerium Alpinum*, in *hortis Germania*, and in *Descriptione montis fracti*, *Rosa Alpina* from the vulgar, who call it *Alprosen* and *Bergrosen*, he maketh it also in the Chapter of *Chamaerium*, to be his third sort. *Lugdunensis* would referre it to the *Evonymus* of *Theophrasti*, but *Clusius* sheweth the error of that opinion: but it is very likely that *Lobel* his, differeth from this of *Clusius*, as I shall shew you in the Chapter of *Boxe*.

The Vertues.

Clusius saith he could not understand, of any other use that this plant might be put unto, then that the *Diers* there, used the small galles that grow on it, to dye a black colour like unto other galles.

CHAP. XXVII.

Costus hortorum major. Coftmary. And *Costus hortorum minor seu Ageratum*. Maudeline.

Must joyne both these sweet hearbes together, both for the likenesse of their flower, and neerenesse of their names: of the former there is but one sort, but of the other there are divers, whereof I doe intend to shew you the knowledge in this place.

1. *Costus hortorum major*.
Coftmary or Alecoast.

1. *Costus hortorum major*. Coftmary or Alecoast.
Coftmary or Alecoast hath many broad and long pale green leaves, dented or nipped about the edges, every one upon a long foot-stalke, among which rise up many round greene stalkes, with such like leaves thereon, but lesser up to the toppe, where it spreadeth into three or foure branches, every one bearing an umbell or tuft of gold yellow flowers, somewhat like unto *Tansie* flowers, but lesser, which afterwards are the heads containing small flat long seed: the roote is somewhat hard and stringie, which being divided with the heads of leaves, may bee replanted in the Spring for increase.

2. *Ageratum vulgare five Costus hortorum minor*.
Common Maudeline.

Common Maudeline hath somewhat long and narrow leaves snipt about the edges, the stalkes are two foote high, bearing at the toppes many yellow flowers set round together, and all of an equal height, in umbels or tufts like unto *Tansie*, after which followeth small whitish seed, almost as great as *Wormseed*: the whole hearbe is sweet and bitter, being as well gained by slipping as sowing.

3. *Ageratum flore albo*. White Maudeline.

This Maudeline hath woody stalkes, and many small leaves thereon like the other, but somewhat smaller and lesse dented or notched in on the edges, at the toppes of the stalkes grow many flowers, as it were in a tuft together, like unto the common Maudeline, but wholly white, except a little shew of yellow in the middle; the scent of the whole plant is not so strong as the other; the roote is small and stringie like the other also.

4. *Ageratum minus*. Small Maudeline.

This other small Maudeline hath divers hoary stalkes, not rising much above a foote high, beset as thick with leaves as the former or fuller, upon all sides of the stalkes, which are smaller, longer, narrower, and whiter than the other, and rising unto the leaves of yellow or golden *Cassidony*, here before described: at the toppes of the stalkes stand many yellow flowers, thicke thrust together, in an umbell or tuft, very well resembling the first or common garden Maudeline, of a reasonable good and quicke scent, which turne into downe, and is carryed away with the winde, the roote is small and white with many fibres annexed unto it.

5. *Ageratum purpureum*. Purple sweete Maudeline.

This rare and dainty plant hath many small leaves lying upon the ground, round about the toppe of the roote, somewhat like unto the leaves of the first Maudeline, hee set forth, nicked on the edges towards the points of them, and not backwards, somewhat bitter in taste, yet not so much as the common, from among the leaves arise many small stalkes, beset with such like leaves as grow below, but somewhat smaller unto the very toppes, where many flowers stand one above another, every one upon a short foot-stalke, consisting of five small greene leaves, of an excellent violet-like purple colour, coming forth of small greene huskes, of so excellent a dainty sweet scent, that it passeth the Violet in scent, and to be compared with Muske: after the flowers are past, there arise small long seed vessels, bearing small seed therein: the roote is yellow, small and short, bushing forth many small fibres, whereby it taketh fast hold of the ground.

6. *Age-*

3. *Ageratum vulgare* five *Costus hortorum*.
Common Maudeline.

4. *Ageratum minus*.
Small Maudeline.

5. *Ageratum purpureum*.
Purple Sweet Maudeline.

6. *Ageratum Ferulaceum*.
Fennell leaved Maudeline.

6. *Ageratum Ferulaceum*. Fennell leaved Madeline.

This rare hearbe is to be joynd with the Maudelines, for that the flowers decay not being gathered, and kept for a long time. It hath many Fennell-like leaves lying upon the ground, round about the roote, which shooteth forth divers crested or cornered stalkes, a foote and a halfe high; whereon doe grow at certaine distances, on each side one above another, such like leaves compassing the stalk at the foote of them, as Fennell doth : at the toppes of the stalkes stand large umbels of flowers, some of the stalkes rising lower than others, yet all making a round compassed tuft of yellow flowers, very like unto the flowers of Groundsell for the forme, but of a more excellent gold yellow colour, which being gathered before they grow to full maturity, will abide a long time in their perfect beauty, which hath caused the name, and to be joynd with them : the roote is somewhat long, black and woody, rugged also, and a little writhed with divers fibres growing to it.

The Place.

The first three sorts have beene found naturall in divers rough untilled places of *Tuscanie in Italy*, and *Narbonne in France*, but in gardens onely with us. The fourth groweth on dry grounds, and often out of old mud and stone walles. The fift groweth upon the rockes in clifts, where it hath but a small crust of earth upon it, the roote growing sometimes into the chinkes, and moistned onely by the vapours of some waters, passing neare it, or the dew and moisture from the rockes. The last groweth in dry and hungry grounds, and among the Pine tree woods.

The Time.

They doe all flower in June and Iuly in most places where they are planted and prosper.

The Names.

Costmary or Alecost in English, is called in Latine by some *Costus hortorum major*, and by others *Balsamita major*, *Mentha Græca*, *Mentha Romana*, *Mentha Corymbifera major*, *Mentha Saracénica*, *Ovaria* by Gesner in *hortis*, *Herba Maria* by *Casalpini*, and *Lesulata* by others as the Italians doe, the Germanes *Frauen nuntz*, the French *Cog & Buume*, as the Dutch doe *Balsome*. But *Ageratum* is called *Αγεράτον* in Greeke, *quasi non senescens*, or *senectutem non sentiens*; because it (saith) the flowers gathered in a fit time waxe not old or decay by age : *Matthioli*, *Gesner*, *Lacuna*, *Castor Durante*, *Lugdunensis*, *Camerarius*, and *Tabernmontanus* doe call it *Ageratum*, *Dodonæus* *Balsamita fœmina* & *minor*, and *Cistus hortensis minor* by *Gesner*, *Mentha corymbifera minor* by *Cordus*, by *Casalpini* *Camphorata*, *Herba Iulia* by *Anguillara*, *Gesner* in *hortis Germaniæ*; and *Eupatorium Mesnes* by *Tragus*, *Gesner* in *hortis*, *Matthioli* and *Loanensis*; in briefe most of the best later Writers, judge it to be the true *Ageratum* of *Dioscorides*, though some would disprove it : and likewise the true *Eupatorium* of *Mesnes*, although *Dodonæus* denyeth both the one and the other : For the *Eupatorium* of *Mesnes* and *Avicenna* (saith he) differ not, and that of *Avicenna* and *Dioscorides*, are both of them but one plant, even the ordinary *Agrimony*, but *Matthioli* hath answered both these controversies in my judgement so sufficiently, in his answer to *Andreas Marinus*, as nothing can be better : And in conclusion saith, they are no Practitioners in Physicke, that shall deny the *Eupatorium* of *Mesnes*, to be the *Ageratum* of *Dioscorides*. The second *Ageratum* with white flowers, is the second *Ageratum* with *Matthioli* and *Lugdunensis*, and called *Ageratum floribus candidis* by *Lobel*, *Tabernmontanus* and *Camerarius*; the third is the third *Ageratum* with *Matthioli* and *Lugdunensis*, and called *Ageratum minus* by *Lobel*, *Camerarius*, and *Tabernmontanus*, and by *Bauhin*, *Ageratum folijs non serratis* : the fourth is the *Ageratum purpureum* of *Lugdunensis*, which as he saith some Germanes called *Moschatella cerulea*, yet is not the *Moschatella* of *Cordus*, *Bauhin* calleth it *Ageratum serratum Alpinum* : the last is called by *Lugdunensis* *Ageratum ferulaceum*, but *Bauhin* referreth it to the *Achillea montana Arthemisiæ tenuifolia* facie of *Lobel*, to the *Achillea montana* of the same *Lugdunensis* and *Tabernmontanus*, and to the *Chrysanthemum Alpinum secundum Clusium* (but in my opinion it is not that *Chrysanthemum* of *Clusius*, for we have had it growing in our gardens from the seed, sent us by the name of *Chrysanthemum tenuifolium*) and therefore hee himselfe calleth it *Chrysanthemum Alpinum folijs Abrotani multifidis*.

The Vertues.

The ordinary Costmary as well as Madeline (as some of the other are sure of the same quality) provoketh urine abundantly, & mollifieth the hardnes of the mother. *Galen* saith it is hot in the first degree, & dry in the second, that it digesteth, and after a sort gently dissolveth inflātions, it gently purgeth choler and flegme, that it extenuateth that which is grosse, cutteth and divideth that which is tough and glucinous, cleaseth that which is foule, and hindereth putrefaction or corruption, it dissolveth without attraction, openeth obstructions, and healeth their evill affects, and is a wonderfull helpe to all sorts of dayagues ; It is astringent to the stomack, and strengthneth the liver, and all the other inward parts, and taken in whey it worketh the more effectually. Taken fasting in the morning, it is very profitable for the paines in the head, that are continuall, and to stay, dry up, and consume all thin distillations or rheumes from the head into the stomack, and helpeth much to digest raw humours that are gathered therein ; It is very profitably applyed to those that are fallen into a continuall evill disposition of the whole body, called *Cachexia*, taken especially in the beginning of the disease. In briefe it is an especiall friend and helpe to evill, weakes, and cold livers. The seed is familiarly given to children for the wormes, and so is the infusion of the flowers in white wine, and given to them to the quantity of two ounces at a time. It maketh an excellent salve to cleanse and heale old ulcers, being boyled with Oyle of olive and Adders tongue with it, and after it is strained, to put a little Waxe, Rosin, and Turpentine, to bring it into a convenient body.

CHAP. XXVIII.

Tanacetum. Tanfie.

Here are two sorts of Garden Tanfies, whereof the one is called ordinary or common Tanfie, and the other curld or double Tanfie : but there are some others also to be spoken of here in this Chapter.

1. *Tanacetum vulgare & crispum*. Ordinary and curld Tanfie.

Our garden Tanfie hath many hard Greene leaves, or rather wings of leaves, for (although they bee two

1. *Tanacetum vulgare* & *crispum*.
Ordinary and curld Tanfie.

two sorts, yet one description may serve them both) they are many small ones set one against another all along a middle ribbe or stalke, and snipt about the edges; in one sort the leaves stand closer and thicker, and somewhat crumpled, which hath caused it to be called double or curld Tanfie; in the other sort thinner and more sparsely set; it riseth up with many hard stalkes, whereon grow at the toppes of the branches gold yellow flowers like buttons, which being gathered in their prime, will hold the fresh colour a long season: the seed is small, and as it were chaffie: the roote creepeth under ground, and shooteth up againe in divers places: the whole hearbe both leaves and flowers are of a sharpe strong bitter smell and taste, but yet pleasant and well to be endured.

2. *Tanacetum versicolor*. Party coloured Tanfie.

The party coloured Tanfie is in roote, leafe and flower, altogether like the other common garden Tanfie; the only difference betweene them, consisteth in this, that upon the first shooting up of the heads of leaves, they are almost all white, and after they are growne great, there will bee many leaves, remaining white, among the greene, which maketh it the more delightfull, seeming like unto a party coloured Feather, in regard of the fine cut leaves of white and greene.

3. *Tanacetum lanuginosum*. Woolly Tanfie.

Woolly Tanfie from a thick blackish spreading roote, sendeth forth divers winged leaves, somewhat like unto the former Tanfie and neare unto the leaves of Yarrow, (whereof some would make it a kinde) of a very sweet scent, and withall very woolly, set close together about the roote, among which spring up divers woolly stalkes, having a few such like leaves upon them, and at the toppes many tufts of yellow flowers.

4. *Tanacetum minus flore albo*. Small white Tanfie.

Small white Tanfie hath divers winged leaves lying upon the ground, round about the toppes of the roote, very much cut or divided into parts, somewhat resembling both Tanfie and Yarrow, of a pale greene colour, being both lesse bitter in taste, and lesse hot, or strong in smell than Tanfie: from whence rise up the stalkes, little above a foote high, here and there set with the like leaves, but smaller; the flowers at the toppes are like unto Camomill flowers, with a border or pale of white leaves, and a yellow thrumme in the middle: the roote is small and short, somewhat thicke at the head, and smaller downewards, with divers small fibres thereat.

5. *Tanacetum Alpinum*. Mountaine Tanfie.

The Mountaine Tanfie hath many winged leaves lying upon the ground, compassing the toppe of the roote, very like unto the ordinary Tanfie, in the division of the leaves, and of a deepe greene colour, as bitter in taste, but more pleasant in scent than it: from whence rise up the stalkes, little above a foote high, here and there set with the like leaves, but smaller; the flowers at the toppes are like unto Camomill flowers, with a border or pale of white leaves, and a yellow thrumme in the middle: the roote is small and short, somewhat thicke at the head, and smaller downewards, with divers small fibres thereat.

6. *Tanacetum inodorum*. Unfavory Tanfie.

Unfavory Tanfie hath his large winged leaves, very neare resembling Tanfie, lying upon the ground, and among them round hard greene stalkes, with very few and shorter leaves thereon, at the toppes whereof stand divers flowers, upon short foote-stalkes, very like unto the flowers, of the great white Daisy, and as large, consisting of foureteene or sixteene leaves, as a pale or border, about a yellow thrumme in the middle: the roote spreadeth under the upper part of the earth, and goeth not farre downe: the whole is altogether without any scent therein at all, yet the leaves are of a hot and sharpe taste, quickly piercing the tongue.

There is another of this kinde of unfavory Tanfie, whose leaves are more loosely spread, although as much divided, and the flowers being white, are as small as Feverfew.

The Place.

The ordinary Tanfie groweth in some places beyond Sea by the hedges and ditches sides, and in the borders of fields; the curld Tanfie is peculiar to our owne Land, and so is the second, and likely to be a degeneration from the ordinary sort by accident, and nursed up in our owne Country, where the slips doe often loose, and sometimes keepe their kinde. The third groweth about *Mompelien* in *France*, and in other places. The fourth groweth as well in *Germany* as in *Italy*, in divers places. The fifth groweth on the high and snowy Hills on the *Alpes*, among the *Switzers*. The last groweth in *Hungary*, *Austria*, *Germany*, and about *Valentia*, and in the Country of *Daulphine* in *France*.

The Time.

They doe all flower in the Summer Monethes of June and Iuly.

The Names.

Tanfie is called *Tanacetum*, corruptly taken, as *Fuchsius* thinketh, from *Tagetes*, or *Apollonius* his *Arthenissa Tragantes*, and *Athanasia* peradventure of *Athanasios sine morte*, or *non moriens*, because the yellow flowers gathered in due time, dye not of a long time after, like as divers of the other hearbes last remembered; *Tabernamontanus*

3. *Tanacetum lanuginosum*. Woolly Tanfie.
 4. *Tanacetum minus flore albo*. Small white Tanfie.

5. *Tanacetum Alpinum*. Mountaine Tanfie.

6. *Tanacetum inodorum*.
 Vnflavory Tanfie.

tenus calleth the ordinary Tanfie, *Arthemisia Dioscoridis*, and the double Tanfie *Arthemisia sativa* Anglica. The second hath no other name then is in the title, except that some doe call it white Tanfie, because many of the leaves will bee white. The third is called *Tanacetum lanuginosum* of *Lugdunensis*; *Banbinus* in his *Pinax* would referre it to the *Stratiotes Millefolia flavo flore* of *Cleopius*, and *Millefolium luteum* of *Lobel*, but I thinke he is therein mistaken, for the leaves of *Stratiotes* being much smaller, and having no scent declare it so. It may be also the *Heliochrysum italicum* of *Matthiolum*, but not any *Achillea*, whose descriptions yee shall have in another part hereafter. The fourth is called by *Dodonaeus* *Tanacetum minus flore albo*, of *Lobel* *Tanacetum minus candidis floribus*: (but it is not likely to be the *Achillea* of *Matthiolum*, *Castor* *Durantes* and others, who follow the description of *Dioscorides* and *Matthiolum*; the flowers of whose *Achillea* are of a whitish purple, with some yellow spots in them) for that it hath both the forme and the smell of Tanfie, but somewhat weaker. The fifth by *Lugdunensis* is called *Tanacetum parvum Alpinum*, and saith that the people in the Mountaines where it groweth, call it *Iva Moschata*, and some *Arthemisia Alpina*: *Gesner* in hort. calleth it *Tanacetum cognata herbula*, in English Mountaine Tanfie. The two last are called *Tanacetum inodorum* of most, yet some doe adde *Bellidis, majore flore*, and some *Bellis Tanacetifolio*: some have thought it to bee *Sideritis Italorum*, but *Pena* contradiceth it. *Cleopius* sheweth the differences of the greater and the lesser. Wee call it in English according to the Latine, Vnflavory Tanfie, and I place it here among the rest of the sweet Tanfies, for the names sake, raysted from the likeness of the leaves, although it hath no scent. The Italians call it *Tanacetum*, and *Dandaa*: the French *Tanaisie*, and *Athanasie*: the Germanes *Reinsfern*, because the leaves resemble *Ferne*, and the Dutch thereafter *Reyn vaer*, wee in English Tanfie.

The Vertues.

The decoction of the common Tanfie (and some of the rest come neare in effect thereunto) or the juyce drunke in wine, is a singular remedy for all the griefes of the urine, to provoke it being stopped, to helpe those that have the strangury, and have weake reines and kidneies, and that cannot make their water but by drops. It is also very profitable to dissolve and expell winde, whether in the stomack, belly, or bowels, and to procure women monethly courses, and to expell windinesse in the mother. If it be bruised and sinelled unto often, as also applied to the lower part of the belly, it is assuredly found to be profitable for such women as are given to miscarry in childbearing, to cause them goe out their full time, without danger or losse; it is used also against the stone in the reines with good successe, especially to men. It is much used both in Lent and in the beginning of the Spring, while the heart is young and tender, to make cakes thereof with egges fried, which are called Tanfies, and are very profitable for those stomackes, that are troubled with bad humours cleaving therennto, both to helpe to digest them, and by clearing the stomack of them, to carry them away downeward. The seed is much commended and very profitably given to children for the wormes, and the juyce in drinke is as effectuell; being boyled in oyle, it is very profitably applied to comfort the sinewes that are shrunk by crampes, or are in paine through cold: It is said also, that the roote preserved in Sugar, is a remedy for them that have the gowt, if they take thereof fasting for a certaine time together.

CHAP. XXIX.

Matricaria. Featherfew.

Here are divers sorts of Featherfew to bee entreated of here, as shall hereafter follow.

1. *Matricaria vulgaris simplex.* Common Featherfew.

Common Featherfew hath many large fresh Greene leaves, very much torne or cut on the edges: the stalkes are hard and round, set with many such like leaves, but somewhat smaller, and at the toppes stand many single flowers, upon severall small foot-stalkes, consisting of many small white leaves, standing round about a yellow thrumme in the middle: the roote is somewhat hard and short, with many strong fibres at it: the scent of the whole plant is very strong and stinking, and the taste very bitter.

2. *Matricaria flore pleno.* Double Featherfew.

This differeth very little from the former but in the flowers, which are very thicke and double, with white leaves, so that onely a little yellow spot is to be seene in the middle.

1. 3. *Matricaria vulgaris simplex & bullatis floribus aureis.* Ordinary & naked Featherfew. 2. *Flore pleno.* Double Featherfew.

3. *Matricaria bullatis floribus aureis.* Naked Featherfew.

This kinde differeth not from the former, but that it hath his flowers, without any of the pale or border of white leaves about it, and therefore being naked, and without those leaves, I have named it naked Featherfew, as an especiall difference from the former.

4. *Matricaria grati odoris.* Sweet Featherfew.

This other Featherfew differeth not from the first, either in roote, leafe, or flower, being in all things so like, that there can be no difference perceived betweene them, untill you smell thereunto, and then it is soone found to bee of a more pleasant softer smell, which so abideth in the kind, and is not so made by art, or degenerated by any casualty, but the worke of nature onely.

5. *Matricaria inodora.* Vnsavory Featherfew.

The Vnsavory Featherfew is a small low plant, rather spreading than rising high into many branches, whereon are many leaves set, here and there without order, every one being smaller, shorter and thicker than the leaves of the common Featherfew, but cut in on both sides, somewhat like unto it, of no smell at all: the flowers are white with a yellow thrumme in the middle like the other, which have a certaine heave dill scent, but very weake, the roote is bushy like the former.

6. *Matricaria sive Parthenium tenuifolium.* Fine-leaved Featherfew.

This Featherfew hath a few leaves below, rising from the roote, as small and fine as Fennell, and very like unto Sootherwood, but smelling so like Featherfew, and bitter withall, that even thereby it may easily be knowne, to what stocke or tribe it doth belong, from among which rise divers brownish round and hard stalkes, to the height of halfe a yard or more, whereon grow disperdely such like leaves: at the toppes of the stalkes stand many small white flowers, in an umbell, thicke set, or close together, very like unto the flowers of Yarrow; that they may soone deceive him that heedfully doth not marke them: the roote is small, white, and woody, with some small fibres at it,

7. *Matricaria*

7. *Matricaria* sive *Parthenium Alpinum Clusii*. 8. *maritimum*.
Mountain Featherfew of *Clusius*. 6. *renuifolium*.

7. *Matricaria* sive *Parthenium Alpinum Clusii*. Mountain Featherfew of *Clusius*.

Mountain Featherfew hath many slender weake Greene branches trayling on the ground, and taking roote as they creepe thereon, very like unto Camomill. and not rising above a foote high, about which are set many leaves, almost as fine as Camomill, but cut in after the manner of Mayweed or Featherfew, and very neare of the same smell as Featherfew, being of a hot taste, but not unpleasant: at the toppes of the stalkes stand many flowers together, very like unto the former, but that the middle thrumme is smaller and paler, and the circling leaves not altogether so white, but as large, and somewhat rounder or closer set, of the same scent with the hearbe: the roote is composed of many small fibres shooting downe from a small head.

8. *Parthenium maritimum minimum*. Small Sea Featherfew.

I have thought fit to place this Sea plant, with the rest of the same tribe, as I meane to doe with as many as will abide the culture and maruring, to prosper in this garden, intending to shew you the rest in their convenient places: The roote is small spreading abroad many long fibres, from whence rise up slender weake branches lying upon the ground, diversly set without order, with many small whitish Greene leaves, cut in or dented on the edges, very like in forme, unto the leaves of the great white Daisie, but much lesler and more full and fleshy, or thicker, of a strong fierce scent, somewhat like unto Featherfew, or rather unto sinking Maithes or Mayweed: at the toppe of every branch stand one or two flowers, somewhat like unto those of Featherfew or Mayweed, but smaller, and the bordering leaves also smaller, having a whitish Greene head or huske of leaves under them.

The Place.

The first is found wilde in some places of this Land, as well as in others, yet for the most part it is nourished in gardens

as well as the second, which as *Clusius* thinketh, is peculiar to us: the third grew in *Essex*, and was there found by a Gentleman called Master *William Cory*. The fourth grew in an Island called *Iliua* in the Levant Seas, as *Camerarius* saith, but it hath bene found wild in our owne Country, as it hath bene affirmed unto mee, as well as the other naked kinde. The fifth groweth in *Egypt*, as *Prosper Alpinus* saith, and is onely naturall to that Country. The sixth was found in *Spaine*, by *Myconus* a learned Physitian of *Barcinona*, and sent to *Molnans* who composed the great Herball called *Lugdunensis*. The seventh *Clusius* found upon the Mountaines of *Sirius*, which are part of the Alpes. The last *Pena* saith grew plentifully neare the Fishermens Cottages, at the foote of *Mons Casius* in *Narbone* in *France*.

The Time.

They all flower in Iune and July, but the Sea plant is the latest.

The Names.

It is called in Greeke *ματρίκαριον*. *Parthenium quasi virginale quia mulierum morbis uterinis medetur*, & inde vulgo *Matricaria*. It is called also *febrisfuga* from whence I thinke our English name Featherfew, or Feaverfew is derived, it being good to expell feavers or agues. It is held by most of the later Writers to be the true *Parthenium* of *Dioscorides*, yet *Lobel* and *Pena* (even as *Brasavolus* and *Fuchsius* before them, whom *Matthioli* doth confute) by many reasons alleaged doe shew, that both the face or forme of the leaves, compared by *Dioscorides* to Coriander but lesler, as also the properties given to *Parthenium*, can by no means be found in this *Matricaria*: but may all most truly and plainly be found in *Cotula fetida*, or sinking Mayweed: the discourse is too long here to recite, I therefore referre you to the place where you may read it a large, in the description of *Parthenium* in their *Adversaria*, as also in *Lugdunensis* in the Chapter of *Matricaria*. *Parthenium*, as *Galen* saith was called in his time, *Anthemis*, *Helxine*, *Linzoestis* and *Amaracus*; and *Pliny* affirmeth, that *Helxine* was called *Perdicium* and *Parthenium*, and in another place he saith, that it was called *Leucanthemum* and *Tammacum*, and that *Celsus* called it *Perdicium* and *Muralium*, so that hereby it may be seene, that *Parthenium* was a word applied to many hearbes. *Fuchsius* would make *Matricaria* to be the second kinde of *Dioscorides* his *Arthemisia*, called *Leptophyllos*, that is *renuifolia*, and *Parthenium* to be *Cotula fetida*, which as I said before. *Matthioli* disproveeth: the second is so called by divers Authors as it is in the title, and by *Tabernmontanus* *Arthemisia tenuifolia flore pleno*: the third is a species not spoken off by any Author before, as I take it. The fourth sort *Camerarius* calleth *Matricaria altera ex Iliua*, of *Tabernmontanus* *Arthemisia tenuifolia odorata*, and *Bauhinus* *Matricaria odorata*; and we *Matricaria grati odoris*, because it is of so good a scent. The fifth *Prosper Alpinus* saith is called in *Egypt* *Achaovan*, and he thereupon called it *Parthenium inodorum*: in English: Unsavory Featherfew. The sixth was judged by *Myconus* that sent it out of *Spaine*, (as is before said) to be another *Parthenium*, *quasi virginale*, and it may be that of *Hippocrates*, which many judge to bee *Cotula fetida*, *Bauhinus* calleth it *Matricaria folijs Abrotani*. The seventh *Clusius* calleth *Parthenium Alpinum* *Camerarius* *Matricaria sive Parthenium Alpinum*, and *Bauhinus* *Matricaria Alpina (hammeli folijs)*. The last *Lobel* and *Pena* call *Cotula sive Parthenium maritimum minimum*, and *Lugdunensis* *Parthenium maritimum minimum*, and is likewise

like wise the *Chamemelum maritimum* of *Dalechampius*, set out in the same place of *Lygdunensis*, for they are both one, as may be gathered both by the figure and description, although the flowers in *Lobel's* figure be more obscured: in English small Sea Featherfew. The Italians call it *Matricaria*, and *Amarella*: the French *Esp. argoutte*: the Germans *Mutterkraut*, and *Meltram*: the Dutch *Modervuit*, and we in English as I said before, Featherfew, or rather Feaverfew.

The Vertues.

It is chiefly used for the diseases of the mother, whether it be the strangling or rising of the mother, or the hardness or inflammations of the same, applied outwardly thereunto, or a decoction of the flowers in wine, with a little Nutmegge or Mace put therein, and drunke often in a day, is an approved remedy to bring downe womens courses speedily, and to warme those parts oppressed by obstructions or cold, as also helpeth to expell the dead birth, and the afterbirth. For a woman to sit over the hot fumes of the decoction of the hearbe, made in water or wine, is effectuall also for the same purposes, and in some cases to apply the boyled hearb warme to the privie parts. The decoction thereof made, with some Sugar or honey put thereto, is used by many with good successe, as well to helpe the cough, and stuffing of the chest by cold, as also to cleanse the reins and bladder, and helpe to expell the stone in them. The powder of the hearbe, as *Dioscorides* saith, taken in wine, with some Oxymel, purgeth like to *Epithymum* both choler and flegme, and is available for those that are short winded, and are troubled with melancholy and heavinesse, or sadness of the spirits: It is very effectual for all paines in the head, comming of a cold cause, as *Camerarius* saith, the hearbe being bruised and applied to the crowne of the head; It is also profitable for those that have the Vertigo, that is, a turning and swimming in their head. It is also drunke warme (I meane the decoction) before the accesse or comming of an ague, as also the hearbe bruised with a few cornes of Bay-salt (and some put beaten glasse thereto, but I see no reason wherefore) and applied to the wrestles of the hand, to take away the fits of agues. Some doe use the distilled water of the hearbe and flowers, to take away freckles, and other spots and deformities in the face. And some with good successe doe helpe the winde and collicke, in the lower part of the belly, (and some say it is good also for the winde in the stomack) by bruising the hearbe, and heating it on a tyle, with some wine to moisten it, or fried with a little wine and oyle in a Frying-panne, and applied warme outwardly to the places, and renewed as there is need. It is an especiall remedy against *Opium*, that is, taken too liberally. It is an hearbe among others, as *Camerarius* saith, much used in *Italy*, fried with egges, as wee doe Tanfies, and eaten with great delight; the bitternesse, which else would make it unpleasant, being taken away by the manner of dressing.

CHAP. XXX.

Chamemelum. Camomill.

Have divers sorts of Camomill to shew you in this Chapter, some common and well knowne to most, others more rare, and heard of but by a few, and unto them I thinke it not amisse to joyne the Mayweeds, because they are as well the like linking, as lesse or not sweet.

1. *Chamemelum vulgare*. Ordinary Camomill,
& *flore pleno*. Double Camomill.

1. *Chamemelum vulgare*. Ordinary Camomill.

Our ordinary Camomill is well knowne to all to have many small trayling branches, set with very fine leaves, bushing and spreading thick over the ground, taking roote still as it spreadeth: the toppes of the branches have white flowers with yellow thrummes in the middle, very like unto Featherfew, but larger, and not so hard, but more soft and gentle in handling, which give a small white seed, not observed by many, and being cast in the ground, will bring forth plants as other seed doth: the whole hearb is of a very sweet scent.

2. *Chamemelum nudum*. Naked Camomill.

We have another sort of fine small Camomill in our gardens, although very rare, like unto the former, but with whiter, finer, and shorter leaves set on the stalkes, that rise somewhat higher, and beare naked small flowers, that is consisting onely of the yellow thrummy heads, without any pale or border of white leaves, smelling almost as sweet as the former.

3. *Chamemelum flore pleno*. Double flowered Camomill.

The double Camomill groweth very like the single, but a little higher, and more upright, having fresher Greene leaves, the flowers being composed of many rowes of white leaves, making them double, as we call them, & with a yellowish spot in the middle of each flower for the most part, which is of a sweeter scent than the single, but spreadeth on the ground in the same manner, and is more tender to bee kept in Winter: this also hath seed in the middle of the flowers, which being broken and cast into the ground, will produce double Camomill, even as double Featherfew will doe the like.

4. *Chamemelum pumilum Africum*. Small Camomill of Africa.

This small Camomill groweth lower than the former naked Camomill, with as fine small leaves, but longer: the flowers being yellow thrummy heads like it, but bigger, and without any pale or border of white leaves, smelling as sweet as the best Camomill.

5. *Chamemelum*

2. *Chamamelum nudum*.

Naked Camomill.

4. *Chamamelum premium Africanum*.
Small Camomill of Africa. 5. *Chamamelum Hispanicum amplo flore*. Great Spanish Camomill.

This great Camomill groweth in the same manner as the ordinary Camomill doth, with Greene striped stalkes, of a cubite high, branching forth into many parts, whereon doe grow such like leaves, and as finely cut in or divided, the ends whereof are blunter, and divided into two parts, and not very thicke set on the branches; at the tops whereof stand the flowers, each being foure times larger than the flower of the ordinary sort: consisting of about twenty wayed or cindented leaves, of a very pale yellow colour almost white, for a pale or border, about a pale yellow thrum in the middle: after the flower is past the seed ripeneth in these heads, which is small and yellowish like the ordinary sort: the roote consisteth but of a few fibres, which dye every yeare, the plant being but annuall, and must be new sowne in the Spring; it is of a good scent, somewhat resembling the garden Camomill.

6. *Chamamelum Hispanicum luteum odoratum*. Sweet yellow Spanish Camomill.

This yellow Camomill is like unto the garden Camomill in all things, saving the flowers which are wholly yellow, both the bordering leaves, which are of a shining yellow colour, about foureteene in number, and the middle thrum, but the whole flower is at least twice as bigge as the flower of the ordinary sort, and almost as sweet, but lesser almost by the halfe than the former.

7. *Chamamelum Hispanicum incanum parvum*. Small hoary Spanish Camomill.

This small Camomill groweth not to be above an hand breadth high, having some few hoary whitish Greene finely cut leaves, lying upon the ground, being as small and fine as those of Southernwood, or fine Wormewood, from among which riseth up a bare or naked stalke, without any leaves thereon, and one somewhat large flower, standing at the toppe, having many white leaves, standing about a pale yellow middle thrum; the whole plant and every part thereof, is as well without scent as without taste.

8. *Chamamelum Alpinum inodorum*. Vnsavoury Mountaine Comomill.

Vnsavoury Mountaine Camomill hath many hoary stalkes rising from the roote, without leaves for a certaine distance, and then having many set together, small toward the bottome, seeming to bee but as stalkes to the leaves, which are somewhat narrow, and deeply cut in on both sides, as it were into deepe notches, being more thicke and full of juyce, then other sorts are by much, among which rise up divers other weake stalkes, without any cut leaves on them, and one somewhat large flower at the toppe of each, like unto a Camomill flower, but larger, the border of leaves being white, and the thrum yellow in the midde: the branches spread farre, and take roote in divers places: the roote is composed of a few whitish strings, the plant hath little or no smell to commend it, and is a little bitter in taste.

9. *Corula fetida, & non fetida*. Mayweed with a strong, and no scent.

Mayweed is so like unto Camomill, that I must needs joyne them together: but that which stinketh groweth more upright than either that which smelleth not, or the common Camomill, and neither of them creepe or runne on the ground, with the branches taking roote as Camomill doth: the leaves thereon are longer and greater than Camo.

8. *Chamamelum Alpinum inodorum.*
Vnflavory Mountain Camomill.

9. *Cotula fetida & non fetida.*
Mayweed with a strong and no scent.

Camomill, yet very like, but of a paler Greene colour, the one sort smelling strong and unpleasant, the other having no scent at all: the flowers of them both are very like unto Camomill, but larger both the white border and the middle yellow thrum, whereby and by the scent thereof they are onely to be discerned from Camomill for many doe gather the flowers of that which smelleth not, instead of Camomill flowers, either of ignorance or wilfulness, and so sell them promiscuously to the Apothecaries, that know not this note of distinction.

Of this kinde there hath beene found oftentimes, and in divers places of this Land, a sort with double flowers almost as large as double Camomill flowers.

The Place.

Small Camomill groweth familiarly wilde in many places (on greenes as they are called) of this Land, and with the Mayweed oftentimes that sinketh not, which groweth also among corne, as the stinking fort doth: the naked and double sort grow onely in gardens: the fourth was found by *Guillame Boel* in *Africa* by *Tunis*: the fifth, sixth, and seventh in divers places in *Spaine*: the eighth in sundry places of the *Alpes*: the last plentifully in our owne Land.

The Time.

They all flower in the Summer, yet some earlier than others.

The Names.

Camomill is called in Greeke *Ανθεμίσ*, *Anthemis* of *Dioscorides*, and *Ανθίσκος* of *Theophrastus*, and this for a distinction *Λευκάνθημος* of the whitenesse of the flowers: and *Μαλίσκος* quod mali odorem habeat, of the scent of an Apple or Quince. It is called by some in Latine *Leucanthemum*, and *Anthemis*, but most generally *Chamamelum*, and of some *Chamomilla*, as it is also in the Apothecaries Shops. Some call the garden Camomill, both single and double *Chamamelum Romanum & odoratum & nobile*, thinking them to be sweeter kinds than the wilde, when as that which groweth wild is usually brought into gardens, and will by manuring become of as good a scent, or any other before in the garden. The rest have their names in their titles, both in Latine and English, as much as is convenient, and that others have called them: but Mayweed as is before said in the last Chapter, is more truly taken to be *Parthenium* of *Dioscorides*, yet generally called *Cotula*, taken as it is thought from the *Thulcaus Cauta*, the diminutive being *Cautula*, corruptly called *Cotula*: by the Greekes *κνυανθемίς* & *κνυανθемός* *Cynanthemis & Cynanthos*, that is, *Camomilla canina & Canina herba*: the Germanes call *Krottendill*: the Arabians call *Camomill Debonigi & Babunegi*: the Italians call it *Camamilla*: the Spaniards *Manzanilla*: the French *Chamomille*: the Germanes *Chamillen*, and the Mayweed *Krottendill*: the Dutch *Camille*: and we in English Camomill.

The Vertues.

A decoction made of Camomill, and drunke, taketh away all paines and stiches in the sides. The flowers onely of Camomill beaten, and made up into balls with oyle, driveth away all sorts of agues, if the party grieved bee annoynd with that oyle taken from the flowers, from the crowne of the head, to the soles of the fecte, and after laid to sweat in their bed, with sufficient coverings upon them, and that they sweat well: this is *Nichessor* an Egyptians medicine; which *Galen* seemeth to confirme, for he saith that the *Sophi* of the Egyptians consecrated this herbe to the Sunne, as a remedy for all sorts of agues: but therein saith *Galen* they were deceived, for it hea-

leth onely those that are already digested; but it is very profitable for all other sorts of agnes, that come eyther from flegme or melancholy, or from an inflammation of the bowels: for these (saith he) Camomill is a soveraigne remedy to be applied, when as they shall be concocted: and therefore there is nothing can be more acceptable and profitable to the *Hypochondria*; that is, the sides; and that part where the liver and spleene lye, then it. The bathing of a decoction of Camomill taketh away wearinesse, and easeth paines to what part of the body soever it be applied, besides, it comforteth the sinewes that are overstrayned, mollifieth all swellings, and those that are not overhard, and rarifieth those that are bound together. It moderately comforteth all parts that have need of warmth, and digesteth and dissolveth whatsoever hath need thereof, by a wonderfull speedy property. It easeth all the paines of the collick and stone, as also all paines and torments of the belly, and provoketh urine gently. The flowers boyled in posset drinke, provoketh sweat, and helpeth to expell colds, aches, and paines wheresoever; the same is an excellent helpe to bring downe womens courses; A Syrupe made of the juyce of double Camomill, saith *Ban-hinus*, but of garden Camomill say *Pena* and *Lobel*, with the flowers and white wine, is a remedy against the jaundise and dropfie, that commeth by the evill disposition of the spleene. The flowers boyled in lye is very good to wash the head, and to comfort both it and the braine. The oyle made of the flowers of Camomill is much used, against all hard swellings, and paines, or aches, shrinking of the sinewes, or crampes, or paines in the joynts, or any other part of the body; and helpeth to dissolve wind, and paines in the belly, used in glisters for that purpose: annoynted also, it helpeth stitches, and paines in the sides. Mayweed is often used with good successe for the same purposes that Camomill is, both to dissolve tumours and winde, and to ease paines and aches, in the joynts, &c. especially the stinking sort, which is stronger in operation than the other.

CHAP. XXXI.

Ambrosia. Oke of Cappadocia.

Although there be extant with some Writers, two sorts of *Ambrosia*, as *Mathioli* in his last Edition, and three sorts with *Lobel* in his observations, and so likewise with *Gerard*; yet finding both the sorts in *Mathioli*, and the later sort in *Lobel* and *Gerard*, to be other herbes, as I shall shew you in the sixth place among the *Abrotana*, and not *Ambrosia*: I have here onely shewed you one, as *Dodonaeus* before me hath done also, which is the first both with *Lobel* and *Gerard*, as the truest, and is thus to be knowne.

1. *Ambrosia hortensis*.
Oake of Cappadocia.

2. *Ambrosia hortensis*. Oake of Cappadocia.

The Oake of Cappadocia from a long slender roote, bushing forth with many fibres, sendeth forth one hoary white striped, or straked stalke, rising to be two foote high at the least in any good ground, divided or spread into many branches, from the very bottome, whereon are set without any certaine order, somewhat large leaves, upon pretty long foot-stalkes, very much cut in on the edges, somewhat resembling the division of Mugwort leaves, especially the ends of them, but much smaller than they, being all whitish or hoary upon the greene, and of a very pleasing scent, not so hot or resinous as *Bortys* or Oake of *Ierusalem*: at the toppes of all the branches both great and smal, stand the flowers, which are small round yellow mossie burtons, never opening abroad, nor bringing any seed, but fall away as idle chaffe: but under these flowers from among the leaves, come forth small short stalkes, bearing two or three, or foure small rough and pointed heads, without any flowers before them, wherein is contained small round blackish seed, almost like the kernels or stones of Raisons or Grapes.

The place.

This is said to grow naturally in *Cappadocia*, but *Bellonius* setteth it downe to have found it in many places of *Asia minor*, and is onely to be found in gardens thorowout all *Europe*.

The Time.

It flowreth not with us untill August, and hardly giveth us any perfect seed, for the least cold night comming before it can seed, taketh it away, making it presently to perish, so that for the most part wee are to seeke for seed, from *Italy*, or other places.

The Names.

It is called in Greeke *ἀμβροσία*, quasi τὸ τῶν θεῶν βρώμα, *Deorum cibis*, the meate of the Gods: for so Gentilisme accounted of it, for the excellent fragrantcy it yeldeth, and that mortall men

did not make it their food, or because, as they supposed, it did make men that did eate thereof, to bee of so long life, that they might be held to be immortall. *Anguillara*, *Gesner* in hort. and *Camerarius* suppose it to bee *Conyza Hyppocratis*. *Lugdunensis* calleth it *Artemisia monoclonos*, but giveth two figures thereof, one with an upright stalke without any branches, and the other branched. *Gesner* likewise calleth it a kinde of *Artemisia*, and some doe take it to bee the second *Artemisia* of *Pliny*, but *Dodonaeus*, *Camerarius*, *Lobel*, and *Tabernaemontanus*, doe all call it

Ambrosia.

Ambrosia, or *sativa* & *agrestis*: *Bauhinus* calleth it *Ambrosia maritima*: in English Oake of *Cappadocia*.
The Vertues.

The properties referred by this ancient Writers to this hearbe are scarce answerable to so glorious a title; for *Dioscorides* saith onely, it hath a property to repell, stay and bind those humours, that fall into any part of the body, being annoynted or outwardly applyed, and so saith *Galen* also, and more is not said by any Autho thereof: onely *Pliny* in writing the words of *Dioscorides*, in stead of repell, hath set downe discussing, as mistaking the Greeke word, and mis-interpreting it.

CHAP. XXXII.

Botrys. Oke of Ierusalem.

WE have generally knowne but one sort of *Botrys*, which is a small low hearbe, but of late dayes there hath come to our knowledge, another sort more tall, and like unto a small shrubbe, because it is more woody.

1. *Botrys vulgaris*. Common Oke of Ierusalem.

The ordinary Oke of *Ierusalem* is a small bushy hearbe, full of branches, a foote and a halfe high, with some few, and not many leaves thereon, which at the first springing are reddish on the under side, and after grow to be of a yellowish Greene colour, especially when they grow old, and in the time of the flowering and seeding; which are much cut in on the edges, like unto *Grunsell* but larger: the toppes of the branches, and so downe to the halfe of their height, is fully stord with small pale yellow flowers like unto the blossomes of Vines, which turne into small brownish seed: the roote is long and hard when it hath given seed, perishing yearly: the whole plant is of a resinous sweet scent, and while it is Greene is somewhat clammy in handling.

2. *Botrys Americana*. Indian Oke of Ierusalem.

This *Botrys* or Oke of *Ierusalem* riseth up higher, and the branches are more woody and durable: the leaves are somewhat like unto wild *Arrache*, but larger, and much cut in on the edges, like unto the former, the whole plant, both flowers and seed, is most like unto the former: and doth most likely abide the Winter of his naturall warme Countries, which are nothing so violent as ours, but will not doe so with us, without much care to preserve it; but doth spring of the seed sowne, as well as spilt, at, or before the gathering: the scent whereof is somewhat strong, but not unpleasant, very neare unto the other.

The Place.

The first groweth in *Italy* and *Narbone* in *France*, in divers places, as well by the water sides, as in the dry sandy grounds. The second is naturall of *Mexico* & *Virginia*, from whence it hath bin brought.

The Time.

They both flower and seed in August and September, and doe often raise themselves, of their owne sowing, especially the former.

The Names.

It is called in Greeke *κορυς* and *Botrys* in Latine, *a floribus & seminibus in botrys formam ramulis insidentibus*, because the flowers, and so the seed also groweth like unto a bunch of Grapes. All Authors call it *Botrys*, yet *Eyselenus* calleth it *Artemisia Turcica*, and *Camerarius* saith that the Italians call it *Patientia*, *Cordus* upon *Dioscorides* calleth it *Ambrosia altera species*, and moreover saith, that in some Apothecaries shops in *Germany*, the seed thereof was taken for *Anomum*: *Dioscorides* saith, that in his time, the *Cappadocians* called it *Ambrosia*, and some others *Artemisia*. *Bauhinus* calleth it *Botrys Ambrosioides vulgaris*. And the other he calleth *Botrys Ambrosioides Mexicana*, and saith the seed was sent by the name of *Parote*: wee doe generally call it *Botrys fruticosa Americana*, as a distinction from the other: in English Shrubby Oke of *Ierusalem*.

The Vertues.

Dioscorides applieth it not to any other thing, then that it helpeth those that cannot take their breath, unlesse they hold their neckes upright, being taken in wine: but others have found out more especiall properties therein; for in that it both heateh and dryerh, attenuateh, cutterh, cleanseh, purgeth, openeth, and expectorateh rough flegme. It is very profitable for all the diseases of the chest or breast, troubled with flegme, whether it bee thin or rough, or rotten filthy corrupted matter to spit forth, as also for those that are short winded, or have the cough of the lungs, either the hearbe it selfe alone being boyled, and the decoction taken with Syrupe of Violets, or with Liquoris added into the decoction, and taken for divers dayes together. The Greene hearbe is of especiall good use in the paines of the mother, to be heard on a tyle, and moistned with Muscadine, and laid hot to the belly. As also, if you take Oke of *Ierusalem*, Featherfew, and Camomill flowers, and fry them together with some oyle of

1. *Botrys vulgaris*.
Common Oke of Ierusalem.

Lillies into a cake, and apply it warme to the belly, is an approved remedy for women in childbed, that feele any paines of the mother, after their delivery. The fumes of the decoction thereof also taken underneath, by sitting over it helpeth to bring downe the courses, and to expell the dead child. It is much used to be laid into Wardrobes or Presses, not onely to kill or drive away the mothes, but for the sweet scent to perfume the garments.

CHAP. XXXIII.

Artemisia. Mugwort.

Here are three or foure sorts of Mugwort to be here declared, besides a stranger lately come from *Virginia*, although *Pliny* and others doe reckon but two sorts, one with broader, and another with smaller leaves.

1. *Artemisia vulgaris*.
Common Mugwort.

1. *Artemisia vulgaris*. Common Mugwort.

The common Mugwort hath divers leaves lying upon the ground, very much divided or cut in deeply about the brims, somewhat like unto wormewood, but much larger, of a sad or darke Greene colour on the upper side, and very hoary white underneath: the stalkes (doe grow in some to be purplish, and then the flowers are deeper coloured) rise to bee foure or five foote high, whereon grow such like leaves as those below, but somewhat smaller, branching forth very much towards the toppe, whereon are set, very small pale yellowish flowers like buttons, which fall away, and after them come small seed, inclosed in small round heads; the roote is long and hard, with many small fibres growing from it, whereby it taketh strong hold in the ground, but both stalke and leafe doe die quite down every yeare, and the roote shooteth anew in the Spring: the whole plant is of a reisonable good scent, and is more easily propagated by the slips, then by the seed.

2. *Artemisia minor*. Small Mugwort.

This small Mugwort is somewhat like unto the former; having such like leaves, divided or cut in on both sides, Greene above, and whitish underneath, but much smaller than they: the stalke likewise (for oftentimes it hath but one) riseth not so high, nor is so great, but bearing the like flowers, yet paler: the scent whereof is also a like.

3. *Artemisia tenuifolia montana*. Fine Mountaine Mugwort.

The Mountaine Mugwort, is also not much unlike the former, having divers square brownish branches, not above a foot and a halfe high, whereon doe grow such like leaves almost, but longer, narrower, and much more crumpled, or finely jagged on the edges; the flowers are pale and small like the former: the roote is long and blacke, spreading in the ground.

4. *Artemisia Polyspermos*. Fruitfull Mugwort.

This kinde of Mugwort riseth up usuall but with one stalke, dividing it selfe from the bottome thereof into many branches, whereon are set some what sparsedly, somewhat longer and larger leaves than the small Mugwort, but more finely cut in on the edges, unto the middle ribbe, and ending in a longer point; the toppes of the branches, are more plentifully stored with flowers than the other sorts, which turne into small seed, bearing abundantly.

5. *Artemisia Virginiana*. Virginian Mugwort.

This Virginian being so lately come to our knowledge, that we can scarce give a perfect description thereof unto you riseth up, somewhat higher and larger spread, with much divided leaves like the first but greater, the flowers hath not beene yet thorowly observ'd.

The Place.

The first groweth plentifully in many places of this Land, as well as in others, by the way sides, as also by small water courses, and in divers other places. The second likewise is found in some of those places, but farre lesse frequent. The other three are strangers, and nursed up with us onely in gardens.

The Time.

They all flower and seed in the end of Summer.

The Names.

It is called in Greeke *ἀρτεμισία*, and *Artemisia* in Latine also, and recorded by *Pliny*, that it tooke the name of *Artemisia*, from *Artemisia* the wife of *Mausolus*, King of *Caria*; when as formerly it was called *Paribenis*, quasi *Virginialis* Maidenwort, and as *Apuleius* saith, was also called *Parthenium*: but others thinke it tooke the name from *Artemis*, who is called *Diana*, because it is chiefly applyed to womens diseases. The first is generally called of all Writers *Artemisia* & *vulgaris*, because it is the most common in all Countries. Some call it also *Mater herba-*

rum.

2. *Artemisia minor*. Small Mugwort.

3. *Artemisia tenuifolia montana*. Fine Mountain Mugwort.

4. *Artemisia Polypermos*. Fruitfull Mugwort.

4. *Artemisia Polypermos*. Fruitfull Mugwort.

rum. The second is called by *Matthiolus* and others *Artemisia minor*, and so doe we. The third is called by *Lugdunensis* *Artemisia leptophylla incana*, and in English Fine Mountaine Mugwort. The last is called by *Bauhinus* *Artemisia Polyphermos*, and the other by *Lugdunensis* *Artemisia Monoclonos quorundam alij Ambrosia*, in English Fruitfull Mugwort.

The Vertues.

Discozides saith, it heateb and extenuateb. It is with good successe put among other hearbes, that are boyled for women to sit over the hot decoction, to draw downe their courtes, to helpe the delivery of the birth, and to expell the secondine or afterbirth, as also for the obstructions and inflammations of the mother; it breaketh the stone, and causeth one to make water where it is stopped: the juyce thereof made up with Myrrhe, and put under as a pessary, worketh the same effect, and so doth the roote also, being made up with Axungia into an oymntment, it doth take away Wens and hard knots, and kernels that grow about the necke and throat, as also to ease the paines about the necke, but especially and with more effect, if some field Daifies be put with it. The hearbe it selfe being fresh, or the juyce thereof taken, is a speciall remedy, upon the overmuch taking of *Opium*: three drammes of the powder of the dried leaves taken in wine, is a speedy, and the best certaine helpe for the Scitica. A decoction thereof made with Camomill and Agrimony, and the place bathed therewith while it is warme, taketh away the paines of the sinewes, and the crampe. It is said of *Pliny*, that if a Traveller binde some of the hearbe about him, he shall feele no wearinesse at all in his journey; as also that no evil medicine or evil beast shall hurt him that hath this hearbe about him. Many such idle superstitious and irreligious relations are set downe, both by the ancient and later Writers concerning this and other plants, which to relate, were both unfeemly for me, and unprofitable for you. I will onely declare unto you, the idle conceit of some of our later dayes concerning this plant, and that is even of *Bauhinus*, who glorieth to be an eye witnesse of this foppery, that upon *Saint Johns* eye, there are coales to be found at mid-day, under the rootes of Mugwort, which after or before that time, are very small or none at all, and are used as an Amulet to hang about the necke of those that have the falling sicknesse, to cure them thereof. But Oh the weake and fraile nature of man! which I cannot but lament, that is more prone to beleave and relye upon such impossures, than upon the ordinances of God in his creatures, and trust in his providence.

CHAP. XXXIII.

Abrotanum. Sothernwood.

F Sothernwood (which is the *Abrotanum mas*, as the late and best experienced Authors doe hold; the *femina* to be the Lavender Cotton, which shall be set downe in the next Chapter,) there are many sorts, as they shall be declared in their order: of which number I have taken some from those hearbes going before, as also from Wormewood that shall follow, because I suppose they rather belong to this Tribe, than to any of the other, from whence I have taken them.

1. *Abrotanum mas vulgare*. Common Sothernwood.

1. *Abrotanum mas vulgare*. Common Sothernwood.

Our ordinary Sothernwood (which is the most common in gardens with us, and generally called Sothernwood: for the other sorts are called by other names, for the most part, and not acknowledge to be of this kinde) riseth up with many weake and woody branches bending downwards, if they be not held up, specially while they are small, for the elder stems are more strong and great, rising in time to bee higher than any man, from which doe grow out many small and long branches, whereon are set many small fine and short leaves, as fine as Fennell, but not so long, of a grayish or russet Greene colour, somewhat strong, but not unpleasant in smell, and of a strong and somewhat bitter taste: from the middle almost to the toppes of the upper sprigges, stand small round yellow flowers hanging like little buttons, which never open much, but passe away, and after them come the seed, which is smaller than that of Wormewood: the root groweth not very deepe, but is woody, with divers strings annexed unto it: this loseth all the leaves on the stalkes and branches every year, and shoot forth anew in the Spring.

3. *Abrotanum majus*. Great Sothernwood.

This great Sothernwood is altogether like the former, growing as high, or rather higher, and with leaves like thereunto, but somewhat larger and greener, of a strong resinous scent, not so pleasant, but drawing somewhat neare unto the smell of Camfire or Francumfence, the flowers and seed differ not from the other, nor the roote, which is woody and runneth under ground in the same manner.

3. *Abrotanum arborescens*. Tree Sothernwood.

This rare kinde of Sothernwood groweth upright, with one stem or stalke, to the height of a man, if the lower small sprigges bee pruned from it in the growing, and shooteth forth many branches on all sides, on which doe grow many leaves, very much cut in and divided, but are nothing so fine and

3. *Abrotanum arborescens*.
Tree Sothernwood.

4. *Abrotanum inodorum*.
Vnsfavory Sothernwood.

and small as the former, but yet a little quicker, and nearer resembling Wormewood, as it is also in the taste, and more aromaticall than Sothernwood: the flowers stand at the toppes of the branches, being more plentifull and larger than the former, but yellow like them, after which come the seed. which likewise is somewhat larger: the roote is woody, spreading many strings and fibres: the plant is more tender than the others, and will require some care to preserve it in the Winter more than they.

4. *Abrotanum inodorum*. Vnsfavory Sothernwood.

Vnsfavory Sothernwood springeth up with many slender, but woody whitish stalkes for the most part, leaning or lying upon the ground, yet sometimes standing somewhat upright, upon which at severall places, come forth many small whitish leaves, not so small or finely cut or divided as the common Sothernwood, but greater, of little or no smell at all, but of a hot taste, drawing rheume into the mouth, to bee spit forth: from among which spring forth small greenish purple branches, set with the like leaves, but smaller, and many small pendulous greenish purple heads, along the sprigges to the toppes, which when they open, shew out small pale purplish flowers; the roote is somewhat woody, and brancheth forth divers wayes, with many small strings or fibres.

5. *Abrotanum humile odoratum*. Small sweet Sothernwood.

This small Sothernwood shooteth forth many small woody branches, rising seldome above halfe a yard high, but very thickly spreading into other smaller sprigs, set full of small leaves, somewhat longer, greater, and greener than the last: the toppes of the stalkes are stored with many small round heads, which shew forth small yellow greenish flowers: the roote spreadeth like the other: the whole plant as well leaves as flowers, and the sprigges yeeld a very good scent and pleasant favour, more than the other, somewhat inclining to Wormewood.

6. *Abrotanum campestre*. Field Sothernwood.

The Field Sothernwood hath many small fine leaves, rising from the roote, very like unto the leaves of common Sothernwood, but of a darke Greene colour, and likewise many woody stalkes, about a foote high or more (yet sometimes but one) divided diversly, having such like leaves growing thereon, as are below: the slender sprigges are stored with plenty of small round Greene heads or buttons, which containe small yellowish flowers like Sothernwood, and plenty of small seed following them: the roote is long, thick, blacke, and woody, with divers fibres annexed therunto: the smell hereof is more neare unto Mugwort, than Sothernwood.

7. *Abrotanum campestre incanum*. Hoary Field Sothernwood.

This other Field Sothernwood, is in all things like the last described wild Sothernwood, but that the leaves are of a whitish or hoary colour, and of a sweet aromaticall scent and taste, and that the roote is of a darke reddish colour on the outside, with divers small fibres growing from it.

The Place.

The first is usually found in gardens but his originall is not set downe. The second groweth in Germany, and brought into their gardens. The third came out of the Levant into Italy, from whence it hath beene sent to divers other places, as well here, as to Germany, the Low-countries, &c. The fourth *Clusius* saith he found in Austria, Hungary,

5. *Abrotanum hamile odoratum*. Small sweet Sothernwood. 6. *Abrotanum campestre*. Field Sothernwood. 7. *Abrotanum campestre incanum*. Hoary field Sothernwood.

Hungaria, and other parts thereof. The fifth is onely found in the gardens of Herbarists that are curious. The sixth groweth in *Harcynia sylva Saxonothuringica*, as *Iohannes Thalius* setteth it downe. And the last about *Lintz* in *Austria*, from whence, *Bauhinus* in his *Prodromus* saith, it was brought to him.

The Time.

Most of them doe flower in *July* and *August*, yet some later, so that we seldome see them beare seed, especially the greatest.

The Names.

It is called in *Greece* *Abrotonon* δια το πρὸς ὅλῳ ἀβρὸν καὶ ἀπὸ τοῦ παλαιοῦ, ἀπὸ τοῦ ὅτι τὸ σπορὸν αὐτοῦ, hoc est quod conspectu tenerum mellis & delicatum appareat : aut quod gravem acremve & difficilem halitum spirat : in *Latine* after the *Greece* *Abrotonum*, but more usually *Abrotanum*. *Pliny* calleth this *mas Campestre*, and the *femina montanum*. The first is called generally by all Authors *Abrotanum mas*, and by *Cordus nigrum*, except *Dodoneus* in *French*, and *Anguillara* who call it *femina*, in *English* common *Sothernwood*. The second is called by *Camerarius* *Ambrotanum magnum camphoratum* quibusdam *Incesaria*, and by *Bauhinus* *Abrotanum mas angustifolium maximum* : in *English* *great Sothernwood*. The third is called by *Anguillara* *Absothium del Comasco*, and *Absothium arborescens* of *Lobel*, *Lugdunensis*, *Tabernmontanus*, and *Gerard* : but *Dodoneus* calleth it *Abrotanum femina arborescens*, and *Bauhinus* in his *Pinax*, *Abrotanum latifolium arborescens*, in *English* *Tree Sothernwood*. The fourth is called by *Dodoneus* *Absothium inodorum* & *inspidum* : by *Lobel*, *Lugdunensis*, and *Gerard*, *Abrotanum inodorum* : but *Clusius* calleth it his second *Arthemisia tenuifolia* : all these Authors doe give one and the same figure for this plant : *Dodoneus* for *Absothium*, *Lobel* and others for *Abrotanum*, and *Clusius* for *Arthemisia*. *Bauhinus* calleth it *Abrotanum latifolium inodorum* : in *English* *Ynfavory Sothernwood* ; for we have a *Wormewood* that is unfavory, differing from this, as shall be shewed you among the *Wormewoods*. The fifth is called by

Dodoneus

Dodonæus and *Lobel* *Abrotanum odoratum humile & dense fruticosum*: by *Tragus* *Abrotanum tertium*, and by *Bauhinus* *Abrotanum minus angustifolium minus*: in English Small sweet Sothernwood. The sixth is called by *Matthioli* in his later Edition *Ambrosia altera*; whom *Lacuna*, *Lonicerus*, *Castor* *Durantes*, *Lugdunensis* and *Camerarius* doe follow, and *Lobel* *Ambrosia tenuifolia*. *Gesner* calleth it *Ambrosia Leptophylla*, and *Clasius* *Arthemisia tercia tenuifolia*, it is *Tragus* his *Abrotanum sylvestre quartum*: and *Tabernmontanus*, *Gerard*, and *Bauhinus* *Abrotanum campestre*, in English Field Sothernwood. The last is called by *Bauhinus* *Abrotanum campestre incanum Carline odora*: in English Hoary field Sothernwood. The Arabians call it *Cathsam Kefum*, or *Gaiffum*: the Italians and Spaniards *Abrotano*: the French *Auranne & bois de S. Jean*: the Germanes *Stabwurtz*: the Dutch *Averonne*: and wee Sothernwood.

The Vertues.

Dioscorides saith, that the seed bruised, heated in warme water and drunke, helpeth those that are bursten, or are troubled with crampes, or convulsions of sinewes, with the Sciatica, and with the difficulty in making water, and to bring downe womens courtes: the same taken in wine, is an antidote or counterpoison against all deadly poison, and driveth away Serpents, and other venomous creatures, especially against Scorpions and poisonfull Spiders; as also by the smell of the hearbe being burnt, or laid in places where they come: the oyle thereof being annoynted on places convenient, especially the backe bone, before the fits of agues taketh them away: it is profitably laid to the eyes to take away the inflammation of them, if it be put with some part of a roasted Quince, and boyled with a few crummes of bread: boyled with barley meale, it taketh away pimples, pusties, or wheales, that rise in the face, or other parts of the body. The feed as well as the dried hearbe, is often given to kill the wormes in children: the hearbe bruised and laid to, helpeth to draw forth splinters, and thornes out of the flesh: The ashes thereof dryeth up and healeth old ulcers, that are without inflammation, although by the sharpnesse thereof it biteth sore, and putteth them to some paines, as also the fores that happen in the privie parts, of men or women. The ashes likewise mingled with old Sallet-oyle (for we have neither the oyle of the feed of the Maltick tree, which is much commended, nor the oyle of Cherua, or the great Spurge, called *Palma Christi*, nor some other that are used in other Countries) helpeth those that have their haire fallen, or their heads bald, to cause the haire to grow againe, either upon the head or beard: Some say the juyce thereof with oyle doth the same. *Durantes* saith that the oyle made of Sothernwood, and put among other oymtments, that are used against the French disease, is very effectuall, and likewise killeth vermine in the head. The distilled water of the hearbe is said to helpe them much, that are troubled with the stone, as also for the diseases of the spleene and mother. It is generally held by all both old and new Writers, that it is more offensive to the stomacke than Wormewood, because it hath not that astriction in it. The Germanes commend it for a singular wound hearbe, as their name of *Stabwurtz* given unto it doth testifie.

CHAP. XXXV.

Abrotanum femina. Lavender Cotton.

Here are divers sorts of Lavender Cotton, to be here remembered.

1. *Abrotanum femina vulgare*. Ordinary Lavender Cotton.

1. *Abrotanum femina vulgare*. Ordinary Lavender Cotton.

The ordinary Lavender Cotton hath sundry woody brittle hoary branches, whereon are set many long foure-square hoary or whitish leaves, dented about the edges: at the tops of the branches stand naked stalkes, bearing every one a large yellow head or flower, like unto Tanfie or Maudeline, but greater, of a gold yellow colour, abiding so a long time upon the stalkes, and being kept dry likewise: after which cometh small darke coloured seed: the roote is woody, and spreadeth sundry hard fibres: it is of a strong sweet scent, but not unpleasant.

2. *Abrotanum femina magnum*. Great Lavender Cotton.

This Lavender Cotton is very like the ordinary Garden kinde, but not bushing so thicke with stalkes, growing to have a great high and thicke stemme or stalke, not set with so many branches thereon, but somewhat bigger than the other, whereon grow foure-square dented leaves like thereunto, but somewhat larger, thicker and greener: the flowers stand in the same manner every one upon his long stalke, being as yellow and large as they, which give the like seed: the roote spreadeth in the ground with hard woody branches, like the other, and endureth the extremities of Winter as well as the other: the smell of the whole plant, and every part thereof is strong, but not so pleasant to a great many, as the other: this will be propagated by slipping, as well as the other.

3. *Abrotanum femina Narbonense magno flore*. French Lavender Cotton.

The French Lavender Cotton groweth not to bee so high as the ordinary garden kinde, but hath many woody short little branches, not above halfe a yard high, diversly spread into many other finall ones, whereon are leaves like the o-

cher,

3. *Abrotanum femina Narbonense magno flore.*
French Lavender Cotton.

ther, but somewhat smaller and more thinly or sparsely set on the branches, of a greenish white colour, neither so green as the last, nor fully so white as the ordinary, of a strong scent, somewhat like the ordinary kind. the flowers stand upon the toppes of the smaller sprigges, every one by it selfe, upon a bare or naked stalk, without leaves for a good space, which are of a paler yellow colour than they, and much larger, which give seed somewhat of a darker colour than it: the roote is as great and woody, and spreadeth much in the ground.

4. *Abrotanum femina Erice folijs.* Fine Lavender Cotton.

This Lavender Cotton groweth not so great or high, as the French kind, but hath many short woody branches, whereon doe sparsely grow smaller, shorter, and finer whitish Greene leaves, very like to the leaves of common Heath: the flowers are yellow standing in the like manner as the others doe: this hath a fine small scent to commend it, somewhat resinous, not very faintish or weak.

5. *Abrotanum femina folijs Rosmarini majus.* Rosmary leaved Lavender Cotton.

This kinde of Lavender cotton, shooteth forth from his woody roote, many slender hoary stalkes, little above a foote long, whereabout grow many very narrow small and flat leaves, like unto the leaves of Rosmary, which while they are young are more hoary white, and have but a small shew of denting about the edges: but when they are grown old, they are more Greene, and the denting about the edges is more apparant, of a sweet scent, and bitter taste: from these stalkes come forth divers short sprigges, with very few leaves on them, on the toppes whereof stand severall yellow flowers, like unto Lavender cotton, but much larger, which die downe to the stalkes every yeare, after it hath borne seed, as the other kindes doe.

6. *Abrotanum femina folijs Rosmarini minus.* Small Rosmary leaved Lavender cotton.

There is no difference betweene this and the last, in the leaves and flowers, but in the finalnesse thereof, being more slender, low and small in every part, which is not by reason of the place (as being more dry and barren) where it groweth, but growing in the same place, with the former, is smaller, and the seed being sowne, retaineth still the same forme it had, in the naturall place.

7. *Abrotanum femina viridis minor.* Small Greene Lavender cotton.

This small kinde of Lavender cotton is very like unto the last small kinde, but that it groweth somewhat greater and higher, having Greene and not hoary stalkes at all, as the leaves also are, and a little longer, being as bitter in taste as it, but not of so sweet a scent: the flowers stand in the same manner upon slender stalkes, and of the same fashion, but of a paler yellow colour: the roote is woody like it, and full of small fibres.

8. *Abrotanum femina repens.* Creeping Lavender cotton.

This creeping Lavender cotton also, is a small low hearbe, whose branches stand not upright, but lie downe, or as it were, crepe upon the ground, and are as white and hoary, or rather more than the ordinary, and so are the small dented leaves also, but they are somewhat thicker and fuller: the flowers likewise are yellow like therunto, but somewhat smaller; and the smell is not much unlike unto it also.

9. *Abrotanum peregrinum Lobely Cypressi folijs.* Strange Lavender cotton.

This strange plant I have here inserted among the rest of the Lavender cottons, presuming it to be his right place, although Lobel giveth it the name of Sothernwood, with the face of Cypress: but he maketh no mention of any flowers, whether they are answerable therunto, which might assure us of the truth, and put the rest out of all doubt: but as he setteth it downe, so doe I give it you here, the description thereof, untill I see the face thereof my selfe, to contrary or confirme the title. From a small roote riseth up many black hard slender stalkes, about a foote, or a foote and a halfe high, bearing many long, narrow, and flat leaves, interlaced or brayded like unto the leaves of the Cypress or Savine tree, and dented about the edges: the flowers as I said, he doth not expresse, nor can I give you any further knowledge hereof as yet.

The Place.

The first groweth in Germany. The second in divers places in Narbone in France. The third is not knowne to us, whence it is naturall. The fourth, fifth, and sixth, Clusius found about Salamanka in Spaine. The seventh is unknowne whence it is: and the last it is likely by the title whereby it was sent, came out of Egypt. Many of them grow in the gardens of those that are curious Conserverers of rare plants.

The Time.

They doe all, or most of them flower in July and August.

The Names.

There is some controversie among Writers concerning the true *Abrotanum femina* of Dioscorides, some holding that which others refuse and confute; but by Martholus, and the most judicious of the later Writers, this is taken to bee the true *Abrotanum femina* of Dioscorides, although Fuchsius and Dodonaeus doe deny it, unto whom also

Clusius

Clusius doth agree, saying that it cannot be that of *Dioscorides*, which hath as hee saith, divided leaves like unto Sea Wormewood, and yet setteth downe both it and the rest of that kinde, under the name of *Abrotanum femina*, which I thinke he would not doe, if he thought they had not some neare resemblance; but *Mutibolus* doth shew against *Fuchsius*, that the plant which he setteth forth for *Abrotanum femina*, is farre unlike it (being the *Abfintium Ponticum* of *Dodonæus* and others, whereof I shall speake in the next Chapter) and that although *Fuchsius* doth set forth the true *Abrotanum femina* of *Dioscorides*, yet it is under the name of *Chamæcyparissus*, not knowing it to be the right: *Dodonæus* also (whom *Gerard* followeth in translating his words, and his Corrector letteth them passe as current) contesteth that this *Lavender cotton* cannot bee *Dioscorides Abrotanum femina*; but would make his greatest and his smallest Sothern woods to be it: which as all may well observe, differ very little either in leaves or flowers, from the ordinary *mas*; and therefore I the more meruaile that hee should refuse this, for the flowers sake onely, seeing his *mas* and *femina* are to like in flowers: but *Dioscorides* in describing his *Abrotanum femina* saith, *floribus referta est, comantibus in summo fulgore auri*, which doth most lively expresse the flowers hereof, and cannot be referred to either of his Sothern woods, and therefore he setteth forth this plant, and the divers kindes thereof, under the name of *Santolina*, which he would referre to *Elaeagnus*, and *Stachys Cyma*, but how truly let others judge. The first is the *Abrotanum femina vulgare* by *Mutibolus* and divers others, and *Santolina* by *Anguillara*, as they call it in some places of *Italy*, and *Crespolina* by *Casalpino*, as they call it in other places of *Italy*. Some of the later Writers would make it to be the *Chamæcyparissus herba* of *Pliny*, which may well be doubted of, seeing he is so briefe therein, giving onely the bare name, and a few properties: the second is called by *Camerarius* *Abrotanum femina folijs magis viridibus*; whereunto *Clusius* seemeth to agree, making it his second *Abrotanum femina*, *Fabius Columna* maketh it to be an other sort of *Potium*, but not so hoary as our ordinary *Lavender cotton*, in English great *Lavender cotton*. The third is called by *Cordus* *Santonium majus*; by *Tabernmontanus* *Abfintium maritimum primum*: by *Pena* and *Lobel* it is taken to bee the true *Scriphtium* of *Dioscorides*, yet say it hath the face of *Abrotanum femina*. *Dodonæus* calleth it his first *Santolina*: it is *Clusius* his third *Abrotanum femina*, which he calleth *Narbonense*: *Columna* his *Poly altira species major*, and *Bauhinus* his *Abrotum femina flore majore*: in English French *Lavender cotton*. The fourth is *Dodonæus* his third *Santolina* and *Bauhinus* his *Abrotanum femina folijs crice*, and called by some *Inguentaria Lusetanorum*, *Bauhinus* judgeth it to be *Chamæcyparissus Dalechampi*, as it is set downe in *Lugdunensis*, but by the comparison of the description thereof, I finde that that *Chamæcyparissus* doth better agree with the second Spanish *Abrotanum femina* of *Clusius*, called *Salmanicensis secunda*, in his Spanish observations. The fifth is *Clusius* his fourth kinde of *Lavender cotton*, and the first of his Spanish kindes, and called by *Bauhinus* *Abrotanum femina folijs Rosmarini majus*: the sixth is the second Spanish *Abrotanum femina* of *Clusius*, which *Bauhinus* calleth *Abrotanum femina Rosmarini folijs minus*: the seventh is the third *Abrotanum femina Salmanicensis* of *Clusius*, called by *Bauhinus* *Abrotanum femina viridis*. The eighth is *Dodonæus* his fifth *Santolina*, which *Bauhinus* calleth *Abrotanum femina repens canescens*, in English *Creeping Lavender cotton*. The last *Pena* and *Lobel* in their *Adversaria* say, they received both the plant and seed from *Bolonia*, under the name of *Sabina Egyptia*, and referring it hereunto, call it *Abrotanum peregrinum Cupressi folijs*, which *Bauhinus* thinketh to bee *Dodonæus* his fourth *Santolina*: but there is some doubt thereof, as I said before in the description, for *Dodonæus* giveth flowers to his fourth *Santolina*, with the leaves of *Cipresse*: but *Bauhinus* maketh two sorts of this plant of *Lobel*, the one he calleth *Abrotanum femina folijs Cupressi*, and the other *Abrotanum Sabina folio*, and quoteth *Lobel* for both, when as *Lobel* doth acknowledge but one plant, although it be set downe in two severall places of the *Adversaria*, but not in his observations, as *Bauhinus* saith: *Gerard* his figure of *Chamæcyparissus*, which he calleth *Lavender cotton*, is utterly false, being the figure of *Muscus terrestris clavatus*, and his whole Chapter a mere transcript of *Dodonæus* in most things thereof. The Italians call it in some places *Santolina*, and *Crespolina* in others, as is before said; the Spaniards *Terva lombriqueria*: the French *Petit Cyprez*, and *Cyprez de jardin*, and *Guarde robbe*: the Germanes *Garten Cyprez*: the Dutch *Cyprez*, and we in English *Lavender cotton*.

The Vertues.

Dioscorides, and so all other Writers doe generally say, that the vertues hereof and of the former Sothernewood are alike, working the same effects, and applyed to all the diseases it is appropriate unto: but particularly it is observed by *Mutibolus*, that halfe a dramme of the powder of the dried leaves of *Lavender Cotton*, taken in a little of the distilled water of Fetherfew, every morning fasting, for ten dayes together at the least, and afterwards every other day, is a very profitable medicine for women troubled with the whites to stay them. *Pliny* saith that his *Chamæcyparissus* (which as I said before, is taken by some to be this *Lavender cotton*) is good against the poison of all venomous Serpents and Scorpions being taken in wine. The seed is generally in all our Country given to kill the wormes, either in children or elder persons, and accounted to be of as great force as Wormesseed: the leaves also are good when seed cannot be had, but are not of so great vertue. *Clusius* saith, that in *Spaine* they use the decoction of the Spanish kindes, to take away the itch and scabbes, in whomsoever have them, but he adviseth, there should be caution used in giving it.

CHAP. XXXVI.

Abfintium. Wormewood.

Although *Dioscorides* (and *Galen* also) make mention but of three sorts of Wormewood, the one a common sort, well knowne as he saith, the best growing in *Pontus* and *Cappadocia*. The other Sea Wormewood or *Scriphtium*, and the third *Santonium* of the Country beyond the *Alpes* in *France*, yet there hath since beene found out many hearbes, accounted to be kindes or sorts of them, for some likenesse of face, or vertues, or both, as shall be declared hereafter.

I. *Abfintium vulgare*. Common Wormewood.

Common Wormewood is well knowne to have many large whitish Greene leaves, somewhat more hoary underneath, much divided or cut into many parts, from among which rise up divers hard and woody hoary stalkes,

1. *Absothium vulgare*. Common Wormewood.T. 309 f.
ANS. 3. *Absothium Ponticum* sive *Romanum vulgare*.
Common Roman Wormewood.

two or three foote high, beset with the like leaves as grow below, but smaller, divided at the toppes into smaller branches, whereon grow many small buttons with pale yellow flowers in them, wherein afterward is contained small seed: the roore is hard and wooddie, with many strings thereat: the stalkes hereof dye downe every yeare; but the roote holdeth a tuft of greene leaves, all the winter shooting forth new againe, which are of a strong scent but not unpleasant, and of a very bitter taste. There is a Tree Wormewood like herunto, but growing greater and higher in the warme Countries.

2. *Absothium Ponticum verum*. True Roman Wormewood.

This Wormewood hath more slender and shorter stalkes, by a foote at the least than the former, and reasonable large leaves, yet smaller, and more finely cut in and divided then it, but as white and hoary both leaves and stalkes: the flowers also are of a pale yellow colour, standing upon the small branches in the same manner; so that, but that it is smaller in each part, it is altogether like it: the rootes likewise are smaller, lesse woody and fuller of fibres: the sinell thereof is somewhat aromaticall sweete, and the bitterneffe is not so loathsome to taste: Vnto this answereth the *Absothium Ponticum Creticum* of *Bauhins*, but that it is in his owne Country more sweet in scent, and little or nothing bitter in taste, but somewhat altereth in another soyle.

3. *Absothium Ponticum* sive *Romanum vulgare*. Common Romane Wormewood.

This is a small low hearbe (if I may call it a Wormewood) with much more slender & short stalkes than the last, whereon grow very smal and fine short hoary white leaves, smaller and finer than those of the fine Sothernwood, which grow at severall joynts, many coming forth together, at the tops of the stalkes grow small yellowish flowers, neither so many nor so great as the last: the roote from a short head shooteth forth many long fibres, whereby it is nourished in the ground, sending forth divers sprouts round about it, whereby it is much encreased: the smell hereof is faint, and farre weaker than the other, & the taste thereof much lesse bitter.

4. *Absothium tenuifolium Austriacum*. Five leaved Wormewood of Austria.

This small Wormewood, hath many small hard and stiffe hoary stalkes, whereon are set without order, small and somewhat long hoary leaves, very like unto the leaves of Sea Wormewood: which stalkes are divided towards the toppes, into many other small and slender branches rising from the joynts, where the leaves doe grow with many small heads, which shew forth many small whitish flowers.

5. *Absothium inodorum*. Vnsavory Wormewood.

The Vnsavory Wormewood is in leafe so like the first common Wormewood, both for the whitenesse, largenesse, and divisions thereof, that it cannot be knowne from it at all, unlesse you make your nose the judge of the scent, which in this is so small, that it is generally said to be without any at all: yet it hath in the heate of Summer, a small weake sinel, such as is found in some of the Sothernwoods: the flowers and all things else are alike: but this is somewhat more tender to be preserved in the Winter than the former.

6. *Absothium album* sive *Umbelliferum*. White tufted Wormewood.

This white Wormewood hath his roote composed of many small blacke fibres, which shooteth forth many heads, of long somewhat thick and broad hoary white leaves, cut in about the edges, in some places more than in others, narrower at the bottome, and broader at the point, made somewhat like unto the leaves of the great field Daisie, but smaller: from some of these heads doe shoot forth, slender hoary stalkes, about a foote and a halfe high, set here and there with such like leaves as grow below, but smaller: at the tops whereof stand many fealy silver white and greene heads, in a tuft together, out of which breake forth silver white small flowers,

4. *Abinthium tenuifolium Austriacum.*
Fine leaved Wormewood of Austria.

6. *Abinthium album sive Umbelliferum.*
White tufted Wormewood.

flowers, made of many leaves standing in a double row, in the middle tip with a little yellow (the whole tuft of flowers doth somewhat resemble the flowers of Yarrow: but much more pleasant to behold) which stand a great while in flower, and afterwards turne into small chaffy seed: this holdeth some heads on the leaves all the Winter, but are very small untill the Spring begin to come on, which then shoote forth, and become as large as is expressed before, having little or no smell at all, but exceeding bitter.

7. *Abinthium umbelliferum tenuifolium.*
White tufted Wormewood with fine leaves.

7. *Abinthium umbelliferum tenuifolium.* White tufted Wormewood with fine leaves.

This other white Wormewood, hath much smaller and finer cut leaves than the former, but as hoary white as the other: the stalkes are shorter, not rising so high: the umbell or tuft of flowers is somewhat smaller also, but as white, so that it differeth in nothing from the former, but in the smallness of the plant, and in the small and fine divisions of the leaves, neither hath it any more smell or lesse bitter taste. Bauhinus maketh two sorts more of this kind, when as himselfe saith in his *Prodromus*, that all the differences arise onely from the soyle and climate, which he hath observed both by sight of the divers plants, and examining of them.

8. *Abinthium album Vallesiacum.* The Vallesians white hearbe or Wormewood.

This white Wormewood hath many soft woolly and very white leaves, small, long, and narrow, made very like unto our Sea Wormewood, in so much that *Cemerarius in Horto*, taketh it to be the very same, but that it hath a sweeter scent, and not so ungratefull a taste: the flowers are yellow that grow towards the toppes of the stalkes, which afterwards give small seed like the other small kinds.

9. *Abinthium Alpinum incanum.* Hoary Mountaine Wormewood.

From a reddish fibrous roote ariseth divers small bending

stalks about a spanne high, set very sparsely, with very fine cut hoary leaves, like both for forme and colour to our ordinary Romane Wormewood: from the middle whereof upwards to the toppes, at the severell joynts with the leaves shoote forth slender stalkes, bearing at the ends of them scaly heads, out of which come pale coloured flowers, and after them small blacke seed, smelling like Tanfie, the whole plant smelleth and tasteth like Wormewood.

Bauhinus setteth forth another sort, which he calleth *Absointhium Alpinum candidum humile*, which should bee here inserted, but that I thinke it rather a species of the *Absointhium umbelliferum*, because hee saith it beareth heads like the *Senecio lutea*, or *citrina*, and therefore I forbore to recite it.

The Place.

The first groweth as plentifully in England, in many places wild, as in other Countries. The second is found upon divers high Mountaines, and not elsewhere wild, but is nursed up in many gardens, both in Italy and Germany, and with some lovers of rare plants with us. The third *Clusius* saith groweth plentifully in many places of Hungary and Austria, and in other places also, as other Writers doe set downe, it is much esteemed in our Country, and therefore found in many Country gardens of our Land. The fourth *Clusius* saith, he onely found in Austria, where women gather it and bring it to Vienna, for the use of the Apothecaries, or any else, promiscuously with the other Ponticke or Romane Wormewood. The fifth is not knowne whence his originall was, but is onely kept in gardens as a rarity, and variety among others. The sixth *Clusius* saith he first found, onely on the high cliffes of Austria and Stiria, and afterwards on the Mountaines. The seventh groweth on Mount Baldus, and on *Serva* one of the Belluni Mountaines. The eighth groweth on the hills, among the Valesians, as the last doth also.

The Time.

They doe all for the most part flower in August, yet some earlier, or later than others.

The Names.

Wormewood is called in Greeke *ἁλνθία*, quasi *ἀνάρη* impotabile ob amaritudinem, vel ingustabile, quia illud non tangunt animalia in depascendis herbis. *Dioscorides* calleth it also *ῥαδιμαχὸν* a profundo amaro. The first is generally called *Absointhium vulgare*, and of some *latifolium*, yet *Ruellius* calleth it *Ponticum*, and *Bauhinus* saith it is the *Ponticum sive Romanum officinarum*, meaning his owne Country: for I am sure it is not to be called by any of our Apothecaries in their shops. The second is scarce knowne to any in our Land, *Gesner in hortis* calleth it *Absointhium commune minus sive Alpinum*, *Camerarius* upon *Matthiolus* *Absointhium montanum*, and so doth *Tabermontanus* who calleth it also *Romanum*, *Bauhinus* calleth it *Absointhium Ponticum Montanum*, and *Gerard* *Absointhium tenuifolium Ponticum Galeni*. The third is more frequent as I said before, and usually called *Absointhium Ponticum*, or *Romanum*, of most Writers, judging it to bee the true *Absointhium* of *Pontus*, that *Dioscorides* and *Galen* doe commend: yet *Gesner* and *Lacuna* call it *Abrotanum femina*, and so doth *Fuchs*, for which as I said in the Chapter before, *Matthiolus* taxeth him of an error. *Tragus* calleth it *Abrotanum minus*, and *Cordus* upon *Dioscorides* *Abrotanum album*. *Ruellius* and *Casalpinus* take it to be *Absointhium Santonicum*: and *Lobel* and *Pena* in their *Adversaria* set it downe for the *Absointhium Gallatum Sardonium* of *Dioscorides*, in English every where almost, Romane Wormewood, or Cypresse. The fourth is called by *Clusius* *Absointhium tenuifolium Austriacum*, and by *Lobel* and *Lugdunensis* *Absointhium Ponticum Tridentinum herbariorum*, by *Dodonaeus* *Absointhium Seriphium*, but his figure is the same, with *Clusius* his *Austriacum*, *Lobel* his *Tridentinum*, and *Gerard* his *tenuifolium seu Romanum*, in English fine leaved Wormewood of Austria. The fifth *Gesner in hort.* and *Lobel* in his observations call *Absointhium inspidum*, and *Bauhinus* *Absointhium inspidum*, *Absointhio vulgari simile*, in English Vnsavory Wormewood. The sixth *Clusius* calleth *Absointhium Alpinum umbelliferum*, *Camerarius* *Absointhium Pannonicum flore albo*, and *Lobel* and others *Absointhium album*; in English white tufted Wormewood. The 7. is another kind hereof growing in other places, as *Bauhinus* hath well observed, and so setteth it downe in his *Prodromus*, for *Pona* setteth forth a 3. species in his Italian Booke, differing in nothing but the smalnes of leaves and flowers, *Lobel* calleth it *Umbelliferum alterum Italicum*. The 8. is called by *Gesner in hort.* *Absointhium Seriphium femina*, & in his Appendix *Absointhium album e Valesia*: for he saith in the said Country of Valesia it is called *herba alba*, *Weisskraut*: *Camerarius* saith it is called by some *Absointhium Santonicum*, & thinketh it may better be called *Santonium femina Valesiana*, than *Seriphium* as *Gesner* doth, *Bauhinus* calleth it *Absointhium Seriphium montanum candidum*. The last *Bauhinus* calleth *Absointhium Alpinum incanum*, and saith it is the *Alpinum 2.* of *Pona*, in his Italian *Baldus*, because *Pona* there saith it is very like that of *Gesner* & *Camerarius*, which is the last before this, but I cannot so thinke, for that of *Pona* is a species of the umbelliferous kinds. There is a controversy among many learned men and Writers, as you may here well perceive, by their names they give to the severall Wormewoods are extant: which should be the true *Absointhium Ponticum* that *Dioscorides* preferreth, and *Galen* so much commendeth and preferreth before all others, both for the good smell, and aromaticall taste, others being excessive bitter and lothsome, and that it hath lesser leaves and flowers, but especially for the striction it hath more than others, which is so effectually for the liver and stomacke. *Lobel* and *Pena* in their *Adversaria* have scanned the matter, and answered all objections as I thinke at large, the summe whereof in briefe I will here set downe for all to understand: First, for the kinds. *Dioscorides* and *Galen* make but one kinde of *Absointhium*, and not many, and but onely say, that the best in property groweth in *Pontus*, as they doe in divers other hearbes, shew in what place the most vigorous of that kinde doth grow, which property it obtaineth, more by the goodnesse of the place, injoying the commodity of a free and cleare ayre, and other things correspondent, then by the nature of the hearbe it selfe. Then for the scent, that it is more aromaticall than others, yet hereby they intimate that others are sweet, although not so much, which is well knowne likewise to be the benefit of the place where it groweth, for some hearbes are more or lesse sweet, or more or lesse stinking, which transplanted doe alter; as *Agrimony* and divers others are sweet in some place, and nothing at all in others. Then the leaves have troubled many learned men, for they thinke it is a fault in the transcribers, to set downe lesser for greater or longer, as it often hapneth in *Theophrastus*. But more often in *Dioscorides*, as in the Chapters of *Helenium Meum* and others, & may be also in *Galen*, not by his owne fault, but by the transcribers: but *Galen* himselfe in his Chapter of *Abrotanum* taketh away all these doubts, where he saith thus, there are three species or differences put under the name of one kinde of Wormewood, that which is called *Ponticum*, the second *Santonium*, and the third *Seriphium*: *Seriphium* and *Santonium* are enemies to the stomacke, and trouble it: Wormewood onely among them named *Ponticum*, that is growing in *Pontus*, is pleasing to the stomacke. From which place we may well gather that the strife is appeased, concerning this matter, that our

our common Wormewood is that Wormewood of *Discozides*, the best whereof as he saith, is that which groweth in *Pontus*, without naming either species or genus : so that it is for certaine that our common or Romane kinde, is not another from the *Ponticum* ; and by reason of the place is more vigorous and effectually, but not differing in property. *Galen* acknowledgeth that in this there is bitteresse, and an astringent gratefull to the stomacke, necessary for cholericke vomitings, and to cleanse it from obstructions, by which it giveth strength and comfort thereunto : which things we see by infinite and daily experiments, even of the common people, as well as of Physicians, to be effected by our common Wormewood, used either inwardly or outwardly : none findeth fault with the smell for it is of an aromaticall scent, and is very fit and apt to refresh the spirits of any : *Galen* in appointing that of *Pontus* to be used, doth it rather to exclude the *Santonium* and *Seriphium*, then that which he simply calleth *Absinthium* : Thus much I thought good to relate out of *Penn* and *Lobel*, referring the rest to the learned, to be further satisfied, if they please to read the whole tractate : but by this is said you see, that the vertues of our common Wormewood are so excellent, that we need not seeke for another kinde to performe those, that are commended in Wormewood ; and therefore I the more mervaile at our Apothecaries, that take the Sea Wormewood, in stead of the Romane or Ponticke, and use it rather than the common, onely because there is lesse bitteresse therein, than in the common, and therefore more pleasing to the taste, when as the properties are no way answerable. Neither can I commend the use of that fine leaved Wormewood, which is commonly called Romane Wormewood, to be used in stead of the Ponticke, not having either that bitteresse or that astringent, which are both so comfortable to the liver and stomacke. Our common Wormewood hath beene observed to grow in *Pontus*, and the Countries thereabouts, by *Belonius* in his travels, as he setteth it downe in his 76. Chapter of his first Booke of observations, and elsewhere, and brought to *Constantinople* for their use there. And it is generally held, that the Arabian Physicians did first name it Romane, which *Discozides* named Ponticke, and from them, all others since have held it in so great account, imagining it to be a sort differing from the common. The Arabians call it *Absinthium*, the Italians *Assenzo*, the Spaniards *Assentios*, the French *Alvine* and *Abfise*, or *Abfinthe* : the Germanes *Wermut*, the Dutch *Assen*, and wee Wormewood.

The Vertues.

Discozides saith that Wormewood is of an heating and binding property, that it purgeth chollier, that cleaveth to the stomacke or belly : that it provoketh urine, that it helpeth surfeits, and that taken with *Seseli* and *Spica Celtica*, it easeth the paines of the stomacke, and the hard swellings of the belly : the decoction or the infusion thereof taken, doth take away the loathing to meate, and helpeth those that have the yellow jaundise : (for which purpose *Camerarius* in his *hortus medicus*, giveth a good receite. Take saith hee of the flowers of Wormewood, Rosemary, and blacke thorne, of each alike quantity ; of Saffron halfe that quantity : all which being boyled in Renish-wine, let it be given after the body is prepared by purging, &c. A small draught thereof taken for some few dayes together, bringeth downe women : monethly couries : being taken with vinegar, it helpeth those that by Mushrooms, are almost strangled : being taken in wine it is a remedy against the poison of *Ixia* (which as I said before, is the roote of the blacke *Chameleon*, and with *Pliny* translated *viscum*, Mistletoe or Birdlime) of Hemlocke, the biting of that small beast or Mouse which we call a Shrew, and of the biting of that Sea fish called *Dracomarium*, which is called a Quaviver : it helpeth the Quinsie being annointed with it, and Niter mixed together : and taketh away wheales and pufhes used with water : it taketh away the black and blue markes in the skinne, that come after bruising or beating, if it be mingled with honey and annoynted ; as also it helpeth the dimnesse of the eyesight being used in the same manner : it helpeth sore and tunnning eares, as also easeth the paines of them, if the hot vapours of the decoction, bee taken in thereat by a funnell or other wise ; it easeth the toothach : a decoction made thereof with cutt or boyled wine, and annointed, easeth the paines of the eyes ; it helpeth the paines of the heart and liver, being beaten and mixed with the *Ceratium Cyprinum*, and applied to the place affected ; as also applied to the stomacke with Rosewater, it giveth much comfort to those that have lien long sicke : it helpeth those that are troubled with the swelling and hardnesse of the spleene, or those that have a hot sharpe water, running betweene the flesh and the skin, if it be used with figges, vinegar, and the meale of Darnell : The wine that is made thereof, called Wormewood wine, is available for all these purposes, restoring many to health that have beene troubled with those diseases ; so that they have no agues that take thereof. Being put into Chests, or Presses, or Wardrobes, it preserveth them from wormes and mothes, &c. and driveth away Gnats or Wasps, and such like, from any part of the body, if the skin be annoynted with the oyle thereof : the juyce is of like effect, but is not used so much in drinckes, for it troubleth the stomacke, and causeth headach ; being put into the Inke whetewith Bookes are written, (or printed) it keepeth them from being eaten with Mice. *Galen* in his sixth Booke of simples maketh mention of Wormewood in this manner. Wormewood hath a binding, a bitter, and sharpe quality ; it likewise heateth, cleanseth, strengthneth, and dryeth. It therefore purgeth downwards the choleticke humours of the belly, and avoideth them also by urine, especially those that are in the veines : but helpeth no flegme that is contained therein, or in the chests or lungs : for the astringent quality therein, is stronger than the bitter : but by reason of the sharpnesse it partaketh more of heat than of cold, so that the temperature thereof, is hot in the first degree, and dry in the third, yet the juyce is farre better than the hearbe it selfe : and speaking of Sea Wormewood called *Seriphium*, he saith it is like unto Wormewood both in kind and in taste : which qualities *Discozides* giveth to *Santonium* ; for of *Seriphium* he saith it is more agreeing to Sothernwood, than to Wormewood : whereby it is thought by divers, that the place in *Discozides*, or in *Galen*, is perverted by some Writers faults, for they cannot be so farre differing in judgement one from another : It is often used, and by most, either inwardly given, or outwardly applied for the wormes, in children or elder persons : *Pliny* saith, it healeth old sores or ulcers in the head, and cureth the itch also : the decoction thereof with Cumminseeds taken warme, easeth the paines of the belly and chellicke by winde : the seed thereof helpeth the bloody fluxe, and all other fluxes ; it is said, that if a few leaves of Wormewood be eaten, it defendeth one from surfeiting and drunkenesse. The vinegar wherein Wormewood is boyled, is especially good for a stinking breath, that cometh either from the gums or teeth, or from corruption in the stomacke. It is likewise much commended in tertian and other lingring agues, by opening obstructions and purging by urine, and by strengthening the liver and stomacke : The conserve thereof much used, preserveth them from the dropie that are fallen into it, or are in danger to fall thereinto, so as there be a fit course held before, by purging the offensive humours, and such other helps as the learned Physician may appoint. The

distilled water is somewhat effectually, but is much weaker to all the purposes aforesaid: yet the temples being bathed therewith, it helpeth the paines of the head that come of a cold cause, and dropped into the eyes helpeth to cleare the eyesight. The other Wormewoods, although they have some properties, yet by how much they want of the bitteresse and astringency, by so much weaker they are for the diseases aforesaid.

CHAP. XXXVII.

Abinthium Scripium sive marinum, & Santonicum. Sea Wormewood, and strange Wormewood.

Because I would not overburden one Chapter with too many sorts of Wormewoods, I thought it convenient to entreat of the Sea kindes, and other strange sorts, in a Chapter by themselves, which are as followeth.

1. *Abinthium Scripium sive marinum Anglicum.* English Sea Wormewood.

The English Sea Wormewood riseth up with many hoary round woody stalkes, three or foure foote high at the least, having thereon divers hoary white long and narrow leaves, broader and longer than any Sothernwood leaves, or the common Romane Wormewood, but nothing so large as the true Romane Wormewood, of a kind of saltish, but not bitter taste, and of a kinde of unpleasing favour: the flowers are small and yellow standing at the joynts with the leaves, towards the toppes of the branches, as the former common Wormewood doth, and give the like small seed: the roote groweth somewhat deepe and woody.

2. *Abinthium Scripium Narbonense.* French Sea Wormewood.

The French Sea Wormewood groweth not so high as the former, nor so white and hoary, the leaves are small long, and finely cut lik: them, but thicker, and of an evill coloured Greene colour, and strong unpleasing favour, and evill taste: the flowers are yellow, growing as the former doe, and the seed that follow in the small round heads alike.

3. *Abinthium Scripium Germanicum.* Germane Sea Wormewood.

This Germane Sea wormewood is also very like the last, but with fine hoary white leaves, somewhat finer or smaller, and groweth not so high: in other things there is little or no difference.

4. *Abinthium maritimum Lavendulae folio.* Lavender leaved Sea Wormewood. 4. *Abinthium maritimum Lavendulae folio.* Lavender leaved Sea Wormewood.

This Wormewood shooteth forth many slender weake woody and brittle stalkes, bending a little downewards, whereon doe grow divers hoary white long leaves, somewhat broader than Lavender leaves, having sometimes some cuts or divisions at the bottomes of them, which is but seldome scene, and in a very few of the lowest next to the ground: those that are set on the stalkes are smaller, and sometimes are cut or divided at the ends, of a reasonable weake scent, betweene Lavender and Sothernwood, but unpleasing taste: the flowers grow after the same manner that the common Wormewood doth, and of a yellow colour, and the seed is not unlike thereunto also.

5. *Abinthium Santonicum Egyptianum.* Egyptian Wormewood.

I must here remember also this plant (that is set forth by *Matthioli* first, and from him *Dodonaus*, *Lugdunensis*, *Tabernaemontanus*, *Gerard*, and *Bauhinnus*, doe all number it among the Wormewoods, as *Lobel* and *Pona* likewise doe, yet much doubt whether it be a Wormewood or no, for that they say they saw it growing with *Gesner* about a fingers height, and the dryed plant with *Falerandus Donrez*, was in shew like unto Maidenhaire, with white leaves set on both sides, of a middle stalke) rather to incite others to obtaine it, that it may bee better knowne, than that I have any knowledge thereof my selfe, whose description *Matthioli* who had it from *Cortusius*, setteth forth in this manner: it is (saith he) a small low hearbe, growing in *Egypt*, with small leaves, almost like unto Lavender cotton, and many slender short branches set full of leaves: the seed is small and bitter in taste, but not extreme: some saith he would make it an *Abrotanum mas*, but they might better, as he saith, call it a *famina*: Some also thought that the Wormeseed that cometh from the Levant to us, should be gathered from this plant, but as he saith, he is doubtfull thereof himselfe, yet withall saith, that it hath all the vertues that the Italian Wormewood hath.

6. *Abinthium Santonicum Alexandrinum sive Sementina & Semen Santum.* Wormeseed Wormewood, or Levant Wormewood.

This Wormewood likewise is a plant set full of branches, and with very few, and those very fine small leaves on them, at the bottome like unto the finer sorts, of an ash colour, but stored so plentifully with seed upwards, that it seemeth to be there without leaves, and wholly to consist of seed, which as *Raemolpius* saith, are somewhat bitter in the naturall places, and of a reasonable good and quicke scent with us, especially if they be fresh and not old,

5. *Abſinthium ſantonicum* Aegyptiacum.
Egyptian Wormewood.

6. *Abſinthium ſantonicum Alexandrinum* ſive *ſeucentina* &c.
Wormewood, or Levant Wormewood.

Abſinthij Scriphi ſive marini diverſa genera.
Diverſorts of Sea Wormewood.

old, but much ſtronger, as it ſhould ſeeme by his relation that taſted it, where it grew and moved one to caſt very forcibly.

The Place.

The firſt groweth neare our Sea Coaſts in many places of our Land, as alſo of the Low-countries: the ſecond neare the Sea at *Alarſelles*, and by *Venice* alſo: the third in *Mifnia* in *Germany*: the fourth about the Coaſts of the Venetian Gulph, and in the Iland of *Sio* likewiſe: the fifth is ſaid to grow in *Egypt*, but *Penn* and *Lobel* doubt thereof: the laſt groweth in *Syria* and *Arabia*, from whence being brought into divers Chriſtian Countries, it hath there ſometimes growne, and there from the figure taken and ſet forth. *Rauwolfius* as it is ſet downe in the Appendix to *Lyedunensis* ſaith, hee ſaw it growing about *Bethlehem*, in the Land of *Jury*.

The Time.

Theſe all flower and ſeed when the former ſorts doe, ſaving the two laſt, which coming out of warme Countries are later than the reſt with us.

The Names.

The names of *ſcriphi* & *ſantonicum* *Scriphium* & *Santonicum* are confounded by many Authors; for the firſt is called *Abſinthium Scriphium*, or *marinum* by the beſt Authors, who call it either *Belgicum*, or *Anglicum*, yet *Camerarius* in *horto* calleth it *Abſinthium Santonicum*: the ſecond is called by *Dodoneus* and *Cluſius* *Abſinthium Scriphium Narbonenſe*, but *Lobel* his *Abſinthium Xantonicum* in my judgement is the ſame, although *Bauhinius* make them different, calling the one *Abſinthium Scriphium Gallicum*, as hee doth the other *Abſinthium Santonicum Gallicum*: the third *Cluſius* ſaith hee ſaw in the garden of *Nicholtzius* in *Vienna*, being ſent him from *Mifnia*, and thereupon he calleth it *Abſinthium marinum Miſnenſe*, and *Bauhinius* *Abſinthium Scriphium Germanicum*, and ſaith it is

the *Absinthium Serpygium* of Gesner in *hortis*: the fourth is called by *Lobel*, *Tabernmontanus*, and *Gerard*, *Artemisia marina*, by *Clusius* *Artemisia folio Lavendule*, by *Dodoneus* *Absinthium angustifolium*, but *Camerarius* wondering why he should so doe, calleth it *Absinthium latifolium marinum*, and by others *Absinthium Serpygium & marinum*, *Camerarius* thinketh it is *Matthiolum* his *Absinthium marinum*, but surely his figure doth much differ from it: the fifth is called by *Matthiolum* and *Lugdunensis*, *Absinthium Serpygium Egyptium*, by *Dodoneus* and others *Absinthium Egyptium*, by *Lobel* *Absinthium aliud sive peregrinum Egyptium*, and by *Bauhinus* *Absinthium Santonicum Egyptiacum*: the last is called by *Anguilara* *Abrotanum mas*, not knowing that Wormefeed was gathered from it, by *Matthiolum Sementina*, (as the Italians call it, and the French *Barbotim*) and so doe *Dodoneus*, and *Tabernmontanus*, and *Semen Sanctum* by him, *Lobel*, *Lugdunensis*, and others, *Scheha Arabum* by *Rauwolfius* and *Lugdunensis* in *Apendice*, *Santonicum* by *Lonicerus*, *Semen Zedoarie* by *Lobel*, and *Absinthium Serpygium Alexandrinum* and *Zine semen* by *Cordeus* upon *Dioscorides*, and in his *History of plants* also, by *Bauhinus* *Absinthium Santonicum Alexandrinum & Iudicum*, for they are both but one plant, although he setteth them downe for two: by divers others *Semen Lumbricorum & ad Lumbricos*, whose seed is generally called Wormefeed, and therefore I have called the plant rather Worme-feed Wormewood, than Holy Wormewood, not thinking any more holinesse in this than in others.

The *Vernes*.

The Sea Wormewoods are of nothing that goodnesse in quality as the common and aromaticall bitter sorts are: they are as *Dioscorides* and *Galen* say, aduerse and hurtfull to the stomack: yet because it hath not that bitternesse therein as the common sort, it is more accepted and used by many; that rather desire to please their palate, than to be cured of their diseases by bitter medicines, our Physicians and Apothecaries feeding this humour for their owne profit, and to please their patients. The Wormefeed is chiefly, and as I may almost say, onely spent for the wormes in children, and to smaller effect if elder persons take it.

CHAP. XXXVIII.

Chamedrys. Germander.

E Might have joyned both *Chamedrys* and *Tenacium* in one Chapter, because divers Authors both ancient and moderne have not distinguished them, some naming that *Chamedrys* which others call *Tenacium*, and contrarily some call that *Tenacium* that others call *Chamedrys*: yet I think it fit to sever them into two Chapters, and speake of them both true and false, as they are now generally received.

1. *Chamedrys vulgaris*.
The common Germander.

Maximus

1. *Chamedrys vulgaris*. The common Germander.

Common Germander shooteth forth sundry stalkes with small and somewhat round leaves, ended about the edges, the flowers stand at the toppes of a deeper purple colour than the next, the roote is composed of divers spriggs, which shoote forth a great way round about, quickly overspreading a ground.

2. *Chamedrys major*. Great Germander.

The great Germander riseth up with bigger and harder square stalkes, halfe a yard high, spreading into divers branches from the very bottome, whereon are set two leaves at a joynt, somewhat larger than in the ordinary, and more dented about the edges, greene above, and somewhat grayish underneath: the flowers doe stand in a longer spiky head, and are larger, but of a paler purple, and gaping like the other: the roote is more bushing with threads, and creepeth lesse than the other. *Prosper Alpinus* saith in his Booke of Egyptian plants, that in *Corcyra*, hee saw a Germander almost two cubits high, with leaves twice or thrice as bigge as any that grew in *Italy*.

3. *Chamedrys Apula unicanlis*. Germander of Naples.

The Germander of Naples never riseth up with more than one whitish square stalkes, about a foote high, at each joynt whereof grow two long and narrow hairy thicke leaves, dented about the edges, round at the ends, and of a whitish greene colour: the flowers grow at the toppe in a long spike with smaller and rounder leaves set with them, and are hooded as the former are, with whitish beards, and a long yellowish point in the middle, but standing in prickly huskes: the seed is small, long, and round headed, yet greater than the proportion of the plant would seeme to give.

4. *Chamedrys laciniatis folys*. Jagged Germander, or with fine cut leaves.

This fine Germander riseth up usually but with one weake slender square stalkes, divided into other smaller branches, rising not above a foote high, whereon doe grow divers leaves, two alwayes set together at a joynt, on each side of the stalkes, which are very much cut in on both sides, making no shew of the forme of any Germander leafe, unless one

one heed it very well : from the middle to the tops of the stalkes, at the joynts with the leaves, come forth purplish flowers like the former, after which follow small blackish seed : the roote is small and fibrous, and dyeth every yeare after it hath given seed, but will come oftentimes of it owne sowing and shedding.

5. *Chamedrys spinosa Cretica*. Thorney Germander of Candy.

This Thorney Germander is a small low plant, having many square hairy and hoary stalkes, not above a cubite high, full of joynts, whereat grow forth divers somewhat round and long leaves, dented about the edges, in the lower much more than in the upper, which seeme to be without any denting at all : at each joynt with the leaves stand forth most usually two thornes, and sometimes more, which are in some small and short, in others bigger and larger, and sometimes shooting forth from those joynts small branches, which end also in a thorne : from the middle of the stalkes upwards, come forth the flowers at the joynts among the leaves, standing in small hairy and hoary huskes, very like for forme unto the flowers of Germander, but of a yellowish red or brownish colour : after the flowers are past the seed groweth in those huskes, which is blacke and round.

6. *Chamedrys spuria montana Cisti flore*. Mountaine Germander.

The Mountaine Germander riseth up with many weake and slender brownish woody stalkes, about a foote high ; whereon are set without any order as in the former, many small leaves dented about the edges, very like the leaves of the common Germander, but somewhat smaller, Greene on the upper side, and gray or hoary underneath : at the end of every stalke of leaves, there shooteth forth a long slender and hairy foote-stalke, without any leafe thereon : on the toppe whereof standeth one large white flower, consisting for the most part of sixe leaves, yet sometimes it will have eight or ten, according as nature listeth, and the fertility of the soyle is ready to produce, with many small threads in the middle : after the flowers are shed, there come up in their places large tufts or bushes, of long hairy feed, like unto those of mountaine *Avens*, but greater : the roote is hard and woody, shooting long strings and fibres under ground, and divers strings likewise above the ground, which take roote as they lye, the stalkes that bore seed dying downe to the ground every yeare, and the roote renewing then againe in the Spring : it hath little scent to be perceived therein, but of an astrigent or drying taste.

7. *Chamedrys Alpina saxatilis*. Rocks Germander.

From a hard knobbed roote shooting forth many blackish fibres, spring up divers round stalkes, about a foote high, not branching forth at all ; whereon grow two thicke leaves together, in order up to the toppe, the lower being larger than those above, somewhat dented about the edges, but not so much as those of Germander, of a shining Greene colour on the upper side, and yet covered as it were with a little hoariness or downe, but very grayish, almost white underneath : the toppes of the stalkes end in a long spiky head of flowers, with leaves among them, every one consisting of foure or five, and sometimes of sixe or seven small pointed leaves, of a pale blue colour, with some threads in the middle : after which come small round blackish seed in small huskes : this loseth not his Greene leaves or stalkes in Winter, but being of small or no scent at all, but of an austere and harsh taste.

8. *Chamedrys spuria major frutescens*. The greater bastard Germander.

This Bastard Germander (for so I esteeme all of them, rather than true Germanders, which have not hooded and gaping flowers, as the true Germander hath, but consisting of foure or five, or more leaves as these doe, however their leaves bee like to make them beare the names of Germander) hath many square and somewhat hairy stalkes rising from the roote, beset with two large leaves at a joynt, somewhat like unto Germander leaves, but larger, and deeper dented in at the edges ; towards the toppes branching forth into spiky heads of blue flowers, consisting of foure leaves apeece, whereof the uppermost is the largest, with some

4. *Chamedrys lacinialis folijs*. Jagged Germander, or with fine cut leaves.

5. *Chamedrys spinosa Cretica*. Thorny Germander of Candy.

stripes

stripes or veins therein, and two small threads and a long pointell in the middle : after which arise small flat two forked huskes, containing small seed : the roote creepeth a little under ground, sending forth here and there some stalkes ; but the stalkes also as they lye on the ground, will take roote and shoote forth fibres : the taste of the leaves are bitter.

6. *Chamedrys spuria montana* Ciffi flore.
Mountain Germaner.

7. *Chamedrys alpina saxatilis*.
Rocke Germaner.

8. *Chamedrys spuria major frutescens*.
The greater ballard Germaner.

9. *Chamedrys spuria minor latifolia*.
The smaller ballard Germaner.

Clusus giveth two other sorts of this kinde, one as tall, but creeping and shooting forth branches abundantly; *Species* whose leaves are smaller, and the flowers paler: the other somewhat lower, having narrower and larger leaves, *alio die* but not differing in any thing else.

9. *Chamedrys spuria minor latifolia*. The smaller bastard Germander.

This smaller bastard kinde hath many weeke purplish, or brownish branches, lying rather on the ground, than standing upright, and not above a foote high, whereon are set two leaves at a joynt as in the rest, very like unto Germander leaves, and dented about the edges also, but somewhat lesser: the toppes of the stalkes are likewise branched forth into spiky heads of flowers, consisting of foure leaves, whereof the uppermost also is the longest, of a more excellent deepe blue than in the other, yet sometimes it is found with flowers of a paler blue, or almost of an ash-colour, and in some pure white: the seed following the flowers is small and reddish, growing in a small huske: the roote is bushy and spreading under ground as well as above, like the other, and abideth like it, shooting forth new stalkes every year: the taste hereof is a little bitter like the other, but more astrigent.

10. *Chamedrys spuria minima*. The least bastard Germander.

This little bastard Germander (for the manner of the growing, and height of the plant is very like unto the small Gentian of the Spring, set forth in the Chapter of Gentian or Felworts in my other Booke) hath two or three small short stalkes rising from the roote, not above two or three inches high, whereon doe grow two small dented leaves together, as in the former, but much smaller, rounder, and thicker, and standing so close one joynt unto another, that they can hardly be discerned to grow severally, but all together: from the toppes whereof shoote forth naked short foot-stalkes, every one sustaining betwene two small leaves, one large flower in comparison of the plant, made of foure leaves like the other, of a pale blue or ash-colour: after which come flat and larger huskes than in the other, containing such like small seed: the roote is of many fibres shooting forth here and there some other plants.

11. *Chamedrys spuria sylvestris*. Common Wild Germander.

The common wilde Germander that groweth every where in the Medowes, sendeth forth divers square up-right stalkes, yet sometimes a little bending, having two leaves set at each joynt, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller up higher, the tops of the stalkes are spiked with divers blue flowers set about them, made of 4. final round leaves apeece, with a little white eye in the middle, small pointed, and some threads also, after which come small flat pouches, containing small seed: the roote in small and thready.

12. *Chamedrys spuria minor angustifolia*. Narrow leaved wild Germander.

This small Germander hath divers round reddish stalkes, somewhat rough, hard, and hairy, an hand breadth high bending downwards, whose lower leaves are somewhat long and broad, round at the ends, and not dented at all about the edges: but those that grow up higher upon the stalkes, are shorter and narrower pointed also at the ends, and snipe about the edges: the flowers grow spike fashion, being either of a pale blue colour or bluish, made of foure leaves like the other, and so are both heads and feeds: the roote is blackish, hard and stringy.

13. *Chamedrys Auftriaca laciniata*. Jagged base Germander of Austria.

The leaves of this jagged Germander that grow upon the round rough stalkes, are hard and somewhat hairy, divided into many small long pieces, the flowers are blue standing in a long spike, as many other of the former doe, and round biforked heads, after them with very small seed in them.

14. *Chamedrys Hispanica folijs tenuissime divisjs*. Wilde Spanish Germander with fine cut leaves.

The round stalk hereof is more slender than the last and hairy, set with many joynts, and shorter and narrower leaves thereat, full of small leaves at the toppe, where it breaketh forth into two small foot-stalkes, whereon stand the small flowers, with each a small long pointell in the middle.

The Place.

The greater Germander is found in many Countries, as well as in the upper Germany, as *Clusus* saith, and the lesser in the lower, as *Lobel* saith, they are onely found in gardens with us. The third groweth in the fields of Naples. The fourth groweth in Saxony, as *Iohannes Thalius* saith, and is onely preserved with those that are curious conferrers of rare simples. The fifth we have often had among other seeds out of Italy and Spaine from *Boelius*, and did grow in Cardinall *Bembus* his garden, as *Bauhinus* saith. The sixth *Clusus* saith he found on the highest toppes of the Alpes in Austria and Styria, and *Camerarius* saith it is found plentifully on the Hills, both in Savoy and Switzerland, and in Dauphine in France, as *Lobel* saith. The seventh *Pona* setteth downe in the description of *Mons Baldus* that he found there. The eighth and the two lesser kindes thereof, *Clusus* saith he found in Hungary, Austria, Bohemia, and other places thereabouts. The ninth *Clusus* also saith hee found in the lower Austria, about Vienna and Newstadt. The tenth *Clusus* also saith he found in the toppe of the snowy Mountaine in Austria called *Sneberge*. The eleventh as I said, in every Medow thorowout the Land almost, as also by ditches and hedges sides: The twelfth in the Medowes by Bassill: The thirteenth in Austria, and the last in Spaine.

The Time.

These doe all flower in June or July at the furthest, except the Thorney Germander, and the Spanish and Candy kindes, which come later.

The Names.

Germander is called in Greeke *χαμαίδρυς*. *Chamedrys*, quasi *humilis* aut *parva quercus, a foliorum similitudine*, and *χαμαίδρυς*. *Chamedrops* as *Discorides* saith, in Latine *Trixago* & *Trissago*, and *Quercula minor*, and of some *Tenurium*. The first and second are generally called of most Writers *Chamedrys*, and of some *mas*; and of some as I said *Trixago*, and *Trissago* major or minor, *repens* is added according to the kinde, and of some *Serratula minor*, and of some also as *Matthiolus* saith, *herba Februm*, and *Febrifuga*, from the effects. The third is called by *Columna Trixago* *Apula unicanlis*, & forte *Verberna recta* *Discoridis*, and by *Bauhinus unicanlis*. The fourth is called by *Matthiolus Chamedrys altera*, and so doe *Durantes*, *Lugdunensis*, and *Camerarius*, who accounteth it an error in them that would make it a *Chamapitys*, as if it smelt like *Roslin*. *Fuchsius* and others *Chamedrys famina*. *Tragus* calleth it *Chamapitys agrestis*, and first also tooke it to be *Chamapitys altera* *Discoridis*, whom *Dodonaeus* and *Clusus* follow, for he calleth it *Chamapitys multifidis folijs*, and also *Ajuga*, and *Tabernmontanus* *tuamofchata*. *Lobel* calleth it *Chamedrys laciniatis folijs*, and by that name it hath continually beene sent to us. *Bauhinus* calleth it *Borrys Chamedrysoides*.

dryoides. The fifth Bauhinus hath onely set forth and given it the name in the title. The sixth is called by *Clusius* *Chamedrys montana*, and so doe *Lugdunensis* and *Tabermontanus*, who saith it is also called *Argentina Monsfeliaca*, *Chamedrys Alpina* by *Camerarius*, who saith some called it *Hirtzwortz*, and thereupon *Gesner* called it *Cervaria* & *herba Cervi quibusdam*. *Lobel* calleth it *Chamedrys montana frutescens durior*. *Lugdunensis* saith, some call it *Lenca* of *Discorides*. *Bauhinus* calleth it *Chamedrys Alpina Cisti flore*. The seventh is called by *Pena* in the description of *Mons Baldus* *Veronica petraea semper virens*: *Bauhinus* saith it is *Clusius* his sixth *Teucrium pumilum* in his History of plants, and calleth it himselfe *Chamedrys Alpina saxatilis*. The eighth is called by *Clusius* *Teucrium majus Pannonicum*, in his Pannonick observations, and maketh it the fourth *Teucrium* in his History. *Bauhinus* calleth it *Chamedrys spuria major altera frutescens*. The ninth is *Clusius* his fifth *Teucrium* in his History of plants, or *Teucrium Pannonicum minus*, which *Bauhinus* calleth *Chamedrys spuria minor latifolia*. The tenth *Clusius* calleth *Teucrium minimum*, and *Bauhinus* *Chamedrys Alpina minima hirsuta*. The eleventh is called *Chamedrys vulgaris femina*, by *Fuchsius*, *Turner*, *Lonicerus*, and *Lugdunensis*, *Pseudochamedrys* by *Thalies*, *Teucrium pratense* by *Lobel*, and by *Clusius*; and commonly with us *Chamedrys sylvestris*: the twelfth is called by *Bauhinus* *Chamedrys spuria minor angustifolia*, who taketh it to be the third sort of the fourth kinde of *Clusius* his *Teucrium*. The thirteenth and the last are remembered onely by *Bauhinus*. There is some controversie among our latter writers, what hearbe should be the true *Chamedry* and *Teucrium* of *Discorides*, *Galen* and other ancient writers: for *Dodonaeus* by comparing both the Texts, saith that our common *Chamedrys* doth more properly belong to the descriptions of *Discorides* and *Plinius* *Teucrium*, and so contrarily *Teucrium* unto *Chamedrys*, for *Discorides* setteth them downe in this manner, *Xaphis* *herba* *fruticosa* *et* *arbuscula*, id est *Chamedrys exigua est frutex dodrantalis*, that is, *Germander* is a small shrubbe of a span height, and of the other he saith, *Teucrium herba fruticosa* *et* *arbuscula*, *Teucrium herba est virgata, sive virgulas plures ferens*. *Teucrium* is an hearb bearing many stalkes, and hereby he saith it is evedent, our common *Germander* is not a shrub, which doth raise it selfe up as *Teucrium* doth; and besides that, *Pliny* in describing *Teucrium* saith, it spreadeth branches like rushes, which doth more fitly agree to our common *Germander*, thereby transferring the *Chamedrys* to be the taller shrub, and *Teucrium* the lesser and lower: yet as he saith, seeing *Discorides* himselfe saith, that in his time they were transferred, for the likenesse of their leaves, one unto another, it is not absurd to call them as they are usually entituled: but as I shall shew you in the next Chapter, the *Teucrium* of *Discorides* is better to bee explained than *Dodonaeus* doth. It seemeth also that *Dodonaeus* having bene in an error in his former worke concerning *Hierobotane mas* & *femina*, giving the figures of the *Chamedrys sylvestris* thereunto, reclaimed himselfe in his later History or *Pemptades*, and left them both out, as not allowing of his former opinion. The Arabians call it *Damedrios* *Chamedrios* and *Kemadrius*: the Italians *Chamedrio* and *Quercivola*, and some *Calamandrina*: the Spaniards *Chamedrios*: the French *Germandree*: the Germanes *Gamanderle* and *Bathengel*: the Dutch *Gamandree*, and we in English *Germander*.

The Vertues.

Germander is hot and dry in the third degree, and is more sharpe and bitter than *Teucrium*, and as *Discorides* saith, is a remedy for coughes taken with honey, for those whose spleene is become hard, for those that can hardly make their water, and helpeth those that are falling into a dropsie, in the beginning of the disease, especially if a decoction be made thereof, when it is Greene and drunke. It doth likewise bring downe the termes, helpe to expell the dead child, and taken with vineger doth waste or consume the spleene: it is most effectuell against the poison of all Serpents, both drunke in wine and laid to the place: used with honey it cleanseth old and foule ulcers; and taketh away the dimnesse and moistnes of the eyes, being made into an oyle and annoynted. It is likewise good for the paines in the sides, and for crampes. The decoction thereof taken for some dayes together, driveth away, and cureth both quartane and tertian agues. The Tuscans, as *Matthiolus* saith, doe highly esteeme thereof, and by their experience have found it, as effectuell against the plague or pestilence, as *Scordium* or water *Germander*. It is also as he saith good against all the diseases of the braine, as the continual paines of the head, the falling sicknesse, melancholicke fullennesse, the drowisie evill, those that are sottish through the dulnesse of the spirits, and for crampes convulsions, and pallsies: a dramme of the seed taken in powder, doth purge chollier by urine, and is thereby good for the yellow jaundise: the juyce of the leaves dropped into the eares, killeth the wormes in them: It is also given to kill the wormes in the belly: which a few toppes of them when they are in flower, laid to steepe a day and a night in a draught of white wine, and drunke in the morning will doe also. *Theophrastus* in setting downe the properties of *Germander* saith, that the one part of the roote purgeth upwards, and the other part downewards; whereof there is more wonder than for *Thapsia* and *Ischias*, that is blistering Fennell, and tuberos or knobbed Spurge to doe so: *Andreas Vesalius*, pag. 49. speaking of the China roote saith, that if a decoction hereof bee made in wine, and taken for 60. dayes continually foure houres before meate, it is a certaine remedy for the gowt. *Durantes* giveth the receipt of a Syrupe very effectuell for the spleene in this manner. Take saith he, *Germander Chamepitys* or Ground Pine, Ceterach or Milt waste, and Madder, of each one handfull: the barke of the roote of Capers, the rootes of Smallage, Elecampane, Orris, or Flagg Flower-de-luce and Liquorice, of each halfe an ounce. Of the leaves and barke of Tamariske, and of Cyperus, of each three drammes, of the seed of Anise, Fennell and Smallage, of each one dramme, of Raisins stoned one ounce. Let all these be boyled according to art, in a sufficient quantity of Posset, (that is of vineger and water equall parts.) Vnto each pound of this decoction being strained, put sixe ounces of Sugar, and three ounces of Cinamon water, which being made into a cleare Syrupe, take foure ounces every morning fasting. The decoction thereof is good to stay the whites in women, if they fit therein while it is warme, and likewise easeth the passions of the mother: being boyled in vineger and applied to the stomacke with a little leaven, stayeth vomitings, that rise not from cholliericke or hot causes: the leaves hereof and the seed of *Nigella* quilted in a Cap, stayeth the catarrhe or distillation of raw cold and thinne rheumes: being boyled in lye with some Lupines or flat beanes, and the head washed therewith taketh away the dandriffe or scurfie thereof. The mountaine *Germander* is used by those of the Alpes, where it groweth; to stay all manner of fluxes, whether of the belly, or of the blood, the feminine courses, and the bloody fluxe, as also to stay vomitings.

CHAP. XXXIX.

Teucrium. Tree Germander:

It remaineth that I shew you in this Chapter the rest of the Germanders called *Teucria* Tree Germanders to distinguish them from the former sorts, whether they be true or false.

1. *Teucrium majus vulgare*.
The more common Tree Germander.

1. *Teucrium majus vulgare*. The more common Tree Germander.

Tree Germander groweth like a little shrubbe, with hard woody, but brittle stalkes, a foote or two, and sometimes a yard high, if it be well preserved and defended from the injuries of the Winters, branching forth on all sides from the very bottome, bearing alwayes leaves by couples, smaller, smoother, and thicker than those of Germander, of a darke shining greene colour on the upper side, and grayish underneath, and dented also about the edges like them; the gaping flowers stand about the toppes of the branches spike fashion, one above another, of a pale whitish colour saith *Clusius*, of a purplish saith *Lobel*, of both which I have had plants, somewhat larger than those of Germander, and without any hood above, having a few threads standing forth: the seed is small blackish and round, contained in small round, but pointed huskes: the roote is somewhat woody, with many blackish fibres: the whole plant is of a fine weake scent, but somewhat stronger, if it be a little bruised, holding the stalkes and greene leaves continually, if it be not exposed to the sharpnesse of the Winter season.

2. *Teucrium Creticum*. Tree Germander of Candy.

This shrubby Germander of Candy, riseth up with such like woody brittle stalkes as the former, but somewhat smaller and whiter, whereon doe grow such like leaves, and in the same manner, but somewhat lesser, lesse greene, and shining above, and more hoary underneath, two alwayes set at a joynt, but on the contrary side: with the leaves towards the toppes come forth five or six flowers standing in a huske, like unto the former, but a little lesse, and of a purple colour, after which come small round seed like the other: the whole plant is somewhat sweeter than the former.

3. *Teucrium Beticum*. Tree Germander of Spaine.

This Spanish shrubby Germander groweth in some places of Spaine, to the height of a man, but usually much lower with one woody grayish stemme or stalk, dividing it selfe into some branches, but fewer than the former, two alwayes set at a joynt: the leaves stand likewise two together, somewhat greater, and waved a little at the edges, of a sad greene colour above, but not shining, and more hoary underneath, the flowers stand at the joynts with the leaves towards the toppes of the stalkes, of a white colour, without any hood above, and with sundry threads in the middle, the lower leaves hanging downwards: the smell hereof is lesse sweet and more bitter than the former, but abideth with stalkes and leaves thereon, greene like the rest, but will require a little more care for the Winters provision in our Country.

4. *Teucrium Alpinum inodorum*. Unflavory Tree Germander of the Alpes.

This small low shrub hath divers hairy and woody stalkes, not above an hand breadth high bending downwards, and dividing it selfe into many smaller branches, whereon are set very small hoary leaves, somewhat rugged or wrinkled and dented a little about the edges, like unto the uppermost small leaves of wood Sage, the flowers are very large for the proportion of the plant, being like unto Germander and hooded, of a purplish blue colour, standing spike fashion at the toppes of the stalkes, the roote is stringy and white: the whole plant hath little or no scent.

The Place.

The first groweth in the rocky places of sundry hills in Italy, and other Countries: the second came from Candy to *Clusius*, the third *Clusius* saith he found neare the Sea coasts in Spaine, not farre from Hercules pillars, as also in the Island of Cales: the last as *Bauhinus* saith, was found on the greater hill of Saint Eernard in Switzerland.

The Time.

These sorts of Germander doe flower somewhat later than the former.

The Names.

The Greekes call it *τευκρίον*, and the Latines *Teucrium* also, a *Teucro* inventore teste *Plinio*, some also call it *Quercula major*. In the last Chapter the opinion of *Dodonæus* is set downe concerning *Teucrium* and *Chamadrys*, but he doth not in my opinion declare the whole truth, which from the rest of *Dioscorides* text may bee gathered: for of *Chamadrys* he saith *folia habet effigie & diversum quercus*, it hath leaves like the Oake, both for shape and divisions, which

3. *Teucrium Batianum*.
Tree Germander of Spaine

which argueth them to bee greater than of *Teucrium*, whereof hee saith; *Triffaginis est similitudine, tenuifolio, non multum a Cicere alieno*: so that *Teucrium* hath lesser leaves than *Chamaedrys*, yet like the lesser ones thereof, and not much differing from those of Ciche pease, and with such leaves is the *Teucrium* furnished. *Pliny* in his 25. Booke, and 5. Chapter, hath foully erred in the description of *Teucrium*, where he saith it is called *Hemionitis*, or *Hermion* (as *Matthiolus* hath it) having neither flower nor seed, which some would call *Asplenion* or *Splenion*, as he hath it, and then telleth fables how the vertue thereof was knowne to be good against the spleene, in that the Swine that eate thereof were found to have no milt. And againe, that the intrailles of beasts being cast upon the hearbe, the milt or spleene of them onely lying nearest was consumed, *scilicet*, of the dead beast, and then addeth by and by the true description (although somewhat varying from that of *Dioscorides*) of *Teucrium*, so that he confoundeth both *Hemionitis* and *Teucrium* together in one description. *Matthiolus* saith that some did take *Teucrium* to be *Crassula major*, or *Fabianversa*, called by others *Telephium*. The first is simply called *Teucrium* by *Matthiolus*, *Lobel*, and many other Authors, and by *Clisius* *Teucrium vulgare fruticosum*, but by *Dodonaus* *Chamaedrys altera seu assurgens*: the second *Clisius* calleth *Teucrium Creticum*, saying it was sent by the name of *Chamaedrys major*, and *Bauhinus* *Teucrium Creticum incanum*: the third *Clisius* calleth *Teucrium fruticosum Batianum*, and so doe *Lugdunensis*, *Tabermontanus*, and others, that have taken it from him, *Bauhinus* calleth it *Teucrium peregrinum folio sinuato*, and maketh a quere, which *Clisius* had made before; an *Pederota Pausania*: the last *Bauhinus* in his *Panax* and *Prodomus* calleth *Teucrium Alpinum inodorum magno flore*, and yet is the same with his *Teucrium folijs Scorodonia*, as any may well see that will compare them together, for *Camearius* who had his from *Candy*, by the name of *Scordium verum*, sheweth that it hath the leaves of *Scorodonia*, but lesse.

The Vertues.

Galen maketh *Teucrium* to be hot in the second degree, and dry in the third, and of thinne parts, and cutting also, whereby it is helpfull for the spleene: it is saith *Dioscorides* used either greene or dry, and is good to consume the spleene, being inwardly or outwardly applied: it is also used against the sting of venomous creatures.

CHAP. XL.

Scordium. Water Germander.

S*cordium* being a kinde of Germander must be next entreated of, yet for that it smelleth of Garlick, it must be separated from them, and with it the other of his kinde, and some also for the affinity in name or smell are not unfit to be joyned together in this Chapter.

1. *Scordium legitimum*. Water Germander.

Water Germander (from a small roote full of white strings spreading in the ground, and creeping or running about also, shooteth forth divers weake square hairy branches, which take roote in divers places, as they lye and spread, whereby it encreaseth much, whereon doe grow many leaves, two alwayes at a joynt, which are somewhat larger and longer than garden Germander leaves, of a sad or darke greene colour, whereon yet there is a shew of hairynesse and hoarynesse, somewhat soft in handling, full of veines, and dented about the edges, of a scent somewhat strong, resembling Garlick: the flowers are small, red, and gaping, standing at the joynts, with the leaves towards the toppes of the branches: we have not observed what seed it beareth.

2. *Scorodonia* five *Scordium alterum quibusdam*, & *Salvia agrestis*. Wood Sage.

Wood Sage riseth up with square hoary stalkes, two foote high at the least, having two leaves set at every joynt thereon, which are somewhat like unto Sage leaves, but smaller, softer, whiter and rounder, a little dented about the edges, and smelling somewhat strongly: at the tops of the stalkes and branches stand the flowers on a slender long spike, turning themselves all one way when they blow, and are of a pale or whitish colour smaller than Sage, but hooded, and gaping like unto them: the seed is blackish and round, foure usually set in a huske together: the roote is long and stringy, with divers fibres thereat, and endureth many yeares.

3. *Scorditis Plinij primum*. The first Garlicke Germander of *Pliny*.

Because *Dodonaus*, *Lobel*, *Pena*, and *Dalechampius*, have set forth divers hearbes for the true *Scorditis* of *Pliny*, as some *Scorodonia* or *Salvia agrestis*, some *Stachys*, and others *Gallitricum*, none of them having the smell of *Scordium*, or the vertues that *Pliny* giveth to his *Scorditis*: therefore *Honorius Bellus* a Physitian in *Candy*, a diligent searcher, and of great knowledge and judgement in hearbes, sent to his friends in divers places, the true *Scorditis* of *Pliny*, with the leafe of Wild Mints, or water Mints; whose description is as followeth: It hath from a long great and fibrous roote, abiding long, and not perishing every yeare, many square hairy white branches, lying round about it on the ground: whereon are set two leaves at a joynt, broader and rounder than the former *Scordium*, and all hoary white, being somewhat like unto the leaves of Horehound, or water Mints: at the toppes of the branches come

1. *Scordium legitimum.* Water Germander.

2. *Scordonia* fve *Scordium alterum* quibusdam & *Sa'via egre'cia.* Wood Sage.

3. *Scordotis Plinij primum.* The first Garlicke Germander of Pliny.

come forth the flowers, standing as it were in a long spiky head, with leaves among them, which are of a very pale purplish colour, almost white like unto Horehound, after which cometh small round blacke seed : the whole plant smelleth of Garlicke, as much as *Scordium*, and thereby to be knowne as well as by the leaves, to differ from those bastard kindes that other Authors have set forth.

4. *Scordotis alterum Plinij Pona.* Another Garlicke Germander of Pliny.

The other *Scordotis* riseth up with his stalke more upright, and more branched than the former, bearing the like leaves,

4. *Scordetis alterum* Plinij Pona.
Another Garlicke Germander of Pliny.

5. *Alliaria*. Sawfe alone, or Iacke by the hedge.

leaves, but somewhat larger, and roundly dented about the edges, two at every joynt, and two branches with them likewise, having spiked toppes of reddish flowers.

5. *Alliaria*. Sawfe alone, or Iacke by the hedge.

The lower leaves of Sawfe alone are rounder than those that grow towards the toppes of the stalkes, and are set singly one at a joynt, being somewhat round and broad, and pointed at the ends, dented also about the edges, and somewhat resembling Nettle leaves for the forme, but of a fresher Greene colour, and not rough or pricking: the flowers are very small and white growing at the toppes of the stalkes one above another, like unto Rocket, which being past, there follow small and long round pods, wherein are contained small round seed somewhat blackish: the roote is stringy and thready, perishing every year after it hath given seed, and raiseth it selfe againe from its owne sowing: the plant or any part thereof being bruised, smelleth of Garlicke, but more pleasantly, and tasteth somewhat hot and sharpe, like almost unto Rocket.

Alsejor. This is sometimes found with larger and rounder leaves, in nothing else differing.

6. *Scordis affinis Elephas Columna*. The Germander-like hearbe of Naples.

This Germander-like hearbe hath a square tender hollow stalke, somewhat hairy, and of a whitish Greene colour as the leaves are likewise, two alwaies set at a joynt, the lowest being smaller than the other that grow upward to the middle of the stalke, being somewhat like unto Mint leaves, but rounder at the points, and roundly dented about the edges like Germander, but more sparingly: from the joynts with the leaves on all sides, from the very bottome almost of the stalke, spring forth branches set with the like, but smaller, longer, and more pointed leaves, towards the toppes whereof come forth gold yellow gaping or hooded flowers, every one upon a slender foote-stalke, betwene the leaves like the head of an Elephant, with the bowed snout, and two crooked teeth on each side thereof, and purplish spots like eyes under the upper hood, of a very sweet scent, and flowering by degrees one after another, after which come grayish seed contained in heads, with very thinne skins that they may be discerned thorow them: the roote is long and white, with some transluceid graines like wheate cornes growing at them.

The Place.

The first groweth in many wet grounds, and by water sides in many places of England; *Dioscorides* saith, as well on the Hills, as by water sides, for it will abide well if it be transplanted into a garden, and *Camerarius* saith that it is found to be stronger and sharper that groweth on high grounds. The second groweth in woods and by wood sides, as also in divers fields and by-lanes in many places with us: the third as is said groweth in Candy, whereas *Honorius Bellus* saith, the people gather it promiscuously with the former sort, and soufe it, or sell it to others: the fourth doth grow also in Candy, and sent to *Signor Contarini*, from whom *Pona* saith he had the knowledge thereof. The fifth groweth under walls, and by hedge sides, and path-ways in fields in many places: the last on the hill *Campocari* in Naples, as *Columna* saith.

The Time.

They doe flower in June, Iuly, and August, somewhat before which time, the most usuall manner is to gather the water Germander, and dry it to keepe.

The Names.

Water Germander is called in Greeke *Ζηκοδισ*, and in Latine *Scordium*, from *σχοδος* which is *Allium* Garlick, because of the smell: the likenesse of the Greeke name, did much deceive the former ages before us, for as *Matthiolus* writeth, it begun to be knowne but a while before his time, and that all men both Physitians and Apothecaries used the wild Garlick called *Ophioscoridon* in stead of the true *Scordium* in their medicines, the occasion whereof (besides their owne ignorance and negligence in not distinguishing of the words) was *Avicen*, as it is most likely or his Translator that appointed *Scordium* in one composition of Treacle, and wild or crow Garlick in another: and the Physitians of the former ages, thinking that *Avicen* had interpreted himselfe, expounding one place by another, continued the error by tradition without further search, untill learning & all other sciences began to be more sought into, and refined as it were from the grosse puddle of ignorance and barbarisme, which brought the knowledge of this to light, as it did of many other things; so that now our curiosity doth not rest in *medys & uilibus*, but transcendeth *ad imas & minimas etiamsi inutiles*: It is called also *Trixago palustris*, Water or Marsh Germander, both for the likenesse thereof unto Germander called *Trixago*, and for the growing thereof in marshes, &c. Some also call it *Scordium* from the strong scent so unpleasant to the senses. *Pliny* saith that *Cratæus* did ascribe one of the sorts hereof unto Mithridates, and called it Mithridation; and it may be from hence as well as from Garlick, was called poore mens Treacle, and by our Country people English Treacle. The first is called *Scordium*, or *Trixago palustris* of all Writers, and although *Tabernmontanus* and *Gerard* that followeth him, doth make two sorts thereof, as *maius* and *minus*, a greater and a lesser, yet I never could observe any other difference then in the place which produced them, being one more or lesse fruitfull or barren then the other. The second is called by *Lobel* and *Camæarius* *Scordium alterum*, and *Scordium maius* *Pliny* by *Gesner*; who calleth it also *Salvia montana*, and *Ambrosia quibsdam*; *Tragus*, *Lonicerus*, and *Tabernmontanus*, call it *Salvia sylvestris*, and *Salvia Bosci*, and *Bosci* *Salvia*, and *Eugdunensis* *Salvia agrestis*, as *Dodonæus* also doth, who taketh it likewise to bee *Sphacelus Theophrasti*, as I have formerly shewed. *Cordus*, *Thalins*, and *Gerard* call it *Scordonia*, and *Scorodonia*, although his figure thereunto is not right. *Cæsalpinus* calleth it *Melinum alterum*, *Ætius* and *Bauhinus* *Scordium alterum* *Salvia sylvestris*. The third is called *Scordotis legitimum* *Pliny*, both of *Bellus* and *Pona* in his description of *Mons Baldus*, and it is very probable that *Camæarius* doth meane this sort, which he calleth *Scordium Creticum lanuginosum*: for as I said before, *Bellus* saith, the people of *Candy* make no difference betweene them, but in gathering put them together. It is probable also, that *Anguillara* called this *Scordium alterum*, which hee saith was found about the banke of the River *Piscara*, with leaves as large as Baulme: and that such is found in *Candy* also, in *Greece* and other places, nothing differing either in scent or quality from the first. The fourth is called by *Pona* in his Italian *Baldus Scordotis secundum* *Pliny*. The last is called by most Authors *Alliaria*, yet *Gesner* in *hortis* calleth it *Alliastrium*, and *Ericus Cordus* *Rima marina*, but *Anguillara* *Rima maria*, *Dalechampsius* upon *Pliny* taketh it to be his *Alectorolophus*, and so doth *Lobel* also, some also take it to be *Thlaspidium Cratæi*, and *Tragus* calleth it *Thlaspidium cornutum*. The last *Columna* calleth it *Elephas Campoclaurensum*, and *Bauhinus* *Scordio affinis*, *Flephas*. The Italians call *Scordium Calomandrinum palustre*, the Spaniards *Camedreos de arroyos*, the French *Scordion* and *Chamaraz*, the Germanes *Wasser Rothenegel*, and *Lachen Knoblauch*, the Dutch *Water Gamandree*, and we in English *Water* or *Marsh Germander*. The Italians call Sawce alone, or Iacke by the hedge *Alliaria*, the French *Alluire*, and *Herbeaux auëz*, the Germanes *Knoblauchs kraut*, and *Saltkraut*, the Dutch *Look sonder look*.

The Vertues.

Dioscorides and *Galen* doe both agree that water Germander is of an heating and drying, or binding quality, bitter also, and a little fowre and sharpe, whereby it is effectfull to provoke urine, and womens monethly courses: the decoction thereof in wine being either greene or dry, is good against the bytings of all venomous beasts or Serpents, and all other deadly poisons; and also against the gnawing paines of the Stomake, and paines of the side that come either of cold or obstructions, and for the bloody fluxe also: made into an Electuary with Cresses, Roslin, and Honey, it is available against an old cough, and to helpe to expectorate rotten flegme out of the chest and lungs: as also to helpe those that are bursten, and troubled with crampes. *Galen* in *lib. 1. Antidot.* (which *Matthiolus* and others also set downe) recordeth that it was found written by sundry faithfull and discrete men, that in the warre of the bondmen, where the bodies of the slaine had lien upon *Scordium* any long time, before they were buried, they were found to be lesse putrified than others, that had not fallen thereupon, especially those parts that were next the hearbe; which observation bred a perswasion of the vertue thereof to bee effectfull, as well against the poison of venomous creatures, as the venome of poisonfull hearbes or medicines. It is a speciall ingredient both in Mithridate and Treacle, as a counterpoison against all poisons, and infections either of the plague or pestilentiall or other Epidemicall diseases, as the small pockes, meafels, faint spots, or purples: and the Electuary made thereof, named *Diascordium*, is effectfull for all the said purposes: and besides is often given, and with good successe before the fits of agues, to divert or hinder the access, and thereby to drive them away. It is often taken also as a Cordiall to comfort and strengthen the heart. It is a most certaine and knowne common remedy to kill the wormes, either in the stomacke or belly, to take a little of the juyce thereof, or the powder in drinke fasting. The decoction of the dried hearbe with two or three rootes of Tormentill sliced, and given to those that are troubled with the bloody fluxe, is a safe and sure remedy for them. The juyce of the hearbe alone taken, or a Syrupe made thereof is profitable for many of the forenamed griefes. The dried hearbe being nised with a little honey cleanseth foule ulcers, and bringeth them to cicatrizing, as also closeth fresh wounds: the dried hearbe made into a cerate or pultis, and applied to excrescences in the flesh, as Wens and such like, helpeth both to constrain the matter from further breeding of them, as also to discusse and disperse them being growne. It being used also with vineger or water, and applied to the gowt, easeth the paines thereof. The greene hearbe bruised and laid or bound to any wound, healeth it, be it never so great. Wood Sage is hot and dry in the second degree, the decoction thereof is good to bee given to those whose urine is stayed, for it provoketh it and womens courses also. It is thought to be good against the French poxe, because the decoction thereof drunke doth provoke sweat, digesteth humours, and dissolveth

swellings and nodes in the flesh : the decoction of the hearbe rather Greene than dry made with wine, and taken, is accounted a safe and sure remedy for those who by falls, bruises, or beatings, doubt some veine to be inwardly broken, to disperse and avoid the congealed blood, and to consolidate the veine, and is also good for such as are inwardly or outwardly bursten, the drinke used inwardly, and the hearbe applied outwardly : the same also, and in the same manner used, is found to be a sure remedy for the palseie : the iuyce of the hearbe or the powder thereof dried is good for moist ulcers and sores in the legges, or other parts to dry them, and thereby to caule them to heale the more speedily : it is no lesse effectfull also in Greene wounds, to be used upon any occasion. Iacke of the hedge is eaten of many Country people as sawce to their salt fish, and helpeth well to digest the crudities, and other corrupt humours are engendred by the eating thereof, it warmeth also the stomacke, and causeth digestion : the iuyce thereof boyled with honey, is held to be as good as *Erysimum*, hedge Mustard for the cough, to helpe to cut and expectorate the flegme that is tough and hard to rise : the seed bruised and boyled in wine is a good remedy for the wind collicke, or for the stone, being drunke warme, the same also given to women troubled with the mother, both to drinke, and the seed put into a cloth, and applied while it is warme, is of singular good use : the leaves also or seed boyled, is good to be used in glisters, to ease the paines of the stone : the Greene leaves are held to be good to heale the ulcers in the legges, the roote tasteth sharpe somewhat like unto Raddish, and therefore may be used in the same manner, and to the same purposes that it is.

CHAP. XLII.

Baccharis. Bacchar.

I though sundry Writers have set forth divers hearbes, for the true *Baccharis* of *Dioscorides*, and other learned men have refused them : yet these hearbes come nearest thereunto, the one the learned of *Mompelier* account the truest, and with them many others doe agree : the other *Ranwolfius* setteth forth, which are therefore here proposed unto you.

1. *Baccharis Mompeliensis*.
French Bacchar.

foote, of a pale purplish colour : the roote was not fully observed, but seemed by some parts thereof, to be fibrous like blacke Hellebor, and sweet also.

The Place.

The first groweth plentifully neare *Mompelier*, and many other places also. The other in *Syria*.

The Time.

The first flowreth with us about the end of Iuly, or beginning of August. The other time is not expressed.

1. *Baccharis Mompeliensis*. French Bacchar.

This hearbe hath divers somewhat long and large leaves lying upon the ground full of veins, which make it seeme as if it were crumpled, soft and gentle in handling, and of an overworne Greene colour, seeming to be woolly : from among which in the Summer time, riseth up a strong stiffe stalke, three or foure foote high, set with divers such like leaves, but smaller up to the toppe : where it is divided into many branches, at the ends whereof come forth divers flowers, three or foure for the most part, at the end of every severall branch, and every one on a small foote-stalke : which flowers consist wholly of small threads or thrums, standing close and round ; and never laid open like other flowers, that consist of leaves, of a dead or purplish yellow colour, out of greenish scaly heads, which thrums turne into a whitish downe : at the bottome whereof is the seed, small and chaffy, which together with the downe is carried away with the winde, and riseth up in sundry places of a garden, where it is once planted, and beareth seed : the roote consists of many strings and fibres, bulshing somewhat thick, not running deepe into the ground, but so taking hold of the upper face of the earth, that it may easily be pulled up with ones hand : the smell whereof is somewhat like unto *Avens*, but lesse in gardens, than growing wild, even as *Avens* doth in gardens, and divers other sweet hearbes that are of thin parts and subtil.

2. *Baccharis Dioscoridis Ranwolfio*, Syrian Bacchar.

The Syrian Bacchar, brancheth forth from an hoary stalke, about a foote high, into many smaller sprigges ; bearing somewhat long and narrow leaves thereon, as white, hoary, and woolly as Mullein leaves, without any foot-stalke at the bottome, but compassing the stalke about : these being larger below, yet lesse than Mullein, and those above smaller, and smaller to the tops : whereon stand the flowers very thicke set together, somewhat like unto golden Tufts, or Mountaine Cotton weed, called also *Cars*

2. *Baccharis Diofcoridis Ranzolfius.*
Syrian Bacchar.

The Names.

It is called in Greeke *Βακχαρίς*, *Baccharis*, or as some would have it *πακχαρίς*, *Pachcharis*, as though it should bee named *παυχαρίς* *Pancharis*, from the excellent smell it hath. *Pliny* saith that some in his time called it *Nardus rufica*; but saith hee, they were in an error that did so call it, for *Asarum* is most truly and properly called of the Greekes *Νάρδος* *Nardus*, *Nardus rufica*, and therefore *Gerard* in following the old error reprehended so long agoe, giveth it the English name of *Mowmans Spikenard*, whereunto it hath no resemblance, neither for forme nor vertues, and his figure also is rather the figure of *Matthiulus Baccharis*, then of this: and although in former times divers did thinke, that *Asarum* and *Baccharis* in *Diofcorides* were all one hearbe, and thereupon came the name of *Asarabaccara*; some taking *Asarum* to be *Baccharis*, and so contrarily some taking *Baccharis* to be *Asarum*; for *Cratæus* his *Asarum* is not *Diofcorides* his *Asarum*, but his *Baccharis*, as any may plainly see, that shall read his description, yet now time and diligence have expell those errors. The first of these is called *Baccharis Monspeliensium*, whereunto it doth more fitly agree, than any other hearbe that others have set forth; as *Pena* and *Lobel*, *Clusius*, and others doe agree; although *Dodonæus* calleth it *Conyza major altera*, and saith it hath little or no likenesse unto *Diofcorides* his *Baccharis*, *Matthiulus* his *Conyza major*, is said by the Author of *Lugdunensis*, to be this *Baccharis Monspeliensium*; and *Lobel* and *Pena* say that the plant which *Matthiulus* set forth for *Baccharis*, cannot agree unto that of *Diofcorides*, but is a kind of sweet Mullein, or a kinde of Moth Mullein: yet *Rabinus* in his *Pinax*, calling this *Conyza major vulgaris*, shewing thereby that many did call it so, referring it as well to *Matthiulus* his *Conyza major*, as to his *Baccharis*; which *Lugdunensis* saith, are so contrary one unto the other, as that they cannot be accounted both one plant, as in the Chapter of *Baccharis* he sheweth. They of *Salamanca* in Spaine, as *Clusius* saith, called it *Helenium*, and divers both women and Monkes, used both the roote and the hearbe, for scabs and itches, which is one of the properities whereunto the true *Helenium* serveth. The other *Ranzolfius* onely finding in Syria, seemeth to referre unto *Diofcorides* his *Baccharis*; which *Clusius* thinketh rather to bee a kinde of that Mountaine Cotton weed, which *Fuchsius* calleth *Filofella minor*, and therefore *Rabinus* calleth it *Gnaphalio montano affinis Egyptiaca*.

The Vertues.

Diofcorides saith, that the rootes of *Baccharis* boyled in water and drunke, helpeth those that are troubled with convulsions and crampes, as also those that have ruptures and are bursten, such as have bruises by falls or otherwise, and those that can hardly draw their breath, or are short-winded, as also for old coughs, and the difficulty in making water: it also procureth the feminine courses, and is very profitable against the bytings of venomous creatures being taken in wine: the greene roote being bound or hanged to, expelleth the birth, and is good for women in travell to sit over the warme fumes of the decoction thereof. For the sweet smell thereof it is put into Wardrobes to perfume: and the smell thereof procureth sleepe: But the greene leaves by reason of their astringency are good to ease the paines of the head, the inflammations of the eyes, and the watering of them in the beginning, the hot swellings of womens breasts after childing, and those hot inflammations called *Saint Antonies fire*, being applied to the places affected. *Pliny* saith further, that it helpeth to breake the stone, and to take away paines and prickings in the sides. *Paulus Agineta* saith moreover that the decoction of the roote openeth obstructions, and that the leaves are helpfull by their astringent quality to stay fluxes: *Virgil* in his seventh Eclogue saith, that is was used in his time as a garlaad to secure one from witchery and charmes, in these verses.

At p̄ ultra placitum ludarit, Bacchare frontem
Cingite, ne vati nocent mala lingua futuro.

CHAP. XLII.

Nardus. Spiknard.

Although it is not my meaning to shew you the Indian Spiknard in this place, in that it is a plant peculiar to the Easterne parts of the world, and was never brought to grow in these Christian Countries; yet there is a bastard kind thereof found nearer hand, very like unto it, which I must set forth unto you, and some others also, that for the affinity either of scent or property, or both, have beene called *Nardi*.

1. *Nardus Gangitis spuria Narbonensis.* Bastard French Spiknard.

In imitation of the true Indian Spiknard (which *Pena* saith doth grow in divers places of Syria and Egypt, which relation is his onely; for we never could understand by any of our Merchants that trade into those parts, that it

was

1. *Nardus Gangitis spuria* Narbonne's.
Bastard French Spiknard.

green leaves, not divided or dented at all, smallest at the bottom, and broad toward the end, which change yellow in the end of Summer, or beginning of Autumne: among these leaves rise up sometimes more, and sometime but one slender stalk, without any leaves thereon: at the toppe whereof stand many small whitish flowers, like unto the smaller sorts of Valerian, every one on a slender foote stalk: which afterwards bring small seed like unto them also: the whole plant is sweet and aromaticall, more than the Indian Spiknard, hotter also, and sharper in taste, than either of the other.

3. *Nardus Celtica altera*. Mountaine French Spiknard with tufted flowers.

This other French Spiknard differeth in nothing from the last but in the stalk with flowers, which is branched at the toppe, bearing three or foure flowers in a tuft together, on the end of every small branch.

Bambinus in his *Prodromus* setteth forth another sort hereof like thereto in most things, but that it is wholly without scent.

4. *Salunca Neapolitana sive Nardus ex Apulia*. Italian Spiknard.

This small plant hath a thicker and yellow roote than the last recited, somewhat rugged, but not scaly like it, and somewhat resembling the garden Valerian, but lesse, having fibres at the bottom, and in divers other places at several spaces, where it shooteth forth also upwards divers heads or small knobs, and from them many small long leaves, somewhat larger than the other, narrower likewise below, broader upwards and pointed at the ends; what flowers, stalks, or seed it beareth is not expressed: it hath the sweet scent of garden Valerian, and likewise the sharpe taste thereof, and this is all is declared of it: but that they of Naples use it in their medicines, in stead of the *Malabathrum* of *Dioscorides*, for the excellent sweetness of the leaves.

5. *Hirculus veterum Clusij*. Vnsavory Spiknard.

This small plant (being found dry amongst many bundles of *Spica Celtica*, or French Spiknard, by *Clusius* in *Antwerp*) is set forth to have a blackish hairy roote, like unto it, but without any smell at all, and smaller, shorter, and whiter leaves, rather grayish, and of an ash-colour: it was found without any stalk, and so *Dioscorides* and *Pliny* say it was found in their time: but theirs (as they say) had a strong scent, but not sweet, and growing with it was uttered among the true; and by the smell as well as colour and taste was to be knowne from it; for it tooke the name *τρυγος* or *Hirculus*, of the smell thereof like unto that of a goat.

6. *Nardus montana triberosa*. Knobbed mountaine Spiknard.

This kinde of Valerian or Spiknard, call it which you will, hath his first leaves lying on the ground, without any division in them at all, being smooth and of a darke Greene colour, which so abide all the Winter: but those that spring up upwards, when it runneth up to flower, are cut in on the edges, very like unto the jagged leaves of the great garden Valerian, and so the elder they grow, the more cut and jagged they are: the stalk and flowers are very like the stalk with flowers of the garden Valerian, but of a darke or deep red colour, and more store of them thrust together: the seed also is not unlike it: the roote is tuberous or knobbed, both above and below, and round about

was a commodity so neere at hand, but brought further of; as I shall hereafter further declare) this bastard kinde hath beene observed to grow answerable in a manner to all the parts thereof. For it hath a few small hard fibres, which thrust themselves into the ground: from which spring forth divers hairy round spiky heads or beards, of the bignesse of ones finger, and of an hand breadth high, of a pale browne colour, which are not pointed at the toppes but flat or blunt, through each of these heads, even from the lowest part next the roote, shoote forth divers long rough Greene rushes, scarce a foote high, many of these growing close one unto another, so that they make the forme or shew as it were, but of one plant; and after this manner hath hee set forth the figure thereof: but hee further addeth afterwards, (which *Lyngdunenſis* pretermitteth, although he setteth downe all the former part) that it is altogether without smell, except those hairy spiked heads or beards, which being bigger than the Indian kinde, doth smell somewhat like unto that Mosse that groweth upon Oakes, or that other that groweth upon the ground, and that these heads being halfe way within the ground, doe send forth each of them in the middle of those rigid rushes, a tall slender and smooth stalk, rising about a cubite higher than the rushes: from the middle whereof up to the toppes of them on each side, come forth many small Greene cods pointed at the ends standing in cuppes like unto those of Cranes bill. The whole forme hereof doth so neare resemble the true Spiknard, as it hath beene observed by *Pena* and others, who as he faith among a number of bundles, found some that had the parts both of fibres heads, rushes, and leaves distinctly, to be seene as this is here described; that it is not to be doubted that it is a species thereof.

2. *Nardus sive Spica Celtica*. Mountaine French Spiknard.

This Mountaine Spiknard creepeth upon the ground under the loose leaves and mosse, &c. with small long and hard slender rootes (for so I call them rather than stalks, as some others doe, because in these rootes consisteth the whole vertue and efficacy of the plant, and are by the best Apothecaries used onely in Mithridatum, &c. and no part else) covered with many short small dry leaves like scales: sending forth in divers places as it creepeth and spreadeth, here and there small blackish fibres into the ground, whereby it is nourished: at the head whereof stand sundry small buttons or heads, from whence spring many small narrow, and somewhat thicke

3. *Nardus Celtica altera.*
Mountaine French Spiknard with tufted flowers.

4. *Salunca Neapolitana.*
Italian Spiknard.

5. *Hirculus Clasti.*
Vnflavory Spiknard.

6. *Nardus montana tuberosa summitates.*
The tops of the knobbed mountaine Valerian.

6. *Nardus montana tuberosa primum germinans.*
Knobbed mountaine Valerian, the first leaves.

7. *Nardus Montana longiori radice.*
Long Tuberous Mountaine Spiknard.

the French Spiknard was gathered, as *Dioscorides* also and *Pliny* imagined. The sixth was found by *Pena* as he saith, on the hills neare *Mindenum*, and on the hills of *Veganium*: *Clusius* saith hee had it from *Ferrantes Imperatus* of *Naples*, and gathered from the hill *Virginea*. The last is likely, being a kinde of the other to bee found in the same places with the other.

The Time.

They all floweret and florish in the Summer moneths of June, July, and August, some earlier or later than others.

The Names.

Nardus is called in Greeke *Nardos*, a *Nardo urbe* *Cyriaca* forte saith *Lobel*, *Euphrati contermina* & *vestigia quasi Nardus spica*, and so the Indian kinde is generally called *Spica Nardi*, and of some *Nardus Indica*, for a distinction betwene it and *Celtica*: The first of these *Pena* calleth *Nardus Gangitis spuria Narboa*, both for the likeness thereof unto the true *Nardus Gangitis* of *Dioscorides*; and that the next Towne of any note unto that Hill whereon it groweth, being about seven miles off, is called *Gange*; and by that name of *Nardus Narbonensis*, and *Nardus spuria Narbonensis*, it is called by all other Writers. The second is called *Nardus Celtica* of *Dioscorides*, and of all other Writers since, and *Casalpini* following *Pliny* *Nardum Gallicum*. It is in shops called *Spica Celtica*, and by the most and best, is judged to be the *Salinca* that *Virgil* in his *Bucolics* maketh mention of in these Verses.

Punicis humilis quantum Salinca Rosetis,
Judicio nostro, tantum tibi cedit Amyntus; in English thus;

As the Mountaine Spiknard unto the purple Rose tree,
So (if I judge) *Amyntus* yeelds to thee.

And is thought by them also, that the name *αλιόγρια* is corruptly put for *αλιόγρια* in *Dioscorides*: for the *Valesians* call it in their tongue to this day *Selliga*, as favoring of *Salinca*, as *Pena* saith also: yet *Matthiolus* findeth fault with *Fuchsius* and *Leonicentus* for taking them to be both one; and the *Germanes* also, who were reckoned a part of the *Celts*, call it *Selinck*: Some would have it called *Nardus ligustica*, because it groweth so plentifully on the Alpes of *Liguria*, and yet *Matthiolus* saith, that the Physicians of *Genoa* which is a City in *Liguria*, did not know it before his time, and that he had published his Commentaries upon *Dioscorides* in the Italian tongue, which caused many both Physicians and Apothecaries, to be more inquisitive into the knowledge of hearbes, than they were before. Some also following the Arabians doctrine and words call it *Nardus*, or *Spica Romana*, because they call it in their tongue *Cambul Rumini*. The third is called by *Camerarius* in his Epitome upon *Matthiolus Spica Celtica fastigiato florum ordine*, by *Clusius* *Nardus Alpina seu Celtica*, but *Bauhinus* maketh this of *Clusius* to be the former, when as *Camerarius* saith it is not the same with *Matthiolus* and others, which is the first here, and *Bauhinus* himselfe calleth it *Nardus Celtica altera*. The other is remembered by *Cordus* upon *Dioscorides*, and *Bauhinus* in his *Prodromus* and *Pinax*, and called by him *Nardo Celtica similis inodora*. The fourth is called by *Lugdunensis Salinca Neapolitana*, by *Tabernmontanus Plutminus Apulum*, and by *Bauhinus* *Nardus ex Apulia*. The fifth as is before said, was thought by *Clusius* to be the *Hirculus* of *Dioscorides*, although it smel not strong as he saith his doth: *Anguillara* taketh it to be the *Nardus Sampboritica* of *Dioscorides*, although *Matthiolus* findeth fault with him for that opinion; *Gerard* calleth it *Vrinwort* in English, wherunto it hath no correspondence: for not having smell or taste, it cannot have the properties of *Nardus*, which hath both. The sixth is generally called *Nardus montana*, and also thought by all Writers, to be *Dioscorides* his *Nardus montana*, notwithstanding hee saith it hath neither stalk nor flower, nor seed, for *Matthiolus* freeeth him from that fault, (first both because in the forefront of his owne description

tion he saith, it hath the stalke and leafe of *Eryngium*, and therefore could not be so forgetfull, as within two or three lines to contrary his owne Writing) in laying the error in the writers of his copy, in the same manner as he set downe in *Dillanmus*, and is declared in the Chapter thereof going before: that is, *εἰς* for *συμπερι*, *profert* for *confert*, it beareth not, for it profiteth not, the roote onely and no part else being to be used: as also that the leaves hereof doe not agree with the leaves of *Eryngium*, wherein it is most likely an error is committed also, in miswriting and mistaking one word for another, for all other things agree sufficiently thereunto. *Dioscorides* and *Galen* say also it was called *Thylactis*, because it was brought out of *Cilicia* in leatherne bagges, which were called *badus*, and *Rivis*, as it is in *Dioscorides* copy, but called *Pyrus*, as it is in *Galen*, because it was used as a perfume in their sacrifices. *Bauhinus*, *Camerarius*, and others make two sorts thereof, one that hath but one two or three round small rootes like unto Olives, which thereupon he calleth *Nardus montana radice olivari*, and the other hee calleth *Nardus montana radice oblonga*, and *Camerarius* *Nardus montana longius radicata*, when as it may be the place onely, where they naturally grow, that causeth the difference of forme in the rootes, as it hapneth in *Anthora*, *Napellus*, and many other things, too long here to recire: for being transplanted and manured, they grow much greater, and somewhat alter that forme it formerly held in the naturall places, yet I have given you the figures of both to see the difference.

The Vertues.

Dioscorides saith that the true Indian Spiknard is of an heating and drying faculty, and that it provoketh urine. It is profitable to stay the loosenesse of the belly, and all fluxes both of men and women, and thin wary humours, being taken in drinke or applyed to the places affected: being drunke with cold water, it is profitable to those that have a loathing of their meate, or having swellings or gnawings at their stomacks, as also for them that are liver-growne, that have the yellow jaundise, or the stone in the reines or kidneys. The decoction used as a bath for women to sit in, or over it, taketh away the inflammations of the mother: It helpeth watering eyes by repressing and staying the humour, and thickning it also. *Galen* saith the same things and addeth withall, that it dryeth up the fluxe of humours, both in the head and breast. It is an especiall ingredient into Antidotes, against poison and venome, as *Mithridatum*, &c. There had need be caution taken in the using of it, for it often provoketh vomitings, being either put with *Rubarbe*, as sometimes it is appointed, or in other cordiall medicines: and therefore our *London* Physicians in their *Pharmacopoea*, have appointed it to bee left out of many cordiall medicines. It is also with great caution to be forbidden to women with child, because it procureth them much disquiet, and may force their courses beyond either their time or conveniency. The oyle made thereof according to art. doth both warme those places that are cold, maketh the humours more subtill that were thicke or congealed before, digesteth those that are crude and raw, and also moderately dryeth and bindeth those that were too loose or fluxible: and hereby worketh powerfully in all the cold griefes and windinesse of the head and braine, of the stomacke, liver, spleene, reynes and bladder, and of the mother: being snuffed up into the nostrils, it purgeth the braines of much theume gathered therein, and causeth both a good colour and a good savour to the whole body: Being steeped in wine for certaine dayes, and after distilled in *Balneo calido*: the water hereof is of singular effect, for all cold indispositions of the members, used either inwardly or outwardly: for it comforteth the braine, helpeth to stay thin distillations, and the cold paines of the head, as also all shaking and paralitick griefes: it helpeth also in all sudden passions of the heart, as faintings, and swoonings; and for the collicke, two or three spoonefulls thereof taken upon the occasion: The first of these which is the bastard kinde, being almost without smell or taste, doth declare it to bee of small vertue and efficacy: but the mountaine French Spiknard, is reckoned to be effectuell, for all the purposes that the true Spiknard serveth for, but is weaker in operation; and moreover by reason it is somewhat more heating and lesse drying than it; it is more pleasing to the stomacke, and provoketh urine more effectually: the decoction thereof with *Wormewood* being drunke, helpeth those that are troubled with the swellings and windinesse of the stomacke, and being taken in wine is good for them, that are stung or bitten by any venomous creature. It helpeth also to dissolve all nodes and hard swellings, and is profitable for the spleene, reines, and bladder. It is also an ingredient of no small effect in *Mithridatum*, and others; and is used outwardly in oyles and ointments, to warme and comfort cold griefes wherefoever they be. The Mountaine Spiknard is weaker than the Celticke or French Spiknard, by the judgement of *Dioscorides*, *Galen*, and others.

CHAP. XLIII.

Valeriana. Valerian.

Here are many sorts of Valerians to be remembred in this Chapter, some naturall, others strangers to our Country; and yet have beene free denizons in our gardens along time, others but of late.

1. *Phu majus* sive *Valeriana major*. The great Valerian.

The great Valerian hath a thicke short grayish roote, lying for the most part above ground, shooting forth on all sides other such like small peeces or rootes; which have all of them many long and great strings or fibres under them, in the ground, whereby it draweth nourishment: from the heads of these rootes spring up many greene leaves, which at the first are somewhat broad and long, without any division at all in them, or denting on the edges: but those that rise up after, are more and more divided on each side, some to the middle ribbe, being winged, as made of many leaves together on a stalke, and those upon the stalke in like manner, are more divided, but smaller toward the toppe than below: the stalke riseth to be a yard high, or more, sometimes branched at the toppe, with many small whitish flowers, sometimes dasht over at the edges with a pale purplish colour; of a small scent which passing away, there followeth small brownish white feed, that is easily carried away with the winde: the roote smelleth more strong than either leafe or flower, and is likewise of more use in medicine.

There is a Mountaine kinde hereof, as *Camerarius* saith, found in *Savoy*, which is more sweete than this, even Altera odonatic.

2. *Valeriana*

1. *Phu mayus sive Valeriana major.*
The great Valerian.

2. *Valeriana cretica tuberosa.*
Knobbed Valerian of Candy.

2. *Valeriana cretica tuberosa.* Knobbed Valerian of Candy.

This Valerian of Candy hath his first leaves, that spring up and lie upon the ground round about the roote Greene, thick, and round, like unto the leaves of *Alarabacca*, and sometimes greater; the next that come after them are somewhat longer, and somewhat divided or cut in on the edges, and those that follow more and more divided, so that those that grow upon the stalke, are very like unto the divided leaves of the former Valerian: the stalke is hollow, and riseth to be two foote high at the least, having here and there two smaller leaves set at a joynt: at the toppe whereof, which is divided into some smaller branches, stand many white flowers in an umbell, thick thrust, somewhat larger than those of the former, which turne afterwards into small and flat seed with a little downe at the head of them, like thereunto also: the uppermost roote from whence the leaves and stalke doe spring, is small round short and tuberos, from whence shoot forth round about it, divers other smaller rootes, fastned thereunto by long strings, like as the rootes of *Filipendula* are, the scent whereof is very like unto the former great Valerian.

3. *Valeriana Alpina major sive latifolia.* Broad leaved wild Valerian of the Alpes.

This wild Valerian hath many large and somewhat round pale Greene leaves, and in some they will be yellowish, rising from the roote, lying upon the ground round about; every one having a long foote-stalke thereunto, some whereof are very like unto Ivie leaves, but lesser and gentler, and others longer like unto the leaves of *Canterbury Bells*, but lesser also, and not so hard; in some a little dented, in others more dented about the edges, but not divided at all: the stalke is round, and about a foote and a halfe high, in some Greene, in others somewhat reddish, having few leaves thereon, which are smaller, longer, and deeper cut in on the edges, than any below, and at the toppe is branched, whereon stand divers small purplish flowers, like unto the other Valerians: after which come small seed like unto the rest: the roote is large, round, and whitish, set with divers knots or joynts, and long fibres under them, of a reasonable good smell, like unto wild Valerians, and of a bitterish binding taste.

4. *Valeriana Alpina minor.* Small wild Valerian of the Alpes.

This small Valerian hath foure or five small long, and somewhat narrow leaves, with one or two dents onely at the edges, lying on the ground next the roote, and are somewhat like unto the leaves of the great wild white Day-sie, especially those that grow highest, and are the smallest, but with fewer dents or notches about the edges: the stalke riseth not up above a foote high, having very few leaves thereon, which are smaller, longer, and narrower than those below, with as few dents or notches on the sides as the other: the toppe of the stalke is divided into a few small branches, on every of which grow a few white flowers, like unto the Valerians, but smaller: the roote is small, and creepeth a little under ground, sending forth fibres, but no lesse sweet than the former.

5. *Valeriana annua sive Estiva Clusij.* Summer Valerian.

This annual Valerian, hath divers long leaves lying on the ground, all of them deeply cut in or gashed on the edges, somewhat like the leaves of the Starre Thistle, among which rise up round hollow stalkes, two or three foote

3. *Valeriana Alpina major five latifolia.*
Broad leaved wild Valerian of the Alpes.

4. *Valeriana Alpina minor.*
Small wild Valerian of the Alpes.

5. *Valeriana annua five Aethra Cuscy.*
Summer Valerian.

foote high, with some leaves growing thereon, two alwayes set together at a joynt, as in the other Valerians, but smaller and more divided than the lower; branching forth towards the top, on the which stand many flowers set together in tufts, being small and long, divided at the brimmes into five parts, making a shew of flowers, consisting of five leaves a piece, somewhat like unto the flowers of the Indian Valerian next following, and are of a pale red or flesh colour, which afterwards bring small seed, like unto the red Valerian of *Dodonaeus*; the root is small, white, and woody, but perisheth every yeare; this hath a small weake scent of Valerian.

6. *Valeriana Indica five Mexicana.* Indian Valerian.

The Indian Valerian groweth quickly into a stalke, from the first leaves that spring up, which are but few next the ground, somewhat long and broad, somewhat like unto the first leaves of the Mountaine Spiknard, of a pale greene colour; the stalke is weake and hollow, not standing upright, but leaning or bending downwards, set with joynts, at the which stand two long leaves, like unto those below, but a little more cut in or divided at the edges, and at the joynts likewise shoot forth two branches, sometimes on each side one, and sometimes but one branch on the one side, which are divided, and at the toppes of them doe beare many flowers, set thicke together in an umbell or tuft, each whereof is somewhat long, and endeth in five divisions; two of the uppermost whereof are broader and shorter than the rest, other two hang downe as labels or lips, and the fift is the greatest standing in the middle, in some plants of a deepe red, or purple being in bud, and of a pale purple colour being open, and in others milke white; each of these standeth in a small greene huske, wherein after the flower is fallen, the seed groweth, which huske openeth it selfe, and sheddeth the seed on the ground, when it is through ripe, if it be not carefully tended and gathered, which is

M

spongy.

6. *Valeriana Indica* five *Mexicana*.
Indian Valerian.

spongy, rounder, bigger, and blacker than any of the former Valerians, without any downe at the end of them: the roote is small and stringy, perishing every yeare with the first frosts: the whole plant is utterly without any smell, in all that I have seene, and almost without taste likewise.

7. *Valeriana rubra angustifolia*. Narrow leaved red Valerian.

This small red Valerian is very like unto the greater red Valerian set forth in this & my former Book, but differeth chiefly in the smallnesse, being lower, and the leaves long, and very narrow, very like unto the leaves of Line or Flaxe, but not so long, harder or rougher in handling than they, and ending in a point: the flowers are of a pale red, like unto them for forme, being long, but smaller than they, and having as little scent to commend them.

8. *Valeriana Petrea*. Rocky Valerian.

This small Valerian hath divers leaves lying upon the ground, some of them little or nothing divided, others as much cut in, and gashed on the edges, as any of the other Valerians, but they are nothing so great; the stalke is branched at the toppe, carrying tufts of purplish flowers, but smaller: the seed that followeth is smaller, without any downe at the head, but in stead thereof it hath little skins, as it were at the ends, divided in five parts, making them seeme like a Starre, much like unto the toppes of the seed of Scabions: the roote is small and fibrous, having a small scent of Valerian, as the leaves and flowers have also.

9. *Valeriana minor annua*. Small Valerian of a yeare.

This small Valerian hath the first and lower leaves somewhat round and dented, but the other that follow, and grow upon the stalke, are divided like unto other Valerians, the flowers are small and purplish, which are followed by small seed that is blowne away with the winde, the roote is small and thready, perishing every yeare.

10. *Valeriana minima*. Small Valerian.

This little Valerian is very like unto the small wilde Valerian, but much smaller, having the leaves much divided like thereunto: the stalkes are not above halfe a foot high, bearing tufts of small purplish flowers: the rootes are long and small, with small white threads or fibres, smelling like unto the small wild Valerian.

There are some other hearbes set forth by *Lobel* and others for Valerians, which in my judgement have so little resemblance thereunto, that I have not thought good to ranke them in their Tribe, but referre them to others, the one is called *Physicuma Nonspeliensium*: the other *Phu minimum alterum*, which *Dodonaeus* calleth *Album alus*, and generally is called of most, *Lactuca agnina lambes lettuce*, or Corne Sallet; which I have mentioned among the kindes of Lettice in this and my other Booke.

11. *Valeriana rubra Dodonai*. Red Valerian.

This Valerian hath divers hard, but brittle whitish Greene stalkes rising from the roote, full of tuberous or swelling joynts, whereat stand two leaves on each side one, and now and then some small leaves from betweene them, which are somewhat long and narrow, broadest in the middle, and small at both ends, without either division or dent on the edges, of a pale Greene colour: the stalkes are three or foure foote high, branched at the toppes, at the ends whereof stand many flowers together, somewhat like unto the flowers of the ordinary Valerian, but with longer neckes, of a fine red colour, but without any scent of Valerian: after the flowers have stood blowne a good while, they suddenly fall away, and the seed which is small and naked, with a little tuft of downe at the toppe thereof, whereby it is easily carried away with the wind, ripeneth quickly after: the roote is great, thicke, and white, continuing long, and shooting out new branches every yeare.

12. *Valeriana Graeca*. Greeke Valerian.

The Greeke Valerian hath many winged leaves lying on the ground, somewhat like unto the wilde Valerian that groweth by the ditch sides, but more tender and small, among which rise two or three round hollow brittle stalkes, two or three foote high, whereon are set at the joynts such like leaves as grow below, but smaller, the roppes of the stalkes are divided into many small branches full of flowers, each consisting of five small round pointed leaves, of a faire bleake blue colour in some plants, and in others white, with some white threads tipt with yellow pendants in the middle: after the flowers are past, there come up in their places small hard heads, containing small blackish seed: the roote is composed of a number of small long blackish threads, without any scent of a Valerian.

13. *Valeriana sylvestris*. Wild Valerian.

This wild Valerian hath sundry winged leaves springing from the roote, whereof the end leafe is the largest, of a sad Greene colour, without any dents on the edges, the stalke hath two such like leaves at a joynt as grow below, but smaller, and at the toppe branched, with sundry small whitish purple flowers, but deeper than the Garden Valerian, the roote is a bush of blackish threads and strings, which send forth strings of encrease, besides that the lower branches doe shoot forth fibres also. Of this kinde there is accounted a greater and a lesser.

Majer.

The

8. *Valeriana petraea*, Rocky Valerian.

12. *Valeriana Græca*, Greeke Valerian.

11. *Valeriana rubra* Dodonæi, Red Valerian.

13. *Valeriana sylvestris*, Wilde Valerian.

The Place.

The first is said by *Dioscorides* to grow in *Pontus*, it is found in the wet grounds of Mountaines, and in other moist places, it is generally kept in our gardens. The second grew in *Candy*, and was sent by *Honorius Bellus* from thence unto *Clusius*. The third groweth on the Mountaines of *Austria* and *Styria*; and so doth the fourth also, as *Clusius* saith he had from *Plateau*, but recordeth not from whence he had it. The sixth is said to come from *Mexico* a Province in the West-Indies, it came into these parts first from *Italy*, and as *Bauhinus* saith, that which beareth purple flowers, groweth (as he was given to understand) in the Country of *Latium*, or of the Latines in a place there called *Siculum*, and from thence was called of some *Valeriana Sicula*, and that with the white flower in the Country of the Sabines. The seventh was gathered on *Mons Baldus*. The eighth *Fabius Columba* found on the Mountaines in the Kingdome of *Naples*. The ninth groweth in garden onely with those that are curious, the naturall place being not knowne. The tenth *Lobel* saith groweth about *Mompelier* in *France*. The eleventh and twelfth in our gardens chiefly, for we know not the naturall places of them. The last two sorts grow in many Marshes and wet Medowes by Rivers and water sides in our owne Country.

The Time.

They doe all flower in the Summer moneths of June and July, & the Indian kinds if they be set early, will flower betime, and continue flowering untill the frosts pull it downe, and so doth the Summer or annuall kind also.

The Names.

