The leaves of all these sorts (for it is probable they doe not one differ from another) are cooling, and doe disperse tumours, and hard swellings, if they shall be beaten with bread and so applied, the decoction of them being drunke, provoketh urine, for as *Galen* saith, the leaves have a digesting quality, with some temperate humidity in them also, as Mallow leaves have, *Columella* sheweth that in former ages, there was much profit made by the feeding of sheepe herewith to give store of milke, and not onely to fatten them, but Bullockes and Goates also, and Hens, and all other sorts of cattell: but was planted also for Bees to feede on, as from whence they did gather more honey, then from any other plant whatsoever, and besides it abideth greene eight moneths of the yearre for their pasture, and may be kept dry the rest of the year following, as the dry fodder: if women that be Nurses have not any store of milke in their breasts, let them steepe some of the leaves and young branches hereof in faire water all night, and being strained forth in the morning, let them take three parts thereof, with a fourth of wine, which will breede good store of milke in them, and make their children strong and able: the dried leaves steeped all night in water, and boyled afterwards, strained and drunke is as effectuell as the juyce.

CHAP. LV.

Pseudocytisus. The bastard or base tree Trefoile.

Here are divers sorts also of this base or bastard kinde to shew you, whereof one is the most adulterate of them all, which therefore shall be last exprest.

1. *Pseudocytisus Hispanicus primus*. The first *Spanish* base tree Trefoile.

This first base tree Trefoile groweth up to the height of a small tree, whose body and branches are covered with a grayish barke, the younger twiggies being hoary white, the leaves are many, and smaller then in any other sort of *Cytisus*, three alwayes set on a stalke, of a pale greene colour, and abiding in the Winter, contrary to any of the rest, of a bitterish taste, the flowers are yellower and smaller then Broome flowers, standing as it were spike fashion at the end of the branches, after which come rough hairy long pods, wherein is thicke flattish blacke seede, smaller then that of Broome: the roote is woody and spreadeth divers wayes, the wood is firme and yellowish.

2. *Pseudocytisus Hispanicus secundus*. The second *Spanish* base tree Trefoile.

This second *Spanish* sort, riseth not much above a yard high, full of shootes from the rootes, which are branched forth and wholly white, having hoary Trefoile leaves, never open but as it were folded together, the middle rib being great, of an extreame bitter taste: the deepe yellow flowers, are somewhat sweete and stand at the end of the branches like the former and the pods that follow are long and rough, of a blackish purple colour, the points being turned downewards, with greater and blacker seede in them: the roote is like the former.

3. *Pseudocytisus niger*. Blacke base tree Trefoile.

This base tree Trefoile groweth with the limber plant shootes, it bringeth forth not so high, but straighter and greater then the last, the barke of them being of a darke grayish colour, beset with small Trefoile leaves, somewhat round, and a little bitter in taste, and of a darke greenish colour, the flowers grow at the toppes of the stalkes many together spike fashion, of a yellow colour and pretty sweete sent, like unto honey, the cods that follow are somewhat long and flat, with brownish seede in them.

4. *Pseudocytisus folijs subrotundis*. Base tree Trefoile with roundish leaves.

The stem hereof hath sundry branches growing forth from it, and set with small roundish darke greene leaves, upon very short footstalkes: the flowers, are smaller then those of Broome, and yellow, but more close set together at the ends of the branches, then the smallness of the plant might seeme to beare, of a pretty sweete sent, and a pulselike taste, the pods and seede are small like the last.

5. *Pseudocytisus Hispanicus Bauhini*. *Bauhinus* his *Spanish* base tree Trefoile.

This *Spanish* base tree Trefoile hath hard round striped stalkes, foure or five foote high, branched into sundry branches, somewhat woolly, stored with divers small Trefoile leaves, of a pale greene colour, the flowers are small and yellow like the others, unto which succede many small pods like unto those of Birds-foote, three, foure, or five joyned together on a stalke, with small flat blackish seede in them: this is not the same with the first of these base tree Trefoiles here set downe being much different.

6. *Cytisus facie quibdam Alisum fruticans*. A *Cytisus*-like unlike plant:

Because others before me have placed this plant as last of the *Cytisus*, so must I for this time, which else might

1. *Pseudocytisus Hispanicus primus.*
The first Spanish bare tree Trefoile.

2. *Pseudocytisus Hispanicus secundus.*
The second Spanish bare tree Trefoile.

3. *Pseudocytisus niger.*
Black bare tree Trefoile.

4. *Pseudocytisus folijs subrotundis.*
Bare tree Trefoile with roundish leaves.

in some sort have beene set with the other *Alyssa*, the description whereof is thus. From a tough woody roote grow up sundry plant hoary Greene stalkes, spreading into branches, set with divers hoary Greene leaves together, contrary to all the other *Cytisus*, yet each leafe by it selfe, somewhat like unto them, but thicker and hairy also, the flowers are many and yellow, hat stand at the toppes, spike fashion, composed of loure leaves like to Stocke Gilloflowers, after which come feedes in round pods.

The Place and Time.

Threē of these grow in *Spaine*, the former two found by *Clusius*, and the last by some other, the other two in *France* and *Germany*, and flower and feede in the time of the former.

The Names.

The first of these is the first *Cytisus* of *Clusius*, which *Lobelard* *Lugdunensis* call *Cytisus Hispanicus primus*, by *Dodonæus* *Pseudocytisus* prior, and *Bauhinnus* *Cytisus minoribus folijs ramulis tenellis* will fir. The second is *Clusius* his second *Cytisus*, called also *Cytisus secundus Hispanicus* by *Lobel* and *Lugdunensis*, and by *Dodonæus* *Pseudocytisus alter*. The third is the *Pseudocytisus seu niger Cordis*, the *Cytisus niger* sive major of *Camæarius*. The fourth *Cytisus* of *Clusius*, the *Cytisus minor* of *Gesner*, which *Lugdunensis* calleth *Cytisus Gesneri*, and by *Bauhinnus* *Cytisus glaber nigricans*. The fourth is the *Cytisus alter minor* of *Lobel*, which *Eystetensis* calleth *Trifolium arborescens*. The last *Bauhinnus* onely hath described in his *Prodromus*, by the same title I doe here give it you.

The Vertues.

We have nothing recorded of any particular, any of these base shrubbes are indued withall, and although some may thinke, that they are of the same quality with the former, I am not of that opinion, in regard they are all much more bitter then the former, and some intensively bitter, which can'te no helpe to encrease milke, in any creature, nor yet to fatten them as the former doe.

6. *Cytisus* facie quibusdam *Alyssa* fruticans.
A *Cytisus*-like unlike plant.

CHAP. LVI.

Cupressus. The Cypress tree.

SOME doe make two sorts of Cypress trees, the male and the female, the one that spreadeth more then the other, which groweth more upright, not much differing in any thing else, which maketh me thinke the diversity riseth from the soyle or some casualty, and that the male which spreadeth is not a distinct species, which preserveth the kinde naturally as all other things doe, especially seeing as *Theophrastus* saith, the one doth degenerate into the other, and that both doe beare nuts and feede alike. I shall therefore under one make mention of both sorts, if they be so, and shew you that the Cypress groweth to be a great tall upright tree, spreading out the branches so even round about, that it seemeth to be so formed by Art, being small below, not farre above the ground, then spreading out larger, yet keeping a round close compasse and afterwards spiring up to the toppe, lesse and lesse, very well representing a *Piramis* or *Spire* steeple, the body and armes are covered with a reddish barke, the leaves are ever green, but loosing much of the verdure in Winter, which it regaineth the next Spring after, and somewhat long, slender, and flattish round, parted very much and somewhat resembling *Savine*, of a resinous sent and strong taste: some trees are seene in some places to be more spreading in their branches, and not abiding so close, especially when they grow old, and doe beare their small yellow flowers, and their fruite, or nuts, as they are called afterwards, which grow here and there among the boughs, cloven or opening into divers parts growing ripe, but close and hard while they are young, of a russet browne colour, wherein are contained small brownish feede, but not so small as mores in the Sunne, as *Matthiolus* and others make them to be: the roote spreadeth much, but not very deepe: the wood is reddish, very firme and durable, not subject to corruption or wormes, but defending all other things, by the strong heady sent it hath, from all mothes and wormes, it yeeldeth out of the body of the tree, a kinde of liquid Rosin, like unto that of the *Larche* and Turpentine trees, of a very quicke and sharpe taste.

2. *Cupressus Americana*. The Cypress tree of America.

Although I doe not take this to be a true Cypress tree, yet because it hath obtained that name by all our travellers into the hether or Northerne parts of *America*, where it is found in sundry Countries thereof, let me joyne it here, untill by a better regard I may place it in a fitter. It groweth in some places to be a very goodly tall tree, fifty, sixty, yea eighty foote high, without any branch, and neere three fathome compasse at the lower end, and then spreadeth sundry large armes and branches, beset with many winged leaves, which are very fine, small, smooth, plaine, and not square, crumpled or plaited as the true Cypress is, and somewhat longer also, set on both sides of the stalkes, without any certaine order, being not alwaies opposit: the nuts are somewhat like those of the Cypress but greater, with thicker, more open scales and greater feede within them. The wood smelleth somewhat

what sweete, which in part caused it to be termed a Cipresse. Whether this should be that *Thuja*, of *Theophrastus*, lib. 8. c. 15. that is both in stocke, branches, leaves, and fruite, like unto the wild Cipresse, it were somewhat worthy to be scanned, whose fruite it is likely, is that *Habbel*, that *Paludanus* brought home with him in his returne from his traualles, and said it was so called in the East Countries, the figure, whereof I here give you with this branch: the nut it selfe doth much resemble the nut of this, both for forme and large thickenesse of the scales. This loofeth his leaves in Winter.

The Place and Time.

The ordinary Cipresse tree, groweth in sundry of the warme Countries, of the Levant, eastwards, and in many of the Isles likewise in the *Mediterranean* Sea, as *Rhodes*, and *Candy*, where it is so familiar to the soile, that it springeth up every where, of it owne accord, in the Mountaines *Ida*, and *Leuce*, if the ground be stirred a little, and that nothing else be sowne thereon, and beareth ripe fruite from *September*, almost all the Winter. The other is as is said, in sundry Countries of the North *America*, whose seede was brought by *Master Tradescant* from *Virginia*, and sown here, doe spring very bravely.

The Names.

It is called in Greeke *κυπρίσιον* and *κυπρίσιον* *καὶ* *κυπρίσιον* *μελὶ* *οὐ* *ῥι* *ἀνέμω*, id est, a partu parvium ramorum, in Latine *Cypressus*, and *Cupressus* also. The *Arabians* call it *Suro*, and *Seru*, the *Italians* *Cypresso*, the *Spaniards* *El Cypres*, the *French*, *Dutch*, and *English*, *Cypres*, and the *Germanes* *Cypressen*.

The Vertues.

The Cipresse cooleth, bindeth, and dryeth without either heate or biting sharpnesse, but so much as may put the acerbity in action, yet it doth resolve and consume humidities, in putride ulcers, the pouther of the leaves with a little Myrrhe and wine, helpeth those fluxes that fall on the bladder, and provoketh urine being stopped, and without Myrrhe the fluxes also of the belly or stomacke, bleedings, and spitings of blood: the decoction of them, performeth the same likewise, it helpeth also the cough, and shortnesse of breath, by taking falling a small draught, and if the like draught be taken every morning for many daies together, it will helpe the rupture, so as some of the fresh leaves be applyed also to the place, and well bound on; which things the nuts do performe more effectually, and in all fluxes of blood and humours: the small chips or rasping of the wood, taken in Wine provoketh womens courses, and helpeth the biting of the Scorpion, as also procureth a good colour to the whole body: the leaves bruised and laid unto fresh wounds that bleede much, doth stanch the bleeding, and so consolidateth the wound: being used by themselves, or with fine Barley meale, it helpeth Saint *Anthonyes* fire, creeping ulcers, and carbuncles and the sores and ulcers of the privy parts in man or woman, and helpeth the inflammations of the eyes, and applyed with a cerote to the stomacke doth much comfort and strengthen it against castings, and other the passions thereof upon defluxions of sharpe

1. *Cupressus major*, sive *jastron*.
The Cypresse tree.

2. *Cupressus Americana*, an *Thuja Theophrasti*; *Cupressus similis*, cujus fructus *Habbel* hinc appellatur. The American or Virginia Cypresse with the fruite *Habbel* of *Clusius* which is like unto this.

Kkkkkk 3

humours

humours thereon, the leaves beaten with some dry figges, doe mollifie the hardnesse of tumours, and of the testicles, and consumeth the *Polypus* of the nose, which is an excellence or peece of flesh growing therein: the same also boyled in vinegar and made up with the meale of Lupines, causeth rugged nailes to fall away, and helpeth the tooth ache, the mouth being often washed therewith: the same also taketh away the Morpew, freckles, spots, and the like in the skinne, the nuts boyled in Wine, and the haire washed therewith, causeth them to grow black, and if the ashes of them be mixed with the pouther of a Mules hooft, and oyle of Myrtles, it will stay the falling of them: the branches and nuts of the Cypressle being burned, driveth away gnats, and other such like troublesome flies: the leaves being laid among seedes of any sort, will keepe them from being eaten with wormes, and the wood in Wardrobes will preserve garments from Mothes: the wood it selfe is in no age subject to the worme, neither will the sent decay in many yeares, and therefore much desired in chests and boxes, *Thevet* reporteth that he saw at *Damiate* in *Egypt*, a Cypressle chest that was digged ten foote deepe out of a moorish ground, and found uncorrupt in any part, which as was likely had lye there since *Sultan Selim* subdued *Egypt* in the yeare. 1512.

CHAP. LVII.

Arbor Vitæ. The tree of life.

His tree being in some sort like unto the Cypressle, I thought good to joyne next thereunto. It setteth to be a reasonable great and tall tree, standing long in a place, covered with a darke reddish barke on the body, but more red on the branches, spreading many branches, and many small twiggies bending downewards, which and the long leaves, that come from them, on both sides are flat, and plaited or braided, as it were like a braided lace, of a darke yellowish Greene colour, soft and not hard or pricking, abiding Greene, alwayes smelling without falling away, and tasting somewhat strong and resinous, not pleasing to many, but ready to provoke casting, yet very cordiall, and pectorall also to them that can endure it, at the ends of the branches come forth small mossie yellowish flowers, which turne into small scaly yellowish heads, wherein lie small and long brownish seede: the wood is firme and hard, and of a brownish colour.

The Place and Time.

It first was brought from *Canada* by the *French*, in King *Francis* the first his time, and presented to him, and from the encrease thereof, is spread sufficiently through all the Countries neere it, and flowreth in *April*, and *May*, and the fruit is ripe in *August* and *September*.

The Names.

This being a new found tree, hath no true, ancient Greeke or Latine name to call it by, for although most that have written of it, referre it to the *Thuja* of *Theophrastus*, lib. 5. c. 5. which he compareth both in branches leaves and fruit, unto the Cypressle tree, yet *Omne simile non est idem*, and although it hath some likenesse in the leaves, yet so it is not in the fruit, and I verily beleave, that it is *proprium sui generis*, not to be paralleled, or made the same with any other we have, as most of the trees and herbes of *America*, are not equall to those that grow in *Europe*, the hether part of *Africa* and of *Asia* the lesse, as experience sheweth. *Lugdunensis* maketh it to be his *Thuja tertium genus*. Some would make it a kinde of *Cedrus Lycia*, but that beareth red berries, which this doth not. Some also have called it *Arbor Paradisea*: but it was presented to the *French* King by the name of *Arbor Vitæ*, but upon what reason or ground I know not, but ever since it hath continued that name of the tree of life. *Clausius* and *Banckius* say, that some would referre it to the *Bruta arbor Plinij*, but that as he saith hath whitish branches, and sweete being burned.

The Vertues.

Although we have no forraign experience to report unto you, yet upon tryall of the leaves by some in our owne Land, we have found that they that were long time troubled with a purulentous cough, and shortnesse of breath, have beene much releived and holpen thereof, by the use of the leaves taken fasting with some bread and butter, as the most familiar way for some few dayes together, thereby expectorating the flegme stuffing the lungs, and so clearing the passages, as they found much good by it, and double the resinous smell and taste, abiding dried as well as fresh, doth evidently declare the tenuity of parts therein, and a digesting and cleansing quality, which if any would put into action they should soone see the effect.

Arbor Vitæ. The tree of life.

CHAP. LVIII.

Tamariscus. The Tamariske tree.

Have three or foure sorts of Tamariske, to bring to your consideration, one whereof was never published or made knowne to the world, before I gave you a hint thereof in my former Booke, which I meane to ranke with therest here.

1. *Tamariscus foliolatiore*. The Germane or broader leaved Tamariske.

The broader leaved Tamariske groweth but low in fundry places, over that it doth in other, for I have observed it growne in some places where it hath stood very many yeares to be a reasonable great tree, whose barke was somewhat thicke and rugged, of a darke reddish colour, the younger shootes being reddish at the first, greene after, and blackish when they are dry, beset all about with fine long darke greene leaves, as it were crumpled, because they are so small and short, that stand about the longer, yet are they greater and broader then the French kinde: at the end of the young shootes come forth a long spike of flowers and leaves among them, each flower being made of five purplish leaves like threds, divers of them standing in a greene huske together, in which huskes when the flowers are past, grow feede lying among them, which together are carryed away with the winde: the leaves fall away every Autumne, and spring anew in the Spring.

Myrica sive Tamariscus spectrum.
Tamariske of three sorts.

2. *Tamariscus folijs albidis*.

White Tamariske.

Of this kinde I have seene another sort very beautifull and rare, brought me by Master William Ward, the Kings chiefe servaunt in his Granary, from his house at Boram in Essex, whose branches were all red, while they were young, and all the leaves white, abiding so all the Summer, without changing into any shew of greene like the other, and so abideth constantly yeare after yeare, yet shedding the leaves in Winter like the other.

3. *Tamariscus folio tenuiore*.

The French or finer leaved Tamariske.

This finer leaved Tamariske doth in many places grow but into a small shrubbe also, but in others into a great thicke and tall tree, with many spreading armes and branches, whose leaves are set in the same manner, and grow after the same fashion, but finer and smaller like unto Heath, of a grayish greene colour: the flowers are smaller, and grow spike fashion like the other, being purplish at the first, but white when they are blowne open, consisting of five leaves apeece, which turne into downe with the small feede in them, and falleth away as the Willow and Poplar doe, but Lobel saith, they turne not into downe, but the fruite is round like Ollive stones, which as he saith being laid in the Sunne have stirred to and fro for three dayes together, having a worme within them, which was the chiefe cause of the motion, and having made a hole in the graine commeth forth: which of these is truest, seeing both affirme the matter as eye-witnesses of the relation, I know not, never having seene the tree beare out his fruite or feede with us.

4. *Tamariscus Egyptia galviferens*. The Egyptian Tamariske.

This tree groweth in Egypt, and other places of Syria, Arabia, and Turkie, as Bellonius saith, who observed it to be a wondrous great and high tree, growing as well in dry ground as in moist, whole woods of them growing together in each soile, whose kind is of this last described, but besides, it beareth small hard excressences, like unto great Gaules, of divers formes, some longer, some shorter, some broad, others thicke or slender.

The Place and Time.

The first groweth naturally in Germany, in divers places, and as Cordus saith, he observed two sorts, one growing neere the River of Rhine with a finer leafe, and firmer wood, and a little pith, and another about the Danubius or Danow, with broader leaves, and not so firme wood: The second is declared in the description: The third groweth not onely in Narbone, and about Mompelier, but in Spaine in divers places, as Clusius setteth it downe: the last in Arabia, Egypt, and the places neere therabouts, they flower about the end of May, or in June, and the seed is ripe and blowne away in the beginning of September.

The Names.

It is called in Greeke *μυρίκη* in Latine also *Myrica*, and *Tamarix*, but of divers *Tamariscus*, and by Pliny *Bria sylvestris* in Achaia as *Lugdunensis* saith. The first is called *Tamariscus*, and *Tamarix humilis* by Cordus and others, and

and *Tamariscus Germanica* by Lobel, all others call it *Africa* or *Tamoris sylvestris* or *altera*. The second hath no other name, but what I have given it. The third is called *Tamariscus* or *Tamarix Narbonensis* by Lobel, *Lugdunensis*, and others, and *Myrica*, and *Tamariscus sylvestris* by Clusius and *Alpinus*, and *Tamarix Gallica* and *Hispanica* by Clusius also: The last is taken to be the *Africa*, and *Tamarix sativa* of Dioscorides, by Clusius, Cordus and others, by Bellonius *Tamarix gallica* anasta. The *Arabians* call it *Cheimasel*, and the former *Tarfa* or *Cusa*, the *Italians* *Tamarigio*, the *Spaniards* *Taray*, and *Tamargueira*, the *French* *Tamaris*, the *Germans* *Tamariscken baum* oder *holtz*, the *Dutch* *Tamariscken*, and we in *English* the *Tamariske tree*.

The Vertues.

Tamariske as *Galen* saith, is of a cleansing and cutting quality, without any manifest drying, yet it hath a little therein, but the fruite and barke are much more drying, and is very powerfull against the hardnesse of the spleene, if the roote or leaves or young branches be boyled in Wine or vinegar, and drunke and applied outwardly to the place also, the leaves boyled in Wine and drunke, is good to stay the bleeding of the hemorrhoidal veins, the spitting of blood, and womens too abounding courses, and helpeth the jaundise, and the chollick, and the bitings of the Spider *Phalangium*, the Viper and all other venomous Serpents, except the Aspe. The barke is as effectually, or rather more to all the purposes aforesaid, and both it and the leaves boyled in Wine, and the mouth and teeth often washed therewith, helpeth the tooth ache, being dropped into the eares easeth the paines, and is good for the rednes & watering of the eyes: the said decoction with some honey put thereto is good to stay gangrenes, and fretting ulcers, the said decoction is also good to wash those that are subject to lice and nits. The wood is held so powerfull to waste and consume the hardnesse of the spleene, that (although it is likely to be fabulous that is said thereof) if Swine drinke, or care their wash out of the toughes made thereof, it will waste their spleene so much, as that they will be found quite without after a while, but it sheweth that is very effectually to consume the spleene, and therefore to drinke out of cannes or cups made thereof, is very good for spleneticke persons. The ashes of the wood are used for all the aforesaid effects, and besides doth quickly helpe the blisters raised by burnings or scaldings of fire or water. *Alpinus* saith and *Veslingius* affirmeth it, that the *Egyptians* doe with as good successe use the wood hereof to cure the *French* disease, as others doe with *Lignum Vitæ*, or *Guajacum*, and give it also to such as are posselt with leproy, scabbe, pustles, ulcers, or the like and is available also to helpe the dropisie, arising from the hardnesse and obstruction of the spleene as also Melancholly, and the blacke jaundise that ariseth thereof.

CHAP. LIX.

Erica. Heathe.

Here are a great many sorts of Heathes, and therefore to avoid confusion I must divide them into four Ranckes or Orders the first of those whose leaves are like *Tamariske*, the second like unto the *Heathelow Pine* or *Coris*: the third is of those that lye or leane downe to the ground, and the last of those that beare berries.

1. *Erica vulgaris*. Common Heath.

2. *Erica vulgaris hirsutior*. Common rough Heath.

1. *Erica*

1. *Erica vulgaris*. Common Heath.

The Heath that groweth most frequent in our Land, is a low shrubby plant, little above halfe a yard or two foote high, with rough woody brownish stalkes and sundry branches, plentifully stored with small short Greene leaves like to those of Tamariske, foure usually set together, from the middle to the ends of the branches, stand small bottle like bright purplish flowers at severall distances about the stalkes, and ending in foure corners, in which grow small seede when they are past: the roote spreadeth deepe, sometimes this is found with white flow- *Flora alba* ers, but very seldome.

2. *Erica vulgaris hirsutior*. Common rough Heath.

This other Heath groweth like the former in all things, but somewhat higher, the leaves whereof are alike also, but more rough, and of a hoary Greene almost white: the flowers also are like, but somewhat paler, and herein consisteth the chiefest difference: the rootes of both grow downe, and are strongly fastned in the earth: the seed is like, and so is the roote.

3. *Erica Græca Phana dista*. The Greekish common Heath.

Belonius in his first Booke of Observations, and the 53. Chapter, that giveth us the knowledge of this Heath, saith, that meeting certaine boyes that had gathered bundles of Heath about *Syderocapsa* in *Macedonia* to burne, which they called *Phana*, was desirous to know the difference betweene it and common Heath, and by them he learned this, as one especiall note of difference, that it is easily pulled up by the rootes, without any instrument to digge the ground, when as the other common sort cannot be gotten out without a spade to digge it.

The Place and Time.

The first groweth throughout the Land in walle grounds that are called Heathes, because this kinde of plant groweth most plentifully thereon: the second groweth on *Wind* or Heath, where *Clevis* saith he found it, and the last in many places of *Greece*, the first and second are found sometimes twise flowering in the yeare usually, in *July* and *August*, and sometimes in the Spring also.

The Names.

The generall name for Heath in *Greece* is *agion*, but *Tetralix* by the *Athenians* as *Pliny* saith, in Latine *Erica*, and of some *Africa*, mistaking it, yet by *Varro Sifara*, but that particular sort here shewed you in the third place is called *Phana* now addayes by the *Greekes*. *Marcellus* was in a very great error, that made Heath a kinde of Broome, because it serveth to the same use, that is, to sweepe houses. The first is by all called *Erica vulgaris*, and *Erica Myrica foliis* by *Lobel* and *Clevis* who also so calleth the second, which *Bauhinus* saith, some tooke to be the *Selago Plinij*. The last is sufficiently exprest in the description, and here before. The *Italians* call it *Erico*, the *Spaniards* *Quewo*, the *French* *Bruiere*, the *Germanes* and the *Dutch* *Heyden*, and we Heath.

CHAP. LX.

1. *Erica Coris folio maxima alba*.
The great white flowered Heath.

His Heath groweth the greatest of any, even as tall as a man, and yet sometimes much lower, with woody browne stalkes and branches, the leaves being small round and short, somewhat like those of *Coris*, set in a *quadripartite* forme, or crosse fashion, the flowers likewise grow foure together at a space, from the middle of the branches upwards, forming a very long spike of a foote long, and are like small long and hollow white bottles somewhat sweete, the seede and rootes are like the former kinde.

2. *Erica Coris folia maxima purpurascens*.
The great purple flowered Heath.

This differeth from the former in nothing, but in having slenderer stalkes, yet as high, and in the flowers, which are long and hollow like them, but of a purplish colour.

Another like hereunto *Mathioli* setteth forth with flowers onely at the toppes of the branches.

3. *Erica major floribus ex herbaceo purpureis*.
Greene Heath with purplish Greene flowers.

This likewise differeth little from the last, but onely that it is lower and more largely spread, and hath darker green leaves, foure set together all along the branches, and flowers likewise up to the toppes in forme like them, but of a whitish Greene purple colour being fully growne.

4. *Erica scoparia*. Brush Heath.

The Brush Heath groweth close and round, with sundry slender branches, and small Greene leaves on them, which quickly fall away from the stalkes being a little dry, and the flowers two together for the most part, smaller then the former, and of an herby Greene colour, but hollow as the other: besides these, it likewise sometimes beareth small scaly heads of leaves, like unto those of the common hard Time.

2. *Erica Coris folia maxima purpurascens*.
The great purple flowered Heath.

Alteri

5. Erica

3. *Erica major floribus ex herbaceo purpureis.*
Great Heath with purplish green flowers.

4. *Erica Scoparia.*
Bruin Heath.

5. *Erica humilis Belgica Lobelia Scoparia nigrifolia.*
T. & low Dutch or Bruin Heath.

6. *Erica Scoparia alba.*
Another Bruin Heath.

7. *Erica Corisfolio quinta Clusij.*
Clusius his fifth Heath with triple branches and leaves.

8. *Erica virgata five sexta Clusij.*
 Small upright Heath without branches.

5. *Erica pumila Belgarum Lobelij scoparia nostras.*
 The low Dutch or our Broome Heath.

This Heath groweth low and short, hard and brittle, with blackish stalkes and brownish branches, and small greene leaves like those of Tyme set on them, somewhat hairy, but foure together as in the rest, the flowers grow five or sixe together at the toppes of the branches, hollow like the rest, and of a pale purplish colour.

6. *Erica scoparia altera.*
 Another Broome Heath.

This other differeth not much from the last, but in bearing three leaves at a space, somewhat broader then the other, green above and gray underneath, and a little hairy withall: the flowers likewise are many, and stand three together, at the toppes by equall distances, turning all one way, being somewhat larger and greaterbellyed, but of a deeper red colour then the last.

7. *Erica Corisfolio quinta Clusij.*
Clusius his fifth Heath, with triple branches and leaves.

This triple Heath groweth low, and with slender branches, three usually set at a joynt, and three small thinne leaves likewise set by spaces thereon, in an even order or manner, the flowers grow from the middle to the top, somewhat large, many together at the joynts, upon longer footestalkes, and are of a dull or dead purplish colour.

8. *Erica virgata five sexta Clusij.*

Small upright Heath without branches.

This Heath hath sundry hard and upright stalkes rising from the roote, scarce a cubit high, being all single, without any branch spreading from them, and covered with an ash-coloured barke, at the severall joynts whereof come forth divers small darke greene leaves buihing together, and towards the tops sundry hollow flowers, like the rest standing together by spaces, of a most bright deepe crimson colour hanging downe,

9. *Erica similis preziosa planta Lobelij.*
Lobel his strange Heath.

upon

upon long footstalkes: you must understand that all these sorts beare small seede, although it is not mentioned to every one.

9. *Erica similis peregrina planta Lobelij.* Lobels strange Heath.
 Brancion his Garden, yet would joyne it in the end of his Heathes, with this title as one of them, is a very strange Heath indeed, when as he made another plant that was very like it, to be a kinde of *Sedum minimum vermiculatum*, as in the same page, and the next line unto this, he himselfe doth set it downe, yet calling it *Erica peregrina altera*, being so neere one unto another that I thinke them *congeneres* groweth shrubby, that is, with woody stalkes and branches, like other Heathes, with many small long narrow leaves upon them, and purplish flowers at the toppes, consisting of foure small leaves apeece, as neere as my memory will serve me, saith Lobel.

The Place and Time.

Clusius saith, that he found the first in sundry parts of Portugall, not farre from Lisbonne: the second in the same places, but more plentifully, and in the Country of Narbone as Lobel saith. The third also about Lisbonne, and the fourth both in Spaine, Portugall and Aquitaine, and Narbone also almost every where, it flowreth there twice every yeare, both in the Spring and Fall: The fifth Clusius saith he found, both in Brabant and Gelderland, and also in old Castile in Spaine, and Lobel saith in Flanders, and Brabant, but he might as well have said, on Hampstead Heath, and divers other Heathes in England: The sixth in Portugall also, and in our Land likewise. The seventh by Lisbonne also. The eighth was scene by Clusius as well in England about Windsor, in flower in September, as in old Castile, and France. The last was not knowne to Lobel from whence it came to him that had it, neither can I say more of it: They flower most of them in July and August, and yet some continue in flower longer, and some beginne sooner.

The Names.

The first, second, third, and fourth here, are of the same numbers with Clusius in his history of Plants, and Lobel calleth the second *Inniperifolia dense fruticans Narbonensis*. The fifth is the thirteenth *Erica Coris folio* with Clusius, & with Lobel *Erica pumila Belgarum*, and the fifth *Erica* with Dedonius. The sixth is Clusius his twelfth *Erica Coris folio*, which Lobel calleth *Erica Inniperifolia altera*. The seventh is Clusius his fifth *Erica coris folio*, which Bauhinus nameth *Erica ternis per intervalla ramulis*. The eighth is Clusius his sixth *Erica coris folio*, which Lobel calleth *Erica pumila caliculata unedonis flore*. The last is entituled by Lobel as I said, *Erica peregrina Brancionis*.

CHAP. LXI.

1. *Erica prostrata sive supina pallide purpurea.* Pale purple creeping Heath.

His leaning Heath groweth up with many round browne stalkes, of a foote long or more, leaning downe to the ground, and sometimes taking roote againe as they lye, about whom are set many long small leaves foure set together, and sometime five at a place, the flowers are of a pale purple colour, standing at the toppes of the branches like unto the other of this kinde, the seed that followeth in this as in most of the other, is small and blackish, the roote is hard and woody.

2. *Erica supina herbacea.* The Greene flowered Heath.

This Heath hath low creeping stalkes, scarce a foote high, branched forth, and foure leaves at every place, set a crosse the roote, the flowers come forth among the leaves, towards the tops, being small and hollow, with foure ends like the rest, but of an herbey or Greene colour: the seede is like the other.

3. *Erica supina carnea.*

Blush coloured leaning Heath.

This low Heath groweth not higher then the last, but much more beautifull in that, although the stalkes be blackish and slender, leaning to and lying on the ground, and the leaves stand by three at every space all along the branches: yet the flowers that grow at the ends of them, are of a fine flesh colour, hollow like the rest, and ending in foure points with eight blackish threads within them, and a purplish pointell in the middle; this hath also small blackish seede, this is often found with leafy Greene heads like those of Time.

4. *Erica supina maritima Anglica.* Our English Sea low Heath.

This fine small Heath groweth low, but thicke set with stalkes and branches, and thereon very small blewish Greene leaves up to the toppes where the flowers stand many together as in others, of an excellent purple colour, continuing long in flower and colour.

The Place and Time.

The first *Clusius* found in *Styria* and *Austria*, upon the hills there, and so likewise the second, and the third in *Hungary*, and flower at the time with the rest: The last was found by *Lobel*, about *Possumouth* in our owne Land.

The Names.

The first, second, and third, is the seventh, eighth, and ninth *Erica Coris folio* of *Clusius*, the last hath not bene mentioned by any before now, and by *Lobel* termed *angustifolia maritima Anglo britannica*.

CHAP. LXII.

Erica baccifera fruticulus albo. White berryed Heath.

The white berryed Heath riseth up with stalks a cubit high distributed into branches, and both covered with a blacker bark then any of the rest, the leaves likewise that are set in a triple order at every place, are of a blacker Greene colour, and of a little heating as well as binding taste: it hath sundry small brave shining or transparent white berries like almost unto darke pearles, at the toppes of the branches full of an acide juyce, and three hard graines or seede within them, what flowers it bore hath not bene observed.

2. *Erica baccifera nigra*. Blacke berryed Heath.

The branches of this Heath, spread farre about upon the ground, and as they lye shoote forth rootes againe, taking up after a while, a great deale of roome, which a number of triple leaves doe compasse, and sometimes foure at every space, being thicker, somewhat like unto the former, at the first of a drying taste, and after somewhat sharpe and biting upon the tongue: the flowers stand at the joynts with the leaves, towards the toppes, consisting of three leaves a peece, of a whitish Greene colour, with purplish threds within them, which turne into small blacke berries, like unto Juniper berries, with a darke purplish juyce within them, and many triangular graines or seed within them likewise.

The Place and Time.

Clusius saith he onely found the first not farre from *Lisbone* in *Portugall*, and the other on the Hills of *Austria* and *Styria*, and we may say in *England* and *Ireland* also in many places, and flower at the same time with the rest, or rather somewhat later.

The Names.

The first is called *Erica baccifera* by *Lobel*, and *Erica baccifera tenuifolia* by *Tabernmontanus* and *Gerard*, and is the tenth *Erica coris folio* of *Clusius*, *Amatus Lusitanus* tooke it to be the *Ascalis* of *Dioscorides*, which the Por-

1. *Erica baccifera fruticulus albo*.
White berryed Heath.

2. *Erica baccifera nigra*.
Blacke berryed Heath.

tingals call *Tamarinhera*, and the fruite *Tamarinus*. The second is the *Erica baccifera* of *Matthiolum*, which *Lo-bell*, *Lugdunensis*, and *Thalini* call *Erica baccifera Matthioli*, and is the eleventh *Erica coris folio* of *Clusius*: but this is not the *Vaccinia palustris Dodonæi*, before set forth, which *Lugdunensis* calleth *Erica baccifera Dodonæi*, nor the *Oxycozum Cerdæ*, being all one.

The Vertues.

I have reserved the declaration of the Vertues of all the former, unto this place, that I might shew you them altogether. Heath is somewhat drying, and a little bitter withall, except the berryed sorts, as *Clusius* hath related by the taste of most of them. *Galen* saith it hath a digesting quality, resolving the malignity of humours, by transpiration or sweating, which a decoction of the flowers being drunke, doth performe, and thereby giveth much ease to the paines within the body, and expelleth the wormes therein also: the leaves and flowers made into a decoction is good against the sting or bitings of Serpents, and other venomous creatures, and the same being drunke warme saith *Matthiolum*, for thirty dayes together, morning and evening, doth absolutely breake the stone and drive it forth: the same also, or the distilled water of the whole plant, being drunke easeth the chollicke: the said water or the juyce of the herbe dropped into the eyes helpeth the weaknesse of the sight: *Clusius* saith that *Rondeletius* at *Mompelien* used the oyle made of the flowers of Heath with good successe against the Wolfe in the face or any other foule or fretting and eating canker spreading over the whole face: the same also doth dissolve tumours: a bathe made by decoction of the herbe and flowers is good for them to sit in, that are troubled with the stone, or with the gout, for it giveth much ease to them both: the white berryes of the Heath saith *Clusius* are brought to the markets in *Spaine*, and there sold to give to those that have hot agues, to coole the heate and quench their thirst; and besides are much desired saith hee, of women and children, to please their pailate: the honey that the Bees take from the flowers of Heath is called *mel improbum*, but we have not found any ill quality therein in our Land: onely it will be higher coloured then in those places where no Heath groweth.