It is called in Greeke $\pi\eta$ *Phu*, and $\nu\alpha\rho\delta\omicron\ \delta\gamma\iota\lambda\alpha$, *Nardus agrestis*, or *sylvestris*, because it is in smell and faculty like unto *Nardus*, in Latine *Valeriana*, a multis quibus valet facultatibus. Some also call it *Thericaria*, because it is an especiall ingredient into Treacle, and herba *Benedicta*, of *Paracelsus* it is called *Terdina*. The first is generally called, both in shops and of all other, *Phu majus*, and *Valeriana major hortensis*: in English the great garden Valerian, and of some Capons taylor, and Setwall: but Setwall properly is *Zedoaria*, an Out-landish roote in the Apothecaries shops, which never was knowne to grow in any of these Christian Countries. The second is called by *Bellus*, *Nardus Cretica*, because the rootes have the smell of *Nardus*, (but the whole face of the hearbe, as hee saith himselfe, is most properly like a Valerian) as all the sweet Valerians are more or lesse. The third is called by *Clusius* *Valeriana sylvestris Alpina prima latifolia*, and is the *Valeriana Alpina prima*, and also the *Valeriana Alpina Scrophularia folio* of *Bauhinus*, described in his *Prodromus*; both which as hee himselfe saith, are comprehended under this of *Clusius*: and is also the same that *Pilleterius* sent from *Mompelier*, unto *Lobel* in his life time, under the name of *Valeriana montana*, which I doe here publish, and it is probable to be the *Valeriana montana* of *Lygdamus*, although *Bauhinus* seemeth to make it an other peculiar sort. The fourth is called by *Clusius* *Valeriana sylvestris Alpina secunda saxatilis*, which *Bauhinus* calleth *Valeriana Alpina Nardo Celtica similis*. The fifth is called by *Clusius* *Valeriana amua sive Aftiva*, and *Bauhinus* calleth it *Valeriana folijs Cactirape*. The sixth is generally now called *Valeriana Mexicana*, and *Indica*: notwithstanding as is before said, they have bene both found growing naturally in *Italy*; and as *Bauhinus* saith *Paschalis Gallus* sent him that with the white flower, from *Padoa* many yeares agoe, under the name of *Valeriana Indica Imperati*; and againe from *Casibon* under the name of *Nardus Cretica*: *Corsusius* did judge it to be *Tripolium* of *Dioscorides*, and was chiefly led therunto, by the figure of *Tripolium*, which he saw in a Manuscript of *Dioscorides*, which *Pinellus* kept in his Library. The seventh *Bauhinus* onely hath set forth the description thereof, under the same name is expressed in the title. The eighth *Fabius Columba*, calleth *Valerianella altera tenuifolia seminis scabiosa stellato*. *Tabernmontanus* calleth it *Phu minus petraeum*, and *Bauhinus* *Valerianella semine stellato*. The ninth hath no other than is set downe in the title. The tenth *Lobel* calleth *Phu minimum*, and *Bauhinus* *Valeriana sylvestris folijs tenuissime divisis*. The eleventh is taken to be *Polemonij altera species* by *Gesner* in his *hortis*, and saith it is the *Limonium Mompeliensum*, but *Dodonaeus* contrarieth that opinion, *Lobel* calleth it *Ocimum Valerianthou*: *Dodonaeus*, *Camerarius*, and others *Valeriana rubra*, and usually with us, *Valeriana rubra Dodonaei*, yet *Camerarius* in his Epitome calleth it *Phu peregrinum*. The twelfth is called *Valeriana Graeca* by *Dodonaeus*, and so generally with us and others, *Lobel* and *Camerarius* *Valeriana peregrina*, and *Bauhinus* *Valeriana cernlea*. The last is usually with most called *Valeriana palustris*, and *sylvestris*. The Arabians call it *Fu*: the Italians *Valeriana*: the Spaniards *Terva benedicta*: the French *Valeriane*: the Germanes *Balkaria*, and *Theriack kraut*: the Dutch *Speerkrude*, and we in English as is before said.

The Vertues.

Dioscorides saith that the garden Valerian hath a warming faculty, and that being dried and given to drinke, it provoketh urine, and helpeth the strangury, and the decoction thereof taken doth the like also, and doth take away paines of the sides, procureth womens courses, and is used in Antidotes. *Galen* saith that the rootes of *Phu* or Valerian are sweet, and like unto *Nardus* in quality, but much weaker to all purposes almost, yet it provoketh urine more plentifully, than either the Indian or Syrian *Nardus*, and is like unto Celtick *Nardus* therein. *Pliny* saith that the powder of the roote given in drinke, or the decoction thereof taken, doth helpe all stranglings or choakings in any part, whether they be because of paines in the chest, or sides, and taketh them away. The roote of Valerian boyled with Liquorice, Raisins, and Aniseed, is singular good for those that are short-winded, and for those that are troubled with the cough, and helpeth to open the passages, and to expectorate flegme easily. It is given to those that are bitten or stung by any venomous creature, being taken in wine: it is of especiall vertue and property against the plague, the decoction thereof drunke, and the roote being used to smell unto: it helpeth also to expell the wind in the belly. The greene hearbe with the roote taken fresh, being bruised and applied to the head, taketh away the paines and prickings therein, stayeth rheumes and thin diffusions, and being boyled in white wine, and a droppe thereof put into the eye, taketh away the dimnesse of the sight, or any pime, haw, or webbe therein. It is of excellent property to heale any inward sores or wounds, as also for outward hurts or wounds, and draweth any splinter or thorne out of the flesh. The decoction of the roote of the lesser Valerian, is stronger to resist poisons and infections than the greater, as *Matthiolus* saith. It is very profitably applied to asswage the swellings of the cods, caused of cold or of winde, if the fumes or vapours of the decoction thereof, made with wine, be applied warme unto them. The water distilled from the greater Valerian both hearbe and roote, in the moneth of May, is singular good to be taken fasting for all the purposes aforesaid, and is a good and safe medicine in the time of the plague: it killeth also the wormes in the belly, and is singular good to wash either greene wounds, or old ulcers. It is generally called in the Countries of this Land, the poore mans remedy, to take the decoction of this roote and drinke it, when by taking

cold

cold after sweating, or over-heating their bodies, they be troubled with the cholicke or winde, or are otherwaies distempered: or to use the greene hearbe bruised and laid to any cut or wound, or to draw out any thorne or splinter, and heale it after.

CHAP. XLIIII.

Conyza. Fleabane.

Dioscorides setteth forth three sorts of *Conyza* or Fleabane; a greater and a lesser, and a third which is betwene both. Theophrastus and Pliny that followeth him, make but two sorts, a male and a female: others have added a fourth, the least of all: but there are divers other hearbes referred unto them by Clusius and others, as they have found them in their travels: some of these sorts are found wild in our Country in some places, but because they are not very frequent to meet with, I thinke it not amisse to ranke them with the rest of their Tribe in this place.

1. *Conyza major* verior *Dioscoridis*.
The truest great Fleabane.

1. *Conyza major* verior *Dioscoridis*. The truest great Fleabane.

This great *Conyza* which is accounted the truest and nearest unto that of *Dioscorides*, hath divers hard rough, or hairy round woody stalkes, two or three foote high; whereon are placed without order, many long and somewhat narrow pale greene leaves, dented a little about the edges, very clammy as the stalke is also, but much more in the hotter Countre, than in this, and are somewhat like unto the leaves of the Italian Starrewort, but larger, and more pointed at the ends: towards the toppes of the stalkes come forth at every joynt with the leaves a yellow flower, somewhat large, like unto the flower of Hawkweed or Groundsell; which when it is full ripe, turneth into downe, and flyeth away with the seed: the smell hereof is somewhat strong, but somewhat sweet withall, and not loathsome: and is also glutinous and clammy, that what small thing soever as Flies, &c. lighteth upon it, is held thereon.

2. *Conyza major montana Germanica*. Great Mountain Fleabane of Germany.

This kinde of *Conyza* hath divers round greene stalkes, about two foote high, nothing so clammy as the former, having many long pointed leaves set thereon without order, of a sad or darke greene colour, each whereof is foure or five inches long, and an inch and a halfe broad: the flowers are yellow, somewhat larger than the other, every one standing at the toppes of the branches, upon a long stalke, in the same manner that the former doe, that is with a pale or border of leaves, and many small thrums in the middle, passing into downe; and is carryed away with the winde, even as they doe. There is another of this sort with longer leaves, and lesser flowers.

3. *Conyza Helenitis mollis incana*. Hoary sweet Fleabane Mullet.

This Fleabane Mullet riseth up with divers long and somewhat broad leaves, neare unto the forme of Fox-glove leaves, but that these are hoary or gray on the upperside, and of a brownish greene on the under side, herein somewhat like unto the leaves of *Rha Heleni folio*, or Bastard Rubarbe with Elecampane leaves: the stalkes are hoary likewise, rising to be two or three foote high, set with the like leaves as grow below, but smaller and smaller up to the toppes, where many flowers stand together, like unto the former Fleabanes, and much greater than Groundsell, which turne into downe and flie away with the winde: the roote is composed of many blackish strings and fibres, whereby it taketh fast hold of the ground, the whole plant is somewhat clammy, yet much lesse than the first, and much sweeter than it.

Lobel giveth us the figure of another sort, whose chiefe difference consisteth in that the leaves are jagged or cut in on the edges.

4. *Conyza Helenitis pilosa*. Hairy Fleabane Mullet.

This Fleabane is both in forme of leaves and flower, and other things so like the last recited Fleabane Mullet, that there is no other difference to be found; but in that both leaves and stalkes are besides the hoariness, more hairy and rough than it, which causeth it to be held as a differing sort.

5. *Conyza montana pilosa*. Hairy Mountain Fleabane.

This kind of Fleabane is also a differing kind from the last, in that the leaves as well as the stalkes, which are round, firme, a foote high or more, are hairy and rough, being smaller than the former, and not much bigger than the leaves of Hysope, but as glutinous and clammy (which may be by reason of the hot climate wherein it groweth) as the first, of a strong virulent scent like to the smell of a Goat: at the toppes of each of these stalkes, which are many, standeth one small pale yellow flower, somewhat like unto the flower of a Sow-thistle, which turneth into downe.

Conyza folio

2. *Conyza major montana* Germanica,
Great Mountain Fleabane of Germany.

3. *Conyza Helenis* melissa incana,
Hoary Sweet Fleabane Mullet.

6. *Conyza odorata carnulea*. Sweet purple Fleabane.

4. *Conyza Helensis pilosa*.

downe, and is carried away with the winde as all the rest are: the roote is blackish without, but white within, hard, dry and woody, of an harsh taste, allringent or binding; the whole plant else is somewhat bitter, with a little acrimony also to be tasted therein.

6. *Conyza odorata carnulea*. Sweet purple Fleabane.

From a short whitish root with many fibres thereat, springeth up many small short leaves, somewhat like unto the leaves of the garden Daisie, but somewhat writhed: among which riseth up a stalke two foot high sometimes, brownish at the bottome, set here and there up to the toppe with longer and narrower leaves, where it is divided into small and short branches; whereon stand many flowers, one above another, in small skaly greene heads or huskes, composed of many small and narrow bluish purple leaves, somewhat white at the ends or tippes, with a small yellow flat thrum in the middle, and in the middle thereof, there riseth up divers white threads, whereby each flower consisting of three colours, white, purple, and yellow, maketh it seeme the more delectable to the Spectators: after these flowers are past, there commeth in those huskes or heads that held them, small long seed lying in the downe, each having some thereof at the head, which together therewith is blowne abroad with the winde, if it be not gathered and kept: the whole plant is of a sharpe taste, but the roote much more, almost as much as pepper, and of a strong but not unpleasant scent.

7. *Conyza carnulea Alpina major*. Great blue Mountain Fleabane.

The roote of this Fleabane is small, woddy, and reddish, from whence riseth a thicke hairy stalke, about a foote high, divided at the halfe way into three small branches, each whereof hath other small stalkes, and one flower at the head of them, which is of a purplish blue colour, like unto the
lalt,

last, and likewise turning into a downy matter, easie to be carryed away with the winde: the leaves on the stalkes are thinly set thereon, being hairy thicke, long and narrow, about three or foure inches in length, and about an inch in breadth.

8. *Conyza cerulea Alpina minor*. Small blue Mountaine Fleabane.

This small plant is scarce an hand breadth high, and sometimes lower, having a small round slender stalk, somewhat hairy, whereon groweth onely one bluish flower; like unto the greater kinde of Mountaine Fleabane, but three times smaller, with many threads in the middle flying away with the wind, when it is ripe as the other: it hath many small leaves at the bottome of the stalk, and the toppe of the roote, which are of a pale Greene colour, and about three inches long, but shorter as they grow higher upon the stalk, every one having a short foote-stalk at the bottome thereof: the roote is blackish and fibrous.

9. *Conyza minor vera Pena*. The truest small Fleabane.

The little Fleabane is seldome found with more than one stalk rising from the roote, which is a foote and a halfe, or sometimes two foote high, and sometimes lower than a foote, somewhat hairy and clammy also, but greener than the great kinde, as the leaves are also, which are long, narrow, and fat or clammy, somewhat like unto the leaves of *Linaria* or *Toade-flaxe*, set thereon up to the top, where it sometimes brancheth forth, or from the middle thereof upwards; with the small leaves come small pale yellow flowers, like unto the great kinde, which turne into downe, and are blowne away with the winde, as the others are, the roote is small and slender, with a few fibres thereat, but the whole plant smelleth sweeter than most of the former, and dyeth every yeare, and either raiseth it selfe of its owne sowing, or must bee new sowne every yeare.

10. *Conyza minor Rauwolfij*. Small Syrian Fleabane.

The small Syrian Fleabane hath many small low branches about a foot or more high, whereof few stand upright, the most of them leaning or lying downe upon the ground, and taking roote againe, in severall places as they lye; the leaves that are set thereon are small and long, somewhat like unto the leaves of the Olive tree, being fat or clammy, and hairy also, of a strong scent, yet somewhat sweet withall: the toppes of the stalkes are garnished with small yellow flowers like unto the last, which when they are ripe flye away with the winde as they doe.

There are other sorts of Fleabanes which because they grow in moorish watery, or wet places, shall be remembred hereafter among the marshy or watry plants.

The Place.

The first groweth naturally onely in the warmer Countries of *Spain*, *Italy*, *Narbone* of *France*, and the like, and will hardly endure the cold of these Countries, and therefore must be carefully kept in the Winter, if any would have it. The second is familiar to *Germany*, and therefore will better abide, having beene found by *Joannes Thalius* and others in *Harcynia sylva* in *Saxony*, and we in many places of our owne land, as toward *Hampsted*, &c. The third and fourth *Lobel* saith were found upon the hills in *Artois*. The fifth was found by *Myconius* on high hills in *Spain*. The sixth is found in divers places in the Kingdome of *Naples*, in moist fields that are in the Mountaines, as *Columna* saith, as also in the sand pits or places, neare the River of *Rhosne* by *Lions* in *France*, and the *Alpes* in *Austria*, as *Clusius* saith. The seventh was found on *Saint Bernards Mount* in *Switzerland*; and the eight on the Hill of *Saint Gotthard*, as *Baughinus* saith in his *Prodromus*. The ninth groweth not farre from *Madriil* in *Spain*, as *Clusius* saith, as also in the woods of *Grammont* neare *Mompelien*, as both he and *Lobel* say. The last *Rauwolfius* found growing about *Tripoly* in *Syria*.

The Time.

They doe all flower in the Moneths of *June*, *July*, and *August*, some earlier or later than others; the first and the ninth for the most part flower latest.

The Names.

It is called in Greeke *κνυζα*, and in Latine also *Conyza* sic forte dicta quia κνυζας, id est culices suo lentore capiat, because as is said in the Description, the glutinous clamminesse both of leaves and stalkes, holdeth fast whatsoever falleth upon them, yet *Dioscorides* saith it is so called, because *Suffitu vel Substratu culices abigit & culices necat*. *Gaza* translateth it *Pulicaria*, and we in English Fleabane accordingly, because being burnt or laid in Chambers, it will kill Gnats, Fleas, or Serpents, as *Dioscorides* saith, and not Fleawort, for that is an other herbe as shall bee shewed in his place. The first is the truest great *Conyza* of *Dioscorides*, by the judgement of *Camerarius*, *Dodonaeus*, *Lobel*, *Pena*, *Lugdunensis*, and others. The second *Joannes Thalius*, as I said, first called *Conyza major montana*, who hath also another which he calleth *major altera*, both of them being very like one unto another, whereof *Camerarius* in hort. setteth out the figure, and *Baughinus* thereupon calleth it *Conyza montana lutea folijs oblongis*. The 3. of both sorts and 4. are so called, as they are in their titles, by *Lobel* in his Dutch Hearball, because the scent of them is not strong like the other *Conyzas*, but sweet like Honey. The fifth is called by *Lugdunensis* *Conyza montana Myconi*, and *Baughinus* *Conyza montana folijs glutinosiss pilosis*. The sixt is called by divers *Conyza odorata*, as *Lugdunensis* saith, and of *Columna* *Amellus montanus*, because hee saith it is so like unto the *Amellus Virgilij*. *Gesner* in his booke *De Collectione Stirpium*, and *Cordus* also, calleth it *Conyzoides cerulea*, *Tabermontanus* *Conyza cerulea*; it is called also *Dentelaria* of the effect to cure the toothach. *Baughinus* calleth it *Conyza cerulea acris*, and saith it is the same that *Dodonaeus* in his French Booke calleth *Erigerum tertium*, and in his Latine Booke *Erigerum quartum*: but *Dodonaeus* in those places maketh no mention of any blue or purple colour in that *Erigerum* but onely saith it hath a pale yellow flower, so quickly fading, that it abideth not a day, but even almost the same houre that it is blowne, it doth

9. *Conyza minor vera Pena*.
The truest small Fleabane.

fade, which I am sure this *Amelins* doth not, and is not wholly yellow, as that of *Dodonæus* is. The seventh and eight *Bauhinus* calleth *Conyza cerulea Alpina major & minor*. The 9. is called *Conyza minor vera*, both by *Pena*, *Clusius*, *Gesner*, & others, because it differeth from the more common fort. The last *Paulwolfius* referreth to the *Conyza minor* of *Dioscorides*, which *Clusius* rather thinketh is a species of his greater kinde, yet *Bauhinus* calleth it *Conyza major altera*, and quoteth both *Paulwolfius* and *Clusius* to call it *Conyza major Dioscoridis*. The Italians call it *Conyza*: the Spaniards *Attadegua*: the French *Conyza*: the Germanes *Hundsang* and *Durwurtz*: the Dutch *Donderwortel*.

The Vertues.

The leaves of Fleabane as *Dioscorides* saith, are fitly applied to the byrings or hurts of all venomous creatures, as also for pushes and finall swellings, and for wounds: the leaves and flowers boyled in wine and drunke, is good to bring downe womens courses, and to helpe to expell the dead child: taken also in the same manner, it is good to procure urine, or when one maketh it by drops: it helpeth also those that have the yellow jaundise, and the griping paines of the belly: it is also good for the falling sicknesse, taken in vineger: the decoction is good to helpe many griefes of the mother, if women be bathed therewith, or fit therein: if the juyce bee put into the Matrix it causeth aborcement, that is to be delivered before the time: the oyle made of the hearbe, and annoynted, is very effectuell to take away all shaking fits of agues, and those tremblings that come of cold. The small kinde helpeth the paines in the head. *Galen* saith that both the greater and the lesser are hot and dry in the third degree, and therefore powerfully warmeth any place wherunto they are applied, whether used of themselves, or boyled in oyle, and annoynted: the leaves bruised and bound to any greene wound or cut, being first well washed or cleansed, healeth in a short space: applied also to the soles of the feete, it stayeth any laske or fluxe, and bound to the forehead is a great helpe to cure one of the frensie: it openeth the obstructions of the liver, if the decoction thereof made in wine be drunke: If either Goats or Sheepe eat hereof it will kill them by any extremity of thirst. The lesser is effectuell to all the purposes aforesaid, but is more powerfull to helpe any fluxe, or the bloody fluxe. The sixth as is said before, helpeth the toothach.

CHAP. XLV.

After. Starwort.

He likenesse in many things that the Starworts have with the Fleabanes, enforceth me to place them next thereunto, whereof we have such a number, as well of those that were formerly knowne to many, as those which our later times have made knowne to us, and from *Virginia*, *New-England*, &c. have come not the least flore unto us. And although *Dioscorides* hath set forth but one kind, which he calleth *After Atticus* of the place no doubt, where it grew most plentifully, or was of greater force, which was the Country of *Athens*, yet later Writers having found out divers other hearbes, somewhat like unto it, have referred them thereunto; all which I meane in this Chapter to declare unto you.

1. *After Atticus luteus verus*. The true After Attick, or yellow Starwort.

1. *After Atticus luteus verus*. The true After Attick, or yellow Starwort.

This Starwort riseth up with two or three rough hairy stalkes, a foote and a halfe high, with long rough or hairy brownish darke greene leaves on them, divided into two or three branches: at the top of every one whereof standeth a flat scaly head, compassed underneath with five or sixe long browne rough greene leaves, standing like a Starre, the flower it selfe standing in the middle thereof, is made as a border of narrow long pale yellow leaves, set with brownish yellow thrums, the root dyeth every yeare after seed time.

2. *After cernuus Columne*. The soft Starwort of Naples.

The soft Starwort is very like unto the former yellow Starwort, but that the leaves hereof are somewhat broader, larger, and not so rough or hairy, the stalke is in like manner branched toward the toppe, which is not slenderer there than below, but groweth thicker where the flower standeth, and bendeth downward; on the toppe of every branch standeth one flower, somewhat like the other, consisting of many yellow leaves, with brownish threads or thrums in the middle, and compassed about with many more greene leaves, which are soft and gentle in handling, and not prickly or rough as the other: the seed is hiter in taste, long and narrow, somewhat flat withall, yellowish, clammy, crested, and sweet in smell: the root is composed of divers bigge yellowish strings, of an aromatical taste.

3. *After supinus*. Low creeping Starwort.

This low Starwort riseth up with many slender weakerested, and somewhat hairy stalkes, leaning downwards, and not standing upright, whereon are set many long

3. *Aster spicius*. Low creeping Starwort.

long and narrow leaves, a little round at the toppe, very like unto the former, but smaller and greener up to the toppe; every stalke beareth one flower which is yellow and large, like unto the flower of a corne Marigold, contained in a very hard huske, made of small Greene leaves, which after the flower is past, becommeth so hard and woody that one can scarce open or breake it, to take out the seed which lyeth close sticking therein: the roote is long and slender, having a few fibres set thereat, and abideth divers yeares, if it be a little defended from the extremity of Winter.

4. *Aster luteus major Austriacus*. Great yellow Starwort of Austria.

This Starwort hath many long and narrow leaves, of a pale Greene colour at the ground, somewhat like unto the leaves of that kind of *Scabious*, that is called Divels bit, whose leaves are not jagged at all, but are sometimes covered with a little downe, the stalke is about two foote high, brownish and round, whereon are set sparsely long narrow pointed leaves, a little dented about the edges, at the toppe whereof it is divided into a few small and short branches, every one bearing a large yellow flower, composed of many small flowers, consisting of five leaves apeece, set together in a round head, compassed about with many long, somewhat broad and flat leaves, of a most excellent yellow colour, of a weake scent or none at all: after the flower is past, the seed is contained in the heads, cornered as if it were three square, lying dispersed in a downy substance: the roote is somewhat thicke and blackish, growing allope in the ground, sending forth many strings, & shooting forth many heads, whereby it may be encreased.

5. *Aster montanus folijs Salicis*. Starwort with Willow leaves.

This Starwort from a long creeping roote, wonderfully spreading under ground, and encreasing: shooteth up divers crested strong Greene stalkes, two foot high, plentifully stored with leaves thereon, being longer, harder, and greener than the last, without any downe or woolliness on them, and a little dented about the edges, somewhat sharpe and hot in taste: the toppes of the stalkes are divided into two or three small branches, each sustaining divers small Greene heads, composed of many small leaves set together, one about another, which in time open themselves into flowers, of as large a size as the last, but with a smaller thrum in the middle, and narrower leaves compassing them, parted or divided at the end.

6. *Aster luteus lanuginosus*. Starwort with woolly leaves.

This woolly Starwort hath divers small and strong Greene or browne stalkes, somewhat woolly, rising from the roote (which is spread under ground, and fastned with many long and strong fibres, shooting yearly new sprouts for encrease, but nothing so much as the last) beset without order, with many long and narrow Greene leaves, bowing to the ground, and covered over with a soft woolly downe, compassing the stalkes at the bottome of them; of a sharpe hot taste, and somewhat bitter: at the toppe of the stalke standeth a large head, made as it were of many scaly leaves, which sustaineth a large round flower, consisting of many long, narrow, and pale yellow leaves, as a border to the middle, which are a number of small mossy flowers set together, of a deeper yellow than the border; the whole flower doth resemble that of *Elecampane*, and without any scent to commend it: the stalke brancheth forth from the joynts below, into three or foure branches, rising higher than the middlemost, every of them bearing such a flower: which when they are past, the seed contained in those heads, with the woolly or downy substance therein, is carried away with the Winter.

7. *Aster luteus angustifolius*. Narrow leaved Starwort.

This narrow leaved Starwort hath as great a creeping running roote as the fourth, and giveth as plentiful encrease, from whence spring up many small hard Greene stalkes, not much above a foote high, whereon grow many long and narrow leaves, without any order one above another, not dented at all about the edges, but else very like unto the leaves of the wild Pellitory or *Parmica*, up toward the toppes, where they are divided sometimes into two or three small branches, every one bearing a Greene scaly head, and out thereof a yellow starlike flower, as the others have, but lesser than any of the former: these branches doe seldome over-toppe their middle or master branch, as the last recited doth; the seed that followeth is very like unto the other: and carried away with the wind in the same manner.

Pena and Lobel in their *Adversaria* have set forth two sorts of *Aster*, which they call *Aster montanus*, and *hirsutus*: *Bambinus* maketh them both of the number of his yellow *Asters*, but because that, as *Clusius* seemeth to say they are comprehended under the others here set downe, I make no further mention of them.

8. *Aster Virginicus latifolius luteus repens*. Yellow creeping Starwort of Virginia.

This Starwort riseth up with a strong round stalke, two or three foote high, bearing at the joynts two faire broad leaves like the leaves of a small *Flos Solis*, but more pointed at the ends, and being harder in feeling, full of veines: at the toppe of the stalke (which seldome brancheth) standeth one large flower (rising out of a Greene huske made of nine or ten Greene leaves) composed of many long and narrow yellow leaves, with a brownish thrumme in the middle: which being past, there followeth seed like unto a small *Flos solis* as it is said, for I never saw it beare seed: the roote is stringy, creeping under ground, and spreading much: it loseth both stalke and leafe every yeare, and springeth a new from the roote.

6. *After luteus angustifolius.*
Narrow leaved yellow Starwort.

5. *After luteus lanuginosus.*
Starwort with woolly leaves.

8. *After Virginicus latifolius luteus repens.*
Yellow creeping Starwort of Virginia.

9. *After Virginicus luteus membranaceo caule.* Yellow Starwort of Virginia with a filmy stalk.

This yellow Starwort groweth to be 6. or 7. foot high, with many stalkes, whose lower part thereof, almost to the halfe, is round, hard, and strong, the other part upward having a small filme of skin on foure sides thereof (as is to be seene in many other plants) up to the toppe which brancheth not, but beareth sundry small flowers, as if they were tufts at the first, but being blowne open, each is a yellow starre composed of five or six small and long yellow leaves with small thicke yellow pointels in the middle, each having a blackish tippe or point resembling flowers, and afterwards turne to be flat seed, broad at the head, which are so separately set together, that they resemble the head of seed of a *Ranunculus*, but greater: the leaves stand singly on each side of the stalkes, being very like unto the former, of a dead or sullen greene colour, but not altogether so large and broad, a little longer pointed also, and more rough in handling, with a small foot-stalke under each: the roote is knobbed and woody, with sundry long strings fastned unto them, and encreaseth much at the sides, but creepeth not, holding strongly in the ground: this flowereth late with us, and that not but in a warme yeare, whereby we seldome observe the seed: divers doe take this to be the *Wisanck* or *Wosocan* of the Virginians, but if *Gerard's* information be right, as it is most probable, that which he calleth *Wisanck*, beareth crooked pods, and such doth the *Periploca* of Virginia, as I first well observed in Master *Francquevilles* garden, whose roote creepeth farre under ground, and therefore in my judgement this cannot be their *Wisanck*; this also loseth the stalkes as the former, and springeth fresh every yeare.

10. *After Virginicus luteus alter minor.* Another yellow Starwort of Virginia.

The other yellow Starwort of Virginia groweth up but with one upright small round stiff stalk, foure or five foote high, bearing two faire greene long shining leaves at every joynt, dented about the edges, but smaller than the former, standing on small foote-stalkes, and somewhat hard in feeling: at every joynt with the leaves on both sides, from the very bottome come forth branches, halfe a yard long at the least, with the like leaves on them: at the toppe of each stalk and branch standeth one flower, whose greene small round button under it, hath divers small greene leaves on the head thereof, out of which breaketh the flower, consisting of a dozen yellow small and long leaves, compassing a middle deepe yellow thum: this although I and some others have had it growing with us, yet flowered and seeded with none but Master *Tradescant* at South *Lambeth*. The seed by reason it flowereth late, we have not yet well observed: the root is composed of sundry white and long hardish strings, with small fibres at them, and abideth divers yeares, encreasing by the sides, but perisheth to the ground, shooting new heads every yeare.

11. *After Conyzoides.* Fleabane like Starwort.

This kind of Starwort hath long and narrow leaves growing on the branched stalkes, which are a foote high, set singly thereon without order: the flowers grow singly at the toppe of every stalk and branch, composed of many duskie yellow leaves, with a browner thum in the middle turning into downe, which with the small seed is carried away with the wind: the roote is thready.

Wee have had from Virginia another sort of this kind, very like unto it, but with smaller flowers.

12. *After*

11. *Aster Conyzoides*.
Fleabane like Starwort.

12. *Aster supinus Conyzoides Africanus*.
Fleabane-like Starwort of Africa.

12. *Aster supinus Conyzoides Africanus*. Fleabane like Starwort of Africa.

This hath sundry weake branches rising from a slender long white roote, with divers small and long hoary leaves set thereon without order : both stalke and branches beare each but one yellow Star-like flower thrummed in the middle, which after it is ripe turneth into downe, which with the small seed enclosed together, flyeth away with the winde.

13. *Aster Atticus Isalorum flore purpureo*. Purple Italian Starwort, or the purple Marigold.

The Italian Starwort hath many woody round and brittle stalkes rising from the roote, about two foote high, whereon are set without order to the toppes many somewhat hard and rough long leaves round pointed, and is divided into sundry branches, bearing single flowers like Marigold, the outer border of leaves being of a bluish purple colour, and the middle thum of a brownish yellow, breaking out of a Greene scaly head, like unto those of Knapweed, but lesser : these flowers abide long in their beauty, and in the end wither and turne into a soft downe, wherein lie small blacke and flat seeds, somewhat like unto Lattice seed, which with the downe is carried away with the wind : the roote is composed of sundry white strings which perish not, but abide many yeares with Greene leaves on their heads, and spring afresh every yeare.

14. *Aster Atticus caruleus alter*. Another blue Starwort, or another purple Marigold.

This other purple Marigold or blue Starwort, is a species or differing sort of the other *Aster Atticus Isalorum flore purpureo*, so like thereto in stalke, leafe and flower, that one would thinke there wete no difference, and indeed it is not much, but consisteth chiefly in these particulars : the leaves of this are narrower than the other, and pointed at the ends : the stalke riseth not up so high, flowreth somewhat earlier before the other, and is of a palet purple colour, and sometime found white also.

Of this Narrow-leaved kinde there is one also which groweth lower than this, and is therefore called a dwarf kinde. *Alter Humilis*

15. *Aster Alpinus caruleo magno flore*. The great blue Mountaine Starwort.

From among a number of small long and narrow leaves, hoary as well on the under as upper side, of the forme of garden Daisie leaves, being small and narrow at the bottome, and growing broader to the end, which is round pointed lying about the roote of this Mountaine Starwort, upon the ground, riseth up a stalke scarce a foote high, beset with the like leaves as grow below, but smaller up to the toppe, where there standeth a round head, composed of many small purplish leaves set close together, in the midit whereof breaketh forth a large great flower, consisting of many long narrow leaves, of a purplish blue colour, standing as a pale or border, about a middle yellow thum, which upon the fading, turneth into downe, wherein the seed lyeth, and both together are disperfed with the wind : the roote is somewhat long, growing aslope in the ground, with many small white fibres annexed thereunto, and encreasing by the sides as the rootes of Daisies doe.

Aster

13. *Aster Atticus italorum flore purpureo.*
Purple Italian Starwort, or the purple Marigold.

15. *Aster Alpinus ceruleus magno flore.*
The great blue Mountain Starwort.

16. *Aster hirsutus Austriacus ceruleus magno flore.* Great blue Starwort of Austria.

This Starwort likewise hath many leaves lying upon the ground, about the toppe of the roote, but they are thicker, broader, rougher, yet with a soft hairinesse, somewhat sharpe about the edges, and ending in a more rigid or sharpe point: with such like leaves is the round stalke also beset up to the toppe, where it is divided sometimes into one or two branches, each sustaining as large a flower as the last, but the middle thrum is of a paler yellow colour, and compassed about with a number of small long leaves, of a pale blue colour, which passeth into downe, like unto the other: This although it be somewhat like the last, yet is not the same, but a manifest differing kinde thereof.

17. *Aster minor angustifolius.* The French purple Starwort.

This purple Starwort riseth up with many slender, but straight upright stalkes, of a foote and a halfe high, set with many leaves up to the toppe, longer and narrower than any of these blue or purple Starworts last recited, somewhat like unto the leaves of *Linaria* or *Tode-flaxe*: at the toppe of each stalke stand three or foure flowers smaller than the two last Starworts, and somewhat lesser than the first of these blue kindes; consisting of many small leaves standing as a Starre, of a very pale bluish purple colour, and the middle thrum yellow, which passe into downe, and carryed away with the wind as the others doe. I should adjoyne unto these the *Tripolium*, both for the likenesse of the flowers, and the English name of Sea Starwort; and although it be a sweet hearbe, yet because it is a plant that delighteth better to grow in watery places, I will referre it to bee spoken of among the *Paludosa* or watery hearbes.

18. *Aster Virginicus latifolius precocior purpurante flore parvo.* The earlier and broad leaved purplish Starwort of Virginia.

The leaves of this Starwort which stand singly on the sundry hard stiffe brownish Greene stalkes, of a yard high, with short foot-stalkes under them, are broad and round at the bottome, growing narrower to the point, and finally dented about the edges, of a fresh Greene colour on the upper side, and somewhat yellowish underneath: each great stalke towards the toppe brancheth forth into flowers, which stand in a tuft or spike, with divers small Greene leaves below them on the stalke, and the flowers being many, set on severall small branches, have a small greenish scaly huske, and a small pale purplish flower coming out of it, consisting of sundry small leaves laid open like a Starre, with divers pale yellow threads rising up like a thrum, which turne into a downe with small seed therein: the roote is living, holding Greene leaves all the Winter when the stalkes are withered and dead, but hard and woody at the head, sending forth long whitish strings: this flowreth a moneth or two before the next, that is about the end of August, or later if the yeare prove not warme.

19. *Aster Virginicus angustifolius serotinus parvo albente flore.* The narrow leaved and later flowered Starwort of Virginia.

The many stalkes of this Starwort grow higher than of the other, bearing single leaves at every joynt, being long and narrow, without any dent at the edges, and without any foot-stalke at the bottome: at every joynt from about the

17. *Aster minor angustifolius.*
The French purple Starwort.

the middle upwards it shooteth very long branches, and they oftentimes branched againe, at each joynt whereof stand single leaves, but much smaller and thicker set than below, the flowers stand singly also at the joynts and toppes of every stalke and branch, which are small and Starre fashion, of a pale white colour, with a single purple thrum in the middle, rising out of a small greene huske which turne into downe like the former: the roote is composed of sundry long white strings, which live long, and encrease much, losing all the stalkes in the Winter, and holding a tuft of greene leaves, untill it shoot new stalkes the next year: this flowereth much later than the other, sometimes not untill the end of October, or beginning of November, yet a moneth sooner in a warme year.

The Place.

The first kind of Starwort groweth in Province and Narbone in France, in Lombardy also. The second on the Mountaines in the Kingdome of Naples. The third in New Castile in Spaine. The fourth at the foote of the Alpes of Austria and Stiria, and on Leyenberg, and other hills neare Vienna. The fifth in Moravia, and on the hills neare Vienna. The sixth likewise neare Vienna, at the foote of divers hills, and on the woods that were felled there. The seventh likewise in the fields neare Vienna, and in a small Wood neare the River Donau or Danubius. The eight hath beene many yeares growing in England, since it was first brought out of Virginia, and so hath the ninth also, but the tenth we have had scarce time enough to observe it thorowly since we got it from Virginia, by the meanes of Master George Gibbes Chirurgeon of Bathe, who brought in his returne from thence, a number of seeds and plants hee gathered there himselfe, and flowered fully only with M. Tradescant. The eleventh groweth in many places of our owne land, in moist or shadowy places. The twelfth Guillaume Boel many yeares agoe brought out of Barbary with him. The thirteenth in many meadowes both in Italy and France. The fourteenth in many places of Hungaria, Austria, and Moravia. The fifteenth in the grassy fields on the Alpes of Austria. The sixteenth groweth about Crenisum in Austria, and other parts of the Alpes there, as also on the Mountaine Iura in Switserland neare Geneva. The seventeenth on the dry Rocky hills and Olive yards about Montpellier and Castrum novum. The eighteenth and last were sent us from France growing first in Canada. Some of them are hardly nourished up in gardens, especially the eighth and ninth, which are unwilling to change their natural habitation.

The Time.

They doe all flower in the Summer moneths of Iune and Iuly, some earlier or later than others.

The Names.

It is called in Greeke *Ἀστὴρ ἰσχυρὸς* & *ἰσχυρὸς*: in Latine *Aster Atticus*, *Bubonium* & *Inguinalis*, both for that the flower is like a Starre, and that as it is likely, it grew plentifully about Athens, and of the effect to cure the sores that hapned in Inguine, the groyne, *Herba Stellaria* also of some. The first is called by all *Aster Atticus legitimus*, but *Baubinus* to distinguish it, added *foliis ad flore in rigidis*. The 2. is called by *Fabius Columna* *Aster Cernuus*, because the flowers bend downe their heads, and by *Baubinus* *Aster Atticus folijs circa florem mollibus*. The third is called by *Clusius* *Aster secundus supinus*, and so doe *Dodonaeus*, *Lobel*, and *Lugdunensis*, and *Camerarius*, *Aster Atticus repens*. The fourth is called by *Clusius* *Aster tertius*, *Austriacus primus*, or *Aster Pannonicus tertius*, of *Baubinus* *Aster luteus major folijs succise*. The fifth is *Clusius* his *Aster Austriacus secundus*; of *Tabernmontanus*, *Bubonium luteum*: of *Gerard* *Aster Italoium* but falsely, of *Lugdunensis* *Bellis lutea*: of *Baubinus* *Aster montanus luteus Salicis glabro folio*. The sixth is *Clusius* his *Aster lanuginosus folio five quintus*: of *Tabernmontanus* *Aster luteo flore*: of *Gerard* *Aster hirsutus*: of *Baubinus* *Aster luteus hirsutus Salicis folio*. The seventh is *Clusius* his *Austriacus quartus*: of *Baubinus* *Aster luteus linariae, rigido glabro folio*. The eighth came first to us by the Virginian name *Aguafcomense*; some thinke that the Virginian name of the ninth is *Wisack*, but falsely: but the tenth and eleventh without names, and therefore we have given them such names as seemed to us most convenient, and as are in their titles, untill some fitter may be given by other. The eleventh *Lobel* in his observations calleth *Aster Conyzoides*, as I and all others doe, but the twelfth was so entituled by *Boelius*, as it is here set downe. The thirteenth is called generally *Aster Atticus Italoium purpureo* or *caruleo flore*. The fourteenth is a species of the last *Atticus Italoium flore purpureo*, whereof both *Clusius* and *Camerarius* make mention. The fifteenth is *Clusius* his *Aster Austriacus quintus*, which he saith may be called *Amellus Alpinus*, in that it doth resemble the *Amellus* of *Virgil*. *Lugdunensis* calleth it *Aster purpureus montanus*. *Baubinus* *Aster montanus caruleus magno flore folijs oblongis*. The sixteenth *Baubinus* onely remembreth by the name of *Aster hirsutus Austriacus caruleus magno flore*. The seventeenth *Lobel* calleth *Aster minor Narbonensis Tripoly flore, linariae folio medio purpureus*. The two last have their names given by us, as we thinke fittest for them. There hath beene formerly some controversie among Writers, what plant should bee *Aster Atticus* of *Dioscorides*, divers allowing of that *Aster Atticus flore luteo*, which is set forth in this & my former Booke, whereof the 2. here set forth, as I said, is a kind nearest thereunto, others refusing it utterly, because it hath no purple colour in the flower, which that of *Dioscorides* hath, both in the description thereof by him, (as many doe translate that part in the description of the flower, to be *purpureum* & *luteum*, whereas the new Editions have *Purpureum luteum*) and in the vertues, where he saith that divers say, that the purple of the flower, or in the flower, is good to heale the sores of the groine; and rather allowing of the 12. kinde here set forth, as likewise in my other Booke (whereof those with purple flowers here described are species) to be both the true *Aster Atticus* of *Dioscorides*, and the true *Amellus* of *Virgil*, which he describeth in the fourth Booke of his *Georgicks*, and that most plainly in these Verses.

*Est etiam flos in pratis, cui nomen Amello
 Fecere agricolæ, facilis quærentibus herba :
 Namque uno ingentem tollit de cespite sylvam.
 Aureus ipse, sed in folijs, quæ plurima circum
 Funduntur, violæ subluet purpura nigra.
 Sæpe deum nexis ornata torquibus aræ,
 Asper in ore sapor : tonsis in vallibus illum
 Pastores, & curvæ legunt propè flumina Melle.*

Yet *Guilandinus* misliketh hereof, and although he allow of it, to be *Asper Atticus*, yet not to be *Amellus*, whom as I take it, *Matthioli* doth convince : he nameth no man, but saith, that some would make that hearbe, which by the judgement of all men, is *Chelidonium minus*, to be the *Amellus* of *Virgil* ; which neither the flower, being all yellow, though standing like a Starre, nor having any purple colour therein, which *Virgil* saith *Amellus* hath ; for his words *Aureus ipse*, which is the flower, hath in folijs *quæ plurima circumfunduntur*, the purple colour of the violet, but not so faire, and cannot be referred to the leaves of that plant : neither the stature or forme of *Chelidonium*, which is low lying upon the ground, and *Amellus* rising high, and bearing a bush of flowers at the toppe of his stalke, as *Virgil* saith, *uno ingentem tollit de cespite sylvam* : neither the time of the flowering, for *Chelidonium* flowreth in the Spring, and *Amellus* in the end of Summer, when the fields are mowed, as he saith, *Tonsis in vallibus illum*, *Pastores legunt propè flumina Melle*. *Pena* and *Lobel* in their *Adversaria* also, would make *Tripolium* to be the nearest unto *Amellus* of *Virgil*, because the flower is purple, starre fashion, and yellow in the middle, and that it usually groweth in moist places, neare unto Rivers, as *Virgil* saith of his : which hath the greatest probability next unto this, of any other hearbe, but *Virgil* his words, *asper in ore sapor*, which is harsh or binding, agreeth not unto *Tripolium* : and because I find no other Author agreeing thereunto, and that this is most commonly received of all, I dare not forsake so great reasons, and so many judgements, and adhere to this one of *Pena* and *Lobel*.

The Vertues.

Discofides saith, that the purple leaves of the flowers boyled in water, was held to bee good for the paines and sore in the groine, as also the use of the fresh hearbe in oyle to anoynt the place, and likewise the dried flowers, to be taken into the right hand of the patient, bound to the place that is grieved, it taketh away inflammations in those places, it helpeth children also that have the falling sicknesse : and those that are troubled with the Quinsie. It helpeth an hot stomacke, the inflammations of the eyes, and the fundament when it is fallen downe, if an oymntment be made of the Greene hearbe, and old Hogs grease ; it helpeth them that are bitten by a mad Dogge, as *Cræteus* saith ; it consumeth the swellings of the throat, and driveth away Serpents if it be burned. *Galen* saith it is called *Eubonium*, not onely because, that being anoynted, but also that being hung or tyed to the places, it healeth the sores in the groine : for it hath not onely a digeffing, but also no small cooling quality, and repressing, being of a mixt property like the Rose. *Pliny* addeth that being bound to the place, it is profitable for the paine in the hippes.

CHAP. XLVI.

Ruta. Rue, or Hearbe graced.

Here are foure or five speciall sorts of hearbes called by the name of Rue, having little likeness thereunto, but onely some shew in the leaves, which are these. First *Ruta Canina*, whereof I meane to speake among the *Scrophularias*. The second is *Ruta pratensis*, called also *Thalicttrum*, which you shall finde in the next Classis. The third is *Ruta Muraria*, which shall bee spoken of among other *Capillare* hearbes, and the fourth is *Ruta Capraria* sive *Galega*, which shall be declared among the *Alexipharinacea* Counterpoisons. Divers other hearbes have bene entituled *Ruta*, by singular Authors, as you shall finde among the names of them, whereof to make mention here were needlesse ; I rather referre you to the places specified. But of our ordinary or garden Rue, common enough through all this Realme, there are some other sorts thereof, which are here to be remembered with them, although not usually bred, or to be easily kept in the gardens of our land.

1. *Ruta hortensis major.* The greater ordinary garden Rue or Hearbe of Grace.

This ordinary garden Rue groweth up with hard whitish woody stalkes branching forth on all sides, and bearing thereon sundry long leaves divided into many small ones, being somewhat thick and round pointed, and of a darke bluish Greene colour : the flowers that stand at the toppes consist of foure small yellow leaves, with a Greene button in the midst, compassed about with sundry small yellow threads, which growing ripe, containeth within it small blacke seed : the roote is white and woody, spreading farre in the ground, and abiding many yeares.

2. *Ruta Hortensis minor.* The lesser garden Rue.

This Rue is so like the ordinary garden kind, that it will deceive many that doe not heedfully regard it, and I my selfe am halfe perswaded that it is the next sort of Rue, which is the greater sort of wild Rue, transplanted and manured in gardens. It riseth not up so high, neither beareth so great stalkes : the leaves are very like the common garden kind, but that they are smaller, and of a blacker or darker Greene colour : it doth more seldome give any flower with us, and the smell thereof is not so strong, nor the taste altogether so bitter as the other ; and herein consisteth the difference betweene them.

3. *Ruta sylvestris major.* The greater wild Rue.

This wild Rue, is in all things like unto the garden Rue, but that the leaves are somewhat longer and narrower, and the colour of them are darker, more tending to Greene : the stalke is strong and woody, in the naturall places, much more than in these colder climates, but riseth not fully so high as our garden kinde, where it scarce attaineth to any wooddiness : the flowers also are yellow, composed of foure yellow leaves like unto it ; and small seed in

foure

1. *Ruta hortensis major*.
The greater ordinary garden Rue of Heerbe or Giace.

3. *Ruta sylvestris major*.
The greater wilde Rue.

four square heads (and sometimes in three square heads) like the other. This is of a more strong and virulent scent and taste than the garden kind.

4. *Ruta sylvestris minor*. Small Wild Rue.

This small Rue, is also like unto the former, but that the leaves hereof are much more finely cut than it, both shorter and smaller, but as strong, or rather more than the other, both in scent, taste, and quality: the stalk hereof riseth not so high as the other, but brancheth at the toppe, bearing yellowish small flowers, and small seed in four square heads, like therunto: the roote is long and woody.

5. *Ruta montana*. Mountaine Rue.

This Rue is the smallest of all the rest, whose leaves are the finest cut, and divided of them also, so that it hath scarce the face or forme of any leafe of Rue; they are also much whiter in colour than any of them, and the most virulent and pernicious of all the rest, both in scent and taste: the flowers and seed are like unto the other sorts, but the smallest of them.

6. *Ruta sylvestris Syriaca sive Harmala*. Wild Assirian Rue.

The Assirian wild Rue riseth up with many darke round Greene stalkes, about a foote high or more, whereon are set divers long leaves, divided into many parts, each whereof is longer, thicker, and greener, than the small wilde Rue, but not of so strong or virulent a savour as it, yet somewhat strong, and a little sharpe and bitter: at the tops of the stalkes stand many flowers, consisting of five white leaves, larger than in any of the other sorts of Rue; in the middle whereof riseth up a Greene three square head compassed about with many yellow threads: in which three square head when it is ripe, is contained small brownish cornered seed: the roote is thicke, and somewhat yellowish, with divers small fibres annexed to it.

The Place.

The two sorts of Garden Rue are onely nursed up in gardens in all places, yet the second is not so common as the first, but onely kept by a few. The other two wild sorts grow upon the Mountaines in *Spain* and *Italy*, and about *Mompeller* in *France*: but how we should beleeeve *Gerard*, who saith some of them grow on the hills in *Lancashire* and *Torke-shire*, you may easily gesse by their abiding our Winters, in gardens, for being of so hot and burning qualities, and growing in hot Countries, not enduring any cold; how should they be naturall to our climate, especially the more Northerly parts: the fifth in *Spain* also, *France*, and other hot Countries. The last groweth in *Syria*, from whence it was sent into these Countries: as also in the fields, and about the hedges neare unto *Constantinople*, as *Belonius* saith, in the fifth Chapter of his third Booke of observations.

The Time.

The garden kindes especially the lesser, doth feldome flower in our land, and therefore scarce ever beare good seed. And the wild or Mountaines kindes doe the like.

The Names.

It is called in Greeke *ῥιγανον*, *Pegannum* quia caliditate semen genitale coagmentat, the roote of the fifth kinde, as

4. *Ruta sylvestris minor*.
Small wild Rue. 6. *Ruta sylvestris syriaca* sive *Harmala*.
Wild Affiriani Rue. 5. *Ruta Montana*. Mountain Rue.

Dioscorides saith, was called in his time, *Moly montanum*: and the roote of the Affiriani wilde kinde, was also as hee saith, called *Moly*, for the likeness thereof, being blacke without, and white within: and *Ruta* in Latine, of *Ruo*, for the violent fierce vapours it fendeth forth, causing itching blisters, &c. in English Rue, and Hearbe Grace, or Hearbe of Grace, for the many good properties whereunto it serveth: for without doubt it is a most wholesome hearbe, although bitter and strong, and could our dainty stomacke brooke the use thereof, it would worke singular effects, being skilfully and carefully applied. The first is called *Ruta sativa*, or *domestica*, *hortensis*, or *latifolia* & *major* by all Authors. The second is called by *Tragus* *Ruta hortensis minor*, and by *Cordus* *Ruta sativa minor tenuifolia*, *Dodonaeus* calleth it *grave olens*. The third is called *Ruta sylvestris* of *Mathiolus*, *Lobel*, *Lugdunensis*, and others, and is the first of the wilde kindes with *Dodonaeus* and others, as the fourth is the second wilde with him. The fifth is the smallest wilde Rue, called of *Lobel* *Rutula* and *Pegauum Narbonensium*: of *Dodonaeus* *Ruta sylvestris minima*: of *Clusius* *Ruta montana legitima*: of *Camervius*, and others *Ruta sylvestris tenuifolia*. The last is called *Harmala* even in *Dioscorides* his time, as he saith, and *Basafan* of others, and so it is called still with most Writers, or *Harmel*, yet some *Ruta sylvestris*, and *Syriaca*. The Arabians call it *Sadel*: the Italians *Rutta*: the Spaniards *Arruda*: the French *Rue*: the Germanes *Rauten*: the Dutch *Ruyte*: and we in English Rue, or Hearbe Grace.

The Vertues.

Both sorts of Rue (that is) the garden and the wilde, as *Dioscorides* saith, doe heate, burne, and exulcerate the skin. It provoketh urine and womens courses, being taken in meate or drinke. The seed thereof taken in wine is an Antidote or Counterpoison against all dangerous medicines, or deadly poisons: the leaves hereof taken either by themselves, or with

with Figges and Walnuts, is called *Mithridates* his counterpoison, or Mithridate against the plague, causeth all venomous things, as well as of Serpents, to become harmlesse; being often taken either in meate or drinke, it abateth venery, and destroyeth the ability of getting children: a decoction made thereof with some dried Dill leaves and flowers, easeth all paines and torments, inwardly to be drunke, and outwardly to be applied warme to the place affected. The same being drunke, helpeth the paines both of the chest and sides, as also coughes, hardnesse, or difficulty of breathing, the inflammation of the lungs, and the vexing or tormenting paines of the Sciatica, and of the joynts being anyoynted, or laid to the places, as also the shaking of agues, to take a draught, before the fit come: being boyled or infused in oyle, it is good to helpe the wind collick, or the swelling hardnesse or windinesse of the mother, and freeth women from the strangling and suffocation of the mother, if the share and the parts thereabout be anyoynted therewith: it killeth and driveth forth the wormes of the belly, if it be drunke after it is boyled in wine to the halfe, with a little honey; it helpeth the gowt, or paines in the joynts of hands, feete, or knees, applyed thereunto; and the same with Figges helpeth the dropisie, which is a running of sharpe water, betwene the flesh and the skin, being bathed therewith: being bruised and put into the nostrils, it stayeth the bleeding thereof. It helpeth the swellings of the cods, if it be boyled with Bay leaves, and they bathed therewith. It taketh away wheales and pimples, if being bruised with a few Mirtle leaves, it be made up with waxe, and applyed thereon. It cureth the Morpew, and taketh away all sorts of warts, on the hands, face, nose, or any other parts, if it be boyled in wine, with some Pepper and Niter, and the places rubbed therewith: and with Allome and Hony, helpeth the dry scab, or any tetter or ringworme: the juyce thereof warmed in a Pomgranat shell or rinde, & dropped into the eares that are full of paine, helpeth them: the juyce of it and fennell, with a little honey, and the gall of a Cocke put thereunto, helpeth the dimnesse of the eye-sight: an oyntment made of the juyce thereof, with oyle of Roses, Cerusse, and a little vinegar, and anyoynted, cureth Saint Antonies fire, and all foule running sores in the head, and those stinking ulcers of the nose and other parts. The eating of the leaves of Rue taketh away the smell both of Garlike and Leekes: The Antidote that *Mithridates* the King of Pontus used to take every morning fasting, thereby to secure himselfe from any poyson or infection, was this. Take twenty leaves of Rue, a little salt, a couple of Walnuts, and a couple of Figges, beaten together into a Masse, which is the quantity appointed for every day. Another Electuary is to be made in this manner. Take of Niter, Pepper, and Cominseed, of each equall parts, of the leaves of Rue cleane picked, as much in weight as all the other three weighed, beate them well together as is fitting, and put thereto as much honey as will well make it up into an Electuary, (but you must first prepare your Cominseed, laying it to steep in vinegar, for 24. houres, and then dry it, or rather toste it in an hot fire-shovell, or as others would have it in an Oven) is a remedy for the paines and griefes of the chest or stomacke, of the spleene, belly, and sides, by winde or stitches, of the liver by obstructions, hindering digestion of the meate, of the reines and bladder, by the stopping of the urine, and helpeth also to extenuate fat or corpulent bodies. The leaves of Rue first boyled, and then laid in pickle, are kept by many to eat, as sawce to meate, like as Sampire is, for the dimnesse of sight, and to warme a cold stomacke. The distilled water thereof, is effectuell for many purposes aforesaid. Our garden kindes worke all these effects, but the wild kindes are not used so often with us, not onely because we have them not usually, and that they will not abide our cold Country, but their fiercenesse is scarce tolerable, except for outward griefes and applications, for the falling sicknesse, palsies, gowts, joynt-aches, and the like, wherein they worke more forceably than the garden kindes, for taken inwardly by women with child, it destroyeth the birth, and mightily expelleth the after-birth. *Antigonius* in his Rhapsody or huddle of memorable things, relateth a story of a Weasell, that being to fight with a cruell Serpent, eateth Rue, and rubbeth her selfe therewith, before hand, to be the better defended from the poyson; whereby it was found to be powerfull against the sting or byting of venomous creatures. The small Mountaine kind is so violent, that it may soone kill one, if it be not carefully looked unto, or to great a quantity given at a time.

CHAP. XLVII.

Caryophyllata. Avens.

Here are divers sorts of Avens more than formerly hath bene knowne, to bee set forth together in this Chapter.

1. *Caryophyllata vulgaris.* Ordinary Avens.

Our ordinary Avens hath many long rough darke Greene winged leaves, rising from the roote, every one made of many leaves, set on each side of the middle ribbe, the largest three whereof grow at the ends, and snipt or dented round about the edges; the other being small pieces, sometimes two, and sometimes foure, standing on each side of the middle ribbe underneath them: from among which rise up divers rough or hairy stalkes, about two foote high, branching forth diversly with leaves at every joynt, not so long as those below, but almost as much cut in on the edges, some of them into three parts, and some of them into more: on the toppes of the branches stand small pale yellow flowers, consisting of five leaves, very like unto the flowers of Cinque-foile, but larger: in the middle whereof standeth a small Greene head, which when the flower is fallen, groweth to be rough and round, being made of many long greenish purple seeds, like graynes, which will stick to any bodies cloaths: the roote is made of many brownish strings or fibres, which smell somewhat like unto Cloves, in many places, especially in the higher, hotter, and dryer grounds, and freer cleare ayre; but nothing so much, or not at all in many other places, especially if they be moist, and are of an harsh or drying taste.

Of this kind *Camerarius* saith there is another found in Mountaines, that is larger than it, not much differing else in any thing.

2. *Caryophyllata montana.* Mountaine Avens.

Major.

The Mountaine Avens from a long brownish round roote, of the bignesse of ones finger, creeping under the upper crust of the earth, (and not altogether so stringy as the former) with some small fibres shooting downwards in severall places, and smelling and tasting like the other, sendeth forth divers winged leaves, made of many small leaves towards the bottome, standing on both sides of the ribbe, the end leaves being largest and whole, not divided,

1. *Caryophyllata vulgaris*. Ordinary Avens.2. *Caryophyllata montana*. Mountain Avens.

but somewhat deeply cut in on the edges, of a fresher Greene colour likewise, softer also and gentler in handling : from among which rise slender stalkes, seldome branched, having very few leaves thereon, at the toppes whereof stand usually one flower apeece, yet sometimes more, made for the most part like the former, consisting of five or six leaves, much larger than they, and of a deeper yellow colour, and sometimes with a white flower, as *Cammarinus* saith in *horto*, tending to rednesse, having many yellow threads in the middle, compassing a Greene head, which when the flower is past, increaseth to be a round head, beset with flat seeds, not so rough, or ready to stick to ones garments, but every one of them having a long featherlike haire or thread at the end : the whole plant as well leaves as flowers and seed, are covered with a small soft hairy downe, which is not much or easily discerned, unless one heed it very well.

3. *Caryophyllata Alpina minor*. Small Mountain Avens.

There is a smaller kinde hereof found on *Mont Baldus*, little differing from the former, but in the smallnesse thereof, being covered with a soft downe, and of a darker Greene colour, the flowers being large for the smallnesse of the plant, and consisting of six leaves for the most part.

4. *Caryophyllata Alpina minor altera*. The other small Mountain Avens.

This small Mountain Avens hath much longer leaves than the last, lying upon the ground round about, and much more divided, or cut into divers parts, making each part of the leafe to resemble that of Smallage, being a cubite in length, from among which rise up two or three weake trayling stalkes, with foure leaves thereon, much lesse than the lower, but more finely cut in, on the toppe whereof standeth one large flower, consisting of sixe, and sometimes of eight leaves, standing in a Greene huske, whose ends reach to the height of the flower, which is of a paler yellow colour than the former, and turneth into such like heads, of long hairy feeds as the former : the toothe is somewhat long and slender, branched forth, and with divers fibres at them.

5. *Caryophyllata montana sive palustris purpurea*. Purple Mountain or marsh Avens.

This Marsh Avens hath leaves somewhat like the second sort, but with longer foote-stalkes, and somewhat hairy, the stalkes rise as high as the first many times, with fewer leaves set here and there on them, and more divided ; at the toppes stand two or three small flowers apeece, hanging downe their heads, of a purplish yellow colour, scarce appearing above the huskes that containe them : after which come such heads, but more soft and downy : the roote creepeth in the ground, and smelleth much lesse than the former, and some little or nothing.

Wee have had from *New-England* another of this kind, brought by *John Newton* a Chirurgeon of *Colliton*, that is taller and greater than this, differing little in any thing else, giving flat thin blackish seed in huskes.

6. *Caryophyllata aquatica altera*. Another Marsh Avens.

This other is like unto the fifth, but hath the huske that containeth the flower, spreading beyond the brims thereof, which is in some more reddish, and in some more double than in others, not differing in any other notable thing.

7. *Caryophyll-*

3. *Caryophyllata Alpina minor.*
Small Mountain Avena.

5. *Caryophyllata montana purpurea.*
Purple Mountain Avena.

7. *Caryophyllata Pentaphylla.*
Cinque-foile Avena.

7. *Caryophyllata Pentaphylla.* Cinque-foile Avena.

The Cinque-foile Avena hath the leaves thereof divided into five parts, like unto a Cinque-foile leafe; dented about the edges, the stalkes are about a foote high, having some such like leaves thereon, at the joynts where it brancheth forth; at the toppes whereof stand pale yellow flowers, like the first sort; but smaller, with many yellower threads, somewhat downy in the middle: the roote is composed of many brownish strings, smelling somewhat like unto the former kindes.

The Place.

The first as I said before, is found wilde in many places of this Realme, under hedge sides, and by the pathes in many fields, and delighteth rather to grow in shadowy than Sunny places, yet is usually brought into gardens to be at hand, to be used upon any occasion. The second is found upon divers Mountaines, as Coronos in Bohemia, by the Springs of the River Albis, as Matthiolus saith: upon Mons Baldus, as Pena saith, and in some other places. The third and fourth upon Mount Baldus, as Pena relateth, both in his Latine and Italian descriptions thereof. The fifth and sixth grow by water sides, and in moist and wet, or marsh grounds, on the Mountaines. The last was found by Clatena on the Rbatian Alpes in Switzerland, whereas he saith, hee tooke it for a kinde of Cinque-foile or Tormentill at the first, untill by the smell and colour of the roote, he judged it a kinde of Avena.

The Time.

These doe flower in the months of May, and Iune, for the most part, and their seed is ripe in Iuly at the farthest.

The Names.

It is generally called in Latine now adayes *Caryophyllata* and *Garyophyllata*, (for it is not found to be knowne to any of the ancient Greeke or Latine Writers, except it bee *Gemm* of Pliny, as most of the later Writers doe confidently, and nor without good reason suppose) from the scent of the roote, so neare resembling

Cloves.

Cloves, which are called *Caryophylli*, yet some have called it *Herba Benedicta*, of the excellent or blessed qualities thereof, and others *Sana-munda*, for the like effects. *Tragus* would have it called his *Nardus agrestis*, not onely for the sweet scent of the rootes, but for the cordiall properties it hath. The first is as I said, called of the most of the later Writers *Caryophyllata* & *vulgaris* & *hortensis*. *Bruselsius* as I thinke first, and after him *Gesner*, *Tragus*, and *Tabernmontanus* call it *herba Benedicta*, and *Benedicta*. *Camerarius* saith the French call it *Sana-munda*, and *Turner* as I thinke, or *Gesner* first, and after them *Lobel*, call it *Geum Plinij*. The second is called of *Matthiolus* (who first set it forth) *Caryophyllata montana*, and so doe *Dodonaeus*, *Lugdunensis*, *Anguillara*, *Tabernmontanus*, and *Gerard*: *Camerarius* calleth it *Caryophyllata Alpina*, *Tragus* *Benedicta sylvestris*: *Lobel* *Caryophyllata major rotundifolia*; and *Gesner* *Geum Alpinum quartum*, in his *hortis Germanie*; *Bauhinus* calleth it *Caryophyllata Alpina lutea*. The third and fourth being the lesser sorts of this kind, were found by *Pona* on Mount *Baldus*, and called by him, *Caryophyllata Alpina omnium minima*, and *minima altera*. The fifth is called by *Lobel* *Caryophyllata Septentrionalium retundifolia* pupposo flore: by *Clusius* *Caryophyllata montana prima*: by *Gesner* in *hortis*, *Geum rivale*: by *Camerarius* in *horto*, *Caryophyllata palestri*, and in his *Epitome* upon *Matthiolus* *Caryophyllata aquatica*: by *Iohannes Thalius*, *Caryophyllata major seu purpurea*: by *Lugdunensis* *Caryophyllata montana Dalechampij*: and by *Bauhinus* *Caryophyllata aquatica nutante flore*. The sixth is mentioned by *Bauhinus* in his *Matthiolus* under the title of the former, and calleth it in his *Pinax*, *Caryophyllata aquatica altera*, the flowers whereof are expressed by *Clusius* under the name of *Caryophyllata montana tertia*. The last is called by *Pona* and *Lobel* in their *Adversaria*, *Caryophyllata Alpina Pentaphylla*. *Castor Durantes* giveth the same figure, with the name and description of *Matthiolus* his *Caryophyllata montana*. *Tabernmontanus* calleth it *Caryophyllata Alpina quinquifolia*, and so doth *Bauhinus* in his *Pinax*, who also setteth it downe as if it were the *Polyrhizos latifolia* in *Lugdunensis*, which there is set forth, to have a white flower, growing on some hills in *Savoy*, but *Gerard* in translating *Dodonaeus* his supposition, that the *Caryophyllata montana*, should be the *Baccharis* of *Discozoides*, excepting the colour of the flowers, and the smell of the rootes, which yet he endeavoureth somewhat to reconcile, sheweth onely *Dodonaeus* his minde, and not fully his owne, unless you will beleene that, all that he tranlateth out of *Dodonaeus*, was first his owne opinion.

The Vertues.

Being accounted by the latest best Writers (as I said before) to be the *Geum* of *Plinij*, it is as hee saith, not onely good for the diseases of the cheft or brest, but good also for fitches or paines of the sides, and to expell crude or raw humours, from the stomacke and belly, by the sweet savour, and warming quality, for which purposes *Avens* is found by all to be effectually. It also dissolveth the inward congealed or clotted blood, happening by falls or bruises, or the spitting of blood, the rootes especially either Greene or dried, being boyled in wine and dranke; as also all manner of inward wounds, or outward if they be washed, and bathed therewith, or if they be fistulous to be injected. The same decoction also drunke, comforteth the heart, and strengthneth the stomacke, and a cold braine, and therefore is good in the Spring time to open the obstructions of the liver, helpeth the winde collicke by dissolving the wind, and fitches and paines in the sides, and being of a binding quality, helpeth also those that have fluxes, or are bursten, or have a rupture. If soyle spots or markes in the face, or other parts of the body be washed therewith, it taketh them away, and leaveth the skin well coloured. The powder of the dried rootes, or the iuyce of them when they are fresh, worketh the same effects that the decoction doth: and in callous ulcers, with the iuyce of the rootes, if a little vardi-graefe be added, it worketh a singular good effect. Some use in the Spring time to put the roote to steepe for a time in wine, which giveth unto it a delicate favour and taste, which they drinke fasting every morning, to comfort the heart, and to preserve it from noysome and infectious vapours of the plague, or any poison that may annoy it; as also to helpe digestion, and to warme a cold stomacke, troubled with grosse or foule humours, and to open the obstruction of the liver and spleene. Some doe use to lay the rootes dried among garments, to perfume them with the smell thereof, and to keepe away Mothes, &c. from them. The Cinque-foile *Avens*, because it participateth with the other, both in smell and taste, although weaker, cannot but likewise partake with them in the qualities aforesaid, yet not so effectually, although I know not any Author hath made mention of any experimentall effect thereof. The Mountain *Avens*, as *Matthiolus* saith, is found to be as good as the ordinary, for all the diseases whereunto it is applied, and worketh more forceably and speedily in them all.

CHAP. XLVIII.

Calamus Aromaticus, The Aromaticall Reed; and *Acorus legitimus* *Discozoides*, five falso *Calamus odoratus officinarum*. The true *Acorus* of *Discozoides*, or sweet smelling Flagge, untruly called *Calamus* in the Apothecaries shoppes.

Have joyned both these plants in one Chapter, for the transposition of the names, and the sweet smelling properties the one doth enjoy, although falsely appropriated to the other, & much differing both in face and manner of growing.

1. *Calamus Aromaticus* *Matthioli*. *Matthiolus* his Aromaticall Reed.

This Aromaticall Reed groweth with an upright tall stalke, set full of joynts, at certaine spaces up to the toppes, (not hollow as divers other Canes and Reeds are, but stuffed full of a white spongiouse pith, which is of a gummy taste, somewhat bitter, and of the bignesse of a mans finger) and at every one of them, a long narrow leafe, of a darke browne Greene colour, smelling very sweet, differing therein from all other kindes of Reeds: on the toppes whereof groweth a bushy or Featherlike panicle, like unto those of the common Reed: the roote is knobby, with divers heads thereat, whereby it encreaseth and shooteth forth new heads of leaves, smelling also very sweet, having a little binding taste, and sharpe withall. This is the description thereof extant in sundry Authors since *Matthiolus*, which because it so neare resembleth the common Reed, is supposed by divers to bee but first feined by *Matthiolus*, although all others follow him therein, therefore I give you not their figure: but the figure of the dried stalkes that *Camerarius* and *Clusius* set forth, that all may see what manner of thing that *Calamus* is, and the whole figure of the plant, as *Alpinus* setteth it forth, in *lib. de plantis exoticis*.

2. *Calamus*

1. *Calami Aromatici Syriaci ut fertur veri stipites sicca.*
The dry stalks of the true Aromaticall Reed as it is supposed.

2. *Calamus Aromaticus Syriacus vel Arabicus suppositivus.*
The supposed true Syrian or Arabian Aromaticall Reed.

2. *Calamus Aromaticus Syriacus vel Arabicus suppositivus.* The supposed true Syrian, or Arabian Aromaticall Reed.

This plant which is supposed by many to be the true Indian *Calamus aromaticus*, (but much suspected by others) riseth up from a thicke unprofitable roote, three or 4. inches long, bigge at the head, and small at the bottome, with one, and sometimes more stalkes, two cubits high (saith *Bauhinus*, who describeth it from the sight of the plant he received from Doctor *Doldius*: but halfe a cubite high, or somewhat more, saith *Alpinus lib. de plantis exoticis*) being straight, round, smooth, and easie to breake into splinters, full of joynts, and about a fingers thicknesse, hollow and spongy within, of a whitish yellow colour (like the pith of an elder, saith *Alpinus*, or like other Reeds, as *Bauhinus* saith) the stalke is divided into other branches, and they againe into other smaller ones, two usually set together at a joynt, with two leaves under them likewise, very like unto the leaves of *Lyfimachia*, the Willow hearbe, or Loofe-strife, but lesser, being an inch broad, and an inch and a halfe long, compassing the stalke at the bottome, with sundry veines running all the length of them: from the joynts rise long stalkes, bearing sundry small yellow flowers made of leaves, like also unto *Lyfimachia*, with a small pointell in the middle, after which follow small blackish long heads, or seed vessels, pointed at the end, containing within them small blackish seed: the stalke hath little or no scent, yet not unpleasant saith *Alpinus*, being bitter, with a little acrimony therein: but *Bauhinus* saith, it is of an aromaticall taste, and very bitter. This (saith *Alpinus*) the Arabians and Egyptians doe use and call it *Cassabelarira*, that is *Calamus Aromaticus*, & from them all other Christian nations have to accepted it: but how improbable let any others judge that will beleeye, *Theophrastus*, *Dioscorides*, *Galen*, *Pliny*, and others who doe all call it a Reed, when as this you see is none, and as *Theophrastus* & *Pliny* say differeth not in forme from other Reeds: for *Pliny* reckoneth up 29 sorts of Reeds, whereof this is one in their times, and for the sweetnesse thereof, onely used in sweet oyntments: for the taste also; *Dioscorides* saith it hath some altringency, and a little acrimony therein, but mentioneth no bitternesse, when as this hath more bitternesse in it than any other taste, which could not be forgotten by *Dioscorides* if his had any in it. This plant groweth both in sundry moist places in *Egypt*, as also by the lake *Gennasareth* in *Iudea*, and in divers places also of *Syria* and *Arabia*: and for ought that wee can perceive, is rather a kinde of yellow *Lyfimachia* than any other plant.

3. *Acorus verus sive Calamus officinarum.* The sweet smelling Flagge.

This sweet smelling Flagge hath many flaggy long and narrow fresh Greene leaves, two foote long apiece, or more, yet oftentimes somewhat brownish at the bottome, the one rising or growing out of the side of the other, in the same manner that other Flagges or Flower-deluces grow, which are thin on both sides, and ridged or thicke in the midst, the longest for the most part standing in the midit, and some of them as it were curled or plaited towards the ends or toppes of them, smelling very sweet, as well when they are Greene and fresh, as when they are dried, and so kept a long time; which doe so abide in a garden along time, as though it never did, or never would beare flower: the leaves every yeare dying downe to the ground and shooting out fresh every Spring, but after two, three, or foure yeare abiding in a place without removing, besides the leaves it shooteth forth (not any stalke)

3. *Acorus verus* sive *Calamus officinarum*.
The sweet smelling Flagge.

as other Flower-deluces doe) a narrow long leafe by it selfe, flat like unto the other leaves, especially from the middle thereof upwards; but from the botome to the middle it is thicker, narrower, or rounder, where it beginneth to grow flat, at which place commeth forth one long round head, very seldome two, in forme & bignes like unto the Catkin or Aglet of the Hasselnut tree, growing upright, and of the length thicknesse of ones finger, or rather bigger, set with severall small lines and divisions, like unto a Greene Pine apple, of a purplish Greene colour for the most part, out of which bunches, shoote forth small pale whitish flowers, consisting of foure small leaves apeece, without any so good scent as the leaves, falling quickly away, and not giving any seed, that ever I could observe or understand: the roote is thicke and long, lying under the upper face of the ground, shooting forward, and with small rootes as suckers on all sides like unto the garden Valerian, whitish on the outside, or greenish if it lye above the ground; and more pale or whitish on the inside, with many joynts thereabouts, and whereat, it hath or doth shoote forth long thicke fibres underneath, whereby it taketh strong hold in the ground, of a firme or fast substance, yet not hard or woody, but easie to be cut, of a sweet scent, and somewhat bitter taste.

The Place.

The first is thought by *Mathiolus* and others, to grow in *India*, *Syria*, & *Indea*. The dry stalkes of the 2. are said to grow at the foot of Mount *Libanus* in *Syria*, not far from *Tripoli*, in the wet grounds there: the other as is said before. The other *Calamus* of the shops, or true *Acorus* groweth in many places of *Turky*, (in moist grounds for so with us it joyeth and flourisheth better than in dry) from whence the largest roots, the firmest, whitest, & sweetest are brought unto us: but it groweth also in *Russia*, and those other places thereabouts, in very great plenty: but the rootes being dried, are more lanke or small, not so firme or white, nor of so singular a good scent.

The Time.

These Reeds are strangers not growing with us, we having no further knowledge of them: the sweet smelling Flagge beareth his catkin in the beginning or middle of Iuly and August.

The Names.

The first and second have their names in their titles, as their Authors have called them, but whether either of them be the true *Calamus Aromaticus* of *Dioscorides*, *Galen*, and others, it were worthy the knowledge; for although it be commonly so taken to be, yet *Clusius* in part improving it, and I shewing more doubts, doe make it the more improbable: and it is very certaine, that we have no true *Calamus Aromaticus* brought unto us in these dayes, for even thorow all *Turkie*, with both Physicians and Druggists, or Merchants, (for they have no Apothecaries such as are in Christendome) it is not scene or knowne, for the Arabian word of *Cassab el dherira*, which is *Calamus Aromaticus*, they understand not what it is, and being demanded for it by that name, (although the Arabian tongue be very frequent among them) they still will give contrary things for it, as *Mathiolus* in his Epistles, and *Bellonius* in his observations doe declare. Now whether it should be called *Calamus Aromaticus*, or *odoratus*, it is worth the scanning also, because very many doe thinke the word *aroma*, from whence commeth *Aromaticus*, is the same with *odor* and *odoratus*; but I finde *Garcias* a very learned Writer, and others also to contrary that opinion; saying, that the Arabian words, *derire* or *dherira*, signifying *aroma*, (as *Cassab* doth *Arundo* or *Calamus*) is properly a drogue or druggie, whether they be spices that smell sweet, or any other thing used in medicine, that hath either a strong or no smell, for so the Hebrew word *deror* signifyeth also, as *Mor deror*, *Myrrha aroma*, or *aromatizans*, the best Myrrhe, in the Scripture *Exod.* the 30. chapter, and 23. verse, was appointed among other spices to make the holy anoynting oyle, and in the 34. verse of the same Chapter, with *Galbanum* which hath no sweet scent, as I thinke every one knoweth, and other gums to make perfume to burne: and Myrrhe although it be reckoned with *Aloes* and *Cassia*, as a sweet rhing, in many places of the Scripture, yet it is not sweet to us, as wee account sweet things in these dayes, and Myrrhe and *Aloes* are called *Aromata*, in the 19. chapter of Saint *Iohns* Gospell. *Garcias* saith *Calamus aromaticus* he knew well, and was of much use in *India*, both with himselfe, and other Physitians, as also with many persons of high and low degree, but any to be *odoratus* sweet, he knew not, but only *Iuncus odoratus*, and I thinke *Pliny* first broached that error in numbring up his sorts of Reeds, calleth one *odoratus*, and therefore judged to be this, and therefore *Hippocrates* calleth it *Myrspeus*, that is *unguentarius* or *unguentis petius*. And againe whether that roote that is generally called, *Calamus odoratus* and *Aromaticus* of the Apothecaries and others now adayes, be the true *Calamus Aromaticus* of the ancient Writers. *Brassavolus Ferratiensis*, and *Fuchsius* in their Writings, doe hold that opinion, that the *Calamus odoratus* of the shops, which is a roote and not a Reed, or a stalk of a Reed, is the true *Calamus aromaticus* of the Ancients: which, that it cannot bee so, let us first scan the name, which is *Calamus*, or *Arundo* a Reed, which the Ancients alwayes speake of, and name no roote thereof to bee used, but the stalk or reed it selfe, and which *Theophrastus* and *Pliny* say, differeth not, but is like unto other sorts of Reeds; although it groweth in *Arabia* and *Syria*, as well as in *India*, and all men plainly see, that this roote of

Calamus

Calamus so called in shops, is neither a reed, nor the root of a reed, for being seene growing Greene, as it is now adayes in many places, and as it is described before, there is no correspondency of it with a reed, (and truly to see the face of things growing, hath brought many things to knowledge, which else would have lien in perpetuall ignorance and darknesse: how much therefore the world is indebted to those that are diligent searchers out of the genuine plants of the Antients, both by their face or forme, and by their properties and vertues, let the good and honest acknowledge, let the vile or base neglect or contemne.) Secondly, the Antients declaring the other notes, whereby it may be knowne say in this manner, that which is the yellower and fuller of Joynts is the best, (the thicker and shorter faith *Pliny*, somewhat pliant) breaking into long shivers, (not brittle or breaking short) the fistula cane or pipe being *plena araneorum*, or as *Pliny* saith, *inest fistula araneum* or *araneus quod florem vocant, praestantior est cum numerosior* or *numerosus*, which can be no other wise interpreted, then that the pith in the middle of the cane or pipe, which they call the flower, the more the better, is like unto a Spiders cobweb, (that is full of threads) and clammy in chewing, of an astrigent taste, somewhat quicke, and biting upon the tongue: now although some of these notes or markes may be found in that ballard *Calamus* of the shops; yet that is not enough, (for that hath deceived most men, to judge a thing to be right, because of one or two notes agreeing, the rest being not answerable,) but all the notes must agree, for the false *Calamus* breaketh short and not into shivers; it is not clammy in chewing, nor hath it any fistula or pipe full of that cobweb like pith: by which comparison all men may plainly see, that our *Calamus* is not that of the Antients, and that we are utterly destitute of the true *Calamus aromaticus* of *Dioscorides*, and the rest of the ancient Writers: and yet so perverse are many in these dayes, that they will still persist in their old errors, because they were bred in them, and will know no other, although they bee told them: but what may be the best substitute thereof in medicines, many have thought diversly. In that booke of substitutes that is falsely attributed to *Galen*, *Sphagnum*: that is *Muscus arboreus*, the mosse that groweth upon trees) is appointed, which divers have accepted, and *Matthioli* among the rest, but as he saith examining, and considering the matter more seriously; he is not ashamed to retract that opinion, and condemne it quite, as erroneous, judging no correspondency, but rather a meere contrariety, to be betwene *Calamus Aromaticus*, a simple of that worth, rarity, and quality, and the mosse of trees, which although it be a little sweet in smell, yet of no other quality equall thereunto. Some therefore appoint the seed of *Nigella Romana*, both for the scent and sharpe quicke taste, and other properties incident thereunto. Others would have the *Galanga major* to be the substitute, for the heating and opening qualities, they thinke it hath; but both the one and the other are hotter in their degrees by much, than the *Calamus* of the Antients is: *Matthioli* judgeth they shall not doe much amisse, that take the rootes of *Angelica* in the stead thereof, because it expelleth both urine and womens courses, and besides the many other good properties therein, it is found by manifest proofes to be singular good to expell any poison of venomous creatures, or otherwaies, and a soveraign remedy against the plague, and pestilentiall ayres. But the most and best doe agree, that the *Squinant* or *Iuncus odoratus* cometh nearest both in degrees and qualities unto it, or else that false *Calamus* of the shops, is the next best and nearest substitute thereunto, although it doe exceede it in heate, the lesse being to be taken, agreeing in many qualities therewith, and may also safely be used, untill the true *Calamus* bee better knowne, and brought in use. *Acorus* is called in Greeke *ῥίζα ὀξυς*, because *ῥίζα ὀξυς*, id est, *pupillus* sive *aciei oculorum caliginosa medetur*, it helpeth to cleare a dimme eyesight. *Monardus*, *Tragus*, *Matthioli*, *Cordus*, *Gesner*, *Camerarius*, *Lugdunensis*, *Lobel*, and *Clusius*, doe all call it *Acorus* or *Acorum*; and perperam *Calamus Aromaticus officinarum*. *Anguillara* calleth it *Calamus noster Iridis species*. *Amatus*, *Celsipinus*, *Brasavolus* and *Fuchsius* *Calamus aromaticus vulgo*. There hath beene formerly great ignorance of the true *Acorus* of *Dioscorides*, for in that it was generally taken and used for *Calamus*, it did amuse them the more, not imagining it to be *Acorus*, untill some more industrious and diligent, finding it growing in *Turkie*, and comparing it with that they had read thereof, perswaded themselves certainly to be the true and right *Acorus*; and *Matthioli*, first after them that so found it, as I thinke published it to the world, and *Lobel* and *Clusius* after him, have now so well perswaded most men, except onely the most unlearned, or the most wilfull, that few make any doubt or scruple thereof; yet some still would make the *Galanga major* to be the true *Acorus*, but it is knowne certainly, that the *Galanga major* groweth in *Syria*, and hath neither leaves or rootes like unto a Flower-deluce, as *Dioscorides* describeth his *Acorus* to have, but rather hath leaves like unto Reeds, nor doe the rest of the faculties of *Galanga* answer these of *Acorus*.

The Vertues.

If this *Calamus aromaticus* be the right *Calamus* of *Dioscorides*, then he saith it hath these faculties. It provoketh urine, and boyled with grasse rootes and snallage seed, it helpeth those that have the dropsie. It helpeth the defects of the reins, is profitable against the Strangury, or making water by drops; as also for those that are bursten bellied: it provoketh womens termes or courses, either drunke or applied to the place: the fumes thereof taken thorow a Reed or Tobacco-pipe, either by it selfe, or with some dried Turpentine, cureth them that have a cough: it is put into bathes for women to sit in, as also into Glisters to ease paines. It is used in mollifying oyles and plaisters, that serve to ripen hard impostums, as also for the sweet scent thereof. *Galen* saith that because it is temperate, betwene heate and cold, somewhat astrigent, and having a very little acrimony, it is profitably used among other things, that helpe the liver and stomacke, doth gently procure urine, and is put with other things into fomentations for the mother, when it is troubled with inflammations, and gently to procure the courses; it is as he saith, hot and dry in the second degree, but is more drying than heating, and hath therein a little tenacity of parts, as is in all sweet smelling things. The *Acorus* or sweet smelling Flagge as *Dioscorides* saith, is good to provoke urine, if the decoction thereof be drunke: it helpeth to ease the paines of the sides, liver and breast; as also to ease the griping paines of the collicke and crampe, and good for those that are bursten: It helpeth likewise to walle the spleene, and to bring helpe to them that have the strangury, and freeeth those from danger that are bitten by any venomous Serpent. It is very profitably used among other things, in bathes for women to sit in, as the *Iris* or Flower-deluce rootes are; the juyce dropped into the eyes, dryeth rheumes therein, and cleareth the sight, taking away all filmes or such like that may offend them. The rootes is of much use in Antidotes against all venome or poison, or infection: thus saith *Dioscorides*: furthermore, it is a speciall remedy to helpe a sinking breath, if the roote be taken fasting every morning for some time together. The hot fumes of the decoction made in water, and taken in at the mouth thorow a funnell, are excellent good to helpe them that are troubled with the cough: a dram of the powder of the rootes of

Acorum.

Acorus, with as much Cinamon, taken in a draught of Wormewood wine, is singular good to comfort and strengthen a cold weake stomacke. The decoction thereof drunke is good against convulsions or crampes, and for falls or inward bruises. An oxymell or Syrupe made of *Acorus* in this manner, is wonderfull effectfull for all cold spleenes, and cold livers. Take of the fresh rootes of *Acorus* one pound, bruise them after they are cleane washed and pickt, steepe them for three dayes in vinegar, after which time let them be boyled together, to the consumption of the one halfe of the vinegar, which being strained forth set to the fire againe, putting thereto as much honey as is sufficient for the vinegar to bring it into a Syrupe: an ounce of this Syrupe taken in the morning with a small draught of the decoction of the same rootes, is sufficient for every dose. The whole rootes preserved either in Sugar or Honey, is effectfull also for the same purposes: but the greene rootes preserved are more desired than the dried rootes that are steeped, and afterwards preserved. The rootes bruised and boyled in wine, and applied warme to the testicles that are swollen, dissolveth the tumour, and easeth the paines; it likewise mollifieth hard tumours in any other parts of the body. It is verily beleevd of many, that the leaves or rootes of *Acorus* tyed to a hive of Bees, stayeth them from wandering or flying away, and draweth a greater resort of others thereunto. It is also affirmed, that none shall be troubled with any fluxe of blood, or paines of the crampe, that weareth the hearbe and roote about them. The rootes of *Acorus* or *Calamus*, as it is usually called, are used among other things to make sweet powders, to lay among linnen and garments, and to make sweet waters to wash hand, gloves, or other things to perfume them.

CHAP. XLIX.

Juncus odoratus five *Schananthos*. The sweet Rush or Camels Hay.

Because through all the sorts of Grasses and Rushes, I finde none sweet, fit for this *Classis*, but this which I bring here to your consideration, let me, following the like method of *Dioscorides*, insert this Rush, and the other that shall follow in the next Chapter, in the end of this part of sweet hearbes, as a complement to the same. Of this sort of sweet Rush, I finde two sorts, a finer and a courser, or the true and a bastard kinde, although the ancient Writers have made mention but of one sort, which is the finest and truest.

1. *Juncus odoratus tenuior*.
The finer sweet smelling Rush.

1. *Juncus odoratus tenuior*. The finer sweet smelling Rush.
This finer Rush hath many tufts or heads of long rushe-like leaves, thick set together, one compassing another at the bottome, and shooting forth upwards, the outermost whereof are bigger or grosser than those that grow within, which are a foote long and berter, small, round and stiffe, or hard, and much smaller from a little above the bottome of them, than any Rush (with us) of a quicke and spicy taste, somewhat pleasant, and of a fine sweet gentle or soft scent: thus it hath growne with us, but bore neither flower, nor shewed any appearance of stalks, by reason the Winter deawes perished it quickly: but in the naturall places it beareth divers strong, round, hard joynted stalks, having divers short brownish or purplish huskes on the toppes, containing within them mossie whitish short threads or haire, wherein lyeth a chaffe seed: the roote is stringy or full of long fibres, which are very hard as they are brought on, from their naturall habitations, which have the smallest scent or taste, of any other part thereof, for so much as ever I could observe, either by the greene or dried leaves that have beene brought unto us: yet *Martholus* saith, he had some plants, that rose with him of seed, whose rootes were sweet, some losing their scent; but the leaves and rushes of his were bigger than ours here described; having as hee saith leaves like Sedge, which is *Carex* or *Sparganium*, or like *Zea*, which is a large, or great kinde of wheat; whereby I guesse it was of the greater or grosser kinde next hereunto following.

2. *Juncus odoratus crassior*. The grosser sweet smelling Rush.
This greater or grosser Rush, groweth in the same manner, that the former doth, but is greater in every part thereof, and lesse sweet also, as well as lesse sharpe and hot in taste; whereby it seemeth to be a kinde of it selfe, that groweth so great in the naturall, as well as forraigne parts; or that it being the same kinde, by growing in moister places, acquireth thereby the larger habitude.

The Place.

They grow naturall in *Arabia*, *Syria*, *Mesopotamia*, and all that Tract of the Easterne Countries, as also in some places of *Africa*.

The Time.

As I declared in the description it commeth not to flowering in these colder Countries, and therefore *Clusius* and others

others have thought it to be an annual plant : but assuredly it dyeth not every yeare in those hotter parts , and flowreth in the Summer time.

The Time.

It is called in Greeke *ῥίζη ἀρωματισμένη* : *ῥίζη* a root & *ῥίζη* funibus dicitur : *ἀρωματισμένη* odoratis, and of some *ῥίζη ἀρωματισμένη* *ῥίζη* unguentis dicitur, in Latine *Iuncus*, a *jungendo*. Some doe call it *Schenanthos* quasi *Schenanthos* *flor* *junci*, and corruptly in shops *Squinanthum*. Some also call it *Iuncus odoratus rotundus*, to put a difference betweene this, the *Iuncus vulgaris rotundus*, and the sweet *Cyperus*, that is called *Iuncus odoratus angulosus vel triangularis*. It is called also *Palea de Mecha* and *Pastus Chamelorum* : in English the sweet smelling Rush, or Camels Hay, according to the Latine names, or Squinant if you will. There hath beene much diversity among the later Writers, concerning the true Squinant, some thinking it not to be true which we have in shops, some making the great Galanga to be the roote of the sweet Rush of *Dioscorides*, as the Monkes that wrote Comentaries upon *Mefnes* : *Fuchsius* likewise and *Anguillara* alleadged many reasons, why they thinke that those small Rushes that are used now adayes in the Apothecaries shops, are not the true *Iuncus* of *Dioscorides* and others, both for that they are small peeces of rushes and straws as it were, and not flowers or stalkes, or rootes, which *Dioscorides* saith are to be had in use, and that they have (they say) not any quicke biting taste, nor sweet scent of a Rose, all which *Dioscorides* saith plainly may be found in his *Iuncus* : concerning whose reasons this I say, that the flowers are truly seldome brought over unto us, and when they are brought, they are found of little quicknesse in taste, or sweetnes in smell : and *Galen* complaineth that in his time they were very scarcely to be heard : and indeed it seemeth probable, that because these small Rushes, which are now usually in the Druggists and Apothecaries shops to be had, are found to be more quicke and hot in taste, than either the other stalkes, flowers, or rootes that are brought us, these are and have beene received into more use, and the other flowers are left off, or quite neglected to be used, which hath caused the Merchants likewise, not to aske or seeke for them to bring them.

The Vertues.

Dioscorides saith it provoketh urine and womens courses, discusseth all swellings and wind, but troubleth the head a little : it gently cutteth or breaketh humours, and digesteth them, and looseth the breathing places of the veines ; the decoction of the flowers (saith he) drunke, stayeth the spitting of blood, and is conduible to the griefes and diseases of the stomake, lungs, liver and reynes. It is also put into Antidotes against poison and the venome of Serpents. The roote hereof is held to be of an astringent property, and therefore is more effectfull for those that have a loathing in their stomackes to their meate, a dram thereof taken with the like quantity of pepper every morning fasting for certaine dayes together, is a very good remedy for those that have the dropie, and for convulsions or crampes : the decoction thereof is profitable for women to sit therein, that are troubled with the mother, for as *Galen* saith it openeth obstructions, digesteth crudities, expelleth corrupt humours, cutteth tough flegme, and consumeth congealed matter in the body, and therefore it is of excellent good use, for the stopping of urine or womens courses, taken either in drinke or by fomentation, it allayeth the inflammations of the liver, stomacke, and body : the rootes doe binde more, and the flowers are more hot, but in all the parts thereof there is astriction ; in some more, in others lesse, and therefore it is very profitably mixed with those medicines that serve to stay bleeding. It is used to be boyled in the broth of a chicken (I meane the whole plant) as very helpfull to ease the paines of the wombe, that women feele after their childing, the powder thereof is singular good for the sores of the mouth, and for all creeping ulcers ; and taken with wine and vinegar, it is effectfull for those that have an ulcer in their stomacke, if the stomacke or belly be fomented with the decoction thereof, it taketh away all inflammations therein, and easeth the paines.

CHAP. I.

Cyperus. Sweet *Cyperus*, or English Galinga.

TO finish this first part of sweet hearbes, I have some sorts of sweet *Cyperus* to describe unto you, others which are not sweet, I shall speake of in their proper place : yet unto these I thinke good to adjoyne the *Trasi dulce*, for the neere resemblance in face and forme unto the others, and for the pleasantnesse in taste, though not in smell.

1. *Cyperus rotundus odoratus vulgarior*. The more common round rooted sweet *Cyperus*.

This round rooted sweet *Cyperus* shooteth forth many heads of long and narrow leaves, somewhat ridged in the middle, every leafe seeming thereby to be three square, and somewhat hard and rough in handling, and sweet in scent : among these leaves rise many smooth square stalkes, about three foote high, stuffed with a white pith, and not hollow) without any knot or joynt therein, unto the toppes, where there stand a few short leaves, and many small panicles, or chaffie Greene spikes or eares of small leaves above them, which after containe within them the seed : the roote is composed of many long and round blackish browne small rootes, fastned together by long strings, of the bignesse of small Olives, or the greater *Filipendula* rootes : of a sweet scent even while they are Greene, but more when they are dry, and of a bitter taste, somewhat like unto Galanga.

We have had a smaller sort hereof brought us from *Spain* by *Boelius*, not differing from this, but in the lownesse of the stalke, not being a foote high, and in being smaller also in leafe and roote.

Alter Hæmilus Hispanicus.

2. *Cyperus rotundus odoratus Syriacus major*. The greater Assirian sweet *Cyperus*. Of this kinde also there hath beene one brought out of *Syria* and *Egypt*, whose rootes and leaves were somewhat larger than the former, the stalke being somewhat shorter, the scent of the rootes somewhat stronger and quicker, and of a browne colour, on the outside else not differing in any thing.

3. *Cyperus rotundus odoratus Syriacus minor*. The lesser Assirian round rooted sweet *Cyperus*.

There is also another lesser sort brought both from *Syria* and *Candy*, being more rough, whose rootes and leaves are lesser by the halfe than the last, the stalkes also shorter than the small Spanish, but not differing in any other thing.

4. *Cyperus*

2. *Cyperus rotundus odoratus vulgarior.*
The rare common round rooted sweet Cyperus.

3. *Cyperus rotundus odoratus Syriacus minor.*
The lesser Asian round rooted sweet Cyperus.

4. *Cyperus longus odoratus.* The ordinary sweet Cyperus, or English Galingale.

This ordinary sweet Cyperus hath his leaves long, and as it were three square like the former, and as rough or hard in handling also: the stalkes are smooth, stuffed with a white matter, like as the others are, and three-square like the other, rising somewhat higher, and having some short narrow leaves at the toppes of them, and small long panicles like unto the other in all things, so that they are hardly discerned asunder above ground; the onely difference consistin in the roote, which in this is long and round, of a blackish browne colour on the out-side, and whitish within, full and firme, creeping under the superficies of the earth round about, whereby it is quickly increased, and hath also a very good sweet scent, as well greene as dry, yet more being dry than when it is greene and fresh.

5. *Cyperus dulcis rotundus esculentus, Trass dulce vocatus.* The most delicate sweet Cyperus, or Rush Nut.

The leaves hereof are long and narrow like the other, with a thicke ridge in the middle, and sharpe pointed, a foote and a halfe in length; among which rise up the stalkes, smooth, without joynts, three-square, and a cubite high, or more; at the toppes whereof stand five or sixe short narrow leaves, compassing the stalke, and standing like a starre, from among which come forth pale yellowish spiked eares, which are the flowers, wherein lyeth the seed, when their colour is thorowly wasted and decayed: the rootes are small, long and round, and many of them smaller at the one end, than at the other, hanging or growing at the ends of long strings, somewhat like unto the manner of growing of the Virginia Potatoes, of a pale reddish colour on the outside, and white and firme within, of the bignesse of beanes; of no sweet scent, nor bitter or aromaticall taste like the other, but pleasant to the taste, eating like Chestnuts, or rather more delicate.

The Place.

The first is found in moist and moorish grounds, both on Mountaines, and at the foote of them, in sundry places in Italy and Spaine, as also by Nilus, and other places in Egypt, as *Alpinus* saith, but is not to bee seene but in gardens of the curious, either in France, Germany, the Low. countrey, or England, where they hardly endure the Winters, without great care. The second groweth in Syria and Egypt. The third in Syria and Candy. The fourth groweth in many Countries, and as well in Spaine and other hot Countries, where the rootes are sweeter, although smaller, as in these colder Northerne parts on this side the Alpes: it groweth well in our gardens, especially if they bee somewhat moist and not too dry. The last is reported by many Writers to be found naturally growing no where, but neare unto Verona in Italy, but *Amatus Lusitanus* saith, they are brought out of Ethiopia and S. Thomas Island. And it is probable by *Drepanum* in Sicilia, for *Baptista Cortesius* in his *Miscelanea Medicinalia* meaneth this, as I take it: but are planted in Spaine and other hot Countries for their delight and use. It hardly groweth with us to

5. *Cyperus dulcis rotundus esculentus Trasi dulce vocatus.*
The most delicate sweet Cyperus, or Ruth Nut.

5. *Cyperus esculentus sive Trasi cum flore.*
The Ruth Nut flowering.

to any perfection, neither will it abide the extremities of our Winters; for as *Camerarius* saith it will rot, if it bee not taken up before Winter, and new set againe in the Spring, after it hath beene well steeped in water.

The Time.

All these round rooted *Ciperi* doe flower or carry their bushy toppes in August with us, but the ordinary long rooted kinde, giveth his tufted head in the end of Iuly for the most part.

The Names.

The Greeke words *κύπερος* *Cyperus*, *κύπερος* *Cyperus*, and *κύπερος* *Cyperis*, are taken by divers good Authors, to be one and the same plant, others to be different, especially *Cyperus* from *Cyperus*, because that *Pliny lib. 21. cap. 18.* maketh *Cyperus* to be *Gladiolus*, whom *Gaza* in his translation of *Theophrastus* doth in all places follow, and *Pliny* in another place calleth the long rooted sweet kind *Cyperida*: but if I might shew my opinion, I would say that *Cyperus* is the sweet round rooted kinde, then which no other was knowne to *Dioscorides*; and that *Cyperis* is the long sweet kind as *Pliny* doth take it: and that *Cyperus* is the water or marsh *Cyperus*, my opinion herein being confirmed by *Aristophanes* in *Dialogo de canis*, where he maketh the quire or company to say *Saltavimus per Cyperum & Phleum gaudentes cantibus*: so that hereby *Cyperus* must of necessity be here understood to bee a water or marsh hearbe, as *Phleum* is also, among which the Frogges are conversant: *κύπερος*, is so called from the round forme of the roote, which is like a small boxe or vessell, in Latine also *Cyperus* and *Iuncus triangularis & angulosus*, to distinguish betwene it and the *Iuncus levis* or *vulgaris*, ordinary Rushes, yet *Cornelius Celsus* calleth it *Iuncus quadratus*, because at it is likely in those places where he observed it, it did peradventer beare foure-square stalkes; but it is not so in many other places: in English many doe call it *Gallinga* or *Gallingale* after the name the Dutch give it, because the round rootes are somewhat like unto the rootes of the small *Gallinga*, and yet that kinde with round rootes, is not so frequent in our land as the other with long rootes, to be so called for the likenesse thereof betwene them, I thinke the name is transposed from the one to the other. It is called also as commonly *Cyperus*, and sweet *Cyperus*, after the Greeke and Latine names. The first is generally by all Writers, called *Cyperus rotundus*, and *odoratus* is added for a distinction betwene this kind that is sweet, and another that hath no scent, which shall be declared in his place. The second *Lobel* and *Camerarius* upon *Matthiolum*, call *Cyperus major rotundus Syriacus*, and *Prosper Alpinus* saith the Egyptians call it *Hodueg*. *Rauwolfius* calleth it *Cyperus Orientalis major vel Babylonius*. The third is called by *Lobel* *Cyperus rotundus Syriacus minor*: and *Camerarius* on *Matthiolum* calleth it *Cyperus minor Creticus*. *Barbinius* calleth it *Cyperus rotundus orientalis minor*. The fourth as I said before, is called by *Pliny* *Cyperis*, by *Matthiolum* *Cyperus*, and by others *Cyperus longus*. *Lobel* and *Lucdunensis* *Cyperus longus habitior*. *Cordus* upon *Dioscorides* calleth it, *Cyperus Romanus sive longus*. The last is called by *Camerarius* and *Taberna-*

montanus Cyperus dulcis; and so it is probable *Theophrastus* doth in his 6. booke de *causis plantarum*, 16. & 17. chap. reckoning *Cyperus*, (which *Gaza* translateth *Gladolus* in all places, following *Pliny* herein, as is above said) among other sweet rootes to be eaten. *Dalechampius* upon *Pliny*, *Casalpini*, *Clusius*, and *Fabius Columna*, take it to bee *Malinathalla* of *Theophrastus*, and *Anthalium* of *Pliny*. The Italians generally call it *Trafi*, and *Trafi dolce*, *Dolcolini*, and *Dolceguine* as *Clusius* saith, from *Belonius lib. 2. cap. 25.* and thereafter divers Writers doe call it so, and *Dulcicolum*, as *Matthiolus*, *Gesner*, *Dodonaeus*, and others; it may fitly bee called *Rust-nuts*, from the Spanish *Inucia avellanada*, of the forme of leaves and rootes. *Baptista Cordesius* saith it (if this bee his) is called *Furiosum* and *Azulinum*, and by the Sicilians *Casianalos*, because the rootes taste like Chestnuts. *Pona* in the description of Mount *Baldus* saith confidently, that he hath found it by experience in suffering the rootes to grow unremoved for three or four yeares, that it beareth neither stalke, nor flower, nor seed. But *Matthiolus*, *Casalpini*, *Lobel*, *Dodonaeus*, and *Columna*, doe all say, that it hath both stalkes, flowers, and seed, and so doe give the figure thereof in all their Workes: and *Clusius* in his annotation upon *Belonius lib. 2. cap. 40.* giveth a figure without flowers, as if it bore none: but assuredly both he (if he thought so) and *Pona* might be as much deceived herein, as they that wrote the *Colocasia* never bore flower, which *Columna* disproveth. There remaineth one thing more to be spoken of, and that is, that many of our Apothecaries, are not onely so ignorant, that they doe not know, that onely the round sweet *Cyperus*, is that *Cyperus* and no other, which all the ancient Authors have appointed to be put into the medicines that they appoint; but are without care also, or desire to be furnished with those things, that are the genuine drogues of the Ancients; because the false is better cheape, and easier to be had, and put into their choicest and chiefest medicines, as well as others, the common long rooted *Cyperus* in the stead thereof; which although in an extreme necessity, may supply the want thereof; yet as we all know, no substitute can bee so effectual to all purposes, as the genuine is. The Arabians call it *Sabarade*: the Italians *Cypero*: the Spaniards *Junca de olor*: the French *Souchet*: the Germanes *Wilder galgan*: the Dutch *Wilde Galgaen*: and we in English as I said before, *Galtingall*, and sweet *Cyperus*.

The Vertues.

It is of a warming quality saith *Dioscorides*, and giveth breathing to the veines: It provoketh urine, and helpeth to breake the stone in the bladder, and to consume the water in the dropsie, if the decoction thereof be drunke: and is a remedy against the sting of the Scorpion: it provoketh womens courses, and is good for the fretting paines and stranglings of the mother, if the parts be bathed with the decoction thereof, or they sit over the fumes thereof, or in the decoction. The powder thereof is a most especiall remedy for all foule sores and ulcers of the mouth, although they be spreading and devouring cankers. It is also used in sweet oynments and salves that are warming and comforting. *Galen* saith the rootes of *Cyperus* are of greatest use, being of an heating and drying quality, without sharpnesse: whereby it wonderfully helpeth all ulcers, that by their over-much moisture doe hardly admit any cure, and by the astringent quality it hath, it helpeth all manner of sore mouthes. It hath a cutting quality also, whereby it helpeth those that are troubled with the stone, and provoketh urine and womens courses. The rootes of *Cyperus* and Bayberries, of each a like quantity beaten to powder, and made up with the urine of a Boy under yeares, and laid upon the belly of those that have a dropsie, doth helpe them very much: and both of them boyled in wine, and drunke often while the other is used outwardly, doth worke effectually. *Alpinus* saith the Egyptians doe much use both the powder of the rootes, and the ashes of them when they are burnt, to cure the ulcers both of the mouth, and secret parts, and the decoction of them to be drunke, to comfort and warme the stomacke, braine, lungs, sinewes, arteries, and the wombe; and if it be taken for some time together, it warmeth and strengthneth the naturall vigour of the spirits, it is also an especiall remedy for cold and moist braines, and the distillations thereof, by warming and comforting the braines and the senses: it conduceth helpe to the crudities, humidities, and windinesse of the stomacke and belly, and to helpe the shortnesse of breath and coughes: as also for all cold and moist wombes, and the griefes and diseases comming thereby. It bringeth much comfort to those that by long sicknesse are much spent in their strength of body, and weaknesse of their stomacks, and faintings of their spirits; by warming, quickning, and comforting them, by helping and strengthening the digestion, and proenring warmth to the blood, and good colour to the face: it helpeth those that have strong or stinking breaths, drinking the decoction thereof made in wine. The long sweet *Cyperus* commeth somewhat neare to all the faculties formerly expressed, yet performeth them not so effectually. There is much hereof spent in sweet powder, and sweet washing waters, and to perfume Garments, Gloves, &c. as also into Perfuming-pots with vinegar and Rosewater, a few Cloves and Bay-leaves to perfume Chambers. The *Trafi* or *Rust-nuts*, are for the most part spent, as junkets to be eaten for pleasure, rather than used Physically for medicine: yet it is found to bee good, both for the paines of the breast and sides, if a creame bee made thereof and drunke; and therefore very profitable for those that have a cough, to helpe to expectorate the slegme: the same also drunke mixt with the heate of urine, and allayeth the sharpnesse thereof: it helpeth also the sharpnesse of humours in any dysentery, or fluxe, and stayeth it, if hot steele be often quenched in the decoction thereof and drunke. It is also thought by many to further venerous adions, by taking the creame thereof, when it is steeped, stamped, and strained with the broth of fat flesh: for it is a little windy and nourisheth well, as by the sweetnesse thereof may bee perceived, and the qualities of heat and moisture conjoynd therewith.

Having thus shewed you the chiefest of these sweet hearbes and plants that grow with us, it is time to convert my stile to another forme, that you may therein heare what will be intreated of.

PLAN-

PLANTÆ CATHARTICÆ SIVE PURGANTES PURGING PLANTS.

CLASSIS SECUNDA, The Second Tribe.

CHAP. I.

Being to shew you here the chiefeſt ſorts of purging plants that may grow with us; I muſt as well ſpeake of them that worke upwards, as downe wards, as alſo of thoſe that are conducing or helping thereunto, although they be not ſo forcible in working as the others, I ſay the chiefeſt or moſt, becauſe, that as in the former *Claffe* ſome are omitted that are diſperſedly related of in other places of this Worke, ſo likewiſe it will fall out in this and ſome of the other following *Claffe*s, and begin with the hearbe Aloes, whoſe bitter juyce is ſo frequent in uſe every where knowne by the name of Aloes and Aloes Succotrina.

1. *Aloe vulgaris* Herbe Aloes, ſive *Sempervivum maritima*.
Sea Houſlecke.

1. *Aloe vulgaris* Herbe Aloes, ſive *Sempervivum maritima*.
Sea Houſlecke.

This hearbe hath divers long fleſhy pale greene leaves, of the thickneſſe of ones finger, with divers hard dents or points on both ſides of them, and pointed at the end likewiſe, the one enclosing the other at the bottome, and ſtanding round, the outward-moſt bending for the moſt part backwyrds, eſpecially in thoſe wee ſee are brought to us; but in the naturall places ſtanding all of them outright and ſtiſſe, or rather bowing inward than backward, whoſe leaves are nothing bitter in taſte in the places either natural or planted, but rather cold: in the middle of theſe leaves riſeth up a ſhort thick ſtalke, branching forth into 2. or 3. parts; little more than a foot & a halfe, or 2. foot high, bearing many ſmall bottle-like flowers, of a whitish colour with us, & ſo *Diſcorides* ſaith alſo, but in the hotter Countries yellowiſh, as we are certainly informed, divided at the ends, into five or ſixe parts, every one hanging downe round about the ſtalke, from the middle thereof up to the top; it beareth ſeed in huſkes like unto an *Aſphedill*, after the flowers are paſt: the roote is thicke, and about a foote long or leſſe within the ground, ſhooting out ſome thicke fibres at the end, and ſome ſmall ones round about the ſides, eſpecially in the naturall places, but are ſeldome ſeene to give any with us, as they hang up in our houſes, but may better be diſcerned, if any of them be put into the ground in the Summer time: the ſtalke next to the roote will have the markes of the withered leaves when they are paſt and fallen away; as may plainly be diſcerned in many of thoſe that are brought from *Spain* hither: and ſhoot forth a number of heads round about it, whereby it may be eaſily encreaſed.

2. *Aloe Americana*, Hearbe Aloes of *America*.

The neare reſemblance of the leaves hereof unto the former hath cauſed it to be thus entituled, for it beareth very large long leaves, of a pale greene colour, whereon is to be ſeene an eye, of blue or aſh colour, being of the length of a man, and of two or three fingers thickneſſe in the naturall places, dented about the edges where they are thinnest, with hard ſharpe teeth like the other, and ending in a hard round bigge blackiſh thorne or prick; as bigge as a *Faul-*

2. *Aloe Americana.* Hearbe Aloes of America.*Aloe Americana caulis cum floribus et operatine flos et siliqua feminum.*
The stalks and the flowers of the Aloe Amer. a flower & head of seed by themselves

consistent, which leaves are found on the under-side, and channelled or made hollow like a gutter on the upper-side, and at the bottom encompass one another, but growing flat when they are elder after a footes length, unto the end: the innermost still abiding channelled and hollow: these leaves are full of juice and full of threads running thorow them, but are no more bitter than the other: in the middle of these leaves after a long time abiding, riseth a strong great spongy stalk, of the bignesse of a mans arme, with a few small dry and brownish leaves, sparsedly set thereon, and of the length of a Horsemens staffe in some places, but rising higher than two speares length in others; as at *Avignon*, where as it is reported, within the space of 45. dayes, the Greene stalk grew to the height of 22. hands breadth: that is, about nine or ten foote: and about twelve cubits length, in the Duke of *Florence* his garden, and fiftene cubits at *Rome*, branched almost from the middle thereof up to the toppe, into divers branches, and each of them againe into others, the great branch standing out for a good space, and then turning upwards; on each whereof are set a number of flowers, even two or three hundred, being no other then long and large Greene three-square hard huskes, thrusting out sixe great yellow hard and crooked threads, tipt at the toppes with yellow pendants; and in the middle amongst them another yellow round headed pointell, *Lobel* saith, of a purplish blue colour, which is not true, for they are of a whitish or yellowish Greene colour, and of a sweet scent: these huskes that beare the flowers, after they are dry become the seed vessels, which being ripe, are divided into three parts or cells, each containing abundance of white halfe round light biparted seed, closely compact together: the roote is very great, comparable to the rest of the plant, two or three cubits long, harder than the former, giving a number of young sprouts yearly, which being separated and planted, will quickly take roote in the ground, and grow up; but must be kept from cold in the Winter, and will not desire to be much watered.

The Place.

The first groweth in *Arabia Asia*, *Syria*, and all the East Countries, and in *India*, as well a great way within the land, as neare the Sea side, and in the Ilands there, as in *Socotora* as *Garcias* saith, where the best is made, as also in many places of *Italy*, and in *Spain* about *Andalousia* neare the Sea shore in such plenty, that divers thought to have made good store of Aloes there, but after triall was made, it was not found any way so effectual as the *Indian* sort. The other sort grew first in *America*, (which being brought into *Spain*, was from thence, spread into all quarters) and in that abundance about *Mexico*, as Vines doe in *Spain*, which they there use to plant, to serve them in stead of hedges, as well to separate as to defend the limits of their grounds.

The Time.

They flower in the hottier Countries, in the first Summer Moneths, but never in these colder, for they are preferred with great care from the frosts in Winter, which will cause them quickly to rotte, if they seele never so little almost.

The Names.

The first is the *Aloes* of *Dioscorides*, and all others both ancient and moderne Writers, and as *Pena* saith, because

it most commonly groweth neare the Sea, many doe suppose it tooke the name either from *ἀλός*, that is, a salt salt, or from *ἀλ & α Salo*, the Sea it self, with whose breath it is much delighted. The hardned juyce thereof is also usually called Aloe, and because the best and purest is made, as *Garcia* saith, in the Island *Socotora*, it is called *Aloe Socotrina*, and corruptly in the Apothecaries shops *Aloes Succotrina*, or *Succo citrina*. It is also called *Aloes hepatica*, because the best is browne and red like a liver. It is called also *ἀπολίον*, because it not onely groweth in the ground, but will live also out of the ground. Some of the moderne Herbarists doe call it *Sempervivum maritimum*, from the thicknesse of the leaves and likenesse unto *Sedum*, called *Sempervivum*. *Columellus* in his verses by naming *Sedum* under the bitter juyces, is thought to meane this, and called it *Sedum amarum*, for there is no *Sedum* that hath a bitter juyce but this onely. Another sort of Aloe was formerly wont to be brought, (before wee became industrious, to chuse onely the best for our use) which was called *Caballina*, either because they gave it hories, being the courtest, or because it was not fit for men but horses, the knowledge as well as importation whereof, is almost utterly forgotten and neglected. It is called in English hearbe Aloes after the Greeke and Sea Housleeke after the Latine name, and Aygreene, that is Evergreene. *Pliny* and others have written of an *Aloe metallica*, or *fossilis* in *India* and other places, but it is found by divers Writers to be an error in them, and no such thing to be found. The second as *Gomara* in the end of his Mexican History saith, is called of some of the Indians *Mell*: and of some others *Maquay*: of some Spaniards *Cardon*, because of the prickles about and at the end of the leaves, and of others *Pil y Aguilla*, that is to say, thread and needle, because it supplieth both their uses; the sharpe end thornes serving as an aule or needle, and the threads running within the leaves being spunne, serving as thread. *Clusius* calleth it *Aloe Americana*, and so almost all other Authors after him, onely *Label* calleth it *Aloe folio mucronato*. *Fragosus* saith that the prick of the thornes hereof are venomous.

The Vertues.

The first hearbe Aloe is usually hung up in houses to bee ready at hand upon all occasions, to apply a little of the juyce of a leafe presently cut of, or the peece of a leafe it selfe, upon any cut or fresh wound, which is found to bee singular good to soder and heale them: even as *Dioscorides* saith, that that sort which grew in *Asia*, *Arabia*, &c. is of more use to glue or soder wounds, than that which cometh out of *India*: the leaves also are found to bee exceeding cold in the hot Countrees, and of very great use and effects for all manner of scalding with water, or burning with fire, gun-powder, or the like, healing them quickly: the nature of the juyce, or Aloe it selfe, is fit to thicken, to dry, to procure sleepe, and moderately to heate; it openeth the belly, purgeth the stomacke, and the yellow jaundie, and stayeth the spitting or vomiting of blood, if a dramme thereof be taken in faire water: it is not onely a good purger of it selfe, but is added also with other purgers to cause the lesse trouble in the stomacke: it healeth greene wounds, and bringeth old sores to cicatrizing, as also those of the genitors, it healeth the chappes of the fundament, the piles and breaking forth of blood from them, being used outwardly; but assuredly it is found not convenient for those that are troubled with the piles, to take thereof inwardly, because it heateth, and maketh the blood of them to be the more sharpe and fretting. It is also found to be more helpfull to stegmaticke, than to hot, dry, and cholericke constitutions. It easeth the paines of the head to bee taken in pills; or being dissolved to annoynt the forehead and temples: dissolved in wine and honey, it helpeth the forenesse of the reynes and gums, and all ulcers in the mouth: being torrified in a cleane earthen vessell, it is an especiall good medicine to be used with others for the eyes. *Galen* sheweth that it is hot in the first degree compleat, or second inchoate, and dry in the third, and hath a little astringent faculty therein also, but exceeding bitter: it openeth the belly and purgeth moderately the stomacke chiefly, whereunto it is most friendly and comfortable above all other medicines, (for whereas all other purgers doe trouble and weaken the stomacke, this onely is found to comfort and strengthen it:) and those humours that are in the lower parts next unto the passage, for it is no strong or generall purger of the whole body, to expell grosse humours, but those onely that be in and about the belly. And for this purpose the Aloes simply it selfe, is fittest to be used, for if it be washed, it loseth the most part of the purging quality, and hath onely a comforting and strengthening property left. And therefore if Aloes that is washt be given to those that are feverish, howsoever it may doe small harme to some, yet it is found to doe much to others. Masticke or Cinamon are accounted, the best correctors or helpers to be mixt therewith when it is given: It healeth also those ulcers that are hardly cured, and especially those in the fundament and secret parts. *Mesnes* saith it cleanseth the head and stomacke, and easeth those paines are incident unto them: and that the continuall use thereof preserveth any from dangerous and deadly diseases, and with Mirrhe preserveth the bodies, not onely of the living but of the dead, from all putrefaction and corruption: which effects long before his time were well knowne to the world, for the manner of embalming the bodies of the dead, with Aloes and Myrrhe, which was used among the Jewes, as appeareth in the 19. Chapter of Saint *Iohns* Gospell, the 39. verse, where it is said that *Nicodemus* brought about 100. pound weight of Mirrhe and Aloes mixed together which was laid with the body of our Saviour *Iesus* in the Sepulchre. But the Aloes that is mentioned in all other places of the Scriptures, is understood to bee the *Lignum aloes*, which the Apothecaries use in their shops, in many medicines, appointed both by Greeke and Arabian Authors, as well inward as outward, for sweet oynments, perfumes, and other compositions: and the Aloe tree is onely once or twice named, as in the 24. of *Numb.* and the 6. verse. The parable of *Balaam* concerning the beauty of *Jacob*, or the children of *Israel*, in the faire spreading of their habitations, to be like valles stretched forth, like gardens by the River side, like the Aloe trees, (which Saint *Ierome* translateth Tabernacles) that God planted, as the Cedars beside the waters. And in the 45. Psalme where Saint *Ieromes* translation hath *Alyrrha Gutta & Casia*, it should be *Alyrra Aloe & Casia*, for the Hebrew word *Ahalad*, which the most judicious doe translate *Agallochum* into Greeke, and *Lignum aloes* into Latine. It is often given to children for the wormes, either of it selfe, or in a few Raisons of the Sunne opened, and the stones taken forth and some put therein, or outwardly applied to the belly, under the navill, made into a plaister with a little oyle of Wormewood, or some other such thing, Aloes also is often used in medicines for the eyes, with a little honey to allay the heate in them, to cleanse the inward roughnesse of the eye-lids, and cleare the dimnesse of the sight, that cometh by moist humours distilling into them, by drying it up without sharpnesse or offence: it healeth also the itching in the corners of them. Being mixed with a little vinegar and oyle of Roses, and the temples and forehead annoynted therewith, about the time of rest, doth much helpe the headach, and is a meanes to procure sleepe to those that want: if it be dissolved in wine, and the head washed therewith, it stayeth the falling of, or shedding of the haire: used with honey and wine, it cleanseth all foule ulcers, that

that happen in the mouth or throat, as also fistulae, that happen in the yard of a man, or in the fundament: and afterwards ingendred flesh therein, to fill up the cavity. Briefly, Aloes is of so much use in the Apothecaries shops; or should be, if our delicacy and niceness did not hinder it, as either Honey or Sugar: but the bitterness of the one, is so unpleasant and unwelcome to this delicate age, and the sweetness of the other so much pleasing and acceptable thereto, that the rotting and corrupting sweetness of it hath overcome and overgrown the wholesome bitterness, that preserveth from corruption of the other: yet notwithstanding the effects are the same, they formerly have beene, and so are used; being three or foure times washed with the depurate juyce, or strong infusion of Damaske Roses, and dried up againe, it is then called *Aloe Rosata*, Roised Aloes; which is a safe and gentle medicine for tender bodies, familiar and comfortable to the stomacke, helping more to strengthen it than other Aloes, and purgeth also lesse than it, yet somewhat openeth the belly, and is good against surfs. The Aloes (that is to say, the dried juyce taken from the hearbe) that is used in all these Christian Countries, cometh from the East-Indies unto us, where it is made: yet *Fabius Columna* saith, he made as good Aloes in *Naples*, from the leaves that grow there, as any that ever came out of the *Indies*, which thing how he brought to passe, were I thinke worthy to be knowne, and might be beneficiall to this Realme in time to come; if in any of our remote plantations (as in the Summer-Ilands, or other such like hot Countreies) the hearbe were planted in that plenty, that thereof some quantity of the dried juyce might bee brought to us, both to requite their travell, and to save so much paines and cost, to bring it from the East-Indies. The manner whercof as he relateth it is thus: It came into his minde to make some Aloes, out of the leaves that grew with them in sufficient plenty at *Naples*; and finding that the juyce of the leaves, bruised according to the usuall manner of all other hearbes, was unprofitable and unfavoury also, or that the scarifying of the roote, did not yeeld any juyce bitter like Aloes, or of any worth, hee tried that way, to take the juyce out of the leaves of Aloes, which he had formerly tried and found effectually, to have the red or bloody juyce, out of the hearbe or thistle called *Atractylis*, (as I shall shew you, when I come to speake thereof in his proper place) which was, that the juyce was to be drawne or taken, not out of the fleshy substance of the leaves, but out of the veines, that runne thorow them: he therefore pulling divers leaves from the rootes, while they were fresh, he laid their ends downewards, round about the brims of a broad stone pan, that was glazed or leaded, (such as our milke-pans are) from the mouths or ends of whose veines, dropped forth a yellow liquor by drops, which gathering together into one, when they had dropped well of themselves, hee stroaked a little harder with his hand, to draw forth what might be had from them, and tooke that also that grew thicke from the ends of the leaves, and this he hid in the open and hot Sunne: having thus taken a reasonable quantity of this yellow juyce, he let it stand in the hot Sunne, for three or foure dayes, but set it aside, and covered it in the night time, and as the juyce dried on the sides of the pan, he often every day, scraped it downe into the moist, untill it became thorow dry and hard, and as easie to be dissolved as any: which from being yellow at the first, became more reddish in the drying, and lastly, blacke almost like dried blood; yet cleare or thorow shining, light in feeling and not heave, of a sweet and aromaticall favour, but so extreme bitter, that even the ayre was infected therewith, and became so bitter, while it was thus in doing, that it was scarce to be endured, by piercing into the mouth and throat. And thus as he saith not without much delight and content to himselfe: he found out the way, not knowne to any before, how to make pure, sincere, translucent, brittle and hard Aloes, of the colour of a liver; and was content to abide the trouble and paine, thus to impart it to others, that they also might take the pleasure and profit thereof, to know and doe it if they will: but having given directions to some that failed in not doing right, they have left it of, as not to be done. The Aloes of *America* is said to be bitter and sharpe in the hot Countries, where it groweth: but hath no bitterness in these European parts of the world, where it is nursed up of divers. The juyce of the young leaves, and of the roote, mixed with the juyce of the Wormewood, that groweth in the same Country, is very profitably put into the wounds of those have beene bitten by vipers: the juyce of the leaves boyled a little on the fire, is a fire remedy, quickly to heale both greene wounds and old sores: of the yongest and tender leaves, they use likewise to make conserve; and use it for the purposes aforesaid: Some also say it healeth the French disease, to be taken in this manner, Take a good peece of the roote hereof cut small, and boyle it in a large stone pot, with a good quantity of faire water, for three houres space at the least, stopping the pot very close with clay, or some other such like matter, that no fumes breake forth, which pot after it hath beene so long in boyling, being placed nigh unto the sicke Patient, so as they may receive the hot fumes thereof, when it is opened, will cause or procure them to sweat abundantly: Or else if a leafe hereof be roasted under hot embers or coales, and the hot fumes thereof taken, will provoke sweat so extremely, that it is able almost to overcome the spirits, not to be endured, although this remedy bee used but for three dayes onely together. They of *Mexico*, and other parts of *America*, where it groweth naturally, have as great use of this plant, and serveth them to as many purposes, as the Cocar Nut-tree doth to them of the East-Indies, or more, and that is more by many, than any other plant or tree, growing upon the Earth. For first the mighty tall and strong stalkes thereof, after it hath given his flower and seed, and becometh dry, as also the leaves after they have beene dried, are gathered and laid up to serve them instead of wood to burne: the hollow or channelled leaves serve them in stead of tiles to cover their houses, to defend them from raine, which they can so aptly dispose, that no other thing with them there can better performe that office. They use to cut it downe before it grow great, to cause the roote to grow into the greater substance, from whence, a hole being made therein, they gather a certaine liquor, which will quickly grow into the forme of a Syrupe, and being boyled a little on the fire, will be as thicke as Honey, a little cleared and settled will become as Sugar; dissolved with water it will serve as vinegar, and will be made into wine; if *Ocopali* (which is a roote they use to call the medicine of wine) bee put unto it: which wine they much use, but nothing wholesome; for it soone intoxicateth the braine, and causeth drunkenness: but it moreover causeth so foule and stinking a breath to them that use it, that no carrion carkeise, or stinking sinke doth smell so loathsome. The Priests and Painters of those Countries, doe use the leaves, both in stead of Paper to write upon, and to draw any figure thereon: the Priests also use to pricke and wound themselves with the sharpe ends thereof, which are so sharpe and strong; that although they can cause them to pierce how farre they please, yet will they not breake in the flesh, no nor in other harder substances, for those prickles serve them in stead of an awle to make any hole, and the long threads in the leaves, serve in stead of thread, to sew or tye any thing they would therewith, yea it hath beene spun into so good and strong thread as any hempe can make, and cloth hath beene woven thereof and made into shirts, &c. (as *Clusius* reporteth the Daughter of his Host at *Civell* in *Spain* did performe

forme and shew to him, while he was resident there,) and often brought into the markets to bee sold : and being made into a coarser thread, serveth as cords or ropes in Ships, or other such like purposes, and with it also they use being platted together, to worke into Sandals (a kinde of shooes in much use with the Spaniards, as well as the Indians) into mattes to lay on the ground to goe upon, or to lay any thing thereon to dry : and into short coarse garments, such as Shepherds and Shipmen use, to be thereby defended from heat and raine.

CHAP. II.

Iucca sive Yucca India putata. The supposed Indian Iucca.

Nto these kindes of Aloes may most fitly in my judgement bee referred, that plant which is usually in these parts called *Iucca* or *Yucca*, for unto no other plant that I know can it better bee adjoynd, the forme of the leaves especially being so like, and although the flowers be differing, as may be perceived by the figure and description, yet that letteth not, for so also are the flowers of that of *America*, much differing from those of the true Aloes, whose description is on this wise.

Iucca sive Yucca India putata. The supposed Indian Iucca.

Iucca sive Yucca India putata. The supposed Indian plant.

This rare Indian plant hath a great thicke tuberous roote spreading in time into many tuberous heads from whence shoot forth many long hard and narrow guttured or hollow leaves, very sharpe pointed, compassing one another at the bottome, of a grayish Greene colour abiding continually, or seldome falling away, with sundry hard threads running in them, and being withered, become pliant withall to bind things : from the midst whereof (some

(some yeares for it doth not every yeare with us) springeth forth a strong round stalke, divided into sundry branches, whereon stand divers somewhat large white flowers hanging downewards, consisting of sixe leaves with divers veines, of a weake reddish or bluish colour spread on the backe of the three outer leaves, from the middle to the bottome, not reaching to the edge of any leafe, which abide not long, but quickly fall away without bearing any seed in our Country, as farre as could be observed by any hath growne in this land, or in France, &c.

The Place and Time.

This groweth in divers places of the West-Indies, and in our English plantations also, of Virginia, & New-England, as it hath beene confidently affirmed to me. It flowreth not untill the middle or latter end of July, the flowers falling away within a while after they have beene blowne open.

The Names.

That it cannot be the true *Tucca* of *Oviedus*, *Thevet* and others, whereof the bread called *Casavi* is made, both they and *Monardes* shew plainly: for the true *Tucca* beareth leaves divided into seven or nine parts, standing on long foot-stalkes. Yet not knowing what other or fitter name may be given it, let it hold still that name of *Tucca* or *Tucca*, or *Hyjuca* if you will, untill a fitter may be knowne. *Bauhinus* calleth it *Tucca* *folijs Aloes*.

The Vertues.

There hath not beene knowne any property conducing to any disease as yet found out, or related of it. Some Merchants Factors have affirmed, but how probable I know not, that it groweth in some parts of *Turkie* naturally, and that they make a kinde of course cloth from the threads in the leaves, which are strong and hard: but the Relators were surely deceived herein, for if it doe grow there, it hath beene onely brought to them, as unto us and planted: the natives formerly in *Virginia*, as I heare, did and doe make bread of the rootes hereof, as they of *Hispaniola* doe of the true *Tucca*, and much after the same manner, and it is said likewise, that the raw juyce is dangerous, if not deadly: *Aldinus* relateth that the wound made by the sharpe point end, of one of these leaves in his owne hand, wrought such intolerable paines, that he was almost beside himselfe, untill by applying some of his owne *Balsamum* thereto, it miraculously eased him of the anguish, and all other trouble thereof.

CHAP. III.

Lapathum sativum & *Rha*, Garden Dock and Rubarbe.

Because both the true and the bastard *Rha* or Rubarbe are sorts of Dockes, as shall be shewed; I have therefore placed them together with the Patience or garden Docke in one Chapter, and unto them for the names sake, rather than for any knowne properties correspondant, I have adjoynd two other plants called also *Rha*, although they have no resemblance unto the Dockes, as the other sorts of *Rha* have.

1. *Lapathum sativum* sive *Patientia*, Garden Patience, or Monkes Rubarbe.

Garden Patience is a Docke bearing the name of Rubarbe, for some small purging quality therein, and groweth up with large tall stalkes set with somewhat broad and long faire Greene leaves, not dented at all, the toppes of the stalkes being divided into small branches, beare reddish or purplish flowers, and three-square seed like unto other Dockes: the roote is long, great and yellow, like unto the wild Dockes, but a little redder, and if it be a little dryed, sheweth lesse flore of discoloured veines then the next doth when it is dry.

2. *Hippolapathum rotundifolium* vulgare. Common Great round leaved Docke, or bastard Rubarbe.

This Bastard Rubarbe hath divers large round thinne yellowish Greene leaves, rising from the roote, a little waved about the edges, every one standing on a reasonable thicke and long brownish foote-stalke, from among which riseth up a pretty bigge stalke, about two foote high, with some such leaves thereon as grow below, but smaller; at the toppe whereof stand in a long spike many small brownish flowers, which turne into hard three-square shining browne seed, like unto the garden Docke or Patience: the roote groweth greater than that of Patience, with many branches or great fibres thereat, yellow on the out-side, and somewhat pale yellow within, with some discoloured veines therein, like to the Rubarbe next to be described, but much lesse than it, especially when it is dry, which then hath quite lost that fresh colour, which the other Rubarbe holdeth perspicuously.

3. *Hippolapathum maximum rotundifolium* exoticum, sive *Rhaponticum* *Thracicum* sed verius *Rubarbarum verum*.

True Rubarbe, or Rubarbe of *Pontus*, or English Rubarbe.

Because in my former Booke, I made onely a short relation of this Rubarbe, and the effects thereof; I thinke good here to give you a more ample declaration thereof, for it deserveth to be worthily accounted of. At the first appearing thereof out of the ground, when the Winter is past, it hath a great round brownish head, rising from the middle or sides of the roote, which openeth it selfe into sundry leaves, one after another, very much crumpled or folded together at the first, and brownish, but afterward spreadeth it selfe, and becommeth smooth; very large, and almost round, every one standing on a brownish stalke, of the thicknesse of any mans thumbe, when they are growne to their fulnesse, and molt of them two foot and more in length, especially in any moist or good ground: and the stalke of the leafe also from the bottome thereof, next unto the roote, unto the leafe it selfe; being as long, that is to say, two foote more, the breadth thereof also in the broadest place, from edge to edge being equall, or as much of a sad or darke Greene colour, and thicker in substance than the last, of a fine tart or fowrish taste, much more pleasant than the garden or Wood Sorrell: from among these riseth up some, but not every yeare, a strong thicke stalke, not growing so high as the Patience or garden Docke, with such round leaves as grow below, but smaller at every joyn up to the toppe, and among the flowers, which are white, contrary to the last recited Bastard Rubarb, or any other of the Dockes, spreading forth into many branches, and consisting of five or sixe small white leaves a peece, hardly to be discerned from the white threads that are in the middle, and seeming to bee all threads: after which come brownish three square seed, like unto other Dockes, but larger, whereby it may be plainly knowne to be a Docke: the roote groweth in time to be very great, with diuers and sundry great spreading branches from it, of a darke brownish or reddish colour on the outside, and with a pale yellow thin skin under it, which covereth the inner substance or roote; which rinde and skin being pared away, the roote appeareth of so fresh and lively a colour,

2. *Lapathum sativum* sive *Patientia* & *folium Hippolapatum* rotundifolij *vulgaris*. Patientie, or Monkes Rubarbe, and a leafe of the Bastard Rubarbe.

3. *Hippolapathum maximum* sive *Rhaponticum* *Thracium* vel *Rabarbarum verum*. True Rubarbe, or Rhaponticke.

Zolour, with flesh coloured veins running thorow it, that the choisest of that Rubarbe, that commeth to us, from the Indies and *China*, cannot excell it: which roote, if it be dried carefully, and as it ought (which must be in our Country by the gentle heate of a fire, in that we want the heate of the Sunne to dry it, as is used in the naturall places, and every peece kept from touching one another, (which thing may be observed, is also done by the Indians, in the dryed rootes that come to us, who put them upon strings to dry them apart:) will hold his colour almost as well as when it is fresh, and give a yellow tincture to the spittle when it is chewed, but not so much, nor hath that bitterness, and astringtion therein that the Indian root hath, as I have said before, I have divers yeares taken up of these rootes, and dryed them carefully as I have shewed you, and they have bene shewed to the best and most skillfull, who have approved of them, and divers of our Physitians have oftentimes used them, and very many others to good purpose.

4. *Rhabarbarum & Ponticum genuinum officinarum*. The true Rubarbe and Rhapantick of *China*, and the Shops.

Martholm hath given us a figure of Rubarbe, which he setteth forth for the true, but from whom or whence he had it, he declareth not, and it might be a figment out of his owne braine, as some others of his are: although hee seemeth to say that he learned from Persian Merchants, that it did grow in the Country of *Succur*, which is subject to the Great *Cham* of *Cathay*, in the Mountaines, nigh the chiefe City thereof, called also *Succur*, whose figure and description divers other Authors have followed. *Trincavell* in his first Booke and 12. Chapter, of the compoition of Medicines, relateth also, that a Merchant who had formerly bene an Apothecarie, and resident in *Persia* a long time, did report unto him, that there grew true Rubarbe in great abundance, upon the hilly places in *Persia*, and that it was carried from thence into *Syria* and *Egypt*, and from thence into divers other Countries of the world: but assuredly that Rubarb, which is used now adayes in all the world, I am sure in all the Christian Countries of this part of the world, commeth chiefly from the Country of *China* in the East-Indies, and hath bene brought by Arabian, Turkey, and other Merchants, in former times from thence over land by Caravans: (as they call them, that is a number of Merchants and others, having Camels laden with it, and

4. *Rhabarbarum* & *Ponticum* geranium officinarum.
The true Rubarbe and Rhabarbeck of China, and the theps.

5. *Rha Ponticum* Enulae folio latiore,
The broader Elecampane leaved Rubarbe.

and all other manner of drugges and spices there to be had, wherewith they served all this other part of the world) unto *Cairo* and *Alexandria* in *Egypt*, *Damasco*, and *Tripoli* in *Syria*, and from thence (as from the Store-houses) into other Countries: but now since the passage into the East-Indies by Sea hath beene knowne, and that it hath beene brought unto us that way, there hath little or none beene brought by the Caravans over land, as in the former times. The forme of the roote, as all know that have seene and observed it, is somewhat great, round, and long withall for the most part, yet there are smaller and shorter peeces, as well as the greater that come together: whose colour on the outside is not all alike, no more than the substance within, for still some is better coloured and sounder than other: the best is firme and somewhat heavy, not spungy and light, somewhat browne, but fresh on the outside, without many blackish (which are suspicious places, where oftentimes being broken it is rotten, corrupted and naught, I say many, for the best peeces have sometimes some) spots, which doe not runne farre inward, and if they doe yet notwithstanding, the rest is excellent good, and not to be refused for a little bad, which must be cut away as not fit, or at least not so fit to be used as the better, which is very much discoloured with flesh-coloured veines running thorow it, bitter in taste, and somewhat aromaticall in smell, especially if it bee fresh, and causing the spittle to be yellow, being a little chewed in the mouth. These properties belonging to the true Rubarbe, being so manifestly to be seene and discerned in the rootes of the former kinde, (excepting onely those things which the nature of the Climate produceth) may so reasonably perswade any of reasonable ingenuity, that the former is the same true Rubarbe with this, and a very Dock proper to the Country of *China*, and peradventure to some other Countries besides also. And if tryall were made thereof in some hotter and dryer Countries, of our foraine Plantations abroad (as I have of late to divers of them put it in practise) I verily beleieve, it would come much nearer to the other qualities of the true *China* Rubarbe than it doth, and is wanting in ours, according to the heate and climate thereof, wherein it is planted. This I thought good to intimate here, both to shew the correspondence of this Rubarbe of our English groweth, with that of the Indies, which is more probable to be a Docke of that Country, than any such plant as *Matthiolum* setteth it out for, both by figure and description: and besides further to excise some more of our Nation, if there be any ingenuity in them, to make the tryall by planting it in sundry other the hotter Countries, what effects it will procure, and how much it will better our English breeding: The true *Rhabarbarum* which hath formerly come to us with Rubarbe (and not that false kind of the great Centory rootes) is onely the lesser and longer peeces of the rootes of the true Rubarbe, whose figure is set forth with the other.

5. *Rhabarbarum* Enulae folio latiore. The broader Elecampane leaved Rubarbe.

I have adjoynd this and the next plant, for the names sake onely (as I said before) because *Lobel* hath so named and referred them: but to another place they might be more truly referred in my judgement, and that is unto the laceus Knapweeds, or *Centaurium majus* great Centory, both for the likeness of flower and seede, although the scales of the head be different; yet at this time take the description of them in this place: It hath diverse leaves rising from the roote, somewhat large and long, yet nothing so large as the leaves of Elecampane, greenish on the upper

upperfide, and grayish or white and woolly underneath, like therein unto the leaves of Elecampane, every one standing on his owne stalke, broadest at the bottome, and pointed at the end, and dented about the edges; from among which riseth up, a reasonable bigger round stalke, about halfe a yard or 2 foote high, bearing at the toppe thereof one great scalye head, consisting of very broad and loose or open browne scales; at the first shew representing a small Artichoke head, but that the scales doe not stand close together, but are much more open and loose, especially after the flower is past; which standeth in the middle, composed of many blewish red or

6. *Rhaponticum angustifolium*. The narrow
Elecampane leaved Rubarbe.

purple threades or thrumes, very delicate to behold: after which come blackish round and long feede, very like unto the seede of a Iacea or great Centorie, but a little longer and not altogether so thicke: the root is somewhat long and thicke, blackish on the outside, and of a deadish colour on the inside, more loose and spongye than either any Docke or great Centory, which hath in former times bene used among the Apothecaries for *Rha Ponticum*.

6. *Rha Ponticum alterum angustifolium*. The narrower
Elecampane leaved Rubarbe.

There is small difference betweene this and the last described, but only in the leaves, which are a little narrower and longer then it, being as hoary white underneath and greene above as the other; and a little unevenly waved on the edges: the head and flowers are a like but a little larger, and so is the roote, so that it is very likely, the naturall place of their growings, causeth the chiefest difference betweene them.

The Place.

The first groweth about *Lansanna* in *Savoy* as *Tragus* saith, but only in gardens with us: the second naturall upon the hills not far from *Caria* in *Germany*, as also nere *Friburg* in *Switzerland*, and on the mountaines in *Austria*. The third as it is reported grew in *Thracia*, and from thence brought to *Trospus Alpinus*, at *Padoa*, from whence some Apothecaries in *Venice* had it: and Master Doctor *Matthew Lister*, one of the Kings Physicians being in *Venice*, obtained 3 or 4 feedes, which he sent me with some other feedes that he procured; and with me (as I thinke the first in this Land) they sprung up grew and feeded within two or three yeares, and from them, both I, and many other my friends, as well in England as beyond Sea have bin furnished. The fourth groweth chiefly as I sayd in *China*, or *Cataya* (for they are held to be but one Countrey) as *Matthiolus* his *Persian Merchant* saith, and in the Mountaines of *Persia*, if ye will beleeve *Trincavel* his Apothecary, turned merchant, as is before declared: The fifth groweth both on Mount *Baldus*, as I am enforced, nere *Verona* in *Italy*, and also upon the hills in *Switzerland*, and in some craggie places in *Savoy*; though *Lobel* saith the

feede thereof, was first brought out of *Turkie*, and that the last was brought out of *Italy*.

The Time.

All these sorts of Rubarbe doe grow with us in our gardens and doe flower, about the beginning or middle of June, and the feede is ripe in July. The rootes that are to be dried and kept all the yeare following, are not to be taken up, before the stalke and leaves be quite withered or gone, and that is not untill about the middle or end of October; for if they be taken either a little before the leaves doe spring, or when they are sprung up, the rootes will not have halfe so good a colour in them.

The Names.

The Greekes doe call the Dockes *ῥάβδον* *Rapadum*, from *ῥάβδον*, or *ῥάβδον*, *exinanire*, quod foliorum decedum album emolliat, lenit & exinaniat, in Latine *Rumex*, which is rather attributed to those Dockes are sowen, than to those are wilde, and chiefly unto *Sorrell*, because the leaves are used to be eaten or sucked, to coole the heate and quench the thirst, even as children doe sucke a teate, which was called among the old Romans *Rumex*, *Galen* in 2 *Alimentor*, saith *Lapathum* might be called a wilde Beete, it is so like unto the garden kinde, but because the Beete is more pleasant than the Docke, no man but will more willingly eate the Beete. The first here, is called of most men *Lapathum sativum*, *Patientia* & *Rhabarbarum Monachorum*, meaning those that commended upon *Mefues*: The second *Hippolapathum*, it is also called of *Lobel* and others *Pseudo Rhabarbarum*, of *Celsus* and *Camerarius*, *Lapathum rotundifolium*, and of *Cordus* in *hisor. Plantar. lib. 4. fol. 201. Rhabarbaricum*, in *Englis* great round leaved Dock, or bastard Rubarb. The third *Alpinus* calleth *Rhaponticum Thracicum*, because as is aforesaid, it was brought him out of that Countrey of *Thracia*, and in his tractate thereupon he will by no meanes bee perswaded that it is true Rubarbe, but so entitleth it, and the rather because he onely saw the rootes while they were young as his figure sheweth, but not so great as the true Rubarbe, such as I have expressed: neither do I thinke he pared away the outer barke or skin of the rootes to make the inside appeare the fairer, but as agreed many with us also have done, dried the roots as they tooke them out of the ground, and then they shewed both blacke and small. Master Doctor *Zyfler* also sent it me by the name of *Rhaponticum verum*, but because the is so like, both in colour, forme, and quality unto the true Rubarbe, and the small long rootes unto the *Rha Ponticum* or Rubarbe of *Pontus*, I account it true Rubarbe and *Anguilara* saith these are both one, the difference consisting chiefly in the greater or lesser long peeces, and to the climate, which giveth the true Rubarbe, or Rubarbe

of Pontus, a more solid and firme substance, a more bitter taste and aromaticall smell, and an astringent or corroborating quality after the purging, all which are the effects from the climate, as being hotter and dryer, and therefore giving unto the rootes firmenesse bitternesse and astringion, which are all wanting in some sort in the rootes of this Rubarbe growing with us: yet it hath the purging quality, onely in a double proportion and the forme and colour so like the true as may be, which causeth it to be had in respect and good use, besides the beauty of the plant it selfe, and may well be called English Rubarbe, to distinguish it from that which cometh from China. The fourth is thought by the most and best writers to be the *Rha* or *Rheum* of *Dioscorides*, *Galen* and the other ancient writers, which was diversely named in our former times, as *Rha Barbarum*, *Rha Turcicum*, *Rha Ponticum*, and *Rha Scenicum* or *Sceniticum* many thinking them to be severall things, because of the names imposed, as coming from severall places, when as the goodnesse or badnesse, newnesse or oldnesse of the rootes might cause this variation. For the Arabians did call it *Raved* or *Raiwand* *Sceni*, or *Seni* as some write, but I finde it should be rather *Cini*, which corruptly the Portugalls, first pronounced *Chini*, according to their Language, and from them all our parts of the world, doe call that Country *China*, which was formerly called *Sinurum regio*: much controversie there is among writers, concerning the name *Rhabarbarum* or *Barbaricum*: First for the name *Rha barbarum* the *Rha* of *Barbaria*, what this name of *Barbaria* should signifie, some thinking it to be that part of *Africa*, where old *Carthage* stood, as *Fuschin* who saith lib. 1. de compositione medicamentorum, that the souldiers that went with the Emperour *Charles* to *Tunis*, brought true *Rubarbe* of that Country home with them: others thinke that it was brought from *Barbarum* a City in *India*, above the River *Indus*, and that *Rha Indicum* and *Barbaricum* were all one: and others thought that it came from an Island in the red Sea called *Barbaria*, whereunto shippes for Merchandise doe much resort: but *Matthiolus* refusing all these opinions, would faine induce his owne, that *Barbaria* being often mentioned in *Galen* as lib. 4. c. 6. de uenda sanitate, that *Ginger* was brought out of *Barbaria*, which *Dioscorides* and *Pliny* say groweth among the *Troglodites*, and from them brought to us: and againe he saith that *Glans Ynguentaria* or *Nux Ben*, is brought out of the Country of *Barbaria*, which *Dioscorides* saith groweth in *Ethiopia*, in which Country the *Troglodites* doe inhabit, and *Pliny* lib. 12. c. 21. saith it groweth with the *Troglodites*. *Pliny* also in the same booke and 19 chapter shewing the causes of the scarcitie of *Cinamon* in his dayes, saith it was because the *Barbarians* in their furie burne the woods where it grew: whereby as *Matthiolus* saith, it may plainly appeare, that the name *Barbaria*, can signifie no other Country than the *Troglodites* of *Ethiopia*: which as *Strabo* in his fifteenth booke of Geography saith, is as plentifull in spices as the South parts of *India*: but by the trafficke of our Merchants in these times, there is no *Rubarbe* growing in those parts that they can heare of; and if I might ghesse as formerly others have done, I would say that the name *Barbarum* was joyned with *Rha*, in that both *Græcians* and *Romanes* accounted all remote nations from them to be *Barbarians*. Now for the names, *Scenicum* and *Sceniticum*, *Mesues* saith it is all one with *Indicum*, whose saying *Matthiolus* contradiceth, saying it should be rather *Sinicum* which is a Country of *India*, for the *Scenite* be a people of the desert of *Arabia*, and are utterly destitute of all manner of Spice and drugges of worth. The name of *Rha Turcicum* and *Ponticum*, is thought also to be all one, because some Turkish Merchants brought it from *Pontus*: and for the word *Rha*, itooke the name as some suppose from the River *Rha*, now sayd to be called *Folga* in *Pontus*, where those rootes did grow: but I rather thinke it came from the Arabians *Reiwand* or *Raiwand*: whether the *Rha Barbarum* and *Rha Ponticum*, be one thing or diverse, is next to be spoken of: *Matthiolus* contendeth against *Ruellius* and others, with many words and reasons to proove them differing: First that *Rha Ponticum* as *Dioscorides* and *Galen* describe them, are without sent; then that *Rubarbe* hath in it a purging quality by nature, which *Rha Ponticum* hath not, being sayd by *Dioscorides* and *Galen* to have rather an astringent quality therein: and that it is not bitter as *Rubarbe*, but rather somewhat sharpe & quicke; it is not solide and heave, but spongie and light; it is not drye but tough or pliant; it is not yellow as *Rubarbe*, but blacke: by which reasons he is perswaded that they differ, and that *Ruellius* was in a greater error to say, that they differed onely in the sent, which hapned by the coldnesse of the Country, where *Rha Ponticum* grew: *Matthiolus* also saith that *Manardus Ferrariensis*, having beene formerly of that opinion, was after ward otherwise perswaded, upon sight of the true *Rha Ponticum*, that was brought out of *Muscovia*, agreeing in all things with that of *Dioscorides*, as the sayd *Manardus* relateth, in the last Epistle of the first booke written to *Leoniceus*: Surely this we may well say, that *Dioscorides* and *Galen* never saw or knew such *Rubarbe*, as we have brought us now a dayes, and I am halfe in doubt that wee in these times cannot well tell what sort of *Rha Ponticum* that was of *Dioscorides* and *Galen*; for if we scanne the text of *Dioscorides* a little, we shall finde him to say, that the *Rha* or *Rheum* called by the name *Rha Ponticum*, is a roote like unto the roote of the great Centory, (and if it be but like, it cannot be the same) but smaller, on the outside of a blackish red colour spongie, light and without sent, and that it grew in the Countrey beyond the *Bosphorus*: the best as hee saith is that which is found, without rottennesse or worme holes, and doth sticke in the mouth with a little astringion in the tastig, and giveth a yellow colour in the chewing, tending to a Saffron colour: this comparison of the roote to be blacke like the roote of great Centorie, but lesse, and of a redder colour, spongie and without sent, cannot agree with any of the qualities of that *Raphonticum*, we have formerly seene brought unto us, much lesse unto the *Rubarbe* that wee have now, and for the rootes of the great Centory, they are very long and great, almost like unto a great Parsneppe roote, but blacke on the outside and very rugged; which made those in ancient times, and unto our dayes still obstinately to take the very rootes of great Centory, and use them as if they had beene true *Rha Ponticum*: So that to assioyle this doubt wee may well say that it is probable, that those rootes which were usually brought in those times, when *Dioscorides* and *Galen* lived, were the small rootes, or the long branches of the greater rootes of *Rubarbe*, and not dressed or pared, that is the outer skinnes taken away, which are blackish being dried, and not such great thicke rootes as we have now a dayes, and that they were adulterate, as *Galen* mentioneth some were in his time, that is, that the rootes were boyled or steeped in water for some time, to take out the strongest juce, and the rootes dried up againe, which then it is probable, might be of a blackish red colour and spongie, light, and without sent, not having any purging quality, but onely an astringent left in them: for I doe verily thinke that *Rha Ponticum* (such as I have seene, hath beene brought over to us, being in colour taste and qualitie, the same with *Rubarbe*, but in smaller and longer peeces) is either but a small kinde of *Rubarbe*, growing not bigger in those places

places, from whence it is brought, or that it is but the bigger branches of the great rootes of Rubarbe, the colour and properties as I sayd being so like. The fit and last, *Lobel* and *Penz* have onely set forth, under the titles before expressed, whom all other writers that have mentioned them have followed: and it is probable that the Turkes, with whom as it should seeme it is called *Rhaponticum*, used it in steede of the true *Rhaponticum* of *Diocorides*, and to note the difference betwene them, *Lobel* addeth *Helenii folio*. But some of latter times have called it *Centaurium helenii folio*, for by that name, I received the seedes thereof from beyond Sea: but that quality yellow, in the true *Rhaponticum* of *Diocorides*, and not to be found, either in this or the great Centory, doth easily convince their obstinacy, that will still persist in an opinion so contrary to truth.

The Vertues.

The leaves of these kindes of Dockes, boyled in broth, doe a little (some more, some lesse) mollifie or loosen the belly; but the rootes have a more opening or purging quality in them, and some more or lesse also according to their quality. The first round leaved one, somewhat more than the garden Patience or Monkes Rubarbe; although weaker than the next thereunto by much: The Bastard Rubarbe hath almost worne out the use of the Patience or Monks Rubarbe, it is grown so common & plentiful, so that unlesse some that are wilful & will not use it, but Patience, or that are too gripple, not to be at any cost to have the best, or have little care what they use, but take what commeth next to hand, there is (or should be) none, but will use it in their diet Beere, or Ale, or in decoctions to purge the Liver, and cleanse the blood, before the other; yet that I may relate the properties that are found therein (that thereby you may be assured this Bastard Rubarbe, will doe the same more effectually) are these. *Tragus* saith, a dramme of the dried rootes of the first sort called of some Monkes Rubarbe, with a scruple of Ginger, made into powder, and taken falling, in a draught or messe of warme broth, purgeth choler and flegme downward very gently, and safely without danger; the seede thereof contrarily doth binde the belly, and thereby helpeth to stay any sort of laske, or bloody fluxe: the distilled water thereof is very profitably used to heale scabbies, as also foule ulcerous sores, and to allay the inflammations of them. The juyce of the leaves or rootes or the decoction of them in Vinegar, is of very many used as a most effectuall remedie to heale all scabbies and running sores. The round leaved Docke or Bastard Rubarbe, hath as I sayd all the properties of Monkes Rubarbe, but more effectual, both for inward and outward diseases, and moreover healeth the sting of Scorpions; and as *Diocorides* saith, he that shall take the roote thereof, shall feele no paine after the stinging: the decoction thereof with Vinegar, stilled or dropped into the eares taketh away the paines, gargled in the mouth, taketh away tooth-ach, and being drunke healeth the laundise: the seed thereof taken, easeth the gnawing and griping paines of the stomacke, and taketh away the loathing thereof unto meate, which commeth by vitious sharpe humors gathered to the mouth of the stomacke: the roote thereof, helpeth the ruggednesse of the nayles, and being boyled in wine, it helpeth the swellings of the throate, called the Kings Evil, as also when the kernells of the eares be swolne: and helpeth them that are troubled with the stone, provoketh Urine, and helpeth the dimnesse of the sight. The rootes of this Bastard Rubarbe, is used in opening and purging Diet drinks, or in Diet Peere or Ale, with other things, to open the Liver, and cleanse the blood, and to allay the heate thereof. The properties of the other round leaved Docke, which we have entituled English Rubarbe, are the same with the former, but much more effectual, and hath all the properties of the true Indian Rubarbe, excepting the force in purging, which is but of halfe the strenght thereof, and therefore needeth, as I sayd, to be taken in double quantitie, and likewise hath not that bitterness or astringtion, in other things it worketh almost in an equall quality: The true Indian Rubarbe is an excellent and safe medicine, to purge the body of choler and flegme, being either taken of it selfe, made into powder, and drunke in a draught of white wine, or steeped therein all night, and taken fasting, or put among other purgers as shall be thought convenient, cleansing the stomacke and Liver, and thereby the blood, opening obstructions, and helping those griefes that come thereof, as the laundise, the Dropsie, the swelling of the spleene, tertian and day agues, and the pricking paine of the sides, as also stayeth the spitting of blood, coming as well from the Lungs, as any other part: the powder taken with Cassia dissolved, and a little wash Venice Turpentine, cleanseth the Reines, and helpeth to strengthen them afterwards, and is very effectual to stay the *Gonorrhoea* or running of the reines. It is also given for the paines and swellings in the head; for those that are troubled with melancholy, and helpeth the Sciatica and Goute, and the paines of the Crampe: for which purpose one dramme or two, of the extract thereof, made in this manner, and given in broth doth work effectually. Let a sufficient quantitie of Rubarbe be steeped in Cinamon water, which being strongly pressed forth, let it be stilled in a glasse Limbeck *in balneo*, untill the water be drawne forth, and the substance remaining, be of the thicknesse of honey, which keepe in a close covered pot or glasse, for the use aforesaid. The powder of Rubarbe, taken with a little Mumia and Madder rootes, in some red wine, dissolveth congealed or clotted blood in the body, happening by any fall, or bruise, and healeth burstings, and broken parts, as well inward as outward; the oyle likewise wherein it hath beene boyled, being anointed worketh the same effect: It helpeth the yexing, or hickocke, and all fluxes of the belly, if it be toasted or dried a little by the fire, but much more if it be more roasted to be halfe burnt, and taken in wine after this manner: Take a pint of good Claret wine, and burne it with some Sugar, and a toppe or two of Rosemary, into which put a dramme and a halfe of Rubarbe torrifed, or roasted by the fire as is aforesaid, and one dramme of *Chebul Myrobalanes*, a little broken or bruised, let these stand in the burnt wine all night by the fire, and straine it forth in the morning, giving this at two times fasting, which will in three or foure dayes stay any scowring or lax, strengthening the stomack and inward parts afterwards. It is used to heale those Vicers that happen in the eyes, and eye lids, being steeped and strayned, as also to assuage the tumors and allay the inflammations, and applied with honey or oyle, that is to say boyled wine, it taketh away all blacke and blew spots, or markes that happen therein. This Rubarbe is so gentle a medicine, that it may be given to all sorts of gentle constitutions, (but in robustions or strong bodies it purgeth little or nothing) whether they be children, or women with childe, and that safely at all times of the year: the whey of milke, but especially of Goates milke, is the best and most accomodate liquor, wherein it is to be steeped & taken, or else in white wine, and it worketh thereby the more effectually in opening obstructions, and in purging the stomacke and Liver, from choler and flegme; and most doe use a little Indian Spiknard as the best corrector thereof: The other two last sorts of Rubarbe are not much or often used, and their qualities are more astringent then opening, little experience having beene made with us, to shew you more of them.

CHAP. III.

1. *Colocynthis Vulgaris*. Coloquintida or the bitter Gourde.

THis bitter Gourd runneth with his branches upon the ground, as a Gourd or Cowcumber doth, having diverse rough hairy leaves thereon, every one by it selfe, which are lesfer and somewhat longer, than those of the Cowcumber, and more divided or cut in at the edges, most usually into five or seaven parts, each partition also dented in, or notched round about, the leaves of the forme doe very much resemble those of the Citrull Cowcumber; at the joynts with the leaves come forth the flowers which are yellow, of the same fashion with them, but somewhat smaller, and also small tendrells or twining stalkes as the Vine hath, where with it windeth about any plants, or other things that stand next unto it, thereby strangling or killing them: the fruite that followeth is small and round as a ball, many of them not much bigger than a great Crabbe or Pearce-maine, Greene at the first on the outside, and afterwards growing to be of a browne yellow, which shell is as hard as any Pompion or Gourde, and is usually pared away while it is Greene, the substance under it being white, very light, spongie, or loose, and of an extreame bitter taste, almost indurible, and provoking loathing or casting in many that taste it; having therein fixe orders or rowes of white hard seede, of the bignesse of Cowcumber seede, but fuller harder and rounder; and nothing so bitter or foreable in working, as the white pulpe or substance is: the roote is not very great but stringie, and quickly perishing with the first cold approach of winter.

Colocynthis Pomiformis & Pyiformis.
The round and Pearce fashioned bitter Gourde.

2. *Colocynthis major rotunda*. The greater Coloquintida, or bitter Courde.

This sort of bitter Gourde differeth not from the former, either in leafe or flower or manner of growing, but onely in the fruite, which groweth to be twice as big as the former, and as round; Greene at the first, but of a pale yellow when it is ripe, whose pulpe or inner substance is also white and spongie, and in a manner as bitter, with such like seedes as are in the former; and disposed for the most part into eight rowes, or partitions: the roote perisheth as the former.

3. *Colocynthis oblonga*. The long bitter Gourde.

This kind of Colloquintida differeth not from the last great sort, for either manner of growing, forme of the leaves or flowers, but onely in the fruit, which is as great almost as the last, but is not so spherically or round like a ball, but somewhat long with the roundnesse, and being a little flat at the head; the shell or outer rinde thereof, is Greene at the first, and afterwards groweth to be whitish, with many spots thereon: this is also bitter but not so extreame as the first.

4. *Colocynthis pyriformis*. Pearce-fashioned Coloquintida or bitter Gourde.

This Pearce-fashioned kinde, hath many trayling rough branches like the first, and such like long and round pointed leaves, cut in also on the edges but not so deeply, neither so large or great, and of a darker Greene colour; at the joynts with the leaves, come forth the flowers, being yellow, but smaller than the first, and likewise small twining claspers as the other, which taketh hold on every thing, that it may comprehend: the fruite is small, not bigger than a large Catherine Pearce, and many smaller, yet all fashioned like a Pearce, the head whereof is somewhat rounder than a Pearce; the shell or outward rinde whereof is Greene, but whiter when it is ripe with many long lines or strakes thereon; the inner pulpe or substance, being almost as white, light, and spongie but lesse bitter than any of the rest, at the least in those have growne in my garden, having but foure rowes or rankes of white seede like the rest.

The Place.

The first commeth as a Merchandise to us from *Arabia*, *Egypt*, and *Syria*, yet is nourished up in the gardens of those that are curious. The other sorts some have beene found in *Spain* and *Italy*, but we sow their seede every yeare in our gardens, if wee be desirous to see them, for they never come up of their owne sowing.

The Time.

They flower late, and so doe they ripen with their fruit, which unlesse the yeare prove kindly, hardly come to perfection, untill it be very late: but the first worst of all.

The Names.

The first as that which onely was knowne, or at least mentioned by the ancient writers, is called in Greeke *καλοκυνθισ* *Colocynthis*, and of some *αμυδα μικρα* *Sicna picra quasi Cucumis amarus*, the bitter Cowcumber: Hippocrates calleth it *καυδονος* & *αμυδα*, of the Latines *Colocynthis*, and *Cucurbita sylvestris*, in the Apothecaries shops *Coloquintida*; and we in English, either *Coloquintida*, or the bitter Gourde, which you will. The rest of them have

have their names in their titles, as most writers do call them, that mention them, and as much as can be said of them, onely *Tragus* calleth the *Pyriformis*, *Colocynthis Germanica*, because it is lesse dangerous, and more easie to grow in these colder Countries. *Beslerius* that set out the Bishop of *Eystet* in *Germany* his garden, calleth both the Peare fashioned *Colloquintida*, and the greater that beareth round fruite like an Apple *Pseudo colocynthis*. It is the same that in the Scripture in the 2 of *Kings* and the 4. chapter, is called a wild Vine, whereof one gathered wilde Gourds: the Arabians call it *Chendell* and *Handal*, and thereof *Trochisci Alhandal quasi ex Colocynthide* came.

The Verine.

The inner white soft spongie substance, under the outer shell or rinde, is that onely without any seede, which is used; and being extreame bitter purgeth violently, even to excoriation and blood oftentimes, especially in tender bodies: but the dose or quantity which was given by the ancients, and is yet continued in the hotter climates of *Europe*, (their dry constitutions better enduring it) doth farre exceede the proportion, that our moi-ster bodies; are possible able to endure without manifest danger, unlesse it be in those that are robustious, and used to continuall strong labour: for *Dioscorides* appointeth 4. *oboli*, that is 2. scruples or 40. graines, of the inner substance to be made with honey, Myrre and water into pills, when our Physitians, dare scarce give one *obolus*, that is 10. graines or halfe a scruple; yea they thinke halfe this quantity, mixed among other purgers, is a strong purgation, and it is so found by dayly experience, and therefore to avoide the danger that often happeneth, being a great enemy to the stomacke and bowels, although *Pliny* saith the contrary, it is best to correct the violence thereof with oyle of *Roses*, *Gum Tragacantha* and *Bdellium*, as it is appointed in the *Trochisci Alhandal*, which leniseth the sharpenesse thereof by the gummies, and causeth it by the lubricity of the oyle, to passe the sooner away. This is the safest way to take it inwardly at the mouth, the substance of the seede in powder, or the decoction, is not of halfe that force, as the pulpe it selfe, so found by *Labels* experience, and others; if the feedes be taken forth out of an apple, and it overcrushed with loame or clay, and some Vinegar and Niter put to be heated therein, the liquor doth ease the paines of the tooth-ach, and fastneth loose teeth, if they be washed therewith: and if in an Apple so ordered, some old sweete wine, or new boyled wine, be put to sleepe for a day and a night (which some have falsely interpreted that the Apple, should be steeped in the wine) and the wine strayned forth to be brunkle warme, purgeth the body more gently. *Dioscorides* order was to boyle the wine or strayned forth, in the Apple, and let it stand open all night to coole in the ayre: It purgeth strongly flegme and choler, and other tough or clammy grosse humors, from the further or more remote parts, as the braines, sinewes, muscles and joynts, as also from the lunges and breast, and from the veynes also; and is therefore very helpefull (if it be wisely applyed) to all the diseases that happen to those parts, as all old paines in the head, the meagrimme that is inveterate; the falling sicknes, the apoplexie, the turning or swimming dislines in the head, the watering of the eyes, the could Gout, the Sciatica or hippede, and other paines of the joyntes and sinewes: it is helpfull also for the Jaundise, and for putride or rotten fevers, for an old cough, the straightnesse of the chest, shortnesse of the breath, and above all these, it helpeth the cholicke, whether it proceede from flegme or from winde, as also the dropsie, being taken either in glisters, or suppositories: it is not good to be given to the aged or weake, but to the strong, young, and lusty bodies; neither to women with childe, for if it bee applyed to the wombe it destroyeth the childe. Being steeped in vinegar, it taketh away all discolourings of the skinned, as morpew, and leproy, dry faulre and scabbes, if the places affected, be often rubbed therewith. Pure oyle being put into an hollowed or censed apple of *Coloquintida*, and set upon warme ashes or embers, to be thoroughly heated, both maketh the haire blacke, that was not so afore, stayeth it from falling that is disposed thereunto, and keepeth it long from growing gray: the same oyle dropped into the eares, taketh away the paine, and singing noyse of them: and mixed with a little Oxe gall and anointed, on the belly warme, killeth the wormes and causeth them to avoide, and oftentimes purgeth the belly, being onely so applyed: *Galen* saith, that the bitternesse thereof, which might be available for many griefes, suffereth it not to exercise them, but is overcome by the vehement purging quality it hath: If when it is taken it should worke overmuch, and bring forth excoriations and blood, to the danger of the patient, a decoction of Rayfins of the Sunne, given with Oyle of sweete Almonds, or the Oyle of Walnuts, mitigateth the violence thereof. Rats and mice doe much delight to eat feedes, and the seede hereof also: if therefore they be set, or layd, in diverse corners of the house, troubled with them, it will kill and destroy them all: The decoction of them also sprinkled in Chambers is sayd to kill fleas: The other sorts of *Coloquintida* are seldome or never used with us, yet *Tragus* commendeth the use of *Colocynthis Pyriformis*, as being lesse bitter and violent in purging, and therefore safer to be taken inwardly.

CHAP. IIII.

Cucumis agrestis sive Asininus. The wilde or spitting Cowcumber.

His wilde Cowcumber (as well as the former wilde or bitter Gourde, differing from all the rest of their families) is fit to be entreated of apatt by it selfe, as also to be next remembred, being as violent in all the qualities thereof, as the former, or rather more: It creepeth on the ground like unto the former, with many rough trailing branches, whereon are set very rugged and rough ill coloured greene leaves; somewhat whitish underneath; little or nothing divided or parted at the edges; at the joynts betwene the branches and the leaves, come forth small pale yellow flowers, opening into five leaves, at the end of small greene heads for the most part, as all other sorts of Gourds, Cowcubers, &c. doe: but those that have flowers onely without such heads, fall away quickly without fruite; for that greene head, as in all others, groweth to be the fruite, which is small, rough, round and long, and somewhat of a grayish greene, when they are ripe; the short rough foote stalkes, being crooked, and bending the fruite downwards, which with a little touch, when they are thoroughly ripe, will quickly open at the end next the stalke, and spirt out the juyce, and some feede, into their faces or hands, or other places against

Cucumis sylvestris.
The Wilde Cowcumber.

it that touched it: the seede being ripe, is blackish and somewhat rugged, but otherwise white, lying in a Greene moyst substance, very bitter and loathsome to taste: the roote is white, and firme, thicker, and shorter, than in any other fort of Gourde or Cowcumber, with some fibres thereat, very bitter as is all the rest of the plant.

The Place.

It groweth naturally wilde in Italy, as *Matthiolus* saith, in many places by the way sides; and in untilled and moorish places, we onely preserve it in gardens, throughout the whole Land, where it is used.

The Time.

The roote hereof doth often abide in the ground, all the winter long, if it stand reasonably defended, or the ground be rich with soyling, shooting then forth leaves betimes: in other colder grounds not defended, they perish every yeare: the fruite is usually ripe in August.

The Names.

It is called in Greeke *ovus ayeos*, in Latine *Cucumer* & *Cucumis agrestis*, or *aspinus*, as many writers doe, or *anguinus*, as *Turner* and *Cordus*, but not properly: *Matthiolus*, *Tragus*, *Dodonaeus*, and some others, call it *Cucumis sylvestris*. The dried or hardened joyce of the fruite, is called, *Elaterium*, *Gaza* translating *Theophrastus* calleth it *Agitatorium*.

The Vertues.

The rootes hereof and the dried joyce of the fruite, artificially and not rudely prepared, which is called *Elaterium*, are chiefly used in medicines and scarce any other part: Concerning *Elaterium*, there is difference betwene *Theophrastus*, and *Dioscorides*, of the age, and durability, and in extinguishing or encreasing the flame of a lampe or candle. *Theophrastus* in the ninth booke and foureteenth chapter of his history of Plants, saith *Elaterium* is the most durable medicine of all others, and

that the best, is the eldest; for as he saith, a Physition of sufficient credit, kept by him some *Elaterium*, that was 200 yeares old, which he received of one as a gift; which notwithstanding the age, was of wonderfull vertue, and untill it was 50 yeares old, it was so abundant in humidity, that put to the flame of a lampe or candle, it would put it out. And *Dioscorides* saith that *Elaterium*, is fit to be used as a purging medicine, from two yeares old, untill it be tenne, and that is the best, which being put to the flame of a lampe or candle, will make it burne the more bright. Vnto *Theophrastus*, *Pliny* subscribeth the same thing, and saith that it is found true by experience, that untill it be 50 yeares old, it will cause a lampe or candle, to sperte hither and thither, before it put it out; whereupon *Matthiolus* giving credit to the testimonies of *Theophrastus* and *Pliny*, is perswaded that the text of *Dioscorides* is corrupted, but I verily beleeve they both say true, the reconciliation of their repugnancy, being onely in the manner of making of *Elaterium*. *Theophrastus* his *Elaterium* being Greene, as I suppose, and made of the substance of the inner pulpe of the fruite; yet in the tenth chapter of his fourth booke, he saith it is made of the seede, which I never saw, or heard of any to be so made with us; and that of *Dioscorides* being white, (which as he saith himself is the best, and condemning the Greene, made onely of the more thinn watery, and wheyish part: *Mesues* also saith that the best is white: my selfe having made of both sorts can testifie, that *Elaterium*, made of the substance of the fruite; although very gently pressed through a fine sieve, will be Greene, and continue moyst many yeares, after it is evaporated and dried up hard, relenting with the ayre, and will require many yeares to consume the humidity therein, when as the other fort, made of the whitish, wheyish liquour, that droppeth through the sieve of it owne accord, in the cutting of the fruite, without any touch of pressing, will be white when it is dried, and so remaine white, hard and drye, for many yeares, unless it be left open to the moyst ayre, or stand in a moyst place to cause it to relent: the Greene sort likewise is not of halfe, that force or violence, to purge either upward or downeward, as the white *Elaterium*; whereof one graine weight dissolved in liquor, worketh forceably in any tender body; yea I have oftentimes seene, that halfe a graine weight put into a purging medicine, to quicken the weakenesse thereof, hath troubled the stomacke very much by castings, and much disquiet, and working also downeward with more violence, then it could bee thought the whole graine given of it selfe could doe. This narration although somewhat tedious, I was the more willing to declare, because I thinke none hath shewed it before, and my little experience may set an edge unto others, to polish that which I have here shewed you, but rough hewen. The dose or quantitie thereof taken at a time, *Dioscorides* saith is a whole *obolus*, and the least quantitie halfe an *obolus*, (some take the *obolus* to weigh 12 graines, but the most usuall is but 10 graines,) which sheweth as I sayd before, the great doses, which the ancients were wont to give of purgers in their medicines, which we dare not follow: It purgeth choler and flegme from all parts of the body, and as he saith, is the best medicine to purge those that are purifie and snort winded: to procure a vomit, he advieth to dissolve it in water, and with a feather dipped therein, to touch the lower part of the tongue, as low as you can; but milke or rather cream which is more unctuous, is fitter to give it in, for it will not suffer it to stick to the tunicles of the stomacke, but will cause it slippe away the more speedily: it helpeth also the falling sicknesse, being put into the nostrils with milke, and mixed with honey and old oyle, it cureth the Kings evill, being annointed therewith: It bringeth downe womens courses that are stayed, and

and killeth the birth if it be applyed to the secret parts: It purgeth clammy and watery humors from the joynts, and that strongly: the juyce of the roote doth the same likewise, and therefore used in glitters, or layd as a plaister or pultis, upon the place payned with the Sciatica, easeth the paines thereof, the same juyce of the roote, boyled with wormewood in water and oyle, cureth an inveterate megrime, if the temples be often bathed therewith, and some of the leaves and rootes, be beaten together, and layd as a pultis thereunto afterwards; the juyce of the roote with a little milke, cast up into the nostrils doth the same: for it wonderfully purgeth the braines from excrements, and healeth the evill savour of the nostrills caused thereby: It cureth also the old paines of the head and the Epilepsie: and being mixed with Goates dung, and layde as a plaister upon any great or hard swellings, or kernells, it resolveth them: The juice of the roote, as well as of the fruite (and so doth the decoction of them also, saith *Mesues*) being drunke doth helpe the dropisie, for they mightily draw forth watery humors, and the yellow laundise, and all obstructions both of the liver & spleene: *Dioscorides* also sheweth this medecine to cure the dropisie. Take saith he halfe a pound of the rootes hereof, and being bruised, let it be put into three quarters of a pint of strong wine, giving thereof three ounces, for 3 or 4 dayes together, untill the tumour be discerned, to be abundantly wasted and fallen; which thing it worketh saith he, without any troubling of the stomacke: A few graines of *Elaeterium* mixed with conserve of Roses, and some thereof taken will doe the like, and herewith *Cassor Durantes* saith he cured many: The powder of the roote mixed with honey, and layd upon any fowle scarre in the skinne, doth attenuate it, and taketh away the markes or blew spots, that come upon bruising or blowes: the roote boyled or layde to steepe in strong Vinegar, cureth the morpew and clenseth the skinne of all foule spots, freckles, and other discolorings thereof; and the powder of the dried roote saith *Dioscorides*, clenseth the face and skinne from all scurfe, and taketh away the blacke or ill colour from any scarre: the juyce of the leaves dropped into the eares, easeth them of the paines and noyse therein, and helpeth the deafenesse: the decoction of the roote gargled in the mouth, taketh away the paines of the teeth; the powder of the roote mixed with honey, and put into old sores and ulcers, clenseth them thoroughly, and thereby furthereth their healing wonderfully: Our Apothecaries doe most usually take the roote of this wilde Cowcumber as a substitute for the roote of *Coloquintida* or the bitter Gourd, that not being so frequent or easie to be had as this.

CHAP. V.

Scammonia. Scamonye.

HAVING shewed you in the two last Chapters, some purging plants that runne, or spread upon the ground, or clime up by those things that are set by them: let me conjoyne some other the like, part growing naturally in our owne, and part in other Countries, and first of *Scamonye*, which is properly a *Convolutulus* or winding Bell flower, which we call Bindeweede: I will comprehend in this Chapter also, those only that in forme and force in working, come neereſt unto the true: the rest that differ shall follow.

1. *Scammonia Syriaca legitima.*
The true Scammonie.

3. *Convolutulus major albus.* The great white Bindeweede.

3. Scam.

1. *Scammonia Syriaca legitima*. The true Scammonye.

The true Scammonye hath a long roote, of a darke ashy-colour on the outside, and white within, and of the bignesse of an arme, (for such hath bene brought us from *Tripoli*) with a pith in the middle thereof, and many fibres thereat, (which being dried as *Matthiolus* saith, the pith taken out, seemed so like unto the rootes of *Turbith*, which are brought us, from the farre remote Easterne parts, none knowing what plant it is, nor whereunto it is like, some thinking it to be the roote of *Tripolium* or Sea-Starre-worte, which *Matthiolus* confuteth; others a kind of *Ferula* or *Ferulaceous* plant, altogether improbable, but that they are not so tough, but more brittle, that otherwise it might be thought, to be the right *Turbith* of the Apothecaries shoppes) from whence arise many long, round, Greene, branches, winding themselves like a Bindeweede about stalkes or trees, or any other herbes or things that stand next unto it, unto a good height without any clasping tendrills, like the true or wilde Vine: from the joynts of the branches, come forth the leaves, every one by it selfe, (yet I have seene dried plants that have had two leaves one against another, upon short foote stalkes, somewhat broad at the bottome, with two corners next thereunto, and some also round that I have seene, and then growing long and narrow to the end, being smooth, and of a faire Greene colour, somewhat shining: towards the tops of the branches at the joynts with the leaves, come forth large whitish Bell flowers; with wide open brimes and narrow bottomes; after which come round heads, wherein are contained 3 or 4 cornered blacke feede; for such I have had given me, from whence hath sprung plants, which perished quickly, not abiding a winter with me: if any part of this plant be broken, it yeeldeth forth a milke, not hot or burning, nor bitter, yet somewhat unpleasent, provoking loathing, and almost casting.

2. *Scammonia Macrorhiza Cretica*. Long rooted Scammonye of Candie.

Prosper Alpinus, in *lib. de exoticis*, saith, that he in his former times received from Candie, another sort of Scammonye, differing nothing from the true Scammonye here before described, but in the fashion of the roote which is long and slender, of about a fingers thicknesse, but purging as strongly as that of *Syria*, and this in my judgement doth very neere resemble, our common white greater Bindeweede, that shall follow next the Countrey making the difference onely as I thinke.

3. *Convolvulus major albus*. The great white Bindeweede.

Our great Bindeweede commeth as I thinke so neere unto the former Scammonye, that excepting the largenesse of the rootes, and the greater force in purging, which may both proceede from the climate; you would say this were *altera eadem*, whose many slender winding stalkes, runne up and winde themselves upon hedges, or whatsoever standeth neere unto it, having diverse large leaves growing severally thereon, somewhat long, and pointed at the further end, and parted into two points at the broad part, next to the stalke, making it seeme almost three square, being smooth and of a pale Greene colour, yeelding a milke being broken, but not so plentifully as the Scammonye: at the joynts with the leaves towards the toppes of the branches, come forth large white Bell flowers, without any division in them, after which rise round skinnie huskes, or heads, containing within them diverse blackish, three cornered feede, like the former, but lesse: the roote is whitish, and small, of the bignesse of Couchgrasse, or somewhat greater, running much under ground, and shooting forth in sundry places: both stalkes and leaves perish every yeare, the roote living in the ground, and shooting a fresh every spring, which yeeldeth milke, being broken.

4. *Scammonia Monspelica dicta*.
French Bastard Scammonye.4. *Scammonia Monspelica dicta*.
French Bastard Scammonye.

The neere resemblance of this plant, unto the former in many particulars, but especially in the feede, shewing it to be a Bindeweede, hath caused me to joyne it likewise in the same Chapter, which hath sundry twining branches rising five or sixe foote high, twining or clasping the trees or other things that it can reach, whereon are set two broad and almost round, yet pointed leaves at a joynt, of a blewish Greene colour: from betweene the leaves and the branches, as also at the toppes of them, come forth many small white flowers, clustering together starre fashion, consisting of five narrow pointed leaves with threds in the middle: after which succede such like heads, and black cornered feede, as in the former sorts: the roote hereof is small, of the bignesse of ones finger, with many fibres thereat, brownish on the outside, and pale within, this yeeldeth more plenny of purging milke than the last, comming somewhat neerer therein unto the first.

5. *Scammonia rotundifolia Virginiana*.

We have had a kind of *Volubilis* from *Virginia*, very neere resembling this kinde of French Scammonye, both in growing and forme of leaves (as you may perceive by one set by the plant) but the flowers being small and white doe open like a Bindeweede, and not like a starre, into five leaves, like unto the last, the feede groweth not in pods, but in small heads, being small and blackish like other Bindeweeds, and therefore if not to the family of Bindeweeds, I know no better place than to insert it here. And peradventure this may be the Indians *Hololuchi*, that *Aldinus* mentioneth in his *Farnesian* garden to be so dangerous.

The Place.

The first groweth in *Syria*, and the farther Easterne parts, where no frosts are felt in the winter, for it quickly

quickly perish with the first approach thereof, and therefore to be kept safe in these cold climates, it requireth some vault, or stove, or other such convenient place. The second groweth in Candy as *Alpinus* saith. The third is frequent in sundry places of the Land, growing by the hedges sides and running thereon. The fourth groweth neere the Sea side, as well by *Mompelier*, as the kingdome of *Valentia* in Spaine, where *Celsus* saith he found it: and the last in *Virginia*.

The Time.

They flourish in these Countries in June, Iuly, and August, but the first, and two last, doe seldome perfect any seede with us.

The Names.

The first, is called in Greeke *Σκαμμόνια*, and in Latine also *Scammonia*: the dried juyce which is most in use, is called *Σκαμμόνιον Scammonium*, both in the Druggists, and Apothecaries shoppes, as also with most writers, yet some call the plant so too: the same being prepared, that is, baked in a quince, under the embers, or in an Oven; or any other way, is called of the ancient writers *Diagridum*, which should onely be used in medicines, according to the appointment of all Physitians, who are led by the tradition of their elders: but all Apothecaries in generall, doe use the Scammonie it selfe, as it cometh, without any other preparation, so as it be of the purest, and best, which by their dayly experience, they finde to worke more certainly, and more safely, than the *Diagridum*, which is much dailed in the baking or other preparation: and besides, whereas the ancient writers doe appoint it to be dissolved, and so mixed with their medecines, or to be boyled in the Eleqtuarie, so to be dissolved, wherein it is appointed to be put: the dayly experience of Apothecaries, who are chiefe masters in their professions, or should be, if they be worthy of their name, doth testifie there against; finding that if Scammonie come to never so little heate almost in the mixing thereof, it will curdle together and lye in knots in the medicine, beate yee it almost never so long after it is mixed; and therefore they alwayes in their Scammoniate medicines, rubbe it finely into powder of it selfe, without other preparation, and so put it last of all other things into any medicine, that hath bene boyled or heated, and that when it is almost cold, for feare of curdling or gathering together in knots, as I sayd before; and being thus mixed, the medicine shall worke more safely without perturbations of the stomacke, &c. and more surely without tediousnesse or procrastination, than if *Diagridum*, were put into it: let not this be imputed as an error in our profession, or a settled wilfulnesse to contrary so great and ancient authority, for we know that true experience hath mastered reason and antiquitie, and we also know, that the experience and diligence of our times, hath in many more things, not onely taught us to vary from the Methode and order, appointed by the ancient writers of Physicke and hearbes, but to contrary them also, when we have found either by reason or experience, that there is cause so to doe, as in the dose of this Scammonie is plainly to be observed. For *Dioscorides* appointeth a dramme to be given at once, when no Physitian with us, dare scarce give halfe a scruple, or not above. The second *Alpinus* so calleth, as is in the title, and that is as much as can be sayd of it: the third is called *Tolabilis major* & *Convolutus major*, by diverse, as also *Smilax levis major* by others, *Helxine Cissampelos* by *Cordus* on *Dioscorides*, and *Malucosissus Damocratis* by *Anguilara*: the fourth *Gesner* in *hortis* calleth *Scammonia Mompel*, and *Lobel Scammonium Mompeliense*, but *Celsus* who in his Spanish observations, first calleth it *Scammonia Valentinas* doth in his history entitle it, *Apocynum latifolium*, yet referreth it to that of *Mompelier* as both one: *Camerarius* and *Lugdunensis* doe call it *Scammonia maritima Mompeliaca* as the learned of *Mompelier* doe, and use it accordingly: the last is remembered onely by my selfe, who suppose it by being like in forme to the last, to be neere also in quality thereunto.

The Vertues.

Scammonie being the basis as I may so call it, of those medecines wherein it is put, there had neede of especiall care to be taken in the choise thereof, that onely that which is sincere and pure, without drosse or adulteration, be used in Physicke; which may be knowne if it be not heavey, or close compact together, but that it be moderately light, with some small holes or hollownesse heere and there therein; and that it be smooth and plaine in the breaking, and not in grumes or knots, or having small stickes or stones in it; somewhat cleere and blackish also, but not of a deadish darke or evill favored colour, and that will be made quickly into a very fine and white powder: this I mention comparatively, for it will be a very hard matter, for any to know the best by relation, but by inspection; and chiefly by comparison of the good and bad together, that so you may learne to know either of them at the first sight. The dosis hereof as it is appointed by *Dioscorides* and others, doth so farre exceede the proportion of our moderne Physitians, that it hath made *Pena* to doubt; that the Scammonie in *Dioscorides* time, was more corrupt, and encreased with other things than ours is, because he gave so much, and we doe give so little; and *Matthiolus* on the other side to doubt, whether wee have any sincere Scammonie brought unto us at all, or else that the text of *Dioscorides* is corrupt, where he appointeth a dramme or foure obolos, that is, two scruples to be taken at a time; and he setteth downe also, that if a purging medicine be required to be effectually; you should take 3 oboli, that is halfe a dram, of Scammonie, 2 oboli, that is one scruple of blacke Hellebor, and one dram of Aloes, all these to be taken together at one time: but the greatest dosis now adayes exceedeth not halfe an obolus to a strong body, and lesse to the weaker, or more tender. *Pena* in his diligent observations, and declarations hereof set downe in his *Adversaria*, hath caused all whom it may concerne, both to understand the choise of this Scammonie, as also thereby to bethinke them of the sincerity of other drugges; and that as he guesseeth the quantity of Scammonie is so great, that is spent in all countries, which is made onely in one, that unlesse the quantity were augmented by mixture, there could not be sufficient sincere and pure juyce, to serve them by much; and although in former ages, and even in our former times, there hath bene much false and corrupt Drugges, brought into *Europe*, and all the countries thereof farre and neere: yet the skill and curiositie of these times is such, that our Merchants taking onely the best for us of all sorts, and refusing the course, hath I thinke lessened, if not worne out, that sophisticating art in the masters thereof, when they see that none but true and sincere is affected and bought: the worst to lye on their hands untill it grow better: It purgeth both flegme, yellow choler, and watery humors very strongly: but if it bee indiscreetly or carelessly given without due respect, it will not onely trouble the stomacke more than any other medecine, but will also scowre, fret and rase the guts in working too forceably, oftentimes unto blood, and oftentimes causing faintings and swoonings: Our Physitians therefore doe seldome give, to any tender and gentle body any Scammoniate Eleqtuary,

and but in pills seldome any at all, to avoyd the dangerous symptomes that often happen thereupon; for *Tinye*, *Paulus Aeginata*, and others shew the dangers thereof, and *Meſues* also declareth three severall hurts or harmes that come to the body thereby, and the remedies of them, which is not from the purpose to bee here set downe. The first is saith he, that it engendreth certaine gnawing windes in the stomacke, so much offending it that it procureth a disposition to vomite. To be baked therefore in a quince, and some partlie, fennell, or wilde carrot feed, or *Galanga* mixed with it, is the remedy hereof: The next is that it enflameth the spirits, by the overmuch sharpnesse or fiercenesse therein, whereby it readily induceth feavers, especially in those that are subject to obstructions & replete with putrid humors; which inconveniences are taken away, by putting those things into your decoctions, that doe coole and quench the heate thereof, and such are the mucilage of the feedes of *Psyllium*, or Fleawort, Prunes boyled or rather the pulpe of them, the juyce, or the Iulep, or the water of Roses or Violets; or if before the boyling thereof, (that is the *Scammonye*) you steepe it in the oyle of Roses or Violets, or in the juyce of a fowre sweete quince, and mingle with it a little *Sumach* or *Spodium*. A third is that having a strong opening and drawing faculty, it causeth immoderate fluxes of the belly, by opening the mouth of the veines more than is fit. This harme also is taken away, by mixing astringent and restraining things with it, such as Masticke is, and especially yellow Myrobolanes and quinces, or the juyce of them. Againe, it raseth or shaveth the intrales and guttes, by reason of that sharpe juyce wherewith it doth abound, and by which it procureth torments and paines therein, the disease called *Dysenteria* which wee call the bloody fluxe, and *Tenasmos*, which is a disease, when one desireth to goe often to the stoole, and can doe nothing; but this danger is remedied, if moyst, fat and slippery medecines be used, as gum *Tragacantha*, *bdellium*, and oyle of Almonds and Roses, as also the pulpe of prunes, made up with Sugar, the mucilage of *Psyllium* or Fleaworte feedes, Masticke and quinces taken afterwards, and warme water last of all; all which cause it to passe the quicker from the stomacke and bowels, and thereby stay it from doing harme; whereby those that are wise, are taught to give the broth of barley, sweetned with Sugar, to drinke to those that have taken thereof: This fault also is helped, if cold medicines as well as hot, being mixed together be given, thereby to yeeld helpe to the heart, liver, and stomacke: thus farre *Meſues*. The juyce saith *Dioscorides* applyed to the wombe, destroyeth the birth; being mixed with honey and Oxe gall, and rubbed on wheales pimples and pushes taketh them all away: and boyled in Vinegar and annointed, taketh away the Lepry or outward markes in the skinne: being dissolved in Rosewater and vinegar, and the head moystned therewith, easeth the continuall paines therein. A dramme or two of the rootes of *Scammonye* purge in the same manner that the juyce doth, if some of the things appointed therewith be given with it: the rootes boyled in water, and made into a pultis, with barley meale, easeth the Sciatica, being layd thereon: it taketh away scurfes and scabbes, if they be washed with the Vinegar, wherein the rootes have bene boyled, and also healeth apolstumes. Our English Bindweede hath bene experienced to be purging, the rootes especially being boyled, and the decoction thereof taken in a reasonable proportion. That of Candy is mentioned in the description. They of *Mompelier* have often used the dried juyce of the fourth, in stead of the true *Scammonye* when it was wanting, but in a double quantity, which yet did not worke so effectually.

CHAP. VI.

Scammonia supposititia. Supposed or Bastard Scammonyes.

Here be some other plants to be joyned next unto the true *Scammonye* for the strong purging quality in them, but not either deadly or dangerous, as the *Apocynam*is, which else for the outward likeness might be referred unto them.

1. *Scammonie Monspeliciæ affinis*. Spanish Bastard Scammonye.

This Spanish kinde of Climer is very like unto the great Bindweede, in the branches, leaves, and rootes, but the leaves being somewhat longer, are of a grayish greene colour, giving milke more abundantly than any, and the rootes being small white and brittell, more abundantly creepe under ground, and quickly overspread any place where it groweth, a litle peece being left in the ground, will spring up quickly into a plant ready to clime; so that many being weary thereof, doe strive rather to destroy it quite out of their gardens than keepe it any longer: the flowers are white and starre fashioned, but there come long poddes after them, like unto *Periploca* or *Asclepius*, this looseth both leaves and branches, and springeth a new every yeare.

2. *Secamone Egyptiacum*. Bastard Scammonye of Egypt.

This likewise seemeth to be of the same kindred with the former, as by *Alpinus* his relation may be gathered; for as he saith, the Egyptians with whom he saw it, reckoned it a kind of *Scammonye*, yet made no great use in Physicke thereof. It climeth he saith with many winding branches, having long and hard greene leaves on them, greater than the leaves of *Seseli Ethiopicum frutex*: the flowers are white but larger than the former sort, and bring hard crooked coddles afterwards, two alwayes growing together, like unto the coddles of the *Oleander* or Rose Bay tree: from the leaves or branches of this plant, floweth a pale yellowish milke or juyce, no lesse heating and burning the throat than a spurge, this looseth his leaves, but not his branches every yeare, fresh springing a new in the spring.

The Place.

The first, grew about *Pincia* in Spaine as *Clusius* saith. The other in Egypt.

The Time.

They doe both flower in the latter end of Summer, and bring ripe fruit in the end of September.

The Names.

The first *Clusius* saith he received the seedes thereof out of Spaine, and calleth it *Apocynum vertum latifolium*; *Lobel* calleth it *Scammonie Monspeliciæ varietas*, *Dodonæus* putteth it for his former *Periploca*, and *Tabernmontanus* calleth

1. *Scammonia Monspeliace affinis*, &c
  2. *Scammonia Aegyptiaca*.
- Bastard Scammony of Spaine and Aegypt.

calleft it *Volubilis marina*. *Banfinus* in his *Pinax* calleft it *Scammonia Monspeliensis foliis acutioribus*. The other *Alpinus* faith the Egyptians call *Sechamone*, taking it as I sayd before for a kinde of *Scammony*, as by their name may appeare: *Banfinus* seemeth to referre this to the other sort of the second kind of *Apocynum* of *Clusius*, but in my judgement he is mistaken, the leaves of this being much longer, than in that, and the flowers differing, which in this is white, in the other reddish and greene, like to the narrow leaved Dogs bane for he faith they are alike, and indeede maketh it his third *Apocynum*.

The Vertues.

These doe purge a little, but to little purpose, none of them comming any thing neere the vertue or force of the true *Scammony*; yet they of Egypt doe sometimes use the juyce of their owne kinde, in the stead of the true *Scammony*, and to that purpose doe gather and harden the juyce thereof, and keepe it to use when they want better, allowing double quantity for a dose.

CHAP. VII.

Soldanella five Volubilis marina. *Soldanella* or Sea Bindweede.

Although this plant groweth by the sea side, and plentifully enough on our owne coasts, in many places, and might therefore be remembered among other Sea plants, when we come to them, yet because it hath a strong purging quality therein, I thinke it not unfit to joyne it unto the other of his nature: I will also adjoyne hereunto that kind that groweth upon hills, called *Soldanella Alpina* or *Montana*, because the leaves are round, somewhat like unto these.

This Sea Bindweede hath many weak, slender, brownish greene branches, trayling or lying upon the ground, rather than raising it selfe up, or climbing upon other things, whereon are set divers leaves, not alwayes two together at a joynt, nor yet alwayes single, one at a joynt, which are almost round like unto the leaves of *Asarabacca*, but a little unevenly dented about the edges, and thicker, every on standing on a long foote stalke, and of a grayish greene colour; among which come forth the flowers towards the ends, every one by it selfe, comming forth at the joynts, in fashion like unto the small low common Bindweede, that groweth upon the ground by the way sides, every where almost, but a little larger and of a reddish purple colour: after which come round heads, wherein is enclosed two or three round blacke feedes: the roote is small and long, spreading a little in the ground, and shooting up diverse heads in severall places: if any part thereof be broken, there issueth forth a whitish water, which as well as the leaves are bitter, salt and unpleasant.

2. *Soldanella maritima major*. The greater Sea Bindweede.

This other kinde hath likewise divers long slender branches: whereon are set larger leaves, many of them having a division, on both sides the leafe, next the bottome, and many of them but on one side, and many also that are smaller having none at all; yet all of them for the most part a little sinuated on the edges, toward the ends, which are round or with a dent in the middle, making the point seeme double forked, with many veines running therein: the flowers are of a reddish purple colour, and are not bell or cup fashion, like the former, but consists of five somewhat large and long leaves: the heades and feedes are like the other, and the roote creeping a little in the ground.

3. *Soldanella Alpina major*. The greater Mountainine Soldanella.

From the likenesse of the leaves, this Mountainine Soldanella tooke the name, which hath many hard round leaves, set upon long foote stalkes, a little unevenly cut about the edges, greene on the upper side, and of a grayish greene underneath, and somewhat reddish like the leaves of Sowbread, resembling the Sea Soldanella: the stalkes are slender, small, round, and reddish, about a spanne high, bearing foure or five flowers at the toppes, every one hanging downe their heads, like unto a bell flower; consisting but of one leafe plaited into five folds each

2. *Soldanella vulg. & major maritima.*
The greater Sea Bindweede.

3. *Soldanella Alpina major.*
The greater Mountaine Soldanella.

Each of them ending in a long point, which maketh the flower seeme to have five leavēs, having a round Greene head in the middle, with a pricke or point at the end thereof: the flower is of a faire blew colour, in some deeper or paler, or white as nature listeth, without any smell at all: the middle head after the flower is fallen riseth to be a long round pod, bearing that pointell it had at the end thereof, wherein is contained small greenish seede: the roote hath many fibres, shooting from a long round head or roote. There is a lesser sort hereof as *Clusius* saith, little differing in sunder one from the other, but in the greatnesse or smallnesse.

The Place.

The first groweth on our owne Sea coasts, in many places plentifully, as well as in other Countries. The other groweth as well wilde in desert places, as in gardens in Syria, as *Rauwolfius* saith, as also on the coasts of the kingdom of Naples, as *Imperatus* saith: the last groweth on the snowie hills in Hungary as *Clusius* saith.

The Time.

The two former flower toward the end of Summer, and their seede is ripe in August: the last in the naturall places flowreth not untill July or August, as the snow melteth sooner or later, but in Aprill in Gardens.

The Names.

The first is taken of all writers for the most part, to be the *Κεράμιν θαλασσία* *Brassica marina* of *Dioscorides*, all the markes and notes thereof agreeing with this: yet it hath no resemblance unto any kinde of Colewort, as the name should import, yet many authors doe call it *Brassica marina*, as *Matthiolus*, *Cordus*, *Gesner*, *Camerarius*, *Dodonaeus*, and others, and some of them also call it *Soldana* and *Soldanella*, as well as *Lobel*, *Casalpini*, *Tabermontanus*, and others. *Bauhinus* calleth it, *Soldanella maritima minor*: we in English doe call it by diverse names, as some call it *Sea cole*, according to the Latine name, others more properly in my judgement *Convolvulus marinus*, *Sea Withwind*, or *Sea Bindweede*, because the branches winde themselves, and the flowers, are so like the small kinde of *Bindweede*, and that it groweth naturally neere the Sea coasts, as also *Sea Bells* for the likeness of the flowers, and some also call it *Tussilago marina*, *Sea Fole-foote*, for the resemblance of the leaves. The other *Rauwolfius* calleth *Brassica marinae genus*, as it is extant in the Appendix of the great Herball of *Lugdunensis*, and *Imperatus* calleth it, *Convolvulus marianus noster*, *Bauhinus* calleth it, *Soldanella vel Brassica maritima major*, and hath set forth the figure thereof in his *Matthiolus*: the last is called by most, *Soldanella Alpina*, and by some *Lunaria minor carulea*, in English Mountaine Soldanella, (but not Mountaine Bindweede, as Gerard doth, because it is no Bindweede) or else Blew Lunary or Moone wort.

The Vertues.

The herbe and every part thereof as *Dioscorides* saith, is an enemy to the stomacke, being sharpe in taste, and openeth the belly very powerfully, and violently, and therefore not fit to be given, but unto strong and robustious bodies, and that boyled also in the broth of fat meate, to hinder the violence of its working: the decoction thereof with some Rubarbe, is commended by some to helpe the Drop sicke and Timpanie, and the powder of the leaves with Rubarbe, and a few *Cubebs* drunke in wine, is of the like operation: the juyce also not pressed, but

but issuing forth of it owne accord when it is broken, gathered, and dryed, and afterwards relented, and layde as a plaister to the bottome of the belly, worketh upon that disease (the Dropfie I meane) mightily, drawing forth those watery humors: diverse also doe use to cate the Greene herbe fasting, to purge them, even as others doe Scurvie grasse: the powder of the dryed hearbe is of very good use, to bring or raise up flesh in deepe and hollow Vlcers, helping also to heale them. The Mountaine Soldanella, is of a drying or binding property, good to consolidate wounds and helpe the Sciatica and Goutte.

CHAP. IX.

Convolvuli sive Volubiles majores. The great Bindweedes or Bellflowers.

T Here are diverse sorts of Bindweedes or Bellflowers, some greater, others lesser, of the greater in this Chapter, whereof some of them have beene made mention by former authors, but others not spoken of by any before.

1. *Convolvulus Azureus sive caruleus major.* The greater blew Bindeweede or Bell flower.

This greater Bindeweede riseth up with many winding branches, climbing and spreading on whatsoever it can take hold on, that standeth neere it, winding it selfe alwayes contrary to the course of the Sunne, on these branches grow many faire, great, round leaves, pointed at the end; of a sad Greene colour, at each joynt, where the leaves are set come forth flowers on pretty long foote stalkes, two or three set together, which at the first are long and pointed, almost like a finger, but being blowen open are like great bells with broad open mouthes or brimmes, made of one whole leafe, ending in five corners and foulded or plaited so also, and small at the bottome, standing in small Greene huskes: these flowers are of a pale blue colour being in budde: but being open are of a very deepe azure colour, or blue, tending to a purple, the foulds or plaits being deeper or redder, which open for the most part in the evening, abiding so all night and the next morning, untill the Sunnes heate closeth them, never opening againe: after these flowers are past, the stalkes of them bend downewards, and beare within the huske three or foure blacke feedes: the rootes are stringy, and perish every yeare.

2. *Convolvulus major purpureus sive trifolius.* The greater purple Bell flower with cornered leaves.

The growing of this Bellflower is all one with the former, the chiefest difference consisting in the leafe which is three cornered, and in the flower which is deeper, tending to a deepe purple violet colour, and more reddish in the plaits and bottome.

3. *Convolvulus trifolius Virginicus.* Blew Bell flower of Virginia.

This Bell flower or Bindeweede climeth and spreadeth on pales, &c. like unto the former, having leaves very

1. 2. 3. *Convolvulus caruleus major folio rotundo sive Nil Asiaticum, trifolio vulgaris & Virginicus.*

The great blew Bindeweede, with a round and triparted leafe vulgar, and that of Virginia.

5 *Convolvulus pennatus Americanus.*
The red Bell flower of America.

Q

like

like unto the last, but smaller, and cut rounder in the division of the leafe on each side, and one side also a little longer, bending downwards: the flowers also are much smaller, of a watchet or pale blew colour, changing upon the fading thereof to be of a reddish purple: the feede is like the former but smaller, and the roote periseth like the rest.

4. *Convolvulus Arabicus* five *Egyptius*. The Arabian or Egyptian Bindeweede.

The Arabian or Egyptian likewise climeth and spreadeth like the other, with a leafe at every joynt, standing on a long foote stalke, parted sometimes into five small long leaves, sometimes into more, each one ending in a small pricke, and the one or the other lower peece of the leafe, divided into two parts; at the joynts with the leaves, come forth such like Bellflowers, as are in the former, of a purplish blew colour.

5. *Convolvulus tenuifolius* five *pennatus Americanus*. The red Bell flower of America.

This Indian kinde riseth up at the first with two double forked leaves, abiding a long time without fading, betwene which springeth up a stalke, three foote high in some places, branching forth diverse wayes, being of a brownish colour, and spreading it selfe as the others doe: the leaves that are set at each joynt, are winged; that is, sundry small, narrow, and long, darke Greene leaves, but fresher being young, set on both sides of the middle ribbe, and one at the end, from the joynts likewise rise long stalkes, with two or three or more small long hollow flowers at the ends of them, of the fashion of Tobacco, or the white Iasmin flowers with five points, and not so much layd open as the other Bell flowers, being of a bright red colour, and plaited like the Bell flowers, with five chives or threads in the middle, tipped with so many pendants which turne into long pointed pods, containing long and blacke feede, tasting hot like Pepper, the roote is small and stringie perishing every yeare: the leaves taste a little sweete and nitrous, and yeeldeth a thinne pale milke, when it is broken.

The Place and Time.

All these are strangers, the two first are thought to come out of the East Indies or the East Countrey towards it, the rest are specified in their titles from whence they came: They all flower late, and therefore we can very seldome get ripe feede from any of them.

The Names.

The first is taken by most, to be the Nil of Avicen and Serapio, which they call *granum Nil*, and *Habal Nil*, for there is another Nil or rather Nir, because of the blue colour, which is the Anill or Indico of Dioscorides and our times, which shall be spoken of in his place, it is called by some *Flos Noctis*, because his chiefest beauty is in the evening, night, and morning; others call it *Convolvulus Azureus* & *caruleus*, as they call the second *trifolius* & *purpureoceruleus*: the third and fourth have their names in their titles, as much as can be sayd of them; the last is called *Quamochlit* by the Indians, and *Iasminum folio Millefolii* by Casalpini, who was the first as I take it that wrote of it, Camerarius next unto him in *Horto Medico* saith, it may not unfittly be called *Convolvulus tenuifolius*: and Fabius Columna saith, it cannot be more fitly referred to any tribe, or family of plants, than unto the *Convolvuli*, and therefore calleth it himselfe *Convolvulus pennatus exoticius rarior*; he that set forth Clusius his *Curas Posteriores*, referreth it to the *Iasmines*, calleth it *Iasminum Americanum*, and so doth Bauhinus also: but in the flowers onely is the likenesse of the *Iasmine*, and in no other part of the plant, or manner of growing, all the *Iasmines* being woody and perennes plants, and this as the other *Convolvuli* herbaceous & annuall; some have taken it to be the *Ligustrum nigrum*, that Columella speaketh of, but with little judgement in mine opinion: the Italians call the first and second, *Campana Lazura*, that is, *Campanaceulea*, the Arabians in Syria and Egypt *Hismisen*.

The Vertues.

The feede of the first and the second also (for they are *congeneres*) doe purge very strongly, but slowly and oftentimes with great trouble to the stomacke, causing vomitings, yet it avoydeth raw indigested flegme, and melancholy humors, from those that can endure it, and killeth the long flat wormes of the belly.

CHAP. X.

Convolvuli five *Volubiles minores*. The smaller Bindweedes.

He lesser sorts of Bindweedes remaine to be intreated of in this Chapter, whereof there are many and sundry varieties, all of them having a purging quality, more or lesse, as you shall presently heare in this Chapter.

1. *Convolvulus Althaeae foliis*. Mallow leaved Bindeweede.

This small Bindeweede groweth not high, nor climeth much upon any thing, but for the most part, lyeth with his small slender hayrie branches upon the ground, having diverse leaves very thinnely or sparsely set on them; somewhat broad and long, like unto the leaves of Marsh Mallows, but smaller, crumpled and cur in on both sides at the lower ends, dented about the edges, and of an hoarie or dusky grayish Greene colour, clammye or sticking like gumme to the teeth, sharpe and somewhat bitter in taste, when they are chewed in the murther: the flowers come forth one by one, at the joynts with the leaves, all along the stalke up to the top, every one upon a long stalk, which are very like the small wild Bindweede, that groweth upon the ground: consisting of one whole leafe yet plaited, as it were before the opening into five plaits, and being open have five corners, as if it had five leaves, broad like a cup or Bell at the brims, and small at the bottome, of a fine delayed purple colour sometimes, and sometimes deeper: the roote is small and brownish, creeping under ground, and shooting up heads in other places.

2. *Convolvulus minor albus Vulgaris*. The common small Bindweede.

The common small Bindweed that groweth every where in fields, by the wayes and hedg sides, sometimes riseth up and windeth it selfe, but usually spreadeth on the ground, with long trailing and winding branches, one within another, and leaves set thereon somewhat like unto the greater white Bindeweede, but much lesser, the flower is for forme like the other white Bell flower either wholly white or the plaits purplish but lesse, made of one leafe plaited as it were into five fouldes, and opening wide at the brims, after which come small blackish feede, in small long and round heades: the roote is small and slender, running both very deepe downe into the ground, and

and spreading farre abroad likewise, especially if it get into garden mellow grounds.

3. *Convolvulus spica folius*. Lavender leaved Bindweede.

This small bindweede is as great a plague to the fields, where it naturally groweth as the last: the leaves are long and narrow, resembling Lavender, and the flowers of a deepe purple colour, wherein it differeth from others, for else it is like the last.

1. *Convolvulus Althea folius*. Mallow leaved Bindweede.

2. *Convolvulus minor albus vulgaris*. Common small Bindweede.

4. *Convolvulus minor purpureus*. Small purple Bindweede.

This Bindweede is in all things like the second, saving that the flowers are either of a pale purplish, or bluish colour, the foulds being white or of a deeper purple, without and white within, and the bottome so likewise, which is of much beauty.

5. *Convolvulus minor Africanus*. The small African Bindweede.

There is small difference in this from the former for the manner of growing, the leaves onely make the variety, which are not divided at the bottome, but whole, and the flowers purple, but bell fashion like the rest.

6. *Convolvulus Africanus minimus*. The least African Bindweede.

This sort creepeth not as the former, but standeth a little upright, or leaneth somewhat downe upon the ground, like the next Spanish kinde, the smallness both of leaves and flowers from the last maketh it noted to bee a severall species.

7. *Convolvulus minor Hispanicus caeruleus*. The blue Spanish Bindweede.

This Spanish kinde shooteth forth sundry small branches three foote long or more, from the small threddie roote which dyeth every yeare, having sundry leaves set singly thereon, small and long at the bottome, and broader, and almost round at the end, somewhat hayrie as it were all over: at every leafe for the most part, from the middle of the stalkes upwards, commeth forth a flower like unto the common sort, folded into five plaits, which open into so many corners, of a most excellent faire skie coloured blue (so pleasant to behold, that it amazeth the spectators) with white bottomes pointed upwards and yellow in the middle, which turne into small round white heads, containing within them small blackish cornered seede to be new sown every yeare.

8. *Convolvulus minor Atriplicis folio*. Blacke Bindweede.

If this small Bindweede meeteth not with hearbes or other things whereon to clime, it riseth up but a little, and leaneth downe againe unto the ground, otherwise meeting with fit things, it will winde with his long slender reddish threddie branches about them, to the height of three or foure foote or more, bearing his leaves singly at the joynts, as the others doe, either somewhat like unto the leafe of an Arractre, or round like unto the wilde black Brionye, for of both sorts there are, but much smaller: the flowers are very small and many standing together along a small long stalke, that commeth from the joynt, where the leafe standeth, and are of a reddish Greene colour, but so small that they are oftentimes not heeded, and so quickly faded that they are scarce regarded: after which come small blackish three cornered seede: the roote is small and slender, perishing every yeare, and

3. *Convolvulus spica folius*. Lavender leaved Bindweede.

rising of the fallen seede every spring, unlesse it be continually weeded out of the garden.

9. *Halvine Cissampelos ramosa Cretica*. Branched blacke Bindweede of Candy.

The stalke hereof is much branched, and the branches also much divided, having two small leaves at every joynt hoarie, and hairy very like unto Mouleare, the upper leaves being smaller, and the flowers large, of a pale bluish colour, spread open like the small Bindweede: the seede that followeth is blackish browne, one in a small round head, the roote is very threddie and bushing, yet perisheth yearly.

4. 6. 7. *Convolvulus minor purpureus*. *Carolicus Hispanicus & Africanus minimus*. Purple and Spanish blew Bindweede and the least African.

8. *Convolvulus minor Atriplicis folio*. Blacke Bindweede.
5. *Africanus minor*. The small African Bindweed;
4. *Major Arabicus sive Egyptianus*. The Arabian or Egyptian Bindweede. folio 170.

10. *Cissampelos altera Anglica minima*. Small blacke Bindweede.

This onely in the smallnesse, rising not above a hand breadth high, differeth from the common blacke Bindweede.

The Place.

The first *Clusius* saith he found in many places of Spaine: the second, third, and fourth, grow in sundry Countries of

of this Land : the fifth and sixth were found by Doctor Boelius, (often remembered both in my former and this worke) in *Barbary* and brought to us : the seventh was also found by him in *Spain* and *Portugall* : the eighth in many Countries of this Land, both in fields and else where. and will bee also found as a weede in gardens, to be pulled out : the ninth in *Candy*, and the last groweth about *Drayton* neere *Portsmouth*.

The Time.

They flower in Summer, yet some later than others of their kinde.

The Names.

They are called *Convolutuli* & *Volubiles*, quia crebra revolutione vicinos frutices & herbas implicet. *Clusius* calleth the first *Convolutulus Alibæ folio*, not knowing to what plant of the ancients it might be referred, unlesse it might be the *Lusone* of *Pliny*, whereof he maketh mention in the 22. chap. of his 22. booke. *Gerard* much mistooke this plant, calling it *Papaver corniculatum minus*, but his correcter hath amended it : The second is called *Convolutulus* & *Volubilis minor* by most writers, yet some *Smilax levis minor* as *Dodonæus*; and *Helxine Cissampelos* as *Mathioli* & some others, and taken to be the *Scammonia tenuis* of *Pliny* : the third is thought by *Castor Durante* to be *Cantabrica Plinii*, and *Clusius* saith the same likewise : of *Cortusius* called *Scammonia Patavina*, of *Guilandinus* *Helxine flans*, of *Tabernmontanus* *Scammonium minus*, and of *Lobel* as it is in the title : the fourth, fifth, sixth, and seventh, have their titles in their foreheades, as much as is necessary robe sayd of them : the eighth is thought of many to be the *Helxine* of *Dioscorides*, which was called also *Cissampelos*, in Greeke *ἡλίξιν καὶ ἀμπέλον*, *ab ἡλίξει trahere vel herere* : & *καὶ ἀμπέλον* quasi vitæalis sive *Hedera Viticæ*, because this *Helxine* should be knowne to differ from *Parietaria*, called *Helxine* also, this most commonly growing in Vineyards, creeping up upon the Vines, with a leafe like *Ivie* : *Democritus* in *Geoponicis* calleth it *Malicocissos*, quasi mollis *hedera* : *Lobel* calleth it *Cissampelos* altera atriplicis effigie : *Dodonæus* calleth it *Helxine Cissampelos* & *Convolutulus niger* : *Tragus* taketh it to be *Orobanchæ* of *Theophrastus*, which *Gaza* translateth *Ervangia* : of *Thalins* in *Harcynia sylva*, *Volubilis media sive nigra*, *Cordus* on *Dioscorides* taketh it to be *Elatine*, *Angullara* to bee *Centunculus Plinii*, and *Fabius Columna* calleth it *Polygonum Hederaceum* : the ninth is so called by *Pona* in his *Italian Baldus*, as it is in the title : the last is not spoken of by any before.

The Vertues.

They are all of the nature of the other small Bindweedes no doubt, which is to move the belly : yet *Clusius* saith the first is used in *Portugall*, as an herbe of singular effect to heale all sores or wounds; *Cissampelos*, is said likewise to purge the body strongly, if either the juyce, or the leaves and herbe in powder, be drunke in wine or other drinke. The leaves being bruised and layd on hard tumors or knots in the flesh, dissolveth and consumeth them.

CHAP. XI.

Smilax aspera. Prickly Bindweede.

Here are two sorts of this Bindweede, differing very notably both in leafe and fruit, as you shall heare by and by : but there is another plant referred unto them, which is the *Sarfaparilla*, that is brought from the West Indies, which I must adjoyne, and speake of it also here.

1. *Smilax aspera fructu rubro*. Prickly Bindweede with red berries.

This Bindweede groweth up with many branches, wherewith it windeth about trees, and other things, set with many crooked prickles or thornes like a bramble, all the whole length, bending this way and thar, in a seemely proportion; for at every joynt it bendeth or boweth it selfe, first one way and then another, having somewhat a broad and long leafe thereat, standing upon a long foote stalke, and is broad at the bottome, with two forked round ends, and then groweth narrower unto the point : the middle ribbe on the backside of most of them, having many small thornes or prickles, and also about the edges; the lowest being the largest and growing smaller up to the toppe, smooth and of a faire Greene colour, and sometime spotted with white spots; at the joynts with the leaves also, come forth clasping tendrels, like as the Vine hath, whereby it windes it selfe; the flowers stand at the toppes of the branches, at three or foure joynts, many breaking forth together in a clustre, which are white, composed of sixe leaves a peece, starre fashion and sweete in sent, after which come the fruits, which are red berries when they are ripe, of the bignesse of *Asparagus* berries or small Grapes, and in some lesser; wherein are contained sometime two or three hard blacke stones, like also unto those of *Asparagus*; the roote is slender white and long, in hard dry grounds, not spreading farre, but in the looser and moyster places, running downe into the ground a pretty way; with diverse knots and joynts thereat, and sundry long rootes running from thence.

2. *Smilax aspera fructu nigra*. Prickly Bindweede with blacke berries.

This other prickly Bindweede, is like the former for the manner of growing in all points, his branches being joynted in like manner, with thornes on them, but nothing so many, climbing as the former : the leaves are somewhat like it, but not having those forked ends at the bottome of every leafe like it, but almost wholly round and broad at the bottome, of a darker Greene colour also, and without any, or very seldome with any thornes or prickles, either on the backe or edges of the leaves, with tendrells like a Vine also : the flowers come forth in the same manner and are starre fashion, consisting of sixe leaves a peece like the other, but they are not white as they are, but of an incarnate or bluish colour, with a round red umbone in the middle of every one, which is the beginning of the berry, that when it is ripe, will be blacke and not red, being more tappie or fleshie than the other, with stones or kernells within them like unto it : the rootes hereof are bigger and fuller than the former for the most part, and spreading further under the ground.

3. *Smilax aspera Peruana*. Sarfaparilla of America.

The Sarfaparilla that cometh from *America* into *Spain*, and from thence into other Countries, hath beene seene fresh, even the whole plant as it hath beene brought from *Spain* to the Duke of *Florence*, *Lucas Glinus* his Physitian, being by as a witness, that in all things it did resemble the prickly Bindweede, and differed in nothing

1. 2. *Smilax aspera* spinoso & non spinoso folio.
Prickly Bindweede, with red and with blacke berries.

3. *Smilax aspera* periana five *Saraparilla*.
West India *Saraparilla*.

Buenos noches Hispanis. The heades with feedes
of the true *Saraparilla* as it is supposed.

nothing from it. *Matthiolus* setteth downe this relation in his Commentaries, in the 111. chapter of his first booke of *Dioscorides*, speaking of *Saraparilla*, what plant it should be, and agreeeth with *Ghinus*, that the *Smilax aspera* (with red berries, for in not speaking of the other he declareth that he knew it not) was the true *Sarsa*, which both *Ghinus* and others likewise had proved by many trialls, to be as effectuall to cure the French disease, as the *Sarsa* of the Indies. *Prosper Alpinus* likewise in his booke of Egyptian plants, declareth that he found in the Island *Zacynthus*, the rootes of *Smilax aspera*, whose leaves he setteth forth to bee without prickles, growing by a running river side, to be greater larger and fuller of substance, than ever he had scene them, in any other place in *Italy* before; and being so like the true *Sarsa* of the Indies, that he was fully perswaded the *Saraparilla* that commeth from *Pern*, was the rootes of *Smilax aspera*; the difference betweene them, in greatnesse or goodnesse, if any be, to be onely in the climate and soyle; and saith that an Apothecary in that Isle, had gotten much money thereby, both by his owne practise, and the sale of them to others for *Sarsa*: and saith moreover that he saw himselfe, in some bundles of the Indian *Sarsa*, some of the rootes, that had the knots at them, as the *Smilax aspera* hath, and some leaves therein also like it, which my selfe have sometimes scene in them likewise. *Gabriel Fallopius* likewise in the booke that he wrote of the cure of the French disease, in the chapter of *Saraparilla* saith thus; I was perswaded saith he, and stood in that opinion along time, that the *Saraparilla*, was the roote of *Ebulus* or Wall worthe, untill a Spaniard that brought the whole plant unto the Duke of Florence, made my error knowne unto my selfe, for I saw it to be the roote of that *Smilax aspera*, that *Dioscorides* and other the ancients make mention of in their writings, and was better confirmed in my opinion, by the experience I had thereof, in curing diverse about *Pisa* as perfectly of the French disease, by the rootes of this *Smilax aspera*, which I caused to be digged up for my use, growing on the hill of *S. Julian*, as with the rootes of *Saraparilla* for two yeares while I layed there to practise Physicke; which opinion also *Amatus Lusitanus*, a Physitian of good note, although a few, confirmeth in the fifth booke of his Centuries. *Alpinus* also sheweth another note of difference, in the rootes of *Smilax aspera*, whereat many in his time stumbled: for they saw the rootes of *Smilax aspera* growing in *Italy*, to be short and full of knots, with small fibres at the end; and the rootes of the other to be long and smooth without any knots: to enforme you therefore thoroughly herein, and take away this doubt: he sheweth that the first rootes of *Smilax aspera*, are downe right, short, and full of joynts

joynts or knots, from which joynts or knots, shoote other rootes or strings, which in dry grounds, are but small and short fibres, and in the more moist and mellow, are greater and longer, without any joynt at all in them, (as is to be seene in the rootes of many other plants, whole rootes have many strings) and that these rootes are they, which are like the *Sarsaparilla*, and not the first, which are short and full of joynts: and that the smallest of the rootes of *Smilax aspera*, growing in *Italy*, or other dryer Countries, must be rather imputed to the climate and soyle, rather than any thing else: by this narration you may perceive the judgement of the elder times, and likewise their practise to use *Smilax aspera* instead of *Sarsaparilla*, for the diseases whereunto *Sarsaparilla* is proper: but I verily beleve that the plant of *Sarsaparilla*, that groweth in *Peru*, and the West Indies, is a peculiar kind of it selfe, differing from the *Smilax aspera*, as notably as the *Mechoacan* from our *Briony* and may very well be that plant that *Simon de Tovar*, chiefe Physician of *Sevill* in *Spaine*, sowed the feedes of, and had it growing with him: and of the seed that he sent to *Clusius* under the name of *Convolvulus peregrinus*, did one plant likewise spring for a yeare with *Honestus Lopes*, in the low Countries, to whom *Clusius* had imparted some of *Tovar*'s feede, but perished at the first approach of winter: the descriptions of both *Tovar* and *Clusius*, in their manner of growing, are set forth by *Clusius*, in the second booke and 18 chapter of his *Exotickes* or strang things, which I thinke not amiss here to relate unto you, yet contracted into one, least it should bee too tedious to set them downe both particularly: Having put the feede into the ground, the first two leaves that sprung (say *Tovar* and *Clusius*) were very like the first two leaves of *Campanula Indica*, the blue Bindweede (and such likewise doth the feede of *Mechoacan* yeeld, at the first springing saith *Tovar*) the roote afterward saith *Tovar* sent forth many branches, which woound themselves, very much about the poales that were set for them to clime on, like unto *Smilax aspera*, having such like leaves also, but greater and softer: the branches had crooked thornes or prickles, growing on them likewise as the *Smilax aspera* hath, but fewer and nothing so sharpe: that of *Honestus Lopes* saith *Clusius*, sprang up with many branches, winding it selfe also about the poales, that were stucke into the ground by them; having some tender prickles like thornes growing on them, especially at the joynts, which were (saith he) nothing but the first sprouting of rootes, which no doubt would have taken hold of the ground, if earth had bene put unto them; it had very greene leaves saith *Clusius*, like unto Bindweede, but longer, and cornered like ivy leaves, ending in a long point, like to the leaves of *Smilax aspera*; the flowers saith *Tovar* were great and white, every one as bigge as a middle sized dish, which opening in the morning did fade at night; from whence the Spaniards called the plant *Buenas noches*, that is, good night: the plant of *Honestus Lopes* saith *Clusius*, brought forth buddes for flowers, but could not bring them to perfection, the early frosts destroying the whole plant: *Clusius* saith that he had a small branch with three heades of seed thereon, (whose figure I here give you) the largest that ever he saw in that kinde, for it had five leaves a peece, every one almost an inch broad and long, which seemed to be the cup of the flower and fruite, every head which was three square and skinnie, had within it three round feede, as big as great pease, of a smoakie or brownish colour. The report of Master White a Painter, unto Master *Gerrard*, as he fettest it downe in the chapter of *Sarsaparilla*, is somewhat to this purpose; that it is the roote of a shrub or hedge tree, like unto Hawthorne trees with leaves like Ivy, the comparison unto Hawthorne is rude, according to his skill, but it seemeth the branches abide and perish not, there spreading very much: the leaves are better resembled: but flowers or fruite he remembered not. These descriptions doe seeme unto me, (although no mention of roote be expressed in the relation) very probably to set forth the growing of *Sarsaparilla*, whereof no doubt *Simon de Tovar*, if he had lived longer, had given *Clusius* better information: *Bauhinus* in his *Pinax*, maketh it a third species of *Smilax aspera*, calling it *tertia Smilax aspera Indica Occidentalis*: time no doubt will declare the truth hereof more plainly, yet it might be hastened, if there were in any eminent person, any such ingenuity of spirit, as to cause such things, that are rare to be sought out, and brought home (and many such there are in *Italy*, as at *Florence*, *Rome*, *Venice*, *Padou*, and many other places, that have their gardens stored with all the rarest plants they can heare of, and brought thither) and then if care, diligence and experience had the ordering of them, after they were brought, they might make them famous that procured them, and be the means of a great deale of knowledge to others, for the true declaration of such things, as are either doubtfull or hidden in the course of Physicke.

The Place.

The two first grow in *Italy*, *Spaine*, and other the warmer Countries, whether the continent or Isles, throughout *Europe* and *Asia*: but the third is found onely in the West Indies; the best commeth (as it is sayd) from the *Honduras*, others not so good from other places there, as the fertility or the barrenesse of the ground, and the temperature of the climate, affordeth meanes thereof.

The Time.

In the hotter Countries these flower, and bring forth their berries timely enough in the yeare, but in these colder Countries, without conveniencie to keepe them in the winter, the frosts will soone consume them.

The Names.

The word *Smilax* is diversly taken and with diverse significations among writers; it is taken for two sorts of trees, it is likewise taken for three sorts of herbes. *Theophrastus* maketh mention of one of the trees, in the 3. booke and 16 chapter of his history, calling it *Smilax Arcadum* a soft Oake, which is like unto an *Ilex* or Holly Oake. The other which the Grecians call *Smilax* simply, is called in Latine *Taxus*, the Yew tree: the herbes, are first, this here expressed, as well as the other more gentle sort, which is the common Bindweede, this the Grecians call *σμίλαξ τεργεβα* *Smilax aspera*, as they call the other *σμίλαξ λευκή* *Smilax levis* sine lenis, and the other the Grecians call *σμίλαξ κρηνη* *Smilax hortenfir*, which is *Dolichus* or *Phaeolus*, the French or Kidney Beane, as shall be shewed in their severall places. This *Smilax aspera* is called also of *Galen* in his seventh booke of simples *Milax aspera*. *Theodorus Gaza* the translator of *Theophrastus*, interpreteth it *Hedera Cilicia*, following *Pliny*, who saith in lib. 26. c. 35. that the herbe called *Smilax* which is like unto Ivy, and came first out of *Cilicia*, but is more frequent in Greece, hath thornie branches, &c. *Pliny* also calleth it *Nicophoros* lib. 24. chap. 10. It is called generally of all *Smilax aspera*, onely *Lonicerus* calleth it *Volubilis aspera*, and *Clusius* as I thinke first of all distinguished it by the berries, calling the one *rubro fructu*, and the other *nigro*, when as they might as well be distinguished by their leaves, the red berryed as I take it having thornie leaves; and the other smooth

smooth and without thornes or prickles, yet *Gerards* figures have both of them prickles on the leaves, calling the one *Lusitanica* and the other *Germanica*, whereas it is but one and the same plant, growing in severall Countries: *Tragus* seemeth to bee doubtfull of *Dioscorides* his *Smilax aspera*, thinking *Lupulus* the Hoppe to be it; *Lobel* calleth that with blacke berries *Smilax aspera altera facie Sarsaparilla aut ei congener*. And it is very likely to be that kinde that *Alpinus* saith, he found with so large and great rootes, as is before exprested, and others so much commend to be used instead of *Sarsaparilla*. The *Zarsaparilla* or *Sarsaparilla* it selfe, is a Spanish word, which the Spaniards imposed upon this, when they first saw it in the West Indies, because they judged them to be both one thing, that is *Smilax aspera*: for so they call it in their language *Zarsa*, or as some write it *sarsa*, signifying *Rubus* a Bramble, and *Parilla viticula*, the diminutive of *Vitis* a Vine, as if one should say a small Vine-like Bramble, and yet *Garcias Lopes Lusitanus* saith, the name the Indians call it by, doth signifie as much. Some call it *Salsaparilla*, and some *Smilax Peruana*. *Matthiolus* giveth us a figure of *Sarsaparilla*, neither branches nor leaves, having any shew of thorne or prickles at all upon them, which as he saith he received from *Cyprus*; and hath no knot or head, from whence the long smooth roots should spring, such as is in the true *Sarsaparilla*; which as I sayd before I have often seene my selfe in diverse bundles thereof: but assuredly there are diverse sorts of *Sarsaparilla*, the best being very large & full, with a white pith in the middle, which will rend or live in the middle very easily, and this most commonly is brought without head or knot, but with a number of fibres on all sides thereof, which must be taken away before it can be used, another sort is not so full and great, yet rendeth or cleaveth reasonably well, and is the most spent, because the most store thereof is brought: the third is a hungry sort, and is of least respect and use, this being usually brought with the heads or knots, to be seene from whence the rootes spring, I say usually, for sometimes you may finde a head or two among the middle sort.

The Vertues.

This prickly Bindweede saith *Galen* if the leaves be tasted they have some sharpenesse in them, and being used any way they heate. *Dioscorides* saith that both leaves and berries being drunke, before or after any deadly poyson is taken, are a remedy there against, serving to expell it. It is sayd also saith he, that if to a new borne childe, some of the juyce of the berries hereof be given, it shall not be hurt by poyson ever after: It is given as an Antidote against all sorts of poytious or venomous things. If a dozen or sixteene of the beryes being beaten to powder, bee given in wine, it procureth Vrine when it is stopp'd. The distilled water of the flowers being drunke, worketh the same effect, and clenseth the raines, and aswageth inward inflammations. If the eyes be washed therewith, it taketh away all heate and rednesse in them, and if the sores of the legges be washed therewith, it healeth them thoroughly. The rootes as you have heard before, are used by diverse learned and judicious men in stead of *Sarsaparilla* with as good successe, as if they had used the true: for *Sarsaparilla* doth not purge the body of humours manifestly as other purgers doe, being generally held not to heate, but rather to dry the humours, yet it is wel perceived that it spendeth the humours, by a secret and hidden property therein, whether by purging, or wasting & consuming them. much wherof is performed by sweating which it provoketh notably: It is much used now adays in many kinds of diseases, namely in all cold fluxes from the head & braine, rhumes and catarrhes, as also all cold griefs of the stomack, and expelleth winde very plentifully, both from the stomacke and mother: It helpeth not onely the french disease, but all manner of aches in the sinewes and joynts, all running sores in the legs, all hegmaticke swellings, tetter, or ring wormes; and all manner of spots and foulness of the skin: it is not convenient to be given to those whose livers are over hot, nor to such as have agues. The manner of using it, is diverse according to mens severall opinions, for in former times it was used beaten to powder and so drunke; others againe boyled it so long untill it became tender, which being beaten or broken, was after ward strayned into the decoction, making a kind of thicke drinke like a cream. Some againe and that most usually boyled it in water, to the halfe, or to the consumption of the third part, as they would have it stronger or weaker, and that either by it selfe, or with other things meete for the disease attempted, and others also put it among other things into drinke, either beere or ale new tunned up, to drinke after it hath stood three or foure dayes for Physicke drinke, for the remedy of those griefes, it is conduible as aforesayd.

CHAP. XII.

Lupulus sive Lupus salictarius. Hoppes.

He Hoppe is found to be of two sorts, one manured for the use and profit of the toppes heads, the other wilde growing in hedges, and other such like places of it owne accord, and was no doubt by ordering and manuring brought to be larger in every respect, and more fruitfull for use, such as the manured is: I thinke it not amisse to speake of them both in this place, being so neere in forme and quality the one unto the other, and not separate them, or trouble two places with them.

1. *Lupulus sativus*. The manured Hoppe.

The manured Hoppe riseth up at the first, with diverse great browne heades, like unto *Asparagus* but larger; which after ward spreading into rough branches, clime upon great high poles, that are set for them to ruine on, having many hard and rough darke greene leaves on them, cut into three or five divisions, somewhat like unto Bramble leaves, and dented also about the edges: at the toppes of the branches, which hang downe againe, for the most part come forth many scaly heads, being as it were a number of small yellowish greene leaves, growing thicke together; from among which come forth the flowers, of a whitish yellow colour, which being past, and the heads changing their colour, to be somewhat whitish yellow, they are fit then to be gathered to keepe: and then there is a small round seede found therein: the roote is great at the head, shooting forth many blackish strings, taking fast hold of the ground.

2. *Lupulus sylvestris*. The wilde Hoppe.

The wilde Hoppe groweth up in the same manner, ramping upon trees or hedges, as standeth next unto them, with rough branches and leaves like the former: this giveth both smaller heades, and in farre lesse plenty, than the manured doth, yea many times, there is scarce a head or two seene in a yeare upon diverse, and herein consisteth the chiefe difference.

The

The Place.

These plants are more frequent in these colder, than in the hotter countries, which sheweth the goodnesse of God unto us, to provide for every Country, such things as are fit for the sustentation of life; for where Vines grow not, and the water too cold and raw, to drinke simply of it selfe, there are these Hoppes chiefly bred to make drinke to serve instead of wine or water: They delight chiefly, or rather onely to grow well, in low moist grounds, where they may have moysture enough, and yet not too much; for therefore where they are planted on hillocks, as it were, there are trenches made to receive any great quantity of water, and bee conveyed away, that the plants stand not drowned therein.

The Time.

These spring not up untill April, and flower not untill the latter end of June, the heads are not gathered, untill the middle or end of September.

The Names.

It is observed and much marvelled at, by our ordinary writers, that this plant should not be remembered by *Dioscorides*, *Galen*, or any other of the ancient Greeke or Latine writers except *Pliny*, who doth but onely name it and, number it among those herbes that grow of themselves, and that are used for meate with diverse nations, calling it *Lupulus salictarius*. The *Arabians* have not onely remembered it, but commended the use of it highly for many diseases, as you shall heare by and by. *Mesues* maketh it his third kind of *Volubilis* with rough leaves, among his purging plants: the *Greekes* at this day call it *Levon* & *Spovvia*. *Bryon* and *Bryonia* it is likely for the forme of the leaves and running of the branches. It is called *Lupulus* & *Lupus salictarius*, & *reptivus* (quia salit & reptat per arbores, vel quia scandit salices) of all our moderne writers, onely *Lobel* calleth it *Vitis septentrionalium*, the Vine of the Northerne regions, and *Tragus* as I sayd before thinking it to be *Smilax aspera*: the *Italians* call it *Lupolo*; the *Spaniards* *Hombrazillos*, the *French* *Honblon*, the *Germanes* *Hopfen*, the *Dutch* *Hoppe*, and we in *English* *Hoppes*.

The Vertues.

The first buds of the Hoppes, being layd a while in sand, maketh them the tenderer, and being boyled are used to be eaten, after the same manner that the buds of *Asparagus* are, and with as great delight for the taste, yet they have little nourishment in them: their Physicall operation therefore is to open, the obstructions of the Liver and spleene, to cleanse the blood, to loosen the belly, and to cleanse the Reines from gravell, and to cause them to make water in whom it is stayd; the decoction of the toppes of the Hoppes, of the same as well as of the wilde, and so also the rootes doe worke the same effects, but that they are somewhat hotter than the young buds, which have more moysture in them: in cleansing the blood, they helpe to cure the French disease, and all manner of scabbes, itch, and other breakings out in the body, as also all tetters, ringwormes and spreading sores, the morphew likewise and all discolourings of the skin, and are used in Agues: the decoction of the flowers and tops, are used to be drunk, to helpe and expell poyson that any one hath drunk: half a dram of the seede in powder taken in drink, killeth the worms in the body, it likewise bringeth down womens courses, & expelleth Urine. The flowers and heads, being put into bathes for women to sit in, take away the swellings and hardnesse of the Mother, and is good for the strangurie, or those that very hardly make their water; the juyce of the leaves dropped into the eares, cleanseth the corrupt sores, and stench arising from the corruption in them; *Mesues* saith they purge choler, but worke more effectually, being steeped in whey of goates milke: A Syrupe made of the juyce and sugar, cureth those that have the yellow jaundise, easeth the headach that cometh of heate, and tempereth the heate both of the liver and stomack, and is veryprofitably given in long & hot agues, that rise of choler and blood: Those bakers that will use the decoction of Hoppes, to mould up their bread, shal make thereby their bread to rise better, and be baked the sooner: *Celsus* reciteth the manner of a medecine used in *Spain*, by women leeches, to cure the falling of the haire, caused by the french disease, in this sort. A pound of the rootes of Hoppes, wel washed & boyled in 8 pints of faire water, to the consumption of the third part, or a halfe if they see cause; whereof they give half a pint to drinke in a morning, causing them to sweate well after: into the decoction they put sometimes, two or three roots of parly, and as many of couch grasie, with a few Rayfins of the sunne. The Ale which our forefathers, were accustomed onely to drinke, being a kinde of thicker drinke than beere (caused a stranger to say of it, *Nil spissius dum bibitur, nil clarius dum mingitur, unde constat multas faeces in ventre relinquunt*, that is, there is no drinke thicker that is drunke, there is no Urine clearer that is made from it, it must needes be therefore that it leaveth much behinde it in the belly) is now almost quite left off to be made, the use of Hoppes to be put therein, altering the quality thereof, to be much more healthfull, or rather physicall, to preserve the body from the repletion of grosse humors, which the Ale engendred. The Wilde Hoppes are generally used Physically more than the manured, either because the Wilde is thought to be the more opening, and effectual, or more easily to come by, or that the owners of the manured, will not spare, or lose so much profit, as that which would be taken away might yeeld; yet assuredly they are both of one property, take which you will, or can get.

Lupulus salictarius. Hoppes.

CHAP. XIII.

Bryonia five *Vitis* sylvestris. Bryonie or Wildé Vine.

Vnder this title of Bryonie I must comprehend diverse and sundry plants, some whereof are of our Land, and found plentifully therein: others are strangers comming from other parts: Among which I must remember the *Mechoacan* of *America*, a plant neereft resembling the white Bryonie, as you shall heare when we come to it, and some others also that are strangers of those parts.

1. *Bryonia vulgaris* five *Vitis alba*. The common white Bryonie or wild Vine.

The white Bryonie or wild Vine that groweth commonly abroad, ramping up on the hedges, sendeth forth many long rough, very tender branches at the beginning, growing with many very rough broad leaves thereon, cut into five partitions for the most part, in forme very like a Vine leafe, but smaller, rougher, and of a whitish or hoarie greene colour, spreading very farre upon trees or bushes, or whatsoever standeth next it, and twining with his small claspers, that come forth at the joynts with the leaves: at the severall joynts also with the leaves and claspers come forth, (especially towards the toppes of the branches) a long stalke, bearing thereon many whitish flowers, together in a long tuft, consisting of five small leaves apeece, layd open like a starre; after which come the berries, standing more sepeare one from another then a cluster of grapes, greene at the first, and very red when they are through ripe, of the bignesse of Nightshade berries, of no good sent, but of a most loathsome taste, provoking vomit: the roote groweth to be exceeding greate, with many long twines or branches growing from it, of a pale whitish colour on the outside, and more white within, and of a sharpe bitter loathsome taste.

2. *Bryonia alba vulgaris* fructu nigro. Common white Bryonie with blacke berries.

This Bryonie differeth from the former white kinde, neither in the running rough branches or in the leaves, or in any other thing from it, but in these two particulars: the berries hereof are blacke and not red, when they are through ripe, and the roote is of a pale yellow colour on the inside, and somewhat brownish on the outside.

3. *Bryonia Cretica* discoccos. Candie white Bryonie with double berries.

The white Bryonie of Candy, shooteth forth many long rough trayling branches, in the same manner like the former in all respects, with clasping tendrells winding it selfe upon any thing as the other doth; bearing broad leaves with such divisions therein, as it hath, but that they are somewhat smaller, greener, and striped with white lines thorough the middle, as likewise in the veynes that goe to the corners: the flowers likewise are somewhat greater than the former, of a pale whitish colour, standing every one, upon a little longer foote stalke, which give berries in their places, greene at the first, but red when they are ripe, and formed in a differing manner from the others; for standing semicircular upon the stalkes, they are joynted at the bottome, as if it were but

1. *Bryonia alba vulgaris*: White Bryonie.

6. *Bryonia Sylvestris* nigra. Common blacke Bryonie.

one berrie, but are parted at the toppes into two parts, wherein are contained two feedes, from whence rose the name: the roote is very long, but never growing to be bigger than a mans arme, of a browner colour on the outside, and not so white within as the common.

4. *Bryonia nigra Dioscoridis.* Blacke Bryonie with blacke fruite in clusters.

This blacke Bryonie sendeth forth many long greene branches, whereon are set diverse broad leaves, somewhat long pointed and not divided on the edges at all, of a sad or darke greene colour, having at the joynts with the leaves clasping tendrills, whereby it windeth it selfe about whatsoever it meeteth with, towards the toppes come forth likewise long bunches of whitish mossie flowers, which after ward turne into berryes, greene at the first, and blacke when they be ripe: the roote is somewhat great and blackish on the outside, but of a yellowish colour on the inside, full of a clammy moyst humour or juyce, that will cleave to your fingers.

5. *Bryonia nigra baccifera.* Blacke Bryonie with single red berries.

This kinde of Bryonie hath many long and square branches, more hard or woody than the last, winding themselves about every thing that standeth next unto them, but hath no claspers at all, the leaves are somewhat like unto the great white Bindeweede, of a shining colour, a little unevenly dented about the edges, and standing upon long foote stalkes: towards the toppes of the stalkes, at the joynts with the leaves, come forth white flowers, every one standing on a short stalke, which afterwards give single berries; greene at the first; and red when they are ripe, little lesse than Chertyes, wherein are contained foure or five somewhat large round and blacke feede: the roote is great thicke and long, somewhat like the last, and having such like clammy juyce within it as it hath.

6. *Bryonia nigra sylvestris, five Sigillum Sanctæ Mariæ.* Common blacke Bryonie or our Ladies signet.

This kinde of Bryonie hath also long trayling branches, without any clasping tendrills, (in all places that I have seene) whereby it might fasten and winde it selfe; the leaves are somewhat broad and like unto the leaves of the rough or prickly Bindeweede, ending in a sharpe point: the flowers come forth at the joynts upon long stalkes, many clustering together, in long thinne or sparled clusters, every one consisting of five small white leaves, and after they are fallen, there come in their places, small berries, red when they are ripe for the most part, or changing somewhat blackish, in some places by standing long: the roote is brownish on the outside, and white within, somewhat great if it grow in moyst grounds, but much smaller or whiter, in hard drye or stonie places, as *Dalechampsia* saith; of a little hot and sharpe taste.

7. *Bryonia alba Peruana five Mechoacan.* The Mechoacan of Peru.

The Mechoacan of Peru that hath grown in these parts, sendeth forth divers darke grayish long branches, winding themselves about Poales that are set for them, or any other things that are next unto them, whereon doe grow faire broad leaves, pointed at the ends, very like in forme, unto the leaves of the last recited Ladies seale, but of a darke greene colour, thinner and harder in handling, seeming so dry as though they had no juyce in them: the flowers are many, standing in long clusters, yet every one bigger than any of the former, (of a fullen yellow colour in the Indies as *Monardus* saith, and as large as an Orenge flower, with an umbone in the middle, which afterwards becommeth the fruite, and being ripe is as big as an hassell nut, divided by a thin skinne in the middle, in each side whereof lye two blacke feedes of the bignesse of pease) of a darke whitish colour in the warmer Countries of Europe, but not with us, yeelding berries and feede but not so large: the roote groweth to be as great as any Bryonie roote, being not bitter or loathsome to taste, as it is, but rather altogether without either taste or smell, having many circles in it, as may be discerned in the dry rootes, that come over to us, and may easily be brought into powder.

8. *Mechoacan sylvestris.* Wild Mechoacan.

This wild kind of Mechoacan is altogether like the other,

7. *Bryonia alba Peruana five Mechoacan.*
The Mechoacan of Peru.

both

Mechoacani radix.
The roote of Mechoacan:

both in manner of growing, with branches, leaves, flowers and rootes, but lesfer in every particular, and the roote (wherein is the chiefest difference) being sharpe and loathsome, procuring vomiting and troubling the stomacke, when it is taken, as much as any ordinary Bryonie can doe.

9. *Mechoacan nigricans* five *Italapium*. Blacke Mechoacan or Italap.

Although we have not scene this Italap grow with us, or have heard it to grow in any these parts of *Europe*, neither are assured that the plant thereof is of this family, more than by conjecture, and sight of the dried rootes, (brought unto us as a Merchandise and a purging roote) being somewhat like in vertue and in forme unto the smaller peeces of the former Mechoacan: yet I thought good to make mention of it in this place, among the rest of this kinde, both to let it be knowne to the world, and to excite some one or other to get the seede, or the greene roote, that by sight thereof growing fresh, we may know to what tribe or family it doth belong: It cometh to us in small thinne peeces, some greater some smaller, yet nothing so large as the greater, but rather as the smaller peeces of *Mechoacan*, of a brownish blacke colour, somewhat more solid, hard, compact, and gummie withall, for out of it will rise a black gum, being layd on a quick or burning coale, but not (same in any that I have scene or tried) and of no unpleasant taste; but sticking a little in the teeth when it is chewed.

The Place.

The first groweth on bankes or under hedges, throughout this whole Kingdome. The second groweth in some Countries of *Germany*, *Bohemia*, &c. where the former white doth not. The third groweth plentifully in *Candy*, from whence *Honorius Bellus* sent the seed thereof to *Clusius* and others. The fourth *Gerard* saith groweth in bushes and hedges, almost every where, but herein I am sure he is much mistaken, thinking that our ordinary blacke Bryonie is this of *Dioscorides* for I have neither found it my selfe in any place, nor understood of a certainty from others, that they have found any with blacke berries and a blacke roote; and I finde some good authours doe doubt, whether the right be to be found or no. The fifth *Bauhinus* saith was found in the woods by *Huningen* a village in *Germany*. The sixth is found wild in many places of our owne Countrie as well as in *Italy*: as *Matthioli* saith, or in *France* and *Germanie* as *Lobel* saith. The seventh as *Monardus* saith, groweth in the Province of *Mechoacan* 40 miles beyond *Mexico*, from whence it was first brought into *Spain*: but afterwards, both more plentifully, better conditioned and of more effect, was brought from the firme or maine land of *Nicaragua* and *Quito*. The eighth *Monardus* saith was brought from the promontory of *S. Helen*, which is on the same continent with *Nicaragua*. The last is likewise brought from a place in the *Indies*, called *Chelapa* or *Calapa*, from whence also it tooke the name.

The Time.

They doe all flower in the monthes of *July* and *August*, some earlier or later than others, as their originall is from colder or warmer countries, and their seede if they give any ripe with us, is perfect soone after.

The Names.

It is called in Greeke *αμνιά* & *μυκιά* *Vitis alba* & *Vitalba* sic dicta non quod sit vitis sed quod ei similis, as also *βρυονία* αβύω forte quod est pullulo, extollo, exalto, quod in vicinis frutices scandens se extollat atq; late pullulet: it is likewise called *ψιλοτριμ* quod ex ejus acinis coria depilari ac confici possunt, in Latine of some *Vitrella*, of others *Rosastrum*, of *Apuleius* *Apiafellum* & *Vva Taminia*, but of most *Vitis alba*, *Bryonia*, and *Bryonia alba*. The second is called *Bryonia nigra*, *Vitis nigra*, & *Vitis alba baccis nigris*, and onely distinguished from the first, by the colour of the fruite and roote, for that it is but one kind, differing by the nature of the climate where it groweth. The third is called *Bryonia Dicoctos* of *Honorius Bellus*, who as I sayd before, first sent it from *Candy*. *Bauhinus* calleth it *Bryonia Cretica maculata*. The fourth is called in Greeke *αμνιά* & *μυκιά*, in Latine *Vitis nigra*, (ita dicta ab acinis radiceque nigris, & quod vitis similitudinem habet) *Bryonia nigra* & *Vitis Chironia*, the true kinde of *Dioscorides*, whose branches having tendrels, whose leaves being Ivye like, the berries and roote blacke, is knowne to very few. The fifth is called by *Bauhinus* in his *Prodromus* *Bryonia syl. baccifera*, in his *Pinax*, *Bryonia levis* five *nigra baccifera*. The sixth is taken of most writers to be *Vitis nigra*, or *Bryonia nigra* of *Dioscorides*, as *Matthioli*, *Anguillara*, *Lacuna*, *Gesnar*, *Castor Durantes*, *Lugdunensis*, *Tabernmontanus*, and *Lobel*. *Dodonaeus* calleth it *Tamus* & *Vitis sylvestris*, but saith it differeth from that *Vitis sylvestris* that is called *Labrusca*, which differeth little from the true manured Vine; but that it groweth wild and beareth few or no grapes: Some as *Dodonaeus* call it *Vitis Taminia*, and the berries *Vva Taminia*, yet some would appropriate that name to the *Bryonia alba*: it is in most of the Apothecaries shoppes in *Italy*, *France*, and *Germanie* called *Sigillum Sanctae Marie* or *Beatae Marie*: Some likewise would have it to be the *Cyclaminus Cissanthemos* of *Dioscorides*, which it cannot be, for he saith the roote is unprofitable, which this is not, and others to be *Pliny* his *Salicistrum*; both which are more truly referred to the *Dulcamara* or *Solanum lignosum*. *Gerard* is much deceived in thinking *Cyclaminus altera Dioscoridis*, to be a kinde of *Cyclamen*. The seventh is called of most men *Mechoacan*, from the place where it grew, yet *Monardus* saith the Spaniards that used it, called it *Rhabarbarum* from the effects, and to distinguish it, called it *Mechoacanum Indicum*, & album *Rhabarbarum*, and *Rhabarbarum Mechoacanum*: *Bauhinus* saith it doth nearest resemble the *Bryonia sylvestris*, and therefore calleth it *Bryonia Mechoacana dicta*, *Dodonaeus* rather taketh it to be a kinde of *Scammonie* calling it *Scammonium Americanum* but not rightly. The eighth is called *Mechoacana sylvestris*, as a wild and worse kind of the former, and as *Monardus* saith, they that do once use it, will never use it againe, in regard of the violent paines and symptomes it doth procure, and therefore *Monardus* thought it to be rather a *Scammonie*, and is called of *Bauhinus* *Bryonia Mechoacana sylvestris*. The last is called *Italapium*, *Italap*, and *Gelapo*, in different places. *Bauhinus* calleth it *Bryonia Mechoacana nigricans*. The Arabians call the white English *Alsefera*, the Italians *Vite bianco* & *Zucca salvatica*, the Spaniards *Nuxa Blanca* *Bryonia* and *Norca blanca*, the French *Colewees* and *Fenardent*, the Germanes *Stickwurts* *Hunds raben* & *Teufels Kirsche*, the Dutch *Witte Bryonie*, and we in English *Bryonie*, *White Bryonie*, *White wild Vine*, and *Tetter berries*.

The Vertues.

The roote of the white *Bryonie* purgeeth the belly, with great violence, troubling the stomacke and hurting the liver, wherefore it is not rashly to be taken, but as *Mesues* adviseth, some spice is to be added to it, or some Masticke, Quinces or other such like astringent and strengthening thing. The first and tender shootes, as *Dioscorides* and *Galen* say, were used in their times to be eaten in the spring, both to purge the belly and to provoke urine, and is sayd to be also used in our times in other parts, but not in our countrie, who delight not in so bitter,

but

but in more pleasant sallets: By the strong purging quality of the roote, it may bee profitable for the diseases of the head, as the falling sicknesse, the distennesse and swimmings in the head and braine, by drawing away much flegme and rheumatick humors, oppressing those parts, as also the joynts and sinews, and is therefore good for palsies, convulsions, crampes, and litches in the sides: in purging the belly of waterish humors it is good also, as same say, against the dropisie, and in provoking Urine: it also clenseth the raines and kidneyes from gravell and the stone, by opening the obstructions of the spleene, and wasteth and consumeth the swellings & hardnes thereof. It clenseth the mother wonderfully, in helping those that are troubled, with the rising and suffocation thereof, by drinking once a weeke, of the wine wherein the roote was boyled, going to bed, and expelleth the dead childe, and afterbirth in those those that are delivered, but is not to be used by women with childe, for feare of abortion: it bringeth downe also their courses when they are stopped, by taking a dram of the roote in powder in wine, or sitting in the decoction of the rootes; it clenseth the chest of rotten flegme mightily, and therefore an Electuary made of the rootes and honey, doth wonderfully helpe them that have an old and strong cough, or that are ready to be strangled with flegme oppressing them, and that are troubled with shortnesse of breath: the same also is very good for them that are bruised inwardly, to helpe to expell the clotied or congealed blood, *Discozides* also saith that the roote being taken, helpeth those that are bitten with a viper or an adder; the *Facula* or white hardened juyce, is often used to be taken to the weight of two or three graines at the most, in wine or broth, for all the purposes of purging aforesayd. For outward applications, *Discozides* saith, that the leaves, fruite, and roote, by the sharpe quality that is in them, doe cleanse old and filthy sores, are good against all fretting and running cankers, gangrenes and retters, and therefore the berries usually called of the Country people, Tetter berries, are with good successe, and often experience applyed to them: the roote also clenseth the skinne wonderfully, from all blacke and blew spots, freckles, morpew, leproie, foule scarrs, or any other deformity of the skinne whatsoever, as also all running scabbes and maginiesse, either the powder of the dried roote, or the juyce thereof rudely taken, but especially the *facula*, or fine depurate and hardened white juyce, to be used at all times of the yeare. The distilled water of the rootes worketh the same effect, but more weakely; yet the water is often used to cleere the skinne from spots, &c, the roote being bruised and applyed of it selfe to any place, where the bones are broken, helpeth to draw them forth, as also splinters or thornes in the flesh: and being applyed with a little wine mixed therewith, it breaketh byles and helpeth whitlowes on the joynts: it is sayd that *Augustus Caesar*, was wont to wear it with bayes, made into a roule or garland, thereby to be secured from lightning. The rootes of the blacke Bryonie are of the same effect with the white, but much weaker in purging choleric and flegme and other humors, and provoking Urine, in helping the falling sicknesse, the palsey, the passions of the mother, and the other diseases before mentioned: it doth in some sort cleanse the skinne of spots and markes, but the white is both more used, and more effectually; the juyce hereof or the roote it selfe, boyled with wine, and honey, and drunke, and the roote also bruised and applyed with honey, to the Kings Evill, is very effectually to heale it, and all other kernels, knots, or hard swellings, either in or about the necke and throate especially; or in other parts: being applyed also in the same manner, to any place out of joynt, is good both to ease the paines, and to consolidate and strengthen the sinewes, that they be not easily againe put out of their place: it is often used also with good successe, being fresh, bruised and applyed to the shoulders or armes, that are full of paine and ach, as also to such hippos or hucklebones, as have the Sciatica, or paines therein: the leaves bruised with wine and layde upon the fore neckes of Oxen, that are wrung with the yooke helpeth them. *Matthiolus* saith, it was reported unto him, that the roote of our sixt Bryonie (which I say is called beyond Sea, *Sigillum Beate Marie*, our Ladies seale or signet, and which he thinketh to be the blacke Bryonie of *Discozides*) being roasted in the embers and eaten; is a powerfull medicine, to helpe forward the acts of Venerie, and addeth withall, that it excelleth all other medicines, taken for that purpose; which yet he saith he can hardly beleeeve; yet *Lobel* doth yerke him for that report. The *Mechocann* is a familiar medicine used of many, especially when we first had it, as all new things are, but now is much neglected, although it be the same, and worketh the same effects: it is given to all ages young and old, and to young children, yea women with childe without any harme or danger, as also at all times of the yeare, for being without any evill taste or smell, it may be the better taken of the most delicate, and tender stomacke, that doth loath all other medicines: it is most usually being made into powder taken in wine, or if any refuse that manner, the roote may be boyled either in a little broth, (as it was to Queene *Elizabeth* in her last sicknesse, without her consent or sence in the taste) or wine, and so taken: the dose whereof in powder, is from halfe a dramme to a whole dramme, or a dramme and a halfe or two drammes, as there is cause, respect being had to the age and strength of the patient: It purgeth cholericke and flegmaticke, yea grosse viscus and putride humors, whatsoever in the body, as also the yellow waterish humors of the dropisie, with much ease and facility: it clenseth also the liver and spleene, and like the true Rubarbe strengtheneth the stomacke, corroborating the inward parts, after purging and opening the obstructions of them, it helpeth also all diseases that come from them, as the dropisie: the Jaundise, &c. for it rectifieth the evill constitution of the Liver, by opening and dissolving the hardnesse thereof, as also of the spleene and stomacke, dissolveth also the windinesse and expelleth it; it taketh away also all old, or inveterate paines of the head, by cleansing the braine and the nerves, and purging those rheumaticke distillations, and humors that are in them; it helpeth also all paines whatsoever in the joynts, in particular or generally, as the joynt aches or gout, and those of the bladder and raines, in procuring one to make water; and the collicke also, by expelling the wind wonderfully; it helpeth the paines of the mother, by tempering the cold humour, and expelling the windinesse which are the causes thereof: it helpeth the shortnesse of breath, and the old cough: It is also available in the French disease, by taking it often as there is cause, and purging the old peccant humors, especially if the disease be not of any long continuance. It taketh away also the cause of old and long lingring agues, whether they be *tertian* or *quotidian* or other *intermittive* agues, caused by obstructions. The *Ialap* is in working and purging somewhat like unto the *Mechocann*, but exceedeth it, in working more strongly, and a little more churlishly upon both flegmaticke and watery humors, yet strengthening both the liver and stomacke: the manner to take it is, being made into powder, to drinke it in white wine fasting, yet some take it in the distilled water of *Cichotie* or *Borrag*, or else in broth made with cold herbes.

CHAP. XIII.

Ricinus sive Palma Christi. Palma Christi, or great Spurge.

BEcause there be many sorts of Spurges, and that this kinde of great Spurge doth much differ from all the other sorts, hereafter set forth, I thinke it fittest to ranke it in a chapter by it selfe before the other, as a capitaine to all the rest; for although the properties be conformable to the Spurges, yet so are not, either forme of leaves, flowers, or seede, of any of the foure or five sorts, I shall here shew you: Take this therefore as the first kinde.

1. *Ricinus sive Cataputia major vulgarior.* The more ordinary Palma Christi, or great Spurge.

This great Spurge, (which doth grow in the warme and hot contries, of *Europe* and *Asia* to be as great in the body as a man, and as tall as a reasonable great tree, and is used to be lopped every yeare, whose seede cannot be gathered without a ladder set thereto, and whose leafe falleth not away in the winter as *Bellonius* saith in the first booke of his observations, the 18 chapter) springeth up in our countrie, to be eight or neere sometimes tenne foote high, whose stemme will be hollowed as bigge almost as our ordinary canes, of a brownish colour, with an eye of blew hoarinesse upon it: the leaves that stand both upon the stemme, and upon the branches it sendeth forth, every one severally, on all sides upon long foote stalkes, are very broad, and divided into five or seaven or into more divisions (representing the hand of a man, with the fingers spread abroad) of a darke or deepe greene colour on the upper side, and whitish greene underneath; the flowers are many round buttons, shooting forth together, and stand all along upon a long stalke, at the toppes of the stem and branches, consisting of many pale yellow threads, which fall away without bearing any seede: but lower upon the stemme or maine stalkes; and sometimes also upon the branches, breake forth other heades, which are the seede upon long foote stalkes, being three square or three feedes joyned together, rough and as coloured on the outside, or outer shell, which opening it selfe, or being opened, there lyeth within it the seede, whose outward huske is discoloured, or as it were spotted and shaped like unto a ticke, which containeth within it, a pretty large, shining round somewhat long and flat seede, of a browne colour, having a white pulpe or kernell within it; of a fiery hot taste, burning the mouth and throat, of whomsoever shall taste it, but very unctuous or oylie; whereof an oyle is pressed, which is onely used for outward remedies, for as *Dioscorides* saith it is *cibus fadum*; but serveth to burne in lampes, in those hot countries, where it is naturall and plentifull, the roote consisteth of many long and great strings, and small fibres, which perisheth with us quickly, after it hath felt the first frosts, and must be new set every yeare by them will have it, but abideth in the warme countries, as I sayd in the beginning of the description many yeares.

1. *Ricinus sive Cataputia major vulgarior.*
The more ordinary Palma Christi or great Spurge.

4. *Ricinus Americanus & solum novellum.*
Palma Christi of America, and one of the first leaves.

2. *Ricinus*

2. *Ricinus major Africanus Syriacus vel Egyptianus.* Palma Christi of Syria, &c.

Camerarius in his *hortus medicus*, maketh mention of another sort whose seede was twice so bigge as the former, the colour whereof was not so pale or spotted, and came as he saith out of *Syria*. This is very probable to be that hot violent sort, that *Aldinus* in his *Farnesian garden* remembreth, being brought from *Egypt*, the halfe

4. *Fructus Ricini Americani.*
Palma Christi of America seede.

part of whose seede being taken by a strong young man of twenty yeares, mightily troubled with the headach, purged him very forcibly and eased his paines, but in that he chewed the seede in his mouth (and did not swallow it whole without chewing as it should have bene) it inflamed his throate and mouth of his stomacke so violently, that after he had endured an ague, intolerable thirst, and fainting of the spirits, nine dayes after the taking thereof he dyed, notwithstanding the care of three Physicians with all the remedies they could use. Of the seede being, set sprung up a plant greater than the former, whose leaves were larger more crumpled and redder in other things little differing.

3. *Minor.*

There is another kinde also but lesser in every part thereof, although it grow in the same ground, whose seede being ripe is evidently ob-

served to be much lesser: This is not remembred by any Authour that hath written thereof, before *Clusius* in the second booke of his *Exoticæ* and 21 chapter, and *Befferus* that set forth the Bishop of *Eystot* his garden, in a great large volume, whose seede that we first saw came from the *Bermudas*, where they made oyle thereof, and grew with us in that manner before expressed.

4. *Ricinus Americanus,* Palma Christi of America.

The *Palma Christi* of *America* differeth from the first, and second sort, not onely in the greatnesse, for as *Monardus* & *Aldinus* say it groweth to be a much greater tree, than any growing in *Spain*, whose first leaves were almost round, & bigger than the first, but those that follow are broad and torne on the edges, into sundry corners, in the seede there is some difference also, which although they be three alwayes joyned together, yet the outer huske is not rough or prickly, but smooth and of an ash-colour, the innermost seede it selfe, being somewhat like the other, but more blacke and not spotted at all, and is as oyle as the first, for thereof as I here, there is made good floré of oyle which serveth in the steede of oyle for any outward uses. *Clusius* remembreth a very small sort of this *Indian* kind, whose seede is the smallest of all other, even smaller than the former small kinde, which was brought from *America*.

The Place.

The first groweth in *Spain* as *Clusius* saith, to a great largenesse as is before sayd, and in *Candy* as *Bellonius* saith, the greater kind, whereof *Camerarius* maketh mention, groweth in *Syria*, & *Africa*, and as *Aldinus* saith in *Egypt*. The first lesser sort in *America*, and *Guinea* as *Clusius* saith, in the place before remembred. The great kind of *America*, *Monardus* saith groweth in *Gelisco* a province of new *Spain*, from whence an oyle made of the seede thereof is brought, of much use as you shall heare by and by: and the last and least of all other, was brought from *Brasil* as *Clusius* saith in the 25 chapter of his 2 booke of *Exoticæ* the ninth fruit.

The Time.

Those that grow with us flower not untill the beginning of *August*, and their seede doth seldomé come to perfect ripenesse in this Country.

The Names.

It is called by *Dioscorides* in Greeke *κικαν*, *Cici* & *Croton*, a *Crotonis* sive *ricini animalis similitudine*, quod refert semen. *Arias Montanus* in his Commentaries upon *Ionas*, saith that the hebrew word *Kikajon* (which is neere the Greeke *Kiki*) doth signifie this plant, although *S. Ierome* did translate the word to be *Hedera*, and our *English* bibles have it, a Gourd that was rayed up by God to shelter *Ionas* from the heate of the Sun. *Ionah* c. 4. of some *Pentadactylus*, by *Mesues Granum Regium*; *Cesalpinius* from the Italian name *Girasole* tooke it to be *Heliotropium Dioscoridis*, but in most commonly it is called *Ricinus* & *Palma Christi*, and in the Apothecaries shops *Cataputia major*, the oyle whereof is known to the most of them, by the name of *Oleum de Cherva*, yet it is also called *Oleum Cicinum*, as well as that oyle made of the *Indian* seed, brought from thence: In *Spain* they call the seede of the ordinary as well as the *Indian* sort, *Figo del inferno*, and thereafter some call it *Ficus infernalis*. The lesser kinde *Clusius* saith in the same place before mentioned is called *Eraway* by the *Indians*. The great *Indian* kinde, *Clusius* saith is called *Curcas* in *America*, and we to distinguish it from the former kind, do call it *Ricinus Americus*, or *Americanus*, *Palma Christi* of *America*. The *Arabians* call it *Cherva*, the *Italians* *Mirasole*, *Girasole*, & *Cataputia maggiore*, the *French* *Palma Christi*, the *Germanes* *Wunderbaum*, the *Dutch* *Molenkrut* and *Wonderboome*, and we in *English* *Palma Christi*, or great *Spurge*.

The Vertues.

The seede of *Palma Christi* is almost wholly used, and the leaves but seldomé, yet 30 feedes clenfed from the huskes, being bruised, and taken in drinke saith *Dioscorides* (but *Costans* in his Commentaries upon *Mesues* judgeth this to be a fault in the writers of the copy of *Dioscorides*, setting 30 for 3. and yet that is the utmost, according to the dose of those times as I have sayd diverse times before) doth purge choler and flegme, and draw water abundantly from the belly, provoking Urine also; which manner of purgings as *Dioscorides* himselfe confesseth, doth trouble the stomacke and overturne it mightily: yet with good advise it may be given to strong and able bodies, with Aniseed or Fennellseed, who are troubled with the dropie, joynt aches, the gout and sciatica, because it draweth water and flegme very strongly, from the more remote parts. *Durantes* adviseth some of the

seede to be boyled in the broth of an old cocke, for the same purposes: the oyle he saith of the seede is profitably put into glisters, to open obstructions, to ease the paines of the collicke and windinesse of the mother; *Clusius* saith he knew diuerse Emperickes give of the small seed, that came out of *America* in a small quantity as a purge in diuerse diseases, because by purging the body well, they found good successe, they held it as a secret of worth, which they kept to themselves. *Monardus* saith that the oyle of the *Indian* seede, (and other authors say the same, of the oyle of the former kinde) is found by dayly experience, to bee helpfull to many diseases, as well in the *Indies* as in *Spain*; for as he saith it helpeth all diseases proceeding of cold causes, it dissolvethe tumours and swellings, disperseth winde especially of the collicke and mother, if the places grieved be anointed therewith, and some few drops thereof also taken in a little chicken broth that is fat: it wonderfully helpeth the crampe, and convulsion of the sinewes, being gently rubbed on the places grieved, and thereby causeth the sinewes to be stretched forth, that were shrunk: by anointing the stomacke the belly or the left side, where the spleene lyeth, it easeth them of the obstructions in them: it killeth the wormes in children, if either you give a droppe or two thereof, inwardly in milke, or fat breath, or anoynt the lower part of the belly therewith, it taketh away also the hardnesse of the belly in children, that are apt thereto, or have wormes: the oyle also helpeth all scabs, or running sores of the head: dropped into the eares, cureth the deafenesse, and taketh away the paines and noyse therein: it mightily clenseth the skinne from all manner of spots, markes or blemishes therein, as also the deformities of scarres and of the pox: the greene leaves bruised and applyed of themselves, or else with barley meale, asswageth the inflammations as well as the swelling of the eyes, and the swellings also of womens breasts, after childing: being applyed likewise to womens breasts, they doe helpe to encrease milke in them: It hath bene formerly set downe by good authors, that *Palma Christi* planted in a garden, was a sure remedy against moales, to keepe them from working in the ground: but *Camerarius* disproveth that asseveration saying, that they will work in the same manner, although they be planted therein, yea or although the branches be thrust into their furrowes or trenches.

CHAP. XV.

Tithymalus sive *Lactaria*. Spurge or Milkewort.

Here are many other sorts of Spurge, that are remembered by diuerse authors, with whom there is much variation about the true names of diuerse of them: some of them are of the Sea, as particularly to be found thereabouts: others in the woods and mountaines properly belonging to them: some againe onely growing in gardens in these parts, and for the most part not well knowne elsewhere to be found, others also of the fields: they have also obtained sundry names according to their formes or natures, yet all of them Spurges or Milkeworts: for some sort is particularly called *Tithymalus*, some others *Lathyrus* or *Cataputia*, others againe *Esula* or *Pityusa*, and others *Peplus*, *Peplus* and *Chamaesyce*: and because they are all of them congeneres, that is of one family or kindred, and of one quality or property, which is to purge, I thinke it fittest to remember them all together, yet in severall chapters.

1. *Tithymalus paralius*. Sea Spurge. 1. *Tithymalus Paralius* sive *maritimus*. Sea Spurge.

The Sea Spurge riseth up with diuerse reddish woody stalkes a foote or halfe a yard high, set thicke with leaves, from the bottom to the toppe, which are small long and narrow, yet broadest in the middle, somewhat like unto the leaves of Line or Flax, but thick and whitish, full of a white milke if any part be broken, which is so hot, that being tasted, it burneth the mouth and throate intollerably; at the toppes of the stalkes stand many pale yellowish flowers, with two leaves under them compassing the stalke, as it is usuall to all the other sorts of Spurges, and containing them, after which come three square small heades, wherein is contained round discoloured seed: the roote is long and woody, abiding long, and so doe the leaves on the branches not falling away in winter.

2. *Tithymalus maritimus Venetus*. Sea Spurge of Venice.

This Sea Spurge hath longer or taller and thicker stalkes, somewhat hollow and reddish, branching forth into diuerse parts, beset with small long leaves, but somewhat larger, and more separate than the former, two alwayes standing together all along the branches like Licorice: the flowers are small, pendulous, and of a sad purplish colour, consisting of five small leaves a peece, like a small starre, without any round leaves under them as in the former, after which come such like heads and seed: the roote is great long and woody withall, sending forth new branches every yeare.

3. *Tithymalus maritimus Creticus spinosus*.

Thorny Sea Spurge of Candy.

The Thorny Sea Spurge of Candy, sendeth forth diuerse brownish round stalkes, whereon are set many whitish hoary leaves, being small thick and long, as plentifully yeelding a causticke or burning milke as any of the former: upon the branches stand diuerse thornes with the leaves, and likewise the ends of the stalkes and branches end in sharpe thornes; under which come forth the flowers, in some whitish, in others purplish like unto the last *Tithymalus* for the forme, and without any cups of leaves under them, which give small round seede like the former: the roote is not woody as the former but very fleshie, especially while it is young, and abiding many yeares.

4. *Tithymalus*

2. *Tithymalus maritimus* Venerus.
Sea Spurge of Venice.

3. *Tithymalus maritimus spinosus* Creticus.
Thornie Sea Spurge of Candy.

4. *Tithymalus linifolius* Paralis congener. Ballard Sea Spurge.

This Spurge, riseth up with brownish stalkes, having many narrow leaves growing thereon, like unto the first Sea Spurge, but somewhat larger and a little broader: the flowers feede and roote are not much differing from it.

The Place.

The first of these groweth by the sea side, as well in divers places of our owne Country, as beyond the Sea: The second groweth on the shores of the Adriatique sea in many places, and in the Island *Lio* that pertaineth to the *Venerians*. The third in *Candy* as *Honorius Bellus* saith. The last in *Franconia* or *Frankeland*, neere unto the banks of the river of *Mayne*.

The Time.

They flower in July for the most part, and their feede is ripe in August.

The Names.

Tithymalus in Greeke is so called as it is thought from *μαῖμα* & *μαῖδα* exitiosa, quia lacem ab uberibus exitiosum reddit, in Latine *Tithymalus* also and *Lactaria* or herba *Lactaria* of giving milke, which is common to all the rest of the Spurges. Some call it also *Lactuca marina* & *caprina*, both for giving milke as Lettice doth, and that Goates delight much to eate it. They are all in generall called Spurges in English, from the purging quality, and Milkewort likewise from the milke they yeeld, which as I sayd is common to all the sorts of them. The first of these is called almost by all writers *Tithymalus Paralis* or *maritimus*, agreeing with that of *Dioscorides* (which he sayd was called in his time *Tithymalus* and *Mecona*) in all points. The second *Anguillara* thinketh to be *Alypum* of *Dioscorides*; and *Pena* and *Lobel* say, that at *Venice* it is used as a kinde of *Pityusa* or *Esula* by the Physicians & Apothecaries there, whereupon they called it in their *Adversaria*, *Esulararia* & *Lio Veneratorum insula*. The third is remembered onely by *Bellus* in his third Epistle to *Clusius*, saying that in *Candy*, (because it is of the kindred of the *Tithymals*, giving abundance of milke, they call it *Galsitrida*, as differing from another of that name, which I have shewed you before, in the 22 chapter, of the former part, under the name of *Blattaria Cretica spinosa*, which *Clusius* called *Leucoium spinosum Creticum*, and was judged of others to be a *Verbascum spinosum*. The last is called by *Camerarius*, *Tithymalus linifolius Paralis cognatus*, and by *Bauhinus* in his *Pinax*, *Tithymalus maritima affinis linariae folio*; by *Tabernmontanus*, *Tithymalus amygdaloides angustifolius*.

The Vertues.

The first of these sea Spurges is not mentioned by any author either ancient or moderne to be used in Physicke; for the vehement and sharpe exulcerating quality thereof is such, and so great in purging exceeding other spurges, that it is not safe to use it inwardly, and outwardly applyed it doth burne the skinne, and therefore unless it bee to take away scarres, scabbes, or warts, or the like it is not used at all: onely *Galen* saith of it, that the milke thereof mixed with meale and cast into the water, astonisheth fish so much, that it maketh them to rise to the top

of the water. The second is as I sayd before used at Venice, by the Physitions and Apothecaries instead of *Eula* (I meane the rootes) in *Benedicta Laxativa*, purging pills and other medecines, because it purgeth forceably, and with great Violence, as *Tena* setteth it downe. The third is used in *Candy*, of the poorer sort as a strong purger, when they have occasion: but the last is not mentioned by those authors that have written of it, what forcible quality in purging it hath.

CHAP. XVI.

Tithymalus Characias. Wood Spurge.

F this kind of Spurge there are diverse sorts, which I entitle Wood Spurge as a difference to be knowne from others, although all of them doe not natrally grow in woods.

1. *Tithymalus Characias vulgaris*. English wood Spurge.

The English wood Spurge, hath diverse tough woody brownish red branches, two foote high or more, bare or naked of leaves, for a space next to the roote, and afterwards set up to the toppes, with many narrow and long leaves, yet broader than those of the Sea Spurge, and nothing so large as the next, somewhat smooth in handling, and without any dentes about the edges, turning reddish in the spring, and more in the sommer time: at the toppes of some of the stalkes, (for all of them doe seldome flower at once, and are very much branched) stand many yellow flowers, whose under cups, that is the two almost round leaves compassing the stalke, are yellow likewise; after which come small round heads, almost three square, standing up a little higher in those cups, than the flowers did upon little stalkes, every one by it selfe, wherein are contained small brownish round feede, the roote is long and somewhat woody, spreading well under ground, but not creeping.

2. *Tithymalus Characias Monspeliensium*. Great French Wood Spurge.

This kinde of Spurge is somewhat like unto the former, but groweth larger and bigger, having but one or two stalkes at one time standing upon the roote, which are reddish, bare of leaves at the bottomes of them, on the stalke that flowreth standeth harder and larger leaves than the former, which is divided at the toppe, into sundry small branches: whereon grow the flowers, standing in cuppes as the former doth, which are more yellow in some places, and more blackish in others, the feede and rootes are correspondent unto the other.

3. *Tithymalus Characias folio lanuginoso*. Hayrie or downie white wood Spurge.

This white wood Spurge, hath stalkes and leaves somewhat like unto the last, but that the stalkes doe never

1. 4. 5. *Tithymalus Characias*, *Serratatus* Monsp.

Characias angustifolius.

Wood Spurge. Great French wood Spurge. Narrow leaved Wood Spurge.

8. *Tithymalus Myrsinites incanus*.

Hoarie Myrtle Spurge.

turne red, but alwayes abide whitish, and are branched: the leaves also being almost as large, are whiter and softer in handling, with a kind of cotten or hairinesse on them, which maketh them to be the easilier knowne, by that difference: the flowers are of a paler yellow colour, not differing in feede or roote.

4. *Tithymalus Characias serratus Monspeliensum*. Dented Wood Spurge.

This wood Spurge riseth up with many greenish stalkes, 2 or 3 foote high, whereon are set small long thick fat Greene leaves, some what like unto the leaves of the largest Mirtle, but more pointed at the ends and a little dented about the edges, the stalkes are branched very much at the tops, that beare yellow flowers like unto the other, but smaller, whose feede differeth not from them. The roote is white and very long, nothing so hard or woody as the former, but as *Pena* saith having a more fleshy pith in the middle, and a more soft substance without, whose barke doth so neere resemble the *Turbith* of Alexandria, as no roote can doe more.

5. *Tithymalus Characias angustifolius*. Narrow leaved Wood Spurge:

This small Wood Spurge hath diverse weake branches, that stand not upright, but set thicke with leaves which are white long and narrow, much like unto the first wood Spurge, but nothing so great; the flowers feede and roote differ little from the other.

6. *Tithymalus lunato flore Columna*. Small wood Spurge with horned flowers.

This wood Spurge riseth up to no great height, with hairy stalkes, bare at the bottome, thicke set about the middle, with somewhat hairy leaves smaller and softer than the last, of a blewish Greene colour, and smaller upwards: the flowers stand in cuppes as the others doe, of a greenish yellow colour, consisting of foure leaves a peece, bowing outwards like unto an horne or halfe moone, joyning together at the backe of them, with yellow threads in the middle: the feede is like the other: the roote is very small in respect of the plant, and blacke on the outside.

7. *Tithymalus Myrsinites*. Mirtle Spurge.

This Spurge hath divers whitish branches, leaning downeward, not standing up right; whereon are somewhat thicke set without order, many smooth and whitish Greene leaves, small at the bottome, and larger in the middle, ending in a point somewhat small and sharpe; somewhat like for forme but not for hardnesse, unto the leaves of *Knee holme*, or *Butchers Broome*, the flowers are small and yellowish, not so many standing together as the other, else alike, as the feede and rootes are.

8. *Tithymalus Myrsinites incanus*. Hoary Mirtle Spurge.

This white or hoary Spurge hath many upright reddish stalkes, about a foote or more high, whereon are set without order, such like leaves as the last recited Mirtle Spurge, but a little larger, and of an hoary white colour and hairy withall: the flowers are yellow standing at the toppes of the stalkes like unto it, and the heads triangled bearing the like feede: the roote is small and differeth not much from the former.

9. *Tithymalus verrucosus Dalechampii*.

Wartlike Mirtle Spurge.

This kinde of Spurge hath small slender stalkes, halfe a yard high, divided into branches, whereon are set without order, small broad whitish Greene leaves, like unto small Mirtle leaves: the flowers are small and yellowish, after which come round heads, standing like small wartes, whereof it tooke the name, wherein are smaller feede, than any of the former: the roote is small and not long, with diverse sprays running from it.

10. *Tithymalus arboreus*. Tree Spurge.

The stemme of this tree spurge groweth up right, as bigge as a mans thumbe, from the bottome, and being there bare without leaves for almost halfe a foote, then shooteth forth diverse

10. *Tithymalus arboreus*. Tree Spurge.

branches,

branches, of a fingers thicknesse, whereon are set narrow long leaves, somewhat like unto the Sea Spurge, or rather the marsh Spurge, or great *Esula*, having larger yellow flowers and feedes, but like the other former sorts: the rootes are not so great and long as some of the former, yet sufficiently comprehending in the ground, to sustaine the whole plant, which *Lobel* compareth to a Myrtle tree, for the bignesse and fashion of growing but not to the leaves.

11. *Tithymalus latifolius Hispanicus*. Broad leaved Spanish Spurge.

This broad leaved Spurge springeth up sometimes, but with one stalke, halfe a yard high or more, and not branched, and sometimes with more, and spreading forth many branches, from the bottome up to the toppe: the leaves that stand on them, are large and long, of a fresh Greene colour round pointed, somewhat thicke or fat in handling: and like to the younger leaves of Woode, the flowers are of a purplish yellow colour, like in forme unto the others of this kinde, and standing in cuppes after the same manner: the roote is great thicke and white.

12. *Tithymalus palustris* five *Esula major Germanica*. Great Marsh Spurge.

This great Spurge (which is usually called *Esula major*, to distinguish it from other Spurges) riseth up with many great round reddish stalkes, whereon are somewhat thicke set, many long and somewhat broad Greene leaves, neither so broad or long as those of wood Spurge, else somewhat alike: the tops of the stalkes are furnished, with fewer and smaller yellow flowers, than so great a plant, would beare shew to have: some flowers breake forth also below the toppe, at the under joynts, standing upon their stalkes, three or foure together at the most: after wards come small round feede like unto the others, the roote is of a blackish colour on the outside, and white within, great thicke and spreading diverse wayes, the barke whereof is thicker and more fleshy than in any of the rest, and endureth the extremities of the winter, although the branches for the most part perish every autumn, and rise a new every spring.

13. *Tithymalus Helioscopius*. Sunne turning Spurge or Wartwort.

The Sunne Spurge or Sunne turning Spurge, hath for the most part but one reddish stalke, halfe a yard high, bare of leaves at the bottome almost half way upwards, and then spreading into two or three small branches, whereon grow sparsedly, diverse yellowish Greene leaves, smaller at the bottome, and broader at the ends, somewhat like unto Purslane leaves; the flowers are yellow like unto the rest, standing in hollow cups of two leaves a peece, the stalke running through them, as is to be seene in most of the others, the whole toppe or head of flowers is sayd to turne with the sunne, whereof it tooke the name, the feede is small but round and like the rest: the roote is small and threddy, perishing every yeere after feede time, and rising againe of it owne sowing.

14. *Esula dulcis Travi*. Sweete Spurge.

This sweete Spurge riseth up, but with one brownish stalke for the most part, not above a foote high, whereon grow not very many leaves, yet without order, which are somewhat long and narrow at the bottome, and broader to the middle, yet not sharpe but round pointed, and of a pale Greene colour, giving milke when they are broken, but not sharpe or hot, like all the rest:

11. *Tithymalus latifolius Hispanicus*.
Broad leaved Spanish Spurge.

12. *Esula major Germanica*.
Great Marsh Spurge.

The Place:
The first groweth most usually in woods, as

13. *Tithymalus Helioscopium*.
Sunne Spurge.

well in our Land as in *Germany*, *Hungary* and other places. The second at *Mompelier* and other places in *France*, as also in the Kingdom of *Valentia* in *Spain*, as *Clusius* saith. The third groweth likewise in *Spain* and *France*, as also in *Germany* and in *Switzerland*. The fourth *Lobel* and *Pena* say, groweth nowhere, but in the Country of *Narbone* or *Languedocke*, yet *Clusius* saith he found it in the kingdom of *Valentia* in *Spain*. The fifth is sayd by *Lobel* to grow in *Narbone*, and *Provence*, and not to be seene any where else but in gardens. The sixth *Columna* saith he found on the hills *Apprenses* in *Naples*. The seventh groweth as *Camerarius* saith, on certaine hills in *Italy*, but in these parts, chiefly in the gardens of the curious. The eighth was sent out of *Italy*. The ninth groweth in the dry sandy grounds, nigh unto *Lyons*, by the river *Rhodanus*. The tenth is found onely in the hot Countries of *Spain*, *Italy*, and *Narbone* in *France*, and is kept with great care and regard from the frosts of our cold winters. The eleventh was found by *Clusius* in *Spain*. The twelfth groweth in many places of *Germany*, and as *Lobel* saith in his observations, in a wood belonging to *M^r John Coltes*, nigh unto *Bath* very plentifully. The thirteenth groweth wilde with us in many and diverse places, as well as in other Countries. The last groweth as *Tragus* saith, in the moyst grounds upon some of the *Alpes* in *Switzerland*, and *Pena* and *Lobel* say in the gardens of the Low Countries, with them that are lovers of plants.

The Time.

All these flower in the Summer months of *June* and *July*, some earlier or later than others, and their seede is ripe soone after: the first *Myrtle* leaved *Spurge* is observed by *Camerarius* to abide the winter better, than some other, that come from hot Countries.

The Names.

The first is called in *Greece* *πύρρα* & *ζεορκίς* & *Tithymalus Characius* also in *Latine*, that is to say *Vallaris*, because it usually groweth in the low moyst places of the woods, or in trenches that have bene made to drayne the water, and is the first *Tithymalus Characius* of *Dodonæus*, and with *Lobel* *Tithymalus Characius Amigdaloides*, we call it in *English* *Wood Tithymall*, or *wood Spurge*, because it is more usually found in woods, than any where else. The second is called by *Lobel* and *Pena* *Tithymalus Characius Monsp.^{liensis}* & *Characius* simply by *Matthi*, *Lacuna*, *Lonicerus*, *Lugdunensis*, and *Tabermontanus*, by *Clusius* *Tithymalus Characius legitimus*, called also *ma* & *rounting ab ampla* & *patula coma* & *Amigdaloides a foliorum forma*, by *Dodonæus* *Tithymalus Characius alter*. The third *Clusius* waketh to be another sort of this second kind, but differing in the smoothnesse and woollinesse of the leaves. The fourth is called by *Lobel* *Tithymalus serratus Monspeliensum*, which is the fifth *Characius* by *Dodonæus*, and by *Clusius* called *Tithymalus Myrtilis Valentinus*, for he saith the true *Myrtilis* of *Dioscorides* is neither knowne in *Spain* nor in *France*. The fifth *Lobel* in his observations calleth *Myrsinites altera*, yet saith it better agreeth with a *Characius* or *Wood Spurge*, then *Mirtle Spurge*: it is the fourth *Characius* of *Dodonæus*, who saith they doe amisse, that call it *Myrsinites*; *Clusius* calleth it *Tithymalus Characius tertius Austriacus*: it is the third *Myrsinites angustifolius* of *Tabermontanus*, and by *Bauhinus* *Tithymalus Characius angustifolius*. The sixth *Fabius Columna* calleth *Tithymalus lunato flore*, from the likenesse of the flowers, and *Bauhinus* thereupon calleth it, *Tithymalus saluaticus lunato flore*, taking it to be the *Dendroides* of *Coræus* upon *Dioscorides* and the *Platophyllos* of *Anguilara*, but with no reason that I know, for it answereth unto neither as you may perceive by the description. The seventh is called *femina* by *Dioscorides*, and *Myrsinites* by *Matthiolum*, *Gesner*, *Camerarius*, *Dodonæus*, *Lobel* and others. The eighth *Bauhinus* calleth *Tithymalus incanus hirsutus*, and thinketh it may be the plant, that *Camerarius* calleth *Pityusa Anglica*, because *Doctor Pennye* sent it him; but because it hath leaves so like unto the former *Spurge* with *Mirtle* leaves, I have joyned it next thereunto. The ninth is called by *Dalechampsius* *Tithymalus verrucosus*, and by *Bauhinus* in his *Pinax*, *Tithymalus Myrsinites frutis verrucosus*, and saith *Guilandinus* was wont to call it *Alpium*. The tenth is called *Tithymalus Dendroides* by *Matthiolum*, *Gesner*, *Camerarius* and others. *Lobel* calleth it in his *Adversaria* and Observations, *Dendroides sive arboreus Myrsifolius*, *Myrtilis speciei non a foliis sed a frutice*, which as it seemeth made *Dodonæus* to account it a kind of *Characius*, and set it for his third of that kinde. The Eleventh is called *Platophyllos* of *Clusius*, who judgeth it to be the right or true *Platophyllos* of *Dioscorides*, and so all others since him, because there is not any of these *Spurges*, found to have so great and large leaves as this hath; although *Pena* and *Lobel* tooke the *Characius Monspeliensum* to be *Platophyllos* which afterwards changing their minds, they acknowledged this of *Clusius* to be the most probable. The twelfth is called *Esula major*, and *Esula major Germanica*, by *Tragus*, *Dodonæus*, *Lobel*, and *Lugdunensis*, and by *Bauhinus* in his *Pinax* *Tithymalus palustris fruticosus*. The thirteenth is generally by all writers, taken to be the true *Helioscopium*, that is *Solifragus* of *Dioscorides*, and by *Brunsfelsius* and *Tragus* called *Esula vulgaris*. The last is called by *Tragus* *Esula dulcis* for the reasons shewed in the description, whom diverse others since have followed: *Tragus* himselfe saith that many would referre it to *Miliaria* of *Plinie*, but this may bee plainly seene to be a kinde of *Tithymall*. *Camerarius* in his *hortus medicus*, nameth a kinde *Tithymalus arvensis annuus*, which hee saith is like

hseunto,

hereunto, but fuller of branches, and but an annual or yearly plant, and that it is not without sharpnesse, which *Bauhinus* referreth to the *Cyparissias* with spotted leaves, as is hereafter shewed in his *Pinax* he referreth hereunto also, the *Pityusa* sive *Esula minor floribus rubris* of *Lobel*, and calleth it *Tithymalus montanus non acris*, but I cannot so thinke, but take it to be a sort of the small *Esula*, as you shall finde it in the next chapter save one. The rootes of diverse of the Spurges, and of some other plants also, are taken by diverse writers, to be the *Turbith officinarum*, and of the ancients, as the *Myrsinites altera* of *Lobel*, being the fifth in this chapter, which he saith is taken of some to bee the true *Turbith*, that commeth from *Alexandria* into these Christian parts of the world: of the *Characias Monspeliensum*, *Lobel* saith in the same place againe, that the rootes be the most like unto the true *Turbith* if any be like it. The *Esula rara Venetorum* set forth in the last Chapter, is also called by some, *Turbith nigrum* of *Albanius*: but all the best writers say, that the small common *Esula*, is the true *Turbith nigrum* of *Albanius*; whom *Mesues*, *Rhasis* and *Avicen* follow, the roote of *Alypum Narbonensium*, or herbe *terribilis*, is likewise called *Turpetum album* by the same *Albanius*, in diverse places of his booke, *de methodo medendi*. *Mesues* againe saith that *Turbith* is the roote of an herbe that giveth milke, whose leaves are like unto *Thapsia* or *Ferula*, Fennell giant, and there upon diverse have taken the rootes of *Thapsia* to be true *Turbith*. *Serapio* taketh the roote of *Tripolium* or Sea Starwort, to be the true *Turbith*; and lastly the roote of *Scammonee* is taken of some, to come nearest the true *Turbith*, as hath beene shewed in the chapter of *Scammonee* here before. *Matthioli* saith that all the sorts of *Tithymall*, were indifferently taken and used for *Esula* by Physicians and Apothecaries in his time: but assuredly the *Turbith officinarum*, which is most likely to be the same of the ancients, is not the roote of any of the *Tithymalls*, or Spurges, because all of them are hot and sharpe, whether fresh or dried, and the true *Turbith* is almost insipid, and because they being dry break short, without any of those long threads that are in the true *Turbith*: neither can it be *Alypum* or *Esula*; for they are hot likewise: It cannot be the roote of *Thapsia*, which besides the heate and sharpnesse is too white also, and the roote of the true *Turbith* is somewhat blackish on the outside and not so white within as *Thapsia* is. That *Tripolium* cannot be it, *Dioscorides* and *Galen* declare sufficiently, who say it is sharpe in taste, and hot in the third degree, which qualities are not to be found in *Turbith*. Lastly, that *Turbith* should be the roote of *Scammonee*, I cannot thinke, because they doe quickly grow greater than the rootes of *Turbith*, are ever seene to be. The *Arabians* call *Tithymall Xanxer* & *Ethutia*, *Mesues* *Saebran* & *Alfecbran*, the *Italians* *Titimale* & *Tortumaglio*, the *Spaniards* *Leche nerfa* & *Leche tregna*, the *French* *Herbe au lait*, the *Germanes* *Wolffs milke*, the *Dutch* *Wolfs milch*, and we in *English* *Milkewort* or *Spurge* in generall, and particularly *Sea Spurge*, *Wood Spurge*, &c. as is extant in the titles.

The Vertues.

All these Spurges except the last, are heating and exulcerating the skinn, if they be outwardly applied, and are vehement and exoriating purgers taken inwardly, without great care and caution: for as *Mesues* saith in his booke of purging Herbes, they are all offensive to the heart, liver, and stomacke, they breake the veines, shave the guts, and heate the whole body so much that thereupon they raise fevers many times: the first ill qualities therefore he saith are taken away if those things be put thereto in the taking, that doe strengthen the heart, liver, and stomacke. The second and third are taken away, by putting thereto such things as have a glutinous quality, and such are *gum Tragacant*, *Bdellium*, and the mucilage or expression of the seedes of *Fleaworte* and *Purslaine*. The fourth evill quality is taken away, by mixing cold and moist things with it, and such are the juices of *Sowthistle*, *Endive*, *Purslaine*, *Nightshade*, or the seedes of *Quinces* well beaten with *Vinegar*. These *Tithymalls* or Spurges doe purge with great violence, both upwardly vomits, and downward by the stooles, stigmatike humors, both from the stomacke, and from the joynts, as also blacke choller, melancholy, and the dropsie, but they waite and macerate the body, and consume generation: 3 or 4 dropes of the milke taken fresh is often put into a dry figge, which is taken by strong Country people, to purge them; but it requireth some caution in gathering of the milke, that they stand with their backs, and not their faces to the winde, and especially that they touch not their face or eyes with their hands. The milkie juyce of them is the strongest worker; the seedes and leaves are next in quality thereto, and the rootes of most are of the same operation, but not so strong: yet they being boyled in *Vinegar* helpe the toothach, especially if they be hollow, and the milke put into them, so as it touch not any of the other teeth or gummies, doth worke more effectually and speedily; the same milke layd also upon any hairy place, taketh away the haire; but it is necessary that it lye not long at a time, & that the places be anointed with oyle of roses, and *Nightshade* quickly after: the same also taketh away callous knots, and all other callous or hard kernels, or cornes of the feete, or other parts of the body, if they be first pared to the quick, and some thereof dropped on or layd to: the same also boyled in some oyle of bitter *Almonds*, clenseth the skinn of the markes or scarres that come of sores, as also other deformities and discolouring of the skinn, and the scabbes and scurfes of the head: The *Myrtle leaved Spurge* is effectually in all these diseases, excepting vomiting where in it is weaker. The rest are all of a like quality, but the *Helioscopium* is the weakest; yet the leaves of the greater sorts in generall, although some attribute it to the broad leaved *Spurge* onely, cast into the water, causeth the fish therein, to rise up to the toppe thereof, which lying thereon as halfe dead for a while, may be easily taken with ones hand or otherwise. A lye made of the ashes of them, and the ashes themselves also, are answerable to the same effects before set downe in many things. The sweete *Spurge* as *Tragus* saith doth strongly provoke vomits, if the roote thereof be taken inwardly. The outer bark of the roote, being steeped a day and a night in *Vinegar*, and then taken forth dried and powdered, halfe a dramme of that powder taken in wine or honnyed water, doth purge all waterish humors downewards, as also choller, and is very profitably given to those that have the dropsie, the roote also wonderfully sodereth and healeth all manner of greene wounds. *Tragus* also sheweth the manner of making certaine pills, that are very effectual for the dropsie, and those that are short-winded, which may be taken as he saith without either paine or danger. Take of the rootes of *Esula* prepared as aforesayd halfe an ounce, of *aloes* one ounce, of *Masticke* one dramme, these being beaten into powder each by it selfe, are to be made up with *Fennell water* into great or small pills.

CHAP. XVII.

Lathyrus five Cataputia minor. Garden Spurge.

Nto these greater Spurges I must adjoyne this other kinde of Spurge, which by all authors both before and since *Galens* time, was accounted to be neereſt unto them, and yet differing from them, and therefore fittelt to be expreſſed in a Chapter by it ſelfe: yet hereof there are two or three ſorts obſerved, one greater than another, as ſhall be preſently ſhewed.

1. *Lathyrus major hortensis.* The greater garden Spurge.

The greater of theſe garden Spurges riſeth up, but with one hollow ſtraight whitith ſtalke, as big as a finger, ſhaddowed as it were over with browne, on which grow up to the toppe, for the firſt yeare, many thicke fat long and ſomewhat narrow leaves, of a blewiſh Greene colour on the upperſide, and more whitith underneath, ſomewhat like unto Willow leaves for the forme, yeelding milke as plentifull as any of the reſt: the next yeare after, it divideth it ſelfe, into many ſmall branches, with ſmaller leaves at every partition, every part thereof yeelding milke, as the others doe: the flowers are of a pale yellow colour, and ſtand in cups like the former ſorts, but are ſmaller than many of them, yeelding ſweete, and nothing ſo hot and burning feede, in three ſquare heads, ſomewhat like unto thoſe of *Palma Chriſti*, but round and bigger, than any of the former Tithymalls or Spurges, which in the hot Sunne will cracke and leape out of the huſkes: the roote is long and wooddy, perishing as ſoone as it hath given feede, and ſpringeth againe of it owne feede, that is ſuffered to fall.

2. *Lathyrus major vulgaris five Cataputia minor.*
Ordinary garden Spurge.

2. *Lathyrus minor.* The leſſer garden Spurge.

The leſſer kinde of garden Spurge is ſo like unto the former, that I ſhall neede but onely to tell you, that it is the very ſame, but leſſer in every part thereof; for whoſoever hath ſeene the greater ſort, will preſently ſay when they ſee this, it is the ſame, but a leſſer kinde, and ſo much I hope will ſatiſſie to declare and diſtinguiſh theſe two ſorts.

3. *Lathyrus minima.* The leaſt garden Spurge.

This ſmall garden Spurge hath many ſlender branches, lying upon the ground, ſet full of ſmall leaves, no bigger than thoſe of Knotgraffe, among which riſeth up a ſtalke, about a foote high, with ſuch like leaves on it as grew below: at the toppe whereof ſtand many ſmall yellow flowers, cluſtering thicke together on their ſmall foote ſtalke, but not ſpread abroad like unto the former ſorts: this yeeldeth milke as the others doe: the roote is ſmall, ſpreading many ſmall ſtrings, with fibres at them.

The Place.

They all grow in ſome places wilde, about the borders of fields, but moſt uſually in gardens, where, when they are once planted they will hardly be rid out againe.

The Time.

They flower in July, and the feede is ripe in Auguſt.

The Names.

They are called in Greeke *λάρβεος* *Lathyris*, quia congenerem *Tithymalo* quidem, ſed efficiacorem & magis viroſum ſignaret: in Latine *Cataputia minor*, for as is before layd, the *Ricinus* or *Palma Chriſti* feede, is called *Cataputia major*, and it is likly it was ſo called quia ſemen fert ſeu pilulus ſive cataputia, & in Engliſh garden Spurge, that they may differ from all others. The firſt and ſecond are generally by all writers called, either *Lathyrus* or *Cataputia minor*. The laſt is called by *Lugdunensis* *Lathyrus minor Dalechampi*, and *Bauhinus* thereupon *Lathyrus minor conglomerato flore*, and it is likly alſo to be the ſame that *Ceſalpinus* calleth *Cataputia puſilla*; The *Arabians* call it *Mandana* and *Mahena*; the *Italians* *Cataputia*, *Lathyrus* and *Cataputia minor*, the *Spaniards* *Tarago*, the *French* *Eſſpurge*, the *Germanes* *Springkraut*, *Springkorn* and *Treibkorn*; the *Dutch* *Springkruid* & *Spurgie*; and we in Engliſh, *Spurge* and garden *Spurge*.

The Vertues.

The feede of this Spurge, is for the moſt part onely in uſe with us, whereof 5 or 7 or 9 or 10 graines, at the moſt are taken at a time, to purge both by ſtoole and vomit, tough flegme, choller, melancholy, and water, as *Dioſcorides* ſaith: the uſuall manner is to ſwallow the feedes whole, without breaking either huſke or kernell and then they worke the more gently and weakely, but if the huſkes be broken, and the kernels ſwallowed whole or chewed, or bruſed and mixed with drinke or broth, they will then worke more violently, and therefore to be taken with the more caution: the milke is more violent, even as the former Tithymalls or Spurges are to be taken inwardly but outwardly applied and carefully, it helpeth to take away haire on the eye-browes, forehead or temples, for it muſt not touch any other part of the face or ſkinne; the ſame alſo cauſelouſly applied, taketh away the prond and dead fleſh in wounds, hard callous knobs, cornes or warts in the fleſh, (if they be firſt pared to the quicke and then applied) running ſcabs and ſores, and the blemiſhes ſcarres and ſpots of the ſkinne: it is put alſo into hollow teeth to take away the paine, but you muſt beware that it touch no other of the teeth or gummes, or other part of the mouth: the milke made up into *Trochiſces*, or little balls, with the meale of beanes or peafe, and kept dry, doth ſerve all the yeare to uſe, as occaſion is offered, for the purpoſes aforeſayd, the diſtilled water of the whole plant, is of eſpeciall uſe, to clenſe the ſkinne from freckles, morpew, or any other diſcolourings, either of it ſelfe, or mixed with the water of beane flowers, and baſtard Diſtancie, and being gently

gently bathed on the places troubled with the itch, taketh it away in a very short space: the same simple water also clenseth foule vicers and sores. The leaves being boyled in fat broth, worketh to some purposes more safely, though more weakly. It is held by many good authors, to be effectual for all the purposes, the greater Spurge or *Palma Christi* is applied unto.

CHAP. XVIII.

Tithymali sive Esula minores. The smaller Spurges.

AVING shewed you all the sorts of the greater Spurges, there remaine diverse other small kinds, which I will comprehend in this chapter, that so I may accomplish, and set forth the whole family of them together.

1. *Pityusa, Tithymalus Pineæ sive Esula minor.* Pine Spurge or small *Esula*.
This small Spurge hath diverse weake and slender stalkes, halfe a yard long, whereon grow many small long and narrow pointed leaves, without order round about them, very like unto the leaves of Tode-flaxe: at the toppes of the stalkes grow yellow flowers, sometimes dasht over with purple, like the former Spurges but lesler, and standing in the like cuppes, which falling away, the feede groweth in small three square huskes, wherein is contained small round feede: the roote is small and long, of the bignesse of ones finger, somewhat blackish on the outside, but white within, and abiding many yeares, yet the extremities of the winter, doe sometimes rot it and cause it to perish: both milke, roote and feede, are somewhat like in heate and sharpnesse unto the garden Spurges, but not altogether so violent: the roote of this *Esula* is accounted of the most skillfull, to be the truest *Esula minor*; and the extract out of the roote hereof, rightly prepared and called *Extractum Esula*.

2. *Pityusa sive Esula minor floribus rubris.* Small Spurge with red flowers.
There is another of this kinde growing a foote high with such like leaves thereon, whose flowers are reddish standing in the like cuppes, that the other Spurges doe.

3. *Tithymalus Cyparissias vulgaris.* Common Cypress Spurge or Wellcome to our house.
The Cypress Spurge is so like unto the first described, that it deceiveth many, that doe not marke them precisely; for this hath also diverse slender brownish stalkes, whereon grow small narrow leaves, yet somewhat shorter and thicker than the former, and thicker set upon the stalkes also: the flowers and feede are like the other, and so is the roote also, whereupon diverse have mistaken it, and take it for the true *Esula minor*, and so have used it in stead thereof.

1. *Tithymalus Pineæ.* Pine Spurge.

2. *Esula minor altera papaveris floribus.*
Small Spurge with red flowers.

3. *Tithymalus Cyparissias vulgaris*.
Cypresse Spurge or welcome to our house.

5. *Tithymalus Leptophyllus*.
Small annuall Spurge.

4. *Tithymalus Cyparissias maculatis foliis*. Cypresse Spurge with spotted leaves.

This other Cypresse Spurge, differeth not much from the former having smooth round reddish stalkes, two foote high at the least, the tops whereof doe a little bend downewards; the leaves are fat and long like unto the former, but standing more together at spaces, which are Greene on the upper side, and more yellowish underneath, thicke set with deepe yellow spots almost red, which are eminent at their first springing: the flowers likewise are of a little deeper colour, tending to a red or purple: the roote is smaller than those of the former, and more parted into sprays or branches, with many fibres at them, of a brownish red colour on the outside, and pale within, not abiding as the other doth after seeding time.

There is another of this kinde lesser in all parts thereof, else not differing from it.

5. *Tithymalus Leptophyllus*. Small annuall Spurge.

This annuall small Spurge hath many slender weake stalkes, bushing forth into many branches, and spreading farre upon the ground, whereon grow very small long and narrow leaves, standing upright, the uppermost whereof are somewhat broad at the bottome, and compasse the stalkes, ending in a long sharpe point or end: the flowers are yellow, like unto the other and very small, after which come three square heads, but very small, wherein is contained very small round grayish feede, not much bigger than poppy feede: the roote is small long hard and woody, perishing every yeare as soone as it hath given feede.

6. *Esula rotunda sive Peplus*. Round headed Spurge, or Vineyard Spurge.

This Spurge shooteth forth round about the roote many small weake reddish upright branches with small leaves set by couples for the most part, somewhat like the leaves of Sun-turning Spurge, but rounder pointed and smaller, of a grayish Greene colour on the upper side, and a little reddish or purplish underneath, oftentimes which will change to be wholly purple, in the Sommer time: the flowers are very small and yellow standing more round, or close together, as it were in an umbell, otherwise like unto the rest: and so is the feede also very small, contained in three square heads: the roote is small and long, with many small strings and fibres at it, perishing also every yeare, and rising againe of it owne sowing.

7. *Peplus*. Small purple Sea Spurge.

This small purple Sea Spurge, spreadeth his small purplish branches upon the ground more plentifull than the other, and somewhat lesser; whereon doe grow many small leaves like the other, but not so round at the ends; and purplish likewise both underneath and above oftentimes, especially in the beginning of the heate of the yeare: the flowers are small and yellow like the other, and so is the feede, but somewhat bigger and standing two together for the most part, not onely upon the toppes, but here and there upon the branches also: the roote is small and slender and of no use.

8. *Chamaesce*. Petty Spurge or time Spurge.

The petty Spurge is one of the smallest Spurges that is, having very small slender branches, lying upon the ground, divided oftentimes into other smaller, with smal pale green leaves set thereon, smaller than those of Tyme,

Minor

6. *Efula rotunda* five *Peplus*.
Round headed Spurge.

7. *Peplus*. Small purple Sea Spurge.

or as *Penâ* compareth them unto Rupturè wort : the flowers are the smallest and so is the feede of all the rest : set in heads by couples like the last : the roote is small and long, consisting of nothing but threds, and is of no use.

9. *Efula exigua foliis obtusis*. Petty Spurge with broad pointed leaves.

This Petty Spurge like wife groweth close upon the ground, the small round branches not exceeding an hand breadth in length, with small long and narrow leaves, broad at the points or ends, as if they had beene cut off, set without order on them, yielding milke as the others doe : the flowers and feede is like the last, and so is the roote also.

10. *Tithymalus exiguus saxatilis*. Rocky pettie Spurge.

This is the smallest Spurge of all the rest, the small branches not extending two or three inches in length, with the smallest and narrowest leaves of any set thereon : the flowers are small and somewhat reddish : the feede is agreeable to the plant, and the roote as small as threds.

11. *Apios* five *Tithymalus tuberosus*. Tuberous or knobbed Spurge.

Tuberous or Knobbed Spurge, hath diverse small reddish branches, lying upon the ground, with many small leaves, somewhat like unto those of *Saint Johns* wort set thereon without order, every one having the middle ribbe white therein : some of those beare a few small flowers at the toppes of them like unto the other Spurges, and feede likewise in three square heads : the roote is tuberous in his naturall place, blackish without white within, and formed somewhat like a peare or figge, from whence the name thereof rose : but a little differing in our climate, not keeping so proportionable a figure as it hath come over to us, even as the blacke Raddish hath done likewise : and therefore we may thereby plainly perceive the nature of the foyle doth alter much the forme of rootes, and leaves also in many things.

12. *Apios* five *Tithymalus tuberosus, oblonga radice*. Long rooted Tuberous Spurge.

This other Tuberous Spurge, the figure whereof *Clusius* had sent him from *Plauen*, is so like the former, that I verily beleeve (as I sayd before of the former) the foyle and climate was the cause of the alteration therein, yet briefly to shew you what he saith thereof, is this, it hath five or sixe branches rising from the roote lying upon the ground, somewhat reddish towards the bottome of them, divided into other smaller branches : the greene leaves, that are set thereon by couples on both sides are small like the other, but a little rounder : the flowers that grow at the toppes are of a yellowish red colour, after which come three square heads somewhat rugged or set with knobbes, wherein is contained small round feede, like unto the other, the roote is long and round, having many other small and long thicke rootes, issuing from the lower end thereof, with many small fibres thereat, blackish on the outside and white within, like the former.

13. *Tithymalus tuberosus Germanicus*. Knobbed Spurge of Germany.

The knobbed spurge of Germany, differeth from the former two sorts of *Apios*, first in the rootes which consist of many reddish knobs, set together with diverse long fibres among them, like unto the rootes of *Scrophularia*, or great Figgewort : the branches are small and tender, whereon grow the leaves which are small and narrow.

8. *Chamaejas*.
Petty Spurge or Tyme Spurge.

10. *Apios* seu *Tithymalus tuberosus*. 11. *Ischus* seu *Apios oblonga radice*.
Knobbed Spurge. Long rooted tuberous Spurge.

row, somewhat like unto the leaves of *Mesereon* but smaller: the flowers are yellow, and the seede small and round, growing in three square heads, like unto the other sorts of Spurges.

The Place.

The first and third sorts, grow in some places of *Germanie* and *France*, both by the Rivers side: and borders of fields, but no where naturall in *England* that I can heare, but in the gardens of those that are lovers of plants; the third is oftentimes found in the Country gardens of poore folks in many places with us. The second is found in some *Herbarists* gardens in the low Countries; *Ioannes Thalius* remembreth the two sorts of the fourth kinde, which hee found in cragged stonie places, lying open to the sunne, and in the borders of some fields, that were dry in *Saxonic neere Turin* in *Germanie*. The fifth also is found in the fields in the same places of *Germany*, that the last are; but neerer the villages. The sixth groweth in the Vineyards of *France* in diverse places, as also in ditches and borders of fields there. The seventh groweth neere the Sea side in *Narbone* and about *Marsailles*. The eighth groweth about *Mompelier*, in the dry sandy Vineyards and Olive grounds, neere the Sea also. The Ninth and Tenth, grow about *Mompelier* and *Marsailles*, as also *Padoa* as *Bauhinus* saith. The eleventh groweth on Mount *Athos* as *Bellonius* reporteth, in *Apulia* and the Kingdome of *Naples*, as *Ferrantes Imperator* affirmeth, who sent some of the rootes thereof unto *Clusius*, in *Candy* also and diverse other the warmer Countries, but they are all nursed up onely with us in the gardens of those that are curious. The twelfth is not exprest where it is naturall. The last is remembred by *Camerarius*, who saith it was found in certaine woods about *Lyphik* in *Germanie*.

The Time.

They doe all flower in the Sommer Months of *June*, *July*, and *August*, some earlier and some later than others; but the third kinde is often found in flower in *May*.

The Names.

Pityusa is called in Greeke *Πύρρα*, in Latine and in shoppes *Esula*, or *Esula minor*, because there is a greater as hath beene shewed before; it seemeth to have taken the name from *Pityusa*, being derived thereof; and made diminutive, as if it were *Pityusula*, and short *Ysula* or *Esula*, as a small *Pityusa* or Pine Spurge. The first is taken to be the *Pityusa* of *Dioscorides*, and called *Esula minor* generally in most Countries, although the seede answer not to the description of *Dioscorides*; yet is often confounded with the third, which is called *Cyparissias* by most authors, and therefore *Tabernmontanus* maketh the first to be his second *Tithymalus Cupressinus*: that the roote hereof is taken by *Alduarinus* and others for *Turbitib*, I have shewed before. *Nicolaus Myrepsicus* in some medecines and purging pills, doth appoint to be put thereinto *Esula*, by the name of *Chamaepitys*: whereupon *Fuchsius* thinketh, that *Nicolaus* his *Chamaepitys*, is the ordinary ground Pine and not any kind of *Tithymall*, being deceived by the *Etimologie* and double sense of the word: for *Chamaepitys* signifieth a low Pine, which *Pityusa* doth also: but *Chamaepitys* doth resemble a Pine, as wel in the refinous smel, as in the forme of the leaves, which *Pityusa* doth not; and also that *Pityusa* is a strong purger, fit for such medecines, and pills, as *Nicolaus* appointeth it an ingredient, and therefore by *Chamaepitys* there he only meaneth that *Esula* with Pine tree leaves. The second is by *Lobel* in his observations set forth under the same title, is here exprest, and I have adjoynd unto the first as most likely to be a species thereof, rather than of the *Esula dulcis* *Tragi*, as I have shewd you in the next chapter save one before this; as *Bauhinus* would make it. The fourth *Bauhinus* referreth as I sayd before to *Camerarius* his *Tithymalus arvensis*, and to that which *Ioannes Thalius* in his *Hercynia Saxanoburgica* calleth *Γαζαριον*. *Bauhinus* in his *Pinax* calleth it *Tithymalus Cyparissias foliis punctis croceis notatis*. The fifth is *Matthiolus* his *Leptophyllos*, whom *Camerarius* and *Thalius* doe follow. It is *Tragus* his *Esula exigua*, and *Peplis minor* of *Dalechamps*. The sixth is called

called *πικραλίς*, *Peplus* & *Syce*, and *μικρὴν ἀνδροῦς* *Mecon aphrodes* as *Dioscorides* saith, in Latine *Efula rotunda*, from the forme as well of the branches, growing up round about the rootes, and the umbell of flowers which are round, which names hold withall writers. The seventh is called *πικρία καὶ πικρία*, *Peplus* & *Peplion*, of the red colour of the leaves, and *ἀνδροῦς* *Andrachne agria*, i. *Portulaca sylvestris*, of the face and forme of the whole plant: it hath no other Latine name than *Peplus*, yet *Bauhinus* calleth it *Peplus maritima folio obtuso*, and *Cesalpinius* *Peplium*, and is *Dalechampius* his *Peplion*. The eight is called *Χαμαίη*, *quasi humilis vel terrestris* ficus generally of all writers. The ninth and tenth *Bauhinus* onely remembreth, and giveth the names as they are in the titles. The eleventh is called *Ἀπῖος* of *Dioscorides*, and *Ἰσχυά* of *Theophrastus*, from the forme of the roote, which is like unto a pear or figge; in Latine *Tithymalus tuberosus*, by which names either the one or the other, all writers call them; but there is an error in *Fuchsius* and *Tragus*, in mistaking a small wilde kind of Vetch, with small tuberos or clogge rootes, growing in woods and fields to be *Apios*, which *Matthaeus* ti crepon calleth *Pistacopios*, and is the plant that *Gerard* doth call in *English* Pease Earth Nut, in Latine *terra glandes*, and of *Tabernmontanus* and others *Chamaelarius*: *Turner* also is in another error supposing the *Bulbocoffanum* or *Nocula terrestris* to be *Dioscorides* his *Apios*. The twelfth *Clausius* saith he had the figure onely sent him from *Placentia*, and thereupon calleth it *Ischas altera*. *Bauhinus* translating the name to *Tithymalus oblonga radice*, and I to *Apios* sive *Tithymalus tuberosus oblonga radice*, but I verily thinke it to be, but a luxurious kind of the former *Apios*. The last *Camerarius* onely hath made mention of in his *Hortus Medicus*, and calleth it *Tithymalus tuberosus alter*, and *Bauhinus* *Tithymalus tuberosus Germanicus*, as it is in the titles.

The Vertues.

All these spurge are of the nature of the former, yet some more, some lesse violent in purging, and conducing better to some speciall diseases, as you shall heare in particular. The first *Pityusa* which is accounted the truest *Efulaminor*, (although the *Cyparissus* be taken of many for the same, and is used but with lesse successe, yet nearest thereunto) is accounted of force to heale the bitings or stings of venomous serpents: it purgeth strongly downewards both choller and flegme, and taketh away the hardnesse and paines of the belly, and swellings of the breasts: the feede and roote prepared helpeth the dropsie, being carefully and with good advise taken: the leaves (steeped a while in vinegar, and afterwards dried and made into powder, which is the preparation of them) may be given to the weight of three drammes saith *Dioscorides*, (which I hold proportionable, to the rest of the great quantities of purgers, given by the ancients whereof I have spoken before, which is over large to be given to any in our time, or at least nation) the roote (prepared in the manner aforesaid) is given likewise to the weight of two drammes saith *Dioscorides*, in meade or honeyed water: but one dramme is so strong, that it is not fit to be taken but with caution, and by a strong body) the feede saith *Dioscorides* may be taken to the weight of a dramme: but seeing 9 or 10 feedes, of the garden Spurge is a sufficient strong medicine, I thinke so many of those feedes are too many by much: and of the juyce or milke a spoonfull *Dioscorides* appointeth, being made into pills with flower, which is the strengest of them all: an extract made artificially out of the rootes is much commended by many in the dropsie, and other diseases before named, but it had neede of an artift, as well in the preparing as giving. The Pills of *Efula* set downe in the 16 chapter before, doe properly belong unto this place, being to be made more properly, of this *Efula* than of that. The small annuall spurge is in purging like the other sorts, but is not so strong for the diseases aforesaid as the former are. The feede of *Peplus* or the round *Efula*, being beaten and drunke in hydromel or honeyed water, purgeth flegme and choller. The leaves are used to be pickled up, and kept to be used in meates, and the powder of them saith *Dioscorides*, strewed upon meate troubleth the belly: The small purple Sea Spurge hath the same properties, and is used to be pickled and eaten, with the like effect that the former is. The Petty or Tyme Spurge, is used for paines of the mother, if the young branches and leaves be bruised with a little wine, and put up as a pessary: The same boyled and taken doe purge the belly even as the milke or juyce doth also, and is good against the stinging or biting of serpents, and taketh away all manner of warts and excrescences of the like nature. It is very effectuell for the dimmesse or mistinesse of the eyes, to cleere the sight, and also for watering or running eyes, and to take away filmes or scarres that grow upon them, used with a little honey. The tuberos or knobbed Spurge saith *Dioscorides*, purgeth downewards, if the lower parts be taken, and upwards if the upper parts be taken: but the juyce to the quantity of halfe a dramme, purgeth both wayes, and so doth the plant being taken wholly together. The manner of drawing out the juyce thereof (is somewhat rude in regard of the exquisite manner of preparing extracts chymically in our dayes) as *Dioscorides* setteth it downe is thus. Beate the rootes and put them into a vessell full of water, stirre them well therein, and with a feather gather the upermost upon the water, which being dried and kept, serveth for the uses aforesaid, and for those that have the dropsie. All these cleanse the skinne from discolouring, even as the former doe, and with as good successe. There is none of them but are strong and violent, and therefore great caution and advise is to be had, in taking of them inwardly, and therefore some appoint to put diverse cold hearbes to them in the taking: but for outward applications there is the lesse feare of danger, because if the skinne be any thing exulcerated, and the parts inflamed, helpe may sooner be had and applied thereto, than within the body.

CHAP. XIX.

Hippophaes, Hippophaestum & Hippomanes. Thornie Milkewort or Fullers thorne

Becaufe *Dioscorides* speaketh of *Hippophaes* and *Hippophaestum*, making them both Thotnie plants, yeelding milke and purging, before *Ricinus* and the *Tithymales*, and *Theophrastus* in his ninth booke, and fiftenth chap. saith that *Hippomanes* is made of *Tithymalus*, or *Lactaria* Milkewort, the best as hee saith, was knowne to be made in *Tegea* and was held to be of great worth; yet my *Theophrastus* in Latine, which is very ancient without name of the Printer or yeare of the Printing, hath in that place *Hippophaes* although I confesse I have seene Greeke copies which have had *Hippomanes*; but surely *Hippomanes* being declared by other authors, to bee a kinde of poyson made of the nature or thimne (perme of *Mares*, as you shall heare by and by, could not in my minde be so unknowne to *Theophrastus*, that he should say, it was made of the *Tithymalls* or Milkeworts, but rather that *Hippophaes* was a Milkewort, or made thereof; for in his 6. booke and 4. chapter, at the latter end he numbred *Hippophyon* which *Gaza* tranflateth *Lappago*, among those plants that beare thornes at the leaves, and in the same booke and 5. chapter he nameth *Hippopheos* which *Gaza* tranflateth *Lappago* likewise, to have gentle smooth leaves, not like unto the Capers, which have sharpe leaves as well as stalkes, and in his 9 booke and 15 chapter, maketh no mention either of forme, having declared it before, or of purging or poysonfull quality therein; but numbred it among other things, the best wherof grow in *Arcadia*, and nameth it next after the *Elaterium*, made of the Wilde Cowcumbes, so that it is probable his *Hippophyon*, *Hippopheos*, *Hippophaes*, or *Hippomanes*, whether you will, for diverse doe thinke diversly, is an herbe or roote, that beare thornes as is before declared, whose condensate milke or juyce, was of much worth being made in *Tegea*: I thinke it not amisse somewhat to declare both what I thinke *Dioscorides* his *Hippophaes* and *Hippophaestum* are, and the derivation of the name: and what *Anguillara* and others say of it also, that say they have found it, to incite some indoltrious to attaine it also, if that which I shall shew you in my opinion be not ir, and likewise to shew what diverse authors doe report of *Hippomanes*, that thereby the diversity of things might cleere *Theophrastus* from imputation of want of knowledge, what *Hippomanes* was, or variety from others, and that his *Hippopheos* and *Dioscorides* *Hippophaes*, was one and the same thing: This therefore is the text of *Dioscorides* concerning *Hippophaes*. *Hippophaes* wherewith fullers doe refresh garments, groweth in gravelly grounds and neere the sea. It is abushyng plant rthicke of leaves, or well spreade, having long leaves like unto the Olive tree, but smaller and longer, and betweene them many whitish hard thornes distant one from another. The flowers stand in clusters like unto those of Ivy, but smaller and more gentle, somewhat reddish or bluish out of a white: the roote is thicke and tender full of juyce, like milke and bitter in taste, from whence as from *Thapsia*, a juyce is taken, which being dried up either by it selfe simply, or with the flower of *Orobis* (or the bitter vetch) is kept for their use that neede it: *Hippophaestum* (saith *Dioscorides*) which some call *Hippophaes*, groweth in the same places, and is a kinde of Fullers thorne also. It is a low herbe having thornie small leaves, without either stalke or flower, with empty heads, it hath thicke and tender rootes: a juyce is drawne out of the rootes, leaves, and heads, and dried up to be used: Thus farre *Dioscorides*: In comparing therefore *Dioscorides* and *Theophrastus*, I doe not finde them to vary more than in a letter or two of the word. For as you heare *Dioscorides* saith *Hippophaes* hath many branches full of leaves, and some thornes also, and *Theophrastus* doth intimate the same, saying that *Hippopheos* hath smooth leaves, and thornes by the leaves, or is a thornie plant as *Pheos* (of which you shall heare in that part that speaketh of thornie plants) *Capers*, *Calitrops*, and *Respharrow* are: *Dioscorides* saith the roote of *Hippophaes* is thicke and full of a milkie juyce, and *Theophrastus* saith *Hippophaes* (as I sayd my booke hath it, and *Columna* in his chapter of *Hippophaes* hath so also, or as others have *Hippomanes*, which as I sayd before cannot be) is made of a *Tithymall* or Milkewort, the best being made in *Tegea*, and is of great worth, *Pliny* maketh mention of *Hippophaes* in one place, and of *Hippopheos* in another, as of one and the same plant, as likewise of *Hippophaestum* in severall places, which as yet in one place he calleth *Hippopape*, but in that he doth but relate what he hath out of *Dioscorides*, yet somewhat different: it is probable he never saw the plant, but did deliver what he sayd onely upon the credit of the author, we shall not neede to insilt more upon him. The Greeke name *ἵπποφαης* commeth either of *ἵππος* & *φαῖς* or *φῶς* which is interpreted *equarum salus aut lux*, aut ab *equis* genita, for so *Pliny* in his 22. booke, and 12. chap. saith, *Debent accommodata esse & equorum natura re, neq. ex alia causa nomen accepisse*: and *ἵπποφαης* ex *ἵππος* & *φαῖς* quia equorum maniam sive furorem sanabat: but becaufe *Dioscorides* saith it was called *Spina fullonia*, and that garments were clenfed thereby, it seemeth the Etymon of the word was rather derived from *ἵππος* taken pro adverbio accrescentis, & sic pro valde or multum, & *φαῖς* pro lumine or nitore, of the clenfing quality: for so *Pliny* saith of *Hippophaestum* in his 27 booke and 10 chapter *Hippophaestum nascitur in spinis ex quibus fiunt pile fulloniae*: for with the plant or roote made into bals, those rimes of his used to scour garments, like as if it were done with sope. *Anguillara* saith he found *Hippophaes* in the Island *Peloponessus*, in the sandy grounds by the seafide, which had a roote of the length of ones hand or better, yielding a thinn juyce, being either broken or wounded, like in colour to milke, of a very bitter taste (but saith he saw then neither flower nor fruite) and strong smell, which the inhabitants call *Acantha Nacatharile*, *Spina purgatrix*, the purging Thorne, which *Basilinus* setteth downe in his *Pinax* for a kinde of *Rhamnus Catharticus folio olea*, and thinketh the *Hippophaestum quorundam Lugdunensis* to be the same; *Fabius Columna* refusing the opinion of others that tooke the *Rhamnus primus* of *Dioscorides*, as *Lobel* suppoeth that purging thornie plant to be growing by the sea sides of *Italy*, *France*, and *Holland*, suppoeth that that kinde of *Rhamnus* which groweth in *Campania* and *Apulia*, by the sea shores, called by the *Italians* in those places *Spina santa*, and which is the second sort of the first kinde of *Rhamnus*, set forth by *Clausius*, doth more necerly resemble the *Hippophaes* of *Dioscorides*: but in my minde neither of both these shrubbes, wanting milke at the roote can be the *Hippophaes* of *Dioscorides* called also *Spina fullonia*. *Ruellius* likewise saith that *Hippophaestum* was brought from *Narbone* in *France*, which had small whitish leaves among the thornes; by *Lugdunensis* it is said that *Hippophaestum* was sent to *Dalechampsius* from *Melita* or *Malta*, and was a plant, spread full of thornie branches or rather the branches being wholly but thornes themselves, with small white flowers, standing close together.

gether at the joynts and partitions of the branches; but whether it were purging was not signified: this declaration, being onely taken from the dried plant was sent: but if I may be bold to give my censure, what *Hippophaes* is, and whether it be to be found or no, I would surely conjecture, that the plant called *Galafrivida Cretica*, which I have set forth in the 15 chapter of this part, under the title of *Tithymalus maritimus Creticus spinosus*, and as I say there, is sayd by *Honorius Bellus* to be a kinde of *Tithymall*, or Spurge having thornes, and giving milke, whose roote is thicke and fleshy, might as neere resemble *Hippophaes*, both for forme, for giving milke and purging quality, as any other plant whatsoever, and even the relation of the leaves and flowers set downe in that place, is not greatly differing, let others judge hereof as they see cause. Now concerning *Hippomanes* let me shew you also, what diverse authors have written thereof. First it is imputed to *Theophrastus* to say, as some corrupt (as I thinke) grecke copies have it as I sayd before, and *Camerarius* as I thinke was the first that did so cause it to be read, that *Hippomanes* is made of *Tithymall*, but is mistaken for *Hippophaes* as I sayd before. *Theocritus* saith in *Pharmaceutria*, that *Hippomanes* is a plant whereby horses are made furious madde, *Collumella* saith that *Hippomanes* is a poyson, which kindleth lust in horses like to that of men, but what it is, or whereof it is made or taken, he doth not expresse. *Pliny* also in his 28 booke and 11 chapter affirmeth, that *Hippomanes* was of so strong power or force in witchery or forcery, that being but layd to the brassen figure of the mare at *Olympus*, it would drive the horses in extreame fury to cover it: which *Pausanias* before *Pliny* his time, doth set downe more at large in his fift booke: but *Aristotle* in his 6 booke and 18 chap. of the nature of beasts, saith that the mares doe let passe from them a certaine thinne humour, like unto their sperme, when they are inflamed with lust to be covered, which is called *Hippomanes* by some, and in the 22. chap. of the same booke he saith, that there sticketh to the forehead of the foale, new fallen, a certaine round, and somewhat broad blacke peece of flesh or skinne, of the bignesse of a small dried Figge, which the mare licketh up with the secondeine, as soone as shee hath foaled, which if any shall take away before she hath devoured, and afterwards offer it her to smell thereunto, shee not knowing the sent thereof, will be stirred in to great fury or madnesse, but will not suffer her foale to sucke her that hath it taken therefrom; which thing *Iunius Solinus Polybister* confirmeth in the 48 chapter of his booke, onely he varyeth from *Aristotle*, in taying it is of a brownish yellow colour, which hee said was blacke. And *Pliny* writeth also the same thing in his 8 booke and 47 chapter, although he said also, it was an other thing as you have heard before. *Virgill* in his third booke of *Georgicks* hath these verses, to shew what it is, and whereto used, taken as it should seeme from *Aristotle*.

Hinc demum Hippomanes, vero quod nomine dicunt
Pastores, lentum diffillat ab inguine virus
Hippomanes, quod saepe male legere nocere.

And *Tibullus* the Poet in his 2. booke and 4. Elegie, hath the same also in effect in these verses:
Et quod, ubi indomitis gregibus Venus afflat amores
Hippomanes, cupida stillat ab inguine equa.

Anguillara is of opinion that the *Hippomanes* of *Theocritus* is the lesser *Stramonium*, or thorne apple, and that *Crataevus*, whom *Theocritus* his interpreter doth cite saith, that it is a plant whose fruite is like the wilde Cow-cucumber fruits, but full of thornes: Now if the ancients have left these doubts, whether *Hippomanes* be an herbe or made of an hearbe, and shew not certainly what the hearbe is, or doe not all agree that it is the sperme of mares, how shall we in these times compound the controversie.

The Vertues.

Discorides saith that the pure juyce of *Hippophaes* it selfe being dried, and the weight of halfe a scruple thereof taken, or the weight of two scruples, if it be made up with the meale of the bitter Vetches, taken in meade or honied water, purgeth downwards flegme, choller, and water: the whole plant rootes and all being bruised and put into meade, and about a quarter of a pint thereof taken, worketh in the same manner: the juyce taken from both the plant and the roote, as it is used to be done with *Thapsia*, a dramme thereof taken at a time, is a purgation of it selfe for the same purposes. The juyce pressed out of the rootes, leaves, and heads, of *Hippophaestum*, is to be dried and halfe a dramme thereof given to whom you will, in meade or honied water, drawen forth flegme and water: principally and chiefly this purgation is fit or convenient, for those that are troubled with the falling sicknesse, shortnesse of breath, and aches in the joynts and sinewes.

CHAP. XX.

Alypum Monspeliensum sive Herba terribilis Narbonensium. Herbe Terrible.

Because this herbe is of a most violent purging quality, sharpe and exulcerating withall, very like unto the former *Tithymalls*. I thinke it fittest to joine it next unto them and another with it, which by *Pena* his judgement is very like thereunto, both for face and quality.

1. *Alypum Monspeliensum*. Herbe Terrible.

This terrible herbe hath many woody stalks, rising two or three foote high, dividing it selfe into smaller branches, covered with a thinne barke, the elder branches being, of a darke purplish colour, and the younger more red, thicke set with small hard and dry leaves without order, from the botome to the toppe, which are somewhat long and small at the setting on, broader in the middle, and sharpe pointed, somewhat like unto small Mirtle leaves, of a greenish colour on the upper side, and whitish underneath: at the top of every branch standeth a round flower in a scaly head, consisting of many purplish thrummes or threads, paler in the middle than round about, somewhat like unto the head of a *Scabiosa* or rather *Knapweede*: the roote is of a fingers thicknesse, long, woody and of a brownish colour, somewhat salt, if it grow neere the sea shore, where it may drinke any of the Sea water, or else not salt at all, but bitter if it grow further off: the leaves also casting after the same manner.

1. *Alypum Montpelienſium* ſive Herba Terribilis.
Herbe Terrible.

Hippogloſſum Valentini Cluſii.

2. *Tartonraire Maſſilienſium*.
Gutworre or Trouble belly.

2. *Tartonraire Maſſilienſium*. Gutwort or
Trouble belly.

The herbe Gutworre or Trouble belly, hath very many hoary, or ſilver white ſlender and very tough branches, two foote high, divided into many other ſmaller, whereon grow many ſmall white hoary leaves round about them, ſmaller than thoſe of *Alypum*: the flowers are white and ſmall, ſet cloſe together, in a long tuft, but ſo covered with the white woolleſſe that they can ſcarſe bee perceived: after which come ſmall blacke ſeede, bitter and unpleaſant, and ſo fiery hot, that if any ſhall either chew of them or the leaves, a little in their mouth, they will ſo heate the mouth, lippes, and jawes, that no waſhing will for a long time take it away: the roote is ſmall long and wooddy, with many fibres at it, yellowiſh on the outſide and white within, nothing ſo hot, bitter or unpleaſant as the leaves or ſeede, yet leaving a ſmall hot taſte at the end, without any ſent, and not giving any milke: it is ſaith *Pena*, very like unto the *Turbith* of *Alexandria*, or of the ſhoppes, in the forme thereof.

The Place.

The firſt groweth on the mountaine or hill, called *Ceſtus* or *Cap de ceſte*, and in other rockes and ſtony places, hard by *Marſeilles* in *France*, as alſo in diverſe places in *Spaine* as *Cluſius* ſaith. The ſecond doth likewiſe grow neere *Marſeilles* by the Seaſide, on a ſmall hill neere thereunto, called *Monbrond*, as *Pena* ſaith, and all a long the coaſt of *Liguria*, and the Iſles of *Corſica*, and *Sardinia*, as *Lugdunenſis* ſaith.

The Time.

They flower not untill it be late with us, but *Cluſius* found the firſt in flower, in the moneths of *February*, and *March*, as he ſaith in *Spaine*.

The Names.

Αλυπτον in Greeke, quaſi indolens inoffenſumque remedium eſt dicitur, per contrarium enim ſe habet, quem admodum in aliis, Graece ſcilicet *ſella* *αλωνα* ſive *dilecia* *αλβον*, *Holoſtium* tota oſſe, cum herba ſit tenera appellant: except it might rather be ſaid to come from *αλυνον*, id eſt, *ſalſum* vel *maritimum*, becauſe it groweth neere the ſea: in Latine it is called alſo *Alypum* & herba terribilis, according as the common people of *Provence* doe call it, from the effects it worketh. It is called alſo *Alypias* by *Aethnarius*, yet ſome thinke that his *Alypias*, which as he ſaith purgeth ſlegme, doth differ from his *Alypum*, which purgeth blacke choller: but *Paulus* reconcileth this doubt in his ſeventh booke; and fourth chapter, where hee ſaith, that the ſeede of *Alypum*, purgeth downwards blacke choller, taken with a little ſalt and Vinegar, in the ſame quantity that *Epithymum* doth: but if we credit *Dioſcorides*, ſaith he, it doth lightly exulcerate the guts: but is the ſame in my judgement ſaith *Paulus*, which is now called *Alypias*: the roote hereof, as I ſayd in the chapter of *Tithymalli*, is called by *Aethnarius* *Turpetum album*, as that of *Eſula minor*, *Turpetum nigrum*: There is ſome doubt with many, whether we have the true *Alypum* of *Dioſcorides* or no, for that ſome copies differ from others in the deſcription of the forme of the plant, ſome having the word *υδραγρος*, that is like fennell, and *ιμπεριος* ſomewhat red ſay others, whereupon

whereupon *Lobel* and *Pena* are bold to affirme in their *Adversaria*, that our age knoweth no herb, that may so well or more truly, both in the forme and purging vertues, resemble *Dioscorides* his *Alypum*, (except the *Fernus*) then this herbe here set forth, altering that word onely, which as he saith may be a fault (such as is common in many other places of his worke) in the transcribers: and hereupon as it is probable *Mesues* grounded his opinion, that Turbith was the roote of a ferulous plant. *Clusius* saith that diverse professors in the Vniuersitie at *Valentia*, did call an herbe which he there found *Hippoglossum*, supposing it to be the true *Hippoglossum* of *Dioscorides*; whereunto it cau as he saith be nothing like, the properties being so differing, except in a little appearance of likeness in the leaves: *Clusius* also doth not acknowledge it to be *Alypum* but misliketh of their judgement; that doe referre it thereunto, because the leaves are so dry, that they seeme to be without any iuyce in them; whereupon the *Spaniards* call it *siempre enjuta*, and from the round head of flowers, which is paler in the middle than round about, doe call it *Coronilla de frayles*, *Coronula fratrum* the Friers Crowne, and of some as he saith *Segulhada*, but others of good judgement doe hold them, to be both but one plant, the diversity, if any be, to consist in the climate. *Dalechampius* as *Lugdunensis* setteth it forth, was of opinion, that it might be *Empetron* of *Dioscorides*, which others as he saith called *Phacoides*, onely led thereunto, by the purging quality and growing neere the Sea, as *Empetron* doth; and because that the *Critillum* or *Faniculum maritimum*, is disprooved by most not to be *Empetron*, which many heretofore thought to be so, (and among the rest *Pandolphus Collinarius*, in his defense of *Plinye* against *Leonicerus*, for it is certainly seene, that *Plinye* hath confounded that *Empetrum*, which is a *Saxifrage*, with the other which is a purger) because it hath no purging quality in it at all: but seeing we hold this *Alypum*, to be the right or neerest it of *Dioscorides*, I cannot see what reason can move any, to thinke it to be *Empetrum* also, seeing *Dioscorides* maketh them two distinct herbes in severall chapters, and placed the one the very next unto the other: some also as *Lugdunensis* saith, take it for *Parmica*, or for the third sort of *Conyza*. *Bauhinus* in his *Pinax*, calleth it *Thymela foliis acutis, capitulo Succisa, sive Alypum Montpellierensium*. The other is called *Tartouraire* by *Lugdunensis*, and *Lobel*, and is so called as hee saith, in the Isles of *Corsica* and *Sardinia*, and all along the Sea coasts of *Liguria* and *Marseilles*. *Dalechampius* saith that many doe referre this to the *Sesamoides magnum* of *Dioscorides*, which he hath mentioned in his fourth booke, and 147 chapter, with leaves of *Gromdrell* or *Rue*: and therefore *Dalechampius* in the description hereof saith, the leaves are like *Rue*, which in my judgement doth very hardly agree thereunto, but much lesse unto *Gromdrell*, whereunto they are also compared. Furthermore he saith also, that peradventure this may be that *Helleborus* of *Theophrastus*, whose seede is like *Sesamum*, and wherewith in *Anticyra* as he saith they used to make purgations: but the extreame purging quality herein, shewing it as *Pena* saith, to be a new plant of our ages finding, and not well knowne to be mentioned by any of the ancient writers, Greekes, *Arabians* or *Latines*, hath caused diverse to referre it, as I say, some to *Sesamoides*, and others to *Theophrastus* his *Helleborus*, with the fruite of *Sesamum*, and yet whosoever will advisedly consider, the seede of all the sorts of *Hellebores*, both the white and the blacke, shall not finde them much unlike the seedes of *Sesamum* it selfe. *Alphonus Pontius* of *Ferrara* tooke it to be *Cneorum* of *Theophrastus*: the roote hereof as *Pena* saith, is like unto the Turbith of *Alexandria*, and hath not so much heate or bitterness therein, nor other evill taste as others have. *Bauhinus* calleth it *Thymela foliis candicantibus serici in star mollibus*.

The Vertues.

The seede of *Alypum* (saith *Dioscorides*) or herbe terrible, purgeth downeward blacke choller or melancholy, if it be taken in the like quantity with *Epithymum* and a little salt and Vinegar put to it in the taking, but he saith it doth a little exulcerate the bowells: the common people in *Narbone*, but especially the Quacksalvers and women leeches, as *Pena* saith, notwithstanding they find the effect to purge with such violence, yet doe often give it, making a decoction with the leaves flowers or seede, or otherwise make them into powder, and give it them with wine or broth; the smallest quantity thereof, to be taken in chicken broth, saith *Plinye* is two drammes, a meane quantitie is foure drammes, and the greatest portion to be given at once is sixe drammes: *Clusius* saith that the Landlopers in *Spain*, doe usually give the decoction hereof unto those, that are troubled with the French disease, and that with good successe as it is reported: the other Gutworke or Trouble belly is as violent in working as the former, or rather much more, for the violence thereof is so unlimited, that it oftentimes causeth immoderate fluxes, even to blood and excoiations; especially if the dried leaves be given unadvisedly in powder, and mixed with some potable liquor, and driveth forth cholericke, flegmaticke, and watery humors in abundance; the roote likewise worketh powerfully for the same diseases, which if it were *Theophrastus* his *Helleborus*, or *Dioscorides* *Sesamum*, were unprofitable or of no use; the seede onely with them and not the roote, having the propertie and power of purging. Advice therefore before taken, and preparation both of the physicke and body, the quantity also, the disease and strength of the patient considered, it may be admitted to be given where better and safer things cannot on the suddaine be had.

CHAP. XXI.

Thymelaea. Spurge Olive.

Here remaine yet some other violent workers, which shall be declared in this and the next Chapters following, and first of the *Thymelaes*, and then all the sorts of *Chamelaes* and *Sanamunda* of *Clusius*, because they are so like both in forme and nature: and let me also adjoyne the small *Sesamoides* of *Dalechampius*, for the neere affinitie with them.

1. *Thymelaea*. Spurge Olive.

This Spurge Olive hath diverse tough stalkes, rising to the height of two or three foote, sometimes in the naturall places, and much lower in some other, of the thicknesse also of ones thumbe, covered with an ash coloured barke, and spread into many branches; whereon grow many small, clammy, flat, pointed leaves, somewhat like unto Mirtle leaves, or rather unto the narrow leaves of the Olive tree, for they are larger and broader than the leaves of Flaxe, whereunto many doe compare them, and doe continually abide on the branches without falling.

falling off, as the *Chamaelax* doth; at the toppes of the branches, grow many small starlike flowers, consisting of foure white leaves a peece; after which come small berries greene at the first, and of a very red colour, like unto Corall when they are ripe, being a little more long than round, of the bignesse of a Mirtle berrie, with a palpe or substance like unto a Cherry, wherein is one kernell covered with a blacke soft and brittle shell: the roote is soft and tender while it is young; very like unto a Raddish roote as *Clusius* saith, but woody when it is growne elder, covered with a tough thicke barke.

2. *Thymelaea minor* sive *Cneorum Matthioli*. Small Rocke Roses.

This plant hath diverse long weake and slender but tough branches lying upon the ground divided usually into other smaller ones whereon grow many small long and somewhat thicke leaves neere unto those of *Mesereon*, set without order to the tops where it shooteth forth a tuft of many flowers together, consisting of foure leaves a peece, of a bright red or carnation colour, and in some plants white, very sweete, which turne into small round whitish berries, containing small round feede, of a grayish colour: the roote is long and yellowish, spreading divers ways under ground, and abideth many yeares shooting forth new branches.

3. *Chamaelaea Germanica* sive *Mesereon vulgo*. Dwarf Bay or flowering Spurge.

There are two sorts hereof, the one having a pale, and the other a deeper red coloured flower, they both rise up with a thicke woody stemme, five or sixe foote high or more, and of the thicknesse (if they be very old) of a mans wret at the ground, spreading into many flexible long branches, covered with a rough grayish barke, beset with many small long leaves somewhat like unto Privet leaves but smaller and paler and in a manner round pointed, falling away every yeare: the flowers are small consisting of foure leaves, many growing sometimes together at a place, and usually before the leaves appeare, after which come small berries, greene at the first and very red afterwards, but blackish red being suffered to abide long on the bush, the roote spreadeth into many long and tough branches covered with a yellow barke.

4. *Chamaelaea Alpina incana*. Mountaine spurge Olive.

This mountaine Laurell hath a small woody stemme three or foure foote high or more, branching forth towards the upper parts, into many slender and tough branches, covered with a rough hoary greene barke, beset at the ends thereof with flatter fuller and smaller round pointed leaves than the former, of a grayish greene colour on the upperside and hoary underneath, which fall away before winter as the last doth: the flowers are many, set together at the ends of the branches, greater than the last, consisting likewise of foure leaves a peece of a light bluish colour, standing in small grayish huskes, of as little sent as the other: the berries are small long graines of an excellent red colour, which afterwards turne blacke: the roote is long and spreadeth about under the upper part of the earth.

5. *Chamaelaea triccocos*. Widdow waille.

This triple berryed Spurge Olive hath no great stemme at all, but spreadeth from the ground into many flexible tough greene branches, whereon are set diverse narrow, long, darke-greene leaves all along them, which

1. *Thymelaea*. Spurge Olive.

2. *Thymelaea minor* sive *Cneorum Matthioli*. Small Rocke Roses or Spurge Olive.

abide

3. *Chamaelea Germanica*, five McCreene.
Dwarf Bay.

4. *Chamaelea Alpina* incana.
Mountain Spurge Olive.

5. *Chamaelea tricoceus*.
Widow Waile.

7. *Sansevieria tertia* Clusii.
The third Spanish Spurge Olive of Clusius.

8. *Sansevieria Africana*.
Spurge Olive of Africa.

the Aromaticall tree, which is like to Cinamon : *Lugdunensis* by correcting the grecke text of *Theophrastus* in divers places where he thinketh it is faulty, sheweth the figure of a Plant, accounted of divers, as he saith, to be the *Cneorum album* of *Theophrastus*, which *Bauhinus* judgeth to be the *Dorychnium Imperati* & *Placem*, mentioned in *Clusius* his History of Plants. But *Bauhinus*, both in his annotations upon *Matthiolum* as he hath published them, and in his *Pinax* referreth both these Plants of his, the first unto *Ocymoides repens Polygoni folio* of *Lobel*, and the other unto the *Ocymodes repens* of *Camerarius*, *Myconius*, as *Lugdunensis* saith, referreth his *Cneorum album*, unto *Avicenna* his other *Oleander*, which he calleth wild *Oleander*, for as he saith it is like common *Oleander*, both in leafe, flower, and sent. The third is called *Chamaelea* & *Mesereon* usually now adayes, and so likewise by *Tragus* : *Dodonaeus* and *Camerarius* call it *Chamaelea Germanica* : by *Fuchsius* and others, *Daphnoides*, *Gesner* in *hertis Daphnoides nostrum vulgare* : *Lugdunensis*, *Lauricola femina*, *Anguillara* *Pipermontanum*, and *Lobell*, *Laurus pusilla*, and *Mesereon Germanicum* : some also take it to be *Chamaedaphne Dioscoridis*. The fourth is called *Chamaelea Alpina incana* by *Lobell*, & *Chamaelea altera* by *Clusius* and *Italica* by many with us, because *Clusius* said it came to them only from *Italy*. The fifth is the true *Chamaelea* & *Mesereon* of the *Arabians*, & generally called now adayes *Chamaelea triccocos*. The sixth is called *Sanamunda*, by the *Spanish Mores* in *Granado*, as *Clusius* saith, and of the professors of Herbarisme, or Herbarists there also, though the countie people call them, as he saith, *Amerda cruz*, of the propriety of the strong purging. *Bauhinus* calleth it *Thymelea folys* *Chamaelea minoribus subhirsutis*, and is the *Thymelea species Myconi* of *Lugdunensis*, & the second *Sanamunda* of *Clusius*, which *Bauhinus* calleth *Thymelea folys Kati lanuginosus falsus*. The seventh is the *Erica Alexandrina* of *Lobell* ; and the 3. *Sanamunda* of *Clusius*. The eight is called *Sesamoides minus Dalech antip* by *Lugdunensis*, who in my mind much confoundeth both himselfe and his readers herein, for he referreth this both to *Clusius* his second *Sanamunda*, which he saith is hot, sharpe, and somewhat salt, even as he saith his *Sesamoides* is : and also to the *Cneorum nigrum Myconi*, which he sheweth after the description thereof, that the taste of the leaves is somewhat binding, with a clamminesse or glutininesse therein also, which is quite differing in propriety, and yet he maketh them to be all one Plant : and *Bauhinus* following him herein, setteth it downe in his *Pinax* : but both this description, as I have before given it you, differeth from *Clusius* his second *Sanamunda*, which as *Clusius* saith, hath his flowers in clusters at the tops, and from the other which hath them at the joynts, *Clusius* again giveth unto his yellowish flowers, like unto those of the Olive tree, and *Dalechampsius* saith, it beareth small white flowers, very sweete : so that it may seeme to be a species thereof, and not the very same, but it cannot be also his *Cneorum nigrum Myconi*, if the tastes be so different : let others judge hereof after they have considered them both well. The ninth *Bauhinus* setteth downe in his *Pinax*, with the title *Thymelea folys polygala glabris*, in his *Prodromus* with the title *Sanamunda viridis, vel glabra*, and referreth it to the *Thymelea species Myconi* of *Lugdunensis*, who saith it doth best agree with *Clusius* his first *Sanamunda*. The last is not remembered by any before.

The Vertues.

The first Spurge Olive worketh very churlishly with whomsoever, and in whatsoever manner you give it, viz. the leaves prepared beaten to powder, and taken in wine or broth, or the berries swallowed whole or bruised and taken by themselves ; for as *Dioscorides* saith, if twenty foure of the berries be taken in drinke (this proportion is answerable to the rest of the phisicke in those times as I have often said) or the inner pulpe of them onely, it purgeth downewards very strongly, both Choller, Flegme and water, but as he saith, they will burne the jawes and throate, and therefore they had neede be rowled, or otherwise given with flower or barley meale, or swallowed in meale, or in raisins, the stones taken out, or taken with purified honey, being beaten with niter and vinegar, it is applied to them that are given to over much sweating. He that will give the powder of the leaves, had neede first to take away the strings that runne in the leaves ; which may be done while it is grossely beaten, before it be beaten finer, which prepared in this manner may be made into *Trochiscos* or balls, to keepe all the yeare, the leaves being gathered in Autumne : It is a remedy also for them that have eaten and drunken Hemlocke, the poysonfull herbe. All the *Sanamunda's* likewise are violent purgers, for halfe a dramme of the juyce of the berries taken in wine, or in broth, which is the better, and the safer way, purgeth watery humours abundantly ; and therefore if it be taken with good advyse warily, it may doe good in Dropsies, Gouts, Joynt-aches, the *Sciatice*, and the like : in *Spain* they usually give a dramme in the decoction of red Cicers, which purgeth flegmaticke and melanchancholy humors wonderfully, and consequently is available to all such diseases, as rise from such humours, *Lugdunensis* recordeth a cure of one in the Hospitall at *Lions*, who was grievously tormented with the Crampe, performed by *Dalechampsius*, by giving him a dramme of the leaves of the fourth kinde here set downe in powder, in a litle barley water, which wrought as forceably as if he had taken *Colocythis*, and thereby was restored to his health. The country people, as *Matthiolum* sheweth, doe often take of those berries to purge themselves, thinking to be their owne Phyitians herein, and deceive them of their fee due for their counsell, but as he there saith, they often deceive themselves, by their unskillfull foolhardinesse, and make more worke for the Physicians to cure them of the paines and torments, and other dangerous diseases that follow the taking of these violent purgers, if they free them not of further trouble by their owne deaths : *Pliny* is justly to be taxed for writing in his 27. booke and 9. Chapter that the *Coccognidium* (which as I said before, is called by the *Grecians* the fruite of *Thymelea*) doth stay or bind the belly (*Sistit alvum*, is the word in the generall Copie, which yet some would impute to be the error of the Writer out thereof, when it should be *Ciet alvum*) when *Galen* and all other Authors acknowledge it to be a strong purger. *Mesues* adviseth that *Mesereon* (which I said before the *Arabians* doe confound, and is to be understood this *Thymelea*, as well as that *Chamaelea*, &c.) is not to be given without the correctors appointed for it, and yet not, but unto strong able bodies : All these therefore are not safe to be given to weak bodies or stomackes, to women with child, or to children that are not strong, except they be strongly infected.

CHAP. XXII.

Laureola. Laurell or Spurge Laurell.

THis Laurell or Spurge Laurell (that it may be knowne from the Bay tree, which is of divers, called the Laurell tree) riseth up usually but with one stemme, yet sometimes with more, very tough and pliant, covered with a whitish thicke tough barke, branching forth into divers parts toward the toppes, whereon are set many long, smooth, thicke, somewhat broad and shining darke greene leaves, somewhat like unto Bayleaves, but longer, smother, softer, and not with hard veins therein as Bayleaves have; the flowers come forth towards the toppes of the stalkes and branches, and at the joynts with the leaves many set together, which are somewhat long and hollow, ending or spreading into foure small leaves, of a whitish, yellow, greene colour: after which come small round, and somewhat long blacke berries when they are ripe, wherein lieth a white kernell; the roote groweth downe deepe into the ground, and spreadeth likewise tough long white strings, somewhat woodie: both leafe and flower, both barke and roote are very hot and sharpe in taste, heating and burning the mouth and throat of any that shall taste them: it keepeth the greene leaves all the Winter, and doth not shed them.

2. *Chamadaphnoides* sive *Laureola Cretica*. Candie Laurell.

From a crooked small white roote, rise up three or foure crooked and bending blackish stalkes, thicke set with leaves without order, covering them almost wholly, which are long and small towards the bottomes, and grow broader to the ends, being thicke and hard, greene above, and grayish below, tasting very hot, and burning both mouth and throat very notably; what flowers or fruit it beareth, hath not bene seene, but referred unto this Laurell for the forme and propertie, and groweth very low.

The Place.

The first groweth wild in many places of this realme, as well as beyond the seas, and being brought into gardens will there abide, and flourish sufficiently well, the other hath not floured, as is before said.

The Time.

The first flowreth very early in the yeare, even in January or February, and sometimes before, if the Winter be milde, the berries are ripe about June; the other hath not floured, as is before said.

The Names.

It is called in Greeke *Δαφνοειδής* a *Lauri foliorum similitudine*, and the Latines accordingly, *Laureola quasi pusilla Laurus*. Some doe appoint two kinds of *Laureola*, *mas* & *femina*, some accounting this to be *mas*, and *Chamaelea Germanica* to be *femina*, others this to be *femina* and *Chamaelea* to be *mas*; so variable are divers in their opinions: *Matthiolus* taketh this to be *Chamadaphne* of *Dioscorides*, and the *Chamaelea* to be *Daphnoides*, but in both

1. *Laureola Flores.*
Laurell in flower.

2. *Laureola cum bacis.*
Laurell with berries.

he is much mistaken: *Lobel* and *Lugdunensis* doe take this *Laureola* which he calleth *Mas*, to be *Daphnoides*, and the *Chamaelea Germanica* to be *Chamedaphne* or *Laureola foetida*. *Tragus* also is much deceived in mistaking this plant, for *Dioscorides* his *Thymela*. Most of other writers doe call it *Daphnoides*, or *Laureola*, *Dodonaeus* as I said before, would make it to be *Cneorum nigrum* of *Theophrastus*, and the *Chamaelea* his *Cneorum album*. In my former booke I was partly perswaded, that *Chamedaphne* of *Dioscorides*, was the *Chamaelea Germanica*, or came somewhat neerer therunto; but upon better thoughts, I thinke that *Chamedaphne* may be more truly referred, to the *Laurus Alexandrina* of *Matthiolum*, whose leaves are small like unto Bay leaves, and the berries red when they be ripe, standing upon the leaves: and if you would aske me then, which is the *Laurus Alexandrina* of *Dioscorides*, I would answer you, that it is that *Laurus Alexandrina legitima*, that *Lobel* hath set forth in his Appendix, to his *Adversaria*, whose branch I communicated to him, to set forth, as I had it from *Pisa*, whose leaves come neerer unto *Dioscorides* his description, than either that of *Matthiolum*, or of any other as you shall further understand in his proper place; the other is called *Chamedaphnoides*, id est, *Laureola Cretica* by *Prosper Alpinus*, lib. de plantis exoticis.

The Vertues.

The leaves and berries hereof are as violent a purger, and do heate and inflame the throat, bringing the stomack, of whomsoever shall take thereof, and drive them into as many dangerous diseases, as any of the former; yet taken adviledly it purgeth flegme from the stomack and oftentimes by vomit also, it procureth womens courses, and being chewed in the mouth, it draweth down from the head and braine much corrupt matter that would offend it. Many Empericks do give the berries sometimes, but the leaves more often, to evacuate the watery humors in the dropsie, and think they finde good successe thereupon, as also to ease the paines of the collicke, doe give the powder of the leaves in a little broth: the berries and leaves hereof when they are fresh boyled in oyle, and afterwards strayned forth: this oyle being annointed on the belly looseneth the belly, and helpeth the collicke, and being annointed on the backe and raines provoketh urine and helpeth the piles.

CHAP. XXIII.

Laurus Tinus sive *sylvestris*. The Wilde Bay tree.

L Shall in this chapter shew you the wilde Bay trees, and joyne it next unto the *Laureola*, both for the name and nature thereof.

1. *Laurus Tinus Lusitanicus*. The first wild Baye of *Clusius* or of *Portingall*.

The wilde Bay tree riseth up to the height of an hedge bush, or the Dog-berrie tree; having diverse long square stalkes, full of branches, and faire large broad leaves, somewhat like unto Bay leaves, set in or-

1. *Laurus Tinus Lusitanica cerulea bacca*.
The first wilde Bay of *Clusius* or of *Portingall*:

2. *Laurus Tinus alter* vel 2. *Clusii*.
The second Wilde Bay of *Clusius*.

derthereupon, two alwayes set together at a joynt, one against another, but of a darke greene shining colour, of no sent at all in them, and of a bitter sharpe unpleasent taste, troubling the stomacke, causing loathing, and casting withall: at the toppes of the branches and twigs, stand many small sweete smelling flowers in clusters, consisting of five white leaves a peece: after which succcede small berries, being somewhat long flat and cornered, of an excellent pale bright blew colour, inflaming and burning the mouth and throate, of whosoever shall taste it, that it is almost insupportable, and not but in a long time, and by drinking milke, and holding it in the mouth, to be taken away or eased; this abideth greene all the winter.

2. *Laurus Tinus* alter vel 2. *Clusii*. The second wilde Bay tree of *Clusius*. This other wilde Bay tree, riseth to be a bush, much about the same bignesse with the former, having stronger stalkes, and more plentifully branching forth, which are reddish being young, and more greene with the rednesse when they are older: whereon grow the leaves in the same order, but somewhat longer, narrower, and more full of veines than it: the flowers stand at the toppes of the twigs and branches, in the same manner that the other doe, but are more purple and lesse sweete than they; which afterwards give smaller, fuller, and blacker berries, than the former: this also holdeth his greene leave all the winter without shedding.

3. *Laurus Tinus sylvestris* alter five tertius. The third wilde Bay tree. This wilde Bay groweth seldome to be a tree of any height but abideth low shooting forth many slender branches, covered with a darke greene barke, with sad greene smooth leaves, set by couples thereon, somewhat resembling Bay leaves without any smell: the flowers grow in tuftes or clusters at the ends of the branches, somewhat reddish while they are in bud, but whiter being open with reddish edges, consisting of five leaves a peece, smelling sweete: there seldome followeth any fruite but are blacke round berries when it beareth, yet not perfect to spring againe in any that I have seene.

4. *Laurus Tinus Cretica fruticosa*. The shrubby wilde Bay of Candye. This Bay tree groweth low and shrubby, bearing many slender round short branches covered with a black barke with knotty joynts, whereon are set 5 or 6 or more leaves like the former, but smaller upon short foot stalks which are wholly without sent, but heating the mouth and tongue with a little asfriction: the fruite or seede is as small as a pepper corne, with a thin rind opening into three parts like a Sprnge seed, containing within each part a small long whitish kernell like to a graine of wheate, smelling strong and tasting somewhat bitter and heating or burning the mouth and tongue.

The first groweth in *Portugall* and *Spain* in diverse places, as *Clusius* saith, in *Italy* also on the hills of *Florence* and *Romania*; and in the wood *Valena* in *Narbone*, and among the dwarfe scarlet Oakes, in many places of Mount *Cetus* or *Sessius* neere *Mompelien* in *France*. The second as *Clusius* saith he found in the *Monestery* of *Pera longa* in *Portugall*, and neere the Seaside also, in other parts of *Spain*; the third he saith he onely saw in *Doyot* his garden, rayled from *Italian* seede, which afterwards communicating the suckers thereof, became familiar in many other Herbarists Gardens there, as it doth also with us in our Country: and the last in *Candye*.

The first flowered in July and August, and the fruite was ripe in October in some places of *Portugall*; when as in other places, *Clusius* saith he found it in flower in November, with the fruite on it then also: the second flowereth also and beareth ripe fruite much about the same time: the third flowereth with us onely in December and continueth flowering January and February, if the winter be not too early or too extreame.