CHAP. LXIII.

Agrifolium five *Aquifolium*. The Holly bush or tree.

Some have thought that there are divers sorts of Holly, some trees, some shrubs, some with prickly leaves, and some with smooth, but the truth is, it is but of one sort, for although it hath beene scene in divers places to grow to be a great tree, as *Gesner* in *hortis* reporteth, of divers, and of one at *Curia* thirty foute high, whose leaves were smooth and not prickly, yet no doubt but it rose from a young shoote that was prickly at the first, for while it is suffered to shoote forth sundry rodde from the roote, or before any of them groweth to be great, the leaves are prickly, but growing old as the *Ilex* doth, it loseth the prickles and becommeth smooth, and onely prickly at the end, and sometimes not. It is with us most usually a bush, and with many shootes from the roote growing slowly, unlesse the ground be not gravelly, where it most frequently is found, but more mellow and gentle; the outer barke whereof is of a sad Greene colour, but it hath also another inward, which is whiter: the leaves are set on the stalkes and branches on short footstalkes, being somewhat broad, hard, thicke and long, smooth shining, and of a very fresh yellowish Greene colour, cut round about the edges, into round notches or dents, and every point of them very sharpe and prickly: the flowers grow close to the stalkes, at the foote of the leaves many coming forth together round about them, and consist of foure white leaves with foure threds in the middle standing about a Greene round head, with groweth to be a small red berry when it is ripe, like unto a Hawthorne berry, but with a little Crowne at the toppe which parteth into foure small triangular feede, with hard shels, and a small sweete kernell within them, abiding on all the Winter, almost in his greatest beauty: the roote groweth deepe, the wood is firme and hardly sinking in water, and of a whitish colour.

2. *Aquifolium undique echinatum*. Holly with leaves wholly prickly.

This differeth not from the ordinary sort, either in body, barke, fruite, roote, or use, onely in the leafe, which is no lesse armed with sharpe prickles, all upon as about the edges thereof.

The Place and Time.

Holly groweth in waste and untilled grounds, in divers Countreies throughout the whole Land, and as I said seldome groweth with us to be a tree of any bignesse, it flowereth in *June*, and the berryes grow ripe, not untill the end of *October*, and then abide almost all the Winter long, being fresh at *Christmas*, the leaves doe alwayes abide Greene.

The Names.

Theophrastus calleth it in Greeke *αειξ*, which *Gazar* rendereth *Aquifolia*, following *Pliny* therein, and yet he hath an *Aquifolia Ilex*, which is the *Ilex coccigera* declared before, by which name he would intimate that there is an *Ilex*, that hath dented prickly leaves, as the *Aquifolium* hath, and not that the *Aquifolium* is any kinde of *Ilex*, which beareth Acones, and the rather in that the *Aquifolium* doth not endure such hor situations as that *Ilex* doth: some doe call it *Agrifolium*, as well as *Aquifolium*, *Lacuna* tooke it to be *Dioscorides* his second *Palmarum*, and *Guilandinus* from *Pliny*, the *Cratægu* of *Theophrastus*, *Dodonæus* saith that some called it *Ruscus sylvestris*, *Casalpini* doubteth whether it may not be the *Hedera rigens* of *Pliny*, which he saith, *stat sine adminiculo*, and therefore, *sola omnium generum ob id vocata cissos*, none of these Authours shewing any prickles in the leaves of those plants they set forth. The *Italians* call it *Aquifoglio*, the *Spaniards* *Azobor*, the *French* *Houx*, and *Housson*, the *Germanes* *Waldstiffel*, and of some *Stechender Palmen*, as *Gesner* in *hortis* saith, which is *Palma aculeata*, without all reason, the *Dutch* *Hulst*, and we *Holly*, or *Holme* and *Huluer*.

The Vertues.

The berryes are hot and dry, and of thinne parts, helping to breake winde saith *Dodonæus*, and therefore good to helpe the chollicke, for saith he, I have it from them who have made tryall of them, that tenne or twelve of the

2. *Agrifolium* five *Aquifolium*
The Holly bush or tree.

2. *Aquifolium folio laevi et aculeato roto.*
Holly with smooth leaves, and one all over prickly.

the berries being taken doe purge by stooles, grosse clammy and slegmaticke humours : *Gerard* appropriateth these words to himselfe, as if he had had the relation, and yet he saith within a few lines after, that Holly bea-ten to pouther, and drunke doth stay fluxes and discenteries, which are quite contrary one to another, upon a sud-daine apprehension, but upon better consideration they may both stand for good that the fresh berries, by reason of their moist slipperinesse may move the belly downwards, and the berries being dried, and thereby having lost their moisture and slipperinesse, doe then binde the belly as we have knowne by many experiences : but the barked of the tree, or the branches, is held to be much more effectuell to binde then the berries : *Matthiolus* saith that a decoction of the rootes of Holly (but saith he the barked of the roote is more powerfull) fomented on the places that have beene put out of joynt, doth helpe them much, both to mollifie and discusse the hardnesse and tumours, the places gather thereon, and helpeth also to consolidate the broken bones : some use to tie the branches with leaves upon their Bacon, and Martinmas Beefe, to keepe Rats and Mice from them by their prickles : the branches with berries, are used at *Christ tide* to decke up our houses withall, but that they should defend the house from lightening, and keepe themselves from witchcraft, is a superstition of the *Gentiles*, learned from *Pliny* saith *Matthiolus* : with the flowers of Holly saith *Pliny* from *Pithagores*, water is made ice : and againe, a staffe of the tree throwne at any beast, although it fall short by his defect, that threw it, will flye to him, as he lyeth still, by the speciall property of the tree : This I here relate, that you may understand the fond and vaine conceits of those times, which I would to God we were not even in these dayes tainted withall. The Birdlime made of the rootes of Holly, is as good as that made of Mistletoe, whereof neither is to be admitted into inward Physicke without certaine death or danger.

CHAP. LXIV.

Laurus. The Bay tree.

Under the name of *Laurus* is described sundry sorts of plants by the ancients, as *Laurus Alexandrina*, *Chamaedaphne*, *Daphnoides*, and *Laurus Tinus*, and *Taxa*, and others, whereof I meane not to en-treare in this place, having spoken of them already in others, but of those trees that are properly called Bay trees, which are two, onely knowne to us in *Europe*, the one with broader, the other with a lesser leafe (and yet *Bellonius* saith, he observed five sorts in Mount *Arbos* and *Greece*) where unto might be adjoynd the wilde Bay, but that I have shewed you the sorts thereof in another place, but unto them I will adde another sort of rare Indian Bay tree, lately knowne unto us,

L L L L L

1. *Laurus*

1, 2. *Laurus latifolia major & minor.*
The greater and the lesser Bay tree.

3. *Laurus Americana exhorto Farnesiano cujus cortex ex*
Cassia lignea multum assimilatur. A strange Indian
Bay tree, or *Cassia lignea* of the West Indies.

1. *Laurus major sive latifolia.* The greater Bay tree.

This Bay groweth with us in many places, very high, spreading armes and branches reasonable well, covered with a darke greenish barke, the leaves are somewhat broad and long, hard, full of veines, of a darke greene colour, pointed at the ends, and smelling somewhat sweete, but of a bitter taste, and alwayes abiding on the trees, the flowers grow many together, and of a whitish greene colour, after which come somewhat long and round berries, with a tough blacke skinne or covering, somewhat wrinkled, with a hard firme kernel within, parting into two parts, the roote spreadeth under the ground, and groweth deepe also: the wood is firme, smooth, and white.

2. *Laurus minor.* The lesser Bay tree.

The lesser Bay tree groweth not so high, and doth runne more into suckers or shootes, whereon grow smaller thinner, and longer leaves then of the former, yet smelling well also, the rest of the parts doe not vary much, but that the berries be smaller and rounder.

3. *Laurus Americana cujus cortex Cassie lignee multum assimilatur.*

The strange Indian Bay tree, or *Cassia lignea* of the West Indies.

I must needs adjoyne this strange Indian Bay tree, both for the rarity and excellency thereof, which I take out of *Tobias Aldinus* his description of some plants that grew in *Cardinal Farnesius* his Garden at *Rome*, and grew from the berries were brought from the West Indies, in that Garden of the Cardinall 1620. which were blacke rugged, like Bay berries, and somewhat long like Ollives, pointed at the end, and divers growing together in a bunch, each upon a short footstalk. It shortly grew into a great height and bignesse, the leaves were very like unto Bay leaves, or rather in a meane betwene the great Kings Bay (which I take to be that we call *Laurocra- sus*) and the common Bay or the Citron tree, which being chewed, at the first are somewhat bitter, but after with a sweetnesse have some macilaginouse or clammynesse in them, yet smelling like the common Bay, whose footstalk is thicker then of them, and the branches smaller and finer: but saith it is wonderfull to seele so much viscid and tough clammynesse in them, which made a doubt with some learned Herbarists, whether it were not the tree of Cinamon, or of *Cassia* or Canell, and that not by any light conjecture, for *Garzias ab orta* saith the leaves of the Canell tree are of the colour of Bay leaves, but neere the forme of the Citron tree leaves, and all Authours writing of the trees of Cinamon or Canell, say the leaves are like Bay leaves: the fruite also by *Garzias* of the Canell, is blacke and round, of the bignesse of an Hasell nut and like an Ollive. *Gomara*, *Carate*, and *Cuespa* say that the fruite groweth in clusters or bunches, *Acosta* that the fruite is blacke and shining, when it is ripe, the macilaginouse taste also in this plant, seemeth to be in that sort of Canell is thought with us to be the true *Cassia lignea*, yea the best *Cassia* with *Dioscorides* is called *Daphnitis* which is a word derived from *Daphne* which is a Bay: but saith he, I will shew you my opinion, that we have no true Cinamon, although I have read of many that affirme our Canell to be the true Cinamon of the Auncients, yet I have faith he, many reasons a-
gainst

gainst it, which for brevity I here omit, hoping to declare them in another place.

The Place and Time.

The Bay groweth wilde naturally in divers places of *Narbone in France, Spaine, and Italy* and in other warme Countreys where it groweth very great, especially neere the Sea, but is wholly planted with us, or raised from sowing the berries: it floweth in *May*, the fruite is scarce thorough ripe either in *October, or November*.

The Names.

It is called *Δάρον* in Greeke; *quasi daron quod usque valde sonet*, for nothing doth more crackle or make a noise in the fire then it: in Latine *Laurum*: much Gentilisme might be inserted here of *Daphne*, the Daughter of *Landon*, whom *Apollo* overtook flying from him, and by the implored aide of her mother earth was transformed into a Bay, from whence taking a branch, he in honour of her, crowned himselfe: but under this rugged shell was hid a smother kernell: for the Bay was a token of prophecy, and by *Apollo* is signified wisdome: that is, that wisdome doth foresee events, when the passions be overruled: as also that they wore a Garland of Bayes to be kept safe from lightening and thunder: that wisdome knoweth how to avoide the judgements of God, when foolishnesse is liable to them, and must undergoe them. The *Arabians* call it *Gaur* or *Gar*, the *Italians* *Lauro*, the *Spaniards* *Lanverro*, the *French* *Lanrier*, the *Germanes* *Lorbeerbaum*, the *Dutch* *Laurusboom*, and we the Bay tree: the berries are called in Greeke *δαρύνες*, in Latine *Lauri bacce*.

The Vertues.

Galen saith that the Bay leaves or barke doe dry and heale very much, and the berries more then the leaves: the barke of the roote is lesse sharpe and hot, but more bitter, and hath some astringent withall, whereby it is effectually to breake the stone, and is good to open the obstructions of the Liver, Spleene, and other inward parts, as the drop sicke and jaundise: the berries are very effectually against all venome, and poyson of venomous creatures, and the stings of Wasps, and Bees, as also against the pestilence, or other infectious diseases, and therefore is put into sundry Treacles for that purpose: they likewise procure womens courses, and if seven of the berries be taken by a woman in fore travell of child birth, it will cause a speedy delivery, and expell the after birth also, and therefore women with child that have not gone out their time, must take heed of taking any, lest they procure an abortion, or delivery before their time: they wonderfully helpe all cold and rheumaticke distillations, from the braine to the eyes, lungs, or other parts, and being made into an electuary with hony, they helpe the consumption old coughes, shortnesse of breath, and thin rheumes: they likewise helpe the Meagromie, and mightily expell winde, and provoke urine, and helpe the Ventosities of the mother, and kill the wormes: the leaves worke also the like effects, and boyled in fish broth, give a fine relish, both to meate and broth, and helpeth to warme the stomacke, and to cause digestion without feare of casting, which taken by themselves they oftentimes provoke: a bath of the decoction of the leaves and berries, is singular good both for women to sit in that are troubled with the mother, or the diseases thereof, or with the stoppings of their courses, or for the diseases of the bladder, paines in the bowells by winde, and stoppings of urine: a decoction likewise of equall parts of Bay berries, Cuminsseeds, Hyssope, Origanum, and Euphorbium with some hony, and the head bathed therewith, doth wonderfully helpe distillations and rheumes, and setteth the pallate of the mouth into its place: the oyle which is made of the berries, is very comfortable in all cold griefes of the joynts, nerves, arteries, stomacke, belly or wombe, and helpeth palsies, convulsions, crampes, aches, tremblings, and numbnesse in any part, wearinesse also, and paines that come by fore travelling in wet weather, or foule wayes: all griefes and paines likewise proceeding from winde, either in the head, stomacke, backe, belly or wombe, by annoying the parts affected therewith, and by putting some of the oyle, or boyling the berries in the decoctions for glitters, doth breake wind and ease the torments of the belly by the winde chollike wonderfully: it helpeth also the paines in the eares, either some of the oyle dropped thereinto, or a decoction of the berries being made to receive the warme fumes thereof into the eares by a funnell: the said oyle taketh away the markes of the skinn and flesh, by bruiſes, falls, &c. and dissolveth the congealed blood in them: it also helpeth the itch, scabs, and wheales in the skinn.

CHAP. LXV.

Arbutus & Adrachne. The Strawberry trees.

These two trees doe both goe under one *English* name of the Strawberry tree, because they are so like one unto another, both in their growth, leafe, and fruite, that one not very well acquainted with them, may soone mistake one for another, and therefore I have thought good to put them both into one Chapter.

1. *Arbutus.* The Strawberry tree with dented leaves.

This Strawberry tree (in some places, as in Mount *Arbos*, as *Belonius* reporteth, groweth to be a tree of very great height and bignesse) in most other places it groweth but low, or rather like unto a shrub tree then of any bignesse, having a rugged barke on the body, and smooth or red on the young branches, and having many suckers rising from the rootes, with faire fresh greene leaves, set without order thereon, very like unto Bay leaves, but thicker, shorter, and finely dented about the edges, and without any sent, as the Bay leaves have, with a reddish middle rib in some places, but not usually so with us, and abiding on the bushes like the Bay: at the ends of the branches come forth long stalkes, with very fine white flowers set thicke together all the length of them whose brimmes are a little red or blash colour, formed like unto little bottles, or the flowers of Lilly convally, which being past, there rise in their places, severall round berries, greene at the first, yellowish afterwards, and of an excellent reddish colour, and somewhat hoary withall being full ripe, like unto a Strawberry, but much greater in the naturall warme Countreys, as great as a plumbe, but with us, and in *Ireland*, where they have beene found growing of their owne accord, no bigger then a Raspis berrie, and neere unto the same, both forme and colour, that is, like a pallide claret Wine, of an austere taste, and having certaine small seedes within them each of them covered with a thinne skinn.

1. *Arbutus*. The Strawberry tree with dented leaves.2. *Adrachne*. The Strawberry tree with smooth leaves. 2. *Adrachne*. The Strawberry tree with smooth leaves.

This other Strawberry tree groweth low and never seene so high as the former; but so like thereunto that it is discerned from it onely by these markes; the barke of the tree and branches is not rough or rugged, but smooth and redder by much, both in young and old branches like unto Corrall, yet *Theophrastus* saith it hath a white barke, which it is like he meaneth of the under or new barke that commeth after the old falleth away in Summer, but the *Arbutus* doth not so: the leaves are so like unto Bay leaves, being also smooth and not dented on the edges that they are onely distinguished from them by the smell, these having no sent, and the berries hereof are of a darker red colour, and somewhat more sweete, the other being a little aultere or harsh, and so tasting on the tongue in the eating.

The Place and Time.

Both these sorts grow in the warme Easterne Countreyes abundantly as also in *Greece*, and the Isles of the *Mediterranean* Seas, especially in *Candy*, on the hills, and among the Rockes, but the first especially in *Italy*, *Spain*, and some parts of *France*, and hath bene of late dayes found in the West part of *Ireland*, of a reasonable bigge sife for a tree, but with smaller fruite: it flowreth not onely in *July*, in the warme Countreyes, but at other times of the yeare also, and the fruite scarce ripeneth in a whole yeare, for I have seene a fresh branch, that was brought me with fresh sprung flowers and ripe fruite thereon likewise, so that it is usually seene both with flowers and fruite at once. The *Adrachne* is every third yeare spoyled of the outer barke, and regaineth it quickly, and keepeth the same time with the other.

The Names.

The first is called in Greeke *ῥυαγες* *Comarus*, and the fruite so also by some, or *ωυδινωρον* *Memacylon*, as *Dioscorides*, *Galen*, and others say, in Latine *Arbutus* & *Unedo*, and by *Ovid* *Fraga montana*; some have thought that the *Arbutus* of *Dioscorides*, and *Theophrastus* were differing plants, because their descriptions were so divers, but by the judgement of the best they are both one, the other is called in Greeke *αδραχνη*, yet the most Greeke copies have *αδραχνη*, but because *Adrachne* is the herbe *Portulaca*, Purslane, which some to distinguish would call this *Portulaca arbor*, but *Pliny* findeth the fault, and therefore calleth it *Adrachne* and *Portulaca arbor*, since which *Gaza* and others have followed him therein: but the *Grecians* generally now adayes, as well as those in *Candy*, call it *Adrachla*, as *Horatius Bellus* saith: all our moderne Writers call them, by the same names, and no other then are here set downe, except *Guilandinus* in *Pappra*, who attributeth all these names to one plant *Omarum*, *Conarium*, *Arbutus* & *Unedo*. And it is observed that *Galen* saith in *Italy* among the vulgar, *Epimelis* was called by the name of *Unedo*, peradventure because the flowers of *Epimelis* are very like to those of *Arbutus* or *Unedo*, when as *Epimelis* is defined by himselfe to be another plant, differing both from *Arbutus*, *Unedo*, or any of *Dioscorides* sorts of *Mespilus*. The *Arabians* call the *Arbutus* *Hatiladis*, the *Italians* *Albastro*, the *Spaniards* *Madronho*, and *Madromeiro*, the *French* *Arbousier*, the *Dutch* as not knowne to them have no name that I can finde, and we call them

them both the Strawberry tree, but with the severall distinctions that I give them in their titles: yet it hath come to us from *Ireland*, by the name of the Cane Apple, with as great judgement and reason as many other vulgar names are.

The Vertues.

Dioscorides and *Galen* say of the *Arbutus* that it is troublesome to the stomacke, and breedeth head ache, and therefore adviseth those that have any paine in the head to forbear the eating of that fruite, *Amatus Lusitanus* first setteth it downe, that the distilled water of the flowers and leaves of the *Arbutus* (but *Matthiolum* addeth the *os de Corde cervi* to be mixed therewith in pouther) is a soveraigne remedy and helpe against the pellilence, and all other venome to be given presently upon the first complaining of the griefe, it is altringent or binding, and therefore may well serve against fluxes: the properties of the other are not declared.

CHAP. LXVI.

Morus. The Mulberry tree.

Here are two or three sorts of Mulberries as I have elsewhere shewed, yet I must shew you them here also.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree.

This groweth if it be suffered very great and tall, otherwise it will be led on Arbours, or as you will have it, the body being great, and both it and the greater armes covered with a thicke rugged barke, the younger boughes and branches being smother, whereon are round broad leaves set, pointed at the end, dented about the edges, and sometimes gashed in on the edges, resembling a Vine leafe, the bloomings or flowers are short downie catkins, after which follow the fruite made of many graines set together Greene at the first, red after wards, and somewhat harsh or lowre, but blacke when they are full ripe, full of a sweetish juyce, that will dye the fingers and mouth of them that gather and eate them: wherein lye divers small seed, the roote groweth not deepe, but spreadeth farre, being of a yellowish colour.

2. *Morus alba.* The white Mulberry.

The white Mulberry groweth not to that greatnesse, but riseth higher, more knotty and brittle, spreading reasonable well, but not so thicke, the leaves are like the former, but not so thicke set on the branches, nor so hard in handling, of a paler Greene, and some what longer, and more divided with longer stalkes: the fruite is smaller and closer set together, Greene and somewhat harsh before they are ripe, but exceeding sweete, almost ready to procure loathing, when they are thorough ripe, and whitish, with the like seede as is in the former: the roote likewise is yellow but paler.

1. *Morus nigra vulgaris.* The common blacke Mulberry tree.

2. *Morus alba.* The white Mulberry tree.

3. *Morus*

3. *Morus Virginiana*. The *Virginian* Mulberry.

The *Virginian* Mulberry groweth quickly with us to be a very great tree, spreading many armes and branches; they grow faire great leaves very like the last: the fruite or berry is longer and redder than the first when it is ripe, and very pleasant also.

The Place and Time.

The two former sorts are nourished up as it were in Woods or great Orchards, in the Levant Countries to nourish their silke Wormes, where they keepe abundance, and may peradventure be naturall in some of those places; they are plentifully also nourished up in *Italy* for the same purpose: but the last as the name importeth came from *Virginia*, where it groweth hugely, with great store of great leaves and small store of fruite, but in the season with the other, which is in *July* and *August*, yet the leaves of them all appeare the last of all other trees.

The Names.

It is called in *Greek* *μορεα* and *συκιν* *Morea* & *Sycinos*, in *Latine* *Morus*; some call the first *Morus rubra*, and others *nigra*, in our shoppes *Morus celsa* quasi *excelsa*, as a distinction betweene it and the bramble *Rubus*, whose berryes are called also *Mora*; but *bati* is added to know it by, the white is called *Morus alba* & *canadida* by all: *Sellonius* saith that the *French* doe falsely call it *Sycomor*, but we shall shew you the true *Sycomor* by and by. The *Arabians* call it *Tur* and *Thut*, the *Italians* *Moro*, the *Spaniards* *Moras del Moral*, the *French* *Meurier* and *Meure*, the *Germanes* *Maulberbaum* and *Maulbeer*, the *Dutch* *Moerbe* & *seemboom*, and we in *English* *Mulberry*, and *Mulberry tree*.

The Vertues.

The *Mulberry* is of different parts, the ripe berryes being by reason of their sweetnesse and slippery moisture, opening the belly, and the unripe binding it, especially when they are dried, and are then good to stay fluxes and laskes, and the abundance of womens courses: but the barke of the roote hath a stronger purging quality, and a bitternesse withall, whereby it is able to kill the broad wormes in the body of men or children: the leaves and young tender toppes have a middle or temperate faculty: the ripe berryes if they be taken before meate, doe make passage for the rest to follow, but if after meate, and passe not quickly away, they corrupt in the stomacke and draw the rest on to putrefaction with them, otherwise they trouble little: the juyce, or the syrope made of the juyce of the berryes, helpeth all inflammations and sores in the mouth or throate, and the *Uvula* or palate when it is fallen downe: the juyce of the leaves is a remedy against the biting of the spider *Phalangium*, or any other Serpent, and for those that have taken *Aconite*, the leaves beaten with Vinegar is good to lay on any place that is burnt with fire: the leaves of the Vine, of the earely Figge, and of the *Mulberry*, boyled in raine water is good to wash the haire, to cleare and to give it a faire colour: a decoction made of the barke and leaves is good to wash the mouth and teeth when they ake: if the roote be a little slit or cut and a small hole made in the ground next thereunto, in the harvest time it will give out a certaine juyce, which being hardened; the next day is of good use to helpe the toothache, and to dissolve knots, and purge the belly: the leaves of *Mulberries* are said to stay bleeding in any place of the body, whether it be at the mouth or nostrils, or the bleeding of the piles, or of a wound, being bound unto the places: a branch of the tree taken when the Moone is at the full, and bound to the wrist of a womans arme whose courses come downe too abundantly, doth stay them in a short space, the leaves laid to sleepe in urine doe take away the haire from skins.

CHAP. LXVII.

Sycomor. The true *Sycomore* or *Mulberry Figge*.

Here are two sorts of this *Sycomore* tree, the one bearing fruite out of the body, and greater armes of the tree only, the other upon stalkes without leaves.

1. *Sycomor* sive *Ficus Egyptia*. The *Sycomore* of *Egypt*.

This *Sycomore* groweth to be a very great tree, bigger then the *Mulberry tree*, with great armes and branches, and thereon full of round and somewhat long leaves pointed at the ends, and dented about the edges, very like the round leaves of the *Mulberry tree*, but harder and rougher like *Figge* leaves, this beareth small figs or fruite, and no flower, and that differing from all other trees, for it thrusteth them forth from out of the very trunk or body it selfe onely, and the elder branches next to the body, and now where else, and are very like unto white or wilde *Figges*, and of the same bignesse, but much sweeter, and without any kernels therein, the whole tree and every part aboundeth with milke, if the barke be but gently wounded, for if deepe it giveth no milke at all, which maketh it to beare three or foure times every yeare, new rising out of the places where the old grew (but whereas *Theophrastus* and *Dioscorides* say, that the fruite ripeneth not, unless they be scratched with iron scratchers, and that within foure daies after they will be ripe, the use in these dayes, where they grow is, that they doe ascend the trees, and with small knives, cut a small peece from the head of every fig, while they are Greene, and after the poorer sort of people eat them. The wood hereof is solid, hard and blacke, and abiding fresh, and as if it were still Greene long after it is felled, neither will become dry, unless it be kept under water, and therefore is fittest to make piles in Marshes, or waters.

2. *Sycomor* altera sive *Ficus Cypria*. Another *Sycomore* or *Figge* of *Cyprus*.

This other *Sycomore* groweth to be as great as a *Plummetree*, or white *Poplar tree*, whole armes and branches are stored with broad and somewhat round leaves, like unto the *Elme* (which made *Dioscorides* say it was an *Elme*) but indeed very like unto the former: this also beareth such like fruite like *Figges* but smaller, even no bigger then plummets which rise both from the body, and the greater armes, but not immediately out of them, as in the former, but on certaine stalkes in branches, which rise by themselves, without any leaves with them, and are as sweete as figges, and beare also foure times every yeare, but not unless they be slit, that the milke in them may come forth.

The Place and Time.

The first groweth chiefly in *Egypt*, in *Syria* also, and *Arabia*, and other the places nere thereunto: the other

in Cyprus, Caria, Rhodes, and other the places neere them: they have not bene brought into Italy that I can learne: their Time is exprest in their description.

The Names.

The first is called in Greeke *συκωμορ* and *συκουρ* also by some, but not rightly as *Dioscorides* saith; in Latine also *Sycomorus*, and *Ficus Egyptia*, the Egyptian fig, and is the true Sycomore tree, and *Theophrastus* calleth it *Morus Egyptia*, to called as *Galen* saith, from the likenesse of the tree and the fruite unto the Mulberry, and the Figge. *Helionius* saith the Egyptians now adayes call it *Ficus Pharaonis* in their language, and some *Gumers* as the Arabians doe, the other is called by *Theophrastus* *Ficus Cypria* in Creta, *Marthiolus* calleth it *Sycomore similis*, *Cordus* on *Dioscorides*, *Sycomorus* in Cypro, and *Lugdunensis* from *Rauwolfius* *Ficus Egyptia* *Dioscoridis*, *Sycomorus* *Gregorum*, and *Munaciz* of the Arabians.

The Vertues.

The fruite of the Sycomore trees agree well in the belly, and maketh it solable, but is troublesome in the stomacke, by the overmuch moisture, and giveth but little nourishment to the body: the milke that is taken from the tree, by wounding it gently, and afterwards dried and made into Trochisces, and kept in an earthen pot, hath a property to mollifie hard tumours, to foder or close together the lippes of Greene wounds, the fruite it selfe being laid plaisterwise, worketh after the same manner: the said dried milke is good against venomous creatures and the plague, the same also easeth the paines in the head and eares, and is drunke by them that are splenticke.

1. 2. *Sycomorus* sive *Ficus Egyptia* & *Cypria*.
The Egyptian and Syrian Mulberry Figgetree.

CHAP. LXVIII.

Ficus. The Figge tree.

Here are divers sorts of trees that are called Figge trees, very much differing in kinde one from another, I will therefore in this Chapter onely shew you the sorts of our ordinary eating Figges that grow in Europe, and afterwards of the rest, that have not bene declared before.

1. *Ficus sativa* sive *vulgaris*. The ordinary Figge tree.

This ordinary Figge in our Country in some places, I have seene as great almost, and as much spread as an Apple tree, with a grayish rugged bark on the body, and elder boughes, and Greene on the younger, which are hollow or pithy in the middle, the leaves grow single on the branches, being long and large, thicke, rough, and of sad a green colour on the upperside, and whitish underneath, divided into three, but usually into five parts, yeelding a sharpe bitter, and almost exulcerating milke when they are broken, as the branches and the Figges also will doe when they are Greene, the fruite breaketh out from the branches without any flower, and are both of sundry colours, of severall sizes, and ripening at contrary times of the yeare, as also with thicker or thinner skins that cover them, these that are most ordinary are white, and of a reasonable bignesse.

2. *Caprificus*. The wilde Figge tree.

This Figge tree differeth not from the former but in growing not so great, and that the fruite is small and hard, never ripening on the trees, but falling off unripe and are nothing to sweete or pleasant as the manured, that is ripe and mellow, or soft, but like it while it is Greene and hard.

3. *Ficus nigra* sive *præcox*. The blew Figge early ripe.

This tree also differeth not in the growing from the former, but riseth not to that greatnesse, the fruite is also like the former, and of the same size and bignesse in Spaine and other places, but of a darke purple blackish colour, with an eye of blew as it were cast over them, and blackish red throughout, being not fully so luscious sweete as the ordinary white Figge is: this Figge tree beareth twice in the yeare in the warme Countries, that is, in the Spring about April, and afterwards in the Autumne when the other are ripe: those in the Spring doe seldome ripen kindly, for want of the heate of the Sunne, and by reason of the moisture of the season, yet are they very delicious, so that they quickly both putrifie if they be kept long, and not artificially dried, but quickly corrupt also in their stomackes that eat them, and therefore none dareth eat them, but they must drinke some Wine after them, to helpe to digest them, for if they passe not quickly out of the stomacke, but putrifie therein, they put them in danger to torne them into a fever: and this is that kinde of great blacke Figge, that we have for the best kinde growing with us, which is usually planted against a wall, and yet will not ripen the fruite with us, untill August, and then will be so mellow and soft, and moist that they will be ready to fall about their fingers that handle them.

4. *Chamaeficus*. The dwarfe Figge tree.

The dwarfe Figge tree groweth not much higher with us then to a mans shoulders, with slender branches bending

1 *Ficus vulgaris*. The ordinary Figge tree.4. *Chamaeficus*. The dwarfe Figge tree.

ding downewards : the fruite or Figges are smaller, even in our Country then the last, but of the same colour, and reasonably well stored on them, this is tenderer then the other, and is usually planted in boxes, to be removed into stoves for the Winter time, and set abroad in Summer like our Orange trees.

The Place and Time.

The manured Figge hath beene as I suppose alwayes planted where it grew in any Country, the wild being found so in sundry places, it is thought that both the other came out of *Barbary* into *Spain*, *Italy*, and other places where they grow, and beare ripe fruite both in the Spring and *August*, or *September*, which in *Spain* are after the gathering laid in the Sunne to dry, that they may the better be kept all the yeare after.

The Names.

The tree is called in Greeke συνη and the fruite συνη, in Latine *Ficus* both tree and fruite : the wild Figge tree is called in Greeke συνη δρυς and is called by *Galen* and others, in Latine *Ficus sylvestris*, & *Caprificus* ; the unripe fruite of the manured, as also of the wilde kinde is called in Greeke συνη, and in Latine *Grossus*, but properly *Olynthus*, as well as *Grossus* doe signifie the early ripe of each sort : the dried Figges are called in Greeke συνη, and of some, as *Paulus Aeginetus* and others, in Latine *Carica*, yet *Pliny* saith that *Carica* is a peculiar kinde of Figge, growing in *Syria*, so you see the word is used both by Greekes and Latines, the graines or small kernells within the Figge is called by the Greekes συνη, and by the Latines *Ficaria*, *Pliny lib. 15. c. 19.* calleth them *Framenta*, the early Figges are called in Greeke συνη, quasi *precursores*, in Latine *praecones* and *Grossi* of some as is before said, the branches of the tree are called *Crade* both in Greeke and Latine, yet *Nicander* his interpreter doth call the Figges themselves so. In the West Indies where it hath beene planted by the *Spaniards*, it never looeth the leaves, God so providing them a remedy at all times against the venome of their Spiders, which is the milke comming from the tree, when the leaves are broken off. The first is usually called *Ficus sativa*, or *communis* by all : In our Summer Islands they grow so mellow, as that they will be dried at no hand to be kept long, as those in *Spain* are (which cometh to passe as I thinke, for want of skill in taking them in their fir time, that is, before they grow too ripe and mellow.) The second as I said before is called *Ficus sylvestris* and *Caprificus*. The third is called *Ficus nigra*, or *purpurea*, and of some *Ficus de Algarva*, yet some doe hold that the last or dwarfe Fig is more truly called so, and some that they may be both called *Ficus de Algarva* : it is generally called *Chamaeficus*, or *humilis Ficus*, and *Ficus pumila* by diverse, *Engdunensis* calleth it *Chamaefyce arbore*. The *Arabians* call it *Sin*, or *Fin*, or *Tin*, the *Italians* *Fichi*, the *Spaniards* *Hyygo*, the *French* *Figues*, and the tree *Figuier*, the *Germanes* *Feigenbaum*, the *Dutch* *Feigenboom*, and we in *English* *Figges*, and *Figge tree*.

The Vertues.

The Figge tree is hot, and of thinne parts, which the milke that issueth from the leaves and branches, being broken, and the juyce taken from them, when they are young and pressed forth, doe plainly declare, being exceeding hot, not onely biting and sharpe, or forcibly cleaving, but even exulcerating and offending the mowthes of the veines, and taking away warts, as also that it purgeth, yet is it not safe to take it inwardly, for feare of exulcerating inwardly, yea the branches of the tree are of such an hot temper, that if they be put to boyle with Beefe

Beefe that is hard, it will thereby become tender and soft, the wilde Figge tree, and the milke thereof is more effectfull then that of the manured : if the leaves of the Figge tree be rubbed over the piles, they will open againe and bleed : the Figges themselves are hot and moist, and nourish well, the dried better then the Greene, so they be temperately taken, for the continuall use of them breed ill blood, puffe up the body with loose flesh, and cause them to become lousie; yet *Galen* saith that the use of Figges and Grapes, in his old age, above all other fruit did him least harme : if they be eaten while they are fresh and Greene, they loosen the belly, but doe somewhat trouble the stomacke : the dried Figges doe heate the stomacke, and cause thirst, yet they nourish and are good for the throat, and arteries, the reins and bladder, and to regaine a good colour to them that by long sickness have lost it : Figges are one of *Mithridates* three ingredients into his antidore, against both poyson and Plague, as you have heard before in Wallnuts and Rue : the decoction of Figges, Hillope and Licoris, is a very good Ptfiane drinke to helpe an old cough, hoarsenesse and shortnesse of breath, and all the diseases of the breitt and lungs, and is good also in dropies, and the falling sickness, and for the Quinsie also, a slit figge tosted and held to an aking tooth, doth often ease the paines; two or three Figges slit, and laid all night in *aqua vite*, are very good for those that are puffed and short winded, to take them in the morning. Figges bruised and applied with Barley meale, and the poulder of Fenugreke seede doe mollifie the hard tumours and kernells, under the throat and eares, and elsewhere, as also the hardnesse of the Mother, and if some leaven and salt be put to them, it breaketh Plague sores, and it may be was the same *Hezechias* used : they are mixed also, not as *Pliny* hath it, with *radix asclepiadis*, id est *sterearia* (but with *radix asclepiadis Calcantha*, that is, *Copperas*, as *Dioscorides* hath the word being mistaken by *Pliny*), against the inveterate sores of the legges, and all other foule running ulcers : being boyled in Wine with Wormewood, and then applied with barley meale, are very profitably applied to the belly of those that have a dropisie : and beaten with salt and applied, taketh away the itch and scab, and the ashes also of them being made up into a salve and applied, healeth kibes, and chilblaines : the dried milke of the wilde Figge tree, as well as the tame doth curdle milke like rennet, and dissolveth it being curdled, as vinegar : this milke or the juyce taken from the young lancke branches, is moist fit to use inwardly against the poyson of *Gyssum*, and the *Phalangium* Spider, but outwardly applied it is good for many things, as put into an hollow tooth, it easeth the paine, the same mingled with the juyce of Mustard, and dropp'd into the eares, easeth the paines, noise, and itch in them, and helpeth the deafenesse : applied to a place bitten or stung, by any mad dogge or venomous creature, taketh away the paine and danger together : the same also made up with Barley meale, healeth the running sores of the head, and likewise helpeth the Lepry, Morpheus, the white scurfe, and moist scabbes, pufhes, wheales, and all other eruptions in the skinned, or discolourings in the face : the lye that is made of the branches of the wilde or tame Figgetree, being burnt to ashes, after it is cleered, is accounted among causticke medicines : it helpeth running cankers and Gangrenes, and consumeth Waits and Wennes, by dipping some Woolle or Spunge therein, and daily applying it thereto, and is sometimes dropped into hollow Vleers, that fret and creepe, and are full of moist humours, for it cleneth, sodereth, and bringeth up flesh therein, and closeth up the lippes thereof, like those plaisters that are applied to Greene wounds : it is likewise drunke by them that have the bloody fluxe and old defluxions; to disperse also the congealed blood in the body, by any bruise or fall, adding thereto a little oyle and water, and so it is taken by them that have either rupture or convulsion. *Rezelius* saith, that if a Bull, be never so mad, be tyed to a Figge tree, he will quickly become tame and gentle : and some have affirmed, that the Figge tree and the Bay, are not blasted with lightning. The blew figge is no doubt of the same operation with the white to all purposes, but the fruite cometh molt to maturity with us, and eaten with great pleasure with salt and Pepper.