It is called by *Theophrastus* in Greeke *Δάφνη δάφνη*. *Laurus sylvestris*, in his first booke and 15 chapter; among those trees that are ever greene, which *Gaza* translateth onely *Laurus*, not naming *sylvestris* at all, for it is not remembred by *Dioscorides* or *Galen*, or other of the Greeke writers. *Pliny* maketh mention thereof, in his 15 booke and 30 chapter, and in other places, calling it *Tinus*, which some understand to be this *Laurus sylvestris*, wilde Bay. *M. Cato* also remembreth it in *l. de re rustica*, by the name of *Laurus sylvestris* and no other ancient Latine writer besides: all the later writers doe call them *Tinus*, *Laurus Tinus*, and *Laurus sylvestris* as *Clusius* doth. The *Italians* call it *Lauro salvatico*, and as *Lobel* saith *Lauro regio* if he be not mistaken; the *Spaniards* and *Portingalls* *Yna de perro*, *Follado* and *Durillo*; the *French* *Laurier sauvage*; the *Germanes* wilde *Lorbeerbaum*; the *Dutch* wild *Laurus Boom*; and we in *English*, the Wilde Bay tree.

There is nothing recorded of them by any Author, to be used either inwardly or outwardly; but our late Experience hath found the berries, as I sayd before, to inflame and burne the mouth and throate, in as violent manner, or rather worse than *Laurell* or *Chamaelea*, and worketh downwards likewise with trouble and perturbation of the whole body.

CHAP. XXIII.

Sambucus. Elder.

Among the number of these strong purgers, the Elders must not be omitted to be spoken of, whereof there are many kinds, and the *Ebulus* Wallwort or Danewort, is to be reckoned with them, for the likeness both of forme and qualitie, as all Authors doe.

1. *Sambucus vulgaris*. Common Elder. The common Elder tree groweth up sometime, if it stand alone and in good ground, to a reasonable great height, otherwise standing thicke together, as for the most it is found to be, it is a shrubbe of meane height, spreading his branches farre and wide, covered with a grayish barke for the outside, but underneath it hath another that is greene, having a pith in the middle even of the Elder branches, but the young ones much more: at the joynts of the branches come forth on both sides winged leaves, consisting of 7 or 9 upon a stalke, a little nicked or dented about the edges, of a faire sad greene colour, but smelling somewhat rancke and strong: the flowers stand at the toppes of the severall branches and twigs, many growing together in broad tufts or umbells, of a white colour, smelling more strong than the leaves, which being past, there rise up in their places

1. & 3. *Sambucus vulgaris* & *laciniatis folijs*.
The common and the jagged Elder.

4. *Sambucus racemosa rubra*.
Red Berried Elder.

small round berries greene at the first, and blackish when they are ripe, full of a purplish juyce within them; wherein lie some small flat seedes or graines: the roote is great and thicke spreading farre about. There is a kinde of *Fungus* or excrecence growing at the foote of the body, and on the branches of this tree, called Iewes eares, which I shall further declare among the other sorts of Mushrooms.

2. *Sambucus fructu albo*. White berried Elder.

This Elder is so like the former, both in growth, barked, pith, branches, sent, leaves and flowers, that untill it come to beare fruit, it is very hard to be discerned from the other; the chiefest difference hercof, is that the berries are not blacke, but of a pale whitish yellow colour in most places, yet in some they abide greenish; and hereby onely it is distinguished from the former.

3. *Sambucus laciniatis folijs*. Jagged Elder.

As the former Elders were distinguished onely by their berries, so the onely difference in this from the first, is the forme of the leaves, which are so much jagged, and divided even to the middle ribbe, that unlesse the smell thereof declared his descent, no body by the present face would deeme it an Elder: in all other parts thereof as well flowers as fruit or berries, it differeth not from the common Elder.

4. *Sambucus racemosa rubra*. Red berried Elder.

The Mountaine Elder also, differeth little from the first sort, for but that it groweth seldome so great, and that the flowers being somewhat yellowish, grow not in large spread tufts, but in small long branched clusters, like unto Privet, and that the berries following them are of a scarlet red colour, pleasant to be eaten and not offensive to any: it is like it in the growing, rugged white barke in the body and Elder boughes, and somewhat reddish in the young leaves, as also in the rootes the wood being not so soft nor so pithy.

5. *Sambucus palustris* five *Aquatica*. Marsh Elder.

The Marsh or Water Elder, hath his body and branches covered with a whitish barke, but they are smaller and more brittle than any of the former: the leaves also differ much from them, being broad and smooth divided at the edges, into three, or sometimes into five divisions or incisures, and dented round about, being very like unto a Vine leaf, and coming somewhat neere unto the great Maple or Sicomore leaf, as we use to call it: the flowers stand in tufts or umbells like the first sorts, but they are smaller and whirish, the outermost being larger by much than any of the innermost, or of the former Elders, consist of five leaves a peece, round pointed, which compass the middle flowers round about, but have no threds in the middle, of a reasonable sweete sent: after which follow very red berries, somewhat flat and full of a red juyce, bitterish in taste, ready to provoke casting.

6. *Sambucus Rosea*. The Gelder Rose.

Of this kinde is this Elder or Gelder Rose, growing after the same manner with such like leaves, but the flower is composed of it were of many white, or pale bluish flowers, set together in a round tuft or ball.

7. *Ebnlus* five *Sambucus humilis*. Walewort, Danewort, or Dwarf Elder.

Wallwort is but an herbe every yeare dying downe with his stalkes to the ground, and rising againe a fresh every spring, and is like unto the Elders both in forme and qualitie, that deservedly it hath the name of a dwarf Elder, which riseth up with a foure square rough hairy stalke foure foote high or more sometimes: the winged leaves:

6. *Sambucus Rosæ*, 5. *Et Aquatica five palustris*.
The Gelder Rose and the Marsh Elder.

7. 8. *Ebulus vulgaris & laciniatis foliis*.
Ordinary Wallwort and with fine cut leaves.

leaves, are somewhat narrower than the Elder, but else so like that it might soon deceive one not very well exercised or cunning: the flowers are white with a dash of purple, standing in umbels very like those of the Elder, but more sweete in sence; after which come small blackish berries, full of juyce while they are fresh, wherein there lye small hard kernels or feede: the roote doth creepe under the upper crust of the ground, springing a fresh in diverse places, being of the bignesse of ones finger or thumbe sometimes.

8. *Ebulus foliis laciniatis*. Jagged Wallwort.

This Wallwort is in all other things save the leaves, so like unto the ordinary kinde, that there can be knowne no difference: but the forme of the leaves, doth so deforme the whole face of the plant, and bring it out of knowledge, like the Jagged Elder, that none almost would thinke it should belong unto the former: the flowers and fruite and sence, onely leading us to judge of the species, and whereunto to be referred, for the leaves are almost as much jagged and divided as the Jagged Elder, which is the onely difference in this from the former.

The Place.

The first or common Elder groweth not wilde but is planted in all places, to serve for hedges, and partitions of grounds, vineyards, &c. to hold up the banks by ditches and water courses, and to bee planted in places where Conies breed for shadow: every sticke or branch being thrust into the ground, serving as a stocke which will easily take roote and grow. The second as it seemeth *Tragus* first found in the woods of *Germany*. The third is found wild on hills in watery woods. The fourth is not knowne certainly from whence his originall came, but is found planted in the gardens of those that are curious, and lovers of rare plants. The fifth is found by water sides and moorish grounds of *Germany*, *France*, *England*, *Italy*, and *Piemont* in *Savoie* as *Pena* hath set it downe. The sixth is nurfed up onely in gardens, but best delighteth in moist grounds: The seventh groweth wilde in many places of *England*, where if it be once gotten into a ground, it will so creepe and runne therein, that it will hardly be gotten forth. The last is a stranger in *England* as yet, and nurfed onely in that curious garden of that *Venetian Magnifico Signior Contarini*.

The Time.

All or most of the Elders flower in June, the Wallwort somewhat late, as his fruite is likewise later ripe, even not untill September, when the others are ripe for the most part in August.

The Names.

The Elder is called in Greeke *ακτις*, *quasi littoralis dista videtur*: in Latine generally *Sambucus*, of *Sambix* as it is thought the first finder thereof; but *Quintus Serenus* calleth it *Sabucus* in his verses, and thought to be derived from *Sabucus* or *Sambucus* as *Hermolani* saith, which is an hollow instrument of Musicke, called also *Peltis & Magadis*: The excrescence growing on the Elders is usually called *Fungus Sambucinus* of *Dodonæus* *Gummi Sambuci*, and of some *Auricula Iude*, in English Iewes eares. The first is called *Sambucus urbana domestica, campestris, and vulgaris* of all writers, and of *Bauhinnus* *Sambucus fructu in umbella nigro*. *Tragus* calleth the second

Sambuci aliud genus. Dodonæus Sambuci altera species. Lobel Sambucus fructu albo. Bauhinus Sambucus fructu in umbella viridi. The third is called *Sambucus Montana* of *Matthioli*, *Gesner*, *Castor Durantes*, & *Camerarius*: of *Tragus* and *Lonicerus* *Sambucus Sylvestris*, and because he saith it hath bene certainly observed, that the *Hindes* and *Doe* doe greatly affect the leaves thereof, when they are great with young, *Tabernmontanus* calleth it *Sambucus cervina*, and *Gerard* after him *Sambucus racemosa vel cervina*; of *Lobel* *Sambucus montana racemosa*, and *Ioannes Thalius*, in the description of *Harcynia Saxono-thuringica*, *Sambucus montana*, seu *roßesackel*. *Bauhinus* calleth it *Sambucus racemosa rubra*, putting a doubt whether it be *Sambucus montana* of *Pliny*, which he saith groweth on *Mountaines*, and thinking it also to be *πυρρ* of *Theophrastus*, whereof he maketh mention in his 3 booke and 4 chapter, among those trees that onely delight to grow on hills, and will not grow in the champions, and which *Gaza* in the Latine translation hath omitted and left out: but the Greeke *Theophrastus* hath not *πυρρ* as *Bauhinus* setteth it downe, but *ρυρρ*; *Phagus*, as *Gaza* hath it in other places, he and *Pliny* before him, being the cause of many mens errors, in mistaking the Latine *Fagus* a Beech tree, for this *ρυρρ* & *Phagus* of *Theophrastus*, which is a kinde of Oake as you shall understand in his proper place, when I shall speake of all the sorts of Oakes. The fourth *Lobel* in his Dutch herball, first made knowne to all, having found it planted in the gardens of the low cuntry Apothecaries, and others that were lovers of rare and strange plants, and called it *Sambucus laciniatis foliis*, whom all others have followed. The fift is called *Sambucus aquatica* of *Matthioli*, *Tragus*, *Lobel*, *Castor Durantes*, *Lugdunensis* and others. *Sambucus palustris* of *Dodonæus*, *Cesalpini* and *Camerarius*; *Cordus* in *historia* calleth it *Lycostia phyllos femina*. i. *Vna lupina*; *Ruellius* tooke it to be *Opulus* but that is a kind or name of Maple; as *Lugdunensis* hath it. *Anguillara* calleth it *Platanus aquatica*; (and so do the *Italians* for the most part) which is the third kinde of Maple as he saith, *Gesner* calleth it *Sambucus palustris vel aquatica sylvestris*; and saith some also called it *Chameplatanus*: *Lugdunensis* first and *Bauhinus* after him, doe take it to be *δρυπάλ* & *Thraupalus* of *Theophrastus* in his third booke and fourth chap. and in his fourth booke and 1 chap. *Bauhinus* calleth it himselfe *Sambucus aquaticus flore simplici*, as hee calleth the *Gelder Rose* *Sambucus aquatica flore globoso pleno*. The *Wallworthe* or *Daneworthe* or *dwarfe Elder*, is called in Greeke *ζευαδεν*, id est, *humilis Sambucus*, in Latine *Ebnulus*, by which names all other Greeke and Latine writers have called it: and the last from the Noble *Contarenius* his garden, receiveth the name of *Ebnulus laciniatis foliis* as it is in the title. It is supposed it tooke the name *Danewort*, from the strong purging quality it hath, many times bringing them that use it unto a fluxe, which then we say they are troubled with the *Danes*. The *Arabians* call it *Infatti*, the *Italians* *Sambuco*, the *Spaniards* *Sabuco*, *Sauco* & *Caxivero*, the *French* *Susean Suser* & *Suin*, the *Germanes* *Holder* & *Holler*, the *Dutche* *Vlier*, and we in English *Elder*.

The Vertues.

Both *Dioscorides* and *Galen* doe attribute to the *Wallworthe*, as well as to the common *Elder*, (for they account their properties both one) an heating and drying quality, purging watery humors abundantly, but not without trouble to the stomacke: the first shootes of the common *Elder* boyled like unto *Asparagus*, and the young leaves and stalkes boyled in fat broth, draweth forth mightily choller and tough flegme; the tender leaves also eaten with oyle and salt doe the same: the middle or inner barke boyled in water, and given to drinke, worketh much more violently; and the berries also either greene or dry, expell the same humors, and is often given with good successe to helpe the dropsie, by evacuating great plenty of waterish humors: the barke of the roote also boyled in wine, or the juyce thereof drunke, worketh the same effects but more effectually, then either leaves or fruite doe; the juyce of the roote taken provoketh vomit mightily, and purgeth the watery humors of the dropsie; the same decoction of the roote cureth the biting of the viper or adder, as also of a mad dogge, and mollifieth the hardnesse of the mother, if women sit therein. and openeth the veines and bringeth downe their courses: the berries boyled in wine performe the same effects; the haire of the head or of other parts washed therewith, is made blacke; the juyce of the greene leaves applied to the hot inflammations of the eyes, asfwageth them: the leaves boyled until they be tender, then beaten and mixed with barley meale, and applied to hot inflammations asfwageth them, and helpeth places that are burnt either by fire or water, cureth fistulous ulcers being layde thereupon, and easeth the paines of the goutte, being beaten and boyled with the tallow of a bull or goat, and layd warme thereon: the juyce of the leaves snuffed up into the nostrills, purgeth the tunicles of the braine; the juyce of the berries boyled with a little honey, and dropped into the eares, easeth the paines of them; the decoction of the berries in wine being drunke, provoketh urine: the powder of the seedes, first prepared in vinegar, and then taken in wine, halfe a dramme at a time, for certaine dayes together, is a meanes to abate and consume the fat fleshe of a corpulent body, and keepe it leane: the berries so prepared, and as much white tartar and a few aniseede put to them, a dramme of this powder given in wine, cureth the dropsie humour, by purging very gently: the dry floweres are often used in the decoctions of glisters to expell winde and ease the chollicke, for they lose their purging quality which they have being greene, and retain a attenuating and digesting propertie being dried: the distilled water of the floweres, is of much use to cleare the skinne from sunne burning, freckles, morpew, or the like: and as *Matthioli* saith both the forepart and hinderpart of the head, being bathed therewith, it taketh away all manner of the headach that commeth of a cold cause. The Vinegar made of the floweres of *Elder* by maceration and insolation, is much more used in *France*, than any where else, and is gratefull to the stomacke, and of great power and effect to quicken the appetite, and helpeth to cut grosse or tough flegme in the chest. A *Syrupus acetosus* made hereof, would worke much better than the ordinary, for these purposes. The leaves boyled and layd hot upon any hot and painefull apostumes, especially in the more remote and sinewie parts, doth both coole the heate and inflammation of them, and ease the paines. The distilled water of the inner barke of the tree or of the roote, is very powerfull to purge the watery humors of the dropsie or timpanie, taking it fasting, and two houres before supper: *Matthioli* giveth the receipt of a medicine to helpe any burning by fire or water, which is made in this manner; take, saith he, one pound of the inner barke of the *Elder*, bruse it or cut it small and put it into two pound of fine sallit oyle, or oyle Olive, that hath bene first washed oftentimes with the distilled water of *Elder* floweres, let them boyle gently a good while together, and afterwards straine forth the oyle, pressing it very hard, set this oyle on the fire againe, and put thereto, foure ounces of the juyce of the young branches and leaves of the *Elder* tree, and as much new wax: let them boyle to the consumption of the juyce, after which being taken from the fire, put presently thereunto, two ounces.

ounces of liquid Vernish, (such as Ioyners use to vernish their bedsteads, cupboards, tables, &c.) and afterwards of *Olibanum* in fine powder foure ounces, and the whites of two egges being first well beaten by themselves, all these being well stirred and mixed together, put it up into a cleane pot, and keepe it for to use when occasion serveth. The young budde, and leaves of the Elder, and as much of the rootes of Plantaine beaten together, and boyled in old Hogs grease, this being laid warme upon the place, pained with the gout doth give present ease thereto. The leaves also burned and the powder of them put up into the nostrills, staeth the bleeding being once or twice used. If you shall put some of the fresh flowers of Elders into a bagge, letting it hang in a vessell of wine, when it is new made, and beginneth to boyle (I thinke the like may be tried with a vessell of ale or beere new tunned up, and set to worke together) the bagge being a litle pressed every evening, for a seaven night together, giveth to the wine a very good rellish, and a smell like Muscadine, (and will doe little lesse to ale or beere.) The leaves of Elders boyled tender and applied warme to the fundamente, easeth the paines of the piles, if they be once or twice renewed growing cold; The foule inflamed or old ulcers and sores of the legges, being often washed with the water, of the leaves or of the flowers distilled in the middle of the moneth of May, doth heale them in a short space. The distilled water of the flowers, taketh away the heate and inflammation of the eyes, and helpeth them when they are bloud hotten. The hands being washed morning and evening with the same water of the flowers, doth much helpe and ease them that have the Palsie in them, and cannot keepe them from shaking. The pith in the middle of the Elder stalkes, being dried and put into the cavernous holes of Fistulous ulcers, that are ready to close, openeth and dilateth the orifices, whereby injections may be used, and other remedies applied for the cure of them. It is said that if you gently strike a horse that cannot stale, with a sticke of this Elder, and binde some of the leaves to his belly, it shall make him stale quickly. The Mustrumes of the Elder called Iewes eares, are of much use being dried to be boyled with Ale or Milke with Columbine leaves for sore throates, and with a litle Pepper and Pellitory of *Spaine* in powder, to put up the *wound* or pallet of the month when it is fallen downe. *Matthiolus* saith that the dried Iewes eares steeped in Rosewater, and applied to the temples and forehead, doe ease the paines of the head or headach. The Mountaine or red berried Elder, hath the properties, that the common Elder hath, but weaker to all purposes: the berries here of are taken to be cold, and to procure sleepe, but the frequent use of it is hurtfull: It is said that if a branch of this Elder be put into the trench that a moale hath made, it will either drive them forth, or kill them in their trench. The Marsh Elder is of the like purging qualitie with the common, especially the berries or the juyce of them. Hens and birds doe feede upon them willingly in the Winter. The Wallwort or Danewort, is more forceable or powerfull than the Elder, in all the diseases and for all the purposes whereunto it is applied, but more especially wherein the Elder is little or nothing prevalent; the Wallwort serveth to these uses. The young and tender branches and leaves thereof taken with wine, helpeth those that are troubled with the stone and gravell, and laid upon the testicles that are swollen and hard, helpeth them quickly: the juyce of the roote of Wallwort applied to the throat, healeth the Quinsie or Kings evill: the fundament likewise is stayed from falling downe, if the juyce thereof be put therein: the same also put up with a litle wooll into the mother, bringeth downe womens courses; the same juyce of the roote is a mighty purger of watery humours, and held most effectfull for the dropie of all others herbs whatsoever: the dried berries or the seeds beaten to powder, and taken in wine fasting, worketh the like effect, the powder of the seeds taken in the decoction of *Chamaepitys* or ground Pine, and a litle Cinamon, to the quantitie of a dramme at a time, is an approved remedy, both for the gout, joynt aches, and sciatica, as also for the French disease, for it easeth the paines by withdrawing the humors from the places affected, and by drawing forth those humors that are fluent, peccant and offensive: the ponder of the roote worketh in the like manner, and to the same effect. The roote hereof steeped in wine all night, and a draught thereof given before the access and coming of the fit of an Ague, prevaileth so effectually there against, that it will either put off the fit, or make it more easie, and at the second taking seldome faileth to rid it quite away. An ointment made of the greene leaves, and May butter made in the moneth of May, is accounted with many a soveraigne remedy, for all outward paines, aches and crampes in the jointes, nerves, or sinewes, for sturkenesse and lamenesse by cold and other casualties, and generally to warme comfort and strengthen all the outward parts ill affected: as also to mollifie the hardnesse, and to open the obstructions of the spleene, the grieved parts anointed therewith. The leaves laid to sleepe in water, and sprinkled in any chamber of the house, as it is said, killeth Fleas, Waspes and Flies also, if you will credit the report. *Tragus* saith, that the tender branches boyled in wine, whereunto some honey is put, and drunke for some dayes together, is profitable for a cold and drie cough, cureth the diseases of the breast, by cutting and digesting the grosse and tough flegme therein. Briefely whatsoever I have shewed you before in relating the properties of Elder, doth Wallwort more strongly effect in opening and purging choller, flegme and water, in helping the gout, the piles, and womens diseases, colouring the haire blacke, helpeth the inflammations of the eyes and paines in the eares, the stinging and biting of Serpents or a mad Dogge, the burnings or scaldings by fire and water, the wind-collicke, the collicke and stone, the difficultie of urine, the cure of old sores and fistulous ulcers, and other the griefes before specified, which for brevite I doe not set downe here, avoiding tautologie as much as I can.

CHAP. XXV.

Helleborus niger. Blacke Hellebor or Bearefoote.

F the Hellebors there are two primary sorts, white and blacke: Of the white sort we will speake in the next Chapter, and of the blacke in this whereof there are sundry sorts as you shall heare.

1. *Helleborus niger verus*. The true blacke Hellebor, or Christmas flower.

The true blacke Hellebor (or Bearefoote as some would call it, but that name doth more fitly agree unto the other two bastard kinds) hath sundry faire greene leaves rising from the roote, each of them standing on a thicke round stiffe greene stalke, about an handbreadth high from the ground, divided into seven, eight, or nine parts or leaves, and each of them nicked or dented from the middle of the leafe to the pointward on both sides.

1. *Helloborus niger verus*.
Blacke Hellobor or Christmas flower.

2, 3. *Helloboraster minor*, & *ir-jouis pinojus*.
Bastard blacke Hellobor or Beares foote, and with trifolite prickly leaves.

3. *Helloboraster maximus frut. confiligo*.
The greatestt bastard blacke Hellobor or Beares foote
called Setterworte.

sides, abiding greene all the Winter, at which time the flowers rise on the like short stalkes, as the leaves grow on, without any leafe thereon for the most part, yet sometimes having a small short pale greene leafe, resembling rather a skin than a leafe, a little under the flower, and grow but little higher than the leaves: each stalke also beareth usually but one flower, yet sometimes two, consisting of five large round white leaves a peece like unto a greate single white Rose, changing sometimes to be either dasht with a purple about the edges or to be wholly purple without any white in them, as the weather or time of continuance doth effect, with many pale yellow thrums in the middle, standing about a greene head, which after growth to be the seede vessell, divided into severall cells or podes like unto a Colombine head or *Aconitum hyemale*, but greater and thicker, wherein is contained somewhat long and round blackish seede, like the seedes of the bastard kindes: the rootes are a number of brownish blacke strings, which runne downe deepe into the ground, and are fastened to a thicke head, of the bignesse of ones finger. Of this kinde there is an other whose flower is red from the first opening, which *Bel-lonius* remembreth in his observations to have seene in the woods of Greece.

Floriastro.

2. *Helloboraster minor flore viridante*. Bastard blacke Hellobor or Beares foote.

The smaller bastard Hellobor or Beares foote is in most things like unto the former true blacke Hellobor, for it beareth also many leaves upon short stalkes divided into many parts, but each of them are longer and narrower, of a darker greene colour dented on both sides, and feeble somewhat hard, perishing every yeare, but rise againe the next Spring: the flowers hereof stand on higher stalkes, with some leaves on them also, yet very few, and are of a pale greene colour like the former, but smaller by the halfe at least, having likewise many greenish yellow threads or thrummes, in the middle, and such like heads, or seede vessells and blackish

seede

seede in them, the rootes are more stringie blacke and hard than the former.

3. *Helleboraster alter trifolius spinosus*. Trefoile Prickly leaved Bearefoote.

This sort differeth little in the manner of growing, from the last described, having long stalkes with leaves thereon, and flowers at the toppes of the same fashion and so is the seede also that followeth, but the leaves are harder, and only divided into three partes, & the dentes about the edges are hard sharpe and prickly; the flowers being of a paler or whiter Greene colour.

4. *Helleboraster maximus sive Confligo*. The greatest ballard blacke Hellebor, or Bearefoote, called also Setterwort.

This great Bearefoote hath diverse sad Greene leaves, rising from the rootes, each upon along itallke, which are divided into 7 or 9 divisions or leaves, each whereof is narrower than the lesser ballard blacke Hellebor or Bearefoote, nicked or dented about the edges, but not so deeply, and abiding above ground Greene all the winter, whereas the other perisheth as I said every yeare, and riseth againe in the spring: this shooteth up a reasonable great and tall stalke, higher by the halfe than the other, with such like leaves thereon as grow below, smaller up to the toppe, where it spreadeth into divers branches, bearing many hollow cup-like flowers, divided at the brims into 5 parts, but doe seldome spread themselves open, of a whitish yellow Greene colour somewhat like the other bastard kind, & sometimes purplish about the brims or edges, with a Greene head in the middle, & a few white threads about it: (whereby it may seeme likely to be that fourth kind of *Veratrum nigrum* of *Clusius*, which he calleth *peregrinum*, and saith is like unto the third of *Dodonæus*, whose figure as hee saith, he sheweth there, to be knowne which he mea-

5. *Helleborus niger serotinus*.
Fennell leaved ballard blacke Hellebor.

8. *Epipactis Matthioli*. *Matthiolas*
his ballard blacke Hellebor.

6. *Helleborus niger Saniculae folio major*.
The greater purging Sanicle like Hellebor.

Alter
classj.

neth; but it is not the third of *Dodonæus* as he saith, but the second, and this that I here describe unto you, is *Dodonæus* his third *Veratrum nigrum* which greene head growing to be the vessel, wherein the blacke seede is contained, shooteth forth into foure, five, or sixe hornes; fashioned like the other bastard kind, but smaller, as the feede is also for the most part, the roote is but single with nothing so many stringes growing with it, and oftentimes perisheth after it hath given feede, yet not alwayes, nor in all places: the whole plant, and every part thereof, is of a worse smell than the other: the roote of this with the lower part of the stalk next thereunto is that Settet wort, that the countrie people doe use to rowell their cattell withall. Of this kinde also *Clusius* maketh mention of an other, differing onely in the darker greene colour of the leaves, and in the flower, that the edges of the three innermost are of a darke purple colour.

5. *Helleborus niger fernulaceus*. Fennell leaved bastard blacke Hellebor.

This kind of bastard Hellebor shooteth forth many greene stalkes, sometimes lying or leaning to the ground, or else standing somewhat upright, beset very thicke with small leaves, finer and shorter than fennell, some of them ending in a tuft of such like fine greene leaves, and some having at the toppes of them one large flower, a peece, somewhat reddish or brownish on the outside, while they are in bud and a while after, which being open consist of 12, or 14 long and narrow leaves, of a faire shining yellow colour, set in order round about a greene head with yellow thrummes in the middle, laying themselves open in the Sunne or a faire day, but else remaining close: after the flower is past, the head growing greater sheweth it selfe compact of many round whitish feede, very like unto the head of *Adonis* flower, but much greater: the rootes are many long and blackish stringes set together at the head, very like unto those of the lesser blacke Hellebor or Bearefoote, but harder, stiffer, or more brittle, and seeming to be without any moisture in them, but abide and increase every year, although the stalkes with greene leaves doe utterly perish every year.

6. *Helleborus niger Sanicula folio major*. The greater purging Sanicle like Hellebor.

This Hellebor hath divers broad darke greene leaves, each of them standing upon a long footstalk, which are cut in on the edges into five divisions for the most part, & dented about besides, somewhat resembling the leaves of the common Sanicle, but more truly the leaves of the field *Ranunculus* or Crowfoote, or *Geranium Batrachoides*, Crowfoot, Cranes bill: from among which rise up divers slender smooth greene stalkes, having some leaves upon them, and at the tops of them, two or three or more flowers together, each of them consisting of many small hard whitish leaves, as a pale or border, compassing many threads in the middle; which being fallen, there rise up many flat whitish and long feede, somewhat like unto seete Fennell feede, but not altogether so bigge, nor so yellow; *Gerard* following *Dodonæus* description, and not his owne knowledge; saith the seeds are like unto *Carthamus*, and his Corrector mendeth not the fault: the rootes are small blacke stringes, shooting from a topple head, like unto the roote of the Bearefootes.

7. *Helleborus niger Sanicula folio minor*. Small purging Sanicle like Hellebor.

This small Hellebor or Sanicle, (which you please to call it) hath divers small and somewhat round leaves, every one upon a long footstalk, being not much broader than the nayle of a mans thumb, yet divided even to the middle ribbe into seven parts, every one of them being short, narrow, and dented about the edges: the stalkes are many and small, not above an hand breadth high, with one or two leaves on them, more cut in and divided than the lower are; at the toppes of them stand divers small flowers very thicke, set together in tufts or umbles, like unto the last, but smaller, after which come small flat feede, somewhat like the other, but lesser by much, as it is also in all the other parts thereof.

8. *Epipactis Matthioli*. *Matthioli* his bastard blacke Hellebor.

This small herbe riseth up with sundry slender weake smooth stalkes, bearing each of them a broad greene leaf, divided for the most part into five divisions or parts, somewhat like those of the sixt, yet sometimes but into three, especially the first or lowermost, and dented also about the edges: the flowers grow from among the leaves upon the like slender stalkes, being starrelike, and composed of sixe pale coloured leaves, with many short th eades in the middle; the roote is a tuft of blackish fibres like the former blacke Hellebors, issuing from a thicke a head.

The Place.

The first groweth in *Germany*, *France*, and *Italy*, and *Greece* in sundry places: the second I have seene in some woods in *Northamptonshire*, and in other places of this Land; the third grew at *Delft* with *Corvinus*, and then at *Rome*, as *Aldinus* saith in his *Farnesian* garden: the fourth groweth, as *Tragus* saith in the borders of stony fields and grounds, and on rockie hills by the *Mosella* and the *Rhine*, as also in *Harcynia Sylva*; and as *Pena* saith in *Aquitaine*, as also by the river *Lotus* at *Mompelier*: the fifth groweth neere *Vienna* in *Austria*, and both the *Hungaries* as *Clusius* saith: the sixth groweth naturally on the hills of *Germany*, and other untilled and craggy places: the seventh groweth on *Monsfructus* neare the *Alpes*, as also on the *Pyrenean* hills: the last as *Pena* saith in the low grounds or valleyes of the Forrest or wood of *Essens*, not farre from *Jupiter's* hill.

The Time.

The first doth flower in December and January, if the weather be any thing temperate: the second, third, and fourth in February or March, and their feede is ripe in May; the fifth in April; the other in May and June.

The Names.

It is called in Greeke *ἐπὶ ἑλβε*, and sometimes without the asperation *ἐπὶ ἑλβε*, sic dictum voluit quod cibum corporis eripiat, in Latine also *Elleborus* & *Elleborum*, and also *Helleborus*, & *Helleborum*, & *veratrum*, quod mentem vertat: But there is much controversie and contrarietie, both in the ancient and moderne Writers concerning them: for the *Helleborus* of *Theophrastus* and *Dioscorides* doe much differ the one from the other, and divers of our moderne Writers, thinke that ours doe differ from them both. Some likewise appropriate one herbe, some another unto theirs as you shall presently heare. *Theophrastus* saith in the ninth Booke, and eleventh Chapter of his History of Plants, that the rootes of the blacke and white Ellebor, are like the one unto the other, except the colour, that is, the one blacke the other white (which may be reconciled if you will take it spoken onely of their Fibres, the one being blacke, the other white) but that the leafe of the blacke as he saith is like unto a Bay leafe, and that of the white unto those of Leekes, can no way be reconciled, for they are so differing from *Dioscorides* or ours, that we may well say, we neither have nor know any of both *Theophrastus* his Ellebors, unless there be

be some error in the text as many thinke. *Dioscorides* describeth his blacke Ellebor, to have leaves like *Platanus*, the Plane tree, but lesse, neere unto those of *Spondilium* or cow Parsnippe, but more rough and blacker, cut into many divisions; the stalke is rough, the flowers, saith he, are whitish, inclining to purple, standing in a cluster: the feede is like *Cincus* or bastard Saffron, which is called *Sesamoides* in *Anticyra*, wherewith they make purgations: the rootes are small blacke strings, coming from a certaine head like an Onion, which are in use; thus farre *Dioscorides*: unto this description our true black Hellebor doth not agree in all things: for the leaves of ours, do very forrily resemble those of the Plane tree (which is a whole broad leafe cut otherwise in the edges into parts or divisions) or of the *Spondilium* cow Parsnip, (which is a broad whole leafe consisting of many much broader divisions in it) neither are the leaves rough, (but cented or toothed at the ends) nor the stalke rough, but smooth, nor do the flowers stand in clusters but one by one each upon their own stalk, or two at the most on a stalk: whereupon *Dodonæus* would mak our sixt sort here exprest, which is somewhat like the *Sanicle* or *Selfe* heale, to be the *Veratrum nigrum*, or *Elleborus niger* *Dioscoridis*, because it hath seeds in tuftes, which *Gesner*, *Pena*, and *Lobel*, call *Abrantia nigra* of *Dioscorides*, and *Fuchsius* *Sanicula femina*: but *Dodonæus* himselfe is much puzzled, to make it agree thereunto, finding it to differ in many things; sometimes in making the feede to be like *Cincus*; whereunto it hath but little resemblance, as I shewed you in the description, and sometimes blaming the text, (where it is said to be called *Sesamoides* in *Anticyra*, to be corrupt, and that *Dioscorides* borrowed it from *Theophrastus*; who saith that in *Anticyra*, they did give *Elleborus Sesamaceus* the *Sesamoides* like *Elleborus*, that is to say whose fruit is like unto *Sesamum*, to purge withall: And it is most probable, that the feede of the blacke Hellebors, both the true and the bastard kinds, may somewhat agree thereunto, and not very unfitly be compared unto the fruit or feede of *Sesamum*, & the seed of *Cincus*; but whether the seed of those black Hellebors, have more force in purging than the rootes have, I am not certaine. that any hath made a true experiment, for most of our moderne writers do agree, that both our white and black Hellebors are the true sorts, set forth by *Dioscorides*, (& notwithstanding the variation, as it is before set downe) *Theophrastus* also. The first is called *Helleborus niger* by all that have written of it, some adding thereunto *Flore magno purpureo*, as *Gesner*, or *Flore rosco* as *Bauhinus*, or *legitimus* or *verus*, as others doe. *Dodonæus* onely in his French Herball calleth it *Planta leonis* and *Anguillara* *Elleborus niger annuus*, but why I know no reason: the second is called *Helleboraster* & *Helleborus niger vulgaris* by *Gesner*, by *Cordus nostras*, by *Fuchsius* *adulterinus hortensis*, and *Consiligo* by *Lugdunensis* and *Turner*: the third is remembered by *Aldinus* in his *horto Farnesiano*: the fourth is called by *Dodonæus* in his French Herball *Lycostanum primum* whom *Lobel* seemeth in his *Adversaria* to follow, saying it commeth neere to the *Aconites*; *Gesner* in *hortis* took it to be *Pulmonaria Vegetii*, *Cordus* calleth it *Sesamoides magnum*, and *Tragus* *Pedicularia fetida tertia*, *Dodonæus* and *Clusius* *Veratrum nigrum tertium*, and *Cesalpinus* *Eneaphyllon Plinii*: but generally it is called either *Helleborastrum magnum* as *Tabernmontanus*, or *Helleboraster maximus*, or *Helleborus niger sylvestris adulterinus*, or else *Consiligo Ruellii*, as *Lobel*, *Lonicerus*, *Lugdunensis* and others: yet all the Hellebors both black and white are also taken by one or other to be *Consiliges*, for in regard there is no description of *Consiligo* extant in any author, but the vertues and properties onely whereunto it is applied, divers have written thereof diversly. *Tragus*, *Lonicerus*, *Gesnerus* and others, both Phisitians and Apothecaries almost through all Germany, and the parts adjoyning in former times, tooke this fift sort, called *Buphtalmum majus*, by *Anguillara*, *Clusius*, and others; and *Helleborus niger ferulaceus* by *Lobel*, but *Pseudo Helleborum* by *Matthiolus* to be the true *Helleborus niger* of *Dioscorides*, or at least a kind thereof, and which *Clusius* saith was so used of all in *Vienna* and those parts before he came thither, and shewed them their error and the right kind, which they ever after used: *Dodonæus* also calleth it *Buphtalmum*, joyning it next to *Eranthemum* or *Flos Adonis*, whereunto it is very like in leaves and feede, but not in rootes: others would make it *Sesamoides minus* of *Dioscorides*, whereunto it hath no correspondency: the sixt is called by *Fuchsius* *Sanicula femina*, and so doth *Gesner*, who also calleth it *Astrantia nigra*, as *Lobel* doth; following as it should seeme *Tragus*, who calleth it *Ostereitum montanum*: *Tabernmontanus* calleth it *Imperatoria nigra*, *Dodonæus* as I sayd before, taketh it to be *Elleborus niger*, or *Veratrum nigrum* of *Dioscorides* and *Bauhinus* in his *Pinax* calleth it *Elleborus niger*, *Sanicula folio major*, and I from him do so likewise, as thinking it a name as proper, if not more then any other is given it: the seventh *Bauhinus* onely hath described in his *Prodromus* by the same title that I have given it: the last is the *Epipactis* of *Matthiolus*, which *Lobel* and *Pena* call *Elleborine Alpina* *Sanicula* & *Hellebori nigri facie* & *commentitia*, as counterfeited by him, yet others doe not thinke so: but whether the *Epipactis* of *Dioscorides*, which he saith some called *Elleborine* should bee referred to the white Ellebor, as *Camerarius* and others would have it, or to the blacke, resteth doubtfull, because *Dioscorides* is so brieve in his description thereof, that it cannot certainly be determined, he onely saying it is a small Herbe with small leaves, good for the diseases of the Liver, and against poyson. The Arabians call it *Cherbachem* and *Charbach* asued, the Italians *Elleboro negro*, the Spaniards *Verdagambre negro*, the French *Vire* & *Veraire noir*, the Germans *Zwart Nieswurcz*, and *Christwurcz*, the Dutch *Swert Niescruit*, and we in English as it is in their titles.

The Vertues.

The true blacke Hellebore is used for most of the griefes and diseases, whereunto the white is available, but is nothing so violent or dangerous: the leaves shred small, or the juice of the leaves made up with flower, into small cakes, and baked, hath been used to good purpose to helpe the Dropcie, Jaundies, and other evill dispositions of the Liver and Gall: The leaves sometimes also are used to purge and open the body in some cases, as well as the rootes which are of greater use, and greatest effect; against all melancholike diseases, long lingring Agues as the quartaine and the like, the Meagrim and the old paines in the head, the blacke as well as the yellow Jaundies, the Leprosie, falling sicknesse, Consumption eyther of the Lungs or whole body, or paines in the belly; Sciatica, Crampes, Convulsions or shrinking of sinewes, and all other griefes, paines and aches of the joynts or sinewes, if the roote be taken in powder, in infusion or decoction, or in broth, being first prepared in vinegar as is sometimes used to bee done, that is steeped in vinegar for a day and a night, and after dried up againe, which manner of preparation is according to the ancient custome then used: but wee have not found that the roots of this blacke Hellebore growing in our owne Country, to be deadly to cattle if they eat it, or any of the other sorts, or that this hath any such strong or churlish operation in working, as the ancients doe attribute to theirs of the hotter Countries, that thereby such preparations should neede to qualifie the malignitie thereof: for wee have never seene ours, (I thinke the moisture and tempetature of our climate, abating and correcting the

the violence thereof) to worke any troublesome fit or passion in any that hath taken it, without any of that preparation aforesaid, (the remedy if any danger be thereby is to drinke Goates milke) yet *Matthiols* doth much commend his *Elleborismus* (the receipt whereof is in the third booke of his Epistles namely in that to *Hannschius*) whose preparation is to sleepe the rootes and take out their pith and dry the barke againe, and preferreth the rootes of that true blacke Ellebor that beareth red flowers, before those that beare white, but in want of the one as he saith himselfe, the other may be to as good effect taken; for that kind (if it be a kind of it selfe, that will not degenerate, and not the quality of the climate onely causing the colour) wee have not seene growing in our land, although such an one hath bene sent me from beyond sea, but perished quickly after: he commendeth it for all the griefes aforesayd: yet if an extract be made of the rootes, it will serve upon all occasions, being ready at hand to be used: the rootes applyed in a pessarie mightily prevaile to bring downe womens courses: the powder of the roote strowed upon foule Vicers, although they be fistulous doth quickly heale them; and if there be any callous or hard flesh growne in the Fistula, the roote left in it for two or three dayes will consume it quite. *Galen* remembreth this in *6. de simpl. med. facult.* and *Iulius Alexandrinus* saith, he often tryed it to be true: the rootes boyled in vinegar, and any place washed therewith troubled with scabbes, wheales, or pusses, the leproy or any other such like breaking out, yea although they be gangrenous or eating sores, by staying their eating or spreading, preserveth the flesh from putrefaction: the same decoction also helpeth the Toothach, if the mouth be gargled therewith: as also dropped into the eares easeth the noyse and helpeth the deafenesse. The Second kind which is the lesser bastard Hellebor or Peares foot, for any thing that ever I could finde, by the severall tryalls made thereof, is more forceable and churlish in working and purging then the former; a dram of the rootes steeped in wine all night and drunke in the morning, assuredly prevaileth powerfully against all the diseases appropriate unto the former kind: therefore I shall not neede to repeate the same things againe: but besides the things before remembred, the powder of the dried leaves thereof doth helpe to kill the wormes in children more effectually: a little thereof given in drinke or broth, or in a Fig or Raynsins, or strowed upon bread spread with Hony: it is sayd also to resist any poyson that is taken to expell it, or cause that it shall not hurt: the use hereof likewise in outward causes, is the like with the former, as for foule sores and Fistulaes, Scabs, &c. An idle conceit possessed many in ancient times, that he that would digge up the rootes hereof, had neede to cate Garlicke before hand, least the evill vapours that should arise from it in the digging up, did not offend the head and braine: The greater Bastard Hellebor or Setterworke, was held by *Dodonæus* as I sayd before to be a venomous Aconite, not to be dealt with, and that it would kill Woolves, Foxes, Dogs, &c. I have knowne little use thereof unlesse in great necessity, where the other sorts are not to be had, and onely among country people, whose strong robustious bodies are able to abide the working thereof; but is onely or chiefly used to rowell cattell withall, as *Pliny lib. 25. c. 5.* saith that a peece of the roote of blacke Hellebor being drawne through a hole made in the eare of a beast troubled with the cough, or having taken any poisonous thing cureth it, if it be taken out the next day at the same howre. *Absyrus* and *Hierocles* declare the same thing and *Columella* also: this manner of curing is used with us: but the place is changed from the eare to the dewlap of Oxen, and to the foreleg or hinderleg of an horse above the pasterne. It is thought also by divers of good judgement that not onely all the Hellebors both white and blacke will doe the like if any cure be performed hereby, but many other sorts of herbes: yet as the name Lowewort importeth the herbe made into an oymntment, or the decoction of the leaves killeth Lice, if the places be eyther washed or annointed that are chiefly troubled with them. The sixt here set forth, which I call purging Sanicle, hath bene often found by good experience to open and purge the body of melancholy humours, & that safely without such perturbation thereto as is sayd to be in the other sorts of blacke Hellebor: *Dodonæus* likewise supposing this to be *Dioscorides* his black Hellebor, approprieth all the vertues thereto, that *Dioscorides* saith they of *Anticyra* used their *Elleborus Sesamaceus*, the other sorts are not used or very feldome in Physick now adayes.

CHAP. XXVI.

Helleborus Albus. White Hellebor or Neefewort.

Of the white Hellebore there are two principall varieties, as greater and lesser, the greater being accounted vitius manured or of the garden, and the other wilde.

1. *Helleborus albus vulgaris.* Ordinary white Hellebor or Neefing roote.

The first great white Hellebor riseth at the first out of the ground with a great round whitish Greene head, which growing up openeth it selfe into many goodly faire large Greene leaves, plaited as it were with eminent ribbes all along the leaves, compassing one another at the bottome, from the middle whereof riseth up a strong round stalke with divers such like leaves but smaller to the middle thereof, from whence to the top it is divided into many branches, having many small yellowish or whitish green star like flowers, all along upon them, which after tume into small long three square whitish feede, standing naked without any huske to containe them, although some have written otherwise: the roote is reasonable thicke and great at the head, having a number of great white strings running downe deepe into the ground, whereby it is strongly fastened. Some doe make a varietie in the flowers hereof to be whiter, and so would make a differing sort thereof for that cause onely, but I doe not thinke it worth the name of a differing sort.

Alter flore
albo.

2. *Helleborus albus praecox sive atro-rubense flore.* The early white Ellebor with darke red flowers.

This other Hellebor is very like the former, but that it springeth up a moneth at the least before it, and that the leaves are longer thinner & no lesse plaited, foulding themselves backwards oftentimes, and sooner perish falling away from the plant: the stalke hereof is higher then the former, with fewer leaves thereon, bearing such starry flowers, but of so darke or blackish a red colour, that they are scarce discernable but at a neere distance, the feede is very like the former: the roote hath no such tuberous head as the other, but as it were a long bulbous scaly head, from whence shoote as many long white strings as the other: both these lose their leaves wholly and gaine fresh every spring.

3. *Elleborine*

1. *Elleborus albus vulgaris*.
Ordinary white Ellebor or Neeferwort,

2. *Elleborus albus vernus atrorubentibus floribus*
The early white Ellebor with darke red flowers.

3. *Elleborine major sive Calceolus Mariae*. The great wilde
Hellebor, or our Ladyes Slipper.

The greater of these sorts of wilde white Hellebors, riseth up with one two or more stalkes, a foote and halfe high at the most, bearing broad Greene leaves on each side, one by one, somewhat like those of the former white Hellebor, but smaller and not so ribbed, and each compassing the stalke at the lower end; at the top of the stalkes standeth sometimes but one flower, yet sometimes two or three at the most, one above another upon small short footestalkes, with a small leafe at the foote of every one: each of these flowers are of a long ovall forme and hollow withall, especially at the upper part, the lower being round and swelling like a belly: at the hollow part there are small peeces like eares or slippers, that at the first doe cover that hollow place, and after stand apart one from another, all which are of a fine pale yellow colour in all that I have seene; yet it is reported that some are found of a browner colour or tending to purple: there are likewise fowre long narrow and darke coloured leaves at the setting on of the flower unto the stalke, wherein as it were the flower at the first was enclosed: the whole flower is of a pretty sweet sent: the feede is very small, and like unto that of the *Orchides* or *Satyrions*, and contained in like pods; the roote is composed of a number of strings enterlacing themselves one within another, lying within the upper crnst of the earth, and not spreading deepe, of a darke brownish colour. A sort thereof hath beene brought from the North parts of *America*, differing onely in being greater both in stalkes, leaves and flowers, which are not yellow but white, with redish strakes through the bellies of them.

4. *Elleborine minor flore albo*. The small wilde Hellebor
with a white flower.

This smaller Hellebor groweth up in the like manner, and not much lower, bearing the like leaves but smaller, and of a white Greene colour like those of *Lilly Convally*: the top of the stalke hath many more flowers, but lesser growing together spike

3. *Calceolus Mariae*. Our Ladyes Slipper.

America
ms.

fashion

4. *Elleborine minor flore albo.*
Small wilde white Ellebor.

8. *Elleborine angustifolia.*
Variable wilde white Ellebor.

fashion with small short leaves at the stalke of every flower, which consisteth of five small white leaves with a small close hood in the middle without any fent at all: the feede is alike and so are the rootes but smaller.

5. *Elleborine minor flore purpurante.* The small wilde white Hellebor with bluish flowers. The leaves hereof are narrower than the last, the stalke and flowers are alike but smaller and of a pale purplish or bluish colour.

6. *Elleborine flore viridante.* Wild white Hellebor with whitish Greene flowers. This differeth not much from the last, but in the colour of the flower which is greenish on the outside and somewhat white within.

7. *Elleborine flore atro-rubente.* Wilde white Hellebor with darke red flowers. This wilde kinde groweth somewhat bigger and higher, and with larger leaves than any other of these small wild sorts, the flowers likewise are more in number and of a deepe purple colour.

8. *Elleborine angustifolia spicata versicolor.* Variable wilde white Hellebor. This also riseth somewhat high, having narrower leaves on the stalke, yet ribbed somewhat like unto the ribwort Plantaine: the stalke endeth in a long spike of fine purple coloured flowers, in fashion like the rest, but the opening hoodes with their labels are white spotted on the inside with purplish spots: the leaves and rootes are alike.

The Place.

Both the first sorts grow in sundry places of Germany and Austria as Clusius saith, as also in some of the Islands about Russia where a good ship might be freighted with the rootes of the ordinary sort as Master Tradescant the elder affirmed; the other sorts grow many of them in our owne land as well as beyond sea, namely the third fourth and sixth; especially the third in a wood called the Helkes in Lancashire neere the border of Yorkshire.

The Time.

The first flowreth before the second, although it spring earlier out of the ground, being not in flower until the end of July, the rest flower about May, some earliyer or later than others.

The Names.

I have shewed you in the chapter before that it is called *Elleborus* or *Helleborum*, &c. The first is generally called *Helleborus albus*, and by *Dodonæus*, *Cordus* upon *Dioscorides* and others *Veratrum album*, *Guilandinus* took it to be the *Helleborus candidus* of the Grecians, but is assuredly the *Consiligo* of *Vegetius*, *Absyrinus*, *Columella* and *Pliny*.

Pluye, Gerard tooke this for the next to call it *præcox*. *Bauhinus* to distinguish them calleth this *flore subviridi*, and the second *flore atro-rubente* & other writers ex *purpure nigricante*, & *Lobel* addeth *præcox* vnto it: the third is called by *Clusius* *Elleborine recentiorum*, and of others *Calceolus Marie* or *Marianus*, and *Lugdunensis*, *Elleborine ferruginea Dalechampii*, *Gesner* in *hortis Germaniæ* taketh it to be *Alismatis* species, and so doth *Thalins* likewise, and some *Damaſoninum norhum* & *Pseudodamaſoninum*; the fourth is taken by some to be *Epipactis*, by others *Alisma* or *Damaſoninum*, but generally is now adayes called *Elleborine flore albo*: the rest have their names in their titles, as they are most usually entitled by others: the controversies hereabouts I have touched in the foregoing chapter, and therefore will not here againe recite it: the *Arabians* call it *Charbachem*, the *Italians* *Elleboro bianco*, the *Spaniards* *Verdegambre blanco* & *yerva de balaſtarios*, the *French* *Veraire* and *Helleboire blanc*, the *Germanes* *Weiß Nieſwurtz*, the *Dutch* *witte Nieſernyt*, and we in *English* white *Ellebor* or *Neefewort*.

The Vertues.

The roote of white *Hellebor* or *Neefewort* is of most use (neither the leaves flowers nor seede being used at any time with us that i know) and worketh very strongly and churlishly with any that shall take it, it procuring strong vomitings: yet being taken with convenient preparation of the body aforehand, and dieted by advise as *Dioscorides* warneth it, may doe much good to strong constitutions that can endure the working of it, by causing much tough viscus clammy and corrupt humours that offend the stomacke to be avoyded, to be taken not fasting but for sometime after one hath eaten, for which purposes the *Oxymel Helleboratum* is a medecine prepared to your hand and fit to be used: it provoketh womens courses and will kill the birth if it be taken inwardly: halfe a dramme of the roote prepared with *Oxymel* and given in wine, to those that are so deeply possessed with melancholy that it causeth fits of fury or madnesse, doth much abate the peccant humour giving much ease to the party: being likewise steeped and afterwards boyed in broth and given, helpeth those that are troubled with the falling sicknesse, the leprosie, and all other breakings out in the skinn, as scabbes, &c. quartane, agues, the pissecke or pining consumption, an old cough, the dropsie, ruptures, sciatica, goate, crampes, paines in the joynts and sinewes, and paines and swimming in the head: the best preparation of it is to be infused in the juyce of a Quince, or to be put into a Quince, and either baked in an oven, or roasted under the embers, and halfe a scruple thereof given at a time; and this was as *Matthioli* saith, the ancient manner of curing these diseases: but being so dangerous a medecine though sometimes taken with caution, that it putteth many in hazard of strangling, and is onely remedied by eating Quinces, or taking the juyce of the Syrope made thereof, hath made the use thereof wholly almost to be given over and left: the roote saith *Dioscorides* is put with other things to helpe the dimnesse of the sight: the juyce of the roote dropped into the eares taketh away the noyse and ringing in them: being boyed in lye and the head washed therewith it killeth lice and helpeth the running scabbes and sores thereof, being mingled with flower and a little honye or butter, or else boyed in milke and set where flies gnats, &c. doe much resort, doe kill as many as touch it: if hens, duckes, or geese doe chance to drinke thereof it will kill them likewise: being moulded up with meale and honye, and put into moale holes or the byrrowes of field or dormise, or any other such small Vermine will quickly destroy them: the powder or scraping of the roote by it selfe, or with a few leaves of *Marjorome* put up into the nose, purgeth the head and braines by needling: being boyed in vinegar and the decoction gargled in the mouth, easeth the paines of the tooth ach: the same decoction likewise helpeth the itch and scabbes in the hands, and clenseth foule sores and ulcers in the legges and other parts. The *Spaniards* and *Navarrois* doe make a certaine poyson of the juyce of the rootes of white *Hellebor* which after it hath fermented in a horne or earthen leaded vessell (the time when it is readie to be used they know by this tryall: having thred a needle with thred, and wetted it therein. they draw it through a frogge which if it presently dye, then it is good, and ready) they dippe their arrow heads therein, and then what beast shall be wounded therewith shall suddenly dye: which thing *Matthioli* saith, hee also tryed on dogges and chickens, which dyed presently after they were wounded with a weapon dipped therein, in that the venome had pierced the blood, against which poyson no other antidote can be found more fit and speedy, than the eating of Quinces, for even the smell of them being in a house where that poyson is, taketh away the whole force thereof: but is restored againe (as it is said) if ripe grapes be mixed therewith or some pepper cast into it: this poyson is onely used while it is fresh, for it loseth the strength, if the juyce dry upon the arrow heads, and therefore to keepe them the better they use to keepe them in a case, the iron heads being wrapped in wooll and clothes wet therein: but this is the most wonderfull as it is related, that this poyson being drunke, procureth almost no harme to them that drinke it, unless they take too much and as it is sayd the hunters often take it themselves to purge them: it is sayd also that the flesh of those beasts killed by this poyson, is more tender and pleasant in eating than of other nor killed therewith, and especially that part about the wound. *Pausanius* in *Phocis* recordeth a notable stratagem that *Solon* used in besieging the City of *Cyrrheus*, viz. That having cut off the River *Plisus* from running into the City, he caused a great many of those rootes to be put into a quantity thereof, which after they had sufficiently infected the water, he let passe into the City againe, whereof when they had greedily drunke they grew so weake and feeble by the superpurgation thereof, that they were forced to leave their wals unmand, whereby the *Amphyctions* their enemies became masters of their City: the like stratagems are set downe by diverse other authors performed by the helpe of other hearbes. The lesser wilde sorts are not knowne with us to be used in Physicke: but if either of these *Elleborines* be his *Epipactis*, he saith it is good in the defects of the liver and against poysons and to procure vomiting; *Theophrastus* saith the same.

CHAP. XXVII.

Gratiola. Hedge Hyssope.

F the true *Gratiola* or Hedge Hyssope, I doe know but one kinde as all the best authors doe agree; but yet unto it there are added two or three other hearbes, as neereſt thereunto, either in face or qualitie, ſome reckoning the one and ſome the other; and I in this place bringing them all as fit to be ranked under this title.

1. *Gratiola vulgaris*. True hedge Hyssope.

This hearbe is but a ſmall low plant, ſeldome growing with his ſlender bending foure ſquare branches, above a foote high; having diuerſe ſmall leaves ſet thereon, very like unto thoſe of the ordinary garden Hyssope, but a little ſhorter and broader, and of a pale greene colour, of a very bitter unpleaſant taſte: from about the middle of theſe branches, at the joynts of the leaves up to the toppes of them, come forth the flowers, every one at a place, ſtanding upon very ſhort footſtalkes, which are ſomewhat long and hollow, ending in foure leaves, two of the loweſt ſtanding out as it were lippes, and the other two above, ſhorter by the halfe, of a whitish yellow colour, tending to a blacke blew, and ſometimes more blewish or purple: after which come ſmall round heads, wherein is contained ſmall ſeede: the roote ſhooteth forth too and fro under ground very much, with many joynts and ſmall fibres at them, thereby encreaſing and quickly ſpreading largely, eſpecially if it ſtand in any moyiſt place, becauſe it will hardly hold long in any dry ground.

Flare lu-
ſco.

Camerarius ſaith he found by a brooke ſide, not farre from *Geneva* one of this kind with a yellow flower, not differing in any thing elſe.

2. *Gratiola minor ſeu Hyſſopoides*. Small hedge Hyssope.

This ſmall hedge Hyssope ſhooteth forth ſometimes many, and ſometimes but one or two round reddiſh ſtalkes halfe a yard high, branched toward the toppes; whereon are ſet one above another, and ſometimes one againſt another, diuerſe ſmall and ſomewhat long leaves, ſomewhat ſmaller than the former, and neere reſembling Hyssope leaves, of a pale greene colour, joyning cloſe unto the ſtalkes and branches, and without any footſtalke at all: at the joyntes with the leaves come forth flowers, every one by it ſelfe, ſtanding in a long huſke, conſiſting of foure leaves of an excellent blew colour: after which ſucceede ſmall browne ſeede, contained in long round pods: the roote is white and ſhooteth forth many fibres, whereby it comprehendeth well in the ground: the hearbe and every part hereof is utterly without any ſmell, and almoſt without any taſte, yet ſome hold it to have a nitrous or little ſalt, and ſome a little ſweetiſh taſte: Sometimes and in the moyerſt grounds, this is found with larger leaves, and growing higher; ſometimes with ſmaller and longer leaves, which ſcarce riſeth an handbreadth high, and that in the dry grounds.

1. *Gratiola Vulgaris*.
The true hedge Hyssope. 2. 4. *Gratiola anguſtiſolia minor*: Et *latiſolia noſtra*.
Small hedge Hyssope. The leſſer broad leaved hedge Hyssope.

3. *Gratiola carulea, five latifolia major.* The greater broad leaved or blew flowered hedge Hyssope.

This hearbe also is referred unto *Gratiola*, for some resemblance it hath, both for place, and manner of growing, and especially for the bitterness thereof, so like it, which by *Lobel* and *Pena* their judgements was thought at the first likeliest to be a kinde of *Lyfimachia*, and so entituled it *galericulata* for distinction sake, but others of good judgement since, have otherwise thought as you shall heare anon: I have placed it, with the *Gratiola*, partly led by the authority of others, and partly by the common vote of these times, who as frequently call it *Gratiola latifolia*, as *Lyfimachia galericulata*: take the description thereof, therefore in this manner. It is a smooth low plant not rising above a foote high, with many square stalkes diversly branched from the bottome to the toppe, set with divers joyns and two small leaves at every one, which stand upon short foote stalkes, being broad at the bottome and smaller to the end, a little dented about the edges, (which is not remembred in *Lobel* and *Pena* their description) and full of veins, of a sadder Greene colour than the former, longer also and broader: the flowers are gaping, somewhat like unto those of Dead Nettles, of a faire blewish purple colour, with some white spots the ein, every one standing at the joyns with the leaves up to the toppes: after which come forth small feede vessels, formed somewhat like unto the toppe of the thigh bone of a man or beast, wherein the small nut or hucklebone is set; the upper part whereof doth first open, when the feede is ripe, and falleth away when it is touched, shewing, within it small yellow feede: the roote spreadeth much, and with many branches under ground, quickly thereby possessing a large circuit or compasse.

There is a lesser sort hereof found in the like places as the former, differing onely in the smallnesse of the plant.

4. *Gratiola latifolia five nostras minor.* The lesser broad leaved hedge Hyssope.

There is also another small hearbe growing in our Land onely, for ought I can either heare or learne which *Gerard* first found and called *Gratiola latifolia*, as referring it thereunto, and so doe I also, yet more for the resemblance of the flower unto the last (which was not knowne to him, or at least not mentioned by him) and bitterness, than any thing else: Out of the wet boggie ground from among the grasse &c. that groweth about it, springeth up one or more small stalkes, scarce half a foote high, round but crested as it were all the length, which spread forth other smaller branches, whereon doe grow many small leaves, set by couples one against another, being somewhat broad, but very short withall, seeming almost round, and ending in a point, a little dented about the edges: at the joyns with the leaves come forth the flowers, every one by it selfe, on a small foote stalke, being in forme somewhat like the last, a gaping flower but shorter, of a pale reddish colour, spotted in the middle of the lower leafe, with many small white spots: after the flowers are fallen come in their places small feede vessels, in shape somewhat like unto the nut of a crossebow; wherein is contained small yellowish feede: the roote is small long and white, spreading it selfe under ground diverse wayes; which perisheth not in the winter, neither runneth like the last, but spreadeth new branches every year: the taste hereof is as extreme bitter as the last.

3: *Gratiola carulea five latifolia major.*

The greater broad leaved or blew flowered hedge Hyssope,

The Place.

They doe all naturally grow in moyst and marriish grounds, wherein they will joy best, if you will have them to live. The first naturally groweth in many places in Italy and without Saint *Iustines* gate at *Padua* plentifully, and is onely cherished in gardens with us. The second hath bene found naturally growing in some places of our owne Land; but the third in many and sundry places of this Country, in wet low grounds and by waters sides: and the last upon *Hampstead* heath in the wet boggie places, and in sundry other partes of the heath.

The Time.

They all flower in June and Iuly, the first seldome giveth good feede in our land; all the other doe ripen their feede quickly after their flowers are past.

The Names.

None of these hearbes are mentioned by any of the ancient Greeke or Latine writers, nor of *Pliny*. The first is generally now adayes, as it was formerly called *Gratiola* by *Matthiolum*, *Gesner*, *Dodonaeus*, *Lobel*, *Engdumenfis*, and others: it is also called by some *Gratia Dei*, after the high Dutch name *Gotts gnad*, which signifieth so much; yet some call it *Gratia Dei altera*, because there is another herbe among the *Gerania* so called: *Anguilara* thought it might be the *Papaver spumeum* of *Dioscorides*: the feede hereof is called as hee saith *Gilbenech*. *Cordus* calleth it *Limnium five Centauroides*, because diverse for the bitterness sake thereof, did thinke it a species of *Centaureum minus*: he also calleth it *Eupatorium Mesues*, for so it was generally thought to be, in all the upper and lower *Germanie* for along time, and among some of our Apothecaries also in times past: which opinion I thinke is worne out, time bringing the truth to light. *Gesner* calleth it *Gratiola five Centaureum aquaticum*, and thinketh it may be the *Polemonium palustre amarum* of *Hippocrates* (the horse;

leech, not the famous Physician) and *Fabius Columna* that saith it is usually called *Gratiola*, yet saith it is thought of some more truly to be taken, for a common Hysope; *Gesner* used to call it *Sesamoides*; *Barbini* in his *Pinax* calleth it *Gratiola Centauroides*; we call it in English Hedge Hysope for distinction sake, and not for that it groweth by any hedge side; for it might more properly be called Marsh Hysope, from the naturall place of the growing. The second is called by *Camerarius* *Hysoptoides*, (as if you should say a small Hysope) and so it is called in Italy. *Gesner* in *Collectiōe stirpium* calleth it *Gratiola minor*, *Cordus* in his woode of observations, nameth an herbe to be called with them in Germany *Grasse poley*, with the leaves of knot grasse, growing in moorish places, which doth fitly answer unto this plant; and therefore *Barbini* in his *Pinax* doth so referre it; but entitleth it there himselfe *Hyssopifolia*, because his brother *Iohn Barbini*, had so called it formerly; when as in his *Matthiolus* he calleth it *Gratiola minor*, it is called also as he saith by some at *Mompelieri*, where it groweth in the brookes there *Angallis aquatica*, and in *Hassia* as hee saith also, some called it *Halimus aquaticus*. The third is called as I sayd before by *Lobell* and *Pena* *Lysimachia galericulata*, from some resemblance of the leaves, and naturall place of growing, but because none of the rest of the *Lysimachias* have hooded flowers, but consisting of five leaves laid open, I think it fitter to joyne it with these then with those, *Camerarius* calleth it *Lysimachia flore caruleo galericulata* *Lobellii*; *Ioannes Thalius* in his *Hercynia sylva*, calleth it *Sideritis carulea*, and saith it was acclayed also by divers, *Gratiola carulea*. *Cesalpini* calleth it *Gratia Dei*. *Tabernmontanus* *Tertianaria*, and *Dodonæus* in his French Edition *Herba Induica altera*. With us it is generally called, as well *Lysimachia galericulata*, as *Gratiola lausolia*, but more properly as I sayd in my judgment *Gratiola*, both for that this is extreame bitter as they are, and hath hooded flowers as all the others have, yet I have added thereunto *major* because of the next, in English the greater broad leaved, or blew flowered Hedge Hysope. The last is called by *Gerard* as I sayd *Gratiola latifolia*, whereunto I have added *nostras minor*, because if the last or this be to be referred unto the *Gratiola*, this is the lesser, which may stand untill a fitter be found out: The *Arabians* as is before sayd, call the seeds *Gelbeneck*, the *Italians* the herbe *gratia Dei* and *Stancaca vallo*, the French *Grace de Dieu*, the Germans *Gottes gnad*, the Dutch *Gods gratie*, and we in English, Hedge Hysope.

The Vertues.

The first hedge Hysope worketh very strongly and churlishly, both upward and downeward, avoiding much tough and grosse flegme chollic and watery humors, thereby giving ease to those that are troubled with watery humors, paines in the joynts and the hips, the dropie, the gout and sciatica; if either the decoction of the Greene herbe be given, or a small quantitie of the powder of the dried herbe: it helpeth also both tertian & quartaine agues taken in the same manner, but because it is so churlish, it is needfull to put thereto some correctors, as *Annisfeede* *Cinamon* or the like: Some also give the powder in broth the lesse to offend. *Camerarius* commendeth the extract hercof, made into pilles with the powder of *Cinamon*, not onely to be available against the dropie, but against all sorts of tertian and day agues, if some of the juyce of *Calamint* be added unto it: it is profitably given for the obstructions of the liver and spleene, by opening and purging the peccant humors: it killeth the wormes in the belly, and prevaileth much against all putrefactions, either inward or outward, for the powder, infusion or decoction, cleneth and healeth wonderfully all old and foule ulcers, and consolidateth fresh wounds. The second is not applied to any disease by any Author or other, that ever I could learne. The other two likewise are not remembered by any, whereunto they might be available; yet their bitterness comming so neare unto the first *Gratiola*, induceth me to thinke, that they cannot but be effectfull, if not to purge by the bitterness, yet to consolidate and heale by the temperate heate is joynd with them: the *Italian* name declareth the true experience they have found in it, that horses will become lancke and leane that feede thereon.

CHAP. XXVIII.

Staphis agria. Stavescare or Loufewort.

Tavescare riseth up with a short, but strong blackish Greene stalk, branching forth divers wayes, whereon doe grow great large leaves, cut at the edges into five or seven divisions, somewhat like unto the leave, of the great yellow Aconite or Wolfshane, but deeper edged, and of a sad or darke Greene colour, every one standing upon a long foote stalk, the flowers grow at the toppes of the branches one above another, upon short stalks, being somewhat like a Larkes spur flower, for it hath a spur or heele behind it, of a very deepe or darke blew colour, but much larger: after which come in their places three or foure horned feede vessells, like unto the Aconites but greater, wherein are contained triangled rough great feede: the roote is long and woody, perishing every yeare, after it hath borne feede.

The Place.

It is onely nourshed up in our gardens, and that very hardly, for if it be not well defended, it will not abide a Winter with us; for it never riseth to flower or feede the first yeare it is sown, but in the hotter countries of Italy, as *Naples*, and in *Isiria* and *Sclavonia*, and other places it groweth in the open champion grounds.

The Time.

It flowreth not with us untill it be late in the yeare, notwithstanding it hath abidden a Winter, and never giveth perfect feede.

The Names.

It is called in Greeke *σταφίς ἀγρία*, *Galen* hath it *ἀνδρὶς ἀγρία*, but at this day the naturall Greekes call it *σταφύλιον*, but more properly *σταφύλιον*; that is *gratum pedicularium*; in Latine *Staphis agria*, in the Apothecaries shoppes beyond sea *Staphisaria*, and *Pedicularis*, and *Pituitaria* sic dicta a viribus quas habet pediculos enecando, & fervore pituitam educendo, and thereupon *Cordus* on *Dioscorides* calleth it *Pibiracōdonon*. *Pliny* seemeth to call it *Yva Taminia* in his 26. Booke and 13. Chapter, but in his 23. Booke and first Chapter, hee saith that *Astaphis agria* or *Staphis*, is corruptedly called *Von Taminia*. The feede thereof is so called also, being onely in use, and to be had in shoppes. The *Arabians* call it *Alberas Habebras*, *Muthuzagi*, *Mibbezagi*, the *Italians* *Staphisaria*, the *Spaniards* *Fabraz Paparaz yerva pionia* is *piyheya*, the French *Estaphisagria* *Panillense* and herbe aux povioux or povioux, the Germans *Bissmint*, the Dutch *Luyfermunt*, and we in English Stavescare and Loufewort.

The Vertues.

A few of the seed bruised and strained into posset drinke, and drunke, worketh very strongly upon the stomacke, bringing forth abundance of slimie grosse flegme, but there had neede of great caution to be used, of whosever shall take it, for in that it heateth extremely, and bringeth danger of strangling by the violence thereof; it is not used but by ignorant or desperate Surgeons, or countrie leeches, without such correction and things as may mitigate the force thereof, that thereby it may do no harme; which being so ordered, it is then used to be given to those that are troubled with itch, scabbes, the leprosie, or foule scurfe, as well inwardly, as to wash the places outwardly with the decoction of the feede, which helpeth much, as also to kill lice and vermine, growing in the heads or bodies of any, or the seeds mixed with oyle and *axungia*, and anointed on the places. Some use to make an Electuary of them, by boyling them in water, with some few correctors, unto which liquor being strained, so much Sugar is put, as may be sufficient to make it up with the powder of Aniseede and Cinamon into an Electuarie, whereof a dragme is a sufficient proportion at a time, and is profitable for the diseases aforesaid, as also to procure womens monethly courses: it is also good to wash foule ulcers in the mouth or throate; but if the decoction be too strong, you may alay it with some vinegar, and a little honey mixed therewith and so use it: the seeds bruised and boyled in vinegar is good to helpe the toothach, if the teeth and gummies be washed therewith, for it draweth downe abundance of rheume, which peradventure was the cause thereof, being bruised also with a little pelletory of *Spaine*, or without it, and put into a fine linnen cloth and chewed where the teeth paine you most, doth the like, and often easeth and sometimes taketh away the paine. Some say that if the flowers be chewed in the mouth, and some of them laid upon the hurt place, of any stung or bitten by any serpent, they will heale them: the feede beaten and mingled with meale, and of it selfe so laid, or made up into a paste with some hony, will kill Mice and Ratts, and such like vermine that doe eate it.

Staphysagria,
Staveacre or Loufewort.

CHAP. XXIX.

Euphorbium; The burning thornie plant called *Euphorbium* & *Anteuphorbium*.
The remedy for the *Euphorbium*, or the burning thorny plant.

THE most extreme of all violent purging plants, I bring this to your consideration, not having any to exceede it in the qualitie of heate or violence; and chereunto as many other Authors before me have done, I joyne that other cooling herbe, which is accounted the onely helpe and remedy against the fierie heate thereof.

1. *Euphorbium*. The burning thornie plant called *Euphorbium*.

This strange thornie plant, from a leafe thrust into the ground, will shoote forth rootes, and grow to have divers thicke and long leaves, round also and not flat, halfe a yard in length, set with divers great ribbes, which are armed all the length of them, with a double row of small sharpe thornes or prickes, two for the most part set together, like unto the middle bone of a fish, &c. what fruit or flower it beareth we have not learned of any, that hath scene it growing in *Barbery*, from whence it hath bene brought, both into our countrie and into others: the rootes are great thicke and long, spreading very much, but impatient to endure any cold, as the leaves are also: there issueth out of the leaves, as some say, or out of the rootes as others say, a pale yellowish gumme, in small droppes or peeces, most violent fierce even to smell unto, but being tasted doth burne the mouth and throate not to be endured, the dust also and fuming vapours that arise from it when it is stirred, but much more when it is beaten to powder, doe so fiercely penetrate into the head and mouth, but especially the nostrills, that it procurereth frequent and strong weeping, often times even unto delacrymation; and if any shall touch their face, or any other part of the skinne that is tender, with their hands after they have handled it; it will burne and enflame it so terribly that oftentimes it will raise blisters and wheales, the furie whereof will not be allaid feare in halfe a day after, although cold water or any other cold thing be applied to mitigate the strength thereof, and therefore in the same naturall places groweth with it as the chiefe and onely remedy thereof, the

2. *Anteuphorbium*. The remedy for *Euphorbium*.

The *Anteuphorbium* hath divers fat thicke greene stalkes, with many thicke and long leaves thereon somewhat like unto the leaves of Purslane, but much bigger, both stalkes and leaves being full of a cold and slimie moisture, most fit and apt to temper the heate of the former; we have likewise no further understanding of either flower or feede that it beareth: the rootes are great and thicke, from whence shoote forth many long and great strings and small fibres, but as quickly subject to the cold as the former, and perisheth upon the first cold blast that commeth upon it.

The

1. *Euphorbium*.
The burning thorny plant called *Euphorbium*.

Anticuphorbium.
The remedy for *Euphorbium*.

The Place.

Both these plants have been brought out of *Barbery* as I said from many places there, as also other Isles thereabouts, and here they have thrived well all the heat of the year, but as I said will endure no manner of cold, and therefore without extraordinary care and keeping not to be kept in our land.

The Time.

The time of the well thriving is formerly expressed, for it never bore flower with us, or with any that hath had it, as farre as we can learne.

The Names.

The Greeke name is *εὐφορίαν* and the Latines have no other name than *Euphorbium* for it, although *Pliny* calleth the plant *Euphorbia*, and the gumme *Euphorbium, luba* that was father to *Ptolomy*, and first ruled both the countries of *Mauritania*, is said by *Pliny* to have first found this plant, and gave it the name *Euphorbium*, after the name of his chiefeest Physician, whose brother *Misa* healed *Augustus*, who also wrote much in commendation of it. I have called it in English rather a thorne or thorny plant than a thistle, for that it hath no resemblance with any thistle or thistle like plant, neither is it venomous or poysonous, though violent in heat: the *Anticuphorbium* hath no other name in any Author that hath written of it; onely *Dodonaeus* who first gave us the figures of both these plants, thinketh this may be some species of *Telephium* or *Orpine*.

The Vertues.

Although neither *Dioscorides* nor *Galen*, have made mention of any purging qualitie in the *Euphorbium*, yet *Pliny* for got it not, making mention thereof in his 26. Booke and 8. Chapter, and *Mesuer* hath found and declared it, and so hath *Ætius*, *Paulus* and *Aetharius*, who have exactly delivered their knowledge therein; that it doth mightily purge the waterish humors of the dropsie, and tough viscus flegme from the joynts, and the more remote parts of the body, and therefore helpeth the gout and Sciatica, by cleansing consuming and eradicating those grosse humors, that lie deeply hid in the hollownesse of the joynts and sinewes: but because it heateth the body and fretteth the bowels extremely, corrodng them and the stomacke, and inflaming the liver, it is necessary that it be corrected before it be given, and that it be grossely not finely beaten to powder; as also that such things be mixed with it, as may allay the violent heat and sharpnesse, and such are cold and aromaticall feedes, and such things also as may make it slippery, the more easily and speedily to passe away, and therefore made into pills with hony, may be effectuell, and that the quantities of these correctors be so plentifull, that they may cover the superficies thereof. It being so dangerous, therefore the adviser to be taken, is that it be not used inwardly, but in cold windie and temperate bodies, and not in hot and dry constitutions; but outwardly applied it is of exceeding good use; as mixed with the oyle of Wallflowers, or any other digesting oyle, it wonderfully helpeth all cold diseases of the sinewes, as palties and shakings, or trembling of the joynts and sinewes, as also crampes and convulsions or shrinkings, aches & lamenes that come from cold: a plaister made up with it, oyle and waxe, is available for all these recited griefes, as *Galen* saith. The powder of *Euphorbium* mixed with *Auxungia* and anointed, cureth all scurfes and scaldnesse of the head, and with Beares greafe, causeth haire to grow on the head, or any parts of the body, where haire doth usually grow, it being shed or not appearing upon some cause applied

applied also with oyle to the temples of such as are droufie dull and heavie to sleepe, which we call the Lethargie, doth quicken their senses, and causeth them to be more lively: the nape of the necke being anointed with the oyle of *Enforbium*, recovereth their speech againe that have lost it, by reason of the Apoplexie, or any other casualtie: it being mixed with vinegar and applied, taketh away the markes and scarres of wounds, and all other foule spots or blemishes in the outward skin: The *Anteuphorbium* is the chiefeft, if not the onely remedy against the violent heate, and piercing qualitie of the *Enphorbium*, for the juyce thereof being very cooling and slimie; tempereth it so well and speedily, that it never faileth to give ease.

CHAP. XXX.

Sena. *Sene* or purging *Sene*.

Here are two sorts of this purging *Sene* tree, differing very little betweene themselves, as also three or foure sorts of base or bastard sorts, more churlish then the other in working, as you shall heare by and by.

1. *Sena Alexandrina.* *Sene* of Alexandria.

2. *Sena Alexandrina & Italica.*
Sene of Alexandria and of Italy.

This *Sene* by the judgement of those that have written thereof groweth not above a cubite high, with slender branches, set with many leaves together on a ribbe, somewhat like unto *Licoris*, being narrow and pointed, which being dried and brought over unto us, if they bee fresh, will smell very like unto fresh new made hay: the flowers stand at the tops of the branches, one above another being as *Matthiolus* saith (for wee have never seene them beare flower in England) of a yellow colour, like unto the flowers of Coleworts, that is consisting of five leaves laid open, (but some rather thinke, the flowers are formed like unto those of the Spanish Broome, or of the bastard *Sena* called *Colutea*, as most plants that beare cods do) with purveines running thorough every leaf: after which come crooked thinne huskes, fashioned somewhat like a halfe Moone: in the middle part whereof (the skinnies of the huskes growing so close together, that they can hardly be parted) growe flatseed very like unto grape kernels, but of a blackish greene colour, and somewhat flat: the whole plant perisheth (as it is sayd) every year, and must be new sowne of them that will have it.

2. *Sena Italica.* The *Sene* of Italy.

This *Sene* differeth in no other thing from the former, but in the forme of the leaves, which are not so narrow and pointed, but broader and rounder, which difference is plainly to be discerned, by comparing the leaves of that *Sene* that commeth over from Alexandria, with that which groweth in Italy, and therefore there needeth no more to be sayd thereof.

The Place.

The first groweth (as it is generally thought) in *Arabia Felix*, and in *Syria* also, as some say, and brought to Alexandria in Egypt, as many other things are, which from thence is transported unto all other Countries. The other *Matthiolus* saith, was in his time frequently sowne, in the Duke of Florence his dominions in Italy; many Acres in a field being sowne therewith, they will hardly spring up with any leaves in our Country, for experience hath bene made thereof many times.

The Time.

They flower in the Summer moneths, but in Italy as *Matthiolus* saith, it must not be sowne untill May, and will not indure but unto Autumne.

The Names.

Mesues and other *Arabians* call it *Sena*, but *Hermolaus Senna*, it is generally held by all good Authors, that it was not knowne to the ancient Greeke and Latine writers, *Dioscorides*, *Theophrastus*, *Galen*, *Pliny*, &c. or others that did transcribe their copies, although some would referre it to *Dioscorides* his *Delphinium*, others to *Pelecyum*, some to *Peplium*, others to *Empetron*, some to *Alypon*, and others to the *Cercis* or third *Colutea* of *Theophrastus*, or to his first *Colutea*, all which are quite contrary thereunto, and can by no meanes agree unto them. The *Arabians* being the first finders out thereof, and of the purging quality therein; who did much use the huskes or cods, as wee call them: but later experience hath found the leaves to bee of more effect with us.

The Vertue.

The leaves of *Sene*, howsoever used are a very safe and gentle purger, as well made into poulder, and the weight of a French Crowne or dramme thereof taken in Wine or Ale, or broth fasting; as the infusion of halfe an ounce in Wine or Ale for a night, or the decoction of halfe an ounce, or if need be of six drammes, with some other herbes or rootes (but because they are a little windie, a few Aniseed or Fennell seede, and a little Ginger is to be added unto them to helpe to correct that evil quality) and then they purge melancholy, chol-

ier, and flegme from the head and braine, the lungs and the heart, the liver and the spleene, cleansing all those parts of such evil humours as by possessing them, are the causes of those diseases incident unto them, and comforting the stomacke, especially if some cordiall or stomachicall helper be put with it: for *Mefues* saith it hurteth the stomacke, but *Monsardus* and *Matthiolus* denye that it can doe so, in regard that Sene hath somewhat a bitter taste partaking of heat and drynesse, all which qualities are knowre rather to strengthen the stomack, then to trouble or weaken it; it strengtheneth the senses both of sight and hearing, and procureth mirth by taking away that inward humour, which was the inward cause of sadness in the minde, opening the obstructions of the bowells, and causing a fresh and lively habit in the body, prolonging youth, and keeping backe old age: Divers things are added hereunto to quicken the working thereof, and to make it the more effectuell as Rubarbe, Agaricke, Cassia Fistula drawne, Syrupe of Roses, &c. according as the nature of the disease, the age, strength, and necessitie of the patient doe require: *Serapio* saith it wonderfully helpeth such as are distracted of their senses, by the extremitie of the fits in agues, or in other diseases, which wee call raving or talking idle, or such as are growne fortith, their braines being overdulled, or growing into a frensy or madnesse by inflammations of the braine, the epilepticke also or the Falling sicknesse, and the headach, all sorts of Palfies, which are the resolutions of the sinewes, the lowse evil also, and all sorts of itches scabs and wheales or pufhes, &c. whatsoever: Sene likewise is an especiall ingredient among other things put into a bag, to make purging Beere or Ale, fit to be taken in the spring of the yeare, not onely for all those diseases afore mentioned, but also to cleanse the blood from all sharpe humours, mixed or running therewith: Purging Prunes also and purging Currans are made herewith, by boyling Sene and some other opening herbes and rootes, or if yee will without them, with some Anniseede, Fennellseede, Cinamon, Ginger and Cloves, some of these or all of them a litle quantity, and according to the proportion of your Prunes or Currans, being set to stew with the decoction of your Sene, and other things above specified, these may be given to the daintiest stomack, that is without offence and without danger, to open the body and purge such humours above specified, as trouble the body: And because the decoction of Sene, is too unpleasaut, to many weak and tender stomacks, & even the smell thereof doth cause them to refuse any potion made therewith, the infusion thereof for a night in warme embers, and strained forth in the morning is much lesse offensive, & yet no lesse purging: In that infusion while it is warme you may dissolve some *Manna*, or put thereto some Syrupe of Roses and so take it. Cassia fistula also may be drawne with the decoction of Sene, corrected as aforesayd & fogiven of it selfe, or made into a bole with Rubarbe powdered, or with the powder of Sene leaves, & a litle Anniseed and Licoris together: some also I have knowne, that after they have infused Sene, Rubarbe, Agarick, Tamarinds & Tartar, with a few Anniseeds or Fennellseeds, Cinamon and Cloves in white wine, whereunto some have put thereto juice of Fumitory for a whole day and night, then distilling the water from them, they keepe it to drinke with some Sugar put thereto, as a most dainty and pleasant purge: After this manner waters may be distilled from other things, as Meccaean, Turbith, Scamony, and all the sorts of purgers, infused in wine or the juice of Fumitory, or other herbes as may be thought meete; whereunto being distilled, Sugar, Manna or Syrupe of Roses, or Rubarbe may be added, and so drunke for the purposes aforesaid: For the manner of distilling these things, if they be done in glasse they will be more neate and dainty, and the glasse body to bee set in sand or ashes, the water distilled will be the stronger in efficacy from the ingredients, and the weaker if the glasse body be set in *Balneo* with water: yet may they bee distilled in an ordinary Still, so as it be close. If this Sene might be made to grow with us here in England in any quantity, or in any of our plantations abroad, which are more warmely situate, a water might bee distilled from the whole plant, while it is greene and fresh, according to the manner of other waters distilled from herbes, which would bee as dainty a purger as could be taken. The lye wherein Sene and Camomill flowers are boyled, is marvelous good for weake braines, to confort and strengthen them, as also for the sight and hearing, if the head bee washed therewith; the same lye also is very profitable for the sinewes that are stiff with cold, or strunke with crampes, to helpe to warme, comfort and extend them: it helpeth also to take away the itch in the body and the hands, if they bee washed therewith as *Durantes* saith, and is available to cleanse and cure foule Ulcers and sores: The *Irish* Sene worketh the same effects before specified, but more weakely in every part.

CHAP. XXXI.

Colutæ. Bastard Sene.

F the Bastard sorts of Sene there are many, differing much one from another, as shall be shewed you in this Chapter.

1. *Colutæa viscaria vulgaris*. Ordinary Bastard Sene with bladders.

This greater Bastard Sene groweth in time to be a tree of a reasonable greatnesse, the stem or trunk being of the bignesse of a mans arme or greater, covered with a blackish greene ragged barke, the wood whereof is harder then of an Elder, but with a pith in the middle of the branches which are divided many wayes, having divers winged leaves composed of many small round pointed or rather flat pointed leaves, set at severall distances, and somewhat like unto Licoris, or the Hatcher fitch, among which come forth yellow flowers like unto Broome flowers and as large; after which come thinne swelling cods, like unto thinne transparent bladders; wherein are contained blacke seede set upon a middle ribbe within the bladders, which being a litle crushed betwene the fingers, will give a cracke like a bladder full of winde: the roote groweth great and woody, branching forth divers wayes.

2. *Colutæa scorpioides major*. The great Scorpion podded Bastard Sene.

This ballard Sene groweth nothing so great or tall, but shooteth out sundry stalkes from the roote; the elder whereof have a whitish barke, and the younger a greene, with winged leaves set thereon as in the former, but smaller, greener and more pointed: the flowers are yellow like the other, but smaller also, and with a reddish veine or stripe downe the backe of the uppermost leafe, the pods are slender and long, with small swelling branches thereon like unto a Scorpions taile.

3. *Colutæa*

1. 2. *Colutea vesicaria vulgaris* & *Scorpioides*.
Common and Scorpion podded bastard Sene.

3. *Colutea humilis*.
The lower bastard Sene.

3. *Colutea Scorpioides humilis* sive *minor*. The lesser
Scorpion Bastard Sene.

This lesser bastard Sene is in all things like the former, but lower and smaller both in leafe flower and cods of feede which have not such eminent bunches on them as the last. *Alpinus* hath set forth another of this sort, having more leaves set together then the last and the end leafe bigger then all the rest, being all hoarie or of a silver like colour, sweete as the flowers are also.

4. *Colutea maritima glaucosolia*. Small Sea bastard Sene.

The sea bastard Sene hath small slender branches, feldome longer then halfe a yard, whereon grow such like winged leaves, as the former hath, but that they are a little dented at the ends of every one, making every leafe seeme somewhat like unto the forme of a hart as it is painted, and being also of a more blewish colour then any of the rest: the flowers are yellow very like unto the former, but not growing so many together in a tuft, and after them come small joynted or bunched pods, wherein lye such like feede.

5. *Polygala Valentina clusii*. Evergreene Bastard
Sene of Valentia.

The neare resemblance of this plant unto the former, hath caused me to joyne it with them, whose description is this: It hath many small weake, but lichey and tough slender greene stalkes, rising scarce a foote high, whereon are placed without order, such like wings of leaves as are in the former, but much smaller, thicker and of a blackish blew greene colour; like as the leaves of Rue are, of an unpleasant and binding taste, abiding on the branches all the winter, as well as summer without shedding: at the tops of the stalkes and branches, which are bare without leaves for a good space, come forth many small yellow flowers; very like unto the

*Colutea
scorpioides*

flowers

flowers of Mellilot, hanging downe round about them in manner of a crowne, after which succeed small long and round podds, with three or foure divisions or bunches on them, wherein lie the feede, being somewhat long hard and black; the roote is long and somewhat thicke, hard and tough withall. Of this kinde *Clusius* maketh mention of an other larger in every part, which he found also in the wooddie hills of *Valentia* in *Spaine*, and a third sort with slender greene branches full of pith, with fewer softer and thicker leaves thereon, growing on the sea coasts by *Valentia*.

Major
montana
& mari-
tima.

The Place.

The two first sorts grow about *Trent* plentifully, and are kept in many gardens with us especially; the third groweth at the foote of certaine hills that are neare the *Alpes*, among the hedges and the borders of the vineyards about the *Danone* or *Danubius*. The fourth groweth neare the Sea shore by *Teracimum*, and for the raritie of it brought into *Cardinall Bembo* his garden at *Padua*. The last *Clusius* saith he found in the fields of *Salamanca*, as also in the kingdome of *Granado* and *Valentia*, in the sundry bottomes of the hills.

The Time.

They doe all flower with us in June and July, or thereabouts, and give their ripe feede the next moneth after, except the fifth which being more tender seldome abideth a yeare with us.

The Names.

It is called in Greeke *καλὴ-τρία*, and in Latine *Colutea*. The ordinary *Colutea Vesicaria* is taken of most Writers since *Mathiolus*, to be the *Colutea Lipare* that *Theophrastus* mentioneth, lib. 3. c. 1. but I doe rather thinke the *Colutea Scorpoides* should be it, because it properly beareth *siliquis* poddes, when as the other hath rather *vesicas tumentes*, swolne bladders, and not properly podds or cods, and that *Theophrastus* would have given some proper note of difference from other sorts of *siliquis* cods, if he had meant these thinne transparent skinned bladders, and not the other which are the more formable; even as his *Colytea* and *Cercis*, which are *arbores siliquose* or *siliquate*, and by some thought to be *Arbor Indæ* and *Laburnum*; if I be mistaken herein let others of better judgement be umpires in this case. The other sorts received the name *Scorpoides*, from the forme of the pods, which are distinguished into bunches or joynts, as a Scorpions taile, and may also be called *Siliquose*, as a distinction from the first or greatest: they are called in English Bastard Sene, because the leaves are so like unto the leaves of the true Sene tree; *Ruellius* as I take it being the first that called it Sene. The first is by most Authors called *Colutea* yet *Cordus* in his *historia* calleth it *Sena*, *Ruellius*, *Sena Mauritanorum*, and *Gesner* in his *hortis*, saith it was called *Sena sylvestris* quibusdam sed male, but others *Colutea vesicaria*, *Cesalpinius* calleth it *Emeri alterum genus*, the second *Emerus vulgo*, but by all others *Colutea scorpoides major*, and by *Bauhinus* *Colutea siliquosa major*, the third being called *humilior* or *minor* by all; the fourth is so called as it is in the title by *Bauhinus*: the last is called by *Clusius* *Polygala Valentina*, of the people in *Valentia* *Coronilladel Rey* that is *Sertula regia*, where as he saith the Apothecaries use the flowers for *Mellilot*, and because he found it plentifully in divers territories of *Spaine*, as also in *Valentia*, and that the learned there (as he saith) did referre it to the *Polygala* of *Dioscorides* and *Pliny*: *Lobell* calleth it *Colutea minima*, and therefore I have you see referred it to the *Colutea*'s, as being in face or shew most like unto them, and as I thinke not much differing in vertue or propertie, as by the unpleasant taste, both of leaves and feede may be gathered, I have therefore given it an English title as I thinke not unfitting it.

The Vertues.

The leaves of the greater bastard Sene with bladders, as also of the other with Scorpion pods, doe both provoke strong vomitings and purgings downewards, but very churlishly and with some trouble to the stomacke and bowells; avoiding tough flegme and choller: the feede is more forcible in each of those qualities, and worketh more turbulently in the body, and from the joynts: it is therefore seldome given to any but to strong bodies, and where any better or other purgers are not at hand: Let not therefore any take this to be good Serie, or use it instead thereof. *Theophrastus* saith it doth fatten sheepe wonderfully, and therefore much used in those countries, but seldome proved in ours: the qualities of the other sorts of bastard Sene, are not set downe by any, but surely their taste being unpleasant like the other, declare them to be not much differing.

CHAP. XXXII.

Genista & Spartium. Broome.

Here are many sorts of our ordinary Broome as well as *Spartium*, *Spanish* Broome, reckoned among those plants that doe purge, as also divers others smaller sorts called *Genistella*; of all which I meane to entreate in this Chapter.

1. *Genista vulgaris* sive *Scoparia*. Our common Broome;

Our common Broome shooteth forth many woody stemmes or stalkes, of the bignesse of a mans finger oftentimes (especially if it be suffered to grow long) at the bottom, rising to the height of a reasonable tall man spreading into divers the like woody branches, covered with an hard and thinne darke grayish greene barke, which shoote forth a number of slender plant square, or cornered small twigs or branches, like rushes; whereon appeare small darke greene leaves, three or foure sometimes set together at a place, abiding but a small time, so that it is seldome seene with leaves on it: the flowers are large, and of a gold yellow shining colour, growing one above another for a good space at the toppes of the branches, which turne into hard and flat small cods, almost blacke when they are ripe, wherein is contained small and shining brownish feede: the roote is long and woody, yet tough withall, spreading many wayes under the ground, never perishing but sending forth new shootes every yeare, and more especially when the old stalkes are cut and taken away: From the rootes herof in many places (but more often where no Broome groweth, namely by fields and hedge sides and upon heathes) groweth another plant, whose stalke is of the bignesse of a finger or thumbe, sometimes above two foote high, having a shew of leaves on them, and many flowers at the toppe, somewhat like unto the flowers of *Orchis*, but larger and of a deadish yellow colour, as the stalkes and leaves are also: which perisheth without feede, or encreasing the roote, being somewhat round and scaly.

Rapum
Geniste.

This differeth from the former chiefly in not growing so great or high, and that the slender branches are thicke flored with leaves like unto Saint Johns wort: the flowers, seede, &c. are like the former.

3. *Genista luesis*. Island Broome.

This Island Broome shooteth forth many stalkes, divided into many branches full of great joynts or knees, with livers small and narrow leaves set round about the joynts, of a pale yellowish Greene colour as the stalkes are so, this hath yellow flowers and seede like the common.

4. *Genista alba tenuifolia*. White Broome.

This Broome is very like the former, but that it groweth not so great, having many twiggie branches, which in time grow to woody stalkes, whereon are set many smaller leaves then the former, somewhat Greene on the upper side, and of a gray and shining colour underneath: the flowers, are in forme like the others but somewhat smaller, and of a whitish colour: the seedes and pods are also like the former.

5. *Chamaenista*. Dwarf Broome.

This low or Dwarf Broome never groweth very great or high, neither come his slender Greene plant branches to be hard or woody, but alwayes abideth low, rising little more than a foote in height: on whose Greene plant twiggies are set small and somewhat long leaves, of a darke Greene colour on the upper side and gray underneath, abiding on them all the summer long, and at the toppes grow small yellow flowers, not so yellow nor so large as the first, but like unto them for the forme, and so are the pods and seede but smaller: the roote is long, tough, and much spreading in the ground, and long lasting.

6. *Chamaenista cretica*. Dwarf Broome of Candy.

The Candy dwarf Broome hath low small hoary branches lying upon the ground, not exceeding one hand in length, yet divided into branches of two or three inches long, having very small and very narrow leaves set thereon, two or three growing together, one being longer than the rest, all hoary as the stalkes are: from the joynts with the leaves come forth three or foure yellow flowers like the other.

7. *Genista tinctoria vulgaris*. Common Greeneweede or Diersweede.

Our common Diers weede hath a number of small tough Greene stalkes, two foote long or thereabouts, rising from a roote very much disperfed under ground, and woody; whereon grow without order many small long leaves of a sad Greene colour, and many yellow flowers at the toppes, very like unto Broome flowers, but lesser and some what paler, after which come small pods lesser than Broome, and seede therein not much unlike.

8. *Genista tinctoria Hispanica*. Spanish Greeneweede.

The Spanish Greeneweede hath more woody stalkes, rising much higher than the former, and bare without either leafe or branch for a good space above the ground, and then spreadeth forth many small short and brittle branches, stord with many long and narrow leaves, somewhat like unto the leaves of Flaxe or Spurge flaxe, Greene on the upper side, and of a glittering white or silver colour underneath, somewhat harsh and bitter withall in taste: the flowers are many and yellow, that stand at the toppes of the branches, like unto the former: the whole plant is very beautifull to behold, either in flower or out of flower. Under this herbe when it was in

1. *Genista vulga is & Ripum Geniste*.
Ordinary Broome, and Broome Rape.

7. *Genista tinctoria vulgaris*.
Common greeneweede, or Dyers weede.

7. *Genista alba tenuifolia*.
White Broome.

8. *Genista tinctoria Hispanica*.
Spanish Greene yecde.

9. *Genistella montana Germanica*.
Bale Broome of Germany.

10. *Genistella pinnata altera Hispanica*.
Spanish bale Broome.

flower, *Clusius* saith he found growing in his naturall place, such another Broome rape, as is before specified, about a foote high, stord with many large and long gaping flowers, from the middle of the stalke upward, both stalke and flowers being of a yellow colour, and full of an unctuous or oylie moisture.

9. *Gemistella moniana Germanica*. Base Broome of Germany.

From a small and much spreading roote under ground, shooteth forth divers Greene weake rushy stalkes of leaves, or leaved stalkes (for the whole stalke being about a foote long, consisteth onely of small and somewhat long leaves, one springing forth from the end of another, and some likewise comming forth from the joynts of them) branched also here and there; which abide Greene all the Winter, new comming up in the Spring: at the toppes of these stalkes, come forth many yellow flowers like unto Broome flowers, but smaller when they are blowen, standing at the first close together in a soft woolly head: the cups or huskes that containe the flowers, abiding woolly afterwards: the feede is small, enclosed in small pods that follow.

10. *Gemistella altera pinnata, Hispanica*, Spanish base Broome.

This Spanish base Broome hath likewise many leaved stalks, rising from the roote to the height of a foot or lesse, branching forth in diverse places, the whole plant as the former before, consisteth onely of leaves, but somewhat greater and broader than the other, waved as it were a little on the edges, and each leaf rising from the middle rib of the other, being somewhat hard and rough in handling, thicker also than the former, and each leaf pointed at the ends of them, and sometimes ending in two points: the flowers are small and of a gold yellow colour like the former, foure or five standing together at the toppes of the stalkes enclosed in soft or woolly huskes, some also of the lower leaves of the flowers, seeming downie, the pods and feede are not unlike the other, neither the roote, but not so much spreading.

11. *Pseudo Spartum Hispanicum*. Bastard Spanish Broome.

Because this plant doth participate both with the former base Broomes in some things, and with the Spanish Broomes that follow, I have thought good to place it betweene them both, whose description is as followeth. The stemme riseth up to be two foote high or thereabouts, covered with a whitish barke, spreading into many small branches, some of them the length of ones hand, and some shorter; whereon doe grow very sparingly a few leaves, somewhat long but very narrow, which doe not abide but fall away, within a very short space after they are sprung, so that the plant for the most part is seene without leaves: on the toppe of every branch standeth one soft woolly round head, like unto the former Base Broomes, which after openeth it selfe into many small pale yellow flowers, every one standing in a woolly huske; after which come small pods wherein lyeth small feede like the others.

12. *Spartum Hispanicum frutex vulgare*. Ordinary Spanish Broome.

The ordinary Spanish Broome groweth to be five or six foote high or more, with a woody stemme below covered with a darke gray or ash coloured barke, shooting forth many pliant long and slender Greene twigs, whereon in the beginning of the yeare are set many small and somewhat long Greene leaves, which fall away quickly.

12. *Spartum Hispanicum frutex vulgare*.
Ordinarie Spanish Broome.

13. *Spartum Hispanicum minus monospermum flore luteo*.
The smaller Spanish Broome with yellow flowers.

not abiding long thereon: towards the toppes of these branches grow many flowers, fashioned like unto Broome flowers, but larger and more spread open, of a more shining gold yellow colour, and smelling very sweete, after which come small long cods, crested at the backe, wherein is contained blackish flat seede fashioned like unto the kidney beanes: the roote is woody, dispersing it selfe diverse wayes under ground.

13. *Spartum Hispanicum minus monospermon flore luteo.*

The small Spanish Broome with yellow flowers.

This smaller Spanish Broome, groweth with a stemme or stalke of the bignesse of ones thumbe at the bottome, to bee about two foote high, whose barke is rough and straked all along, sending forth many Greene slender pliant branches, which divide themselves againe into many other small twiggs, whereon for a while after they are shot forth, abide a few small leaves, untill they begin to shoote out flowers, and then fall away, leaving the branches naked and without leaves, all the rest of the yeare after: from the sides and joynts of the smaller twiggs, shoote forth small long stalks, bearing many smaller yellow flowers, than the former Spanish Broome, without any sent for the most part: After which come small round skinnie cods, containing for the most part, but one seede in every one of them, being blackish and fashioned somewhat like unto the Kidney Beane, which when they are ripe, will by the shaking of the winde, make a noyse in their pods: the roote is hard and woody.

14. *Spartum Hispanicum majus flore albo.* The greater White flowered Spanish Broome.

The other Spanish Broome (in his naturall place) groweth much higher than the former, even to any mans height, whose branches are more lithy and pliant than the other, having small leaves on them like the other, and as soone fading: the flowers also stand upon long stalks, and are like them for the forme, but larger and of a white colour, of as small sent as they, which afterwards turne into small round pods, like the former, but smaller, each one containing but one seede for the most part, and smaller also.

15. *Chamaespartium montanum triphyllum.* Dwarf Broome of Naples.

This small Broome hath woody stalks from whence shoote forth ruslike branches set at distances with three small whitish hairy leaves as small as those of Sothernwood, at the toppes whereof stand yellow flowers and hoary hairy huskes succeeding.

The Place.

The first groweth plentifully in many places of our owne Country, as well as in *Spaine, Italy, France, and Germany*: The second is found in some places about *Mompelher in France, and Friburg in Germany*: The third groweth in the Iland of the *Turbene Sea* called *Ilva*: the fourth in some places of *Spaine* only: the fifth is found in many places of our own Land: the sixth groweth in *Candy*, as *Alpinus* saith, and *Bauhinus* saith he had it out of the garden of the Noble *Contarenius at Padua*: the seventh groweth in many untilled or unmanured grounds of our land, as also by the hedges, and way sides, and in some meddowes also plentifully, where they keepe it for the profit is made thereof, even as of Broome: the eighth *Clusius* saith he found in no other place, than onely in the kingdome of *Murcia in Spaine*, and there also he saw the Broome rape, growing from the roote thereof. The ninth groweth in many dry unmanured sheepe pastures, in *Narbonne of France*, as *Pena* and *Lobel* say: the tenth *Clusius* saith, he onely found in some rough dry grounds in the Kingdome of *Valentia*: the eleventh was found in *Spaine*, neere unto a place called *Aguas blancas*, as *Bauhinus* from Doctor *Albinus* saith: the twelfth in many places of *France, Spaine, and Italy*: the thirteenth is common as *Clusius* saith, in the dry sandy grounds, of both the countries of *Castile*: the fourteenth he saith he onely found in the Iland of *Gades* or *Cales*: the last *Columna* saith he found on the hills in *Naples*.

The Time.

All these flower some earlyer or later in the former moneths, and give their seede ripe before winter, but the *Spanish* kinds are for the most part the latest that perfect their seede.

The Names.

Genista or as some write it *Genista*, *agennium flexilitate & adnexus utilis* haud dubie nominatur, vel potius quia genibus medetur dolentibus; and therefore diverse in former times did take *Spartium Dioscoridis*, to be the *Genista laxinorum*, and even *Pliny* also in his time was doubtfull whether it were not so, for *Spartium* as *Dioscorides* saith *vinculi usum in alligandis viribus prebeat*, and therefore the controversie among diverse writers, endured untill *Ruellius* his time, who refused the opinions of *Hermolaus* and *Marcellus*, that tooke them to bee both one, but *Pena* and *Lobel* since them in their *Adversaria*, call the *Genista Scoparia* (which is our common Broome) *Spartium*, as if there were no difference, when as yet they appoint the *Spartium*, or *Spartum Hispanicum* & *Narbonense*, to be the true *Spartium* of *Dioscorides*, which many call also *Genista Hispanica, Italica* and *Africana*. Many likewise mistooke the *Spartum Inceus*, which is a kinde of *Rush*, wherewith in *Spaine* they make frailes or baskets, to put *Rayfins, Figges*, and other things in, to be the *Spartum frutes*, deceived by the name onely, with-

out further examining the matter. But now in these dayes, it is evidently knowne to all that are conversant in Herbarisme, that *Spartium* or *Spartium* as some write it, is one plant by it selfe, and *Genista* another, although the one be somewhat like the other; and that *Spartium frutex* is differing from the other *Spartium* called *lunus*; the first here set downe is generally by all writers called either *Genista vulgaris* or *Genista angulosa*, or *Scoparia vulgi*. *Lonicerus* only calleth it *Genista minor seu non aculeata*, and *Cesalpinus* *Genista quadrato junco prima*: this *Rapum* *Genista* of all sorts (I mean both of this Broome, and of the other Dyers weede and of the hedge sides, &c.) are called of *Clusius Hamoderon*, according to *Theophrastus lib. 8. c. 8.* or *Leimoderon* as others have it; and of most *Orobanchæ*, although according to *Theophrastus* there is another *Orobanchæ* that riseth up among the *Eryum* or *Orobis*, and strangleth it as *Tares* doe Wheate, whereof came the name: the second is called by *Lugdunensis* *Genista minima*, and by *Bauhinus* *Genista ramosa foliis Hyperici*; the third is also called by *Lugdunensis* *Genista lutescens*; the fourth is by *Tabernmontanus* called *Genista alba*, and by *Gerard* after him *Genista tenuifolia*. The fifth is the same that *Clusius* calleth *Chamegenista Pannonica* 74. and *Gerard* *Chamegenista Anglica*, howsoever the figures of them seeme diverse: it is likely also to be the *Genista minoris* species of *Thalys*, and of some is termed *Chamegenista*: the sixth is not only remembered by *Bauhinus* in his *Prodromus* & *Pinax*, by the same name in the title, but called also *Spartium Creticum*, by *Alpinus* in *lib. de plantis exoticis*. The seventh is generally called *Genista tinctoria* or *infectoria*, and *Genistella tinctoria*. *Flos tinctorius* of *Brühfelsius* and *flos tinctorius* of *Fuchsius*, *Lonicerus* and *Castor* *Durantes*, *Tragus* tooke it to be *Ferula*, & *Lonicerus* *Lysirachia*. *Anguillaria* and *Cesalpinus* *Corneola*, *Cordus* calleth it *Chameleuce*, and *Bauhinus* *Genista tinctoria Germanica*, in English Greene-weede, or Dyers weede because the Dyers doe dye a yellowish Greene colour with the leaves and stalkes hereof, and therefore provide thereof good store. The eight is called by *Clusius* *Genista tinctoria Hispanica*, of *Lobel* *Genistella infectoria*. *Lugdunensis* thinketh it may be the *Oricella* of *Thevet*; some take it to be the *Lutea herba* that *Pliny* mentioneth in *lib. 33. c. 3.* but therein they are much deceived, as I shall shew you when I come to speak of that hearb, *Bauhinus* calleth it *Genista tinctoria frutescens foliis incaris*. The ninth is called by many *Chamegenista*, *sagittalis*, by *Camerarius* *Chamegenista sagittalis Pannonica*, by *Clusius* *Chamegenista altera*, of *Pena* & *Lobel* *Genistella graminea montana*, *Gesner* in *hortis Germanicis*, calleth it *Genista minima*, & *Cordus* *Genista angulosa*. *Tragus*, *Lonicerus*, *Lugdunensis*, & *Tabernmontanus* call it *Chamaespartium*. The tenth is called by *Clusius* *Chamegenista peregrina*, & *fodolith* *Lugdunensis*. *Lobel* calleth it *Genistella pinnata altera Hispanica*, *Camerarius* *Genista pumila*, *Dodonæus* *Genista humilis*, *Tabernmontanus* *Chamaespartium tertium*, and *Bauhinus* *Chamegenista caule foliato*. The eleventh is called by *Bauhinus* in *Prodromo* *Genista Hispanica affinis*, and in his *Pinax* *Sparto primo affinis* but because it doth participate both with *Spartum* in some things, and *Genistella montana* in others, as I have shewed in the description; I thought good to place it betweene them both, and call it *Pseudo Spartum Hispanicum*, in English bastard Spanish Broome. The twelfth is called *Spartum Hispanicum*, and *Genista Hispanica*, *Spartum Græcorum*, and *Spartum frutex*. The thirteenth is called by *Clusius* *Spartum 2 Hispanicum*, by *Lobel* *Spartum Hispanicum alterum flore luteo*, by *Dodonæus*, *Spartum frutex majus*. and by *Bauhinus* *Spartum alterum monospermon semine reni simili*. The fourteenth is called by *Clusius* *Spartum Hispanicum tertium*, by *Lobel* *Spartum 2 flore albo*, by *Dodonæus* *Spartum frutex minus*, and by *Bauhinus* *Spartum tertium flore albo*. The last is called by *Columna* *Spartum Equicolum m'n m'm montanum triphyllum*. The Italians call *Spartum Spartio*, and *Genista Genistra*, the Spaniards the one *Spartio* and the other *Genistra* *Giesta* and *Geistra*: the French *Geneste* and *Geneste de Espagne*, the Germanes call *Spartum* *Pfirschen*, and *Genista Ginst*; the Dutch *Brem* and *Spanische Brem*, and so we in English Broome and Spanish Broome.

The Vertues.

Our ordinary Broome doth much offend the stomacke and heart, if *Anniseedes*, or *Fennell seedes*, or *Roses*, or *Masticke* be not given with it, being taken inwardly: the juyce or decoction of the young branches, as also of the feede, or the powder of the feede taken in drinke, purgeth downwards, and draweth from the joynts, flagmaticke and watery humors, whereby it helpeth those that are troubled with the drop sicke, the goutte, the sciatica, and the paines in the hippes and joynts: it provoketh strong vomits also, and helpeth the paines of the sides, and swellings of the spleene, cleneth also the reines, kidnies, and bladder of the stone engendred therein, and hindreth the matter from encreasing, or growing to be a stone therein againe, and provoketh urine abundantly: the continuall use of the powder of the leaves and feede, doth cure the blacke Jaundise: the young buds of the flowers are gathered, and kept in brine and Vinegar to be eaten all the year after, as a sallet of much delight, and are called Broome Capers, which doe helpe to stirre up an appetite to meate, that is weak or dejected, helpeth also the obstructions of the spleene, and to provoke urine that is stopped, opening and cleneth the urinary parts, by the use of them very effectually: The distilled water of the flowers is profitable for all the same purposes, it helpeth also surfeits, and altereth also the fits of agues, if 3 or 4 ounces thereof, with as much of the water of the lesser Centory, and a little Sugar be put therein, and taken a little before the access of the fit, first being layd downe to sweate in their bed: the oyle or water that is drawne from the ends of the greene tickes heated in a fire helpeth the tooth-ach: There is a lye made of the ashes of Broome, which by art may be made as cleere as Claret wine, which *Camerarius* commendeth to be profitable for those that have the Drop sicke. The juyce of the young branches made into an oymment with old *Axungia*, that is Hogges grease, and anointed: or the young branches bruised, and heated in oyle or *Axungia*, and layd to the sides that are pained, either by the wind as in fitches and the like, or in the spleene, easeth them in once or twice using it: the same also boyled in oyle, is the safest and surest medicine to kill lice, and other vermine growing in the head or body, of any: the same also is an especiall remedy for joynt aches, and swollen knees, that come by the falling downe of humors upon a contusion or puncture; The Broome Rape, is commended by some to be as good a sallet as *Asparagus*, taken when they are young, and eaten either raw or boyled, but it is much more bitter: If Kine feede thereon it maketh them sooner desire the bull, and therefore in *Spain* they call it *gerivator*: the decoction thereof in wine is thought to be as effectual in helping to avoyd the stone in the Kidneyes and bladder, and to provoke urine as the Broome it selfe: the juyce thereof is accounted a singular good helpe to cure as well Greene wounds as old, and filthy sores, and malignant Ulcers: the insolate oyle, wherein there have bene three or foure repetitions of infusion, of the toppe stalkes with flowers strayed and cleered, cleneth the skinn of all manner of spots, markes and freckles that rise by the heate of the sunne, or the malignity of humors; All the other sorts of lesser

Broome, have the like qualities, and may be conducible for the same diseases, but every one in his owne proper existence, some being weaker or stronger than other. The *Spanish* Broome over and above the same properties, as also to purge downwards and to provoke vomits, especially the feede taken to the quantitie of a draine in mead or honied water, purgeth by vomit as Hellebor doth, without trouble or danger: the flowers thereof boyled in meade and drunke, or the poudre of them taken in a reare egge, or the jayce of the young branches drunke fasting, doe cure the Kings evill and the hippe goutte, and an oximell made of them and the seed, often used, breaketh and healeth all impostumes of the Spleene, by causing the corrupt matter to void it selfe upwards often, and draweth also flegme and raw humors from the joynts.

CHAP. XXXIII.

Cassia solutiva, Purging *Cassia*.

N former times there was onely one sort of purging *Cassia* knowne, but there hath beene since brought to our knowledge an other, whereof I meane to give you the relation in this place.

1. *Cassia solutiva vulgaris*. The ordinary purging *Cassia*.

The purging *Cassia* tree groweth in *Assiria* about *Babylon*, and in the *Indies* to be a wonderfull great tree, spreading both in height and breadth very much, but in *Arabia*, *Egypt* and *Italy* much lesse, yet growing to be a tree of a large size or bignesse, whose wood is solid and firme, yellowish towards the sappe or outside, and blackish like *Lignum vite* at the heart, covered with a smooth soft and ash coloured barke, very like unto the *Walnut* tree: the branches are not very great, and but thinly stored with winged leaves, consisting of eight or tenne leaves, for the most part five standing on each side of the stalke, without any odde one at the end, each whereof is larger and longer pointed than the leaves of the *Carob* or sweete *Beane* tree, that followeth in the next Chapter to be described: the flowers are yellow and large, many growing together on a long stalke, and hanging downe somewhat like as the *Laburnum* or *Beane Trefolie* doth, consisting of foure leaves for the most part, or sometimes of five leaves, with many greenish threads in the middle, standing about a small long crooked umbone or horne, of a very sweete sent, especially in the morning, before the Sunne shine upon them, but grow weaker in smell, as the Sunne groweth hotter upon them: the small horne in the middle of the flower, groweth to be the pod, which while it is young is Greene, but in time cometh to be of a darke purple colour, and being suffered to grow longer, or taken at the time and kept turne blacke, being of divers sizes both for length and greatnesse, some being smaller and some greater, some a foote, or a foote and a halfe, or two foote long, with a hard round wooddy wrinkled shell, not very thicke or very hard to breake, with a seame as it were, or lit all the length thereof at the backe, eminent to be seene and with another small one against it upon the other side, which causeth it to be easily broken into two parts by the middle long wayes, and

1. *Cassia solutiva vulgaris*.
The ordinary purging *Cassia*.2. *Cassia Brasiliانا*.
The great *Cassia* of *Brasilia*.

distinguished

distinguished inwardly into many skinny wood-like partitions: on both sides of which partitions grow a soft blacke substance like unto hony and very sweete; which is that part onely that is to be used, and no part thereof else beside: betwene these cells or partitions lie round and flat gristly seed, of a darke brownish colour, very like unto the seede of the Carob tree: the rootes are great, and grow deepe in the ground: the choise of the best cods or canes, is that they be moist within, and that the seeds doe not rattle when they are shaken.

2. *Cassia solutiva Brasiliiana*. Purging *Cassia* of *Brassill*.

There is another sort of *Cassia*, that hath beene brought from *Brassill*, which differeth not much from the former, either in the forme of the tree or fruite; for the tree it selfe groweth (as by relation it is affirmed) great, and hath such like winged leaves as the former hath: the fruit onely or chiefly differeth from the other in this, that it is about two foote long, (especially such as we have seene) and more than two inches broad, and about an inch and a halfe thicke; whose barke or outward rinde is much harder, thicker, browner and flatter than the other but with great wrinkles or furrowes crossing it, as the other hath; the seames likewise at the backe, and against it are greater and more eminent, and the seede lying in the cells, larger and flatter also, the pulpe or blacke substance lying upon the woody skinner, is as sweete as the other, but of more force in working by the one halfe at the least.

The Place.

This first groweth plentifully in *Egypt*, but yet not naturally, for it is onely in their orchards where it hath beene planted: for it is generally held to be first brought thither, and to *Arabia* also, from *Syria* and *Armenia*, and they from the East *Indies*: it groweth also in the West *Indies*, first planted by the Spaniards in *Hispaniola* in so great abundance, that from thence the most store that is spent in Europe is brought: The other groweth in *Brassill*, from whence it was brought into these parts.

The Time.

The first flourisheth chiefly in *June*, and the fruite hanging upon the tree all the yeare, are gathered much about the time of the flowering: for the tree holding his Greene leafe all the Winter, hath usually both blossomes and Greene fruite, and ripe all as it were at one time. The other hath not beene hitherto further described or knowne.

The Names.

Cassia or *Cassia* is a word of divers significations, for it is either the *Aroina* of the ancients, *Theophrastus*, *Dioscorides*, *Galen*, &c. like unto *Cinamon* called *Cassia lignea* in the Apothecaries shoppes, or this *Cassia fistula*, or else a shrubbe called *Cassia poetica* or *Monspeliaca*, but it is very likely that this tree, nor his fruite was knowne to any of the ancient Greeke Writers, unless as *Cordus* saith it might be the *Faba Indica* of *Aristobulus* and some others; but the later Greeke Authors, as *Alduarinus*, and others since his time, called it *καρσία μιλαννα*, *Cassia nigra*, from the *Arabians*, who first brought in the use thereof, and called it *Cassia fistula*: and because it was not knownen where else it did grow then in *Egypt*, it was called by many *Siliqua Egyptia*, and is thought by divers that it may be the *Siliqua* called *Ficus Egyptia* by *Theophrastus* in his first Booke and 18. Chapter: and of others *Cassia solutiva*: the usuall name is *Cassia fistula* in all Apothecaries shoppes: but why the name of *Cassia* should be given to this tree or his fruite, is not easie to know or learne: *Pena* and *Lobell* in their *Adversaria* thinke it might come from the Greeke word *κασσιον*, quod coriaceum vocant, because the cods or canes are like leather; but I verily beleeeve the *Arabians* (and it may be those from whom the *Arabians* had it) called it *Cassia* in regard of the sweetnesse of the flowers, like unto the *Cassia aromatica* or *odorata*; and *Solomon* in the 4. Chapter and 14. verse of the *Canticles*, maketh mention of this *Cassia* tree, as I take it, for in the Latine Translation of *Saint Jerome*, I find it is *fistula*, which the Translators make to be *Calamus* in English: And it is not improbable that the true *Cassia aromatica*, or *odorata*, was called *Fistula*, because the peeces of the barke were rowled together, and hollow like a pipe, even as *Cinamon* (which is *congenior* if not *idem*) is, which in some countries is called *Canella*; and I finde that the people both in *Italy* and in *Spaine* doe call the *Cassia aromatica* by the name of *Canella*, yet to this day, either from the forme of *Cinamon*, which is like unto a pipe, or from *Canna*, a reede or Cane, as I thinke rather, and the diminutive thereof, is *Canella* a small Cane reede. They are much deceived that thinke the barke of the pipes or fruite of this *Cassia fistula*, is of any more force than a dry chippe, to procure womens courses, &c. as some in former times did, for the error is grosse: The other is called by *Lobel* *Cassia siliqua Brasiliiana pri-gatrix compressa*, who first gave us the knowledge thereof in his *Pharmacopœa Rondelsiana*.

The Vertues.

The inner blacke substance or pulpe, censed from the shells, seeds, and skins that grow together with them, is the onely medicinall part that is used, taken by it selfe in balls, or bits, of in potions or drinckes, and is very effectually to purge the reines, kidneyes and bladder, for it tempereth the heate of them, cleanseth the humors that lie therein, both by urine and the stoole, and thereby giveth much ease to those that are troubled with the stone, if they use it often: taken with *Rubarbe* and a few *Anniseed* and *Licoris* to correct the windinesse thereof, it is an especiall good medicine in *gonorrhœa* to cense the reines; that other helpes may be the more available afterwards, as also to cense the liver, the stomach and mesentery veines, from choller and flegme, cleareth the blood and quencheth the heate thereof, and is therefore profitable in all hot agues: it is very effectually against all Rheumes and sharpe distillations, and against chollericke and melancholike diseases: it is often used in all the kindes of pectorall diseases, as old coughes, shortnesse of breath, wheezings, and the like, if it be taken with *Agaricke* as some advise: it is not so convenient for those that have moist, weak and slippery bowells, unless it be given with *Mirbalans*, *Rubarbe*, *Spicknard*, or *Masticke*: else it may be safely given to all sorts of people, ages and conditions, and to prevent the danger of such lubricities, divers doe use to give it with *Hierapicra*: The young cods taken while they are small and Greene, boyled a little and then laid in the shadow a while to drie, and after boyled in Sugar or Hony, doth purge the body, as the pulpe or blacke substance, and is a delicate medicine fit for tender and weak stomackes, that abhorre all manner of Phisicke; and here of the usuall quantitie is three or foure ounces to be taken at a time for elder persons, and one ounce for the younger: the use of *Cassia* outwardly either in ointments or plaisters, is much commended of many for all hot pimples, and other eruptions in the skinner, and also to ease the paines of the gout and hot inflammations, and paines in the joynts. The other

other sort of *Cassia* is more effectual in purging, for it hath beene tryed by experience, that one ounce hereof, is as forcible as two bunces of the other, and is effectual to all the diseases aforelaid.

CHAP. XXXIII.

Siligna dulcis five *Ceratonia*, The sweete Beane or Carob tree.

F this kind of sweete Beane or Carob tree, there hath beene one other also lately found out, and made knowne to the world by *Pona*: for the ordinary sort, being well knowne to most, especially in *Spaine* and *Italy*, and other the hotter Countries of the East, is remembred by the ancients.

1. *Siligna dulcis* five *vulgatior*. The ordinary sweete Beane or Carob tree.

The *Carobe* or sweete Beane tree that hath beene of longest knowledge to all, groweth in the hot Countries, as *Spaine* and *Italy*, to be a very great tree covered with an ash coloured barke, spreading very much in breadth with very faire great branches, the younger being reddish at the first, whereon doe grow sparsely winged leaves, very like unto the leaves of the purging *Cassia* tree, but that they are rounder at the ends or points, and somewhat harder in handling, of a darke Greene colour on the upper side, and of a paler Greene underneath: it beareth a long catkin in the winter, like unto that of the Walnut, which in the spring time openeth into many darke purplish flowers, and afterwards bringeth crooked cods, of the bignesse of a large beane cod, in some larger in others smaller, Greene at the first, and of a brownish colour, when they are ripe; wherein are flat and round feedes, very like unto those of *Cassia*, and are of an unpleasant taste, while they are fresh, but gather more sweetnesse being kept to be dry: the shell thereof although hard is eaten, aswell as the inner substance, which that I may use the words of *Pliny*, is neither of a fleshie woody or skinnie substance, but of them all as it were mixed together. In the hotter countries of *India* &c. as *Strabo* in his Geographie writing of the trees of *India* doth report, there is a certaine thicke substance lying within these cods, which being taken forth serveth the *Indians*, and those other people where they grow in stead of Sugar or Honey, to preserve the young cods of *Cassia*, *Gingar*, *Mirobalan*, and other fruites withall.

2. *Caroba* five *Siligna ex Guinea purgatrix*. The Carob or purging Beane of *Gimye*.

The *Carob* or purging Beane of *Gimye*, groweth no doubt in his naturall place, to be a great tree, but in the lesse warme Countries, as *Italy* whereunto it was first brought, it cannot doe so: but sheweth by the growing that it much differeth not from the former, bearing his leaves after the same manner; the fruites (for we have no knowledge of the flower as yet) is crooked thicke and short (and as *Pona* saith, somewhat like an *Anacarde* or *Cajou*) about three inches long, of a browne colour on the outside, very like unto the other, having a bowing or roundnesse all the length of the backe, and an eminence or list as it were in the hollownesse: within which is

Siligna dulcis *vulgatior*.

The ordinary sweete Beane or Carob tree.

four or five somewhat rounder and not so flat feedes, more pointed below and round at the head: the taste is more sharpe and quicke, even almost burning the throate, which peradventure is but from the nature of the hot Country, where it grew and may grow more milde, after it hath beene inured unto a more temperate climate.

The Place.

The first as is before sayd groweth in all the South and East Countries, as *India*, *Armenia*, *Syria*, *Arabia*, *Egypt*, &c. and in *Greece*, *Spaine*, *Italy*, &c. frequently in many places, as both *Matthioli* and *Clusius* make mention: the other is originally from *Gimye*, and is set forth onely by *Pona* of *Verona*, in his *Italian* booke, who had it from *Signor Contarni* of *Venice*.

The Time.

The first flowreth in the very beginning of the spring, and

1. Flores & fructus *Silignae dulcis vulgaris*
2. Et ex *Guinea*.

the fruite is ripe in the hot time of the Sommer onely: of the other there is no further knowledge as yet, than of the fruite.

The Names.

It is called in Greeke *κεράτια*, *Ceratia* of *Dioscorides*, id est, *siliqua*, & *κερατορία* & *κερατορία*. *Ceratonia* & *Ceronia*, quasi *cornuta Siliqua*, of *Galen*, *Aginetia* and others, because the cods are crooked, or bowing inwards like a sicke or horne: But that *siliqua* whereof *Theophrastus* maketh mention in his fourth booke and second chapter, and which the *Ionians* called *Ceronia*, and some as he saith *sicus Egyptia*, but falsely, with a white flower and fruite growing from the body of the tree, more plentifully than from the branches, cannot bee this *siliqua*, but some other, even as *Lugdunensis* and others affirme also: *Pliny* calleth it *Siliqua dulcis* and so doth *Alpinus* and others: in some Apothecaries shops beyond Sea *Xylocarattia* or rather *Xylocaratia*, the *Arabians* call it *Charnebum*, in *Italy* they call it *Carobe* and *Carobole*, and in *Naples* *Salequa*, corruptly, from *siliqua* as *Matthiolus* saith, the *Spaniards* call it *Algarrovas*, the *Germanes* and *Dutch* call it *Saint Johns brot*; that is, *Saint Johns bread*, supposing that *Saint Iohn* fed upon these fruites, and wilde honey, while he did abide in the wilderness of *Iudea*, as in *Matth.* 3. 4. but they are much deceived, for the word in the Hebrew text (as *Junius* and *Tremellius* doe note upon the 22 vers. of the 11. chap. of *Leviticus* is *Arbiz*, (whereof there were foure kindes; of each whereof it was lawfull for the *Israelites* to eate) translated into Greeke *κεράτις*, in Latine *Locustæ*, which are kindes of grasshoppers, peculiar to those Easterne Countries, much differing from ours: but this *siliqua* or sweete Beane tree, is the same mentioned in the 15 chap. and 16 vers. of the Gospell according to *Saint Luke*, whereof the swine fed themselves, and the prodigall child would faine have eaten of them to stay his hunger; but could not have them: for in all these Countries where they grow, the poorer sort of people doe often eate them, and the hogges for the most part consume the rest: the seede of this Beane, was that kinde of weight in ancient times called *Karat*, and among the goldsmithes a Carret, weighing fixe graines formerly; although in these dayes they account it to be but foure.

The Vertues.

The fruite while it is fresh and new gathered, helpeth to purge the belly, but being dried doth rather binde it, and is then more beneficiall to the stomacke, than while it is fresh, because it somewhat troubleth it with the evill taste, and hard digesting thereof: the sweete substance within them, is often also used as honey, both to loosen the belly, almost as much as the extracted pulpe of *Cassia*, and is also good for the inflammations of the reins and backe to temper the heate, and is effectuell in the diseases of the chest, as coughes and shortnesse of breathes as *Cassia* is, which things also the decoction of the cods, performeth very well: *Galen* in his second booke of *Aliments*, condemneth the use of them for meate, saying they are hard of digestion, and are not easily avoyded forth of the body: and in his seventh booke of simple medicines, hee saith they are of a drying and binding quality, although they containe in them some sweetenesse, and that they are somewhat like unto *Cherries*, that being fresh they loosen the belly, and being dry binde it, because the moyest substance being consumed, the thicker essence remaineth.

CHAP. XXXV.

Tamarindus. The Tamarind or fower Beane tree.

The Tamarind or fower Beane tree groweth to be as great as a Plum tree with many branches thicke set with pale greene winged leaves, that is many set together on both sides of the middle rib but smaller, then either those of the *Cassia* or Carob tree, having alwayes an odde one at the end, which usually close themselves together, both at the setting of the sunne, and upon raine, and open againe at the rising thereof, and faire weather, of a fower or acide taste: the flowers are somewhat large and white, like unto flowers of the Orange tree, consisting of eight leaves, smelling very sweete, having foure small white threds, standing in the middle about the umbone, which after groweth to be the fruite, and when it is ripe, is much larger, than any kidney beane cod, some greater and lesse than others, as in all sorts of fruite, somewhat bending or crooked, wherein is contained a blacke substance, not distinguished into cels, as the *Cassia solutiva* is, but the seede lying dispersed among the pulpe, hath diverse bigge and long strings running through it, of a very acide fowre or sharpe sweete taste, very pleasing to the palate and stomacke: the seede or kernels are greater than those of *Cassia*, and as it were square and somewhat flat also: the tree never looseth his leafe, but will endure no cold, as hath beene often tryed in those colder Countries.

The Place.

This tree naturally groweth in many places in the East Indies as *Garcias* saith, it is onely nourished as a stranger both in *Arabia* and *Egypt* in their Orchards.

The Time.

We have no certaine knowledge of the time of flowering or the bearing of ripe fruite.

The Names.

It is called by the *Arabians* (for none of the ancient Greeke writers hath made any mention of it) *Tamarin-dus* that is the Date tree of India, for *Tamar* signifieth a Date with them, and of the later Greeke writers *Oxyphenicon*, that is the fower Date tree; but both of them very unfitly, for it may very well be perceived that it is nothing like unto any kinde of Date tree, *Lacuna* following *Mesues*, calleth it *Dactylus Indicus*, of the Greeke word *dactylus* that signifieth a finger, which the fruite doth very well resemble, being bowed or crooked like unto a bowed or bended finger: some take it to be *Pala* of *Pliny*, whereof he maketh mention in his 12 booke and 6. chap. some againe thinke that it differeth nothing from the *Palmule Thebaice* of *Dioscorides*, the Dates of *Thebes*: and because it should not want an English name, according to the property thereof, I have called it the fowre Beane tree, for that the fruite or cod is so like a great kidney Beane cod.

The Vertues.

The inward pulpe of the Tamarind is very effectuell to purge choller, and therefore is of great good use in all hot or pestilentiaall agues, it openeth the obstructions both of the liver and spleene, and therefore is profitable against

Tamarinda.
The Tamarinde or fower Beane tree.

Tamarindi fructus cum juvene.
The cod and feedes of the Tamarinde tree.

gainst all breakings out of the skinne, which come of the heate of blood, or of a sharpe or salt water, running betwene the flesh and the skinne, as itches, scabbes, leproye, and the like, and helpeth those that are troubled with the Jaundies, and the stopping of the Spleene: it doth exceedingly helpe to assuage the thirst, if an ounce thereof be dissolved in faire water, and a little Sugar mixed therewith, or taken of it selfe; for the people of the hot countries, doe usually eate thereof in their long travells to quench their thirst, which they were never able to endure without it, to refresh themselves in the great heate, both of the Summer, and of those drie places, where no water is to be had. It cooleth all inflammations, both of the liver and of the stomacke, as also of the reins and backe, and helpeth the *Gonorrhoea*, or running of the reins: taken with Burrage water, it quickneth the dulled spirits by melancholy, and somewhat mitigateth the fits of frensie and madnesse: it doth stay all rheumes and distillations, being taken with some Sugar and the water of Maiden haire: if a small quantity of the pulpe of *Tamarinds* and *Cassia*, and the powder of Rubarbe be mixed together, it maketh a delicate medicine to purge the stomacke and liver, and is very effectuell to helpe to expell all hot or burning agues, and procure an appetite: it staeth also vomitings, and taketh away the loathing of meate: the leaves as well as the pulpe serve instead of vinegar, with many of the *Indians*, *Ethiopiens*, *Arabians* and others, they give the leaves also to children for the wormes, and both leaves and pulpe serve outwardly to coole all hot inflammations, and wheales, pimples, and such like. The young cods of the Tamarinds are preserved in *Arabia* with the hony of the Carobs, or with Sugar, which serve for all the purposes before recited.

CHAP. XXXVI.

Nux Ben five Glans unguentaria, The oyle Nut Ben.

His oyle Nut Ben hath undergone much controversie, and contrarietie among those Authors that have antiently written thereof, as namely *Dioscorides*, *Theophrastus*, *Pliny* and *Galen*: for *Dioscorides* saith that the tree is like unto *Tamariske*, *Theophrastus* saith it hath leaves like unto Mirtle leaves, *Pliny* saith like unto the leaves of *Heliotropium* or Turnesole: but that I may compose this controversie and end this contrarietie betwene them, I will shew you here the true description and figure thereof, such as Doctor *Tobias Aldinus* the Cardinall *Farnesius* his Physition at Rome hath set it forth being well grownen, for that which *Honorius Bellus* a famous Physition, living long in Candie had growing with him from the Nuts, which he planted, (and sent the figure thereof to his friends in divers places, & especially to *Iohannes Pena*, an Apothecary in Verona, who in the description and catalogue of the names of those plants that grow upon Mount *Baldus*, which he set forth himself, hath inserted the figure hereof, as

Nux Ben five Glans inguentaria cum sitiqua integra, & nux exempta forism.
The oyle nut Ben with the whole cod, and the nuts taken out and let by themselves.

he received it from the said *Bellius*) was but a young plant, of not above a yeare or two's growth. *Theophrastus* in describing the tree growen great, saith it groweth crooked, and not straight upright spreading rather in breadth than in height, whole leafe is like those of Mirtles, but longer as by this figure that you here see you may well perceive, and nothing like unto those of *Tamariske*, and that the comparison of *Pliny* in the leaves like Turnsole, is not much amisse, for if they be both compared they will not be found much to differ in the forme, I meane Turnsole leaves, from the larger Mirtle leaves, but the difference betwixt *Dioscorides*, and *Theophrastus* riseth as it is thought from the error in the Writers out of the copie of *Dioscorides*; the Greeke word in *Dioscorides* and *Theophrastus*, being so neare and like the one unto the other, that it might easily be mistaken, which are *μυρτιάς* in *Dioscorides* *Myrica*, five *Tamariscus* & *αλβαν* *Myrtus* in *Theophrastus*, yet it is more probable that there is no error in the Text of *Dioscorides*, in that his comparison of this tree unto *Tamariske* is not unto the forme of the leaves, as *Theophrastus* his is, but unto the forme of the whole body, and growing thereof: the true description therefore hereof, as *Aldinus* hath most accurately set it downe is thus. The first two or three yeares saith he, it sprang up and withered or perished downe every Winter to the roote, and rose againe a fresh every Spring, but after it became three or foure yeare old, it grew more woddy and more likely to abide without decaying: it rose up yearely after the first, with one stemme shooting forth branches of winged leaves, or rather winged branches of leaves, the barke being whitish as the leaves are also, but they are composed after such an order as no other tree doth the like; for the branches rise up with the stemme or body, divided into sundry other smaller twigges no bigger than rushes, set with two leaves at severall spaces distant farre in tunder, ending in small long points like haire, but have no eyes or budde at the fecte of the leaves, as the small branches of all other trees have, which sheweth that the whole branched stalke or divided branch, is but as one winged leafe: the leaves first falling away, leaving the branches bare, which then shew like unto ordinary or *Spanish* Broome when it hath lost the leaves; and after the leaves the stalkes likewise perish that held the leaves wholly unto the very stemme, and therefore sheweth to be but as one winged leafe of a tree, as in the Ash, Walnut &c. the lowest of these leaves are somewhat round pointed like the herbe *Heliotropium Santurner*, those on the middle of the branch more sharpe pointed like unto Myrtle leaves, and the uppermost smallest somewhat like unto Knot-grasse: it hath not borne either flowers or fruit in our Christian countries as yet so far as I can heare: the roote is thicke, long, white and tuberous as it were, yet ending in some sprays being not much woddy but rather fleshie and tender: but the nuts or fruits, such as have been brought over to us enclosed in their husks, as also out of their husks are expressed here by themselves: that is, that many, of them grow single in the husks & some two together, and that the nuts enclosed in every huske each by it selfe have their place bunched forth where each of them lie, and straightned betweene them both, the lower and upper end of the huske being small and sharpe pointed, and about an handbreadth long, round and of a darke ash colour on the outside, and somewhat reddish on the inside, of the substance of leather, lither or easer to bow, rugged on the outside with many long streakes in it, but smooth on the inside: the nuts themselves are three square, for the most part, covered with a whitish soft and somewhat tough woddy shell, wherein the white kernell lieth, which is not altogether insipid, but somewhat sharpe in taste and oylie withall, causing a kind of loathing upon the tasting almost ready to provoke vomiting; out of which is pressed an oyle, as *Dioscorides* and *Galen* affirme, like as is pressed out of Almonds; and not from the shells or husks as some formerly supposed, for it is commonly knowne to many here in our owne land, and to my selfe also, who have pressed as good oyle out of the kernells of the nuts, as any hath beene brought from beyond seas: and therefore *Theophrastus* was herein much mistaken, or at least misinformed, that said the oyle that served for sweete oyles and ointment, was drawne from the husks and shells and not from the Nuts themselves, and *Pliny* also who saith the same doth erre in that, although he saith that an oyle is drawn out of the nuts, which the Physicians doe use: for the oyle to both uses is one and the same.

The Place.

These trees grow in Syria, Arabia, Ethiopia and India, and although some say in Egypt also, yet I thinke *Proserpinus*, who was curious to set downe all the rare trees, and plants unknowne in Italy that grew there, would have given us some knowledge thereof, among other Egyptian plants, if they had beene there in his time.

The Time.

We have as I sayd before, no knowledge of the time of flowering hereof.

The Names.

It is called in Greeke by *Dioscorides*, *Galen* and others *Βαλαν* & *μυρτιάς* *Balanus Myrpsica*, that is *Glans Inguentaria*,

guentaria, and by *Lobel Glans unguentaria cathartica siliquata*: by *Theophrastus Balan*^o onely, and by *Pliny Myrobalanus Trogloditis*, in his 12 booke and 21. chap. but why the Grecians should call it *Balanos* an Acorne, being like unto none of the kindes of Acornes, nor the fruite it selfe, nor shell or huske I know not, for if they that doe so call it, had ever seene the huskes, wherein the Nuts are enclosed, they would surely have given it a more proper name. *Monsardus* tooke them to be the *Avellana purgatives* of the West Indies, because the fruite is more like an Hasell nut than an Acorne, and called them *Ben Magnum*, but he was much mistaken therein, and therefore the *Arabians* called it *Ben* and *Habben*, which signifieth a Nut with them, yet *Pena* seemeth to make the name and forme to agree together. *Rauwolfius* called it *Machalep album* saying it is three square, and like a Beech mast or fruite of the Beech tree, for which cause onely as it is likely, *Belonius* compared the tree to a Beech, it is called either *Balanus myrsifica* or *Glans Unguentaria*, after the Greeke signification of most writers, but we in these dayes more usually call it *Nux Ben*, and the oyle *Oleum de Ben*, or as the ancients called it *Oleum Balaninum*, I have given the *English* name to it, according to the most proper signification as I thinke, calling it rather a Nut, than an Acorne as *Gerard* doth after the Greeke name.

The Vertues.

The kernells of the nuts bruised and drunke with *Pesca* posset (that is water and vinegar mingled together) doth purge the body from grosse and thinne flegme also, and thereby is helpfull to those are troubled with the wind collicke, if a few Aniseede and Fennellseede be put unto it: the oyle that is drawne out of the nuts doth the same also, and provoketh vomiting, cleansing the stomacke, of much foule matter gathered therein, yet it doth much trouble the stomack in the meane time: but the nut being toasted at the fire loseth much of that evill quality, oftentimes causing them to purge downewards only: it is with very good effect also put into glisters for the same purposes, the oyle dropped into the eares, helpeth the noise in them, and the deafnesse also: a dragma of the kernell taken in posset, doth loosen and dissolve the hardnesse of the spleene and liver. *Mesues* commendeth the drie presfing after the oyle is taken from it, being of a cleansing as well as of a cutting qualitie, & by reason that the moisture is taken from it, of a drying effect also, for to helpe the itch, the leproy and running sores, and to take away the ruggednesse of the skin, morpew, drie scabbes, scarres, freckles, wheales and pimples, from the face or body; especially if it be used with vinegar and niter, with which it well agreeth, and performeth the cures much better. It is also used with the meale of *Orobis* the bitter Vetch, or the meale of Darnell in manner of a plaister, to be laid to the side to consume the spleene; It helpeth the gout also used in the same manner; used with barley meale, it comforteth the sinewes, that are pained with cold, and all spasmes or crampes, and used with hony dissolveth all knots and hard swellings, the shells or huskes are of an exceeding binding propertie, fit to be used when occasion serveth for such purposes: The oyle that is pressed forth out of the nuts is much used of Perfumers, although it have no sweete smell of it selfe to commend it, yet it is of so excellent a qualitie, that being kept never so long, it will not grow ranke, and therefore it doth both preserve the sweete scents of Muske, Civet, Ambergrise and the like mixed with it, and keepeth that the gloves, leather, or other things, shall not gather spots or stains in them, nor ever grow mouldy, as those things that are perfumed with oyle of Almonds will doe. This oyle likewise is much fitter than oyle of Almonds, to receive any sweet thing to be steeped in it, and to keepe the sent thereof in it, for being utterly without sent of it selfe, neither growing ranke by any time, the sent of any, thing will be the sooner infused, and the longer also retained and kept therein.

CHAP. XXXVII.

Frangula sive Alnus nigra baccifera. The blacke Alder tree.

The black Alder tree, riseth seldome to be of any great bignesse, but for the most part abideth like a hedge, bush or tree, spreading into branches, the wood of the body being white, and of a darke red at the core or heart, the outward batke being of a blackish colour, whereon many white spots are noted to be seene; but the inner barke next unto the wood is yellow, which being chewed will turne the spittle yellow, as much or more than *Rubarbe*, neare unto a Saffron colour, the leaves are somewhat like unto those of the ordinary Alder tree, or those of the female Cornell or Dogge berry tree, but blacker, and not so long but rather rounder, the flowers are white coming forth at the joynts with the leaves which turne into small round berries, greene at the first, and red afterwards, but blackish when they are thorough ripe, divided as it were into two parts, where n is contained two small round and flat feedes: the roote runneth not deepe into the ground, but spreadeth rather under the upper crust of the earth.

The Place.

This tree or shrubbe groweth in woods in many places of our land, as in *Saint Johns* wood by *Hornsey*, in the woods upon *Hampsted* heath, &c.

The Time.

It flowreth in May, and the berries are ripe in September.

The Names.

It is called *Frangula quia cito frangitur*, that is, the branches be brittle and easie to breake, and *Alnus nigra baccifera*, that it might

Alnus nigra baccifera seu *Frangula*.
The blacke Alder tree.

be knowne from the *Alnus vulgaris*, whose barke is whitish and the wood more red, and beareth not berries as this doth: *Tragus* calleth it *Faulbaum* that is foule tree, of the evill sent and taste, the *Idea ficus nostra* sive *Fragula vulgo* of *Lugdunensis*, differeth not from this, although he would seeme to make it. The *Italians* call it *Frangola*, the *Germans*, as is before said with *Tragus Faulbaum*, the *Dutch* *Sporrekenhout* and *Hondsboom*; and we in *English* the blacke *Aller* or *Alder* tree.

The Vertues.

The inner yellow barke hereof as *Matthiolus* saith, purgeth downewards both choller and flegmē, and the watry humors of hydropicke persons, and strengthneth the inward parts againe afterwards, even as *Rubarbe* doth: if the barke hereof be boyled with *Agrimonie*, *Wormewood*, *Dodder*, *Hoppes*, and some *Fennell* and *Smallage*, *Endive* and *Cichory* rootes, and a reasonable draught taken every morning for some time together, is very effectuall against the laundise, the dropsie, and the evill disposition of the body, so as some especiall purging medicine, have bene taken before to avoyd the grosser excrements, and then it will the better loosen the belly, and keepe it soluble without trouble or danger to the stomacke, purging and strengthning the liver and spleene, in so good manner that diverse have bene cured by this onely medicine, who have had their livers and spleenes swolne with humors and hardnesse; by opening all obstructions in the inward parts, and clenfing them from such evill humors as they were full of before: the dried barke is onely fit for those purposes, for the fresh or Greene barke being taken inwardly, provoketh strong vomitings, paines in the stomacke, and gripings in the belly; yet if the decoction thereof may stand and settle for two or three dayes, untill the yellow colour be changed into blacke, it will not worke so violently by much as before, and in not provoking vomiting or purging; it will strengthen the stomacke, and procure an appetite or desire to meate: the outer barke contrariwise doth bind the body, and thereby is helpfull for all laskes and fluxes thereof; but this should be given after it hath bene dried also, to worke the better: the inner barke hereof boiled in vinegar, is an approved remedy to kill lice, to cure the itch, and take away scabbies, and drie them up in a very short space: the same also is singular good to wash the teeth, both to take away the paines, to fasten those that are loose, to clenfe them from corruption; and to keepe them sound: the leaves are said to be good fodder for Kine, to cause them give the more abundance of milke.

CHAP. XXXVIII.

Evonymus. The Spindle tree or Pricke wood.

Although the former ages, were content to know but one sort of this *Evonymus*, or Spindle tree, yet *Clusius* in his *Pannonicke* travells, hath set forth two other sorts, not knowne before to any, which I will here shew you together.

1. *Evonymus vulgaris*. The common Spindle tree.

Our ordinary spindle tree, is also but a shrubbe or hedge bush, rising up with many stemmes, or sometimes

1. *Evonymus vulgaris*.
The common Spindle tree.

3. *Evonymus Pannonicus latifolius* *Clusii*.
Broad leaved Spindle tree of Hungary.

but with a few, the elder boughes, having a whitish barke, and the younger greene, with foure brownish lines like lists, running all the length of them, which make them seeme foure square, the wood is somewhat whitish, hard, and yellow, it hath diverse branches, whereon doe grow faire and darke greene long leaves, broadest in the middle, from among which come forth long stalkes, whereon stand foure or five white flowers, clustering together, consisting of foure leaves a peece, with some threds in the middle, after which come round hard huskes or red berries, divided into foure parts, in each whereof lieth a white hard feede, covered with a yellow skinne, which will give a yellow colour, if it be put into water: the rootes are many, not running deepe into the ground, but spreading rather under the upper face thereof.

2. *Evonymus Pannonicus*. The Spindle tree of Hungary.

The Spindle tree of Hungary, hath diverse gentle and pliant stemmes, rising from the roote, which grow to be three or foure foote high, and of the thickest of ones thumbe, covered with a thicke greene barke, with many blacke spots therein, divided into many other lesser branches, set in a seemely or comely order one above another, about which grow many leaves, set opposite one unto another, somewhat like unto the greater Mirtle leaves, but more gentle in handling, lightly dented about the edges, of a drying taste at the first, but afterwards somewhat bitter, and liot, from among the leaves at the joynts of them come forth small long stalkes, with two or three flowers on each of them, consisting of foure leaves apeece, of a shining purplish colour hanging downe their heads, and with a square umbone in the middle, which grow into a foure square head or berrie, like in forme unto the former, somewhat spongie or light, of a faire yellow colour on the outside, wherein lie shining round feede, blacke on the outside, two or three lying in one cell or partition, which are very like unto the feedes of ballard Dittany.

3. *Evonymus latifolius*. Broad leaved Spindle tree of Hungary.

This broad leaved Spindle tree, riseth up (if it be manured) to be higher than any man, spreading his slender pliant branches, uncapable to breake, whereon doe grow many faire broad greene leaves, set by couples, and as large as the leaves of *Latrocerasus*, or Cherry Bay tree, lightly dented about the edges, and of an unpleasant and bitter taste: at the joynts betweene the leaves and stalkes spring forth long stalkes, with diverse flowers at the end of them, hanging downe their heads, consisting of foure white broad leaves, tending to a flesh or bluish colour, very like unto the common Spindle tree, which turne into foure square heads of berries, and sometimes into five square berries, but much larger, having certaine lists like to winges on every of them, wherein are contained white graines or kernells, covered with a yellow skinne as in the first.

The Place.

The first groweth in many places of this Kingdome, in woods and untilled places, and serveth among other shrubbes for hedges; the second *Clusius* found both in the upper and the lower Hungary, upon those hills that runne to the Alpes, as also in Moravia in the woods there. The last was found by *Clusius* also, in a wood in that part of Hungary that is called *Interamnis*, and which the Germanes call *Windeischlands* beyond the river *Dravus*.

The Time.

They doe all flower about May, and their berries are ripe in September.

The Names.

This is generally by most Writers called *Evonymus*, and taken to be the true *Evonymus* of Theophrastus, quod boni nominis in lib. 3. cap. ultimo, and which hee calleth *Tetragonia* translated *Quadratoria* by Gaza in his third Booke and sixt Chapter; but there are diverse, and *Lugdunensis* with them, that have rather judged an other shrubbe to be *Evonymus*, which *Gesner* in his Epistles, and *Clusius* in his history of Plants, thinke to be a kinde of *Ledum*, and is by *Clusius* called *Ledum Alpinum*, (which I have remembered before in the former Clasis) by *Vissler* *Abdoandus Nerium Alpinum*, as *Gesner* in *descriptio montis fratti* doth record, and is probable to be *Chamaerhododendros Alpina* odora of *Pena* and *Lobel* in their *Adversaria*, and which *Lobell* in his Observation calleth *Balsamum Alpinum*: but *Clusius* sheweth plainly, that it cannot agree therewith, not having a four square head or huske. It hath bene corruptly called *Anonymus* of diverse, instead of *Evonymus*, as *Cordus* in *Hist.* saith, *Tragus* mistaking it called it *Carpinus*. It is called also *Fusanum* and *Fusoria*, because the Italians called it *Fusaro*, as being used by Turners and others, to make spindles for spinning wheelcs and other things, and by *Bauhinus* *Evonymus vulgaris gravis rubentibus*. The second is called by *Clusius* *Evonymus alter, vel secundus* by *Camerarius* and *Tabermontanus* *Evonymus Pannonicus*, and by *Bauhinus* *Evonymus gravis nigris*. The last is called *Evonymus five latifolius* by *Clusius* and all others. It is called in English Spindle tree, Pricke timber tree and Prickwood, and in some countries of this land Dogge wood, and might from the forme of the berries, as well be called Square berried tree. The Italians call it *Fusano*, the French *Fusin*, and *bonnet de presire*, the Germanes *Spindelbaum*, the Dutch *Papenhaut*.

The Vertues.

This is seldom used in Physicke with us for to helpe any disease; yet it is found by experience that three or foure kernells will purge both by vomiting & by the stoole, causing much choller and flegme to be avoided. *Theophrastus*, and from him diverse others, have said that the leaves hereof are pernicious and deadly, especially to Sheepe and Goates, unlesse they be purged by *Anochus* (which word is not well knowne what it meaneth) *Domeneus* interpreting it, that they should be purged upward and downward, and others understanding it, that they should be purged by want or abstinence from meate. *Dalechampius* as *Lugdunensis* setteth it downe, confirmeth that saying of *Theophrastus*, to be hurtfull to Goates by his owne experience, who saw flockes of Goates feeding upon the shrubbes that grew with this, but none of them to touch it, and that they refused to eat it being cast unto them, but *Clusius* saith the cleane contrary, that hee understood the Goates in Hungary did greatly desire to eat the leaves thereof, and tooke no harme thereby, and that the Hungarians in their language call this shrubbe *Kechke rago sa, id est capris rosa arbor*, the Goates Rose tree, so diverse be the writings and opinions of men whereof in many other things we have sufficient experience.

CHAP. XXXIX.

Rhamnus solutivus five *Spina Infectoria*. The purging Thorne.

Here are diverse sorts of *Rhamnus*, some for this *Clasfis*, others for another, as shall be shewed in their places: Of this thorne formerly, we had the knowledge but of one sort onely, untill *Clusius* in his *Pannonick* observations set forth two other, the one whereof shall be here expressed, for I must referre the other to another place, that is to the Kindes of *Lycium*, where you shall finde it.

1. *Rhamnus solutivus vulgaris*. The common purging thorne.

The purging thorne, that is frequent in our owne Land, is for the most part but a low shrubbe or hedge bush, seldome growing any thing bigge or like a tree, having many stemmes or branches rising from the roote, covered with a smooth blackish red barke on the outside, and Greene on the inside, the innermost being yellow, the wood whereof is of a whitish yellow, toward the outside, and of a reddish yellow inward, and at the heart

2. *Rhamnus solutivus seu Spina infectoria vulgaris*.
The common purging Thorne.

3. *Rhamnus solutivus minor Panponicus*.
The lesser purging thorne of Hungary.

1. *Rhamnus solutivus vulgaris* Exaltationem cum floribus. A more exact figure thereof.

strong, and not easie to bend or to breake, whereof strong bowes may be made, and hath bene in times past : the smaller branches are furnished with many leaves like unto those of the crab tree, but smaller, with small long straight thornes in many places set with the leaves, the ends of the branches ending in a thorne also; among the leaves come forth many flowers, every one upon a severall foote stalk, consisting of foure leaves a peece, of a whitish Greene colour; after which come small round berries, Greene at the first, and blacke when they are ripe, full of pulpe or juyce that is Greene, with one or two small graines within them of an unpleasant taste.

2. *Rhamnus solutivus minor Pannonicus*. The lesser Purging thorne of Hungary. This lesser *Rhamnus* groweth much lower than the former, with smaller branches, not above a yard and a halfe high, having many leaves thereon, smaller and narrower than the former, almost as small as those of the blacke thorne or slowe tree, with a few thornes set here and there upon the branches, but ending alwayes in a thorne : the flowers are like unto the other but smaller, and of an herby, or whitish Greene colour, with smaller berries also succeeding them.

The Place.

The first groweth in many places of this land, but especially in *Kent*, as at the hither end of *Dartford* next unto *London*, *Farningham* upon the *Connie* burrowes, and in a narrow Lane neere *South Fleete*, and in many other places. The other *Clusius* found in *Pannonia*, and in *Germany* neere the bathes at *Baden*.

The Time.

Their flower in *Aprill* and *May*, their fruite is ripe in *September* and *October*.

The Names.

It is called *Rhamnus*, although it can be referred to none, either of *Dioscorides* or *Theophrastus*, yet all agree, it is a species or kind of *Rhamnus*, and so even the thornes declare, and therefore the word *solutivus* is added thereunto, to denominate the difference. *Matthiolus* I thinke first called it *Spina infectoria*, and is by many followed therein *Tragus* calleth it *Rhamnus alia species*, yet knew not of any purging quality in it. *Dodonaeus* called it *Rhamnus solutivus* and *Lugdunensis*; *Rhamnus Casbaticus* & so doth *Bauhinus*; *Coranus* calleth it *Cervi spina*, *Gesner* *Spina Cervina* and *Casalpini* *Spina Cervalis vulgo*, and some also *Burgi spina*, from the French word *Bourgespine* whereby they call it as also *Nerprun*. The other is called of *Clusius* *Spina infectoria pumila prima*; although *Gerard* hath called it in *English* *Laxative Ram* and *Bucke borne*, yet I have rather entituled it a purging thorne, as most fitting to it.

The Vertues.

The berries hereof dried and a drame of the powder, given in wine or the broth of flesh, doth purge both flegme and grosse thicke humors also, yet *Pena* saith it rather draweth forth thinne flegme, and that from the joints and Arteries, and therefore is singular good for dropsie; some doe make an Electuary and some a Syrupe of the juyce of the berries clarified, and Sugar or Honey put thereto, but because it worketh a little troublesomely, some spices are to be added thereto to aromatise it, as Cinamon, Ginger and Cloves, and some add Masticke and roses also, which doth correct the evill quality therein, and cause it worke without paine : an ounce or more of either Electuary or Syrupe may be given at a time, dissolved either in wine or in the broth of flesh, which will draw forth raw whayish humors, and choller abundantly, as also thicke clammy flegme, for it worketh not with any troublesome heating of the parts, but doth strengthen them after purging, not causing any flux to follow : Of these berries are made three severall sorts of colours, as they shall be gathered; that is being gathered while they are Greene and kept dry, are called *Sappe berries*, which being steeped in some Allome water, or fresh bruised into Allome water, they give a reasonable faire yellow colour, which painters use for their workes, and Bookebinders to colour the edges of bookes, and leather dressers to colour leather, as they use also to make a Greene colour called *Sappe Greene*, taken from the berries when they are blacke, being bruised and put into a brasie or copper kettle, or pan; and there suffered to abide three or foure dayes, or a little heated upon the fire, and some beaten Allome put unto them, and after pressed forth, the juyce or liquor is usually put up into great bladders, tyed with strong thred at the head, and hung up untill it be drye, which is dissolved in water or wine, but sacle is the best to preserve the colour from starving as they call it, that is from decaying and to make it hold fresh the longer : the third colour (whereof, none that I can finde hath made mention, but onely *Tragus*) is a purplish colour which is made of the berries suffered to grow upon the bushes, untill the middle or end of *November*, that they are ready to droppe from the trees.

CHAP. XL.

Anagris & Laburnum. Beane Trefoiles.

He *Anagris* and *Laburnum* are such congeners, so like the one unto the other, that diverse writers doe call that *Anagris*, which others call *Laburnum*, and indeed I know no other distinction betwene them, than of *fetens & non fetens*, *major & minor*.

1. *Anagris fetida*. Stinking Beane Trefoile.

The stinking beane Trefoile in his naturall places, which are the hot Countries of *Spain* and *Narbonne* in *France*, seldome groweth to be higher than a man, but transplanted into more cold and temperate climates, riseth twise so high; having the barke of the body, and elder boughes, of a darke grayish Greene colour, the younger of a fresher Greene, from whence shoote forth at diverse places three somewhat large leaves together, standing upon a pretty long foote stalk, of a Greene colour on the upper side, and of an hoary or silver shining colour underneath; of a strong unpleasant sent, like unto stinking *Gladwin* especially in the hot countries, for in the colder countries it is nothing so much, and very little in ours, as I have tryed, who have had it many times growing with me : at the joynts with the leaves come forth many flowers, standing upon a long stalk, one by another, which are larger than in any *Cytisus*, almost as great as the *Colutea*, the lower leaves being of a paler yellow colour, and the uppermost which cover them, of a deeper gold yellow, which after turne into large and long flattish cods; wherein lye foure or five seedes, twise as big as in the other, almost as big as *Kidney beanes*, and more discoloured than the other, that is of a darke purple spotted, which were of a fairer purple, before they were

1. *Anagyris fetida*.
Stinking Beane Trefoile.

2. *Laburnum majus*.
The greater lesse Stinking Beane Trefoile.

were thorough ripe: the roote thrusteth not deepe into the ground, but is well fastened with branches and fibres within the ground. Of this kind there is one growing in Candy, whereof *Honorius Bellus* gave knowledge to *Chesius*, that hath rounder leaves, which as yet I never saw.

2. *Anagyris non fetida* sive *Laburnum majus*. The greater lesse Stinking Beane Trefoile.

This Beane Trefoile groweth larger in body and branches, than the former, and sometimes shooteth forth diverse stemmes from the roote, the wood whereof is very firme and hard, yellow toward the barke, and blackish at the heart, (whereof the strongest bowes are made, and stakes that will abide hard in the ground longer than others) with leaves larger than either the former or the smaller sort, of a darkish Greene above, and silver colour underneath like them: the flowers are more in number, and smaller than in the former, the stalkes of flowers, hanging downe and not standing up, being sometimes almost a foote long, and not so long as in the former, and are for the most part all of one pale yellow colour, the cods likewise are blacker, shorter and smaller, and so are the feedes within them also, yet greater than in the lesser sort, else much alike, being blackish and very hard, scarce yeeldes to be mollified in water: the leaves and flowers have but little sent at all to discommend them, in any that I have seene and smelt.

3. *Laburnum minus*. The lesser Beane Trefoile.

This lesser Beane Trefoile is in most things like unto the last described but that it groweth not so great, nor are the leaves so large by the halfe, nor yet either flowers or feedes.

The Place.

The first as is before said groweth in hot Countries: the second, and so doth the least also, in many of the woods of Italy, and the higher parts of France, and other places, and upon the Alpes.

The Time.

The first seldome abideth with us to shew his flower: but in his naturall places, it flowreth early even in January and February, in Spaine as *Culsius* saith, but in April and May, in other places; and the feedes are ripe in the Summer time after in Spaine, but not untill September in other places: the other flowreth in May and June, and the feede sometimes ripeneth well, but not untill September, but the least ripeneth well.

The Names.

The first is called of *Dioscorides* *ἀνὰγυρις* & *ἀνὰγυρος*, *Anagyris* & *Anagyros*, which *Pliny* saith some called *Acepon*: vera & fetida, is usually added to it to distinguish it from the other, which is also called *Anagyris* of some, but altera or non fetida which second or non fetida, *Matthiolus* calleth *Anagyris prima* & major, as he calleth the least *Anagyris altera*, but he contendeth against *Gesner* who did in following other mens opinion, make the great *Laburnum* or *Anagyris altera* to be *Laburnum* of *Pliny*, which is the least and called *Egbelo* of those that dwell about *Trent*. *Camerarius* in barto calleth it *Laburnum*, when as he calleth the least, *Anagyris altera* of *Matthiolus*, *Anguilara* saith it is called by the inhabitants *Egano*, & thinketh it may be *Ebeni secunda* species *Theophrasti*; *Lugdunensis* also calleth it *Laburnum primum*, and the least *Laburnum alterum*, and saith it might be called *Anagyris Alpina*; *Cordus* calleth

calleth it *Arbor trifolia*, diverse doe call the least *Laburnum*, *Faba in versa*, Gerard his figure of *Anagyris foetida*, and *Anagyris*, are the same that are in *Matthiolus*, but the titles are contrary, for Gerard his *Anagyris foetida*, is the *Eghele* or *Anagyris altera* in *Matthiolus*. It is probable in my opinion, that the smaller *Laburnum* should be that *Collyrea* of *Theophrastus*, which is set down in the 14. c. of his third book, with a willow leaf: for if you take any one leaf by it self, it may well resemble a Willow leaf; both for forme and colour, and beareth small seeds in cods, like unto pulse as that doth: *Gesner* did referre this kinde unto the mountaine *Cytisus*, but *Matthiolus* reprooveth him for it: the great booke of *Egisterius* calleth it *Anagyris laifolia*, but I call it *Laburnum majus*, as I doe the least *Laburnum minus*.

The Vertues.

The leaves as well as the feede of the first Beane trefoile, are a strong vomit, especially in the hot Countries, where it groweth, and *Honorius Bellus* writing thereof to *Celsus*, saith that in *Candy*, where that kind groweth with rounder leaves, if the Goates or sheepe do chance to feed thereon, the milke which they give will cause any that shall take it, to fall as well into extreme scouring downewards as strong casting upwards, and that many thereby have beene brought in danger of their lives: the young leaves saith *Dioscorides* applied unto tumors or swellings, discusseth and represseth them; and if a dram of the powder of them, be drunke in wine, as he saith also, it expelleth both the dead birth, and the secondine, and likewise bringeth downe the monethly courses of women; if some of the leaves be bound to those that have hard and uneasie travell in child bearing, it causeth a speedy delivery of the birth, but they must bee taken away presently afterwards; they are likewise given in wine to those that are short winded, and to such as are often troubled with the head-ach: the barke of the roote hath a digetting ripening and discussing quality: both the other forts here set downe, have the same properties, for they are also of the same temperature, but *Matthiolus* saith, that he hath knowne, that some that have taken ignorantly of the feede of the lesser Beane trefoile, have had strong vomitings even unto blood: *Solerius in scholiis in Aetium* saith, that by certaine and undoubted experience it hath beene found, that a dramme either more or lesse of the dried bark thereof made into powder, and taken in any kind of drink, purgeth very strongly both upwards and downwards, but in a diverse manner; for if as he saith, (which I take rather to be but a conceite) the barke be pulled off from the tree upwards, it will cause vomitings, if downewards great purging of the belly downwards: the Bees saith *liny*, refuse to touch the flowers of this *Laburnum*, which is the lesser Beane Trefoile. but it hath beene truly observed, that both in the naturall places where it groweth, as also with us, that the Bees doe not refuse to feede upon them: the *Grecians* have an usuall proverbe with them, *Anagyrin commovere* when they would signifie one, that worketh as wee say his owne woe, or is the cause of his owne harme.

CHAP. XLI.

Myrobalani. Myrobalans or purging Indian Plummes.

Although there be none of these Myrobalan trees (whereof are 5 sorts of fruites well known & distinguished in the Apothecaries shops) growing in any of these Christian Countries of *Europe*, as far as ever I could learne yet I could doe no lesse than make mention of them here, both because the fruites are often used in Physicke among other purgers, and to make it knowne to all that might be mistaken by the name, and thinke that the Myrobalane Plummes, the red and the white that I have remembered in my former book, be some of these kinds: but so they are not, neither for forme nor quality: as also to stir up some ingenious mind among our Merchants, that trade to *Aleppo* & *Cairo*, & into *Persia* and the East Indies, to give order to their factors, if they doe it not themselves, to enquire and seeke out such of the forts that are to be found in the places of their abode, and either to plant the stones of these severall kinds in those warmer countries, if they abide any time in them, that when they are a little growne they might then send them hither: or send the fresh stones over hither to us (for those are too dry that are brought for physicke use) that wee may plant them here to try if they will not growe and abide with us, that at least, having but a sight of the forme of the leaves of any fort, we might compare them with the descriptions that writers have made of them, whether they are answerable thereunto: I must in the meane time therefore but shew you them as *Garzias* and others before me have done, with such descriptions as they gave of them, and are extant, not knowing whether they be true or no.

1. *Myrobalanus Citrina.* The yellow Myrobalane or purging Indian Plum.

The tree that beareth these yellow Myrobalanes is said to grow as great as a Plum tree, having many branches and winged leaves on them like unto the true Service tree: the fruit is for the most part as bigge as reasonable Plummes, somewhat long and not fully round, but having many faire ridges on the outside, especially when it is dried, shewing it to be five square though round, of a yellower colour on the outside then any of the rest; the flesh or substance being of a reasonable thicknesse, yet not so thicke as the Chebuls, or Emblics, nor so thin as the Bellerici; the stone is white thicke, and very hard to breake, with emminences and ridges also therein, and a very small long kernell lying in the middle, of an infringing taste as the dried fruit is also, but much more then it: this hath no such kernell that thereout may be pressed an oyle, as *Bellonius* noeth of the kernells of that fruit that hee rooke to bee the yellow Myrobalane tree, in the plaines of *Hiericho* as he noeth it, in *lib. Observationum* 2. cap. 86.

2. *Myrobalanus Chebula.* The purple Myrobalane, or purging Indian Plum.

This kind of Myrobalane tree growing in stature and branches like a Plum (as *Garzias* saith all the forts are) bearing leaves on the branches like unto the Peach tree: the fruit hereof is the greatest and longest of all the five sorts, of a blackish purple colour on the outside while it is fresh, which it holdeth in the dry fruit; (which *Matthiolus* commended for the best) being five square as the former, of the thickest substance, and more fleshy then any other, and with the smallest stone in the middle, not fully so hard to breake as the former, but with the smallest kernell therein.

3. *Myrobalanus*

Myrobalanorum 5. Genera.

*Fructus Emblicorum cum nucleis
interiore barbato.*

Myr. flum.

Myr. indica.

Myr. bellerica.

Myr. chepaka.

Myr. emblica.

3. *Myrobalanus Bellerica.* The round Myrobalane, or purging Indian Plum.

The round Myrobalane is like the rest for growth, but bearing leaves like the Bay tree, yet of a paler greene colour, and somewhat ashy coloured (underneath peradventure) withall: the fruit is of a mean bignes, round and smooth, yet being as it were three square in many, and of a pale russettish colour when they are fresh, but of a darke or dusty whitish colour on the outside, being dry, of the thinnest substance or least fleshy of any of them: the stone whereof is thicke greater then any other, proportionable to the fruit, very hard to break, with a kernell within of a reasonable bignes.

4. *Myrobalanus Emblica.* The bearded or six square Myrobalane or purging Indian Plum.

The tree that beareth this Myrobalane or delicate Plum, being like a Plum tree for height and manner of growing (as you have heard before that *Garzias* saith so of them all) hath leaves of a palme or handbreadth long, very finely cut in or divided on the edges: the fruit is round in shew, but doth separate or will be broken into six parts, as both we have observed in the dry fruit, alwayes brought unto us, broken into small peeces, without any stones; and more plainly in the fruit preserved, whereof good store hath bene brought over many times unto us, which will be divided into many parts: the stone whereof within it is six square, with three greater ridges, and three lesser lying betweene them, and bearded at the head of the three greater ridges, the kernell within it being separated into the three severall divisions, having each of them two calls, wherein the parts of the kernell lye almost three square.

5. *Myrobalanus Indica.* The blacke Myrobalane or purging Indian Plum.

The blacke Myrobalane tree is like the rest; whose leafe (as *Garzias* saith) is like unto a Willow leafe: the fruit saith *Garzias* is eight square, which may be when they are fresh, but they cannot be so plainly discerned in those that are brought over unto us dry, the smallest of all the rest, somewhat long, altogether fleshy, without any stone in the middle, and the blackest of any.

The Place.

All these fruits grow in the East Indies wild and not manured, but in divers provinces, as some in *Goa* and *Batecala*, others in *Malavar* and *Dabul*. Yet *Garzias* saith foure sorts grow in the kingdome of *Cambaya*, and the *Chebuls* in *Bijnagar*, *Decan*, *Guzerate* (which we call at this time *Surrate*) and *Bengala*: *Bellonius* saith in his booke of observations that the yellow Myrobalanes grow in *Arabia* and *Syria*, and also in the plaines of *Hiericho*, but I doe much doubt of the certainty thereof and thinke rather that he was mistaken.

The Time.

We know so little of the trees, that we know lesse of their time of flowering or bearing fruit.

The Names.

These kind of fruits were not any of them knowne unto any of the ancient Greeke writers, as *Dioscorides*, *Theophrastus* or *Galen*, neither unto *Pliny*, for although hee maketh mention of a *Myrobalanus*, yet hee addeth *Trogodytes*, which is the *Nyx Ben*, *Balanus Myrsica*, or *Glans Pnguentaria*, as I shewed you a little before, yet

yet both *Balanus Myrepsica* and *Myrobalanus* have but one signification in the Greeke tongue. The *Arabians* were the first that made them knowne to the world, and called them all in generall by the name of *Delegi*, as by the writings of *Mesues* and *Serapio* doe appeare; but the Greekes that translated these *Arabians*, gave the names of *Myrobalanes* unto these fruits, because (as it is likely) they thought the fruit was like unto an *Acorne*, and therefore gave the name *Balanus*; but why they should give the other word *Myros*, which signifieth an oynment, cannot be understood by any, for none of these were ever used in any precious or sweet oynment, and *Myrobalanus* signifieth as much as *Balanus Myrepsica Glans unguentaria*, the *Acorne* for oynments. *Attuarii* among the latter Greeke writers maketh mention of them, but that none of these did grow among the *Arabians* their ignorance of their growing declareth plainly: for *Mesues* writeth that the *Citrini Chebuli* and *Nigri* doe all grow upon one tree, and for that they beare twice in a yeare, the *Citrini* are the unripe, and the *Nigri* are the ripe of the first bearing, and the *Chebuli* the fruit of the later bearing, which how contrary unto truth it is, *Garzias* doth declare, in his booke of the Drugges of the East Indies, where hee plainly sheweth that all the five sorts, grow severally each upon a severall tree, as I have shewed you before: the *Indians* call the *Citrini* or *Flavi* *Arare*, but the Physicians *Aritiqui*, and the *Indici* or *Nigri* they call *Resenvale*, the *Bellericki* *Gotini* or *Gotni*, the *Chebuli* or *Chebuli Aretca*, and the *Embliki* or *Annale* as *Garzias* hath it, or *Annale* as *Acosta*. I have you see intituled them all purging Plums, as most proper for them in my judgement, and given them their sundry Epithites according to their quality as I thinke.

The Vertues.

All these sorts of *Myrobalanes* have a gentle purging quality, some more and some lesse then others, some also purging choller, some flegme, and some melancholy; but they have in them also an astringent quality, much more then is in *Rubarbe*: the *Citrines* and *Bellericks*, that is the yellow and the round *Myrobalanes* doe purge choller gently: the *Chebules* and *Embliki* that is the purple and six square *Myrobalanes* doe purge flegme: and the *Indies* or black ones melancholly: the decoction or infusion of them all doth purge better then any wayes else, yet so gently that in evacuating the humors, they strengthen the stomacke, the liver and the heart, but given in powder they binde the body more then purge it, and indeed the binding quality in them all, especially in the dried fruits, is more predominant, and as *Garzias* saith, the *Indians* wholly use them for that purpose, and therefore they are the best medicines to be mingled with *Scamony* and all other violent purgers, to restrain their violence and to correct their fiercenesse, and yet as *Mesues* saith they are often put with *Cassia*, *Manna*, & *Tamarind*, to helpe the working of them, as a most safe medicine: the *Bellericks* and *Embliki* by purging the stomacke from rotten flegme lying therein, and strengthening the braine and joynts, the heart and liver, and binding all other loose or fluent humors in the parts of the body, are very effectfull, as also for the trembling of the heart, and to stirre up the appetite, stay vomiting and restrain the fury and belchings of choller, to increase the power and facultie of the spirits, to qualifie the excessive heat of the inward parts, and the thirst is raised thereof, and doe helpe and give ease to those that are troubled with the hemorrhoides or piles, by restraining the fiercenesse of choller flowing unto them, and for this last effect, the *Citrines* are most used: also for all hot constitutions, and in all hot agues where there are no obstructions, for (they as all the other sorts also) doe rather cause obstructions, and therefore in all such when they are to be used they are to be corrected with *Wormewood*, or the juice of *Fumitory*, or with *Rubarbe*, *Agarick*, *Spiknard* and the like, as also with other opening and diureticall things: the *Chebules* in especiall doe purge flegme, sharpen the memory, cleare the eye sight, cleanse and strengthen the stomacke, and are very effectfull against the dropisie, and all old agues: the *Indies* or blacke *Myrobalanes* in speciall, doe purge melancholy, and blacke or burnt choller, and thereby are available for the quartaine Ague, the Lepry or foule evill, and all paraliticke diseases: the *Embliks* and *Bellericks* in especiall purge flegme and comfort the braine very much, as also the heart and stomacke, stay vomiting and stirre up the appetite. They all of them in generall are of especiall use in all Fluxes both of the stomack and belly, by gently purging the malignant fluxibilitie of the humors, and strengthening and binding the parts afterwards; but as an especiall receipt to binde or stay an old continued Laske, I have knowne this medicine doe much good. Take and burne a pint of Claret wine, with a little *Rosemary* and *Sugar*, wherinto put to sleepe all night one dram of *Rubarbe*, first sliced and tosted at the fire, and halfe a dram of *Chebule Myrobalanes*, which standing by the fire all night, and strained forth in the morning, is to be taken at two severall times, a draught in the morning fasting, which if it helpe not sufficiently the first time, being renewed and taken two dayes more, will certainly stay the laske wholly, if the malignity and sharpenesse of the humors bee not so strong that scarce any medicine will cure it. The *Chebule Myrobalanes* broken and steeped in *Rosewater*, or in the clarified juice of *Fennell* for two or three dayes, and after strained forth; this water dropped into the eyes doth cleare the sight, and a fine cloth wet therein and often applyed, taketh away the heat and inflammation in them, and stayeth rheumes and distillations into them: the powder of any of the *Myrobalanes* and *Masticke*, put into running *Ulcers* and sores, dryeth up the moisture and consolidateth them: The *Chebules* and the *Embliks* are often brought over unto us preserved, whereof the *Chebules* are more used Physically for such purposes as are before set downe, then the *Embliks* are, which being nothing harsh in taste as the *Chebuls*, but being very pleasant, are more often used as a delicate preserved Plum, among other junkets, then for any Physicall respect.

CHAP. XLII.

Agaricus & Terebinthina ex Larice. *Agaricke* growing on the Larch tree, and the fine cleare Turpentine taken from it also.

Because the *Rosin* or *Turpentine* of the Larch tree doth gently open and purge the belly; but more especially the *Agaricke* that groweth thereon, I must shew you the manner of growing of *Agaricke*, give you also the view of the body of the tree, from whence it is taken, and some branches and leaves thereon to be knowne by; but the description of the tree it selfe, shall be shewed you among the other *Coniferas & Resiniferas arbores*; trees that beare Cones or Pine apple like fruit, and out of which is

is extracted a cleare liquid Rosin or Turpentine, called in shoppes *Venice Turpentine*, by boring the tree to the heart, and receiving it into vessells, and from the body of the tree when it is growne great and old in many places, and from the greater armes and boughes also, groweth certaine excressences like Mushromes but greater, called *Agaticke* of divers and severall sises, that is from the bignesse of ones hand lesse or more, to be as bigge as any mans head, and sometimes greater, covered with a hard blackish barke, which being cut and pared away, the substance under it appeareth very white, and if it be of the best sort, very light also, easie to breake, loose or spongie and without strings through it, somewhat sweete in taste at the first, but very bitter afterwards, and not having any hard barke on the outside: the blacke, heavy, and hard, is utterly unfit to be used in Physicke.

The Place.

The Larch tree groweth in many woods about *Trent* and *Brixia* in *Italy*, and neare the rivers *Benacus* and *Padus*, and in *Galatia* a Province of *Asia*, as *Dioscorides* and *Galen* doe record, and in *Agaria* a country of *Sarmatia*, from whence the *Agaricke* tooke the name; in *Silesia* also *Moravia*, *Lusatia*; And the *Agaricke* is gathered in most of these places, so is the *Turpentine* likewise, but especially from the woods about *Trent*, &c.

The Time.

The Rosin or Turpentine is gathered in the hottest time of the yeare, and the *Agaricke* at the latter end thereof, that is November and December especially.

The Names.