CHAP. LXIX.

Musa arbor. The Indian Figge or Plantaine tree.

DIvers doe make this tree (or plant, whichsoever you please to call it in that it dyeth yearly) one of the sorts of Dates, but very erroneously, for it may in my judgement be more truly referred to the Figges; as divers others doe, and therefore I thinke meetest to be joyned unto them. It riseth up to the height of fixe or seven cubits, with a straight stemme or stalke, as bigge as ones thigh or arme, not woody at all, but of a soft substance, and as it were composed of a number of foulded leaves together, so that it may easily be cut downe with the blow of a sword, or with a knife, with a pith like marrow within, not spreading any branch at all, but compassed about with many very large leaves foulding themselves as they rise, like the leaves of the flowering Indian Reede; which when they are spread open at large, are each of them a fathome sometimes or more, and usually foure or five foote long, and two foote, or sometimes a yard broad, hanging almost quite downe, with a great thicke rib running through the middle, and not cut in on the edges in any place: the lower leaves still falling away being dried, and broken off with the winde, leaving the stemme or stalke bare, untill it have attained unto above a mans height, where it bussheth forth a many the like large leaves, that are of a darke Greene colour on the upper side, and paler underneath; in the midst whereof thrusteth forth a great long bunch of flowers; as bigge as an Estridge egge, of a russetish purple colour, divided into many clusters, each flower whereof is saith one is *Lilioracis* *major*, *foliorum extrema substringens colore pheniceis*, after which succede the fruite *Minor* *sapiator*. growing in the same manner in clusters, at severall spaces or distances of the great long stalkes, two or three hundred many times together, each whereof is long and round, in some places greater and smaller then in others, some a span long or more (and one sort in the Kingdome of Congo, is smaller, but better relished then the ordinary, yet rare and not to be found but in very few places else that I can learne) somewhat resembling a small Cowcumber, of a firmer substance then a Figge when it is cut, and without any graine or kernell within it, having a little hollownesse in the middle, where it may seeme to be parted in twaine, and are of a darke greenish colour being unripe, but of a whitish yellow if they be suffered to grow to the full maturity, but many doe cut them downe before they are through ripe, and either hang them up in their houses to ripen, or to carry to Sea to spend afterwards, for being gathered ripe, they will not last long: the outer skinned is to be pared or peeled away before

before they are eaten, the inner substance being yellowish, and of a fine sweet taste, not suddenly to be perceived, yet I having tasted of one that Doctor *Pay* gave me, did thinke I had tasted of an *Orris* roote, preserved with Sugar, which per-adventure was not the naturall relish thereof, but a scititious. Under the stalke with fruite, hangeth downe on another stalke, a tuft of leaves, which some while after will bee another bunch of fruite, usually bearing twise, and in some places thrice every yeare: when the stalke is cut downe, some say that it yeeldeth a kinde of water like milke, both for colour and taste, some say also that the roote beareth but once or twise, or thrice at the most: but the certaintie is, that it needeth to be but once planted, for that it continually fendeth forth new stalkes, as the old decay, and in some Countreies are soone ripe after they spring, and will have ripe fruite, from some of the plants at all times.

The Place and Time.

This generally groweth in most Provinces of the East, as well *Egypt* and *Syria*, as the *Indies*; it groweth also in *Brasill*, but is planted onely in the West *Indies*, in *Cyprus* also it will doe reasonable well, but not so in *Candy*, but in *Spain* or *Portugall*, as I heare, it will not beare at all. *Africa* also and *Ethiopia* wanteth it not, and as is said, hath ripe and greene fruite almost all the yeare long.

The Names.

It is very probable that this plant was not knowne to *Theophrastus* unless it be that which *lib. 2. c. 8.* he saith groweth in *Cyprus* with a large leafe, and a much greater fruite, but is not favoury like the rest: and therefore *Guilandinus* refuseth it, nor yet since his time to *Dioscorides* or *Galen*, no nor to *Pliny*, unless as *Clasius* and others thinke, it may be his *Pala*, mentioned in his 12 Booke, and 6 Chapter, whose fruite was called *Ariena*, of a wonderfull sweetnesse, one whereof was able to satisfie foure men, the leafe thereof being three cubits long and two broad, which is somewhat likeli, in that as *Garsia* saith, it is yet to this day called *Pala*, in the Country of *Malabar*, which is on this side *Ganges*, and beyond *Indus*: it is diversly called, every Country almost, giving it a peculiar name, they of *Malayo* *Pisan*, they of *Bengala* *Quelli*, in other places of the *Indies* *Melopalan*, in *Malabar* also *Chincapalones*, they of *St. Thomas* Island *Abella*: it is said that some doe call one sort *Senoryns*, and another *Cadolyns*, the *Portugals* call them *Figos dorta* and *Figos de Cananor*, others *Ficus Martabana*, of some also *Ficus Pharaonis*, they of *Gisney*, and in the Realme of *Congo* *Bananas*; *Lodonicus Romanus*, and *Brocard*, who wrote the description of the Holy Land call it *Adams Apple*, whom *Cardanus*, and others doe follow, supposing it to be the fruite that *Eve* tooke and gave to *Adam*: but the very text of the Scripture convinceth that error, for it is there said, that they sowed Fig-tree leaves together, to make them aprons to cover their nakednesse, when as one leafe hereof had beene sufficient. Some also as *Barbinius* setteth it downe, call it *Dudaim*, but I thinke that name better agreeth to the *Mandrake*. Of the *Arabians* *Serapio*, and *Avicen* *Manz*, *Musa*, *Amusa* and *Manum*; of the *Moors* *Muz*, and *Genez*, of some *Greekes* and *Latines* *Margaita*: they of

Musa arbor.
The Indian Figge or Plantaine tree.

Musa arborifrutus. The fruite of the said Indian Figge or Plantaine tree.

Brasile call the tree *Paguonere*, and the fruit *Facova*, *Ouedm* and *Acosta* call it *Platanus*, for what cause is not knowne, unless the largeness of the leaves enforced that title, but from thence I thinke hath risen the name of Plantaines, whereby our *English* in all places call them by. The *Italians*, *Spaniards*, *French*, and others follow the Latine name *Musa*, and so would J it should be called, or the Indian clutlerfigge, to distinguish it from the other sorts of Figges, that they be not confounded, but not *Adams* Apple as *Gerard* doth, from the superstitious conceits of *Brocard* or others; for wee might as well follow that foolish *Franciscans* that would transfire it to the *Muses*, as gratefull to them. The *Portugals* have a conceit, that if this fruite be cut either thwart or aslope, there will appeare the forme of a crosse therein, and therefore they will not cut any, but breake them all that they eate, which vaine conceit it is likel y they have taken from the *Maronite* Christians, as *Linshoten* saith.

The Vertues.

It is generally held that no man ever tooke harme by eating the fruite hereof, onely by the much eating of them they have become loose and soluble in their bodies, but that they comfort the heart and refresh the spirit: they are also good for coughes, and hoarseness, and to lenifie the sharpness of humours, descending on the lungs: it is also profitable for those whose urine is hot and sharpe, and to provoke it being stopped, stirring up also bodily lust: but they that have any fever or ague must forbear them, but are good for women with child to nourish the birth: although this may seeme to be somewhat hard of digestion to weake bodies and stomackes, yet to stirring and able persons it is not so: the fruite being cut in the middle long w i e, and dried in the Sun, is then more delicate then a Figge: being baked in an oven, it is no lesse pleasant or boyled in broth, yet it will not abide any long boyling. The leaves being soft are commended to coole such as shall lye upon them, and keepe them temperate in the great heates: some also with good effect apply the juyce of the leaves to places burnt with fire.

CHAP. LXX.

Ficus Indicus spinosus. The prickly Indian Figge.

WE have observed two sorts of this Indian Figge, the one greater, not to be preserved a Winter in our Country without a great deale of care and conveniency for it, the other lesser, abiding reasonable well with us: they that set forth the *Peruan* History, doe say that there is two sorts of wilde, one bearing no fruite, and another so prickly, that it serveth to no use, besides the manured which beareth the graine, but with these I must declare the breeding of the *Cochenille*, which is that graine which the Dyers use, and is said to be gathered from these plants, or one of them.

1. *Ficus Indicus spinosus major*. The greater Indian Figge.

This greater Indian Figge groweth in some parts of the West Indies to have a body or trunk as bigge as ones arme or thigh, and from thence shooteth forth his leaves, but in other places, it groweth from a leafe first set into the ground, and there shooting

1, 2. *Ficus Indica spinosa major vel minor*. The greater or lesser prickly Indian Figge.

forth rootes, and others rising out there-of on all sides, and others out of them; and so one out of another, being formed into branches of such leaves, like unto branches of other trees, each of these leaves are very large, and as thicke as ones hand, and larger in many, beset with small sharpe, and somewhat long white prickles or thornes; dangerous if undadvicedly they be handled, but in *Europe* they are not so thicke set, nor so sharpe but in many places of the leaves, the knots or places where they stood are void: the flowers come forth at the toppe of the fruite, which is at the first like unto a leafe it selfe, and breake out on the side of the greater leaves sometimes, as well as on the tops composed of eight or twelve pale yellow leaves, set in a double row with certain yellow threds tipt with red in the middle: after the flower is withered, yet still abiding on the head of the fruite, it groweth greater and sheweth it selfe to be long, and rounder then the leaves, and flatter at the head, and like unto a Figge, which fruite also is armed with prickles as well as the leaves, and is whitish, which is taken to be the better, or of a reddish or yellowish colour on the out side, or greenish and very red within, full of a watery substance, tasting sweete and pleasant, with diverse feedes therein, and by eating

M m m m m

them

them will cause the urine to be tinged like blood it selfe: the roote groweth neither deepe nor farre abroad.

2. *Ficus Indicum spinosus minor*. The lesser prickly Indian Figge.

This lesser Figge groweth more often with us, from leaves as farre as I can learne, yet I have knowne it rise from the sowne scede, and never into a body or stocke like the former, and is in all the rest as like it as may be, with our any difference but onely the greatnesse, which in this is neither halfe so great or thicke, or the growth halfe so high, and this declaration may be sufficient to describe it by comparing the former discourse herewith that I doe not make a double repetition of one thing.

3. *Cochinille five Fici Indici grana*. The Dyers graine called Cochenille.

There hath beene much doubt and many variable opinions, concerning the breeding of the Cochenille, some taking it to be the *Coccinidium verum*, others to be the *Chermes Arabum*, and that it differeth not from the *Coccus Baphicum* of the *Grecians*. *Fragosus* would seeme to know more then others, and in his third Booke and 15.

Chapter, saith that they are certaine graines that grow in *Pern*, at the rootes of certaine small plants, that are like unto the common Burnet Saxifrage, cleaving to the rootes of it like wild Grapes, but is utterly erroneous for *Pern*, his opinion as it seemeth being taken from *Angulara*, and *Lacuna*, who say that there are certaine graines found in some places here with us, growing on the rootes of the Burnet Saxifrage, whose inner pulpe doth give a crimson dye, and is therefore called *Coccus radicum*, that is, the roote graine: some have taken them to be flies, or such like covered with a small thin skin or case, and sticking under the leaves of this Indian Figge: but *Ioannes de Laet* of *Antwerpe*, in his fifth Booke and third Chapter.

Fici ejusdem Indici fructus. The fruite of either of the Indian Figge trees.

page 229. of his description of the West Indies, sheweth us the truth hereof more exactly then *Ovidius* or many other that have written thereof I thinke, and saith that besides the two wild sorts, whereof one giveth no fruite and the other so prickly that it is of no use, and the tame or manured sort that beareth fruite that is very sweete and of a most pleasant taste, and either white which is esteemed the best, or red or purple, which dyeth the hands with a bloody colour, even as Mulberryes will doe, and being eaten coloureth the urine also into the same bloody colour. There is saith he another sort, called by the Indians *Nochezali* *Nopalli*, or *Nopali Nochezali* which although it beareth not such like fruite, yet it is more accounted of, and husbanded with more care and diligence because it beareth that precious graine *Cochinille*, so called by the *Spaniards*, as a diminutive from the *Coccus* of the ancients, so much sought after, and used by Dyers, for the excellency of the colour: This plant loveth those places that are temperate: *Herrera* describeth the manuring and ordering thereof, and *de Laet* from him in this manner: The graine Cochenille is bred on the tree, which is called *Tuna*, in very many of the Countries of the West Indies, and new *Spaine*, which hath most thicke leaves, whereby it is increased in those places that are open, and yet defended from the North: It is a living creature, or rather a kinde of Insect or flye, not much differing, but coming neere unto a runie or wall louse, being somewhat lesse then a flea, when it first getteth to the plant, and bred from a seed no bigger then an hand worrne, and doe so load the trees, and fill the whole Garden, that they must gather them twice every yeare from the trees, which they set in order and tend like their Vines, and free them from weedes, or what else may hurt them: the younger the trees be, the more plentifully will they beare, and the better graine, but especially it is necessary for them to cleere them from the other sorts of flies, and no lesse keepe away their hens, who will devour the graine: and to cleare their trees from the increase of these other sorts of flies, they use Foxetailes, and when they are growne full ripe, they gather them with great care, and kill them by casting cold water on them, and dry them in the shadow, and keepe them in pots: some kill them by casting ashes amongst them, and afterwards wash them, and others choke or kill them by some other wayes: but it is the best way to kill them with cold water. But now this graine is adulterated by the Merchants, after divers manners, for there are foure sorts to be found hereof: the one giveth a colour of no great worth, as being a wilde sort and not manured: another is blacker, which groweth also of it selfe, without care or husbandry, a third is a mountainous sort called *Chichimeca*, and of a meaner regard, all which they mingle together with the fourth, that is the best and manured. The divers sorts hereof among the Merchants have severall names, according as the *Spaniards* call them: every sort according to the goodnesse hath a name whereby they know it, as *Silvester* and *Tuikaliobe*, the two worst sorts, being of a blacke dull colour, yet the largest graine. *Musfeko* is a gray sort, and is the most ordinary we have, but the *Golbaca*, is in colour betwene both, in size no bigger, but in goodnesse much excelleth them all, and is not much inferiour to the *Rosetta*, which is the

the reddest in shew, and the richest in use of all. And *Texcala* giveth the best sort of graine by far. *Franciscus Zimenez*, writeth that this plant bringeth forth a certaine gumme, which doth temper the heate of the reines, and of the urine, and that the juyce or water distilled from it, is a wonderfull remedy against pestilentiall and chollerick feavers. The Chochenille or graine it selfe is held to be very cordiall, and to drive infection from the heart, for it is familiarly given both to the infected with Plague, Small poxes, or other infections or dangerous sicknesses.

The Place and Time.

Both these sorts grow in the West Indies, the greater sort all the Indies over, from *Florida*, and the other on this side it, where the greater is not found, as being a colder Country then that the greater can live in it, and flourish with us about the end of *May*, or in *June*, and the fruit ripeneth not with us kindly at all, but abideth on all the Winter, and the next Summer too, and yet will be greene on the outside, and waterish or unfavoury, although somewhat reddish within, but more red within than without, and sweete also in the naturall places.

The Names.

Divers Authours have given divers names unto these plants, for *Matthiolum*, *Dodonaeus*, *Lacuna*, *Lobel*, *Cesalpini* and others call it, *Ficus Indica*, divers of the Indians that be Islanders call it *Tuna* or *Tunal*, they of *Mexico* and thereabout *Nochtli*, and as I shewed before *Nochezeli Nopalli* or *Nopalli Nochezli*, and in some places also *Cardi*, but that I thinke is by the *Spaniards*, and thereupon it was called *Cardius Indicus*, and *Ficus India*: diverse did take it to be the *Opuntia* of *Theophrastus* and *Pliny*, but erroneously, for they both say, it is an herbe fit and sweete to be eaten, but the leaves of these are not used to be eaten, neither is it an herbe or plant, naturall to any of the nations of *Europe*, *Africke* or *Asia*, but a peculiar kinde of it selfe; but *Opuntia* is an herbe growing naturall about *Opuntia*, and is usually eaten, and therefore this cannot be it but another herbe, as I have shewed in the Chapter of *Opuntia marina*, among the Sea plants: some also call it *Pala arbor* *Pliny*, as *Belonius* and *Anapallus* also: The lesser sort is called by *Lobel Indorum ferrum nativum*, and *Opuntia Ostocollis*, and by *Banbinus Ficus Indica folio spinoso fructu minore*.

The Vertues.

It is said that the Indians use to lay these leaves bruised upon places that are put out of joynt, or the sinewes or Arteryes over stretched, and to helpe those that are bursten or broken to knit up the places againe: the juyce of the leaves is with good successe used in foule ulcers or sores: The vertues of the graine are set downe a little before at the end of the declaration thereof.

CHAP. LXXI.

Ficus Indica Aenata.
The arched Indian Figge tree.

Ficus Indica aenata.
The arched Indian Figge tree.

His admirable tree for so it is called by many, groweth to be a great tree, and tall, spreading many armes all about, and very long which by reason of the slenderesse and length, bend downe to the ground, shooting forth certaine yellowish stringes at their ends, which as soone as they come to the ground, doe thereinto thrust themselves as strongly as the first, which againe send forth other branches after a while that they are well growne in the same manner as the first, for they also in time grow great, and spread their branches, which likewise bending downe take roote againe, and thus successively one after another, untill it hath taken up a great compasse of ground, even a mile as it is said in compasse, and made as it were a Grove or Wood from that one first tree, whereunder the Indians doe shelter themselves from the heate of the Sunne, and so prune away the under boughes, and branches that they make divers walkes and crosse wayes through these trees, leaving their branches over head as arches to passe under to and fro, and cutting out some looke holes as it were, to give light and ayre to a thousand men, and more that may be sheltered under the shadow of this one tree, with the suckers thereof, among so many of whom it is hard to finde out the originall or mother stocke, the leaves on the young branches are like unto Quince tree leaves, greene on the upper side, and hoary white like them underneath, wherewith Elephants are much delighted to feede, and whose branches they cut downe to give them: the fruit groweth among the branches no bigger then the end of ones thumb, but fashioned like a Figge of

Mmmmm 2

a blood

blood red colour both within and without, somewhat sweete like unto them, but not so pleasant.

The Place and Time.

This tree groweth in divers places of the East Indies, as at *Goa, Malacca, &c.* and abideth alwayes green giving ripe fruite at the time with others in that Country.

The Names.

This tree is mentioned first by *Q. Curtius*, lib. 9. who wrote the acts of *Alexander*, in his warres into the Indies, and by *Theophrastus* also lib. 4. c. 5. who lived neere that time, and calleth it *Ficus Indica*, as *Pliny* also lib. 12. c. 5. after him doth: *Strabo* also although hee gave it no name then, or of the admirable tree, yet here by you may perceive that it is no new found tree in these later dayes, but knowne and written of by the Ancients. *Goropius* would draw this tree into Paradise, and make it the tree of the knowledge of good and evill, that God had planted in the midst thereof, and forbad *Adam* the eating, and of which by eating, he brought a woe of himselfe and his posterity, so bold is he to take upon him to know that which he hath no authority or prooffe for, but onely led by fancies and strong conceits, about the river *Acefine*, in those parts where this groweth, and therefore Paradise must needs be there also. The Portugals call it *Arbor de ray*, that is the tree of rootes, and there upon *Lincolne* in his Booke figureth a tree with a number of rootes thereto, rather out of fancy then sight which *Clusius* mistooked. Some doe call it *Arbor Goa*, but of most *Ficus Indica*, and I have added *arcuata* for a difference from others.

The Vertues.

The fruite is good and wholesome to be eaten, but I cannot learne if ever it was applyed to cure any wound or ulcer in the body, or used in Physicke, for any disease.

CHAP. LX XII.

Pyrus. The Peare tree.

BEcause Peares are so like unto Figges in the outward forme of them, I thinke good to joyne them next thereunto, whereof there is both manured and wilde: the manured doe transforme themselves into so many severall fashions, colours, and tastes, that it would take up many leaves to describe them at large as they might be, for not onely every Country abroad, and beyond the Seas, have severall sorts, which we never saw or heard of, but in our owne Land also, there are so many that it is almost impossible that they should all come to one mans certaine and particular knowledge (yet have I shewed you a many of them in my Orchard heretofore.) Of the wild sorts like wise there are

1. *Pyrus sativa.* The manured Peare tree.

2. *Pyrus sylvestris.* The wilde or Choke Peare tree.

both abroad and at home such variety, that a man might spend his whole time thoroughly to observe and set downe all the sorts that are knowne in other places. I will therefore endeavour but to shew you here a generall description of the tree, both tame and wilde, with some sorts that are not expressed in my former Booke.

1. *Pyrus sativa*. The manured Pear tree.

The manured Pear in generally groweth higher, but slower then the Apple tree, more upright also and not spreading the branches, and no lesse thicke, but rather greater in the bulke or body: the leave are somewhat broader and rounder, greene above and whiter underneath then those of the Apple tree: the flowers are smaller but whiter then the Apple blossomes, and the fruite more long then round for the most part, smaller also at the stalk, and greater at the head, of many differing fashions, sizes, colours, and tastes, and times both in gathering and spending, some being greene, some russet, other yellowish or reddish, some great, others small, or long, or round, or smooth, or bunched out, and so for tastes also, sweetish or luscious, or delicate or waterish, or hard and firme, and well relished, or nor so good to be eaten raw, as baked or roasted, and some to be spent as soone as they are gathered, or soone after, before Summer fruite, others not to be spent untill the Winter be either come in, or neere or fully past; each particular to every fruite were too tedious: for this Worke being growne already to voluminous, and seeing I have shewed them in part elsewhere: The wood is smooth close and firme, and serveth for many uses, both for formes to cut the figures or the like in, and instead of waincot in many poore mens houses, and for many other purposes.

2. *Pyrus sylvestris*. The Wilde or Choake Pear tree.

The wilde Pear tree usually groweth tall and upright, like the manured kinde, and as little spreading, but sometimes low and crooked, but fuller of branches, which maketh them the more knotty, the bark is blacker and more rugged, cleaving also in many places, and easily to be pulled off; with prickles and thornes set here and there on them, but not so thicke as in the Crab, the leaves and flowers doe little vary, but that some will have larger and others lesser leaves and flowers, which will also be a little deeper coloured then others, as the fruite being greater or smaller, and of a more or lesse harsh taste, although all have some, and the colour likewise in some is greene or darke russet, and some will be so faire, yellow and red, that they would invite any that seeth them and knoweth them not to take and taste of them, which then are so different from their expectations, being harsh and unfavoury, that they presently out with their puries and bestow this adage there on, *Non est semper fides habenda fronti*: yet this harsh unfavoury fruite, though later ripe then most of the manured sortes, by being in part mellowed with the Autumnes coldes, and the standing of their juyce being pressed forth and made into Perry, doth in time to alter his former quality of harshnesse and unfavourinesse, that it becommeth fully as cleere, and almost as pleasant as white wine: the wood hereof is harder, firmer, and closer then the former, and so more knotty also, whereby it becommeth more frangible and sooner broken.

Of the manured Peares there is a sort that although it be a good Winter fruite, sweete and well relished, especially if they be stewed or baked, yet the tree hath thornes upon it, like unto the wild sort, this was brought as it is said from *Naples* into *Lyons*, where it is plenty, and called *Poirier d'espine*, and the fruite *Poire espine*, that is, *sativa*, *Pyrus sativa spinosa*, the prickely Pear.

The winged Pear hath a leafe alwayes, or two sometimes, growing to the sides of it, as if it came out of the Pear, and may therefore be called *Pyrophilla*, whereof *Camerarius*, speaketh in *horto*.

The Pome-pear, or Apple-pear, which is a small Pear, but round at both ends like an Apple, yet the tree is a

Pear tree.

The Blood Pear, whose inside is red, as the outside is, *Camerarius* in *horto* maketh mention hereof likewise.

The Laxative Pear which looseth the belly being eaten, *Camerarius* there also hath this.

The double blossomed Pear. This bore double flowers with Master Ward, of the Kings Granary, but whether

it be alive or dead, I am not assured; nor whether it kept the forme, or did alter.

Pyrus sylvestris. The wilde Pear tree.

1. Of the wilde kinde there are the great red Choke Pear, whose colour and property, I have shewed you in the description.

2. The smaller Choke Pear.

3. The Hedge Pear.

4. The lowlie Hedge Pear.

5. The Crow wild Pear.

6, 7. Wild Peares of Candy, the one they call *Achblades*, the other *Agusaga*, as *Bellonius* saith.

The Place and Time.

The manured sorts are onely planted and preserved in Orchards for the purpose, the wilde sorts being some found in our owne Woods, and planted in the Hedge-rows of fieldes, to save the ground of their growing, and yet have as much use of them as by being abroad, the wild flowering and ripening their fruite later then the manured.

The Names.

The manured Pear is called in Greeke *ἄμϐ*, and in Latine *Pirus*, and *Pyrus a fructus figura quad ad Pyramidam similitudinem, elato in mucronem turbinetur*: The wild Pear is called *ἄχϐς* in Greeke, by *Theophrastus*, a *privativo usq*, *quod non sit in usu fructus ejus ad humanum corpus*, yet *Dioscorides* saith, *ἄχϐς* is a kind of wilde Pear of it selfe, and *ἄχϐς* in Latine *Pirus sylvestris*, and *Pyrafter*, or *Piraster*: all peaceable ages have bene much delighted with the variety of all sorts of edible fruites, and therefore *Cato*, *Columella*, and others, but especially *Pliny* hath set downe the names of a number, as they were well knowne in his time which how our age can parallell ours unto them, I cannot tell; yet *Lugdunensis* hath in some sort endeavoured it to his French names, but how truly I know not, nor is it greatly materiaall for us to doe, because names are often given from the place where they best grow, or from the person that first brought them into their Country, or was much delighted with them, or from some other cause or accident, which names are not so fit for one Country as another: Wee have so many in owne Land, that I never knew any one that could be possessed of all sorts, although they strove to doe it as much as in them lay, for still they were informed of some they had not: And I have declared a many of them in my former Booke. The *Arabians* call it *Hameeth*, *Cirmetre*, and *Kemetri*, the *Italians* *Pere*, the *Spaniards* *Pyras*, the *French* *Poires*, the *Germanes* *Bir Biren*, and *Piren*, the *Dutch* *Berre*, and we *Peare*.

The Vertues.

Peares of any good or reasonable relish are more spent for meate then medicine, and most of them eaten raw at severall times as they be fittest to spend, or else stewed or baked, as the kinde doth best sure, and every one list to use them: the sorts also that are fittest for the purpose are dried in ovens to keepe all the yeare, being an excellent repaste: some are preserved in Sugar, as other fruites are, and served in banquets among other sweet meates, or dried up after they are preserved and so put among other dry candid lunctets. The Warden is chiefly, yearely admitted to be taken by the sicke, and aguish in that it hath no astringtion therein to breede obstructions, which are the utter enemies to putrid feavers. The wilde Peares by reason of their harshnesse, are not eaten as the milder sorts are, except some good kinde stewed or baked, to serve the poore peoples dyet, the other scarce fit for the hogs to eate, and therefore are for the most part where store of them grow, beaten and pressed into a liquour which is called Perry, of especiall good use at Sea in long voyages, to mingle with their fresh water, to make it the more healthfull, or lesse offensive to those that must continually drinke water: and will after some time become so milde almost as Wine, and fit and wholesome to be drunke: The Physicall uses of them both are these: They are to be discerned best by their tastes, for according to *Galens* rule, the harsh or sowre doe coole and binde, the sweete doe nourish and warme, and those that are neither much sweete or sowre, but betwene both, have answerable qualities to their degrees: all the sweete or luscious sorts doe helpe to moove the belly downwards more or lesse, but that sort much more, which hath the name of the Laxative Peare: those that are harsh or sowre, doe on the contrary part binde the belly as much, and the leaves doe so also: those that are moist doe in some sort coole, but the harsh or wilde sorts much more, and serve well to use in all causes, where there is neede of repelling medicines, and if the wild sorts be boyled with Mushromes, it maketh them the lesse dangerous, and it is said also that the ashes of the Peare tree wood being taken in drinke, or the lye of them being drunk, doth helpe them that are like to be choked with eating Mushromes: The said Peares boyled with a little hony, doth helpe the stomack very much, that hath any paines or oppression therein, all sorts of them somewhat or lesse, but the harsher sorts doe most coole and binde outwardly applyed: and serve well to be bound to greene wounds, to coole and stay the blood, and to helpe to heale up the wound without inflammation or further trouble: Which course *Galien* himselfe as he saith was driven to use upon an exeigent not having any other thing at hand for the purpose: Wild Peares therefore in the like case doe more close up the lippes of greene wounds then the other. Perry is a drinke that whosoever useth at home being not accustomed to it, will wring them a little by the belly, and will a little force it downward, but being more used it worketh not so at all, but rather cooleth an hot or fainting stomacke, helping the digestion being temperately taken: but at Sea by the working thereof it is made more comfortable, taking away the crudity and rawnesse of the water.

CHAP. LXXIII.

Malus. The Apple tree.

The Apple likewise is divided into tame or manured, and wilde, the one serving for Orchards, to be tended and regarded, the other to be left to the Woods and Hedge rowes of fields, &c. as I did therefore with Peares in the former Chapter so I meane to deal with Apples in this, give you a generall description both of tame and wilde, and the other sorts, that is, especially the Wildings or Crabbes, which were not mentioned in my former Booke.

1. *Malus vulgaris.* The common Apple tree.

The Apple tree in generall spreadeth his armes and branches more then the Peare tree, but riseth not to that height, the leaves are somewhat round, a little long pointed towards the ends of them, and dented about the edges greene both above and below: the flowers white and a little bluish coloured about the edges, consisting of five leaves, the fruite that followeth in this as in the former, is of divers sizes, formes, colours, and tastes, and likewise of variable ripening and lasting, for some will be rotten before others be ripe, and some must be spent, before others be gathered.

Floris duplici-
ci.

The double blossomed Apple differeth from the former in nothing, but in the flowers, which are double, and that it beareth no fruite.

2. *Malus sylvestris.* The Wilding or Crabbe tree.

The Crabbe groweth somewhat like the Apple tree, but full of thornes, and thicker of branches the flowers are alike, but the fruite is generally small and very sowre, yet some more then others, which the Country people to amend, doe usually rost them at the fire, and make them their Winters juncckets: whereof some are redder or whiter, or greener, or yellower then others, being seldome much regarded, or distinguished more then to make Cyder or Verdusoyce of all sorts being indifferently put together.

3. *Chamaemalus.* The dwarfe or Paradise Apple.

The Paradise Apple is also a kinde of wilde Apple, yet no Crab, for it is not grafted like the manured sorts, but as the Crab, riseth without grafting to be a tree of low stature, not much higher then a man may reach, having leaves and flowers like the former: the fruite is of a reasonable size, faire and yellowish, but light and spongy, of a bitter sweet taste, not pleasant, and will not last long but quickly shrinke and wither: the body and branches are much subject to the Canker, which will quickly eate it round and kill it, and besides will have many scabby bunches that deforme it and cause it to perish, and this as it groweth elder, for it is full of suckers, from the roote, which will be as faire and smooth, as of any other tree.

Pomogranata.

Of the manured sort there is one whose flowers are wholly white & smaller, the tree lower and the fruite smaller. There is another which hath no kernels within the core.

Of the manured kinde, the *Holland* Pippin must be remembered, which is a flat and yellowish greene Pippin, and of as good a relish as most of the other Pippins, and of a meane size.

Of Wildings or Crabs, there is the Towne Crab, the greater and lesser red Crab, the greater and lesser white Crab, and the small hedge Crabbe.

The

Malus. The Apple tree.

Malus sylvestris. The Wilding or Crabbe tree.

The Place and Time.

The better sorts of Apples are planted in Orchards, and some of the other, as the dwarfed kinde, the Wildings or Crabbs grow in Woods generally, yet are planted in the hedges in many Countries of this Land to make Cyder withall, the Apples in generall flower, and bud forth leaves later then Peares, and ripen earlier or later for the most part, according to the kinde.

The Names.

It is called in Greeke *μηλιά*, and the fruite *μήλον*, in Latine *Malus* and *Malum*, or *Pomus* and *Pomum*, yet *Pomum* is a generall word including the fruites of many other trees, for some would distinguish all sorts of fruites into *Pomum* and *Nacem*; but *Scaliger* saith the opinion of those Grammarians is too ridiculous: it is therefore usually called *Malus*, but yet that word likewise is referred to divers other kindes of trees, as *Malus Cydonia* five *Cotonea*, *Malus Medica* vel *Citria*, *Malus Limonia*, *Malus Aurata* seu *Aurantia*, *Malus Persica*, *Malus Punica*, *Malus Arminiac* vel *præcocia*, and many others, and *Pliny* numb'reth *Zizypha* and *Tuberos* among them, who reciteth the names of a number of sorts frequent with them, as he doth every where with other sorts of fruites, which to relate here were impertinent. especially to us, who can apply but very few of them to those sorts are knowne among us, and to save time to spend to better purpose. *Cornarius* taketh the *Cassiana mala* which *Columella* calleth *Sesfiana*, to be the *Aurantia* Orange: but *Galen* appointing the *Cassiana mala* to be boyled, to give one for the head ache, did not meane the Orange, which was neither knowne to him or in his time, nor yet is used to be boyled. The Arabians call it *Tufa* and *Tufalia*, the Italians *Mele*, the Spaniards *Manzanilla*, the French *Pomier* and *Pome*, the Germans *Deppffel* and *Apffel*, the Dutch *Appel*, and we *Apple*.

The Vertues.

Apples in generall are cold and windy, and being of sundry tastes, *Galen* sheweth thereby how to distinguish them, for some have an austere taste, and are good for fainting stomacks and loose bellies, others sower good to coole and quench thirst, and some sharpe, fit to cut grosse flegme, some sweete soone distributed in the body, and as quickly passed away, yet sooner corrupting in the stomacke if they be stayed: the best sorts before they be thorough ripe, are to be avoyded; then to be rotted or scalded is the best way to take them, and a little spice or feedes mixed or cast upon them, and taken after meate, doe strengthen both stomacke and bowels, especially in those that either loathe their meate or hardly digest it, and for those that are given to casting, or have a fixe or laske; those that are not sweete, but rather a little sower or harsh, used in that manner are fittest: Sweete Apples doe loosen the belly, and thereby drive forth the wormes that are therein: sower Apples stoppe the belly, and provoke urine; Crabbs for this purpose are the fittest: The sweete Apples, as the Pippin and Pearmaine helpe to dissolve Melancholly humours, to procure mirth and expell heaviness, and therefore are fittest for *Confectio Alkermes*, and *Syrupus de pomis*: The leaves boyled and given to drinke in hot agues, and where the heate of the liver and stomacke causeth the lippes to breake out, and the throate to grow dry harsh and furred, is very good to wash and gargle it withall, and to drinke downe some; this may to good purpose

purpose be used, when better things are not at hand, or cannot be had: the juyce of Crabs, eyther Verdjuice or Cider is of singular good use in the heate and faintings of the stomacke, and against casting, to make a posset with some of it, and drinke, or take some thereof by it selfe: Cider is not onely called in the North Country Wine by those beyond Seas, but is used almost as wine in divers Countries of this Land where it is made, and as I said of Perry before, to a stomacke unacquainted with it, it will be somewhat trouble some thereto, and to the belly, yet by the often use of it, it becometh familiar and helpfull to those that have fainting or weaknesse of the spirits and stomacke, somewhat comforting and refreshing the vitall Spirits; it is of great use at Sea in long voyages, and is more desired then Perry. The juyce of Crabs or Cider applied with wet clothes therein, to scalded or burnt places, cooleth, healeth, and draweth forth the fire: a rotten Apple applied to eyes that are blood shot, or enflamed with heate, or that are blacke and blew about them by any stroke or fall, and bound to all day, or all night helpeth them quickly: the distilled water of rotten Apples doth coole the heate and inflammations of fores, and is good to bathe soule and creeping ulcers, and to wash the face to take away spots, freckles, or other discolourings in the face, the distilled water of good and sound Apples, is of speciall good use to procure mirth and expell melancholly; the oyntment called *Pomatum* if it be sweete and well made doth helpe the chaps in the lips or hands, or to smooth the rough skinne of the hands or face, parched with winde or other accident, to supple and make them smooth.