This tree is called *Λαρίς* in Greek and *Larix* or *Larice* in Latin. *Pliny* hath in no one thing in all his History, shewed his inconstancie and repugnancie, more than in this one tree, not onely in not knowing that whereof he writeth, but denying that which is found true by good experience, and saying that in one place, which hee contrarieth in another, as in his 16. Booke and 21. Chapter, hee reckoneth the Larch tree among those wild trees, that doe not shed their leaves, and are sharpe pointed, where it seemeth he tooke the Larch tree, for the Pine tree, as hee doth in the 20. of the same 16. Booke: and whereas *Theophrastus* in his third Booke, and tenth Chapter, speaking of the difference betweene the Pine and Pitch tree, saith, that the Pine tree being burnt downe to the rootes springeth not from them againe, but as some say the Pitch tree doth as it hapned in *Lesbos*, when the wood *Pyrreus* was fired, which was stored with Pitch trees. This very narration *Pliny* lib. 16. cap. 139. in citing, applieth to the Larch tree, which *Theophrastus* doth to the Pine tree. And in another place *Theophrastus* saith, that a kinde of small Pine is called *Egis* or *Egida*; and *Pliny* saith the small *Larix* is called *Egida*, by all which places it may be plainly seene, that *Pliny* mistooke the Larch tree for the Pine tree. For *Theophrastus* hath not made mention of the *Larix*, in all his History, whereby many did judge that it did not grow in Greece, for else he would have knowne it, and spoken of it. In one place againe *Pliny* maketh the leaves of the Larch tree to be soft, woolly, thicke and fat, and in another place hard & drie: againe he saith that the Larch tree hath not flowers nor any cones to commend it, when as they have cones, and the blossomes on them are very beautifull: and lastly *Pliny* saith (it should seeme following *Vitruvius*, who before him said the same) that the wood of the Larch tree, will not burne, nor make a cole, nor will consume in the fire, any otherwise than a stone, when as himselfe saith and acknowledgeth, as *Vitruvius* also doth, that it yeeldeth forth a Rosin; and how could any man thinke, that a tree yeelding Rosin should not burne, when as the very earth and stones that have any bituminous or resinous qualitie in them, will burne exceedingly, as is plainly seene in our turfe, in pit and sea coales which maintaine our fires, in many places of our Land, and elsewhere also. This I thought good to set downe, not so much to declaime against *Pliny*, as to forewarne others that translate or write others opinions, to be judicious and examine by reason whether that which others have written agree with the truth of the matter, and not hand over head either believe or set downe, whatsoever others have written, be it true or false. Concerning the cleare Turpentine, of this tree called *Venice Turpentine*, there is some controversie among Writers, some alleading it to be taken from the Firre tree, as *Fuchsius* and others, and *Matthiolus* contending there against, that of his owne knowledge and experience, it is onely taken from the Larch tree and no other, for no other Turpentine was to be had in the former times for many ages, because the Merchants neglected to bring the true Turpentine of the *Terebinthus* Turpentine tree, and therefore this onely was used: and no other sort of Turpentine was fit to be taken inwardly in stead of the true from the Turpentine tree, which we doe usually call *Cypresse Turpentine*, because as it is thought the best is gathered in the Island *Cyprus*, those about *Trent* as *Matthiolus* saith use to call it *Larga*, derived as is likely from *Laricea*, yet *Pliny*, *Galen*, and others of the ancients have set downe, that the Larch yeeldeth whitish yellow Rosin, like unto the hony of *Athens* or *Spaine*, but in little quantitie and soone waxing drie, which is that Gumme or Rosin that sweateth out of the tree in Summer of its owne accord without boring: There is also some controversie and contrarietie both in the ancient and moderne Writers, concerning *Agaricke*, *Dioscorides* and *Galen* thinking it to be a roote, like unto that of *Silphium*, yet doubting somewhat thereof. *Dioscorides* saith that some hold it to be a Mushrome, or Excrecence engendred from the rottenesse of the trees, as Mushromes are from the earth. *Pliny* writeth, lib. 16. cap. 8. that it was said that those trees, that bare Acornes in the countrie

Agaricus ex Larice.
Agaricke growing on the Larch tree.

tries of France, did beare Agaricke : and in his 25. Booke and 9. Chapter, he saith that Agaricke was but a Mushrome of a white colour, growing upon a tree about the *Bosphorus*, and in another place that it groweth upon the Cone-bearing trees, among the which the Larch tree is the chiefeft: whereby it is plaine, that the ancients did not well know it. *Brasavolus* saith, that in riding neare *Comalch*, he found Agaricke upon diverse Oakes, and especially upon *Ilex* or evergreene Oake, which saying *Matthiolus* contradicted, saying that in all *Tuskeny*, and other places of *Italy*, as also in diverse countreys of *Germany*, *Carniola* and *Dalmatia* which abound with all the kindes of Oake, he could never see, nor so much as heare that any Agaricke grew on them; but that he saw diverse other hard dry Mushromes, both white and blacke called touchwood growing upon diverse, wherewith the people use to take fire, that the Steele and flint doe give, and use it in stead of Match to discharge their fowling peeces with all. As also that he never saw Agaricke growing upon any tree, but the Larch tree onely, in all the mountaines of *Trent* and *Anavia*, where there be many Oakes growing, as well as Firres, Pines, and Pitch trees, and Larch trees abundantly: yet many doe affirme there is growing in many places upon the bodies of many trees a kinde of white Mushrome, so like unto Agaricke, that many mistake it for Agaricke.

The Vertues.

There is in the leaves, barke, and fruit of the Larch tree, the same temperature that is in the Pine tree, the Turpentine thereof taken to the quantitie of an ounce will gently open the belly, and move to the stooke, provoke urine, cleanse the reines kidneys and bladder, and helpeth to breake and avoid the gravell and stone, and to give ease to those that have the gout: if it be first washed with Plantaine and Rose water, then made into pills, with the powder of white Amber, red Corall, Masticke, and a little Camphire, it doth wonderfully helpe to stay the *Gonorrhoea* or running of the reines, if they be taken for certaine dayes together, and taken simply rowled in Sugar it helpeth it well: it is profitable also for the Ptisicke or Consumption of the lungs, being taken with hony in an Electuary, it helpeth to expectorate rotten flegme, from those are troubled with a continuall cough: the Turpentine as it is the clearest for inward uses, and serveth in stead of the true Turpentine, so is it the best also for outward salves, and doth both draw, cleanse and heale all sores or ulcers, either new or old, and greene wounds also, and therefore there is scarce any salve made for ulcers and greene wounds, wherein Turpentine is not put, there is likewise an oyle drawne chemicallly from Turpentine, which is singular good to be used in wounds, being more drying and consolidating than the Turpentine it selfe, as also to warme and ease the paines of the joynts and sinewes caused of cold: the water that is distilled with the oyle, is used for freckles and spots in the face, a scruple in waight of that water, taken in white wine procureth a vomite, thereby giving much ease to such as have their stomacks overcharged with flegme, the oyle is profitably used in hollow ulcers, being dropped into them, or a tent dipped in it and put into the ulcer: it is good also for the wormes and deafeness of the eares used with a little Oxe gall: some use to mingle bay salt and Turpentine together, and therewith spread a girdle of leather, and tie it about their waistes that have an itch, which by wearing some small time, will cure the itch that is spread over the bodie, as well as the hands. Agaricke is a medicine of frequent and familiar use, often by it selfe, but most commonly with other purgers, to open obstructions of the liver, spleene, and intralls, purging flegme in especiall, but in generall all other vitious humors, offending any member of the body, and because it doth somewhat trouble the stomacke, and procure casting, it is usually corrected with Ginger, and given with Oximell that is syrupe made with vinegar and hony: for it purgeth both thinne and rotten tough flegme, both yellow, hard, blacke, and burnt chollier from the head and braine, from the breast and lungs, from the stomacke, liver, and spleene, from the reines and blacke, and from the wombe, as also from the joynts, sinewes and muscles, and hereby helpeth to cure the diseases that proceede from them, that is such as are troubled with the gout, dropie and falling sicknesse, jaundise, the chollicke and hardnesse to make water, the sciatica or paine of the hips, the pale colour in women caused by the staying of their courses, the shortnesse of breath, the cough and consumption of the lungs, the spitting of bloud, the paines of the mother, the sharpnesse of urine and the wormes: it is helpfull also to cure all sorts of agues, either tertians or quotidian, to ease the griping paines of the stomacke and belly, or such as have had falles or bruises, or are bursten bellied, all which actions it chiefly performeth, by purging those grosse and vitious humors that trouble the parts and members of the body, and are the causes of all these diseases: it is an antidote against all poisons, and cureth the bitings of Serpents very quickly, halfe a drame, or two scruples being taken in wine, either by the infusion or the powder: for the other diseases afore specified, a dramme sliced, and put into a gentle purging decoction but not violent, or into an infusion, is the most generall manner of preparing it to be given; if it be boyled in lye with other Cephalicall helpes, it much comforteth the braine and memorie, and giddinesse of the head to be washed therewith, as also helpeth to stay the rheumes and catarrhes thereof, and cleanseth it much from scurfe and dandriffe.

CHAP. XLIII.

Zizyphus sive Iujuba. The Iujube tree.

Although in former times, there was but one sort of *Iujube* knowne, yet now we have two or three which shall be shewed in this chapter.

1. *Zizyphus sive Iujuba major.* The greater Iujube tree.

The Iujube tree groweth sometimes to be very high, but more often to a reasonable height, having his stemme or body, bowed or crooked, and spreading rather in breadth, the wood whereof is whitish and hard, covered with a rugged barke, from whence spread great branches, and from the lesser and slender whitish twiggies, about a foote long, full of leaves set on both sides, not usually directly one against another, but one alittle above another, with an odde one at the end, each whereof is small, somewhat broad and pointed at the end, dented or finely nicked about the edges, with long veins in them, smooth and somewhat hard in handling, each standing on a short foote stalk, and very like unto the leaves of *Palmyrus* or Christs thorne:

at the foote of every leafe towards the toppes of the twigges come forth, small yellowish flowers, of five leaves a peece, where afterwards stand the fruite, which is somewhat like unto a small Plumme or Olive, but a little long, Greene at the first, and then it is somewhat harsh, and yellowish after, but red and of a reasonable sweetnesse, yet sharpe withall, and somewhat clammy when they are ripe, flat as it were at the lower end, next the stalke, whose skin is thicker and harder than a plumme, and the stone within it is small firme and solid, long, round and pointed like unto an Olive or *Cornelian* Cherry stone, both for forme and hardness: all the branches both greater and smaller are armed with thorns, two alwayes at a joynt, whereof the one is long, strong, sharpe pointed and straight, and the other crooked, both of them of a blackish red colour, like unto the elder branches: the rootes are long and firme in the ground.

2. *Zizyphus frue Iujuba minor.* The lesser Iujube tree.

This lesser Iujube tree is very like unto the former, both for the forme of branches, leaves and flowers, but lower and smaller in all parts, the fruite also is alike, red when it is ripe, with such an hard firme Olive like stone, as the former, but the fruite hereof is smaller and rounder, and not long like as the other is: it is as thickly and strongly armed with thornes though somewhat shorter than the other.

3. *Zizyphus frue Iujuba sylvestris.* The Wilde Iujube tree.

This low Wilde Iujube tree groweth much lower and more like a shrubbe than the last, and more cruelly armed also with small sharpe thornes: the leaves are like but small, growing in the same manner, but fewer on a twigge: the flowers are like the other, the fruite is round and red like the last, and somewhat lesser, but dryer of substance, not having such a pulpie substance as either of the former have, and more austere even when it is ripe.

The Place.

The first groweth naturally in *Africa, Egypt, Arabia & Syria* & those more Easterly Countries, fro whence as *Pliny* saith it was brought into *Italy*, and planted there in his time by *Sextus Papinius*, in the latter end of *Cesar Augustus* his reigne, which now a dayes is very frequent, not onely in many gardens, and Orchards of *Italy*, but in *Province of France* also: it is so tender that it seldome abideth long in our Country, because it cannot endure the cold: The other likewise was brought into *Italy* in these later times from *Syria*, where it is onely to be seene, but with a few that are lovers of rarities. The last groweth wilde, in the fieldes by the hedges, not farre from *Verona*, abundantly as *Pona* saith.

The Time.

They all shoote forth in *Aprill* (for none of them doe hold their leaves all the winter) and flower in *May*: their fruite is ripe in *September*.

The Names.

It is called in Greeke *Κύπαρος* & *Ζίζυφα*, *Zizypha* & *Zinzipha*, of *Columella* *Zizyphus*, of *Clusius* *Zizyphus rutila* & of others *Rubra* and *Punica*, and of the *Arabians* from whom the Apothecaries tooke it *Iujube*, and so doe *Lobel* and *Pena*, *Anguillara* thinketh it to be the *Lotus* of *Athanasius*, as also the *Lotus* of *Theophrastus*, that grew in the *Island Pharis*, mentioned in *lib. 4. c. 4.* which is most likely, for it hath a dented leafe as he saith like unto *Ilex*, whereunto this is more like, than the leafe of the *Lotus arbor*, whereof I have made mention in my former booke. Some doe thinke that this fruite is that which *Galen* in 2. *alimentorum* calleth *Serica*, and unto this opinion many doe adhere, especially because *Avicenna* entreating of Iujubes calleth them *Serica*, for his title is this, *De Iujubis id est Sericis*, yet it is no other likely, but that he was mistaken, for many worthy and learned men, doe doubt of it: but *Pliny* maketh mention of *Sericum*, before *Galen*'s time, in his 15. booke and 14. chap. to be one of the kindes of Tuberes (which we take to be *Nuciperfica Nestorins*, for in his 16. booke 25. chap. he reckoneth the Tuberes, with the Almonds, Peaches, and Apricocks, as if they were all of one kindred, and in his 17 booke and 10. chap. he saith that the Tuberes, are best grafted on the Wilde Plumme &c. and therefore it is likely he thought them of that kinde of Plummes) of the colour of raw silke (and we have a yellow *Nestorin* neere unto that colour) whereof came the name, which maketh me thinke that *Galen*'s *Sericum* should not differ from *Pliny*'s, seeing they lived not any long time, one before the other in *Rome*, and therefore the name could not be there altered: for *Galen* rather allowing of those things that were conduible to medicine, (and we know that Iujubes are so) then of such as did please the palate onely, as *Nestorins* are, and were fit and desired of warlike women and children onely as he saith, did not greatly commend the fruite for any good to the bodies health, yet I verily thinke, and of this opinion is *Cornarius* also, that his and *Pliny*'s *Sericum* are all one. And although *Mathiolus* seemeth to finde fault with *Pliny*'s booke to be false, in naming but one sort of *Zizyphus*, and two of the Tuberes, when as *Columella*, *Avicenna*, and *Sethi*, make two sorts of *Zizyphus*, yet assuredly their other white *Zizyphus* is good onely to kill all foure footed beasts, in the same manner that *Oleander* doth. The other *Cordus* in his history of plants maketh mention of, and calleth it *Iujuba minor*, and which maketh me to thinke it to be a Tubere, it is very probable to be the *Palurus Africanus* of *Theophrastus*, and the *Zizyphus sylvestris* of *Lugdunensis* for

1. *Zizyphus frue Iujuba major.*
The greater Iujube tree.

for I thinke he knew not the next hereunto which I call *glystris*, and is called *Zizyphus glyvestris* also of *Camerarius*, of *Lobel* & *Pena Injuba glyvestris*, who think it to be *Rhamnus altera* or *Palurus Theophrasti*, mentioned in his 4. booke and 4. chap. of *Iohannes Pena* in the description of *Mons Baldus Chamaezizypha* and *Zyzzypha glyvestris*. The *Arabians* call it *Hanen* and *Hanab*, and *Zufalz*, of the *Italians* *Guggiolo*, the *Spaniards* *Azucosa* & *Acoseiso*, the *French* *Injuber* and of some *Guindoules*, the *Germanes* *Reibsbere*, and *Brustbeerlin*, the *Dutche* *Injuben* and in *English* *Injuber*.

The Vertues.

The *Injubes* (especially while they are fresh much more than being dry) doe open the body and gently purge choller, and cleanse the blood. thus saith *Albinarius* and *Simeon Sethi*, yet *Matthiolus* following the opinion of *Avicen*, denyeth that they have any purging quality in them at all: all authors doe agree, that they coole the heate and sharpenesse of the blood, and therefore good in hot agues, and doe helpe them that have a cough, to expectorate tough slegme, and is good for the other diseases of the chests and lungs, as shortnesse of breath, hot distillations, &c. proceeding from hot humors: it is also to good purpose used to cleanse the raines and the bladder from gravell, which it performeth by the viscus quality in them, in making the passages slippery, and the gravell and stones to avoyd the more easily. they also stay vomitings procured by sharpe humours; but they are hard of digestion, and doe not easily passe out of the stomack, being eaten either fresh or dryed, they are therefore used in decoctions alwayes with other things, fit and convenient for those griefes afore said.

CHAP. XLIIII.

I. *Myxos* seu *Sebesten*. The *Sebesten* or *Assyrian Plum*.

He *Sebesten* tree groweth somewhat lower then the *Plum* tree, covered with a whitish barke, the branches are greene, whereon grow rounder thicker and harder leaves then they; the blossomes are white consisting of five leaves a peece, growing many together on a long stalke, which afterwards turne into small Berries rather then *Plums*, of a blackish Greene colour when they are ripe, every one standing in a little cup, of a sweete taste, and glutinous or clammy substance, and a very thicke skinne: within which lyeth a threesquare hard stone, with a thicke shell and a small kernell: these are gathered and laid in the Sunne. whereby they grow wrinkled, and so they are kept, and brought over unto us in boxes.

2. *Sebeston glyvestris*. The wilde *Sebesten*.

The wilde *Sebesten* is in all things like the other, but that it groweth lower, more like unto a hedge bush, and with lesser and thinner leaves; the flowers and fruit are alike but lesse.

The Place.

The first groweth in *Syria*, and is but planted in *Egypt*, as *Alpinus* saith, and from thence were brought into *Italy*, in *Pliny* his time, which were grafted on the *Service* tree, and do now grow in many places there in their Orchards: it is so tender, not enduring the cold with us, that wee can as hardly keepe it, as cause it to spring, the shell of the stone being so thicke and the kernell so small: The other as *Alpinus* seemeth to averre, is naturall of *Egypt*.

The Time.

They flower in *May*, and the fruit is gathered in *September*.

The Names.

The tree is called in Greeke $\mu\upsilon\chi\omicron\varsigma$ and the fruit $\mu\upsilon\chi\omicron\varsigma$ and $\mu\upsilon\chi\omicron\varsigma$ a mucoso fructus hincore: $\mu\upsilon\chi\omicron\varsigma$ enim mucum significat, in *Latine* *myxos* for the tree, and *Myxa* and *Myxaria* for the fruit: it is thought as *Ruellius* saith that the *Syrians* in honour of *Angrifus*, called them *Sebasten*, from whence the *Arabians* called them *Sebesten*; and the *Apothecaries* in their shops use that name onely.

The Vertues.

The *Sebestens* by the judgement of both *Arabians* and *Greekes* doe open the body in the same manner, or rather more by reason of the mucilagines in them, then *Damaske* *plumes*, yet more while they are greene, and lesse when they are dry, yet the decoction of them, or the infusion of them in broth, although dryed and taken whole worketh effectually, which *Fuschius* denyeth, affirming that they binde rather; they serve to coole any intemperate heate of the stomack or liver; and therefore are good in hot agues, and to purge choller whereof they come: *Matthiolus* saith that he hath often found by his experience, that ten drams or twelve at the most of the pulpe of *Sebestens*, taken from the skins and stones, worketh as well and to as good purpose, as the pulpe of *Cassia Fistula*: they are very effectually also to lenifie the hoarsenesse and roughnesse of the throate: they helpe the cough and wheesing of the lungs, and distillations upon them, by lenifying the passages and causing much slegme to be avoyded: they also give ease to them that are troubled with paines in their sides, and mervelously helpeth them that are troubled with the sharpenesse of their urine, proceeding from choller or salt slegme: the

they also drive forth the long wormes of the belly. There is a kinde of Birdlime made of these fruites, by boyling them a litle in water to take away their skinnies and stonies, and after boyling them more to a consistence, the which as *Martholius* saith was used at *Venice* to catch birds, but *Alpinus* saith they use it in *Egypt*, as a plaister to dissolve hard tumors or swellings.

CHAP. XLV.

Ruscus. Butchers Broome.

THe first shootes that sproute from the roote of Butchers Brome are thicke whitish and short; somewhat like unto those of Asparagus, but greater, which in some places are eaten in the same manner that Asparagus shootes are; these rising up to be a foote and an halfe high are spread into diverse branches, greene and somewhat crested with the roundnes, tough, pliant, and flexible, whereon are set some what broad and almost round, hard leaves, sharpe and prickly pointed at the ends, of a darke greene colour, and somewhat like unto Mirtle leaves, two for the most part set at a place very close or neare together: about the middle of the leafe on the backe or lower side from the middle ribbe breaketh forth a small whitish greene flower consisting of foure small round pointed leaves, standing upon a very short or no foote stalke, and in the place whereof cometh a small round berry green at the first, and red like an Asparagus berry when it is ripe, but greater wherein are two or three white hard round feedes contained: the roote is thicke, white, and great at the head, and from thence sendeth forth diverse thicke, long tough white strings.

Ruscus. Butchers Broome.

The Place.

This groweth generally throughout this Land, in copfes, and upon heathes and waste grounds, and oftentimes under or neare the Holly bushes.

The time.

It shooteth forth his yong buds in the Spring, and the berries are ripe about September, the branches and leaves abiding greene all the winter.

The Names.

It is called in Greeke *ῥύσκιον* *Oxymyr sine*, i. *acuta Myrtus* *μυρτιν ἀγρία*, *Myrtus sylvestris*, (but there is another *Myrtus sylvestris* accounted of among the ancients, which is like unto the tame or manured kinde,) and *Pliny* in his 15. Booke and 7. Chapter, confoundeth both these together, in giving to the one the faculties of the other.) *μυρτιν ἀγρία* *Myrtacantha*, *Myrtus spinosa*, *μυρτιν ἀγρία* *Murina spina*, and of *Theophrastus* *καρπουμυρτιν* *Centromyr sine*, *Pliny* saith they called it *Chama myr sine*, and *Aceron* or rather *Aceron* which is one of their baltard names, of the Latines *Ruscus* and *Ruscum*, in the Apothecaries shops *Bruscus*, and of some as *Marcellus* saith *Scoparegia*. The Arabians *Serapio*, and others fowly erred in calling the berries hereof *Cubebe*, which are certaine aromaticall graines or berries like unto Pepper, but with a small point or end. *Ruellius* translation of *Dioscorides* Greeke coppie is faulty herein, that he saith the berries hang downe from the leaves, when as the Greeke words are, it hath round berries in the middle of the leafe, which *Theophrastus* confirmeth in his 3. Booke and 17. Chapter, saying it is proper as well to *Laurus Alexandria* as *Ruscus* to beare the fruit on the leafe. The Italians call it *Rusco* and *Pongitopo*, as if you would say *Pricke-mousse*, even as the Germans doe *Muesdorn*, and both from the Greeke *μυρτιν ἀγρία* *Murina spina* quod arcendi muribus a salsa carne appensa circumloquetur: the Spaniards call it *lus barta* & *Gilbarbeyra*: the French *Buis piquant*, the Dutch *Srekende palme*: and we in English *Kneeholme* and *Butchers Broome*.

The Vertues.

The rootes and leaves of Butchers Broome are hot in the second degree, and dry in the first with some tenuitie of parts: the yong shootes are eaten like unto Asparagus, but because they are more bitter, they are rather used Physically, and are very profitable to open obstructions, to provoke urine, and to amend the strong smell thereof, and is one of the five opening diureticall rootes in the Apothecaries shoppes, helping to expell gravell and the stone, strangury, and womens monethly courses by drinking the decoction of the rootes made with wine: the same also helpeth the yellow jaundies, and the head ach, and with some sugar or hony put thereunto helpeth to expectorate flegme, and to cleanse the chest of much clammy humours gathered therein: *Dioscorides* attributeth to the leaves & berries the same effects: yet some doubting of the operation hereof to such purposes as afore is said, do hold it to be as effectual in knitting and consolidating of broken bones and parts out of joynt, as *Solomon*'s scale Comfrie or the like, to drinke the decoction of the rootes, and apply them poultis wise unto the affected place. The plant twiggies or stalkes with leaves served in former times for many uses, to binde their vines or other things, as *Virgil* his Verses doe testifie in the second of his *Georgicks* in these words,

Nec non etiam aspera Rusci,
Vimina per sylvas, & ripis fluvialis arundo. Cedatur;

and to preserve hanged meate from Mice eating, from whence came the Italian name of *Pongitopi*, and for to make Broomes to sweepe the house, from whence came the name of *Scoparegia*, but the Kings chamber is by revolution of time turned to the Butchers stall, for that a bundle of the stalkes tied together, serveth them to cleanse their stalles, and from thence have we our English name of Butchers Broome.

CHAP. XLVI.

Sesamum. The oyle purging Pulse *Sesamum*.

His plant upon the first springing thereof from the seede, riseth up with four small long and somewhat broad leaves, betwene which come forth other, that when they are full growne, are as large and long as the great Nightshade leaves, but some deeplier dented than others, and even almost torne; especially at the lower end of the leafe next the stalke, each standing on a long foote stalke: the stalke riseth from among the lower leaves, being straight, thicke, fat, strong and round, two or three foote high; from whence shoote forth on all sides (if it obtaine a strong fat ground, and a warme place) diverse stalkes of leaves, like unto the other, (or else abideth bare or without branches) two for the most part set at a joint, and at each joynt of the stalke up to the toppe, commeth forth one flower, of a whitish colour, which is somewhat long like vnto a Bell flower, made of one leafe without division at the edges, having a few long threds at the bottome, not rising so high, that they may be seene without opening the flower: after the flowers are past, there come up in their steede, small long hard cods, having three or foure or five ribbes or crestes, which doe open themselves into so many parts, having in each part small whitish yellow flat seedes lying therein: the roote is somewhat great and long, with many strings and fibres at it, taking as fast hold in the ground, as a Sowthistle doth: both leaves, stalkes, and seedes are very bitter while they are greene, that cattel will not touch them, but being dried they become more pleasant for them to eat: and the seede becommeth more oyle than Lin-seede, from whence is pressed forth a whitish oyle, very sweete while it is fresh, and will not in a long time decay or grow stronger.

Sesamum. The oyle purging pulse *Sesamum*.

The Place.

It groweth naturally in the *Indies* and other Easterly countries, but is onely sown in the fields, of *Syria*, *Egypt*, *Sicily*, *Candy*, *Greece*, and other places thereabouts, it is to be had but in the gardens of lovers of rare plants in all *Italy*, neither in the transalpine countries: the Apothecaries in our land doe seldome use either seed or oyle, few or none of them ever saw the seede, much lesse the plant.

The Time.

It floweth not untill July, and ripeneth not the seede untill September.

The Names.

It is called *σησαμ* and *σάμω* in Greeke, and *Sesamum* and *Sesama* in Latine of all Writers thereof. *Alpinus* saith it is called in *Egypt* *Sempsem*, the oyle thereof *Syris*, and the foot and grounds of the oyle *Thaine*. All Authours almost doe number it among the graines and cornes, as a kinde thereof, and not of the pulse, which doe all for the most part beare cods, yet of diverse fashions, but why they should doe so, I cannot conceive any other reasons, than that it was put into bread as Poppy seede was, the seede being somewhat like unto Millet, and that it was sown in the fields, as other graine and pulse were; for *Theophrastus* in distinguishing the kinds of graine, lib. 8. cap. 1. maketh 3. sorts, the first wheate, barley, &c. the second beanes, pease &c. the 3. Millet, Panicke and *Sesamum*, whereof corne beareth spike or eares, pulse beare cods, and those that are like Millet, Panicke, &c. doe beare a *juba* or *maine*, for so he calleth that reede-like tuft or bushy feather like toppe which the Millet and Panicke doe beare, and setteth downe *Sesamum* among them: now *Sesamum* hath no such bushy feather toppe as Panicke or Millet, or as the like have, but rather severall cods as the pulse, although in differing manner; but *Galen* in *primo Alimentorum* doth number it among the pulses, and saith it was in his time eaten of many as pulses are. *Bellonius* in the 29. Chapter of his third booke of Observations, setteth downe the manner of making the oyle of *Sesamum*, which if any be desirous to know, I referre him to the Author.

The Vertues.

The seede and oyle of *Sesamum* are all of one qualitie and temperature, being neere the second degree of heate and moisture, both mollifying and dissolving: but the leaves especially while they are greene, are more cooling, fit to repress the inflammations and griefes of the eyes, by way of fomenting them, the seede is taken inwardly in decoctions or other wayes, or used in glisters to loosen the belly, when it is bound or pained by the chollicke, which

which it worketh by his unctuous or oylie quality, and therefore the oyle is often used for the same purposes : both *Dioscorides* and *Galen* say that it troubleth and overturneth the stomach, by reason of his unctulosity, and doth hardly digest with them that eate it, yeeldeth a grosse nourishment unto the body, and filleth it up with fat flesh quickly : it causeth a stinking breath because it often slicketh in the teeth when it is eaten, whereby it is offensive : *Alpinus* saith that the Egyptians use the decoction of the seede, to those that are troubled with the cough, the shortnesse of breath, the pleuresie or hard scirrhous swellings of the liver, and *Mesues* saith, it lenifieth the roughnesse or hoarfenesse of the throat, and voyce, making it cleare and free of paine : it cureth the bitings of the horned serpent *Ceraistes*, and easeth the paines of the head, proceeding of the heate of the sunne : the decoction of both herbe and seedes with some honye, is very profitable for women to sit in whose wombes are hard or swollen, and to bring downe their courses when they are stayed, as also to wash their heads, that are much troubled with dandraffe, or scurfe, or dry scabbes : the herbe or seede stayeth vomiting taken in an egge : *Mesues* saith also that the seede or oyle doth fatten the body, and encreateth sperme. The oyle is of great use and effect to anoint the face or hands, or any other part of the body, to clesne the skinne, and to take away sunburning, morpew, freckles, spots or scarres or any other deformities of the skinne, proceeding of melancholy : it is good also to anoint any part scalded or burnt with fire : it helpeth those sinewes that are hard or strunke, or those veines that are too great. The seede was in ancient times much used in bread for to relish and make it sweeter, as also in cakes with honey as Poppie seed was.

CHAP. XLVII.

Iris. The Flowerdeluce.

I Herē are so many sorts of Flowerdeluces, that to shew you them all here againe (having described them all exactly in my former booke) would make this booke, too voluminous, I must therefore referre you thereunto, and give you here some descriptions and figures with the vertues.

1. *Iris major latifolia.* The greater broad leaved Flowerdeluce.

This Flowerdeluce hath many heads of very broad and flat Greene leaves enclosing or foulding one another at the bottome, and after divided in sunder with thinne edges on both sides like a sword and thickest in the middle : from the middle of some of these heads of leaves riseth up a round stiffe stalk two or three foote high bearing at the toppe one two or three large flowers out of everall huskes or skinnies consisting of nine leaves, three whereof fall downe, having a freeze neere the bottomes, three other smaller than they bowed or arched cover the bottomes of the falling leaves, each of them divided at the ends and turning up a little, and three other the largest of them all stand upright but bow themselves a little that they may all for the most part meete together at their toppes or ends : in some white,

1. *Iris major latifolia.*
The greater broad leaved Flowerdeluce.

2. *Iris major angustifolia.*
The greater narrow leaved Flowerdeluce.

3. *Iris biflora Lusitanica.*
The Portugall Flowerdeluce.

Chamaeiris angustifolia.
The narrow leaved dwarf Flowerdeluce.

4. *Coornacchia latifolia.*
Dwarf Flowerdeluce with broad leaves.

5. *Xyris fœœ Spatula fetida.*
Stinking Gladwin.

in others blew or purple, or blackish purple spotted, and in others of such varietie of mixture in colour, that it is admirable, as you may see in my former booke, where I am too copious to bee here expressed, and therefore must referre you thereunto: the seede is enclosed in thicke short pods, being flat, and lying in rowes close one upon another: the roote is tuberous shooting forth on all sides the like knobs.

2. *Iris major angustifolia*. Narrow leaved Flowerdeluce.

This other sort of the greater Flowerdeluces, differeth not in roote, leafe, flower or seede from the former, but in having the leaves narrower than it, and the flowers to be various as the former yet not so much.

3. *Iris biflora Lusitanica*. Portingall Flowerdeluce.

This also hath no greater difference to distinguish it than that it will sometimes flower twise a yeare; and the flowers sometimes have 12 leaves, 4 falling downe, 4 standing up, and 4 arched to cover the falls.

4. *Chamaeiris latifolia*. Broad leaved dwarfe Flowerdeluce.

The dwarfe kinds likewise grow both in roote, leafe, flower and seede like unto the greater kindes in all respects except the lownesse, for some will scarce rise above a foote high, others not halfe a foote, and some scarce so high, as their leaves, which in this sort is broader, in others narrower: the flowers also varying in colour one from another, but not mixed with that variety that is in the former.

5. *Xyris five Spatula fatida*. Stinking Gladwin.

The stinking Gladwin is one of the kindes of wilde Flowerdeluces. both in forme and property, as I said before, and therefore must be numbered among them. It hath diverse leaves rising from the rootes, very like unto a Flowerdeluce, but that the leaves are sharpe edged on both sides, and thicker in the middle, of a deeper greene colour, narrower also and sharper pointed than the leaves of most of the Flowerdeluces, and of a strong or evill sent, if they be rubbed or bruised betwixt the fingers: in the middle riseth up a reasonable strong stalke three foote high at the least, bearing three or foure flowers at the toppe, made somewhat like the flower of a Flowerdeluce, having three upright leaves, of a dead or sullen purplish ash colour, with some veines discoloured in them, the other three doe not fall downe, nor the three other small ones are not so arched, nor cover the lower leaves, as those doe in the Flowerdeluce, but stand loose or a sinder from them: after they are past, there come up three square hard huskes, opening wide into three parts when they are ripe, wherein lye reddish seede, and turning blacke, when it hath abiden long: the roote while it is young is but small, and full of strings, but being growne older they are greater, and fashioned like unto a Flowerdeluce roote, but reddish on the outside and whitish within, very sharpe and hot in taste, and of as evill a sent as the leaves.

6. *Iris bulbosa latifolia prima Clusii*. The first broad leaved bulbed Flowerdeluce of Clusius.

This kinde of Flowerdeluce hath diverse long somewhat broad and hollowish leaves not stiffe like the other sorts but soft, greenish on the upperside, and whitish underneath: among which riseth up one stalke and some-

Clusius his first bulbed Flowerdeluce with broad leaves.

8. *Iris bulbosa minor five angustifolia*.

The lesser bulbed Flowerdeluce.

Z 3

times

times more, not above halfe a foote high, bearing at their toppes one flower a peece, and feldome more, somewhat like unto a Flowerdeluce, confifting of nine leaves, whereof thofe three that ftand upright are shorter, and more clofed together than in others, the three that fall down turne up their ends a little, and thofe three that in others doe cover the falls at their bottomes, ftand like the upright leaves in other Flowdeluces, and are parted into two ends like unto two eares: the colour of the flowers is blew, either paler or deeper, or white, which is more rare, fmelling very sweete, the roote is round and white under the blackifh coates that cover it, having fundry long white rootes in fteede of fibres like unto an *Asphodill*.

7. *Iris bulbosa major Anglica*. The greater bulbed Flowerdeluce.

This hath five or fixe long hollowifh or guttured whitifh greene leaves, broader than in any of the leffer forts, among which rifeth up a thiffe round ftalke two foote high fometimes, at the toppes whereof, out of a skinnie huske breaketh forth one or two flowers confifting of nine leaves likewise, ftanding in the fame manner that the former forts doe, but each of the falling leaves have a yellow spot neere their bottomes, and the three upright leaves are fmall, and narrow at their bottomes but broad upwards: the colour whereof is all blew, purple, or white, or mixed very variably, as is in my booke expreffed: the heads for feede are fmallier than the former, and fo is the feede, and not fo flat: the roote of this is usually greater than in the other fmallier bulbous forts with long haire or threds, in the outer browne coates which are not in the others.

8. *Iris bulbosa minor five angustifolia Hispanica*. The leffer bulbed Flowerdeluce.

This leffer fort groweth in the fame manner that the greater doth, but hath narrower long pointed leaves: the flowers likewise are fmallier, shorter and rounder than in the other, but of the fame faffion, and vary much more in the diverfitie of their colours than it: the feedes are fmallier, and the pods longer and flenderer, and the roote alfo fmallier, but more encreafing in bulbos.

The Place.

The Flagges or Flowerdeluces here mentioned as well as the bulbous kindes grow in diverse Countries as *Africa*, *Greece*, *Italy*, and *France*, and fome in *Germanie*, and in our owne Countrey, but are chiefly nurfed up in their gardens that are lovers of fuch delights; the *Gladwin* groweth as well upon the upland grounds, yet in moift places, as in woods and fhadowie places by the featides in many places of this land, and is continually nurfed up in gardens; yet in paticular you may finde it growing, by a foote path, not far from the hither end of *Dartford* towne in *Kent*; as alfo neere to *Kentifh* towne, which is hard by *London*, if it be not digged up and carryed away, for I doe verily thinke, it is not naturall in that place, but fome feede by chance, hath beene brought among the foyle, whereby it grew there.

The Time.

The dwarfe kindes of Flagge, Flowerdeluces flower in *Aprill*, the greater in *May*, and the bulbous forts not untill *June*, the *Gladwin* flowereth later than any Flowerdeluce doth, that is to fay not untill *July*, and the feede is ripe in the end of *Auguft*, or in *September*, yet the huskes after they are ripe opening of themfelves, will hold their feedes within them for 2 or 3 moneths, and not fhed them.

The Names.

The greekes call it *Iris*, as alfo the *Ireos*, *Iris* and *Hieris*, *quafi sacra*, which made *Gaza* finding it fo written in fome coppies of *Theophrastus*, to translate it *Consecratrix*; but it was called *Iris*, *a celestis arcus similitudine, quam flores ejus representant*, from the Rainbow whose various colours the flower thereof doth imitate, the old ignorant age made a difference betweene *Iris* and *Ireos*, according to the Latine verfe extant thereof, which is this, *Iris purpureum florem gerit Ireos album*. The *Iris tuberosa*, which is a peculiar kinde, as you fhall finde it in my former booke, is called of *Matthiolus* *Hermodactylus verus*, becaufe the rootes are like unto fingers, and from him diverse did fo call it, but moft erroneoufly: for a while *Dodonaeus* tooke it to be a kind of wild Flowerdeluce, and that truly: yet fome did take it to be *Lonchitis* prior of *Dioscorides*: the *Arabians* call it *Asmeni juni* or *Ajerfa*, the *Italians* *Iride* & *Giglio azzurro* & celeste, the *Spaniards* *Lirio cardeno*, the *French* *Flambe*, the *Germanes* *Gilgas* and *Himmelschwertel*; but why *Lobel* fhould call the *Iris bulbosa Anglica* by the name of *Hyacinthus poetarum*, I fee no reason for it hath none of thofe mourning marks are in the *Iris*, nor is it of the forme of a Lilly. *Gladwin* is called in Greeke *Eleos*, *Xyris* ob folii similitudinem quafi rasorium cultum, aut novaculum dixeris, and in Latine *Spatula* or *Spathula fatida*, for *Spatha* is taken for a fword as *Gladium* is, and for that the leaves being bruifed fmell very ftrong, his denomination in Latine and Englifh, hath rifen futable thereunto: *Theophrastus* calleth it *Iris agria*, *Tragus* in mistaking it did take it to be *Gladiolus*, the *Arabians* call it *Caforas*, the *Italians* *Spatola fatida*, the *French* *Gilrent puant*, the *Germanes* *Wendeleuskrant*.

The Vertues.

All the Flowerdeluces efpecially the Flagge kindes are very neere of one quality, but of the bulbous kindes I finde no Author to write, or experience to teach whether they be of the fame or differing propertie. The juyce or the decoction of the greene rootes of the Flag Flowerdeluce, with a little honey drunk, doth purge and clenfe the ftomack of groffe & tough flegme and choller that lyeth therein, which might be the caufe of diverse agues; it helpeth the Jaundife alfo, and the dropfie, by evacuating thofe humors both downwards and upwards; and becaufe it doth fomewhat hurt the ftomack, it is not to be given but with honey & Spiknard: the fame being drunk, doth eafe the paines and torments, or wringing of the belly, and fides, the fhakings of agues, the difeafes of the liver and fpleene, the wormes of the belly, the ftone in the raines, convulfions or crampes that come of cold humors, by warming them and comforting the parts; as alfo helpeth thofe whofe feede paffeth from them unawares or unwillingly, yet as one faith, it doth confume and wafte it very much alfo; and is a remedy againft the birtings and flingings of venomous creatures, being boyled in water and Vinegar and drunke: the fame rootes being boyled in wine and drunke provoketh urine, helpeth the collicke, bringeth downe womens defired fickneffe, and made up into a peffary with honey, and put up into the body, draweth forth the dead childe: it is much commended againft the cough, to caufe tough flegme to be the more eafily extenuate, and to be expectorate and fpit forth; and therefore the *Diaireos* in the Apothecaries fhoppes, either in the powder, or made into a *Loboc* or Licking Electuary, is effectually for the fame purpose; it conduceth much to eafe the paines in the head, and to procure fleepe and reft: being applyed with rofewater rofecake and vinegar, to helpe watering eyes, by clenfing the moift sharpe humors, and drying them up: being put up into the Nostrils, it procureth needlings, and thereby alfo

also purgeth the head very much of flegme: the juice of the root applyed to the Piles or the Hemorrhoides, giveth much ease: and for the Dropisie, an Electuary made of the juice thereof, with other things in this manner, is held very effectuell: Take of *Galanga*, and of *Zedoarie*, of each two drams, of Cinamon and Cloves of each one dram and a halfe, of the leaves of Sea Bindweede called *Soldanella* in the Apothecaries shoppes, halfe an ounce; make these into powder, and with so much hony, wherein three drams of the juice of the rootes of Flowerdeluces hath bene boyled, and is sufficient, make them up into an Electuary; whereof halfe an ounce taken in the morning fasting, for divers dayes will doe much good: it doth also wonderfully helpe the paines and swellings of the cods in this manner. Take foure drams of the powder of the rootes thereof, of Cinamon and of Dill, of each two drams, of Saffron one scruple, mix these well together and apply them to the cods, being first laid upon a scarlet cloth, moistned in white wine, and warmed in a dish, over a Chafing dish with quick coales therein: the decoction of the rootes gargled in the mouth caseth the toothach, and a strong or stinking breath; the oyle called *Olum Irinum*, if it be rightly and truly made of the flowers of the great broad Flagge Flowerdeluce, of what colour I thinke it greatly mattereth not (but not of the flowers of the greater blew English bulbois Flowerdeluce, as I know some Apothecaries have and doe use) and rootes of the same sorts of Flowerdeluces, is very effectuell to warme and comfort all cold joynts and sinewes, as also the Gout and Sciatica, and mollifieth, dissolveth and consumeth tumours or swellings, although they be scrophulous in any part of the body, as also of the matrix: It helpeth the Crampe and Convulsion of the sinewes, warming them, and helping to extend them; the head and temples annoiued therewith, helpeth the Catarrhe or thin Rheume distilling from thence; and used upon the breast or stomack helpeth to extenuate the tough cold flegme, making it easie to be spit out; it helpeth also the paines and noyse in the eares, and the stench or evill savour of the nostrills; it giveth also much ease unto the painefull Piles: The roote it selfe either greene or in powder, helpeth to cleanse, heale and incarnate wounds, and to cover with flesh the naked bones, that ulcers have made bare, and is also very good to cleanse and heale up Fistulae and Cankers, that are hard to be cured: divers doe use to beate the greene rootes, and so apply them to the face or other parts, but it is better tyed in a faire linnen cloth, and laid for a day and a night in faire or Rose water, with which water you may wet or moisten the skin of the face, hands or neck, that are sunburned or deformed with the Morpew, black or blew markes or scarres, or any other discolouring of the skinne, but they that use it had neede to take heede that they use it not too strong, nor let it lie on too long, but rather wash it off againe with faire water, within two or three houres after it hath bene used: The dried rootes called *Orris*, being beaten either alone of themselves into powder, or with other sweete things, are used to be layd in prestes, chests and wardrops, to sweeten and perfume garments of linnen, and like especially, and all things that you will put it to, and thus much of the Flowerdeluce. But there are but few that have written of the Gladwin, or that have remembered the purging qualitie therein, yet many of our country people in many places, doe with the decoction of the rootes purge themselves, and thereby avoyd much corrupt tough flegme and choller: yet some that will not have it worke so strongly, doe but infuse the sliced rootes in Ale, and some take the leaves which serveth well for the weaker and tender stomacks: the juice hereof procureth sneezing, being put up or snuffed up into the nose, and draweth downe from the head much corruption, and the powder thereof doth the same: the powder also drunke in wine helpeth those that are troubled with Crampes and Convulsions, or with the Sciatica or Goute, and giveth ease to those that have any gringing paines in their body or belly: and helpeth those that have the Strangurie, that is, that cannot make their water, but by drops: it is with much profit also given to those that have had long Fluxes by the sharpe and evill qualities of humors, which it stayeth having first clenfed and purged them, by the drying and binding propertie therein, even as Rubarbe and some other such like things doe, the roote procureth womens monethly courses very effectually, if it bee drunke after it hath bene boyled in wine, and some of them shred and boyled in wine and vinegar, in equall parts, that these may sit over the hot fumes, being close covered untill it grow neare cold: the roote used as a pessarie, worketh the same effect, but in women with child it causeth Abortion, that is, the delivery afore the due time: the seed beaten to powder and taken to the quantity of halfe a dram in wine, helpeth those that cannot make water very effectually: the same raken with vinegar dissolveth both the hardnesse & the tumors of the spleene: the root is very effectuell in all wounds, and specially of the head, as also to draw forth any splinters, thornes, broken bones, or any other thing sticking in the flesh without causing any paine, used with a little Verdigrease and hony, and the great cantory roote: the same also boyled in vinegar and layd upon any hard tumors, doth very effectually dissolve and consume them, yea even those swellings of the thoroate, called the Kings Evill: the juice of the leaves and rootes is profitably used to heale the itch, and all running or spreading scabs or sores, and blemishes or scarres in the skinne: some doe suppose by the sharpnesse of the taste in the roote (especially more then in the feede, which is more drying) that it hath as well a corrosive as opening quality therein: some also doe appropriate it to the effects of the chests and lungs, for which the Iris or Flowerdeluce is more proper and effectuell: some also to stay the involuntary passage of the sperme, following *Pliny* therein: and some also to heale the hemorrhoides, and others the diseases of the fundament: it is thought also to bee effectuell against the poyson of Serpents; and thus much for the stinking Gladwin.

CHAP. XLVIII.

Cnicus sive Carthamus. Bastard or Spanish Saffron.

Although these sorts of *Cnicus* might well be placed among the Thistles, as other Authors doe, and with these that other wilde kind, called *Attractylis*, but because these onely have purging qualities; I thought it best thus to separate them, and intreate of these in this place.

1. *Cnicus sive Carthamus sativus*. The manured bastard Saffron.

The manured bastard Saffron hath sundry large leaves lying next the ground, without any prickles, or with very few white ones at the corners of the leaves and divisions, among which riseth a strong hard round stalke three or foure foote high; branching it selfe up to the top, bearing shorter leaves, sharpe pointed,

1. *Cnicus* five *Carthamus sativus*.
The ordinary Spanish Saffron.

2. *Cnicus* alter *Creticus*.
Wilde or bastard Saffron of Candye.

ted, and prickly at the edges, and at their ends a great open scaly head, out of which thrust forth many gold yellow threads, of a most orient and shining colour, which being gathered in a dry warme time and kept dry, will abide in the same delicate colour that it bare when it was fresh for a very long time: the seed when it commeth to maturity, is white and hard, somewhat long and round, and a little cornered: the roote is long white and woody, perishing yearly after seede time. This hath beene found with a white flower but very bare.

2. *Cnicus* alter *Creticus*. Wilde or bastard Saffron of Candy.

This other bastard Saffron of Candye, from a thicke and long blacke root riseth one straight round stalke, halfe a cubit high, set here and there with long sharpe pointed leaves, thicke set with prickles at the dentes of the edges, at the toppe whereof standeth a scaly head compassed with prickly leaves, of the bignesse of the *Attratylis* or Distaffe Thistle. out of which breake forth divers thicke yellow Saffron like threads thicke thrust together, after which the seede groweth therein being white, and as great as the greater Centory seede.

3. *Cnicus* alter *perennis Clusii*. *Clusii* his everli-
ving bastard Saffron.

This bastard Saffron riseth up with divers hard strong and round stalkes, without any branches at all from them, to the height of three or foure foote, bearing thereon at severall places somewhat large and long leaves, dented about the edges, of a sad or duskie Greene colour: at the top of every stalke, standeth one great close hard scaly head, but not prickly at all, not so great as the other *Cnicus* or bastard Saffron, never opening the scales of the head as it doth; from the middle whereof commeth divers threads, yet nothing so many as in the other, of a sad blewish ashe colour, and whitish at the bottome of them, the seede which lyeth among the downe in those heads is greater, (although *Clusius* saith smaller, for I set

3. *Cnicus* alter *perennis Clusii*.
Clusii his everli-ving bastard Saffron.

you forth the plant as it groweth with us) then of the other thick and short, but not white, and in lesser quantity then it: the rootes runne downe deepe into the ground, and being there encreased doe runne and spread themselves, taking up a great deale of roome.

The Place.

The first is generally sown in *Spain*, *Italy* and other places, for the especiall use thereof: The second *Alpinus* saith was brought out of *Candye*: The last groweth wilde in *Spain*, as well about *Sevill* as *Cordula*, and in other places as *Clusius* saith, *Pona* remembreth it to grow upon Mount *Baldus*.

The Time.

They flower in the end of *July*, or about the beginning of *August*, and the seede is ripe about the end thereof.

The Names.

It is called in Greeke *κνικου* and *κνικου*, *Cnicus* and *Cneus*, either *κνικου* quod est pungere vel mordere, or *κνικου* quod est pungere pruriginem excitet, but is more properly to be understood of the wilde kind: or rather a *floris colore*, cum *κνικου* exponatur *croceus vel rubrus*: it is called *Cnicus* and *Cneus*, also in Latin, and *Carthamus* in the Apothecaries shops, *κνικου* quod est pungere as it is thought, quod est purgare, but more truly from the *Arabians Kartam*. The first is called *Cnicus sativus urbanus* and *vulgaris* by most Authors, and *Carthamus* as I said in the Apothecaries shoppes, of some also *Crocus Saracenicus*. The second is remembred onely by *Alpinus* in his booke de plantis exoticis by the name of *Cnicus singularis*: the last *Clusius* calleth *Cnicus alter ceruleo flore*, and so doe all other after him without any great variation. The *Arabians* call it *Kartam*, the *Italians Saffran* *Sarafenisco*: the *Spaniards Alacor* and *Aragon salvaia*: The *Germanes* call it *Wilder Saffran*, the *French Saffran bastard* and *graine de Perroquets*, because they use to feede Parrats with the seede: in English *Wilde Saffron*, *Bastard Saffron*, *Spanish Saffron*, and *Catalonia Saffron*.

The Vertue.

The first *Spanish Saffron* flowers are much used in *Spain* and other places, to bee put into their brothes and meates, to give them a yellow colour, which doth much please them: for as for any relish of spice, or hot quick taste they have none, nor any comfortable qualities, that they should be desired or used, neither have they any great use in Physicke that I know: but many pounds of them are spent in dying silke into a kind of *Carnation* colour: the seede is chiefly used in Physick, or rather the kernells within the seede, which beaten and the emulsion thereof with honied water, or with the broth of a pullet, taken fasting, doth open the body, and purgeth waterie and flegmatick humours, both upwards and downwards, which humors also it voydeth if the emulsion of the seede be given in a glister, and thereby helpeth the collicke and dropisie, and those other diseases that proceede from those humors: being made into a Lohoc or licking electuary, with Sugar and hony, and a few almonds and pine kernells, it clenseth the breast and lungs of flegme sticking therein wonderfully, causing it to be easily spit forth, it also cleareth the voyce, and encreaseth sperme, by the often use of it: but it doth somewhat trouble the stomacke, and therefore some stomachicall helpers are fit to be given with it, as *Aniseede*, *Galanga*, *Masticke*, or if neede be of more forcible, *Cardamoms*, *Ginger*, *al gemma*, &c. a dram of the flowers in powder taken in *hydromel* or honied water, or in barley water helpeth the Jaundise: a dram of the pulpe of the seede taken with an ounce of the Syrupe of *Wormewood*, doth the like also: the confection made of the seeds thereof, called in shoppes *Diacarthamum*, is an especiall good medecine both to purge choller and flegme, as also to cleare and clenise the body of the watery humors of the Dropisie. Parrots doe most willingly feede upon this seede, yet doth it not move their bodi's a white. The second sort *Alpinus* saith is used by the naturalists in the same manner, and to the same purposes to purge that the first is used. Of the last there is little written, but wee may onely suppose that being so like in forme, it should so be also in quality.

CHAP. XLIX.

Papaver corniculatum, Horned Poppie.

Here are at this day two or three sorts of horned Poppies knowne to us, whereas there was but one sort knowne to *Dioscorides*, and other the ancient Greeke and Latin writers.

1. *Papaver corniculatum luteum*. Yellow horned Poppie.

This horned Poppie hath divers long and somewhat large whitish or hoary leaves, lying upon the ground, very much cut in or torne on the edges, and somewhat rough or hayrie, from among which rise up divers weake round stalkes, leaning downe rather then standing upright, somewhat hayrie also, spreading forth into some branches, and bearing a large flower, at the top of every one of them, consisting of foure leaves of a fine pale yellow colour, with a few threds in the middle, standing about a small crooked pointell which in time groweth to be a long naked round pod, halfe a foote long or better; with a small head or button, as it were at the end thereof, wherein is conteyned small blackish round feede: the roote is white long and tough, spreading divers wayes, enduring many yeares, and keeping his leaves all the winter; every part hereof yeeldeth forth a yellow juice being broken, of bitter tast.

2. *Papaver Corniculatum rubrum* Red horned Poppie.

The red horned Poppie hath fewer, lesser and more jagged leaves then the former, nothing so whitish, but of a sullen Greene colour, somewhat hairy also: the stalkes are slenderer and lower, bearing flowers at the tops of them, like the other, and consisting of foure leaves a peece, but much smaller and of a pale reddish colour, for the most part, yet sometimes fadder; after which come such like crooked or horned pods, but smaller then the other; having such like small blackish feede within them: the roote is long and slender, perishing every yeare, and raiseth it selfe oftentimes from it owne sowing, or else must bee sown every yeare in the spring: this yeeldeth no yellow juice, when it is broken like the other.

3. *Papaver Corniculatum flore violaceo*. Blw horned Poppie.

The blew horned Poppie groweth much lower, and with smaller leaves, vety much or finely cut and divided into many parts, of a sad Greene colour: the stalkes are low and slender, yet somewhat hairy, rising not much above

1. 2. *Papaver corniculatum luteum fœværubrum.*
Horned Poppie yellow and red,

3. *Papaver corniculatum violaceum.*
Blow Horned Poppie,

above a foote or halfe a yard high at the most, with small flowers at the toppes of them, like unto the last forme, that is consisting of foure leaves, but of a faire deepe purple colour almost like unto a violet: after which come small slenderer and shorter pods, not above a fingers length, wherein lyeth such like blackish seede, but smaller: the roote is small and perisheth every year.

The Place.

The first groweth naturally by the sea side, as well beyond sea, as on the coastes of our owne country in many places, both of the Kentish and Essex shore, as at *Ric* and *Lid*, at *Harwich* and *Whistable*, in the Isles of *Tenet* and *Shepey*: and is much desired and planied in Gardens, for the beautifull aspect thereof, as well as the vertues: the other two *Clusius* saith, hee first found in Spaine, growing by the way sides, and in the corne fields; as also in *Austria* and *Bohemia*, that with the red flower, *Mathiolus* long before his time remembreth to have found there.

The Time.

The first flowreth from *May*, all the Summer long, untill the end of *August* oftentimes, and his seede ripeneth in the meane time. The second flowreth seldome before *Iuly*, and giveth ripe seede every year, if the time prove not too unkindly: but the last as it is late before it spring, so it commeth late in the yeare to flowring, and seldome giveth good and perfect seed with us.

The Names.

It is called in Greek *ωκυρ* *argemone*, and in Latin thereafter *Papaver corniculatum*, or *cornutum*, a *siliquarum* effigie in *corniculorum* modo inflexa because the pods are crooked like a Corner or Horne, *Pliny* and others say it was called also *Paralison*, that is *marinum*, and of some *papaver sylvestre*. Divers doe thinke that *Glancium* was made hereof, as *Dioscorides* saith himselfe; *Pliny* saith in his time it was so called, deceived as *Dioscorides* saith by the likeness of the leaves: but *Dioscorides* in describing *Glancium*, saith it is the juice of an hearbe, that hath leaves somewhat like unto Horned Poppie, but fatter, yeelding a yellow juice, so that if it bee but like it, it cannot be the same thing: *Clusius* saith that the Spaniards called the last *Rosetta*, and some *Amapolos morados*, because the flowers give a juice like Mulberries: It is called in English of some Sea Poppie: they of *Mompelien* as *Pena* saith, were wont to call it *Anemone corniculata*: The Arabians call it *Almacharam*, the Italians *Papavero cornuto*, the Spaniards *Dormidera marina*, the French *Pavot cornu*, the Germans *Gelb Dahnagen mon* and *Gelb delmagen samen*, the Dutch *Geel Heul* oft *Harne beul*, and we in English Horned Poppie.

The Vertues.

The seede of the Sea or Horned Poppie, doth purge the belly gently, if it be taken in meade or honyed water: the roote thereof boyled in water unto the halfe, and drunke, helpeth the obstructions and other diseases of the liver, and the paines of the Sciatica or hucklebone: it provoketh urine also, and is very good for those that voyd fowle matter, like ragges in their urine; the leaves and flowers as *Dioscorides* and *Galen* say, cleanse fowle and virulent Vicers, and that so powerfully, that *Galen* adviseth that they should not be applied unto those sores or Vicers,

ulcers, that are already clenfed, lest they confume the quicke flesh also; it taketh away also by the strength and force of the clenfing qualitie, even those crusts that ulcers many times doe get by sufferance or ill looking unto: the leaves and flowers saith *Dioscorides*, being used with oyle, cleanse the eyes of cattle, that have spots or filmes in them.

CHAP. LI.

Papaver Spumescens sive *Ben album* vulgo. Spatling Poppie.

His small low herbe hath diverse weake tender stalkes, full of joynts, about halfe a yeard or two foote long, usually lying on the ground, whereon grow many pale whitish Greene leaves, two alwayes set together at the joynts, one against another, having many times upon the leaves, but more often about the joynts of the stalkes a certaine white frothy substance, like unto that is called Cuckow spittle: at the toppes of the stalkes stand many flowers together, every one on a pretty long foot stalk, hanging down their heads, which are white, composed of five small white leaves a peece, with a deepe notch in the middle of every one of them, making it seeme to consist of more than five, standing in a large loose huske striped, the flower scarce appearing above it, wherein afterwards is contained blacke feede: the roote is white and spreadeth in the ground abiding sundry yeares.

The Place.

It is found generally through *England*, in many places and pastures, and by the hedges sides, yer it is much desired to be planted in gardens.

The Time.

It flowreth from June untill the end of July or later, and the feede ripeneth in the meane rime, the roote abideth all the Winter, and so doe some Greene leaves with it.

The Names.

It is generally called *Papaver Spumescens*, and of some *Ben album*, as a difference both from the *Valeriana rubra* *Dodonei*, red *Valerian*, and *Muscipula Lobelij*, each of them called *Ben rubrum*, yet neither of them is the true *Ben album* or *rubrum* of the *Arabians*. *Dodonaeus* taketh it, as others doe also, to be the *Polemonium* of *Dioscorides*, but he is therein more mistaken in my judgement, than those he thinketh are, that take it to be the *Papaver Spumescens* or *Heracleum* of *Theophrastus*, *Dioscorides*, and *Galen*: but *Pliny* sheweth his mistaking the Greeke words *σπιδιον* in the description thereof wonderfully, comparing the leaves to the wings of Sparrowes or birds, when as *Dioscorides* intendeth the herbe *Struthium*, called *Radicula* or *Lanaria herba*, (which some with us take to be *Saponaria*,) because in ancient times, they used to whiten linnen clothes with the rootes thereof, and *Theophrastus*, if *Pliny* had regarded the place, *lib. 9. cap. 13.* (speaking of *Papaver Heracleum*, saith it hath leaves like *Struthium*, called *Radicula*, where-with they use to whiten linnen) might have eschewed that error. It is accounted a kinde of *Lychnis* by most of the best Herbarists, and therefore *Bauhinus* nameth it *Lychnis Sylvestris quae Ben album vulgo*: some with us call it Knapbottle, and others Spatling or Frothy Poppy.

The Vertues.

The feede of spatling Poppie purgeth flegme saith *Galen*, and causeth vomitings saith *Dioscorides*, being taken in meade or honied water, and is especially good for those that are troubled with the falling sicknesse.

CHAP. LI.

Thalictrum sive *Ruta pratensis*. Meadow Rue.

Here are sundry sorts of Meadow Rue, some growing in our owne Land, others in severall countries abroad as shall be described in this Chapter.

1. *Thalictrum majus vulgare*. The greater common Meadow Rue.

This Meadow Rue riseth up from a yellow stringie roore, much spreading in the ground, and shooting forth new sprouts round about, with many herby Greene stalkes, two foote high, crested or cornered all the length of them, set with joynts here and there, and many large leaves on them, as well as below, being divided into smaller leaves, nicked or dented in the forepart of them, of a sad Greene colour on the upper side, and pale Greene underneath: toward the toppe of the stalke there shooteth forth

Papaver spumescens
Spatling Poppie.

forth diverse short branches, on every one whereof stand two or three or foure small round heads or buttons, which breaking the skinne that encloseth them, shew forth a tuft, of pale greenish yellow tufts or threds, which falling away, there come in their places small three cornered cods, wherein is contained small long and round seede, the whole plant as well leaves, as flowers, have a more strong unpleasent sent than the next Spanish kinde.

2. *Thalictrum latifolium Hispanicum*. 1. *Thalictrum majus vulgare*.
Spanish Meadow Rue. Ordinary Meadow Rue.

5. *Thalictrum minus*.
The lesser Meadow Rue.

There is another of this kinde whose leaves standing one against another are not divided at all but are whole and longer, a branch whereof I give you here to see.

2. *Thalictrum majus album Hispanicum*.
Great Spanish white Meadow Rue.

The leaves hereof are much larger than the former, and more divided at the edges, and so like unto Columbine leaves that they easily deceive one not well acquainted therewith, yea are they lesser and of a sadder colour standing on long stalkes, among which riseth up a strong round stalke three foote high at the least, branching forth into two or three parts, with leaves at the severall joints of them, at the toppes whereof stand many small round yellowish buttons in a tuft together enclosed in a white skinne, which breaking each button sheweth to be a small tuft of threads like the former but greater, and of a white colour tipped with yellow and somewhat purplish at the bottome, of a strong sent abiding long in flower if it grow not too open and then fall away like short threads: the seede is like the former but greater, and so are the rootes likewise and yellow like it, which retainne neither stalke nor leafe all the Winter, but shooteth a new in the Spring.

3. *Thalictrum montanum majus*.
The greater mountaine Meadow Rue.

This Mountaine kind hath as large stalkes as the former great kinde, and riseth up as high, but are not crested or cornered at all, the leaves are divided like unto them, and of a sad Greene colour also; the flowers are white, which smell as strong as they, and the leaves are rather stronger than the first: the rootes likewise are yellow, and spreading almost as much.

4. *Thalictrum montanum minus album*. The lesser mountaine Meadow Rue.

This is like unto the last in all things, but in the smallnesse of the plant, and in the smell, which is nothing so strong or unpleasent, for the leaves are Greene as they, and the flowers white in the same manner; and the rootes yellow.

yellow and somewhat creeping : There is also another sort hereof differing little from it, but in the colour of the flower which is of a pale Violet colour with yellow tips.

5. *Thalicttrum minus*. The smaller Meadow Rue.

This small kind is almost in all things like unto the former, but smaller both in leaves, being of a little fresher greene colour, somewhat more shining; and in the stalkes being round and not crested, and in the flowers being somewhat whiter : the rootes likewise are yellow, but doe not spread or creepe, so much as the former.

6. *Thalicttrum minimum*. The least Meadow Rue.

The smallest kind of Meadow Rew, hath such like small or rather smaller, divided and notched leaves than the fourth kind hath, but they are of a whitish greene colour; the stalkes rise not above a foote high or a little more, the flowers are more yellow, and the rootes runne in the ground, rather more than any of the former.

7. *Thalicttrum angustissimo folio*. The narrowest leaved Meadow Rue.

This kinde of Meadow Rue hath yellow stringie rootes, like unto all the former sorts, from whence springeth up a stalke, very much crested or cornered, three foote high, bearing many sad greene leaves at the joynts, which are smaller and longer than any of the former, and ending most commonly in three points longer than any of the rest: the toppe of the stalke is branched, bearing many small pale yellow tufts of flowers, like unto the others. Of this kinde there is another whose leaves being smaller than of that former sort, with uncut leaves or without any division in them likewise, doe not otherwise differ either in height or colour of flowers from the fourth sort: both these sorts with uncut leaves, I saw in a Booke of dried herbes, belonging to Doctor Foxe, President of the Physitians Colledge of London.

8. *Thalicttrum minimum fatidissimum*. Stinking Meadow Rue.

The stinking Meadow Rue hath his stalke round and greene, which is sometimes purplish, not above a foote high with diverse leaves thereon, divided for the most part into three parts, each whereof hath two dents or notches, of as sad a greene colour on the upper side, and of as pale a greene underneath, as the first kinde here set downe, the toppe of the stalke is branched, and on them stand small round mossie or thredie flowers, like the rest, of a pale yellow colour : the small cods that follow are, cornered with a crooked end, fixe or seven standing together, wherein is inclosed small seede : this smelleth most strong and unsavory of all the rest, in his naturall place, but by transplanting and manuring, it loseth part of the virulencie and becommeth lesse offensive.

9. *Thalicttrum Americanum*. The American Meadow Rew.

This stranger is in face and outward habit so like a white Spanish kinde, that they can hardly be knowne asunder, but that it is fuller of stalkes and leaves; the flowers of the topes of the branches are at the first of a pale bluish colour, but being blowne open consist of five white leaves, and a number of white threds in the middle, tip with yellow. There is another smaller sort hereof whose flowers are purple tipped with yellow.

The Place.

The first as I said groweth in many places of our owne Land, in the borders of moist Medowes, and by ditch sides. The second was sent us out of Spaine, is found likewise in our moist Medowes and by ditch sides, but nearer the sea, and at Margate on the chalkie cliffe on the left hand, as you goe from the towne to the sea side; and in other countries farther from the sea side. The third and fourth were found by *Clusius* on the hills in the lower *Austria* and *Hungarie*. The fifth and sixth was found by *Clusius* also in the lower grounds, by the rivers sides. The seventh is said to grow in the fields by *Mischfeld* in *Switzerland*. The eighth grew in the countrie of *Valesia*; and the two last came from *Virginia*.

The Time.

They doe all flower about July, or in the beginning of August.

The Names.

It is generally held by our best moderne Writers, to be the *Thalicttrum* of *Dioscorides*, called in Greeke *Θαλικτρον* and *Θαλιτρον* a *Θαλλιον* vireo, as some thinke, eo quod dum germine protrudit eleganter vireat. Some also have called it *Pigamum quasi miravon*, that is *Ruta*, for the forme or likeness of the leaves, and so have entituled it *Ruta palustris* or *pratensis*; others from the yellow colour of the rootes, have called it *Pseudo rhabarbarum* *Basiliard* *Rubard* : but I thinke more truly of the purging and binding qualitie, both joyned together like unto *Rubarber*. Most Writers now doe call all these kinds of herbes by the name of *Thalicttrum* or *Thaletrum*, with their severall distinctions. For the first here set downe is called by most *Thalicttrum jus*, and of some *Ruta pratensis*, as *Lobel* doth : of *Cesalpini* *Ruta sylvestris*, of *Lugdunensis*, it is set forth for *Pigamum quasi miravon*, i. *Ruta*, and of some as *Gesner* saith *Saxifraga lutea*, *Camerarius* calleth it *Thalicttrum Germanicum latifolium*, and the *Hispanicum* which is here the second he calleth *Italicum*. The fifth is *Lugdunensis* his *Hypecoum*, in his Booke de *palustribus*, and is the *minus* of *Dodonaeus*, or *Ruta pratensis tenuifolia* of *Lobel* and others. The third is the first great *Mountainum* of *Clusius*, and the sixth of *Camerarius* flore albo. The fourth is *Clusius* his small Mountaine kinde, with a white flower, as the purple flowered kinde is his third Mountaine sort. The sixth is *Camerarius* his *Thalicttrum tertium angustifolium*, and *Clusius* his seventh or last. The seventh *Bauhinus* calleth *Angustissimo folio*, as he doth the eighth *minimum fatidissimum* as their titles declare. The two last are called by those that sent it us, as it is in their titles.

The Vertues.

Dioscorides saith that being bruised and applied to old sores, it bringeth them to cicatrizing, that it doth perfectly cure them : and the distilled water of the herbe and flowers doth the like, for as *Galen* saith it drieth without any heate or sharpenesse : The herbe is of some used to be put among other pot herbes, to helpe to move or open the body, and make it soluble : but the rootes washed cleane and boyled in ale and drunke, doth provoke to the stoole more than the leaves, but yet very gently : It is said (according to many other superstitious conceits in other things) that if the whole plant both herbe and roote, be hung up in a chamber, or tied to the necke of any person doth free them from any danger or harme. The rootes hereof boiled in water, and the places of the body most troubled with vermine or lice, washed therewith while it is warme, destroyeth them utterly : In *Italy* it is used against the Plague, and in *Saxonia* against the Jaundie as *Camerarius* saith : *Lugdunensis* in transferring the name *Pigamum* hereunto doth therewith set downe a vertue proper to Rue, as if it did belong to this, that is, that it raiseth up him from his fit that hath the falling sicknesse, if some of the juice be put up into his nostrills, and there kept a while.

CHAP. LII.

Asarum. *Asarabacca*.

Have in my former Booke given you the knowledge of this *Asarabacca*, but because I have not there expressed it so sufficiently, as it ought to be, I have here amplified my selfe in some particulars. Now although there was but one sort of *Asarum*, with all Writers now adayes, yet wee have received another sort out of *Virginia* somewhat differing from the other; and although the name hath beene formerly misapplied to many other herbes, as is in part shewed in the 38. Chapter of the former tribe, and shall be further declared in this; yet now I hope that it is so sufficiently knowne, there is no cause of error, but *Matthiolus* doth adde another herbe somewhat like unto it in leaves, whereof I meane to speake also here.

1. *Asarum vulgare*. Common *Asarabacca*.

Asarabacca hath many heads rising from the rootes, from whence come many smooth leavēs, every one upon his owne footestalke, which are rounder and bigger than Violet leaves; thicker also, and of a darker greene shining colour on the upper side, and of a paler yellow greene underneathe, little or nothing dented about the

1. *Asarum vulgare*. Common *Asarabacca*. 2. *Asarum Americanum*. *Virginia Asarabacca*.

edges: from among which rise small round hollow brownē greene huskes upon short stalkes about an inch long, divided at the brimmes into five divisions, very like unto the cuppes or heads of the Henbane seede, but that they are smaller, and these be all the flowers it carrieth: which are somewhat sweete being sinelled unto, and wherein when they are ripe is contained small cornere trough seede, very like unto the kernells or store of Grapes or Raisins: the rootes are small and whitish, spreading diverse wayes in the ground, and increasing into diverse heads, but not running, or creeping under ground, as diverse other creeping herbes doe, which are somewhat sweete in smell, resembling *Nardus*, but more being drie, than when they are greene, and of a sharpe but not unpleasant taste. *Camerarius* saith that *Gesner* found a greater kinde hereof, and more sweete, upon the Alpes in *Switzerland*, which *Banbinus* as it should seeme never saw, and therefore doubted of the truth.

2. *Asarum Americanum*. *Virginia Asarabacca*.

The *Asarum* of *Virginia* groweth very like the former, but the leaves are a good deale larger, stiffe also and thicke, somewhat crumpled about the edges, of a darke greene colour, but not so much shining as it, and not so

3. *Asarum Matthioli*.
Bastard *Asarum* of *Matthiolus*.

round but a little pointed at the end, some also will be spotted or straked: the flowers have usually but three divisions or points of a paler Greene colour: the rootes are somewhat greater and fuller of substance spreading in the same manner and smelling somewhat more fragrant, and a little hot in taste biting a little the tongue.

3. *Asarina Matthioli*. Bastard *Asarum* of *Matthioli*.
Bastard *Asarum* is a low herbe also, creeping upon the ground, somewhat like unto *Asarum*, having such like leaves upon long hairy footstalkes, but rounder and rougher than they, and somewhat dented about the edges: the flowers are like unto Camomill flowers, but that they are smaller by much, and wholly yellow, as well the border of leaves as middle thrume, and are not unpleasant in smell; the rootes are slender small and long, creeping under the upper crust of the earth, and not shooting downe deepe somewhat of a sharpe taste, and a little bitter withall.

The Place.

The first groweth under trees and upon shadie hills, in *Pontus* and *Phrygia*, as *Dioscorides* saith, and in *Italy* also, and in sundry other places, and is frequent in gardens. The second came from the parts in or about *Virginia*. The third as *Matthioli* saith is found upon some mountaines of *Bohemia* and likewise in *Somersetshire* in our owne Land, found by Dr. *Lobel*.

The Time.

The first and second keepe their Greene leaves all the winter, but shoot forth new in the spring: and with them come forth those heads or flowers, which give ripe seede about Midtommer, or somewhat after: the other doth follow much the same course.

The Names.

It is called in Greeke *Ασάριον* quasi *ἀσπέρτον* in *ornatum non veniens*, as *Pliny* saith because in *coronis non addatur*; but the text of *Dioscorides* is flat against him, for he saith it is *μαδός* *σπαραγμίδης*, a fiveeete herbe used in garlands: it is also called *Νάπτος* *ἀγρία*, in Latine *Asarum* & *Nardus sylvestris* or *Nardus rustica*, and as *Macer* saith *Vulgago*, as by his verse appeareth; *Est Asaron Græcè Vulgago dicta Latinis*: The former times as I sayd before, thought *Asarum* and *Baccharis* to be one herbe, and therefore not knowing what *Baccharis* was, they called this *Asarum* *Asarabaccara*, which name is continued both in *Spaine* and other places, and with us also to this day: but the descriptions of them being so diverse (if they had beene regarded or looked into, which was utterly neglected, and those times led onely by tradition, without searching out the veritie of things) would make one mervaile how they could be so much mistaken, as from the ignorance of some that called *Asarum* *Bacchar*, to make one name of both: but the error being so old even before *Pliny* his time, may seeme to make it the more excusable, but we should not continue in the same course, they formerly did: seeing *Pliny* sheweth the error, and findeth fault with them that were so led, as is shewed in the chapter of *Baccharis*. The first is called *Asarum* by all our later writers, except *Lobel* that calleth it *Asarum Baccharis* five *Baccharis*. The second we have imposed the name according to the forme it carrieth as it is in the title. The third *Matthioli* first called *Asarina*, and so doe others that set it forth after him, onely *Clusius* doth much suspect it, to be his second *Tussilago Alpina*, and that his figure was taken from a dry plant, and before it had brought forth the flowers to perfection: but by the sharpe taste and creeping roote, it may more probably be taken to be the *Catyledon palustris acris* or *urens*. The *Arabians* call it *Asaron*, the *Italians* *Asaro* and *Bacchara*, the *Spaniards* *Asarabaccara*, and we in English *Asarabacca* or *Asarobacca*.

The Vertues.

Dioscorides saith it hath an heating quality, where or howsoever applyed, and that it provoketh urine, & easeth the paines of the stone; is profitable for dropsies, and for the old paines of the Sciatica: and that fixe drammes of the rootes being drunke in honeyed water procureth womens courses, and purgeth like unto blacke Hellebor: *Mefues* placeth it among other purging hearbes and so doe I, for being drunke it not onely provoketh vomiting, but worketh downewards, and by urine also, purging both choller and flegme: it is made the more strong if some Spiknard be added, with the whey of goates milke or honeyed water; but it purgeth flegme more manifestly than choller, and therefore doth much helpe those that are troubled with the paines in the hippes, and the parts thereabout, especially if it be either steeped or boyled in whey: it doth wonderfully helpe the obstructions of the liver and spleene, and therefore profitable for those that are troubled with the dropie, and the overflowing of the gall, which is the Jaundise, being steeped in wine and drunke; it helpeth those continuall agues, that come by the plenty of stubborne humors: An oyle made thereof by setting it in the sunne, and whereunto some *Ladanum* is added, provoketh sweating, if the ridge of the backe be annointed therewith, and thereby driveth away the shaking fits of agues. It will not abide any long boyling, the chiefe strength thereof vanishing thereby; nor much beating, for the finer powder doth provoke vomits and urine, and the courser purging downewards, thus saith *Mefues*: hereby as *Matthioli* saith, the *Germane* Country people were taught to cure, both tertian and quartaine agues, by drinking a draught of the decoction thereof made with wine, wherein a little Mace or Cinamon or honey is put, either every day or every other day, which purgeth the body and often procureth vomittings: as also they anoint the ridge of the backe, and the soles of their feete with the warme oyle made thereof by long sunning, upon the accessse or comming of the fit, being in their warme bed, whereby they prevent the shaking fits, and provoke much sweate, and are thereby cured, that have long lingred under the disease: It is profitable for those that have convulsion of the sinewes, and an old cough. The common use hereof is to take the juyce of 5 or 7 leaves in a little drinke to cause vomittings: the rootes also worke in the same manner, but not so forcibly; but an extract made thereof according to art with wine, might be more safe and effectually, and may be kept all the yeare, to be at hand ready to be given, when there is occasion, the quantity onely is to be proportioned according to the constitution of the patient, as the learned Physitian can best appoint: It is also effectually against the bitings of serpents, (the roote especially) and therefore is put among other simples, both into *Mithridatum* and *Andromachus* Treacle, which is usually called Venice Treacle: *Galen* saith that the rootes of *Asarum*, have the same property that *Acorus* hath but more strong, and *Paulus Aegineta* agreeth with him; but *Lugdunensis* findeth fault with them both, because they have a purging quality, whereof they make no mention, A dramme of the roote in powder given in white wine, a little before the fit of an ague, taketh away the shaking fit, and thereby causeth the hot fit to be the more remisse, and in twise taking expelleth it quite: It is said that

the leaves being a little bruised, and applyed to the forehead and temples, doe ease the paines of the head, and procureth sleepe; and applyed to the eyes, taketh away the inflammation of them: the juice with a little *Tutia* prepar'd, put to it and dropp'd into the corner of the eyes, sharpeneth the eyesight, and taketh away the dimnesse and mistinesse that is often in them. The leaves and rootes being boyled in lye, and the head washed therewith often while it is warme, comforteth the head and braine, that is ill affected by taking cold, and helpeth the memory also. The *Virginia Asarum* hath bene but little experienced by any that I know, and therefore can say nothing thereof, but it is probable to be of the like effects, being so much more aromaticall and sweet. The Bastard *Asarum* as *Matthiolus* saith, hath a little clensing quality, but a greater propertie to attenuate, or make thin that which is thicke, to cut or breake that which is tough, and to open that which is obstruct: a dram of the powder hereof taken in sweete wine, or honied water doth loosen the belly, and purgeth from thence tough and thicke flegme, and blacke or burnt humors: It is to very good purpose and profit, given to those that have the Yellow Jaundise, to those that have the falling sicknesse, and to those that have the Palsie, the herbe eyther taken of it selfe, and catenas in Sallets, or the decoction thereof made and drunke: It killeth also the wormes of the belly: I confesse I might have placed these herbes among the other sorts of sweete herbes, but the purging qualities being so prevalent, both in procuring vomit and working downewards by the floole, hath rather moved me to insert them here.

CHAP. LIII.

Brassica. Colewort.

LI the edible sorts of Coleworts and Cabbiges with some others of delight, I have mentioned in my former worke so amply, that who so will may finde them there at large declared, I will onely in this place give you some figures of them and their vertues more amply, because I was then so brieve, and with them shew you some wilde kinds, as also the Sea Colewort, which for the purging quality is first for this place.

1. *Brassica sativa.* Garden Cabbiges and Coleworts.

The Cabbage (as I have shewed) is of many sorts, some greater others small, some white others red or between white and red, and all these close their innermost leaves so intricate that they grow into a round head, the outmost leaves onely abiding loose and open. The Colewort is well knowne never to close the leaves, but to grow alwayes spreading: the second yeare after the sowing they shoote forth stalkes, bearing pale yellow flowers, and afterwards small long pods with small round seed in them.

Besides those sorts there are others also as the Coleflowers and the Colerape delicate meates: There are likewise some garden sorts of Coleworts not so much used to be eaten, as pleasant to the sight in regard both of the

Brassica sativa. Garden Coleworts.*Brassica capitata.* Cabbiges.

Brassica florida. Coleflower.

Brassica Laciniata. The fine cut Colewort.

2. *Brassica sylvestris.* Wilde Colewort.

3. *Brassica spinosa.* The thorny Colewort.

4. *Brassica marina monosperma*.
Sea Colewort.

fine crumpling forme of the leaves, and of the variable mixture of colours in them, as greene, white, red and yellow, which maketh them to be beheld with the more admiration: of all which I have spoken in my former book, unto these I must joyne the wilde sorts.

2. *Brassica sylvestris*. Wilde Coleworts.

The wilde Colewort groweth with many long grayish round leaves, much gashed or torne on the edges, among which rise the stalkes bearing such like but smaller leaves on them, and yellowish flowers at the toppes, succeeded by small rough pods with small round seede in them: the roote is white, hard and somewhat woddy.

3. *Brassica spinosa*. Thorny Coleworts.

The whitish woddy stalke of this thorny Colewort riseth to be more then two foote high, branching forth into sundry striped or cretted branches, and they againe into other lesser slender twigges, each of them ending in small sharp white thornes, and on each of them under the thornes groweth one flower, in forme like unto an Hiacinthe of a pale redde or bluish colour, from which rise small round pease like heads pointed, wherein lyeth the seede: the leaves that grow without order on the branches are somewhat long and narrow, a little dented or waved about the edges, and with other smaller sometimes set together, of a grayish greene colour.

4. *Brassica marina monosperma*. Sea Colewort.

The Sea Colewort hath divers somewhat broad and large thicke wrinkled leaves, or as it were curled about the edges, growing each upon a severall thicke foortalke and very easy to be broken, of a grayish greene colour, from among which riseth up a strong thicke stalke two foote high and better, with some leaves thereon to the toppe; where it brancheth forth much, and on every branch standeth a large bush of pale whitish flowers, consisting of four leaves a peece; after which come small thicke and short pods, containing but one roundish grayish seede a peece, much greater then *Soldanella* or Sea Bindweede seede; the roote is somewhat great and shooteth forth many branches underground, keeping the greene leaves all the winter.

The Place.

The manured edible sorts are onely nursed up in Gardens: the second groweth wilde on many ditch bankes, as well in the uplands as neare the sea sides: the third is nourished in the curious Gardens of Italy: the last groweth in many places upon our owne coasts, as well the *Kentish* as *Essex* shore, as at *Lidde* in *Kent* and *Colchester* in *Essex*, and in other places also, and in other countries likewise.

The Time.

Their flowering time is towards the middle or end of *July*, and the seede is ripe in the end of *August*.

The Names.

The Greeks call it *κεράρα* and Attice *κεράρα*, or *κεράρα* so called as it is supposed by some, *quod roges*, i. e. *oculorum pupillas obtundat & hebetet*, because it dulleth and dimmeth the eyesight, which *Colemella* significeth by this *Disfrachon*, *Oculus inimica coramile* but he doth contrary himselfe: for both he and other good authors say that it is good for dim eyes, as also to take away the carker in the eyes; others say *quod roges* *αυγην* vel *ρελκην* *ερεν*, *quod cranpulis* *faciet* *et* *adversatur*. *Theophrastus* and other Greeke Authors before him, doe call it *ερα* & *Ραφανιον*, *ομαριαν* (as some thinke) *quondam amicitiam & affinitatem utriusvis feminis*, *vetustioris praesertim, utramvis plantam* *generand*; because of the like esse of the feed, they supposing that if it were old, the one would degenerate into the other; which error in this as in many other things, is fatal to the old world, and I would to God it were not so also to ours; for the opinion is almost hereditary, at the least growne so old by custome, that there is small hope to roote it out of the mindes of a great many, that the seeds doe often change into other herbes, then such as they were taken from, which is quite contrary to the Text of the Scripture, *Genesis* 1. 29. that faith God did appoint every herbe and tree to have the seede of his owne kind within it selfe, and not of another kind; and I would faine have any man of judgement, to tell me if hee thinke it possible that the seede of Cabbages should bring forth Raddishes, or Raddish seede Cabbages; but *Pliny* and others also before him, mistaking the Greeke word of *Theophrastus* and others, which is understood by all of good judgement to be *Brassica*, transferreth all the properties of *Brassica* to *Raphanus*, that is, to Raddish: It is called also in Latin *Brassica*, *quasi praescas* as *Varro* saith; *quod huius scapus minutatim praescatur*; or as others thinke of *Pasfica*, *quod ex caule minutatim praescato passasit*; or as some *ερα* *ερα*, *id est a vorando*, because poore people did most of all call for them to eat them: It is called also in Latin of many *Caulis* quia *prae ceteris gravis, validoque turgescit caule*. And from thence as I thinke came our English word *Cole*, whereby anciently the Colewort was called: the second is usually called *Brassica sylvestris* by all, or *Arvensis* as *Bauhinus* hath it: but that it should be that of the ancients I make great doubt: the third is also called *Brassica spinosa* both by *Alpinus* and *Bauhinus*, who onely that I know have written thereof: The last is thought by some, as *Turner*, *Anguilara* and *Cesalpinus* to bee the *κεράρα* *ερα* of *Dioscorides*, and that not without good reason, the face thereof so well resembling a Colewort, and the bitternesse answerable likewise. *Lobelia* calleth it *Brassica marina sylvestris multiflora monosperma*, but *Bauhinus* *Brassica maritima*; *Gerard* calleth it *Brassica marina Anglica*, as if it were onely proper to our coasts. The Arabians call Cabbiges *Corumb* and *Karumb*, the Italians *Cavolo* and *Verza*, the Spaniards *Coltes* and *Conues*, the French *Choulx*, the Germans *Koll*, the Dutch *Cabuischoolen*, and wee in English Cabbage and Colewort.

The Vertues.

The Cabbiges or Coleworts (for they are in a manner of one operation) themselves being boyled gently in broth,

broth, and eaten doe open the body, but being twice boyled or the second decoction of them doth binde: the nitrous quality therein being quite consumed and spent by the twice boyling: the juice thereof drunken in wine, helpeth those that are bitten by Adders or Vipers, and the decoction of the flowers bringeth downe womens courses, and hindreth conception as it is said, if it be used as a pessary: being taken with hony it recovereth the hoarseness or losse of the voyce: it helpeth those that are entering into a Consumption, if they use to cate them well boyled and often: the pulpe of the middle ribbes of Coleworts boyled in Almond milke, and made up into an Eleuary with hony, is very profitably used by those that are shortwinded and are purse, if they often take thereof; being also boyled twice and an old Cocke boyled in the broth, this being drunke helpeth those that are troubled with griping paines in their stomacke, or belly: the same broth or decoction is very good, for those that are troubled with the paines and obstructions of the liver and spleene, and the stone in the backe and kidnies: the juyce thereof boyled with hony, and dropped into the corner of the eye cleareth the sight by consuming any filme or cloud beginning to dimme it, as also consuming the kanker growen therein: the juyce is safely given to those that have eaten Mushtoomes, if they prove offensive unto them: they are much commended being eaten before meate, to keepe one from sursetting, as also from being drunke with much wine, by restraining the vapours that else would intoxicate the braine, or being drunke, will disperse the vapours and make them quickly rise sober againe; and even *Galen* himselfe applied the juyce thereof, to the temples of them that had paines in their heads caused by drunkenness; for as they say there is such an antipathy or enmity betweene the Vine and the Colewort, that the one will die where the other groweth: swollen and gouty legges and knees, where into many grosse or watery humors are fallen, being bathed warme with the decoction of Coleworts have found ease thereby, for it taketh away the paine and ach, allayeth the swelling and wasteth and disperseth the humors: it helpeth also old and filthy sores, being washed therewith, it healeth all small running sores and scabbes, pustules or wheales that breake out in the skinne; yea it clenseth so strongly saith *Galen*, that it will cure the leproy; the ashes of Colewort stalkes, are of such a drying quality, that they become almost causticke, or burning, and being mixed with old grease, are very effectfull to anoint the sides of those, that have had long paines therein, or any other place pained by the access of melancholike and windie humors, helping mightily to digest them: It is thought to be effectfull for all the diseases of the body, either inward or outward, and therefore *Chrysippus* wrote a volume of the vertues, applying it to every part of the body: and the old *Romans* having expelled Physitions out of their territories, did for sixe hundred yeares maintaine their health, and helped their infirmities, by using and applying it, for their onely medicine in every disease. The broth or first decoction of the sea Colewort likewise doth by the sharpe nitrous and bitter qualities therein, open the belly and purgeth the body, (but the second decoction is said to bind the body,) yet as *Galen* thinketh not without some hurt theeto, because it much varieth as he saith from the temperature of our bodies, being hotter and drier than the garden kindes, and therefore as all other wild herbes, are stronger in operation, and so this clenseth and digesteth more powerfully than they: the leaves while they are young, although bitter, being boyled (in lye saith *Dioscorides*, but in faire water, is most usuall with us in these dayes) are eaten as other Coleworts are, by diverse poore people neare the sea, the boyling, taking away much of the bitterness thereof: the seede hereof bruised and drunke killeth wormes; the leaves or the juyce of them applied to sores or ulcers clenseth and healeth them, and dissolveth tumors or swellings, and taketh away the inflammations.

CHAP. LIV.

Centaurium minus. The lesser Centory.

Here was formerly but one kinde of small Centory knowne, but there hath beene since found out diverse other sorts, referred therunto, both for forme and qualities.

1. *Centaurium minus vulgare flore rubente*. The red ordinary small Centory.

The common small Centory groweth up most usually but with one round and somewhat crested stalk about a foote high or better, branching forth at the toppe into many sprigges; and some also from the joynts of the stalkes below, the flowers that stand at the tops as it were in an umbell or tuft, are of a pale red, tending to a Carnation colour, consisting of five, or sixe sometimes small leaves, very like unto those of Saint Johns wort, opening themselves in the daytime and closing at night: after which come seede in little short huskes in forme like unto wheate cornes: the leaves are small and somewhat round, very like unto *Hypericum*, but without any holes therein as it hath: the roote is small and hard, perishing every yeare: the whole plant is of an exceeding bitter taste.

2. *Centaurium minus flore albo*. White flowered Centory.

This small Centory differeth not from the former, neither in stalke or leafe, neither in forme or height, but onely in the colour of the flower, which is white, as the other is red.

3. *Centaurium minus spicatum album*. Small spiked Centory.

The spiked Centory hath his crested stalke divided at the bottome, into two or three branches, and they againe into others, having his lowest leaves next the ground, somewhat broad and round, yet pointed at the ends; but those which are upon the stalke, and are for the most part two at a joynt, are smaller, long and narrow: at the joynts with the leaves all along the stalkes up to the toppe, most on the one side come forth the flowers, one onely at a place, which stand in small huskes, made as it were of small leaves divided, which consist of five white leaves, and after they are past, come such like small feedes as is in the former.

4. *Centaurium minus luteum*. Small yellow Centory.

The small yellow Centory, is somewhat like unto the former, but somewhat greater, the leaves being larger and broader, and broad at the bottome, yet not compassing it as the next: the flowers likewise are somewhat greater and yellow, wherein it differeth from the other, and is not so bitter.

5. *Centaurium minus luteum, perfoliatum ramosum*. Small yellow thorough leaved, branched Centory.

This yellow Centory hath some small leaves next the ground like unto the former Centories, but somewhat greater

1. *Centaurium minus vulgare.*
The ordinary small Centory.

3. *Centaurium minus spicatum album.*
Small Spiked Centory.

4. *Centaurium minus luteum vulgare.*
Small yellow Centory.

5. 7. *Centaurium minus luteum perfoliatum & minimum luteum.*
The small yellow thorough leaved and branched Centory;
and the least yellow.

greater : the stalke sendeth forth, sometimes diverse long branches from the joynts, and sometimes but onely at the toppe, at the joynts whereof stand two somewhat broad and long pointed leaves, so compassing the stalke about the bottome, and making it seeme as if it ranne thorough them, that they will hold the dew or raine that falleth upon them, the flowers that stand at the toppes of the small branches, are somewhat larger than those of the ordinary sort, composed of sixe or eight leaves, of a fine pale yellow colour, and sometimes deeper, after which come bigger heads; and somewhat greater seede than the other : the roote is small and white like the former : this is not so bitter as the former.

6. *Centaurium minus luteum non ramosum*. Small yellow unbranched Centory.

There is another of this kind of yellow Centory found, that differeth not in leafe or flower from the former; but the stalke bearing perfoliated leaves, brancheth not forth, but beareth onely one flower at the toppe, which hath made it noted to be a different kinde from the other.

7. *Centaurium minimum luteum*. The least yellow Centory.

The least yellow Centory differeth not much from the last described, saving that it is lesse in every part, and beareth two or three or more small flowers, at the toppe of each stalke.

The Place.

Most of those Centories are found in our owne country in many places, the ordinary sort almost every where in fields, pastures, and woods, yet that with the white flower more sparingly by much than the first : the spiked kinde groweth about *Mompelier*, and upon the *Euganean* hills neare *Padoa* : The first yellow Centory groweth in many places of *Kent*, as in a field next unto Sir *Francis Carew* his house, at *Bedington* neare *Croydon*, and in a field next beyond South-Heere Church towards *GraveSEND*, and in many other places where the other sorts are sometimes found.

The Time.

They doe all flower in *July* or thereabouts, and seede within a moneth after.

The Names.

It is called in Greeke *Κενταύριον ῥόδινον*. *Centaurium parvum* & *minus*, *Pliny* maketh three sorts, his *Centaurea Chironia* is *Dioscorides* his *Centaurium majus*, his *Centaurium* is this little Centory, and his third he nameth *Centauris triorchis* mistaking *Theophrastus* his meaning, *lib. 9. cap. 9.* where he speaketh of that kinde of Hawke called in Latine *Buteo a Buffard*, and in Greeke *τρυγών*, of whom they that did gather this Centory should take heed to be hurt. *Gesner* and *Dalechampius* doe both note *Pliny* of this his errour herein : of some *Centaurea*, and for the excessive bitternesse *fel terra*, and for the qualitie *febrifuga*, of some also *Multi radix*, but for what cause I know not; *Dioscorides* saith it was called *Limnesion*, and *Pliny Libadion*, because it loveth to grow in moist places : It is thought to be that herbe that *Theophrastus*, counted among the *Panaces*, and called *Leprophyllum* : *Pliny* saith it was called of the *Gauls* in his time *Exacon* because it did purge by the belly, all other evill medicines out of the body : It is called in *Italian* *Biondella*, because women did with the lye thereof cleare and whiten their faire as *Martiolus* saith, but *Lugdunensis* saith, it doth make the haire yellow : *Bauhinnus* calleth the third *Centaurium minus spicatum album* : *Lugdunensis* calleth the sixth *Centaurium luteum alterum*, and *Fabius Colonna* the last, *Centaurium minus luteum non descriptum*, or *Centaurium luteum novum*. The yellow Centory is called by *Mesues*, *Centaurium floribus luteis sive citreis pallidis*, and is thought by some to be the *Achyllae vera*, that *Pliny* mentioneth in his 35. Booke and 5. Chapter ; and therefore *Gesner in hortis* calleth it *Perfoliata Achyllea*. The *Arabians* call it *Kantaron* *Sages* & *Centurion* *Sege* or *Segir*, the *Italians*, as is before said *Biondella* & *Centaurea minore*; the *Spaniards* *Cintoria* & *felde tierra*; the *French* *Petite Centoïre*; the *Germans* *Tausent guldenkrant* and *Fieberkraut*; the *Dutch* *Klein Santory unde Eerdegal*; and we in *English* small Centory.

The Vertues.

Dioscorides, *Pliny*, *Galen*, *Mesues*, and the other *Arabian* Physicians with diverse others doe all agree; that the lesser Centory being boyled and drunke, purgeth chollericke and grosse humors, and helpeth the *Sciatica*; and yet *Dodonaeus* seemeth to averre, that it hath no purging qualitie in it, that he could finde by much experience thereof : which words and saying *Gerard* setteth downe, as if himselfe had made the experience, when as they are the very words of *Dodonaeus* : it is much used with very good effect to be given in agues, for it openeth the obstructions of the liver, gall and spleene, helping the jaundise and easing the paines in the sides, and hardnesse of the spleene used also outwardly ; making thinnr both the bloud and humors, by the clenfing and bitter qualities therein : it helpeth also those that have the dropie, or the greene sicknesse as the *Italians* doe affirme, who much use it for that purpose in powder ; it is of much use to be boyled in water and drunke against agues as all know : it killeth the wormes in the belly found true by daily experience ; it helpeth also to drie up rheumes as *Galen* saith, being put with other things for that purpose : the decoction thereof also (the toppes of the stalkes with the leaves and flowers are most used) is good against the chollicke, and to bring downe womens courses, helpeth to avoid the dead birth, and easeth the paines of the mother, and is very effectuell in all old paines of the joynts, as the gout, crampes, or convulsions : a dramme of the powder thereof taken in wine, is a wonderfull good helpe against the biting and poison of the Adder or Viper : the juice of the herbe taken while it is greene, as is used in other herbes, and dried in the Sunne, or by decoction and evaporation by the fire, as was used in ancient times, worketh the same effects : but the distilled water of the herbe, as it is more pleasant to be taken, so it is lesse powerfull, for any the purposes before spoken of, because it wanteth that substance and bitternesse that is in the herbe : the juice thereof with a little hony put to it, is good to cleare the eyes from dimnesse, mistes, or cloudes, that offend and hinder the sight, it is singular good both for greene or fresh wounds, and also for old ulcers and sores, to close up the one, and clenfe the other, and perfectly to cure them both, although they be hollow or fistulous, the greene herbe especially being bruised or laid too : the decoction thereof dropped into the eares, clenfeth them from wormes, clenfeth the foule ulcers, and spreading scabbes of the head, and taketh away all freckles, spots, and markes in the skinne being washed therewith. The yellow Centory saith *Mesues* worketh the same effects, that the other with the red flowers doth :

CHAP. LV.

Rubia major. Madder.

BEfides the manured and wild Madder, which were both knowne to the ancients, there are at this time many other sorts found out, not knowne to them, as well of the greater as lesser kinde, some growing on mountaines, some in Medowes and pastures, and some by the sea side: but because I would not cum-ber one Chapter with too many of them, let me onely in this shew you the greater sorts, and in the next following the lesser.

1. *Rubia major sativa sive hortensis.* Garden Madder.

The Garden Madder shooteth forth many very long, weake, foure square reddish stalkes trayling on the ground a great way, very rough or hairy (which therefore *Pliny* calleth *spinosa* prickly) and full of joynts; at every of these joynts come forth, diuerse long and somewhat narrow leaves, standing like a starre or the rowell of a spurre, about the stalkes, rough also and hairy: towards the toppes whereof, come forth many small pale yellow flowers; after which come small round heads, Greene at the first and reddish afterwards, but blacke when they are thorough ripe, wherein are contained the feede: the roote is not very great, but exceeding long, running downe halfe a mans depth into the ground, red, and very cleare while it is fresh, spreading diuerse wayes.

2. *Rubia sylvestris.* Wild Madder.

The wild Madder is in all things like unto the manured, but that the stalkes are smaller, not spreading so farre, nor yet so rough or hairy; the leaves are lesse, the flowers are white, and the roote groweth greater, but not fully so red, nor cleare as the Garden kinde.

3. *Rubia sylvestris longioribus folijs.* Wild Madder with long leaves.

This wild Madder hath diuerse round joynted stalkes, two or three foote long or thereabouts, somewha smooth, or at least nothing so rough, as the other wild sort: the leaves that stand at the joynts, are somewha rough, narrower and longer than the other, seven or eight at a distance: at the toppes of the stalkes, stand many white flowers, made of foure small leaves a peece, which turne into small round feede like the other: the roote is smaller, but red like the former.

4. *Rubia levis Taurinensium.* Smooth leaved Madder.

This smooth Madder hath diuerse round smooth stalkes, two or three foote long, pointed in like mannẽ as the other, but not so frequent, whereat stands foure leaves usually, not rough at all but smooth, larger and broader than the Garden Madder: towards the toppes of the branches, and at the joynts with the leaves come forth diuerse flowers, standing round about the stalkes, which consist of five or sixe small pure white leaves: the rootes are smaller than the other, and runne not farre in the ground.

5. *Rubia levis arborescens Cretica.* The great smooth Candy Madder.

This Madder hath a thicke short stalke about a fingers thicknesse, from whence issue sundry straight smooth

1. *Rubia major sativa.* Garden Madder.4. *Rubia levis Taurinensium.* Smooth leaved Madder.

branches with small short leaves, set at distances like the former sorts, at the toppes of the branches come forth two or three slender sprigges, bearing whitish flowers not unlike to the ordinary Madder: the roote is long and somewhat reddish: there is no roughnesse in any part of this plant: but the roote is somewhat bitter with a certaine austere taste also.

6. *Rubia Marina*. Sea Madder.

The Sea Madder spreadeth many square hard, somewhat rough stalkes, round about the roote, upon the ground and full of joynts, from whence grow many small long leaves, somewhat rough, broadest at the bottome and pointed at the end, more white in the naturall places, then being transplanted, from among which growing lesser towards the toppes, come forth small whitish flowers, starre fashion like the other, but longer: the roote is more red on the outside than within, harder and more woody than the other.

The Place.

The first is onely manured either in gardens or larger fields in many Countries of Europe, for the profit that is made thereof. The second groweth in fieldes and by hedge sides neere Spire and many other places in Germany, and so doth the third likewise, it groweth also in many places, in our owne land, as at a place called *Hodhill* in Dorsetshire, on that side is next to the river, in the parish of *Stompaine*, 2 miles from *Blandford*: at *Warrham* likewise in the same shire, on a mud wall in the same towne; and at a place called *Somerpill*, neere to a Chappell, which is by the landing place, as ye come from *Afferry* to *Cheffell* in great abundance. The fourth as *Lobel* and *Pena* say, groweth by *Turin*, on the hills of *Piemont*. The fifth in *Candye*; and the last by the sea side in *Provence*, and neere *Mompeller*, and in *Spain* also as *Clusius* saith.

The Time.

They flower toward the end of Sommer, and the seede of some of them ripeneth quickly after, but the sea Madder, doth seldome give ripe seede in our Country.

The Names.

It is called Greeke *ῥυβία θάλασσης* & *ῥυβία θάλασσης*, *Erythrodanum* and *Erethodanum*. *Nicander* in *Theriakis* calleth it *ῥυβία* *Schyrium*, in Latine *Rubia* and *Rubia*, and both Greeke and Latine from the colour of the roote, and of the dying cloth, or leather into a red colour. The first is generally called *Rubia sativa*, and *Rubia tinctorum* in shoppes: The other have their names in their titles, as most writers doe call them by: The *Arabians* doe call it *Pave* and *seve alfa* again: the *Italians* *Rubbia* and *Robbia*, the *Spaniards* *Rubia* and *Granza*; the *French* *Garrance*; the *Germanes* *Terberroet*: the *Dutch* *Crappe Roote* of *Mer*. and we in *English* *Madder*.

The Vertues.

There is some controversie betwene our moderne and the ancient writers concerning the vertues of Madder, whether it open or bind the body: the ancient writers *Dioscorides* and *Galen* affirming, that the roote hereof doth open and cleanse the body, of much tough and grosse flegme, that it provoketh urine plentifully; and hath so strong and powerfull an opening quality, that it bringeth downe womens courses, driveth forth the dead childe and afterbirth: but others, and *Dodonaeus* among the rest, denyeth it to have any such strong opening quality, and saith that both *Dioscorides* and *Galen* were much mistaken therein; because that *Dioscorides* saith, it expelleth urine even unto blood, it being but the tincture of the roote in urine, and no blood that is voyded at all, saying that it hath onely a binding or astringent quality, inso much that it helpeth ruptures, stayeth the fluxe of womens courses, the fluxe of the hemorrhoides or piles, the laske, and the abortment, or untimely delivery of women: whose very words and sayings, *Gerard* translateth and setteth downe in his booke, as if he had made the experience, and this contending with *Dioscorides* and *Galen*, had bene out of his owne judgement and tryall: but we must needs say according to the truth, that it hath an opening quality, and an astringent property also: the opening quality is well perceived, by colouring the urine red, even as *Rubarb* will dye it yellow; the property in them both being a like, to open and then to binde and strengthen: it is an assured remedye for the yellow Jaundise, by opening the obstructions of the Liver and gall, and cleansing those parts; it openeth likewise the obstructions of the spleene, and diminisheth the melancholike humour; it is availeable also for those that have the palse, and feeble the paines of the hippes, called *Sciatica*: it is usually given with good effect, to those that have had bruises, by falls or blowes, and inwardly felt as much as outwardly: and therefore it is much used in vulnerarie drinckes; the roote for all these purposes aforesayd, it to be boyled in wine or in water, as the cause doth require, and some honey or sugar put thereto afterwards: the seede hereof taken with vinegar and honey, helpeth the swellings and hardnesse of the spleene: the decoction of the leaves and branches, is a good fomentation for women to sit over, that have not their courses: the leaves and rootes, beaten and applyed to any part that is discoloured, with freckles, morpew, the white scurfe, or any other such deformities of the skinned, cleanseth them throughly, and taketh them away.

CHAP. LVI.

Rubia minor. Small or little Madder.

He smallest madders are many that have bene lately found out, by the diligence of painfull Herbarists or lovers of herbes, some in one Country, some in another; all which I meane to comprehend in this Chapter, that so you may have them all recorded together; but although there be diverse other herbes as *Asperula*, *Aparine*, *Gallium*, *Mollugo*, and *Cruciata*, that may be reckoned as kinds of Madder, and might and should be joyned together, if I follow the course of other Herballs that doe or should joyne the congeners: yet because I have tyed my selfe to another course, let me referre them to another fit place, but not expell them from your sight and knowledge.

1. *Rubia spicata* *Cretica latiore folio*. Candy Madder, with a spiked head and larger leaves.

This small Madder shooteth forth diverse square rough slender stalkes, full of joynts, from whence grow many branches, and where also stand 4 or 5 small leaves compassing them, and somewhat rough: the top branches, end in small long spiked heads foure square, composed of many short rough huskes, set close together one above another;

1. 2. *Rubia spicata* *Cretica latifolia* & *angustifolia*.
Candy Madder with spiked heads, and with larger and smaller leaves.

5. *Rubia pratensis minor caerulea*.
Small Madder with purplish blew flowers.

ther; from whence comē forth small whitish grēene flowērs, scarce to be seenē : after which come forth small greenish feede : the roote is composed of many small fibres, set unto a reddish bigger sprigge, somewhat woody and perishing every year.

2. *Rubia spicata angustifolia*. Spiked Madder with smaller leaves.

This spiked Madder is a kinde of the former, differing in this onely, that it is lesse both in stalkes, branches, and leaves, not growing above an hand breadth high, and with as small leaves as Knawell, perishing every year.

3. *Rubia pratensis levis acuto folio*. Small smooth Madder with sharpe pointed leaves.

This smooth Madder shooteth forth, one smooth square joynted stalke, for the most part, halfe a yarde in length; from the joynts whereof grow other smaller branches, whereat are set foure small long leaves usually and no more, ending in a small point : the flowers that come forth at the toppes are small and yellow at the first, and of a pale white colour afterwards, made of foure leaves.

4. *Rubia quadrifolia rotunda levis*. Small smooth Madder with round pointed leaves.

This other small smooth Madder, hath many square stalkes, halfe a foote long, sending forth other smaller branches, and at every joynt, foure small round pointed leaves, that are not altogether so smooth as the last, but rather a little rough : at the toppes whereof stand small white flowers, upon small threddie foote stalkes, made of foure leaves a preece; the roote is small, threddie and reddish.

5. *Rubia minor pratensis caerulea*. Small creeping Madder with purplish blew flowers.

This small Madder creepeth upon the ground, with many small square smooth branches, much divided or separated into other small ones; full of joynts and at every of them, five or six small round and very fresh greene leaves, smooth also, or but very little rough: from these joynts and roundels of leaves, as well as from the toppes of the branches come severall small flowers, made of five blewish purple round pointed leaves, with some small threds in the middle; the feede is small and long pointed, two for the most part standing together : the roote is small and of a reddish yellow colour, abiding all the winter with greene leaves thereon, and will encrease plentifully from the feede it sheddeth every year.

6. *Rubia minima saxatilis*. The small rocke Madder.

This smallest Madder, groweth not much above an hand breadth high, with a square stalke, spreading small branches from the joynts, at which grow 7 or 8 small long pointed leaves, even the smallest and narrowest of any before mentioned, being somewhat rough also: the flowers are very small, and of a pale red or bluish colour, standing in tufts or umbels, at the toppes of the branches: the roote is small and reddish as all the other sorts are.

7. *Rubia Echinata saxatilis*. Small Rocke Madder with prickely heads.

This small Madder shooteth forth from a small whitish threddie roote, many tender square branches, small and slender below, next unto the roote, and thicker up higher, distinguished by many thicke and hairy joynts whereat grow foure small leaves lesser than those of Rue: betweene the leaves and the branches come forth small

small greenish flowers for the most part standing together upon a foote stalk, each of them consisting of foure leaves, with certaine small threds in the middle, after which rise small heads somewhat rough, which when they are thoroughripe and dry are more sharpe and prickly, divided into foure parts as armes or wings on each side of the head, the middle part also being prickely, wherein is contained small yellow seede: it flowteth by degrees, the lowest joynts first, and the higher afterwards.

8. *Rubia argentea Cretica*. Candy silver-leaved Madder.

This small Madder is like the former small Madder, but that the leaves are longer and whiter, and the flowers yellow.

The Place.

The first groweth in *Candye*, and abideth well with us: the second groweth upon the hills not farre from *Mompelier*: the third in *Germany* in the fields neere the baches of *Luke*, and by *Lipswick* also: the fourth on the hills in *Switzerland*, & about *Strasbourg* likewise: the fifth groweth plentifully in many places of our owne land: the sixth groweth also in diverse places with us, and upon the chalkie hills neere *Drayton*, over against the Isle of *Wight*: the seventh was found by *Fabius Colummus*, on the ruinous moyst walls of *Dioctesians* bathes in *Rome*: the last in *Candye* as *Alpinus* saith.

The Time.

They all flower in the Sommer Moneths, and give their seede shortly after.

The Names.

All these small Madders have their denominations in their titles, as they are called by *Clusius*, *Bauhinus* and others that have mentioned them: onely the fifth I take to be the *Myagrum alternum minus Dalechampii* of *Lugdunensis*; and the seventh is called by *Fabius Columna*, *Cruciata nova Romana minima muralis*, and peradventure is the same that *Cesalpinus* calleth *Cruciata minima in maritimis*, which *Bauhinus* hath altered, and called *Rubia ecbinata saxatilis*.

The Vertues.

These small Madders, as by their taste and temperature may be gathered, are of the same property with the greater kindes, but are lesse effectuell in every respect.

6. *Rubia minima saxatilis*.
The small rock e Madder.

CHAP. LVII.

Psyllium. Fleawort.

The ancient writers have delivered us, but one sort of Fleawort, but there hath beene in later times, some others knowne, which shall be here set forth together.

1. *Psyllium vulgare*. The ordinary Fleawort.

The ordinary Fleawort riseth up with a stalke two foote high or more, full of joynts and branches, on every side up to the toppes, and at every joynt two small long and narrow whitish Greene leaves, somewhat hayrie: at the toppes of every branch stand diverse small short, scallie, or chaffie heads, out of which come forth small whitish yellow threds, such as the Plantaine heads doe give, which are the bloomings or flowers: the seede enclosed in those heads is small, and shining while it is fresh, very like unto fleas, both for colour and bignesse, but turning blacke when it groweth old: the roote is not long, but white hard and wooddie, perishing every yeare, and rayeing it selfe againe of it owne seede, for diverse yeares if it be suffered to shed: the whole plant is somewhat whitish, and hayrie smelling somewhat resinous or like *Rosfen*.

2. *Psyllium majus semper virens*. The greater ever Greene Fleawort.

This Fleawort differeth not from the former in the manner of growing, but onely that his stalke and branches, being somewhat greater doe a little more bow downe to the ground: the leaves are somewhat larger, the heads somewhat lesser, the seede alike; and the roote and leaves abide alke the winter, and perish not as the former.

3. *Psyllium indicum foliis crenatis*. Indian Fleawort with dented leaves.

Indian Fleawort hath a woody reddish rough stalke, next to the ground, about a foote high, spreading forth into diverse branches: the leaves that stand at the joynts thereof are somewhat long, narrow pointed at the end, and notched, or rather somewhat torne on the edges, and hayrie also like the former; the toppes of the branches are more stored with heads than the former, but of the same bignesse and fashion, with flowers and seede shining like the other.

4. *Psyllium minus*. Small Fleawort.

The small Fleawort hath small round reddish branches, leaning downe to the ground, not above a handbreadth high, spreading into more branches, as having three or foure at a joynt, and two leaves standing at every of them, one against another as in the former, but very short and narrow: the small heads that stand at the toppes of the stalkes, have two small long leaves, and sometimes more, set under every of them, one longer then another,

5. *Psyllium vulgare.*
The ordinary Fleawort.

ther, and in time bowing downewards and somewhat hard : the bloomings or flowers are white, and the feede that flowreth is shining, and like the other, but smaller : the roote is small and white with divers Fibres thereat.

The Place.

The first groweth in the fields and untilld places of *Spaine* and *Italy*, but with us no where but in gardens : The second groweth more plentifully in the fields that are neare the sea. The third is thought to come out of the *Indies*, as the name importeth, but we are not sure thereof. The last is naturally of *Egypt* or *Arabia*, and grew in the most noble Signior *Bembo*, his garden at *Padua*.

The Time.

All these Fleaworts flower in *July* or thereabout with us, but in their naturall places, all the Summer long, yet the last, is the latest with us.

The Names.

It is called in Greeke *Ψύλλιον*, in Latine *Psyllium*, *Fulicaris herba*, & *Fulicaria*, because the feede is like unto Fleas, and not because it driveth away Fleas, being brought greene into the house, for that is false: there is also another *Pulicaria* called *Conyza*, which we have shewed before : The *Arabians* call it *Bazara Chatama*, and *Bezercothune*. The *Italians* *Psyllo*, the *Spaniards* *Zargatona*, the *French* *Herbe aux Pouls*. The *Germans* *Pfyllenrant*; and wee in English Fleawort, and not Fleabane, for that is *Conyza*, as is shewed before : The first is generally called *Psyllium* of all writers. *Gesner* in *hortis Germanicis* calleth it *Cynops* of *Theophrastus*. The second is called by *Matthiolus* *Psyllium alterum*, *Gesner* and *Camerarius* call it *Psyllium perenne*; *Lobel* in his *Adversaria* calleth it *Psyllium Plinianum forte majus radice perenne*; the third is *Anguillara* his first *Psyllium* and thought by *Bauhinus* to be the true *Psyllium* of *Dioscorides* and by him called *Indicum*, because the feede came to him under that name. The last as *Bauhinus* saith he had from the most noble *Bembo* his Garden at *Padua*, under the name of *Gottne rubrum*, as he had another called *album*, which is a kind of *Holostium*. *Bauhinus* mentioneth *Prosper Alpinus* to call it *Gottne rubrum*, but I can finde no other then *Gottne mesgiar* *Gosspium arborescens* in his *Egyptian plants*: he saith also that it was sent him from *Heidelberg* by *Spengerus*, with the name *Botanorubro*.

The Vertues.

All Authors doe confirme that the feede of *Psyllium* is cold which *Mesues* attributeth to the barke or outside, saying that the inward pulpe thereof, is hot sharpe and drying, but divers doe utterly mislike and refuse that opinion : the mucilage of the seed made (but indeed the feede is seldome build by any Artift, but alwayes sleept whole) with barley water, and some syrupe of *Roses* or *Violets* put thereto and drunke, doth purge downewards grosse siegme and burnt choller; but the feede being fryed and so taken, stayeth the flux or laske of the belly, and the corrosions that come by reason of hot, chollericke, sharpe and malignant humors, or by the superpurgation of any violent medicine, such as *Scamony* or the like worketh : the mucilage of the feede made with *Rose-water* and a little *Sugar Candy* put thereto, is very good in all hot agues, and burning feavers, and other inflammations, both to coole the thirst, and to lenifie the drinesse and roughnesse of the tongue and throat : it helpeth also the hoarsenesse of the voyce, and diseases of the breast and lungs caused by heat, or sharpe salt humors, and the *Pleurisie* also : the mucilage of the feede made in *Plantaine water*, whereunto the yolke of an egge or two, and a little *Populeon* is put, is a most safe and sure remedy to ease the sharpnesse, prickings, and paines of the hemorrhoides or piles, if it bee laid on a cloth and bound thereto : it helpeth also all inflammations in any part of the body, and the paines that comethereby, as the headach and meagrimme, and all hot impostumes or swellings, or breakings out in the skin, as blaines, wheales, pusses, purples and the like, as also the paines of the joynts, and of those places that are out of joynt, the paines of the Goutte and Sciatica, the burlesing of young children, and the swelling out of the navell, applied with oyle of *Roses* and *Vinegar*; the same also is very often and with good successe applied to heale the Nipples, and the sore breasts of women laying it often thereon : the juice of the herbe with a little hony put into the eares, helpeth the running of them, and the wormes breeding in them : the same also mixed with *Axungia*, and applied to foule corrupt and filthy Vleers and sores, clenseth and healeth them, by cooling the heate and repressing the sharpnesse of the humors, flowing unto them : Whereas divers have written that the frequent use of the feede inwardly taken is very dangerous, it is no otherwise true, then as it falleth out in all other great cooling herbes, as *Nightshade*, *Houfelecke*, *Henbane*, and the like, which are all safe herbes, being wisely and conveniently applied : but ignorance, rashnesse and indiscretion, in the applying of remedies, hath alwayes done more harme and brought more discreditt unto them, then any danger in them can threaten it : and therefore it is not sufficient to know that a medicine is good for such a disease,

seafe, if there want judgment and discretion, how, to whom, and when to apply it : and this I thinke is a good caveat for women leeches, and impudent bold practisers of Phisicke and Surgery.

CHAP. LVIII.

Kali. Glasfewort or Saltwort.

Here are diverse sorts of *Kali*, with the ashes whereof they use to make glasse, and other things, which were none of them knowne to the ancient authors, but remembred onely by the later Arabian Philosophers and Chymickes, of which I meane to entreate in this Chapter, and because diverse doe thinke, that some of these is the *Anthyllis altera* *Ayuga foliis* of *Dioscorides*, for the likeness they have with them; I will in the next chapter, shew you all those herbes called Anthyllides, that are most worthy of that name; for unto some herbes the name *Anthyllis* is falsely imposed, whereof I meane not here to speake.

1. *Kali majus cochlearium.* Great Glasfewort with Snail-like seede.

The great *Kali* riseth up with a bigge round reddish fleshy stalke, very like unto Purslaine, two foote high or thereabouts, divided into many branches, whereon doe grow many thicke, long, round fleshy leaves, pointed at the ends, growing without order, sometimes but one or two, and more often, more standing at a place; here and there also dispersed upon the branches, come forth small yellowish flowers, and after them small brownish heads, turned round like snailles, wherein lye small round seede : the roote is somewhat long, with many fibres thereat, and perisheth every yeare, after it hath given seede for the most part : this hath an evill taste but sal-tish.

2. *Kali minus album.* Small white Glasfewort.

This lesser white *Kali*, hath diverse whitish Greene branches rising from the roote, nothing so high as the former, and bending or leaning downe to the ground, spreading it selfe into other smaller branches, full of joynts; whereon grow more store of smaller and shorter, round and pointed leaves, nothing so fleshy as the former, and of the same pale Greene colour with the stalkes : the flowers are white, and stand singly on the toppes of the branches : after which come small huskes, wherein lyeth the seede, which is small blacke and shining, like unto Sorrell seede : the roote hereof likewise is small white and woody, and perisheth after it hath given seede.

3. *Kali Egyptianum.* Glasfewort of Egypt.

The Egyptian *Kali* groweth up with one slender stalke, bending it selfe downwards, and branching forth at the joynts into other small ones, which for the most part stand more upright, and at every of the joynts, two very long and somewhat hayrie leaves, bowing themselves downwards, because of the length of them : the small branches are bare without leaves unto the toppes or ends of them, where there grow many small and long leaves, hayrie like the former, but nothing so long : from among which grow small whitish purple flowers, with many small threds in the middle of them : Of this sort there is some other with shortet leaves differing in little else.

1. *Kali cochlearium majus.*
Great Glasfewort.

2. *Kali minus album.*
Small white Glasfewort.

4. *Kali geniculatum* sive *Salicornia*. Joynted
Glasswort:

This joynted *Kali* riseth up usually, but with one upright round thicke, almost transparent stalke, a foote high or better, thicke set and full of joynts or knots, without any leaves at all on them, but shooting forth joynts, one out of another, with short eods at the heads of them, and also such like smaller branches on all sides, and they also divided into other smaller ones: this is thought to beare neither flower nor seede, the roote is small long and threddeie.

Kali geniculatum sive *Salicornia*.

There are some other kindes hereof found, differing a little in the forme of the joynts one from another, and one that is wholly reddish, not differing in any thing else from the forme of the other joynted ones.

The Place.

The first groweth by the sea sides, in diverse places both in Syria, Africa, Italy, and Spaine, as also in Provence and Aquitaine or Gascoigne, where also they sow large fields thereof, for the profit is made thereof. The second groweth not onely in those places, but in other colder climates also, and not onely by the Sea, but by the Salt pits in Saxony as Camerarius saith, and upon our owne coasts likewise in many parts, especially of the West Countries; the third is more particular to Egypt as *Alpinus* saith, yet *Columna* saith it is frequent on the Neopolitan West shore. The last is generally growing among other Sea plants in all Countries almost, and on our coasts in many places, as also in Saxony and other places of Germany, where there are lakes of salt water, whereof they make salt.

The Time.

They all flourish in the Sommer, and those that perish give their seede in August and sometimes later: the last abideth the Winter.

The Names.

The name *Kali* came first from the later Arabians, as it is commonly thought (for *Pena* thinketh that none of the ancient writers either Greekes or Arabians, have made any mention of them, or of their propertie to make glasse, which was not made but of the ashes of this hearb; of the same ashes also made into a lye being boyled with oyle was used to be made our ordinary sope; out of the said ashes also they extracted a salt called *Sal Kali* or *Sal Alkali*, so much desired and used by *Chimists*: for the herbe being dried and burnt in great quantitie together, doth melt, and runne into a lump of a blackish ash colour, and is called by diverse *Soda*, and of some *Alumen Catinum*, or peradventure *Calinum*, onely by the alteration of one letter: and of the ashes of any of these herbes, but especially of the 3 former sorts, beaten to powder and mixed with a certaine kind of sand, the glassemen by the heate of fire, in their fornace being molten, doe make those fine Christall glassees servicable to drinke in (but those other glasse bottles, &c. which serve to keepe Rosewater, and other distilled waters in, are made of other things, as also that glasse which serveth for the Windowes of houses) and from this glasse, while it is in the furnace a boyling and refining, riseth a kinde of scumme, which they that tend the furnace, doe diligently take off; and this is called *Axungia vitri*, in French *Sain de verre*; the salt of glasse, and wee in English much thereafter *Sandiver*, and is indeed but the salt part of the ashes separated by the fire from the rest of the molten substance, for it tasteth like salt, and will relent, grow moist, and consume like salt, if it be not continually kept dry as it is: Of the ashes of the *Kali* like-wise relented into a lye, and boyled with oyle of Olives they of Spaine, &c. use to make a kind of hard sope to wash with, the one sort comming from Spaine, &c. we call Castile sope, another from Venice, &c. white or Venice sope, but now it being for the most part spent in making of glasse, there are found out other things sufficient, to make our ordinary sope at a farre easier and cheaper rate. The first is called of *Lobel* and *Pena* in their *Adversaria*, *Kali magnum* *Seds medii foliis semine cochleato*; *Matthiolus* (and *Castor Durantes* following him in all things) in describing this kind confoundeth it with the last, making them seeme but one, *Camerarius* nameth it *Kali cochleatum majus*, and saith it is that *Anthyllis salsa*, that *Iohannes Major* doth mention in these Epitaphicall verses.

E cineris massa, salsaque Anthyllidis herba

Formari flammis lucida vitra solent.

Sic cinis ater eram, cineres nunc solvor in atros;

Sed nitidum summo corpus habebo die.

Bauhinus calleth it *Kali majus cochleato semine*, *Cosalphus Solsole* genus in hortis, and is generally called of most in Italy where it groweth *Ugaro*: the second is usually called *Kali album*, & in French as *Pena* saith *Blanchette*, as a distinction from the former: it is also called *minus* for the same cause, & is usually called in Italy where it groweth *Borda*: it is very likely to be *Anthyllis Chamæpitys* similis of *Cordus*, in his Annotations upon *Dioscorides*, and is likely also to be the *Anthyllodes* of *Thalys* in his *Hercynia sylvæ*. *Bauhinus* calleth it *Kali minus villosum*, the third is the third sort of *Kali Egyptianum* with *Prosper Alpinus*, because it is more proper to Egypt than to other places, as he thinketh: *Bauhinus* calleth it *Kali Egyptianum foliis valde longis hirsutis*. The last is called of most writers

Kali

Kali geniculatum, and of some *Salicornia*, of *Cordus* in *Observationum Sylva*, *Anthyllis constans veluti tritici graminis*, and of *Cesalpinus*, *Salsola* genus aliud, it is called in *English* Glasswort and Saltwort of some; the people that dwell neare it by the Sea side, call it Frogge grasle and Crab grasle.

The Vertues.

All these sorts of *Kali* have a clensing qualitie in them, without any manifest heate; the powder of any of them, or the juyce which is much better, taken in drinke doth purge downewards flegmaticke, waterish and adust or melancholike humors, and therefore are often used for the dropie, to provoke urine, and to expell the dead birth, as also to open the obstructions of the liver and of the spleene, and to consume the hardnesse thereof; they are sometimes mixed with those things, that are used as corrosives to consume proud or spongie superfluous flesh, that groweth in foule and virulent ulcers, but the ashes themselves are very sharpe and biting like a caustike, and the lye that is made thereof is so strong, that it will fetch off the skinne from the hands, or any other part of the body; and therefore if any use it to cleanse the skinne from spottes, freckles, morpew, or the like, they had neede to be cautelous in the using of it, and apply it very sparingly, or delay it sufficiently, and so it may doe good. If the Sope that is made of the lye of the ashes of these *Kalies* or Saltworts, be spread upon a peece of thicke course browne paper, cut into the forme of their shooe sole that are causally taken speechles, and bound to the soles of their feete it will bring againe the speech and that within a little time after the applying thereof, if there be any hope of being restored while they live: this hath beene tried to be effectuell upon diverse persons: *Sandiver* worketh much to the same effect with *Kali*: it is used often being made into powder either to be blowne into horses eyes, or being dissolved squirted into them, to take away any skinne that beginneth to grow there, and dimme the sight: both of them likewise serve to drie up running fores and scabbes, tetters, ringwormes and the like, and to helpe the itch.

CHAP. LIX.

Anthyllis maritima. Sea Chickweede and sea ground Pine.

Dioscorides maketh mention of 2. sorts of *Anthyllis* only, the one with leaves like Lentilles, the other with leayes like unto *Ajuga* or ground Pine, unto each of these some have appropriated certaine herbes, and called them after those names, because they nearest resemble them; but it is judged an hard matter certainly to affirme any of them for the right: of the most likeliest of them, as I said before I shall speake in this Chapter, and referre these other sorts that are not properly called *Anthyllis*, unto their proper places.

1. *Anthyllis maritima incana*. Hoary sea Chickweede.

This small *Anthyllis* also hath diverse hoary branches, set with many small whitish or hoary leaves by distances

1. *Anthyllis maritima incana*.
Hoary Sea Chickweede.

2. *Anthyllis maritima lentifolia*.
Sea Chickweede with Lentillike leaves.

3. *Anthyllis altera herbariorum*. Sea Ground Pine.

Bb 3

about

about them, as small as any Chickweed almost, the flowers are white, and stand at the toppes of the stalkes; after which come small feede.

2. *Anthyllis maritima lentifolia*. Sea Chickweed with Lentill like leavés.

This Lentill leaved *Anthyllis*, hath diverse short crested branches lying upon the ground, of a pale greene colour, and not much above an hand breadth long, spreading forth diversie small branches, whereon are set many small winged whitish greene leaves, many together upon a stalk, somewhat like unto those of the lesser Lentilles somewhat narrow: the flowers stand at the toppes of the stalkes and branches, like pointed statres, of a yellow greene colour, after which come three square heads, like unto a *Tithymall* or Spurge, wherein is contained small round feede: this also is salt in the taste, but somewhat bitter and hot withall.

3. *Anthyllis altera herb ariorum*. Sea ground Pine.

This *Anthyllis* (which is referred unto the second *Anthyllis* of *Dioscorides*, and that not without good judgement) hath divers hard hairy stalkes, without branches upon them, whereon doe grow many somewhat long and narrow leaves without order one above another, thicke bushing at the toppe, somewhat like unto those of *Chamepitys* or *Ajuga*, but dented about the edges and hairy also, somewhat of a warming hot taste, and strong unpleasant favour: the flowers stand among the leaves upon the branches, like unto the flowers of *Chamepitys* or ground Pine, but of a purple reddish colour, after which come small grayish rough feede, somewhat long, foure for the most part in every huske: the roote is somewhat thicke and white.

The Place.

The first groweth neare the sea in *Narbone* of *France* as *Pena* saith, as also in the kingdome of *Valentia* in *Spaine*, as *Clusius* saith. The second hath beene found in the Island of *Portland* in the West parts of this land by *Lobel*, and set forth in his *Adversaria*: the last groweth about *Mompelier*, and was also found by *Clusius* in *Portugall* and *Valentia*.

The Time.

They flower in July and August, and their feede is ripe in September.

The Names.

It is called in Greeke *ἀνθύλλιον*, in Latine also *Anthyllis*, quasi *floridis dicta videtur*. There is much controversie among Writers, concerning these *Anthyllides*, imputing them to be some of *Dioscorides*, every one almost setting forth some herbe or other, under the name of the one or other *Anthyllis*; supposing them to be the right, or at least wayes, to be referred for its likeness unto them; *Lobel* and *Pena* set forth three sorts, whereof the first two here mentioned are two of them. The first is called by *Lobel* and *Pena*, *Anthyllis marina incana* *Alpine folio Narbonensium*: of *Matthiolus* and *Anguillara*, it is set forth under the name of *Paronychia altera* of *Dioscorides*, and by *Cesalpinius* called *Centum grana*: it is thought also by *Anguillara* to be the *Gramen secundum Plinij*, whereof he maketh mention in his 24. Booke, and 19. Chapter. The second is called by *Lobel*, *Anthyllis prior lentifolia* *maritima* *Peplios effigie*, by *Durantes* *Anthyllis minima* & is the *Anthyllis Portlandie lentifolia* *Pena* of *Lugdunensis*. The last is called by those of *Mompelier* *Iva Moschata*, and is with them also accounted to be the *Anthyllis altera* of *Dioscorides*, *Pena* calleth it *Anthyllis Chamepityoides*, *Clusius* *Anthyllis altera*, and saith it is very like unto *Chamepity*. *Lugdunensis* saith it is called *Anthyllis 2. herbariorum*: *Bauhinus* in his *Pinax* refuseth to name this among his *Anthyllides*, but putteth it among his *Chamepityoides*, and nameth that for *Anthyllis Chamepityoides frutescens*, which *Pena* calleth *Sedum maritimum vermiculatum*, doubting to call it *Chamepity* major *Dioscoridis*, but rather *Chamepity* altera *vermiculata*, *Sedi* effigie; for he himselfe misliketh to call it *Anthyllis*, saying it hath no likeness thereto, in comparison of the other he calleth *Anthyllis Chamepityoides*, and called *Iva Moschata* by those of *Mompelier*; but assuredly the *Anthyllis altera Chamepity similis* of *Cordus*, expressed in his annotations upon *Dioscorides*, and the *Anthyllodes minor* of *Thaluis* are none of them frutescentes planta, which *Bauhinus* maketh to be all one with his *Anthyllis Chamepityoides frutescens*, whereunto he referreth his *Anthyllis*, as I have shewed you.

The Vertues.

The likeness of these Sea Chickweedes unto the *Anthyllis prior* of *Dioscorides*, as also the salt taste perswadeth diverse, that they are not inferiour in qualitie unto that of *Dioscorides*, who saith that both his *Anthyllides* are very helpfull to the raines and bladder and to provoke urine, as also to mollifie the hardnesse of the matrix, and being used with oyle of *Roses* and milke, to heale up wounds in the body or flesh; and besides these properties; he saith that his second *Anthyllis*, doth helpe the falling sicknesse being taken with Oxymel or honied vinegar, but *Clusius* saith he learned both of the *Portugalls* and *Spaniards* in *Valentia*, where he found it growing, that they used it much and to every good purpose, to purge and cleanse the blood, when it waxed foule; which sheweth that most of the sea plants, whether saltish or not, have a cleansing quality in them, and might be to good effect applied, if wisely considered, and experience made of them.

CHAP. LX.

Chamepity sive *Iva Arthetica*. Ground Pine or herb Ivie.

Dioscorides setteth downe three sorts of *Chamepity*, whose descriptions I will here expresse; that comparing them with those here set downe, you may see how fitly they doe agree unto them: the first *Dioscorides* saith is a small crooked herbe, creeping by the ground, with leaves like the small Houseleke, but much thinner or smaller, fatter also and hairy, many growing about the roote smelling like the Pine tree leaves, (so hath *Matthiolus*, but *Lugdunensis* hath the Pitch tree, for it is generally held that *Pine* in Greeke signifieth the Pitch tree, and *Padon* the Pine, although some are of the contrary opinion) the flowers are small and yellow, or white, the roote is like that of *Succory*, the other is a kinde of *Ajuga* and hath very small branches of a cubit long crooked like an anchor; the rest is like the former, but hath a white flower and blacke feede, and smelleth also like the Pine tree (or Pitch tree as *Lugdunensis*) leaves: the third which is called the male which is a small herbe, having white hairy small leaves, the stalke also rough and white, with yellow flowers; the feede groweth under the leaves, and smelleth also as the Pine (or Pitch leaves) both these are in quality like the former but weaker.

1. *Chamaepitys vulgaris* Common Ground Pine.

2. *Chamaepitys odoratior*. The Sweet Ground Pine.

1. *Chamaepitys vulgaris*. The ordinary or common Ground Pine.

Our common Ground Pine groweth low, seldom rising above an handbreadth high, shooting forth diverse small branches, set with slender small long narrow grayish or whitish leaves, somewhat hairy, and divided into three parts many times, many bushing together at a joint, and sometimes also some growing scatteredly upon the stalks, smelling somewhat strong like unto Rosen; the flowers are very small, and of a pale yellow colour growing from the joynts of the stalks, all along among the leaves, after which come small long, and round husks: the roote is small and woody perishing every yeare.

2. *Chamaepitys odoratior* The sweete Ground Pine.

This other Ground pine is also a small herbe, growing up with many hairy and hoary white slender branches, not above an hand breadth high, whereon are set many small long leaves, yet shorter than the former, hairy also and hoary white not in tufts or bushes, but growing by couples close together all along the stalks, cut in, or divided into some parts, of a strong but sweeter sent, by much than the former: at the toppes of the branches grow the flowers many together, of a pale yellowish white colour: the roote is somewhat long and fleshy like the roote of Succory or Dandelion, with many fibres thereat, but smaller.

3. *Chamaepitys Austriaca* Clusij. Clusius his Ground Pine of Austria.

This kind of Ground Pine hath diverse square strong hairy stalks, a foote long, with many joynts on them, whereat grow two somewhat long and hard leaves, somewhat like unto the first but broader, greene and shining on the upper side, and somewhat hoary and full of veines on the under side, divided into three or foure parts, or sometimes into more, somewhat hot in taste but not unpleasant, nor of any displeasing sent: from the joynts spring forth smaller branches, with the like leaves on them but lesser divided, and toward the toppes nothing at all but smooth, and long like unto Rosemary leaves; from the upper joynts and ends of the stalks and branches stand diverse gaping flowers, like unto Germander, of a deepe purple or violet colour, for the most part, but sometimes of a lively red colour, and sometimes of a bleaker blew, or skie colour, the lower leaves or chappes of the flowers being whitish, spotted with reddish spots: after which come blacke shining somewhat long and cornered feede, foure for the most part enclosed in every of those rough huskes, wherein the flowers stood before: the roote is composed of many blacke and hard strings, growing somewhat deepe in the ground, and springing afresh every yeare.

4. *Chamaepitys adulterina* seu Pseudo *Chamaepitys*. Bastard Ground Pine.

The bastard Ground Pine is a small low bushing herbe, very like unto the common kinde, having small hairy stalks, set full of long hairy leaves all amongst them, parted into three long parts, of no sent almost, but an unpleasant herby one rather, the flowers stand at the joynts with the leaves, at the toppes of the branches, very like unto those of the common Ground Pine, but of a white colour, and somewhat greater: the feede that followeth is grayish, greater than the common and rounder, foure for the most part contained in every huske: the roote is somewhat thicke and white and abideth the Winter.

The Place.

The first is the most common in our land, yet not growing in many other shires thereof then Kent, as farr as ever I could yet heare or learne: but there it groweth in many places, from on this side Dartford along to Southfleet, Cobham and Rochester, and upon Chatham downe hard by the Beacon, and halfe a mile from Rochester in a field nigh a house called Selfey. The second is more rare to be found saith Pena, who onely saw it on the dry hills and

3. *Chamaepitys Austriaca* Clusij.
Clusius his Austrian Ground Pine.

4. *Chamaepitys adulterina* seu *Pseudo Chamaepitys*.
Ballard Ground Pine.

and higher meadowes of *Savoy*, but heard it grew also by *Genoa*. The third *Clusius* saith he found plentifully a mile and a halfe from *Vienna* in *Austria*, and in other places thereabouts. The last *Clusius* saith groweth in many unmanured places of *Spain*.

The Time.

They all flower and give their seede in the Sommer moneths.

The Names.

It is called in Greeke *χαμαίπυτος*, and in Latine also *Chamaepitys*, quasi *humipinus*, vel *picea* as I said before: it is called also in Latine *Ajuga*, and *Abiga*, *ab abietis odore*, as *Pena* thinketh, but of the most, *ab abigenda partu & procurando abortu*: and as *Pliny* saith, *Dicitur propter abortum*, & *ab alijs* *Tlus terre*: some also, (as it is likely by an Eclipse of *Ajuga*) call it *Iva*, and adde thereto *Arthetica* or rather *Arthrytica*, because of the propertie conducting helpe to the gout and other joint aches: the first is generally in these dayes helde by the best to be the third kind of *Dioscorides*, and not the first as *Matthiolus* and others make it: the second is *Chamaepitys prima* *Dioscoridis* of *Pena*, and called *odorator* for the fents sake, and is the third sort both with *Matthiolus* and *Dodonaeus*. The third is remembered first by *Clusius*, from whom others call it *Chamaepitys Austriaca*, and *cerulea* of *Bauhinus*, and is most likely to be his *Chamaedrys Austriaca*, mentioned in his *Pinax*, and described in his *Prodromus*. The last also *Clusius* calleth *Pseudo Chamaepitys*: and *Lobel* *Chamaepitys adulterina*; *Dodonaeus* calleth it *Chamaepitys spuria*, but putteth two figures thereof, whom *Lugdunensis* followeth therein: it is called in *English* Ground Pine, and *Ground Ivie* after the Latine word *Iva*: and field Cypresse after the low Dutch name *Veld Cypres*, and forget me not after the *Germane* name *Vergiss mien nicht*; for which name *Matthiolus* findeth fault with *Brasavolus*, whose *Germane* Apothecary so inform'd him; and saith it is called by the *Germans* *le lenger, je lieber*, that is the longer the more lovely, which as *Pena* and *Lobel* saiy, is the more proper name of *Dulcamara*, the wood Nightshade; it is called of the *Italians* *Chamaepito*, and *Iva*; and of the *Spaniards*, *Penilho* and *Iva arctica*; of the *French* *Iva Moschata* and *arctica*; and of the *Arabians* *Hamasceos* and *Chamaefebius*.

The Vertues.

The decoction of Ground Pine drunk, doth wonderfully prevaile against the strangury and stoppings of urine, or any inward paines rising from those diseases of the reins and urine, and is specially good also for all obstructions of the liver and spleene, for it clenseth the grosse impure blood, and expelleth that which is congealed, and gently openeth the body, to which purpose they were wont in former times, to make pilles with the powder thereof and the pulpe of figges: it doth also marvelously helpe all the diseases of the mother, used inwardly or applied outwardly, procuring the courses, expelling the dead child and afterbirth, yea it is so powerfull upon those feminine parts, that it is utterly forbidden to women with child, in that it will cause abortion or delivery before the time: It is as powerfull and effectuell also in all the paines and diseases of the joynts, as gouts, crampes, palsies, sciatica and aches, either the decoction of the herbe in wine, taken inwardly or applied outwardly, or both,

for

for sometime together: for which purposes the pillles that are made with the powder of Ground Pine, and of *Hieracium* styles, with Venice Turpentine are very effectual; these pillles also are of a speciall good use for those that have the dropie, to be continued for some time: the same also is an especiall good helpe for the jaundise, and also for those that have any griping paines in the belly or joynts, or any other the inward parts: it helpeth also all distases of the braine, proceeding from cold and flegmaticke humors and distillations; as also for the falling sicknesse: it is an especiall remedy for the poison of the Aconites of all sorts, and other poisonfull herbes, as also against the stinging of the Scorpion, and all other venomous creatures; it is a good remedy for a cold cough especially in the beginning, or that it bee nor growne inveterate: it procureth also sweate if it bee anointed, saith *Pliny*, but applied like other sudorificks, it is likely to bee more convenient: for all these purposes aforesaid the herbe being tunned up in new drinke, and drunke, is almost as effectual, but farre more acceptible to weake or dainty stomackes: And the distilled water of the herbe also hath the same effect but more weakely; the conserve of the flowers doth the like, which *Matthiolum* much commendeth against the palse: the greene herbe or the decoction thereof being applied, dissolveth the hardnesse of the wemens brests, as also all other hard tumors in any other part of the body: the greene herbe also applied, or the juyce thereof with some hony, doth not onely cleanse putride and stinking, foule and malignant and virulent ulcers and sores of all sorts, but healeth and conglutinateth or sodereth up the lippes of greene wounds in any part also: *Matthiolum* commendeth certaine pillles against the Palse, which are made in this manner; Take saith he, of Ground Pine, Starches, Berony and Rosemary flowers, of each one dram, of Turbith one dram and a halfe, of Agarick two drams, of Colocynthis halfe a dram, of Ginger and Sal gemme of each ten graines, of Rubarbe one dram and a halfe, of Spiknard seaven graines, of the powder called *Hierapiera simplex* halfe an ounce, of *diagridium* one dram; let all these be made up into a masse, according to art, with the juyce of Ground Pine; (but I would and thinke it more convenient, I am sure more durable, that it be made up into a masse, with a Syrupe made of Hony or Sugar and the juyce of the herbe,) for so they will not dry or wax hard so soone, of a dram whereof let nine pillles bee made, and three of them taken by those that are paralitick, every night when they goe to bed; and this saith he will give a present and speedy helpe.

CHAP. LXI.

Cochlearia, Spoonewort or Scurvigraffe.

Though out English Scurvigraffe groweth plentifully in the salt marshes, in many places of our land, and might therefore be set among the other marsh plants, yet because I am to set downe the other sorts, let it also take up place here for companies sake.

1. *Cochlearia vulgaris*, Common Scurvigraffe.

Our ordinary English Scurvigraffe hath many thicke fat leaves, more long then broad, and sometimes longer and narrower, sometimes also smooth on the edges, and other whiles a little

1. *Cochlearia vulgaris*.
Common Scurvigraffe;

2. *Cochlearia major rotundifolia* sive *Batavorum*.
Dutch or Garden Scurvigraffe.

waved.

waved, for all these formes are to be seene, as also plaine smooth and pointed, & sometimes a little hollowed in the middle, and round pointed, of a sad green colour, & somewhat brownish sometimes, every one standing by it selfe upon a long foote stalk, which is brownish or greenish also, from among which rise small slender stalkes, bearing a few leaves thereon like the other, but longer and lesse for the most part; at the tops whereof grow many whitish flowers, with yellow threds in the middle; standing about a Greene head, which becometh the feed vessell, which will be somewhat flat when it is ripe, very like unto some of the kinds of *Thlaspi* or Treakle Mustard, wherein is contained reddish feede, tasting somewhat hot: the roote is made of many white strings, which stick deepely in the mudde, wherein it chiefly delighteth: yet will it well abide in the more upland and dryer grounds, and tasteth a little brackish or saltish even there, but nothing so much as where it hath the salt water to feed upon.

2. *Cochlearia major rotundifolia* sive *Batavorum*. The great Dutch or Garden Scurvigrasse.

This Dutch or Garden Scurvigrasse (which is most knowne and frequent in gardens) hath divers fresh Greene and almost round leaves rising from the roote, nothing so thicke as the former, yet in some places, as in a rich strong dunged ground, very large, even twice so bigge as in others, nothing at all dented about the edges, nor with any sensible hollownesse, perceived in the middle, every one also standing upon a long footestalk; from among these rise up divers long slender weake stalkes, higher then the former, and with more store of small white flowers, at the tops of them, which turne into smaller pods, and smaller brownish seeds then the former: the roote is white, small and threddy: the tast of this is nothing salt at all, but hath an hot aromaticall taste almost like spice.

3. *Cochlearia minor rotundifolia*. Small Dutch Scurvigrasse.

This small Scurvigrasse groweth like the last, with many small roundish leaves, sometimes a little crumpled at the edges, not bigger then the nayle of ones litle finger, every one upon his owne foote stalk, which abide all the winter if it be sowed before winter, or that it rise from it owne sowing; other wise if it bee sowed in the spring, it shooteth forth divers long slender stalkes lying on the ground a foote long or better, whereon grow such like small round leaves, very thinly set up to the tops, whereon doe stand many small white flowers, like the last, but much smaller, according to the proportion of the plant, with small feede answerable thereunto: the roote is very small consisting of a few Fibres, which perish as soone as it hath perfected the feede; and will spring up againe in the same place owhere it doth stand it selfe; for doe what you can almost, if you will gather any ripe feede, there will be some shed before you can gather it.

4. *Cochlearia minima rotundifolia*. The least Scurvigrasse.

The least Scurvigrasse is in all things like the last, but that it is much lesse, not growing above three or foure inches long, but lying upon the ground like *Herniaria* or *Rupturewort*: *Banbinus* in his *Prodromus* setteth forth another small one, as though it differed from this last, which therefore he calleth *erecta* upright, wherein is shewed no other difference, and therefore I thinke may be the very same growing in another place.

The Place.

The first groweth all along the Thames side, on both the *Essex* and *Kentish* shore, from *Woolwich* where the brackish Sea water is felt, round about the Seacoasts even to *Dover*, as also from *Dover*, round about the coasts to *Portsmouth*, and even to *Bristol* where it is had in plenty: but I have not heard by any that it groweth on the Northern coasts at all. But the other with round leaves groweth in the marshes in *Holland* in *Lincolneshire*, as well as in the Low Countries *Holland*, as also in the other places of *Lincolneshire*, by the Sea side and thereabouts: It hath been also found growing upon *Jangleborough* hill in *Lancashire*, assured me by a worthy Gentlewoman Mrs. *Thomazin Tinsall*, remembered in my former booke for many things, found growing in those parts by her meanes, which were not knowne to be growing in England, and thereof shee sent me up some for a manifestation of the truth; I heare also that it groweth high unto a Castle in the Peake of *Darbishire*, which is 30 miles distant at the least from the Sea, and that the late Earle of *Rutland*, and divers other personages of good note, had some brought from thence for their owne use; it prospereth well in Gardens being sowed in some moist and cold shadowed places, and yet it will endure the Sunne also: many in many upland countries of this land, doe now use to sow good quantities thereof, for their owne spending, or to make profit thereof to sell unto others: The smaller sorts have beene brought unto us from *Denmarke*, where they grow in an Iland called *Almagria*.

The Time.

They all flower betimes even in *Aprill* oftentimes and in *May*, and give their ripe feede quickly after.

The Names.

It is thought that none of these were knowne unto any of the ancient Greeke or Latine writers, for although some doe imagine it to be the *Britannica* that *Pliny* maketh mention of in his 25. and 3. Chapter, wherewith *Cesar Germanicus* his Souldiers were cured of the disease that raigned amongst them, called by the Physitions *Stomace* and *Sceleterbe*, in plaine English the Scurvy; (which is a disease incident and more frequent to those that are at Sea, then that live upon the land, but yet many have it that never went thither, or ever saw the sea,) which *Pliny* describeth to have a blackish leafe somewhat long and a blacke roote, &c. which it is very likely he taketh from *Dioscorides* his *Britannica*, whom *Galen* also followeth, saying it hath leaves like a wild Docke, but hairy, and a small roote: *Gesner* also taketh it to be *Britannica*, yet assuredly this our *Cochlearia*, as you may well perceive by comparing them cannot be *Britannica*: it is so called from the forme of a spoone, being round as well as hollow; we call them most commonly Scurvigrasse, and not spoonewort after the Latin name, and to distinguish them, call the one English, the other Dutch Scurvigrasse: *Lacuna* tooke the round leaved kind to be *Telephium*: the Germans call it *Leffelkrant*, the Low countrey men *Lepekrant*, and the French *L'herbe aux cuilliers*.

The Vertues.

The English Scurvigrasse is more used for the salt taste it beareth which doth somewhat open and cleanse, but the Dutch Scurvigrasse is of better effect, and chiefly used, if it may be had by those that have the Scurvie, especially also to purge and cleanse the blood, the liver and the spleene; for all which diseases it is of singular good effect, by taking the juyce in the spring, every morning falling in a cup of drinke; the decoction is good for the same purpose, and the herbe tunned up in new drinke, either by it selfe, or with other things, for it openeth obstructions

ctions and evacuateth cold clammy and flegmaticke humors, both from the liver the seate of blood, and the spleene, wasting and consuming both the swelling and hardnesse thereof, and thereby bringing to the body a more lively colour: the juyce also helpeth all foule ulcers and sores in the mouth, if it be often gargled therewith, and used outwardly doth cleanse the skinned from spots, markes or scarres that happen therein: the conserve made of the leaves thereof I meane the round leaved kind, is a fine delicate medecine for weake and tender stomackes, and worketh to the same effect, although a little slowly.

CHAP. LXII.

Fumaria. Fumiterrie.

T Here are diverse kinds of *Fumiterrie*, as they shall be declared by and by; but there are accounted as kindes thereof, the *Fumaria bulbosa*, or *Radix Cava*, whereof I have set forth all the sorts in my former booke: I will therefore here only give you some figures of them without further descriptions: yet of each of these kindes we have received from *Canada*, one which shall bee set forth accordingly.

1. *Fumaria vulgaris*. Common Fumiterrie.

Our common Fumiterrie is a tender sappy hearbe, sending forth from one square slender weake stalke, and leaning downewards on all sides, many branches two or three foote long, with finely cut and jagged leaves, of a whitish or rather blewish sea greene colour, somewhat like unto Coriander leaves; at the toppes of the branches stand many small flowers, as it were in a long spike, one above another, made like little birdes, of a reddish purple colour with whitish bellies: after which come small round huskes, containing small blackish feede: the *corubensis* roote is yellow small and not very long, full of juyce while it is greene, but quickly perishing with the ripe feede: *alba*. In the cornfields of *Cornwall* this beareth white flowers.

2. *Fumaria minor sive tenuifolia*. Fine leaved Fumiterrie.

This small Fumiterrie groweth not so high but more upright than the former, with slender square stalkes, whose lower leaves are very like unto those of the former Fumiterrie & of the same colour but smaller, but those that grow above upon the stalke, are smaller and finer cut in, and the higher the finer and smaller, the highest even as small as Fennell leaves: the flowers grow in the same manner that the other doe, but rather more store together, of a deeper reddish purple mixed with white and yellow, the feede and foote is small and white, but like the former: this is not altogether so bitter, but more sharpe than the other.

3. *Fumaria major Cretica*. Candie Fumiterrie.

This Candy Fumiterrie groweth with crooked bowing square stalkes, like the common, and of the same

1. 2. *Fumaria vulgaris & tenuifolia*.
Common and fine leaved Fumiterrie.

4. *Fumaria lutea montana*.
Yellow Fumiterrie.

height,

c. *Fumaria latifolia* alba.
Clining Fumitory.

Radix caca. nigra.
Hollow root.

7. *Radix Caca. viridi flore.*
Hollow root with a green flower.

7. *Fumaria tuberosa flore viridi.*
Round rooted Fumitory with green flowers.

height, the leaves are as finely cut in and divided as the last, and of the same colour, but somewhat harder, and not so tender and sappy: the flowers at the toppes of the branches, are like the other for forme, but of a white colour, marked with brownish spots: the seede and rootes differ not from the former.

4. *Fumaria lutea montana*. Yellow Fumiterrie.

The yellow Fumiterrie groweth like the other Fumiterries, about a foote high, with many leaves like unto the common Fumiterrie, or like unto those of the *Fumaria bulbosa*, or *Radix Cava*, the hollow roote, but smaller & of the sameblewish Greene colour with them: the flowers are yellow and in some places white, and grow at the toppes of the branches like the other, in forme of little birdes as *Matthiolus* setteth it forth, both by his description and figure, but *Lobel* and *Lugdunensis* say they are staire fashion, like unto the *Chelidonium minus* or like little birds, and not staire fashion like the *Pilewort*: after the flowers are past come small hornes or long pods, like unto the *Chelidonium majus* or *Radix cava*, but lesser, wherein is conteyned small whitish Greene and round, and somewhat flattish seede: the roote is composed of many white long strings, and thicke fibres bushing thicke together, which perisheth not as the former, but abideth many yeares, shooting forth new stalkes, the old ones alwayes perishing.

5. *Fumaria siliquosa Americana*. Indian Fumiterrie.

The stalk hereof riseth to be about a foote high, the leaves are in forme and colour like the ordinary or the last but larger enduring Greene all the winter: the flowers grow spike fashion on the toppe of the stalk formed like those of the Hollow roote, whose bellies are bluish and mouthes gold or paler yellow: the seede is contained in crooked long pods, being round, flattish and yellowish: the roote is thicke and fibrous, the whole plant is more bitter than the ordinary, and therefore more effectuell.

6. *Fumaria alba latifolia*. Climing Fumiterrie.

The climing Fumiterrie riseth up with small slender stalkes, not able to sustaine themselves, but catching hold by certain small tendrels, it sendeth forth at the ends of the smaller branches, on any thing that standeth high unto it, whereby it climeth upon the hedges or other hearbes, it sendeth forth divers stalkes of small leaves, set 2 or 3 or more together, not dented or divided on the edges at all, of a blewish Greene colour, very like unto Fumiterrie: at the toppes likewise of the small branches come forth many small whitish flowers, tipt with bluish, set together nothing like the former, but made like small long hollow huskes or Bell flowers, ending in five small points: after which come small seede enclosed in small broad huskes or pods: the roote is small and long growing downe deepe into the ground, and abideth the winter, shooting forth new branches, for the old perish every yeare.

7. *Fumaria tuberosa flore viridi*. Bulbous Fumiterrie with a Greene flower.

This hath diverse Greene stalkes, with such like leaves thereon as the small Hollow roote hath, but somewhat larger and greener: at the toppes of the stalkes stand small greenish flowers at severall places with diverse small Greene leaves set under them the roote is two or three times bigger than the roote of the small *Capnes fabacea radice*, but yellow like unto it, and the stalkes with leaves and flowers, perishing as quickly as the others.

8. *Fumaria tuberosa Americana*.

Knobbed Indian Fumiterrie.

This kinde of Fumiterrie hath two small round solide rootes like testicles, with diverse small fibres thereat, from betwene which riseth up a stalk of sundry winged leaves, two set together at a joynt, variously divided, and so smally that they almost resemble Juniper leaves, of a blewish Greene colour, the flowers have sundry colours in them, but supposed of some to be but white, it is almost without either sent or taste.

The Place:

The first groweth aswell in the corne fields, almost every where, as in gardens also, and that with white flowers in *Cornwall* in their corne fields. The second groweth in the fields of *Spain* in many places, as also in the fields and Vineyards about *Mompelie*, and in other places also. The third groweth in *Candy* from whence *Clusius* saith he had the seede. The fourth groweth on the hils in *Apulia* and *Calabria*, in the Kingdome of *Naples* and some other places in *Italy* and in *Ilyria* also. The fift groweth in *Virginia* and the backe parts thereof called *Canada*. The sixt by the hedge sides, and among bushes, in some places of *Brabant*, in the low Countries, and about *Frontignana*, and *Mompelie* in *France*, it is found about *Naples* with a yel-

5. *Fumaria semper viridis Americana siliquosa*. 8. Et *Bulbosa Americana*.
Indian Fumiterrie. Knobbed Indian Fumiterrie.

low flower. as it is reported : the seventh is found likewise in the woods of Germany : and the last in America or the West Indies.

The Time.

They all flower early even in May for the most part yet the yellow flowreth much later, as many times not untill August, and their feede ripeneth shortly after.

The Names.

It is called in Greeke *καπνος* and *καπνιον*, Capnos and Capnion, quæ fumus, eo quod succus oculis inditus lachrimationem movet sicut fumus, & claritatem eorum efficit, in Latine Fumaria & Fumus Terre; of the Arabians Scheitergi; of the Italians Fumoterre and Fumoſtomo, of the Spaniards, Palonima, of the French Fumoterre, of the Germans, Erdrauch and Danben Kropf as Tragus saith, and of the Dutch Grisfciom and Duive Kernel. The first is of all Authors called Fumaria or Capnos Fumaria of Lobel. The second is called Fumaria minor, or tenuifolia, to distinguish it from the other. The third is remembered by Clusius by the name in the title, and it may be also the Syriaca of Camerarius. The fourth is called Fumaria Coridalis of Matthioli, and of some as he saith Split; of Gesner and Tabernmontanus Fumaria montana of Lobel Fumaria lutea montana, who taketh it also to be Chelidonium capitis of Etius, of Camerarius and Anguillara Corydalis, of Cesalpini Split vulgo, and Split Illirica or Sclavonica herba of others. The fifth hath its name in the title, and reckoned a kind of the fourth. The sixth is called Capnos of Lobel, who saith it is also called of some Split al. buni; of Dodonæus it is thought to be the first Capnos Plinij, which hee saith was called in his time Pedes gallinaci, and saith also that some called it Corydalis, and Split; and the common sort Corydalis, hee calleth it also Fumaria altera, and Capnos phragmites, as Gesner doth also: but divers of the best moderne Herbarists, doe rather thinke that the Radix Cava, is the Capnos prior Plinij then this; Camerarius Fumaria Clematites, and Bauhinus Fumaria claviculæ donata, and is his fix Fumaria, and yet is the same with his second, if there be not a greater and a lesser as some doe set it downe. The seventh is the Radix Cava viridis flore of Lobel, which although Bauhinus thought it to be referred to the Radix Cava as a sort thereof, yet the roote sheweth it to belong unto the Capnos subacearadice, and so both his description and the title which afterward he amended do declare. The Arabians call it Scheitergi, and Sabetergi. The Italians Fumoterre; the Spaniards Palamilla; the French Fumoterre; the Germans Erdrauch and Katzenkernel; the Dutch Erdrook and Duynkervel.

The Vertues.

y the bitteresse of common Fumiterry, (it is by diverse of the best moderne Writers held to be hot, and not cold, as diverse others from the Arabians have set downe) and sharpenesse joyned therewith, it doth open and cleanse, and by the drie nesse doth strengthen and binde after the cleansing. The juyce or syrupe made thereof, or the decoction made in whey by it selse, with some other purging or opening herbes and rootes, to cause it worke the better, it selfe being but weak, is very effectual for the liver and spleene, opening the obstructions and clarifying the blood from falsch cholericke and adust humors, which is the cause of the leproy, scabbies, tetters, and itches, and other such like breakings out in the skinn, and after the purging doth strengthen all the inward parts, not leaving any evill qualitie behind it, and therefore is reckoned a most safe remedy against all the diseases that rise from those humors, or from obstructions that are the cause of cholericke and putride feavers: the same is good also for the jaundise, and spendeth it by the urine, which it procureth in abundance as Agneta saith. The juyce thereof saith Tragus and the powder of the roote of Efula prepared in equall proportion, that is a dramme, provoketh vomiting where there is canse, being taken in warme water and cureth the drop sicke: because it is somewhat windie it is good to use aniseede and fennelleede with it: the powder of the dried herbe given for sometime together, hath cured a melancholy person as Brasavola saith, but the feede is strongest in operation for all the purposes aforesaid. The distilled water of the herbe is much used also, and brought to cause good effect in all the former diseases; and beside, as Tragus saith conduceth much against the Plague or Pestilence, being taken with good Treacle, which it driveth forth by sweate: the same water also with a little water and hony of Roses, helpeth all the sores in the mouth and throate, being gargled often therewith: the juyce dropped into the eyes cleareth the sight; and taketh away the rednes and other defects in them, although it procure some paine for the present, and bringeth forth water or teares: Dioscorides saith that it hindereth any fresh springing of the haire on the eye liddes, if after they be pulled away the eye browes be anointed with the juyce that hath Gun Arabeck dissolved in it; the juyce of Fumiterry and of Docks mingled with vinegar, and the places gently washed or wet therewith, cureth all sores of scabbies, itches, wheales, pimples or pushes that rise in the face or hands, or in any other part of the skinn of the body. The lesser or fine leaved Fumiterry, as also the climbing Fumiterry worke to the same purposes but more weakly: the yellow Fumiterry is also effectual in most of the diseases aforesaid, and besides that it provoketh urine abundantly; it is very effectual for the cholicke taken Greene or dry in wine for many dayes. Those Fumiteries with hollow and firme rootes are each of them effectual, both against poison and the pestilence being made into powder and drunke, and afterward the party laid to sweate: the same also provoketh urine and helpeth the jaundise: the feede being bruised and drunke helpeth fluxes and laskes: the rootes are also singular good to heale and drie up putrid and running ulcers.

CHAP. LXIII.

Aristolochia. Birthwort.

Although divers doe thinke that none of the *Aristolochia*'s or Birthworts, doe purge or open the belly at all, yet because Mesues the great Arabian Physitian, numbred it among his purging plants, and Dodonæus doth in the same manner: I thinke it not amisse to doe so likewise. Of these Birthworts, Dioscorides and Galen have onely made three sorts, which are the round, the long, and the running Birthworts. Pliny hath added a fourth, which he calleth *Pistolochia*, or *Polyrrhizos*, of all which there are some differences observed in these latter dayes, which shall be declared in this Chapter.

1. *Aristolochia rotunda vulgarior.* The more ordinary round rooted Birthwort.

This round rooted Birthwort, sendeth forth diverse long trailing square stalkes, sometimes halfe a yeard long

or better, not able to stand upright, but lie or leane downe to the ground, with few or no branches issuing from them, but with many round yellowish Greene leaves full of veines, standing at distances without order, one beyond the other, every one upon a short footstalk; at every joynt with the leaves, from the middle of these stalks upwards to the top, commeth forth one long hollow flower apeece, smaller at the bottome, broader at the top, with along peece or flippet as it were, at one side of the top, bending downe, both of them of a deadish yellow or somewhat brownish colour, and somewhat blackish purple on the inside: (this flower *Dioscorides* compareth to a cap or hood, which as it should seeme was their fashion in his time) after the flowers are past come in their places, small round and somewhat long fruited of diverse sises, some as bigge as a Walnut without the shell, some as bigge as it is with the outward Greene shell, and some lesser than both, which when it is ripe openeth into three parts, shewing the seede lying in order within it, separated by certaine skinned somewhat flat and round: the roote is tuberous, bunched out diversly, of a darke or swart colour on the outside, and more yellow within.

1. *Aristolochia rotunda vulgarior*,
Round rooted Birthwort.

3. *Aristolochia longa vera*,
The true long rooted Birthwort.

5. *Aristolochia Clematitis*, The running rooted Birthwort.

2. *Aristolochia rotunda alera*. Another round rooted Birthwort.

This other Birthwort is like the former for the manner of growing, but the stalkes are more and shorter, the leaves are somewhat greater, and have each alonger foote stalk; the flowers are of a pale or whitish purple on the outside, and browne on the inside, with a few hairet set therein, scarce to be discerned as is usual to all the sorts: the fruite is somewhat longer and pearre fashion, more pointed at the end: the seede is flat, somewhat lesse and red: the roote is like the other, but a little yellower.

3. *Aristolochia longavera*. The true long rooted Birthwort.

The long rooted Birthwort is so like unto the round, that it is very hard for one not thoroughly exercised in the knowledge of both to distinguish them: the chiefe differences be these, the stalk is shorter, the leaves are smaller, harder and paler, the flowers are more whitish and greenish, but like in forme, the fruite is somewhat long like a pearre, somewhat like the other, or last round rooted Birthwort, but not so much pointed: the seede differeth not, but the roote hereof is long and not round or tuberous like the other, as bigge as a mans wrist sometimes or bigger, but most usually lesse, of halfe a foote or a foote in length sometimes.

4. *Aristolochia longa Hispanica*. The Spanish long Birthwort.

This Spanish kinde differeth very little from the last recited long rooted Birthwort, for in the flower and roote is the onely difference to be observed; the flower in this is somewhat more purple, both the slipper or eare, and the inner side of the toppe of the flower: the roote likewise is shorter for the most part, and blunter at the lower end, or nothing so much pointed.

5. *Aristolochia Clematitis*. The running rooted Birthwort.

The running rooted Birthwort, groweth with longer, stronger and rounder stalkes than the former, even three or foure foote long, branched oftentimes like the long rooted kind, whereon grow much larger and broader leaves, and of a paler Greene colour, then any of the other: at the joynts with the leaves come forth the flowers, as the other sorts doe, but whereas none of them bring above one flower at a joynt, this bringeth three or foure like unto the rest for forme, but of a pale Greene colour like the long: the fruite hereof likewise is greater than any of the other, as the seede is likewise: the roote hereof hath a stronger sweete sent than any of the former, and is smaller, of the bignesse of the bigger rootes of *Asparagus*, many growing from one head, and running very farre under ground, and springing up againe in many places, of as induring a nature as the Couch grasie almost, for if never so little a peece, be left in the ground as broken off from the rest, that is taken up, it will shoote forth leaves, and there grow againe, so that oftentimes it becommeth no lesse a plague to a ground, than a couch, or any other such like running or creeping herbe.

6. *Aristolochia Clematitis Batica*. Spanish Climbing Birthwort.

The Spanish climbing Birthwort, hath diverse small long twining branches, spreading into many other small ones, running upon small trees and hedge bushes, winding themselves very much about them, like unto the greater Bindweedes, or like unto Hoppes, and often overtopping them, whereon doe grow severall leaves, upon long footestalkes, being round and broad, somewhat like unto the Scammony of *Mompelier*, or unto the other Birthworts, but sharper pointed, smooth and Greene on the upper side, and of a whitish purple underneath; the flowers stand singly at the joynt, as the former sorts doe, and not as the last, having the longest footestalk of any; of the same forme, but of a sad or darke purple colour, and hairy on the inside; the fruite is as great as the last, and so is the seede, but openeth it selfe, at the bottome, contrary to all the former sorts: the roote runneth into the ground like the rough Bindweede, whereunto it is very like, of a pale whitish colour on the outside, and of the bignesse of the last, of nothing so strong a sent as it, and of no unpleasent, but of a sharpe and an alstringent taste.

7. *Pisilochia vulgaris*.
The bushie rooted Birthwort. 8. *Pisilochia Cretica semper virens*. Ever Greene bushie rooted Birthwort.

7. *Pistolochia vulgarior*. The bushy rooted Birthwort.

The bushy rooted Birthwort hath many slender long branched stalkes, a foote long or more, straked and crested as is both the long and the round, whereon grow at distances as in the former, diverse round leaves, smaller, rougher, and blacker than the long, whereunto it is most like, but a little waved as it were about the edges: the flowers also are very like them, but in some very darke, and in others of a greenish yellow colour: the fruite is round and somewhat long, and round at the end or point, like unto the fruite of the first round kinde but smaller, which openeth it selfe also as the last before doth at the bottome next unto the stalke, and shewing such like seede within but smaller: the rootes are many, and small, bigger than bullrushes for the most part, shooting from one head with many small fibres thereto, of a yellowish colour as all the rest are: this looeth the leaves in winter as all the former doe.

8. *Pistolochia Cretica semper virens*. Ever greene hushie rooted Birthwort of Candye.

The ever greene hushie rooted Birthwort of Candye, sendeth forth many very slender flexible and trayling cornered stalkes, branching into diverse other smaller, about a foote long or better, and of a sad greene colour, whereon are set round leaves long pointed, full of veines, but lesser than the former, and of a sad greene colour, so abiding all the winter: the flowers are like unto those of the long kinde, standing upon long foote stalkes, of a very sad red colour on the outside and yellowish within: the fruite and seede is smaller than in any other: the rootes likewise are like the last but smaller, and smelling somewhat sweet.

The Place.

The three first more ordinary kinds grow as well in *Narbone* and *Provence* in *France*, about *Mompeller* in the fields and vineyards, especially the running kinde, that it maketh their wine, where it is frequent, to taste thereof, as also in *Spain* and *Italy*: the other three that are like unto them, *Clusius* saith he found in *Spaine* in diverse places; and *Honorius Bellus* saith in *Candy* also, in his first Epistle to *Clusius*, and *Petrus Bellonius* in his first book of observations and 17 chap. doth also. The seventh groweth in the stony Olive yards of *Provence* and *Spain*; and the last in *Candy*.

The Time.

These doe not flower with us until the middle or end of *July*, and their fruit doth hardly ripen before the winter, yet in the warmer countries they flower and seede early: some of these doe flower much later with us, if with all the care we can use unto them, we can preserve them in the winter, as both the sorts of long rooted and bushy rooted kinds, for the other are more hardy.

The Names.

It is called in Greek *ἀριστολόχια* *quasi* ἀριστα πῦς λοχέαις, i. e. *optima puerperis*, but not *pregnantibus* as *Pliny* hath it, it is good to helpe women that are ready to be delivered, and that are delivered, and not those that are with child, not ready to be delivered, for in such it may cause abortment, or delivery before the time: In former times, when ignorance had hid in a cloud all sorts of learning and knowledge, from all our Christian world, many false herbes were obtained for the right, and in those errors many lived and dyed: but the industry of this later age, hath searched out, found and detected many, and among others this of *Aristolochia*; many taking the *Rad. x. Cava* major to be it, and the *minor* to be the *Pistolochia* of *Pliny*, but all now by the sight and knowledge of the true, are ashamed that any such error should at any time creepe in among wise men: There is also some controversie among the later authors, which should be the *Aristolochia Clematitis* of *Dioscorides*; the Apothecaries of *Italy* in and before *Matthiolus* his time, used this roote of *Aristolochia Clematitis* in stead of the true long Birthwort, not knowing either the true long or that this their *longa* was *Dioscorides* his *Clematitis*: *Lonicerus* and others found out this error, wrote against it, and shewed that it was not the long one of *Dioscorides*, but his *Clematitis*; but *Matthiolus* contesteth against them with many words, both for it, and because they found fault with the text in *Dioscorides*, who saith that *Aristolochia Clematitis* hath slender branches, somewhat round leaves like unto *Houfeleeke*, and the flowers of *Rue*: The Greeke word is *ἀριστολόχια* or *sempervivum parvum* and they thought it should be rather *ἀριστολόχια* *asarum parvum*, because the *Aristolochia Clematitis* hath round leaves like *Asarum*: but *Matthiolus* in shewing that the words are the same that *Oribasius* hath also who wrote the same that *Dioscorides* did, as also that *Scrapio* and *Avicenna* have the same words, and that therefore the text is uncorrupted, would thereupon conclude, that the *Aristolochia longa*, then used in the Apothecaries shops, could not bee *Dioscorides* his *Clematitis*, and the rather, because the flowers of his *Clematitis* are like *Rue*, which those of their *Aristolochia longa* are nothing like, againe he saith the rootes are small, longer then the other; and have a thicke barke that covereth them, but the longe *Aristolochia* of the shops hath a thinn rinde as all know, that have seene it: yet *Matthiolus* is forced to grant, that the *Aristolochia longa*, that was used in the Apothecaries shops, was not the same *Aristolochia longa*, that *Dioscorides* maketh mention of, how then could he not perceive it to be his *Clematitis*, when he had set forth both the long and the round, and knew that the *Aristolochia longa* of the shops, was like unto the other two sorts, but differing in rootes onely from them; but saith, he thinketh it might be the *Pistolochia* of *Pliny*, or a species of that kind of long, whereof no mention was made by the ancient writers; yet how far from likelihood these words of *Matthiolus* are, let others judge: but assuredly the text of *Dioscorides*, and so likewise of those that have followed him, cannot be exempt from blemish, or else neither we, neither any before us, have or know *Dioscorides* his *Aristolochia Clematitis*: for he in describing the three sorts of *Aristolochia*, maketh the two former to agree in leaf, flower and fruit, and to differ onely in the roote, whereunto all doe agree, but in declaring the *Clematitis*, he setteth downe the leaf and flower, to be farre differing, but sheweth not what fruit it beareth, yet maketh it agree with the other two in properties, although lesse forcible: but seeing there is another herbe knowne to be so like the other two *Aristolochias*, and to differ in nothing from them, so much as in the roote, which is sweete, small and longer then any of the other, as *Dioscorides* maketh his *Clematitis* to bee, and the very name *Clematitis* answerable to the plant, what should let it to be the right, and indeede it is so accounted of all now a dayes without doubt or question, notwithstanding the text of *Dioscorides*; as also that their *Aristolochia longa* of former times, according to *Lonicerus* judgement, and those Monkes, that commented upon *Mesues*, is *Dioscorides* his *Clematitis*: Another doubt there is likewise risen of late dayes, what *Aristolochia* was ment by *Andromachus senior*, that he appointeth to be put into his *Theriaca*; for his elegiack verses maketh no distinction: and because *Galen* doth shew in *secundo*

alimentum that *Andromachus junior*, *Andromachus senior* his son, in setting downe his fathers *Theriaca* in prose, doth explaine divers things, that were doubtfull in his verse, as for the *Mel Cecropium* he expresseth it *Mel Atticum*: for *Centaurium* without difference either of greater or lesser, he setteth downe the lesser, and for *Aristolochia* which was left indefinite, he setteth downe *lepte tenuis*, the small. Now here lyeth the doubt, what *Aristolochia* *Andromachus* and *Galen* should meane, by this *lepte tenuis*: *Mathiolus* seemeth to answer this doubt, in shewing that they would not meane any other *Aristolochia*, then the *Clematitis*, because they mention but three sorts; and this *Clematitis* is the smallest roote of the other, and that the *tenuis Aristolochia*, is not the Long of *Dioscorides*, whose rootes he saith were of the thicknesse of a finger; when as of the true Long none are found so small unlesse they be very young rootes, nor yet any other different kind from the *Clematitis*, as divers did thinke; and yet *Galen* in *lib. 6. simp. med.* in setting downe the properties of all the three sorts of *Aristolochia*, commendeth the round as most excellent, and of most subtil parts, and to all purposes more effectuell then both the other: the Long he saith is nothing so subtil, or of so thin parts, but is more hot and clensing; and of the *Clematitis* he saith onely that it is sweeter in smell then the other two, and therefore is more used in sweete oynments then otherwise, and is more weake for medicines, or the cure of any disease; why therefore the *Clematitis* should be taken for *Andromachus* Treacle with our Apothecaries I doe somewhat admire, seeing *Galen* saith that the other are more effectuell for all purposes: The severall appellations of authors of these *Aristolochia's*, are not so divers that they neede any long repetition, for they all as it were agree together, the variation being so small, that it is not worthy the reciting; onely I will shew you how *Bauhinus* in his *Pinax* doth distinguish them severally differing from the titles I give them: the first here set forth, he calleth *Aristolochia rotunda flore ex purpura nigro*: the second he calleth *Aristolochia rotunda flore ex albo purpurascete*: the third hee calleth *Aristolochia longa Hispanica*: the fourth *Aristolochia longa Hispanica*: the fifth *Aristolochia Clematitis rella*: the sixth *Aristolochia Clematitis serpens*: The seventh *Aristolochia Pistolochia dicta* (and is *Aristolochia Polyrrhiza* of *Loebel* and *Pliny*) the last he calleth *Pistolochia Cretica*. The *Arabians* call it *Zarand Masmoera* and *Zaraved*: the *Italians* *Aristolochia*: the *Spaniards* *Astronomia*, the *French* *Sarsine* and *Fozerne*, the *Germans* *Ostherlucy* and *Holworts*: the *Dutchmen* *Ostherlucy* and *Sarsinermide*.

The Vertues.

Galen, *lib. 6. simpl. med.* as I shewed you before sheweth the severall properties of these *Aristolochia's*, the roote saith he of *Aristolochia* is of most use for medicines, being bitter and somewhat sharpe, the round is the most subtil of them all, and of more effect for all diseases; that which is called *Clematitis* is sweeter in sent then the other two, and therefore those that make sweete ointments, doe use it in their ointments, but it is of lesse force and vertue in the curing of any disease; the Long hath lesse tenuity of parts in it, then the round, but yet is not without efficacy, for it hath a clensing and heating power therein, yet it cleneth and digesteth lesse then the round, but healeth no lesse, yea peradventure more, and therefore the long is of more use, for those that have neede of a meane clensing in the tuberous swellings of the flesh, and in fomentations of the mother, but where there is neede of a stronger extenuating faculty, there the round is of more use: and therefore the round *Birchwort*, doth more helpe to cure those griefes and diseases, that rise from the obstruction or abundance, and grossenesse of raw and windy humors: it draweth forth thornes, and splinters, &c. out of the flesh, it healeth all putrefactions, it cleneth and maketh found foule and filthy Ulcers, it cleneth the gums, and the teeth, and maketh them white; it is profitable for those that are troubled with the shortnesse of breath, with the hickocke, with the Falling sicknesse, or with the Gout, if it be drunke with water, (or wine rather) as also for those that are bursten or are troubled with Crampes or Convulsions, or shrinkings of the sinewes and veines, and is as profitable as any other medicine whatsoever: and thus farre are the words of *Galen*, in the place before recited: *Mesuer*, *Paulus Aegineta* and *Etius* do shew the purging qualitie therein, which *Dioscorides* and *Galen* either knew not (as in *Rubarbe*) or past it over in silence, who saith, that the roote either of the round or running *Birchwort*, doth purge downward flegmaticke and cholericke humors also: it cleneth the lunges and the parts of the breast, from the roughnesse and rottennesse of humors; whereof a plaine demonstration is, that it helpeth those that are flegmaticke or shortwinded very much: if it be taken inwardly or applyed outwardly to the part, it mightily draweth downe womens courses, expelleth the dead child and afterbirth, and in the paines of delivery hath very good effect to cause the more speedy ease and delivery, and to cleare the parts, of what is necessary: the roots in powder taken with *Mirhe* & *Pepper* in wine, is used also for the same purposes, of what is necessary: the roots, the long resisteth the venom of Serpents, and other living creatures, the round resisteth all other sorts of payson: but *Pliny* inverteth this order: the roote of the round being taken in water, helpeth those that are bruised by falls, blowes, &c. as also the paines of the sides; the running *Birchwort* helpeth the falling downe of the mother, being eyther applyed in pessarie or in fume, and the place bathed with the decoction; it is said that divers in *Spaine* doe use the rootes of the Spanish running *Birchwort* with no lesse good successe, then they doe the rootes of *Sarsaparilla*, to all the uses whereunto the *Sarsa* serveth: the distilled water of the greene herbe, when it is in flower is profitable for all the diseases aforesaid, and in especiall preserveth from the Plague, and is an especiall good remedy for the winde collicke: the *Pistolochia* or bushy rooted *Birchwort*, is commended by *Pliny* for all the aforesaid womens diseases, to be as effectuell as the other, and that it is very profitably applyed to those that are troubled with Convulsions and Crampes, or those that have bene bruised by stroakes or falls, if it be drunke with water, the seede worketh more strongly: the roote of the round *Birchwort* helpeth to draw forth broken bones, or any other hurtfull thing lying in the flesh, if the fresh roote be applyed and bound thereto: the powder of the dried roote is of singular good use in all eatings, or running, foule and rotten Ulcers, as also that are hollow and Fistulous, by clenning and filling them up, or causing the flesh to grow foundly, especially for *Fistulaes*, if a little Hony, and the roote of *Iris* or the *Flowerdeluce* be used with it: it healeth also all wounds in the head: the fumes thereof, or the powder in a quilted cap, stayeth all Fluxes and distillations of thinne rheume from the head: and it is an usall saying, that without *Birchwort* no *Chirurgion* can performe any great cure: the long *Birchwort* is used as well as the round, in most of those diseases either inward or outward, and some also doe hold that the *Clematitis* or running kind is no lesse effectuell, but you heard before the judgement of *Galen* concerning it. *Pliny* in his 25. Booke and 8. Chap. saith that the fishermen in *Campania* did eall the roote of the round *Birchwort* the venom of the earth, and that having bruised it and minced it with

Lime

Lime and Chalke, and cast it into the Sea, all the Fishes within a great way thereof would with incredible desire gather themselves thereto, and presently upon the taking thereof become as dead, whereby they might easily be taken: but *Lonicera* noteth it as an error in *Pliny*, who referreth that quality to the roote of *Aristolochia* which should be attributed to *Cyclamen*, which he saith is called by the Greekes *ἡ δροσος*, id est, *piscium venenum* because it killeth them.