CHAP. LXXIV.

Malus Cydonia. The Quince tree.

Here are foure or five sorts of Quinces knowne to us in these dayes, which are as followeth.

1. *Malus Cotonea vulgaris.* Our ordinary Quince tree.

The ordinary Quince tree groweth oftentimes to the height and bignesse of a reasonable Apple tree, but more usually lower and crooked, with a rough barke, spreading armes and branches farre abroad: the leaves are somewhat round and like those of the Apple tree, but thicker, harder, fuller of veins, and white on the underside, not dented at all about the edges: the flowers are large and white, sometimes dasht over with a blush: the fruite that followeth is yellow, being neere to be ripe; and covered with a white freeze or Cotton, thicke set on the younger, and growing lesse, as they grow to be thorough ripe, bunched out oftentimes in some places, some being liker an Apple, and some a Pearce, of a strong heady sent, and not durable to keepe, and is sowre, harsh, and of an unpleasant taste, to eat fresh, but meth very pleasant.

2. *Cydonia Lusitanica.*

The Portugall Quince.

The onely difference in this is in the fruite, which is of two sorts, the Apple Quince is great and yellow, seldome coming to be whole or seene without chapping, it is so pleasant being fresh gathered that it may be eaten like an Apple without effence, but dressed after any the wayes aforesaid, it is much more pleasant: the pearce Quince is like the other, but not fit to be eaten raw like the former, but must bee prepared after some of the wayes before set downe, and so it will take up lesse Sugar then the *English*, because it is pleasant of it selfe.

3. *Cydonia Barbarica.*

The Barbary Quince.

This is like unto the last in goodnesse and pleasantnesse, but lesser in bignesse, not cleaving at all.

The *Lyon* Quince is a reasonable great Quince, like the *English*, but not so yellow as the *Portingall* sort.

The *Brunswicke* Quince is almost round, neither like pearce nor Apple.

The Place and Time.

The first is our *English* Quince, that best likes to grow neere ponds and water sides, and is frequent through the Land, the other have their places expressed in their titles: and flower not untill after the leaves be come forth; the fruite being ripe of the *Portugall* and *Barbary*, about the middle of September usually, the other later by a moneth,

The Names.

It is called in Greeke *μηλάνθη*, and in Latine *Malus Cydonia*, a *Cydone* Crete oppido dicitur unde prima advecta laith *Pliny* Cato first called it *Cotonea Malus*, and *Pliny* after him; *Dioscorides* and *Galen* have but two sorts, the one small and round, and the other greater but lesse usefull, called *Struthia*,

Malus Cotonea vulgaris.
The ordinary Quince tree.

which

which as *Galen* saith is so called in *Asia*, *Columella* setteth downe three sorts, *Struthia* great ones, *Chrysomela* gold colour, and *Musica* carely ones, but little. *Virgill* in his third *Ecclog.* calleth the *Chrysomela* a wild sort in these Verses.

*Quod potui, sylvestri ex arbore lecta
Aurea mala decemisti, cras altera mittam.*

But *Pliny* hath erred very much in saying that the *Struthia* or *Struthiomela*, are small, contrary to *Dioscorides*, *Galen*, and *Columella*. The *Arabians* call it *Saffargel*, the *Italians* *Melocotigno*, the *Spaniards* *Membrillio*, and *Marmello*, and from thence is our *Marmelade* of Quinces called *Marmelades*, the *French* *Coing*, and *Pomme de coing*, the *Germanes* *Kutten* *Quitzenbaum*, and the fruite *Kuttenopffell*, the *Dutch* *Queboom* and *Queappel*, and we *Quince* tree, and *Quince*.

The Vertues.

Quinces have a cold and earthy faculty in them, and by the reason of their great binding, they moisten the body lesse then other fruites, for they are cold in the first, and dry in the second degree: they are acceptable to the stomacke, but much more baked, roasted, or scalded then other wise: yet when they are Greene they helpe all sorts of fluxes in man or woman, and chollerick laskes, castings, and whatsoever needeth astringtion, more then any way prepared by fire, yet the Syrupe of the juyce, or the conserve, is somewhat conducibile for much of the binding quality is consumed by the fire: if a little vinegar be added, it stirreth up the languishing appetite, and the stomacke given to casting, and if some spices it comforteth and strengthneth the decaying and fainting spirits, and helpeth the liver oppress, that it cannot perfect the digestion, and correcteth chollour and flegme: if you would have them purging, put honey to them in stead of Sugar, and if more laxative adde for chollour *Rubarbe*, for flegme *Turbith*, for watery humours *Scamony*: but if more forcibly to binde, use the unripe Quinces with *Roses* and *Acacia*, or *Hypocistia*, and some torrefied *Rubarbe*: To take of the crude juyce of Quinces is held a preservative against the force of deadly poyson, not suffering it to have any force in the body, for it hath bene often found most certaine true, that the very smell of a Quince hath taken away all the strength of the poyson of *Eleborus albus*, which Hunters make to kill wild beasts, by dipping their Arrow heads therein: it hath bene also found certaine, that if Quinces be brought into a house where Grapes are hung up to be kept dry all the yeare, they will assuredly rot with the very smell of them: If there be neede of any outward binding and cooling of any hot fluxes, the oyle of Quinces, or the other medicines that may be made thereof, are very available to annoynt the belly or the other parts therewith, it likewise strengtheneth the stomacke and belly, and the sinues that are loosened by sharpe humours falling on them, and restraineth immoderate sweatings: the macilage taken from the seeds of Quinces, boyled a little in water, is very good to coole the heate, heale the sore breasts of women, who have them sore by their childrens default or otherwise: the same also with a little Sugar is good to lenesie the harshnesse and hoarsenesse of the throat, and roughnesse of the tongue: the cotton or downe of Quinces boyled in Wine and applyed to plague sores, healeth them up, and laid as a plaister made up with waxe, it bringeth haire to them that are bald, and keepeth it from falling, if it be ready to shed.

CHAP. LXXV.

Malus Medica vel Citria. The Pomecitron tree.

Although diverse have used this word of *Malus Medica*, to comprehend under it all the other kindes of Lemmons and Orrenges, yet I meane to distinguish them severally, and take it but for one kinde, which as the most principall, I will set in the first place and the rest to follow, whereof there hath bene observed in divers Countries, divers varieties, and their names set downe by sundry Authors, which how they doe agree together I cannot tell, so few of them having bene seene in our Land. I will therefore here shew you those few that *Clusius* hath set downe, with some others of our owne observation

1. *Malus Citria major.* The greater Pomecitron tree.

The greater Citron tree groweth not very high, in some places but with a short crooked body, but in others not much lower then the Lemmon tree, spreading sundry great long armes and branches set with long and sharpe thornes, and faire large, and broad fresh Greene leaves a little dented about the edges, with a shew of almost invisible holes in them, but lesse then the Orenge leaves have, of a very sweete sent, the flowers grow at the leaves all along the branches, being somewhat longer then those of the Orrenge, made of five thicke, whitish, purple or bluish leaves with some threds in the middle, after which all the yeare long followeth fruite, for it is seldome seene without ripe fruite, and halfe ripe, and small, young and Greene, and blossomes all at once: This kind beareth great and large fruite, some as great as a Muske Melon, yet others lesser, but all of them with a rugged, bunched out, and uneven yellow barked, thicker then in any of the other sorts, and with small store of sower juyce in the middle, and somewhat great pale whitish or yellow feede with a bitter kern. If lying in it, the smell of this Apple is very strong, but very comfortable to the senses.

2. *Citria malus minor sive Limonera.* The lesser Pomecitron tree.

This lesser Citron tree groweth very like the former, but the leaves are somewhat lesser and shorter, and so are the thornes also. The flowers are of a deepe bluish colour, and the fruite lesser and longer then they, and no bigger then the lesser fruite of the former, the rinde also reasonable thicke and yellow, but not so rugged, having more store of sower juyce within them, and fewer feedes.

3. *Citria malus sive Limonera pragnans.* Bigge bellyed or double Citrons.

This differeth not in the tree or any part thereof from the last, but in the fruite, which is as great as the last, and a little paler yellow on the outside, having another smaller fruite growing within it lying at the very top or head, yet not to be seene before you cut it, and is divided from the other fruite with a yellow rinde, covering the most part of it, and sticking onely to the other at the head or toppe, the greater fruite hath both juyce and feede within it, but the lesser hath no feedes, and but little or no juyce, and is more sweete then sower: the *Spaniards* call it *Limonera pragnans*.

4. *Limo-*

4. *Limnæra dulcis*. Sweete Limoones or Limerones.

In the fruit of this tree which the Spaniards as *Clusius* saith call *Limones del Emperador*, is the greatest difference from the last, which is smaller then it, but twice as big as a great Lemmon, of a deeper yellow coloured baize, and thinner by much, being full of juyce, but sweete and pleasant and may be familiarly eaten, with the rinde and all.

Malus Medica vel Citria.
The Pomecitron tree.

5. *Limnæra acida*.

Sowre Limoones, or Limerones.

This sowre Limoon is very like this last, but somewhat bigger, more yellow rinded, and somewhat rugged, the juyce whereof is more tower then it, yet lesser then of a Lemmon.

6. *Limnæra multiformis*.

Changeable Limoones or Limerones.

The fruite hereof is wholly neere unto a flesh colour, and of divers formes, some being of one and some of another fashion, not constant in any; the Spaniards call it *Limones de figuras*.

The Place and Time.

All these sorts of Citrons grow in *Spaine*, with those that are curious, to nourish up rare fruites, but gained from sundry places abroad; and the last from the fortunate Islands. Their time is without time, even all the yeare throughout, flowering and bearing fruite.

The Names.

The first and great Pomecitron, is called in Greeke *καριανδρον*, that is, *Malus medica*, *Theophrastus* saith *lib. 1. c. 4.* that it came first from *Media* and *Persia*, and therefore was called *Malum Medicum* and *Persicum*, and some have called it *Malum Assyrium*, others *Malum Citrium* or *Citreum*, as also *Oedromela*, and *Citromela*, and *Citrangula*: some also call it *Citrus arbor*, and some *Cedrus Theophrasti* & *Dioscoridi*, and some *Poncires quasi Pomacitria*. And the second is called by *Clusius* *Limnæra*, as he saith the Spaniards to call the tree, and the fruite *Limones*, as they doe the rest that follow, with their other severall denominations, because both tree and fruite differ from the first or true Citron, which they call *Cidrus*, the *Italians* *Cedri*, and *Citroni*, the *French* *Citrons*, the *Germanes* *Citrinoepffel*, the *Dutch* *Citreen*, and *Citreenboom*, and we in *English* the Citron, or Pomecitron tree or fruite.

The Vertues.

All the parts of this fruite both the outer and inner rinde, both juyce and seed are of excellent use, and of contrary effects one unto another, as some hot and dry, others cold and dry: the outer yellow rinde is very sweete in smell, very aromaticall and bitter in taste: and dried is a very soveraigne cordiall for the heart: and an excellent antidote against venome and poyson, against the plague or any other infection: it warmeth and comforteth a cold or windy stomacke, mightily dissolving the winde, and dispersing raw cold and undigested humours therein, or in the bowels: being chewed in the mouth it amendeth an evill breath, and causeth a good one: it also helpeth digestion, and is good against melancholly: these outer rindes being preserved with Sugar, are used as a junket, more then in any physick manner, yet are they often used in cordiall electuaries, preservatives against infection and melancholly, and other the diseases aforesaid. It also helpeth to loosen the body, and therefore there is a solitive electuary made thereof called *Electuarium de Citro solativum*, to evacuate the bodies, or cold flegmaticke constitution, and may be also safely used where choller is also mixed with flegme. The inner white rinde of the fruite is almost unfavoury and without taste, and is not used in any manner of physicke, but being preserved serveth to fort with other Suckets at banquets; the sowre juyce in the middle is cold and farre surpasseth that of Lemons in the effects, although not so sharpe in taste: it is singular good in all pestilentiall and burning feavers, to restrain the venome and infection, to suppress the violence of choller, and hot distemper of the blood, and extinguish thirst, and correcteth the ill disposition of the Liver, stirreth up an appetite, and refresheth the overspent and fainting spirits; resisteth drunkenness, and helpeth the turnings of the Braine by the hot vapours arising thereinto, and causing a frensie or want of sleepe: the seed is the last to be spoken of, but not of the least property, for it not onely equalleth the barke, but surpasseth it in many particulars, although *Galen* and *Avicenna* seeme herein to be opposite one unto another. *Galen* maketh the seed to be cold, which *Matthioli* would excuse with diverting his intent to the juyce; and *Avicenna* saying it is hot in the first degree, and dry in the second; the barke or rinde, hot in the first, and dry in the end of the second degree, the inner white substance being betwene the outer barke and the inner juyce, hot and moist in the first degree, and the acide juyce cold and dry in the third degree: these seedes are very effectually to preserve the heart and vitall spirits, from the poyson of the Scorpion or other venomous creatures, as also against the infection of the plague, or poxes, or any other contagious disease, they kill the wormes in the stomacke, provoke womens courses, cause an abortement, and hath a digesting quality and a drying, fit to dry up and consume moist humours, both inwardly in the body, and outwardly in any moist or running ulcers and sores, and take away the paines that come after the biting of any venomous creature: the whole fruite or the branches of the trees laid in presses, Chests, or Wardrobes, keepeth cleath

cloth, or silke Garments from Moths and Wormes, and give them a good sent also.

CHAP. LXXVI.

Limonia Malus. The Lemmon tree.

F Lemmons also there are divers sorts, some greater, some smaller, some with thicker, and more rugged rindes, others with smoother, some with a very sharpe and tart juyce, others with a milder.

1. *Malus Limonia acida vulgaris*. The ordinary Lemmon tree.

The Lemmon tree groweth usually great and high with great armes and slender branches armed with long greenish thornes, the leaves are long and very like unto Bay tree leaves, but denser about the edges, or like unto the Citron leaves but lesser, and full of holes like unto them also; the flowers grow after the same manner as the former, but are wholly white and as sweete: the fruite that followeth is somewhat long and round, with a paler yellow rinde then in any of those before, somewhat rugged or uneven, and not so smooth as in other sorts, and somewhat thicker also, the juyce whereof within is almost as sharpe as the next, but yet may be discerned to have the taste as it were but of an hedge fruite, and such like feede as the Citron among it, but smaller and somewhat longer, if it be heedefully marked, though they may seeme both alike.

Limonia Malus. The Lemmon tree.

2. *Malus Limonia acida cortice tenui*.

The thin rinded fower Lemmon.

There is no difference in the tree of this, from the former, nor in the fruite, but that it is a little bigger, the rinde of a fine pale yellow colour, smoother then the other, and much thinner also, wholly replenished with a most delicate sharpe juyce, and the like feede among it.

3. *Malus Limonia acida fructu rotundo*.

Round Lemmons.

The tree that beareth these Lemmons, is in all things like the last, but that it hath few or no thornes at all upon it, and the fruite having a thinner rinde like it, is somewhat rounder then it, with a small crowne at the head, the juyce within being as fower altogether.

4. *Malus Limonia dulcis major*.

The greater sweete Lemmon.

This Lemmon hath this difference from the other, that it is greater then any of the former Lemmons, the rinde yellower and smoother, and the juyce within it much more sweete and pleasant, that it may be eaten as an Orreng.

5. *Malus Limonia dulcis minor*.

The Civill Lemmon.

This Lemmon is so like the best sort of thin rinded fower Lemmons, that it is hard by the outside to knowe their difference, for it is of the same size, but of a little deeper coloured rinde, and the juyce within like the last, of a pleasant tart taste, that may familiarly be eaten, or rather having but little sharpe taste in it.

6. *Malus Limonia sylvestris minime*. The last wilde Lemmon tree.

This sort of Lemmon groweth wild in Syria and Egypt. Bellonius maketh mention of it also, that it groweth about Cairo, that as he saith, are no bigger then Doves or Pigeons egges.

The Place and Time.

We have had all these sorts of Lemmons brought us from Spaine and the Islands at severall times, whereby we have described them unto you: and for their time it holdeth equall with the former, and the other that follow, that is, hold their leaves ever greene and beare blossomes, greene and ripe fruite all the yeare through.

The Names.

Neither the tree nor his fruite as it is likely, were knowne to the ancient Greekes or Latines, but it is in these dayes as in former times called *Malus Limonia*, and the fruite *Limones*. The Spaniards as *Clasius* sheweth, call the tree *Limera*, and the fruite *Limas*, all other nations follow the Latine, according to their dialect.

The Vertues.

Both the rinde and the juyce of Lemmons doe come somewhat neere unto the property of the Citron, though in a weaker degree, and in the want of the one, the other may safely be used to all the purposes before mentioned for the juyce, but the barke or rinde being thinner is feldome preserved or dried to be used inwardly, but yet cometh some what neere it, if any will apply it although weaker to resist poyson, venome or infection, yet the juyce beir

being sharper, cooleth more, but doth not equally resist putride humours like it: an ounce and a halfe of the juyce of unripe Lemmons drunke with a little Malmeſy helpeth to cleane and expell the ſtone out of the kidneies and likewiſe killeth and driveth forth the wormes in the body of men or children: if an angell of gold, or ſo much weight of pure leafe gold be ſet to ſleepe in three or foure ounces of pure juyce of Lemmons for foure and twenty houres, and then taken out, or the juyce drained cleane from it, and ſome of it given in a cup of Wine, with a little pondher of Angellia roote unto any infected with the Plague, and dangerously ſicke, (if there be any hope or likelihood of recovery) it will helpe them, the feedes of theſe are likewiſe almoſt as effectuell as of the Citrons, the juyce of the ſweete Lemmons is neither ſo cooling nor ſo operative for any of the purpoſes afore mention'd. The deſtill'd water in glaſſe from the inner pulpe or ſubſtance of Lemmons cleareth the ſkin from all freckles, ſpots or other markes in the face, or in any other part of the body, provoketh urine, and breaketh and expelleth the ſtone being drunke, and helpeth alſo the running ſcab, and killeth lice in the head, the wormes in the hands or noſe and puſhes and wheales in the ſkinne. The juyce of Lemmons is ſingular good to uſe at Sea in long voyages to put into their Beverage to keepe them from the Scurvy, whereto long Sea journeyes are much ſubject; as alſo the more abundantly to quench their thirſt in thoſe hot climates: it is no leſſe uſefull at home for Dyers, who ſpend much of it in ſtriking ſundry dainty colours which will never be well done without it.

CHAP. LXXVII.

Malus Arantia. The Orenge tree.

Have likewiſe five ſorts or rather kindes of Orengeſ to ſhew you, which are theſe.

1. *Malus Arantia vulgaris.* The ordinary Orenge tree.

The graſſe of ordinary manured Orenge tree groweth often to a very great height and big-
neſſe, ſpreading large armes and branches with a rougher barke below, and ſmooth greene on the
branches, yet it is alſo often found leſſe in leſſe fruitfull ſoiles, ſparingly armed with ſharpe but
ſhort thornes, the leaves are ſomewhat like unto thoſe of the Lemmon, but that each leafe hath a
peece of a leafe ſet under it and are not dented at all about the edges, and are as full of ſmall holes in them, as any
of the former, the flowers are whitith, but of a ſtronger ſweete ſent then any of the reſt, and uſed to many other
purpoſes then either of the other: the fruit hereof is round, with a thicke bitter rinde, of a deepe yellowiſh red
colour, which from it taketh the name of an Orenge colour, having a ſoft white looſe ſubſtance, next unto the
outer coloured rinde, and a ſower juyce lying mixed among ſmall ſkinnes in ſeverall parts, as in the other ſorts,
with ſuch like ſeed alſo: the juyce of ſome is leſſe ſower
then others, and of a taſte betweene ſower and ſweet neere
unto Wine.

Malus Arantia vulgaris. The ordinary Orenge tree.

2. *Malus Arantia ſylveſtris.*

The wilde or Crabbe Orenge tree.

The Crabbe Orenge tree (as our Crabbe Apple tree)
groweth wild, and is fuller of branches, and thicker ſet
with thornes, the flowers and leaves are alike, but leſſer,
and the fruit is very ſmall, and of a pale yellow colour,
with a thicke rinde and little juyce or ſharpe within it, but
plainly taſting as a Crabbe with us, diſtinct from a good
fruit.

3. *Malus Arantia cortice dulci eduli.*

The Apple Orenge.

This Orenge diſtinct from others not ſo much in the
colour of the outer barke which is of a deepe gold yellow-
iſh red, but in the whole fruit, which is through out as
ſweet almoſt as an Apricocke, and yet diſtinguiſhed into
parts on the inſide, like others, which together with the
barke or rinde is to bee eaten like an Apple, the barke or
rinde not being bitter or tough like the reſt: the Spaniards
call this *Naranja caxel*.

4. *Malus Arantia ſunico grano.*

The Orenge without feedes.

This onely diſtinct from that Orenge with the beſt
ſower juyce in having but one graine or ſeed in the whole
juyce lying within it.

5. *Malus Arantia pumilio.*

The Dwarf Orenge tree.

The ſtocke of this dwarf ſence according to his name is
low, and the branches grow thicke, well ſtored with
leaves, but they are leſſer and narrower then the other, the
flowers alſo are many, and thicke ſet on the branches,
which beare fruit more plentifully then the former, but
is leſſe then the greater ſorts, yet as well coloured.

The Place and Time.

All theſe ſorts likewiſe we have ſeene being brought us
from *Spaine*, and *Portingall*, the hedge or wilde Crabbe

fruite from the hither parts of Spaine, and keepe time with the rest.

The Names.

It is thought that these Apples were knowne to the auncients who called them *Mala aurea Hesperidum*, being rare any where else, and therefore *Hercules* made it one of his taskes or labours to slay the Dragon that kept the Garden where they were, and brought them away with him: Some call them *Aurantia a cortice colore aureo*, and some *Arantia ab Arantia oppido dicta*, some *Pomum Naranium*, *Dodonæus Anarantium*, and *Lobel Malum aureum*, which name doth best suite with them for Golden Apples they are indeed: All nations call them according to the Latine, and *Clusius* saith the Spaniards call them *Naranjas*, and the third sort here set downe *Naraxja caxel*, the *Germanes* call the Orrenge *Pomerants*, and the *French* *Pommes d'Oranges*. The flowers of the Orrenge tree are called *Naphs*, and the oymntment made of them *Unguentum ex Napha*.

The Vertues.

The rinde of the Orrenges are bitterer and hotter then those of Lemmons, or Citrons, and therefore doe warme a cold stomacke the more, helping to breake the winde the ein, and the siegme, and after the bitternesse is taken from them by steeping them in water for sundry dayes, and then preterved either wet or dry, besides their use in banquets, they are little lesse effectuall for the strengthening of the heart and spirits, and the other qualities that Citrons have: the iuyce is farre inferiour to either of them, and are fitter for meate then medicine, yet foure or five ounces of the iuyce taken at a time, will drive forth putrid humours from the inner parts by sweat, and after strengthen and comfort the heart. The distilled water of the flowers, besides the odoriferous sentie hath, fit for any perfume, it is good against contagious diseases, and pestilentiall feavers, to drinke thereof at sundry times, it helpeth also the cold and moist infirmities of the mother: the oymntment that is made of the flowers is often used to annoint the stomacke to helpe the cough, and to expectorate the cold raw siegme, and to warme and comfort the other places of the bodies.

CHAP. LXXXVIII.

Malum Assyria vel Poma Adami. Adams Apple.

THis tree for the most part groweth as great as the Orrenge tree, yet sometimes it is no higher then the Citron tree, and spreadeth faire great armes and branches with few, and those short thornes upon them, the leaves are faire and large, almost as great as those of the Citron or Lemmon tree, pounced with holes in the like manner, the flowers also are not much unlike, but the fruite that followeth is more like unto an Orrenge, yet two or three times bigger, pale yel'ow rinded, thicke, rugged or neeven, and with some rifts or chaps thereon, as if it had bene bitten, (from whence was obrudged that fond opinion unto the vulgar, for wise men would be ashamed of so ridiculous an opinion, that it was the fruite that *Adam* tasted in Paradise, and that therefore the markes should remaine upon the whole kinde ever after but thus have you three or foure trees foisted into mens conceits by irreligious cozeners, for *Adams Apple*, like to the rest of the Rellickes in the World) a Spongy substance next to it, and with an acide sweete iuyce, yet not so pleasant as others, lying in parts and round feedes amongst it like the Citron, which may be eaten altogether like the Apple Orrenge as *Clusius* saith.

The Place and Time.

This groweth with the other sorts in sundry places of Spaine, among the Monasteries, or with others that are curious of rare fruites, and is in nature like the rest, ever green, and bearing flowers and fruite all the yeare long.

The Names.

This is called by some *Pomum*, and *Malum Assyrium*, as denoting forth the place of his originall, the more generall part *Poma Adami*, yet *Cordus* in *historia*, calleth it *Citrus altera*, the Spaniards as *Clusius* saith, call it *Toronjas*, and some *Zamboas*, as the *Portingals* doe, the *Italians* *Lomie*, and *Pomi di Adamo*, the *French* *Poncires* in generall.

The properties hereof are referred to the Lemmons yet having a milder iuyce, and therefore not so much regarded as the others: it is by some used to kill the itch and take away the scabs, to cut one of these through the middle, and thereon to cast some fine pouther of *Brimstone*, being heated under the cinders, and rubbed on the parts affected afterwards.

Malum Assyria vel Poma Adami. Adams Apple.

CHAP. LXXIX.

Malva Punica. The Pomegranet tree.

The Pomegranet tree is distinguished into the manured, bearing fruite, and into the wilde bearing none, each of these have like wise diversities in them: Of the manured fruite, there is both fower and sweete, and of a winy taste betweene fower and sweete, for so they are distinguished in the Countreyes where they grow: the wilde kinde like wise is of two sorts, and both bearing double flowers, but one greater then another, but no fruite ever followeth them.

1. *Malva Punica sativa.* The Pomegranet tree bearing fruite.

This Pomegranet tree groweth not great in the warme Countreies, and where it is naturall (and with us rising for the most part into sundry brownish twigges) not above leven or eight foote high, spreading into many slender branches, here and there set with thornes, and with many very faire Greene shining leaves like in forme and bignesse unto the leaves of large Myrtle leaves, every one upon a small reddish footstalk: among the leaves come forth here and there, the flowers which are like bell flowers, broad at the brimmes and smaller at the bottome, being one whole leaf, divided at the toppe into five parts, of an orient red crimson colour naturally, but much paler with us, and many veines running through it, with divers threds in the middle: and standing in a brownish hollow cup, or long hard huske: the fruite is great and round with a hard smooth brownish red rinde, not very thicke, but yellowish on the inside, and a crowne at the toppe stored plentifully with a most cleare liquor or juyce like wine, either sweete or fower, or betweene both, full of seedes, inclosed in skins, and the liquor among them: sometimes this breaketh the rinde as it groweth which will cause it to rot quickly. Cordus in historia maketh mention of one that hath no kernell or seed within it, and doth also mention a wild kinde to grow in Spain, and Africa, which I cannot beleieve to be any other than that wild kinde with double flowers, which followeth next to this to be described, for he maketh that which beareth fruite to have a double flower which is not so.

Abisue seminatibus.

2. *Malva Punica sylvestris major sive Balanatum majus.* The greater double blossomed Pomegranet tree.

The great wilde Pomegranet tree with us, groweth altogether into slender brownish branches, with some thornes among them, and shining Greene leaves somewhat larger then the former, but into a shrubby low tree naturally, from the branches shoote forth flowers very double, as large as a double Province Rose, but with shorter small leaves, of an excellent bright crimson colour, tending to a silken Carnation, standing in brownish hard cups or huskes, divided into five parts: there followeth no fruite unto these.

3. *Balanatum minus.* The lesser double Pomegranet tree.

This smaller kinde differeth from the other but little, the leaves onely are of a fadder Greene colour, the flowers smaller, and lesse thicke, and double, and of a fadder red Orrenge tawny colour, set also in such like hard cups

Malva Punica sativa.
The manured Pomegranate tree.

Malva Punica sive Granata sinilis.
The fruite or Pomegranates.

or huskes. Of one of these two double sorts, it is said that there is one that beareth white flowers, and another that hath them mixed with white and red.

The Place and Time.

The manured kindes grow in *Spain, Portugall, Italy*, and in other warme Countries, but with us preserved and housed with great care: and the wilde kinde with much more: They flower very hardly with us, the first not untill *May*, and the other much later.

The Names.

The Pomogarnet is called in Greeke *εἶδος* and *εἶδος*, and by *Hippocrates* *ἰδαί*, in Latine *Malus Punica*, and *Malus Granata*, and the fruit *Malum granatum*, or *Punicum*, because it is thought that they were brought over from that part of *Africke*, where old *Carthage* stood, into that part of *Spain*, which is now called *Granado*, and from thence called *Granatum*: The flowers of the tame kinde as *Dioscorides* saith are called *Cytini*, yet *Pliny* maketh the flowers of the wilde kinde to be called *Cytinus*, and the flowers both of tame and wilde to be *Balaustium*, but properly as I take it, *Cytinus* is the cup, wherein the flower, as well of the tame as wilde kinde doth stand, for unto their likeness, both the flowers and seed vessels of *Asarum*, and the feede vessels of *Hyoisyanus* are resembled, and not unto the whole flower, and *Balaustium* is generally with us taken to be only the double flowers of the wilde kinde: the rinde of the fruit is called in Greeke *ἰδὼν* and *ἰδὼν*, and so also *Psidium* and *Sidium* in Latine but generally *Malicorium* or *Cortex granatorum*: The greater double blossomed kinde is called *Balaustium Creticum* and *Cyprium*, because it groweth in both places, and the last is called *Romanum*. The *Arabians* call it *Kuman* and *Ruman*, the *Italians* *Melo granata*, and *Pomogranato*, the *Spaniards* *Granada* and *Romanas*, the *French* *Grenadier* the tree, and *Pome de Grenade*, and *Migraine* the fruit, the *Germans* *Granatapfel*, the *Dutch* *Granaetappel*, and we in *English* *Pomegranet* or *Pomegarnet*.

The Vertues.

All the sorts of Pomegranets breed good blood, but nourish little, and are helping to the stomacke, yet those that are sweete please best, but that they somewhat heate it and breede winde, and therefore forbidden in agues, because they breede choller: the softer doe binde, and are fit for an hot fainting stomacke, and stay casting, and provoke urine, and are somewhat offensive to the teeth and gummies, in the eating: those that are of a meane or winy taste, are indifferent to each part: the feedes within the fruit, or the rinde thereof doe binde very forcibly, either the poulder or the decoction taken, and stay casting, the bloody fluxe, womens courses either red or white, the spitting of blood, and the running of the reynes: it is said also that they are good for the dropie: the flowers worke the same effects: the fruit is good against the bitings of the Sea Hare, and the bitings of the Scorpion, and stayeth the immoderate longings of women with childe, the decoction of the rinde, or feedes of the fruit, with a little Syrope put to it, is good against Cankers in the mouth, and ulcers in the privy parts, the fundament, or any other part of the body, and is good against the rupture. it helpeth also the ulcers or running sores in the eares or nose, or rheumes in the eyes, to be dropped or injected, and fastneth loose teeth, destroyeth the flat wormes in the body, and helpeth to take away wens, or the like out-growings in the flesh: with the rinde of Pomegranets instead of Gaules, or else with the Gaules also, is made the best sort of writing incke, exceeding the ordinary, both for blacknesse and durability.

1. *Malus Punica sylvestris sive Balaustium majus.* The great double blossomed Pomegarnet tree.

Flore alba & flore rubra.

CHAP. LXXX.

Prunus. The Plum tree.

IF Plummies there is so great variety, as I have shewed elsewhere, that it were but *allum agere* to repeat them here againe. I will therefore give you a generall description of the tree (I meane the manured kinde, for the wilde kinde which is our Blacke thorne or Sloe, is extant in another Classis of this Worke before) and that the fruit differeth in forme, colour and taste, one from another with the best properties they are serviceable unto. Vnto the Family of the Plummies belong both Apricockes, Peaches, and Nectarins, all of them being Plummies, but of severall kinds. I will therefore place the Apricocke in this Chapter as nearest to them, and the rest in the next Chapter following.

1. *Prunus vulgaris.* The ordinary Plumme tree.

The Plum tree for the most part riseth to be a great tall tree, whose body and armes are covered with a rugged barke, more or lesse, the younger branches being smooth in all: the leaves are somewhat long and broad, and rounder in most then those of Cherries, yet differing much among themselves, some being longer, larger or rounder then others: the flowers are white and small, made of five leaves a peece: the fruit is very variable in forme, some being oval, or Pearre fashion, or Almond like, or round, in colour some being white or yellow, red, greene, or blacke: and in taste, some being soft and waterish, others firmer and not so moist, some sweete, some sower, and others of a meane taste betwene both, or harsh, or of a taste differing from all these, wherein is contained a small smooth flatish stone, with a white bitter kernell within it. *Mr. Tradescant* had a sort that bore double flowers, but perished, not long continuing with him.

Nnnnnn 2

2. *Malus*

Flore dum.

Prunus. The Plumme tree.

Armeniaca malus five Præcocia. The Apricocke tree.

2. *Malus Armeniaca five præcocia.* The Apricocke tree.

The Apricocke tree, if it stand by it selfe as a standerd tree, like other Plumme trees (which it feldome doth in our Country, for that it would hardly beare fruit in that manner) will rise to be as great as a Plumme tree, with great broad, and almost round leaves, but pointed at the ends and finely dented about the edges: the flowers are white and like the former but larger, the fruit that followeth is round, with a cleft or open furrow in the middle, somewhat like unto a peach, of a pale yellowish colour on the outside, as well as on the inside, and a little reddish on a side in most, yet whiter in some, and of differing sizes also, some smaller or greater; of a firmer or softer close substance then any of the Plummes; a smooth flatish stone in the middle, great or little, according to the fruit, which is ripe with, or before the earlier sort of Plummes (and likely long before any of our early sorts were knowne in former times) which was the cause of the name, and a sweete kernell within it, yet it is said there is one that hath a bitter kernell, which I have not seene.

Nucleo
siccato.

The Place and Time.

All the sorts of them are planted, none of them growing naturally in our Country, and either in Orchards, for their private possessours, or in the Hedges, or other places of the Fields, Woods, or Parkes abroad, and flower before eyther Apple or Pear, and the Apricocke before any Plumme, by a moneth or more, and is ripe by St. James tide usually, the other sorts of Plummes comming on every one in their degree, some earlier, and some later.

The Names.

The Plumme as it is thought is in Greeke the *ροκκινυλίζα*, of Theophrastus, lib. 4. c. 3. and the fruit *ροκκινυλίζα*, in Latine *Prunus* and *Prunum*, but I much doubt of it, because beside other things, not correspondent, he saith the leaves doe alwayes abide on the tree. *Ingens Prunorum turba* saith Pliny, even in his time, but I thinke more then twice so many now. *Belonius* lib. 2. c. 91. saith, that the *Damasco* Plummes, that he saw dried at *Damasco*, were bigger then a Wallnut, of a firme substance, and sweete taste, a little tart, with a stone within it, rather long and flat, then thicke and round, and were deare sold even there. The Apricocke is called *μαρμαρα*, *αμυγδα*, *αμυγδα*, and *αμυγδα*, in Latine *Chrysomela*. i. e. *Mala aurea*, *Malus Armeniaca*, and *Præcocia* by all Antiquours, yet some call it *Daracocca*: The Plumme is called by the Arabians *Anas*, *Avas*, and *Hagias*, by the Italian *Prune*, and *Succine*, by the Spaniards *Prunas*, *Andinas*, and *Amexcas*, by the French *Prunier*, and *Prunes*, by the Germanes *Pflaumenboom*, by the Dutch *Pruym bonen*, and we Plummes. The Apricocke is called by the Arabians *Mex*, and *Mirmex*, by the Italians *Armoniache*, *Moniache*, *Bachoe* and *Grisomele*, by the Spaniards *Albiricoques*, *Alvaricoques*, and *Albarchigas*, by the French *Abricot*, and *Carmaignoles*, by the Germanes *Sir Johan Pffersch*, and by us Apricocke.

The Vertues.

There is much diversity in the faculty of Plummes, for some that are sweete, doe moisten the stomacke, and make

make the belly soluble, those that are slowe doe quench thirst more, and binde the belly, yet they are all in some sort cooling: the moister sort and more waterish, doe soonest corrupt in the stomacke, but the firmer doe nourish more, and offend lesse taken plentifully, and those are the fittest to be preserved and kept all the yeare: but the dried fruited, which are sold at the Grocers, under the name of Damaske Prunes, doe somewhat soften the belly, and being stewed are often used with the poorer sort of people, both in health and sicknesse to relish the mouth and stomacke, to procure an appetite, and a little to open the body, allay choller, and coole the stomacke: if a purging decoction with *Sena Rubarbe*, &c. be made for them to be stewed withall, it maketh them the more purging, and the more readily to be taken by those that have weake stomackes; the leaves of the tree boyled in Wine, is good to wash and gargle the mouth and throate, to dry the fluxe of rheume to the palate, gummies, or almonds of the throate: the gumme that commeth out of the trees, is good to breake the stone, and doth serve as a glew to fasten any thing withall: the said gum or the leaves boyled in vinegar and applyed, killeth tetters, and ringwormes. The Apricocks have no use in Physicke that I know, but are wholly spent as a junket, eyther fresh and Greene, or dried preserved or candid, to fort w: h others, for the same purpose. Onely *Matthiolus* giveth us the use of the oyle, prest out of the kernels of the stones, as the oyle of Almonds is made, to be good against the inflamed piies or hemorrhodes, the tumours or swellings of ulcers, the hoarsenesse of the voyce, the roughnesse of the tongue and throate, and likewise the paines in the eares: five ounces saith he, of the said oyle taken with one ounce of Muscadine, driveth forth the stone, and helpeth the chollicke.

CHAP. LXXXI.

Malus Persica. The Peachtree.

He variety of Peaches is great, whereof the Nectarin is a kinde, which because I have already declared them in my former Booke, I will onely here give you the descriptions of them in general, and the speciall uses, as I said in the last Chapter: but hereunto I must adjoyne another strange tree of the West Indies, which *Clausius* tooke to be the *Persica* of *Theophrastus*, *Dioscorides*, *Galen*, *Pliny* and others, which how it doth agree, you shall understand.

1. *Malus Persica vulgaris*. The ordinary Peach tree.

The Peach tree groweth not so great as the Apricocke, planted either by it selfe, or against a wall, but yet spreadeth branches reasonable well, from whence spring smaller reddish twiggies, whereon are set long and narrow Greene leaves, dented about the edges: the blossomes are greater then of any Plumme, and of a light purple colour, after which followeth the fruited, round, and sometimes as great as a reasonable Pippin, especially some; for some are much smaller then others, as also differing in colours and tastes, as russet, red or yellow, waterish, or firme, with a frize or cotton, all over, with a cleft therein like the Apricocke, and a rugged, furrowed great stone

Malus Persica. The Peach tree.

Persica arbor. The Laurell Peach.

withia it, and a bitter kernell within the stone. It sooner waxeth old and decayeth then the Apricocke by much.

Among
to persica
The All-
mond
Peach.

There is another kinde of Peach, whereof *Camerarius* and *Zauhinus* in his *Matthiolus*, and *Gesner* in *hortis* make mention, whose kernels within the rugged stone is not bitter as others are, but sweete like an Almond.

2. *Nucipersica*. The Nectarin.

The Nectarin seldom groweth so great as the Peach, the body and elder boughes being somewhat whitish, and the younger branches very red, whereon grow long leaves, very like those of the Peach: the blossome likewise is reddish, but hath smaller and narrower leaves, and the fruite that followeth is as round and great as a small Peach, but smooth on the outside, and not rough or cottony as the Peach, nor having any cleft, of differing colours and tastes, some Greene, others whitish or yellow, and some red more then others, all of them of a fatter firme substance, and more delicate then the Peach, but with such a rugged stone as the Peach and a bitter kernell within it.

3. *Persia arbor Clusij* The Laurell Peach.

This strange tree whereof *Clusius* onely first made mention, is a reasonable great tree, spreading pale Greene branches, and faire thicke Greene leaves on them like unto the large Bay leaves, grayish underneath and some crosse veines running through them. Iwete both in sent and taste, but a little stipticke and biting: the flowers are like those of the Bay tree, and grow many and thicke set together in tufts, at the ends of the branches consisting of six pale coloured leaves a peece, after which come fruite, at the first Greene and like a plumme, but growing ripe is long and formed like a pear, of a blacke colour and pleasant taste, having a long and round kernell within it, of the fashion of an heart, and of the taste of a Chestnut or Almond: this abideth alwayes Greene, not loosing the leaves in Winter.

The Place and Time.

The two first are familiarly nourished up in our Orchards and gardens through the Land, but from whence is their originall I cannot shew you: The last *Clusius* saith was brought forth of the West Indies, and planted in a monastery in *Spaine*, where he saith he onely saw one tree, and none any where else, yet he understood from Doctor *Tonar* at *Sivill*, that he had such another growing with him: They all flower in the Spring and fructifie in Autumne.

The Names.

The Peach is called in Greeke *περσική μαρμα* and *ροδοσπινα*, also by some in Latine *Malus Persica*, and *Rhodocina*, but not *σπερμα*, as some would have it, to be derived from *Duracina*, for *Doracia* is distinguished by *Paulus Aegineta*, from *Fraxocia*, and *Armenia*, and by him made all three to be better then Peaches: neither is the Greeke *Doracia*, derived from the Latines *Duracina*, but rather *contra*. The Nectarin is called by *Matthiolus* and *Cassianus*, *Nucipersica*, because it resembleth the Walnut in the round smooth outer rinde, and the Peach in the meate, substance and stone. *Anguilara* calleth it *Persicannus*, by the same intention, and *Pliny* *Nuci prunum*. The last *Clusius* maketh the question, whether it be not the *Persica* of *Theophrastus* lib. 4. c. 2. or no, which *Dioscorides*, *Galen*, *Pliny*, and others, doe make mention of also, and which *Theophrastus* describeth to be a great and a faire tree, and most like unto the Pear tree, both in leaves flowers and branches, but that this hath an everlasting lease, it beareth much fruite, and is ripe at all times, the young still follow the old; the fruite is of the bignesse of a Pear, long and like an Almond, and of a Greene colour, it hath a stone within it, like a Plumme, but much lesse, and of a softer substance, very sweete, thus saith *Theophrastus*. Now let me descant a little hereon, and compare them. First, the leaves of *Persica*, saith *Theophrastus*, are most like unto the leafe of the Pear tree, and this saith *Clusius*, is like unto the great Bay leafe, the one is almost as broad as long, and the other twice as long as broad, besides it is small pointed, the flowers of *Persica* are like the Pear tree, which are much larger then those of the Bay, and doe not grow so many together as this doth, nor at the ends of the branches like this: the fruite of *Clusius* is blacke, of this Greene, of that like a Pear, of this as bigge as a pear, but like an Almond, of this the stone is like a Plumme, of that like an Heart, of this as bigge as a pear, but like an Almond, hath ripe fruite onely in Autumne, this at all times of the yeare. And besides all these, which are differences sufficient to distinguish them. I doe not finde almost any plant, either herbe or tree growing in the West Indies to be like unto those that grow in *Europe*, the lesser *Asia*, or the hither part of *Africa*, and therefore by all probabilities, this of *Clusius* cannot be that of *Theophrastus*, yet this sheweth an excellent judgement in *Clusius* to referre this tree to that *Persica*, but in any judgement this *Persica* of *Theophrastus* is most likely to be some kinde of *Azybolare*, or else some other fruite not knowne to us. It was called saith *Clusius* by them where he saw it, *Mamay*, but he was after wards informed by Doctor *Tonar*, that it was not *Mamay*, but called *Aguacate*, by the Indians. Some have thought this *Persica* to be all one with the *Persica arbor*, as *Palladius* calleth it, or *Malus Persica* of *Dioscorides*. *Gaza* translating *Theophrastus* in some places, rendereth it *Persica*, and in others *Persica*, as *Pliny* in one place also confoundeth them both together, although in another he distinctly speaketh of *Persica*, and separateth it himselfe from *Persica*: but how much they differ one from another, the descriptions of both doth plainly declare to any: The Peach is called by the Arabians *Sanch* and *Crauch*, by the Italians *Persiche*, by the Spaniards *Peregos*, by the French *Pescher*, by the Germans *Pfersichbaum*, by the Dutch *Perschoom*, and by us Peach.

The Vertues

Some are of opinion that the leaves of Peaches are of a cold quality, but *Galen* sheweth that the buds and leaves have an excellent bitter quality, that if they be bruited and laid on the belly, they will kill the wormes, and so will they doe also, if they be boyled in Ale and drunke, and open the belly likewise, and also is a safe medicine to disperse humours, being dried; and the poulder of them strowed upon fresh bleeding wounds, doth both stay their bleeding and close them up: the flowers being steeped all night in a little Wine, standing warme, strained forth in the morning, and drunke fasting, doth gently open the belly, and move it downwards, and a Syrupe made of them by reiterate infusions, as the Syrupe of Roses is made is found to worke more forceably then that of Roses, for that it provoketh vomiting, and spendeth waterish and Hydropicke humours, by the continuance thereof: the flowers condited or made into a conserve, worketh to the same effect, the gumme or rather the liquor that droppeth from the tree being wounded is given in the decoction of Coltsfoote, unto those that are troubled

troubled with the cough or with shortness of breath by adding thereto some sweete wine, and putting some Saffron also therein, it is good for those that are hoarse, or have lost their voyce, helpeth all the defects of the lungs and those that vomit or spit blood. Two drammes thereof given in the juyce of Lemmons, or of Radish, is good for those that are troubled with the stone it is said some given in Plantaine or Puslane water, stayeth the casting or spitting of blood: the kernels of the stones doe wonderfully ease the paines and wringings of the belly, through winde or sharpe humours, and are much commended to be effectuell to breake and drive forth the stone, which that they may the more powerfully worke, I commend this water unto you to drinke upon occasion, three or foure ounces at a time. Take fifty kernels of Peach stones, and an hundred of the kernels of Cherry stones, a handfull of Elder flowers, fresh or dried, and three pints of Muscadine, set them in a closed pot, into a bed of Horse dung for ten dayes, which afterwards stilled in glasse, with a gentle fire, keepe for your use: The milke or creame of these kernels being drawne forth, with some Vervain water being applied to the forehead and temples, doth much helpe to procure rest and sleepe to sicke persons wanting it: the oyle likewise drawne from the kernels doth the same being annointed, the said oyle put into glisters doth ease the paines of the chollicke proceeding from winde, and annointed on the lower part of the belly doth the like, and dropped into the eares easeth the paines of them, the juyce of the leaves doth the like, killeth the wormes and ulcers in them, being also annointed on the forehead and temples; it helpeth the Megrome and other paines in the head: If the kernels be bruised and boyled in vinegar untill they become thicke, and applied to the head, or other places that have shed the haire, and are bald it doth marvellously procure the haire to grow againe. The Peaches themselves being eaten, by reason of their sweetenesse and moisture, doe soone putrefie in the stomacke; and therefore *Galen* adviseth that they be never taken after but before meate alwaies, so shall they make the rest to passe away the more speedily with them: or else taken after, they corrupt the rest in the stomacke with themselves. The Nectarin hath a firmer substance, and a more delectable taste, for which it is most accepted, being of no use in Physicke that I know. The *Persea* is not used with any.

CHAP. LXXXII.

Amygdalus. The Allmond tree.

He Allmond is so like unto the Peach in every part thereof, and yet differing from it, that I can doe no lesse then joine it next, in a severall Chapter, and although there are sundry sorts of sweete Almonds, some great and some small, others long and some short; and a bitter kinde also, yet being in the whole surface, so like one unto another, that they can be distinguished by no other thing then the Allmond, I will onely give you one description, and shew you their differences herein, which I thinke shall be suffici-

Amygdalus. The Allmond tree.

ent. The Allmond tree groweth greater and higher then any Peach (and is therefore usually planted by it selfe, and not against a wall, and never grafted that I have seene and knowne, that would take and abide, but is alwayes planted of a stone put into the ground, where you would have it to grow, for it hardly suffereth a transplanting) the body thereof becoming very great, whereby it sheweth to be of long continuance, spreading greater armes and smaller branches, but brittle, with long narrow leaves on them, very like unto the Peach tree: the flowers are of a paler purple colour then the Peach blossomes, and not so bitter, and the fruite very like the Peach, for the outward forme, before it be ripe, but the outer rinde is a dry skinne without any cleft in it, or edible substance under it, as the Peach hath, and the shell under it is smooth and not ragged like it, and not so thicke a kernell within, being bitter in one kinde, which are small like the *Barbery* Allmonds, and sweete in all the rest, whereof some are small, and called *Barbery* Allmonds, others long and slender, and are called *Jordan* Allmonds, and others short and broad, called *Valentia* Allmonds: it is observed that those that grow in the Isle of *Cyprus*, bend downe their heads, contrary to all in any other place.

The Place and Time.

They grow in all places planted, that I know, or can heare of in *Syria*, *Barbery*, *Turkie*, *Spaine*, *Italy*, and wheresoever, we have both the bitter and the sweete of that sort, that is, thicke and short, growing in many places of our Land, and blossome earlier then the Peach of any sort, and the fruite ripe also before them.

The Names.

It is called in Greeke *ἀμυγδαλίνα*, and the fruite *ἀμυγδαλίνα* and *ἀμυγδαλίον*, in Latine *Amygdalus*, and the fruite *Amygdalum*, and *Amygdalum*, some thinke that *Cato*

meant these by the name of *Nuces Græca*, but yet some doe rather referre them to the Wallnuts. *Columella* maketh mention of *Nuces Græce*, *Inglandes*, and *Amygdale*, as of three kinds, for many thinke the Almond was not knowne in *Italy* in *Cato* his time. *Pliny* out of *Theophrastus* setteth downe the way to make the bitter Almond tree to beare sweete Almonds, and the sweete bitter: but with such fond conceits of alterations and transmutations are the workes of the ancients according to their Gentillisme too plentifully stored, which we know is contrary to the law, that God hath set in it selfe to preserve the kinde, and although there be not onely *luxus*, but *luxus nature*, as it hapeneth in many things, as in the Hermaphrodite, yet that altereth not the law of nature, and notwithstanding the example of the Mule. The *Arabians* call the fruite *Ianz Kanz* and *Lauzi*, the *Italians* *Mandole*, the *Spaniards* *Almendres*, the *French* *Amandes*, the *Germanes* *Mandelkern*, the *Dutch* *Amandel*, and we in *English* Allmonds.

The Vertues.

The sweete Allmonds, are the pleasanter meate, formed into many fashions as every one liketh, but the bitter are the more physcally; the sweete are hot and moist in the first degree, the bitter are drying in the second: The sweete Allmonds blanched and dried, that they may be made into pouther, and so taken by it selfe, or with other things helpeth to binde the loosenesse of the belly: the oyle of sweete Allmonds, mixed with the fine pouther of Sugar Candy is good for the dry cough, and for hoarsenesse, to take a little at once; the said oyle drunke either alone or with some Syrupe of Marsh Mallows, is good for those that are troubled with the stone, to ease the paines, by opening and making slippery the passages thereof: It is used also by women in Childbed after their fore travell: being mixed with oyle of Tartar, it maketh a creame called *Lac Virginis*, that clenseth the skin, and lensieth the drynesse or roughnesse, parched with the winde or otherwise: it is used also by it selfe or with other things, to annoint the stomacke for the cold: The pouther of the Allmond cakes, after the oyle is pressed from them, doth serve farre better then sope to cleanse the hands or skinne in any place, and to supple the parts and make them smooth: The greene fruite while they are very greene, are eaten to helpe the moist humours in the stomacke, and are earen with pleasure by women with childe, and being preserved, are very delicate. The bitter Allmonds doe provoke urine, and womens courses, and helpe to mollifie the belly; they are good also taken with *Anylum* and Mintes, for the spitting of blood, and taken with water they are good for paines in the backe, and the inflammation in the lungs; or else taken with fine Turpentine, made into an electuary or licking medicine, with honey and milke, they are good for the obstructions of the liver, for the cough and the winde chollicke taking the quantity of a Hazell nut at a time: the oyle of bitter Almonds is effectual to all the purposes aforesaid and doth more effectually cleanse the skin then that of sweete Almonds: it is also used for the noynte and deafenesse in the eares, to droppe thereof into them: the bitter Allmonds themselves beaten with oyle of Roses and Vinegar annointed on the temples, doe ease the paines in the head, and procureth sleepe and rest in hot agues, or phrenies: it doth mollifie the stiffenesse of the sinewes and joynts, and healeth the bitings of dogs and foule ulcers: if one doe eat five or sixe bitter Almonds before he fall into drinking company, it will keepe him from being overtaken more then the rest: and it is said that if they be given to a Foxe in his meate, it will kill him.

CHAP. LXXXIII.

Cerasus. The Cherry tree.

Here are as many sorts of Cherries almost as of plammes, the most whereof I have declared in my former Booke, but there are some other sorts both tall and low, that are not there mentioned, and are to be shewed in this place. And although I have there set forth, both the descriptions and figures in part of some that I doe here againe mention, both of the taller and lower sort, yet I also give you the figures of some there not set forth but described: the double repetitions being to shew the differences.

1. *Cerasus vulgaris.* The ordinary Cherry tree.

The Cherry tree riseth to a reasonable heighth and greatnesse, spreading well and somewhat thicke, the leaves are neere the plumme for forme, but somewhat longer in most, and dented about the edges: the flowers come forth two or three, or foure at the most at a place or joynt together, every one on his owne footstalk, consisting of five white leaves, with somethreds in the middle, after which come round berryes, greene at the first, and red when they are through ripe, of a meane bignesse and pleasant taste, with a hard white small stone within it whose ketnell is somewhat bitter, but not unpleasant. Some sorts are greater and pleasanter than others, some tart, some waterish, others firme, some red, others whiter.

2. *Cerasus Trapezantina sive Laurocerasus.* The Bay Cherry, or Cherry Bay.
Because this tree beareth berryes very like to faire great blacke Cherries, and a stone within them, like unto a Cherry stone; I thinke it is most worthy to be referred to this stocke or kindred of the Cherries, howsoever formerly I set it among some kindes of Bayes. It sometimes groweth to be a faire great tree, spread into many branches, but usually with us it groweth as a shrubbe, shooting forth sundry greene branches, with goodly faire shining fresh greene leaves thereon, larger then any Bay leafe, the flowers are many and whitish, growing on a long cluster like unto the *Padus Theophrasti*, here also expressed, made of five leaves a peece, but much greater then they; after which cometh the fruite, being as large as any *Flanders*, and of a very blacke shining colour very sweete, with a round stone within them, very like unto a Cherry stone, this is taken to be the *Lotus secundus Theophrasti* by *Lugdunensis*, which may very well be.

3. *Cerasus racemosa purida Padus Theophrasti dicta.* The strange long cluster Cherry.
This tree as I said, is referred to the stocke or kindred of the Cherries, although it doe not much resemble any of them. It groweth to be a great tree, whose body and greater branches are covered with a sad coloured barke, the younger branches being greene, whereon grow somewhat broad and short leaves, harder and more crumpled then any Cherry leafe, and dented about the edges: the flowers come forth at the joynts with the leaves in a long cluster many together, like those of *Lakurnum*, the Beane Tree foile, but very small, and of a downy white colour.

Cerasus vulgaris.
The ordinary Cherry tree.

Chamaecerasus Alpina repens.
The creeping dwarf Cherry tree of the Alps.

Cerasus avium racemosa.
The cluster birds Cherry tree.

Chamaecerasus altera & Hungarica.
Another dwarf Cherry, and one of Hungary.

Cerasus Americana five de Baccalos.
The Baccalos, or new found Land Cherry.

2. *Cerasus Trapezantina* five *Laurocerasus*.
The Bay Cherry, or Cherry Bay.

3. *Cerasus racemosa* fusida *Padae Theophrasti* d. flo.
The strange long cluster Cherry.

4, 5. *Machaleb Germanicum* & *Syriacus* The wild rocke
Cherry of Austria, and perfuming Cherry of Syria.

6. *Chamaecerasus montana Aceris folio.*
The mountaine dwarf Cherry.

7. *Cerasus exotica rotundifolia Indica.*
The strange or Indian Cherry.

colour, smelling somewhat strong and sweete, after which come the fruit, which are small blacke round berries no bigger then small pease, with little substance upon them, and very small stones within them, every one on a short footestalk, but many together in a long clutler, like the wilde clutler or birdes Cherry, of an harsh taste, and of an evill sent while it is eating. The wood also smelleth strong or not well, from whence came the name.

4. *Machaleb Germanicum.* The rocke wilde Cherry of Austria.
This riseth sometimes to the heigh of a reasonable tree, on the branches whereof come forth certaine knots or knobs, and Cherry tree like leaves at them but lesser, and from among them a small long Greene stalk, with eight or ten white flowers thereon, hanging in a clutler, made of five leaves a peece, like unto the Cherry blouf some with a long pointell in the middle, compassed with five white chives, tipt with pendants, purplish at the first, and yellow after, as sweete as Hawthorne flowers, standing in Greene huskes, divided into five parts, after which come small berries no bigger then pepper cornes, and blacke on the outside: at the ends of the branches grow such like shining Greene leaves as the other dented about the edges.

5. *Machaleb Syriacum.* The peruming Cherry of Syria.
This *Machaleb* of the Arabians doth not grow to any bignesse, but with broad short leaves like the Line tree, pointed at the ends and dented about the edges, the flowers are white, and the berries blacke, having a small stone within them like unto a Cherry stone, but lesser, and a brownish cored kernell within them, smelling hot and sweete, yet bitter withall, which many perfumers doe use to mixe with other perfuming sweetes.

6. *Chamaecerasus montana Aceris folio.* The mountaine dwarf Cherry.
This dwarf plant is reckoned also to the Cherryes, having broad leaves cut in or divided at the edges, resembling those of the Maple tree: the fruit is round and red like unto a Cherry, and therefore reckoned as one, two for the most part standing together on a long stalk.

7. *Chamaecerasus exotica rotundifolia Indica.* The strange or Indian Cherry.
This Exoticke Indian, hath streight slender branches, with faire and somewhat broad leaves thereon, somewhat like unto those of the Cherry tree, yet some rounder and not pointed at the ends, but all finely dented about the edges: the fruit is small and red like a dwarf Cherry.

The Place and Time.

The first kinde is alwayes planted in Orchards, where among divers other, it taketh up a roome. The second in Turkey, or Trabizond, and planted first in Italy, at Genoa, in the Prince Orias Garden, where Bellonius first, with tedious travell found it, and was sent from Constantinople, to Matthiolus and others. The third in some gravelly grounds in Savoy. The fourth, fifth and last, are exprest in their titles, and the sixth in Lombardy: And for the most part flower, and beare their fruit about the time that others of their sort doe.

The Names.

The Cherry tree is called in Greeke *κεράσιον*, and the fruit *κεράσιον*, in Latine *Cerasus* and *Cerasa*. *Arboreus* writeth

writeth, and so doth *Pliny*, that the Cherry was not knowne in *Italy*, before the warre with *Mithridates* King of *Pontus*, and that *Lucius Lucullus* after he had overthrowne him, brought it from *Cerasum* in *Pontus*, into *Italy*, and gave it the name *Cerasum*, from the place he had it. The second is called by the *Turkes* *Trebizonium*, that is, *Dalylus Trapezuntica*, but by *Belonius* first, as I take it, *Laurocerasus*, and *Cerasus Trapezuntica*. *Dalechampius* tooke it to be *Lotus Africana*, but *Clusius* contesteth there against. The third is taken by *Dalechampius* to be the *Padus* of *Theophrastus*, which *Clusius* taketh, or mistaketh rather, to be the *Cerasus avium*, or *racemosa vulgo herbariorum*, which is quite another tree, as I have shewed among the other sort of *Cherries*, and *Bauhinn* followeth him therein, making them both one. The *Burgonians* about the River of *Seine*, doe call it *Puisin*, (from whence it is likely *Dalechampius* tooke the name, to come neere to *Padus*) and take it for a kinde of wilde Cherry, as the cluster Cherry is, and in the long clastering of the flowers and fruite together very like it, and because the wood smelleth strong, the *Savians* call it *Puisier*, as also *Cerisier blanc*. *Lugdunensis* doth much confound this with the *Gnajuicum Puvavinum* of *Fallopium*, taking them to be all one, as also with the *Lotus secundus* of *Diocorides*, and the *Diospyros* of *Theophrastus*, and the *Faba Graeca* of *Pliny*, without all knowledge whereof he wrote as it seemeth. It came to me out of *Italy*, by the name of *Laurus regia*, but is most usually now called *Laurocerasus*, and in *English* as it is in the title. The fourth is most likely to be the *Cerasus sylvestris* of *Tragus*, and the *Mahaleb*, or *Macaleb* of *Clusius*, and the *Petrocerasus*, or *Chamaecerasus petraea* of *Gesner*, which *Bauhinn* foully confoundeth with *Martialis* his *Mahaleb*, and the *Chamaecerasus Syriaca* of *Gesner*, which is the true *Mahaleb* to be both one, when as this fifth onely is the true kinde, as the sweet smelling fruite doth plainly declare, besides the diversity of the tree, as is before declared. The sixth came as a rarity from the *Indies*, whereof no more can as yet be said. The last is onely remembered by *Gesner* in *hortis*, and by *Lugdunensis*, who saith that *Gesner* sent a branch thereof to *Dalechampius*, by the name of *Chamaecerasus montis Generis*. The *Arabians* call the Cherry, *Sarasir*, the *Italians* *Ciregie*, the *Spaniards* *Cerazas*, and *Giindus*, the French *Cerises*, and *Guines*, the *Germans* *Kirschen*, and *Kirschen*, the *Dutch* *Krieken*, And we in *English* Cherry.

The Vertues.

Cherries as they are of divers tastes, so they are of divers qualities, the sweete are more lubricke, and passe through the stomacke and belly more speedily, but are of little nourishment, the tart or sowre are more pleasing to an hot stomacke, and procure an appetite to meate, and helpe to cut tough flegme, and grosse humours, but when these are dried, they are more binding the belly then being fresh, and doe give a fine rellish to broths and drinckes wherein they are boyled; being cooling in hot diseases, and welcome to the stomacke, and provoke urine; The Gum of the Cherry tree dissolved in Wine, is good for a cold cough and hoarsenesse of the throat: helpeth to give once a better colour in the face, sharpeneth the eye-sight, stirreth up an appetite, and helpeth to breake and expell the stone: the blacke Cherries being bruised with the stones and distilled, the water thereof is much used to breake the stone, expell the gravell, and breake the winde: the true *Mahaleb* of *Syria*, was mistaken by *Serapio* to be the *Phyllirea* of *Diocorides*, when as the properties are much differing, for *Mahaleb* doth heate and mollifie, even by the testimony of *Mesues* and *Rasis*, and as *Avicen* saith, doth cleanse, attenuate and resolve and ease paines: The oyle drawne from the kernels, doth much more ease the paines in the bowels and backe, being annoynted, then the kernels themselves which some use for the said purpose, and for soundings, and faintings, to be taken with Mede or honied water, and doe helpe the chollicke and stone in the kidneys, kill the wormes in the belly, and provoke urine also.

CHAP. LXXXIV.

Cornus. The Cornell tree.

He Cornell is divided into male and female; the male is of two sorts, one bearing red berries like Cherries, and another whitish: the female hath no diversity.

1. *Cornus mas fructu rubro*. The male red Cornell tree.

The Cornell or Cornelian Cherry tree groweth to be a reasonable tall and great tree, the body and branches are covered with a rugged barke, and the younger smooth, whereon grow smooth leaves, and plaine, not dented at all about the edges, the flowers are many small yellow tufts, as it were short threds set together, which come forth before any leafe, and so fall away likewise, before the leaves appeare much open: the fruite are somewhat long round berries, of the bignesse of small Ollives, with a small hard stone within them, like unto an Ollive stone, reddish when they are ripe, somewhat like a Cherry, of a reasonable pleasant taste, somewhat austere withall: the wood is hard like an horne, and groweth slowly. Of this kinde *Clusius* maketh another sort, with redder berries, little differing in any thing else: and another that groweth low, but yet hath bene observed upon the transplanting to grow much greater.

Fructu masculino rubro in la.

2. *Cornus mas fructu albo*. The white male Cornell tree.

This other Cornell differeth not from the first in any other more notable matter then in the fruit, which becometh not red, but whitish when it is ripe.

3. *Cornus femina*, The Dogge berry or Gatten tree.

This never riseth to be a tree of any bulke or body with us (but *Clusius* saith that he saw in the Woods of *Austria*, as bigge trees hereof a: of the male, and *Belonius* saith the same *lib. 1. c. 56*) but usually abideth as an hedge bush with many pithy strong twiggy stemmes rising from the roote, of a brownish colour and the sprigges more reddish, with a pith within them like unto Elder, having leaves thereon somewhat like the former, but a little shorter and broader, standing upon reddish footstalkes, and the middle rib reddish likewise, the flowers are white and stand at the end of the branches, many growing together in a tuft or umbell, upon reddish footstalkes which turne into small berries, green at the first, and shining blacke when they are ripe, of a most unpleasant bitter taste provoking casting.

The Place and Time.

The first is found wild in many places of *Germany*, and the other sorts hereof also, but the second is more

RARE

1. *Cornus mas* fructu rubro.
The male red Cornell tree.

3. *Cornus femina*.
The Dogge berry or Gatter tree.

rarē, the last groweth in every Country of the Land, serving for a hedge bush; the first flowereth very early, as is before said, in March, and sometimes in February, the fruit is ripe in August. The last flowereth not untill May, and the fruit ripeneth not untill September be well over.

The Names.

The first is called in Greeke *neguid* in Latine *Cornus mas*, to distinguish it from the other, which is called by Theophrastus *Βουκερυσία* *Cornus femina*. There is much doubt and question among many of our later Writers, about this female Cornell (for of the male there is no doubt, all calling it *Cornus mas*, or *sativa*), whether it should be the *Virga Sanguinea* of Pliny, or the *Hartriegel* of Tragus, or his *Faulbaum*, some deferring it to the one, some to the other, but the generall tenet of the most is, that in most things it answereth both to the *Tibetocrania* of Theophrastus, and may well enough agree with the *Virga sanguinea* of Pliny: *Cordus* calleth it *Pseudocrania* quasi *falsa* *Cornus*, and *Dodonæus*, besides that he calleth it *Cornus femina*, taketh it to be the *Opulus Columella*. *Bellonius* saith in the 56. Chapter of his first Booke of Observations, that he found that shrub, which the French in imitation of the Latines call *des Sanguins*, and the auncient Greeke *Cornus femina*, betwene *Philoppos*, and *Bucephala* to be little inferiour unto our greatest male Cornellian trees, thereby esteeming them to be both one: The Italians as *Matthiolus* saith, call it *Sanguinea*, and *Sanguinello*, but whether it be *Tragus Hartriegel*, we are not well assured, for he saith that the wood thereof is so hard that it can very hardly be bored, and therefore serveth for many Country instruments, and long lasting for the hardnesse, which we can not say so of this; we for the most part call it the Dogge berry tree, because the berries are not fit to be eaten, or to be given to a dogge. I heare they call this in the North parts of the Land, the Gatter tree, and the berries Gatter berries, yet some say they call the *Enonymus* so.

The Vertues.

The male Cornell is a fruit very good and wholesomē, pleasant with the austerity, and helping to binde the belly subject of molested with a laske: both leaves and buds saith *Galen*, doe dry exceedingly, and therefore are good to foder up great wounds in strong bodies, but not so fit in small cuts, and more tender persons, because it dryeth too much in such cases: The Conserve made of the fruit, is of especiall use in all fluxes both in man and woman, the liquor that commeth out of the leaves or stalkes, being heated with an iron, that the iron touch them not, is good to heale reiters, and ring wormes. The Female Cornell or Dogge berry, is put to no use that I know, yet *Matthiolus* saith that the people in Italy, by boyling the berries, make an oyle that serveth for their Lampes. If one that is cured of the biting of a madde dogge, shall within one twelve moneth after touch the *Cornus femina*, or Dogge berry tree, or any part thereof, the disease will returne againe. *Schimkins observation*.

CHAP. LXXXV.

Lotus: The Lote or Nettle tree.

Although divers Authours have published sundry trees, under the name of *Lotus*, as *Injuba*, *Laurocerasus*, and many others, yet there is knowne unto us but one true kinde, that is called *Lotus*, the Lote or Nettle tree, yet I thinke not amiss to joine two or three other plants, which may not unfitly be referred to it.

1. *Lotus sive Celtis arbor*. The Lotē or Nettle tree.

The true Lote or Nettle tree groweth to a great height, whose body and elder branches are covered with a smooth darke Greene barke, the younger being more Greene, whereon grow somewhat rough or hard leaves, long pointed, and somewhat deeply dented about the edges, like unto a Nettle leafe, of a darke Greene colour, and often grow yellow toward Autumne: the flowers stand here and there scattered on the branches, after which come round berries like unto Cherries, hanging downwards upon long footestalkes Greene at the first, whitish afterwards, and reddish when they are full ripe, but blackish if they be suffered to hang too long on the branches, of a pleasant austere taste, with an hard round stone within them. There is said by *Theophrastus*, if this be his first *Lotus*, to be another sort without stones, whereof Wine was made, that would not last above two or three dayes.

*sine offi-
cu. li.*

2. *Arbor Guajacana sive Guajacum Patavinum*. The Indian Date Plumme tree.

The Indian Lote tree groweth great, with a smooth darke Greene barke, shooting forth many large boughes, and slender green branches, beset with faire and somewhat broad green leaves, somewhat like unto the leaves of the Cornell tree, but larger, without any dents on the edges, the flowers grow along on the branches, close set unto them, without any or with a very short footestalk under them; consisting of foure Greene leaves, as the huske, and foure other within, of a darke purplish red colour, the fruite that followeth standeth in the middle of the said huske, closing it round at the bottome, and is Greene at the first, and very harsh, but red and round when it is ripe, and somewhat like a Plumme, with a small point at the head, and then of a reasonable pleasant taste or relish, wherein in the hotter climates, but seldome in ours or not with me, are contained thicke and flat browne gristely seedes or kernels, somewhat like unto the kernells of *Cassia Fistula*, which may be somewhat easily cut with a knife.

3. *Guajacum Patavinum angustifolium*. The Indian Date Plumme tree with narrow leaves.

This differeth little from the last, either in stemme or fruite, but onely in the leafe, which is longer and largēt then it.

Lotus arbor.
The Nettle tree.

2. *Guajacum Patavinum.*
The Indian Date Plumme tree.

3. *Gustia* or *Potamogeton angustifolius* Joffe.
The Indian Date Plumme tree with narrower leaves.

4. *Pisbanim Virginianum*
The Virginian Date Plumme or *Pisbanim*.

4. *Pisbanim Virginianum*. The Virginia Date Plumme or *Pisbanim*.

This other kinde, which differeth but little from the second (if it be not all one with it, or at least a greater sort, whereof I am more then halfe perswaded, they doe so nere agree together) hath growne also with me, raised from the kernell were sent with the fruite out of *Virginia*, and grew in a short time to be of seven or eight foote high (which upon remooving perished) but there groweth to be a great tree, whose wood is hard and brittle, and somewhat whitish, but covered with a thin darke green barke: the branches are many and slender, with a thinner grayish barke on them, whereon are set many faire broad Greene leaves, without any dent on the edges, and very like unto the former. It hath not borne flowers or fruite in our Country that I can heare of as yet with any, but the fruite as it came to us, was in forme and bignesse like a Date, covered with a blackish skinned huske of four hard leaves very firme like a Date, and almost as sweete, with three or foure great flat thick kernels within them, very like unto the former, but larger by the halfe.

The Place and Time.

The first groweth in *Italy* in divers places, naturall as it is said: but in many especiall places there, and in *Provence* of *France*, and *Mompelier*, growne great trees, and so also in some places with us: The second came to me from *Italy*, by Master Doctour *John More*: and groweth now in my Garden, but came as it is said out of the West Indies, for *Dalechamp* had it from *Florence*, where they called it *Uva d'India*, and planted it about *Lyon* in *France*: The last as I said came from *Virginia*: The first flowreth earlie, and ripeneth the fruite also sooner then the last.

The Names.