CHAP. LXIII.

Mercurialis, Mercurie.

Under the titles of *Mercuries* I must comprehend also the *Phyllon* of *Theophrastus* and *Discozides*, for that they are out of doubt *congeners* of the same kindred: they are in face and forme the one so like the other: and with them I thinke it not amisse to remember in this place also, the *Mercurialis sylvestris* altera of *Tragus*, called by *Lobel*, *Noli me tangere*: for although *Banhus* place it with the *Balsamina*, yet others reckon it with the *Mercuries*.

1. *Mercurialis vulgaris* mas & femina. French Mercury, the male and female.

I comprehend as you see, both the male and the female Mercury under one description, because as all do agree, they both rise from the seede of the one as *Hempe* doth, and they both are so like, that but for the flowers and seede, that shew their difference, they could not bee distinguished the one from the other: it riseth up with a square greene stalke full of joynts, two foote high or thereabouts, with two leaves at every joynt, and branching likewise from both sides of the stalkes, set with fresh greene leaves, somewhat broad and long like unto the leaves of *Pellitory* of the wall, but lesser and much about the bignesse of the leaves of *Bassill*, finely dented about the edges: towards the tops of the stalkes and branches, at every joynt come forth, in that which is called the male, two small round greene heads, standing together upon a short foote stalk, which growing ripe are the seede, not having any flower, that ever I could discern; in the female the stalke is longer, spike fashion, and set round about with small greene huskes, which are the flowers made like small branches of grapes, which give no seede that ever I could finde, but abide in that manner a great while upon the stalkes without shedding: the roote is composed of many small Fibres, which perisheth every yeare, at the first approach of winter, and raiseth it selfe up againe of it owne sowing, for where it is once inferred to sow it selfe, the ground will never want it afterwards, even of both sorts, for I yet never saw it grow in any place, where either of them was wanting.

2. *Mercurialis sylvestris Cynocrambe dicta vulgaris*. The ordinary wilde Mercury or Dogs Mercury. This Dog Mercury is likewise distinguished into male and female, and riseth up with many stalkes, slenderer and lower then Mercury, and without any branches at all upon them; the male is set with two leaves at every joynt somewhat greater then the female, but more pointed, and full of veines, and somewhat harder also in handling, of a darker greene colour, and lesser snipt or dented about the edges at the joynts, with the leaves come forth longer stalkes then in the former, with two hairy round feedes upon them, twise as bigge as those of the former Mercury: the taste hereof is herbie, and the smell somewhat strong and virulent: the female of this kind hath much harder leaves, and stand upon longer foote stalkes, and the stalkes also are longer; from the joynts come such like long or rather longer spikes, of greenish flowers as are in the former female Mercury, with many small threds in them, which give no seede, no more then the other Mercury: the rootes of them both are many, and full of small Fibres, which runne under ground, and mat themselves very much, not perishing as the former *Mercuries* doe, but abiding the winter, and shoote forth new branches every yeare, for the old dye downe to the ground.

1. *Mercurialis* mas & femina. French Mercury, male and female.

3. *Cynocrambe legitima* *Discozidis* *Banhus*. The true

Dogs Mercury by *Eubirus*.

The true Dogges Mercury is a tender small and soppie herbe, and riseth up like unto the ordinary Mercury, with a round greene crested stalke, about a foote high set with many joynts, branching forth from every joynt; whereat commeth forth at the first two small leaves, and somewhat round like unto *Chickweede*, after which two other spring forth from the same joynt, which are much larger and broader, and from the same place also afterwards come divers other smaller leaves then the first, and this proportion it holdeth, not at one joynt alone, but at every one thorough the whole plant: from the lowest joynt almost of the stalke and branches, up to the top, where come forth three or foure small whitish greene flowers, with many threds in the midst of them, which turne into small hard round feede, like unto those of Mercury but somewhat lesser, greene at the first, but of a blackish aske colour when they are ripe: the roote is white, long and fibrous.

Phyllon

2. *Cynocrambe vulgaris*.
The ordinary wilde or Dogs Mercury.

4. *Phylum maritimum* & *feminifolium*.
Childes Mercury male and female.

3. *Cynocrambe legitima* Dioscoridis Bauhino.
The true Dogs Mercury by Bauhinus.

5. *Mercurialis sylvestris* Noli me tangere dista
sive Persicari: filiquosa. Wilde Mercury
called Quicke in hand.

4. *Phyllum marificum & feminificum*. Childing Mercury male and female.

Childing Mercury also is divided into two kinds, as the former Mercuries are, whereunto it is like in all the parts thereof, that many have bene of opinion, that it is but plaine Mercury, growing in a hotter Country: It hath a branched square stalke (I give you one description for them both, as I did in the former, although others give them severall) full of joynts and branches, in the male lower and more upright, in the female higher and more bushie: at the joynts stand alwayes two soft woolly leaves, somewhat narrower and longer, than in the former, and not dented or but feldome about the edges, of an acide and saltish taste: at the joynts in the male come forth short stalkes, bearing two small round feedes together at the toppe, like unto the male Mercury, (for it doth not give any flowers) which are of an ash colour before they are perfect ripe, but then they turne to be more blew; in the female the stalkes are longer, and beare many small pale mossie flowers, which feldome beareth any feede, which when it doth it is small and round like the other, sometimes two and sometimes more growing together: the roote is white, hard and woody; of the bignesse and length of a finger, perishing every year, and rayeing it selfe againe from it owne feede, in the naturall places: this hath a stronger sent and taste, than any of the former Mercuries: *Dioscorides* his description of this *Phyllum* is inverted, for unto the male he giveth spiked or bushie heads, and unto the female feedes like poppie: but as hee saith himselfe *Crataevus* was his author, and not his owne knowledge.

5. *Mercurialis sylvestris noli me tangere dicta sive Persicaria siliquosa*. Wilde Mercurie called Quicke in hand.

This kinde of wilde Mercury (which for the varietie of the forme hath bene diversely named of writers) riseth up with a round joynted stalke, two foote high sometimes, branching from thence in many places, whereat continually standeth but one leafe upon a very slender rough foote stalke, most like unto those of *French Mercury*, but longer pointed, and somewhat smaller at the stalke, not so finely, but as it were grossely indented about the edges, being thinner, softer, and of blewish Greene colour; from every joynt with the leafe from the middle upwards, and at the toppes of the branches also commeth forth one long browne foote stalke, as small and fine as any haire, bearing one flower thereon, and sometime two or three, somewhat close together, hanging downewards, composed of fixe leaves a peece, somewhat like unto those of the Hollow roote, but greater) of a faire gold yellow colour, *Bauhinus* saith it is found also of a paler colour: two of them that stand like winges at the sides, are larger than the other two that stand under them, which are small and round, the lowest is longer than the other two small ones, and broad at the end: the uppermost endeth in a short crooked horne or heele behind: the botome on the inside is whiter than the rest, which have sometimes some red spots in them: after these flowers are past, there come up in their places, small long joynted pods, hanging downewards, striped as it were all the length of them, wherein is contained small long and somewhat flat feede, of a duskie colour, which is so hardly gathered, in regard that even before it be thorough ripe, if it be but very lightly handled, the pods will breake, and twine themselves a little, as the pods of some certaine pulses will doe, and the seed will leape forth, yea for the most part, the very shaking of the branches by the winde, causeth the pods to breake open, and shed their feede on the ground, where the ripest may best be gathered if they be taken in time: the roote is blackish and thredde, perishing every year; the taste hereof is small and waterish, as *Columna* saith in the Greene hearbe as my selfe can testifie, and little otherwise in the dried, and which gave him no offence nor me also, either in the tasting or handling, but whether there were any further danger in taking a greater quantity, because *Lobel* saith it was venomous, was I doubt but onely an heare-say by tradition, yet neither he nor I would make any further experience therein.

The Place.

The two first Mercuries are found wilde in diverse places of our owne Country, as very plentifully by a village called *Brookel* and in *Rumney Marsh* in *Kent*; the other called *Dogge Mercury* is found in sundry places of *Kent* also, and elsewhere, the female kinde is more feldome found than the male: the true *Dogges Mercury* is not found wild with us, neither the childes or childing Mercuries, but grow about *Mompelien* in *France*, and in *Spain* and *Italy*: the last groweth in the shadowie woods of *Italy*, *France*, and *Germany*: it hath bene found likewise by the shade woods sides, of the mountaines and their vallies in *Wales*, by an industrious Gentleman, and Herbarist, Mr. *George Bowles*; and will abide in our Gardens, every year sowing it selfe being set in a shadowie place.

The Time.

They all flourish in the Sommer Moneths, and therein give their feede; but the Childs Mercury flowreth so late with us, that it hardly beareth ripe feede. The quicke in hand flowreth and presently after seedeth, in his naturall place about the middle and end of *August*, but in gardens in *June* and *July*.

The Names.

French Mercurie is called in Greeke *λινοςφύλλον* *Linosphyllon* & *ἑρμειοειδὲς* *hermeioides*, *Mercurii herba*, & *μερμεριον* *Parthenium*; in Latine *Mercurialis*, because as *Pliny* saith it was found by *Mercury*: *Dogges Mercury* is called *κυνία* & *κυνοκράβη*, *Cynaea* and *Cynocrambe* which is *Canina Brassica*, but because it hath no agreement with any Cabbage (unless you would say it were meate, or a Cabbage for a dogge) others have called it in Latine *Mercurialis Canina*, propter ignobilitatem, others *Mercurialis sylvestris*: The childes or childing Mercury is called in Greeke *φύλλον* & *ελαοφύλλον* *Phyllum* & *Elaophyllum*, quasi *Oleofolium*, *Theophrastus* in his ninth booke and 19. chap. saith that they called one herbe *Phyllum Arrhenogonon*, and another *Thelygonon Maripari*, & *Feminiparum*, which diverse doe thinke is but the former *French Mercury*, because he saith they have leaves like *Bassill*, whereunto the *French* and not the Childs or childing Mercury is most like, and the rather for that *Dioscorides* approprieth to his Mercuries those effects of bearing male and female children, that the *Phyllum* of *Theophrastus* and *Dioscorides* hath. The *French Mercury* is generally of all writers almost, called *Mercurialis mas & femina*. *Cordus* upon *Dioscorides* thinketh them to be the *Phyllum Arrhenogonon*, and *Thelygonon* of *Theophrastus*; and *Bauhinus* calleth them *Mercurialis testiculata & spicata*: the *Italians* call it *Mercorella*; the *Spaniards* *Mercuriale*: the *French* *Mercuriale & Vignoble*; the *Germanes* *Bengelkrant*, and the *Dutch men* *Bingelcruyte & Mercurial*. The second is called *Mercurialis sylvestris*, by *Tragus*, *Lonicerus*, *Cordus* & *Thalys*, & *Cynocrambe* by *Matthiolus*, *Fuchsius*, *Dodonæus*, *Camerarius* and *Lobel*, who in one figure representeth both the male and female.

Columna

Columna calleth it *Mercurialis Carina*, and *Bauhinus* *Mercurialis montana testiculata & spicata*, neither of them both thinking it worthy of the name of *Cynocrambe*, for that they knew it was not answerable to *Dioscorides* his *Cynocrambe*, who doth not make it a Mercury, whereof there is male and female, for if it had beene so, hee would have remembered it, but he putteth it indefinitely not naming either male or female: The third is called by *Bauhinus*, who first set forth the figure and description thereof in his *Matthiolus*, *Cynocrambe vera Dioscoridis*, and *Pons* in his description of *Mont Baldus*, *Cynocrambe legitima Belli*. *Casalpinius* tooke it to be an *Aspine*, and *Columna* calleth it *Aspines facie plantanovia*. The fourth is generally taken of all to be the *Phyllum* of *Dioscorides* and *Theophrastus*. *Bauhinus* calleth it *Phyllum testiculatum* and *spicatum*, as he did the former Mercuries: The last is called of *Tragus* *Mercurialis sylvestris altera*, in his Chapter of Mercury, but putteth the figure thereof in the chapter of *Esula*; of *Lonicerus* *Tithymalus sylvestris*; of *Camerarius*, *Tabermontanus*, *Lobel*, and *Gesner*, *Noli me tangere*, who also calleth it *Milium Caprearum*. It is also called *Pescicaria siliquosa* of *Camerarius*, *Thalius*, *Lugdunensis* and *Lobel*; of *Dodonaeus* *Impatiens herba*, of *Casalpinius* *Catanance altera*, of *Columna* *Balsamita altera*, and of *Lugdunensis* *Chrysea*; *Bauhinus* calleth it *Balsamina lutea*, sive *Noli me tangere*. I have called it *Noli me tangere*, and placed it in the Chapter of Mercuries, and given it an *English* name, proper for it as I take it, let others call it as they please.

The Vertues.

The decoction of the leaves of *Mercurie*, or the juyce thereof taken in broth or drinke, and with a little Sugar put to it, to make it the more pleasant, pargeth chollericke and waterish humors: *Hippocrates* commendeth it wonderfully for womens diseases, which none of the Physicians of our dayes, I thinke ever put in practise, for he applied it to the secret parts to ease the paines of the mother, and used both the decoction of it to procure womens courses, and to expell the afterbirth, and the fomentation or bathing for the same causes; he also gave the decoction thereof with Myrrhe or pepper, or used to apply the leaves outwardly against the strangury, and the diseases of the reines and bladder; he used it also for sore and watering eyes, and for the deafenesse and paines in the eares, by dropping the juyce thereof into them, and bathing them afterwards in white wine; the decoction thereof made with water and a cocke chicken, is a most safe medicine to be taken against the hot fits of agues: it also clenseth the breast and lungs of slegne troubling them, but it doth a little offend the stomacke; the juyce or distilled water thereof, cast or snuffed up into the nostrils, purgeth the head and eyes of catarrhes and rheumes, that distill downe from the braines into the nose and eyes, as also sometimes into the eares: Some use to drinke two or three ounces of the distilled water with a little Sugar put to it, in a morning fasting, to open the body, and to purge it of grosse viscous and melancholicke humours; as also mixing it with May dew taken from Rose bushes, and Manna dissolved therein, for the same purpose, which thereupon some call *Rhodomanna*, which purgeth choller also; It is wonderfull (if it be not fabulous) that the ancient writers, *Dioscorides*, *Theophrastus* and others doe relate, that if women use these herbes either inwardly or outwardly, for three dayes together after conception, and that their courses be past, they shall bring forth male or female children, according to that kinde of herbe that they use: *Matthiolus* saith that the feede of both the kindes of *Mercury*, that is both male and female, boyled with wormewood and drunke, cureth the yellow Jaundise, in a most speedie and merveilous manner: the leaves themselves or the juyce of them rubbed upon warts or bound unto them for a certaine time, doth take them cleane away: the juyce mingled with some Vinegar, helpeth all running scabs, tetters, ring wormes and the itch; *Galen* saith that who so will apply it outwardly in manner of a pultis, to any swellings or inflammations, shall finde it to have a digesting quality, that is, it will digest and spend the humours, that was the cause of the swelling, and alay the inflammations proceeding thereupon, it is frequently and to very good effect given in glisters, to evacuate the belly from those humors that be offensive therein, and worketh as well after that manner, as if so much Sene had beene put into the decoction. The common Dogges Mercury is seldome used, but may serve in the same manner, and to the same purpose that the other is put to, for purging waterish and melancholicke humors. The childes Mercury, although no other hath written of any purging qualitie in it, yet the forme thereof so like unto Mercury, and the saltish acide taste should demonstrate in my opinion an irritating quality: *Theophrastus* and *Dioscorides* have onely mentioned the childing quality, for women to beare either males or females, that use this herbe, according as is before sayd of French Mercury. The *Noli me tangere*, or the Quicke in hand, hath a stronger purging quality, but it is by vomite, and therefore I thinke *Lonicerus* and *Tragus*, have put it under the names of *Tithymales*, as nearest partaking of their nature, which caused *Lobel* and *Pons* to say, it was venomous and deadly, and yet say it wanteth not his prayse for other effects, but shew not what they are: *Camerarius* in *borto* saith some doe apply the distilled water of the hearbe upon the places pained with the goutte, with good successe.

CHAP. LXV.

Malva. Mallows.

Here are three kinds of Mallows, one with whole leaves, but little incised or cut in on the edges, called *Alalva*; an other more deeply jagged or cut called *Alcea*, the third more soft in handling called *Althea*. Of each of these three divisions the varieties shall be reckoned together by themselves, that so each kinde may be separated. Some of each of these kindes I have set forth in my former Booke, whose descriptions neede not to be here repeated, and those are *Malva Hispanica flore carneo amplo*: The Spanish bluish Mallow, *Alcea vulgaris flore carneo*, Vervaine Mallow with bluish flowers. *Alcea peregrina sive Vesicaria*, Venice Mallow, or good night at noone. *Alcea fruticosa pentaphylla*, cinque foile Mallow. *Sabdariffa seu Alcea Americana*, Thorny Mallow. *Bamia seu Alcea Egyptia*, The Mallow of Egypt. *Althea frutex flore albo vel purpureo*, Shrub Mallow with a white or purple flower. *Malva bortenfis Rosea simplex & multiplex diversorum colorum* Holboockes single and double of many colours; and *Malva crispa*, French Mallows; yet the figures of some of them that are next at hand I will insert here: those which remaine to be intreated of I shall remember in this Chapter.

Diviso

Divisio prima. The first Division.

1. *Malva vulgaris flore purpureo.* The common Mallow with purplish flowers.

The common Mallow hath many large soft Greene roundish leaves, yet somewhat cornered and dented about the edges, standing upon long foote stalkes, next the ground, from among which rise up, diverse round Greene stalkes growing in time to be three or foure foote high, especially in good grounds, and to be more hard and almost woody, especially at the bottome, divided into many branches, towards the tops and with many lesser leaves, and more divided upwards; where it bringeth forth many flowers, standing in soft huskes, which flowers twine themselves, at their first shooting forth before they open themselves into fine large, broad pointed leaves, of a fine delayed purplish red colour, with many stripes or veines running thorough every leafe, of a deeper colour, which maketh the flower seeme very beautifull: after which come round flat cases, with many blackish feede, set in order, round about in them: the roote is long and white, growing downe deepe into the ground, tough and somewhat woody.

2. *Malva vulgaris flore albo.* Common Mallow with white flowers.

This Mallow groweth like the former, both for leaves and height of stalkes, the cheefest difference consisteth in the flowers, which are not fully so large as the former, and are of a pure white colour, without any stripe or veine, of any other colour running thorough them, the feede and rootes are also a like.

3. *Malva sylvestris minor.* Small wilde Mallow.

This small Mallow lyeth with his branches upon the ground, having many smaller and rounder leaves, not cut in, or very seldome, and lesse dented on the edges than the common: the flowers hereof are very small and white: the feede and rootes are like the common.

4. *Malva Montana.* The mountaine Mallow.

The mountaine Mallow, hath his lower leaves as large as the common wilde Mallow but longer, with some round divisions or cuts therein, but not deepe, somewhat like unto an Ivey leafe: the stalke groweth not so great and high as the common; with smaller leaves thereon, upwards somewhat rounder and lesse: the flowers are like the common, and so is both feede and roote.

5. *Malva trimestris sive Aestiva.* The Sommer Mallow.

The Sommer Mallow hath soft round Greene leaves, without divisions, yet dented about the edges, somewhat paler underneath; the stalke riseth up to but halfe a yard high, bearing smaller leaves, and a little divided somewhat like those of Marsh Mallows: the flowers are of a paler purplish colour then the common and lesser, the bottome of whose leaves are of a deeper colour, standing upon longer foote stalkes, and not so many together, the feede is small, and so is the roote, and perisheth with the first cold or frost that commeth; but sometimes if the Sommer be kindly, it giveth his ripe feede, before any frosty nights doe come.

6. *Malva Arborea* Tree Mallow.

The tree Mallow groweth with us to be a great tall tree more likely than an herbe, having his stemm somewhat woody, and oftentimes so great in compasse that no man can grape it round with both his hands, the

Malva vulgaris & crispis folijs.
Ordinary and French Mallows.

Malva Hispanica flore carneo amplo.
Spanish bluish Mallows.

leaves

5. *Malva trineftris* sive *Æfiva*.
Summer Mallory.

Malva Rofea simplex.
Single Hollihockes.

Malva Rofea multiplex.
Double Hollihockes.

8. *Malva rofea arborea Indica fimplici & duplici flore*.
The Indian tree Hollihocke with fingle and double flowers.

leaves are twice as great and large, as any common Mallow, and as soft and woolly in handling as the Marsh Mallow but not so white or woolly, yet often somewhat crumpled about the edges: this flowreth not the first yeare of the springing up with us, but in the second Sommer, if the sharpe Winter hath not rotted his stalke in the first yeare (not then being grown to his full strength) being more tender than afterwards; it spreadeth some branches; with leaves on them, but smaller, among which stand faire great and large deepe purple flowers, with stripes and veines in them like the common Mallow, after which rise such like round cates, with blackish feede in them, but larger according to the proportion of the plant, but seldome commeth to maturity in our countrie: the roote and stalke perish usually with us, after it hath abiden two yeare at the most with us; whereas in the warmer and naturall places, it abideth diverse yeares, and groweth to be as high and great as many trees.

7. *Malva arborea marina nostras.* English Sea tree Mallow.

This tree Mallow of our owne countrie, is very like the former tree Mallow, having a wooddy stemme, as great as a mans arme, of a russet or hoary colour; whereon grow soft whitish woolly leaves, almost as large as the others, and as smooth as velvet: the flowers hereof are large, and of a whitish or delayed purple colour, like in forme unto a wild Mallow flower, but somewhat large, yet not so great as the former: the roote is white, great and wooddy, with diverse long strings annexed unto it.

8. *Malva Rosea arborea Indica.* The Indian tree Hollihocke.

If I should Baptista, Ferrarius-like of a mole hill make a mountaine in the description hereof, I might be held over tedious, howsoever he by his elegant Latine stile, may passe with greater delight to his reader, both in his ample narration and fabulous concertation betweene Art and Nature, in that he giveth a greatfull *Vehiculum* to ease the long journey: but this large volume will not admit such spacious relations, and therefore I will abbreviate his long discourse, with as briefe a description as the subject will permit, and referre those to the authour, that list to read all at large. In a small time (that is in two or three yeares in a warme country) this riseth up to be like a pretty great shrubbe or small tree, whose stemme or trunk being somewhat white and wooddy, five or six inches thicke covered with a smooth whitish barked whose lower branches being pruned the upper boughes spread into a round compasse, whereon are set diverse broad rough leaves somewhat like to Vine leaves cut into severall partitions and nicked about the edges, of a faire Greene colour on the upper side and grayish underneath, on thicke, long and rough reddish foote stalkes, sometimes but one, and often two or three at a joynt, which doe abide the Winter without falling away: at the toppes of the branches come forth the flowers standing in Greene huskes divided at the toppes into five parts: in some of these plants the flowers will be single, consisting of five, sixe, eight or tenne large crumpled leaves, all white or a little bluish towards the edges: in others the flowers will be very double, and as large as a Provence Rose of the same colours, but after they have abiden a while blowen open they change more bluish and on the fading deeper, these changes are often scene in one and the same day, yet many times not in two or three dayes abiding in the middle of the flowers standeth a Greene head, compassed with many yellow threds as the Rose hath, which head growing to maturity, hath sundry ridges and furrowes on the outside and full of feede within, distinguished by severall partitions, and are reddish somewhat small long round and crooked, and a little hairie at the backside, 163. feedes have beene numbred to be taken out of one feede vessell: the roote is long, white and wooddy diversly spread under ground, with some small fibres issuing from them.

Diviso secunda. The second Division.

1. *Alcea vulgaris sive Malva Verbenaca.* Fine cut or Vervaine Mallow.

The lower leaves of this Vervaine Mallow are soft and Greene, somewhat like unto the wild common Mallow leaves, but lesser and more cut in on the edges, besides the denting, but those that grow up higher upon the stalke, (whose barked may be broken into threds like hempe, and is sometimes as high as the ordinary wild kinde is) are more cut in and divided, somewhat like unto Vervaine: the flowers hereof are of a paler purple colour than the common mallow, but in most not so much divided into severall leaves, and laid so open, but abiding more close, or lesse spread, and without those stripes oftentimes, being smooth and somewhat shining: the feede and feede vessels are like the common Mallow, the roote also is long tough and white, but somewhat more wooddy within.

2. *Alcea vulgaris flore albo.* Vervaine Mallow with white flowers.

This Vervaine Mallow that beareth white flowers, doth somewhat differ in leaves from the former, for that they are more finely cut in on the edges, then it is; in the flower consisteth a chiefe difference also, which is white, yet tending alittle to a bluish: the feedes and rootes differ not.

3. *Alcea minor.* Small Vervaine Mallow.

There is a lesser kinde of the Vervaine Mallow, never growing so great or high, but alwayes abiding lower, like as the small Mallow doth: the leaves hereof, are more divided and cut in on the edges, and most usually into five parts, and deeply dented also: the flowers are purple like the ordinary Vervaine Mallow, but lesser, and that maketh the difference.

4. *Alcea minor villosa.* Small hairy rough Vervaine Mallow.

The small hairy Mallow, hath many very low and hoary stalkes, not above a foote high, divided into lesser branches, set with diverse small hoary hairy leaves, cut into three or more divisions: at the tops of the stalkes and branches, grow diverse large purple flowers, like unto the first, but every one standing in a hairy huske, almost prickly, after which commeth black feede, contained in those hairy husks, that bore the flowers, but more closely inclosed in them: the roote is of a pale browne colour, about the length of an hand, with small fibres hanging at it.

5. *Alcea Egyptiaca moschata.* The Egyptian Muske Mallow.

One sort of Egyptian Mallow I have, as I said, in the beginning of this Chapter set forth already, but this differeth from that in these particulars, both stalke and leaves, are all hairy over: the leaves are parted into seven or eight parts or corners; the flower is sharper pointed, more yellow, and as sweete as Muske, and so is the blacke feede also, but more neare unto Civet, which is like unto the feedes of Mirtle berries, but greater: the roote is great and fibrous; the whole plant is full of limie juyce, and of an herby taste.

1. *Alcea vulgaris*.
Fine cut or Vervaine Mallow.

Alcea vesicaria sive *Venera*.
Venice Mallow or Goodnight at noone.

Alcea pentaphylla.
Cinquetoile Mallow.

Sabdariffa seu *Alcea Americana*.
The Mallow of America or Thorny Mallow.

Alcea Egyptia vulgaris.
The ordinary Egyptian Mallow.

5. *Alcea Egyptia molchata Abelmoschus diflia.*
The Egyptian Muske Mallow.

Divisio tertia. The third Division.

1. *Althea vulgaris.* Common marsh Mallows.

Our common marsh Mallows hath divers soft hoary white stalkes, rising to be three or foure foote high, spreading forth many branches, the leaves whereof are soft and hoary, or woolly, somewhat lesser then Mallow leaves, but longer pointed, cut for the most part into some few divisions, but not deepe: the flowers are many but smaller then those of the Mallow, and white or tending to a blush colour, after which come such like round cases, and feede as is in the Mallow: the rootes are many and long, shooting from one head, of the bignesse of a thumbe or finger, very pliant tough and bending like Licoris, of a whitish yellow colour on the outside, and more white within, full of a slimie viscus juice, which being layd in water, will so thicken it, as if it were gelly.

2. *Althea Pannonica.* Marsh Mallow of Hungarie.

This Hungarian Marsh Mallow differeth not in rootes, stalkes or feede from the former, but onely in leaves, that they are somewhat harder in handling and in the flowers which are much larger and greater then those of Vervaine Mallow, and of a purple colour for the most part: yet there is some that beare white flowers as large as the former, and some that have not so large flowers as they, yet larger then those of the common kind.

3. *Althea rosea peregrina.* The strange Rose marsh Mallow.

This Mallow shooteth forth about May sundry round greenish soft branched stalkes, like the former marsh Mallow, beset with divers soft Greene leaves, and gray underneath, resembling the other but longer pointed: at the tops of the stalkes and branches stand severall white flowers, made of five large leaves a peece, somewhat like a Hollihock with a tuft of white threds, compassing a middle pointell, issuing out of a Greene button or huske, which is as it were ribbed and broad at the bottome, narrowing to the toppe before the flower blow, without any sent like the Hollihocke: all the stalkes die downe every yeare to the ground, the roote is thicke white and fleshy abiding safe in the earth all the winter.

4. *Althea semper virens Bryonia folio.* Ever green marsh Mallows.

This evergreen marsh Mallowe, hath many faire large whitish Greene leaves, somewhat thicke, full of veinēs and rough or hairy, but whitish or hoary underneath, cut in or divided into five parts usually, somewhat like a Bryonie leaf: the stalkes are hoary white and round, rising to be two or three foote high, having such like large leaves upon them, and smaller also among them, standing all of them upon long foote stalkes: the flowers are like unto those of the Mallows, and much about the same colour, consisting of five broad pointed leaves, having many red threds in the middle: after which come flat leaved heads, such as other Mallows have, wherein is contained such like small feede: the rootes are disperfed into severall parts under ground, and dye not, but retaine some of the leaves upon them all the winter, although the stalkes dye downe and perish to the ground.

1. *Althæa vulgaris*.
Ordinary marsh Mallow.

5. *Althæa lutea* sive *Abutilon Avicennæ putatum*.
Yellow marsh Mallow.

3. *Althæa rosea peregrina*.
The strange marsh Mallow Rose.

6. *Abutilon Indicum Camerarii*.
Camerarius his white Indian marsh Mallow.

7. *Althea palustris* Cytini flore. Red flowered marsh Mallow.

Althea frutex. Shrubby marsh Mallow.

5. *Althea lutea* five *Abutilon* *Avicenne* putatum. Yellow marsh Mallow.

The yellow Mallow or marsh Mallow riseth up with one soft woolly Greene round stalk for the most part, and seldome with more, divided oftentimes even from the bottome into divers branches: at every joynt stand severall large round leaves as soft as velvet, pointed at the ends, and dented about the edges, hanging downe at the end of long stalkes, which stand forth right; the flowers stand singly but one at a joynt with the leafe, which is small and yellow, composed of five small pointed leaves, standing in a small Greene huske, which being past, there succede soft Greene pods or seede vessels, turning blacke when they are ripe, composed of many small hornes or pods, set together like unto an head or seede vessell of *Fraxinella*, in every one whereof is conteyned small blacke roundish seede: the roote is not great nor long, but with divers fibres at it, and perisheth every yeare.

6. *Abutilon Indicum* Camerarij. Camerarius his white Indian marsh Mallow.

This Indian marsh Mallow riseth up with an upright straight hairy stalk, shooting from the joynts in divers places small branches, whereat likewise are set such like soft round and pointed leaves, as are in the last hanging downwards for the most part, at the end of long stalkes which are somewhat hairie also: the flowers stand in the same manner that the other doe, but are somewhat larger, and of a white colour, and yellow at the bottome, with divers threds in the middle: the roote is full of small fibres, and perisheth every yeare, in the like manner.

7. *Althea palustris* Cytini flore. Red flowered marsh Mallow.

The red flowered marsh Mallow sendeth forth many soft leaves, somewhat like unto those of the ordinary marsh Mallow, but not so soft or whitish, but of a pale Greene colour on the upper side, and whiter underneath longer also and dented somewhat deeper about the edges, standing upon long foote stalkes, among which rise up divers round Greene stalkes, three or foure foote high, bearing the like leaves on them at severall distances: from the joynts of the leaves towards the tops of the stalkes, and at the tops of them likewise come forth the flowers, consisting of five leaves longer and narrower then in other Mallows, not broad but pointed at the ends, of a deepe reddish purple colour, tending to an orange, and sometimes paler or mote delayed, and in some plants of a white colour, with divers threds standing in the middle, about a small Greene head, which in time becommeth the seede vessel, growing like the cod or seede vessel of the Birthwort, of a sad brownish colour on the outside, parting into five divisions, wherein lye small brownish seede: the roote is long, white and tough, somewhat like a marsh Mallow, but nothing so great, or Mucilaginous, that is slymie.

8. *Althea arborecens* Provincialis. Tree marsh Mallow of France.

This tree marsh Mallow is very like unto the Shrubbe Mallow, set forth in my former booke, but yet is not the same, differing in some notable points from it: for although the stemmes thereof are more woody then the former tree Mallow, yet are they not altogether so hard and woody as the shrub Mallow, but groweth much higher, even to a mans height sometimes, having many whitish hoarie leaves in the naturall places, but of a whitish Greene growing in our climate and not hoary at all, somewhat rough, broad and round, and not so long pointed as the Shrubbe Mallow, yet cut in into some divisions, and dented at the edges; at the toppes of the

the stemmes and likewise from the sides grow many flowers like unto those of the marsh Mallowes, but of as deepe a colour almost as the wilde mallow, yet smaller then those of the shrub mallow, after which come such like flat huskes and feede as the other mallowes give: the roote is great and woody, spreading many branches under ground, abiding long, and sometimes holding the stalkes, with the leaves upon them all the winter, the tops being cut off, yet sometimes also if the winter be over sharpe or it bee not planted or remooved into a warme place, or defended from the extremitie thereof, they will perish downe to the ground, but the next year fresh ones will arise againe from the roote.

9. *Althea fruticosa Cretica*, Shrub marsh Mallow of Candy.

The Shrub marsh mallow of Candy, in the second yeare after it is sowne riseth up with divers woody greene stalkes, covered over with much downe, or woollinesse, three or foure foote high, whereon grow hoary large leaves, cut into corners, and dented about the edges, ending in a point: the flowers grow at the tops of the stalkes, made of five leaves like mallowes and broad at the points, but of a fine delayed red colour, tending to a bluish, having a stile or pointell in the middle, compassed about with whitish threds, which flowers are nothing so great as the former, being not much bigger then the flowers of the ordinary marsh mallow, after which come such like round cafes and feede as they give: the roote is long, tough and white like the common marsh mallow, but more woody, and endureth divers yeares, shooting forth new branches in the spring.

The Place.

In the first division common Mallowes are knowne to grow every where: but that with a white flower is more rare growing not in very many places, but in Kent in diverse places, as at *Apsford* and at *Thrapstone* in *Norhamptonshire*, &c. and in diverse other places; the third is found under hedges and walls in many places; the fourth is oftner found upon hills: the fifth in *Spain*; the first tree Mallow groweth neere *Venice*, all along the *Tirrene* shore, and on the *African* shore also, in which places it abideth many yeare: Our owne Country tree Mallow, groweth in an Island called *Dimie*, three miles from *Kings Road*, and five miles from *Brislow*, as also about the Cottages neere *Hurst Castle*, over against the Ile of *Wight*. The eight was first brought from *Japan* I meane the feede, unto *Rome* or some parts of *Italy* where it was sowne; whose ripened feede afterwards was communicated into sundry Countries. The first of the second division, is very familiar in *Kent*, as in many other places of our owne Land, being in some places more frequent, than the common wilde kinde: it groweth in a field, as you goe to *Hamstead Church* from the towne; but the second which beareth a white flower, at *Westberham* in *Kent*, the third is likewise found in some places of *Kent*, the next two are sometimes found wild also with us. The fourth groweth at the foote of the mountaine *Iura* in *Helvetia* by *Savoie*: the fifth in *Egypt*. The first of the third division or marsh Mallowes groweth in most of the Salt marshes, from *Wolwich* downe to the sea, both on the *Kentish* and *Essex* shore: the second in *Hungary*; the third was brought out of *Africa* as *Cornutus* saith; the fourth is not knowne from whence; the fifth groweth in many places of *Italy*, in the wet grounds, neere unto lakes, rivers and ponds; the sixth is thought, to come from the Indies, but is more likely to be found in some places of *Italy*, it is so like the former, and sent by *Iosephus de Cassabone*, to *Camerarius*, who onely hath set out the figure thereof. The seventh *Camerarius* saith he found in *Italy* abundantly about the river *Amefis*, hard by *Angulara*, where men passe the river; The eight groweth in *Provence* of *France*, as *Lobel* and *Peaslay*, but in *Turin* among the *Swissers* as *Camerarius* saith, who hath set forth a figure, which is very likely to be the same as he saith, with that of *Lobel*; The last was sent to *Clusius* by *Iosephus de casa bona*, which he gathered in *Canada*.

The Time.

They all flower all the Sommer Monethes, even untill the winter pull them downe, yet the tree Mallowes and the tree marsh Mallow, and *Egyptian* Mallow, doe flower later than the rest; the yellow, the Indian, and red flowered Mallow, doe flower in the latter end of Sommer, yet to as if the yeare be not kindly, there is never seed gathered ripe from then; but from the tree and *Egyptian* Mallowes never with us, except that tree Mallow of our owne Land.

The Names.

It is called in Greeke *μαλάν* abemolendo ventre, yet it is written *μολών* in *Epicharmes* and *Antiphanes* copies; in the *Anulularia* of *Plantus* they are called *Molochinarii*, that dyed cloth into a purple colour, and *Lucius*, *Columella* hath this verse, which is not easily interpreted, except of the *Malva horacia*.

Et Moloches primo sequitur quæ vertice solem.

Tragus thinketh that he meant it by the lesser Mallow, and that it turneth his leaves and flowers with the Sunne; *Pliny* hath *Molope quasi mover*, which he referreth to the manured, and in Latine *Malva quasi Molva*, quod alvum molliat, in English Mallow quasi Mellow, either from the softnesse of the leafe, or from the softning of the belly and hard tumors, or peradventure from the Latine. The *Arabians* call it *Chubeze* and *Chuber*, and the feede thereof *Bizeri Chubeiz*, the *Italians* *Malva*, The *Spaniards* *Malvas*, the *French* *Mauve*. The *Germanes* *Pappel*, the *Dutchmen*, *Malwe*, and *Kerkens cruyt*. The Garden Mallowes, which we call *Hollibockes*, are called *Malva sativa*, *Malva Romana*, and by the vulgar in *Italy* in admiring the beaurie and varietie of their colours, *Rosa ultramarina* or *Transmarina*, beyond Sea *Roses*, and some also as the *Dutch* men doe Winter *Roses*, for that their beautifull flowers shew themselves, from the end of Sommer untill winter: *Αλκμα* in Greeke as also *Alcea* in Latine, is taken from *αλκμ* robur, *presidium*, quasi ceteris robustior & efficacior foret, saith *Lobel* and *Pena*; of the *Italians* *Bismalva* and so doe some in Latine call this quasi bis efficacior *Malva* (but others more truly referre this word to the *Althea*) and *Malva salvatica* and *buona Vischio*, of the *Spaniards* *Malva de Yngria* and *Malva Montefina*; of the *Germanes* *Symmaris wurtsel* and *Symons wurtsel*, that is *Radix Simonis* or herba *Simonis*, and of some *Malva Yngarica*: *Αλθαια* *Althea* in Greeke, quasi medica Latine dici posset, of the healing and remedying many diseases: it is also called *Ιβισκος* and *Ιβισκος*, *Ibiscus* and *Ebiscus*, and *Ιβισκος* *Hibiscus*, with the aspiration, as it is also of some Latine writers, of *Barbarus Arisfalthea* from the excellencie of the effects, of *Galen* it is called *Anadendromalache Malva arborea*, but that is thought more fitly to agree to the *Hollibocke*, which as *Theophrastus* saith, groweth in a few moneths to be so great, that the stalkes served as staves for men to walke with, and of some *Ollus Iudaicum* the Jewes pot-herbe: *Pliny* in his 19. Booke and 5. Chapter calleth it *Pastinaca*, for he

saith

saith it differeth from the *Paraspe* root, in being more small and slender, not to be used in meates, but good for medicines, and in his 26. Booke and first Chapter, he saith *Ibiscus* is like unto *Pastinaca* which sheweth a wonderful great error in him, that from the whitenesse, length and likenesse of the roote of *Althea*, unto the *Pastinaca*, would conclude it a *Paraspe*, without regard of other forme or qualities; of the Arabians *Chitini Chateni*, and *Rosa zamani*, and *Serapio* in one place *Alfiam*; of the Italians *Malvavisco*, and I thinke from them divers Latine Authors call it *Malvaviscus* derived as it were from *Malva* and *Ibiscus*, of the Spaniards *Malva-visco*; of the French *Guimaive*, of the Germans *Ibisch* and *Meiburtz*, or *Hufaurtz*, of the Dutch write *Huenst* and write *Malve*, wee in English call it marsh Mallow, from the place where it chiefly groweth in the salt marshes as I said before, or white Mallow from the colour of the leaves, and of some *Wimote*. The first of the first division is called of all *Malva vulgaris*, and of some *Malva sylvestris major*, of *Brunfelsius* *Malva Equina*. The third is called *Malva sylvestris* or *Agræstis minor* of most, and of *Lobel* and others *Malva sylvestris repens pumila*. The fourth is *Matthiolum* his fourth Mallow, which he calleth also *Hederacea* and *Montana*, but of *Lugdunensis* *Malva major tertia Matthioli*: the fifth is called by *Clusius* *Malva trimistris*, and of *Banbinus* *Malva folia vario*. The first of the three Mallows is called by *Matthiolum* *Malva major aërea* and *Arborea*, and so likewise of *Lobel*, of *Dodonæus* & *Camerarius* *Malva arborefcens*. The next never had any other author to expresse it before now we therefore call it *Noftras* or *Anglica*, the eight is called by *Baptista Ferrarius* in his booke *de floribus cultiva Rosa Sinenfis*, because he first received the feedes thereof from China but as he saith some called it *Malva Japonica*, others *Indica*, of the naturalls *Frijo*: I have as you see joyned it to the *Hollihocks*, and because it abideth greene alwayes like the tree Mallow, I have intituled it *Indian tree Hollihock*, if any thinke better to alter it, *per me liceat*. The first of the second division is called *Alcea* and *Alcea vulgaris* or *major* of most authors, but of *Anguillara* and some others it is called, *Canabis sylvestris*, and thought to be that of *Dioscorides*, he also calleth it *herba Pngarica*. The third is the *Alcea* of *Matthiolum*, *Tragus*, and others: The fourth *Lugdunensis* calleth *Alcea villosa Dalechampii*: the fifth is thought by *Pona*, in his Italian description of *Mont Baldus*, to be *Abutilon Avicenne*, which as he saith the *Egyptians* call *Abelmosch*, because of the sent like Muske, and saith that the *Turkes* doe counterfeite Muske with the feedes thereof, and contendeth that it is the true *Abutilon* of *Avicen*, and not the other that is so called; this is very like unto the *Alcea Egyptia*, shewed you here and in my former booke, but more hairy as I said in the description, and therefore *Banbinus* in his *Pinax* calleth it *Alcea Egyptia villosa*: The first of the third division is called *Althea*, and *vulgaris* of most Writers; yet *Cordus* upon *Dioscorides*, and in his History of Plants, calleth it *Malva palustris*, and *Gesner* in *hortis Germanie* *Malva agrestis genus*, of *Anguillara* *Malvaviscus*, of *Lobel* *Althea Ibiscus*, as is before said. The second *Clusius* maketh his *Althea Pannonica secunda*, as I thinke, but is his third in his History, according to *Banbinus*, who calleth it *Althea flore majore*, of *Camerarius* *Althea flore grandi Alcea*, & *Althea Thuringica*. The third, *Jacobus Cornutus* expresseth in his History of *Canada* plants under the same title here. The fourth *Banbinus* onely setteth forth under the name of *Althea frutescens Bryonia folio*. The fifth is called *Abutilon Avicenne* of *Anguillara*; *Matthiolum*, *Dodonæus* and *Camerarius*, of *Lobel* *Althea floribus luteis*; *Gesner* in *hortis Germanie* calleth it *Althea peregrina*, as also *Althea Theophrasti*; but *Pona* in his Italian description of *Mont Baldus*, contesteth against those that call it *Abutilon Avicenne*, saying that it is but an *Althea palustris*, with a yellow flower, in that *Avicen* attributeth to his *Abutilon* or *Arbutilon*, the leafe of a Gourd which he saith this hath not, and the fruit long, like a Medlar, (where as this is round) and not long; *Dodonæus* likewise contendeth that it cannot be the yellow *Althea* of *Theophrastus*, because the rootes of his *Althea*, will condensate water, which the rootes of this will not. The sixth, *Camerarius* who had the feede sent him, from *Joseph de casa bona*, chiefe Herbarist to the Duke of *Tuscanie* or *Florence*, by the name of *Abutilon Indicum*, doth so call it also, saying it may be referred to the *Althea*'s: the seventh is thought to be the *Sida* of *Theophrastus*, which he mentioneth in his 4. Booke and 11. Chapter, for *Camerarius* calleth it *Sida vulgo*, but *Dodonæus* is against that opinion; for in reciting the text of *Theophrastus*, he sheweth that *Theophrastus* maketh his *Sida*, to be an herbe growing within the water, and lifting up the leaves above the water, and bowing downe the head after it hath done flowering unto the water againe, which this doth not: some therefore thinke that *Theophrastus* meaneth the *Nymphaea lutea*, or yellow water Lillie, which hath the like propertie, and the rather because it is a water herbe as all know, and that *Theophrastus* mentioning those plants that grow in the famous lake of *Orchomenis* maketh no mention of water Lillies, which as it is thought, that lake is not without; the chiefe repugnancy may seeme to be in the colour of the flower, which yet he plainly mentioneth not, but not in the forme; *Dodonæus* therefore calleth it *Althea hortensis sive peregrina*, and *Lobel* *Althea palustris Cytini flore* as I doe, and *Banbinus* *Althea palustris*. The eight is that *Althea arborea*, that *Pona* and *Lobel* set forth to grow in *Provence* in *France* neere *Olbia*, and differeth from *Clusius* his *Althea frutex secunda* (set forth in my former Book) as he doth plainly shew in his History of plants, *Camerarius* calleth it *Althea arborefcens*, and so doth *Tabermontanus*, *Lugdunensis* entendeth the first of *Clusius* which hee nameth *Althea lignosa Dalechampii*, having round leaves and a white flower greater than the common *Althea*; for *Banbinus* maketh his fourth and fifth *Althea frutescens*, to differ from themselves, naming his fourth *Althea frutescens, folio rotundiore incano*, and referreth it to *Clusius* his *Althea frutex prima*, in his History of plants, which *Clusius* saith himselfe is not the same that *Lobel* calleth *Althea arborea Olbia*; but maketh his fifth *Althea frutescens, folio acuto parvo flore*, to be *Lobel* his *Althea arborea*, which *Camerarius* also doth acknowledge, calling it *Althea arborefcens*, yet *Lobel* would seeme to make them both one. The last is called by *Clusius* *Althea frutex tertia*, differing from both the former sorts, for *Clusius* there saith the feede came to him from *Candy*, and grew onely in his friends garden, to whom he imparted it.

The Vertues.

The young leaves both of the common and fine cut Mallowses, as also of the French Mallow and the garden Hollihocke, were in former times, and yet are in some countries eaten as a salliet herbe, to mollifie and open the belly, either greene or boyled, as *Martiall* the Poet testifieth in these Verses.

*Exoneratur alvum mihi vilica Malvas,
Attulit, & varias quas habet hortus opes.*

The leaves of any of the Mallowses, and the rootes also boyled in wine or in water, or in broth, with Parsly

or Fennell rootes, doth helpe to open the body, and some also apply the leaves warme after they are boyled, to the belly for the same purpose, and is very convenient in hot agues, and other distemperatures of the body; for by the mollifying quality, it not onely voideth hot cholericke and other offensive humors, but easeth the paines and torments that come by obstructions and constipation of the belly; and therefore they are used in all glisters conducing to those purposes: the same used by Nurses that give sucke to children, procureth store of milke in their breasts: the decoction of the seede of any of the ordinary Mallows made in wine or in milke, doth mervellously help all the diseases of the chest and lungs that proceede of hot causes, as excoriations, the pricke, plurisie, and the rest, if it be continued for some time together: the leaves and the rootes worke the same effects, let any one take which of them they thinke best, or most ready at hand, agreeing to their disposition: they helpe much also in the excoriations of the guts and bowells, and hardnesse of the mother, and in all hot and sharpe diseases thereof, as also the *Alcea fruticosa pentaphylla*: the juyce drunke in wine, or the decoction of them in wine, doth help women to a speedy & easie delivery: the common *Alcea* or Vervaine Mallow is thought to be most effectfull for burlings or ruptures, and the bloody fluxe, and also for the shrinking of sinewes and the crampe: the distilled water of them when they are in flower, worketh to the same purposes, but more weakly, yet it is much commended to be used in hot agues or fevers. *Pliny* saith, that whosoever shall take a spoonfull of the juyce of any of the Mallows, shall that day be free from all diseases that may come unto him; and that it is especiall good for the falling sicknesse. The syrupe also and conserve made of the flowers are very effectfull for the same diseases, and to open the body when it is collicke or bound, by accident or a naturall disposition: the young leaves are often eaten with salt as a sallet: the leaves bruised and laid to the eyes with a little hony, taketh away the impostumations of them, which by surffiance might grow to a Fistula: the leaves bruised or rubbed upon any place stung with Bees, Waspes, or the like, yea of the Scorpion, and the biting of the deadly Spider called *Phalangium*, and is said presently to take away paines, rednesse and swellings that rise thereupon, and keepeth them from stinking, if they be rubbed there with aloerhand; and as *Dioscorides* saith, the decoction of the leaves and rootes, helpeth all sorts of poyson, so as the poyson be presently voided by vomite; a pultis made of the leaves of Mallows, boyled and bruised, whereunto some Beane or Barley flower and oyle of Roses is put, is an especiall remedy against all hard tumours, and inflammations of impollumes and swellings of the coudes and other partes, and easeth the paines of them, as also against the hardnesse of the spleene or liver, to be applied to the places: the juyce of Mallows boyled in old oyle and applied, taketh away all roughnesse of the skinned, as also the falling of the haire, the scurfe, dandruffe, or drie scabbes in the head, or other parts, if they be anointed therewith, or washed with the decoction: the same also is effectfull, against the scaldings by water, and burnings by fire, and to helpe also the disease called Saint *Anthones* fire, and all other hot, red and painefull swellings, in any part of the bodie: the flowers of Mallows boyled in oyle or water, (as every one is disposed) whereunto a little hony and allome is put, is an excellent gargle to wash any sore mouth or thoroate, for it clenseth and healeth them in a short space; if the feete be bathed or washed with the decoction of the leaves, rootes and flowers, it helpeth much the defluxions of rheume from the head, which rose out of the stomack; & if the head be washed therewith, it stayeth the falling and shedding of the haire there of: the greene leaves saith *Pliny*, beaten with niter and applied draweth out thornes or prickes in the flesh. The *French* and curled Mallows, and the *Hollihocks*, are of the same nature and quality, and work to the same effect that the other do. The *Marsh Mallow* is the chiefeest Mallow, of all other, and most effectfull in all the diseases before specified, and therefore as I said before, it was called *Bismalva*, for that it was twice as good in effect as the other; the leaves are likewise used instead of the common Mallows, to loosen the belly gently, and are effectfull in decoctions of glisters for to ease all the paines of the body, opening the straight passages, and making them lubricke, whereby the stone may descend the more easly and without paine out of the reines and kidnies and the bladder, and to ease the torturing paines comming thereby; but the rootes are of more especiall use for those purposes, as well as for the diseases of the breast and lunges, as coughes, hoarsenesse of the thoroate and voyce, wheefings and shortnesse of breath, &c. being boyled in wine, or honied water and drunke: the rootes boyled in water very well, and after they be strained forth the decoction being boyled againe with Sugar to a iust consistence and thereof made into rowles or trochiscs, or the like, are a *Polybrefton* and much used for all the purposes aforesaid: the rootes and seedes of the *Marsh Mallow*, boyled in wine or water, is with good effect used by them that have any excoriations in the guts or the bloody fluxe, not so much by any binding qualitie in them, as by qualifying the violence of the sharpe cholericke fretting humors, that are the cause thereof, and by the sliminesse easing the paines and healing the sorenesse, and in some sort staying the further eruption of blood therefrom, at that time, or any other after: it is profitably taken of them that are troubled with ruptures, crampes or convulsions of the sinewes, and boyled in white wine for the impostumes of the thoroate, called the Kings evil, and of those kernells that rise behind the eares, and inflammations or swellings in womens breasts: the dried rootes boyled in milke and drunke, are specially good for the chin cough: *Hippocrates* used to give the decoction of the rootes, or the juyce thereof to drinke, to those that were wounded, and were ready to faint, thorough the expense and losse of blood, and applied the same mixed with hony and rosen unto the wounds: the rootes boyled in wine he gave also to drinke, to those that had received hurt by bruises or falls, or by blowes and stripes, to those that had any bone or member out of joynt, and to those that had any swelling paine or ach in the muscles, sinewes, or arteries of the body; it is good also to be used in all the ulcers and sores that happen in any cartilaginous place: The Mucilage of the rootes, and of linefeede and fenegreke put together, is much used in pultises, ointments, and plaisters, that serve to mollifie and digest all hard tumors and the inflammations of them, and to give ease of the paines in any part of the body: the seede either greene or drie, mixed with vinegar clenseth the skinned, of the morpew, and all other discolouring thereof whatsoever, being bathed therewith in the Sunne, the seede of the yellow Mallow hath bene tried (even as the seede of the *Marsh Mallow* hath bene also) to be of singular good effect against the stone, if a dramme, or a dramme and a halfe at the most being made into powder, be given at a time, and if the effect presently follow nor, let it be repeated the second time, or the third, and it will give helpe; it provoketh also urine, and easeth the paines that come thereof, and of the stone: it is used by the Turkes to procure rest and sleepe, as *Paludamus* saith: the leaves or juyce or powder of them, or of the seede, is used with good effect, to cleanse and heale greene wounds, by fodering up the lippes of them quickly: The rest of the Mallows doe participate of the properties of the common,

in that all of them have in some measure or other that clammy juyce that is in them.

CHAP. LXVI.

Melochia sive *Corchorus*. The Jewes Mallow.

The Jewes Mallow (for unto that family I referre it, both for some forme like thereunto, but more for the properties) is a small low hearbe, rising up a foote and a halfe high, from whose stalkes shoote forth diverse branches on all sides, whereon grow many leaves without order, up to the toppes, which are somewhat longer and broader than the leaves of *Bassill* some likewise shorter and broader, almost round, yet all of them pointed, and finely nicked about the edges, having at the bottom of each leafe, a small thred as it were on each side, which are of a little sowrish taste, the flowers come forth singly for the most part, but one standing at a place, every one upon a short foote stalk; consisting of 5 broad small pointed leaves, of a yellow colour, with some threds in the middle, which being past, there rise up slender long pods, somewhat like unto those of Swallow wort, which when they are ripe, open into five partitions, shewing within them small seede, somewhat like unto *Nigella*, but lesser, and of a blewish Greene colour: the roote is somewhat long, with many threds or fibres thereat, which perisheth every yeare.

The Place.

It groweth in *Asia*, *Syria*, *Egypt*, and those places abundantly, in the gardens where it is sowne, as also in many places of *Spain* and *Italy*, but the naturall place is not knowne: It is so familiar in *Egypt*, as *Alpinus* saith, that the salt or meales meate that is made without a dish thereof, being boyled in water or fresh broth, is not thought to be sufficient plentiful.

The Time.

It seldome slowreth with us in regard that our Summers are not hot enough to bring it to maturity, for having often sowed it, we could never have it grow above an hand high, the first cold ayre in the night causing it to perish quickly.

The Names.

It is called of most *Melochia* or *Molochia* of *Serapio*; it is thought by *Lobel* to be the *Corchorus* or *Corcorus* of *Pliny*, which he mentioneth in his 15 booke and 22 chap. but not that which he speaketh of in his 25. booke and 13 chap. which is that of *Dioscorides* and *Theophrastus* in his 7 booke and 7 chapter; for that is generally thought to be *Anagallis* or *Pimpernell*, as you shall heare when we come to it; *Rauwolfius* saith in his *Journal* that in *Syria*, *Egypt*, &c. they call it *Moluchi*, and is that *Olus Indicum* that *Avicen* speaketh of. *Matthiolus* thinketh that *Halimus* Sea Purslane is the *Melochia* of the *Moors* and *Arabians*, because it was usually eaten as a sallit herbe.

The Vertues.

It is as *Alpinus* saith in faculty very like unto the marsh Mallow, for it is much used to suppurate, digest, resolve, and mollifie all hard tumors in that the mucleage thereof is more slimie than that of the marsh Mallow, 2 drammes of the seede he saith is usually taken at a time to purge plentifully all sorts of humours: the decoction of the leaves is very familiarly used against dry coughes, hoarsenesse of the throate and voyce, and shortnesse of breath, and with sugar candy is a present remedie: the oyle thereof is used so familiarly by the *Egyptians* in their meales as *Alpinus* saith, and that they seldome eat without it, notwithstanding that it breedeth many obstructions, and the viscus nourishment that it giveth, though little, turneth into melancholy and other diseases.

Vnto this Classis also might be added diverse other herbes, some whereof are set forth in the foregoing, and others in the succeeding Classis, each as they doe more especially partake with that Tribe wherein they are placed, as *Epithymum* before, and *Pollipodie* afterwards, and diverse others also among the bulbous and tuberous rootes, set forth in my former booke, as *Daffodils*, *Sowbread*, &c. And thus have I shewed you not onely all the strong purgers, but many others that are but moderate, conducing or helping, to open or loosen the belly. And now it is meete that I convert my stile to another Classis, or sort of hearbes, which are those that are venomous, and deadly, or dangerous at the least; as also sleepe and hurtfull Plants, and after them with those that are *Alexipharmaca*, the Antidotes, or Counter-poysons, of poysonfull or dangerous Hearbes.

Melochia sive *Corchorus*.

CLASSIS TERTIA, THE THIRD TRIBE.

CHAP. I.

Aconitum Lycoctum. Wolfes Bane.

Have in my former booke given you the knowlledge and description of some of the Aconites or Wolfes bane, and therefore I shall not neede to describe them againe, I will onely recite them unto you, and so follow on with the rest: those already set forth are these, *Aconitum hyemale*, Winter Wolfes bane, *Aconitum luteum Ponticum precox*. The earlier whitish yellow Wolfes bane, *Napellus vernus flore caruleo*, Blew Helmet flower, or Monkes hood, and *Anthora*, the holosome helmet flower or counterpoysen Monkes hood; yet some of their figures I will insert among the rest.

1. *Aconitum Ponticum serotinum flore albido*. Late flowering Wolfes bane.

This late pale yellow or whitish Wolfes bane, hath as large leaves as the other, that I have set forth in my former booke, and divided into as many partitions, cut also on the edges somewhat deeply, but of a fresher Greene colour, and not rising or springing up out of the ground, for almost a moneth after the former is come up; the stalke with leaves thereon, riseth to be foure or five foote high, as the other doth, and with as long a branched head, of pale yellow coloured flowers, almost whitish, as it doth; but flowereth later by almost a moneth, than the other: the cods, feede, and rootes, differ not from the other.

2. *Aconitum flore Delphinii majus*. The greater leaved Wolfes bane, with Larkes heele flowers.

This Wolfes bane, hath diverse Greene leaves, rising from the roote, of a very sad or darke Greene colour, standing upon reasonable long foote stalkes, cut in on the edges, into five deepe divisions for the most part, even to the stalke, somewhat rough or hairy, each part whereof is also dented about the edges: from among which riseth up a reasonable great and strong hairy round stalke, about two foote high, having some such like leaves thereon, as grow below; at the toppe whereof is set many flowers spike fashion, one above another, which are fashioned somewhat like those of Larkes heeles but larger and thicker, with a short thicke crooked heele, behind them, of a very dead or sad blewish purple colour, seeming as if they were rugged or crumpled withall, which addeth a greater evill favourednesse unto them, on the outside, but of a little fresher or more lively blew colour, and smooth on the inside: after which doe come diverse small rough cods, standing together like as other *Aconites* and *Columbines* doe, wherein is contained a rugged blacke feede: the roote is somewhat thicke long and blackish, with diverse fibres and long stringes fastned thereunto, whereby it taketh strong hold in the ground: both stalkes and leaves dye all downe to the ground every yeare, and shoote forth new every spring.

3. *Aconitum flore Delphinii minus*. The finer leaved Wolfes bane with Larkes heele flowers.

The lesser Larkes heele Wolfes bane, hath diverse smooth Greene leaves, upon very long foote stalkes, but they are not altogether so large, or of so sad a Greene colour, and much more finely cut in and divided into many jagges or parts, than the former: the stalke also riseth not up so high, and beareth some smaller and finer leaves thereon, which endeth in a smaller spike or head of almost as large flowers, with a short spurte or heele behind, as the other, but of a fairer blewish purple colour, and more lively, as well on the outside as inside: the cods and feede are like the former, but the roote differeth having three or foure thicke short blackish rootes, ending in small long points, fastned together at the head.

4. *Aconi-*

1. *Aconitum luteum* Ponticum serotinum.
Late flowering Wolfes bane.

2. 3. *Aconitum flore Delphinii majus & minus.*
The greater and lesser Wolfes bane with Larkes heel flowers.

4. *Aconitum croticum minus* sive *Napellus minor*.
The small blew Helmet flower.

5. *Aconitum Lycostomum praecox.*
The early flowering Wolfes bane.

6. *Aconitum ceruleum autumnale*.
The harvest Helmet flower.

7. *Aconitum maximum coma mutante*.
Great Woolfes bane with a bending top.

4. *Aconitum ceruleum minus*, *sive Napellus minor*. The small blew Helmet flower.

The small blew Helmet flower riseth up with a round greene stalke, two or three foote high, whereon grow divers darke greene shining leaves, cut into five partitions very deeply, each of them somewhat cut in on the edges, very like unto the leaves of the greater blew Helmet flower, but that these are not so finely divided, and the divisions are somewhat broader: the top of the stalke is divided into two or three branches, each whereof beareth one flower, and seldome two or three, of a very faire deepe blewish purple colour, very like in forme unto the other great Helmet flower, but that the flower is smaller, and the crest of the Helmet riseth higher, then in that; after which come small pods like the other, and such like feede: the roote is round like a Bulbous, big below and small above, and encreaseth thereby, giving such like rootes, with smaller fibres thereat, then at the greater rootes.

5. *Aconitum lycoflonon precox*. The early flowering Woolfes bane.

The early Helmet flower or Woolfes bane riseth up very early in the spring, with many thicke shining darke greene leaves, cut into five divisions, and they againe somewhat divided or cut in on the edges, but not so finely as those of the greater Helmet flower, neither whitish underneath as they are, but rather of a paler greene on the underside and shining, as well as the upper side: the shining round greene stalke riseth not fully so high as the Helmet flower, being not much above two foote high, having divers leaves thereon, like those below, but smaller, and at the top but a few flowers, in comparison of the other Helmet flowers, but are like unto them both for forme and colour, being of a most brave, deepe blewish purple colour: after which come three pods, standing together for the most part, and no more, wherein lyeth such like round blackish seeds, as are in all the rest: the rootes are very like those of the greater Helmet flower, and encreaseth as much, by setting of sundry such like heads.

6. *Aconitum ceruleum Autumnale*. The Harvest Helmet flower.

This late flowering Helmet flower is very like also unto the smaller Helmet flower, rising as high and having such like darke greene leaves somewhat shining, divided in the same manner, but somewhat larger: the flowers grow in long spikes, of a faire blewish purple colour, the pods and feede are like, but the roote hath onely divers blackish strings or fibres, set at the severall tufts of heads, which are not Turnep like nor bulbous like, as the greater and lesser Helmet flowers are, which maketh the difference, besides the time of the flowering which is later then either of the other, that is not flowering untill August.

7. *Aconitum maximum coma mutante*. Great Woolfes bane with a bending top.

This great Woolfes bane hath very long and slender stalkes, even three or foure foote high, divided at the tops into sundry branches, with long spikie heads, of very large flowers, which for the weaknesse of the stalkes and the weight of the many flowers growing together, bow downe their heads: for the flowers are greater and larger then in any other Helmet or Woolfes bane flowers, and of a paler blewish purple colour, then in the Helmet flower: the leaves also are larger, and more divided then in any, except the lesser Woolfes bane,

Ec

with

Napellus Verus. The true Helmet flower.

Antbor. The counterpoison Monkes hoods.

8. *Aconitum purpureum aliud.*
Another purple Helmet flower.

Aconitum lychnal.
Winter Wolfesbane.

with Larkes heele flowers: the pods are greater and stand three or foure together, with larger rough blackish feede in them: the roote is thicke and long, somewhat like unto the rootes of the greater Helmet flower, and encreaseth such like heads by it in the same manner.

8. *Aconitum purpureum aliud.* Another purple Helmet flower.

This other purple Helmet flower hath larger leaves then the other, of a sadder Greene colour and shining withall, but incised after the same manner: the stalke likewise groweth very high, and often spreadeth into sundry branches, bearing large purple blew flowers in longer spikes then the other: the feedes and rootes be much like the other Helmet flower.

Aconitum hyemale. Winter Woolfesbane.

This is described in my former Booke.

Vnto these kinds of *Aconites* may be referred the *Anthora* or *Antithora*, set forth in my former booke, for that in the outward face and forme of growing, it doth so nearely represent them, that it made *Clusius* thinke it must also be of the same deadly quality with them; and although the name doth import it to be the remedy against the poyson of the herbe *Thora*, which shall be shewed in the next Chapter, and so might challenge to be rather inserted among the *Alexipharmaca*, Counterpoisons, yet because both it is as I said so like unto those former *Aconites* in the flowering, and yet is the remedy against the poyson of these *Aconites*, as well as of that *Thora*, I thinke it fitter to mention it here then there, and give you the figure and properties thereof likewise, among the vertues, although I have said somewhat of them formerly.

The Place.

None of these plants grow naturally wilde in our country that ever I could certainly learne, although Doctor *Penny* in his life time, seemed to affirme, that he saw some of their kinds growing on certaine hills in *Northumberland*: they all grow in woods and shadowie places in *Italy*, *Germany*, and other places.

The Time.

Some of these flower earlier and some later then others, according as their titles testifie; the rest flower in the end of *May* or beginning of *June*.

The Names.

It is called in *Greece* ἀκόνιτον *Aconitum*, ita dictum saith *Pliny*, quia in nudis cantibus nascitur, quas *aconas* narrant, ubi nullo iuxta ne pulvere quidem nutritur, which *Ovid* expresteth in the seventh booke of his *Metamorphosis* in these verses.

Que quia nascuntur dura vivacia cote

Agrestes *Aconita* vocant

Theophrastus saith it tooke the name ab *Aconia* ubi plurimum nascitur, Is autem vicus est *Peryandrinorum*, qui ad *Heracleam* Ponti est, which *Pliny* saith againe in his sixth booke and first Chap. *Portus Aconae veneno Aconito dirus.* But *Pena* milking these derivations saith, Aptior fuerit Nomenclatura interpretatio, si eam ab herba succo, vel radice, quibus quasi cote spicula a venatoribus afflicta & subacta, celerius subirent, & perneciem adferrent, quam si a cantibus, aut a pagis cognomine deducas: yet saith he possit etiam ἀκόνιτιον deduci, quemadmodum τοξικον ἀκόνι τοξικόν & non a taxo. For even so *Xenophon* in *Cyripedia* saith, ἡ δὲ γὰρ τοξικὴν, ἡ δὲ ἀκόνιτιον ἀνδρῶν καὶ τετραπόδων ὄντων. Neque enim jaculari neque in hominem collimare permittimus vobis: it is called *Lycostonon* & *Cynostonum* because it killeth Woolves and Dogs; in Latine *Aconitum* & *Luparia*, for the same causes: But the name of *Aconitum* was referred to many sorts of poysons, and poysonous herbes, one much differing in face, though not quality from another, as hath bene shewed before in the white Ellebor and others, and may be hereafter more as occasion shall serve; It is called of the *Arabians* *Chanach adip* or *ad b*, idest, strangulatorem lupi, of the *Italians* *Aconito* & *Luparia*, of the *Spaniards* *Terna mata lono*, of the *French* *Tue loup*, of the *Germans* *Wolfs wurtz*, of the *Dutch* *Wolfs wurtel*. The first kind here set downe is called by *Gesner* in *hort Ger.* *Aconitum primum flore albo.* *Camerarius* in *horto* under the name of *Aconitum Lycostonum* flore luteo distinguisheth both the kinds very well, saying the greater hath rhe largest leafe and fairest Greene colour and flowreth later then the other, it is thought to be the first kind of *Aconite* that *Matthiolus* giveth only the dumbe figure thereof: The second is called of *Clusius* *Aconitum Lycostonum flore Delphinii jmo.* *Silefiacum*; of *Camerarius* *Aconitum flore Delphinii*; of *Gesner* in *hortis Germanie* *Aconitum ceruleum aliud.* of *Bauhinus* *Aconitum ceruleum hirsutum flore Consolide regalis*; the third is the *Aconitum flore Delphinii* of *Dodonaeus* and *Lobel*; of *Dalechampius* *Aconitum Lycostonum ceruleum jmo.* flore *Delphinii* *Dodonaei*; it is probable to be the fourth *Aconitum* of *Matthiolus*. *Bauhinus* calleth it *Aconitum ceruleum glabrum flore consolide regalis*; the fourth is called *Aconitum Lycostonum tertium ceruleum parvum* of *Dodonaeus*, of *Lobel* *Lycostonum ceruleum parvum facio Napelli*; it is the tenth *Aconitum* of *Clusius*, who saith and so doth *Gesner* also, that is called in *Italy* *Thora Italica*, and of the *Chymistes* there herba tora; of *Bauhinus* *Aconitum ceruleum minus, sine Napellis minor*. The fift is called *Aconitum Lycostonum 4. Tauricum* by *Clusius*, and by *Bauhinus* *Aconitum violaceum seu Napellis secundus*. The sixt is the *Aconitum Lycostonum alterum* of *Dodonaeus*, and is the seventh *Aconitum Lycostonum* of *Clusius*, which he saith is called also *Autumnale*: The seventh is the eight *Aconitum Lycostonum comanum* of *Clusius*, *Bauhinus* calleth it *Aconitum inflexa coma maximum*; the last is called by *Clusius* *Aconitum Neubergerse* and by *Bauhinus* *Napellis tertius*. I call all these kinds Woolfesbanes and Helmet flowers, not onely for a distinction from the other sorts that follow (for all these are in face and forme of growing, and in leaves, rootes, flowers and feede one, not much differing one from another) but to shew you that it is even *Discozides* his distinction, who maketh this his *Aconitum alterum*, which he saith was called *Lycostonum* and *Cynostonum*, although his former *Aconitum* called *Pardalanches* did kill Woolves as well as this, and tha tsuch different herbes should not goe in English under one common name of Woolfesbane, whereby it should bee hard to understand in the naming of them what kind is meant.

The Vertues.

All these plants are poysonous and deadly to mankinde, to be taken inwardly any manner of way, as that feast, at *Amberpe* sheweth, where by ignorance the leaves of *Luparia* or *Napellis*, being put as a salter herbe with others, many that did eate thereof died, after the violent passions they endured for the time: it is also as deadly to Dogs, Woolves, and other creatures, who shall take thereof, either the juyce of the herbe or roote, or the herbe or roote it selfe, put into flesh, and given them to eate: in the juyce of the rootes especially, the hunters of wilde

beastes, doe use to dippe the heads of their arrowes they shoote, or darts they throw at the wilde beastes, which killeth them that are wounded therewith speedily; yet it is said that the flesh of the beastes so killed, is no whit poisonous but safe, and eateth more tender than of others of the same kinde, not killed in the same manner, so as it abide undressed for a day and a night. The ordinary physicaall remedies that is to be used for any that have taken of these herbes, is first to procure vomiting, with all the speede possible, to avoid as much of the evill substance that remaineth in the stomacke as may be; and secondly glisters, both to cleanse the bowells, and to draw the evill quality downwards that way: and thirdly preservatives to defend the heart and vital spirits from suffocation, or the bloud from putrefaction or congelation; which are effected by taking Mithridate, or rather Venice Treacle, which is more appropriate for poysons; as also to drinke the decoction of *Origanum*, *Rew*, *Horehound*, *Wormewood*, or *Wormewood wine*; as also *Southernwood*, *Chamaepitys*, or *ground Pine*, and *Gentiana*: a dramme of the true *Opobalsamum* taken with hony is much commended, and so is *Castor*, *Pepper* and *Rue*, of each a little quantitie taken in wine. Some commend also to drinke that wine, wherein iron, or gold, or silver, made red hot hath beene quenched. *Petrus Aponensis* in his Booke of poysons, commendeth the use of *Terra lemmia*, a dramme or two, thereof to be taken in warme drinke; but above all hee saith that *Aristolochia longa*, or the long rooted Birthwort, is the most especiall antidote or remedy against all *Aconites*: But behold the wonderfull goodnesse of God; who although he hath given to these plants so deadly faculties, yet hath he endued them also with other properties, very beneficiall to mans health: as that the juice or distilled water of *Aconitum Ponticum* of both sorts, dropped into the eyes, taketh away the inflammation or rednesse in them, as also cleareth them from any haw, or pinne or webbe, growing in or upon them. It is said likewise by *Pliny*, that if any be stung with a Scorpion, or other venomous Serpent, or have taken any other poison, that to take of this in warme wine will expell the other; for finding another enemy already possessing the part that he would worke upon, he striveth to overcome his malignity, and spendeth his force wholly upon it, and thereby freeth nature from ruine, (but this were a desperate cure for a desperate disease) and that by the touch onely of this *Aconite*, Scorpions are dulled, and restored againe by white Hellebor; how true this is I leave to every one to judge or trie as he shall thinke best himselfe: but certainly if either the rootes or seedes of these *Aconites*, or of the other *Helmet flowers* be beaten into powder, or the juyce of them boyled with oyle, or Hogges fat, and the head and body anointed therewith, it will kill lice and vermine breeding therein: the lye also wherein the leaves, rootes, or seedes, hath beene boyled, doth the same, and cleanseth the head also from scurfe and dandriffe, *Galen* saith that they are used in foule ulcers and sores, to consume the dead flesh, so as the sores be not in the mouth or privities, which by reason of their vicinity, to the spirits and life are not to be dealt with in such sort: and for the *Helmet flowers* (they are all thought to be of one nature, howsoever it is spoken but of one that is the more common) *Avicen* prescribeth an Antidote or remedy against the poison thereof, to be made with the Mousse that feedeth upon the roote of the *Napellus*, or *Helmet flower*, saying, that that Mousse is the Treacle thereof, and being taken in the whole substance, resisteth the venome of the *Napellus*, and freeth them from all danger; which Mousse *Matthiolus* saith he hath often found, and saith it is that which *Avicen* calleth *Napellus Mossis*, having the same propertie against the poison of *Napellus*, that the plant it selfe so called hath. *Petrus Aponensis* also saith, that this Mousse that feedeth upon the rootes of *Napellus* is the *Bezoar* against the *Napellus*, if it be dried and two drams of the powder given in drinke; but *Antonius Guainerius*, a famous Physitian of *Pavia*, in his Treatise of poysons thinketh that it cannot be a Mousse, that *Avicen* maketh mention of to feede upon the roote of *Napellus*, but that they are certaine great Flies that feede upon the flowers, whereof his Antidote is made that expelleth the poison. For hee there reporteth the industry of a certaine student in Philosophy, desirous to know the truth hereof, who sought diligently for this Mousse, but could neither find or see any, or that any rootes had beene eaten or bitten by any Mousse or the like thing, but found abundance of Flies feeding upon the leaves, which therefore hee tooke, and with them in stead of the Mousse he made an Antidote, which he found to be very effectually, not onely against other poysons, but chiefly that of the *Napellus* or *Helmet flower*: *Petrus Pena*, and *Matthiolus de Lobel* confirmeth this opinion, and experience of *Guainerius* his student by their owne triall also, who not finding any Mousse, nor hearing thereof by any the Shepheards, and others living in those mountaines of *Switzerland*, where the *Napellus* groweth in abundance, or that ever they had seene any Mousse to feede thereon, found as they say great store of certaine great Flies, with blewish Greene heads and wings, like unto *Cantharides* feeding upon the flowers, when as they could not finde any other living creature, to touch or eate it; the grasse every where being eaten by the cattle that fed thereby, but not any part thereof once touched. And therefore much suspected that this *muscus*, was mistaken by the *Arabians* for *muscus*, the Greeke word as well as the Latine, being so neare in letters the one unto the other; (for the roote of this *Napellus* killeth Mice as the name *Myosotonon* and *Myosophonon* doth import;) of which Flies as they say, and not of any Mousse, is made an antidote most prevalent against the poison of the most venomous Spider called *Tarantula*, as also against all other Epidemicall generall, or contagious diseases, and is made after this manner. Take twentie of the Flies that have fed upon *Napellus*, of *Aristolochia* and *Bolearmonicke*, of each a dramme, whereof a dramme is to be taken at a time, *Guainerius* his Antidote is to be made with *Terra lemmia*, Bayberies and Mithridate of each two ounces, xxiiiij. of the Flies that have fed upon *Napellus*, of hony and oyle a sufficient quantitie, to make it up into an Electuary: you may see hereby the various opinions and Writings of men, *Matthiolus* and *Aponensis* saying they have found and used the Mousse, that fed on the *Napellus*; and *Guainerius*, *Pena* and *Lobel* denying it, which whether is the truer, and more probable, is in part shewed before, and in this may be confirmed, that *Dioscorides* and others doe write, that the *Aconitum Lycostannum* (whereof *Napellus* is a kind and as strong) is also called *Myosotonon* or *Myosophonon*, that is *Muricida*, because it killeth Mice, as well as Wolves, and therefore they could not live upon it if it would kill them. The *Antihora* or Counterpoyson Monkes hood, is said by all Authors that it groweth, with or hard by the *Napellus* or *Thora*, although *Gerard* saith the contrary, and advieth that it be not planted neare the *Napellus* or *Helmet flower*, for feare of drawing the venemous qualitie thereof unto it. The roote is said by *Hugo Solerius*, to purge the body very strongly, of waterish and vicious humors, both by vomit and by the stoole, if the quantitie of a beane, be taken in broth or in wine: by reason of the exceeding bitternesse of the roote, it killeth all sorts of wormes in the body: it is also saith *Guainerius*, by mine owne experience and sight, as effectually as *Dillanum* unto all the purposes whereunto it serveth: the powder of the rootes taken in wine, is a most speedie and speciall remedie, against the winde collicke, which the *Savoyards* about *Diam*, where it groweth abundantly,

dantly, know very familiarly, and call it *L'herbe du machon*, that is, the wind collicke herbe, and suppose that it having two round rootes, the one will be full and solide one year, (as it is in the *Orchides* or *Satyrions*) and the other lanke, which changeth to be solide the next year; when the other that was firme in the former year, will then become lanke; that the sound roote will ease the winde chollicke, and the lanke procure it: the same rootes also used inwardly, is not onely the chiefe and principall Antidote or remedie, against the poyson of these Wolfes banes, and Helmet flowers; but of the Leopards bane, which shall be described in the next chapter, and all other poysonous berbes whatsoever: and against the venome of all serpents and other venomous beasts or creatures, and is also a most soveraigne remedy against the plague or pestilence, and all other infections, or contagious diseases, which raise spots, pockes, or markes in the outward skinne; by expelling the poyson from within, and defending the heart, as a most soveraigne Cordiall.

CHAP. II.

Aconitum Pardalianches seu *Thora*. Leopards bane.

F this sort of Leopards bane, there are accounted two severall sorts, differing in bearing more leaves, one than another, as also in the greatnesse of them, and of the whole plant, which yet might rather be attributed, to the fertility or sterilitie of the soyle, wherein they grow: but as they are remembered by others, so I must proceede also, and set them forth here unto you.

1. *Aconitum Pardalianches* seu *Thora minor*. The lesser Leopards bane.

The Leopards bane is a small low herbe, rising up with a small slender round stalke, little more than halfe a foote high, bearing about the middle thereof but one small stiffe or hard leafe, for the most part, but sometimes two or three one above another, and sometimes two together, which are round somewhat like the leafe of *Asarum*, but lesser, smooth, and of a blewish Greene colour full of veines therein, somewhat unevenly dented about the edges, not compassing the stalke, but standing from it, upon short footstalkes: the toppe of the stalke is divided oftentimes into two or three branches, with a small narrow leafe at the joint, and one smooth pale yellow flower at the toppe thereof, somewhat like unto those of *Cinquefoile* or five leaved grasse, consisting in many of foure, and in some of five round pointed leaves, with a small greenish head in the middle, which when their flower is fallen, groweth to be a small head, consisting of many small feedes set together, like unto the heads of diverse sorts of *Ranunculi*, or Crowfeete: the roote is composed of seven eight or tenne, small long round very white shining rootes, somewhat unevenly as it were branched out like knots or joynts in diverse places, plainly to be discerned in some, but in others not, being plaine and smooth, ending in a small long fibre, and all of

1. *Aconitum Pardalianches* seu *Thora minor*.
The lesser Leopards bane.

3. *Aconitum Pardalianches* *Dioscoridis Matibiale cum floribus*
Lugdunensis. *Matthioli* his named Leopards bane with flowers
added by *Lugdunensis*.

them fastened at the head thereof, like unto *Asphodill* rootes, of the most poisonfull qualitie, that hath beene found in any other herbe.

2. *Aconitum Pardalianches sive, Thora major.* The greater Leopards bane.

The greater Leopards bane, is in all things like unto the lesser, before described, but that it is greater, and riseth higher, having larger leaves, and finely dented about the edges, and two or three standing together about the middle of the stalk, some smaller than others, and sometimes one above another, and some small long and narrow ones at the joints and brancheth forth into two or three parts or more, bearing every one his small yellow flower, like the former: the seede and roote is also like the other.

3. *Aconitum Pardalianches Matthioli consentitum.* *Matthiolus* his fained Leopards bane.

I thinke it not amisse to set forth unto your view that figure of *Matthiolus*, which he (as is thought) caused to be drawne according to his owne fancie, taking his patterne from this *Thora*, and desirous to expresse it with some nearer resemblance unto *Dioscorides* his description, of *Aconitum Pardalianches*, hath set forth, with foure round rough leaves, and one long crooked roote, bunched out in diverse places, like unto the taile of a Scorpion, which figure bred a great contention betwixt *Gesner* and him; *Gesner* laying to his charge, that he had but fained it, and that there was no such herbe, in verum natura, because it was made so artificially, and wanted fibres, which all other rootes have, whereby they draw nourishment out of the earth. *Matthiolus* in his defence to that point alledgeth, that *Dentaria* which we call Lungworthe, hath no fibres, being a roote consisting onely of scales, as it were set together; as also in that other roote called *Dentaria bulbifera*, which as *Matthiolus* saith, the Germans call *Sanicula alba*, and he setteth forth among the *Symphyta*; but the Author of the great Herball printed at Lyons who was *Ioannes Molinæus* and going under the name of *Dalechampius*, but of most writers called *Lugdunensis*, taketh upon him the defense of *Matthiolus* his finceritie in his appendix to that generall history, and sheweth the same figure of *Matthiolus*, with a stalk of leaves and flowers added to it, which the former wanted, and with all giveth the description thereof in this manner; it riseth up faith he early in the yeare, if the spring be milde, with his stalk, before any of the lower leaves appeare, as the Coltes foot and the Butterburc doe; having foure small round hairy leaves upon the stalk, set by couples at distances; the flowers are many growing in a tuft, or round head together at the toppe thereof, of a pale yellow colour, with many yellowish threds in the middle: when the flowers are past, then commeth up the leaves, which are foure for the most part, and are almost round, hairy and Greene on the upper side, and hoary white underneath, full of veins running through them, and full of small spots: the roote consisteth of many knots and joints like unto a Scorpions taile, in the same manner as *Matthiolus* hath set it forth in his figure: this he saith groweth on the Alpes of *Savoie*, not farre from the chiefe Monastery of the *Carthusians*, in a rough rockie place, which they call, *Les Escheles*, that is, the ladder, because the way of the rocke, is cut out into steppes, to get up to the toppe: and saith that this he saw with his owne eyes, and that an Apothecary of *Trevers*, who had diverse plants growing thereof in his garden, and abiding many yeares, from whom he obtained the whole plant to set forth, to end the controversie betwene two such worthy men; and yet this figure is much suspected also to be but counterfeit, by *Columna* in the 44. page of his *minus cognitarum stirpium*, & by *Bauhinus* and many others: but if I might shew mine opinion, I would rather thinke that *Matthiolus* set forth his figure a little artificially from the *Doronicum brachiatæ radice* which hath round leaves and such a like roote: if I be mistaken let it be accounted my error.

The Place.

The first groweth in shadowie places, on the snowie hills in *Savoie*, where there is scarce any crust of earth for the rootes to grow in, neere unto *Alura*, and in the toppe of *Iura*. The second groweth in the like places, among those Alpes of the *Valdenses*, that respect *Italy*, called *Vinderflumen* and *Engromia*, as also upon the mountaine *Baldus*, which is not farre from *Verona*; the last his place is declared in the description.

The Time.

They all but the last doe flower in June, and Iuly, which are the spring Moneths of the Alpes, and their seede is ripe in August.

The Names.

It is called in Greeke by *Dioscorides* ἀκονίτιον μαγδαλινης, *Aconitum Pardalianches*, because the herbe killeth Leopards, Wolves, and all other foure footed beasts very speedily. It is called of diverse also *Thora*, from the Greeke word θορη, that is, corruptio, venenum aut mors. *Theophrastus* describeth it in his ninth Booke and ninth Chapter, under the name of *Thelyphonon*, because it is a speedy death to females; or because being put into the secret parts of females, it speedily killeth even within a day. *Gesner* and others take it to be *Limeum* of *Pliny*, in his 17. Booke and 10. Chapter, which he saith is an herbe so called by the *Gauls* wherewith they doe make a medicine, to dippe their arrow heads in, when they hunt wild beasts, which they call *Cervaria*: *Gesner* saith also it was called of some in his countrie, *Lunaria*, because the leaves were round like unto a full Moone, himselfe calleth it *Thora Venenata* and *Toxicum Valdensium*. *Clusius* maketh it to be his third *Ranunculus grumosa radice*, and *Lobel* calleth it *Phthora Valdensium*. *Matthiolus* in contempt of *Gesner* calleth it *Pseudo aconitum Pardalianches*, as though it were but a base kind of *Aconite*, without force or vertues, (which it seemeth he rather uttered in the heate of his contention, and contestation with *Gesner*, who alledged that this was the truer *Aconitum Pardalianches* of *Dioscorides* than in the truth of the matter) it being the nearest to *Dioscorides* his description in all other parts as well as in the rootes which are shining white like *Alabastr*, and the strongest and speediest poison of all manner of herbes. It may be called in *English*, either round leaved Wolves bane, or Leopards bane to distinguish it from the former.

The Vertues.

Dioscorides giveth no other properties to this kinde of *Aconite*, then death to all foure footed beasts, being given to them in flesh, besides the helpe it giveth to the eyes in easing their paines, being put with other things that are for that purpose: *Theophrastus*, and *Pliny* after him say, that it is a remedy against the Scorpion, being taken in warmed wine, for it killeth nature if it finde not an enemy in nature, whom it may kill, against whom it strive and spendeth its strength, to overcome it, that it might free nature of danger, thus saith *Pliny*: it was called *Scorpio* because the roote was like a Scorpions taile, it seemeth also it was upon the like occasion called *Therionophanon*, because it killeth Serpents; for they say, that the Scorpion is a stoned, and looseth both strength and motion, being

being onely touched with the Aconite; and receiveth life and strength againe, if it bee touched or rubbed with white Ellebor. It is found by most certaine experience, that it is the fiercest and speediest poyson, surpassing all other, that groweth on the ground; and that they used to say in the former times, there was not found any remedie against it, although many things had bene tryed, but of later times the industry of man, hath found out his Antigonist or Counterpoyson, which is the *Anthora* before declared. *Gesner in Libro de Lunaria*, reciteth that if a sword, dart, or arrow, be but touched with the juyce thereof, and therewith either man or beast wounded, that any blood be drawne, the malignity thereof so quickly pierceth inwardly, that it presently killeth, corrupting and congealing all the blood, unlesse that part round about the wound be instantly cut away, and that it killeth any wild beast so wounded, after three or foure leapes or springings, but (that which is more wonderfull in my opinion) he saith that the flesh of that beast so killed, is not deadly or dangerous to any that shall eate thereof: therein peradventure like the baite that is given to fish, to make them lye on the toppe of the water, easie to be taken with ones hand, and yet not hurtfull to be eaten, and *Pliny* saith it killeth fish, whereby as hee saith it is knowne, that that poyson is an enemy to the blood. For he saith, that if any blood should fall into the pot, where this poyson is kept, it will presently loose its strength. It is said also that it is so pernicious, that if it be but held in the hand a little time, it will almost take away the senses; as also, that one but smelling thereto, after he had gathered it fell downe as dead, and with much a doe was recovered.

CHAP. III.

Doronicum five *Aconitum suppositivum*. The supposed Wolfes bane.

Doe adjoyne this hearbe *Doronicum*, next unto the Wolfes banes, because many doe hold it a kind thereof, which how true or false you shall heare by and by in his place. Of this kinde there are found diverse sorts, differing either in rootes or leaves one from another, and some for the likenesse, or flowers, or manner of growing, are referred unto them, as shall be presently declared.

1. *Doronicum vulgare*. The most common supposed Wolfes bane.

The most common *Doronicum*, (that hath bene longest known unto us, and kept in our gardens, many of the rest being found of later yeares) hath diverse leaves rising from the roote, every one standing upon a long foote stalk, which are somewhat round, greater than the Romane Sowbread leaves, soft and gentle in the handlig, somewhat hayrie and of a fresh Greene colour; from among which riseth up diverse Greene roundish stalkes about a yard high or more, parted at the toppe, sometime into one or two branches, every one carrying a large flower, somewhat like the Corne Marigold, but much larger, having many narrow long yellow leaves, as a border set about a middle thrumme, somewhat yellower, which when it falleth away, turneth into small whitish downe.

1. *Doronicum vulgare*.
The most common supposed Wolfes bane.

2. *Doronicum minus*.
The lesser supposed Wolfes bane.

3. *Doronicum brachiatum* radice.
Scorpion rooted supposed Woolfesbane.

with very small blackish seede, which is carryed away with the winde: the rootes are small, thicke and short, creeping or lying under the upper crust of the earth, with divers small fibres, shooting from them downe into the ground and increasing divers such like tuberous rootes round about it, which are tender and not hard, somewhat whitish and with some joynts therein, and greenish on the upper side next unto the upper face of the ground: Some would make these rootes to resemble a dead Scorpion, because of the joynts, which are like scales therein; the former part next the leaves, being thicke to be the body, and the other part, being small to be the taile, which is somewhat sweete in taste, and a little bitter, with some austere clamminesse joynted therewith.

2. *Doronicum minus*. The lesser supposed Woolfesbane.
The lesser *Doronicum* hath divers leaves, longer and narrower, then the former, somewhat like unto Ribwort Plantaine, but hairy and of a yellowish Greene colour; the stalkes are slender and rise nothing so high, nor are much branched, but carrying the like yellow flowers as the former, somewhat paler: the roote is small not like the former being without those joynts so plaine in them.

3. *Doronicum brachiatum* radice. Scorpion rooted supposed Woolfesbane.

This Scorpion rooted *Doronicum* hath large round hairy leaves, like the first, somewhat waved or unevenly dented about the edges, of a sadder Greene colour and somewhat bigger; the stalkes have divers narrower leaves thereon, the flowers are yellow and the leaves thereof dented at the ends, the seede is like unto the other, but the roote creepeth not so much, but is somewhat longer thrust downe into the ground, with joynts growing upwards, branched as it were on each side with young rootes, and ending in a small point, with divers long fibres set unto them.

4. *Doronicum Austriacum angustifolium*. Small supposed Woolfesbane of Austria.

This small *Doronicum* of Austria hath fewer leaves then the second, but soft, long, narrow and hairy like them, Greene and somewhat shining on the upper side, and of a paler Greene underneath of a sharper biting taste: the stalke is shorter then it, hairy also but smooth, and striped all along; whereon are set divers narrower leaves, compassing it at the bottome, up to the top, where there standeth but one large flower for the most part, like unto the other *Doronicum*, but of a deeper yellow colour, which turneth into downe, with small blacke seede therein, and carryed away with the winde, in the like manner: the roote is small and joynted somewhat like unto it, but not increasing so fast, with divers long fibres thereat.

5. *Doronicum humile Stiriacum Clusii*. The low Stirian supposed Woolfesbane of Clusius.
This low *Doronicum* hath many large and somewhat round leaves, dented about the edges like unto the third sort before expressed, standing upon high footstalkes: the stalke is lower then it, having some leaves thereon longer and narrower then those below, and at the top (not having any branches) one flower larger then any of the former, but else like unto them, with many long yellow leaves, set about a middle brownish yellow thrum: the roote is somewhat long, blackish on the outside and joynted but not plainly to be discerned, the joynts rising upwards, and not downwards as they doe, in most of the rest, with some other rootes growing from it, and having many long white fibres underneath it.

6. *Doronicum Germanicum*. The supposed Woolfesbane of Germany.
The *Doronicum* of Germany hath divers broad hairy leaves, of a yellowish Greene colour on the upper side, and whitish and smooth underneath, lying on the ground somewhat like unto broad Plantaine leaves, or rather like unto the Crosswort *Gentian*, having some long ribbes therein: among these leaves riseth up a stalke, and sometimes many, bearing long leaves, at every joynt; at the top it brancheth forth into two or three or more parts sometimes, bearing every one a faire large flower, set as it were in a rough cup, which consisteth of many pale yellow leaves, dented at the ends, as a pale or border about the middle, which is made of many small flowers, of foure leaves a peece, of a deepe yellow colour, as it were the thrum; (*Bauhinnus* saith that there hath a sort hereof beene found in *Stiria*) with blew flowers, which being past, the head turneth into downe, and is carried away with the small blackish seede therein: the roote is small, yet joynted like the former sorts, but not so plainly to be discerned, of a sweete sent and a bitter biting taste, having many fibres underneath it, and giving many of sets, whereby it is increased.

7. *Doronicum maximum Austriacum*. The greatest supposed Woolfesbane of Austria.
This great *Doronicum* of Austria shooteth forth many faire Greene leaves from the roote, lying round about it, which are broad, hairy, rough and somewhat round pointed at the ends, every one standing upon a long footstalk: but those which are set upon the stalkes, which rise three or foure foote high or more, are larger and longer then those below, set without order, and compassing it at the bottome like Tobacco leaves, all of them a little unevenly dented about the edges: the flowers upon the toppes of the leaves of the severall branched stalkes, are large and yellow like unto the common *Doronicum*, which after they are past, the greenish seedes that lie among the downe, are conveyd both away together with the winde: the roote is thicke and joynted like the rest, spreading as much as any other.

5. *Doronicum humile* Stiriacum Clusii.
The low Stirian suppoled Woolfes bane, and the *Doronicum*
rootes of the Apothecaries shops.

7. *Doronicum maximum* Austriacum.
The greatest suppoled Woolfes bane of Austria.

6. *Doronicum Germanicum*.
The suppoled Woolfes bane of Germany.

10. *Doronicum Americanum*.
Suppoled Woolfes bane of America.

8. *Doronicum Helveticum incanum*. The hoary Helvetian supposed Woolfes bane.

The hoary *Doronicum* of Helvetia, riseth up with a round hollow greene stalke, a foote high or more, bearing thereon divers leaves somewhat longer and more pointed, then those that grow next the ground, some whereof are round, and others long and round, yet all dented about the edges, of a pale greene colour on the upper side, with a white rib in the middle, and of a meale hoariness underneath, as the footestalke is also: the flower is great and yellow that standeth at the top of the stalke, with many long narrow leaves, not dented at the edges, but smooth compassing the middle thrumme: the seede is carried away with the downe, like unto others: the roote is small, joynted, and as it were scaled like the rest.

9. *Doronicum Helveticum humile*. The low supposed Woolfes bane of Helvetia.

This low *Doronicum* of Helvetia or Switzerland, hath many thicke, darke, greene, hairy leaves, and of a paler greene underneath, lying next the roote being somewhat long and round and dented about the edges; from among which riseth up a short hairy stalke, not halfe a foote high, with very long and narrow leaves set thereon, parted at the toppe into two or three small branches, bearing yellow flowers, of a meane size or bignesse like unto the rest.

10. *Doronicum Americium*. Supposed Woolfes bane of America.

This strange *Doronicum* hath divers very large leaves next the ground somewhat rough and hairie, divided into five parts, each part being five or six inches long, and two inches broad, pointed at the ends, and deeply dented on the edges into three parts: from among which riseth up sundry smooth round stalkes set with the like leaves, but somewhat lesser and lesse divided, and some little or not at all: at the top of every stalke standeth one large yellow flower like unto the former, the bordering leaves being long and narrow, and the middle thrum blownish, and made as it were of many flowers set thicke together: the roote is great thicke and hard, fastned with many long strings, I have here given you two figures thereof, the one taken by us, the other by the French.

12. *Radices Doronici vulgo officinarum*, & *Radices Mechinii rarisioris Lobelii*, pro *Doronicum genuino Arabum* a Pona exhibitæ. The Apothecaries *Doronicum*, and the true one of the Arabians as Pona thinketh.

I have here likewise particularly given you the figures of the rootes of two sorts of *Doronicum* as they are supposed to be, the formost generally received by all or most both writers & Apothecaries for their medicines, whose description is set downe before: the other Pona in his *Italian Baldus* setteth forth supposing it to be more probably the true *Doronicum* of the Arabians then the former, which doth not agree thereunto either in forme or quality, for *Avicen* in the 200. Chap. of his second Booke, and *Serapio* in the 325. Chap. of his Booke of simples have described their *Doronicum* to be a roote of the bignesse of ones thumb, of a hard and heavy substance, of a yellowish colour on the outside and browne within, with some white veins, and is hot and dry in the third degree: thus *Serapio*, but saith Pona, I know no other roote more properly doth represent that *Doronicum*, then this sort of *Mechinus*, which is often found among the *Mechinus* or blacke Ginger, that is brought us chiefly from *Brasil*, which *Lobel* calleth *Mechini rara varietas*, having divers circular knotted lines as it were like joynts on the out-

10. *Doronicum Americium*.
The supposed Woolfes bane of America. 12. *Doronicum antiquorum Pona*.
Lobel his rare varieties of *Mechinus* and the Arabians *Doronicum* by Pona.

side, and is firme and heavy full of white veines therein when it is broken: it is also very sharpe, quicke, biting and aromaticall in taste, and therefore saith he, having all the notes of their *Doronicum*, it can be no other then the true and legitimate *Doronicum*, from whom the reasons being so pregnant, I know not well how to dissent, yet leave it to others to judge as they shall finde cause.

The true rootes of the *Doronicum* in the Apothecaries shops are misset, which should have beene in this table, but are expressed in the fifth figure.

The Place.

The first groweth on the hills in *Savoy*, beyond the lake *Lenanus*, and in other places, both of *France* and *Germany*: the second groweth not farre from *Burdeaus* in *France*. The third on the wooddy hills about *Trent*, and in *Austria* also as *Clusius* saith: the fourth *Clusius* saith he found on divers hills in *Austria*. The fifth likewise about *Newberg* in *Styria*. The sixth is found in many places of *Germany*, in the medowes and elsewhere, and as it is thought, on the hilly grounds in *Northumberland*. The seventh groweth in many places, both of *Austria* and *Hungary*, as *Clusius* saith: the eight upon the *Alpes* in *Switzerland*: the ninth also on the same hills about *Valga*, and the last came from the *French* colony about the river of *Canada* and nourished up by *Vespasian Robin* the *French* Kings Herbarist at *Paris*, who gave *Mr. Tradescant* some rootes that hath encreased well with him and thereof hath imparted to me also.

The Time.

They all flower early for the most part, that is in *May*, and some of them in the *Autumne* againe.

The Names.

The name *Doronicum* which is given to all these plants is derived from the *Arabian* *Doronigi* or *Durungi*, for it is not remembred by any of the ancient Greeke or Latine Authors, except *Altuarius* who calleth it *Carnabasion*; divers have accounted it among the *Aconites*, as *Matthiolus* (calling it *Pardalianches*, and referreth it to *Pliny* and *Theophrastus* their *Aconites*, whose rootes are like *Scorpions*, as the outward face or forme of these are, which bred the suspition; when as the properties of these are not like their *Aconites*, to kill wilde beasts speedily with their Darts, or Arrows dipped in the juice thereof; or to be a caustlike herbe, able to eate away the flesh of a wound, and cause it to fall away:) who having received it from *Cortusius* of *Padoa*, desamerth it to all the world, to be a poyson not fit to be used inwardly in mans body, and that those Physitians that follow the *Arabians* to put it into Cordiall medicines, doe very ill, and little respect the health of man, because both as *Cortusius* writeth unto him, and himselfe upon tryall made as he saith found to be true, that it will kill dogs, the rootes being given them in flesh, which report of theirs how soever be true in dogs, may notwithstanding be not true, being given to other beasts, and may be safely given and without danger to men: for divers things that are wholsome to man, and which we often use without scruple, or doubt of danger, as *Aloes* and bitter Almonds, yet given to a Fox, either of them will quickly kill him, as *Plutarch* reporteth; and the *Cameleon* Thistle as *Fabius Columna* setteth it downe, will kill dogs and swine, &c. and yet is a most soveraigne Antidote against the poyson of Serpents, the roote being drunk in wine, and besides killeth the wormes in children without any further harme, as also even Muske, Saffron, and other things being taken in two great a quantity will kill any man: others hold them to be wholsome, as it hath beene certainly and often found true by good experience, that divers of these sorts are very effectfull to helpe many diseases in men, as you shall heare by and by, and therefore it is not probable, that there lyeth any venomous quality hid underneath those good ones; and besides, *Gesner* saith that he had taken much and often thereof, and had given it to others without any danger or harme; and *Pena* and *Lobel* reporteth that *Iohannes de Vroede* did eate many rootes thereof without any danger, or sense of paine thereby: and therefore doth advise others, not to abdicate the plant wholly from mans use, nor to discredit such famous *Arabian* authors, that have appointed it to be put into *Electuarium de gemmis*, *Electuarium ex Aromatibus*, and *Diamoschum dulce*, and others, as the most Cordiall medicines of all other, and whereof there was never harme taken whosoever did use them, or to say that any that followed their prescriptions, were guilty of the death of any man. *Dodonaeus* was also of the same minde with *Matthiolus* for a while, but afterwards found his owne errour and reclaimed it; but it is much doubted, whether this be the *Doronicum* of the *Arabians* or no; for *Franciscus Pona* in his Italian description of *Mont Baldus*, as I said before, refuseth it, accounting it an auncient received errour, and therefore giveth us the figure of *Lobels Mechinus*, for the true *Doronicum*, the faculties of these being quite contrary to their *Doronicum*, for besides a little sweetenesse and clammy taste in the roote; it hath little or no other taste, except that being fresh, some of them have an aromaticall, and some a bitterish sweet taste, like unto juice of *Licoris*: but the roots of this *Mechinus* are of an aromaticall, sharpe & biting taste: the joynts in the roots of the ordinary *Doronicum*, very likely might cause the later age of the world to erre, in taking it to be the right: but leave we these controversies, and attend the varietie of names and properties of these sorts of *Doronicum*, which may better perswade us of the good to be reaped from them: The first is as I said, the most common, both in the Gardens of our country and others, and is most usually called *Doronicum Romanum* of all writers, or with a sweete roote. The second *Clusius* and others call *Doronicum minus* and *Angustifolium*, *Bauhinus* calleth it *Doronicum plantaginifolium*. The third *Matthiolus* calleth *Aconitum Pardalianches* *Plinij*, *Dodonaeus* *Pardalianches alterum*, *Pena* and *Lobel*, *Doronicum Brachiataradice*; but *Clusius* setteth out the figure more truly, & calleth it his second *Doronicum Austriacum*. The fourth is *Clusius* his first *Doronicum Austriacum* sive minus, and *Bauhinus* *Doronicum longifolium hirsutie asperum*. The fifth is *Clusius* his fourth *Doronicum*, which he calleth *Striacum*, and *Bauhinus* *Doronicum latifolium flore magno*. The sixth is called diversly, by divers; *Matthiolus* calleth it *Alysma* or *Damasonium*, and thinketh it to be the right *Alysma* of *Dioscorides*, and so doe *Camerarius* and *Gesner*, (who calleth it also *Caltha Alpina*) *Pena* and *Lobel* call it *Nardus Celtica alpera*, as *Rondeletius* did take it to be. *Lugdunensis* setteth it forth under the name of *Piarmica montana*, as divers did call it thereabouts as he saith, and yet setteth it forth againe under the title of *Alysma Matthioli*. *Gerard* likewise hath set it forth in two severall places, under two severall titles, the one under *Calendula Alpina*, the other under *Chrysanthemum latifolium*. *Clusius* calleth it *Doronicum Germanicum*, and saith his *Pannonicum* or *Doronicum sextum*, is the same or very like, for both he and divers others doe set it forth, with smooth, and hairy leaves, also as it is found so growing in divers and sundry places. The seventh is *Clusius* his *Doronicum Austriacum tertium*, which *Bauhinus* calleth *Doronicum maximum foliis caulem amplexantibus*: The eighth and ninth

Bauhinus

Bauhinus setteth forth in his *Prodromus* and *Pinax*, under the same titles they doe here beare: the tenth *Robinus* of *Paris* called *Aconitum Americanum*, and *Cornutus* *Aconitum Helianthemum Canadense*; but the upper leaves on the stalks, with the flowers and roote, declare it to come nearer to the sorts of *Doronicum*; the last are as the titles declare them. They may all be called in *English*, either *Doronicum* according to the *Latine* name, for so doe both *Italians*, *Spaniards*, *French*, *Germanes*; and *Dutchmen*; or as I have entituled them supposed Wolfes banes, both that the name may differ from the former Wolfes banes, and to give you to understand that they are but supposed to be dangerous; because as I said before the outward forme of the rootes, like unto Shrimpes or Scorpions, and the leaves round like unto the leaves of Sow bread or Cowcumbers, have caused many to thinke them to be the *Aconites* of *Theophrastus* and *Dioscorides*; but *Columna* hath treated very learnedly hereof in the 18. Chapter of his Booke of Plants, whereunto I referre you, for it were too tedious, to relate his sayings in this place.

The Vertues.

The true *Doronicum* is said to be a soveraigne Cordiall, and to resist the poyson both of beasts and other deadly medicines, to cleanse the breast and to helpe the cough, and to rid those humors, that cause paines in the sides: but our *Doronicum*, although it be not the true of *Serapio* and *Avicen*, yet it is no *Aconite*, as *Matthiolus* and others have supposed; for as is before said, both *Gesner* tooke it often, and a good quantitie at a time, even two drammes in powder, that he might find the operation of it, yet found no harme thereby; and *Vroede*, as *Lobel* faith tooke of it many times, without any harme; but what especiall good they found by it, is not remembered, for *Gesner* maketh not any mention thereof: yet the iuyce thereof is found to be good, for those eyes that be hot and red, and full of paine, by reason of hot and sharpe rheumes, falling into them, to allay the heate, to take away the rednesse, and to give ease of the paines and prickings in them. *Clusius* faith that the hunters, and shepheards that live in the mountaines of *Austria*, doe no lesse use and commend the rootes of the third and fourth sorts, here set forth, (which grow with them more frequently, than the others, at the least best known unto them,) then they doe the rootes of the yellow *Auricularia*, against the swimming or turning in the head, which is a disease subject to those places, rising from the feare and horrour, of such steepe downefalls and dangerous places, which they doe and must continually passe, in seeking for and hunting the wild Goates, and therefore they there call them *Gessnerwurtz*, that is, *Rupicaprararadix*, as *Clusius* doth interpret it; and there hath beene found in their mawes a certaine stone, called by *Bauhinus*, in his Treatise thereof *Bezoar Germanicum*, in the middle of which stones, some of the rootes have beene found almost whole, which sheweth that they feede thereon willingly, without taking any harme thereby. and that the stones bred thereon are Cordiall, and souled: And I doe not thinke but any of the other sorts (seeing they are all in forme, and places of growing, one so like unto another) if triall were sufficiently made, would performe the same effect. For the first sort here expresse (which as I said is called *Caliba Alpina* of some, *Alyssa* or *Damosonim* of others, and *Doronicum Germanicum* of others, of the people in the Alpes *Mutterwurtz*, as *Josias Simlerus* faith, in his Commentarie of the Alpes, that is *Matricaria*, Mother wort, which they have found, and do continually use to procure womens courses, and to ease the paines and diseases of the mother) is very effectually against the poyson of the fish called *Lepus marinus*, as also the venomous biting of the Shrew, and the poyson of a Toade; and is also profitable for them, that have eaten *Opium*, in any dangerous quantitie; it is given with good successe, to them that have the bloody fluxe, or any other paines or gripings in their body or bowells, by reason of sharpe humours gathered therein: it is also helpfull to those that have convulsions or crampes, and ach or paines in the joynts and sinewes, and is very powerfull to be taken with some wilde Carrot feede, to expell gravell, or the stone in the reines or kidneys, if the decoction thereof in wine or water, or the powder of the herbe and rootes be taken: it is applied also outwardly, to ease the paines and inflammations of apostumes and sores: the flowers hereof doe procure needings.

CHAP. IV.

Ranunculus, Crowfoote.

Here are so many sorts of Crowfeete, some of the Woods, some of the Medowes, some of the Mountaines, some of the Water, some of the Rockes, and some of the Gardens; that to proceede in a methodicall manner, and to ease my selfe and the Reader of too much prolixitie, and intricacie, I thinke it best to distinguish or divide them into severall formes or orders, that so they may be the better apprehended and understood, for otherwise it would be too great a confusion, to huddle so many together: and because I have already set forth in my former Booke, many sorts, whose flowers being most beautifull and rare, were fittest to adorne that Garden; I shall not neede to describe any of them againe in this worke, but referre you thereunto to be inform'd of them: but in shewing you the rest, I will give you the figures of some of them, and of the *Anemones* which are nearest unto them, and so bring every of them into their severall order, and begin first with those of the Woods.

Devise prima. The first Division.

Ranunculi nemorosi. Wood Crowfeete.

1. *Ranunculus nemorosus albus simplex*. The single white Wood Crowfoote.

The single white wood or wilde Crowfoote, riseth up with two or three stalkes, about an hand breadth high or better, about the middle whereof, come forth usually three stalkes of leaves, each being somewhat broad, hard and cut in on the edges into three patts, of a sad Greene colour, and dented also; the stalks riseth up two or more inches high, bearing at the toppe one single flower, hanging downe the head for the most part, made of five leaves, somewhat broad and almost round pointed, of a light blewish colour on the outside, before it be blowne open, but white afterwards, and more white on the inside, having a few white threds in the middle,

1. *Ranunculus nemorosus albus simplex.*
The single white Wood Crowfoote

5. *Ranunculus nemorosus flore luteo.*
The yellow Wood Crowfoote.

middle, tipped with yellow, standing about a green head, which in time growing ripe, is somewhat like other heads of Crowfoote, composed of many small seedes set together: the roote is usually of the bignesse of a wheate straw stalke, not growing downe deepe, but creeping longwise under the upper crust of the ground, spreading out into diverse small knobs like branches, of a darke browne colour on the outside, and white within, and of a sharpe biting taste, enflaming the mouth.

2. *Ranunculus nemorosus minimus albus.* The least white Wood Crowfoote.

This small wood Crowfoote, hath such like leaves as the former single white kind hath divided into three parts, and each of them into other againe, standing upon little long foote stalkes, but they are much lesser, so that the whole leafe hereof, is not much bigger than one of the Divisions, or parts of the other: the stalke is verie small with a few leaves thereon, in two places more divided than the lower, little more than two inches high: at the toppe standeth a white flower, consisting of sixe white leaves, with a few yellowish threds in the middle: the roote is small and long like unto the other.

3. *Ranunculus nemorosus flore carneo.* The single bluish wild Crowfoote.

The single bluish wilde Crowfoote, is both for forme, of growing, in stalkes, leaves, flowers, and rootes, like unto the former, so that untill it be in flower, there can hardly be any difference discerned, but when the flower appeareth, it sheweth it selfe much more reddish on the outside, and of a faire pale purple, or bluish colour on the inside, which maketh it a distinct species of it selfe, differing from the rest.

4. *Ranunculus nemorosus flore purpureo caeruleo.* The single purple Wood Crowfoote.

This purple kinde is also like the other, and differeth from them chiefly in the stalke which is somewhat browner, and in the flower, which is of a pale purple blewish colour, like unto a pale violet flower: none of these have any great sent, but yet a little, and more than the yellow kinde which followeth next.

5. *Ranunculus nemorosus luteus.* The yellow wood Crowfoote.

The yellow Wood Crowfoote groweth in the same manner that the former doe, and with such like stalkes of leaves, but they are not so broad, nor so hard in handling, and are more deeply cut into more long and narrower parts, yet each also dented about the edges, especially towards the ends of the leaves, and of a darker Greene colour: from between these stalkes of leaves, shooteth forth sometimes but one, and sometimes two or three stalkes, with every one a flower thereon, somewhat smaller than the former, consisting of sixe usually or of seaven, and sometimes of eight leaves, which are of a faire pale yellow colour, with many yellow threds in the middle, the seede and rootes are like the former: this hath as I said least sent at all. Unto these belong that sort of *Anemone* or rather Crowfoote that *Dodonaeus* calleth *Trifolia* having the leaves parted into three, snipt about the edges with a whitish bluish flower.

Anemone trifolia Dodonaei.

6. *Ranunculus nemorosus Moschatella diitius.* The Muske Wood Crowfoote.

The Muske Crowfoote, hath three or foure slender pale Greene stalkes of leaves, somewhat divided at the edges of them, not halfe a foote high, and not of halfe that height in some places, very like unto those of the Hol-

Anemone trifolia Dodonæi.
Dodonæus bis trefoile Anemone.

7. *Ranunculus nemorosus dulcis* secundus Tragus
Sweete Wood Crowfoote.

6. *Ranunculus nemorosus Muscatella* dictus.
The Muske Wood Crowfoote.

8. *Ranunculus Virginicus* albus.
The white Virginia Crowfoote.

low roote, but smaller, and of a paler shining Greene colour, from among which rise up one or two small stalkes with two such like leaves thereon, but smaller, and a little above them, a small round greenish yellow head, which spreadeth not into leaves, but into foure or five little mossie heads of threads, and so abideth a while, having no other flower, and passe a way into many small kernelly seede; the roote is small and somewhat long, composed as it were of many small very shining white thicke scales growing upwards, and having many white fibres at the head of them, of a little sweetish bitter, sharpe and binding taste, the leaves have a little sweete sent, somewhat like unto that kinde of Cranes bill, called Muske, yet more in the naturall places than in Gardens, when it is transplanted into them.

7. *Ranunculus nemorosus dulcis secundus Tragi.* Sweete Wood Crowfoote.

The first leaves of this kinde of Crowfoote, are round somewhat like unto Violet leaves, and not devided at all, but those that rise next after them, are more devided, somewhat like unto the leaves of the last, and so those that grow after and upon the stalkes are more devided than they: the flowers are small, and of a faire shining gold yellow colour, standing at the toppes of the stalkes, like unto the other common kindes of Crowfeete: after which come the feede many set together in a head, like a small Strawberry, as diverse other Crowfeete have; the roote is composed of many white strings and fibres, like unto others; neither roote or leafe of this kind, hath any sharpe or biting taste in them, but are almost insipide.

8. *Ranunculus Virginensis albus.* The white Virginia Crowfoote.

The white Virginia Crowfoot shooteth forth from a reddish thick tuberous roote with some small fibres thereon, three or foure somewhat large broad whitish Greene leaves upon long foote stalkes, rent or torne on the edges for the most part, among which riseth up a slender round naked stalke, five or six inches high, bearing one white flower at the toppe, made of tenne or of twelve small narrow and pointed leaves, with a few yellowish threds in the middle, set about a greenish umbone, which in time groweth to be a long slender pod, wherein is contained round whitish feede.

The Place.

The most sorts of these are found growing in Woods, Groves, and Orchards, some of them in our owne land in many places, the rest in many places of Italy, Germany, &c. The first is found as well by the brooke sides that passe by Medowes, as in Woods, and by hedge sides.

The Time.

They doe all flower very early in the Spring, in March oftentimes, or at the furthest in Aprill.

The Names.

The first foure are diversly called of diverse Writers, for some call them *Ranunculi nemorosi*, or *nemorum* and *sylvarum*, others *Anemones sylvestres*, or *nemorosi*; but in regard none of these do beare any cottony head of feede, as all the *Anemones* doe. I rather hold with their judgement, that referre them to the kindes of *Ranunculus* or Crowfoote; yet *Chisius* thinketh that they may be reckoned as kindes of wild *Anemones*, and saith that diverse did thinke them to be the *Anemone sylvestris*, that *Theophrastus* calleth *ancumia Leimonia*; the *Italians* call them *Gengevo saluatico*, wild Ginger, either because the rootes of them all, are very sharpe, hot and biting the tongue like Ginger, or rather as I thinke, because the rootes doe grow a little spreading into severall parts, very like unto Ginger. *Tragus* calleth them *Ranunculus sylvestris*, whereof there are two sorts as he saith, *candidus* and *lutescus*, one that beareth white flowers and an other yellow: *Johannes Thalius* maketh them his third kinde of Crowfeete: *Gesner* calleth the first white one *Ranunculus Phragmitis*: I have therefore upon more mature advice entituled them Wood Crowfeete, and set them in the first ranke or division: the second is called by *Ranunculus nemorosus* *Anemones flore minor*: the third, fourth and fifth, have their names in their titles: the sixth is diversly also called, for *Coradus* calleth it *Moschatella*, and some other *Moschatella pratensis* that it may differ from the *Moschatella cerulea* of *Lugdunensis* called also *Ageratum purpureum*; *Lobel* calleth it *Ranunculus minimus Septentrionalium herbido muscoso flore*, *Tragus* and *Gesner* make it to be a kinde of *Aristolochia*, for so they accounted the *Radix Cava* to be, and thereupon as *Camerarius* saith, divers did aswell account it a kinde of *Capnos*, as small Crowfoote. *Lugdunensis* calleth it *Denticulata* from the forme of the roote which is made as it were of many teeth set together: The seventh is *Tragus* his second *Ranunculus sylvestris*, and *Lobel* his *Ranunculus auricomus*. The last hath not bene set forth by any before.

The Vertues.

By reason of the hot sharpe biting taste of the foure first sorts, they are found no lesse to exulcerate the skinne being applied, then any of the other sorts of Crowfeete; yet they may be well used to eate away and consume hard tumours, as also to take away scarres and other blemishes, and wartes upon the hands, &c. and to eate out the core of cornes in the feete, the leaves or roote especially, being bruised and bound to for a certaine space: They are said also to cleanse foule ulcers that are much corrupted and stinking. The 6. and 7. sort are not knowne to be used. Vnto this Division appertaineth those other sorts of *Anemones sylvestres flore pleno*; set forth in my former Worke.

Divisio secunda. The second division.

Ranunculi pratenses & arvenses. Field Crowfeete.

9. *Ranunculus pratensis dulcis.* Sweete Meddow Crowfoote.

THIS Meddow Crowfoote (which I call sweet, not as *Cerard* doth because it smelleth sweete, but in regard it hath no sharpe biting or exulcerating taste, as most of the other Crowfeete have, but is so sweete and pleasant, that many in Germany and other places, doe stee the leaves, when they are young among other herbes, that serve to eate) hath diverse great broad, darke Greene leaves, spread upon the ground, a little hayrie, cut in on the edges into five divisions, and a little dented also about, especially at the ends, and of a paler yellowish Greene on the under side, of a sweete and not unpleasant taste, as I sayd before; among which rise up diverse hayrie stalkes, with some leaves upon them, much more divided and into smaller and narrower parts, than the lower: at the toppes whereof stand many faire yellow flowers, so like unto the next field Crowfoote, that is very violent, sharpe and exulcerating the skinne, that it can hardly

1. *Ranunculus pratensis dulcis simplex & multiplex.*
Single and double meadow Crowfoote.

2. *Ranunculus pratensis acris.*
The common upright field Crowfoote.

3. *Ranunculus repens flore simplici & pleno.*
The common creeping field Crowfoote with single and double flowers.

4. *Ranunculus arvensis.*
Crowfoote of the ploughed fields.

be knowne from it: the seed likewise that followeth is like thereunto: the roote consisteth of many white strings. Of this sort there is one that beareth double flowers, and is planted in gardens onely for the beauty of the flowers. Flora mini-
ticipi.

2. *Ranunculus pratensis cretus acris vulgaris.* The common upright field Crowfoote.

The common field Crowfoote (whose branches stand upright and bend not downe againe unto the ground, neither creepe thereon, or spread, taking roote againe in diuerse places, as the next doth) hath many large darke greene leaves, cut into diuerse parts, somewhat like unto the last, that many might judge it a kind of the same; but the taste declareth the difference, which is very violent, sharpe and heating upon the tongue, and blistering the skinne, if it be layd thereon, no lesse than any exulcerating or corroding herbe can doe, and will have some blacke spots upon them now and then, but not in all, or all places; the flowers are many, and of a gold yellow colour, after which come small heads of feedes: the roote is fibrous as other Crowfoote are. Of this kinde also there is one with double flowers, which I have set forth in my former booke. Flora
Peno.

3. *Ranunculus pratensis repens* The common creeping field Crowfoote.

This creeping Crowfoote, that groweth commonly in fields and gardens also, is very like unto the last described Crowfoote, both for leafe, flower, feede, and roote, but that this is more hayrie and creepeth with his branches upon the ground, taking hold by small white fibres which it shooteth forth at the joynts, and spreadeth farre thereon, his branches also rather leaning then standing upright, or rising so high but the yellow flower, and sharpe biting taste of the leaves is almost equall with the former. Of this kinde there is also one with double flowers nurseed in gardens. Flora
Peno.

4. *Ranunculus aruorum.* Crowfoote of the plowed lands.

This Crowfoote hath diuerse smaller leaves, than any of the former, divided into many narrower parts, of an overworne greene colour; the stalke is about a foote or more high, bearing some leaves thereon, more jagged than the lower, and more divided at the toppe into other branches, bearing pale yellow flowers after which come rough pointed feedes, set in heads many together: the roote is composed of many white fibres or strings.

5. *Ranunculus bulbosus sive tuberosus.* Knobbed Crowfoote.

The knobbed or round rooted Crowfoote, hath diuerse leaves rising from the roote, much more cut in and di-
vided than any of the former except the last, every one standing on a short footestalke, of an overworne greene colour, among which rise up diuerse slender stalkes, a foote, or halfe a yard high, with some leaves thereon at the joynts, more divided, and into longer and narrower parts than those below; at the toppes whereof, stand severall faire gold yellow shining flowers, made of five leaves like the former sorts, with many threds in the middle, standing about a greene head, which after the flowers are past, groweth to be more rough or pricking than the former: the roote is white and round, of the bignesse sometime of a Wallnut, and often much lesse, being no

5. *Ranunculus bulbosus.*
Knobbed Crowfoote.

Ranunculus Anglicus bulbosus.
Bachelours buttons.

bigger than a beane, or sometimes an hassell nut, with some long fibres at the ends especially of it, of a more

Bulbosus
Anglicus. Of this kinde is that thought to be, that beareth double yellow flowers one out of another, and called *Anglicus*,
set forth in my former garden, whose figure is here extant also. As also one whose flower is single and red like
an Orange.

Bulbosus
flore rubro
simplex.

6. *Ranunculus Echinatus Creticus.* Small prickly headed or Crowfoote of *Candye*.
This small Crowfoote hath many stalkes, rising from a threddy roote, round and smooth, full of branches,
scarce rising a foote high, at every joynt standeth one broad sad Greene crumpled leafe, upon a very long foote
stalk: the flowers at the toppes are small, and of a pale yellow colour; and the heades of many small seedes
and browne set together, are somewhat sharpe and prickely.

7. *Ranunculus Apuleii quibusdam.* The small early Crowfoote of *Apuleius*.
This small early Crowfoote, which some take to be the *Barrachium* of *Apuleius*, hath diverse small and short
leaves, lying upon the ground, not so much divided as the last, but cut into three divisions, for the most part, each
of them dented at the ends, and standing upon short foote stalkes, of an inch or two long, compassing one another
at the bottomes of them: from among these leaves rise up diverse weake stalkes, bowing and leaning downe
to the ground againe; at the joynts whereof grow such like leaves, as grow below, standing each of them upon
his short foote stalk, and with them also cometh forth at each joynt, a small short stalk, bearing a flower con-
sisting of five leaves, of a faire pale yellow colour, with diverse yellow threds in the middle; after the flowers
are past, there follow five or sixe small cods or hornes, pointed and crooked at the ends, wherein lye small
brownish round seede, somewhat like those of the Winter Wolfes bane: the roote from the head thereof,
shooteth forth many white fibres, whereby it taketh fast hold on the ground, encreasing into severall heads:
both rootes and leaves are no lesse sharpe and biting than any of the former.

8. *Ranunculus pratensis rotundifolius Bononiensis.* Meadow Crowfoote of *Bononia*.
The leaves that rise from this blackish threddy rooted Crowfoote, are round soft and hayrie, dented about
the edges of a sad Greene colour, and about an inch broad, standing upon very long foote stalkes, but those that
grow upon the stalk are larger, and for the most part round also, a little divided into some parts, but not to the
middle: the stalk is about a foote high, bending a little downe to the ground, and as it were creeping, divided
into smaller branches, with large leaves at the joynts, standing upon long foote stalkes, and small pale yellow
flowers set on the toppes of them, with a few yellow threds in the middle about a Greene head, which growing
to be ripe, hath many sharpe or prickely browne seedes set together.

9. *Ranunculus minimus Apulus.* The small Crowfoote of *Naples*.
This small Crowfoote being the least of all the rest, hath a few small leaves, growing from the roote, divided
into three parts somewhat like unto an Ivie leafe, each of them upon a small long hayrie foote stalk, no bigger
than the nayle of ones finger: the stalk is about a foote high small and slender, and a little hayrie also, with
some leaves thereon, and small yellow flowers at the toppes: the seede is small in heades like the other kindes,
and the rootes small and fibrous.

10. *Ranunculus Pannonicus maximus.* The great Crowfoote of *Hungary*.
The great Crowfoote of *Hungary*, is the greatest of all these sorts of Crowfeete, having diverse very large,
broad, thicke, fappy, pale, Greene, shining leaves, not much lesser than Figge leaves, cut into five parts or divi-
sions, and each of them dented about the edges, being somewhat hayrie withall, a little sharpe and biting up-
on the tongue, but not so much, as most of the former sharpe sorts are: the stalkes are great, strong, and some-
what hayrie, two foote high, spread at the toppes into diverse branches, whereon stand faire gold yellow flow-
ers, like unto other Crowfeete, and such like heads of teede following them: the rootes are many white fibres
or strings, shooting downe from a head into the ground. Very like herunto is the great Crowfoote of *Candye*
set forth in my former booke but that the rootes are composed of long kernelly knots, whose figure I here exhi-
bite unto you.

Creticus
latifolius.

11. *Ranunculus Illyricus minor.* The lesser Crowfoote of *Sclavonia*.
The lesser Crowfoote of *Illyria* or *Sclavonia*, hath but three or four narrow grayish Greene leaves, divided into
four or five or more parts, standing upon long foote stalkes, and of a silver white shining colour underneath:
the stalkes are firme and round, but small, about a foote high or more, having some such like leaves thereon, about
the middle, and spreading into three or foure branches, every one bearing a small shining pale yellow flower,
consisting of five leaves, and sometimes two together upon a stalk: the roote is composed of many small round
grayish kernels, set very close and hard together in a bunch with some fibres thereat.

12. *Ranunculus Illyricus major.* The greater Crowfoote of *Sclavonia*.
This greater kinde is both in leafe stalk and flower, greater and larger than the former, the leaves being broad-
der and greener on the upperside, and not fully of so silver a white colour underneath, the flowers are of a faire
deepe yellow colour, and greater, but the roote hath not so many small graines or kernels set together, in any
that I have observed, but shooteth forth white strings, whereby it is nourished and maintained.

Flore albo
Flore mi-
niato.

Of this kinde some have beene found growing in *Apulia* in the Kingdome of *Naples*, with a white flower, and
an other with a reddish flower.

13. *Ranunculus Lusitanicus autumnalis simplex.* The single *Portugall* Crowfoote.
This *Portugall* Crowfoote hath many broad leaves, lying upon the ground, almost round yet pointed, and
finely dented about the edges, not divided at all, but somewhat hayrie full of veines, and of a darke Greene colour
on the upperside, and of a yellowish Greene underneath, which continue all the winter, not falling away untill
fresh doe spring up: from among these leaves shoote forth two or three small slender hayrie short stalkes, not a
foote high, bare without leaves, bearing each of them one small yellow flower, composed of five, and sometimes
of fixe leaves, with some yellow threds in the middle, which fall away most usually with us, without bearing
any seede, in regard it flowreth so late in Autumne, but in the naturall places; and sometimes with us, if the
yeare be very hot, and sitting for it; it beareth a small head of such like seede, as the field Crowfoote beareth;
the roote is made of small round whitish long kernels or pieces, many set together, somewhat like the *Illyrian*;
but greater and longer: This kinde *Clusius* observed in the Olive-yards about *Lisbone*, to grow with larger crum-
pled

7. *Ranunculus Apulei quibusdam*.
The small early Crowfoote of Apuleius.

8. *Ranunculus pratensis rotundifolius Bononiensis*.
Meadow Crowfoote of Bononia.

Ranunculus globosus.
The globe Crowfoote or Locker Coulons.

6. *Ranunculus Creticus echinatus*.
Small prickly headed Crowfoote of Candia.

11. 12. *Ranunculus Illyricus major & minor.*
The greater & lesser Slavonian Crowfoote.

13. *Ranunculus Lufitanicus autumnalis.*
The Portugall Crowfoote.

pled or swolne leaues, like as it were blisters upon them, and bearing the flower with eight or ten leaves, sometimes as if it were double, whereof he giveth a figure, but the seede will beare such like plants, as he setteth forth the other to be, and therefore giveth no other mention or description thereof.

14. *Ranunculus autumnalis flore multiplici.* Double flowered Autumne Crowfoote;
This is so like the last in the manner of the growing and flowering, that onely the double yellow flowers make the difference.

15. *Ranunculus grumiferae Bononiensis.* Meddow Crowfoote of Bononia with kernelly rootes.
This Crowfoote hath a roote made of many small long and round white kernels, or graines set close together, with diverse long fibres at them, from whence rise up somewhat round leaves, but deeply cut in on the edges, into three parts, somewhat like unto those of the round rooted Crowfoote, sustained by long foote stalkes, and somewhat hayrie: from among which rise up the stalkes, that are hayrie also, and about a foote high, having leaves set thereon at two severall distances, much more cut in and jagged than those below, not divided into many branches, whose flowers at the tops of them are yellow, like unto other field Crowfeete: the small head of rough seede that followeth, is sharpe pointed, and shorter than others.

16. *Ranunculus Gerani tuberosi folio.* Jagged Field Crowfeete of Padoa.
The rootes of this Crowfeete consist of long whitish strings, sending forth many darke green smooth leaves, very much jagged or cut into diverse parts, somewhat like unto the leaves of the knobbed Cranes bill, but larger, each of the cuts being larger and broader than they, which are cut in againe, so that the whole leafe being almost round, is halfe a foote long, and neere so broad also, set upon a foote stalk; an hand breadth long; from among which rise up, diverse smooth greene crested stalkes, about two foote high, spread into branches, having finer cut leaves on them, and small pale yellow flowers at the toppes, with many threds in the middle, like unto others, after which cometh a small round knappe or head of seede.

The Place,

All these sorts of Crowfeete, doe grow in fields, meddowes, and arable grounds, many of them in our owne land, especially the first five sorts; the rest by their titles may be understood from whence they came.

The Time,

The first and the great Candye sort are the earliest in flower, which is about March and Aprill, and the 13th and 14. are the latest that flower of all the rest, which is not untill September, all the other in May and June.

The Names,

It is called in Greeke *βαρβάνιον*, and there after in Latine *Ranunculus*, non solum quia ranarum colorem folia multum imitantur, sed potius quia inter foliarum ut plurimum degunt: in English we call them Crowfeete, rather than Frogwort after the Latine, from the divisions of the leaves, as I thinke, and therefore some call them *Pedes galli*, according to Pliny, yet some writers thought them to be *Coronopus pes cervi* of Dioscorides, and from thence it

14. *Ranunculus autumnalis flore multiplici.*
Double flower'd autumn Crowfoote.

Ranunculus Creticus latifolius.
Yellow broad leaved Crowfoote of Candy.

it is most likely our *English* name of Crowfoote came, they have also diverse other *English* names, as King Cups, gold cuppes, Basinets after the French, Pissabeds, Bolts, Troll flower, and Locker Goulons, which two last are more proper to the eight kinde in my former Booke: of the *Italians* *Ranocolo* and *Pic Corvino*; of the *Spaniards* *Terva belida*, of the French *Grenoielte*, of the *Germanes* *Hanen fust*, and of the *Dutch* *Hancvoet*. The first is *Tragus* his first *Ranunculus dulcis*, five *pratensis* by *Fuchsius* *Chrysanthemum simplex*, by *Dodonæus* in his French Herball and by *Lugdunensis* *Polyanthemum simplex*, by *Tabermontanus* *Ranunculus dulcis*, & by *Bauhinus* *Ranunculus pratensis erectus dulcis*: the second is the *Ranunculus luteus* of *Tragus*, the *Ranunculus pratensis surrectis cauliculis* of *Lobel*, & the second *Ranunculus luteus* of *Dodonæus* & *Lugdunensis*. *Thalins* calleth it *Ranunculus polyanthemus maculatus*, and *Gerard* *Ranunculus Batrachoides*: the third is called by *Lobel* *Ranunculus pratensis reptante cauliculo*, by *Thalins* *Ranunculus polyanthemus primus*, by *Dodonæus* and *Lugdunensis*, *Ranunculus hortenensis primus*, by *Tabermontanus* *Ranunculus vinealis*, and by *Bauhinus* *Ranunculus pratensis repens hirsutus*: the fourth is called by *Lobel* in his *Icones* *Ranunculus arvenis*, as it is in the title, by *Dodonæus* and *Lobel* in his observations *Ranunculus sylvestris tertius*, by *Gesner* in *hortis Germanie* *Ranunculus arvensis*, and by *Cordus* in his history of Plants, *Ranunculus segetalis*, by *Gesner* in *hortis Germanie* *Ranunculus arvensis*, and by *Bauhinus* *Ranunculus arvensis echinatus*: The fifth is called by *Tragus* *Ranunculus exiguus & sceleratissimus*, and by *Gesner* in *hort Germanie* *Ranunculus Flammula dictus*, by *Lobel* *Ranunculus bulbosus*, and by *Dodonæus* *tuberosus*, by *Brunfelsius* *Crus Galli* and *Coronopus parvus*; it is generally taken to be, and so called *Batrachium berofus*, by *Bauhinus* calleth it *Ranunculus pratensis radice verticilli modo rotunda*. The sixth is called by *Pona* in his *Apuley* *quibusdam*, *Pena* and *Lobel* let it forth in their *Adversaria*, under the name of *Ranunculus palustris*, *rotundiore folio semine echinato*, but as *Bauhinus* saith in his *Phytopynax* and *Prodromus*, they confound it with the other *Ranunculus palustris rotundifolius* *Levis*, and therefore he calleth it *Ranunculus palustris echinatus*, not that it groweth in moorish ground but in wet fields. The eighth is called by *Bauhinus* *Ranunculus rotundifolius repens echinatus*. The ninth is called by *Columna* *Ranunculus minimus Apulus*, as it is in the title, and by *Bauhinus* *Ranunculus arvensis parvus folio trifido*. The tenth is called by *Clusius* *Ranunculus Platophyllus*, and is his fifth *Montanus*, which *Bauhinus* calleth *Latissimo folio hirsutus*. The eleventh is generally called of most writers, as also with all Herbarists, *Ranunculus Illyricus minor*, and is the fourth *Ranunculus grumosa radice* of *Clusius*, and by *Bauhinus* *Ranunculus lanuginosus angustifolius grumosa radice minor*. The twelfth is called by all *Illyricus major*, being of the same kind, which *Bauhinus* therefore calleth, *Ranunculus lanuginosus angustifolius grumosa radice major*, and remembered by *Clusius* in the same place with the other. The thirteenth is called by *Clusius* *Ranunculus austriacus*, and is his first *Ranunculus grumosa radice*, whereof he maketh two sorts, and hath two figures upon the diversities of the leaves and flowers, it is therefore called *Lusitanicus* by *Lobel*, *Dodonæus*, *Dalechamp* and all others, except *Bauhinus*, who calleth it *Ranunculus latifolius bullatus Asphodeli radice*. The fourteenth is remembered by *Jacobus Cornutus* onely in his Booke of Canada plants. The fifteenth is called by *Bauhinus* *Ranunculus grumosa radice folio Ranunculi bulbosi*. The last is called also by him *Ranunculus Geranij tuberosi folio*, as it is in the title.

The Vertues.

The first of these kinds, being of no sharpe or biting taste, is held to be harmelesse; for the *Germanes* as *Tragus* saith, use to eat it familiarly among other herbes: but the others are sharpe and doe exulcerate the skinn, especially the fift kinde more than any of the rest, and therefore not to be used inwardly in any case: the second and third sorts here expressed, are oftentimes used to be laid to the wrists of the hands, to drive away agues, the leaves being bruised, with a few cornes of bay salt, and a little glasse of windowes, beaten small and mixed together. *Camerarius* saith that they in *Germany* used to apply the roote of the fift kinde to plague sores, to draw them to maturity and breake them, yet it is no other likely but the other sharpe rootes will doe the like, for they will breake tumours and draw impostumes being wisely applied; and *Tragus* saith, that even those that are not sharpe, doe dissolve and dissolve hard tumors in any part of the body, being applied: a peece of the round rooteed Crowfoote put betweene those teeth that doe ake, or into an hollow tooth, takeeth away the paine, but many times, it either breaketh those that are hollow, or causeth them to fall out: some write, that applied to the finger, by causing more paine therein, than is felt, by the outhach, it taketh away the paine: the decoction of the leaves of the field Crowfeete, healeth scabs and the itch, but they must not be suffered to abide long upon the places; it is likewise used to stay the falling of the haire, the head being washed therewith, being made warme, but not to rest thereon above two or three houres, and then washed off with fresh warme water: it is also said that if the roote be bruised, and applied unto a foule ulcer, it will cleanse and take away all the filthly and corrupt matter therein, leaving the sore faire to be healed up with other convenient things, but it must not lie long to the fore lest it worke too forcible: all these sharpe Crowfeete, have the same operation to take away wartes, or the scabbed ruggednesse of nailes, markes, spots, and blemishes in the skin, and all the other properties attributed to these sorts of Crowfeete, mentioned in the former division: besides being mixed with swines dung, they breake *Scrophulous*, or the small kernells under the eares, and of the necke called the Kings Evill, and applied to the *Hemorrhoides* or piles that swell and bleede not, helpeth to discurse or take them away: but in no hand must it be applied to those that are open and bleede. The distilled water of the herbe, whilst it is in flower, worketh safely to all the purposes aforesaid, and as some report is given with good successe inwardly, with some Holland pouthier, or the species called *Lithontribon*, to provoke urine when it is stopped, and to breake the stone: the dried rootes of most of them made into pouthier, and put into the nose procureth sneezing.

Divisio tertia. The third Division.

1. *Ranunculi Montani*. Mountaine Crowfoote.

OF some of these Crowfeete I have entreated in my former Booke, by the name of *Ranunculus montanus humilior*, of two sorts, and is the first small figure set here also. *Ranunculus montanus albus minor flore simplici*, which is the second figure here, and the double sort among the other garden sorts hereafter. *Ranunculus Thalictri* and *Rutaefolius* both in one figure, being the third in place: and then *Ranunculus Thalictri folio minor* *Asphodeli radice* the fourth: and *Ranunculus gramineus flore luteo simplici* & *duplici* the fift, which are not here againe described: but there are a great many other sorts which I will here bring to your consideration and speake of them.

1. *Ranunculus montanus maximus albus*. The greater white Mountaine Crowfoote.

The great white Mountaine Crowfoote differeth from the lesser single white mountaine Crowfeete that is set forth in my former booke (whose figure I give you here in the second place) chiefly in these things, that the leaves of this Crowfoote, being somewhat hairy and very large, are divided to the stalke into five parts, and each of them somewhat deepe lined about the edges, resembling the leaves of the Globe Crowfoote, but larger and standing upon footestalkes, that are hairy and a foote long almost: the maine stalke is somewhat great and hairy, bare almost of leaves unto the top, where it brancheth out into flowers, under which stand at the joynt three large leaves, much more divided then those below: the flowers are many, each standing on a long footestalk very large and white, consisting of five leaves so large, that the whole flower seemeth to bee as great as a single purple ringed Daffodill, and very sweete withall, having many yellow threds in the middle, standing about a Greene head, whereon being ripe the feede groweth many set together; the roote is somewhat great and long, but as it were bitten off in the halfe, with many long blackish strings hanging thereat.

2. *Ranunculus montanus Pennai*. The great purple mountaine Crowfoote.

This great Crowfoote hath foure or five or more very large and hairy leaves, rising from the roote, set upon long hairy foote stalkes, each whereof is divided into five or more parts, deepe cut in unto the middle, dented likewise about the edges, and of a darke Greene colour on the upper side, and grayish, or as it were hoary underneath, among which riseth up a strong round hollow stalke, hairy also, about a yard high, bearing a leaf onely at the top much divided, and from thence spreadeth into three or foure or more small branches, each sustaining a small leaf or two, about which standeth the flower, consisting of five round leaves of a purplish colour on the under side, and about the edges of the inside, but pure white on the rest of the inside; having many yellow threds in the middle, about a Greene head, which beareth many flattish and blackish browne sharpe pointed feede: the roote is composed of many long fibres or strings, and hairy at it were at the head thereof.

3. *Ranunculus Plantaginifolio*. Plantaine leaved Crowfoote.

This Pyrenean Crowfoote hath three or foure leaves rising from the roote, set on pretty long footestalkes, being somewhat long and broad like unto Plantaine leaves, with ribs therein, but more pointed at the ends, not divided or dented about the edges, but smooth and plaine with some veines running through the length of them, and pointed at the ends of a whitish or grayish Greene colour, circled at it were with a white downe: the stalke is round, firme, and Greene about a foote and a halfe high, bearing two or three longer leaves; broad at the bottom and compassing the stalke, which divideth it selfe at the top, into two or three small branches, having every of them a small long leaf at the foote thereof, and a reasonable large flower at the head without any sent, consisting of five white round pointed leaves, with many yellowish threds in the middle, and a round Greene head, which afterwards growing ripe hath many feedes set together, like unto divers other sorts of Crowfeet: the

Ranunculus Montanus humilior albus simplex & duplex.
Single and double cow white mountaine Crowfoote.

Ranunculus Montanus albus minor simplex.
The lesser single white mountaine Crowfoote.

the roote is composed of many white strings or fibres, fastned to a head which is somewhat hairy, and abideth many yeares, but the leaves perish quite in the end of Summer, and are renewed in the spring.

4. *Ranunculus Pyreneus albus duplex.* Double white Crowfoote of the Pyrenean hills.

This Crowfoote differeth little from the last but in the flowers which are not so many together, and consist of two rowes of white leaves.

5. *Ranunculus montanus Betonicae foliis.* Mountaine Crowfoote with Betony like leaves.

This small Crowfoote hath divers leaves rising from the roote, somewhat broad and long, full of small veines which make it seeme rugged every one upon a little short foote stalk, roundly dented about the edges and round at the point or end, very like unto the leaves of Betony, but that they are smaller, of a brownish Greene colour on the upper side, and of a silver white shining colour underneath: the slender hairy stalk that riseth up in the middle of those leaves, doth scarce exceede the length of ones hand, bare or naked without any leaves unto the top, where it beareth one flower onely, like unto the last described single Crowfoote but smaller, consisting of five small white leaves, pointed at the ends with some yellow threads in the middle, having five small Greene leaves under it, as a huske wherein it is set: the seede is contained in a small rough head like unto other Crowfoote: the roote is a small tuft of white Fibres, somewhat like unto the roote of Betony: the whole plant both leaves and rootes are bitter, with an exceeding austere or allringent binding taste, whereby it is judged not to be hurtfull or offensive, but rather acceptable to the stomacke, and may be profitable for moyst, and cold diseases thereof.

6. *Ranunculus gramineus bulbosus.* The bulbed grasseleaved Crowfoote.

This bulbed grasseleaved Crowfoote hath divers very long and narrow, smooth, grayish, Greene leaves, somewhat hairy at the bottome, and with some long veines therein; from among which riseth up a slender stalk, about a foote high, with two small long leaves thereon, not branched at all, but bearing out of a small huske of five Greene parts, one small faire shining yellow flower, like unto other Crowfoote, as is the seede also, being many set together on a long head, and every one pointed with a crooked end: the roote is somewhat round at the bottome, with a long necke upward, covered with a blackish hairy coate or covering, with divers thicke and round Fibres growing underneath, thicker at the ends then at the heads with some small hairy fibres at the end of them: within that outer hairy coate is found a round bulbous roote, like unto that of *Gladiolus* or Corne Flagge, the one set upon the other which was the elder, and seemed as it were shrunke.

7. *Ranunculus gramineus perfoliatus.* Thorough leaved grasse Crowfoote.

This small thorough leaved grasse Crowfoote sendeth forth from a small fibrous roote, divers narrow grayish Greene grassie leaves, about two inches long, yet somewhat broader then the last; from the middle of whom riseth up the stalk, scarce higher then the leaves, having two long leaves about the middle thereof, broad at the bottome and compassing the stalk, like unto that small kind of yellow Centory, that hath his name from that effect, which brancheth it selfe at the top, bearing two or three very small greenish yellow flowers, consisting of five broad leaves, somewhat foulded inward, and not layd fully open: the head of seede is small, but like unto

Ranunculus nemorosus Thalictri & Rutaceo folio.
Meadow Rue and Garden Rue leaved Crowfoote.

Ranunculus Thalictri folio minor Asphodeli radicebus.
Colombine leaved Crowfoot with Asphodill roots.

Ranunculus gramineus flore luteo simplici & duplici.
Yellow grassle Crowfoot single and double.

Ranunculus montanus maximus albus.
The great white mountain Crowfoot.

the grassie Crowfoote described in my former Booke. Of this kinde there is another whose leaves are somewhat broader, and the flowers more spread open, and with sharper ends.

8. *Ranunculus pumilus alter angustifolius*. Another small narrow leaved Crowfoote.

There is another of this last kinde, which groweth a little bigger and higher, and beareth but one yellow flower upon the toppe of the stalke, larger than in any other of these three last grassie Crowfoote.

9. *Ranunculus Asphodeli radice flore luteo*. Yellow Crowfoote with *Asphodill* rootes.

I have in my former Booke set forth one of this kind, very like herunto both for forme of flowers and rootes; whose figure you have before: this other differeth from it in the leaves (the former being somewhat broader than this, very like unto the small *Thalicttrum*) which are very small, narrow, and much divided, very like unto the leaves of the greater *Bulbocastanum*, or earth Chestnut; some lying upon the ground, and others standing more upright, each standing upon a reddish hairy foote stalke, which with the leaves is very nigh halfe a foote long, in the middle of whom appeareth a Greene head before the stalke is risen, and beareth it at the toppe thereof, as it riseth; which when it is ripe ready to blow, sheweth to be but one faire shining yellow flower, (whereas the other hath many white ones) consisting of five round pointed leaves; with many yellow threds in the middle, standing about a Greene head, which in time groweth somewhat longer than in other sorts of Crowfoote, having many crooked feedes set together thereon, but much smaller than in many of the other: the stalke is singular, not many, but hairy and reddish, seldome branched, but bearing two or three divided leaves towards the toppes, somewhat broader than those below, upon short footestalkes, at severall distances one above another, on both sides thereof: the roote is composed of diverse tuberous, round and somewhat long clogs, ending in a very long fibre, very like unto the other.

10. *Ranunculus alter saxatilis Asphodeli radice*. The pale Crowfoote of Naples, with *Asphodill* roote.

This Crowfoote of Naples, hath many thicke cloggie rootes, joyned together at the end, greater above and smaller downwards, of about a thummes length, with many small fibres among them, from whence the first leaves that rise up are broad, somewhat deeply cut in on the edges on both sides, but those that follow next are much more divided, and into many parts, each part cut in also and dented besides on the edges, and standing upon long foote stalkes, which are broader at the bottome than above, and compasse one another at the foote, for a little way upward, being somewhat hairy also, Greene on the upper side and whiter underneath: the stalke is round and hairy, about a foote and a halfe high, having diverse leaves thereon, much more divided than those below; and at the joynts with the leaves, toward the toppes come forth long branches, with small jagged leaves on them, under a small tuft of three or foure large pale flowers, of five broad or round pointed leaves, of the breadth of ones naile, with many yellow threds in the middle: the feede is small, round, flat and pointed, many set together on a long head.

11. *Ranunculus montanus hirsutus latifolius*. Great hairy Mountain Crowfootes.

The first leaves of this Crowfoote are round, like those of Doves foote, very hairy, of a blackish Greene colour, and soft, divided or cut into three parts, each of them also parted into three smaller divisions, standing upon

2. *Ranunculus montanus Pennai*.

The great purple mountain Crowfoote.

3. *Ranunculus plantaginifolia*.

Plantaine leaved Crowfoote.

long hairy footstalks, yet those that follow are broader, more divided and hairy, among which riseth up a straked hollow stalke, a cubite and a halfe high, with diverse leaves set thereon, and parted toward the toppe into many branches, having small pale yellow flowers on them, like unto others of this kinde, and seede also in the like manner, the roote is long made of many fibres.

12. *Ranunculus montanus lanuginosus folijs Ranunculi pratensis repentis*. Woolly mountaine Crowfoote.

The roote of this Crowfoote hath reddish strings or fibres, sending forth a small soft woolly stalke, about a cubite high, divided into many branches, with pale greene leaves set thereon, being soft and woolly, and standing on woolly long footstalks, an hand breadth long, divided into three principall parts, and each of them into others, and dented about the edges, very like unto those of the Meadow creeping Crowfoote: the flowers hereof that stand at the toppes of the branches are yellow, but larger than the last.

13. *Ranunculus saxatilis magna flore*. Rocke Crowfoote with large flowers.

This Crowfoote hath many small leaves rising from a long fibrous roote, set upon long foote stalks, scarce so broad as the naille of ones hand, parted into three small jagges, and they againe into two or three other, somewhat soft, and woolly: the stalke that riseth up among these, is scarce an hand breadth high, somewhat woolly also bearing but one large flower at the toppe, of a shining gold yellow colour, made of five leaves, with many deeper yellow threds in the middle.

14. *Ranunculus saxatilis folijs subrotundis*.

Rocke Crowfoote with roundish leaves.

This small Rocke Crowfoote, hath a few somewhat round leaves spread upon the ground, thicke and hairy, scarce a naille breadth, yet divided into small peeces, which also are cut in on the edges, standing upon short footstalks, scarce an inch long: the slender woolly stalke that brancheth it selfe from the bottome, riseth not above halfe a foote high with some leaves at the foote of the branches, and many yellow flowers of five small leaves at the toppes: the roote is small and fibrous.

15. *Ranunculus minimus saxatilis hirsutus*.

The smallest hairy Rocke Crowfoote.

This smallest Crowfoote spreadeth diverse verie small, and somewhat round hairy leaves, cut into three round parts, and dented about the edges, standing upon small long hairy foote stalks, in the middle of which riseth up, a small slender hairy branched stalke, not above two or three inches high, with small yellow flowers, at the toppes, like unto the rest, and so is the seede that followeth, the roote likewise is small and fibrous.

16. *Ranunculus villosissimus Mompeliacus*.

Small red hairy Crowfoote of Mompelior.

This red hairy Crowfoote of Mompelior, hath a small roote made of many reddish fibres, from whence spring up diverse thicke small and

4 *Ranunculus Pyrenaicus albus duplex*.
Double white Crowfoote of the
Pyrenian hills.

5 *Ranunculus montanus Betonicae folijs*. Mountaine
Crowfoote with Betony-
like leaves.

7. *Ranunculus gramineus perfoliatus*.

Thorough leaved grass Crowfoote.

Ranunculus alter non perfoliatus latifolius.

8. *Ranunculus pumilus angustifolius*.
Another small narrow leaved Crowfoote.

hairy leaves, at the first being divided into diverse peeces, some whereof are round, and other sharpe pointed; but those that rise up with the hairy stalks, are divided into long and pointed peeces, and as it were prickly at the ends, but of an uneven length, some being longer and shorter than others; which stalks being of an hand breadth high, and branched at the toppe, hath a small divided leafe, at the foote of every of those small branches, that beare yellow flowers of a meane bignesse, like unto others of this sort, the whole plant is covered with reddish soft haire, that it seemeth as if it were reddish it selfe.

The Place.

All these sorts of Crowfeete grow upon the Mountaines, some in Germany, some on Mount Iura by Savoy, some by Mompelier, and others in the Kingdome of Naples, or on the Pyrenean hills, none of them being knowne to grow wild in our countrie.

The Time.

They doe all of them flower about May and Iune, and their seede is ripe quickly after.

The Names.

The first kinde which is of two sorts, *Clusius* maketh to be his second kinde of Mountaine Crowfoote, of two sorts, but this is the later of his. *Lobel* calleth it *Aconitum Batrachoides*, and is the first *Ranunculus montanus* of *Bauhinus* in his *Pinax* which hee calleth *Narcissi flore*: the second is *Clusius* his third Mountaine Crowfoote, which he saith Dr. *Penny* a Physicion of our London Colledge, sent him the figure and description, finding it on Mount Iura nere Geneva; and is *Bauhinus* his sixth *Ranunculus montanus hirsutus purpurascens flore*, and saith it is the *Aconitum candidum acaulon Dalechampij* that *Lugdunensis* set forth, but how can this with a high stalk and a purplish flower, be called *Candidum* and *acaulon* without a stalk. I know not: the third *Clusius* nameth *Ranunculus Pyrenensis albo flore*, whose leaves as he saith are like unto those of Plantaine, and therefore with most *Herbarists* is called now adays, *Ranunculus plantaginifolius*, and so doth *Bauhinus*, who likewise seemeth to thinke, that it may be the *Ranunculus Phoeniceus Myconi*, for the resemblance of the long leaves, like unto those of the Date tree: but herein, in my opinion he is much mistaken, for that the roote of that *Ranunculus* is *Bulbosus*, and therefore more likely to be another, as I shall shew you, by and by: the fourth and fifth have no other names than are in their titles, being plants never set forth by any before, but growing on one of the Alpes, which the inhabitants call *Mont senis*, & sent the one by *Monmel*, & the other by *Pelicerius* unto Dr. *Lobel*: the sixth *Fabius Columna* finding on the hill *Aquicolo*, in the Kingdome of Naples, calleth it *Ranunculus leptomacrophyllon bulbosus*, or *Ranunculus bulbosus gramineus montanus*, which *Bauhinus* thereupon calleth *Ranunculus gramineo folio bulbosus*, and as I thinke doth more nearely resemble, the *Ranunculus Phoeniceus Myconi*, set forth in the great Herball called *Lugdunensis*, which hee saith groweth plentifully at the foote of the hills of *Santa Maria Monteferato*, and the places thereabouts, and as he saith there, hath *bulbosus* rootes and long narrow leaves, and so hath this, but the former hath neither. The seventh and eight with the other of the same kinde are likewise plants never written of by any other before, and therefore their titles must stand as they doe. The ninth *Fabius Columna* found likewise in the hills *Campochresensis* and *Aquicoli*, and calleth it *Ranunculus montanus Leptophyllus Alphoneli radice* which is very like unto that with *Asphodill* rootes, which I have set forth in my former Book, having leaves like the small *Thalictrum*, and a white flower but this hath yellow, which as I there said, *Lugdunensis* setteth among the *umbelliferous* plants, and calleth it *Oenanthe Myconi*, because he finding it on the rockie or stony hills in *Spain*, referred it unto *Oenanthe*, in regard of the rootes; but the flowers and seede demonstrate it plainly to be no such plant, but a plaine Crowfoote, as both by the comparison and mine owne inspection (having had it growing in mine owne Garden many yeares, and seene it with others) may truly be testified: The tenth *Fabius Columna* found likewise on the contrary colder side of those hills *Aquicoli*, and called it, as it is in the title: the last sixe sorts have their names in their titles, as *Bauhinus* calleth them in his *Pinax* and *Prodromus*.

The Vertues.

Most of these sorts of Crowfeete being hot and sharpe in taste, and exulcerating the skinn, no lesse than many of the former, cannot be but of the same quality with them, and although there hath not so many and manifest trials, beene made of these being most of them but of late invention, yet no doubt but they may be applied, for the same purposes; according to their degree, in being more or lesse sharpe than others; onely the fourth sort that hath leaves like *Betony*, for the forme sake of the flowers, being joyned to this family, as is said in the description, hath no such hot sharpe or exulcerating propertie, but as is there said being somewhat bitter, and exceeding altringent in taste, is held assuredly to be friendly to the stomacke, as other things that are of the same qualitie of bitternesse and altringent; which helpe to stay and drie up the defluxions of humors, be they cold or hot that fall from the head upon the stomacke and lungs, and to preserve them from putrefaction caused thereby.

Ranunculi bortenfis. Garden Crowfeete.

Those Crowfeete that are chiefly nourished up in Gardens, should follow next, but that I have already shewed them in my former Booke, selecting all those that beare flowers of any beautie, out of all the rest of the Tribes or Families, to store that Garden with all as was most fit and proper: whosoever therefore are desirous to see their descriptions or know farther of them, I must referre them to that Booke wherein they may see and read the varieties there expressed, The *Anemones* also or Wind flowers and *Pulsatillas* as being kindes of Crowfeete their sharpe taste and exulcerating qualitie declaring the same, should beare a place here with the rest, but that they are all likewise described aforehand, yet I thinke it not a misse to give you some figures of them, to beautifie this worke and to please your eyes,

Ranunculus albus multiplex.
The double white Crowfoote.

Ranunculus Asiaticus flore rubro amplo simplici, vel versicolor.
The larged or the patty coloured Crowfoote of Asia.

Ranunculus Creticus vel Asiaticus flore argenteo.
The silvy like Crowfoote of Candy or Asia.

Ranunculus Asiaticus vel Creticus flore albo.
Single white Crowfoote of Asia or Candy.

Ranunculus Aspaticus flore pleno & Prolifera.
Double red Crowfoote of Turke.

Pulsatilla vulgar.
Red Pasque flower.

Pulsatilla vulgaris.
Ordinary Pasque flower.

Pulsatilla alba.
White Pasque flower.

Anemone latifolia prima Clusij.
Clusius his first broad leaved Wind flower.

Anemone latifolia chersonesus.
The double crimson broad leaved Wind flower.

Anemone latifolia flore purpureo.
Broad leaved Wind flower with purple flowers.

Anemone maxima Chalcidonica.
The great Wind flower of Constantinople.

Anemone maxima Chalcidonica fl.
The flower of the great Windflower
of Constantinople.

Anemone tenuifolia flore simplici violacea.
The thinne leaved Wind flower with a single
purple flower.

Ranunculi palustres & Aquatiles, Marsh and Water Crowfoote.

Such sorts of Crowfoote likewise should follow, and be joyned to the rest, as grow in Morish grounds or Watery places, if I had not set and propounded to my selfe an other manner of method to follow in this Worke; I must referre therefore all those that are desirous, to be satisfied with the knowledge of them unto their proper place, where they shall be intreated of all together, with all other sorts of herbes, naturally growing in such places, which is the Classis of Morish and Watery plants.

CHAP. V.

Mandragoras Mandrake.

Although I have declared in my former Booke the diversities of Mandrake, both male and female, yet I thinke it not a misse to remember them here againe, being a plant both of that worth and raritie, and dangerous and profitable qualities therein, especially *soporiferous* whereof some ensuing plants doe partake.

1. *Mandragoras mas vulgarior*. The more ordinary male Mandrake.

This male Mandrake thrusteth forth from the roote (which groweth somewhat great and downe right, in some but with one, in others with two, three or foure twines or branches, devided a little below the head or toppe, and diverse small fibers besides, blackish on the out side, & whitish within, without other shape of mans or womans parts, whatsoeuer cunning knaves may forme other rootes by Art to be like what they please) many large leaves lying on the ground greater than any Beete leaves, whereunto *Dioscorides* compareth them: from the middle of whom rise up sundry pale Greene flowers, made of five round leaves apeece, each standing on a small slender foote stalle within a Greene five leaved huske wherein afterwards is the fruit set, being of the bignesse of a reasonable Pippin, and as yellow as gold when it is thorough ripe with divers round whitish flat feedes within it, and of an heady or strong stuffing sent, this is the true description of the plant, and therefore those idle formes of the Mandrakes and Womandrakes, as they are foolishly so called, which have beene exposed to publike view, both in ours and other lands and countries, are utterly deceitfull being the work of cunning knaves, onely to get money by their forgery: doe not misdoubt of this relation no more than you would of any other plant set downe in this booke, for it is the plaine truth whereon every one may relie.

2. *Mandragoras mas alter*. Another male Mandrake.

I saw in my Lord Wootton his Garden at Camerbury, whereof Mr. John Tradescant had then the keeping an other

other sort of male Mandrake whose leaves were of a more grayish Greene colour and somewhat scoulded together differing herein from the forecited kinde which grew there hard by this also, but what fruit it bore could not be assured having never borne any as they said.

3. *Mandragorae feminæ.* The female Mandrake.

The female Mandrake hath likewise many leaves lying on the ground but smaller, narrower, more crumpled and of a darker Greene colour, resembling those of *Lettice* as *Dioscorides* compareth them: the flowers also rise from among the leaves, each on his slender footstalk as in the former, but of a blewish purple colour: the fruit that followeth is much smaller than those of the male, but round like them, and not pear fashion as some have thought, (for *Clusius* who saw diverse of them, growing naturally in sundry places in *Spain* denieth it) of a paler yellow colour when they are ripe, and of a more pleasing, or rather of a lesse heady sent, than the apples of the male, wherein are contained such like seede but smaller and blacker, the roote also is like the former, blackish without and white within, neere unto the same forme, parted into more or fewer branches, as nature listeth.

Mandragorae mas & feminæ.
The male and female Mandrake.

The Place.

They grow in woods and shadowie places, and the female by rivers sides, in diverse countries beyond the Alpes, but not on this side naturally, as in *Greece*, the Isles of *Candy*, and others in the Mediterranean sea, *Italy* also and *Spain*: within they are nourished up as rarities in Gardens, the male in sundry places: but the female onely with the curious, as being both farre more rare to get, and more tender to keepe.

The Time.

The male flowreth in March and the fruit is ripe in *July* the female as *Clusius* saith, he found in some places in *Spain* in flower in February, and in the same month in other places of *Spain* it had ripe fruit, but with us where it is best preserved, it flowreth not untill August or September, and the fruit feldome or never ripeneth.

The Names.

It is called in Greek *μανδράγοις*, and *Mandragoras* also in Latine, *quod ad mandra pecorum aliaque speluncas proveniat*; some also as *Dioscorides* saith in his time called it *μανδραγόρ*, and *Circæa*, because *Circæ* the great enchantresse used it as is thought in love matters; *Pythagoras* called it *ανδρῶπιος* *αφ᾽ ὁμοίαν* *ἡμᾶν*, because the roote hath some likenesse of a mans body with two legges, but without armes; they are called also *Μαλῆ* *canina* & *terrestria*, *Dioscorides* saith the female was called *μαλῆ* *τριδάκτυλος* of the *Lettice* like leaves, and *niger*, as the male was called *Candidus*, the fruit of both is round, but of the female as *Dioscorides* saith, like *βοτρίδι*, and not *ὡς* *ὄβυς*, as *Ruellius* his Translation hath it, which caused some to figure it pear fashion, especially seeing *Oribasius* who followed *Dioscorides* most nearely compareth the fruit as well to *acerabibus* as wild pears; but you here before *Clusius* his deniall thereof, as an *oculus testis* of all those that he saw, so that if any fall out otherwise, it might be rather accounted *Insuper nature*, than the ordinary proprietie in nature. *Dioscorides* his third sort called *Morion*, is not *Theophrastus* his *Mandragoras* as *Cordus* thought, which lib. 6. cap. 2. hee saith hath a stalk as *Elleborus*, *Cicuta* and *Albucum*, but is much controverted by diverse, being not certainly knowne what herbe it is, and peradventure also not to *Dioscorides* himselfe, for he relateth it but by heare say, as he doth many other things which were not of his owne knowledge. *Matthiolus* defendeth *Hermolaus Barbarus* against *Brasavolus* and *Fuchsius*, who judged that *Hermolaus* thought the *Melongena* or *Mala insana* to be *Dioscorides* his *Morion*, which he describeth, *ut ferunt* or *tradunt*, to grow nigh unto caves in sundry woods, with lesser white leaves than those of the white Mandrake, a spanne long lying about the roote, which is tender and white, longer then ones hand, and of the thicknesse of ones thumbe: *tradunt* againe saith he, that if a dramme of the roote be given any man in bread or broath, it will take away the use of reason and sense, causing him to sleepe for three or foure houres, after the same manner of disposition as when he tooke it: *Phyicians* use this when there is cause to burne or cut off any member, (that is, to cast him into a deepe or dead sleepe, that the paines may not be so sensible:) by these words of *Dioscorides*, it doth plainly appeare to me, that his *Morion* is but another species of the former which hath no stalks, for the leaves he saith (and peradventure the fruit also) lie on the ground about the head of the roote: but *Pliny* hath faulted foulely in describing the Mandrakes, making those of *Theophrastus* and *Dioscorides* to be one, and transferring that which is proper to the one unto the other. The sundry fables hereof reported in *Matthiolus* and others are not fit here to be related; who so are desirous to know them, may read them in their Authors or Relators. The *Arabians* call it *Labora* and *Tubrobach*; the *Italians* *Mandragora*; the *Spaniards* *Mandracola*; the *French* *Mandragore* and *Mandagloire*; the *Germans* *Abram*; the *Dutch* *Mandragora*; and we in *English* Mandrake:

The Vertues.

The Mandrake as *Galen* saith is of an exceeding cold qualitie even in the third degree, yet hath in it some heat, in the bark of the roote is some driness, and in the apple some moisture, whereby it is of a soporiferous proprietie causing sleepe, esse or drowsinesse, as *Levinus Lemnius* in his Herball to the Bible maketh mention of

an

an experiment of his owne, that upon a suddaine became drowfie, sitting at his booke in his study, and musing what should be the cause, found that it proceeded from the sent of one of these apples, which he had laid on a shelve therein, which being removed he found no further inconvenience: the barke or the juice taken thereof, is given to those that in their sicknesse cannot sleepe, the decoction of the roote in wine also doth the same; and is exhibited to those (as is afore said) that are to be seared, or a limbe or member to be cut off, to induce the lesse sence of paine: the condensate juice taken to the waight of one scruple in sweete wine, purgeth flegme and melancholy by vomit like unto Hellebor, but taken in a greater quantity it killeth: it is used also in pessaries, either of it selfe, or with other emollient things to take away the hardnesse of the matrix, to procure their courses, and to expell the dead birth. But see that not above halfe a scruple be used at a time: the said juice is also used with those ocular medicines that coole inflammations in the eyes: the leaves are likewise used for the same purpose, as also impostumes, and discusse, all hardnesse, knots and kernels in the flesh, and take away the scars of burning, being often rubbed therewith: the roote beaten with vinegar and applied to those inflammations, called Saint *Antonies* fire, doth heale them, and applied with honey or oyle, taketh away the sting of Serpents. It is said that if Ivory be boild with the roote hereof six houres together, it will so mollifie it, that it will take what forme or impression you will give it: the apples and especially the seeds in them, doe purge and coole the hot matrix, as *Serapio Avicen*, and *Paulus Aegineta* after *Dioscorides* have set downe, which peradventure *Rachel* knowing to be available for her hot and dry body, which was the cause of her barrennesse, (and her beauty argueth a probability of such a constitution) desired the more earnestly the Mandrake apples that *Ruben Leahs* sonne had brought his mother, as it is *Genesis* 30. v. 14. the strong sent of these apples is remembered also *Cant.* 7. 12, although some would divert the signification of the Hebrew word *קדרות*, (which is the same in both places) unto Violets or some other sweete flowers, that *Rachel*, desired and the fruite of *Musa* or *Adams* apples to that in the *Canticles*: *Hamilcar* the *Carthaginian* Captaine is said to have obtained a famous victory, over the *Libians* by infecting their wines with the apples of Mandrake, whereby being made drowfie they left their wals unmand.

CHAP. VI.

Solanum. Nightshade.

Here are diverse sorts of Nightshades, properly so to be called, and there be some other that are referred thereunto, for the likenesse of the leaves, flowers, or fruite, or for the properties in the operation. Of those that are referred unto the Nightshade, I have already spoken of diverse in my former booke, whereunto I referre them, that would be enformed of them, not meaning to repeat their descriptions, but denominations in this place, which are *Mirabilia Peruviana*, the Mervaille of Peruor of the world. *Pomum amoris fructu majore*, Apples of love the greater sort. *Stramonium* sive *Pomum spinosum majus flore simplici albo, & purpureo, & Datura Turcarum flore albo simplici & flore duplici purpureo*, Thorne apples the greater, with a single white, or single purple flower. and the lesser with a single white flower, or a double purple flower. *Solanum arborescens* or *fruticosum*, called also *Pseudocapsicum Dodonæi*, or *Amomum Plinij*, *Solanum Americanum*, & *Cerasa Indiana*, Tree Nightshade, the Munme tree, or Winter Cherry tree: & *Solanum vesicarium* or *Alkekengi*, Winter Cherries, Potatoes of *Virginia* called of many, apples of youth, and of *Bahianum* in his *Matthiolus Solanum tuberosum esculentum*, and thought by *Clusius*, that it did in many things resemble the *Pycnocomon* of *Dioscorides*, moved chiefly thereunto from the likenesse of the figure thereof, which he saw in a written copy of *Dioscorides*, that had figures; as also that it might be *Arachidiana* of *Theophrastus*; but setteth it downe in his History of Plantæ, by the name of *Papas Peruvianorum*, and called by the *Indians*, or *Spaniards* *Papas*, as *Gomara* and others say: and although the common wild Nightshade, is not dangerous, as divers others are, nor planted in Gardens with us as it was in former times, to be as a potherbe or falletherbe usually eaten, (but now adayes utterly refused,) and therefore called Garden Nightshade, yet let me set it with the rest of the familie and not disjoine it from them.

1. *Solanum vulgare*. Common Nightshade.

The Common Nightshade, hath an upright round greene hollow stalke, about a foote, or halfe a yard high, bushing forth into many branches, whereon grow many darke greene leaves, somewhat broad and pointed at the ends, soft and full of juice, larger than the leaves of Bassill, else somewhat like and a little unevenly dented about the edges, at the toppes of the stalkes and branches, come forth three or foure or more white flowers, made of five small pointed leaves a peece, standing on a stalke together, one by or above another, with yellow pointels in the middle, composed of foure or five yellow threds set together, which afterwards turne into so many pendulous greene berries, of the bignesse of small pease, full of greene juice, and small whitish round flat seede, lying within it: the roote is white and a little woody, when it hath given flower and fruite, with many small fibres at it: the whole plant is of a waterish insipide taste, but the juice within the berries, is somewhat viscos, like unto a thin mucilage, and is of a cooling and binding quality.

2. *Solanum vulgare baccis rubris*. Red berryed common Nightshade.

I call this common Nightshade, because it is in all things like the former common Nightshade, except that the leaves hereof are somewhat harder and rougher, and the berries when they are ripe, are either of a yellow, or of a yellowish red colour, the whole plant growing also little bigger then the other: this sort we have had out of *Spaine*, but endured not a winter with us, being more tender as coming out of a hotter Country, where it abideth many yeares, and it may be, that it is but a degeneration by reason of the climate, as it hapeneth in sweete Fenell seede and divers other things which change by transplantation.

3. *Solanum Somniferum*. Sleepy Nightshade.

Sleepy Nightshade riseth up, with divers thicke round soft woolly stalkes, divided into other branches, whereon grow many soft woolly, but greene broad round leaves, very like unto Quince leaves, two alwayes set at a joynt one against another, of somewhat a hot taste as *Clusius* saith: the flowers come forth at the joynts with the

1. *Solanum vulgare*.
Common Nightshade.

3. *Solanum Somniferum*.
Sleepy Nightshade.

5. *Solanum Strychnifera* also am.
Sleepy Nightshade of another sort.

6. *Solanum Lethale*.
Dwale or deadly Nightshade.

the leaves, all along the stalkes and branches, three or foure together round about them, which are long and hollow, ending in foure somewhat long and pointed leaves, of a pale white colour, which being past, there rise up in their places small yellowish red berries, yet bigger then those of the former, set in woolly huskes; the roote is thicke long and hard, and of a brownish colour on the outside.

4. *Solanum somniferum antiquorum verum.* The true sleepey Nightshade of the ancient writers.
This Nightshade riseth up with three or foure or more thicke round straight whitish stalkes about a yard high or

more, parted into some other branches, hard to breake, set with somewhat broad leaves very like unto Quince leaves with small footestalkes under them not alwayes two at a joynt, but many standing singly at the joints with the leaves; from the middle of the stalkes upwards, come forth diverse reddish flowers together, consisting of foure leaves apeece after which follow, small striped and pointed greenish huskes; but red when they are ripe, very like unto the bladders of the Winter Cherries, but much lesse, with a red berry within it, in like manner; the roote is somewhat great and woody, covered with a whitish barke, not very thicke, of a fowle sent and insipide taste. Because that kinde of *Solanum*, which *Matthiolus* first, and *Clusius* after him, set forth for the true *Somniferum* of the ancients, doth not beare bladder like huskes or fruites, as *Theophrastus* saith, lib. 9. c. 12. it hath, it cannot be the right, but this onely which hath such.

5. *Solanum Somniferum alterum.* Sleepie Nightshade of another sort.

The other sleepey Nightshade, hath an upright crested or cornered stalke, with many leaves thereon, being longer and narrower than the last, and more inclining downeward to the ground, full of veins running long wise and traverse therein: at the joynts of the stalke, from the middle part upward, come forth severall pendulous flowers, hanging by very long stalkes, being long and hollow like unto a Bell-flower, of a purplish colour, each of them set in a large Greene huske, dented or cut into five parts at the edges, but not very deepe; wherein after the flower is past, standeth a round berry, of a deepe blackish purple colour, enclosed therein to the middle, and having like a Crowne, at the head of the berry; which is full of a wine like juice, and many small white seeds within it: the roote is great and spreadeth many great branches with small fibres also, under the ground.

6. *Solanum lethale.* Dwale or deadly Nightshade.

Deadly Nightshade groweth sometimes to the height of a man, but usually it riseth not up above three or foure foote high, having round green stalkes, set with divers large leaves, much greater than any of those before, smooth and of a darke Greene colour, set upon very short footestalkes; among which at the joynts with the leaves come forth severall long hollow flowers, dented at the brims, of a faint deadish purple colour, standing in a Greene huske; which after the flower is fallen, containeth a great round berry, Greene at the first, but of a shining blacke colour, like shining or polished jet; when it is ripe, full of a purplish juice, and many whitish seeds lying therein: the roote is great, growing downe deepe into the ground, and spreading great branches therein, and besides creepeth under ground, rising up in severall places distant, quickly spreading over a ground: the plant hath no good sent, nor taste, but unfavory and bitter and very pernicious.

Of this kinde there is another sort, whose leaves are lesser, and of a darker Greene colour, standing upon long footestalkes, and the flowers are not so great and large as the other.

7. *Solanum Indicum umbelliferum hirsutum.* Hoary Indian Nightshade.

Clusius in his fourth booke of *Exoticks*, declareth that one *Dr. Cole*, or *Coolmans*, going with *Dutch Merchant Ships* to *Batavia*, and other places, in the *East Indies* (but dying by the way in coming home) had gathered some herbes, and put them up into a booke of papers, which being viewed by *Clusius*, hee found among many others, this dried plant without leaves, which yet he referreth to the kinds of Nightshade; the slender stalkes, being about five inches long, and hoary white, bearing many shrivelled berries, hanging downe out of five pointed huskes or cuppes, of a brownish red colour, of the bignesse of pepper cornes, standing in a tuft or umbell, wherein were white feedes, like to those of Nightshade, but not ripe.

8. *Solanum magnum rubrum Virginianum.* Red Nightshade or Red weed of Virginia.

This great *Virginian* plant, which from the likenes of the leaves we have called a *Solanum*, and referred thereunto, riseth up with a great thick round reddish stalke, of the thiknes of ones thumbe at the least, & 4. or 5. foote high or more, set without order with many very large fresh Greene leaves full of veins, some greater and some smaller and sometimes turning reddish: from the joynts where the leaves stand from the middle of the stalke upwards, come forth severall small stalkes bearing the flowers which are very small consisting of foure leaves a peece of a pale red or bluish colour, divers standing together as it were in a small long cluster, which after bring forth small blackish

blackish round feede, foure usually set in one huske: yet it seldome commeth to ripenesse in our country: the roote is white and groweth great with us, but perisheth if it be not defended from the frosts in winter, which usually rot it, but in the naturall places it groweth as big as a mans legges, (for such hath bene sent me, with many circles to be seene in the middle when it was cut like unto a *Bryony* roote) and above a foote long.

8. *Solanum Mexicanum parvo flore, sive Mirabilis Peruviana minor.* The small Mervale of Peru. This small Mervale of the world, or of Peru, groweth in the same manner, that the greater kinde, shewed you in my former booke doth, but nothing so great or high, having such like leaves set on the stalkes, but much lesser and rounder: the flowers likewise being of a red colour for the most part, and made of one leafe, opening into five parts at the brimes, like the other, are so small, that the whole flower of this is scarce so bigge as the one part, or division of the greater flower, the feed that followeth, and the roote likewise are answerable in proportion to the rest of the plant.

The Place.

The first groweth wild with us, under old walles, and in rubbish, the common paths and sides of hedges and fields as well as in other countryes, either hot or cold, as also both in their and our gardens, without any planting. The second groweth onely wild in the hotter countries of *Spain*, *Italy*, &c. The third *Clusius* saith he found not farre from *Malaga* in *Spain*, and *Matthiolus* saith in *Italy* also. The fourth *Alpinus* saith, groweth in *Candy*. The fifth as *Matthiolus* saith, groweth on the hill *Salvatico* in the County of *Gortio* in *Italy*, hard by *Trent*, and as some thinke in *Syria*, and the East Countries thereabouts. The sixth groweth wilde not onely in many, and divers woods of *Germany*, but in divers places of our owne Land, as in the Castle yard of *Framingham* in *Suffolke*, under *Iesus Colledge* wall in *Cambridge*, and in many places of that Country: also at *Ilford* in *Essex*, at *Croydon* among the *Elmes*, at the end of the Towne: in *Moore Parke* in the Parke of *Sir Percivall Hart* at *Lelling stone* in *Kent*, on the Conny burrics, in *Burling Parke* likewise, as also in the way that leadeth from *S. Mary Cray* to *Footes Cray* over against the gate of a great field called *Wenall*. The seventh is declared in the description. The eighth groweth in *Virginia*, *New England*, &c. from whence the feed and Plants, were first brought to us. The last came as the greater sort did from the *West-Indies*.

The Time.

They doe all dye downe to the ground in winter, although some doe shoote a fresh in the spring, as the 3. 4. 5. 7. 8. 9. doe, yet the third being more tender as comming out of a warmer Country, doth hardly endure, but perisheth utterly by the extremities of our winters, especially if it be not houfed or well defended, and even the two first that dye every yeare, and rise of their owne sowing, doe not spring out of the ground, untill it be late in the yeare, as not untill the latter end of *April* at the soonest.

The Names.

It is called in Greeke of some *τῆλον* & *τῆλον*, but more usually *ἐμπύον* quod vitenum, capreolum, vitem vel acinum, vel tale quiddam signet, at *Pena*, in *Solanorum* classe, quibus cunctis proprium acinos plures vel pauciores habere, nisi quis *ἐμπύον* e. *Theophrastus* suspicari malit, aut *Βοτρυόειον* in *ἐμπύον* mutatum. In Latine *Solanum* & *Solatrium*. *Una lupina* & *Una vulpis*. *Pliny* saith it was called also *Strumum* and *Cucubalus*, but they are thought to be rather bastard names, and not to be proper to this plant, the *Arabians* call it *Hameb albomaleb*, *Hameb alchahich*, and *Hameb althaleb*, the *Spaniard*, *Terva Mora*, and *Morella*, the *Italians* *Solatro*. The *French* *Morelle*. The *German* *Nachtshade*, and the *Dutch* *Nacht-ye*, and *Nachtshade*. In *English* *Nightshade*, *Morrell*, *Petty Morrell*, and in some places *Hemds berries*. *Dioscorides* reckoneth up foure sorts, *Kiama* & *hortense*, *ἐμπύον*: *vesicarium*, *ὑπνωτικόν*, *somniferum*, and *καυτὸν* *furiosum* or *manicum*. *Theophrastus* in his 7 booke and 14. chapter, maketh but three sorts, *solanum* *edule*, *fructum* *veluti* *mitem*, *vel acinosum* *ferens*. Sunt alia duo quorum alterum *somnium*, alterum *insaniam* adfert. The first is generally called by all writers *Solanum* simply, or *vulgare*, or *hortense*, because it is most usuall, and generally every where to be had, and was planted in gardens as other herbes for foode, but now is no where used, but Physically: the second is called of *Cordus* in his History of Plants *Solanum panicum*, and of *Gesner* in *horti Germania* *Solanum rubrum* & *luteum*, and is remembered by others also. The third is generally taken to be the true *Solanum somniferum* of *Dioscorides*, for so *Matthiolus*, *Gesner*, *Guilandinus*, *Lacina*, *Clusius*, *Dodonaeus*, *Lobel*, *Cesalpinius*, *Cassor* *Durantes*, *Camerarius*, and *Lugdunensis* doe set it downe. *Prosper Alpinus* only contesteth against it, and sheweth that the fourth here set downe, which in his booke de plantis exoticis, he saith hath red bladders, and small red berries in them is the right sort, as *Dioscorides*, *Theophrastus* and *Pliny* doe describe their *Solanum somniferum* to be. The fifth *Matthiolus* calleth *Solanum somniferum* *altissimum*, and so doe *Camerarius*, *Gesner*, and *Lugdunensis*, *Dodonaeus* calleth it *Solani lethali* aliud genus. The sixth is generally by the *Italians* called *Bella Donna*, either per *Antiphrasin*, because it is blacke, or as the *Moors* doe account them fairest, that have the finest blacke skinne, or as some have reported, because the *Italian* Dames, use the juice or distilled water thereof for a *fucus*, peradventure by the excessive cold quality, to take away their high colour, and make them looke paler. *Matthiolus* calleth it *Solanum majus*, and so doe *Cesalpinius*, and *Camerarius*: *Tragus* *Solanum hortense nigrum*: *Fuchsius*, *Lobel*, and *Lugdunensis*, *Solanum somniferum*, *Dodonaeus*, and *Clusius* *Solanum lethale*, and so doth *Thalys*; *Gesner* *Solanum sylvaticum*; *Anguillara*, *Guilandinus*, *Dodonaeus*, *Fuchsius*, *Cordus* and others, doe take it to be *Mandragoras morion* of *Theophrastus*, but not of *Dioscorides*, for they are so much differing one from another, as though they had lived in two severall worlds, to give names to herbes, the one not knowing of the other. The *Germanes* call it *Schlaffbeere* and *Dolmurtz*; it is called in *English*, *Dwale*, or deadly *Nightshade*. The seventh *Clusius* maketh mention of, in the fourth booke of his *Exoticikes*, by the name of *Solani Indici* genus, and *Bauhinus* thereupon calleth it as I doe in the title, *Solanum indicum hirsutum corymbiferum*. The eighth we have referred as I said before, to the kindes of *Solanum*, for the likeness of the leaves, although much larger, and call it *rubrum*, both for the colour of the stalke, and from the colour that it giveth, for the *Indians* therewith doe both colour their skinnies, and the barks of trees wherewith they make their baskets, and such like things, as we are informed: the *Indians* themselves call it and our *English* people that live in *Virginia*, call it *Red weede*, but we according to the Latine name, red *Nightshade* of *Virginia*. The last *Bauhinus* setteth forth in his *Prodromus* and *Pinax*, under the title here exprest, not being mentioned by any other writer.

The Vertues.

The ordinary or common Nightshade is wholly used to coole all hot inflammations, either inwardly or outwardly, being no way dangerous to any that shall use it, as most of the rest are; yet it must be used moderately, for being cold and binding in the second degree, the distilled water onely of the whole herbe is fittest and safest to be taken inwardly: the juyce also clarified and mingled with a little vinegar, is good to wash the mouth and throat that is inflamed: but outwardly the juyce of the herbe or berries, with oyle of Roses, and a little vinegar and cerusse, laboured together in a leaden Morter, is very good to anoint all hot inflammations, Saint *Antonies* fire, and all other grieved places, that are molested with heate, as the head ache and frenzies, anointing the temples and forehead therewith, as also the heate and inflammation in the eyes: it doth also much good for the shingles, ring worms, and in all running, fretting & corroding ulcers, and in weeping or moist Fistulas, if the juyce be made up with some hens dung, and applied thereunto: a pessary dipped in the juyce, and put up into the matrixe stayeth the immoderate fluxe of womens courses; a cloth wet therein and applied to the testicles or cods, upon any swelling therein giveth much ease: as also to the goute, that commeth of hot and sharpe humours; the juyce dropped into the eares, easeth those paines that arise of heat or inflammation; *Pliny* saith moreover, that it is good for hot swellings under the throat: the sleepe Nightshade of both sorts, are of one and the same qualitie, being cold in the third degree, and drie in the second, comming neere unto the proprietie of *Opium* to procure sleepe, but somewhat weaker, if a dramme of the barked of the roote be taken in wine, but not to exceede that proportion for feare of danger: the seede drunke doth powerfully expell urine, and is also good for the dropisie; but the often taking thereof in too great a quantite, procureth frenzie; the remedy whereof is, to take good store of warme honied water: the roote boyled in wine, and a little thereof held in the mouth, easeth the paines of the tooth ache: *Pliny* saith it is good to fasten loose teeth: the juyce of the roote mingled with hony, is good for the eyes that are weake of sight: It is more effectuell in all hot swellings and inflammations than the former, in regard it is colder in qualitie, the juyce of the herbe or rootes, or the distilled water of the whole plant being applied: the deadly Nightshade is held more dangerous than any of the other, for it is thought to be cold in the fourth degree: the juyce of the leaves, and a little vinegar mixed together, procureth rest and sleepe, (when upon great distemperature, either in long sickness, or in the tedious hot fits of agues, rest and sleepe is much hindered) if the temples and forehead be a little bathed therewith: as also taketh away the violent paine of the head, proceeding of a hot cause: the leaves bruised or their juyce may be applied to such hot inflammations, as Saint *Antonies* fire, the shingles, and all other fiery or running cankers, to coole and stay the spreading: the danger is very great, and more in the use of this inwardly, than in any of the former, and therefore there had neede of the more heed and care, that children and others doe not eate of the berries hereof, least you see the lamentable effects it worketh upon the takers thereof as it hath done, both in our owne land, upon sundry children killed by eating the broth wherein the leaves were boyled, or the berries, and beyond the sea in the same manner: yet some doe hold that two ounces of the distilled water hereof is effectuell to be taken inwardly without any danger, against the heart burning, and other inflammations of the bowells, and against all other hot inflammations of the skine or eyes, giving ease to the paines. It hath beene often proved, that one scruple of the dried roote hereof infused in a little wine sixe or seven houres; and then strained hard through a cloth, that if this wine be put into a draught of other wine, whosoever shall drinke that wine, shall not be able to eate any meate for that meale, nor untill they drinke some vinegar, which will presently dispell that qualitie, and cause them fall to their vlands, with as good a stomacke, as they had before: this is a good jest, for a bold unwelcome guest. The *Virginia* Nightshade is a familiar purger with them in *Virginia*, *New England*, &c. where they take a spoonefull or two of the juyce of the roote which worketh strongly; but we having tried to give the dried roote in powder have not found that effect.

CHAP. VII.

1. *Solanum lignosum* five *Dulcamara*. Wood Nightshade or Bitter sweete.

Although this plant hath no dangerous quality therein, nor yet is properly any Nightshade, more than the outward conformitie in some sort, yet because many learned Authours have reckoned it as a sort thereof, and called it by that name, let me also place it with them, and shew it you in this place, thus: it groweth up with many slender winding brittle woody stalkes, five or sixe foote high, without any clasps, but foulding it selfe about hedges, or any other thing that standeth next unto it, covered with a whitish rough bark, and having a pith in the middle, shooting out many branches on all sides, which are greene while they are young; whereon grow many leaves without order, somewhat like unto the leaves of Nightshade, but that they are somewhat broad, long, and pointed at the ends, with two small leaves, or rather peeces of leaves, at the bottome of most of them, somewhat like the Sage with eares, and many of them likewise, but with one peece on the oneside, sometimes also those peeces are close unto the leaves, making them seeme as it were jagged, or cut in on the edges into so many parts, and sometimes separate there from, making the leaves seeme winged or made of many leaves, and are of a pale greene colour: at the toppes and sides of the branches come forth many flowers, standing in fashion of a long umbell, upon short foote stalkes, one above another, which consist of five narrow, and long violet purple coloured leaves, not spread like a starre, or very seldom, but turning themselves backwards to the stalkes againe whereon they stand, with a long gold-yellow pointell in the middle sticking forth, which afterwards turne into round and somewhat long berries greene at the first, and very red, soft and full of juyce when they are ripe, of an unpleasant bitter taste, although sweete at the first; wherein are contained many flat white feedes: the roote spreadeth it selfe into many strings under ground, and not growing into any great body: the bark also of the branches, being chewed, tasteth bitter at the first, but sweeter afterwards.

2. *Dulcamara flore albo*. Wood Nightshade with white flowers.

Of this kinde there is another that differeth not from the former, more than in the flowers, whose outer

H h

leaves

leaves are white, and the pointell yellow.

The Place.

This groweth usually by ditches sides, and hedges; where they may climbe up upon them; the first almost every where: the second is very rare and seldome to be met with, yet it groweth by Saint Margates Church in Rumney Marsh, and neere unto Berronslie house on Southwarkes side, when Gerard wrote thereof, but now is not there to be found.

The Time.

The branches abide dispoiled of leaves all the Winter, yet perish not, but shooteth forth new leaves in the Spring, and flowreth about Iuly, the berries are ripe in August.

The names.

This hath not beene remembred, by any of the ancient Greeke Authours, although some of the moderne Writers, have imposed Greeke names upon it, calling it *εργασίδιον*. *Strychnodendron*, which is *Solanum arborescens*; and *γλυκύπικρον* *Glycypticron*, that is, *Dulcamara* or *Amaradulcis*; diverse doe thinke it to be *Melothron* of Theophrastus. Matthioli tooke it to be *Vitis sylvestris* of Dioscorides, lib. 4. cap. 183. Others in referring it to the Nightshades, call it *Solanum lignosum* or *fruticosum* or *rubrum*. It is called of the Germans *Ielenger* or *lieber* and *Hynschkrant*, because the shepheards use it for their cattell, when they are troubled with that disease they call *Hynsch*, of the Dutchmen *Alfrank*; of the French *Morelle du bois*; and we in English Bitter sweete, wood Nightshade, and Fellowworke of some. *Tragus* would referre it to the *Hedera Helica*, or *Smilax* of Theophrastus in his third Booke and last Chapter; or unto the *Smilax lavis* of Dioscorides, set forth in his fourth Book and 140. Chapter; *Dodonæus* thinketh, that that kinde that beareth white flowers, may be *Cyclaminus altera* of Dioscorides. *Gwillandinus* tooke it to be *Salicastrum* of Pliny, lib. 22. cap. 1. but all erroneously: the learned of Montpellier as *Pena* and *Camerarius* say called it *Circea*; whereunto it as little agreeth, as the *Circea* set forth in the next Chapter, as you shall there understand. *Banbinus* calleth it *Solanum scandens*, seu *Dulcamara*.

The Vertues.

Both leaves and fruit are hot and drie, astringent and clensing. *Tragus* sheweth the manner of making a medicine for the yellow jaundise, (and for the dropie saith *Dodonæus*) although it be inveterate, by driving it forth gently, both by urine and the stoole, in this wise: Take saith he, a pound of the wood of wood Nightshade, cut it small, and put it into a new earthen pot, whose cover hath an hole in the toppe, with three pints of white wine, close the joynts of the pot with paste, and set it on the fire to boyle gently, untill a third part be consumed: which afterwards being strained forth, take a draught thereof morning and evening: The iuyce of the leaves and berries is thought to be good for them that have bene bruised by blowes or falls, to dissolve and avoid the congealed blood, and heale the part affected afterwards: it is held also effectually to open the obstructions of the liver and spleene, but so often as I have given it by appointment I have knowne it to purge very churlishly. Some also use the drinke before prescribed against putride feavers or agues. The countrie shepheards of Germany as *Tragus* reporteth, doth use to hang it about their cattells neckes, when they are troubled with the disease they call *Die Hynsch*, which is a swimming in the head, causing them to turne round: diverse countrie people doe use the berries bruised and laid to the finger that hath a Felon thereon to cure it.

CHAP. VIII.

1. *Circea Luteriana major*. The greater Inchanters Nightshade.

THE likenesse also of this plant in some part thereof, hath caused it to be referred unto the Nightshades by diverse, and so must I untill a fitter place may be knowne, the description whereof is thus. It riseth up with diverse small round pointed stalkes, most usually standing upright, yet sometimes leaning downe to the ground, and taking roote at the jointes, about a foote or more high, especially if it grow in a moist shadowie place, with two leaves set at every joynt, each of them set upon a prettie long foote stalk, which are broad and round almost at the bottome, and very long pointed at the end, somewhat dented about the edges: some compare them unto the leaves of Nightshade; others unto those of Pellitory of the wall, being of a shining greene colour on the upper side, and tender, soft, or gentle in the handling, although it be a little hairy, and of a darke grayish colour underneath: from the middle of the stalk almost upwards, doe the flowers grow Spike fashion, many set together one above another, which shew to be of a darke brownish colour, while they abide buddes unblowne open, but being blowne are small white five leaved starre flowers, daint over especially at the brimmes or edges, with a light shew of bluish, with many brownish yellow threds in the middle, where after they are past, came small rough round heads, like unto small burres, sticking unto garments in the like manner, wherein are included small shining blacke round seede, somewhat like unto the seede

feed, of *Pellitorye* of the wall, but lesser: the roote is small, very white, and full of joynts, from whence it shooteth forth and creepeth every way under ground, quickly spreading a great compasse: the taste hereof is somewhat sweetish and waterish withall.

2. *Circea lutetiana minor*. Small Inchanters Nightshade.

This small Nightshade is in all things like the former, but that it groweth much smaller in every part, although it grow in the same places with it.

The Place.

They grow in moist and shadowy places, and sometimes at the rootes of old rotten trees in woods, and sometimes by the hedge sides or borders of fields.

The Time.

They spring up in *Aprill*, are in flower in *June*, give their seede in *August*, and perish downe to the ground afterwards, the rootes abiding safe in the ground.

The Names.

These were not knowne to any of the ancient writers, that we can finde, but are usually in these dayes, called by all Herbarists *Circea*, because in the outward forme, it is like the *Circea* of *Dioscorides*: *Lobel* and *Pena*, call the greater *Circea Lutetiana*, not knowing the lesser, we adde *major* for a distinction between them, the former is called also *Circea Monspeliensum*. *Tragus* calleth it *Lappa sylvestris*, because the small heads of seed, are rough like small burres, for he judgeth the *Amaranthus minor purpureus* to be the *Circea* of *Dioscorides* and *Pliny*. *Iohannes Thalinus* in *Harcynia sylva* (which is joynd with *Camerarius* his *hortus Medicus*) calleth them *Helxine sylvestris*, five *fluviatilis major & minor*, and saith that they are like in leaves, unto the *Helxine*, that is called *Parietaria*. *Gesner* in *hortis Germanie*, calleth it *Ocimum verrucarium* (not being before knowne by any name) because the leaves as he saith, are like *Bassill*, and the rough heads, like unto rugged warts; *Tabernaemontanus* calleth it *herba Di. Stephani*: *Bauhinus* calleth the greater *Solanifolia Circea dicta major*, as hee doth the lesser *Solanifolia Circea Alpina*, which *Fabius Columna* calleth *Circea minima*. Many also have taken the *Mandrake* of *Theophrastus* to be *Circea* of the ancients, because he saith, it was so called by some in his dayes: and some the *Mandragoras* of *Theophrastus*, to be this *Circea*, and have attributed the vertues thereof unto it: but assuredly none of these herbes, nor that in the former Chapter, is answerable unto the description of *Dioscorides* his *Circea*, for although he saith the leaves of *Circea* are like *Nightshade*, yet the flowers are many and blacke, and the seede like unto *Millet*, growing in small hornes: the roote also he saith is almost a foote long, three or foure together, being white, sweete in smell, and of an heating or warming property: so that as I said, none of these answer unto this description in all things, for the seede of none of them is contained in hornes or crooked cods, although *Tragus* saith the *Amaranthus* is; yet the rootes are not sweete nor heating, nor of any use, when as the chiefest property of *Dioscorides* his *Circea*, consisted in the roote applied for many purposes. It is called in *English* of *Gerard*, *Inchanters Nightshade*, derived from *Circes* the great Enchantresse, mentioned by the ancient writers, but why he should call it also *Bindweede Nightshade*, (and his corrector letteth it so passe) I see no cause; for that name doth better agree, unto the wood *Nightshade*, set forth in the former Chapter, because it doth climbe like a *Bindweed*.

The Vertues.

There hath not bene any of the moderne writers, either *Tragus*, *Gesner*, *Thalinus*, *Lobel* and *Pena*, or *Tabernaemontanus*, that have set downe any property, wherewith any inward or outward diseases may be helped thereby, but have overpassed them, as though none of all the Country people where they grow, made any use thereof: but assuredly by the temperate qualities, of cold and moisture therein, they may not unfaily, nor peradventure without good effect be applied in hot griefes, as the *Nightshade* is, although it be moist and not atringent as it is: I do not here set downe any of the vertues of *Dioscorides* his *Circea*, because this is not it, neither doe we know what it is.

CHAP. IX.

Solana Pomifera. Applebearing Nightshades.

Nto the kinds of Nightshade I must, as divers other good authors doe, joyne some other plantes, which for their qualities, either more or lesse dangerous, or for their outward forme and proportion, doe somewhat agree with the former serdone.

1. *Solanum pomiferum herbariorum* Lobelij. *Lobels* red berried Nightshade.

It groweth like common Nightshade but greater, the leaves are like small Tobacco leaves, the flowers are white, like the ordinary sort, the berries are small and round, of an orient reddish colour, with white seedes within them of an insipide taste, almost without any heate or sharpenesse, and perisheth every yeare as Nightshade doth, this differeth from *Mala Ethiopica*, although *Bauhinus* make them to be one, for this hath no prickles, or thornes, on stalkes, or leaves, nor is the fruite hard or crested.

Solanum fruticosum Americanum dictum Amomum Plinij. The Winter Cherry Tree.

This is described in my former Booke.

2. *Mala Insana Syriaca.* Madde Apples of Syria.

This raging or madde Apple, riseth up with a great hard round purplish or brownish Greene stalk, two foote high, divided from the bottome into divers branches, whereon are set many hairy broad rough leaves somewhat unevenly cut in on the edges, and somewhat like the Thorne apple leaves; at the joynts with the leaves, come forth severall large flowers, consisting of six large pointed leaves, in some plants white, in others of a pale, but deadish purple colour, with yellow threds in the middle; which being past there succedeth large, somewhat long and round fruite, in the warme countries, as bigge as a Cowcumber, but in others, seldome bigger then a large great egge set in the same cup or huske, that contained the flower before, whose colour on the outside, is usually according to the flower it bore, either of a whitish Greene, more yellowish, or of a grayish ash colour, or of a pale or wanne purplish colour, with a very thinne skine or barke, and full of a whitish pulpe, and juice within, having many small flat whitish seedes within it, somewhat greater then those of the Apples of love, the roote is composed of many strings, some great, others small, not thrutting downe deepe into the ground, nor abiding but perishing with the first frosts.

3. *Mala Ethiopica.* Madde Apples of Ethiopia.

The Madde apples of Ethiopia, are somewhat like the former, but that it groweth not so high, nor spreadeth so much, but having one upright stalk, about halfe a yeard high, set here and there, with divers small prickles, not very hard or long, and at severall joynts with jagged leaves, both lesser, and lesse cut in on the edges, then the former, especially the lowermost, having some prickles also in the middle rib, on the backside, but those leaves that grow higher, toward the toppes of the stalkes and branches, are much lesser, divided on the edges; the flowers stand dispersed on the branches at the joynts, consisting of fixe white short leaves, with a yellow pointell in the middle, of divers threds joyned together, after which commeth the fruite which is round and a little pointed at the end, smaller and harder then the greater kinde of Love apples, and straked, and furrowed with all in divers places, of an excellent red colour, and turning more deepe when it is ripe, having sometimes small bunches on them, like unto other small apples, growing unto them; and containing a juicye pulpe within it, somewhat more sharpe then the former, but nothing so moist as the love apples, with such like flat yellowish white seede within it: the roote is a tuft of threds, perishing likewise every yeare, and seldome in these colder countreyes commeth to maturity, to shew his beautifull colour or give good feede.

1. *Solanum pomiferum herbariorum* Lobelij.
Lobels red berried Nightshade.

4. *Mala Insana Europaea.* Madde apples of Europe.

This kinde of madde Apples, groweth with an upright round stalk, to the bignesse of ones finger, a foote and a halfe high, from whence spring forth at severall joynts, sometimes on the one side, and sometimes on the other, divers long and somewhat broad Greene leaves, unevenly cut in on the edges; and ending in a long point, three for the most part comming together, each of them upon a short foote stalk: at the tops of the stalks grow the fruite, which are round reddish berries or apples of the bignesse of a Plum, full of feede within them.

5. *Poma amoris majora media & minora.*

Apples of Love, of a greater, lesser, and middle sizē.

These sorts of Love Apples, doe in all things so neerely resemble one another, both in the long trayling branches, the winged and divided leaves, the yellow flowers, and the red berries or fruite, as I have shewed in my former booke, that I can add no more thereunto.

The Place.

The first was brought out of Spaine, the second groweth plentifully wild in Egypt, as divers doe report, as also in

Syria;

Solanum fruticosum Americanum dictum Amomum Plant.
The Winter Cherry tree.

Mala insana Syriaci.
Maddie apples of Syria.

Mala Ethioptica.
Maddie Apples of Ethiopia.

Pomum amarum majus.
The greater Love Apples.

Syria, and these Easterne countreyes: the third is thought to come out of *Ethiopia*, and the backe parts of *Babrye*: the fourth *Lugdunensis* saith, groweth in shadowie places, upon the *Apennine* Mountaines: the last likewise groweth in those Easterly Countreyes of *Egypt*, *Syria*, *Arabia*, &c.

The Time.

The three first doe flower late in the yeare, that is, not untill *August*, so that their fruite, hardly commeth to be any thing ripe with us, but the sorts of the last, doe usually ripen well, if the Sommer be not too cold.

The Names.

The first is called by *Lobel*, *Solanum pomiferum herbariorum*, but is not *Mala* *Ethiopica* of *Dodonaeus* and others as *Bauhinus* setteth it downe. The second is called in Latine *Mala Insana* of most writers, that is *Madde Apples* in *English*, (but many doe much marveile, why they should be so called, seeing none have beene knowne, to receive any harme by the eating of them:) in Italian *Melaniana* and *Melongena*, and of the *Florentines*, as *Matthiolus* saith *Petranciani*, of the Spaniards *Verengenas*, of the French *Pommes d'amour*, but why they should so call it, *Ruellius* doth not know as he saith, when as there is another more fitly to be called by that name; of the *Germanes* *Melanian* and *Dollopffel*: divers doe take this to be *Strychnon* of *Dioscorides*, and *urbanum* of *Theophrastus*, as also the third kinde of *Pliny*, whereupon *Cesalpinus* as I thinke, calleth it *Solanum hirsense*, and *Pyra insana*, of *Bauhinus* *Solanum pomiferum fructu oblongo*, *Hermolaw* is thought by *Fuschius*, and *Brasavolus*, to take this to be the *Mandragoras Morion* of *Dioscorides*, but *Matthiolus* defendeth him, and reprooveth them, for laying that imputation upon him, which he did not avouch. The third is called by *Dodonaeus*, and others, *Mala* *Ethiopica*: *Lugdunensis* calleth it *Capiscum rotundum Dalechampi*, but very erroneously, for this hath no such fiery heating quality therein as the *Cassia Gimney Peppers* have; of *Bauhinus*, *Solanum pomiferum fructu rotundo friato duro*: The fourth is called by *Lugdunensis*, *Hysocianus peregrinus Dalechampi*, and of *Bauhinus* *Solanum peregrinum fructu rotundo*, I have called it *Mala Insana Europea*, because that growing naturally in these parts, it is so like unto the last, which is a kinde of *Mala Insana*: the last is called, *Pomum amoris*, and *Pomum* or *Malum aureum*, which *Arguillara* tooke to be *Lycopersicum*, or *Lycopersum* as some have it of *Galen* and others, and to be *Glancium* of *Dioscorides*, which it cannot be, for that hath a yellow juice and bitter, which this hath not: *Guilandinus* saith it is called *Tumatle* by the *Americans*, and some others also would referre it to *Solanum furiosum*, whereunto it hath no quality correspondent, *Bauhinus* calleth it *Solanum Pomiferum fructu rotundo friato molli*.

The Vertues.

Madde apples are eaten being first boyled in fat broth, with vinegar or salt, oyle and peppér, as a continuall juncker with the *Geniveses* and others, as *Scaliger* saith, and neither breed frensy nor any other harme, and therefore he saith, *minus sano iudicio insana dicuntur*. Yet *Avicen* lib. 2. cap. 455. condemneth them, saying that those that are old are very noisome and hurtfull, although the fresh ones be better: for by their bitteresse and acrimony it is gathered, that they are hot and dry in the second degree, and that therefore they engender *Melancholly*, the *Leprosie*, *Cancers*, the *Piles*, *Impostumes*, the *Headache*, and a stinckling breath, breed obstructions in the *Liver* and *Spleene*, and change the complexion into a foule blacke and yellow colour, unless they be boyled in *Vinegar*; so that it is to be admired, that *Averroes* should commend them, being drest in some fashion. *Fuschius* saith that there is a superabundant coldnesse, and moisture, in the Madde apples, as there is in *Cowcubers* and *Mushrooms*: yet the beauty of the fruite worketh in some, and the insatiable desire of delight to the palate in others, and the inciting to *Venery* in the most, (which these are thought to procure) doe so farre transport a great many, that in *Italy* and other hot countreyes, where they come to their full maturity, and proper relish, they doe eat them with more desire and pleasure then we doe *Cowcubers*, or the like, and therefore prepare and dresse them in divers manners; as some doe eat them raw, as *Cowcubers*, some doe roast them under the *Embers*, and others doe first boyle them, pare them and slice them: and having strowed flower over them, doe frye them with oyle or butter, and with a little pepper and salt, serve them to the table. Some also doe keepe them in pickle, to serve for to spend in the *Winter* and *Spring*: but it is certainly found true, that they doe hardly digest in the stomacke, whereby they breed much windinesse, and thereby peradventure bodily lusty that they engender bad blood and *Melancholike* humours, and give little nourishment at all unto the body, and that not good: the Apples of *Ethiopia*, are of the same quality, although of a firmer substance, not yeelding any good nourishment, but rather offensive to the body, for these two are congeneres in forme, and therefore most likely in quality. The golden apples or apples of love, are cold and moist, more then any of the former, and therefore lesse offensive, these are eaten with great delight and pleasure in the hotter Countreyes, but not in ours, because their moisture is fleshy and insipide, for want of the sufficient heate of the Sunne in their ripening.

CHAP. X.

Solana pomifera spinosa. Thorny applebearing Nightshades.

Here are one or two more to be spoken of, to finish this family of the *Nightshades*, one whose fruite is neereft in likenesse unto these Madde apples, the other to the *Nightshades*, after which the *Thorne* apples should next follow, as being by all authors referred unto the *Nightshades*, but because I have already set forth all their descriptions, I shall not neede to repeat them againe.

I. *Solanum spinosum fructu rotundo*, sive *Pomum Hiericonicum Imperato*.

Thorny Nightshade of *Hiericho* with round apples.

The leaves hereof are very like unto those of the former madde apples of *Europe*, but whiter and softer, having many small thornes on the middle ribbe of every leafe on the under side: on the stalk like wife and branches are sparsely set divers thornes, and purplish flowers at the toppes of them being smaller then the former, after which come smaller apples also, Greene before they be ripe, changing yellow and brownish after wards, being round and somewhat sweete in smell, but as unfavoury, or without taste as the former.

Datura five Pomum spinosum majus flore albo & purpureo.

Datura five Stramonium minus flore albo simplici & flore purpureo simplici & duplici.

These are described in my former Booke, and the figures of the lesser sorts here exhibited.

2. *Solanum poniferum Indicum folio rotundo.*

Stramonium minus five peregrinum simplex & duplici.
Single and double small Thorny Apples,

Indian Applebearing Nightshade with round leaves.

This plant being onely mentioned by *Monardus*, in his history of those simple medicines, that come from the West Indies, is referred by *Bauhinus* unto his Classis of Thorne Apples in his *Pinar*, but should more properly in my judgement, be placed with the fruits, in the last Chapter going before, called Madde Apples, but that it hath farre more excellent properties. The plant groweth in manner of a shrubbe or hedge bush as he saith, of an excellent greenesse, having leaves that are small, thinne and round, bearing long fruit, round at the lower end, and flat toward the stalke, like unto the *Malum insanum* or Madde Apple, of a grayish or aschcolour on the out side, and of a pleasant and gratefull taste, without any acrimony therein, having many very small feedes within it.

The Place.

The first groweth in Syria and Palestina, and other the countries neare there unto; the other groweth in the Mountaines of Peru onely, a Province in the West Indies, and the feede sent unto *Monardus* into Spaine, who sowed the feede, to make trial of the effects, were declared to be in it.

The Time.

It is not mentioned at what time either of them floweth or beareth ripe fruite, but it is probable they varie not much from the season, of the other Thorne and Madde Apples, unto which they are so like in forme.

The Names.

The first *Bauhinus* calleth *Solanum spinosum fructu rotundo*, which *Ferrantes Imperator* of Naples, calleth *Pomum Hiericonicum*; the other *Monardus* saith came to him under the name of *Cachos*, as the Indians it is likely doe call it.

The Vertues.

There hath not any Physicall use beene remembred of the first; whereunto it serveth: but *Monardus* saith of the other, that was sent him out of the Indies, that it is of great estimation there, both with the Spaniards and Indians themselves, in that it provoketh urine, expelleth gravell and the stone in the kidneys and bladder, for which it is most commended; it breaketh the stone in the bladder, if it be not too hard and inveterate, or may by any medicines be dissolved, whereof there were many proofes (as *Monardus* saith) declared to his great wonderment: for as he saith, he did not thinke that the stone in the bladder could be dissolved, and expelled by any medicines, and that the cure thereof consisted onely, in the cutting of it out by a cunning hand: but it was said of this, that the feede taken in any fit and convenient water, for that purpose, will by little and little dissolve the stone into small gravell, which after it is expelled forth, will againe be gathered and grow into a hard stone.

CHAP. XI.

Сарсина. Ginny Pepper.

The Ginny Pepper in mine opinion is fittest to follow next after the family of the Nightshades, being in outward forme likest thereunto, as also being no lesse dangerous, although in a quite contrary nature. for this is as farre exceeding in heate, as the other in cold: hereof there are found out, or at least brought to knowledge many sorts in these dayes, which were not knowne in former times, or neglected and not so heedfully regarded at least, as they have beene of later time, especially by *Gregorius de Reggio*, a Capuchine Fryer, who hath observed a dozen severall varieties at the least in the fruite or cods, although very little differing in any thing else. All which I thinke it not amisse to shew you in this Chapter, with some others also not observed by him, but by *Clusius* and others.

1. *Capicum majus vulgatis oblongis siliquis.* The most ordinary Ginny Pepper with long huskes.

I propound this Ginny Pepper as a pattered, by which yee may frame the descriptions of all the rest, the chiefest difference consisting in the forme of the fruite whether you will call them huskes or cods, as shall bee shewed every one in their order. The plant it selfe riseth up with an upright firme round stalke, with a certaine pitch within them, about two foote high in our Country, and not above three foote in the hotter, spreading into many branches; on all sides, even from the very bottom, which divide themselves againe into other smaller branches; at each joynt whereof come forth two long leaves upon short footestalkes, somewhat bigger then those of Nightshade, else very like, with divers veines in them, not dented about the edges at all, and of a very sad Greene colour: the flowers stand severally at the joynts with the leaves, very like unto the flowers of Nightshade, consisting of five most usually, yet sometimes of six white small pointed leaves, standing open

open like a starre, with a few yellow threds in the middle; after which come the fruite (either great or small, either long or short, either round or square, as the kinde is, either standing upright or hanging downe, as their flowers shew themselves, either of this or that forme, as shall be shewed hereafter,) in this somewhat great and long, about three inches in length, thicke and round at the stalke, and smaller toward the end, which is not sharpe but round pointed, greene at the first, but being full ripe, of a very deepe, crimson, shining red colour on the outside, which is like a thicke skinne, and white on the inside, smelling reasonable well, and sweete, having many flat yellowish white feedes therein, cleaving to certaine thinne skinned within it, which are broader at the upper end, and smaller at the lower, leaving the end or point empty within not reaching so farre, the whole huske but especially the feede, being of so hot and fiery a taste, that it enflameth and burneth the mouth and throate, for a long time after it is chewed, almost ready to choake one, that carelessly taketh much at a time thereof: the roote is composed of a great tuft, or bush of threds, spreading plentifully in the ground, and perisheth even in the hot Countreyes, after it hath ripened all his fruite, and with us, upon the first sharpe frost it feeleth.

2. *Capsicum minus Brasilianum*. Small round *Ginny* Pepper.

This *Ginny* Pepper groweth in the same manner that the former doth, not differing therefrom in any thing, but in the leaves, which being of the same forme, are not so great and large, and in the fruite which is small and round (standing some forthright, and some upright, but none pendulous or hanging downe, each of them upon a long footestalke) about the bignesse of a Barbery, but round and nothing forced, but of a darke or blackish yellow colour, enclining to red, and in another sort almost blacke, having such like feede within them, but somewhat smaller, no lesse hot and fiery then the former, and abideth the winter colds, no otherwise then the former, and indeede seldome beareth ripe fruite in our Countrey. Those which we have had from the *Bermoudas* where they are naturall, are of a yellowish red.

3. *Capsicum rotundum majus surrectum*. The greater round upright *Ginny* Pepper.

The chiefest difference in this sort of *Ginny* Pepper, consisteth most in the forme of the fruite, which standeth upright, as the flowers doe, being great and round like an apple, even the greatest of all the sorts that beare round fruite, of an excellent red colour when it is ripe, like unto a polished Corall.

4. *Capsicum erectum pyramidale majus*. The great upright spire fashioned *Ginny* Pepper.

This is much alike or very little differing from the first, the difference of the fruite is that this standeth upright, great below, and smaller, and smaller to the point, which is sharper then in the first, else it might seeme the same being inverted, that is, either that turned upward, or this turned downward, of as brave an orient Corall like colour as the last.

Capsicum Longum.

I. *Capsicum majus vulgatum oblongum siliquum*, & alia duo genera nempe *quartum* & *quintum*. The most ordinary *Ginny* Pepper with great long huskes, and the fourth and fifth.

2. *Capficum minus Brasitanum* & 7. *alia genera*.
Small round Ginny Pepper, and 7. other forts.

Capfici species quatuor nempe.
15. 16. 17. & 18.

5. *Capficum erectum pyramidale minus*. The lesser upright spyrefashioned Ginny Pepper.

As the fruite of this fort is lesser, by the halfe than the last, and not so sharpe or small at the end, but somewhat round, so the greene leaves also are smaller and narrower, and the stalke smaller and not growing so high: the flowers of this, as of all the rest, that beare their fruit upright, doe stand upright also, which is a certaine rule to know what fruit will be pendulous and what will be upright. The figures of both these last forts are set on the sides of the former table.

6. *Capficum exiguum erectum pyramidale*. The least Spyrefashioned Ginny Pepper.

The forme of this small Spyrefashioned Ginny Pepper, commeth so neare unto the second fort, that many may soone be deceived, in thinking them both one, that doe not heede them more precisely; for although they both agree in growing upright, and being small, yet those (of the second fort I meane) are short and round like unto a wild Olive, and it is smaller and longer, of an inch long at the least, and of a blackish red before they be thorough ripe, but then are as red as the rest: this groweth taller, fuller of branches, and more stored both with flowers and fruite, which make the goodlier prospect: the leaves also are no smaller, than in any other fort going before, and of the same darke greene colour with the rest.

7. *Capficum Cordatum erectum majus*. The greater upright heart fashioned Ginny Pepper.

This fort of Ginny Pepper groweth to be but of a meane height, that is, not so high as most of the former, having large leaves, but not so small at the ends: the fruit is not pendulous or hanging downewards, with his foote stalke, but standing upright, being somewhat great flattish, and as it were bunched out at the upper end next unto the stalke, and smaller below, short and round pointed, somewhat resembling the forme of a mans heart, as it is intituled.

8. *Capficum Cordatum erectum minus*. The lesser upright heart fashioned Ginny Pepper.

This differeth not from the last, but in the smallnesse of the fruit, standing also upright, and being smaller by a third part, or neare an halfe, and shorter also: the figure of this is omitted, because it is the same with the next, but that this is upright and the other pendulous.

9. *Capficum Cordatum propendens*. Pendulous heartfashioned Ginny Pepper.

The fashion of this fort of Pepper, is somewhat like the greater upright heartfashioned Pepper, being neare of the same bignesse, but a little more uneven and not so round, but is as red being ripe, and is pendulous hanging downewards not standing upright as the other. There is another of this fort of pendulous Peppers differing in nothing from the greater but in being smaller.

10. *Capficum filiqua Olivaria propendens*. Pendulous Olivefashioned Ginny Pepper.

This Pepper hath small long and round cods, smaller below than above, being very like unto an Olive berry, as red being ripe as any of the rest, and with the stalke hanging downeward.

11. *Capficum filiqua Olivaria erecta*. Vpright Olivefashioned Ginny Pepper.

This differeth from the last but in being greater than it, and standing upright and not in any thing else. The figure of this is not set in any of the tables; but this figure with eleven is next under the number twelve.

12. *Capficum*

12. *Capsicum filiqua rotunda Cerasorum*. Cherry fashioned *Ginny* Pepper.

There are two sorts of this Pepper, one which is fully round, like unto an *English* or *Flanders* Cherry, the other that hath a little point at the end thereof, this being a little bigger then the other, and both of them hanging downe.

13. *Capsicum filiqua lata & rugosa*. Broad and Crumpled *Ginny* Pepper.

The cods of this Pepper are somewhat large, greater above and smaller below, somewhat flat also and not round, but crumpled as it were or shrunke halfe together, and smelleth pretty sweete.

14. *Capsicum erectum majus longum*. Long and upright *Ginny* Pepper.

This Pepper is long and round, yet not like that, that carryeth the forme of an Olive berry, but much longer, and of an equall bignesse all the length thereof, and standeth upright.

15. *Capsicum oblongum majus recurvis filiquis*. The greater crooked or horned *Ginny* Pepper.

The greater horned *Ginny* Pepper, hath great large cods, about five inches long, sometimes little or nothing crooked at the lower end, which is long and small, sometimes a little crooked or bended upwards, and sometimes very much.

16. *Capsicum oblongum minus recurvis filiquis*. The lesser horned *Ginny* Pepper.

This differeth from the last, in not being halfe so thicke or long, and keeping his end bowed or crooked constantly, not varying as it doth: both this and the last hang downe their cods toward the ground: the whole plant also groweth lesse then the other.

17. *Capsicum bifurcata filiqua*. Double pointed *Ginny* Pepper.

This Pepper is very like the long upright Pepper, and much about the same forme and bignesse, being of an equall size almost, all the length thereof, but differeth from it in this, the lower end is parted as it were, into two short round points, and is also a little smaller there then upwards, neither in colour nor any thing else differing from the rest.

18. *Capsicum filiqua flava brevior*. The shorter gold yellow *Ginny* Pepper.

It might be thought by divers, that onely see the cods of this Pepper, that it differeth from all the rest, in the manner of growing, as well as in the colour of the fruite, but it is not so; for it hath like leaves, stalkes and flowers in every part, and onely differeth in that it beareth cods, very like unto the first sort here set downe, which is the most common, but that they are shorter, and ending in a smaller or sharper point, and of a faire gold yellow colour, not red as all the other before are.

19. *Capsicum filiqua flava longior*. The longer gold yellow *Ginny* Pepper.

This gold yellow Pepper differeth in nothing from the last, but in the cods, which are not so thicke as they, but a little smaller, from the middle thereof being longer, or lessening very finely unto the pointed end, of as faire a gold yellow colour as the other.

20. *Capsicum caule piloso*. *Ginny* Pepper with hairy stalkes.

This *Ginny* Pepper groweth with round Greene stalkes; set full of white haire thereon, contrary to all the former sorts: at the joynts with the branches come forth two such leaves, as the first sort here set forth hath, but larger then they; the flowers are white, consist of five leaves like the rest, but larger also then any of them; after which come the cods, Greene at the first, as all the other are, but as red as the rest, when they are ripe, which are somewhat great and long, ending in a very long point, in the rest, as in the seede and rooters, not differing from the former sorts.

The Place.

All these sorts of Pepper, came first from the *West Indies*, called *America*, and the severall parts thereof, *Brassile* being reckoned as a parcell thereof, and our Sommer Ilands also, although we in *English* from others false relation, give it the name of *Ginny* Pepper, as though it originally came from thence: they are nurfed up in gardens, in all the Provinces of *Europe*, and groweth in many places of *Italy*, *Spain*, &c. Set in pots about the windowes of their houses, either for the pleasure of the beautifull Greene leaves and fruite or cods, when they are ripe, or for the use it serveth, or both. *Cusius* saith it is not onely planted in *Spaine*, and *Portugall* in divers places, but in *Moravia* also as he saith, for the profits sake they make of the fruite, which serveth them in those parts, in the stead of the *East-Indian* Pepper.

The Time.

They use not to sow them untill the end of *March*, or beginning of *Aprill*, no not in the warme Countries: they flower usually not before the beginning of *August*, at the soonest; and their brave red cods ripen not thoroughly, untill the beginning of *Winter*, and so will abide both with flowers and fruite, most of the *Winter* with them; but if they take any frosts with us, they presently perishe, and therefore must be housed if any will preserve them.

The Names.

It is generally held to be *Siliquastrum* of *Pliny*, a *siliquis* quas producit, and *Piperitis* of him also, quia fructus *Piperis* sapore & acrimonia sit, and *Kαλινδρα Καττω* mordeo, *Capsicum* of *Altharius*, *Pena* thinketh it to be *Zingiber Caninum* of *Avicen*: it is in these dayes diversely called, for some call it *Piper Indicum*, *Piper Americanum*, *Piper Brasiliacum*, or *Brasilianum*, some *Calocanthium*, some *Hispanicum*, and some *Piper de Guinea*. *Fragosus* saith that the *Indians* call it *Axi*, and besides the sorts here mentioned, he speaketh of one in the last Chapter of *Spices*, of a blackish blew colour, familiar in *Spain*. Of the *Italians* *Pepe Cornuto*, and *Pepe d'India*. Of the *Spaniards* *Pepe Indiano*. Of the *French* *Poivre d'Inde*, and *Poivre d'Espagne*. Of the *Germanes* *Pfeffer Indiansch*, and so likewise of the *Dutchmen*, we in *English* generally call it *Ginny* Pepper, and some *Indian* Pepper. The first as being best knowne, and first obtained in these Christian parts of the world, is mentioned by most of the later writers: *Fuscius* calleth the first two, *Capsicum rubrum* & *nigrum*, and *Siliquastrum majus* & *minus*, *Matthiolus* calleth them *Piper Indicum*, and mentioneth three sorts, this first kinde, the sixth sort, and the seventh, which the figure in *Bauhinus*, his addition unto him doth demonstrate. *Lugdunensis* calleth them, *Capsicum majus* & *minus*. *Cesalpinius* tooke it to be *Circæa* of *Dioscorides*. *Lobel* calleth them *Capsicum*, vel *Piper Indicum longioribus siliquis*: the thirteenth is likewise remembered by *Fuscius*, by the name of *Capsicum latum*, and *Siliquastrum quadratum*, and so doth *Dodonæus* also, and *Lugdunensis* from him, call it *Capsicum latum*, some also doe call that sort

sort *Capsicum Cordatum*: the last is mentioned by *Camerarius* in his *Hortus Medicus*, by the name of *Piper Indicum*, *piloso caule*: the most of the rest are remembered by the foresaid *Gregorio de Reggio*, and some by *Bauhinus*.

The Vertues.

The *Ginny Pepper* of all sorts (for herein they are all like) are hot and dry in the fourth degree, and beyond it if there be any beyond it, and are so fiery hot and sharpe biting in tast, that they burne and enflame the mouth and throate to extremely that it is hardly to be endured; for if any shall eate thereof unadvisedly, it will bee almost sufficient to choake them, and if it be outwardly applied to the skin in any place of the body, it will exulcerate it, and raise blisters in the same manner, as if they had beene burnt with fire or scalding water: yea the fierce vapours that arise from the huskes or cods, while one doth but open them, to take out the seede, to use or sowe, (especially if they doe mince or beate them into powder) will so pierce the senses by flying up into the head by the nostrills, that it will procure abundance of needings, and draw downe such abundance of thin rheume, that it is to be admired, forcing teares very plentifully: and passing likewise into the throate, it will provoke a sharpe coughing, and even cause a vomiting in that vehemencie, that all the bowells as well as the stomack, will be much perplexed therewith, and if any shall with their hands touch their face or eyes, it will raise so great an inflammation, both in the face and eyes, that they will thinke themselves utterly spoiled, which will not bee remedied in a long time, by all the bathing of them with wine or cold water that may be used, but yet will passe away without further harme: if some hereof be cast into the fire, it raiseth greivous strong and noysome vapours, procuring sneezings very fiercely and coughing, and even vomiting or casting very strongly, to all that be in the roome any thing neare thereunto: yet marke and observe the goodnesse of our good God, that hath notwithstanding all these evill and noysome qualities, given unto man the knowledge how to tame and maister them, and cause them to be serviceable and profitable for their health: for whereas if it should be taken simply of it selfe, either in powder or decoction, it were scarce to be endured, although in a small quantitie, and by often taking would prove very dangerous to life, the way here set downe is found to be the safest, both to be taken familiarly and often without offence in meate as well as medicine, as also to worke those good effects in Physick whereunto it is conducing: It is *Gregorio de Reggio* his receipt, for take faith he, of the ripe cods of any sort of *Ginny Pepper* (for as I sayd before, they are all in propertie alike) and dry them well, first of themselves, and then in an oven, after the bread is taken out, put into a pot or pipkin, with some flower that they may be thoroughly dried, cleanse them from the flower, and their stalkes if they have any, cut them or clip them very small, both huskes and seedes within them, and to every ounce of them, put a pound of fine wheate flower (the same yee dried them withall in the oven, may be part if yee will) make them up together into cakes or small loaves with so much leaven, as yee thinke may be convenient for the quantitie you make; bake these as you doe bread of that sorte, and being baked cut it againe into smaller parts, and bake it againe, that it may be as dry and hard as bisket, which beaten into fine powder and sifted, may be kept for any the uses hereafter specified, or may serve in stead of ordinary Pepper, to season meate or broth, or for sauce, or any other purpose the *East Indian* Pepper doth serve: for it not onely giveth as good, but rather a better taste or relish to the meate or sauce (yea and your wine and other drinke) but it is found to be singular good, to breake and discusse the winde, both in the stomacke and the collicke in the body: it is singular good to be used with such meates as are flatulent or windy, and such as breed much moisture and crudities (whereof fish is reckoned one speciall:) one scruple of the said powder, taken in a little broth of Veale, or of a Chicken, doth wonderfully comfort a cold stomacke, causing flegme, and such grosse or viscus humours as lye low in the bottome thereof to be avoided, helpeth digestion, for it provoketh an appetite to meate, provoketh urine, and taken with Saxifrage water expelleth the stone in the kidneyes, and the flegme that breedeth them, and taketh away the dimmes or mistinesse of the sight used in meates; taken with *Pillule Elephantine* doth helpe the dropie: the powder taken for three dayes together in the decoction of *Penyroyall*, expelleth the dead birth, but if a peece of the cod or huske, either greene or dry be put into the mother after delivery, it will make them barren for ever after: but the ponder taken for foure or five dayes fasting, with as much Fennell seede, will ease all paines of the mother: the same also made up with a little ponder of *Gentian* and oyle of bayes into a pessarie, with some cotten wooll, doth bring downe their courses if they have beene stayed: the same mixed with a *Loboc* or *Electuary* for the cough, helpeth an old inveterate cough, being mixed with hony and applied to the throate, troubled with the squimie, helpeth it in a short space, and made up with a little pitch or Turpentine, and layd upon any hard knots or kernells in any part of the body, it will resolve them, and not suffer any more to grow there: mixed with some niter and used, it taketh away the morphew and all other freckles, spots or markes, and discolourings of the skin, applied with Hens grease dissolveth all cold impostumes and carbuncles, and mixed with sharpe Vinegar, dissolveth the hardnesse of the spleene: if some thereof bee mixed with *unguentum de alabaastro*, and the raines of the backe anointed therewith, it will take away the shaking fits of Agues: a plaister made thereof, and the leaves of Tobacco, will heale the sting or biting of any venomous beast: the decoction of the huskes themselves made with water, and the mouth gargled therewith easeth the toothach, and preserveth them from rottenesse: the ashes of them being rubbed on the teeth, will cleanse them and make them grow white that were blacke: the decoction of them with wine helpeth the Rupture that commeth of water, if it be applied warme morning and evening: if they put it to sleepe for three dayes together in *aqua vite*, and the place affected with the palse bathed therewith, will give a great deale of ease; and sleept for a day in wine, and two spoonefull thereof drunke every day fasting, will helpe a sinking breath, although it hath continued long; and snuff up into the nostrills, will correct and helpe the stinck of them, which is procured of flegme corrupted therein.

CHAP. XII.

Dorycnium. The supposed venomous plant *Dorycnium*.

Here are diverse plants set forth for the true *Dorycnium* of *Dioscorides* by diverse Writers, not any one whereof agreeth with all the notes that he giveth of it; so that yet to this day, the true *Dorycnium*, is not knowne to any that we can heare of: I will therefore here set forth unto you some of those plants, that the most judicious moderne Writers, doe suppose may be referred thereunto, as agreeing therewith in many things, and shew whereunto else they may most properly be referred.

1. *Dorycnium suppositivum* *Montpelienfe* & *Hispanicum*.

The white shrubbe Trefoile of Mompelier and Spaine.

The shrubbe Trefoile, which *Rondeletius* and other the learned of Mompelier, (as *Pena* saith) called *Dorycnium*, shooteth forth many woody branches, browne at the bottome, and whiter towards the toppes, somewhat flexible, to the height of three or foure foote (as I have observed in mine owne Garden) whereon at severall distances, come forth diverse smal whitish leaves, three or five or more together at a joynt, round about the stalkes: at the toppes of the branches stand many small whitish flowers in tufts, like unto the flowers of other Trefoiles but smaller, which turne into small long cods with small round blackish gray feedes within them: the roote is great, woody, very long, and branched into many parts under ground, of a pale reddish or flesh colour on the inside, covered with a darke brownish bark: which abideth diverse yeares, although the branches dye downe to the ground, if there be care taken to defend it from the extremities of the frosts in Winter, for want whereof mine perished: it hath little or no taste at all.

2. *Dorycnio congener* *Cuspi*. Another Trefoile like unto the former.

This other as *Cuspius* saith is very like the former, but more white or hoary, having shorter and broader leaves set in the same manner, three or five together, upon the small bending branches, which are whiter and slenderer than they: the flowers are greenish and larger than the former, standing many together on a slender bare twigge; *Anguilava* and *Camerarius* say the flowers are purple, or of a whitish purple colour, this hath a saltish taste with some acrimony in it also.

3. *Dorycnium* *Dioscoridis* forte *Pona*. *Pona* his supposed true *Dorycnium* of *Dioscorides*.

This strange plant saith *Pona*, that was encreased from the feede sent out of *Candy*, to *Signor Contarina*, and grew in his garden, rose to the height of a foote and a halfe, spreading forth into many branches, whereon did grow many small long and narrow rugged leaves full of veines, lesser then the leaves of the Olive tree, set without order upon them: the flowers were fashioned like unto the blossomes of Pulse or Pease sometimes of a white colour, and sometimes of a more yellowish colour: the seed he saith he did not see, (but surely it must give feede in cods or huskes: for there are very few plants that beare pease or pulse like flowers, but they beare their feede in cods or the like) the rootes are many small strings and fibres shooting from a head, which whether it die every yeare or abide, wee have not yet learned: but *Dioscorides* saith that his *Dorycnium* hath a roote of the length of a cubit and of the thickenesse of a finger when it is growne old, which this as you heare hath not, and therefore if for nothing else, it agreeth not with the right *Dorycnium* of *Dioscorides*, and yet *Pona* saith, he hath not seene any plant that doth so neerely resemble the true *Dorycnium* as this doth.

4. *Dorycnium* *Creticum* *Alpini*.

The supposed true *Dorycnium* of *Candy*.

This plant doth so differ from others, that every one is ready to apply it to a severall plant, as his judgement and affection to some particular part thereof doth draw him, because it doth partake with divers plants, as you shall heare: it riseth with divers straight upright woody stalkes, yet very flexible, divided into many branches from the bottome, all white or hoary; whereon grow many long thicke, and somewhat narrow white silver like leaves, set without order, at the toppes of the stalkes and branches, come forth many flowers together in a tuft or umbell, with some small leaves with them, every one whereof is broad, open at the brims, and round, consisting of one whole leafe, like unto a Bell-flower, or bindweed, which open by degrees, one after another, and not all together, whereby it doth continue the longer in flowering: after the flowers are fallen, come small rough huskes, wherein is contained blacke seed, like unto those of the Bindweedes, somewhat thicke and great: the roote is somewhat great and thicke not growing downe deepe into the ground, with many fibres thereat, which abideth many yeares in the warme countreyes, yet the branches lose their

leaves

3. *Dorycnium Dioscoridis* forte *Pena*.
Pena has supposed true *Dorycnium* of *Dioscorides*.

4. *Dorycnium Creticum* *Alpinii*.
The supposed true *Dorycnium* of *Candy* by *Alpinus*.

leaves in winter, themselves yeelding new, and budding fresh in the spring but hardly endureth a winter with us, unless especial care be had to preserve it, by keeping it in a large pot or, such like, and housing it untill the spring.

The Place.

The two first grow in divers provinces of *Spain*, as *Clusius* setteth it downe, and the foremost about *Mompelien* also. The third and the last grow both in rocky or stony places neare the Sea, in *Candy*, from whence the seede or plants were first brought into *Italy*, and from thence to severall friends elsewhere.

The Time.

They doe all flower very late in these parts, whereby their seede seldome commeth to perfection, and in their naturall not untill the Autumne.

The Names.

It is called in Greeke *Δρυκνιον* *Dorycnium*, and of *Crates* as *Dioscorides* saith, *δρυκνιον* & *καλα* *Halicacabus*, and *Calca*, some write it is called *δρυκνιον* *Dorycnium* quasi toxicum, quo spicula cuspidatae tela infici solita fuerunt, ut celeriores molirentur perniciem saith *Pena*, but we cannot heare, that any of these plants, have any soporiferous, much lesse venomous or mortall quality in them, as *Dioscorides* attributeth to his, and therefore the more suspicious that none of them are the right, although in the outward face, they may all of them, in some things resemble it. There are other plants also referred thereunto, as the *Phyllirea*, which *Gesner* in *hortis Germaniae*, taketh to be a shrubbe like unto the *Vitis Idea*, as also *Pisum cordatum*, or *Vescaria nigra*, sive peregrina cordis effigie, by *Coridus* upon *Dioscorides*. The first is called *Dorycnium verum*, by the learned of *Mompelien*, as *Pena* and *Lobel* say, and *Anguillara*, and *Clusius* say the same also, yet *Clusius* calleth it *Dorycnium Hispanicum*, which was also sent him as he saith, by *Vlisses Aldroandus*, by the name of *Trifolium album*, but by *Coridus* in the place before recited, it is accounted false. *Bauhinus* in his *Pinax* reckoneth it among the spiked Trefoiles, calling it *Trifolium album angustifolium floribus, velut in capitulum congestis*. *Clusius* saith that the Spaniards about *Salamanca*, where he found it, call it *Myediega*, *Gerard* calleth it venomous Trefoile of *Mompelien*, and of *Spain*, making them to be two severall plants, expressed by two figures, and *Mr Johnson* his corrector letteth them so passe likewise, but I had rather give it the denomination of *Dorycnium*, from the Latine, as most other nations doe, and call it *Dorycnium supposititium*, supposed *Dorycnium*, because it is but supposed to be right, or else from the forme, and call it shrubbe Trefoile onely, because it is not dangerous. The second is so called by *Clusius*, as it is in the title, but *Bauhinus* calleth it *Lotos pentaphyllos incanus*. The third is called by *Pena* in his *Italian booke*, *Dorycnium Dioscoridis forte*, but by *Bauhinus* in his *Pinax*, *Iacae olae folio affinis*, and saith hee had the seede from *Horarius Bellus*, out of *Candy*, by the name of *Lago Chymica*, which grew with him, but if the flowers be leuon nous, as *Pena* describeth them to be, it cannot possibly come nere to any *Iacae*, and yet againe in his *Pinax*, fol. 465. he maketh it also to be *Cneoro alba affinis*, which how likely it is, let others judge. The last *Clusius* setteth forth in the Appendix, to his History of Plants, by the name of *Dorycnium Plateau*, because *Iacobus Plateau*, had it growing with him, from the seede received from *Candy*, and sent both the figure and description thereof unto

unto *Clusius*, *Imperatus* also it is likely 'had it from thence, by the same name of *Dorycnium*, for so *Bauhinus* saith, he called it, and *Alpinus* in his booke *de plantis exoticis*, saith that they of Candy doe call it *Dorycnium*. Yet *Pona* doth not account it to be the right, but rather thinketh it to be a *Convolutus*, and calleth it *Convolutus rectus Creticus*. *Lugdunensis* calleth it *Cneorum album Dalechampi*, and *Bauhinus* in his *Panax* calleth it, *Cneorum album folio olea argenteo simili*.

The Vertues.

There hath not beene any experience made of any of these plantes, so farre as I can understand, that they be effectfull to any Physicall use, and therefore I can say no more of them; for seeing none of them are *soporiferous*, as *Dioscorides* his *Dorycnium*, or venomous, and was accounted as strong a *Toxicum*, to dippe their arrowes heads in, to kill wild beasts, as any other; I cannot appropriate the vertues of *Dorycnium*, to any of these plants. Yet *Galen* accounted it onely like unto *Mandrake* and *Poppy*, for the cooling property, and only dangerous if too much were taken thereof, in provoking too much sleepe.

CHAP. XIII.

Hyoscyamus. Henbane.

He ancient writers hath made mention, but of three kinds of Henbane, the one blacke, the other white, and the third yellow; which denominations are not taken from the colour of the herbe or flower, but of the seede: but there hath beene some other sorts found out of later times; all which I thinke meete to set downe in this Chapter together.

1. *Hyoscyamus vulgaris*. Common Henbane.

Our common Henbane, hath very large, thicke, soft, woolly leaves, lying upon the ground, much cut in or torne on the edges, of a darke or evill grayish Greene colour, among which rise up divers thicke and soft stalkes, two or three foote high, spread into divers smaller branches, with some lesser leaves on them, and many hollow flowers, scarce appearing above the huskes, and usually torne on the one side, ending in five round points, growing one above another, of a deadish yellow colour, somewhat paler towards the edges, with many purplish veines therein, and of a darke yellowish purple in the bottome of the flower, with a small pointell of the same colour in the middle, each of them standing in a hard close huske, which after the flower is past, groweth very like (the huske of the Pomgranet flower, but that is not so well knowne unto us) the flower or huske of *Asara bacca*, and somewhat sharpe at the toppe points, wherein is contained much small seed, very like unto *Poppy* seede, but of a dusky grayish colour, the roote is great white, and thicke, branching forth divers wayes under ground, so like unto a *Parisnep* roote, but that it is not so white, that it hath deceived divers, as you shall heare by and by; the whole plant more then the roote, hath an heavie evill soporiferous smell somewhat offensive.

1. *Hyoscyamus niger vel vulgaris*.
Common or white Henbane.

3. *Hyoscyamus Creticus*.
Henbane of Candy.

2. *Hyoscyamus*

2. *Hyoscyamus albus*. White Henbane.

The white Henbane hath divers large leaves, but not so great as the former, yet more soft and woolly and not so much jagged or torne on the edges, rounder also, and of a paler Greene colour; the stalkes grow higher, and with fewer branches on them, the flowers are in forme like the other, but smaller and of a pale colour, inclining to a whitish yellow: the seed likewise groweth in such like hard huskes, but lesse prickely, and is whiter: the roote also is not much unlike, but lesse and perisheth every yeare that it giveth seede, the smell of this is nothing so heady and offensive as the other.

3. *Hyoscyamus creticus*. Henbane of Candy.

This Henbane of Candy, hath lesse and thinner leaves then the last, more white and woolly, and more cut in on the edges, dented also, and standing upon longer footestalkes, the stalkes are more slender and short, having such like flowers, ending in full round leaves, standing higher above the huskes, of a faire yellow and sometime of a pale yellow colour, and purple at the bottome: after which come seede like the common kinde, but somewhat yellower in rounder heades or huskes: the roote is somewhat thicke and short, like a Navew roote, dying every yeare with us.

4. *Hyoscyamus Aegyptius*. Henbane of Egypt.

4. *Hyoscyamus Aegyptius*. Henbane of Egypt.

The Egyptian Henbane riseth up with a strong woolly stalk, about two foote high, wheron are set lesse leaves, then those of the common kinde, and almost as much torne on the edges, especially those towards the bottome, but those that grow up higher toward the toppe, are little or nothing cut on the edges at all, all of them being very white and hoary: the flowers stand every one of them at the joynts with the leaves, and at the tops likewise, in such like huskes as the common doth, and of the same pale yellow colour, with purple veines therein, at the first blowing of them, but afterwards as they grow larger, so the colour changeth to be of a darke reddish colour, with veines of a deeper colour, and a whitish bottome, with a purple pointell, encompassed with yellowish threds in the middle, after which commeth such like prickely heads, as the common kinde hath, and such like seed also: the roote is small and perisheth every yeare.

The Place.

The first is commonly growing by the way sides, and under hedge sides, and wallies: the second groweth by the Sea sides, in Narbone in France, neare where the River Rhodanus runneth into the Sea, The third groweth in Candye, and in Spaine also, from whence the seed being sent, hath growne with me and divers others also. The last is naturall both in Egypt and Syria, and in our Gardens.

The Time.

They doe all flower in July, yet the strange kindes somewhat later, and from their seed growing ripe, and suffered to shed, it springeth up againe every yeare, but the two last doe scarce perfect their seede with us.

The Names.

It is called in Greeke *Σκορδαύς*, quasi faba porcina, quod Aliano auctore, pastu hujus herba convellantur sues aprive, presenti mortis periculo, nisi copia aque statim se foris & intus proluerint: advenies aquas, non ut proluant se tantum, verum etiam ut caneros venentur, eos enim nalli protinus sanitati restituntur; in Latine also *Hyoscyamus*, and corruptly *Isquiamus*, and *Apollinaris*, ab Apolline medicina inventore, vel quia opplet cerebrum vitioso & fetido halitu, eoque mentem percellit, quasi Apollinis cerebro. Pliny saith that the Arabians call it *Altercum*, or *Altercangenum*, but Scribonius saith the Latines call it *Altercum*, ab altercando, quia cum verborum altercatione rixaque se torquent *Hyoscyamo* dementati; Camerarius saith, it is also called *Priapeia*, quia Itali semine utuntur ad priapismum sedandum. It is called by the Arabian Physicians *Bengi* (which name differeth but little from *Bangue* of Garcias ab Orta, and *Christophorus Acofta*, so called of the Persians and Indians also of divers places, and peradventure may be the same, for they say the plant is insipide, or without taste, and the seede both smaller then *Hempe* whereunto it is compared, and not so white: (and which hath a great affinity as *Clusius* saith, with the *Maslac* of the Turkes: yet *Bauhinus* saith, that their *Maslac*, is made of the great *Stramonium* or *Pomum spinosum*) which procureth a kinde of sleepe drunkenesse, or alienation of the minde, as this doth, with some other effects tending to venerie, as may be seene in their workes, whereunto I referre those that would be further informed:) of the Italians *Isquiamo*, of the Spaniards *Velenho*, of the French *Isquame*, and *Hannebane*, of the Germanes *Billenkraut*, of the Dutchmen *Billen cruidt*. The first is called by all authors *Hyoscyamus vulgaris*, or *niger*, onely *Fuchsius* calleth it *flavus*. The second is likewise called *Hyoscyamus albus* of all, and is but of one kinde, although *Bauhinus* seemeth to make two. The third is called by *Clusius*, *Hyoscyamus creticus*, and although he make two sorts as *Bauhinus* doth, that followeth him, yet assuredly I thinke that they are both but one plant, as the descriptions doe declare. The last likewise is by *Bauhinus* divided into two or three sorts, because *Camerarius* in horto, setteth forth two figures, the one he nameth *Syriacus*, the other *peculiaris*; when in his descriptions he saith they differ onely in the broadnesse of the leaves, the one from the other, which may happen rather by the fertility of the soyle, wherein they grow, then of any other specificall difference. *Bauhinus* nameth

it *rubello flore*, and maketh it to be another sort from the *Egyptiacus* of *Clusius*, when as both *Clusius* and *Camerarius* agree in this, that *Paludanus* brought the seede from *Egypt*, and *Ramusolimus* saith he found it growing about *Aleppo*: so that the seven sorts of *Hysocyamus* set forth by *Banbinus*, are but these foure here recited, for his two sorts of white, are but one; his two sorts of *Candy* are but one; and his two sorts, the one *rubello flore*, and the other *spinosis* *sin* is *cauliculis* *Egyptiacus* are but one, even that which *Camerarius* calleth *Syriacus*, and *peculiaris*, and *Clusius* *Egyptiacus* *rubello flore*: but *Diocorides* his third sort, which is the yellow, is not declared, which of these it should be, the first being called *niger*, blacke, and the second white, are peculiarly set downe, and agree upon by all, but the yellow, as I said is not so plainly determined, some taking the *English* Tobacco to be it or the *Indian* kinde, being quite differing in effect, this being hot and stupefactive, the other cold and soperiferous: but if I might be allowed my verdit, I should say that the *Candy* Henbane is most probable to be the yellow, and the *Egyptian* kinde the blacke, or a species thereof differing onely by the climate.

The Vertues.

The blacke or common Henbane, and the yellow, are both accounted to be more dangerous than the white, and therefore to be as much avoyded in inward medicines as may be, and that but in case of necessity, when the white cannot be had, for the white is cold in the third degree, and the other in the fourth, procuring drownesse and a senselesse of the spirits, stupefied by the benumbing qualitie; the white is fit onely to be used in inward Phisicke, which is most available to many good purposes, if it be wisely and conveniently applied; but the leaves of them all doe coole all hot inflammations, either in the eyes or any other part of the body; and are good to assuage all manner of swellings, whether of the cods, or womens breasts, or else where, if they be boyled in wine, and either applied themselves or the fomentation warme: the same also applied to the goutte, asswageth the paines thereof, and of the Sciatica, and all other paines in the joynts, and other parts, which rise from an hot cause; it helpeth likewise the headach, and want of sleepe in hot fevers, applying it with vinegar to the forehead and temples: the iuyce of the herbe or seede, or the oyle drawne from the seede doth the like, and doth the decoction of the hunkes, to wash the feete or the head, but see that you doe not use it too often for feare of danger: *Diocorides* saith that the seede is profitable against the defluxions, of hot and sharpe salt rheumes upon the lungs causing a cough, as also against the strangling and other paines of the mother, and to stay the over-great fluxes of their courses, and all other fluxes of blood: the oyle of the seede is helpefull for the deafnesse and noise and wormes in the eares, being dropped therein: the iuyce of the herbe or roote doth also the same: it helpeth the tooth-ach, if the roote be boyled in vinegar, and a little of the decoction be held on that side the paine is: some have also affirmed, that the fume of the seede being burned, taken into the mouth, will not onely ease the paines, but cause the wormes to fall out from the teeth, but diverse cunning knaves to deceive those they would get money from, having caused such to hold their mouthes over warme water, have cunningly conveyed small peeces of Lute strings into the water, to cause them to believe they voyded so many live wormes, as there are peeces in the water: for the property of those Lute strings is, that feeling the heate of the water, they will seeme to stirre and move as though they were alive: but *Pena* sheweth that hee knew a young woman that used the foresaid fomentation for her teeth, that after shee had ease of them, was for three dayes so troubled in her senses, that she seemed as if shee had beene drunke, being very merry and pleasant all that time, which passed away without further danger: but I know a friend of mine, that having digged up some Parsneppe rootes that grew in his Garden, by chance some rootes of Henbane which grew among them (which as I had before is somewhat like thereunto) were boyled with them, and he eating thereof at supper, was very shortly after first troubled with a drougth, that nothing that he could take would quench it, then his taste, or relish of any thing was taken away, suddenly also his sight was troubled that he could not discern things as they were, but as if they were 3. or 4. fold, his urine also was quite stopped, so that notwithstanding he had great desire to make water, yet he could not possibly: in this perplexitie he continued most of the night, neither could he rest, or sleepe being in bed, but his urine by the stopping thereof grew so hot within him, and not able to passe it from him, caused him to bethinke himselfe of a powder, himselfe had caused to be made, available against the stone, which he caused to be given him, which suddenly caused him to make water and thereby hee presently felt incredible ease in his whole body, for all the things that he had taken before did doe him no good, but by this meanes he quickly recovered his sight, and the other sympones vanished, and before morning, hee was as well as before the taking of that roote: the servants also that did eate of the good Parsnepps that were boyled with these malignant rootes were somewhat discompered, some more some lesse, each somewhat, according to their feeding, and their owne dispositions working together: this I have related that you may know also the danger of this herbe, and of every part thereof; the seede is usually mixed with *Coculus Indus* to take fish, causing them that take it to turne up their bellies, and lie above the water as if they were dead for a while; but they doe not long abide in this manner, but returne to their senses againe and swimme away: Hens also or other birds, that take of this seede will die, and the fume of the herbe being burned, and brought into their roosting place, will cause them to fall downe as if they were dead: the decoction also of the herbe or seede or both, will kill lice and vermine whether in man or beast, which you shall plainly perceive in a dogge troubled with lice, being washed therewith, the lice will be soone found dead upon him, and some fall from him: the fume of the dried herbe, stalkes, and seede burned, and the hands held over the fume thereof, that are troubled with swellings and chilblanes in the Winter, or their heeles that have kibes, will quickly heale them. The distilled water of the herbe is effectfull for all the purposes aforesaid. The remedy to helpe those that have taken Henbane, is to drinke Goates milke, much mede or honied water, Pine kernells with sweete wine; or if these be not at hand or will do no good, Fennell seede, Nettle seede, the seede of Cressies, Mustard or Raddish, as also Onions or Garlicke taken in wine, doe all helpe to free them from danger, and restore them to their due temper againe. The white Henbane is as I said, the fittest and most effectfull in all inward medicines for the griefes afore specified: the other sorts are of the qualitie of the ordinary, that is, more dangerous than the white.

CHAP. XIV.

Papaver. Poppie.

T Here are diverse sorts of Poppies, some tame and of the garden, others wild and of the fieldes; of the Garden kinde some have single and some have double flowers: of the wilde there are diverse kindes, some of the corne fields most properly and plentifully, and therefore called Corne Rose, or Corne Poppie, others whose heads of seede are small & long, bending or bowing like an horne, and therefore called Horned Poppie, of which kinde one sort groweth most usually by the sea side: others by the pathes, hedges and bankes in fields: then that kinde called Spatling Poppie, differing from them all as *Papaver Heracleum* doth, although called Poppie: and lastly, there is a bastard kind of wild Poppie, called in Latine *Argemone*, which although *Dioscorides* reckoneth it not among the Poppies, yet he maketh it like unto the wild corne Poppie, both in heads and flowers, and like the *Anemones* in leaves, and as he saith with a round roote, wherein it differeth from ours. Of some of these kindes I have already spoken, and therefore neede not to discribe them againe: the Garden kindes, with double flowers I have set forth in my former Booke of the Garden of flowers; as also a kinde of that wild Corne Poppie, that beareth double flowers: and in the Classis of purging plants, here before in this Booke, I have set downe all the sorts of Horned Poppie; as also that kind of Spatling Poppie, that is so accounted with us: the rest of the sorts and kindes not set forth, are now to be entreated off: but I thinke it most fit to give you some of the figures before expressed, and to speake of the sorts of *Argemone*, in the next Chapter, and not in this.

1. *Papaver simplex sativum album*. Single Garden white Poppie.

The Garden Poppie hath at the first, foure or five whitish Greene leaves, lying upon the ground, which rise with the stalke, compassing it at the bottome of them and are very large both broad and long, much rent or torne in on the edges, and dented also besides: the stalke (for every roote for the most part hath but one, of the height of foure or five foote (hath sometimes no branches at the toppe, and usually but two or three at the most, bearing every one but one head, wrapped or folded in a thinne filme or skinne, which boweth downe, before it be ready to blow, and then rising and being broken, the flower which was foulded within it, spreadeth it selfe open, and consisteth of foure very large white round leaves, with many whitish round threds in the middle, set about a small round Greene head, having a crowne or starre-like cover at the head thereof, which growing ripe becommeth to be as large as the greatest apple; (*Bellonius* saith the heades are in *Natolia* (where they make *Opium*) so great, that they will containe halfe a pint) wherein are contained a great number of white small round feede, in severall partitions or divisions, next unto the shell the middle thereof remaining hollow,

1. *Papaver simplex album sativum*.
Garden white Poppie

Papaver multiplex flore.
Double Garden Poppies.

and empiric: this head abideth close, and openeth not at the toppe under the crowne, as all the blacke kindes for the most part doe: all the whole plant, both leaves stalkes and heads, while they are fresh, young and Greene, yeeld a milke when they are broken, of an unpleasant bitter taste, almost ready to provoke casting, and of a strong heady sinell, which being condensate, is called either *Opium* or *Meconium*, as you shall heare by and by: the roote is white and woody, perishing as soone as it hath given ripe feede: Of this white kinde, there is another in all things like unto it, but that the flowers, but especially the head of feede is not so great by the halfe, and for the most part hath more branches upon the stalkes; the feede is as white as the other, and as large or great. The varieties of the double garden Poppies are set forth in my former Booke.

Alter.

Papaver sativum
mutiplici
fiore.

2. *Papaver sativum simplex nigrum.*
Single garden blacke Poppie.

There is little difference to be discerned betwene this and the last mentioned, untill it beareth his flower, which in this is somewhat lesse, and of a blacke purplish colour, without any purple spots in the bottome of the leafe as in the next; the head of feede is usually not so bigge as the second sort of white ones, and openeth it selfe a little round about the toppe under the crowne, so that the feede which is very blacke, will fall out if one turne the head thereof downewards.

3. *Papaver sativum simplex flore rubro rubente, &c.*
Single garden red Poppie of diverse colours.

There be some other sorts of this garden Poppie, which differ not onely some what in the leaves from the former, being lesser, and in some crumpled and cut in on the edges, but in the jagged edges also of some of the flowers, and specially in the colour of the flower and feede, for the flower of some will be very red, of others paler, some of a Rose colour, others of a murry colour, either deeper or paler, yet all of them have a deeper spot somewhat large in the bottome of every leafe: and as the flower varieth so doth the feede also, for the Rose and pale coloured flower bringeth gray or ashe coloured feed, the Reddish and deepe murrey, not so pale feede, but more enclining to the blacke: the feedes of all these kindes, the white as well as the blacke or gray, if they be suffered to shed will spring up againe the next yeare, and beare every kinde

4. *Papaver Rhoeas.*
Wild Poppie or corne Rose.

2. *Papaver sativum simplex nigrum.*
Single garden blacke Poppie.

5. *Papaver spinosum Americanum.*
Thorny Poppie of America.

his owne colour of flower and seed, and doe not degenerate or vary, for ought that ever I could observe.

4. *Papaver erraticum, Rheas five silvestre*. Wilde red Poppy or Corne Rose.

The leaves of the wild Poppy, are long and narrow, very much cut in on the edges into many divisions, of a light Greene colour, but not whitish, and sometimes hairye withall: the stalke is blackish and hairy also, but riseth not up so high as the Garden kindes, having some such like leaves thereon as grow below, parted into three or foure branches sometimes, whereon grow small hairy heads bowing downe, before the skinne breake, wherein the flower is enclosed, which when it is full blowne open, is of a faire yellowish red or crimson colour, and in some much paler, without any spot in the bottome of the leaves, having many blacke soft threds in the middle, compassing a small Greene head, which when it is ripe, is not bigger then ones little fingers end, wherein is contained much blacke seede, smaller by halfe then that of the Garden: the roote perisherh every yeare, and the seed springeth every yeare of its owne sowing. Of this kinde there is one that is lesfer in all the parts thereof, and differeth in nothing else. *Banhinus* maketh mention of one of this kinde, that bore a great yellow flower, *Adrianus* and peradventure might be the *Argemone flore luteo* in the next Chapter, but the plant was onely brought dry unto him, gathered as he saith in divers wet places, on the *Pyrenean* hills. The double wild Poppy is described also *pleno* in my former Booke.

5. *Papaver spinosum*. Thorny Poppy.

Vnto the sorts of Poppye I thinke meete to adjoyne this Thorny Poppy, not finding a fitter place; which hath at the first, three or more whitish Greene leaves lying upon the ground, straked with white veines, which growing greater, are long, smooth, and not hairy, somewhat long and broad, rent or torne diversly on the edges, but not to the middle ribbe, having many corners or dentes as it were about them, whereat stand many small sharpe prickes or thornes, not having any white strakes or veines on the under side, but in the white milkye veines are like to that wilde *Carduus* or Thistle, called our Ladies Thistle, and on the under side are more whitish, with some small prickes, along the middle ribbe and veines, compassing the stalke at the bottome of them, which riseth to be two or three foote high, spreading forth into diverse branches, with the like, but lesfer leaves on them, and bearing at every of the toppes, one small head, enclosed in a rough skinne or silme, like as the Poppies have, from whence I thinke rose the name of a Poppy, given unto it, which being open theweth forth a small yellow flower, consisting of five leaves usually, yet sometimes it will have but foure, and sometimes fixe, with a small long Greene prickely head in the middle, tipped at the top with a red spot, which quickly weareth away, and with many yellow threds standing about it; after the flower is past, for it continueth but a while, the head groweth ripe, having five or fixe ribbes from the toppe to the bottome, and so likewise betwene the ribbes, armed with very small, but cruell sharpe and short prickes, or thornes, wherein is enclosed round rough blacke seed, twice as bigge as any Poppye seed: the roote is small and spreading, dying every yeare; every part of the plant yeeldeth a yellow juice.

The Place.

The Garden kindes doe not naturally grow wild in any place, I thinke, although *Dioscorides*, *Galen*, and others say, that the blacke kinde that sheddeth his seede, groweth wilde, for I rather suppose that some seed happening thereby chance, shedd it selfe, and so was thought to grow naturally wilde, and being suffered to shed, will grow plentifully, though smaller, but in all Countries, at the least in all Christian Countries, they are all sowed, and not found wild, so farre as I can learne, onely the first wilde kinde is plentiful enough, and many times too much, in the corne fields of all Countries, and also upon ditch bankes, and hedge sides: the lesfer also is found in corne fields, but more rarely, as also in some other places. The thorny Poppy groweth in the *West-Indies*, from whence the seede was first brought to us.

The Time.

The Garden kindes are usually sowed in the spring, which then flower about the end of May, and somewhat earlier, if they spring of their owne sowing: the wilde kindes flower usuall from May untill July, and the seed of them all is soone ripe after the flowering. The Thorny kinde flowereth seldom before Midsummer, and the seede is ripe in August, but is to be sowed in Autumne, or else it hardly springeth.

The Names.

It is called in Greeke *μακρον αμυδρον* non ministrando, quod vescentes suis muris fungi non possunt; or as some thinke *αμυδρον*, quod ejus usus nimium infrigidet, & hominibus tandem motum auferat, the Garden white kinde is called *μακρον αμυδρον* (and of *Dioscorides* *βουανις thylacitis* and the blacke seede is called *μακρον πιθιτις*) *hortense* or *sativum*: the wild kinde is called *βουανις*, *Rheas*, that is *fluidum*, quia flores protinus decidunt; in Latine *Papaver Rheas*, *erraticum rubrum*, or *silvestre*; *Dioscorides* *Galen*, and others, make onely the first great white kinde, to be the Garden kinde, and the blacke to be the wilde sort, the Garden kinde is called by the *Arabians* *Caxcax*, by the *Italians* *Papavero domestico*, by the *Spaniards* *Dormideras* and *Cascall*, by the *French* *Pavot*, by the *Germans* *Magsamen* and *Olfamen*, of the *Dutchmen* *Huell* and *Mancup*; of us in *English* *Poppy*, or *Garden Poppye* for the most part, yet in some Countries with us, lone silver pinne, *subauditur* faire without and soule within, and in many other places *Cheeseboulles*: the wild Poppy is called in *Italian*, *Papavero silvatico*, in *Spanish* *Amapola rosella*, and *Papoula*; in *French* *Coquelicotte*, *Pavot sauvage* and *Consanons*, in the high *Dutch* tongue *Clapper rosen*, and *korn rosen*, in the low *Dutch* tongue *Rooden huell*, *wilden huell*, and *Colbloemen*, in *English* *Wild Poppy*, *Corne Rose*, *redweede*, and *Cankers*, *Tragus* calleth it *Argemone*. The Thorny Poppy is called generally by all now adays, *Papaver spinosum*, but of *Gerard* *Carduus Cerysanthemus Peruvianus*, by the *Spaniards* in the *Indies*, from whom the *Italians* had it *Figo del Inferno*, that is *Ficus Infernalis*, the Figge of hell, because the prickely head is long and round, somewhat like a figge, and that whosoever should have one of them stick in his throate, it would surely fend him to heaven or hell. The milkye juice gathered from the heades onely of the great white Poppye, growing in the East Countreyes of *Asia major*, towards *India*, and in divers other countreyes of those *Indies*, (for it is there a great merchandise of much use and expence, as also in *Paphlagonia*, *Cappadocia*, *Gallatia*, *Cilicia*, and *Natolia*, which is the lesfer *Asia*, as I said before,) is that true and best *Opium*, that is or should be used in *Narcoticke* medicines, and is an ingredient of much respect, in those great compositions of *Theriack* and *Mithridatium*, &c. whereof a small quantity hath bene gathered in some Christian Countreyes: and my selfe and others in our owne land, have gathered a little from the Greene heads, as they stand, and are but half grown.

growne ripe, slit or cut with a knife in two or three places, that the milke issuing forth, may be gathered into some convenient thing, and hardned afterwards in the Sunne, but not at the fire, which will not be so blacke as that *Opium*, that cometh usually to us, which is rather *Meconium* as *Dioscorides* setteth it downe, which is made of the juice of both leaves and heades pressed forth, of the white as well as of the blacke Poppy, for the true best *Opium* is somewhat of a whitish yellow or brownish colour, and giveth no such yellow tincture, as that which is sophisticate and made with *Glascium*, (which is the yellow juice of an herbe, with leaves like unto horned Poppy, but divers have thought *Glascium*, to be the juice of *Chelidonium majus*, others of *Potum amori majus*, and lally *Banhus* and some others, thinke it to be of this thorny Poppy, because it giveth a yellow juice) but as *Bellonius* writeth, that to have any quantity of true *Opium*, it rather consisteth in the multitude of gatherers (for it must be both speedily gathered, and in the heat of the day) then in the great quantity of ground sown therewith, it being a tedious worke; for a very small quantity can be but gathered by any one in a day, in that every head yeeldeth but little, and must be attended to be taken from them, before it be dryed too much upon them.

The Vertues.

All the sorts of Poppyes are cold in the fourth degree, but especially *Opium* or the condensate juice, as *Galen* and divers other authours doe asseme, yet *Matthiolus* sticketh thereat, thinking it rather to be hot, by the sharpnesse and bitternesse thereof, and is *Anodinum medicamentum*, that is such a medicine, that by procuring sleepe, easeth many paines for the present, which indeede it doth but palliate or cause to be quiet for a time; the continuall use whereof, bringeth very often more harme, and a more dangerous disease then it hath allayed, that is an insensiblenesse or stupefaction of a part or member, which cometh to be the dead palsey, for although *Dioscorides*, *Galen*, and others write, that the white seed is familiarly taken in bread, and made into cakes and eaten with pleasure, and *Matthiolus* and divers others have observed that in our dayes, the white Poppy seede, is sown in *Italy* and other places, and much used, yea and the blacke seede also, although as they all agree, it is stronger in operation, and onely medicinable, or onely to be used in Physicke to helpe diseases; for *Matthiolus* writeth that the inhabitants about *Trent*, doe sow the blacke seede in their fields and grounds, among Beanes and other pulse, which they familiarly eate, being made into cakes, that are made of many foldes, the seede being cast in betweene the foldes, and so kneaded together, and yet hee saith, they are no whit more sleepey or drowsie, then those that eate none of them: as also that in *Stiria* and the upper *Austria*, the inhabitants doe eate the oyle pressed out of the blacke seede in their meates familiarly, in the stead of Sallet oyle, and finde no inconvenience of drowlinesse at all thereby; which made him as he saith, venture to give the creame of the seede made up with Barly water oftentimes, and in great quantity, in the hot fits of agues, and burning feavers, both to aswade thirst, and to procure rest, and hereby as he saith, he shooke of that feare of Poppy, that his wife Masters had by their grave admonitions, seasoned him withall in former times: the Garden Poppy heads with feedes made into a Syrupe, is both frequently used in our dayes, and to very good effect to procure rest and sleepe in the sicke and weake, and to stay catarrhes, and defluxions of hot and thinne rheume, from the head into the stomacke, and upon the lungs, causing a continuall cough, the forerunner of a consumption; but hath not halfe that force in those that are stronger, for the strength or debility of nature worketh divers effects, as you see, as well in this, as in all or most other things; the same also helpeth the hoarsenesse of the throat, and when one hath lost their voyce, which the oyle of the seede doth likewise: the blacke seed boyled in wine and drunke, is said also to stay the fluxe of the belly, and the immoderate course of womens sickenesse: the empty shels of the Poppy heades, are usually boyled in water, and given to procure rest and sleepe; so doe the leaves in the same manner, as also if the head and temples be bathed with the decoction warme, or with the oyle of Poppyes, the greene leaves or heads bruised, and applyed with a little vinegar, or made into a pultis with Barly meale and *Axungia*, cooleth and tempereth all inflammations, as also that disease called *Saint Anthonyes fire*. The *Opium*, but I may rather say the *Meconium*, (which is the juice of the Poppy thickned) that is commonly used in the Apothecaries shops, and is much weaker by the judgement of all, both moderne and ancients, then the true *Opium*, is much colder, and stronger in effect, than any other part of the plant, but if we may know the temperature and qualities of things, by their taste and effect, we may rather judge *Opium* to be hot then cold, or at the least, to have very hot parts in it, witnesseth the bitternesse thereof, the heate and sharpnesse that is felt in the mouth, upon the tastings, and keeping it in the mouth a while, that it is ready to blister both tongue and palate; as also the grievous or heady heavy smell, as well in it, as in the whole plant: but it may be saith *Matthiolus*, the bitternesse, heate, and sharpnesse in *Opium*, or *Meconium*, is rather accessory then innate, and is therein by the mixture and adulterating of it with *Glascium*, and to give a yellow juice, for our *Opium* if it be dissolved doth shew a brownish yellownesse; yet by his leave I may say, that even the fresh milke with us, is bitter and strong in smell like the *Meconium* or *Opium*, but because our ancients, who have found out the qualities of things and left them for our knowledge, have so found and judged of *Opium*, I must as *Matthiolus* saith, leave it for others to descant thereon, as reason and experience shall direct them: It is generally used as I said before in *Treacle* and *Mithridatum*, and in all other medicines that are made to procure rest and sleepe, and to ease paines in the head, as well as in other parts, as I said before, or rather to palliate them, it is used also, both to coole inflammations, agues, or frensies, and to stay defluxions, which cause a cough or consumption, as also other fluxes of the belly, or womens courses, and generally for all the properties that the seede or any other part of the plant is used: it is also put into hollow teeth to ease the paine: it is used both in ocular and auricular medicines with some, and to stay fluxes and to ease paines, but *Galen*, and divers others in the former as well as in our times, have forbidden such medicines, as too dangerous for the eyes, and even any other wayes used inwardly, it is not to be taken, but with good correction and great caution, yet divers have found that applyed to the gout, it hath given much ease of paine: The wild or red Poppy that groweth in the corne, while it is young, is a Sallet herbe in *Italy*, in many places, and in the territory of *Trent* especially, as *Matthiolus* saith, as also to prevent the falling sicknesse, which *Theophrastus* also saith in his 9. booke and 13. Chapter, was common in his time: the Syrupe made of the flowers is with good effect, given to those that have a Plurisie, and the dried flowers also, either boyled in water or made into powder and drunke, either in the distilled water of them, or in some other drinke, worketh the like effect; the same also is available, in all other cephalicall or pectorall griefes; the distilled water

water of the flowers of the wilde red Poppyes, is held to be of much good use against surters, to drinke it evening and morning: it is also more cooling in quality then any other Poppy, and therefore cannot but be as effectuell in hot agues, frensies, and other inflammations, either inward or outward, the Syrupe or water to be used therein, or the Greene leaves used outwardly, either in an ointment as it is in *Populeon*, a cooling ointment, or any other wayes applyed, *Galen* in 7. *facultatum simplicium medicamentorum*, saith the feede is dangerous to be used inwardly. *Gerard* was much mistaken, to thinke that this wilde Poppy should be that, which should be used in the composition called *Diacodium*, and citeth *Galen* for his authour, as if he had taught him that opinion, not understanding what kinde of Poppy *Galen* doth meane by wild Poppy, for he according as *Dioscorides* afore him hath done, accounteth onely the great white Poppy, whose heads are somewhat long, to be the garden or manured kinde, and the other blacke kind to be wild, and doth not meane this red Poppy, because it is onely wild with us, and not sown, as whosoever shall observe the places throughly shall finde. The thorny Poppy being but of late invention, hath not bene applyed to any disease by any, that I can heare of.

CHAP. XV.

Argemone. Bastard wilde Poppy.

Here is of the kindes of wilde Poppy divers other sorts, some described by others, and some not set forth by any before that I know, which being found in our owne land, shall be spoken of with the rest.

1. *Argemone capitula rotundior*, Round headed bastard Wild Poppy.

This kind of wilde Poppy, hath divers hairy Greene leaves lying on the ground, somewhat longer and more divided into parts, then those of the former wild Poppy, somewhat like unto the leaves of the thinn leafed *Anemone* or wind flower, as *Lobel* saith, but is seldome so found with us, from among which rise up diverse rough hairy stalkes, more then two foote high sometimes, bearing such like leaves here and there on them, lesser then those below. all yeelding a yellow juice or milke being broken, and on the top of each branch one flower lesser then the other wilde Poppy, yet consisting of foure round pointed leaves, of a more delayed red colour. sometimes having each of them a blackish spot in the bottome, and sometimes without, with divers blackish threads standing about a small Greene head, which when it is ripe, is somewhat short, rough and round, with some crests thereon, and a little round head, but not a Crowne or starre, like the Pop-

1. *Argemone capitula rotundior*.
Round headed bastard wilde Poppy.

4. *Argemone lutea* Cembro Britanica.
Yellow wild bastard Poppy of Wales.

pies at the top, wherein is contained such like small blackish seed, as the former wild kind hath, but bigger, the roote is small and long, with many fibres thereat, and perisheth in the like manner after seede time.

2. *Argemone capitulo longiore*. Long headed Bastard wild Poppy.

This is in all things like the last, both for leaves, flowers, and seede, the chiefest difference in this from the former consisteth in the head with seede, which is longer then the other, smaller below then above, yet having a little round head at the top, but no crowne and is rough and hard like it.

3. *Argemone Alpina lutea*. Yellow mountaine bastard wilde Poppy.

The yellow outlandish mountaine bastard wilde Poppy, hath many smooth Greene leaves, set on somewhat hairy long footstalkes, an handbreth long, which leaves are very much and finely cut on the edges, very like unto those of the *Coriander* leaved Crowfoote, from among which rise up divers bare or naked stalkes, yet hairy withall, of halfe a foote high, at the toppes whereof stand one flower a peece, of a meane size, consisting of foure yellow leaves, with many whitish threds in the middle tipt with yellow, standing about a small round and rough head, like the former kinde, wherein is contained small blackish seede: the roote is small and long, and threddy at the end.

4. *Argemone Cambro-Britanica lutea*. Yellow wild Bastard Poppy of Wales.

This yellow Poppy, hath many winged large spread leaves, lying upon the ground, that is, many leaves set together on each side of a middle rib, each divided leafe being somewhat deeply cut in, in some places of the edges, more then others, of a deepe, but faire Greene colour: among these leaves rise up, divers branched stalkes two foote high, having some such leaves thereon, but smaller, at severall distances, and at the tops of the stalkes and branches, a faire yellow somewhat large flower, consisting of foure round leaves, with many yellow threds in the middle, standing about a long Greene head in the middle, which when the flower is fallen, and the head ripe, is then larger then the former long headed wilde Poppy, but in the like manner smaller at the bottome and bigger at the toppe, with a small head thereon, containing much small blacke seed, lying within severall cels, in the same fashion that the other Poppies doe: the roote is long, and brownish on the outside, spreading into some branches, and divers small fibres thereat, which perisheth not every year, as the other sorts before specified doe.

The Place.

The two first are often found as well in Corne fields, in *Summer setshire, Kent*, and other Countries of this land, as in the corners and borders of fieldes, and by the way sides. The third was found upon *Sueberg* a hill in *Austria*, as also on some hills in *Italy*. The last groweth in many places of *Wales*, in the valleyes and fields, at the foote of the hills, and by the water sides, about a mile from a small village called *Abbar*, and in the midway from *Denbigh* to *Gnider*, the house of a worthy Gentleman *Sir John Guin*, as also nere a wooden bridge, that giveth passage over the River *Dee*, to a small village called *Balam*, which is in *North-Wales*, and in going up the hill that leads to *Banghor*, as also nere *Anglesey* in the way to the said *Sir John Guin* his house.

The Time.

All of them doe flower about the end of *June*, and in *July*, and the seed is ripe in *August*, in some places earlier, and in others later.

The Names.

It is called in Greeke *Ἀργεμόνη*, quia argemas, idest, oculorum nubesculus tollit, in Latine also *Argemone*, after the Greeke word, *Pliny* in his 25. booke, and 9. Chapter calleth it *Argemonia*, and saith that they in his time made three sorts hereof, whereof the best was that, whose roote did smell like *Francumfence*, but in some places he maketh mention of foure sorts, as in his 21. booke, & 23. chap. he saith, that *Anemone* is called *Argemone*, in his 24. booke, & 19. chap. he saith that *Lappa Canaria*, whose roote smelleth of *Francumfence*, was called *Argemone*, and in his 26. booke, & 6. chap. he saith *Inguinaria* was called *Argemone*: in former times our ordinary *Agrimony* was taken for *Argemone*, but now a daies all our moderne writers do agree, that our *Argemone* is the same that *Dioscorides* wrote of, notwithstanding that he giveth to it, a round roote which ours hath not; some copies have another sort of *Argemone*, which most doe not hold right: the first of these is called by *Lobel*, *Argemone capitulo rotunda canulato*, *Bauhinus* calleth it *Argemone capitulo brevior*, and thinketh it to be the same, that *Lobel* and *Pena* in their *Adversaria*, call *Anemone minor Coriandri folio*, flore *Pulsatille capitulis hirsutis*, nec ut *Papaver corollis donatis*: The second is called by *Lobel* *Argemone capitulo longiore*, as *Bauhinus* doth also, but he maketh it also to be the *Anemone Narbonensis major corniculata* of *Lobel* and *Pena*, in their *Adversaria*, when by the judgement of the best, that *Anemone* of theirs, is *Papaver corniculatum violaceum* of *Clusius*, *Dodonaeus* and others, and doth much differ from this *Argemone*, both in bignesse and colour of the flower, and in the head of seede, that being much longer and smaller then this: *Cordus* in his History of Plants, and 46. Chapter, setteth this forth by the name of *Argemone*, which *Gesner* who set him forth knew not, because *Cordus* saith, it giveth a yellow juice like *Celandine*: The third is set forth by *Pena* in his *Italian Baldus*, and by *Bauhinus*, in his *Prodromus* and *Pivax*, under two titles as two sorts, when as assuredly they are both but one: The last was found as I shewed you before in many places of *Wales*, by *Lobel* in his life time, and therefore entituled justly according to the Country.

The Vertues.

Dioscorides and *Galengivē* unto this kinde of Poppie, a cleansing qualitie and sharpe, that it is able to cleare the spots that happen in the eyes, and such mists, filmes and cloudes, that grow in them to hinder the sight, as also to assuage any inflammations; but others say, that it helpeth the bloody fluxe, the decoction thereof being made in water and drunke, as also if it be boyled in wine and drunke, is a present remedy against the stinging or biting of any venomous beast, and that two drammes thereof taken in wine, waleth the spleene that is swollen: being beaten while it is fresh, and applied to cuttes and wounds healeth them speedily: applied also to any member vexed with crampes or convulsions, to any sores, cankers, or fistulas, to any blacke and blew spots in the face, or on the eyes, by strokes or falles, doth helpe and heale them all: being bruised and applied with vinegar to the throat, healeth the quinsie, and applied to the place grieved with the gout taketh away the paine thereof quickly: being rubbed upon Wartes, it doth in a short time consume them, and take them away. There is no propertie remembred belonging to any of the two last sorts.

CHAP. XVI.

Hypecoum. The herbe *Hypecoum* of *Dioscorides*.

Althogh *Camerarius*, *Dodonæus*, *Lobel*, and others doe reckon this small plant as a species, or sort of wild Cumin, and have referred it to with them, yet I dare not so call it, because I doe not finde either the face, or outward resemblance there of, nor yet the temperature and qualities, to be any way answerable thereunto, but rather unto the Poppies, I have therefore thought it fittest to joine it next unto them, and doe rather incline to the judgement of *Clusius*, to account this plant to be the true *Hypecoum* of *Dioscorides*: unto which I will also adjoine another small plant, reckoned also by *Lobel* to be of the kindes of wild Cumin, which I must call another *Hypecoum*, in that it is so like unto the other: And let me crave leave with all to insert here, as in an extravagant place, that kinde of wild Cumin, which is so accounted of most Writers, as not having a fit place to set it alone, in regard it may not be joyned with the true Cumin, which must be intreated of among the umbellifers, and because this is in other Authors joyned with the former.

1. *Hypecoum legitimum Clusij*. The true *Hypecoum* of *Dioscorides* according to *Clusius*.

This small plant hath diverse long leaves lying on the ground, very much divided, and cut into many parts, of a pale or whitish Greene colour, so like unto *Fumitory* in the colour of the leaves, as also somewhat neere in the many divisions and parts thereof, that it will soone deceive one that doth but slightly regard it, but is smaller and thinner and more gentle in handling, yet is larger in *Spaine* than with us as *Clusius* recordeth; in the middle of them riseth up a stalke or two, with some leaves thereon, and divided towards the toppe into diverse branches; at the topes whereof stand small yellow flowers, consisting of fixe leaves, two whereof are larger than the rest, and stand one opposite unto another, the rest being very small and scarce discerned, but when the flower is blown open: after which doe arise long crooked flat huskes or cods full of joints, somewhat like unto the huskes of the *Scorpioides* of *Matthiolum*, but greater and longer: in the severall joints whereof lye severall square yellowish feedes, very hardly to be taken forth, and separated from the huskes or skinnies: the roote is small, and a little stringy, dying every yeare at the first approach of Winter, and is very hardly made to spring, but by an Autumne sowing: the taste of the plant is unpleasant.

2. *Hypecoum alterum*. Another *Hypecoum*.

This other sort (for so I make it) is very like unto the former, but that the leaves hereof are not so broad and long, being more finely divided, somewhat like unto the Sefeli or Hartwort of *Marseilles* or wild Chervill; the stalkes are smooth, full of leaves and branches, whereat come forth yellow flowers made of five pointed leaves, and after them long pods, which hang downe and stand not upright: nor are crooked like the former, but joyned and with greater and yellow feedes within them, like unto those of *Galega* or Goates Rue.

3. *Cuminum sylvestre*. Wild Cumin.

Wild Cumin shooteth forth diverse long rough, or somewhat hard winged leaves, each whereof is finely denred about the edges; from among which riseth up a slender weak bending stalke, divided at the toppe into many parts, each whereof hath a round whitish soft gentle, and woolly head or ball upon a small foote stalke; like unto those of the Plane tree heads or balls, wherein is contained small feedes: the roote is small and white and quickly perisheth, with the least blasts or dewes of cold nights, and seldome commeth to maturitie in our country, as I have often seene the experience my selfe.

The Place.

The two first groweth as well in Province, in the way to *Arles*, *Mompelier*, and other places in *France*, as in diverse Provinces of *Spaine* as *Clusius* saith: the other as *Lobel* saith, groweth in the same places in *France*, that the former doth: the last he saith likewise groweth plentifully in *Narbone* about *Aquas Sextias*, and other places of *France*.

The Time.

All these flower with us, not untill the midst of Sommer, and give their feede late, but the last worst as I said, and seldome good although late.

The Names.

Dioscorides calleth an herbe in Greeke *ὑπέρκοον* and *ὑπόκοον* *Hypecoum* and *Hypopneum*, for which the Latines have no other name *Hypecoum*, after the Greeke; yet there is great doubt amongst many, what plant should be the right, some thinking the *Thalictrum minus* to be it, others thinking the *Argemone minor* of *Tragus* (which is the lesser *Papaver Rhaea*) to be it: *Matthiolum* (according to his manner, that whatsoever was obruded unto him, and was not manifestly contradictory, was presently presented for right; no markes there of wanting) maketh the *Alcea vesicaria* or *Veneta*, which *Lobel* calleth *Peregrina Solissequa* to be it, which I have set forth in my former Booke: And lastly *Clusius*, and from him *Dodonæus* propound this first plant, for the true *Hypecoum* of *Dioscorides*; *Clusius* affirming that of all the plants that he knew, there was not any that came nearer thereunto than this, unto whom I must also consent, for that neither the face nor the qualitie, as I

1. *Hypecoum legitimum Clusij*.
The true *Hypecoum* of *Clusius*.

2. *Hypecoum alterum*,
Another *Hypecoum*. 3. *Cuminum sylvestre*,
Wild Cumin.

said before doth gainsay it. It is also by *Matthiolus*, and *Castor Durantes* who taketh it from him, as also by *Camerarius*, *Lugdunensis*, *Tabernmontanus* and *Lobel* called *Cuminum sylvestre alterum* or *siliquosum*, and *Gerard Corniculatum*; *Clusius*, as I said before, and after him *Dodonæus* and *Camerarius*, call it *Hypecoum* & *legitimum*, and so doth *Bauhinus* also, who quoteth *Matthiolus* in two places to call *Cuminum sylvestre alterum* both *Delphinium* and this, but he quoteth *Gesner in hortis Germaniæ* to call it so likewise; when in that place *Gesner* his *Hypecoum*, is that of *Matthiolus*, which is the *Alecea vesicaria*, and not this. *Clusius* saith that the *Spaniards* in the kingdome of *Granado* and *Murciano* doe call it *Cadorija*. The second is called *Cuminum siliquosum alterum*, *Dioscoridis* of *Lobel* and *Pena*, whom *Lugdunensis* doth imitate; of *Tabernmontanus* *Cuminum sylvestre* 3, and *siliquosum minus*. *Bauhinus* calleth it *Hypecoum altera species*, and so doe I, the face thereof so nearely agreeing unto the first. The last is called *Cuminum sylvestre*, and *Dioscoridis* primum of *Matthiolus*, and so of most Writers, but *Globosum* of *Camerarius*, and *Capitulis globosis* of *Bauhinus*. *Belonius* in his observations saith, that in the Ile of *Lemnos*, they call it *Lago Chimeni*, that is *leporum cubile*, which the inhabitants of *Lemnos* called at this day *Stalimene*, doe use in their meate in stead of *Origanum* which they want, for as he there saith, it hath both the smell and taste of *Origanum*; and for the likenesse, he there compareth the leaves with those of *Yarrow*, and the round heads to those of the *Romane Nettle*.

The Vertues.

The taste of the two first is as I said before unpleasant as that of the Poppies, and therefore of a temperaturē inclining to the proprietie of Poppie, whereunto *Dioscorides* and *Galen* make *Hypecoum* to be like, there hath not beene any further experience made of either of the former plants, and therefore I can relate no more unto you of them: the last if it be the right wild Cumin of *Dioscorides*, as by *Belonius* his relation here before set downe it may very well be, the seede is effectually against the windinesse, either of the stomacke, or of the belly and bowells, which bringeth tormenting paines and swellings with it, being taken in wine, and expelleth the poyson of any venomous beastes: it is good for moist stomackes, that are troubled with raw crude humors: taken with vinegar, it stayeth the hickocke; and if it be applied with honny and rayfins to the face, or any other place that is blacke or blew by stroakes and beatings, it will quickly take them away, and applied in the same manner to the cods when they are swollen, allayeth the swelling and taketh away the paine.

CHAP. XVII.

Arum, Wake Robin or Cuckow-pintē.

ANto this common *Arum* or Wake-Robin (which groweth wilde in many ditches and drie banks throughout all this kingdome, I must adde divers other sorts, which in most things are like therunto, as also another much differing from all the rest, accounted the true *Colocasia* or *Faba Egyptiaca*.

I. *Arum vulgare non maculatum*. Common Wake Robin without spots.

This Wake Robin shooteth forth three or foure or five leaves at the most from one roote, every one whereof is somewhat large, and long, broad at the botome next unto the stalk, and forked like unto a forrell leafe,

leafe, but ending in a point, without dent or cut on the edges, of a sad or full greene colour, each standing upon a thicke round stalke, of an handbreadth long or more; among which after they have bene up two or three moneths and begin to wither, riseth up a bare naked round whitish greene stalke, somewhat spotted and straked with purple, like the stalke of Dragons, somewhat higher than the leaves; at the toppe whereof, standeth a long hollow hofe or huske, close at the bottome, but open from the middle upwards, ending in a point; in the middle whereof standeth a small long pestle or clapper, smaller at the bottome than at the toppe, of a darke purblish colour as the hofe or huske is on the infide, though greene without, which after it hath so abiden for some time, the hofe or huske decaieth, with the pestell or clapper, and the foote or bottome thereof groweth to be a small long bunch of berries, greene at the first, and each of them when they are ripe, of a yellowish red colour, of the bignesse of an Hasell-nut kernell, which abide thereon almost untill Winter: the roote is round and somewhat long, not growing downe right, but for the most part lying along, the leaves shooting forth at the bigger end, which when it beareth his berries is somewhat wrinckled and loose, another being growen under it, which is solid and firme, with many fibres or small threds hanging thereat, which in the beginning of the yeare, when the leaves beginne to spring yeeldeth a milky tappe being broken or cut: the whole plant is of a very sharpe and biting taste, pricking the tongue upon the tasting, no lesse than Nettles doe the hands, and so abideth for a great while without alteration; the roote with the sharpenesse hath a very strange clamminesse in it, tiffening linnen, or any other thing whereon it is laid, no lesse than starch: and in former dayes, when the making of our ordinary starch (which is made of the branne of wheate) was not known, or frequent in use, the finest dames used the rootes hereof, to starch their linnen, which would so sting, exasperate and choppe the skinne of their servants hands that used it, that they could scarce get them smooth and whole with all the nointing they could doe, before they should use it againe.

3. *Arum vulgare maculatum*. Spotted wake Robin.

This *Arum* is in all things like the former, but that the leaves hereof are somewhat harder in handling, smaller pointed and have some blackish spots thereon, like the spotted Arsemart, which for the most part abide in the Sommer longer greene then the former, and both leaves and rootes, are more sharpe and fierce then it.

3. *Arum magnum rotundiore folio*. Round leaved wake Robin.

This kinde hath somewhat larger leaves, then either of the former, and more round pointed, both at the end and at the bottome next to the stalke, having some white veines appearing in the leaves, and abiding greene longer in the Sommer, even almost untill Autumne, the hofe or huske, with the pestell or clapper, are both of a pale whitish yellow colour, in which things this differeth from the other and in nothing else: *Proffer Alpinus* sec- *Alteram*
teth fort an other sort found at the bottome of some of the *Alpine* hills, whose leaves and flowers differ little from *rotundioris*
the second sort, but the roote is round like unto the rootes of the round rooted Culcas: *dic.*

4. *Arum Byzantinum*. Wake Robin of Constantinople.

This *Arum* of *Constantinople*, hath a reasonable great thicke roote, of an hand breadth long, or thereabouts, having many small round heades, breaking forth on all sides thereof, from whence come forth many fresh greene leaves, very like unto the two first sorts of *Arum*, some whereof will be spotted with small blacke spots, others not having any at all; from among which riseth up a stalke, having such a like hofe or hood, as the *Arum* hath, and a pestle therein which are of a purplish colour in those that have spotted leaves, and white in those

1. 2. *Arum vulgare maculatum & non maculatum*.
Spotted and unspotted Wake Robin.

4. *Arum Byzantinum*.
Wake Robin of Constantinople.

5. *Arisarum latifolium*.
Broad leaved Fryers coule.

6. *Arisarum longifolium*.
Long or narrow leaved Fryers coule.

7. *Araia Egyptia* rotunda & longa radice vulgo *Colocasia diffusa*.
The Egyptian Culcas or wake Robin with a rounder and longer roote.

Faba Egyptia fructus.
The fruite of the Egyptian Beane.

that have no spots, the leaves like wife of those that have spots, spring up for the most part before Winter, and the other not untill the Spring, there hath not any fruite beene observed in this, by any that I can understand.

5. *Arisarum latifolium*. Broad leaved Fryers Coule.

The Broad leaved *Arisarum* groweth in all things like unto the *Arum*, having divers faire Greene leaves, whose middle rib on the upper side, as also some other of the veines are white sometimes, and somewhat thicker and rounder pointed then the *Arum*, the middle stalke bearing the flower (which is a crooked or bending hose at the top, with a small crooked whitish pestell in the middle, risting out of it,) is spotted with red spots, not rising fully so high as the leaves, which are nothing so sharpe in taste, as those of the Wake Robin, and doe alwayes spring up in the end of Autumne, abiding Greene all the Winter: after the huske or flower is past, and the Greene leaves withered and gone, which will be in the Summer, then the berryes doe appeare on the toppes of the stalkes, Greene at the first, and of a yellowish red when they are ripe, which abide untill the frosts cause them to wither, and the Greene leaves begin to appeare: the roote is white and somewhat round, encreasing much by of sets.

6. *Arisarum longifolium*. Long or narrow leaved Fryers Coule.

The leaves of this *Arisarum*, are very narrow and long, not rising so high as the former, but rather lying on the ground, and doth more seldome beare any hose, which is whitish small and long, with a very long and small reddish pestell in the middle, like unto a long worme, scarce rising above the ground, the berryes that follow are white and not red, the roote is white and round, smaller then the former, encreasing by of sets, but not in so plentifull a manner.

7. *Arum Aegyptium* vulgo dictum *Colocasia rotundiore & oblongiore radice*.

The Egyptian *Culcas* or Wake Robin with a rounder and longer roote.

This Egyptian plant, hath beene the subject of much controversie, among many worthy and learned writers, both of our and of former times, some applying it to the *Faba Aegyptia* of *Dioscorides*, whose huske containing the fruite was called *Cibarian*, and whose roote was called *Colocasia*, and others refusing that opinion, call it simply *Arum* and *Aegyptium*, because it was a species or kinde of *Arum*, that is thought to bee naturall to Egypt, as also to other places, as you shall heare by and by, the description whereof is in this manner: It shooteth forth divers very large and whitish Greene leaves, of the fashion of *Arum*, or Wake Robin leaves, pointed at the ends, but somewhat rounder, each of them two foote long, and a foote and a halfe broad, not so thicke and fappy as they, but thinner and harder, like unto a thinn hard skinn full of veines, running every way, and refusing moisture, though they be laid in water, standing every one, on a very thicke stalke, nere five foote long in the said places, which is not set at the very division of the leafe into two parts, as the wake Robin is, but more toward the middle, somewhat like unto the water Lillies, the division of each leafe at the bottome, being somewhat rounder then those of Wake Robin: betweene these leaves after many yeares continuance in a place unflirred, there riseth up sometime but one stalke of flowers, and sometimes two or three, according to the age and encrease of the plant, the standing and keeping (for all these helpe to the fructifying thereof, for else it would not beare any shew of hose, or pestell, or flower, as many that not having seene any, have confidently set downe that it never beareth any) thereof in a large pot, or other such thing, and in a warme place and climate: each of these stalkes are much shorter, then those of the leaves, and beareth an open long huske at the top, in the middle whereof, riseth up for the most part three severall narrow huskes or hoses (and never one alone, as the *Arum* or *Arisarum* do) with every one their pestell or clapper in the middle of them, which is small, whitish and halfe a foote long, from the middle downwards bigger, and set round about with small whitish flowers, smelling very sweete, the flower most first flowering, and so by degrees upwards, which last not above three dayes, and from the middle upward bare or naked, ending in a small long point, after the flowers are all past, that lower part abideth, and beareth many berryes, like as the *Arum* and *Arisarum* doe, but much paler and smaller, the roote is great and bulbous, or rather tuberos, in some more round then in others, which are smaller and long with the roundnesse, as great as the roote of a great Squill or Sea Onion, (which I judge more properly, speaking thereof in my former booke to be a Sea *Hyacinth*) and one which *Alpinus* setteth forth in his *Historia Aegyptiaca*, with great long creeping rootelike the Reede, reddish on the outside, and whitish within, having many bulbous or tuberos heads, shooting from all sides thereof, whereby it is encreased, and with many great fibres shooting there from into the ground.

8. *Faba Aegyptia* *Dioscoridis* & *Theophrasti* cuius radix *Colocasia* dicebatur.

Dioscorides and *Theophrastus* their Egyptian Beane, whose roote was called *Colocasia*.

Because the Egyptian *Arum*, hath beene so much mistaken by many writers that have called it the true *Colocasia* of *Dioscorides* and *Theophrastus*; let me here shew you in this place, the description of the true *Colocasia*, that is the roote of the Egyptian Beane, as *Dioscorides* and *Theophrastus* have set it downe; to affront the false figure of *Matthiolus* his Egyptian Beane, as he set it forth in his comentaries upon *Dioscorides*, moulded from his owne imagination, and not from the sight of any plant growing in *rerum natura*, to make it answer the description, but hath failed chiefly in the fruite, which is not exprest like to thecombe that waspes doe make, but farre differing as many have observed, and objected against him, although as he saith, *Odoardus* did shew it him at *Trent*, with many other rare plants, which he brought out of *Syria* and *Egypt*; the figure of the true fruite, *Clusius* hath set forth, in the 32. folio of his booke of *exoticker* or strange things, which was brought by *Dutch* Marriners from forraine parts unto *Amsterdam*, but was not then knowne where it grew (but since is knowne to be the Kingdome of *Tava* in the *East-Indies*) who was perswaded it might be the true fruite of their Egyptian Beane, unto whose judgement therein, both *Bauhinus* and *Columna* doe encline, and so doe I as you shall heare by and by more at large, but for brevities sake, I will draw both the descriptions thereof by *Theophrastus* and *Dioscorides* into one. The Beane of *Egypt*, which some call the Beane of *Pontus* saith *Dioscorides*, (but *Theophrastus* mentioneth neither *Egypt* nor *Pontus*, but onely calleth it a Beane) groweth in Lakes and standing waters (plentifully in *Egypt* saith *Dioscorides*, which *Theophrastus* (peaketh not of,) in *Asia*, that is in *Syria* and *Cilicia*, but there saith *Theophrastus*, it doth hardly perfect his fruite, but about *Torona*, in a Lake, in the Country of *Calcedonium*, it cometh to perfection, and beareth very large leaves (like those of the batter-burre saith *Dioscorides*) the

salke saith *Dioscorides*, is a cubite long, *Theophrastus* saith the longest is foure cubits high, of the bigneſſe of ones finger, like unto a soft reede, but without joynts, it beareth a flower, twice as large as that of the Poppy (with double flowers, for so I interpret in *plenum caput*, the words of *Theophrastus*) of the colour of the Rose, after which is past cometh a round head called *Ciborion*, or *Cibortion*, that is a small caske, (yet *Athenaeus* saith that a kinde of drinking cup was so called also, whose forme peradventure was like this fruite here expresseſſed) not unlike to the comb which waspes do make, wherein is contained thirty cels at the most, and in every cel or division thereof, groweth a Beane, whose toppe riseth higher then the cell wherein it is enclosed, whose kernell is bitter; which say they, the inhabitants thereabouts put into clay, and thrust downe to the bottome of the water, with long poales, that it may abide therein and thereby make their encrease: the roote is very thicke and great, like unto that of the Reede, but (*Theophrastus* addeth, which *Dioscorides* hath not) full of cruell prickles or thornes, and therefore saith he, the Crocodile refuseth to come nere it, least he should runne against the prickles thereof with his eyes, wherewith he cannot see well, and is called *Colocoriscus* as *Dioscorides* maketh mention, but not *Theophrastus*, which is used to be eaten either raw or otherwayes dressed, that is sodden or roasted, the Beanes saith *Dioscorides* are eaten while they are fresh and Greene, but grow hard and blacke when they are old, being somewhat bigger then an ordinary Beane, which saith *Dioscorides* (*Theophrastus* making no mention of any qualities, or vertues of them) have an astringent or binding faculty, and thereby profitable to the stomacke, and helpeth those that have the fluxe of the stomacke and belly, and the bloody flux, the meale or flower of them strawed upon meate &c. or taken in broth: the huskes whereof saith he doth more good, being boyled in sweete wine, the middle part of the beane which is Greene and bitter, being bruised and boyled in Rosewater, and dropped into the eares, easeth the paines of them. Thus farre *Theophrastus* and *Dioscorides*. Now the description of *Clusius* his strange fruite is thus, as he setteth it downe, This fruite did resemble a very large Poppy head, cut off at the toppe: and consisted of a rough or wrinkled skinny substance; of a brownish colour somewhat light, whose circumference at the top was nine inches, and growing lesſer and lesſer by degrees, unto the stalkes, which as it seemed, did sustaine the flower, after which came this fruite, for there appeared certaine markes of the flower, where it did abide: the upper part hereof was smooth and plaine, having 24 holes or cels therein, placed in a certaine order, like unto the combe of waspes; in every one whereof was one nut, like unto a small akorne, almost an inch long, and an inch thicke in compasse, whose toppe was browne, ending in a point, like as an akorne doth, the lower part having an hole or hollow place, where it should seeme the footestalk upheld it, while it was in its place, whose kernell was rancide or mouldy, thus farre *Clusius*. Let me here also bring in an eye witness or two, of this plants growing in the Ile of *Iava*, Dr. *Iustus Heurnius*, both Divine and Phylition, for the Dutch factory in the Kingdome or Ile of *Iava*, sent into *Holland* a small booke or collection of certaine herbes, &c. growing in that country, with the vertues and uses, wherunto the naturals did apply them (which booke, as I understand by my good friends, Dr. *Daniel Heringbooke*, and Dr. *William Parkins* both English, is kept in the Univerſity Library at *Leyden* in a close cupboard having a glasse window before it, thorough which any one may reade so much thereof as lyeth open) at the end whereof is one by him set downe, under the name of *Nymphaea glandifera* thus described: the huske or cup (saith he) is rugged or full of wrinkles yet soft loose and spongye, like a Mushroome, and of a Greene colour divided into twelve or fourteene cels (*Clusius* his figure here exhibited hath 24) or places, in every one whereof is contained one fruite like unto an akorne of a blackish purple colour on the outside and very white within, the taste whereof is astringent and somewhat bitter withall, like akornes but rough and spongye: it groweth in Moorish places, and by rivers bankes: the leaves are wondrous great and like unto those of the Water Lilly, and so is the flower also of a very strong smell like unto the oyle of *Anacardes*: thus farre Dr. *Heurnius*; whose description in my judgement is so punctuall to those of *Dioscorides* and *Theophrastus* aforeſaid, the description of the roote only wanting, that I shall not neede further to comment upon it, every ones judgement though meane, I suppose being able by comparing to agree the parts: it is probable that *Clusius* having ſcene this booke and the figure hereof annexed to the description might soone pronounce it (as I doe here) to be the true *Faba Aegyptia* of the ancients: there is no mention made in that booke of *Heurnius* by what name the *Javanenses* or *Malayos* doe call it. The other eye witness hereof is M. *William Fincham* an English Merchant, as he is recorded in Mr. *Purchas* his fourth booke of Pilgrimes, the 4. ch. Sect. 5. p. 429. that saith he often did eate of the fruite of a certaine herbe growing in a great Brooke or Lake, two or three courses or miles long on the North-West side of *Fesipore*, which is about twelve courses from *Agra*, in the dominions of the great *Mogoll* called *Surrat* or *Guzurrat* in the East-Indies, which the people call *Camolachachery*, describing it to be like a goblin, flat at the head containing divers Nuts or akornes within it. I have here set downe these things, as well to show you mine owne observations after *Clusius* and others, that assuredly this is the true *Faba Aegyptia* of the ancients, as to provoke some of our nation to be as industrious, as the *Hollanders* by whose care in their travels, this was first made knowne to us, to search out such rare fruites as grow in the parts of their abode, and either communicate them to such as are experienced, or having penned them to publish their labours in Print, if it may be, which I hold the better, according to Mr. *Finchams* example, whose observations have given so great an illustration in this matter, as well as in other things, by me also remembered elsewhere in this worke.

The Place.

The two first are frequent enough in our owne Country. The third is found in some place of *Germany*. The fourth *Clusius* saith came among other rootes from *Constantinople*. The fifth he also saith he found in *Spain* and *Portugall*. The sixth in *Italy*, in divers places. The seventh is not naturall to *Egypt* as I suppose, because it is not found to flower there, being planted for their only use in meates which they seldom take without it, but groweth in *Candy* naturally as *Bellonius* saith, and *Portugall* as *Clusius* reporteth, and in *Italy* also in many places, and in the Country of *Salerno* in the Kingdome of *Naples* as *Columna* reporteth it, as also in the Island of *Iava*, where they use it as familiarly as in *Egypt*, and so recorded in the *Hollanders* Navigation thither, in Anno. 1595. The last as I said before in *Iava* and *Surrat*, and no doubt in sundry other places as *Theophrastus* remembreth, who therefore would not call it *Aegyptia* as *Dioscorides* doth, being not proper to *Egypt*, where for many ages past it hath not bene known to grow now at all, but assuredly if it were a naturall of *Egypt*, it cannot be quite extirpate, and might by good search be there found againe, if men industrious and of knowledge were employed thereabouts.

The Time.

The foure first sorts shoote forth leaves, in the Spring, and continue but untill the middle of Sommer, or somewhat latter, their hoes or huskes appearing before they fall away, and their fruit shewing in August. The fifth and sixt as I said, doe shoote forth their Greene leaves in Autumne, presently after the first frosts have pulled downe the stalkes with fruits, and abide Greene all the Winter withering in Sommer, before which their huskes appeare: The seventh flowreth with his hoes and clappers very late, even in the warme countries, seldome before October or November, and the fruit doth there seldome come to perfection: the last (as may be gathered by the relation thereof) flowreth and beareth fruit in the Sommer time as other herbes doe.

The Names.

It is called in Greeke ἀρὺν, and in Latine *Arum*, and some *Pes vituli*, because the leafe doth somewhat resemble a Calves foote; some also *Dracoea minor*, and *Serpentaria minor*: others againe from the figure of the pestle or clapper in the middle of the hoes, call it *Sacerdotis penes*, and *canis priapus*. *Simon Iarvenfis* calleth it *Aron* and *Barba Aron*; the *Syrians* as *Dioscorides* saith call it *Lupha*: it is called of the *Arabians* *Iaru* and *Sara*, and after them diverse Apothecaries beyond the seas in their shops: In *Italian* *Aro*, *Giaro*, *Gigaro* and *Balaazon* as *Durantes* saith; In *Spanishe* *Taro*, in *French* *Pied de veau*, & *vid or vit de prestre*, & *vit de chien*, in high *Dutch* *Pfaffenpint*, in *Low Dutch* *calfs voet*; in *Englishe* *Wake Robin*, *Cuckowes pintle*, *Priests pintle*, *Rampe*, *Buckrams*, and of some *Starch-wort*. *Cesalpinius* calleth it with spotted leaves, *Gichernum* or *Gigarum* after the *Italian* name, when as all others agree in the name of *Arum*, with the distinction of *maculis albis* and *nigris*, as the kind or sort is; yet the third is called by *Lobel Arum majus Veronense*, and by *Bauhinus Arum veris albis*, and by *Dalechampsius* upon *Pliny* *Calla primum genus Plinij*. *Cordus* in *historia plantarū* calleth it *Dracunculus hemicophyllos*, and as he saith is the same that *Matthiolus* calleth *Dracunculus major*. *Clusius* calleth the fourth *Byzantium*, & it is most probable, it is the same with *Matthiolus* his *Arum aliud minus* with many small rootes, which he saith he received from *Calzolarius* of *Verona*, and thought it grew upon Mount *Baldus*, because he had sent him many plants that grew there: but because this is not mentioned in all the description of Mount *Baldus*, it is more likely that *Calzolarius*, had it from *Constantinople*, or some other place in *Turkie*, and sent it him as a raritie. The fift & sixt are called *Arisarum* or *Aris* as *Pliny* saith, and distinguished by the titles of *latifolium* and *angustifolium*. The *Spaniards* call it *Fraillos*, that is little Friers, because the hoes doth represent the forme of a Friers Cowle: the *latifolium* *Dalechampsius* upon *Pliny* calleth *Calla alterū genus Plinij*, yet *Tragus* thinketh that this *Arisarū*, should be more properly the *Arum* of *Dioscorides*, which is usually eaten, for our *Arum* is so hot and sharpe, that it is not to be endured, whereunto some others doe reply and say, that the *Arum* of the hotter countries is more mild, and yet the same in *specie*: The seventh is called by the *Spaniards* *Manta de nuestra senora* from the largenesse of the leaves, and diversely by divers late Latine Writers, some as I said contesting earnestly, that it is the *Faba Egyptia*, and *Colocasia* of *Dioscorides*, or *Colocasion* of *Nicander*, others flatly denying it and calling it *Arum Egyptium*, which terme *Pliny* useth, but it is not knowne from whom he had it: those that hold and maintaine the former opinion, are *Bellonius*, *Alpinus*, *Camerarius*, *Lugdunensis*, and lastly *Clusius*, who doe all conclude, that this plant which the *Egyptians* call *Culeas*, can be no other plant then the *Faba Egyptia* of *Dioscorides* and *Theophrastus*, although it beare neither flower nor fruit, and thereupon doe much suspect the truth of their descriptions, because there was never heard or found (as they say) any other that did answer in all things unto their descriptions, and that this did most nearely approach thereunto, both for that the name of *Culeas*, so nearely drawing to the Greeke name *Colocasia*, and was so antiently continued among those Nations of *Egypt*, *Syria*, *Arabia* and *Africke*, and that the daily use of the roote to be dressed or eaten raw, for their food and meate as they said their *Faba* was; but the fruit or nuts was their foode and not the rootes, time having inverted both name and use: it is also called *Talasse* by the inhabitants of *Tarso* (but *Lalade* in the *Malaitongue*) which soundeth somewhat neere *Culeas* as it is recorded in the *Dutch Navigation* thither in Anno 1595. before spoken of, where it is said also to beare neither flower nor fruit; but those that hold the contrary opinion that it is but *Arum Egyptium*, and not the true *Colocasia*, although commonly so called, are *Anguillara*, *Guilandinus*, *Maranta*, *Causabonus*, *Matthiolus*, *Gesner* in *hortis Germanie*, *Dodonæus*, *Lobel*, and *Columna*, who have all of them in their times testified it, most of them having seene the flower or fruit, or both, that it beareth: which plainly declareth it to be a kind of *Arum*, and that it is not the *Faba Egyptia*, whose roote was called *Colocasia*: but *Fabius Columna* lastly and most fully to the purpose, doth shew the truth, setting forth the description of this *Arum Egyptium*, amply in every part, to beare leaves, flowers, hoes or huske, with a pestle or clapper therein, and berries afterwards, agreeing in all those parts to the vulgar *Arum* and *Arisarum*, although somewhat in a different manner, as every species of a *Genus* doth; and with all doth defend the veritie of *Dioscorides* and *Theophrastus* descriptions thereof, against all gainesayers, wondering that so many learned men should not discern the truth, but be led away so grossely into errour, against so plaine declarations, that they make of the plant and every part thereof, that is of roote, stalke, leafe, flowers and fruit: the roote to be like the roote of the Reede, but greater and not bulbous like the *Arum*, to be armed with prickles or thornes, when as the roote of this *Arum*, or supposed *Colocasia* is not so, then that it beareth a stalke a cubite or more high, which this doth not, and that it carrieth a flower thereon, bigger than that of the Poppie, and of a Rose colour, which this hath no resemblance thereunto; and lastly that it beareth a head like a *Walpes combe*, with many cells or divisions therein, in every one wherof groweth a fruit or nut, bigger than an ordinary Beane, whereunto this *Arum* hath no likenes; I might adde also the name of the head called *Ciborion*, or *Cibetion*, which as I said signifieth a small casket, from the similitude of the places, wherein the fruit standeth, as also from the forme of the head with the fruit, like unto a drinking cuppe, used among the ancient *Grecians*; as also the fruite or Beane it selfe, so notably knowne to all the Nations, both *Greekes* and others, that it was as a standard for a certaine weight, whose true proportion was certainly knowne, and constantly maintained: the place also of the growing, being in the waters, is differing from that of *Arum*, the vertues and qualities as different from it, all which I have therefore shewed you, that every one may plainly see the truth, and hereafter be better perswaded, if they have erred in their opinion and judgement: And to shew the originall of this errour, as it is most probable: first I may say that the revolution of time, which bringeth on with it many slippes and errours, hath beene the cause thereof, which therefore wise men and judicious, must still be carefull to finde out and reforme: *Bellonius* in the 28. Chapter of his second Booke of Observations, thinketh that *Herodotus* was the first, that was the cause

cause of that error, but I verily suppose it to be more antient, for *Dioscorides* saith in his Chapter of *Arum*, among the diverse names thereof, that those of *Cyprus* did call *Arum* by the name of *Colocasion*, and therefore it is most probable that diverse Nations, eating the rootes of this *Arum*, as well as the rest, which were not hot and sharpe in taste. in those countries, as they are in these colder, did from the *Cyprians* call it *Colocasia*, because the roote of the *Egyptian* Beane, being also called *Colocasia*, was boyled and eaten as those of *Arum* were: and thus this error is eading, and the use of them encreasing by being peradventure, both more plentifull, to be had by encrease, and more acceptable to the taste, than the fruite of the *Egyptian* Beane, it became of lesse esteeme, and in time to be so much neglected, that it was no more looked after and planted, whereby it became to be utterly unknowne at the last, and the name *Culcas*, was still maintained and imposed on those rootes of *Arum*, as if they had beene the rootes of the *Egyptian* Beane. Thus much I thought good out of my simple judgement to declare, which if it doe not agree with truth and reason, I submit it to those that can bring better.

The Vertues.

Tragus reporteth that a dramme weight, or more if neede be, of the roote of that *Wake Robin*, that hath spotted leaves, whether it be fresh and Greene, or dried it mattereth not; being bruised or beaten and taken, is a most present remedy never failing against both payson and plague: some he saith, take as much *Andromachus* Treacle with it, for the more certaintie: the juyce of the herbe taken, to the quantitie of a spoonfull or more, worketh the same effect: but if there be a little vinegar added thereunto, as well as to the roote before spoken of, it will somewhat allay that sharpe biting taste upon the tongue, which it causeth; the Greene leaves likewise being bruised and laid upon any boyle or plague sore, doth wonderfully helpe to draw forth the payson: the powder of the dried roote of *Wake Robin*, to the weight of a dramme, taken with twise as much Sugar, in the forme of a Lohoc or licking Electuary, or the Greene roote, doth wonderfully helpe those that are pursie or short-winded, as also those that have the cough, having their stomacke, chest, and longs, stuffed with much flegme, for it breaketh and digesteth it in them, and causeth it to be easily avoided and spit forth: the milke wherein the roote hath beene boyled, is effectually also for the same purpose: the said powder taken in wine or drinke, or the juyce of the berries, or the powder of them, or the wine wherein they have beene boyled provoketh urine, and bringeth downe womens courses when they are stayed, and purgeth them effectually after child bearing, to bring away the afterbirth; it is said that it expelleth drunkennesse also; taken with sheepes milke, it healeth the inward ulcers of the bowells; the distilled water hereof likewise is effectually, to all the purposes aforesaid; and moreover a spoonfull taken at a time, healeth the itch; and an ounce or more taken at a time for some dayes together, doth helpe the untire: the leaves either Greene or drie or the juyce of them, doth cleanse all manner of rotten and filthy ulcers, of what part of the body soever they be, and the stinking sores in the nose called *Polypus* and healeth them also: the water wherein the roote hath beene boyled, dropped into the eyes, cleneth them from any filme or skinne beginning to grow over them, or clouds or mists that may hinder the sight, and helpeth also the watering and rednesse of them, and when by chance they become blacke and blew: the roote mixed with Beane flower, and applied to the throat or jawes that are inflamed, helpeth them: the juyce of the berries boyled in oyle of *Roses*, or the berries themselves made into powder, and mixed with the oyle and dropped into the eares, easeth the paines in them: the berries or the rootes beaten with hot oxe dung, and applied to the gout, easeth the paines thereof: the leaves and rootes also boyled in wine with a little oyle, and applied to the piles, or the falling downe of the fundament easeth them, and so doth the sitting over the hot fumes thereof: the fresh rootes bruised and distilled with a little milke, yeeldeth a most soveraigne water to cleanse the skinne from scurfe, freckles, spots, or blemishes whatsoever therein: yet some use the rootes themselves bruised and mixed with vinegar, but that is too sharpe, and not to be used but when there is great neede, and with good caution, and not to abide long upon any place: there is a *facula* made by art from the fresh rootes, called *Geraserpentaria*, which is as white as *Starch* or *Cerase*, and being dissolved in milke, or in the distilled water, of the rootes and milke aforesaid, doth wonderfully blanch the skinne, hiding many deformities: the fresh rootes cut small and mixed with a sallet of white *Endive* or *Lettice*, &c. is an excellent dish to entertaine a smell-feast, or unbidden unwelcome guest to a mans table, to make sport with him, and drive him from his too much boldnesse; or the powder of the dried roote, strawed upon any daintie bit of meate, that may be given him to eat; for either way, within a while after the taking of it, it will so burne and picke his mouth and throat, that he shall not be able either to eate a bit more, or scarce to speake for paine, and will so abide untill there be some new milke or fresh butter given, which by little and little, will take away the heate and pricking, and restore him againe. Some use to lay the Greene leaves of *Wake Robin* among their Cheeses, both to keepe them from breeding wormes, and to ridde them also being in them. The *Arisarum* or *Friers Coule*, as *Dioscorides* and *Galen* affirme, is farte hotter, and sharpe or biting in taste, than *Arum* or *Wake Robin*, which is not so found in any part of Europe, whether *Italy* or *Spaine*, *France*, *Germany* or *England*, that I know, both hot and cold countries, but in all of them much milder and weaker than the *Arum* (which caused *Tragus* as I said before, to suspect that our *Arum*, was the *Arisarum* of the antients) and therefore they appoint it, to be laid to eating, fretting, and running sores, to stay their spreading, and abate their malignitie, as also to be put into fistulas and hollow ulcers, to helpe to cleanse and heale them up: a peece of the roote, put into the secret parts of any femall creature, killeth them, causing them to die quickly; which thing is contradicted by some, and said to be utterly untrue. *Amatus Lusitanus* writeth, that in the *Low Countries* it was used against the plague, whereof *Celsus* saith, it was not knowne unto his countrie men, untill he had travelled into *Spaine* and *Portugall*, and from thence gave them the knowledge thereof, by sending it unto them: but it may be hee mistooke *Arisarum*, for *Arum*, which as you may see before, is found effectually for that purpose. The *Arum* of *Egypt* as it is milder in taste, although somewhat sharpe and bitter and slimie in eating, so it is lesse effectually in medicine, because it is more usuall in meate. All the East countries which the *Italians* call the *Levant*, as *Asia*, *Syria*, *Arabia*, *Egypt*, &c. and *Iava* also, and other places in the *Indies* as you heard before doe most frequently eate the rootes hereof boiled in the broth of fesh, and many other wayes dressed, not onely as a daily foode, but as they thinke, to encrease naturall sperme or seede, and to cause a validitie also, and more powerfull abilitie in the act of generation.

CHAP. XVIII.

Christophoriana. Herbe Christopher.

Besides the usuall sort of herbe *Christopher*, which hath beene knowne of a long time to us, we have lately gained an other sort as we suppose, the neare resemblance in face causing us so to imagine.

1. *Christophoriana vulgaris*. Ordinary herbe *Christopher*.

Herbe *Christopher* shooteth forth diverse greene stalkes of leaves, halfe a foote long, which are made into three parts, yet some times into five, the lower parts standing for the most part one against another, or not much distant, and the other at the end of the stalke, each of these parts consist of three leaves separate a sunder, with small foote stalkes unto them, which are somewhat broad, and ending in a point, some of them cut in on the edges more deeply, and all of them dented about the edges, of a sad greene colour; among these leaves rise up diverse somewhat weake, smooth, round stalkes, halfe a yard or two foote high, yet not bending, but standing upright, having three or foure such like leaves thereon, as grew below, but with shorter stalkes: at the toppes of the stalkes stand a tuft or bush of white flowers, every one consist of five small leaves, with many whitish threds in the middle; and after they are fallen come small round berries, greene at the first, and blacke when they are ripe: the roote is blacke without, and a little yellowish within, and somewhat thicke with diverse blackish strings, or great fibres annexed thereunto, which perisheth not, although the stalkes and leaves doe die downe every yeare, fresh springing up againe.

2. *Christophoriana Americana baccis niveis & rubris*. Herbe *Christopher* of America.

This stranger shooteth forth in the Spring many reddish stalkes about a foote high with diverse leaves thereon, divided into many parts somewhat resembling the former, but larger, rougher, and of a sadder greene colour, at the toppes, whereof standeth a large tuft of white flowers composed in a manner wholly of threds, yet if they be more neerely vewed, there will appeare for every flower fixe small white leaves with their threds in the middle, compassing a round greene buton, which comming to maturitie is either white with a purple tippe and foote stalke, or reddish wholly: the roote is blacke, thicke, short and crooked, not growing downewards nor creeping; but with many fibres thereat.

The Place.

The first groweth generally in the woods of mountaines, that are somewhat open and not too much shadowed, and other like places, as well in our owne as other countries. The other both in our Plantations, and the French in America.

The Time.

They flower after Midsummer, and the berries are ripe in August.

Christophoriana vulgaris.
Ordinary herbe *Christopher*.

Christophoriana Americana.
Herbe *Christopher* of America.

The

The Names.

It hath no Greeke, or scarce any good Latin name, although commonly with most, it be called *Christophoriana* or *herba sancti Christophori*, but for what cause and respect I cannot learne, and many do doubt of the Saints name thinking it but composed as relative, bearing Christ according to the morall of the story and not essentiall and indeede: Some call it as *Lugdunensis* saith *Napellus leucanthemos*, and some *Aconitum bacciferum*. *Lugdunensis* saith, it is called with them *Napellus racemosus*, and so with *Maraniba* as *Camerarius* saith, some againe call it *Coffus niger*, *Pena* and *Lobel* make a doubt whether it be nor *Aleæ* of *Pliny*, in his 27. Booke and 7. Chapter, because his *Aleæ* beareth blacke berries like *Ivie*: but diverse good and judicious Herbarists, doe rather take *Aleæ* to be *Ebulus*, for this hath no rough stalke as *Aleæ* hath, but a smooth; and *Paulus Aegineta* interpreteth the roote of *Aleæ*, to be the roote of *Sambucus*; *Bauhinus* calleth it *Aconitum racemosum*, and seemeth to leane to *Lobel* his opinion, whether it be not *Pliny* his *Aleæ* or no. Some also doe call *Scrophularia* by this name of herbe *Christophor*. *Camerarius* saith it is called in high Dutch *Wolfs worts*, when as *Tragus* and others say, the *Aconitum Lycostomum*, that is *Luparia* or *Lupicida* is so called also with them. *Camerarius* saith also it is called with them *Christoffels kraut*, but *Tragus* saith that a kind of Vetch or Pulse, which he thinketh is the *Aracus* of *Dioscorides*, is called with them *Sant Christoffels kraut*: The other is called by *Iacobus Cornutus* in his *Canadensium plantarum historia* *Panax racemosum Canadense*: but why *Panax* being no wound herbe, I see no cause unlesse it were for want of a better name: but I thinke I have entituled it more truly, I am sure more nearly resembling this herbe, than any *Panax* that I know.

The Vertues.

The Inhabitants of all the mountaines and places, wherefoever the first groweth as some Writers say, doe generally hold it to be a most dangerous and deadly poison, both to men and beast, and that they use to kill Wolves herewith very speedily; it must therefore be cautelously used, or rather utterly refused: but I much doubt whether those Mountainers meane not rather that *Aconitum Lycostomum* called *Lupicida*; and although many good Authours hold it dangerous, yet cannot I in my judgement so thinke, not finding herein by the taste any pernicious qualitie; but I cannot learne what helpe this hath procured to any: *Cornutus* saith of his *Panaces Carpimon*, that it is eaten familiarly both with the naturalls, and French inhabitants with them as a faller herbe.

CHAP. XIX.

Climacter, Climbers or Clamberers.

Here are diverse sorts of Climbers or Clamberers, most of which are sharpe hot and causticke, or exulcerating the skinne, if they lie any little time thereon, and thereby dangerous, although not deadly; diverse of them have bene declared in my former Booke, whereunto I referre them that would be enformed of them, yet I thinke it not amisse to let you see some of their figures, the descriptions of the rest shall follow.

1. *Clematis sylvestris latifolia sive Vierna*. The great wild Climer or *Gerards Travellers Joy*.

This wild Climer or Travellers joy, as some call it, hath in some places (especially if it have flood long in a place) a thicke and strong ragged wooddie stemme or trunk, with diverse chops or riftes in the bark, which is of a grayish colour, from whence shoote forth many long pliant grayish Greene branches, more strong and wooddie, than any of the other Climbers. (so that their branches doe in many places serve as wiches, to winde about garden and field gates, or to binde any bundle together,) these branches spread upon the hedges or trees, whatsoever it standeth next unto, dividing it selfe into many other twiggies, whereon are set at the severall joynts, two long stalkes of winged leaves, consisting of five leaves, two and two together, and one at the end, each dented on the sides, with small notches, of a pale Greene colour, and tasting sharpe and hot, biting upon the tongue, but not so much as the burning Climer or Virgins bower; these branches winde themselves about any thing, standeth neare unto them for a great way, but have no clasping tendrells, like the Vine, to take hold and winde it selfe thereby, as *Gerard* saith it hath, so farre as ever I could observe: at the joynts where the leaves stand, come forth likewise towards the toppes of the branches diverse bunches or tufts of white flowers, set together upon small long foote stalkes, with diverse yellow threds in the middle, smelling very sweete; and after they are past, there arise in their places severall heads of many long hoary silver-like plumes, as if they were feathers set together, with a brownish flat seede at the bottome of every of them, which abide a great while, even to the Winter, before they fall off, or are blown away with the winde: The roote is great thicke, and somewhat woddy, disperling it selfe into diverse long branches under ground: the leaves fall away in the Winter, and recover againe in the Spring.

2. *Clematis sylvestris altera Batia*. The great Spanish wild Climer.

This other wilde Climer hath such like running or climbing branches, but spreading farther with many joynts all the length thereof, whereat stand round about it diverse hard and somewhat broad leave, each by it selfe upon a small foote stalke, and dented round about the edges, of as sharpe and hot taste as the former, where also come forth two claspers on each side, whereby it catcheth fast hold of any thing it standeth in the way neare unto it: from the joynts likewise where the leaves stand, come forth (the flowers were not observed) long tufts or heads, in the same manner that the former hath, with the like plumed feathers, of a hoary white colour, with smaller seede below them, then the other.

3. *Clematis Cruciatæ Alpina*. The crosse Climer of the Alpes.

This Crossewort Climer hath many slender and more square branches, than any of the other Climbers, somewhat hard and wooddy, rising to be foure or five foote high, standing for the most part upright, or but leaning a little downwards, from whence shoote forth many small twiggies, not past foure inches long, whereon are set at equall distances, two small stalkes of leaves, all the length of the twiggies, three joyned alwayes together at the ends of them, each whereof is hard rough and full of vaines, of a sad Greene colour, of the bignesse of a large Mirtle leafe, or bigger, dented thicke round about the edges; the flowets come forth single, every one upon a slender

Vinca peruviana vulgaris.
Common Periwinkle.

Clematis Daphnoides latifolia seu Vinca peruviana major.
The greater Periwinkle.

Clematis urens flore albo.
The burning Climber or Virgin's Bower.

Clematis peregrina flore rubro vel purpureo simplex.
Single Ladies bower red or purple.

Clematis perigina flore pleno.
Double purple Ladyes Bower.

Flammula lortii var. clematis.
Upright Virginia Bower.

Clematis Patonice minor.
The lesser Hungarian Climber.

Clematis Patonice Clusij major.
The greater Hungarian Climber.

a slender long foote stalke, consisting of foure woolly and pointed leaves, laid open like unto a crosse, of a bluish white colour, having in the middle thereof, many small whiter leaves foulded together: the roote spreadeth very much under ground, which hath but very small acrimonic therein, or none at all, but the leaves are somewhat sharpe and hot in taste.

4. *Clematis maritima repens.*

The creeping fiery Sea Climer.

This creeping Sea *Clematis*, spreadeth abroad many creeping pliant, joynted and crested branches, about two foote long, covered with a very darke Greene barked, from whence shoote forth many winged leaves, a little dented about the edges, very like unto the *Clematis erecta*, or *Flamula soris*, the upright Virgins Bower, consisting of five leaves, but most commonly of three upon a stalke, being narrower, harder and longer pointed: at the ends whereof cometh forth, a small clasping tendrell, but those that grow up higher upon the stalkes, and nearer unto the toppes, where the flowers doe stand, are much smaller and narrower: the flowers come forth many together, as in the other, set up in long foote stalkes, which are white with many hairy threds in the middle of them: and after they are past, arise many round flat reddish feede, smaller than the other, three or foure upon a stalke together, plumed with a white feather, at the head of every of them: the whole plant is sharpe and hot like unto the other.

The Place.

The first groweth in many places of our owne land, in the hedges of fields, & by the high wayes side, in *Buckinghamshire*, *Bedfordshire*, and *Essex*, but especially in *Kent*, where from beyond *Woolwich* to *Gravesend*, and from *Gravesend* along to *Canterbury*, you may see it in many

2. *Clematis sylvestris altera Barica.*
The great Spanish wild Climer.

1. *Clematis sylvestris latifolia f. Piorna.*
The great wild Climer or C. avelensis frax.

3. *Clematis Crucifera Alpina.*
The lesser Climer of the Alpes.

places:

places. The second *Clusius* onely found in Spaine, betweene *Medina Sidonia* and *Calpe*, and in divers places thereof. The third was found upon mount *Baldus*, by *Iungermannus* as *Bauhinus* saith, but is set downe by *Iohannes Pona*, an Apothecarie of *Verona*, in his description thereof which he sent unto *Clusius*, that first published and set it forth at the end of his history of plants, and was augmented afterwards by *Pona* himselfe, and yet *Bauhinus* saith it was found also very plentifully, both fairer and greater by Doctor *Burserus*, by his sonne of *Austria*: The last *Bauhinus* saith, groweth in many places of the *Adriaticke* sea shore, and in those Islands of the *Venetians* there, called *Lio*, and *Litzesufina*.

The Time.

They doe all flower about *Iuly*, and the feather like toppes of the crested ones, appeare in some places all the winter.

The Names.

They are called *Clematides* of their climbing and spreading branches. The first *Bauhinus* calleth *Clematis sylvestris latifolia*, and so doe I also. *Lobel* and *Gerard* call it *Viorna*, quasi vias ornans, which Latine word I thinke was but derived from the French *Uierne*, or the French from the Latine: *Belonius* saith, it is *Viburnum Galorum*, (and *Ruellius* I thinke tooke it from him ore converso.) as if the French *Uierne* were derived from *Viburnum*, whereof *Virgil* speaketh in these words.

*Verum hoc tantum alias inter caput extulit arbes,
Quantum lenta solent inter Viburnæ Cupressus.*

Wherein he compareth the statelines of *Rome* to the Cypresse tree, and the meanness of other Cities to the low shrubbe *Viburnum*: but so it is not likely to bee, seeing this *Viorna* will rise to the top of the tallest Cypresse itselfe, if it be planted nigh it whereon it may climbe; that *Virgil* his comparison therefore may hold good we must find *Viburnum* to be a low shrub much differing from this, as you shall heare in his place: *Fuchius* thought it to be *Vitis nigra*, *Dodonæus* calleth it *Vitalba*, *Anguillara* judged it to be *Atragene Theophrasti*, whereof he maketh mention in lib. 5. c. 10. whereunto *Clusius* doth consent as being the most likely of any other plant, and *Pena* and *Lobel* doe not dissent therefrom, neither doe I for the reasons there shewed: it is also the *Vitis sylvestris* of *Pliny* whereof he speaketh in his 16. Booke and fourth Chapter, and the *Clematis tertia* of *Matthioli*, the *Vitis sylvestris canstica*, of *Gesner* in *hortis Gemarniæ* the *Vitis sylvestris Diofcoridis* of *Anguillara*, and the *Clematis altera prima* of *Cordus* upon *Diofcorides*: the *Italians* call it *Vitalba*, the *Germans* *Linen* and *Lynen*, the *Dutch* *Lynen*, and in English of most country people where it groweth *Honestie*; and the Gentlewomen call it *Love*, but *Gerard* coyned that name of the Travellers joy. The second *Clusius* calleth *Clematis altera Betica*, and *Bauhinus* that he might vary therefrom, *Clematis peregrina foliis pyri incisis*: The third is set forth by *Pona* under the title of *Clematis Cruciatæ Alpina*, but *Bauhinus* to alter the title, calleth it *Clematis Alpina Gerani folia*: the last *Bauhinus* calleth *Clematis maritima repens*, as it is in my title and describing it in his *Pinax*, referreth it to *Anguillara* his *Clematites*.

The Vertues.

None of these here described are used in Physicke, by any that I know, for although they are all hot and sharpe in taste, some more or lesse then others, yet are they not applied to the purposes that the other sorts are, which *Diofcorides* and *Galen* speak of: both these and the other Climbers whose figure I give you here, and their description in my former booke may very well serve to make Arbours, in Gardens, Orchards, or other places for pleasure, for thereunto they are most fit, if any will so respect as to plant them. The other Climbers serve to take away the scurfe, leproy, or other deformities of the skinne: but may not safely be used inwardly, although *Diofcorides*, *Galen*, *Pliny*, and others say it was used to purge the waters in the Dropick: *Matthioli* saith the water of the upright *Virgins Bower* is effectual in any cold greefes, and that some gave the leaves prepared to helpe the quartane Ague: an oyle made thereof is used to heale those that have aches, crampes, and other paines that come by cold, as also to helpe the stone and to provoke urine: the *Periwinkle* is a great binder staying bleeding, both at the nose and mouth if some of the leaves be chewed, the French doe use it to stay the menstruall courses. *Diofcorides*, *Galen*, and *Agineta* commend it against the laske and fluxes of the belly to bee drunke with wine: it is a tradition received with many, that a wreath made hereof and worne about the legs defendeth them from the crampe. The *Maracoe* or *Virginia* Climer, although I have placed it among them for the manner of growing, yet is it of a farre differing quality, the liquor within the fruite is very pleasant to the taste, as if Muske or Amber were mixed with it, or as others say, having a little aciditie with it, so that it cloyeth not the stomack although one take much thereof, nor giveth any bad symptome, but is held rather to move the belly downewards and make it soluble. *Aldinus* in his *Famesian Garden* hath set downe many vertues thereof rather in an hyperbole I thinke then in verity, which I thinke wererather others fantasies then of his owne approbation: for in his owne judgement and tryall he saith the leaves are of a sleepe property, smelling like unto Nightshade, having withall peradventure some deleteriall or deadly quality in them also, because (as he observed) that flies resting on them were extinguished or kild.

CHAP. XX.

Apocynum sive Periploca. Dogs bane.

Here are three sorts of this *Apocynum* or Dogs bane differing chiefly in the climbing, and in the forme of their leaves, and are dangerous to man and beast, but there are some other plants referred unto them, as well for their face and forme of growing and giving of milke, as for their violent and dangerous qualities, I have spoken of that kind that came out of *Virginia* in my former booke, whereunto I must refer them for the description that are desirous to see it.

1. *Apocynum latifolium non repens*. Broad leaved or upright Dogs bane.

This broad leaved or upright Dogsbane, a woody stemme of the bignesse of ones finger, covered with a grayish

ish barke, from whence arise divers woody, but flexible greenish branches, easie to winde, but very tough & hard to breake, standing for the most part upright, and seldome trayling or laying hold of any thing that groweth neare it, having two broad darke greene leaves, but sharpe and not round at the points, set at every joynt all along, but not very neare one unto another, full of veynes, somewhat softer then Ivie leaves, somewhat thicke also, whose stalkes and branches being broken yeeld a pale yellow coloured milke; but as *Discozides* and other writers say, of a much deeper yellow, that is, in the warmer Countreys; the flowers come forth at the joynts with the leaves, and at the tops three or foure or more sometimes standing together, which consist of five small pointed leaves, of a whitish colour, yet larger then those of *Asclepias* or Swalloweworr; after which (in the hotter Climats, but never in ours that could be observed) grow long crooked and pointed cods, somewhat more hard and woody then those of *Asclepias*, although nothing so much as those of the Rose bay tree, called *Oleander*, most usually two standing together upon one stalke, but severed at the setting to the stalke, and are full of a silken white downe, wherein lye disperfed many flat blackish browne feedes: the roote groweth downe into the ground (spreading into sundry branches, with divers small fibres thereat, this looseth not his branches, but leaves every yeare, new shooting forth every spring.

2. *Apocynum angustifolium sive repens*. Climbing Dogsbane.

The climbing Dogsbane fendeth forth from the roote divers woody branches, yet tough and flexible, of a darke grayish greene colour, and sometimes brownish especially neare the ground, where it beareth no leaves af-

ter it is grownne of any bigneffe or height, which winde themselves from the Sun ward (as in all that I have seene I have observed) to a very great height, twenty foote or more sometimes, if it finde whereon it may climbe higher, or else falling downe againe with his top, whereon stand at severall good distances, laying at the tops where they stand thicker set together, two leaves longer and narrower then the former, and pointed at the ends, somewhat thicke, and of a deepe greene colour almost shining: the flowers stand in the same manner that the others doe, consisting of five thicke leaves, each of them pointed and somewhat bending backwards, seeming to have two leaves a peece, one lying upon another, like unto those of *Epimedium* or Barrenwort, the undermost being greenish and larger then the upper leaves, which lye upon them, and are not so large to cover them wholly, but leave the greene brims, or edges of the lower leaves to be seene round about them, which upper leaves are of a darke purple or reddish colour, and cleave so fast to the lower, that it is very hard to separate them: in the middle of each flower standeth a greene pointell, incompass'd with five darke yellow chives, each of them turning inwards: after the flowers are fallen, appeare (in the warme countreys, but not in ours) small long cods, two alwayes joyned together, but more strictly then the other, bowing somewhat more outwards in the middle, and meeting almost together at the points, wherein lie such like flat feedes, wrapped in the like silken downe: the roote spreadeth in the ground like the other, and sometimes fendeth forth suckers, whereby it is increased: this likewise looseth his leaves but not his stalkes in the winter, and gaineth fresh in the spring.

3. *Apocynum angustifolium salicifolium*. Willow leaved Dogsbane.

This other narrow leaved Dogsbane groweth up in the same manner, that the last doth, having two leaves set at every joynt of the climbing twigs, but they are not so thicke, but somewhat thinner, and much narrower then they, almost resembling the forme of a willow leafe, the flowers are like the other, and blow as late, loosing his leaves in the winter, in the same manner.

4. 5. *Apocynum rectum latifolium & angustifolium Americanum sive majus & minus*.

The great and lesser upright American Dogsbane.

Although I have in my former booke given you both the description and figure of the greater sort of these Dogsbanes by the name of *Periploca Virginiana*, Virginian silke, yet I think it not amisse to mention it here againe, & give you the full figure thereof, referring you to see the description, &c. there, and with it to joyne a lesser sort which creepeth not with the rootes in the ground like it, but from many long fibres shooreth forth a round browne stalke about halfe a yard high, having at each joynt a paire of long narrow leaves, and such a large tuft of flowers at the top, but of a deeper purple colour, which have a certaine clamminesse on them that will detain flies or other light things that happen to fall thereon, after which come long and straight cods (not crooked like the greater sort hereof) with flat browne feedes therein lying in a white kind of downe, like unto *Asclepias* Swalloweworr: this yeeldeth a milky sap like the other, and thought to be both dangerous, although no true tryall hath beene made thereof.

6. *Pseudo apocynum Virginianum, alyz Gelseminum Americanum maximum flore phaniceo*, Virginian Iasmine.

Lemme I pray you make bold to insert in this place to the rest this Indian, I intide him with bastardy for the reasons hereafter specified, whose description I give you in this manner. It shooteth forth sundry weake whitish woody stemmes not able to sustaine themselves without helpe of stakes or fastening to some wall but spreading exceeding high or farre, branching forth on all sides into many small ones, at whose joynts come forth long winged leaves seven or nine set on a middle stalke, each whereof is somewhat broad and long point-

2. *Apocynum angustifolium* frutescens.
Climing Dogsbane.

Apocynum rectum latifolium & *angustifolium* Americanum
five majus & minus. The greater and lesser
American Dogsbane.

red and dented somewhat deeply about the edges, and of a sad greene colour full of veins, very neare resembling the leaves of the great Germane Burnet Saxifrage. This never bore flower with mee, nor any other that hath it in our country that I could heare of: but in the naturall place, as also beyond sea, at Rome, and other warme countries, it beareth a great tuft of flowers together hanging downewards, each whereof is large and somewhat long, somewhat like to the Foxglove, but rather Bell fashion, small at the bottome big in the belly, and wide open at the mouth, cut in on the brims into five or six lips as it were or divisions, of a sad Orange or yellowish red colour, with some yellow threds, & a whitish stile in the middle: after the flowers are past, arise hard, woody, long & flattish double edged crooked and pointed cods, containing within them a double row of flat, thin, transparent, browne skinny and winged feedes, with a thinne woody filme separating them in the middle all the length of the cod: the roote groweth not very deepe but spreadeth, yet runneth not under ground, the leaves all falling away from the branches every winter, and are renewed every spring. By this that hath bene sayd you may perceive the reason why I place it among these dangerous climers, although it have no obnoxious or hurtfull quality therein for any thing I can learne, and doe not call it a lasmine as many others do, nor a Honyfuckle as our English Colonie at Virginia first did, nor a Bell flower as since they have done, nor yet place it with the other Climers in the last Chapter, because of the pods with feedes, neither yet doe I entitle it *Gelsenium bederacum Indicum*, as that good French goose doth, whose horned name is prefixed to his worke of great judgement no doubt, to make it beare an Ivy title that hath so little resemblance thereto.

The Plate.

The first groweth in Syria and those Easterne countries, the other groweth in Italy, in Apulia and Calabria in the kingdome of Naples: the third likely groweth in Italy, the feede being sent from thence, as also in Egypt, the three last sorts came all from our English plantations in America.

The Time.

They flower very late in the yeare, if they flower at all, that is, not untill the end of August, and to the middle of September.

The Names.

It is called in Greeke *Ἀποκύνιον* and *κυνόκρινον*, *Apocynum* and *Cynomeron*, quia canis interfecit: *Dioscorides* saith it was also called of divers in his time *Cynocrambe*, *Brassica canina*, but it is an extravagant name not fit, and *πικρά κρύνη*, *Periploca* of divers; which is as well a word, common to all sorts of herbes, that clime up and wind themselves about trees, and other things as peculiar to these called *Periploca*, whose *Alexipharmacum* or counterpoysion is the *Vincetoxicum* or *Asclepias*, as the *Anthora* is unto the *Thora*, and *Herba Paris* unto *Pardalancher*. *Fabius Columna* seemeth to doubt, that the Herbarists and Apothecaries in Italy did take the *Apocynum* of *Dioscorides*, in their Medicines, which is deadly, in stead of *Asclepias*, and that they did not know the true *Asclepias* of *Dioscorides*, unto whose description that which is called *Asclepias* with them and us doth not agree, for although it hath a number of rootes, yet they doe not smell well, (as *Dioscorides* saith the rootes of his *Asclepias* should doe) nor yet hath it seeds like unto *Securidaca* Hatcher Teeth, but hath leaves, flowers, cods, with silken downe, and feede

seede in them, like unto the *Apocynum* of *Dioscorides*, and differing in nothing but in the milkye juice it yeeldeth; which as he saith, in that, is white like milke (but *Dioscorides* saith, that his *Apocynum* giveth a yellow juice or milke) and in this, is of a pale yellow colour like unto the poyson of the viper, that sticketh in the gums of his teeth; which he saith he hath often shewed to his friends, to shew them the likelihood of danger to be in their *Asclepias*, which yeeldeth such a likely poyson, or at the least to cause them to be more cautelous in the use of it: but assuredly if their *Asclepias* (which is the same with ours called also *Vincetoxicum* as I thinke) doe give a yellowish milke, yet doth it not in our Country, neither the white nor black: he saith also, that the latter writers have set forth divers sorts of *Apocynum* under the name of *Asclepias* of *Dioscorides*, for that they doe not know, nor have seene the true *Asclepias* of *Dioscorides*, unless his *Apocynum* and *Asclepias* be all one, set forth in divers places, and by divers names: thus farre *Fabius Columna*, led away onely by the sight of that yellowish milke in their *Asclepias*; which as you heare he acknowledgeth not to be the right (howsoever the use thereof was frequent with them, and might be as he acknowledgeth also, a counterpoyson as the true *Asclepias* is accounted) but rather an *Apocynum*: but I thinke he did not thorowly consider that the true kindes of *Apocynum*, have all of them woody, yet pliant branches, as *Dioscorides* giveth to his *Apocynum*, fit to binde any thing, which abide and dye not downe to the ground, as all the sorts of *Asclepias* doe, which is the true note to distinguish the *Apocynum* from *Asclepias*. The names of them all, as they are in their titles here set downe, doe little or nothing vary, from those that all other writers give them, some calling them *Apocynum*, and some *Periploca*, and therefore I neede not I thinke, make any further repetition of their divers appellations, onely the fourth *Bauhinus* calleth as I doe, and taketh it to be also the *Secamone* *Aegyptium* of *Alpinus*, and the second sort of the second kinde of *Apocynum* of *Clusius*: the last, because of the woody pods with the manner of the climbing, mooveth me rather to joyne it to these, although I know not of any evill quality therein, and therefore give it a bastard name.

The Vertues.

There is no property herein fit for the use of mans body, appropriated by any, either ancient or moderne writers, for the place in *Pliny*, lib. 24. c. 11. is mistaken or scarce to be beleaved, where he saith the seede of *Apocynum* taken in water, helpeth the pleuresye, and all paines of the sides, (unlesse he thought it to be like the hangman that can doe as much,) and yet afterwards saith it killeth dogges, and all foure footed bealts, being given them in their meate, for *Galen* saith it is a poyson to man, and being of a strong sent it is hot, and that not in a meane degree, although it is not drying in the same, and is not to be used but outwardly, to disencle humours. *Clusius* saith, that the most illustrious Prince, *William Landsgrave of Hessen*, in appointing his Physicians to make tryall of the *Terra Silefiaca*, which was taken at *Strega*, whether it had those properties to expell poysons, as they that brought it to sell reported of it, caused divers poysons to be given to dogs, as *Arsnicke*, *Napellus*, or *Helmet flower*, and *Oleander* or the Rose bay, and this Dogs bane also; which soever of those dogges, had that earth given to him in drinke, did after some fits or passions recover, but those that had none thereof given them dyed all, but none so speedily as those that had this Dogs bane given unto them, yet *Penn* and *Lobel* in their *Adversaria*, speaking of that kind of Dogs bane, say thus; If it be death to a dogge that hath eaten it, it is probable that it is *Apocynum* (for in their title, they make a doubt thereof) of *Dioscorides*: but say they, wee have it for certaine, and of long time found true by experience and tryall, that this is a counterpoyson against other sorts of poyson given to dogges, thus you see the reports of these two are flat contrary, the one unto another, so that which of them to beleave, I leave to every one, as they thinke good: peradventure, this their *Periploca*, *Græca folijs latioribus hederaceis*, (for so they call it) is the same vulgar or common *Asclepias*, that *Fabius Columna* saith, was used in *Italy*, as is before said, and not that *Apocynum retum* of *Clusius*.

CHAP. XXI.

Asclepias sive Vincetoxicum. Asclepias or Swallow-wort.

Having now shewed you all the Venemous Plants, as also those that procure sleepe, and those that are hurtfull and dangerous: let me now shew you also those that are accounted Counterpoysons, to those deadly or dangerous herbes, as also to other sorts of Venome or poyson, and yet not all, for some are dispersed in this worke, in the severall Classes thereof, and some are spoken of in my former booke, as you may there find. The first of them that I shall set forth unto you is the Swallow-wort, because it is so like unto the Dogs bane in the last Chapter, and is his Antidote, whereof there are three sorts as followeth.

1. *Asclepias flore albo.* Swallow-wort with white flowers.

This Swallow-wort riseth up with divers slender weake stalkes; to be two or three foote long not easie to breake, scarce able to stand upright, and therefore for the most part, leane or lye downe upon the ground, if it find not any thing to sustaine it, and sometimes will twine themselves about it, whereon are set two leaves at the joynts, being somewhat broad and long pointed at the end, of a darke Greene colour, and smooth at the edges: at the joynts with the leaves towards the toppes of the stalkes, and at the toppes themselves, come forth divers small white flowers, consisting of five pointed leaves apeece, of an heavy sweet sent; after which come small long pods, thicke above and growing lesse to the point, wherein lye small flat browne feede, wrapped in a great deale of white silken downe, which when the pod is ripe, openeth of it selfe, and sheddeth both seed and cotten upon the ground, if it be not carefully gathered: this yeeldeth no milke either white or yellow in our Country as the Dogs bane doth, in any that I have observed, but a thinne watery juice; the rootes are a great bush, of many white strings fastened together at the head, smelling somewhat strong while they are fresh and Greene, but more pleasant when they are dried: both leaves and stalkes, dye downe every yeare to the ground, and rise a new in the Spring of the yeare, when the stalkes at their first springing are blackish browne.

2. *Asclepias flore nigro.* Swallow-wort with blacke flowers.

The blacke Swallow-wort groweth in the same manner that the former doth, having his long slender rough branches, rise to a greater height then the other, and twining themselves about whatsoever standeth next unto them,

1. *Asclepias flore albo.*
Swallow-wort with white flowers.

2. *Asclepias flore nigro.*
Swallow-wort with black flowers.

them, having such like darke greene leaves set by couples, but somewhat smaller then they : the flowers likewise stand in the same fashion, but somewhat smaller also and of so darke a purplish colour, that it seemeth to be a blacke, and are scarce discerned unless one looke very earnestly upon them : after which come more plentifully then in the former, such like cods, with a white silver downe, and feedes in them as in the former : the rootes hereof are not so bushy as in the other, neither smell so strong, nor doth it give any milkie but a watery juice when it is broken, so farre as ever I could observe.

3. *Asclepias Cretica.* Swallow-wort of Candy.

This Candy Swallow-wort, riseth up in the same fashion that the former doe, with many slender flexible Greene branches, with leaves set at the joynts, on either side, as the white kinde hath, and are very like unto them, but somewhat of a paler greene colour ; the flowers stand in the same manner, three or foure together upon a stalk, but are somewhat of a paler white colour, not so white as they, to whom succede sometimes but one, but most usually two pods together, which are thicker and shorter then those of the white kinde, straked all along, and double forked at the ends, wherein lye feedes and silke as in the former : the rootes have not so many strings as the last, and have as well as the rest of the Plant, a strong smell resembling Boxe leaves.

The Place.

The two first grow in rough untilld places, and in mountaines in divers places, both in France about Narbone, Marseilles and Mompelier, and in Italy also, and in other places. The last grew in Candy from whence the seed came.

The Time.

They all flower in the moneths of Iune and Iuly, and sometimes not untill August, if the yeare be backward, and their cods with feede is ripe about a moneth after : the empty huskes abiding on the dry branches, when the seed and silke is shed out, and fallen on the ground, or blowne away with the wind.

The Names.

It is called in Greeke *ἀσκληπιὰς* *Asclepias*, ab *ἄσκληπιος* *Asclepius*, qui *ἀσκληπιός* *Græci* dicitur antiquo medicina doctore : some ballard names it hath also, as *ῥοσένδρον* quasi *hederula*, and *ῥοσένδρον* *hederifolium* : and thereupon or from the forme of the leaves like unto Ivy : *Ruellius* calleth it *Hederalis*, in Latine it is called usually *Asclepias* and *Vincetoxicum*, which is as a generall word to denominate any Counterpoison, for *Vincetoxicum* quasi *Alexipharmacum* dictum, & quod illi insignis adversus venena vis insti, it was anciently called *Hirundinaria*, (although both the kindes of *Chelidonium majus* and *minus*, be also called *Hirundinaria*) of some, quia acutæ & apertæ ejus siliquæ, cum candida lanugine volanti hirundini fere similis est, alij vero a semine lanugine pinnato, ita dicunt : that is, it is called Swallow-wort of some, because the pointed cods when they are open ; and the silke appeareth out of them, doe somewhat resemble a Swallow flying ; others say from the likenesse of the seed, feathered as it were with the downe about it : it is called in Italian *Venci tassico* & *Asclepiade*, in high Dutch *Schwallen wurtz*, in low Dutch

Dutch Swallow wort, and in *English Swallow wort*, and of some silken Cicely: It is generally by the most writers, and most judicious Herbarists now a dayes, acknowledged to be the true *Asclepias* of *Dioscorides*, although *Anguillaria* doubteth of it; and *Matthioli* denieth it and contesteth against *Fuchs* that said it was *Vincetoxicum*. For first concerning the leaves, to be like Ivy, as *Dioscorides* saith and long as it is in some copies, but *Orbasius* as he saith hath it not so; and *Marcellus* doth thereunto agree, led peradventure as he saith, by the sight of some ancient copies, the leaves being like unto Bay leaves, but sharper pointed; secondly that the flowers had no strong or evill sent; thirdly that the leaves and rootes, did not smell sweet; and lastly, the seede was not like those of *Pelecinum Securidaca*, the Hatcher Fetch; all which *Dodonæus* retorteth saying, all his exceptions and reasons are nothing worth, but I may say all *Dioscorides* his comparisons are not so stricktly to be stucke unto; for in the description of the cods of *Apocynum*, he saith, they are like Beane cods, when as all know they are more like the cods of *Oleander*: and in the description of the leaves of *Periclymenum* he saith they are like those of Ivy, unto whom they are in all mens judgement very little like, and so in a number of other things: Concerning the rootes, *Matthioli* saith, that an ancient Manuscript hath not the word *radix multas*, but *radix tenuis*, but which of them both is taken doth not much alter the matter: but that they are not sweete, no man that hath his sense of smelling perfect, can say so, if he feele their sent, as they grow naturally in the Mountaines; and for the evill smell of the flowers, the word *spissus virus redolens*, is not in all things of one equality: and for the seede although it be not as square as the *Securidaca*, yet is flat, and in colour and bignesse like it. *Fabius Columna* as it is set downe in the Chapter before, tooke the Italian *Asclepias*, to be rather *Apocynum* of *Dioscorides*; and *Lobel* also calleth the blacke Swallow-wort *Periploca minor*, belike because it riseth higher, and clambereth like a *Periploca*, or more then the white: or peradventure because of the blacke flowers, but I shewed you before the chiefest note, to know *Asclepias* from *Periploca* or *Apocynum*. There is little variation in the denominations of these plants by any writers, more then is here expressed, some calling them by the one, and some by the other name, and therefore not worthy further trouble.

The Vertues.

The rootes have a most soveraine quality against all poysons, but in particular as is said before, against the *Apocynum* or Dogsbane; It is effectually given to any that are bitten by any venomous beast, or stung by any Serpent or other Creature; as also against the biting of a mad dogge, a dramme and a halfe thereof taken in *Cardus Benedictus* water, for divers dayes together: It is taken also in wine every day against the Plague or Pestilence: a dramme thereof taken in Sorrell or Buglosse water is very effectuall against all the passions of the heart, if a few Citron feedes be taken therewith, taken in the same manner and measure, it easeth all the griping paines in the belly: the decoction of the rootes, made with white wine, taken for divers dayes together, a good draught at a time, and sweating presently thereupon cureth the dropie: the same also helpeth the jaundise, provoketh urine, and easeth the cough and all defects of the chest and lunges: the powder of the rootes taken with Peony feede, is good against the falling sicknesse, or with Bassill seede or the rinde of *Pomecitrons* is good against Melancholly: and taken with the rootes of *Diellamus albus* or *Fraxinella*, ballard *Dittany*, will kill and expell the wormes of the maw or belly: the rootes are very effectually used with other things, made for bathes for women to sit in, or over, to ease all paines of the mother, and to bring downe their courses: the decoction likewise of the rootes hereof, and of Cumfrye made with wine, is much commended to helpe those that are bursten or have a rupture, also for them that have bene bruised by a fall, or otherwise: the powder of the rootes or leaves, is no lesse effectuall to cleanse all putride rotten and filthy ulcers and sores wheresoever, then the rootes of *Aristolochia* or Birthwort, and may safely be used in all salves, *Unguents* and *lotions*, made for such purposes, in the head thereof, the one for the other: the leaves and flowers boyled and made into a pultis, and applyed to the hard tumours or swellings of womens breasts, cureth them speedily, as also such evill sores as happen in the matrix, although they be inveterate or hard to be cured: the downe that is found in the cods of these herbes, as well as in the Dogsbane, doe make a farre softer stuffing for cushions or pillowes or the like, then Thistle downe, which is much used in some places for the like purposes.

CHAP. XXII.

Herba Paris. Herbe True love or one berry.

BEsidés the usuall and knowne *Herba Paris*, I have two other herbes like thereunto, to bring to your consideration, which I thinke is fit to take up the roome here.

The ordinary *Herba Paris*, or Herbe true love hath a small creeping roote, of a little binding, but unpleasant loathsome taste, running here and there, under the upper crust of the ground, somewhat like a Couch grasie roote, but not so white, and not much lesser then the roote of the white wild *Anemone*, and almost of as darke a colour, but much like thereunto in creeping: shooting forth stalkes with leaves, some whereof carry no berries, and others doe, every stalke being smooth without joynts, and blackish Greene, rising to the height of halfe a foote at the most, if it beare berries (for most commonly those that beare none, doe not rise fully so high) bearing at the toppe foure leaves, set directly one against another in manner of a crosse, or a lace, or ribben, tyed as it is called, in a true Loves knot, which are each of them a part some what like unto a Nightshade leafe, but somewhat broader (yea in some places twice as broad as in others, for it will much vary) sometimes having but three leaves, sometimes five, and sometimes sixe, and sometimes smaller and sometimes larger, either by a quarter or halfe, or as I said before, twice as great: I have sene it also degenerate, that the foure leaves being twice as large as the ordinary, have bene dented in, both at the edges and points, which have bene parted or forked, (and have borne greater berries then the ordinary) all which are of a fresh Greene colour, not dented about the edges: in the middle of those foure leaves, there riseth up a small slender stalke about an inch high, bearing at the toppe thereof one flower spread open like a starre, consisting of foure small and narrow long pointed leaves, of a yellowish Greene colour, and foure other lying between

Herba Paris.
Herbe true love or one berry.

2. *Herba Paris Canadensis rotunda radice.*
Herbe true love of Canada with a round roote.

them lesser then they; in the middle whereof standeth a round darkē purplish button or head, compassed about with eight small yellow mealy chives or threds, which three colours make it the more conspicuous, and lovely to behold: this button or head in the middle, when the other leaves are withered, becommeth a blackish purple berry full of juice, of no hot nor evill, nor yet of any sweetish taste, of the bigneſſe of a reasonable grape, having within it many white feedes: the whole plant is almost insipide, without any manifest taste, and by the effects, in repressing humours and inflammations is accounted as cold as the Nightshade.

2. *Herba Paris triphyllas Brasiliens.* Herbe true love of Brasill.

The roote of this herbe is small and creepeth like the other, sending forth a slender stalkē of fourē or five inches high, having three broader and longer leaves set thereon, then are in the former, the stalkē riseth about three inches above them, bearing at the top three much narrower leaves, as it were the huske to the flower, standing in the middle, consisting of three white leaves having some veines in them, and are about three inches long, and one broad.

3. *Herba Paris Canadensis rotunda radice.* Herbe true love of Canada with a round roote.

This herbe groweth with three large leaves like the last, and at the toppe of the upper stalkē one flower, consisting of fixe leaves, three whereof are Greene and small, which are as it were the huske to the other three leaves which are larger and longer, of a darke purple colour, and in some white, in the middle whereof groweth a small round blackish berry, full of small feedes like Nightshade feede: the roote hereof creepeth not as the former, but groweth into a small round tuber.

The Place.

The first groweth in our woods and copſes, as also sometimes in the corners and borders of fields, and waſtē grounds, in very many places of this land, for besides those places which Gerard hath set downe, which are almost all waſted and consumed, every one running thereunto, that is next him, and gathering it: it is found in *Hinbury wood*, three mile from *Maidstone* in *Kent*, in a wood also called *Harwarſh*, neere to *Pinnenden* heath, one mile from the said *Maidstone*, in a wood by *Chiffelhurst* in *Kent*, called *Long wood*, and in the next wood thereunto called *Iffels wood*, especially about the skirts of a hoppe garden bordering thereon, in a wood also over against *Boxley* Abbay a mile from *Maidstone* in great abundance, not farre from the hedge side of that *Meddow*, through which runnes a rivelet, related by Mr. *George Bowles* a young Gentleman, of excellent knowledge in these things. The second was found as *Bauhinnus* saith in the woods of *Brasill*, but I had the knowledge thereof given me from *Monsieur Loumeau* of *Rebelle* Preacher, who had it out of *Canada*. The last was brought out of *Canada*, and mentioned by *Cornutus* in his booke of *Canada* plants.

The Time.

They spring up in the middle of *Aprill*, or *May*, and are in flower soone after, the berries are ripe in the end of *May*, and in some places in *June*.

The Names.