The Lote tree is called in Greeke *λोटου δένδρον*, and so in Latine *Lotus arbor*, to distinguish it from all the other kinds of *Lotus herba*, which are very many. The first is the *Lotus* of *Dioscorides*, which *Pliny* collecteth *Lotus Celtis*, and supposed to be the first *Lotus* of *Theophrastus*, which grew in an Island called *Loto phagia Insula*, or *Pharis*, but now called *Garbiris* also in *Africa*, where as *Theophrastus* saith, the army of *Ophellus* passing to *Carthage*, were fed with the fruite of this tree for many dayes, they or the people where they grew most abundantly, being called *Lotophagi*, Lote eaters, whereof *Homer* also lib. 9. *Odysse* speaketh that *Ulysses* followers so liked the sweete fruite that they could not be driven from them without blowes, to their shippes againe, (yet some referre this narration to the *Ziziphus*) And is generally called *Lotus Celtis* or *arbor* by all Writers, which *Guilandinus* saith the *Italians* call *Bagolaro*; and *Aspulara Arbor del perlaro*, and *Perlaro*. The French *Mitocoulier*, and *Cacavia* by the *Candians*, as *Bellonius* saith. *Theophrastus* and *Pliny* make mention of another sort of this *Lotus*, without stones, whereof was made a kinde of Wine, that would not endure above two or three dayes, which fruite is as yet unknowne in these dayes. The second is called *Gnajakum Patavinum Fallopi* by *Gesner* in *hortis*, and *Lobel*, who also taketh it to be the *Lotus vera* *Theophrasti*, who are both in an error, *Fallopius* that tooke it for

Q o o o o o

Gnajakum

Guajacum, and *Lobel* that taketh it for *Lotus vera*. *Matthiolus* callt it *Pseudolotus*, and saith that it came from *Angerius de Busbecke*, who sent it from *Constantinople* by the name of *Dactylus ex Trapezunda dulces*, but assuredly either *Busbecke* or *Matthiolus* were deceived therein, a contrary fruit being given them under that name, for the name agreeth not with his description, which is indeede the description of this *Guajacum*, for by that name of *Trabison Carnese Dactylus ex Trapezunte*, hath the *Laurocerasus* beene sent from *Constantinople*, as both *Camerarius* and *Clysius* doe let it downe, which is much differing from this. *Camerarius* and *Bellonius* collect it *Guajacana*, *Casparinus* *Ermelinus*, who also taketh it to be the *Tubercum alterum* genus *Plinij*. *Lugduner* fir as said before, taketh it to be the *Diospyros* of *Theophrastus*, lib. 3. c. 13. and the *Faba Græca* of *Plinij*. *Matthiolus* collecteth the third *Lotus Africana altera*, or *Loti Africana species*. The last hath the name in the title, as it came to us, and for the likenesse I doe set it with them, if as I said it be not the very same: and is also likely to be the *Loti Africana altera species*, as the figure thereof plainly sheweth.

The Vertues.

The berries of the Nettle tree doe binde the belly, and the shavings of the wood made into a poulder and drunke, or boyled in Wine or water and drunke, helpeth women that are troubled with the abundance of their courses, and the lashes of the belly also: the same decoction maketh the haire to become yellow, and stayeth the falling of them. The fruit of the other while they are Greene and unripe are so harsh as they are able to draw their mouthes awry that shall eat them, but when they are full ripe are reasonable sweet and pleasant: but what other property they have, I have not yet understood.

CHAP. LXXXVII.

Lentiscus. The Masticke or Lenticis tree.

He *Arbores resiniferae*, come next to be entreated of, that is, those trees that beare Rosin-like Gumme, which are divided into two sorts, that is, into those that beare berries, and those that beare Cones. The berry bearing trees are these *Oxycedrus*, the prickly Cedar, *Cedrus Lycia*, the Cypresse like Cedar, the greater and the lesser, *Sabina nyrage*, both sorts of Sabine, *Juniperus major*, the greater Juniper tree, of all which I have before in this worke spoken, some adde *Taxus* the Yew tree, but I see no reason for it. There remaine some others to be intreated of, and the Masticke tree is it, wherunto I thinke meete to joyne two other strange trees of the West Indies, which are referred hereunto for their likenesse; the rest of them which are the Turpentine tree, the Balsame tree, the Storax tree, and the Dragon tree shall follow each in their order.

1. *Lentiscus*. The Masticke tree.

The Masticke tree groweth like a tree, if it be suffered to grow up, and often also riseth but as a shrubbe, whose body and branches are in colour alike, that is of a reddish colour, tough and gentle: and doe somewhat bend downe their ends, whereon grow winged darke Greene leaves consisting of foure couple, each of the bignesse of the large Myrtle leafe, standing one against another, without any odde one at the end, with a reddish circle about their edges, and some reddish veines on the under side also, smelling sweete and abiding Greene alwayes on the bushes, the flowers grow in clusters at the jynctes with the leaves, being small, and of a pale purplish Greene colour, and after in their places stand small blackish berries, of the bignesse of Pepper cornes, with a hard blacke shell under the outer skin, and a white kernell within, it beareth besides these berries certaine hornes, with a certaine cleare liquor in them, which turneth into small flyes, that flye away: it giveth also a cleare white gumme in small droppes, when the flockes are wounded in sundry places, which is gathered with great care and attendance.

2. *Lentiscus Tervana*. The Indian Masticke tree.

This Indian Masticke groweth as high as any high Masticke tree, spreading long and pliant branches, bending downewards, covered with a rough reddish bark, set with long winged leaves, made of many leaves, set by couples, with an odde one at the ends, of a sad Greene colour, and a white ribbe in the middle, with rugged veines transverseing them, conspicuous chietely underneath, being plaine and not dented about the edges, and being bruised have no evil sent: the flowers come forth in sparfed tufts together on a stalk, an handbreadth long, consisting of five small white pointed leaves a peece, after which succeed small round berries, like those of the former Masticke tree, upon short footestalkes, of the bignesse of Pepper cornes, Greene at the first, red after, and blacke being ripe, and as sharpe and hot in taste as Pepper, somewhat oylie, covered with a thin skinne, and the inward kernell of a very sharpe sent and taste. We have had a cleare white gumme in great lumps or peeces brought us from some of our English plantations in the West Indies, which they called Masticke, and in the chewing was tenacious like Masticke, whether the tree from whence it was taken was answerable to this or the next, we are not certaine, because there was no relation sent thereof unto us with it.

3. *Lentiscus Pectavis similis Molle dicta*. The Indians Molle.

Clysius maketh mention of a tree called Molle, received from the West Indies, which as he saith might be the same with the former and differing but in age, but because there seemeth manifest difference betweene them, I thought good to sever them, and shew you it with this description that he hath given it. There rose saith he, two small plants, with the worthy Signiour *John Brancion*, at *Meeblin*, from seedes that were called Molle by the West Indians, but perished by the extremity of the Winter, the third year after they sprang up: but the stems of them being young, were of a darke Greene colour, with divers small ash-coloured spots thereon, the leaves were winged like those of the Ash, but much smaller, of a darke Greene colour, dented about the edges, and the end leafe longell, yeilding a white, thicke, and glutinous sweete milke when they are broken, and being bruised smell like Fennell, having an astringent taste: it gave no flowers, but *Lobel* sheweth the flowers were yellow, but the berries that were sowne and sprang, were as bigge almost as Pepper cornes, covered with a reddish skin, and clustering together like unto a small cluster of Grapes: the gumme hereof is said to be sweete in smell.

1. *Lentiscus*. The Masticke tree.

2, 3. *Lentiscus Peruviana* & *Molle Clusij* for aith folius.
The Indian Masticke tree, and the Indian Molle somewhat like it.

The Place and Time.

The first groweth as well in *Provence* of *France* as in divers places of *Italy*, and in *Candy* also, and in many places of *Grecia*, but yeeldeth little gumme there, but especially in the Isle of *Chio*, now called *Sio*; they tend, prune, and manure it with as great paines and care, as others doe their Vines, which goeth beyond them in the profit of the gumme: It floweth in *April*, and the berryes ripen in *September*, and not at severall times, as these Verfes of *Aratus* would intimate.

*Jam vero semper viridis semperque gravata
Lentiscus, triplici solita est grandescere satis.
Ter fruges fundens, tria tempora monstrat arandi.*

As it is there set downe. The second was brought from *America*, and grew, as *Banbinus* relateth it, in *Cardinal Columna* his Garden at *Rome*, where it grew great, which also as it is likely was the same that *Clusius* saith *Everardus Verstius* saw there, and as he saith likewise *Doctor Tovar* of *Sivil* in *Spainne*, sent him such like branches with the unripe fruit in clusters to see, but as he saith, called *Molle* by *Tovar*; *Lobel* also exhibiteth a branch hereof with the next that is dented, at the beginning of his tractate de *Balsamo*: *Clusius* himselfe also having gained a branch hereof from some place not specified, setteth it downe as taken from a tree growne old. The last is mentioned likewise by *Clusius* in his Annotations upon *Monardus*, to grow as all the Chronicles, or Writers of the West Indians say, in all the Vallies and Champion grounds of *Peru*, and especially *Cieza*, *Petrus de Osuna* also in his Letter to *Monardus* saith it grew at *Lima* in *Peru*.

The Names.

The Masticke tree is called in Greeke *ξύλον* (not *ξύλον*) which is *Iuncus odoratus*) *quasi ξύλον fissilis quod faciē frequenter in dentiscalpia findatur*, and the berryes *γυδία* and not *ξύδία*, as some coppies have it, in Latine *Lentiscus* a *foliorum lentore* fortasse by which name all Authours call it, and the gumme *Resina Lentiscina*, and *Mastiche*, and *Mystix* by some, by the *Arabians* *Gluten Romanum*; *Dioscorides* maketh mention of a Greene gumme as well as a white, and *Galen* of a blacke sort that was of *Egypt*, both which are not knowne in these dayes: in *Candy* and some other places, their trees yeeld a yellowish bitter Masticke, but no where so good, and so plentifull in all the world, as in the Isle of *Sio* in the *Egean* Sea: there is another sort of Masticke which is called *Acanthice*, or *Spinalis* as *Gaza* translateth it, because it is gathered from a prickly thistle, as I have shewed among the Thistles in the Chapter of *Chameleon* and *Carlina*. In former times our Apothecaries shops were furnished with no other *Xylobalsumum*, then the sprigs of *Lentiscus*, I would the error might not be continued: The second is called *Molle* by *Tovar*, as I said before, and by *Clusius* in his *Cure posteriorer*, but by *Banbinus* *Lentiscus Peruviana*, and following *Clusius* saith, that it beareth the leaves according to the growth, being dented while it is young, and without dents growing older, which how dissonant me thinks this is to reason, in this plant let others judge upon my judgement, & the forme of the growing the one from the other, for the one that is

○○○○○○ 3

dented

denoted hath an end leafe, bigger and longer then all the rest, which sheweth I am perswaded a manifest difference in *specie*, from this that is not denoted, for I cannot be perswaded that any plant, should so much differ in forme from it selfe in the time of age and youth. The last is also as I shewed called Molle by the Indian Writers, whose sent is like Fennell, when as the other is not so, and is for the likenesse referred to the *Lentiscus Pervana* by *Bauhinus* in his *Mathiolus*, &c. following *Clusius* therein, to be both one, & by *Lobel* joyned with the former and the *Balsamum verum*, making it to agree with the properties thereof in many things, *Baptista Ferrarius* also in his *Flora* mentioneth it by the name of *Tereanthus angustifolia* pag. 372. citing the third Book, and 15. Chapter of that great Book of the West Indian plants, beasts, &c. begun to be Printed more thentwenty yeares ago at Rome, whose title is *Thesaurus rerum medicarum nova Hispania*, &c. The *Arabians* call the Lentiske tree *Darn*, the *Italians* *Lentisco*, the *Spaniards* *Mata* and *Areria*, the *French* *Lentisque*, and those of *Narbone* *Resinele*, the *Germanes* *Mastickbaum*, the *Dutch* *Mastickboom*, and we in *English* the Lentiske or Masticke tree.

The Vertues.

The Lentiske tree is binding in the second degree, or in the beginning of the third. and temperately hot: all the parts thereof are binding, that is, both roore and branch, both barke and leafe, both fruite and gumme, and doe binde and stop all fluxes, and spittings or castings of blood, and is good to strengthen a weak stomacke, and helpe the falling downe of the mother or fundament: the decoction fomented, healeth up hollow sores, and so dereth broken bones, fasteneth loose teeth, and stayeth creeping sores, and doth as much as *Acacia* or *Hypocistis*, and even the juyce of the leaves is as good a substitute for *Acacia* as any other: the oyle that is pressed out of the berries, helpeth the itch, the leprosie and scabbies, both in men and beasts: the gumme Masticke doth binde and stay fluxes in like manner taken any way in pouther; or if three or foure graines be swallowed whole at night when you goe to bed, it not onely eateth all paines in the stomacke, but keepeth it from the like afterwards, the pouther of Masticke with Amber and Turpinte is good against the running of the reines, and for both whites and reds in women: the pouther thereof mixed with Conserve of red Roses, helpeth to stay the distillations of thinn rheume on the lungs, causing a continuall cough and spitting of blood, and if some white *Francumense* in pouther be mixed with it also, it worketh the more effectually, the same also comforteth the braine, procurereth an appetite to meate in moist fluxible stomackes, stayeth castings, and maketh a sweete breath: the same being heated in Wine, and the mouth, gummes, and teeth washed therewith, cleneth and fasteneth the corruption, and loosens both of gummes and teeth: it is also much used in salves and plaisters, to mundifie and heale ulcers, and sores, to stay the fretting fluxes of humours to them, to dry them up, and to fill up the hollownesse: it strengthneth and bindeth also the parts, whereunto it is applied, and comforteth the aking joynts and sinews wonderfully. The oyle that is made of Masticke by infusion and ebullition, *secundum artem Pharmaceuticam*, is singular good in all the aforesaid diseases, moderately comforting, mollifying and binding, and is effectually against all the aforesaid diseases of the mother, against all paines in the belly, colon the chollick, and the stomacke, the hardnesse of tumours, and the paines of the joynts and sinews, it likewise comforteth the braine, and strengtheneth both the liver and heart, but one droppe of the pure Chymical oyle drawne from Masticke is more effectually then one ounce of the former oyle, for it deserveth more commendations then is given it. The effects of the Indian Molle is recorded by those have written of it first, that of the berries, they make a wholesome kinde of Wine or drinke being boyled with water, and according to the boyling of them either vinegar or honey: the decoction of the leaves is good to helpe cold griefes, and applyed warme to wundes after clothes be dipped therein helpeth their cure more speedily, the pouther of the barke also of the tree, strewed or cast into them doth cleanse, ingender flesh, and heale them quickly and perfectly: with the decoction also of the barke, the swellings and paines of legges and thighs, are much comforted and helped; the said pouther of the barke doth helpe to fasten loose teeth, and loose gummes, and of the wood is made fine and good toothpicks: the gumme dissolved in milke and dropped into the eyes taketh away the dimmesse or mistinesse of them.

CHAP. LXXXVIII.

Terebinthus. The true Turpintee tree.

Although *Bauhinus* in his *Pinax* doth make three sorts of Turpintine trees, taking his ground from *Reinwolfus* who maketh two sorts besides the ordinary one, yet I am of *Clusius* his opinion that the greater sort is the *Terebinthus Indica* of *Theophrastus*, which is the Pistake tree mentioned before, so that the other two sorts we hold well to be differing Turpintines with other good Anthours, and to be here described unto you: yet we doe not intend to distinguish them by *mas* and *famina*, as *Theophrastus* doth, that the male is barren, and the female fruitfull, the one bearing red berries which come not to ripenesse, and the other Greene at the first, red afterwards, and blacke, and of the bignesse of a Beane when they are ripe: but *Clusius* saith, that enquiring diligently thereafter, he could heare of no such differences, unless it may be said to be a difference when some fruite trees bring their fruite to ripenesse, when others are empty or idle, by some casualty or ill standing: but by the leaves, the one bearing broader and the other narrower leaves.

1. *Terebinthus latifolia*. The broader leaved Turpintine tree.

This Turpintine tree in many places groweth but like a shrubbe, yet in some to be a great tree, the barke of whose body and greater branches are of an ash colour, the lesser being greenish, and red while they are young, sparingly set with large winged leaves like unto the Pistake tree but larger, every leafe being as great as a Bay leafe, and pointed, not round which putteth the difference betweene them, and smelling somewhat like a Bay, falling away, and not holding on in Winter: the flowers are mossie like the Olive blossomes, and grow on long stalkes coming out of certaine knots, from the ends of the branches, a number of them in small tufts set in a cluster together, of a purplish browne colour, which passe into small berries, somewhat bigger and longer then those of the Masticke tree, and very like unto the true *Carpobalsamum*, Greene at the first, reddish after, and of a blewish colour, tending to Greene when they are ripe, glutinous in handling and sticking to their fingers that touch them, having a kernell within them: most of those berries that grow red before they be ripe, fall away being empty.

empty and idle : this beareth also certaine red hollow skinny bladders, like long hornes, full of a clammy black-
ish liqour, which breed small flies or gnats in them: This being wounded in sundry places yeeldeth forth a liquid
Rosin or cleere Turpentine, but nothing so thinne as that of the Larch tree.

2. *Terebinthus angustiore folio vulgarior.*

The narrow leaved Turpentine tree.

This tree is in all things like the former, but that it never ri-
seth so high, and the leaves are long and narrow, much smaller
then the former, the berries are many of them red on the stalks
at their fall time, which declareth them to be empty huskes, and
no good feed, and but some that will be fall and good.

The Place and Time.

The Turpentine tree groweth in *Narbone*, and *Provence* in
France, in sundry places of *Italy*, and *Spain*, *Cyprus* and
Greece, where for the most part it abideth small, and low, but
groweth very great and high, in *Syria*, *Arabia*, *Cilicia*, *Armenia*,
and other those *Levant* Countries, as *Tellonius* hath observed :
the second as *Lobel* saith, is much the more frequent in all the
places about *Provence* : They flower somewhat earely in the
Spring, and the fruite is ripe in *September* and *October*.

The Names.

It is called in *Greece* *τερεβινθος*, and in *Latine* *Terebinthus*,
and the Turpentine *putivum regium*, *resina terebinthina*, the true
Turpentine tree was not knowne in divers of these later ages be-
fore ours, for as *Matthioli* saith, the liquid Rosin of the Larch
tree had by time obtained the name of Turpentine, and so was
used, no man thinking that there was any truer to be had, untill
the search of diligent men, had brought the true Turpentine to
light againe, that so long time had lyen hid from our Predeces-
sors. The first is the *Terebinthus* of *Matthioli*, *Lugdunensis*,
and others, and the *Terebinthus lentiscifolia* of *Lobel*. The o-
ther is the *Pistachia folio* of *Lobel*, and the *Terebinthus major* of
others. The *Arabians* call it *Botin* and *Albotin*, the *Italians*
Terebinto, the *Spaniards* *Cornicabra*, the *French* *Tereminthe*, the
Dutch *Termentijn boom*, and we in *English* the Turpentine tree.

The Vertues

The leavés, the barke, and the fruite of the Turpentine tree are
hot and dry in the second degree, and doe binde, strengthen, and
repell, but the Turpentine doth heate, cleanse, and purge, draweth,
and mollefyeth and excelleth all other Rosins, yet *Galen* for
some causes preferreth *Masticke*, that is, in binding and streng-
thening; the berries being dry are very néere unto the third degree of drynesse so that they provoke urine, and
are good for the spleene, and for the biting of the Spider *Phalangium* : of the berries is made an oyle, as out of the
berries of the *Lentisc* tree, which heateth and bindeth, and is good in crampes, convulsions, hardness of the si-
newes, and to close wounds : the berries themselves are much eaten by the people in *Turkie* where they grow
and make them their daily food, warming, comforting, and opening the uritory passages, and withall provoke
lust : the Turpentine heateth, mollefyeth, resolvet, digesteth and clenseth : if a dramme or two be taken in a
reare egge it wonderfully helpeth the cough, which cometh by flegme, stopping the lungs, wheefings, and
shortnesse of breath, and all imperfections of the chest by flegme : it clenseth the backe and reines, and stayeth the
gonorrhæa, with a litle dried *Rubarbe* in powder put thereto : it provoketh urine, and helpeth to breake and expell
the stone and gravell, it ripeneth *Empoithumes* and helpeth to expell them, and mightily dissolveth winde
in the paines of the chollicke, of the stomacke or sides, and is good also against the gout, *Sciatica*, and all paines
in the joynts, as well to take it inwardly with some *Chamepiti*, *Sage*, and *Stachas*, as to be made into a searcloth
and applied thereto : it is a speciall ingredient into those Balsomes that are to heale any greene wounds, and is
singular effectuell in all wounds, and fractures in the head, all punctures in the flesh or sinewes, and all breakings
out in the skinn, be it itch or scab, be they piles, pushes or wheales : it draweth forth splinters, thornes or the like
out of the flesh, and healeth the chaps of the lips, hands, fundament or other parts: briefly it is put into all salves,
oyles, oyntments, or plaisters, that serve to cleanse ulcers, to draw and heale any sores, or to warme and comfort any
cold or weake parts : these things the true Turpentine performeth better then any other, which from hence hath
drawne both the name and use : the Chymicall oyle of this Turpentine is wondrous effectuell in many of these
diseases, if it be carefully applied, for it is by farre of more subtil parts, being the purer and more subtil spirits,
whereby they heate and penetrate much more, and therefore inwardly or outwardly must be used in lesser quan-
tity, and as it were but by drops. There are in the Easterne Countries of *Turkie*, as *Bellonius* recordeth, much use
made of the young hornes of the Turpentine tree, before they are growne great, for he saith many thousand pounds
weight of them are gathered while they are no bigger then *Gaulles*, to serve the Dyers there to dye their silke,
which shall hold the colour fresher and firmer then any that is Dyed without them.

CHAP. LXXXIX.

Balsamum genninum antiquorum. The true Balme or Balsame tree of the ancients.

DO deliver unto you this Balsame tree as I should, and as it ought and deserveth, I somewhat doubt of my ability, for who is fit for so rare, so excellent a subject, being heretofore accounted as one of the greatest jewels, and richest endowments of the earth, and as a parcell of the treasure of great Kings, and Princes, and it is thought by many that the greatest and worthiest present that the Queene of *Sheba* did or could bring and give unto King *Salomon*, was some Balsame trees, which she brought out of her Country, that *Salomon* might plant them in his: and it was also one of the greatest jewels the first *Ptolomey* could bring away from thence into *Egypt*, as *Au* hours doe record it: but now the times are so changed, that I thinke I shall scarce gaine credit, that the same true *Balsamum* is extant in *rerum natura*: but least my gates grow greater then my City, and so it runne out at them, let me leave any further preamble, and shew you the thing. The Balsame or Balme tree, never groweth very great, no nor in the naturall places, being suffered to grow as it will, but unto five or sixe cubits high or thereabouts, and in others much lower, with divers smal and straight slender branches issuing from thence, of a brownish red colour, especially the younger twigs, covered with a double barke, the red out. most, and a Greene one under it, which are of a very fragrant smell, and of an aromaticall quicke taste, somewhat astringent and gummy, cleaving to the fingers, the wood under the barke being white, and as insipide as any other wood; on these branches come forth sparsely and without order sundry stalkes of winged leaves, somewhat like unto those of the Masticke tree, consisting some but of three leaves which are those that first come forth and the lowest, others of five or seven leaves, and seldome above, which are set by couples, the lowest smallest, and the next larger, and the end one largest of all, of a pale Greene colour, smelling and tasting somewhat like the barke of the branches; a little clammy also, and abiding on the bushes Winter as well as Summer: The flowers are many and small, standing by three together on small stalkes, at the ends of the branches made of six small white leaves a peece, which are succeeded by small brownish hard berries, little bigger then Juniper berries, small at both ends, crested on the sides and very like unto the berries of the Turpentine tree, of a very sharpe sent, having a yellow hony like substance within them somewhat bitter, but aromaticall in taste, and biting on the tongue like the *Opobalsamum*: From the body hereof being wounded, cometh forth a liquor (and sometimes a little of it selfe without scarifying) of a troubled whitish colour at the first, which after some small time groweth cleare, being somewhat thicker then oyle in Summer, of so sharpe a piercing sent, that it will pierce the nostrils of them that smell thereunto, like unto oyle of spike almost, but as it groweth in age, so it decayeth both in the thinnesse of the substance growing thicker, and in the smell nothing to quicke, and in the colour becomming yellow like hony, or browne thicke Turpentine, as it groweth older.

Balsamum genninum antiquorum.
The true Balme or Balsamum tree of the ancients.

The Place and Time.

Arabia felix about *Mecba*, and *Medin*, and a small village neere them called *Bedrnia*, with the hills, vallies, and sandy grounds about them, and the Country of the *Sabaans* next it, are thought by many to be the onely naturall places, where this tree hath bene ever knowne in these or the former dayes to grow, and from thence hath *Indea* and *Egypt* ever bene furnished, whatsoever hath growne therein as *Alpinus* relateth; but it is somewhat probable to me, that the hills of *Gilead* did nourish this tree long before the Queene of *Sheba* brought any as it is thought to *Salomon*, in that the *Ishmalites* that bought *Ioseph* of his Brethren, as it is set downe *Gen. 37. v. 24.* are said to carry from *Gilead*, Balme &c. downe to *Egypt*, and *Gen. 43. 11.* *Jacob* willeth his Sonnes to carry to *Ioseph* in *Egypt*, some of the best fruites of the Land, sc. *Rosin* &c. which I take to be understood this Balme, or else *Rosin* simply might be thought too simple a present for *Ioseph*, and not one of the best fruites of the Country: but I doubt of the truth of that tale that the Queene of *Sheba* did first bring the Balsame trees to *Salomon*, and that he planted them in the valley by *Iericho*, but rather that they were fetched from the hills of *Gilead*, and planted by him there in Orchards, the better to be tended. *Jeremy* the Prophet doth also often mention the Balme of *Gilead*. And yearly pruned both by the *Iewes* and *Arabians*, to have the greater store of liquor. It flourisheth in the Spring with the Turpentine tree, and fructifyeth with it in the Autumne.

The Names.

From the *Arabians* who call it *Balefsan*, have the Greekes called it *Balsamon*, and the Latines *Balsamum*: the liquor

liquor they call *οποβαλσαμ* *Opobalsamum*, or *βακουμδαλ* *Balsameleon*, and the berries or fruite of the tree *καρποβαλσαμ* *Carpobalsamum*, and *κασσιμ* *Cassium*, and the sprigs or young branches thereof *ελαοδαμ* *Hylobalsamum*. Divers of the ancient Writers have made mention of this tree, but so diversly that many do thinke they wrote of a thing that was not, or that was not seene and knowne unto them, at the least the descriptions are so lame and seeme so to vary one from another, yet if they be warily and wisely considered, they may be brought in some sort to agree thereunto, but for me to argue much in this matter, and the particulars would require a great deale of time and roome, which cannot be spared here, I must referre them to *Alpinus* and *Bellonius*, that would be further satisfied herein who have more largely entreated of this subject.

The Vertues.

This Balsame tree saith *Galen*, is hot and dry in the second degree, so that it is sweete in smell being of thinn parts: but the liquor or *Opobalsamum*, is of more thinn parts then the plant it selfe: the fruite or berries is very like it in quality, but farre inferior therunto in the subtilty: The liquor or *Opobalsamum*, is of great good use against all poysons and infections, both Vipers, Serpents and Scorpions, the pestilence and spotted fevers, and all other putride and intermiffive agues that rise from obstructions, and crude cold humours, to take a scurle or two in some drinke for some dayes together, and to treate thereon, for this openeth the obstructions of the liver and spleene, and digesteth those raw humours in them, cherishing the vitall spirits, radicall moisture, and naturall heate in them and is very effectually in all cold griefes and diseases of the head or stomacke, helping the swimminge and turnings of the braine, weake memories, and the falling sicknesse: it cleareth the eyes of filmes or skinnies, overgrowing the sight, and easeeth the paine in the eares, and their deafnesse and other diseases, to be dropped into the eyes or eares, it helpeth the cough, shortnesse of breath, and consumption of the lungs, by warming and drying up the distillations of rheume upon them, and all other diseases of the stomacke proceeding of cold or winde, the cold or windy distempers also of the bowells, wombe or mother, procuring torments and paires, or the colic moistures procuring barrennesse, procureth the courses, delivereth the dead birth and after birth: the fluxe also of the whites and the stopping of urine: it cleaseth also the reines and kidneyes, and freeth them from the generation of stones in them, and expelleth the gravell or stones in them: it is singular good against the palfie, crampe, tremblings, convulsions or shrinking of sinewes, and for Greene wounds, the most speedy operator of any: from the singular effect whereof all other medicines made for the health of the body or to heale wounds were called *Balsamum*, Balm. The women in *Egypt*, herewith as *Alpinus* sheweth, preserve their beauty, and young forme for a long time, the berries are especial good against poysons and infections, the falling sicknesse, the swimminge and paines in the head, the cough, and diseases of the lungs, the windy paines and stiches in the sides, the restraint of urine, and the rising of the mother and other diseases thereof to sit in a bathe made of them: the wood worketh the same effects but in a farre weaker manner.

CHAP. XC.

Styrax arbor. The sweete Stotax tree.

Esides the Stotax tree, that hath usually been knowne and described by almost all Writers of Herbs, and which I am now about to shew you, *Bauhinus* from *Honorius Bellus* in *Candy*, hath exhibited another sort, whereof he is so briefe, that little more can be assured thereof by his relation, then the name, and the confidence of his judgement from whom he had it, that it may be referred hereunto. A third sort is the *Styrax rubra*, whereof we have lesse knowledge then of the last.

1. *Styrax arbor vulgaris*. The usuall Stotax tree.

This Stotax tree groweth very like unto the Quince tree, both for forme and bignesse, the leaves also are long and round, and somewhat like but farre lesse, whitish underneath and stiff. The flowers stand both at the joynts with the leaves, and at the ends of the branches, consiting of five or sixe large whitish leaves, like unto those of the Orrenge tree, with some threds in the middle, after which come round berries, set in the cups that the flowers stood in before, of the bignesse of Hasell nuts, pointed at the ends, and hoary all over, each standing on a long footestalk, containing within them certaine kernels in small shells: this yeeldeth a most fragrant sweete gum, and cleare, of the colour of browne hony, if we might have it sincere without mixture, which yet wee in small drops have had.

2. *Styrax folio Aceris*. A Stotax with Maple leaves.

From a round blackish rugged roote covered with a celted, or as it were joynted barke come forth out of knots three or five broad leaves like unto those of the Maple or Plane tree, standing on small blackish long stalkes, and are divided in three or five parts, full of veins dented about the edges, and pointed at the end.

3. *Styrax rubra*. Red Stotax.

This thing that formerly was called *Styrax rubra*, was a barke of some kind of tree, and thought to be the *Nasacaphium*, or *Nasacaphium* of *Discorides*, but *Cordus* on *Discorides* scanning the matter somewhat more seriously determineth it to be a thing utterly unknowne to him in his time, and by the cheapensse of that darke that went under that name, saith plainly it was too cheape to be right, *Discorides* making *Nasacaphium*, to be like the barke of the Sycomore tree, as some coppies have it, or the Mulberry tree as others and brought from *India*, being of a sweete or pleasant sent in fumigations as well by it selfe as mixt with other perfumes: but *Matthiokus* taketh *Nasacaphium*, to be that which was called *Tigame* in shops, which as he saith the *Italians* called *Agallocho*, that is *Lignum Aloes*, and so *Cordus* also saith, that one *Iohannes Rodericus* a *Portugall* tooke the *Nasacaphium* to be that which in their shops was called *Palo d'aguilla* *Lignum Aquile*, that is the same with *Lignum Aloes*, as aforesaid, but *Cordus* misliketh that opinion, the *Lignum Aloes* being a wood and the *Nasacaphium* a barke, yet although this long discourse be somewhat from the matter in hand, yet seeing it fell so fitly to speake of *Nasacaphium*, I could not doe otherwise then shew you what others have thought thereof, in that as I said divers tooke it to be *Styrax rubra*, when as no auncient Authour mentioneth it: but both *Serapio* and *Avicenna* divide *Styrax* into *liquidum* and *seccum*, by *liquidum* understanding the pure gumme flowing from the tree, and not that *liquidum* which

which we have now adae by that name, and by the *sees*, the *sees* of the expressed oyle from the fruite, but some of our modernes take the *Calamita* to be *Rubra*.

The Place and Time.

The first groweth in *Provence*, of *France* in *Italy*, *Candy*, *Greece*, and other these hither parts of *Turkie*, where it yeelde .h. no gumme, but in *Syria*, *Cilicia*, *Pamphilia*, *Cyprus*, and other of those hotter Countreies, it giveth much, but is so adulterated that I thinke scarce none in our age hath seene any sincere come over unto us, as by that sincere stuff, that which we have drawn out of the best gumme we could get, is plainly to be discerned, so much grosse *sees* remaining behind, after the expression, and by the comparing of it with *Discozides* his notes: It bloweth in the Spring, yeelding fruite in *September*, the other *Bauhinus* as I said, had it from *Bellus* of *Candy*, but where it grew is not signified.

The Names.

It is called in Greeke *στεραξ*, and in Latine *Syrax arbor*, as the Gumme is called *Gummi Syrax*, or *Storax*, and in shoppes *Storax* or *Syrax Calamita*, which for what cause it was so called, *Galen* declarcth, that because the best and most sincere came from *Pamphilia*, they used to put it into Canes, the better to preserve, not onely the sent as most say, but even the substance too, as I thinke, for the pure sincere gumme is so piercing that no barrell can be made so close, but that it will sear the joynts, and draine through rheum, which opinion of mine although it may seeme strange, as not being heard of before, yet I have many reasons both to induce me therunto, & some to contrary theirs that object the transportation of handfulls of *Dillanum*, in Canes or *Ferula* stalks in the like manner, which are of far differing natures: the one a dried herb, which needed not any such inclosure, to preserve the sent, whereof it hath nor so much that they needed so to put it up for feare of loosing, and besides the cask was so small that abundance of them could containe but a little merchandize, some other cause they had surely, if they did put them, the leaves and stalks I meane, into the Canes (whereof I somewhat doubt, but that they put them rather with Canes to keep them from breaking) & this other a gum that required some tight cask to containe it, for feare of leeking, and the Cane between the joynts, as not having any clinke, was the fittest with them I thinke to containe it, and thereof I thinke came the name of *Calamita*, to confirme which opinion, I have found the sincere gumme of *Storax*, which I have by Art and the presse onely (and not by any distillation) purified and made so be so pure that it would pierce even through a wooden vessel in the heare of Summer, and therefore was forced to keepe the said sincere gumme in a glasse or gally pot, which was so fluent that it would runne upon any small occasion of leaning downe the vessel: a long time after the extracting. There is some doubt also with many, what our *Storax liquida* should be, for none of the ancients have made mention of any such thing: some would have it a kinde of *Storax* from the tree, and to that purpose *Durante* hath figured out a *Storax* tree, appropriating the *Storax liquida*, to issue from thence, which is besides the text, and more then he can prove: others from the *Arabians* I thinke, take it to be the extraction of pure fat Myrrhe, called *Myrrhe flasse*, which I cannot see how it should be so, seeing the *Storax liquida*, is of so strong and piercing a sent that no Myrrhe, from whence they say it should be taken hath any the like: it is therefore assuredly some other thing whereof as yet we have not attained the knowledge, *Bauhinus* lastly in describing this *Syrax folio Aceris*, in his *Prodromus* entitleth it *Syrax liquida*, which how much or little it sorteth therunto, I know not, the time hereafter may declare. The *Storax rubra* something hath bene spoken thereof here before, yet some travaillers have affirmed that the tree thereof groweth in *Cyprus*, but (unlesse they meane the first *Storax* tree) untill it be further confirmed, I shall rest doubtfull thereof.

The Vertues.

There is no part of this tree in use with us, but the gumme that issueth out of it, and it is hot in the second degree, and dry in the first. it heateth, mollefyeth and digesteth, and is good for coughes, catarrhes, defillations of rheumes and hoarsenesse: it provoketh womens courtesie, and mollefyeth the hardnesse and contractions of the Mother, it gently looseth the belly, if a little of the true Turpentine be put unto it, and so made into pillies and taken: it resisteth those poisons that kill with coldnesse, as the Hemlocke doth, and the like: a small quantity thereof taken saith *Pliny*, doth drive away sadness from the minde, but if it be taken too much or too often, it doth contrarily bring and encrease it, and worketh paine and heavinesse in the braine, and cause trouble some sleepes. Used as a pessary it draweth downe mightily, both the courtes and the afterbirth, dropped into the eares, it taketh away the singings and noyse in them, applyed to the hippes, shoulders or joynts afflicted with cold aches it resolveth and comforteth much, and is good to be put into the bathing, are made for lamenesse in the joynts, and wearinesse by travaile, it is also of good use to be put with white francensence, to perfume those that have catarrhes, rheumes and defluxions from the head into the nose, eyes or other parts, by casting it on quicke coales and holding their heades over the smoke, and to are their night caps therewith, wherein they meane to lie: it dissolveth

dissolveth hard tumours in any part, as those about the throate called the Kings Evill, and other nodes or tumours in the flesh or on the joynts: It serveth also as a perfume to burne in houſes or chambers, either alone or with other things, it is put also among ſweete pouthers in bagges, for cheſts and wardrobes.

CHAP. XCI.

Draco arbor. The Dragon tree.

Must needs addethis tree to the rest of the berry bearing Resinous trees, because it agreeth with them, whose description is on this manner. It is a goodly faire great tree to behold, rising as high as a Pine tree, with a great body, covered with a rugged barke, full of chappes and cliffs, bearing eight or nine great armes, equally spreading from the toppe of the trunk or body thereof, each of them bare, for a cubits length, and then thrusting forth at their heads three or foure smallet branches, yet of an armes thickenesse, and bare also for a certaine space, and bearing at the toppes of

each of them, divers very long and narrow leaves joyned together at the bottome, and compassing one another like as the Flowerdeluces doe, each of them being a cubit in length, and an inch in breadth, growing narrower to the end, where it is pointed with a thicke middle rib, running through the middle, all the length of them, and being reddish about the edges, which are sharpe like the *Iris* leaves, abiding alwayes greene from among the leaves at the heads, come forth long footstalkes, of about a footes length, branched forth into other lesser stalkes, bearing at certaine spaces, divers fruities or berries in clusters (for the flowers have not beene observed) each of them like unto a small Cherry, of a fowlish or tart taste, and of a yellowish colour, when they are ripe with a stone within them, very like a Cherry stone, and a like kernell also (but here is no shew of any Dragon here in to be scene, as *Monardus* tableth, and others that from him have set it forth, which sheweth how necessary it is to have judicious and conscionable men to be the first relators of strange or unknowne things) out of this tree being slit or bored, commeth forth a thicke (not cleare as *Marshallus* saith) darke red gumme or Rosin, which hardneth quickly, and will melt at the fire, and flame being cast therein, yet somewhat dryly, being bruised it sheweth a very orient red crimson or bloody colour, yet is very hardly mixed with any liquour, eyther water or oyle: the wood is very hard and firme, and hardly admitteth to bee cut: but the youanger branches are more tender. What if *Matter Hamonds* flesh tree, growing in *Magadascar*, set forth in his Paradox, yeelding liquor like blood, may not prove to be this tree, if the tendernes of the wood, cutting as he saith like flesh, either hinder not the identity, or be not an hyperbole.

The Place and Time.

This tree groweth in the Islands both of *Madera*, and the *Canaries*, and in *Brassill* also, as I am given to understand, where it groweth vast, but *Cusius* saith that he found it in the Orchard, belonging to the Monastery of our Lady of grace in *Spain*, planted among some Olive trees on a small hill: the Time is not expressed. This is so tender, that although it hath sprung with us from the stones that were set, yet it would scarce endure to the end of Summer, but perished with the first cold nights.

The Names.

It is most probable that neither *Dioscorides* nor any of the ancient Greeke or Latine Authours had any knowledge of this tree, or could give any description thereof, but of the gum or Rosin onely, yet neither knew whether it came from herbe or tree, or was a minerall of the earth, but called it *myrras* in Greeke, and thereafter *Cinnabarin* in Latine, *Dioscorides* saith that it was so scarce to be had, that the Painters could not get sufficient for their workes, but yet saith some called it *Sanguis draconis*, so ancient is the name, and by which onely the moderne Writers are led to thinke that the gumme of this tree continuing the name to this day, the rest of this declaration agreeing likewise therunto, is the right *Cinnabaris* of *Dioscorides*: but *Pliny* in his 33. Booke and 7. Chapter, for the elder world hath fabled (no lesse then *Monardus* from his Bishop of *Carthage* in this as is aforesaid) and set it downe for a truth that *Cinnabarin*, is no other thing but the blood of a Dragon or Serpent cruelt to death by the weight of the dying Elephant killed by him, and that both their bloods mingled together, was the *Sanguis draconis* that the Painters used, and was also used in medicines. *Julius Solinus* also affirmeth the same thing: but assuredly the true cause of the name hereof was the bloody colour that the gum gave, however they coloured the truth from others knowledge by the name of a Dragon.

The Vertues.

There is no part of this tree put to any use in Physicke with any that I know, but the gum onely, yet no doubt in

Draco arbor. The Dragon tree.

in the naturall places, or where it groweth, both barke and fruite might be applied for such like diseases as the gumme is put unto, which is very astringent, serving to reſtraine the fluxe of blood or humours, from any parts both in man and woman, as laskes, the menſtrues whites, and the gonorrhea: it is alſo ſaid to helpe the ſtrangury and ſtoppings of the urine, to ſoften looſe teeth, and is very available for the gummes are ſpongy or with looſe fleſh: it is good alſo to ſtay the watering of the eyes, and to helpe thoſe places that are burnt with fire: The Goldſmiths and Glaſiers uſe it much in their workes, the one for an enamell, and to ſet a foile under their precious ſtones, for their greater luſter; and the other by fire to ſtrike a crimſon colour into glaſſe, for Windowes of the like. I doe not know that Painters can bring it to be a fit colour to be uſed in their workes.

CHAP. XCII.

Cedrus magna Conifera Libani. The great Cedar of Libanus.

Hereſt of the *Arbores reſiniſſere*, thoſe trees that beare Roſſins are to follow, which are theſe that beare Cones, being the great Cedar, the Pine tree, and all the ſorts thereof both tame and wild, the Pitch tree, the Firre tree, the Larch tree, the Cypreſſe, and the *Arbor vite*, or tree of life: and firſt of the great Cedar. This great Cedar groweth up with a great thicke upright body, taller then any other tree whatſoever ſtored with branches on all ſides, but ſo ordered that the lower branches ſpread largeſt, and ſtill upward they grow ſmaller up to the toppes, repreſenting the forme of a Pyramid or Sugar loafe, to them that view it a farre off; the greater and loweſt branches with the body are ſomewhat rugged and full of chappes, but that of the upper branches is very ſmooth, and of an aſh colour, and being rubbed away with ones nailes, appeareth greene underneath, and reddiſh under that: the branches ſome ſay grow all upright, but others ſtraight out, and as it were croſſe wiſe, ſtrong, but brittle, and eaſie to be broken, not to be bended and ſo placed about the body, one above another that they yeeld an eaſie aſcent up to the toppes, as it were by ſteps: the leaves grow many together, out of a knot, which are ſmall long and narrow, like unto thoſe of the Larch tree, ſomewhat hard, but not ſharpe at the end as they are, and ſo ſet, the longeſt being in the middle, and the leſſer on the ſides, that they repreſent the forme of a Painters penſell, abiding alwayes greene on the trees, being ſomewhat ſweete in ſent, a little ſowre, bitter and astringent in taſte: it beareth Cones that grow upright like as the Firre doth, not hanging downe as others doe, ſlenderer then thoſe of the Pitch tree, and thicker, greater, and harder then thoſe of the Firre, ſomewhat yellowiſh and round at the end, made of many ſcales, with a ſhort foote-ſtalke to it, but ſo firmly ſet to the branch, that without breaking away ſome of the wood of the branch, it cannot be pulled away, yet the ſcales opening of themſelves, will fall away, leaving the ſtalke bare that went through the middle of them, but this it will not doe untill the next yeare after it be ripe, for it requireth one whole yeare to ripen, within which is the ſeede, as bigge as Grape kernells, ſomewhat ſweete in taſte, bedewed with an oylie ſubſtance, that is of a good ſent: out of this tree there cometh two ſort of Roſſin called *Cedria*, the one thinne like unto that of the Firre tree, which cometh forth by piercing the tree at the ſundry knots while they be young and not covered with a rugged barke, and putting thereto an horne, out of which it muſt runne: the other Roſſin floweth forth of it owne accord, growing hard of it ſelfe thereon, which will thicke ſo faſt to the teeth if it be chewed, that it will hardly be pulled away againe, and being ſmelled unto giveth a very ſweete ſent; the Wood is durable above all other, and not in many ages yeelding to corruption.

Cedrus magna Conifera Libani.
The great Cedar of Libanus.

The Place and Time.

This Cedar groweth on ſundry mountaines in Syria, and the parts neere thereunto, and the coldeſt parts of them that are covered with ſnow as *Amanus*, *Taurus* and *Libanus*, and not in many places elſe that have bene obſerved, the time is declared in the deſcription to be a whole yeare in perfecting the fruite, and as *Pliny* ſaith, new come forth before the old are ripe.

The Names.

This Cedar is called in Greeke *ξέδρος* (not knowne to *Dioſcorides*, *Galen* or *Pliny*, as their workes teſtifie, for theirs is the *Oxycedrus*, that beareth berries like to Juniper, or the Mirtle) and *ξέδρος* quaſi *Cedrabies*, becauſe it groweth high, like the Firre, *Theophraſtus* calleth it *ξέδρος* & *φινικιά* *Cedrus Phenicea*, which *Gaza* unſkilfully tranſlateth *Punica*, and in the *Geoponicks* *Dendrolibanus*, *Cedria* you have heard before what it is, namely Roſſin that floweth out of the tree, when it is bored or peirced, as in the Firre and other trees: but *Cedrium*, which ſome call *Cedrelanum*

*Cedrela*um or *Cedreoleum* is the first liquid substance that commeth out of the stickes, while they are in the burning (such as we call tarre, that is, the liquor of the Pine and itch tree stickes when they burne) before the hard Pitch commeth forth, with which as well as with the *Cedria*, in former times the *Egyptians* embalmed the bodies of the dead, to cause them to abide for ever uncorrupted: but many Writers confound these and the Pitch of the Cedar together, that issueth out in the burning after the first, calling them *Cedria*, when as they are divers. The *Arabians* call the tree *Serbin*, (and the *Rossin* or Tarre *Kitrin Alkitrin*; and *Ketran*) the *Italians* *Cedra*, the *Spaniards* *Cedro*, the *French* *Cedro*, and we *Cedar*.

The Vertues.

There is no part of this tree put to any Physicall use, but the *Cedria*, or *Rossin* that commeth out of it which is hot in the fourth degree, and preserveth the dead bodies from rotting, and therefore was called the life of the dead, and the death of the living, because if it be laid on garments or skins, it will burne and consume them: yea and to the tender flesh of the living, it will worke like a causticke: yet is it effectuell to cleare the sight from filmes or skinner that are growne over it, and taketh away the scarres of wounds and sores, and mixed with a little vinegar and dropped into the eares, it killeth the wormes, and with the decoction of Hyssope, being put in taketh away the noyse and humming in them, if a little of it be put into an hollow tooth it easeth the paines, and breaketh the tooth, if it be mixed with a little vinegar, and they washed therewith it will doe the like: it helpeth the dis ease of the throat called the *Quinsie*, and killeth both nits and lice: it resisteth the poyson of the Sea Hare taken in soddin Wine, and if it be laid with salt on the biting of the venomous serpent called *Cerastrus*, it will helpe it: it helpeth the leprosie also, if it be either annointed or taken inwardly, and purgeth the ulcers of the lungs, and healeth them if a small quantity thereof be taken: it also helpeth the itch and scabs in man or beast, it killeth the living childe in the mothers body, and expelleth the dead, and taketh away all hope of conception if the privy parts be touched therewith.

CHAF. XCIII.

Larix. The Larch tree.

The Larch tree groweth oftentimes as high as either the Pine or Firre tree, but most usually lower, covered with a very thicke barked, rugged and full of chappe, and reddish on the inside, the branches grow one above another, in a comely order, having divers small yellowish knobs or bunches set at severall distances, from whence doe yearly shoote forth many small thicke long and narrow, soft and smooth greene leaves, as it were in a rust together, like the former Cedar, but shorter, smaller and blunter pointed than the leaves of either Pine or Firre tree, which doe not abide any Winter as they doe, but fall away as other trees that shed their leaves, and gaine fresh every Spring (which is peculier to this alone, among all the other kindes of *Rossin*-bearing trees) the blossomes are very beautiful and delectable, being of an excellent fine crimson colour, and very sweete, which afterwards turne into small soft cones, like unto Cy presse nuts while they are close, but longer then they, made of many fine and thin small scales, one lying upon another, standing on a short stalk, having small seeds on the inside of every scale, formed like a small Bird, with two wings, and a small sweete kernell within them like the Pine kernell: the wood is very firme, hard, and close; long in growing and long lasting, and maketh the best coales for all Smiths worke, and for Miners to melt the Ore of metall, above any other wood to hold fire longest and strongest, although *Pliny* saith, lib. 16. c. 10. that it burneth no other wise then a stone, nor maketh any coales, which how it can bee, that a *Rossin*ous tree should not burne any may judge: it yeldeth forth a liquid *Rossin* being bored, very cleare and white, which we call *Vence Turpentine*: there is also found upon the bodies, and greater boughes hereof, a kinde of hard and dry Mushrome, called *Agaricke*, whereof I have spoken with the *Turpentine* of this tree, in the second Classe of this Booke, which is of purging Plants.

The Place and Time.

It groweth not in all Greece, for neither *Dioscorides* nor *Theophrastus*, hath made any mention thereof, but most plentifully in the Woods by *Trens*, and in all that tract betwene *Germany*, and *Italy*, and many other places of *Germany*, it shooteth forth as is said young leaves every Spring, with the blossomes presently after, and ripeneth the fruite before Winter.

The Names.

It is called in Greeke *λαρίς*, and the *Turpentine* *πιντιν* *λαριν*, in Latine also *Larix*, and the liquid *Rossin* *Resina Laricea*, or *Larigna*, or *Terebinthina Venetia*, *Pliny* faulted many times in mistaking the *Pinus Picra* of *Theophrastus* for this, applying those things to the *La-*

Larix. The Larch tree.

rix, which he doth to *Picea*, as *Lugdunensis* sheweth very amply. *Vitruvius* also erred with *Pliny*, in saying that the wood of the Larch tree did burne no otherwise then a stone in the fire: that *Fuchsius* also was in an error. *Mathioli* sheweth, that thought the Venice Turpentine was taken from the Fire tree, for he protesteth that upon his owne knowledge and sight, it came from the Larch tree, he also insileth against *Brasavolus*, that thought other trees had produced *Agaricke*: but those of other trees were hard Mushromes, such as we call Touchwood, which serveth like tinder to receive fire strucke from the flint, &c. all Authours call it in Latine *Larix*, the Italians and Spaniards *Larice*, the French *Melese*, the Germanes *Leichenbaum*, and we the Larch tree.

The Vertues.

I have spoken so sufficiently of both Turpentine and *Agaricke*, in the second Classis of this Worke, that I can adde nothing more thereto, and therefore to prevent a double repetition of the same things, I must referre you thereunto.

CHAP. XCIII.

Pinus, The Pine tree.

Here are many sorts of Pines, some tame some wild: of the tame kinde there is observed little variety: but of the wild much, for some grow on mountaines farre distant from the Sea, others on the hills and places neere the sea, of all which, although they be many, I would make but one Chapter, and not separate them into any more.

1. *Pinus urbana sive domestica*. The manured Pine tree.

The tame Pine tree groweth very great and high, with a thicke reddish coloured barkes, spreading large armes towards the toppes, and they againe divided into other lesser, whereon are set by couples together at a joynt or knot all along the branches, close one unto another, long narrow or almost round, hard and sharpe pointed, pale greene leaves, abiding continually on the young branches, and not falling away but from the elder: this beareth certaine small yellow catkins in the Winter, which fall away in the Spring as the cones: the fruit or cones, that are some what long and round, grow very high on the branches, and are somewhat greater then in any of the other sorts, composed of sundry hard and browne woody scales, lying close one unto and upon another, which when they open of themselves, or are cau ed by the heats of the fire, doe shew within them certaine hard shels, which containe in each of them, a long and whit every sweete kernell, covered with a very thin reddish skinn, that is easily rubbed off: the wood hereof is firmer, heavier and closer grained then of the Firre or Deale, reddish also, and not so short or brittle as it is, and with a kinde of moisture about the heart. This is not so plentifull in yeelding either Rosin or Pitch, if it should be so ordered as the wilde kindes.

1. *Pinus urbana sive domestica*.
The manured Pine tree.

2. *Pinus sylvestris montana fructu ser.*
The fruitfull wilde Pine tree.

3. *Pinus sylvestris altera fructifera Teda arbor forte.*
The loft shield wilde Pine tree.

4. *Pinus sylvestris humilis in fructifera.*
The low wild barren Pine tree.

Of this kinde some make another sort, whose cone or apple is somewhat longer.

2. *Pinus sylvestris montana fructifera.* The fruitfull wilde Pine tree.

This wild Pine groweth seldom to high, but very like unto the former tame kinde, being no otherwise to be distinguished from it, but that it groweth of it owne accord upon hills and mountaines, and that the barke thereof is thicker and rounder, and the leaves somewhat shorter, harder, more prickly, and of a sadder Greene colour, and the cones or fruits smaller, but have as good and sweete a kernell within them as the former, and contained in as hard a shell.

3. *Pinus sylvestris altera fructifera Teda arbor forte.* The loft shield wild Pine tree.

This other wild Pine groweth great in size, and large in body, but yet not of that height as the other, neither is the barke reddish nor so thicke, but darker and pliable: the leaves also are like, but grow thicker on the branches, even foure or five at a knot or joynt, and the tree fuller of branches, but more crooked and full of fappe, and end in a pensill-like forme: the cones are small and short, not much bigger then those of the Pitch tree, of a darke purplish colour, full of Rosin, but softer, and the shells within them easie to be broken betwene ones fingers, the kernells likewise being very tender and short, and sweete, like unto those of the tame Pine, but a little harsher, as the taste of most wilde fruites are, in comparison of the manured. This kinde doth more frequently corrupt with the abundance of the fappe, which is the Rosin, then almost any other sort.

4. *Pinus sylvestris humilis in fructifera.* The low wild barren Pine tree.

This wilde Pine tree riseth up with little or no body at all, but shooteth forth very long armes round about, like unto pipes, from whence peradventure it was named *Tubulus* being ten, and sometimes fiftene cubits long, whereof some call it also *repens*, being slender and without knots, or branches, of which are made hoops to binde caskes, because they are so smooth and so flexible: the cones are not bigger then the last, but have no kernells within them that may be eaten, and therefore called *infructifera*, barren or fruitlesse, and not because it beareth not cones or fruit.

5. *Pinus sylvestris sterilis elatior.* The taller barren wilde Pine tree.

This tree hath a single blackish roote, that shooteth downe into the ground like a stalk, the body whereof is often crooked and writhen, covered with a reddish barke, but the branches are smooth, and easie to be broken, being thicke bushing at the toppe, the leaves are slender and hard, and but two at a knot or joynt, somewhat writhed at their first springing, and tasting harsh and somewhat fower: the cones are but small and without any edible kernells like as the last is.

6. *Pinus maritima major fructifera.* The greater Sea Pine tree.

This greater Sea Pine riseth to a meane height, with a crooked body, and for the most part spreading into branches from the ground, the leaves are somewhat long, and like the first wilde kinde, but shorter and greener, the cones are somewhat lesser, longer, and whiter, with much Rosin often on them, the kernells whereof are like unto them, but covered with a blacke skin. *Clusius* hath set forth another sort hereof, whose figure I here give you.

Pppppp a

7. *Pinus*

*Altera co-
no oblo-
giori.*

6. *Pinus maritima major fructifera.*
The greater Sea Pine tree.

6. *Pinus maritima major fructifera altera Clusij.*
Another sort of the greater Sea Pine tree of Clusius.

7. *Pinaster maritimus minor.*
The lesser or dwarf Sea Pine tree.

8. *Pinaster pumilus montanus.*
The dwarf mountain Pine tree.

7. *Pinus maritima minor*. The lesser or dwarf Sea Pine tree.

The lesser Sea Pine scarce riseth to the height of a man, full of more slender and pliant branches then the former, not covered with so rugged a bark, nor spreading so much, the leaves are very slender, shorter and not so hard: the Cones are likewise lesser and slenderer, and so are the kernels also, and covered with a blacke skinne.

8. *Pinaster pumilio montanus*. The dwarf mountain Pine tree.

This dwarf Pine riseth to a mans height, branching forth from the ground into somewhat large armes, and covered with a thicke rugged bark, spreading about: the leaves stand by couples, as in divers of the other sorts but thicker shorter and blunter pointed, and of a sadder greene then in the first wild kinde, the cones are small little above an inch long, not much bigger then the Larch tree cones, but more round at the head, and smaller at the end, standing upright, and not hanging downe as all the others, the shell of the nut within is winged as many are, but the kernell is small and hard.

9. *Pinaster tenuifolius julo purpurascens*. The crooked mountaine Pine with thin leaves.

The body and branches hereof are crooked or writhed and not streight, the leaves thereon are very thinne, and shorter then many others, two joynted together round about the branches, at the ends whereof come forth certaine small scaly catkins of a purplish colour which fall away into a small ponthier, and after them come in the middle a new sprout of leaves, inclosed in a certaine skin: the cones hereof are small and blunt pointed.

10. *Pinaster niger latiore folio julis pallescentibus*. The crooked mountaine Pine with broader leaves.

This other crooked Pine hath such alike body and branches as the last, spreading much, and with a sadder bark, the leaves are broader also, sharper pointed and shorter then they, and of a darker greene colour: the catkins coming forth at the ends of the branches like the last, are of a yellowish greene colour, and not purple as they are, after which come new leaves in the like manner: the cones are smaller then they.

The Place and Time.

The first tame kinde is found planted in sundry places of divers Countries, for the beauty of the tree with his ever greene leaves, yet a: e they found also wild about *Ravenna* towards the Sea side. The other sorts grow both in *Spain*, *Italy*, and *Germany*, and the parts neere adjoining, and the Sea kindes neere the Sea, in many places and upon the Land also as *Clusius* hath observed: the catkins of many come forth in the Winter, and fall away in the Spring: others spring not untill *May*, the fruite of some of them being ripe in the end of Autumne and others, not of a year after the springing.

The Names.

The Pine tree is called in Greeke *πικύνη*, in Latine *Pinus*, the Cones are called *κωνίαι*, in Latine *Coni*, and the ancienter Greekes *ελάτης*, but now the kernels are so called, the kernels within them *πικύδαι*, *Pityides*, as *Dioscorides* saith, who callth both those of the Pine and of the Pitch tree by that name, whereof *Matthiolus* is in some doubt that the place is erroneous, the word Pitch tree being thrust into the Text without any ground of reason: for *πικύδαι* are *πικύδαι* *καρπία*, as *ελάτης* be *πικύδαι* *καρπία* *Pinorum fructus*; and the kernells only of the Pine tree are edible, and not the Pitch tree. That *πικύνη* which *Theophrastus*, *Dioscorides*, and *Galen* sheweth, should be the Pine tree, and not the Pitch tree, maybe shewed in divers places out of *Galen* and others, although *Pliny* doth mistake them, from the likeness of *Pence* to *Picea*, and *Pitys* to *Pinus*, as also *Pence* to *Larix*; and *Bellonius* from him doth so also, and *Gaza* sometimes translateth them right, and sometimes wrong, but there may be as much doubt, what tree *Dioscorides*, and *Theophrastus* meant by *πικύνη*, whether the Pitch as it is thought by the most judicious of some sort of Pine, because *Dioscorides* putteth them both together in the title of the Chapter, as if they were both of one kinde, and yet saith some held them to be divers sorts, and nameth the fruite of them both by one name as is shewed here before, when as it is plainly knowne to all that have observed them; that the Pitch tree doth more resemble the Firre then the Pine, as being no other difference betwene them, the Pitch and the Firre, then betwene male and female, as I shall shew you after a while, and there is greater difference betwene the Pitch and the Pine tree, then there is of the Pines among themselves: and *Theophrastus* also in many places of his Bookes nameth *πικύδαι*, as if there should be two sorts of Pitch trees, a tame and a wild, which is not found in him to be so distinguished, as he doth of the Pine: I know to mend this matter, that *Lugdunensis* sheweth the reading of *πικύδαι*, to be understood *picea, squifolium*, two words in his judgement; but how those two words should be so often joynted together in him, I see not unlesse they were meant one thing. *Matthiolus*, findeth much fault with *Pliny*, that maketh *Teda* his sixth kinde of Pine tree, taxing him for error for it, for that *Theophrastus* and others make *Teda* to be but the peculiar fault or corruption of the Pine tree of what kinde soever, that is suffocated and killed with the abundance of it owne fatnesse, not suffering the sappe to rise that should nourish it, and then serveth for lights as Torches, lived out into shivers, the cause whereof *Theophrastus* sheweth *lib. 6. caus. cap. 15.* as he did *lib. 3. hist. c. 10.* what *Teda* is, but other good Authours shew that although *Teda*, be so taken with *Theophrastus* and others, yet that letteth not, but that there might be also a tree peculiar that bore the name of *Teda*, it being *homonymia*, a word of divers significations, and that else *Pliny* was not in his right senses, to appoint it a peculiar kinde, and knew it was appropriated to corrupt trees also, as himselfe declareth in many places of his Bookes. The first here set downe is called *Pinus urbana, domestica, sativa*, and *vulgatissima* by all Authours that have writen thereof. The second is called *Pinus sylvestris frutifera*, or *montana*, or *Pinaster* likewise by all Authours. The third is the *Pinus sylvestris Cembro* of *Matthiolus*, which *Lugdunensis* callth *Teda arbor Plinij*, as he maketh the computation, and his *Pinus Tarentina* also. The fourth is *Matthiolus* his *Mago*, and the *Pinus tubulus* *Pliny* also of *Lugdunensis*. The fifth is the *Pinus sylvestris sterilis* of *Lugdunensis*, but is not the *Pinus maritima* *Theophrasti* of *Label*, nor the *maritima major* of *Lugdunensis*, for these are the next or fixt, that is *Pinus maritima major*, although *Bauhinus* putteth them all under one title, and the other of this kinde, is another sort thereof that *Clusius* hath set forth. The seventh is the *Pinus maritima minor* of *Dodonaeus*, and *Bauhinus*, and the third *Hispanica* of *Clusius*. The eighth is *Clusius* his *Pinaster pumilio*. The ninth his *Pinaster tertius Austriacus*. And the last is his *Pinaster secundus Austriacus alter* or *niger*. The *Arabians* call the Pine *Senabar*, the *Italians* and *Spaniards* *Pino*, the French *Pin*, and the kernells *Pignons*, the *Germanes* *Hartbaum*, and *Fichtbaum*, and *Pynholtz*, the Dutch *Pinappelboom*, and Wee the Pine tree, or Pine Apple tree.

The Vertues.

The barke of the Pine tree is binding and drying, stayng the laskē and provoking urine: it helpeth the frettings and gallings of the skin, ulcers also that possesse the upper parts, and burnings with fire, taken with *Cerasum Myrtinum*, or with *Litharge*, and skinneth them after, and mixed with *Coperas*, it stayeth the fretting or creeping of ulcers, the fumes thereof taken underneath, causeth a delivery of the birth, and expelleth the secondine: the leaves are cooling and awaige inflammations, and keepe ulcers from being inflamed, a dramme of them taken in water or mede, that is honied water, are good for the heate of the Liver; if they be boyled in vinegar, and gargled warme in the mouth, it helpeth the paines in the teeth and gummies, the like doth the shivers of the Torchpine boyled in vinegar and gargled. The kernells of the Apples are wholesome, and much nourishing while they are fresh, and although they be somewhat hard of digestion, yet they doe not offend, especially if they be steeped three or foure houres in warme water, before the taking, to soake out their sharpenesse and oylinesse: those that are of hot constitutions may take them with Sugar, but those that are cold with hony, and so they doe amend the putrefying humours in the stomacke and bowels, and stir up bodily lust and encrease sperme, if they be made into an electuary with a little pouther of *penidij pennies*, and some sweete wine, also they much helpe an hoarse throat, wheefings and shortnesse of breath, and when the voyce is lost, and expectorate flegme, and are good for an old cough, and the ulcers of the lungs: they also lenifie the urytory passages being fretted with the stone, and cause them to be easily avoyded: they helpe also to ripen inward Impollumes, and are singular good for macilent bodies, to hearten them and make them grow fat, being often taken they helpe the palse, shaking, and numbnesse of the members. Both Confitmakers, and Cookes know how to make dainty *Queecheses* for their delight that will have them. There is a water distilled from the greene cones or appies that is very effectual to take away the wrinkles in the face, to abate the over swelling breasts of Maides, by bathing them with wet cloathes in the water laid on them, and to restore such as are ravisht into better termes.

CHAP. CXV.

Picea. The Pitch tree.

The Pitch tree hath formerly bene comprehended under one kinde, yet *Pliny* seemeth to reckon a *sativa* and a *sylvestris*, the *sativa* to be *Sapinus*, and the *sylvestris* *Picea*: but we in these times knew but one sort until *Clusius* hath added a dwarte sort thereunto.

1. *Picea vulgaris*. The ordinary Pitch tree.

The Pitch tree is so like unto the Firre tree that it oftentimes deceiveth them that are not skilfull

Picea. The Pitch tree. 2. *Picea pumila*. The dwarte Pitch tree.

or well exercised therein, for it is to be discerned but by some especial notes. It riseth up as high and groweth as great as the Firre, steeple fashion, with a thicke reddish ashcoloured barke, rough and tough like leather, and spreadeth the branches a crosse as that doth, but bending downe, not standing upright as the Firre doth: The leaves also are thicke set on all sides of the branches, and not onely on two as the Firre: being thicke and short, round, and not flat as the Firre leaves are, softer also and not hard, pointed at the ends like it: the cones come forth at the ends of the branches, after the catkins are fallen, which are somewhat reddish at the first springing forth, and being full grown are slender, about seven or eight inches long, bending downewards, abiding so long on the trees, untill the scales opening, the seed within them which is small and blackish, falleth out upon the ground, the wood is smoothen, softer, lesse knotty, and with fairer and straighter graines, and thereby more accepted in workes then the Firre, from this tree is gathered small peeces of white hard dry Rosin, distilling out thereof of it owne accord, very like unto *Olibanum*, that many may be deceived with it, as also a liquid Rosin or Turpentine, by boring the tree as others are, and Pitch also, as from the Pine.

2. *Picea pusilla*. The dwarf Pitch tree.

This tree never riseth high, but alwayes abideth low, spreading the branches in manner of a crosse as the former, beset with shorter and paler greene leaves all about them, this beareth certaine small beads, of the bignesse of an Hasell nut, composed of scales laid close one upon another, whose end is a prickly leafe, which opening when it is ripe sheweth it to be like hollow voyd or empty places within, and from the beads that are at the ends of the branches, shoote forth oftentimes branches with sundry short and prickly leaves: whether it bore either flowers or fruite, *Clusius* saith he knew not, for he saw none on any that he found.

The Place and Time.

The first growth usually in all Countries with the Firre trees, but seldome neere the Sea: the other *Clusius* found in his search for simples in *Germany*, but nameth no place: The Pitch tree blossomes fall away in *March* and *April*, when the cones begin to come forth, which are ripe before Winter, but abide on as is said, if they be not gathered, untill it shed all the seede, and that the windes and the weather have rotted and blowne downe the stalkes of the withered.

The Names.

It is called in Greeke *πίκρος*, and in Latine *Picea*: because the pitch is made of this tree yet, as all Anthoours doe agree, the Pine tree is most usually taken for that purpose, and of it is made both the best and the most store. *Bellonius* as *Clusius* thinketh was much deceived in the Pitch tree, taking the wilde Pine tree for it, in his second Booke and third Chapter, where *Clusius* noteth it, giveth it the figure of his Pitch tree, which is the wilde Pine tree as he saith, but *Bellonius* in his first Booke and 44. Chapter, doth there give the figure of the *Sapinus*, which he saith some French men call *du Sapin*, and some de la Suisse, which as *Lugdunensis* saith, is the name by which they call the Pitch tree, so that it seemeth probable that *Clusius* hath herein mistaken *Bellonius*, yet he saith in the said second Booke and third Chapter, that the Inhabitants doe take *Teda*, Torches from this tree, and that they make pitch, and *Cedria*, Tarre from it also, which is most usually made of the wilde pine tree, but if pitch were not made of this tree, it had the name of pitch tree given it in vaine: *πικροδάμνη* *Pityocampe*, are taken to be called *Eruca painorum*, when as they onely grow on this tree. The Arabians call it *Arz*, but *Tragus* saith, they call the Pine tree by that name also, the Italians *Pezzo*, the Spaniards *Pino negro*, the French *Pesse* and *Soiffe*, the Germanes have no other distinct name then *Thannenbaum* to call it by, by which also they call the Firre tree, onely they call it *Schwartz oder rot Thannenbaum*, which *Tragus* calleth *Abies rubra*, and thinketh it to be *Picea*, the Dutch *Peckboom*, and we Pitch tree.

The Vertues.

The properties thereof are wholly attributed to be the same with the Pine tree, as is before said, both for the barke and the leaves, but this not having any kernels, that are fit either to be eaten or used in physicke, we can say nothing of them.

CHAP. XCVI.

Abies. The Firre tree.

Although *Bellonius* and *Dodonæus* from him, doe follow *Theophrastus* and make two sorts of Firres, a male and a female, yet unlesse the Pitch tree may be accounted his male, I know not how it may be granted in our dayes: which if it be as *Clusius* and others seeme to yeld unto, I marvaile then what tree his *πίκρος* shall be. I have therefore but one sort of Firre to shew you, although I know some by the smoothnesse and colour of severall sorts of the wood, might argue them of differing sorts, yet I hold that not sufficient to make a severall species, no more then is scene in our Oake, which growing in some places will be smoothen or rougher, tougher also or more brittle, of a paler or yellower colour, and with more or lesse veines therein then in others, which cometh to passe by the moist or dry, stiffe or sandy grounds wherein they grow. It groweth taller then any other, except the great Cedar, growing straight up to a great height, without either branch or knot, and covered with a rough hard brittle gray barke, the greater armes stand alwayes foure together, one opposite unto another in forme of a crosse, and grow upright, the side branches on the younger standing but by couples: this order it holdeth in all up to the toppes which is smallest, having risen like a *Pyramis* by degrees: the leaves that grow on the elder branches, stand without order, and are harder yet blundy pointed, then those on the younger, which stand but on two sides, making the branches seeme flat, and very thicke set one unto another, like the teeth of a combe, and these of the younger growth are flatter then of the elder, oftentimes forked at the ends, of a pale fresh greene on the upper side, and grayish underneath, and smallest towards the ends: the agglers or catkins that this beareth, are small and of a whitish yellow greene, enduring a whole yeare on the trees, after they have shewed their flowers: the cones or Apples thereof, are greater then those of the Pitch tree, and with broader scales, blunt or in some double pointed, on the inside of every scale almost lyeth a small seede, joyned to a thinne skinn like a wing, and abide greene untill Winter, and then grow ripe

ripe, but alwayes stand upright, and yeeld much Rosin in the Summer, but being wounded yeeld a yellowish cleare Turpentine, which is sharper then that of the Larch tree, and fit onely for outward medicines: the wood hereof is soft and smooth, with many fouldes, and the knots are the hardest in any Timber.

The Place and Time.

This tree groweth in all the Countries of Germany, Polonia, Denmarke and Muscovia, and in divers other Countries also in Italy, Greece, &c. in Scotland also, as I have beene assured, but not in Ireland or England, that I can heare of, saving where they are planted, and whether there were ever any growing naturally in England at any time heretofore is almost out of question: The time is declared before.

The Names.

It is called in Greeke *Ιαδαμ*, and in Latine *Abies*, and so called by all Writers without variation, but that *Clausius* and some others make it to be the *Abies fœmina* of *Theophrastus*, as they would make the Pitch tree his *mas*, yet as I said *Bellonius* and *D. domus* doe shew us another tree to be his *mas*, which yet is so like the Pitch tree, that if it be not it, we know not what to make it. *Banhus* also consenteth unto them, and yet he calleth the *mas*, *sursum spectantibus conis*, when as their figure sheweth them to be dependentous. The Italians call it *Abete*, the Spaniards *Abeto arbol*, the French *Avet*, *Sap*, and *Sapin* also in sundry provinces thereof, yet *Pliny* saith the lower part of the Firre is called *Sapinus*, and the knotty upper part *Fusleria*, the Germanes as I said *Thaunenbaum* and *weiszthannenbaum*, the Dutch *Dennenboom*, and we in English Malt tree, Deale tree, but most generally Firre tree.

The Vertues.

The bark and dry Rosin of the Firre tree, is in property very like unto the properties of the Pine tree, but that this is more sharpe and more clensing. The cleare Turpentine or liquid Rosin of the Firre, is hot and dry in the second degree, and very clensing withall, yet as I said not so fit for any inward as outward medicines, being somewhat too hot sharpe and nauious to many, and especially seeing we have two other sorts of Turpentine fitter for inward griefes, it is of excellent use in all salves and Balsames that are for the head, or any other Greene wound or old ulcer, clensing very much the old filthy sores, and helping to heale them after, and sodening up the lips of the fresh.

Abies. The Firre tree.

CHAP. CXVII.

De Resina. Of Rosins.

Having now shew'd you all the trees that beare gumm'es or Rosins, I thinke it not amisse to entreate a little more largely of the Rosins, and Gumm'es themselves apart, both to shew you the severall sorts of them, and the severall manners of drawing them forth, which I could not either well doe before, or were omitted to speake of them here, and have their names must all in one place, but because Gumm'es and Rosins would be too much to handle in one Chapter: I will onely make the Rosins my taske in this Chapter, and the Gumm'es in the next, and for that Rosin is of two sorts dry and moist, I will speake of them in each Section, but of the dry ones in the first place, and of the moist after.

Rosin is an cillinous substance dissolving and melting of it selfe by the heate of the fire, and apt to burne with a flame, and called *rosin* in Greeke, and *Resina* in Latine, the dry Rosin is called *rosin* *Æres Resina arida*, and *resin* *Æres Resina frigida*, boyled Rosin, that is, such as from the Turpentine or liquid Rosin is boyled with water in great kettles or cauldrons, into our ordinary yellow hard Rosin or into blacke Rosin, which is usually now adayes called *Colophonye*. yet some say that *Colophonye* is the toothe of the Turpentine, after the oyle is distilled from it, and *rosin* *Æres Resina liquida*, liquid Rosin which is Turpentine.

1. *Resine Cedri. The Cedar Rosins.*

There cometh out of the great Cedar tree, a dry Rosin of it owne accord, hardning upon the tree, which being chewed sticketh so fast to the teeth that it can hardly be pulled from it.