This herbe *Paris* hath not bene knowne, to either antient Greeke or Latine Writers, that wee can finde by their writings. It hath found therefore divers names, by divers of the moderne Authours, every one according as his opinion and judgement led him: for although *Matthiolus*, *Casalpinus*, *Anguillera*, *Camerarius*, *Dodonaeus*, and *Lugdunensis* following them, doe call it *Herba Paris*, as it is now generally termed of all Herbarists; yet in the former times, *Fuchsius* tooke it to be *Aconitum Pardalianches*, and to be deadly or at least dangerous, whom *Matthiolus* contradicted, and *Cordus* in his History of plants, seemeth to be of *Fuchsius* opinion, calling it *Aconitum* sive *Pardalianches monococcon*, but because it was found by good experience not to be hurtfull, but helpfull, *Tabernmontanus* calleth it *Aconitum salutariferum*. Some called it *Vivaverfa*. *Tragus* not knowing any Latine name, that others called it by, giveth it the name of *Aster*, from his owne countrie people, who called it *Sternkraut*, but he addeth thereunto, *sed non Atticus*, because it might be knowne, he did not account it the *Aster Atticus* of *Dioscorides*, and others: he also calleth it *Vivaverfa*, after the Germane word *Wolfsbeer*, whereby they in other places usually call it; as also *einbeer*: the Italians call it *Herba Paris*; the Spaniards *Cemelba*; the French *Raisin de Reinard*; the Dutch *Wolfsbessen*, and *Spinne copen*. *Gesner* in *hortis Germanie*, and *Lobel* and *Pena* in their *Adversaria*, call it *Solanum tetraphyllum*, from the forme of the leaves and berries, or both, and *Bauhinus* as leaning unto their judgement, calleth it *Solanum quadrifolium Bacciferum*. The second *Bauhinus* calleth *Solanum triphyllum Brasiliense*; and I *Herba Paris triphylla Brasiliensis*, because I doe not account the *Herba Paris* to be any kinde of *Solanum*. The last *Cornutus* calleth *Solanum triphyllum Canadense*.

The Vertues.

Although some formerly did account this herbe to be dangerous, if not deadly, as by the name of *Aconitum*, it may be gathered, because the forme thereof bred in them such auspicion, yet have not set downe any evil Symtomes that it wrought, and therefore *Pena* and *Lobel* say, they made much triall thereof upon dogs, & other creatures, to finde out whether it would worke any dangerous effects unto them, but did not see any harme come to them that had eaten it, and therefore upon report of the contrary effect it would worke, they made triall likewise thereof upon two dogs, to whom was given of *Arsenicke* and *Sublimatum*, of each halfe a dramme in meate, unto one of them, about an houre after their taking of it, when their furious & foming fits were over, that they become more quiet, as if they were ready to die, there was given one of them, two drammes of the powder called *Pulvis Saxonicus*, (the receipt whereof hereafter followeth) in red wine, who presently thereupon grew well, the other dying without helpe: the receipt of the powder is thus. *Ref. Radicum Angelicae sativae & sylvestris Vincetoxicis, Phu sive Valerianae majoris, Polypodij quercini, Allibae & Urticae ana unciam dimidiam, Corticis Meserei Germanici, drachmas duas, granorum herbae Parisii numero 24. Foliorum ejusdem cum toto numero 36. ex radicibus & cortice in aceto maceratis, siccatis ut ceteris & mixtis fiat omnium pulvis*: the leaves or berries alone are also effectuell, to expell poisons of all sorts, but especially that of the *Aconites*, as also the plague and other infectious diseases: it hath bene observed faith *Matthiolus*, as well from my owne experience, as from *Baptista Sardus*, the Author that enlarged the *Pandects*, that some have bene holpen hereby, that have lyen long in a lingring sickness, and others that by Witchcraft (as it was thought) were become halfe foolish, as wanting their wits and senses, by the taking a dramme of the feedes, or the berries hereof in powder, every day for twenty dayes together, were perfectly restored to their former good estate, and health: the leaves dried and given in powder, have the like operation, yet in a weaker manner; it is thought also that the berries procure sleepe, being taken at night in drink: the rootes in powder ease the paines of the collicke incontinently, being taken in wine: the leaves are very effectuell, as well for greene wounds, as to cleanse and heale up old filthy ulcers and sores, and is very powerfull to disperse all tumours and swellings, and to allay all inflammations very speedily, as also those tumors that happen in the cods, privy parts, or in the groine: the juyce or distilled water of the leaves, taketh away all heate and inflammation in the eyes: the same leaves also or their juyce applied to fellons, or those nailes of the hands or toes, that have empoistumes or sores gathered together at the rootes of them, healeth them in a short space.

CHAP. XXIII.

Biftorta. Bistort or Snakeweed.

Here be diverse sorts of Bistorts, some being of late, others of elder account.

1. *Biftorta major vulgaris*. Common Bistorte or Snakeweed.

This common Bistort hath a thicke short knobbed roote, blackish without, and somewhat reddish within, a little crooked or turned together, of an harsh or astringent taste, with divers blackish fibres growing thereat, from whence spring up every yeare divers leaves standing upon long foote stalkes, being somewhat long and broad, very like unto a Docke leafe, and a little pointed at the ends, but that it is of a blewish Greene colour on the upper side, and of an Ash colour gray, and a little purplish underneath, having divers veines therein; from among which rise up diverse small and slender stalkes, two foote high, almost naked and without leaves, or with very few, and narrower, bearing a spikie bush of pale flesh coloured flowers, which being past, there abideth small feede somewhat like unto Sorrell feede but greater.

2. *Biftorta magis intorta radice*. Bistort with more crooked rootes.

This Bistort differeth not much from the former, being a little lesse, both in leafe and roote, which are more writhed and crooked than the former; the Spikie flowers, &c. are equall also, almost unto them, and so is the three square feede.

3. *Biftorta Alpina majora*. Great Mountaine Bistort

The great Bistort hath many very long and pointed leaves, of the same colour with the first, both above and underneath, some of a cubite or a foote and a halfe long, and but narrow in comparifon of the length, being about three inches broad, these stalkes rise almost twice as high as the first, almost bare without leaves thereon, which are much smaller, bearing a spike of bluish flowers, foure inches long at the toppes: the roote is foure times bigger than the common sort, blacke without, with many blacke fibres at them, but not so red within as the first, but rather whitish.

4. *Biftorta*

4. *Bistorta minor nostras*. Small Bistort of our owne Countre.

This small Bistort sendeth forth three or foure small narrow leaves, scarce an inch broad, and almost foure inches long, Greene above, and gray underneath; the stalkes are slender, and but with one or two leaves set thereon, at the toppes whereof stand small long round spikie heads of white flowers, with diverse small Greene leaves among them; after which come a reddish feede almost round, which being drie, become blackish, and are bigger than those of the first: the roote is small in proportion, but somewhat crooked or turned like the common kinde, being of a blackish colour without, and somewhat whitish within, of the same auster binding taste, that the rest hath.

5. *Bistorta minor Alpina*. Small Bistort of the Alpes.

This small Bistort hath broader leaves, and not so long as the last, the tuft of flowers likewise at the toppe is closer set together, in other things not differing.

6. *Bistorta Alpina pumila varia*. Variable leaved small Bistort.

This Bistort hath not onely two or three broad and short almost round leaves pointed at the ends, but two or three very narrow and long leaves also with them comming from the roote, the stalk is scarce an hand breadth high, with many such whitish flowers thereon as are in the other small ones.

The Place.

The two first grow at the foote of hills, and in the shadowie moist woods neare unto them, in many places of Germany; and in our countre likewise in the like places, but chiefly is nourished up in gardens. The third groweth on the high hills in *Silesia*, and other places: the fourth groweth especially in the North, as in *Lancashire*, *Torke-shire*, and *Cumberland* in diverse places. The two last are found likewise on the Alpes in diverse places, but the last among the *Smitzers*.

The Time.

They all flower about the end of May, and the feede is ripe about the beginning of July.

The Names.

It is called generally *Bistorta*, quod radice in se serpentis modo contorta, & convoluta consistit, of *Tragus*, *Lonicerus*, and others *Colubrina*, from the Germane title of *Schlangewurtzel* and *Natterwurtzel*; of *Fuchsius* *Serpentaria*, quod venenosum serpentium ictibus succurrit: of *Gesner* in hortis Germanie *Limonium*, *Fracastorius* calleth it *Bulapathum*, as well as *Bistorta*. *Lobel* and *Clusius* thinke it may be *Britannica* of *Dioscorides* and *Pliny*. *Bauhinus* calleth the first, *Bistorta major radice minus intorta*. Some call it *Behen rubrum*, others take it to be *Molybdana* of *Pliny*. Some also doe take it to be the second *Dracunculus* of *Pliny* lib. 4. cap. 16, the second is called by *Tragus* *Colubrina minor*. *Bauhinus* calleth it *Bistorta major radice magis intorta*. The third *Bauhinus*, that hath first set it forth as I thinke, calleth it *Bistorta Alpina maxima*: the fourth I take to be differing from the next, and therefore call it *Nostras*: the fifth is called by *Camerarius*, *Clusius*, *Lobel*, *Bauhinus*, and all others that have written

1. 4. *Bistorta major vulgaris & minor*.
Great and small Bistorte or Snakeweede.

5. 6. *Bistorta minor Alpina & Alpina pumila varia*.
Small Bistorte of the Alpes and variable leaved Bistorte.

hereof *Bistorta minor*, or *Alpina minor*; onely *Gesner in hortis Germaniæ*, reckoneth it to be a small sort of *Limnium*. But in that *Bistorta* cannot be *Britanica* this sheweth: in the description thereof that the leaves are rough or hairy, when these are smooth, and that the rootes of *Britanica* are small and short, when these are not small although short; and *Galen* in his sixth Booke of Simples, saith that although the leaves of *Britanica* be somewhat like unto Docke leaves, yet they are blacker and more hairy. And that it cannot be *Behen rubrum*, the faculties doe easily declare, for the rootes of the true *Behen rubrum* & *album*, are both sweete in smell, and are of an hot quality, that they are effectual to procure venery, or bodily lust which these cannot: the last is not remembered by any Author before this time. The *Italians*, *Spaniards* and *French* doe follow the Latine, as we doe also, the *Low Dutch* the *Germanes* in their appellations, which is *Natterworte*.

The Vertues.

Both the leaues and rootes of *Bistort*, have a powerfull facultie to resist all poyson, a dramme of the roote in powder taken in drinke, expelleth the venome of the plague or Pestilence, the small Pocks, Measells, Purples, or any other infectious disease, driving it forth by sweating: the same roote in powder, or the decoction thereof in wine being drunke staeth all manner of inward bleedings, or spitting of bloud, as also any fluxes of the body in man or woman; as also when one is troubled with vomiting: the powder also of the roote, or the decoction thereof being drunke, is very available against ruptures or burkings, or all bruises or falls whatsoever dissolving the congealed bloud, and easing the paines that happen thereupon: the same also helpeth the Jaundise: the water distilled from both leaues and rootes, is a singular remedy to wash any place, bitten or stung by any venomous creature, as Spiders, Toades, Adders, or the like, as also for any the purposes before spoken of; and is very good to wash any running sores or ulcers: the decoction of the roote in wine being drunke, hindereth abortion, that is, when women are apt to miscarrie in child bearing, the leaves also killeth the wormes in children, and is a great helpe to them that cannot keepe their water, if they put thereto some juyce of Plantaine; and applied outwardly doth give much helpe in the gonorrhoea or running of the reins: a dramme of the powder of the roote, taken in the water thereof, wherein some iron or Steele being red hot hath bene quenched, is an admirable helpe thereunto, so as the body be first prepared and purged from the offensive humours: the leaves or seedes, or rootes, are all very good to be put into decoctions, or drinckes, or lotions, for either inward or outward wounds, or other sores; and the powder strowed upon any cut or wound in a veine, &c. that is apt to bleede much, staeth the immoderate fluxe thereof: the decoction of the rootes in water, whereunto some Pomgranet Pills, and flowers are added, serveth for an iniection into the matrice, as well to stay the access of humours to the ulcers thereof, as also to bring it to the place being fallen downe, and to helpe to stay the abundance of their courtes: the roote of *Bistort* and Pellitory of *Spain*, and burnt Allome of each alike quantitie, beaten small & made into a paste with some hony, a little peece hereof put into an hollow tooth, or holden betwene the teeth, if there be no hollownesse in them, staeth the defluxions of rheume upon them, when it is the cause of paine in them, and helpeth to cleanse the head, and avoide much offensive matter: the distilled water is very effectual to wash those sores or cankers that happen in the nose or any other part, if the powder of the roote be applied thereto afterwards: it is good also to fasten the gummes, and to take away the heat and inflammation, that happen as well in the jawes, almonds of the throat or mouth, if the decoction of the rootes leaves, or seedes, be used, or the juyce of them: the rootes are more effectual to all the purposes aforesaid, than either leaves or feedes.

CHAP. XXIV.

Tormentilla, Tormentill or Setfoile.

Although formerly there hath but one kind of Tormentill or Setfoile bene knowne to our *English* Writers, yet now there is found out and made knowne to us two other sorts, which shall be all declared in this Chapter.

1. *Tormentilla vulgaris*. Common Tormentill.

The common Tormentill (is so like unto *Cinquefoile*, that many doe mistake it, for it may well be reckoned as one of them) hath many reddish slender, weake branches, rising from the roote, lying upon the ground, or rather leaning, than standing upright, with many short leaves that stand closer to the stalkes, than the other *Cinquefoiles* doe, with the foote stalke encompassing the branches at severall places, but those that grow next to the ground are set upon long foote stalkes, each whereof are like unto the leaves of *Cinquefoile*, or five leaved grassie, but somewhat longer and lesser, and dented about the edges, many of them divided but into five leaves, but most of them into seven, whereof it tooke the name Setfoile, and standing round with the divisions like a starre, and therefore called *Stellaria*) yet some may have sixe and some eight, as the fertility of the soile and nature list to worke: at the toppes of the branches stand divers small yellow flowers, consisting of five leaves, like unto those of *Cinquefoile*, but smaller: the roote is smaller than *Bistort*, somewhat thicke but blacker without, and not so red within, yet sometimes a little crooked, having many blackish fibres thereat.

2. *Tormentilla Alpina major*. The greater Tormentill.

This Tormentill differeth not from the former, but in the largenesse of the leaves and rootes, which are much greater and redder, and of a better sent, in all things else agreeing with the former.

3. *Tormentilla argentea*. Silver leaved Tormentill.

This white Tormentill, hath many short, low and thicke spread reddish stalkes, with leaves like unto a *Cinquefoile*, but much smaller than the first, and consisting of five leaves in many of them, and sixe and seven in most of them, & sometimes more being somewhat longer, & each of them set upon very long foote stalkes, greene on the upperside, and of a silver shining white colour underneath, smooth and not snipt at all about the edges: the flowers are smaller than in the first by the halfe, and of a white colour, set about the stalkes at the toppes, at severall distances, and standing in small huskes, wherein afterwards is contained small yellowish seede: the roote

1. *Tormentilla vulgaris*.
Tormentill or Setfoile.

3. *Tormentilla argentea*.
Silver leaved Tormentill.

Root is thicke and somewhat long, joynted or knotted, blackish on the outside and somewhat reddish within, with many fibres thereat.

The Place.

The common sort groweth as well in woods and shadowie places, as in the open champion countrie, about the borders of fields in many places of this land. The second groweth among the *Helvetians* or *Swissers*, as also in the county of *Tirol*: the last groweth upon the *Alpes* in divers rockie or stony places, as also upon the *Pyrenean* Mountaines, and among the *Savoyards* likewise.

The Time.

They doe all flower in the Sommer, from the beginning to the end, but the last is latest.

The Names.

It hath beene not set forth, by any of the antient Greeke or Latine Writers, yet it hath obtained a Greeke name from the forme *ἑπτάφυλλον* *Heptaphyllum*, or *Septisolum*, Setfoile, or Seven leaves, but not properly, for they are not seven leaves, but the number is seven of the divisions of every leaf; for to speake properly, it is but one leaf, cut into five or seven divisions, and not seven leaves: for this is a generall rule in all leaves, whether of herbes or of trees, that what leaf falleth away wholly together with his stalke and not in partes, and at severall times, is but one leaf, whether winged as we call it, as the leaves of the Ash tree, the Elder, the Wallnut tree, Cinkefoiles, and this Setfoile, in herbes: for in all these and the like, the whole stalke, with the leaves falleth away together, and not any part of those leaves at one time, and part at another, as in all other trees and herbes that have not winged divided leaves. Although this narration be somewhat prolix and extravagant, yet I hope to some good purpose, in regard the use thereof, may be profitable to young Herbarists, that know not or regarded not so much before: the first is called *Tormentilla vulgaris*, and of some *Stellaria*, from the forme of the leaves, and yet there are divers other herbes called *Stellaria*, as shall be shewed in their places, and some *Consolida rubra*, from the efficacy and colour of the root. The second *Camerarius* in *horto*, calleth *Tormentilla Alpina* and *Bauhinus Tormentilla Alpina vulgaris major*. The last is very variably entituled by divers, as *Pentaphyllum argenteum* of *Anguillara*, *Pentaphyllum Alpinum petrosum* & *minimum* by *Lobel*, *Pentaphyllum* of *Thalium* in *Harcynia sylva*, *Bauhinus* calleth it, *Tormentilla Alpina flore sericeo*. Some also doe thinke it is *Chrysogonum* of *Dioscorides*, but thereof he hath but a very short description, saying *Crysgogonon* busheth thickly with Oaken leaves, whose flower is very like unto *Verbascum Coronarium*, the roote whereof is like a Turneppe, very red within and blacke without; but this herbe hath not leaves like an Oake, neither is the flower of any such beauty, or respect, that it might be put into garlands: as the *Verbascum Coronarium* (which is thought to be the *Lychinis Coronaria* Rosecampion with the red flower, a

fit and usuall flower for garlands, for no other *Verbascum* is knowne to be put to that use) neither is the roote like a Turneppe, whereby you may see what great difference there is, betweene this and that: But the true *Chrysogonum* of *Dioscorides*, *Ranunculus* found among the corne fields, not farre from *Alippo* in *Syria*, as *Luadunensis* setteth it forth, in his Appendix to the generall History of Plants; and *Fona* also, sheweth in his *Italian* description of Mount *Baldus*, as you shall have it more fully in his proper place: the *Germans* call it *Blutwurtzell* and *Rotwurtzell*, that is, *radix Sanguinaria*, and *radix rubra*; and some after the Latine *Tormentill*, as most of the other Nations doe.

The Vertues.

Tormentill is of the same temperature and qualitie, that *Bistort* is, which hath caused divers to account it a kinde thereof, being cold in the second, and drie in the third degree, and therefore most excellent to stay all kindes of fluxes of blood or humors, in man or woman, whether at the nose, mouth, belly, or any wound in the veines, or any where else; the iuyce of the herbe or roote taken in drinke, not only resisteth all poyson or venome of any creature, but of the plague and pestilence it selfe, and pestilentiall feavers, and infectious diseases, as the pockes, meafells, purples, &c. by expelling the venome and infection from the heart by sweating: if the Greene roote, is not at hand, or not to be had readily, the powder of the drie roote is as effectuall, to the purposes aforesaid, to take a dramme thereof every morning; the decoction likewise of the herbes and rootes made in wine, and drinke, worketh the same effect, and so doth also the distilled water of the herbe and roote, rightly made and prepared, which is to sleepe them in wine for a night, and then distilled in *Balneum marie*; this water in this manner prepared taken with some *Venice Treacle*, and thereupon being presently laid to sweate, will certainly by Gods helpe expell any venome or poyson, or the plague, or any fever or horror, or the shaking fit that happeneth, for it is an ingredient of especiall respect in all antidotes or counterpoysons, never to be forgotten out of them, it is so effectuall in the operation against the plague; yea it is said that good shepheards doe carefully preserve this herbe, and give it their Sheepe for the rot, and many other diseases in them: for there is not found any roote, more effectuall to helpe any fluxe of the belly, stomacke, spleene, or bloud than this, prepared after what manner one will, to be taken inwardly or applied outwardly: the iuyce taken doth wonderfully open the obstructions of the liver and lungs, and thereby certainly helpeth the yellow jaundise in a short space. Some there be that use to make cakes hereof, as well to stay all fluxes, as to restraine all chollericke belchings, and much vomitings with loathings in the stomacke; in this manner, take the powder of the roote, and of a peece of a Nutmeg beate, made up with the white of an egge, and as much meale of Oates, as all of them come unto, which being baked, is to be taken every morning one, untill you finde helpe: or the powder of the roote onely, made up with the white of an egge, and baked upon an hot tile and so taken. *Andreas Valesius* de *radice China*, p. 84. holdeth this opinion thereof, that the decoction of the roote is no lesse effectuall to cure the French poxe, then *Guaiacum* or *China*; because it so mightily resisteth putrefaction: *Lobel* saith that *Rondeletius* used it in the stead or after in the same manner, that he used *Hemodactyles* for joint aches: the powder also, or the decoction to be drunke, or to sit therein as in a bath, is an assured remedy against abortion in women, that is, when they use to miscarrie often in childbearing, if it proceede from the over fluxibilitie or weakenesse of the inward retentive faculties, as also a plaister made therewith and vinegar, applied to the reines of the backe doth much helpe; it doth much helpe likewise those that cannot hold their water, the powder taken in the iuyce of Plantane, and is commended also against the wormes in children: it is very powerfull in ruptures and burlings, as also for bruises and falls, to be used as well outwardly as inwardly: the roote hereof made up with pellitorie of *Spaine* and Allome, and put into an hollow tooth doth not onely asswage the paine, but staich the fluxe of humors thereunto, which was the cause thereof: the iuyce hereof also being drunke, is found effectuall to open the obstructions of the liver and gall. *Tormentill* likewise is no lesse effectuall and powerfull a remedy, for outward wounds, sores and hurts, than for inward, and therefore it ought to be a speciall ingredient in all wound drinckes, lotions and injections, for foule and corrupt rotten sores, and ulcers of the mouth, or secret parts, or any other part of the body; and to put either the iuyce, or powder of the roote into such ointments, plaisters, and such things that are to be applied to wounds and sores, as cause shall require: it doth also dissolve all knots, kernells, and hardnesse gathered about the eares, the throate and jawes, and the Kings evill, if the leaves and rootes be bruised and applied thereunto: the same also easeth the paines of the *Sciatica*, or Hippegout, by restraining the sharpe humors that flow thereunto: the iuyce of the leaves and rootes used with a little vinegar, is also a speciall remedy against the running sores in the head, or other parts, scabbes also, and the itch, or any such eruptions in the skinned, proceeding of salt and sharpe humors: the same also is effectuall for the hemorrhoides or piles in the fundament, if they be washed and bathed therewith, or with the distilled water of the herbe and rootes: it is found also helpfull to drie up any sharpe rheume that distilleth from the head into the eyes, causing rednes, paine, waterings, itchings or the like, if a little prepared *Tutia* or white Amber, be used with the distilled water hereof: many women also use this water as a secret to helpe themselves and others, when they are troubled with the abundance of the whites or reds, as they call them, both to be drunke, and injected by a Syring.

CHAP. XXV.

Pentaphyllum sive *Quinquefolium*. Cinkefoile or five leaved Graffe.

He next unto the *Tormentill* must come the Cinkefoile to be intreated of, not onely for the likenesse of the outward face, or forme of the plant, but of the properties also, as you shall heare hereafter. Hereof there are many more sorts found out, and now made knowne, than formerly there was, and therefore I thinke it fit to expresse them in some method and order, that is in three rankes; the first shall be of those sorts, that beare white or whitish flowers; the second shall be of those that beare yellow flowers, and lie downe with their leaves upon the ground, or runne with their rootes; the third shall be of those that stand more upright bearing yellow flowers.

Primus

Primus Ordo. The first Ranke.

1. *Pentaphyllum majus luteo flore vel albo.* Great white or yellow Cinkefoile.

THis first and greatest upright Cinkefoile, hath many leaves rising from the roote, each upon his owne foote stalke, divided in five parts, as if they were five severall leaves, dented about the edges, and some times round pointed, very like the great common yellow Cinkefoile, but larger and a little hairy; from among which rise up straight or upright stalkes, and not much leaning downe to the ground, as the next that followeth doth; a little hairy also, and divided at the toppes into two or three branches, and they againe into other smaller: upon every one whereof standeth one flower, of a white colour and larger than in others, but consisting of five leaves, as all others doe; in the middle whereof standeth a small downy head, encompassed with many reddish yellow threads: the roote is somewhat thicke and long, and reddish with all.

2. *Pentaphyllum majus alterum album.* Common great white Cinkefoile.

This other white Cinkefoile, which is more common with all Herbarists, have many leaves growing from the roote, divided into five parts, each of them somewhat longer, a little dented, and pointed also at the ends, greene on the upper side and hoary white underneath, betwene these leaves grow weake branches, leaning downe to the ground, scarce a foote long, with many such like leaves upon them, but lesser than those below: the flowers of these, are almost as large, as those before, and of a white colour, consisting of five more round pointed leaves, than the greater before, yet with a nicke in the middle, with many small yellow threads in the middle, set about a woolly head, having many small seedes set together, like unto a Crowfoote heade of seede; the roote is somewhat thicke and long, blackish on the outside, but reddish within, with many fibres thereat. Of this sort there is an other whose greene leaves are not dented about the edges, little differing in any thing else.

and hand
erectis fo-
ljs.

3. *Pentaphyllum filiquosum Arabicum albidum.* Codded Cinkefoile of Arabia.

This Cinkefoile of Arabia riseth up with a tender transparent browne stalke about a spanne or halfe a foote high, and afterwards groweth to be a foote high or more, having some leaves at the ground, and others upon the stalke, each of them set at the end of pretty long footestalkes, standing upright, bowing a little downewards in the middle, and raised at the ends. which leaves are soft, and of a sad greene colour, divided into five parts, whereof those two that are on both sides next the stalke, at the first are very small, the next two are twice as bigge as they, and the fifth in the middle, bigger by halfe then either of the last: but after they have stood a good while, the two lower leaves onely grow somewhat larger: the stalke divideth it selfe from the ground up to the middle thereof, into divers reddish branches; set at every joynt with the like leaves: at the toppe

1. *Pentaphyllum majus luteo flore vel albo.*
Great white or yellow Cinkefoile.

2. *Pentaphyllum majus alterum album.*
Common great white Cinkefoile.

whereof

3. *Pentaphyllum filiquosum Arabicum albidum.*
Codded Cinkefoile of Arabia.

7. *Pentaphyllum fragiferum.*
Strawberry Cinkefoile.

whereof grow a long spiky bush of flowers, one set above another, flowering one after another, thereby enduring very long with flowers on them, which before they are blowne resemble small cups, set in small green huskes, with pointels in the middle, but being blowen open, consist of foure little long and narrow hard leaves, of no pure but a fullen white colour with me, but bluish with others, not standing as other Cinkefoiles doe, but upright all of them together almost, on the one side of a button, which is in the middle of the huske, and the pointell below then on the other side, standing forth an inch long, small at the bottome, and bigger at the further end, of a very darke or browne colour, having foure small purplish threds, with yellow chives hanging at the ends about it: at the joynts all along the stalkes, where they beginne to flower, come forth much smaller Greene leaves, divided onely into three parts: the seede did not come to perfection in my Garden, but withered by some carely cold blastes, pulling downe all the heades, that were full of flowers and cods, to have seeded, but *Alpinus lib. de exoticis*, saith it beareth long and slender round and pointed pods, containing small round blacke seed, the roote neither spreadeth deepe nor wide, but perisheth with the first frosts.

4. *Pentaphyllum album minus.* Small white Cinkefoile.

This small Cinkefoile, hath many bushy upright stalkes, growing thicke together, with many hoary white leaves, in forme like the common white Cinkefoile, and at the toppes of them many white flowers, like unto others, composed of five round pointed leaves, with a nicke in the middle: the roote is blackish and threddy, more then the former, and the whole plant, both stalkes, leaves, and flowers, are both lower and lesler, in other things little differing.

5. *Pentaphyllum album minimum.* The least white Cinkefoile.

This least Cinkefoile, hath his low stalkes somewhat hairy, but not hoary, being little more then one handbreadth high; whereon grow upon short footstalkes, small leaves consisting of five parts, dented onely at the ends: the toppes of the stalkes are divided, into many branches, whereon stand many white flowers like the last, but smaller, the roote is small and blackish.

6. *Pentaphyllum minus argenteum.* Small silver leaved Cinkefoile.

This other small Cinkefoile spreadeth on the ground, with very many whitish branches, covered next unto the roote, with many short brownish threds or haire, more like then leaves; above which come forth the leaves, made of five parts, as small as the last, but round pointed, and not dented at the end, of a sad Greene colour on the upper side, & of a most fine shining silver colour underneath: at the tops of the branches stand a confused number of greenish heads or huskes, set round about long branches, much differing from the other sorts, out of which appeare very small whitish flowers, scarce to be discerned, which turne into a very small yellowish seed, somewhat brown, the

M m

roote

roote is small, long hard and threddy, abiding diverse yeares, and busheth thereat so thicke, that it doth spread a great deal of ground.

7. *Pentaphyllum fragiferum* Clusij. Strawberry Cinkefoile.

This Cinkefoile hath divers long hairy stalkes of leaves, rising from the roote, not set close together as other Cinkefoiles are, but parted or divided more like unto a winged leafe, sometimes into five, and sometimes into seven leaves, rough and hairy also, dented about the edges, Greene above and gray underneath, two set one against another, with a little space betwene, but those three at the ends, standing somewhat closer together: the stalk that riseth up among these leaves, is about a foote high or more, reddish and hairy, and divideth it selfe at the toppe into lesser branches, with divers leaves thereon, divided into three parts, on the toppes whereof stand large white flowers, very like unto Strawberry flowers, but somewhat lesse, with many yellow threds in the middle; which being fallen there succede small round heads, very like unto Strawberryes, but smaller and without any juice therein, having small reddish seeds within them: the roote is somewhat thicke, long, hard, and woody, reddish within and blackish without, with divers small long fibres thereat.

The Place.

The first *Bauhinus* saith, was found on the walls of *Wallfat*, a City of the *Switzers*. The second as *Clusius* saith, groweth in many of the woods, upon the mountaines in *Austria*, extending to the *Alpes*, as also in *Moravia*, *Hungary*, in *Italy* also, and divers other places: the other sort of that kinde, *Tragus* saith, he found nowhere from *Luha*, a City of the Empire; the third was brought out of *Egypt*, or out of *Arabia*, as the title declareth. The fourth grew in stony places, about *Curia* of the *Switzers*. The fifth grew saith *Clusius*, in the stony and rocky places of the *Alpes* in *Austria* and *Stiria*. The sixth is a Plant raised from the seeds that came among other sorts of feedes, sent me from beyond sea: the last groweth in divers places of *Hungaria*, and *Austria*.

The Time.

They doe all flower in the Sommer moneths of Iune and Iuly, and the third in August.

The Names.

It is called in Greek Πεντάφυλλον, and in Latine *Pentaphyllum* and *Quinquefolium*, a numero foliorum, *Gaspar* translating *Theophrastus* calleth it *Quinque petum*. *Tragus* sheweth his mind and opinion concerning the *Pentaphyllum* of *Dioscorides*, and *Theophrastus*, that our Tormentill is their best and most noble *Pentaphyllum*, and is therein to be led as he saith, by the text of *Theophrastus*, in his tenth booke and fourth Chapter, (which yet contrarieth his judgement in my mind) for he there saith, that all the leaves are five parted, and his roote reddish when it is fresh, and blackish and square when it is dried; but Tormentill hath more leaves of seven divisions, then five, and hath alwayes yellow flowers, when as *Dioscorides* saith his hath whitish. The first *Bauhinus* calleth *Quinquefolium album majus caulescens*. The second is his *Quinque folium album majus alterum*, and by all other Authors, *Pentaphyllum* or *Quinquefolium album*, the other of that kind *Tragus* calleth his owne, that is, *Pentaphyllum Tragi & nobile*. Unto the third I have given the name as *Alpinus* doth, from the forme of his leaves and fruit, and from the place of his naturall abiding, but *Pona* in his *Italian* *Baldus* calleth it, *Lupinus Arabicus* five *Pentaphyllum peregrinum*. The fourth *Bauhinus* calleth *Quinquefolium album minus*. The fifth is *Clusius* his second, which he calleth *Quinquefolium minus flore albo*, and as he saith is the same that *Lobel* calleth *Pentaphyllum minimum & petraeum*, but that as *Clusius* saith, his kinde hath as large flowers as the Strawberry, which *Lobel* hath not, but *Clusius* is therein much deceived, for *Lobel's* *Pentaphyllum petraeum* or *petrosum*, is declared before to be the *Stellaria argentea* of *Camerarius*, and with *Bauhinus*, *Quinquefolium album minus alterum*. The sixth came to me by the name of *Pentaphyllum argenteum*, and because it is none of the great ones, I have added thereto *minus*. The last *Clusius* calleth, *Pentaphyllum fragiferum*, and is the *Fragaria quaria* *Tragi*. The *Italians* call it *Cinquefolio*, the *Spaniards* *Cinco Tramo*, the *French* *Quinfucille*, the *Germanes* *Funff finger kraut*, the *Dutch men* *Vijsvinger czuyt*, we in *Englis* Cinkefoile and Cinkeheld, and five finger grasie, or five leaved grasie.

Secundus Ordo. The second Ranke.

1. *Pentaphyllum vulgatissimum*. The most common Cinkefoile.

THE common small Cinkefoile spreadeth and creepeth farre upon the ground, with long slender strings like Strawberries which take roote againe, and shooteth forth many leaves, made of five parts, and some times of seven, dented about the edges, and somewhat hard, the stalkes are slender, leaning downwards, and beare many small yellow flowers thereon, with some yellow threds in the middle, standing about a smooth green head, which when it is ripe, is a little rough, and containeth small brownish seeds: the roote is of a blackish browne colour, seldome so bigge as ones little finger, but growing long with some threds or fibres thereat, and by the small strings it quickly spreadeth over the ground.

2. *Pentaphyllum incanum repens* *Alpinus*. Creeping Mountaine Cinkefoile.

The creeping Mountaine Cinkefoile, shooteth forth many leaves from the roote like unto the former, and dented about the edges, but softer in handling; and somewhat of a grayish Greene or hairy shining colour: the stalkes are slender and trayle almost upon the ground, with some lesser and lesser divided leaves on them, then below, bearing many gold yellow large flowers, with yellow threds in the middle, and such like seeds: the roote is smaller and more fibrous then the former, but spreadeth in the like manner.

3. *Pentaphyllum repens minus*. Small creeping Cinkefoile.

This small Cinkefoile, creepeth and spreadeth upon the ground like the last, and is in stalkes and flowers alike also, saving that the leaves are somewhat larger and nothing hoary or shining, but Greene, and have a little soft hairy downe on them, and the flowers are not of so gold a yellow colour, in other things not much differing.

4. *Pentaphyllum minus repens lanuginosum*. Small woolly creeping Cinkefoile.

This woolly Cinkefoile is very like the last for growing, both of stalkes, leaves and flowers, but the stalkes are a little

1. *Pentaphyllum vulgatifissimum*.
The most common Cinkefoile.

4. *Pentaphyllum minus repens variegatum*.
Small hoary creeping Cinkefoile.

6. *Pentaphyllum supinum Potentilla facie*.
Low Cinkefoile with wild Tansie leaves.

long

a little slender, not Greene but reddish, the leavēs are more woolly, and the edges deepe-ly dented in, the flowers also are of a deeper gold yellow colour then the last.

5. *Pentaphyllum minimum repens*.

The smallest creeping Cinkefoile.

This smallest Cinkefoile, is lesse creeping then any of the former, having many small leaves of five parts, as others have, but a little whitish hoary underneath, this scarce beareth any stalke, with small pale yellow flowers, having a purplish head in the middle, which growing ripe is hard, and like a small Strawberry head as all the rest have, the roote is small, but somewhat sharper in taste then the others, but yet astringent withall.

6. *Pentaphyllum supinum Potentilla facie*.

Low Cinkefoile with wild Tansie leaves.

This small Cinkefoile creepeth not, nor yet standeth upright, but leaneth downe with his weake stalkes to the ground ward, having very long stalkes of leaves on them, divided into many parts next the ground, set on each side thereof two at a space one against another, and an odde one at the end, all of them dented about the edges, very like unto wild Tansie leaves, but not hoary or silver like as they, but Greene: the flowers come at the joynts with the leaves towards the toppes of the stalkes, which are there, lesser and lesse divided then those below, every one by it selfe, which are small and of a pale yellow colour, with a head in the middle, which after it is ripe, is like unto the other Cinkefoile heads of seede, that is, like unto a small hard dry Strawberry: the roote is small long and blackish, like the ordinary Cinkefoile.

7. *Alterum eidem simile Enncephyllon*.

Another small one like thereunto.

There is another low one of this kind, that *Bauhinus* hath set forth in his *Prodromus*, whose small slender stalkes, three or foure inches long are many, lying round about the roote upon the ground, divided into many branches, whereon are

M m 2

long stalkes of leaves like unto the last, but divided into nine parts, each of them much narrower than they, very hairy and dented about the edges: the flowers are small and more yellow, standing in the same manner, and yeelding the like heade of seede: the roote is somewhat thicker and blacke ending in long fibres.

The Place.

The first groweth by woods sides, hedge sides, the pathways in fields, and in the borders and corners of them, almost through all the land: the second groweth on the highest toppes of the Alpes, that are nighest unto *Austria*; the other *Pentaphyllum* of *Clusius* groweth in the grassie fields of the Alpes neare *Austria*: the third groweth the most common of all others, by the wayes sides, in dry grounds in *Hungary*, the lower *Austria*, *Moravia* and *Bohemia*: the fourth groweth in the same places with the third, but more rare to be met with; the fift *Tragus* saith, in many sandie grounds of *Germany*, and in the grassie fields that are by the woods sides: the sixt *Clusius* saith he found in the borders of fields, that are by the woods sides about *Vienna*, and is cherished in gardens with many; the last groweth on the Alpes among the *Swissers*.

The Time.

They doe all flower in Sommer for the most part, yet the least, is often in flower the earliest, which is sometimes in April, and the second in May.

The Names.

The first is generally called by all, either *Pentaphyllum* or *Quinquefolium* vulgare; of *Bauhinus*, *Quinquefolium majus repens*: the second is the third *Pentaphyllum* of *Clusius*, called by him, *Pentaphyllum Alpinum flore aureo*, and by *Bauhinus*, *Quinquefolium minus repens Alpinum aureum*: the third is *Clusius* his first sort, of the fourth kinde of *Pentaphyllum*, which *Bauhinus* calleth *Quinquefolium minus repens lanuginosum luteum*: the fourth is the other sort, of *Clusius* his fourth kinde, and called by *Bauhinus*, *Quinquefolium minus repens aureum*. The fift is the first kinde of *Tragus*, called by him *Quinquefolium minimum*, and by *Lobel* in his *Adversaria*, *Pentaphyllum minus luteum*: the sixt is called by *Lobel* in his observations and *Icones*, *Pentaphyllum supinum Tormentille facie*, but by *Clusius* more properly, *Potentilla facie*; by *Dodonæus* according to his figure, but not the description *Quinquefolium tertium repens*, which is Mr. *Gerardus* *Fragaria vesca sive sterilis*: *Bauhinus* calleth it *Quinquefolio fragifero affinis*; and calleth the last (which if it be not the same and growing lesse in his naturall or wilde place, yet is very like it) *Quinquefolio affinis Emneaphyllum*.

Ordo tertius. The third Ranke.

1. *Pentaphyllum majus erectum.* The greater upright Cinkefoile.

The greater upright Cinkefoile, hath somewhat longer and larger Greene leaves, than any of the former sorts, cut into five parts, and often also into seven, and but with three leaves towards the toppes, and dented about the edges: the stalkes are strong and upright, not much above halfe a yard high, branched divers wayes, with large pale yellow flowers at the toppes of them, which turne into seede like as the other sorts doe, the roote is blackish and stringie. Of this kinde, there is some that doth sometimes beare white flowers, and others purplish, whereof their flowers make the difference.

2. *Pentaphyllum rectum minus.*

The lesser upright Cinkefoile.

The lesser upright Cinkefoile, hath smaller and rounder leaves than the other, of a sad Greene colour on the upper side, and gray or hoary underneath: the stalkes are tenderer and lower, and the flowers at the toppes of them, are somewhat smaller and of a more gold yellow colour, and herein consisteth the chiefest differences the one from the other.

3. *Pentaphyllum montanum erectum.*

The Mountaine upright Cinkefoile.

The Mountaine upright Cinkefoile, hath divers upright but slender hoary stalkes, scarce halfe a yard high, divided at the toppes into sundry branches, whereon grow divers leaves, cut into five deeper parts, and deeper dented about the edges, somewhat hairy also, and a little hoary underneath but not shining, whose foote stalkes are some shorter and some longer than others: but those leaves that grow below, at the foote of the stalkes stand upon very long foote stalkes, and are for the most part divided into seven parts or leaves: at the toppes of the stalkes grow gold yellow flowers, like the former but smaller, the seede that followeth, is not unlike the rest, neither is the roote which is blackish.

The Place.

The first groweth in many places in *Germany*, *France*, and in *Savona* of *Narbome* where it beareth white flowers say *Pena* and *Lobel*, and in *Italy* purplish: the second groweth in *Germany* in divers places, for *Fuchsius* and *Iohannes Thalius* make mention of it: the third *Bauhinus* saith was found on the hill *Crenzensis*, in the ascending to the toppe.

The Time.

The flower for the most part all the Sommer long.

1. *Pentaphyllum majus erectum.*
The greater upright Cinkefoile.

The Names.

The first is called *Pentaphyllum majus* by *Brunfelsius* and *Lobel* in his Observations; and *rectum majus* by *Camerarius*: yet unto *Lobels* figure in his Icones, and unto *Gerards* figure, the title is *Pentaphyllum vulgare*: in the *Adversaria* the title is hereof, (because of the variation of their flowers in the colour as I said before) *Pentaphyllum albidum & purpureum*: with many Herbarists in these dayes it is called *Pentaphyllum Heptaphylli facie*, because it hath so usually seven divisions or leaves upon a stalk. *Bauhinus* termeth it *Quinquefolium rectum luteum*. The second is called by *Mathiolus* in some editions *Pentaphyllum album*, and by *Tragus* *Pentaphyllum exiguum*; by *Johannes Thalius* in *Hercynia sylva* *Pentaphyllum canum*, by *Camerarius* *Pentaphyllum rectum minus*: by *Dodonaeus*, *Fuchsius* and *Lugdunensis*, *Pentaphyllum* or *Quinque folium luteum minus*: by *Gerard* *Quinquefolium Tormentalis facie*, by *Tabernaemontanus* *Quinquefolium petreum majus*, and by *Bauhinus* *Quinquefolium folio argenteo*. The third *Bauhinus* in his *Pinax*, and *Proderius* setteth downe under the title of *Quinquefolium montanum erectum hirsutum luteum*.

The Vertues.

Having declared unto you all the severall sorts of this kinde of herbe, called Cinkefoile, in their Orders and Rankes, I must now declare unto you the chiefe properties of them altogether, and yet shew which is the most effectuall in speciall: all these sorts for the most part, having one qualitie of cooling and binding, yet the binding is more incident, and naturall unto them all, then the cooling, in that some of them are a little sharpe or bitter in taste, which argueth some more heate, yet I may ghesse the sharpnesse or bitternesse therein, is no more any signe of heate than it is in Cichory, or Poppy or *Opium*: our common wilde creeping Cinkefoile, the greater upright one and the white Cinkefoile, are the chiefe for use, and strongest in effect of all the rest. These three sorts are much alike for their operation, and are held to be as effectuall for all the purposes, whereunto the *Tormentill* is used, as well for preserving against venomous and infectious creatures, and diseases in each respect, as in keeping from putrefaction, for binding and restraining fluxes, either of bloud or humors, or any the other effects, whereunto *Tormentill* is applied; so that in stead thereof, and where it is wanting Cinkefoile may be used to as good purpose, I might referre you therefore to the properties of the *Tormentill*, to be informed thereby, for the severall helpes, that this doth give; but I will shew you some particular remedies, it worketh upon especiall griefes and diseases: as first, it is an especiall herbe, used in all inflammations and fevers, whether infectious and pestilentiall or topicall among other herbes, to coole and temper the bloud and humors in the body, as also for all lotions, gargles, injections and the like, for sore mouthes, ulcers, cankers, fistulas, and other corrupt and foule or running sores: yet some are so foolish to thinke, that the decoction of one branch of leaves thereof, taken with a little Pepper, doth helpe a quotidian or daily ague, that three branches helpeth a tertian, and foure a quartane ague; but this set number of leaves and branches, is rather an idle conceit, as it is also to were it in their shoes, for the same purpose, then any certainty fit for a wise man or physician to leane and trust unto: the juice hereof drunke about foure ounces at a time for certaine dayes together, cureth the quinsie and the yellow jaundise, and to be taken for thirtie dayes together cureth the falling sicknesse, and for all fluxes in man or woman, whether the whites or the reds, as also the bloody fluxe, the rootes boyled in milke, and drunke is held most effectuall of any other remedy: the rootes boiled in vinegar, and the decoction thereof held in the mouth, easeth the paines of the toothach: the juice or the decoction is good to helpe the hoarsenesse of the throate taken with a little hony; as also is good for the cough of the lunges: The distilled water of both rootes and leaves, is effectuall to all the purposes aforesaid, and if the hands be washed often therein, and suffered at every time to drie in of it selfe without wiping it will in a short time helpe the palsie, or the shaking in them: the roote boyled in vinegar helpeth all knots, kernells, hard swellings and lumps growing in the flesh in any part applied thereunto; as also all inflammations and *S. Antonies* fire, all empoisons and painefull sores, with heate and putrefaction, the shingles also and all other sores of running and foule scabbs, sores, and itches: the same also boiled in wine, and applied to any joynts full of paine and ache, the gout also in any of the joynts of the hands or feete, and that also of the hippe called *Sciatica*: and if the decoction thereof be also drunke, it helpeth forward the cure much the sooner, and easeth also much paines in the bowells: the rootes are likewise effectuall to helpe ruptures or burstings to be used with other things available therefore, either inwardly or outwardly or both, as also for bruises, or hurts by blowes, falls, or the like, and to stay the bleeding of wounds, in any part inward or outward.

CHAP. XXVI.

Gentiana. Gentian or Fellwort.

Although I have set forth in my former Booke divers sorts of *Gentians* or *Fellwort*, yet there remaine divers others to be intreated of, which shall be here remembered; and because I was there somewhat brieve in declaring the vertues as was fit for that worke, being but an abstract of choise plants, that beare beautifull flowers to store a garden of pleasure, and not a generall worke wherein all things are to be comprised, and all that may be said of every one also, I will here therefore amplifie my selfe the more in their vertues, that have beene spoken of, which are the most effectuall, and of these also, for they are to be referred unto them: yet I thinke good to give you here some of the figures extant before. But that I may use such a methodicall course, as I have formerly held, in setting forth other plants which have divers sorts of one kinde, I will divide this family of *Gentians* into a greater and lesser sort, and of the lesser sort which admitteth a subdivision, and not the greater; I will divide them againe into *perennes*, everling or abiding, that is, that perish not in the Winter; and into *annuus* annuall, that is, such as spring up and perish the same yeare that they flower, abiding onely the Sommer and not the Winter: I might also divide the lesser sort againe into *Vernalis*, *Aestivalis* and *Autumnalis* flowering plants, whereof every one in their order.

Gentiana majores. The greater Gentians.1. *Gentiana major flore purpureo.* Great purple Gentian.

THE great purple Gentian, is very like the great yellow Gentian in most things, having a great thicke brownish yellow roote, parted into two or three great branches; with great fibres at them but a little more hard and woody of as bitter a taste as the other, which sendeth forth at the severall heads thereof, many faire broad three ribbed darke Greene shining leaves, so like unto the other, that it is somewhat hard to distinguish them, many of these heads from among the leaves, shoote forth thicke and strong stalkes, three or foure foote high, with divers joynts on them, and two leaves at them, one against another: towards the toppes whereof come forth the flowers compassing the stalkes, at two or three of the uppermost joints, with two leaves apeece under them, like as in the other, which are not laid open, starre fashion, like the other, but abide close and hollow, the brimmes onely divided into fixe or more round parts, of a purple colour, but paler at the bottome of them, where they are spotted with purple spots on the inside, having so many yellowish threds in the middle, as the flower hath corners, standing about a long Greene by forked head, which growing ripe is the seede vessell, and containeth there in such like flat brownish feedes as the other, but somewhat lesse.

2. *Gentiana major flore albo.* Great Gentian with white flowers.

This white flowred Gentian is very like the former, and the great yellow kinde, not much lesser and lower in any part than the former, whose flowers are not purple but pure white, and hollow like the other, without any spots in them, this making the whole difference betweene them.

3. *Gentiana major flore pallido punctato.* Great pale yellow spotted Gentian.

This spotted great Gentian, is in all things also like the first, but in the flowers, which are of a duskyish pale yellow colour, spotted both within and without with very many blacke spots.

4. *Gentiana major flore caeruleo.* Great Gentian with blew flowers.

And this also differeth neither in greatnesse of stalkes, leaves and flowers, nor in the manner of growing, but in the colour of the flower, which is of a blew colour.

5. *Gentiana Asclepiadis folia.* Swallowwort Gentian.

This is described in my former Booke.

The Place.

All these sorts grow in many places on the Mountaines of Germany, and in other places, but are not to be found so usually as the great yellow.

The Time.

These doe all flower in June or thereabouts.

The Names.

It is called in Greek *Γεντιανή* in Latine, and so likewise *Gentiana*, a *Gentio* Illyriorum rege primū inventore, as Di-

1. *Gentiana major cujusque coloris.*
The greater Gentian of any of the colours.

Gentiana cruciata.
Crossewortte Gentian.

scorides & Pliny set it down: Serapio saith it was called *Basilica*: of some it was called as some copies of Dioscorides hath it *Centauria radix*: of some *Aloes Gallica Narce* sCh. ronion, and as Pliny saith, some *Romanes* called it *Cnendia*, and some *Ciminales*. The *Italians* and *Spaniards* follow the Latine name *Gentiana*, the *French* also *Gentiane*, the *Germanes* *Gentian*, *Enzian*, and *Bittermurtz*; but the *Gentiana Conciata*, they call *Modelgher*; we call it in *English* either *Gentian* or *Fellworre*, mixed as I take of *Latine* and *English* together, or *Bitterwort*, and of some *Baldmony*: all Authors doe generally call them all *Gentians*, and distinguished according to the colour of the flowers, as they are in their titles.

Gentiane minores vernaes perennes. The lesser Gentians of the Spring, abiding.

1. *Gentianella major sive Gentianella Alpina latifolia magno flore.* The greatest small Gentian of the Spring.

THIS greatest of the small Gentians is very like unto the Gentian of the Spring, that I have already set forth, yet it is not the same, having larger greene leaves, of two inches long and one broad, somewhat round pointed, with three ribbes or veines running through them, as the others have, the stalke rising from the middle of these leaves, groweth about foure inches high, with a small leafe or two thereon, bearing at the end thereof a large huske, sustained by two small and long leaves, from the middle whereof shooteth forth a very large and great hollow blew flower, ending in five small points: the roote is small yellowish and fibrous.

2. *Gentianella angustifolia verna.* Small narrow leaved Gentian of the Spring.

This small Gentian of the Spring, shooteth from the roote, which is long slender much spread under the ground and yellowish, many heads of divers small long and narrow leaves set together, somewhat longer then the next that followeth; from some of these heads, (for all flower not in one and the same yeare, those flowering the yeare following, which flowered not the yeare before, and those that did flower, not flowering againe the next yeare after,) riseth up a small slender stalke, somewhat higher then the former, bearing thereon, two such like small leaves at a joynt, and at the toppe one flower for the most part, (seldome more or the stalke branched) much smaller then the last, narrow long and hollow like a hose or huske of one entire leafe at the lower part, but ending above into five corners or small pointed leaves, laid open like a starre, having small peeces of leaves like as it were eares, set at the bottome of the divisions of them, both of them of a perfect blew colour, but not so deepe as the former, having a white line in the middle of each of them, and the ground or bottome of the flower whitish also, with a few threds standing about a small head, not to be seene untill the flower be almost or fully past, unlesse one open it; which after it is ripe is small and long, containing very small brownish seede.

3. *Gentianella minor verna.* The smaller Vernal Gentian.

This little Gentian groweth in all things like the last, saving that the leaves are not so long and narrow, but are small, and of the breadth of the naille of ones little finger, somewhat pointed at the end: the stalke is much about the same height, and beareth such a like small blew flower, sometimes having those small peeces or eares at them, and sometimes without them: and these be the chiefest differences betweene them.

4. *Gentianella omnium minima.* The least Gentian of all.

This least Gentian (so called because of the bitterness in it, else it might very well be accounted rather a kind of mosse) spreadeth, and as it were matterth upon the ground, with many small and long leaves, among which

1. *Gentianella Alpina verna major.*

The greatest of the small Gentians of the Spring.

- Gentianella verna minor.*

The smaller Vernal Gentian.

rife small little foote stalkes, little more then an inch high, bearing each of them one flower, larger then the proportion of the plant may seeme to beare, of a pale blew colour scarce appearing out of the huske: the roote is small and white.

The Place.

The first groweth upon the *Alpes*, that are neere unto *Switzerland* as *Bauhinus* saith, The second groweth on the dry cold hills of *Savoy*. The third *Clusius* saith he found as well upon the *Pyrenean* hills neare *Spaine*, as also upon divers hills of *Austria* and *Hungary*, *Gerard* saith it is found upon *Salisbury* plaine, in *Sussex*, and nere *St. Albons*, but I doubt he was mistaken, for that which groweth in those places, as farre as I can heare or learne, as also in many other of our owne land, is not this Vernal kinde, but some other, that flower some in the Sommer, some in Autumne, as you shall understand by and by. The last as *Bauhinus* saith groweth upon the hills among the *Switzers*.

The Time.

The two first sorts doe usually flower in Aprill, the third in May, and the last latest, and it is but casuall, if they flower at any other time, for their leaves abiding greene all the Winter, they do encrease at the roote and may be easily parted.

The Names.

These are called by most writers, *Gentianella quasi Gentiana minor*, and *verne* because they doe chiefly flower in the Spring time. *Lugdunensis* saith, they may be called *Thylacitis major & minor*. The first *Bauhinus* in his *Pinax* and *Prodromus* calleth *Gentianella Alpina latifolia magno flore*, as it none had made mention of it before himselfe, but assuredly it is the same that *Lugdunensis* setteth forth, although that of *Lobel* and *Clusius* be a lesser of that great sort, which is that I have already set forth in my former booke, which he calleth *Gentianella Alpina angustifolia magno flore*. The second is the *Gentianella angustifolia* of *Lugdunensis*, which differeth from the *Alpina minor* of *Clusius*, although *Bauhinus* doth not distinguish them, but calleth it *Gentianella Alpina major*, when all others call it *minor*. *Gesner* in *hortis Germanie* calleth it *Calathiana verna*, and *Lugdunensis* *Helleborine Dalechampii* on *Dioscorides*. The third *Clusius* calleth *Gentianella minor verna*, and is thought by divers to be *Cantabrica* of *Pliny*. *Casalpini* taketh it to be *Vincetoxicii species pusilla*. The French by a speciall name, call both the greater and the lesser of this sort *Reperet*. The last *Bauhinus* calleth *Gentiana omnium minima*, as it is in the title, and peradventure is the *Gentianella Bavarica* of *Camerarius* in his *Icones*, but that this he saith hath longer and that rounder leaves.

Gentianella astricta. Small Gentians of the Sommer.

1. *Gentiana Penniceae carulea punctata*. Doctor Pennies blew spotted Gentian.

Although I am in some doubt, whether this be a Gentian, and dare not as firme it to be any of the great kinds of Gentian (and *Clusius* also to whom Dr. Penny gave both the figure and description, was doubtfull of it not to be of the smaller kinde, let mee therefore place it either as the last of the greatest Sommer sorts, and least of them, or first of the Sommer kinde, but greater then any of the smaller, whose description is as followeth. It hath a joynted stalke about a foote and a halfe high, somewhat reddish toward the bottome next to the roote, with two leaves like the great Gentian, set at each joynt, but much smaller, and with more veines or ribbes therein then it, each standing upon a reddish foote stalk, greater below then those above, where they do in a manner compass the stalke, from the middle of the stalke upward come forth the flowers at the joynts with the leaves, on both sides of the stalke, three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short foote stalk under them, consisting of five small pointed leaves, spread like a starre, of a pale blew colour finely spotted, with many small blacke prickles on the inside, having a small umbone in the middle, and five small threds, tipt with yellow standing about it: the seede that followeth, is enclosed in such heads or huskes, as the Gentians have: the roote is small and yellow, with many fibres annexed unto it. Hereunto I may referre another very like unto it, found in the North parts of this land, namely in *Lancashire*, by Mr. *Hesket*, a Gentleman in his life time very skilfull in the knowledge of Plants, whose figure I here exhibit, that some other may be stirred up to finde it out againe, that we may have further knowledge thereof.

Gentiana dubia anglica.

2. *Gentianella astricta cordata*. Small Heartlike Sommer Gentian.

This Sommer Gentian, hath a small long fibrous, but woody yellowish roote, (and thereby may be judged to be but annuall and not abiding) from whence arise small leaves, somewhat round pointed, with a greenish yellow ribbe in the middle of them, two alwaies set one against

another

another: the stalke is square, about halfe a foote high, with the like leaves at the joyntes and divided from the middle upwards, into divers small short branches, on the toppes whereof stand very large flowers, in comparison to the smallnesse of the Plant, which is of a whitish blew colour before it be open, and writhed together, like to many of the flowers of the small Bindeweeds, but being opened consisteth of a long hollow round huske ending in five hard leaves, somewhat broad and pointed like a starre, of as brave a deepe blew colour, as any of the former: betweene those greater leaves, there are other smaller leaves set, each of them round at the ends and dented in, making them seeme like unto a heart, as it is painted, from whence the name in the title *cordata* heart-like, was imposed upon it, the like forme being not observed in any of the other: the feede vessell after the flower is past, groweth to have a small long necke, and bigger above, which being ripe openeth it selfe at the head, contrary to the rest, containing within it much blacke feede, but twife as bigge and as long as the other.

3. *Gentianella aestiva purpureo. carulea.* Small purple Sommer Gentian.

This purple Sommer Gentian shoote th forth a reasonable strong stalke, a foote and a halfe high, with divers joynts, and two leaves at every one of them, somewhat broad at the bottome, where it joyneth to the stalke, not having any foote stalke to stand on, growing smaller to the end, and long pointed: the stalke at the toppe hath some short branches, whereon are set five or six or more small purplish blew flowers, ending in five small pointed leaves, after they are fallen and past, come up small long cornered pods, or feede vessels, containing much small feede: the roote is slender long and fibrous, and perisheth after bearing, raising it selfe againe from its owne sowing, and if it spring before Winter, it will endure it well and flower the next yeate, else if it rise in the Spring, it will abide all the first yeare and flower and feede the next.

4. *Gentianella aestiva flore lanuginoso.* Sommer Gentian with a cottony flower.

This Sommer Gentian springeth up with many long and narrow leaves, lying in compasse upon the ground, with three veines in every one of them, as is usual in all or most of the Gentians, from among which riseth up a square stalke, about a foote high or more, bearing at every joynt two such like leaves as grow below, but lesser and longer pointed: at the joynts with the leaves, toward the toppes of the stalkes, shoote forth two or three short branches, bearing every of them three or foure flowers, larger then the former and bigger belyled, ending in five points or leaves, of a paler purple colour, having a small purplish cottony downynesse, at the bottome of each of the leaves, where they are divided on the inside: after the flowers are fallen, there appeare small long huskes, like hornes, full of small round feede, the roote is small and long, of a pale colour somewhat woody, perishing as all the Sommer kindes doe.

5. *Gentianella aestiva flore brevior.* Sommer Gentian with short flowers.

This kinde of Gentian is somewhat like unto the last, but that the leaves are broader by the halfe, two alwaies standing at a joynt, of a deeper greene colour, the stalke is square and branched at the toppe in the same manner, bearing divers flowers on every of them, which are both shorter and greater then they, and of a pale blew with colour, the feedes and rootes are much alike: all these kinds as well as the former are very bitter, which cause them to be referred to Gentian.

6. *Gentianella aestiva minima Neapolitana.* The small Sommer Gentian of Naples.

This small Gentian hath small square stalkes, little more then halfe a foote high, but fuller of branches and flowers then the last, the leaves thereon are somewhat long and narrow, the stalkes are branched from the bottome, with many small flowers on them, standing in small huskes, which are long like a cuppe, the brimmes ending in foure parts, somewhat distant one from another, making the ends to seeme the longer, of a purplish colour inclining to rednesse, with a small woolliness at the bottome of each of the foure leaves, where they are divided, and white also on the inside, at the lower part of them, and of a paler purple about the edges; after which come up small long heads, forked at the toppe, wherein is contained small round shining yellowish seed, yet bigger then any of the former, the roote is longer and more full of threds or fibres then the last, spreading much under ground.

The Place.

The first as *Clusius* saith, Dr. Penny of London, shewed him the figure, and gave him the description, and told him that he gathered it upon *Bockmüt* a hill of the *Smitzers*, and the other of that kinde, as is said in some places of *Lancashire*, but we know not where. *Columna* saith he found the second upon the hills *Aquicoli* in *Naples*. The third and fourth groweth in the meadowes, at the foote of hills in many places of *Germany*, as *Clusius* saith. The fifth groweth on the toppes of hills onely, in many places of *Austria*. And the last on the hills in *Naples* as *Columna* saith.

The Time.

These doe all flower in the Sommer Moneths of *July*, and *August*, and not before, the feede growing ripe soonē after, which shedding themselves continue their kinds, but will hardly endure transplantation, or rise of the seed sowed in a Garden, as both *Camerarius* and others have observed, and my selfe can say the same.

The Names.

These are called *Gentianelle aestivae*, and are *mediae inter Gentianas & Centaurias minores*, as partaking of both in forme and property, *Clusius* calleth them *Fugaces*, because they abide not a Winter, unlesse it be upon their first yeares sowing, that they doe not runne up to flower, for so they may be said to abide two yeares, yet they are called annual in that they perish after flowering. *Baobinus* calleth them *pratenses*, because they grow in meadowes, yet some of them are onely found on the toppes of hills. The first Dr. Penny called *Gentiana punctata*; but *Clusius* referreth it to the Classis of his *Fugaces*. *Baobinus* calleth it in his *Phytopinax* *Alisma folio glabro* but in his *Finax*, *Gentiana palustris latifolia flore punctato*. *Columna* calleth the second *Gentianella carulea cordata*, for the causes expressed in the description, which *Baobinus* entitleth *Gentianella utriculis ventricosi*. The third is *Clusius* his first kind of *Gentiana fugax*, which *Baobinus* calleth *Gentiana autumnalis ramosa*; which title in my judgement is not correspondent to the Plant, as indeed in these small Gentians, as well as in many others, he is much and often mistaken, making two sorts of one, and sometimes misapplying the authors titles, to those that are not right, for neither is this plant onely full of branches, to beare the title *ramosa*, for others of this sort are so also, neither doth it flower so late to be made an *Autumnalis*, more then the other in this order, which

which for the most part are past before the Autumnall kindes be in flower. The fourth is *Chrysus* his second *Gentiana fugax*, which *Baubin* calleth *Gentiana pratensis flore lanuginoso*: the fift is *Chrysus* his third *Gentiana fugax*, which *Baubin* calleth *Gentiana pratensis flore brevioris & majoris*: the last *Columna* calleth *Gentianella purpurea minima*.

Gentianella autumnales. Small Autumnne Gentians.

1. *Gentianella Autumnalis Pneumonanthe dista*. The greater Autumnne Gentian.

THe greater of these small Gentians, that doth flower in Autumnne, riseth sometimes with more, and sometimes with fewer stalkes, sometimes also they rise higher, to be two foote high at the least, and sometimes not above a foote high, according to the fertilitie of the soile, of a brownish Greene colour, having many long and narrow darke Greene leaves, set by couples on them, up to the toppes, which feldome branch forth, but beare every one, a reasonable large hollow flower, bigger than any of the rest that follow, of a very deepe blewish purple colour in most, yet in some a little paler, ending in five points or corners: the rootes are many, small and long, thrusting downe deeper for the most part into the ground, then those before named, and abiding after seede time, not perishing as the rest.

2. *Gentianella autumnalis fimbriata flore*. Autumnne Gentian of Naples.

This Gentian of *Naples*, from a long yellowish small roote, creeping like Couchgrass, doth shoote forth a few long and narrow leaves, somewhat like unto the leaves of *Line* or *Flaxe*, but shorter, but those that grow up higher on the stalke, unto the middle thereof are still larger, and from the middle to the toppe, decreasing againe, but in all places two set at every joint, and striped from every one of the joynts on both sides all the length of the stalke, which being Greene and about a foote high, beareth at the toppe thereof a purplish Greene cuppe or huske, consisting of foure large pointed leaves enclosing the flower, which before it blow open is long and writhed, of a pale blew colour, but being open, is of a deeper blew colour, ending in foure leaves somewhat long, and as it were purled about the edges, with a little hairinesse at them also, having a small leafe at the bottome of each of them, and a few yellow threds in the middle, standing about an umbone or head, which when the flower is fallen groweth to be the seede vessell, forked into two parts at the head, where it is somewhat greater then it is below, wherein when it is ripe is contained, very small blacke seede.

3. *Gentianella autumnalis Centauree minoris folijs*. Autumnne Gentian with small Centory leaves.

This Autumnne Gentian groweth up with sundry stalkes, not a foote high, parted into divers small branches; whereon stand two small leaves together, as is usuall in all the Gentians, very like unto those of the lesser Centaury which are not so long as either of the former, a little broader and of a whiter Greene colour: at the toppes of the stalkes and branches grow divers orient blew flowers, not so large as either of the two former, but

1. *Pneumonanthe*.
The greater Autumnne Gentian.

3. *Gentianella autumnalis Centauree minoris folijs*.
Autumnne Gentian with small Centory leaves.

set in small long huskes, halfe way rising above the toppes of them, after which come small feede in long horned vessells, the roote is small and full of threds.

4. *Alia flori Centaurea minoris similis folio majore.*

Another with small Centory like flowers.

I have scene in M^r. Thomas Pemble his garden at Maribone a sort that was more spreading than the former sorts, small but with larger leaves and flowers than Centory, and of the same colour of the Centory flowers, yet more plentifully stored and longer lasting; the plant perishing as the other.

5. *Gentianella Centaurea minoris folio minor.*

A smaller Gentian with Centory leaves.

This small Gentian is very like unto the last, in the fashion and order of the leaves, but that they are somewhat smaller, and the stalk much lower, being not above three inches high, yet stored with many small branches, whereon are set long and somewhat large blew flowers, very like unto the lesser Vernall Gentian, after which the feede and vessells being ripe shew to be like the last: the roote is likewise small, but with many more fibres thereat then others.

6. *Gentianella minima elegantissima Bavarica Camerarij.*

Other excellent sorts of Autumne small

Gentians with Centorie like leaves.

The greater of them spreadeth sundry branches upon the ground, set full of small Centory like leaves, but a little pointed, and at the toppes of each, an orient blew flower made of five leaves. The other is even the smallest of all, with small round leaves (which the cutter hath perverted) and Starre-like blew flowers like the last.

The Place.

The first groweth in many places of Germany, and other places beyond the seas, as also in divers places of our owne land, as neare Longfield by Gravesend, neare Grenehithe and Cobham in Kent, in the fields about Sir Percivall Harts house at Lellingstone in Kent, and in a chalkie pit, not farre from Dartford in Kent hard by a Paper Mill, in the West Country also in divers places: it groweth as well in wet as in dry grounds. The second groweth on the hills in Naples, as Columna saith. The third groweth in Kent in divers places, as about Southfleet and Long-field upon the Downes, as also upon Barton hills in Bedfordshire, upon a peece of waste Chalkie ground, as yee goe out of Dunstable way, towards Gorkambury, and not farre from the ruines of the old Cittie Verulam, which is not farre from Saint Albones: the fourth is not knowne from whence it came: the fift upon divers of the Alpes: and the last according to the title in Bavarica.

The Time.

These flower for the most part not untill August, and that is later than the former, and therefore deservedly have the name of Autumne Gentians.

The Names.

The first is set downe by Matthioli, Lobel, Cordus, Clusius and others; some under the name of *Gentiana minima*, as Matthioli; some *Pneumonanthe*, as Cordus and Lobel; some *Calathiana viola*, as Gesner in horti Germania; some *Campanula autumnalis* as Dodonaeus, and of *Lugdunensis Campanula pratensis*: the second Columna onely mentioneth by the name of *Gentianella cerulea simbriata angustifolia autumnalis*. Bauhinus calleth it *Gentianella cerulea oris pilosis*: the third is the tenth Gentian of Clusius, and called by Eysitensis horti author *Gentianella autumnalis folijs centaurea minoris flore caruleo*. Lobel calleth it *Gentiana minima*. Bauhinus *Gentiana angustifolia autumnalis floribus ad latera pilosis*: the fourth is not mentioned by any before: the fift is the eleventh small Gentian of Clusius: the last is called by Camerarius, *Gentianella elegantissima Bavarica*; Bauhinus referreth it to the *Gentiana verna Alpina*: I to the *Calathiana verna Dalechampi* of *Lugdunensis*; but that Camerarius saith it flowreth in Autumne.

The Vertues.

The greater Gentians are more used in Physicke with us then the smaller, although they be neare of one property, and almost as effectual both inwardly and outwardly, and in the places, where the smaller are in plentie to be had, and the greater not so readily to be gotten, they doe very well serve in their stead. They are by their bitternesse so available against putrefaction, venomne and poyson, the plague also or pestilence, being a most certaine and sure remedy, that the Germans account it their Treakle, holding nothing to be a more commodious counterpoyson, and for this purpose did formerly make a Treakle therewith and other things, at Iena which was transported into our country, and we thereupon called it *Iena Treakle*, made of Gentian, *Aristolochia*, Bayberies and other things, which were all good, wholesome, and effectual for griefes and paines in the stomacke, and an especiall medicine against the infection of the plague, to expell the malignitie of that, and all other infectious diseases, and to preserve the heart, to strengthen it also against faintings and swoonings; which Treakle was bitter, and therefore the more likely to worke these, and other good effects; but that *Iena Treakle*, which hath since crept into the place of it among the vulgar, because it is sweet and pleasant; is for that cause greedily fought after, and for the cheapenesse, of most sorts of poore people desired, but there is nothing in it, that can doe them good, nor hath beene found to helpe them of any disease, being nothing but the drosse and worst part of Sugar, taken

taken from it in purifying, the which they call refining; and because the good is bitter, therefore but few can away with it: yet in *London* it hath bene upon occasion, both censured and condemned by a Jury, and many hundred weights thereof, bene publickly burned in the open streetes, before their doores that sold it, as a iust witness to all (if they would understand their owne good, and be perswaded by reason, true judgement and experience) that it is not a thing tollerable in a Common-wealth. I have thus farre digressed from the matter in hand, and yet I hope not without good and iust cause, to informe all of our countrie to submit their wills and affections unto those of learning and judgement in Physicke, and not be obstinate in their selfe willed opinions, and ignorance; for assuredly if that kind of *Leane Treakle* were wholsome or effectually to any good purpose, it were as easie for the Physicians to give way to the use thereof, as for any other tollerated medicine: but the saying is most true, *Nititur in vetitum semper, cupimusque negatum*, the more a thing is forbidden the more it is desired; for the wrong opinion of many is to thinke, that it is for the private profit of some that the thing is forbidden, and therefore stollen bread is sweetest: But to the matter now in hand. The powder of the dried rootes taken in wine, either of themselves or with other things, as *Mirthe*, *Rue*, *Pepper*, and the like, is a certaine remedy against the stings or bitings of *Serpents*, *Scorpions*, or any other venomous beasts, and against the bitings of a madde dog, being taken three or foure dayes together, and care taken to keepe open the wound with Vinegar or salt water, and to cleanse and dresse it in order as it should be; the same rootes also taken in wine helpeth those that have obstructions in their livers, or are liver growne as they call it, or have paines in their stomackes; those also that cannot keepe or relish their meate, or have dejected appetites to their meate, for hereby they shall finde present ease and remedy: being steeped in wine and drunke, it refresheth those that are overweared with travel, and are by cold and ill lodging abroad, growen starke or lame in their joynts: these also that have any gripping paines in their sides, as prickings, stiches or the like: it helpeth those that are bruised by blowes or falls, by dissolving the congealed blood, and easing the paines: the same also is held very effectually against all agues, to take of the roote not in wine, but some other drinke, or the water distilled of the herbe: the fresh roote, or the dried made into a pessary, and put into the matrice, expelleth the dead child, and the afterbirth, for it thoroughly worketh upon those parts, and therefore not to be given to women that are with child, and being taken inwardly, procureth their courses being stopped, and the urine when it is staid: the decoction of the roote is marvelous effectually to helpe those that are pained with the stone: the same also taken in wine doth mervellous much good to those that are troubled with crampes and convulsions in any parts: it doth much good also to those that are bursten, and have any ruptures. *Dioscorides* saith that there is so great power and efficacy in the rootes hereof, that it helpeth not men onely, but beasts also that are troubled with coughes, and the outgoings of their intrails, and that it expelleth the wormes of the belly: it breaketh much winde in the body, and causeth it to avoid; and generally it is available in all cold diseases, either inward or outward, and as *Galen* saith, is most effectually, where there is any neede to extenuate or make thinne, thicke flegme or grosse humors, cleansing of corrupt and filthy sores or ulcers, purging of peccant and offensive humours, and opening the obstructions of the liver and lungs, gall and spleene, and freeing the parts affected, with any the diseases incident unto them, and all these things, *Galen* holdeth it to worke by the facultie of bitterness therein; for assuredly if our stomackes could brooke this and other bitter medicines, and were not so nice and daintie to refuse whatsoever is not pleasing to the palate, it would worke admirable effects in the curing of many desperate and inveterate diseases inwardly, and cleansing and healing foule corrupt and desperate sores and ulcers outwardly, and therefore the *Italians* not underservedly, doe call the *Gentiana cruciata*, *Petimborsa*, *quasi mettere in bursā*, put it into your purse, either as *Mathiolus* saith that it was to be gathered whetsoever it was found and fit to be kept in ones purse, as ready to be used upon all occasions, or that it did by curing of diseases, get store of crownes to be put into the purse; so excellent they accounted this roote and herbe to be used: the decoction of the leaves, or the juice of them, or the rootes, worketh the same effects: and so doth the distilled water of the leaves, flowers, and rootes, artificially made in Glasse, and drawn by the vapours of a *Balneum* or Hot water; for this water drunke, hath bene often tried to cure in a wonderfull manner; all those sorts of agues that breede by the obstruction of humours or blood, and killeth the wormes of the belly: the said water used to the face, cleanseth it from all sorts of spots, freckles, morpew, and other defections, or discolourings of the skinne whatsoever, if it be often bathed lightly therewith; the powder of the roote, or the juyce thereof healeth all wounds that are fresh; as also is most soveraigne and effectually for all sorts of foule, putride, or rotten ulcers wheresoever, yea although they be hollow, or fistulous, cancerous also fretting or running, for it mightily cleanseth and drieth and healeth up also: the same also or the powder of the dried rootes applied to the ulcers, knots, or kernells of the necke or throat, which is called the Kings evill, healeth them certainly and speedily, as also the painefull swellings of the hemorrhoidiall veines, which are called the piles when they are fallen downe and grow vicerous or sore: the juice either fresh or condensate, that is, made thicke by extraction and evaporation to his consistence fit to be kept, is used to be infused into the eyes, to take away inflammations and rednesse in them, and to cleare & cleanse them from skins and filmes growing upon them: the roote or the juice of them, or the decoction of the herbe or roote, is given likewise very often to cattell to drinke, to free them from the Bottes, and wormes, and many other diseases, as also when they begin to swell, being poisoned by any venomous worme or ticke, which they often lick up with the grasse; as also when such wormes or other hurtfull vermine have bitten Kine by the udders or other tender places, which presently thereupon swell, and put the cattle to much paine, making them forebare their meate; which when the countrey people see, they bruising the leaves of any of the *Gentians*, growing neare unto them, and wringing out the juice, stroke therewith the udder, or bitten place, and they by two or three times so doing are helped and cured: the rootes of the smaller *Gentian* of the Spring, being dried and given in powder to any to drinke, will cause much venting or farting, and is given with good successe to helpe the torments of the wind-collicke, and other sore and grievous pangues, or paines in the stomacke or bowells, it is also profitable to helpe the yellow jaundise, as also any evill disposition in the liver or body, engendred by long sicknesse or bad diet, whereby they pine away by a consumption.

CHAP. XXVII.

Scorfonera. Vipers Grasse.

Although I have set forth in my former Booke two sorts of *Scorfonera* or Vipers Grasse which are the *Spannish* kinde and the low purple kinde, yet because there are some others that *Clausius* and others have made mention of, and some also nor yet published by any, I thinke it meete to declare all those not spoken of before, in this place and Chapter.

1. *Scorfonera major Pannonica latifolia*.

The greater *Hungarian* broad leaved Vipers Grasse.

This greater *Hungarian* Vipers grasse is very like unto the *Spanish* kinde, in all things almost, the leaves hereof are more in number, that rise from the head of the roote, as broad and long as they, but not crumpled about the edges, nor of that grayish Greene colour, but smooth, and of a darke or evill Greene colour; this hath two or three stalkes rising up among the leaves, and sometimes but one, according as the roote hath encreased into severall heads, having some lesser leaves upon them, and at the top, a scaly somewhat long Greene head, from the middle whereof groweth the like double yellow flower as the *Spanish* kinde hath, and the like seede also, lying in such downy substance, neither of them to be well discerned the one from the other, after they have growne any time in the garden together: the roote also is long and great, spreading into many branches, and shooting forth into divers heads, from the upper part thereof, blackish on the outside, and white and pleasant within as the other, yeelding milke in every part in the same manner also, abiding many yeares and not perishing after feede time, as the Goates beards doe, whereof all these are accounted as kindes.

2. *Scorfonera humilis latifolia Pannonica*. The dwarfe *Hungarian* Vipers grasse.

This dwarfe or low *Scorfonera*, shooteth forth not so many long leaves but almost as broad as the last, somewhat stiffer and shorter; and of the same Greene colour; from among which riseth up one firme, but hollow and short stalk, not above an handbreadth high, bearing some few small and short leaves thereon and a yellow flower, out of the like Greene scaly head, but shorter than the other, with the like seede therein also: the roote is blacke without, and whitewithin yeelding milke as the other doth.

3. *Scorfonera minor angustifolia Pannonica*. The small *Hungarian* Vipers grasse.

This small Vipers grasse hath long and very narrow Greene leaves, very like the leaves of *Tragopogon* or Goates beard, but shorter and not so many, the stalkes are slenderer and much lower then the first, bearing smaller and more single flowers upon them then it, and lesser seede, but like in all other respects, lying in such downe; the roote likewise is long and blacke without and white within, but smaller and slenderer, never growing to be halfe so great, neither yeeldeth such store of milke as the other doth.

1. *Scorfonera major Pannonica latifolia*.
The greater *Hungarian* broad leaved
Vipers grasse.

5. *Scorfonera tuberosa radice*.
The smallest *Spanish*
Vipers grasse.

2. 3. *Scorfonera humilis latifolia & angustifolia*.
The greater low, and the lesser tall
Hungarian Vipers grasse.

N^o

4. *Scorfonera*

4. *Scorfonera elatior angustifolia Pannonica*. Tall narrow leaved Purple Vipers grasse.

The taller purple Vipers grasse, hath many such like narrow long leaves as the last, and longer stalkes, with some lesser leaves on them, divided sometimes into two or three branches, bearing every one a small flower like unto the last, but of a blewish purple colour, standing in a shorter greene head, wherein is contained shorter and thicker feede, then in the former, the roote is long, and blacke without and white within, like the other, and yeelding also but little milke, yet abiding as the rest.

5. *Scorfonera minima tuberosa radice Hispanica*. The smallest Spanish Vipers grasse.

This least Vipers grasse hath divers leaves very small and narrow, lying on the ground, some rootes giving smooth leaves, and others crumpled about the edges, the stalkes are very small, and scarce rising three or four inches high, bearing out of a long small scaly head, a very small and single pale yellow flower, wherein grow smaller blacke feedes, and enclosed in farre lesser downe, then in any of the other, the roote is as thicke as three fingers or more, but much shorter then in any other kindes, blackish without, and somewhat whitish within, yeelding very little milke, when it is broken, but abideth the Winter almost as well as any of the rest.

6. *Scorfonera Illyrica*. Vipers grasse of Slavony.

The multitude of long narrow leaves with three ribbes in them to the number of fifty or an hundred, and of twenty slender stalkes, of small yellow flowers, and smaller seed after them then most of the former, the roote being blacke and thicke, maketh this kinde differ from the rest.

The Place.

The first groweth in many places of Germany, Bohemia, and Hungary. The second on the hills by Baden in Germany. The third in many of the same places with the first. The fourth on a small hill nigh unto Stampfen, which is two Dutch miles from Pofonium, a chiefe City in Hungary, and in other places thereof. The fifth grew in Spaine, and good store of the rootes being brought hither, I planted some of them in my Garden, perceiving them in forme to differ from others, which growing yeelded such leaves, flowers, and feede, as is before set downe. The last in Illyria or Slavonye, as *Alpinus* saith.

The Time.

They doe all flower in May, and their feede is ripe before the end of Junē.

The Names.

The first knowledge of *Scorfonera* to the world, came by *Monardus* a famous Physitian in Sivell, although it was found out, and the use of it likewise, thirty yeares before he wrote thereof, who made a small tractate thereof, and of the *Bezar Stone*, which *Clusius* translated out of the Spanish into the Latine tongue, and published it with other of his workes translated also, and annexed to his booke of strange or Exoticke things, wherein it is set downe that a Moore, a bondslave did helpe those that were bitten of that venomous beast, (or Viper as it is called by others) which they of *Catalonia*, where they breed in abundance, call in their language *Escuerfos* (from whence *Scorfonera* is derived.) with the juice of this herbe, and the roote given them to cate, which both tooke away the poison and healed the bitten place very quickly, when Treacle and other things would doe no good, which ever since hath growne in estimation, as well against venome or poyson, as against other diseases, as you shall heare by and by. The first is called by *Clusius*, *Scorfonera major Pannonica*, by *Matthiolus* *Scorfonera Bohemica*, whom *Lobel* and *Eugdencensis* follow, *Tabermontanus* and *Gerard*, call it *Germanica*, and *Bauhinus* *Latifolia altera*. The second is called by *Clusius*, *Scorfonera humilis latifolia Pannonica*, by *Tabermontanus*, *Scorfonera Pannonica*, and by *Bauhinus*, *Scorfonera latifolia humilis nervosa*. The third is called by *Lobel* *Scorfonera altera*, by *Tabermontanus*, *Scorfonera Germanica angustifolia*, and by *Bauhinus* *Scorfonera folijs nervosis*. The fourth is called by *Clusius*, *Scorfonera angustifolia elatior Pannonica*, by *Thalins*, *Scorfonera tenuifolia altera*; and by *Bauhinus*, *Scorfonera angustifolia subcarnulea*. The fifth because it came from Spaine without any name, I have entituled it according to the face and forme thereof, *Scorfonera minima tuberosa radice Hispanica*, it is very probable that *Bauhinus* in his *Prodromus* doth meane this plant, it commeth so nere unto it which he there calleth *Hieracium cap Ilacco flore*, for he saith it better agreeth to a *Scorfonera* then *Hieracium*. The last *Alpinus* setteth forth under the same title it hath, some doe call them *Viperaria* and *Viperina*, and some *Serpentina*.

The Vertues.

Bauhinus saith that the rootes of the Spanish kinde, hath in their naturall places some bitternesse, which if it be so (for I never saw such) is not perceived in those that have growne many yeares in our land, it is very likely that the temperature of the Climate, doth alter in some part the bitternesse thereof; but *Monardus* writeth, that those that grow in Spaine are somewhat sweete in taste like a Parsneppe, and may be eaten in the same manner, the roote hereof saith *Monardus*, whether raw or dressed, or condited, as also the juice of the herbe taken by themselves, or with any other cordiall or Counterpoyson, doth not onely helpe the biring of that so venomous a Serpent the *Escuerfos*, but of the Viper, and all other virulent creatures, the water distilled in glasses, is a present remedy for all contagious fevers, for by causing sweate the infection is evaporated, and the sicke person restored, the same also or the roote if selfe taken, is good against the passions and tremblings of the heart, as also against swoonings, sadnesses, & melancholy: the roote preserved and taken fasting, or the said water drunke for some dayes together, doth open the obstructions of the liver, spleene, and the other inward parts, as also helpeth to bring downe womens courses, and to ease the suffocation, or other diseases of the mother whatsoever, for in those feminine griefes it hath a very powerfull effect as hath bene often and certainly found true: it is also very good against the swimming or turning of the braine, and all other paines in the head, it is also very cordiall both to strengthen the vitall spirits, when they are much subject to faint or swoone, as also against melancholy or sadness, that ariseth without manifest cause, if the clarified juice of the herbe be set in the Sunne for certaine dayes, and the purer liquor thereof mixed with a little hony, be dropped into the eyes, it both cleareth and strengthneth the sight, and taketh away the spots and blemishes in them. The rootes preserved with Sugar, are not onely very pleasant to the taste, but effectuall for many of the aforesaid griefes.

CHAP. XXVIII.

Tragopogon. Goates beard.

Although it is not certainly knowne, that the Goates bearded have the like *Alexipharmicall* property, to expell venome and poyson, as the *Scorfonera*s or *Vipers* grasses, yet because they are so like unto them in outward forme and manner of growing, they being but as *species ejusdem generis*, the *Tragopogon*, or Goates beard, being the standard or *genus*, and herein principally differing, that all the *Tragopogons* are but annual, or perishing after they have borne seede, and all the sorts of *Scorfonera*, living after seede time many yeares. I have thought it not amisse to joyne them in neighbourhood as they be in kindred, whereof there be sundry sorts, some delivered in my former worke, others here to be expressed, and of them some not written of by any before.

1. *Tragopogon aestivum*. Sommer Goates beard.

The Sommer Goates beard, (which I so call because it is but annuall, to be sown in the Spring, and perishing in the end of Sommer, when it hath given seed) is a small Plant, rising up with one stalke little above a foote high, whereon grow three or foure long and narrow leaves, yet shorter then in any of the other, that hath beene described in my former booke, broader at the bottome then they, and growing lesse by little and little to the end, of a pale Greene colour, with a whitish ribbe in the middle; the stalke brancheth out into two or three parts, each of them bearing a large Greene head, wherein is contained a small flower, of a pale purplish ashe-colour, opening only in the morning, and shutting up before noone, the long pointed ends of the huske or head, rising above the flower, which is not usuall in most of the other Goats beards; which being past the head groweth greater, having the outermost feedes greater and thicker then the rest, spreading one from another, with no downe at all at the ends of them, but the smaller feede being in the middle, are smaller then any of the other, the roote is somewhat long woody, perishing before winter, and yeeldeth but a very little shew of milke, when the leaves are broken, or the rootes being young.

2. *Tragopogon minus luteum*. Small yellow Goates beard.

The small yellow Goates beard, hath a small slender stalke, about a foote high, with very few leaves thereon, which are somewhat long and narrow, as it were dented but rather waved about the edges, and of a pale Greene colour, at the toppe of the stalke standeth one Greene head, like other Goates beards with pointed ends, enclosing a large flower of a pale yellow colour, like unto the greater yellow kinde, which yeeldeth small seed with downe at the ends of them, and spreading in the same manner, the roote is somewhat long, and yeeldeth milke as the other doth.

3. *Tragopogon laciniatum majus*. The greater Goats beard with jagged leaves.

This jagged Goats beard hath his first leaves, long, narrow, and smooth at the edges, like unto the purple Goats

1. *Tragopogon aestivum*.
Sommer Goats beard,

3. *Tragopogon laciniatum majus*.
The greater Goats beard with jagged leaves,

beard, long and narrow at the bottome, and broader towards the ends, but those that rise up afterwards, and those that grow next unto them upon the stalke, are jagged or torne as it were on the edges, on both sides in some leaves, and in some but upon the one, in some also more divided, and others lesse, of a paler greene colour underneath then above; the stalke riseth up to be about two foote high, with such leaves but smaller on it to the toppe, but lesse divided, and the uppermost not at all, where it is branched into three or foure smaller parts, every one bearing a small greene head, like unto the ordinary kinde, not having any pointed leaves rising up, as is in the purple and some other sorts, enclosing within it a smaller yellow flower, then the ordinary yellow sort, opening in the morning, and shutting at noone, which being past, there cometh such like feede, but smaller and not rough, the roote is long and blackish on the outside, and white within, yeelding milke as others doe, and perishing after feede time, as others doe.

4. *Tragopogon laciniatum minus.*

The lesser Goats beard with jagged leaves.

This lesser kinde, shooteth forth from a long and somewhat thicke roote, brownish on the outside, divers long and very narrow leaves, more finely cut in on the edges, and into farre smaller parts then the former, among which riseth up the stalke a foote and a halfe high or better, with some such like leaves thereon, but smaller, and lesse divided at the toppe where it is divided into three or foure branches, with every one a flower on them, like unto the last, but of a paler yellow colour, standing in greene heads, without bearded, as most of the sorts of yellow Goats beards doe, and after yeeldeth the like head of long rough feede, with downe at the ends of them as others doe.

5. *Tragopogon luteum angustifolium.*

Common Goats beard with narrow leaves.

This Goats beard is very like unto the common yellow kind, but that it is not so great, nor riseth up so high, and hath much narrower, or rather grasse like leaves, and almost as long, the flowers are not so large, nor so thicke of leaves, and give the like feede.

6. *Tragopogon hirsutus humile.* Small rough Goats beard.

This likewise differeth not much from the last, but that it is lower, and the leaves are not so long and narrow, but a little broader, shorter, and rough withall, on both edges set with haire, as in the hairy wood grasse, the flowers are small and yellow like the last, but lesser, and so is both feede and roote.

7. *Tragopogon luteum Apulum.* Goats beard of Naples.

This Goats beard of Naples, hath many very long narrow leaves, somewhat broader then the next small purple kind, but somewhat hairy, some of them growing upright, and others bending downewards, among which a stalke riseth scarce higher then the leaves, bearing a large greene bearded huske, contrary to all other, with yellow flowers, containing a flower which consisteth of many yellow short leaves, more like a Hawke-weed, then a Goats beard, which passeth with the downe at the feed like others, and not halfe so great but yellowish, and smaller at the lower end, where others are greater.

8. *Tragopogon crocifolium purpureum.* Small purple Goats beard.

This small purple Goats beard hath many very long and narrow leaves, lying on the ground at the head of the roote, the stalke divideth it selfe into three or foure reddish branches, set with some leaves thereon, all of them narrower then grasse leaves, very like unto the narrow long leaves, of the manured or English Saffron, with a white line downe the middle of them, and hard in handling, each of the branches bearing a bearded greene huske, with a darke purple flower therein, dented at the endes of the leaves thereof, and having yellow threds sprinkled with meale as it were in the bottome of them, as the greater purple flower hath, and openeth but in the morning, and closeth at noone in the same manner, after which come the feede, spreading into a round globe or head, with the downe at the ends of them, as in the greater, the roote is great and long, yeelding milke as the others.

9. *Tragopogon Apulum suave rubrum.* Rose coloured Goats beard.

The Rose coloured Goats beard sendeth forth many long and narrow leaves like unto Grasse, with a white line in the middle of them, smooth and gentle, if you take them upwards, but as rough as Barly leaves, stroaking them downewards, and broadest at the setting to of the stalke, which is two foote high, scarcely dividing it selfe into any branches, but beareth at the toppe one large and great head, in respect of the Plant, parted into eight long leaves or bearded, in the middle thereof is the flower, consisting of tenne or twelve leaves, of a pale purple or bluish colour, neere unto a Damaske Rose, having divers blackish blew threds in the middle of them. With a mealy dust upon them, which being past, the head or huske groweth somewhat narrow, with a long necke, containing within it the feed, which is not fashioned into a round globe, with downe at the head of the feedes, as in all the former except the first, it hath five longer and greater feedes on the outside, with little or no downe at the ends of them, and the lesser in the middle, with a little downe at the ends, which are yellowish and smooth but the least of all other: the roote is long and slender, even the smallest of all, white downewards and somewhat hard,

Tragopogon purpureum.
Purple Goatsbeard.

hard but more reddish at the toppe. This is very like the former or annuall Goates beard if it be not the same. *Camerarius* in his *Hortus Medicus* maketh mention of one with a white flower, which I never saw yet nor heard *Flore Albo* of by any other.

The Place.

The first was sent me out of *Italy* among other feedes, but from whence they had it I know not. The second as *Bauhinus* saith groweth about *Mompelier*, and so doth the fourth also. The third groweth in many places, both in *Italy* and *Spaine*, for I had feedes thereof out of *Spaine*, by my friend *Boelus* that gathered them: the fift I found in the Medowes about *London*, and other places of our land, but not so plentifully as our greater yellow kinde: the sixth, seventh, eighth and ninth, grow on the hills in *Naples*, as *Columna* recordeth, both in his *Phytobasanos*, and *stirpinum minus cognitarum historia*.

The Time.

These doe flower about the time of the others, which is in the end of *May*, or in *June*, and the feede is ripe soone after: but all of them, except the first, doe abide greene the first *Winter* after it is sown, or doth rise of its owne sowing, and flowreth and feedeth the next year after: but the first as I said, flowreth and feedeth the same year, and must be new sown every year, for I never knew it spring from any feede, that it shed ic selfe.

The Names.

It is called in Greeke, *τραγοπόδον*, and *τραγοπόδον*, *Tragopogon*, *Barba hirci* and *Barbula hirci*; and *γερσοπόδον* *Barba senis*, quod a calyce semina promissa hirci vel senis barba instar pendunt; so say both *Dioscorides* and *Theophrastus*. The first came to me with the famenname, I have set with it in the title *Tragopogon esivum*: the second *Bauhinus* calleth *Tragopogon folio oblongo sinuato*: the third, both *Anguillara* mentioneth, calling it *Acorus Theophrasti*: as he saith others did, and *Fabius Columna* in his *Phytobasanos* *Tragopogon laciniatis folijs*. The fourth *Bauhinus* calleth *Tragopogon tenuissime laciniatum*. The fift is called by *Tabermontanus* *Barbula hirci minor*, and by *Bauhinus* *Tragopogon gramineo folio radice villosa*. The sixth *Columna* calleth *Tragopogon Apulum hirsutum humile*; and *Bauhinus* *Tragopogon hirsutum*. The seventh *Columna* calleth *Tragopogon Apulum humile hirsutum luteum*; the eighth *Columna* also calleth *Tragopogon crocifolium montanum flore nigro purpureo*, and *Bauhinus* *Tragopogon purpureo caruleum crocifolium*. The last is called by *Columna* *Tragopogon gramineo folio suave rubente flore*. Some have doubted that this is not the *Tragopogon* of *Dioscorides* and *Theophrastus*, because the leaves of the most of them are greater than the leaves of the *Saffron*, but notwithstanding it is generally taken to be the right, because of the head of feede, which agreeth so well thereto, as no plant else can doe the like; and besides *Columna* hath set forth some of those before recited, which agreeth better with *Dioscorides* and *Theophrastus* *Saffron* leaves, than any of the rest, which therefore he taketh to be the truest. It is called in *Italian* *Saffrifica*; and with some *Sessifica*, and *barba di becco*: in *Spanish* *Barba Cabrera*, and *Barba di Cabron*: in *French* *Barba de bouc*: in *High Dutch* *Bocksbart*: in *Low Dutch* *Boexbaert* ende *Iosephs bloemen*: in *English* *Goates beard*, and goe to bed at Noone, or Noone tide, and of some *Starre* of *Ierusalem*, and others after the *Dutch* word *Iosephs* flower: of some also *Saxifrage*.

The Vertues.

The rootes of the greater wild yellow kinde chiefly, as also of the other kindes here set forth, being dressed as a *Parfnepe*, is more delicate and pleasant to the taste in eating: the rootes boyled and dressed (or as some doe eate them raw) is a fine sallet likewise to be eaten cold, and are very acceptable to the stomacke, helping to strengthen them that are growing into a consumption, or are become spare and leane by some long sicknesse: the distilled water saith *Tragus*, is the most present remedy that is to helpe inward impostumes (such as is the *Pleurisie*) and all other paines and stitches in the sides: the *Italians* use it much and often against all the griefes of the stomacke, both to take away the heart burne as we call it (which is an hot and sharpe humour in the stomacke fretting and paining it) and doth helpe also in a dejected appetite, to incite and stirre it up, as also against the defects of the breast or liver, and to helpe to expell gravell and the stone from the reynes, kidneies, and bladder, whereof the name *Saffrifica*, which is as much as breakstone, declareth the propertie: some doe hold opinion, that the purple and ashecoloured kindes being more bitter, astringent and absterfive, have a more binding and clesning qualitie than the others, and are therefore onely to be used for medicament, and the others as nutriment: and that they onely are effectuall to all the purposes before recited.

CHAP. XXIX.

Echium. Wilde Buglosse, or Vipers Buglosse.

Echium that painefull and industrious searcher of plants, hath given us the knowledge of many more sortes of Vipers Buglosse as he hath done of many other plants, than any before him; whereof I meane to en-treate in this place, and with them some others also.

1. *Echium vulgare*. The common Vipers Buglosse.

The common Vipers Buglosse hath many long rough leaves, lying on the ground, from among which rise up divers hard round stalkes, very rough, as if they were thicke set with prickles or haire, wherein are set, such like long rough haire or prickly sad greene leaves, somewhat narrow, the middle ribbe for the most part being white: the flowers stand at the toppe of the stalkes, branched forth into many long spikd leaves of flowers bowing or turning like the Turnesole, all of them opening for the most part on the one side, which are long and hollow turning up the brimmes a little, of a purplish violet colour, in them that are fully blowne, but more reddish while they are in the budde, and not blowen open, as also upon their decay and withering, but in some places of a paler purple colour, with a long pointell in the middle, feathered or parted at the toppe: after the flowers are fallen, the feedes (growing to be ripe, and enclosed in round heads) are blackish, cornered and pointed somewhat like unto the head of a Viper: the roote is somewhat great and blackish and woody, when it groweth toward sesde time, and periseth in the *Winter*.

2. *Echium vulgare flore albo.* White flowered Vipers Buglosse.

There is little difference in any thing betweene this and the former, but in the colour of the flowers, which in this is of a white colour wholly, and the leaves of a little fresher Greene colour, and in some places growth greater.

3. *Echium flore rubro.* Red flowered Vipers Buglosse.

The red wilde Buglosse is also like the former, but that his hairy stalkes are sometimes marked with purplish spots, and the leaves thereof somewhat broader: the flowers which stand in the same crooked and bowing manner, upon short foote stalkes, are of a brave red colour, and in some a little paler: the seede and rootes are alike and differ not.

4. *Echium pullo flore.* Vipers Buglosse with darke reddish purple flowers.

This wilde Buglosse hath shorter stalkes, and not so rough, but rather soft and woolly, whereon stand leaves, more thinnely placed, and without order: toward the toppe of the stalkes it brancheth forth into divers short sprayes, with some flowers on them, but not so plentifully as in the former, and are of a dead or darke blackish purpler colour: there is no disagreement either in seede or roote.

5. *Echium Creticum latifolium rubrum.* Red flowered Vipers Buglosse of Candy.

This Candy wilde Buglosse, hath large rough leaves lying on the ground, of a sile betweene Buglosse and Plantane leaves, betweene whom riseth up round rough stalkes, two foote high, sometimes divided into many branches, with divers rough smaller leaves on them to the toppes, which are bowing in the same manner with the former, from whence grow hollow flowers, ending in five cornered brimmes like unto the rest, of an excellent pale red or bluish colour at the first, and more purplish afterwards, standing in rough huskes, made of five small leaves a peece: the seede that followeth is like the rest.

6. *Echium Creticum angustifolium rubrum.* Spotted Vipers Buglosse of Candy.

This spotted wilde Buglosse hath rougher leaves and stalkes than the last, rising not fussy so high, but both stalkes and leaves marked with red spots, almost as much as the stalkes of Dragons, but the spotted on the leaves are paler than on the stalkes: the leaves are very long, but narrower than the last: the flowers stand in the same manner that the others doe, of so orient a red colour, that they will not lose it, but keepe their bravery after many yeares keeping drie: in the rest it is like the former.

7. *Echium pumilum flore luteo.* Dwarfed yellow Vipers Buglosse.

This dwarfed kinde is in all things like the former Vipers Buglosse, but in the smallnesse of the whole plant, not growing to be a foote high: the leaves likewise are thereunto answerable, and so are the flowers also, of a pale yellow colour but not so bushie as it.

8. *Echioidea lutea minima.* The least yellow bastard Vipers Buglosse.

This little bastard wilde Buglosse, hath divers leaves lying upon the ground, not above two inches long, and

1. *Echium vulgare.*
The common Vipers Buglosse.

3. *Echium flore rubro.*
Red flowered Vipers Buglosse.

4. *Echium pullo flore.*
Vipers Buglosse with darke reddish flowers.

11. 12. *Echium Creticum album & nigrum.*
Hoary white and blacke Vipers Buglosse of Candy.

not full halfe an inch broad, thicke, rough, and a little hard, but those that grow upward upon the stalke which is a foote high, are somewhat broader, rough and whitish, the leaves that grow towards the toppes being marked with yellowish purple spots: the toppes of the stalke is branched, and beareth small yellow long hollow flowers, like the other; the feede contained in the huskes are small, foure for the most part set together in a head or huske, and somewhat like the rest: the roote is small and somewhat long, browne on the outside, and white within.

9. *Echioides parva alba.* The small white Vipers Buglosse.

This small white wilde Buglosse, is in most things like unto the last, but that the leaves have no spots upon them, and the flowers are pale almost white: the feede differeth not, but the roote is very small and threddy, yet browne as the other.

10. *Echium Hispanicum flore calcaris donato.* Small Spanish Vipers Buglosse with spurres.

This small plant which *Baubinus* referreth unto the kindes of wilde Buglosse, because I am not well acquainted with it, must passe as he hath called it, and that you may know it, he thus describeth it; from a wooddie fibrous, browne coated roote, rise divers round and somewhat hairie stalkes, some of an hand breadth long, and others shorter bending downwards, compassed with a few thicke leaves, like unto the mountaine Speedewell but thicker and rougher: the flowers that grow at the tops, are hollow, long, and ending in foure brimmes like unto the other sorts, but of a blew colour, having a spurre or taile behind, like those of Todeflaxe: the feede is long, rough, and blacke like the other.

11. *Echium Creticum album.* Hoarie white Vipers Buglosse of Candy.

This Candy plant hath many thicke long and narrowish hoary leaves, somewhat like those of Alkonet, set full of sharpe haire, from whence rise sundry small hand-high stalkes, round and rough likewise with a few smaller leaves sparsely set thereon, at whose toppes stand tufts of yellow flowers in small long rough huskes unto whom small white feede doe succede of the likenesse of Vipers heads, and of the bignesse of wheate cornes: the roote is long blacke small and woddie, divided into other smaller partes.

12. *Echium Creticum nigrum.* Blacke Vipers Buglosse of Candy.

This daimtic Candy Buglosse groweth high with many sharpe prickly thicke stalkes bending downwards set full of thicke long leaves as sharply set with prickly haire as the stalkes, and ending in a sharpe point: at the toppes of the stalkes, and likewise at the joynts with the leaves, come forth faire large bell flowers with open brimmes, some of them being blew, either pale or deepe, others more purple with foure or five small, threds in their middles, after whose fading rise blacke Viperhead-like feede in long cods, or feede vessells; from whence the name of that, was imposed to distinguish it from the other with white feede; it hath a single long white roote of a thombes bignesse, and small at the end: the whole plant is of little sent, but of a sweetish sharpe taste.

The Place.

The first groweth wilde almost every where. The second about the Castle walles of *Lewes* in *Suffex*. The third and fourth in *Hungary*, and *Austria*. The fifth and sixth in *Candy*. The seventh and tenth in *Spain*. The eighth and ninth on the hills in the Kingdome of *Naples*, as *Columna* reporteth. The eleventh and twelfth in *Candy*.

The Time.

They all flower in Sommer, and their seede is quickly ripe after.

The Names.

It is called in Greeke *Εχιν* *Echium*, *ἀλκιβιάδιον* & *αλκίβιον* *Alcibiadiou*, and *Alcibion*, or *Alcibiadium*, of the first finder thereof, who being bitten by a Viper, gathered this herbe, and chewing it, and swallowing downe the juice, and applying the rest of the herbe to the bitten place, freed himselfe from danger, *Apuleius* saith it was called *Θηροπύλλον* *theriorrhizon*, *Viperæ radix* and *εχιδνιον*, from the forme of the seede, which as *Dioscorides* saith is like the head of a Viper, and thereof tooke the name *Echium*, yet some others say from the effects in the rootes, to cure the bitings of the Viper, in Latine also *Echium*, of most Authours, yet of some *Buglossum sylvestre viperinum*, & *Serpentaria*, and some also tooke it for *Anchusa*, as *Ibalium*, and *Cæsalpinus*, and under that name saith the seede of the *Candy* forts were lent him. *Cordus* on *Dioscorides* called the first *Lycopsis* and *Lonicerus Buglossum sylvestre*. *Camerarius* and *Mathiolus* mention the second, *Clusius* the third, fourth, fifth, and sixth, and the seventh in his *Cura posterior*, *Columna* the eighth, and ninth, and *Bauhinus* the tenth, under their severall titles as they are here expressed, the two last by *Alpinus* in his booke de plantis exoticis. It is called of the *Italians* *Echio*, and *Buglossa Salvatica*. Of the *Spaniards* *Terva di las bivoras*. Of the *French* *Borrache sauvage*, and *L'herbe aux vipères*. Of the *Germans* *wild ocksen song*. Of the *Dutch* men *wild osfontonghe*. In *Englisch* wild Buglosse, and *Vipers Buglosse*.

The Vertues.

It is as you have heard, by the first finder out of it, an especiall remedy against the biting of the Viper, and of all other Serpents or venomous creatures, as also against poyson, and poysonfull herbes, it is added further by *Dioscorides* and others, that whosoever shall take of the herbe or roote, before they be bitten, shall not be hurt by the poyson of any Serpent. And I thinke from this and some other the like qualities in herbes, to heale the diseases, whereof some forme may be seene in them, hath come the application of many other, whose formes have bene imagined to have bene found in them, which they call *Signature plantarum*, whereof *Crollius* in his *Basilica chymica*, hath given demonstration of all the parts of the body, from the head to the foote, and moreover of many the diseases of the body, and of divers other things, whereof they that will reade his worke may be better informed that desire the knowledge thereof; the rootes or feedes, are thought to be most effectfull for the foresaid causes, as also to comfort the heart, and to expell sadnesse, and causelesse Melancholy, it tempers the blood, and allayes the hot fits of agues, the seede drunke in wine procureth abundance of milke in womens breasts; the same also being taken, caeth the paines in the loines, backe, and kidneyes, the distilled water of the herbe, when it is in his chiefest strength, that is in flower is excellent to be applied inwardly or outwardly, for all the griefes aforesaid: There is a syrupe made hereof, very effectfull for the comforting of the heart, and expelling sadnesse and melancholly, which is made in this manner. Take of the clarified juice of the common wilde or *Vipers Buglosse* foure pound, of fine Sugar three pound, of the infusion of the flowers thereof one pound, boyle these gently unto the consistence of a syrupe, which keepe by you, to use as you shall have cause. But because it is somewhat hard to presse forth this juice, by reason of the limnesse thereof, it is fit that after you have beaten the herbe well, you set it close covered in a cold cellar, or other cold, and moist place for two daies and nights, and then wring or presse forth the juice, and clarifie it with the whites of egges bearen, and passed gently of it selfe, through a thicke *Hippocras* bagge; and because many know not how to make the infusion, before spoken of rightly as it should be, it is thus. Gather of the flowers of the said wild Buglosse, a good quantity, which you shall put into a pot, with some water, being made boyling hot aforehand, stoppe the pot close unill it be cold, and then wring forth the infusion; you may renew the infusion, by putting in fresh flowers as before, once or twice more, if you will have it strong of the flowers.

CHAP. XXX.

Fraxinella sive *Diptamnus albus*. False white Dittany.

Have given you the descriptions of all the sorts of false Bastard Dittany, or white Dittany, in my former Booke, whereunto I referre you. I shall onely here exhibite the figure and amplifie the Vertues.

Fraxinella may more fitly be called false white Dittany, then bastard Dittany, because there is one already set forth in the first Tribe or Classis by the name of *Pseudodittamnus*, Bastard Dittany, least two herbes should be called by one name, and then neither should be well understood when they were called for distinct *epithites*; is most requisite therefore to avoid confusion.

The Vertues.

The false white Dittany then is heating and drying, the rootes which are most in use doe attenuate or make thin grosse humours, it openeth obstructions, provoketh the menstrues and urine, and clenseth that which is foule and contagious. It is very effectually both against poyson, and the venome of Serpents, and other poysonfull creatures, and against the pestilence, and other contagious diseases, to take a dramme or two of the powder of the roote in wine or broth: the same also taken, killeth the wormes of the belly, breaketh the stone, causing it to avoid in the urine, it warmeth and cleanseth the matrix, expelleth the dead childe, and after-birth, if the part be fumigated with it and Penniroyall, or taken in Wine: it easeth the paines and torments in the inward parts or bowels, and healeth inward hurts and wounds: it is much commended against the Epilepsie or falling sicknesse, and other cold griefes of the head and braines, and is helpe to be of great good use against the *French* disease, to use it with the decoction of *Guaiacum*.

Fraxinella vulgaris.
The most common false white Dictany.

CHAP. XXXI.

Galega. Goats Rue.

1. *Galega sive Ruta Capraria.*
Goats Rue.

ribbe,

1. *Galega vulgaris.*

Common Goats Rue.

BEcause this herbe is so effectuell against all infections, I could do no lesse then insert it here, and take it from the other leguminous plants, where it might be placed, which otherwise I would not have done; and herunto I must adjoyne another, for the neerenesse, both for forme and vertues.

The common or most usuall Goats Rue, sendeth forth many round hard stalkes, foure or five foote high, whereon grow one above another at severall joynts, long winged leaves, that is, many leaves set on each side of a middle ribbe, which are small yet somewhat broad and long, and pointed at the end, smooth on the edges without any dentes, somewhat like unto the leaves of Vitches, and of a faint Greene colour, at the toppes of the stalkes stand many small Leguminous flowers, one above another, of a pale blewish purple colour, and in some plants pure white, after which come small round pods, about an inch and a halfe long, a little bunched out in some places, but nothing so much as the *Orobis* or bitter Vetch, wherein lie three or foure or five small pale seede like unto a Vetch: the roote is white and woody, spreading well in the ground, and abiding divers years.

2. *Galega montana Dalechampij.*

Mountaine Goats Rue.

This other Goats Rue shooteth forth divers round hard stalkes, nothing so high as the former, whereon groweth such a like winged leafe at every joynt, but broader and thicker set together, smooth also on the edges, but having the middle

ribbe of every leafe, raifed up a little high : at the toppe of the ftalkes ftand divers fuch like flowers as the former, but all on one fide of a pale colour, tending to yellow, which afterward yeeld fmall, long, blackifh pods, wherein lie fmall flattifh feede, like unto Lentills : the roote is fomewhat great and blacke, fending forth very long ftirings, whereby it fafteneth it felfe deepe in the ground.

The Place.

The firft groweth commonly wilde by the way fides of moift fields and medowes, both in *Italy*, *Savoy* and other places ; as alfo found of late growing wilde in the Medowes by *Linton* in *Cambridgefhire* : the other not but upon the toppes of mountaines, where any plaines are found.

The Time.

They flower in the end of *June* and *July*, and the feede is ripe in *Auguft*.

The Names.

This herbe hath not bene knowne to the ancient Authors ; and therefore hath no name, but is ufually called in Latine *Galega* or *Ruta Capraria*, for they that firft found it and the vertues, gave that name of *Ruta* thereunto, as finding it no leffe effectfull than the beft Rue : fome call it *Galega*, and fome *Herba Gallica* as *Fracaftorus* : and of fome *Capraria* : the *Florentines* call it *Lavaneje* ; in other parts of *Italy* it hath divers other names as *Gefner* faith *Caftreane*, *Lavanna*, *Thorina* or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbanefe*, and *Giarga* as *Brasavolus* faith. Some with us call it *Italian Vetch*, but moft commonly *Goates Rue*. The other *Lugdunenfis* called *Galega montana* ; and *Bauhinus* referreth it to the *Orobis Pannonicus* of *Clufius*, which it cannot be, for he faith it perifheth every yeare ; and alfo to the *Arachus latifolius* of *Dodonæus*, which it cannot be neither, for *Dodonæus* faith, his *Arachus* is called of divers *Eroium Venetum*, which differeth little or nothing at all from *Clufius* his firft *Orobis Pannonicus*, fo that in this, as in very many other things, he is much miftaken.

The Vertues.

Goates Rew is moft effectfull againft the bitings or ftings of any venomous creature, yea thofe *Italians* and others (as *Pena* and *Lobel* fay) that ufe to gather *Vipers* (which are certainly *Adders* with us, by the judgement of the beft) doe account it more effectfull to preserve them being bitten or ftung, than any Treacle of the beft making, or to defend them from any other infection, and therefore eate it continually, as other herbes in fallers or otherwife in their meates and brothes. It is no leffe powerfull and effectfull againft poifon then the plague or peftilence, or any infectious or peftilentious fevers or difeafes, that breake forth into fpoors or markes, as the meafells, purples, and the fmall pocks, in all which it is admirable, what effects it worketh, both to preserve from the infection, and to cure them that are infected, to take every morning fome of the juice thereof, as alfo to eate the herbe it felfe, every morning fafting, but it will be the more effectfull if the juice be taken with a little good Treacle and fome Tormentill rootes in powder, mixed with *Cardus benedictus* water, or with fome vinegar and fine Bole-armonicke, and Treacle in the faid water, and prefently to fweat two houres thereupon, which it caufeth alfo in fome fort it felfe, and may be ufed as well when any is infected, as when any feare themfelves to be infected with the plague ; a fpoonefull alfo of the juice given in a morning fafting, is very effectfull to kill the wormes in children, or the herbe it felfe fried with a little oyle of bitter Almons, and laid hot unto the navell, as alfo to helpe the falling fickneffe before it grow ftiong, and old upon them ; it is very profitably applied to the belly pained with gripings of winde and the collicke, being fried and laid to warme : in the fame manner alfo laid upon plague fores before they be broken, either difperfech them (yet defending the heart, not ftirring it inwardly) or draweth them forth, and healeth them : it is alfo effectually applied with vinegar to gangrenes, running ulcers and fores, to ftay the malignitie of them in their fretting and fpredding, and to defend the vitall fpirits from danger : it is held alfo to be very cordiall to preserve the heart from palpitations, tremblings and fwounnings, and againft melancholike vapours oppreffing it. Some ufe a Syrupe made of the juice, and fome of the diftilled water as a more familiar medicine, to take upon all occafions inwardly, for all the purpofes aforefaid ; and fome ufe to make an oyle of the flowers digelted in the Sun, by often repetitions of infufion to anoint the wrefts of the hands where the pulfe is felt, as alfo the region of the heart, to defend it from the difeafes aforefaid, and danger of infection : it is no leffe effectfull for Sheepe, Goates, and Cattle, for from the experience of Goat-heards therein, came the name of *Capraria* added unto it : it fatteneth hennes alfo wonderfully, and caufeth them to lay egges the more plentifully. The other Mountaine Goates Rew, is held alfo almoft as effectfull againft poifon and infection of the plague as the other.

CHAP. XXXII.

Phalangium. Spiderwort.

Here are divers forts of Spiderworts, fome of antient knowledge, others of later acceffe, of all which I have given the descriptions in my former Book, which although I meane not to reapeate here againe ; yet I thinke it not amiffe both to give you fome of their names & figures, and to fet downe their vertues. It is thought it tooke the name φαλάνγγιον and φαλάνγγισ, *Phalangium* and *Phalangites* from the forme of the feede vefells, others from the forme of the leaves like to that Spiders legges in going, but more certainly I thinke from the propertie of curing the dangerous poifon of that great Spider. For which purpofe both *Dioscorides* and *Galen* doe commend the flowers, leaves, and feedes of it, as alfo againft the veruencie of Scorpions and other Serpents, and to difcuffe the torments that rife from their hurts or otherwife. The names of thofe defcribed are thefe *Phalangium Allobrogicum* : The *Savoy Spiderwort* : *Phalangium majus Italicum album*. The greater *Italian Spiderwort*. *Phalangium non ramosum vulgare*. Vnbranched Spiderwort. *Phalangium ramosum*. Branched Spiderwort. *Phalangium Ephemerum Virginianum* *Iohannis Tridescanti*. The foone fading Spiderwort of *Virginia*, or *Iohn Tridescanti* Spiderwort of *Virginia*, which is of a deepe purplifh blew colour, whereunto may be added of later knowledge one with a white flower, and another with a reddifh or Carnation.

Phalangium ramosum.
Branched Spiderwort.

Phalangium non ramosum.
Unbranched Spiderwort.

CHAP. XXXIII.

Petasites vulgaris. The Butter burr.

Petasites vulgaris.
The common Butter burr.

THE Butter burr is of two sorts, the one greater the other lesser, differing also in the flowers, as you shall heare: but because they are so like one another, one discription shall serve for them both. Each of them riseth up very early in the year, that is, in February, with a thicke stalke about a foote high, whereon are set a few small leaves, or rather peeces, and at the toppes a long spiked head of flowers, in the one which is the lesse and the more rare to finde, wholly white and of a better sent than the other (yet some say it hath no sent) in the greater which is more common with us of a blush or deepe red colour according to the soile wherein it groweth, the clay ground bringing a paler colour somewhat weake, & before the stalke with the flowers have abidden a moneth above ground will be withered and gon, blown away with the winde, and the leaves will beginne to spring, which when they are full growne are very large and broad, that they may very well serve to cover the whole body, or at the least the head like an Umbello from Sunne and Raine, being somewhat thinne and almost round, whose thicke red foote st alkes about a foote long, stand toward the middle of the leaves; the lower parts being divided into two round parts close almost one to another, and of a pale Greene colour above, and hoary underneath, that with white flowers bringing smaller leaves than the other, and having divers ribbes and veines therein: the roote is long and spreading under ground being in some places no bigger than ones finger, in others much bigger, blackish on the outside, and white within, of a bitter and unpleasant taste.

The Place and Time.

Both these sorts grow in low and wet grounds by rivers and waters sides, their flowers, as is said, rising and decaying, that is, in *February* or *March* before the leaves appear in *Aprill*.

The Names.

It is called in Greeke *παραδινος*, and *Petastis* also in Latine, deduced a *Petaso*, id est, *magno galero* ita ut vicem *galeri* supplere possit. Some take it to be *Iphium* of *Theophrastus*; and some to be *Personata* or *Perfolata* of *Pliny*. *Camerarius* in horto calleth the more common *mas*, and the other *femina*; but in his Epitome upon *Matthiolus*, he and *Matthiolus* call the greater sort *Tussilago major*. The *Italians* call it *Capellazi*; the *Spaniards* *Sombrereta*; the *French* *Herbe aux tigneux*; the *Germans* *Pessilentz wurtz*; the *Dutch* *Dockbladeren*.

The Vertues.

The rootes hereof are hot in the first degree, but as *Galen* saith drie in the third, and are by long experience found to be very available against the plague and pestilentiall fevers by provoking sweat, if the powder thereof be taken in wine; as also resisteth the force of any other poyson; the roote hereof taken with *Zedoaria* and *Angelica* or without them helpeth the suffocation or rising of the mother: the decoction of the roote in wine being taken is singular good for those that wheefe much and are short winded: it provoketh urine also and womens courses, and killeth the flat and broad wormes in the belly: the powder of the roote doth wonderfully helpe to drie up the moisture of fores that are hard to be cured and taketh away all spots and blemishes in the skinne.

CHAP. XXXIV.

Polyrhizos Virginiana. The rattle Snakeweede of Virginia.

His plant of *Virginia* so certaine a remedy against the biting of that venomous rattle Snake, as they call it which breedeth in *Virginia*, must not be forgotten among the rest, for it is a Counterpoison, to be compared, and I thinke preferred before any the foreremembred most soveraigne plants against poysons: whose description as farre forth, as hath yet come to our observation, is this: It riseth up with divers small square stalkes, spreading not much above halfe a foote long, whereon are set divers duskyish hoary greene leaves, somewhat rugged as it were with many veins, and somewhat resembling the leaves of *Pistolochia*, whereunto it may be referred but smaller, set without order one at a joint: the flowers grow more at the bottome of the stalkes next the roote than on the branches as the *Pistolochia* doth, and are not much unlike it, but of a darke or fullen yellow colour, and somewhat lesse also; after which come very small heades with feede, somewhat like to the *Pistolochia* but lesse: the rootes are a number of very small blackish gray fibres or threds, as small almost as haire, which have both an aromaticall and resinous sinell, when they are drie, more than when they are greene, and of an aromaticall resinous astringent taste, without any great or manifest heate.

Polyrhizos Virginiana. The rattle Snakeweede of Virginia. *The Place.*

It groweth very frequent in the upper parts of our *Virginian* plantation, in the fields and champion countries; where under the grasse and herbes, that venomous rattle Snake lurketh and abideth, ready to bite whomsoever shall come neare unto it.

The Time.

It flowreth with us in *June* and *July*.

The Names.

This may very well be referred to the *Pistolochia* I said, but I have severed it being so notable an Antidote; but by what Latine name it might best be called, either *Pistolochia Virginensis*, or as I doe *Polyrhizos Virginiana*; I leave it to every man to doe as he will, or untill a fitter Latine title may be given it, if it be thought expedient: our people in *Virginia* doe there call it the Snakeweede, or Snakeroote, and thereupon may be called *Columbrina*.

Subrina Virginiana, I have kept the same *English* name, untill another of better respect may be given unto it. But there is a cornuted *Cornutus* that among his *American* plants, calleth this (a horne plague on his head for his labour) *Snagroel* or *Snagroel* nothe *Anglia*, the envy was base, whereby he wrote so, yet would colour it in that he could not write true, but false *English* and *Latine* too, it were not amisse therefore that he were whipt at the schoole for it.

The Vertues.

It is both a most certaine and present remedy against the venome of the Rattle Snake, which is a Serpent of a large size, farre greater then any Snake or Adder with us, having naturally under the throate, certaine loose hard skinny scales, which by motion grate one against another, making a creaking noise, which our people called a rattle, not that it hath any rattle indeed, but this noyse it maketh, stirre it selfe never so little, yet usually it is so quicke and wary in leaping at any, that it doth it not but suddenly: Now the manner of the using hereof, is this (God of his goodnesse providing a remedy, out of the same place and ground, from whence the evill doth proceed,) as soone as any is bitten by that creature, (for oftentimes it happeneth that some are bitten, before they can avoid the Serpent, the manner of them being to leape suddenly upon one, that the rattle cannot be heard before they be bitten) they rake of this herbe and chaw it in their mouthes, and swallow downe the juice thereof, and also apply of the herbe to the wound or bitten place, which instantly cureth them; for being taken quickly after they be bitten, it doth so defend the inward parts, that the party feelth not so much almost as any outward paine, much lesse any of those inward Symptomes, are incident to those that doe not presently use this remedy, this is the present helpe of the present hurt, but if it so happen that any being bitten, cannot get of this herbe in any reasonable time, he dyeth certainly, yet if within twelve houres after the biting; he doe use this remedy, it will assuredly recover him, but with more trouble and paine, and with longer time, before it hath wrought a perfect cure, for it is evident, that the poyson of this Serpent pierceth the blood, which runneth with all the speed it can unto the heart, the chiefest fortress of life and health, which being infected, death must necessarily and speedily follow, but if it be defended by the vertue and force of any medicine, it preserveth the one, and expelleth and utterly defeateth the intent of the other. The powder of the herbe and roote taken in wine or other drinke, hath bene found a certaine and present cure for the biting of a madde dogge: as also to cure both the quartaine ague within three times taking, viz. halfe a dramme, or if neede be a whole dramme at a time before the access of the fit, and any other ague, or pestilential feaver, or the pestilence it selfe.

CHAP. XXXV.

Alexipharmacum Indicum sive Contrayerva Hispanorum. The Indian Spanish Counterpoyson.

BEcause the roote of this herbe also is of as certaine a cure, to helpe all sorts of venome and poyson (as well of hurtfull beasts, as of herbes, rootes, &c. wherewith the Indians by dipping their arrow heads therein, did kill whomsoever they wounded,) as the former *Virginian* Plant, I thought fit to joyne it thereunto, although we have no more knowledge thereof, then what we may gather from seeing and observing the dryed rootes and from the relation thereof by *Monardus*, out of

Petrus de Osmia his letter to him, which is extant in his booke of the simple that are brought out of the new world, which *Clusius* translated out of the Spanish into the Latine tongue, and hath published it with

other of his workes and joynd it to his booke of *Exoticker*. It hath saith *Monardus*, the roote of a Flower-deluce, and is of the smell of a Figgetree leaf: this is all the description that *Monardus* hath made of it: but *Osmia* in his Epistle maketh mention of the leaves to be like the Ribbewort Plantaine, *Iosua Ferrus* also wrote thereof as he saith to *Monardus*, to Dr. *Tovar*, and to *Valdes*, and in his booke of secrets maketh mention thereof in two Chapters, the one is of *Contrayerva*, the other he entitleth *de Contrayerva Bezoar*, whereby he meaneth the herbe or roote that is found in the middle of a *Bezoar* stone when it is broken, which he accounteth to be of more vertue then the stone it selfe, whercon it is engendred, but we in viewing many dryed rootes that came from *Spaine* unto us, have observed no good forme of any Flower-deluce in the roote, nor have seene any roote to exceed the bignesse of ones thumbe, and not one of many to be so great, but for the most part of the bignesse of a finger or lesse, and not any so long, but usually no longer then a joynt or two at the most, not so smooth on the outside as the roote of white *Orris* or the Flowerdeluce, but more rugged in all, & in some more knobbed, (that is, with small knobs or bunches sticking out all along the roote) then in others, which are of an even size, and some againe are greater at the one end, and smaller at the other, divided as it were by little spaces, in the growing almost like the greater Figgewort roote, or the roote of *Dentaria Coralloides*, being of a yellowish browne colour on the outside, and in some more blacke, but white on the inside, with many fibres or strings growing from them, this roote lyeth or creepeth under the upper crust of the ground, like as the Flower-deluce, Tormentill, Bistort, and the like

Contrayerva Hispanorum sive Drakenaradix Clusij.
The Indian Spanish Counterpoyson.

doe, and doth not grow downe right, like other sorts of rootes, and are a little warme or hot in taste upon the tongue, drawing water as *Pellitory* of *Spaine*, but nothing so hot nor sharpe, or drawing rheume so much, which is not well perceived, unless heedfully observed, neither doth the heate abide any long time after the chewing, but is soone gone, leaving the roote almost like a dry chippe, without any manifest stipticity, astringency, or aromaticity, that I could perceive, although *Monardus* saith it hath, and judgeth it to be hot and dry in the second degree.

The Place.

It groweth saith *Monardus* in *Charcas*, and as *Ferrus* aforesaid, saith in *Tonsaglia*, provinces in *Peru*, in the *West-Indies*, and in some other places there, and from thence brought into *Spaine*, and to other Countreys.

The Time.

We must abide the time to know further hereof, before we can declare it to any other.

The Names.

Monardus first wrote hereof from the intelligence he had by *Osmus* Letter to him, and called it *Radices Venenis adversantes*, and said the *Spaniards* called it *Contrayerva*, which is as much as *Alexipharmacum*, a counterpoyson, or rootes resisting venome and poyson especially of that where with the *Indians*, by dipping their arrow heads therein, killed both the *Spaniards* and other their enemies in their warres, and the wild beasts whom they hunted, and is the same also that *Clusius* calleth *Drakena radix*. I have given it the title of *Alexipharmacum Indicum* sive *Contrayerva Hispanorum*, and in *English* the *Indian Spanish Counterpoyson*, from both places and properties.

The Vertues.

The rootes hereof (saith *Monardus*, *Petrus de Osma* and *Iosua Ferrus* made into powder, and taken in white Wine is a most present remedy against all manner of venomes and poysons, of what kinde soever they be (excepting *Mercurie Sublimat* onely, which is to be cured by drinking of no other thing but milke) by forcing the poyson upward by vomit, and avoiding and expelling it by sweating: the powder drunke, in the same manner (they say) resisteth such charmes or the like witchery, that is used in such drinks that are given to procure love. It likewise killeth the wormes of the belly, and is also good against agues, either *tertian*, *quotidian*, or *quartaine*, to be taken before the coming of the fit, which will not onely hinder or lessen the fits, but by continuing the use thereof, will utterly take them away. I have knowne some that have made a composition of the powders of this roote, *Bezarstone* and *Scorfonera* rootes made into a masse or lump, to be used upon occasion against poysons and infections of the Plague, or any other contagious disease as the small pox, purples, measles, or other that raise spots in the flesh, and is a most soveraine cordiall, to preserve the heart and the vitall spirits from danger, and to expell it by sweating &c. For the said *Ferrus* saith, that the *Bezarstone* is engendred in the beast that breedeth it by the vertue of this herbe which it eateth, and by the naturall disposition of the beast, some also adde unto that confection, some other things, as besides *Scorfonera* rootes, *Bistort*, *Tormentill*, or the like, as every ones affection leadeth them more or lesse. *Ferrus* saith he made a tryall hereof with the best Treakle, and found it more effectfull for the diseases aforesaid. Again he saith, that the *Indians* doe not eat the bodies of those they have slaine by their poysoned arrowes, untill they have lyen three or foure dayes with their wounds washed with the juice of this herbe, which rendereth them tender and fit to be eaten, which before were hard.

Vnto this Classis also should appertain divers other Plants, but that some of them are already described, and set forth in my former Booke, as *Mirabilia*, &c. And of the *Antidotes*, or remedies against poyson, some are there also set forth, as *Angelica*, *Carduus Benedictus*, &c. And some likewise not onely in the first Tribe of this worke here before, as *Chamapitys*, &c. but in sundry other *Classes*, hereof, as they happen to be entreated of in their order.

SAXIFRAGÆ PLANTÆ

NEPHRITICÆ SIVE CALCULI
LVM FRANGENTES.

SAXIFRAGES OR BREAKES

Stone Plants.

CLASSIS QVARTA, THE FOVRTH TRIBE.

CHAP. I.

1. *Saxifraga alba vulgaris*. The common white Saxifrage or Breakestone.

Here are so many and diuers sorts of herbes that beare the name of Saxifrage, that is, from the effects in breaking and expelling the stone, much differing in forme one from another, that I have therefore thought a small good to make a peculiar Classis of them, and yet not of all, for there are sundry Umbelliferous and other plants, which cannot so fitly be severed from their owne Tribes.

This white Saxifrage that is most common in our land, hath a few small reddish kernells or rootes, covered with some skins, lying among diuers small blackish fibres, which send forth diuers round faint, or yellowish greene leaves, and grayish underneath, lying above the ground, unevenly indented about the edges, and somewhat hairy, every one upon a little foote stalke; from whence riseth up a round brownish hairy greene stalke, two or three foote high, with a few such like round leaves thereon as grow below, but smaller, and branched somewhat at the toppe, whereon stand pretty large white flowers of five leaves apeece, with some yellow threds in the middle, standing in long crested brownish greene huskes: after the flowers are past sometimes ariseth a round hard head, by-forked at the toppe, wherein is contained small blackish feede, but usually they fall away without any feede, which yet is not that which is called white Saxifrage feede, for those same kernells or graines of the rootes, are they which are usually called the white Saxifrage feede and so used.

2. *Saxifraga alba altera bulbifera*. The Mountaine white kernelly Saxifrage.

This other white Saxifrage is very like the former in every part, but yet hath many especially differences to distinguish it, as first in the rootes, which although they are round, red, and bulbous like the other, yet are they twice as great, and made as it were of scales or cloves, one laid upon another, like the roote of a Lilly: the leaves are round and hairy, but somewhat lesser, with brownish foote stalkes: the stalkes are greater, having leaves thereon, as in the former, but at every joynt with the leafe commeth forth a small bulbe or kernell, like unto those at the roote, which when it is thorough ripe, will encrease to be plants, as the bulkes of the bulbed Lilly, or of the bulbed Corrall roote will: the flowers and heades with feede are alike: the bulbes on the stalkes by the Cutters fault are not specified in the figures.

3. *Saxifraga alba Alpina*. Mountaine Saxifrage without kernelly rootes.

This Mountaine Saxifrage groweth so like unto the first white Saxifrage, that *Bauhinus* taketh it to be no other but the very same with the first, but there is some varietie therein; first, in that this springeth up with fewer leaves at the ground, yet round and like to the white Saxifrage, then, although it hath small stalkes, with leaves thereon like it, yet at the toppes it hath pale yellowish flowers: and lastly the rootes are wholly composed of long strings or fibres, not having any of those small knots or kernells, that the former hath growing amongst them.

The Place.

The first of these groweth in many places of our owne land, in the lower moist, as also in the upper drie corners of Meadows, and grassie sandy places, on the backe side of *Graves Inn*, where Mr. *Lambes* Conduit heade standeth. The second groweth on the hills in the Kingdome of *Naples*: the last on the high snowie *Alpes* under the trees.

1. *Saxifraga alba vulgaris*.
The common white Saxifrage.

2. *Saxifraga alba bulbifera*.
The Mountaine white Saxifrage.

The Time.

They flower in *May*, and then they are gathered both for the seedes' sake, which are as I said, the small graines or kernells at the rootes, or upon the stalkes, as also to distill: it quickly perisheth downe to the ground, when any heate commeth.

The Names.

This herbe is called *Saxifraga* or *Saxifragia*, from the effect to breake the stone, (but not knowne to any of the Greeke or ancient Latine Writers, that we can finde) and *alba* from the flowers, which is added to distinguish it from all the other sorts. The first is generally called *Saxifraga alba*, by all the moderne Writers; *Lobel* addeth *Chelidonioides*, because of the kernelly rootes; of *Bauhinus rotundifolia*, and of *Clusius tuberosa radice*. *Fabius Columna* onely maketh mention of the second, by the name of *Saxifraga bulbosa altera bulbifera montana*; and *Bauhinus* from him *Saxifraga adfolia bulbos gerens*: the last is called by *Lugdunensis* as it is in the title, who maketh it different: in *English* white Saxifrage or Breakestone: the *Italians* and *Spaniards* call it *Saxifraga bianca*; the *French* *Rompi pierre* and *Saxifrage blanche*: the *Germans* and *Dutch* *Witt Stein brech*.

The Vertues.

This Saxifrage being somewhat bitter, and held to be hot and drie in the second degree, is as effectuell as any other sort of Saxifrage whatsoever to cleanse the reynes and bladder, and to dissolve the stone engendered in them, and to expell it and the gravell by urine; to provoke urine also abundantly being stopped, and to helpe the strangury or pissing by dropes: for which purposes, the decoction of the herbe or rootes in white wine, or the powder of the small kernelly rootes, which is called the seede taken in white wine, or in the same decoction made with white wine is most usuall. The distilled water of the whole herbe, rootes and flowers, as it is effectuell in a manner, so it is much more familiar to be taken of any that hath neede thereof; it provoketh also womens courses, and freeth and cleanseth the stomacke and lungs from thicke and tough flegme, that troubleth it, and causeth it the more easily to be avoided.

CHAP. II.

Saxifraga alba Petrea. White Rocke Saxifrage.

His white Rocke or Mountaine Saxifrage, I have joyned next unto the former, for the neare affinitie it hath therewith. It sendeth forth from a small long reddish roote, with some fibres thereat, divers somewhat hairy leaves longer & deeplier cut in on the edges, than those of the former, among which riseth up a brownish hairy stalke, about a foote and a halfe high, flored with branches from the bottom to the toppe; at the ends whereof stand the flowers in greene huskes, consisting of five very white leaves a peece, having some yellowish threds in the middle, standing about a head or umbell, which in time

time growing to be the seede vessel, hath divers small seede contained within it; the taste of the leaves are sweetish at the first, but a little sharpe afterwards.

The Place.

It groweth on Mount *Baldus*, not farre from *Verona*, in the territory of the *Venetians*.

The Time.

This flowereth in the naturall places in the end of *Iune*, and the seede is ripe soone after, and perisheth wholly afterwards.

The Names.

It is called by *Pona* who set forth the description of Mount *Baldus*, and what plants doe grow in every part thereof, by the name of *Saxifraga alba petrea*; but *Bauhinus* according to his usuall manner, in all things almost that may be altered, doth vary the name twise, calling it first in his *Phytopanax*, *Alfne Tridactylites Alpina*; but afterwards in his *Panax* changing his former minde, calleth it *Sedum tridactylites Alpinum majus album*, and none of them both in my opinion answerable to so famous an Herbarists judgement; as to referre them to such plants, as yeeld so small likeness: for unto the *Alfnes*, (whereunto I said he referred it at the first, but disclaimeth it afterwards) although it may seeme to have some resemblance, in the white flowers, yet the leaves and other parts thereof, withstandeth that comparison; and unto any kinde or sort of *Sedum*, it hath in my judgement farre lesse correspondencie, which sheweth a strong conceit in him beyond compare, to make his later opinion worse than the former, which as is judged in most, should be more considerate and exact: but surely I thinke it doth so nearly resemble, as I said before, the former white Saxifrage, both in forme and qualitie, that it is most fitly to be referred unto it, and unto no other plant so likely: the chiefe differences consisting in the forme of the branches, leaves and rootes, as you may plainly perceive both by the description and figure.

The Vertues.

It hath no doubt the same properties that the former hath, both the name arguing it, and the likeness of face in growing not reclaiming, and the taste especially, whereby the qualitie is chiefly discerned answering thereunto, and although there is not any authorities extant to warrant this my conceit, yet those foreremembred conditions therein, may plead a strong perswasion of veritie, and untill it be contradicted by sufficient triall and experience to be other wise, I hold it may passe for currant as a Saxifrage.

Saxifraga alba petrea. White Rocks Saxifrage.

CHAP. III.

Saxifraga aurea. Golden Saxifrage

Saxifraga aurea. Golden Saxifrage.

Saxifraga aurea is a small low herbe having many round leaves lying on the ground bluntly ended about the edges somewhat like the former common Saxifrage, but not hairy, somewhat thicker also and of a darker greene colour, among which rise up divers slender and weake stalkes, little above a hand bredth high, with such like leaves on them as grow below up to the toppes, where among the leaves come forth very small gold yellow flowers not easily observed, and falling away so quickly, that they are so seldome seene with them, and after they are past, there appeare in their places small round heads, wherein is contained small round reddish seede: the roote is composed of a number of small strings or fibres: the whole plant is almost insipide or without taste, but nothing hot that it may be judged to be effectuall to dissolve or expell the stone.

The Place.

It alwayes groweth in moist places by Well sides, or other standing and sometimes running waters, and sometimes also in moorish grounds, as about *Tidnabam* in the Forrest of *Deme*, at *Ashford*, and *Iden* in *Kent*, at *Chepstow* in *Essex*, and in divers other places.

The Time.

It flowereth in *May* and sometimes in *Aprill*, but abideth greene all the rest of the yeare, and perisheth not like the last.

The Names.

It is called *Saxifraga aurea* of most Writers, from the

forme of the leaves and colour of the flowers, scarce any well knowing whereunto better to referre it, *Lobel* from the naturall place of the growing and insipidity of the taste, calleth it *Lichenis facie & nataliis*, and *Beslerius* that set forth the huge great booke of the Bishop of *Eystot* his garden, following *Lobel* calleth it *Hepatica palustris*. *Tabernmontanus* calleth it *Chrysosplenium*: *Vlisses Aldroandus* tooke it to be a kinde of *Erysimum* but farre unlikely.

The Vertues.

The insipide taste as I said before, doth not argue any certaine effect or property to worke upon the stone or gravell either to dissolve or expell it, unlesse it be by some specificall or hidden property therein, yet assuredly it could not in my opinion have received the name of a Saxifrage among so many authors without some proper effect therefore, which rose no doubt from some Empyricall observation and practise, which gave it both the name and the opinion, unlesse it might from the likenesse of the leaves as I said before judged, which because I cannot maintaine nor disprove, I leave it for others to disprove if they can.

CHAP. IV.

Saxifraga vera Dioscoridis Matthioli. *Matthiolus* his true Saxifrage of *Dioscorides*.

He true Saxifrage of *Dioscorides*, according to the judgement of *Matthiolus* and others, from whom he received it, is a small low shrubby Plant, that sendeth forth divers small woody, and somewhat hairy stalkes, full of joynts close set one unto another, having divers small short and whitish narrow leaves, growing divers together at every joynt, at the toppe whereof come forth very small purplish white flowers, set with some leaves under them, this doth somewhat resemble Time, both in the lownesse and manner of growing, but hath no such sweete sent, or hot sharpe taste like unto it, whereby it may be knowne to be a different Plant.

The Place.

It hath beene sent unto us out of *Italy* among other rare seeds, but where the naturall place of growing is, it is not readily knowne.

The Time.

It is very slow in growing, so that it did not flower untill so late in the yeare, that an early frost caused it to perish, that we could gather no seedes.

The Names.

It is very probable that it is the true *Σαξίφραγος Saxiphragon* or *Saxifragon* of *Dioscorides*, and differeth much from the *Satureia* or *Thymbra* *St. Iuliani* of *Pena* and *Lobel*, set forth before in this worke, which *Bauhinus* calleth *spicata*, (that it may the better agree with *Dioscorides* his *Satureia*) and supposeth to be this plant of *Matthiolus*, but I by the sight and taste of the plant not finding it to agree, with the smell or taste of either Time or Savory, cannot agree unto him, but doe rather judge it to be a peculiar plant of it selfe, and to come neerer unto his *Thysium inodorum* before mentioned, and therefore have separated it from the other Saxifrages that follow *Dodonæus*: (and *Gerard* who hath but onely translated his words) judgeth the *Serpillum vulgare*, to be *Dioscorides* his Saxifrage, but they are both deceived.

The Vertues.

I doe verily beleve that this plant, hath either the same especiall vertues against the stone and gravell, restraint of making water and other the qualities, whereunto *Dioscorides* doth appropriate his Saxifrage, or commeth somewhat neere thereunto, and I am hereunto chiefly led by the sight and forme of the plant, and from the name of *Saxifraga Dioscoridis*, whereby it was sent unto us.

Saxifraga vera Dioscoridis Matthioli.
Matthiolus his true Saxifrage of *Dioscorides*.

CHAP. V.

1. *Saxifraga major Italorum Matthioli.* *Matthiolus* his Italian great Saxifrage.

He great Saxifrage of the *Italians*, as *Matthiolus* relateth it, hath a great woody stemme of the bignesse of ones finger, toward the lower end, full of chinkes or clefts, spreading very thicke, with many slender hard whitish branches full of joynts, and two small long whitish Greene pointed leaves, set at every joynt very like unto *Pinkes*, and many other smaller and shorter standing with them: the flowers stand at the toppes of the branches, out of whitish Greene huskes, consisting of five

five and sometimes sixe, small white leaves, indentured at the ends, of a sweete smell, standing above the huskes, laid open like a little starre, after which follow small round and somewhat long heads, full of small reddish round seede, much lesse then that of Poppy. *Lobel* and *Pena* thinketh that this Saxifrage is the same that they have set forth in their *Adversaria*, but that with us it groweth not so great and woody.

2. *Saxifraga Anglica Lobelij Occidentarium.* *Lobel's* West Country Saxifrage.

This saith *Lobel* is very like the former, but that the flowers are white, and grow in small tufts at the toppes of the small stalkes, the whole plant being white.

2. *Saxifraga Anglica Occidentarium Lobelij.*
Lobel's West Country Saxifrage.

3. *Saxifraga palustris Anglicana.*
Mr. Goodyers Marsh Saxifrage.

4. *Saxifraga Cretica prior.*
The former of the two Saxifrages of Candy.

3. *Saxifraga Bavarica.*
The Saxifrage of Bavaria.

3. *Saxifraga palustris* Anglica. Mr. Goodyers Marsh Saxifrage.

This hath sundry small leaves about an inch long, very small and narrow lying next the roote, among which rise divers slender round stalkes about halfe a foote high, full of joynts and branched here and there, set at the joynts with the like small leaves many together, but two for the most part longer then the rest, growing smaller and shorter up to the toppes, where groweth one pretty large white flower, made of five round pointed leaves a peece, with some white chives in the middle, the roote is small and fibrous.

4. *Saxifraga Cretica* prior Alpina. *Alpinus* his first Candy Saxifrage.

From a small long white roote, having a few small fibres at the head, shooteth forth a hard white woody stalke, divided into sundry small branches, sub-divided also into other lesser, which stand not upright but lean downwards, set at each joynt with two small long and pointed leaves, somewhat like to those of *Tragopogonum*. Goats Marjerome, and about the same bignesse: the flowers are small, made of many white threds set together, standing betwene the leaves, this is wholly without either smell or taste almost.

5. *Saxifraga Cretica altera* Alpina. *Alpinus* his other Candy Saxifrage.

They have also another kinde of Saxifrage growing in barren dry grounds, very like to a small Pinke, for the leaves and manner of growing, but the flowers stand at the toppes of the branches in tufts or umbels of a pale reddish colour, this is of an astringent and drying taste, with a little acrimony.

6. *Saxifraga montana* Neapolitana. Mountaine Saxifrage of Naples.

This small Saxifrage which *Columna* found growing out of the Chinkes of rocky steepe hills, beareth two small long leaves, at each joynt of the stalkes very like those of *Matthiolus* his great Saxifrage, but somewhat broader softer, and whitish, with some smaller ones set with them likewise, where also rise branches, bearing white flowers at the toppes, made of foure small pointed leaves a peece, with divers small threds in the middle and are succeeded by small round skinny heades, with small browne feede within them; the roote is made of many small threds.

7. *Saxifraga maritima* Neapolitana. The Sea Saxifrage of Naples.

This is another sort of the last described growing on the walls nigh the Sea at Naples, being twice as bigge, and having bluish coloured flowers in Autumne and afterwards long pointed seed vessels, and small browne feede in them, this creepeth on the ground, and standeth upright when it flowereth.

8. *Saxifraga Bavarica*. The Saxifrage of Bavaria.

The Saxifrage of Bavaria, spreadeth upon the ground, with a number of slender round branches, divided into others, set full of leaves, two at every joynt, which are narrow, somewhat long and thicke, and of a pale Greene colour, at the toppe of every small branch standeth one flower, set in a small cuppe or huske of whitish Greene leaves, of which colour the stalkes are also, consisting of five small pure white leaves, pointed at the ends, and sometimes a little purfled about the brims, and with a wash of purple, laid open like a little starre, with some pale coloured threds in the middle the feede that followeth in final round and somewhat long heads, is small, flat, blacke and shining, the roote is small and white, and groweth downe somewhat deepe.

The Place and Time.

The first two sorts grow in the West parts of this land as *Lobel* saith, who relateth in his *Adversaria*, that he found the second betwene *Chipnam* and *Marleborough* in London high way to *Bristow* on a chalky hill, yet *Matthiolus* saith, he had the first from *Mount Baldus* where it groweth, the third Mr. *Goodyer* saith, he found on a boggy ground below the red Well of *Wellingborough* in *Northamptonshire*, the fourth and fifth in Candy, the sixth and seventh in Naples, and the last in Bavaria. They all flower late.

The Names.

Lobel and *Pena* say that the third Saxifrage of *Matthiolus* which some call *magna Matthioli*, and others *major Iracundorum* is the same which they have set forth in the first place, in their *Adversaria*, although it grow not so great, and entitle it also *Saxifraga antiquiorum*, but I interpolated my opinion of that in the last Chapter, but *Bauhinus* supposeth them to be two severall plants calling that of *Matthiolus* *Caryophyllus Saxifragus*, and that of *Lobel* *Caryophyllus Saxifragus frigosus*: the second is a species as *Lobel* thinketh of the former, as is said in the description, and cometh nearest to the second sort of Candy Saxifrage, but differing in the flowers, yet *Lobel* doubteth if it may not be a kinde of Chickeweede: but sure he need not doubt it, nor that it was *Synanchice Dalechampi*. The third here expressed cometh nere likewise unto *Columna* his first Neapolitane Saxifrage, but that ours groweth in morish, and his in rocky places, and that the flowers of his have but foure leaves, and ours five round pointed, and his shurpe. *Alpinus* maketh mention of the Candy kindes and *Columna* of the Neapolitane which he entitleth *Alme Saxifraga montana & maritima*: the last *Camerarius* and *Pona* call *Saxifraga Bavarica*, but *Bauhinus* putteth a doubt or *querre* whether it be not the *Saxifraga magna Matthioli*, when as *Pona* in the description of *mount Baldus*, mentioneth the *magna Matthioli*, in divers places thereof, and describeth and giveth the figure of *Bavariaca* distinctly.

The vertues.

The *Italians* doe wonderfully extoll with praises the vertues of their Saxifrages, and so doe the *Candiot* and *Neapolitanes* likewise, to breake and dissolve the stone in the reines and kidneies, and bladder, and to procure urine, and to confirme the truth thereof, *Matthiolus* saith he received from *Calzolarius* an Apothecary of *Vecon*, such great stones of sundry persons that were voided in making of their urine, that it could hardly be beleaved, that they could passe through the pipes from the bladder; to give him knowledge how powerfull in operation these are, that can expell the stone in the kidneies and bladder, be they never so great, the other Saxifrages except the third, have the same properties taken in wine, or in a draught of the decoction of them, with Quich grasie rootes, doth effectually performe as much as the former, to dissolve and breake the stone.

CHAP. VI.

Gramen Parnassi vulgare. The common grasie of *Parnassus*.

His Grasie of *Parnassus* hath many leaves rising from the roote, not altogether round, but ending in a point, smaller and thicker than Violet leaves, with many ribbes or long veines in them, of a fresh Greene colour, every one standing on a long foote stalke, among which there ariseth divers slender weake stalkes, scarce a foote high, and scarce able to stand upright, whereon grow at the severall joynts such like leaves, but smaller, without any foote stalke, but having the stalke joyning so close to it, that it seemeth almost to runne through it, the toppes of the stalkes are naked and bare of leaves unto the flowers for a good way, which are white and consist of five leaves standing round, and in the middle a small round Greene head or button, with some yellow threds about them, which in time growing to be ripe is a round button, wherein is contained small reddish seede: the roote is a small blackish threddey bush of fibres, not perishing as divers of the former doe.

Gramen Parnassi duplicato flore. Double flowered Grasie of *Parnassus*.

This is in all things like the former, saving in the flower, which hath a row of smaller leaves, within the other outermost, which maketh a shew of the double flower: this seldome giveth any seede as the former,

The Place.

The first groweth in many moist moorish grounds in *England*, as in the Moore neere *Lynton* and *Cambridge*, at *Hesser* and *Drakestone* in *Suffolke*, in the Butchers close thereby; in a Meadow close on the backside of the Parsonage house of *Burton*, and at the bottome of *Barton hills* in *Bedfordshire*; as also in the middle of the great Towne-field of *Haddington*, which is about a mile from *Oxford*, and on the other side of *Oxford*, in the pasture next unto *Botley* in the high way. The other was found in the country of *Brabant*.

The Time.

They flower not untill about Saint *James* tide, and the seede is ripe a moneth after.

The Names.

It is called *Gramen Parnassi*, and judged by most to be the right *Gramen Parnassi* of *Dioscorides*, although *Gesner* in *hortis Germanie* saith, that the right is not knowne to any in our dayes, but saith withall that the *Polonians* doe call it *Enneadynamis*. It is very probable, that this herbe grew most plentifully upon Mount *Parnassus*, whereon cattell feeding, became fat and well liking, as our Clover or three leaved grasie doth with us, and thereupon took the name, as is usuall in divers countries to call herbes by the name of Grasie, although they have no likenesse with Grasie indeede; and this may answer Mr. *Gerards* finding fault with the name of *Parnassus* Grasie, *Cordus*

Gramen Parnassi flore simplici.
Singl. *Parnassus* Grasie.

Gramen Parnassi duplici.
Double flowered *Parnassus* Grasie.

in his history of plants, calleth it *Hepatica alba*, Gesner in *Collectione stirpium Unifolium palustre*, Lobel calleth it *Gramen Parnassi hederaceum recentiorum*, Tabernmontanus *Gramen hederaceum* and *Flos hepaticus*. The other is called by Lobel *Gramen Parnassi duplicato flore*.

The Vertues.

Paulus Aegineta saith that *Parnassus* grasse, is temperately cold, of thinne parts, and somewhat fowre, the juice of the herbe, or the decoction thereof, or of the rootes, doth dissolve and expell stones and gravell from the reins and bladder gathered therein, and provoketh urine abundantly; and the seede thereof taken in powder, worketh more forcibly then either the herbe or roote, and withall doth stay any vomitings from the stomacke, and any fluxe of the belly, the decoction of the rootes made with wine, being drunke, doth ease torments and griping paines in the bowels, and the ulcers that are in the bladder, it helpeth also against the biting of any venomous beast, the juice of the herbe or roote is good to coole any inflammation or heate in the eyes, to dry up the running or watering in them, and to cleare them from mistinesse or cloudy skins, that obscure the sight, if it be mixed with a little hony and dropped into them: it is held also effectually to ease the toothache, being gargled in the mouth: the herbe, or roote, or seede, either the juice, decoction or powder, is very effectually applied to close up greene wounds, that are much subject to bleeding, and restraineth inflammations that may disease the party, or hinder the cure.

CHAP. VII.

Lachryma Iob. Iobs Teares.

Have thought good to place this plant in a Chapter by it selfe, and not with the kindes of Gromel, because it differeth so much from them in growing, because the seede doth nearest resemble them: and although divers Authors have thought it rather to be a kind of grasse or reede, and therefore have placed it among them; yet I cannot finde it agree with either of them, more than in the jointed stalkes, and leaves, which in my judgement, is not so sufficient a marke, to make it of that kindred, but as *Colonna* saith, the flower and seede especially of plants, doth best demonstrate to what genus every species may be referred. It shooteth from a thicke bulbie threddy roote, many reasonable thicke round jointed stalkes, about a foote and a halfe high, whereon at every joint standeth one narrow long, great leafe, somewhat like unto the leafe of Miller, or a small Reede, rather standing upright, than at any time bending downe; and at the joints with the leaves commeth forth one graine or seede, of the bignesse of a good Pease, wrapped in some huskes, round at the bottome, and pointed at the end, whereat hangeth two or three small chaffie huskes, or beards as *Pliny* calleth them, somewhat like unto small lanke short eares of corne, which are idle having nothing within them: the seede it selfe, being taken out of the skins, wherein it was wrapped, is somewhat like unto a Gromel-seede, but much larger, brighter of colour, and harder to breake, round yet pointed at the one end, somewhat flat also, and with an hole at the bigger and lower part, where it stood upon a little short foote stalk: the taste whereof being broken, and having but little kernell within it, is a little drying without any other manifest taste.

The Place.

This groweth naturally in the Isles of *Candy* and *Rhodes*, in *Syria* also and those Easterne Countries, but no where else in *Europe*, unless it be planted as it is said.

The Time.

It groweth slowly in our countrie, and seldome giveth ripe seede for the want of sufficient heate of the Sonne to ripen it, before the frosts doe take it.

The Names.

It hath bene judged as I said before by former Authors, to be a kinde of Reede, and therefore Gesner in *hortis Germanicis*, calleth it *Arundo lythospermos*, and so did *Matthiolus* account it, & found fault with *Fuchsius*, that tooke it to be a kinde of *Lythospermum*, as *Tragus*, Gesner, and divers others, who called it *Lythospermum majus*, Pena and Lobel in their *Adversaria*, doe call it *Lythospermum Plinianum sive majus*, and doe very probably referre it to the *Lythospermum* of *Pliny*, lib. 27. cap. 11. (which hee there calleth *Diospiros*, *Iovis tritum*, which name is not so proper unto it, as the other *Lythospermum*, although the leaves hercof, are more like unto the blades of corne) but not of *Dioscorides*, who in the description confoundeth them both together, but in that he saith, the seede is of the bignesse of a Cich Pease, he doth most properly demonstrate this *Lythospermum*, for that of *Dioscorides*, which is our Gromell seede, is nothing so great, yet called also *Lythospermum fruticosum* of Gesner: it is now most usually called *Lachryma Christi* from the *Italians*, who when they first had it called it simply *Lagrima*; and since every severall countrie,

countreie, hath added another epithite thereunto: for the Spaniards call it *Lagryma de Moſen*; the French *L'arme de noſtre Dame*: the Germanes *Lachryma Iodoci*; as Geſner ſaith. *Lugdunenſis* calleth it *Lithoſpermum arundinaceum*; and *Bauhinus* *Lithoſpermum arundinaceum* forte *Dioſcoridis* & *Plinij*, an *Coix Theophrasti* lib. i. cap. 16. *hiſtoria plantarum*; we in *Engliſh* follow the titles, of almoſt all Nations; for ſome call it *Iobs Teares*, ſome *Moſes Teares*, or *Iobs Droppe*, or *Moſes Droppe*; *Chriſti* Teares, our *Ladies Teares*, and ſome *Gromell* reede according to *Geſner* his *Latine*.

The Vertue.

It is of little uſe in *Phyſicke* that we can underſtand in the naturall places, or where it may be had in more plenty than with us; yet ſome as *Pena* and *Lobel* ſay doe commend it, either in powder or the decoction thereof, againſt the ſtone or gravell in the kidnies and bladder: but beyond ſea, the greateſt uſe they make of it, is of the ſeede, to perforate and ſtring them, as other things for beades, to ſtint God with their prayers, and tell him how many they mumble upon them, and are ſure that they have done him ſo good ſervice therein, that he muſt needs give them heaven for it.

CHAP. VIII.

Lithoſpermum. Gromell.

Here are divers ſorts of *Gromell* found out and knowne to this later age, more than was to the former, and there are alſo ſome others that are ſomewhat like them, and therefore joyned unto them, although they participate with other plants: of them all I meane to ſpeake in this Chapter.

1. *Lithoſpermum majus erectum & legitimum*. Great upright Gromell.

The great *Gromell* riſeth up with divers upright, ſlender woody, hairy, browne and creſted ſtalke, very little or not branched at all, whereon doe grow without order, long, hard, rough, and darke greene leaves, ſharper pointed and ſomewhat longer and narrower than the next: at the toppes of the ſtalke ſtand divers ſmall white flowers, in rough browne huſkes, wherein after they are paſt, is contained a white hard, ſlony, round, ſhining ſeede, like unto *Pearles* and greater than the next: the roote is long and hard, or ſomewhat woody, with divers branches and fibres thereat, which periſheth not, although the ſtalke die downe to the ground every yeare.

2. *Lithoſpermum majus ſive vulgare*. The greater creeping Gromell.

This kind of *Gromell* groweth up with ſlender hard and hairy ſtalke, trailing and taking roote in the ground as it lyeth thereon, and parted into many other ſmaller branches, with ſuch like hairy darke greene leaves, but ſhorter and broader than the former: at the joints with the leaves come forth very ſmall blew flowers, and after them ſuch like hard ſlony roundiſh ſeede, but ſmaller and not fully ſo white and ſhining: the roote is like the former, abiding the Winter, and ſhooting forth ſtalke fresh in the Spring, but giveth more plenty of ſeede, then the former, yet leſſer than the firſt.

2. *Lithoſpermum vulgare majus*.
The greater creeping Gromell.

3. *Lithoſpermum minus vulgare*.

Small wilde Gromell.

The ſmall wilde *Gromell* ſendeth forth divers upright hard branched ſtalke, full of joynts, to be two or three foote high, at every of which joynts grow ſmall long hard, and rough leaves, leſſe than the laſt, and of a darke greene colour, among which leaves come forth ſmall white flowers, and in their places when they are paſt, grayiſh round ſeede like the other, the roote is not very long, but with many fibres faltened thereto.

4. *Lithoſpermum anguſtifolium umbellatum*.

Umbelliferous Gromell.

This *Gromell* ſpreadeth ſundry woody rough ſtalke, yet eaſie to breake, ſpread into divers branches about halfe a foote high, with many very narrow rough leaves ſet on them without any order, the middle ribbe in them being ſomewhat great; the flowers ſtand at the toppes of the branches, and ſome times from the upper joynts, divers being ſet together as it were in an umbell which conſiſt of five ſmall round pointed leaves of a blew colour or rather being long and hollow are parted and cut into five parts ſet in rough greene huſkes, wherein after the flowers are paſt growth uſually two white and hard long and pointed ſeedes ſet together: the roote is hard and woody covered with a browniſh red barke.

5. *Lithoſpermum Anchuse facie*.

Small Gromell with tufted toppes.

This ſmall *Gromell* hath many hard brittle, woody, low and hairy ſtalke, riſing little above halfe a foote high, dividing themſelves even from the ground, into many ſmaller branches, whereon are ſet diſperſedly ſmall long and narrow rough greene leaves, whoſe middle ribbe riſeth up ſomewhat high: the flowers for the moſt part ſtand at the toppes of the branches in an umbell, divers tuſting together, and ſometimes alſo at the joynts

3. *Lithospermum vulgare minus.*
Small wilde Gromell.

5. *Lithospermum Anchusæ facie.*
Small Gromell with tufted toppes.

6. *Lithospermum arvense radicerubente.*
Small corne Gromell.

Lithospermum Germanicum Passerina Tragl.
Germane Gromell or Sparrowwort.

joynts with the leaves, standing in rough huskes, which are somewhat larger then any of the other, and of a fine blew colour in some, in others white or reddish, to whom succeed small and somewhat long pointed hard and white feede, two for the most part joynted together, the roote is long and woody, spreading under ground, covered with a rough brownish red barke.

6. *Lithospermum arvense radice rubente.* Small corne Gromell.

This small Corne Gromell, shooteth forth three or foure rough branches, divided into other smaller ones, having many small long narrow hairy darke greene leaves growing on them, very like those of the former Gromell, but not so hard or long, but set without order in the like manner, the flowers grow at the toppes, with many small leaves among them, consisting of five small white leaves, which after they are past there succeed small blackish feede, two, three, or foure set together in the same huske: the roote is somewhat reddish, but little or nothing colouring the fingers of them that touch it.

7. *Lithospermum minimum Germanicum, Passerina Tragi.* The small Germane Gromell or Sparrow-wort.

The small Gromell of Germany riseth up for the most part, but with one slender stalke, branched into one or two parts at the most, scarce a foote high, set here and there with small long and narrow leaves, somewhat like unto Linx or Flaxe, and whereon stand small white flowers up towards the toppe, which turne into small smooth round blackish feede, very like else unto Gromell feede, the roote is small and threddy and perisheth every yeare.

8. *Lithospermum Linariae folio Monspeliense.* French Gromell with flaxen leaves.

This kinde of Gromell hath likewise but one stalke, branched into two or three parts at the toppe thereof, whereon grow long and narrow leaves, somewhat larger then the former, and not rough as the other Gromells are: the flowers are small, of a pale whitish yellow colour like unto the former, but stand many together at the toppes of the branches, and after they are past, arise small round heads like Coriander feede, wherein is contained round hard blackish feede like unto Gromell, the roote is small and stringy.

The Place.

The first groweth wilde in some places of Italy, and the parts of France next unto it, and not with us, but is onely nourished up in the Gardens of those that are lovers and curious. The second and third grow wilde in many places of our land, in barren or untilld places, and by the way sides. The fourth *Bauhinus* saith was brought out of the Garden at Padoa, groweth as *Lobel* saith in the rough or stony descent of the valley of Ostia in Piemont. The sixth groweth in corne grounds in many places beyond the sea, and in the way from Brissell to Bath as *Lobel* saith. The seventh groweth in Germany, in the Corne fields by Alzein, and the rhunder hill as *Tragus* saith, and in Franconia as *Camerarius* saith, betweene Herbiopolis and Frankford. The last groweth about Mompelien in France.

The Time.

They doe all flower from Midfommer unto September sometimes, and in the meane time the seed ripeneth.

The Names.

It is called in Greeke *Λιθόσπερον*, id est, *Lapideum semen ob duritiem*, in Latine also *Lithospermum*, *Pliny* giveth it other names, as *Gorgonum*, *Eginochos*, *Heraclia*, and *Dyspiros*, but this name doth more fitly agree with the *Lachryma Job*, as I showed in the Chapter before, but indeed he confoundeth both descriptions together, and the names also; and of Physicians and Apothecaries for the most part *Milium Solis*, and *Gramen Solis*, ab aliquibus ita dici putatur, quod semen candore solis & lucis splendore fulgeat, but *Serapio* saith from the authority of *Aben Iulia*, that it should be called *Milium Soler*, because (the feedes being small as *Milium*) it grew upon the mountaines called *Soler*, otherwife of the *Arabians* it is called *Kilb*, *Cult*, *Colt*, and *Calub*, of the *Italians* *Lithosperma*, and the lesser kinde, *Milho Salvatico*, and *Milum Solis*, as *Castor Durrantes* saith, of the *French* *Gromell*, and *L'herbe aux perles*, of the *Germanes* *Amerbursz*, and *Steinsamen*, of the *Dutchmen* *Perlecruct ende Steenfaat*, in *Engliss* *Gromell*, *Pearle plant*, and of some *Lichwale*. The first is called by *Brusseus* *Saxifraga terria*, and is thought by *Bauhinus* to be the *Lithospermum minus* of *Matthiolus*, *Dodonæus*, and others, (and not his *major*, which he seemeth not to know,) and yet calleth it *Lithospermum majus erectum*, and referreth it to the *Milium Solis lativum* of *Tragus*, the *Lithospermum legitimum* of *Clusius*, the *Lithospermum alterum fruticosum* of *Johannes Thalius*, in his description of *Flavynia sylva*, which by them all is said to grow upright, and to differ from my second, which *Clusius*, *Dodonæus*, *Camerarius*, *Lobel*, and *Lugdunensis* doe all call *major* and *major repens*; and yet *Bauhinus* calleth it *Lithospermum minus repens latifolium*, contrary to them all, he referreth this also to the *Pulmonaria minor Dalechampii*, which *Lugdunensis* exhibiteth, which how truly I cannot well see, the third in my judgement is the *Lithospermum minus*, both of *Matthiolus*, *Dodonæus*, *Camerarius*, *Gesner*, *Lobel*, and others: the fourth *Bauhinus* calleth in his *Pinax*, *Lithospermum angustifolium umbellatum*, and there saith, he hath described it in his *Prodromus*, but I can finde none there expressed, but in the Appendix to his *Pinax*, in folio 521. it is briefly described, and more at large with the proper figure unto it by the name of *Lithospermum synesceus angustifolium* in his *Matthiolus*. The fifth is the *Lithospermum Anchuse facie* of *Lobel*, which *Bauhinus* calleth *Lithospermum minus erectum*, but I finde so little difference betweene these two last, that if any would take them to be both but one plant, I should readily agree thereunto: the sixth is the *Lithospermum sylvestre* of *Tragus*, *Fuschius*, and *Camerarius* in his Epitome of *Matthiolus*, and the third of *Dodonæus*, the *Anchusa degener facie Moly solis* of *Lobel*, the *Echium minus Lithospermo congener* of *Gesner* in his Appendix, the *Anchusa arvensis alba* of *Thalius*, and *Lithospermum arvense radice rubra* of *Bauhinus*, who likewise saith it is the *Lithospermum nigrum* of *Lugdunensis*; but surely either *Lugdunensis* is much mistaken in his description and figure, or *Bauhinus* in his reference and opinion: for *Lugdunensis* describeth it, and so the figure expresseth, to have many small leaves set together at spaces about the stalkes, like as a small Madder hath, which doth not correspond with any *Lithospermum*. The seventh *Tragus* and *Camerarius* call *Passerina*, and *Lingua Passerina*, and thereupon may be called Sparrow-wort, as well as small Gromell with flaxen leaves, and is the fourth *Lithospermum* of *Dodonæus*, the *Passerina herbiorum uni caulis* of *Lobel* and *Pena*, *Lingua passerina* of *Tabernmontanus*, *Passerina Linaria* of *Gerard*, reckoning it with the *Linaria*, *Bauhinus* calleth it *Lithospermum Linariae folio Germanicum*, and referreth it also unto the *Linaria altera botryodes montana* of *Fabius Columna*, whose description and figure in my judgement doth utterly disclaime it: the last he calleth *Lithospermum linariae folio Monspeliacum*, and *Lobel* and *Lugdunensis* *Lithospermum linariae folio*.

The Vertues.

The three first kinds are hot and dry in the second degree, as all diureticke things for the most part are, and are both most (and I thinke onely) used, the rest either not at all or vey seldome, which if they should, they are not found to be halfe so effectuall, as any of them, which are accounted to be of as singular force to breake the stone, and to avoid it and the gravell, engendred either in the reines or bladder, as also to provoke urine being stopp'd, and to helpe the strangury or making of water by drops, as any other herbe or feede whatsoever: the feede is of greatest use, and chiefly used to be bruised and boyled in white wine, or in broth or the like, or the powder of the feede taken in white wine, or in broth or the like, as a barley cream or Amound milke, made with the kernells of the foure greater cold feedes, and the feedes of Gromell boyled in the Barly-water, is both a pleasant, safe, and effectuall medicine for the stone, to be drunk in the morning fasting, for three dayes together, when you are troubled with the fits thereof, this is *probatum* upon divers; *Mathiolus* saith, that if a dramm and a halfe of the seed of each of the Gromells (the greater and the lesser he meaneth,) halfe a dramme of Spleenwort or Miltwaite, and two scruples of white Amber, being all made into powder, mixed together and taken for many dayes together fasting, in the iulce of Plantane, Purslane, and Lettice, is singular good to helpe the *Gonorrhoea* or running of the reines: two drammes also of the feede in powder, taken with womens breasts milke, is very effectuall to procure a speedy delivery, to such women as have fore paines in their travaile, and cannot be delivered: for with this onely medicine saith *Mathiolus*, he hath holpen many women in those cases: the herbe it selfe, when the feede is not to be had, either boyled, or the iulce thereof drunk, is effectuall to all the purposes aforesaid, but not so powerfull or speedy in operation, the decoction also, to be bathed or fomented, as also to sit in, is much commended for an outward remedy.

CHAP. IX.

Filipendula. Filipendula, or Droppewort.

F this *Filipendula* or Droppewort, there hath bene formerly knowne but one kind, *Lugdunensis* setteth forth one greater, and *Barbini* hath added thereunto another much lesser; *Dodonaeus*, *Lobel* and others, have called another plant *Filipendula montana*, which *Clusius* calleth *Alectorolophos Alpina*, as a species thereof, but I dare not allow of their opinions therein, not finding them to agree, in rootes, or flowers, or feede, and but a little in leaves: I will therefore speake in this Chapter of the ordinary sorts, and of the others in the next, but for the *Oenanthe* (as they are so called) and by that name knowne to us in these dayes, because they be rather umbelliferous plants, I thinke it fitter to speake of them in that Classis of umbelliferous plants, with the other Saxifrages that are of that Tribe, then joyne them together with these.

1. *Filipendula vulgaris*. Common or ordinary *Filipendula*.

This *Filipendula* shooteth forth divers long winged leaves, that is, many small leaves, some bigger and some lesser, set on each side of a middle ribbe, and each of them dented about the edges, somewhat resembling Burnet and wild Tansy, or rather Agrimony, or betwene them all, but harder in handling, among which leaves ariseth up one or more stalkes, two or three foote high, having some such leaves thereon as grow below, and sometimes also divided into other branches, spreading at the toppe, into many white sweete smelling flowers, consisting of five leaves a peece, with some threds in the middle of them, standing together in a tuft or umbell, each upon a small foote stalk, which after they have abiden a good while open and blowne, doe fall away, and in their places appeare small round chaffy heads like butrons, wherein are the chaffy seed set and plac'd, the roote consisteth of many small blacke tuberous peeces, fastened together by many small long blackish strings, which runne from one unto another.

2. *Filipendula altera major*. Another great *Filipendula*.

This other *Filipendula* is so like the former in the leaves, that it can scarce be discerned from the other, the flowers at the toppe of the stalk, are of a white enclining to a purple, made of five leaves a peece like the other, after which the heads beare round and blackish feede within them, the rootes are verry many, and somewhat longer and whiter, enclining to rednesse, but fastned together by long strings and fibres as the former.

3. *Filipendula minor*. Small *Filipendula*.

The small *Filipendula* hath two or three such like leaves as the former, rising from the roote, but much smaller, and more neerely resembling the wild Tansy leaves, but not white as they are, but of the same darke Greene colour with the former; from among which, the stalk that is scarce an handbreadth high, ariseth up sometimes without division therein, and sometimes also parted into two or three other branches; whereon stand many smaller white sweeter flowers then the former, but with threds therein like them, and set together in an umbell in the same manner; after which come the feede, many set together, formed almost like unto a small bunch of grapes, the rootes are many, and glandulous or tuberous like the former, but smaller and redder, yet tyed together by strings like them.

The Place.

The first is common in many places of this Land, as well upon and about St. Vincents rocke, by *Bristow*, and neare *Sion* in the meadow there, as also in the corners of dry fields and meddowes, and their hedges sides, the second as *Lugdunensis* saith, groweth on the toppes of very cold mountaines, the last was found in the stony rough grounds about *Mompelier*.

The Time.

They flower in *June* and *July*, and their feede ripeneth in *August*.

The Names.

This is taken by many learned writers, and herbarists in these dayes, to be the *Οἰωνός* *Oenanthe* of *Dioscorides*; which he describeth in his third booke and 132. Chapter, and not that *Oenanthe* which he saith in his fifth booke is the flower of the wild Vine, that beareth onely flowers and not grapes, and because that *Mathiolus* contesteth against *Fuchius*, to whom *Brunfelsius* and *Tragus* doe agree, for to holding it, *Lobel* in his *Adversaria* would seeme

1. *Filipendula major*.
The greater common *Filipendula*.

3. *Filipendula minor*.
The lesser *Filipendula*.

seeme to maintaine *Fuchsius* opinion against *Matthiolus*, proving as he thinketh, every part of *Dioscorides* his description to agree thereunto; yet still *Matthiolus* his assertions will hold good against *Fuchsium* and *Lobel* that this *Filipendula* agreeth not with *Dioscorides* his *Oenanthe*, especially in the seedes, for it is such an eminent marke that none can alter or gainesay. It is called of all moderne writers *Filipendula*, quod numerosi illi in radice bulbilli, quasi ex filo pendere videantur, some write it *Philipendula*, because *Nicholaus Myrepsus* called it *φιλίπενδουλα*. Some thinke this to be *Molon* of *Pliny*, whereof he maketh mention in his 26. booke, and 7. chapter, but it is doubtfull: the *Italians* and *Spaniards* call it *Filipendula*, and the *French* *Filipende* and *Filipendule*, the *Germanes* *Rotten Steimbrech*, that is, red breakestone, from whence came the Latine name among them *Saxifragarubra*, red *Saxifrage*; as also *wild Garb*, that is *Millefolium sylvestre*: we call it *Filipendula*, and some *Filipipendula* and *Dropwort*. The second *Lugdunensis* calleth *Oenanthe alia Mycni*, because he saith it is so like the ordinary *Filipendula*, both in outward forme and face of growing, in rootes and leaves, and in the tast and relish also, and not unlikely thereby to be of the same vertue and property, but *Banhinus* referreth it rather to the next *Filipendula montana*, whereof I cannot see any reason, for in my opinion it is the same with the former, and not a species of the next, let others be judge herein that are judicious. The last *Banhinus* setteth forth by the name of *Filipendula minor*.

The Vertues.

The ordinary or vulgar *Filipendula* is somewhat bitter in taste, and thereupon judged to be hot and dry in the third degree, it is very effectually to open the passages of the urine, when it is stayed, as also to helpe the Strangury, and all other paines of the bladder and reines, helping mightily to breake and expell the stone, either in the kidneyes or bladder, and gravell also that is not as yet condensate into a stone, whether you will use the leaves, flowers, or seede, but the rootes are most usuall and most effectually, either taken in powder or in a decoction with white wine, whereunto a little honey is added: the same also helpeth to expell the *secondine* or afterbirth, taken in the same manner: an ancient copy of *Dioscorides* saith, it helpeth also the yellow Jaundise, *Paulus Aegineta* saith, it is good for those that have the falling sicknesse, and that it will helpe them if they use it often: the rootes made into powder, and mixed up with hony, into the forme of an electuary, doth much helpe them whose stomakes are swollen, breaking and dissolving the winde which was the cause thereof, as also is very effectually for all the diseases of the lungs, as shortnesse of breath, wheesings, hoarsenesse of the throat, and the cough, and to expectorate cold flegme therefrom, or any other parts thereof.

CHAP. X.

Filipendula montana. Mountaine or Hooded *Filipendula* or Droppewort.

Clufius and others have made mention of divers sorts of this kinde of *Filipendula*, (if I may fo callie, for I doe herein rather please others than my felfe, who thinke them with *Clufius*, to be as unlike them in forme, as differing alfo in qualitie peradventure) yet becaufe fuch learned men have fo accounted of fome of them, let me in their errour be joyned with them for this time.

1. *Filipendula montana major albida*.

Whitish Mountaine or hooded *Filipendula*.

This firft hooded Mountaine *Filipendula*, fhooteth forth his round crested or streaked ftakes, of a fingers thicke-
neffe and a cubites height, whereon are fet winges of many cut and divided leaves, on each fide of them, from the bottome to the toppe, fomewhat like thofe of the former *Filipendula*, or betweene them and Yarrow, but hard and fomewhat rough in handling, whereon are growing a long spiked head of whitifh flowers, formed like the gaping hooes of the Satyrions or Testicles, called Cullions or Dogges ftones, every one fet in a five leaved huske, which being fallen, there follow round heades, pointed at the toppes, wherein are contained, much small grayifh feede: the rootes are many long and thicke strings, fomewhat like unto the Asphodill clogges, but not fo great, which are fet together at the heades, and ending in long fibres, abiding many yeares, and fhooting frefh leaves and ftalkes in the Spring, although the old die downe to the ground and wither.

2. *Filipendula montana mollior altera*.

Smooth mountaine or hooded *Filipendula*.

This other mountaine *Filipendula*, hath fuch like ftalkes, with long & divided leaves on them, in the like manner, not differing from them, but in that they are nothing hard, but very gentle and fmooth in handling; the flowers grow likewife at the toppes of the ftalkes, in a long spiked head, many fet together, and in forme hooded like them, but are in fome of a pale whitifh yellow colour, and in other of a reddifh purple: the rootes alfo are not fo great and thicke, but rather like Asparagus rootes.

The Place.

Both thefe forts grow as *Clufius* faith, on the graffe places, in the mountaines of *Austria* and *Stiria*, in *Flanders* alfo, and in *France* in their Medowes.

The Time.

They flower in *June*, and ripen their feede in *Auguft*.

The Names.

Pena and *Lobel* doe call the firft of thefe *Filipendula altera montana*, and fo doe alfo *Dodonaeus* and *Tabernaemontanus*, but *Clufius* doth rather referre both it and the other unto the *Fiftularia* or *Pedicularis* for that they needeft refemble it in forme, excepting the rootes, and thereupon calleth them *Alcithorolophus Alpina*; *Bauhinus* calleth it *Filipendula montana flore pedicularie*, and with all maketh it to be that *Oenanthe alia Miconi* of *Lugdunensis*, which is more probably another fort, of the former and true *Filipendula*, as I have fhewed you in the Chapter before. The fecond *Clufius* calleth *Alcithorolophus Alpina fecunda vel altera*; and *Bauhinus* *Filipendula montana altera*; I have, as I faid before, followed them in this their errour, and doe call them in *Englifh* Mountaine or Hooded *Filipendula*, according to the *Latine*.

The Vertues.

I do not finde any vertues appropriate pecularly to thefe plants, either by *Clufius* or any other that have mentioned them, and unles they have the fame qualities that the Yellow or red Rattle have, which fome call Loufewort, becaufe if theepe feede thereon, it will caufe them to breede lice abundantly: they muft abide without ufe to us.

Filipendula montana.
Mountaine *Filipendula*.

CHAP. XI.

Helxine five Parietaria. Paritary of the Wall.

Here are two sorts of Paritary of the Wall, although the ancients have mentioned but one, that is a greater and a lesser, as shall be declared.

1. *Parietaria vulgaris*. Common Paritary of the Wall.