There is another also drawne from it that is liquid, and both of them called *Cedria*, but this liquid especially, for that there is more store of it gathered, and is of more use also, and is drawne from the tree by boring it at the young knots before the bark be rugged, and setting an hollow horne to the hole, that it may runne out thereat into vessels set under to receive it, and is of as sweete a sent as the Strawberry saith *Lugdunensis*, and not as *Dioscorides* saith of a grievous sent, for *Matthiolus* out of a very auncient manuscript amendeth the word to be of a strong sent, or strong sweete sent as *Virgil* his verse doth intimate. *Urit odoratam nocturna in luvaina Cedrum*: which may be understood of the wood also, but there is a certaine liquour called *Cedrium* by *Pliny*, and others, which

which is like our Tarre, and taken in the same manner from it, for they of Syria make Pitch of this Cedar, as also of the *Oxycedrus* the prickly Cedar, as we in Europe do of the Pine and *Teda*, that is, cut into tickes to burne this liquour commeth first from it in the burning, which is of that force and efficacy, that in Egypt they did besmeare the dead bodies therewith sundry times, which preserved them perpetually from putrefaction, for being of a causticke quality, it did feede upon, and consume the moisture in the carcase, and so kept it from putrefying, but divers have confounded both the *Cedria* and the *Cedrium* together, and the pitch likewise calling them promiscuously, some while *Cedria*, or *Oleum Cedrinum*, which is *Cedreleon ex malis Cedri*, saith Pliny, and at other times *Cedrium*, when as properly *Cedria* is the *Lachrymacruda Cedri*, or *resina Cedri*, and the *Cedrium*, the *Pix liquida Cedri*, and the pitch it selfe is *Pix Cedrina*, yet both the *Cedria*, and the *Cedrium* are of one operation: They in Syria, by Pliny his words in making pitch hereof, and of the Turpentine tree did use a kinde of furnace, wherein they piled their stickes, and made a fire round about the furnace, but put no fire within it, as we in Europe doe, in making pitch, as I shall shew you hereafter, when I come to speake of the pine and pitch trees, *Bellonius* saith that of any of the Resinous trees as well as of the Cedar is made *Cedria*, which both *Matthiolus* and *Lugdunensis* doe worthily reprehend for so manifest an error: The Vertues and properties whereof are set downe before, and neede not a repetition here againe.

2. The *Oxycedrus* or great prickly Cedar tree giveth a certaine dry Rosin or Gumme as it is called, somewhat like unto the Masticke, but that the graines are long, and of a more yellowish colour, but so dry if it be chewed betweene the teeth, that it will not be wrought into a paste like Masticke: but will be as a pouter in the mouth continually: this I take is called Gum *Juniperi*, in the Apothecaries shoppes, and *Vernix* also, and *Sandarach* likewise, because the tree is so like unto Juniper, and *Lugdunensis* saith that both the gum of Juniper, and of the *Oxycedrus* are called *Vernix*. Hereof is made a most stinking Tarre, called by the French *huile de Cade*, when as they make pitch of the wood, as they do of the pine and pitch trees. This is most likely to be the sweet Cedar of the Bermudes.

3. *Resina Laricee*. The Larch tree Rosins.

The Larch tree yeeldeth likewise two sorts of Rosin, one breaking out at the chinkes of the barke on the body and elder boughes, which is cleere and white like unto white dried Turpentine, and smelleth reasonable well, which will not be kept in drops, but will runne together into lumps, untill in time it will grow dry and hard. It yeeldeth forth also a liquid Rosin, when the tree is bored to the heart as is before said, year after year, one or other, but not the same trees every year, one hole above another for eighth or tenne foote above the ground, which when they have done on one side, they doe so to another, still closing up the hole close with a pinne or wedge; this yeeldeth saith Pliny, lib. 16. c. 10. a liquour of the thickest of thinn hony, which never groweth hard, and againe in another place he saith, The Larch tree yeeldeth forth a thinn Rosin of the colour of hony, smelling strong, notwithstanding that he had said that it burneth no more then a stone, nor yet maketh any coales. *Vitruvius* also lib. 24. c. 6. saith the Larch tree yeeldeth a liquid Rosin of the colour of the hony of *Athens*, which is good for those that have a pilsicke: but in that they say it was of the colour of hony, you must not understand the colour of our red hony, but such as that Country of *Athens* gave, which was nothing so high coloured as ours, and which I do in part beleve, led by divers reasons, to thinke, that that liquid Rosin which floweth out of the Firre tree, being some what neare the colour of our hony was the Turpentine used formerly in the Apothecaries shoppes but as *Matthiolus* asureth us, the cleare white Turpentine that is in most use in the Apothecaries shoppes for inward medicines, and called *Venice* Turpentine (in imitation of the true Turpentine which commeth out of the Turpentine tree, as divers Liqueurs are called Balamies, in imitation of the true Balsame) is taken from the Larch tree, whose properties are declared before.

4. *De Resina Pini, & Picea*. Of the Rosins, of the Pine tree, and of the Pitch,

The Pine tree yeeldeth forth a kinde of fatty or gummy Rosin, that is of a whitish yellow colour, made up with a great deale of drosse for the most part, and but little cleane Rosin in severall parts to be seene in it, which dorth quickly become dry, and to be made into pouter, smelling somewhat strong and sweete, and is our ordinary or common Francemence that is usually burned in houses and chambers, to aire and perfume them, called also *Parrosin*, and in shoppes *Resina pini* in France *Garipot*: this Rosin runneth out of the trees of it owne accord, and especially as *Matthiolus* and *Lugdunensis* say, out of the *Cermolo* or *Teda*, as being the sweetest, and falling upon the ground, is gathered from thence with what drosse it hath gathered into it in the spreading, and so put up with whatsoever sticketh to the barkes of the trees likewise, whereby it becommeth so foule as we have it, and therefore had neede to be melted and strained before it be used, and then will grow hard and fit to be used, there is a kinde of dry Rosin also gathered from the nuts or apples called *Resina Strobilina*, which *Galen* maketh the chiefest and best of all other Rosins, although *Dioscorides* maketh it the last and worst. It yeeldeth no other liquid Rosin that I can learne: but from it and the sorts thereof, before it turne into *Teda* as after, but especially then, as having most store of pitchy matter in it, is made the best pitch and most store, and is made in Europe, where the trees grow, somewhat after the manner of making charcoales with us: For having prepared a place for the purpose, paved in the middle, and raised up also a little, with a trench round about it, for the pitch to runne into, they pile up the tickes and cloven wood, setting them upright to a sufficient height and breadth, this pile or heape they cover with the branches of the tree, plashed close together, and very well limed or lomed on the outside, quite all over, that no chinke be therein, for if any happen it must be presently stopped with lome, that no flame or fume passe out thereat, for feare of losing all, and onely one hole left below, where the fire is to be kindled, which also must be stopped up after the fire is well kindled, and that the liquour beginneth to runne into the trench, which must have severall gutters from it to be led from thence into others fit to receive the pitch as it runneth out: the Tarre and water with it runneth first out, which is kept together, and the pitch that commeth out after by it selfe, and then barrells are filled up with them severally: the thinnest liquour is called *Pix liquida* in Latine, and *πικρὴ ὕλη* in Greeke, and when it is boyled againe and made harder *πικρὴ ἔνζυμ* and *πικρὴ πύμα* *Pix arida vel secca*, and *resolita*, but the *Pissasphaltum* is a bituminous or hard pitch, taken out of the earth, and was used to be melted with Tarre to temper it, and make it serviceable for ships. The Vertues whereof being not specified before, shall be shewed hereafter in the end of the Chapter.

5. *Resina Picea*. The pitch tree Rosin.

The pitch tree likewise thrusteth forth a whitish Rosin gathered betweene the barke and the tree, and breaking out

out into drops, so like unto *Thui* or *Olibanum*, that many did counterfeit it therewith, as *Galen* saith *lib. 2. de comp. med. secund. gener. c. 2.* and *lib. 3. c. 2.* who calleth it *μυτινον σίμυα*. *Picea bulla*, and this peradventure may be that Roslin of the pitch tree, made in *Asia*, and called there *Sphagas* as *Pliny* saith, who also in another place saith hereof, that the pitch tree giveth a great deale of Roslin so like unto *Thui*, that being mingled together, they can scarce be discerned to be severall: this Roslin also is used to be mixed with the pine tree Roslin before spoken of, which is likely to be *Galen* his *κρυωσις*, and with them the *Resina strobilina* mixed all together: cut of this tree likewise being wounded as in other trees for that purpose, is drawne forth a liquid Roslin, like unto that of the Firre tree, called by *Pliny* *Pice Brutia*, as I take it, which is redder then the ordinary Roslin, and peradventure may be also the *Colophony* of the ancients, which was like *Resina frilla*, and brought from *Colophony*, but more tenacious, as betwene Roslin and pitch, which I take to be that which is usually called with us now adays *Burgony* pitch, which while it is fresh is somewhat soft in working, and sharpe in scent, but afterward growing as dry as a dry Roslin, that will easily be made into poulder. Of the wood and stickes hereof as of the pine, either together or leparate is made pitch, as is before shewed.

6. *Resina Abiegna*. The Firre tree Roslin or Turpentine.

Some doe say that there is gathered from the Firre tree, a dry kinde of Roslin passing out thereof voluntarily as is before said of the pine and pitch trees, and put altogether to make our common *Francumfence*, which how true or false it is, I cannot either maintaine or disprove, the knowledge of many such things, although of daily use is not easily attained, by them that dwell farre from the naturall places of their growing. From this Firre tree being bored to the heart, as is done in other the like, and some say out of the pitch tree as well, issueth forth in the younger trees a cleere yellowish Turpentine or thinne Roslin, but from the elder somewhat thicker, which being put into great cauldrons is boyled with a double quantity of water, but I thinke twice double will not serve, so long even two or three dayes continually night and day, untill it become so thoroughly boyled and dried, that it will not yeeld to a thrust, when it is cold, but will be hard and dry, and then is called yellow Roslin, and being molten a new is cast into great cakes, of an hundred weight a peece more or lesse, and according as the Turpentine is in clearenesse and goodnesse so will the Roslin be, and this is the *μυτινον σίμυα* of the Grecians, and *Resina frilla* of the Latines.

7. *Resina Cupressina*. The Roslin of the Cypresse tree.

There is sometimes found on this tree, a certaine kinde of dry Roslin, but so little that we have little knowledge thereof, and lesse use, *Dioscorides* and *Pliny* doe both make mention of a liquid Roslin, to be taken out of it as out of the Turpentine tree Larch tree and others.

8. From the *Savine* trees likewise of both sorts, in the hot Countries is taken a dry Roslin.

9. From the *Cedrus Lycia*, the Cypresse like Cedars of both sorts, is taken such like dry Roslins as from the *Oxycedrus* in small peeces falling to poulder in the chewing like unto it.

10. From the *Arbor vite* sometimes is taken a dry Roslin in small peeces and small quantity.

11. From the *Arbor Thuirifera* is gathered the *Thui* or *Olibanum*, but what the tree is from whence it was taken we know not, nor they that have made mention of it, for some say one thing and some another, so that I dare lay no more of it here, but in the next Classis.

12. Of the dry or liquid Roslins taken from the Lentiske or Masticke tree, from the *Palmarum* or Balme tree, from the *Syrax* or Storax tree, and from the Turpentine tree, I have spoken sufficiently before, saving onely that I would give you further to understand that in *Syria*, and the parts neere thereto they make pitch of the Turpentine in the same manner as they doe of the Cedar, besides the cleere true Turpentine that is drawne forth by piercing the tree, as in other Roslin bearing trees.

The Vertues of Roslin and Pitch.

Roslin in generall as *Galen* saith, that is of all sorts, is hot and dry, but they differ much one from another, in being more or lesse sharpe and hot, and of thin parts: the *Strobilina*, that is, the Roslin taken from the nuts of the pines is the hottest, and that from the Turpentine tree the most temperate, the dry white Roslin of the pitch tree is hot and dry, but yet is not so drying as the *Strobilina*, although more heating: that of the Firre tree is as a meane betwene them both, even as that *Colophony*, which smelleth and is like *Thui* or *Olibanum* is temperate likewise, the moistest of them all is that other sort of the Larch tree Roslin, which is the sharper, of the stronger sent, and more bitter taste: The *huile de Cade* or sinking Tarre, coming from the *Oxycedrus* or prickly Cedar when it is burned, healeth all scabbies and itch in man or beast, and other deformities in the skin, as the Lepry morphew and the like, and performeth in a manner whatsoever the *Cedria* it selfe can doe. The Venice Turpentine boyled to a dry Roslin, is farre better then any other ordinary boyled Roslin to stay the flux of Gonorrhea. The common *Francumfence*, *Parresin*, or Roslin of the pine tree besides the uses to burne and perfume a house as is before said, it serveth in salves as a principall ingredient, to heale and fill up with flesh hollow ulcers, and to warme and comfort any cold griefe or part of the body: The Roslin of the pitch tree, called *Burgony* pitch, in being sharper and more hot, is much used for scarleathes against cold aches, and all sorts of paines and griefes proceeding of cold, and by reason of the sharpe and quicke sent, is the more piercing: The pitch it selfe is hot and dry in the second degree, yet mollesyeth hard knots tumours and swellings, it bringeth boiles and fores to supparation, and breaketh carbuncles, and blanes, disperseth and scattereth botches and empollthmes, draweth forth corruption in fores, and healeth them by causing flesh to grow up in them, and is used in many salves, both oynments and plaisters that serve to draw and to heale: The Tarre water that commeth first out and with the Tarre, doth kill any Tetter or Ringworme being used thereon, and likewise any itch, and healeth up scabbies or scalles in the head, the Tarre it selfe is hotter then the pitch, and is used saith *Dioscorides*, against poysons, as also is good for those that have the Tisick or cough, or rotten flegme stuffing the lungs, and for hoarsenesse and a tough flegme, that will not easily be expectorated: being rubbed with salt on a place that is bitten by a Serpent helpeth it, and being mixed with as much waxe it taketh away the ruggednesse of the nailes, it helpeth the hardnesse of the mother, the rifts in the fundament, the chaps on the hands or feete, it stayeth also spreading ulcers, it breaketh or dissolveth the kernels under the eares and throat, called the Kings evill, being made up into a pultis with Barley meale, and a boyes urine, and applyed warme: it is likewise dropped into the eares with a little oyle of Roses to cleanse the mattering of them: it stayeth creeping ulcers applyed with Brimstone or

or the barke of the pine tree, or with branne: The blacking that is made of the pitch when it is burned, healeth watering eyes, and the fretting sores in the corners of them: and with it and ordinary Turpentine well mixed, is made the Printers Incke where with they print Bookes, but not our ordiary Incke now adayes, howsoever it might be in use in *Dioscorides* his time. The Turpentine that cometh out of the Firre tree is sharper and hotter then that of the Larch tree, and more nauious to be taken inwardly as I said before, and therefore more usually put into salves, and for outward remedies: The Rosin that is made thereof is neere unto the property of Pitch cleansing heating drawing, and mollesying as well, and drying more then pitch: the ponthor of Rosin is almost as effectuall as Amber pouthor in the running of the reines, experimented by sundry Chirurgions, who hauented it instead of the best sort of dried Turpentine, which is for the same purpose, either to try conclusions or to save charges: it is used with pitch in many salves, or without it for all the purposes whereunto pitch serveth for all greene wounds to heale them, and for all old sores and ulcers to cleanse them, incarnate and heale them up afterwards: it may be used in fumes with Olibanum, Masticke, and other things that are burned, and the headayred with their smokes to helpe to dry cold rheumes, catarrhes, and distillations from the head. The Rosin of the Cypress tree is heating and binding, and serveth effectuallly for all the purposes that is spoken before of the nuts or leaves, or what else thereof is used: The Rosins of the small Cedars are neere the property of the prickly Cedar, although not so effectuall or violent. In the like manner whatsoever droppeth or runneth forth from the Sabine trees is sharpe and hot like the leaves, &c. of the trees: and for the *Arbor vite*, although there hath been sometimes a kinde of Rosin found sticking to the barke of the tree, yet it hath bene in so little quantity, that I have not learned what use any hath made of it. The other Rosins of the Balme tree, Turpentine, Lentiske and Storax trees are spoken of sufficiently in their proper Chapter, and need not a repetition here againe, of the same things there delivered: The Vertues of the *Tinus* or *Olibanum*, you shall have in the next Classis with the relation thereof.

CHAP. XC VIII.

De Gummi arborum & herbarum carund. mque succis condensatis.
Of the Gummes of trees, and herbes, and of the dried juyces of them.

THe Rosins of all sorts being declared in the former Chapter, there remaineth to speake of Gumme issuing both out of Herbs and Trees, and the condensate juyce of plants, yet I must except out of this number and Chapter the gummes and dried juyces, whose plants are not knowne to us, from whence they proceed, and that are brought of old or of later dayes, from the East or West Indies, which are of use in physicke, for I determine to handle them in the next Classis, with the forraigne drugges in the Apothecaries shops. I have as you see here joyned the condensate juyces unto the gummes, because to them that know not their manner and nature, they seeme to be gummes, one as well as another: and that I may shew you the difference betwene a gumme and a dried juyce, and both of them from the Rosins before spoken of, thus they ate: Gummes are of two sorts, one that is of a watery or earthy substance, and will dissolve in warme or cold water, wine, or the like, and not in or with oyle, nor melt of themselves, being set to the fire, and will burne without flaming, and such are the Gummes of many trees. The other is oylous or unctuous and in part resinous, in that it cleaveth so fast to any thing toucheth it, and chate will not dissolve with cold water, wine, or vinegar, but onely with warmed wine or vinegar, and will also better dissolve of themselves being set to the fire, then the other gummes will, and will give a flame in the burning, yet nothing so much as the Rosins, which as I shewed before are wholly unctuous, melting with the heate of fire, and burning with a flame like oyle and such like unctuous matter being set on fire: Another difference of a Rosin from a Gumme is this, that all Rosins although Liquid (some sooner or later then others,) will be dried ro be made into pouthor; the juyces have scarce any of them any unctuous matter in them, being onely composed of a watery and earthy substance, condensate together, which wholly dissolveth with water and burneth like earth: to begin therefore.

1. *Gummi Arabicum.* Gumme Arabecke.

Is a certaine cleare white Gumme that is brought from the parts beyond the Seas, and is taken to be the Gumme that cometh out of the *Acacia* tree of *Egypt* by many good Authours, *Belonius* also confirming it, who travailed through those parts; and observed it, and *Alpinus* who lived a while in *Egypt*, yet some have taken it to be the gumme of plumme trees, or of other trees growing in those parts: It is of sundry formes and colours, for some are in round hard dry peeces, of the bignesse of a Tennis ball, or bigger, or not halfe so great or lesse, all of them rugged and not smooth on the outside, but whitish for the most part. which being broken is cleare pure, white and transparent, yet some more or lesse then others, and some ate very small long peeces, and therefore called *sermientulatus*, and held for the best, being in substance like the other peeces of the same greater size, are reddish, yet cleare and transparent also, which some take to be the gumme of some other tree, because it is of such a different colour, but that is no sufficient reason to disprove it, for we see in divers others sorts of gummes, that the severall peeces doe not all hold one forme or colour, and yet are true: this dissolveth of it selfe in water, and serveth as a glew to stiffen binde, or fasten many things: the tree hercot shall bee declared the second Chapter after this, for the manner thereof, it distilleth or droppeth out of the tree in bigger or lesser peeces, as either nature list to thrust it forth, or as it is helped by cutting the barke and giving it way to issue forth, which sticking too, and not falling off or upon the ground, is so gathered and reserved.

2. *Gummi Prunorum & Cerasorum.* Plumme tree and Cherry tree Gumme.

The Gumme of both these trees come forth in the same manner that is said of the former, being of severall colours each of them, that of the Plumme tree for the most part being whiter then the other, which is redder: yet both of them cleare and more clammy then the former, and vary, some of the Plumme trees being reddish, and of the Cherry trees white.

3. *Gummi Amygdalarum & Persicorum.* Almond and Peach tree Gummes.

Both these trees likewise yeeld Gummes very like unto the Plumme and Cherry tree, that it is somewhat hard to distinguish them, but that they are somewhat whiter and a little dryer. Thus having shewed you all the Gummes of the Trees that are knowne to us, let me in the next place shew you the other sorts of Gums, taken for the most part from the rootes of Herbes and plants.

4. *Gum Tragacantha.* Gum Tragacanth.

This Gumme as I have shewed before in speaking of the plant called Goates thorne is taken from the rootes hereof as they grow, a pit being made round about the roote, which will in the greatest heate of Summer, being deeply wounded, thrust forth very slender small peeces, crooked or writhed, seldome greater then a tagges point, or ones fingers end, and most usually a great deale smaller; some very pure white, and others a little yellowish, and some more reddish, much of it gathering drosse, which sticketh fast unto either barke or stones, or earth, or the like: the gumme it selfe is sweetish in taste, and quickly relenting in water into a gelly, like made starch, and glewing things together as firme as starch or glew, in small and thin materials. The properties hereof are declared with the plant.

5. *Opopanax.* The Gumme Opopanax.

This gumme taken from *Panax*, the All heale of *Hercules* is a yellow gumme, very browne on the outside and yellow within being broken, the best is pure and sincere, that is, not mixed with stickes or drosse, but cleane gum, and in small drops, yet sticking fast together, of a fowrish sent, and somewhat strong, and being dissolved with wine or vinegar, will make it looke yellow, even as the herbe it selfe, being broken will yeeld a yellow sap or juyce in our owne Land: from the rootes chiefly and not from the stalkes is this gumme taken, in the like manner as I shewed you of the gumme tragacanth by digging a hole round about the roote, and laying boordes or tyles or the like, round about and in the bottome to keepe the gumme cleane, from earth, stones, or any other thing that might soule it, falling among it after the roote is cut in three or foure places, as some doe, or making a hole or two therein as others doe, whereunto the gumme will be drawne, and from thence flow forth: In the Classis of Vntelliferous plants are the Vertues exprest whereunto I referre you.

6. *Galbanum.* The Gum Galbanum.

The great *Ferula* or Fennell giant of one sort, is the plant from whence this gumme is taken, and that not in every Country for that onely which groweth in *Syria*, as *Dioscorides* saith yeeldeth Galbanum, the rootes being wounded in the same manner as is before said of the *Panax*: the gumme smelleth strongest of any of the *Ferulaceum* gummes, and is it be sincere a little yellowish, with white peeces amongst it, and divers parts of stickes or stalkes broken among it, and sometimes the feedes also, so clammy and tenacious that one can hardly touch it without cleaving to their fingers, and dissolving onely with wine or vinegar.

7. *Sagapenum.* The Gum Sagapenum.

As *Syria* bringeth forth the *Ferula*, from whence *Galbanum* is taken, so is *Media* the ourse plot, as *Dioscorides* saith, where the same or another *Ferula* groweth, from whence the gumme *Sagapenum* or *Serapinum* is taken in the same manner that the former is, and doth not much differ from it, but that it is not so clammy, or gummy, but dryer, and of a redder colour, and smelleth not halfe so strong or stinking as it doth: The Vertues both of *Galbanum* and *Sagapenum*, are amply set forth under the title of *Ferula*.

8. *Gum Ammoniacum.* The Gum Ammoniacum.

This gumme likewise is taken from a *Ferula* as it is said, growing in *Cyrene* of *Africa*, so that you see the diversity of the climate, although in one and the same plant produceth diversities of gums, differing both in forme and operation: this gumme is much whiter then any of the three last mentioned, pure and sincere without any stick or stalk in it, and with many whiter peeces among it, and not smelling any thing so much as the *Sagapenum* doth, which also being dissolved, will be whiter then any of the former. The properties of this Gum is very like unto the two last of the *Ferulous* gums, and thereunto you may referre it.

9. *Euphorbium.* The gum of the burning thorny plant.

This gum is taken from the thorny plant *Euphorbium*, as we have bene alwayes informed from others, and not from any kind of *Ferulous* plant, as *Dioscorides* saith, the forme of which plant, as it hath come from beyond the Sea unto us, even a small plant, we have here before exhibited unto you, the gum is of a browne yellowish colour, and somewhat whiter within, in almost as small graines and drops as Masticke, of a most violent burning hot piercing sent, piercing the nostrils if it be but a little stirred, but much more and almost intollerable to him that shall beate it, and more to them that shall take it inwardly, the properties hereof are declared with the description of the plant.

10. *Sarcocolla.* Sarcocoll.

This is a small reddish and whitish gum, in very small peeces and pouthers, little bigger then Poppy seed, somewhat bitter in taste, and ready to provoke casting, but of no sent almost at all, *Dioscorides* saith it is taken from a tree in *Persia*, which neither he describeth, nor we have any further knowledge of, it cleneth and dryeth, it closeth up greene wounds, and stayeth catarrhes, defluxions and rednesse in the eyes.

11. *Gum Hedera.* Gum of Ivy.

The gum that is gathered in the hot Countreys from the stems and greater branches of the Ivy tree is of a very darke red or browne colour, coming to us in small drops, cleaving fast together in lumps, a little cleare, and of somewhat a strong sent, but very sharpe and burning: it killeth nits and lice, and some doe put it into a hollow tooth to helpe to each, being mixed with things convenient for it: some use this gumme with other things, and some alone; made up with a little hony and crummes of bread into a palle, and cast it into standing pooles and ponds of fish to make them turne up their bellies and lye as dead above the water for a small time, that they may be taken, which will returne to their senses againe.

12. *Scammonium.* Scammony.

I have made a long narration hereof in the second Classis of this Work, whereunto I must referre you, and onely shew you here that the generall vote of the Writers thereof, is that the juyce hereof is taken from the rootes of the plant, ordered in the same manner that is shewed in gathering the gummes of *Panax* and *Ferula*, &c. but I am halfe perswaded it is otherwise, and made in another manner, because it doth not condensate into graines

or small peeces as rhose aforefaid, but is made into a whole uniforme lumpe or maffe, of a darke grayifh colour, fomewhat light and not ponderous, a little fpongy alfo, or with fome holes in it, fomewhat cleare and not muddy or droffie, of a ftrange and ftrong tafte, almoft procuring cafting, and giving a fhew of milke upon the moiftening with the tongue, but not burning in the mouth or throate, for that is a figne of adultering: The qualities are expreffed at large in the place before named.

13. *Aloes. Aloesuccotrine.*

The Herbe *Aloe*, or Sea Houfeleeke, I have likewise largely entreated of in the faid fecond Claffis before, with the whole manner of drawing out and preparing the joyce, whereunto I muft referre you, fo to fave a tautologic or repetition of the fame things againe, which were too tedious.

14. *Opium. Opium.*

This alfo with all that can belong therunto, I have expreffed in the Chapter of Poppy before, and cannot adde unto it any thing, more then is there fet downe with the Vertues and Cautions, in as ample manner as I can.

15. *Elaterium. Elaterium.*

After I had given you the description of the wild Cowcumber, in the fecond Claffis before, I declared the making of the *Elaterium* of two forts, both greene and white, as may be fufficiently gathered from what is there faid, and therefore I fhall forbear to fay any more thereof in this place, referring you thereunto, where the properties are alfo expreffed.

CHAF. XCIX.

Palma. The Datetree.

Although there be divers kindes of trees that goe under the name of *Palma* in Latine, whereof *Pliny* in his time mentioned three fcore and one, and fince his time many others not knowne to him, have bene brought to light, yet there is but one kinde of Date tree properly fo to be called without variety, howsoever the climate where they grow, feeme to make a diverfity, of greatneffe or goodneffe one from another in the fruite, fuch as *Theophrastus* and *Pliny* reckon, and although againe, for want of a fitter *Engliſh* name, as the former Writers have thought, they have bene called Date trees generally: yet I would if I could avoid that improper name, and rather call them *Palmes* for the diftinction of them: I will therefore in this place give you onely the description of the true Date tree, and thereto adjoyne two other called *Palmitos*, which others doe account low or wilde Date trees; when in truth they have little or no refemblance thereunto, faving a little in the leaves, and fpeake of fuch other *Palmes*, as have come to our knowledge, in the next Claffis.

1. *Palma vulgaris. The ordinary Date tree.*

The Date tree ufually groweth very great and tall, yet in fome places nothing fo high as in others, bare of branches unto the toppe, the barked whereof is not fo well to be faid fealy or rugged, as knaggy, having ſhort knagges, which are the ends of the middle ribbes of the leaves, fticking out round about the body, which give an eafie footing like ſteps, to climbe or get up into the toppes of the trees to gather the fruite, the leaves that grow at the toppe are very long and large, made as it were of divers parts, and foulded together double; the middle rib being thicke and almoſt woody, but ſpongy within, which doe alwayes abide greene, and hang downewards with their ends: the flowers are encloded in a long ſkinny ſheath, hanging downe from the lower branches of leaves and ſometimes higher, which opening it ſelfe at the end into two parts, fhew forth a number of white ſaffron-like ſmall flowers, hanging by ſmall threds in great bunches together; after which come the fruite, upon the faid threddy footſtalke, greene at the firſt, and reddiſh when they are ripe, with a hard firme ſmall long and round whitifh ſtone with a furrow in the middle: ſome forts are ſmall, and ſome great, ſome of a ſoft ſubſtance ſome firmer and harder. ſome whitifh, ſome yellowiſh, or reddiſh, or blackiſh, ſome round like an Apple, others long with the roundneffe, ſome having the toppe ſoft, and ſome none at all, ſome ſo ſweete and luſtious that they will not keepe long, unleſſe they be preſſed into cakes to be kept, others will abide whole for a long time, and fit to be ſent alſo into any fere Country; yet all of them having a ſmall round hard crowne or cap at the head, which with rubbing one againſt another falleth off: the ſtones within the fruite, notwithstanding that they are ſo ſolid and firme as a very ſtone, and can hardly be broken with a hammer, yet having a ſmall hollow place in the middle of them, with ſo ſmall a kernell therein, that it would not be thought to ſpring thereby, yet being put whole into the ground hath ſhot forth long narrow hard leaves, and have abiden in a convenient warme place divers yeares, without any great progresſe, ſo little it liketh ſo cold a climate.

2. *Palma humilis five Chameriphes vel Palmitos.*

The wilde or low Date tree called the *Palmito* tree.

The *Palmito* or low or wilde Date tree groweth in divers places of *Europe*, not to be above a yard high in the ſtocke or body, ſhooting out leaves from thence very like unto the former Date tree, but much leſſe and ſhorter: this beareth a round head at the ſide of the leaves, compoſed of many ſoulds of ſkinnes, which breaking open, fhew forth a number of white flowers, ſtanding upon ſmall threddy ſtalke: this head being cut off, before it open it ſelfe for flowers, is very delicate to eate like a Coleflower or Cabbage, and more pleaſant then either Hartichoke, Chardon, or Tartuſſiſbe, and are ſerved to rich mens tables for a ſallate of great delight.

3. *Palma Chamerops Pliny five Chameriphes ſpinofis folijs. The Thorny Palmito.*

This groweth in a manner wholly like the laſt, but the leaves being made as it were of many hard plaites have many ſharpe and ſhort prickles or thornes, on the backe of them, and the ſtalke of them likewiſe, whereby it differeth from the other, whether the heads and fruite be alike, I cannot certainly heare.

The Place and Time.

The manured Date tree groweth in all the Eaſterne Countries generally, *Galen* and *Pliny* with others commended thoſe eſpecially above others, that grew in *Iudea*, and in the valley of *Hiericho*: *Bellonius* ſaith, they deſerved not commendations, neither were they ripe about *Ieruſalem*, above a moneth after they had bene gathered in *Egypt*: they grow alſo in *Italy* where they are planted but beare no fruite, and in *Spain* by the Sea ſide,

Q q q q q

but

Palma vulgaris & legitima.
The ordinary and true Date tree.

Palme spinosum fructu & floribus.
The blooming and fruit of the Date tree.

2. *Palma humilis sive Chameripbes.*
The wild or Low Palme, called the Palmito tree.

3. *Palma Chamarops spinis sive Chameripbes spinosus foliis.*
The thorny Palmito.

but the fruite is nothing so good as in *Cyprus* and the *Levant*. The other two sorts grow, the first in *Sicilia*, *Candy*, &c. the other in *Spain*: they flower in *April*, and are ripe in *November* or later.

The Names.

The Date tree is called in Greeke *Ἰνδὸν Τῆνον*, in Latine *Palma*, and the fruite *Ἀκκὺν* *Agavus Palmule* and *Dactyl*; the sheath or skin which enclōfeth the flowers, is called *Ἑλὸν* *Elate*, and *ἄνθη* *Spatha*, and some thinke one kinde of Date is called *Palma Elate*: the best sort of Dates are called *Caryote* and *Phanicolanite*, which were also called *regia*, because they were first for the dyet of Kings. *Thebanes* were the leane dry Dates, that had little substance in them: the ancient Writers have set downe many things of Dates, that there is male and female, and that they both beare fruite, so that they be within the sight one of another, or else they will not beare, but I pray you account this among the rest of their fables. The second is called *ῥαυρὸς* by *Theophrastus*, and *Chameripbes* in Latine by *Lobel*, *Lugdunensis*, and *Palma humilis* also by *Matthiolus*, and *Palmiter* or *Palmito* by the vulgar in *Italy*, *Spain*, &c. the Greekes also call that head that is used to be eaten *ῥαυρὸς*, the *Italians* and *Spaniards* *Cesaglion*. The other is called by *Lugdunensis* *Chamerops Plum*. The *Arabians* call the Date tree *Machla*, and *Nachal*, and the fruite *Tamar*, the *Italians* *Palma* the tree, and *Dattoli* the fruite, the *Spaniards* *Palmeira*, and *Tamaras*, and *Dattiles* the fruite, the French *Palmier*, and *Dattier*, and *Palmer*, and *Datties*: the *Germanes* *Dattelbaum*, and *Dattels*, the *Dutch* *Dayboom*, and *Dayer*, and we in *English* *Date tree*, and *Dates*.

The Vertues.

The unripe Dates are very harsh and binding, and the ripe also while they are fresh more then when they are dry, staying womens courtes, vomittings, and the laske of the belly, and stay also the bleeding and falling downe of the fundament and piles, being taken in red wine: if they be used that are dry, they helpe the hearfensie and roughnesse of the throate, the sharpe cough by reason of sharpe rheume falling on the breast and lungs, the decoction of them taken awayeth the force of hot agues, and stayeth spittings of blood, the paines in the stomacke and bowels, because of a flux, and boyled in old *hydromel*, that is, mede or honied water, and taken doth refresh the spirites: used like wise in broches or meates they doe the like, and some what provoke unto enery, but being taken too often, or too liberally they breed head ach, and a kinde of perturbation of the braine, like unto drunkennesse, and the leprosie also as it is said, the sheath out of which the flowers breake, is very allringent, and so are the leaves also in the cases aforesaid: the decoction thereof maketh the haire blacke, being often used, and stayeth fretting ulcers, and helpeth the weaknesse and paines in the backe, in the bladder, and in the bowels: the Date stones being burned and washed serveth in stead of *Spodium*, to binde and restrain the fluent humours into the eyes, and to consume the pinne and web in them, and to dry up pulses being used with *Spiknard*, it stayeth the falling of the haire from the eyebrows: being mingled with wine and used, it helpeth any excressences out of the flesh, as wennes and such like, and bringeth foule ulcers to cicatrizing: *Diaphenicon*, which is the Elettuary made of Dates, purgeth cholley and slegme very effectually, so it be taken with good caution and aduise, and that from two drammes unto sixe in white wine, or a decoction of *Sene*, as shall be thought fit, and is conveniently given in compound and long agues, and in those diseases that are bred of raw humours, as in the chollicke the paines of the backe and mother. The head of the Dates, or Date braines, is very pleasant and fawoury to the taste, and is much used where they grow to be eaten with a little Pepper and salt: of the leaves of the *Palmito* they use to make Broomes to sweepe the house, which last a long time; of them likewise they make Mats, and Baskets.

CHAP. C.

Acacia sive Spina Egyptia. The Egyptian thorne or binding Beane tree.

Dioscorides hath made mention of two sorts of *Acacia*, the one of *Egypt*, and the other of *Cappadocia*, and *Pontus*: *Theophrastus* also speaketh of two sorts, blacke and white: that of *Egypt* is reasonable well knowne, but of that sort of *Pontus*, there is some controversie among Writers, some taking one bush to be it, and others denying it to be it, the differences of *Theophrastus* sorts are one, ly expressed in the wood, as it is likely, the white to rot quickly, and the blacke to be long lasting and of very good use to many purposes, *Dioscorides* having described them. I shall therefore here shew you them, and with them adjoyne another sort of *Acacia* brought out of the West Indies, mentioned by *Aldinus* in his *Farnesian garden*.

1. *Acacia sive Spina Egyptia vera*. The true *Acacia*, that is Egyptian thorne or binding Beane tree.

The *Egypt* an Thorne groweth in some places to be a great tree, and rather crooked then straight or rising high, covered with a blackish barke, spreading abroad great armes and branches, full of sharpe thornes, with many winged leaves set on both sides of them, that is, with foure winges of leaves on a side, made of sundry small ones, set opposite on a middle rib, without any odde one at the end, although it be so expressed, *Bellonius* saith that he counted 350. of those small leaves, that were upon the whole branch, and yet all of them might but cover his thumb: the flowers grow among the branches, like flocks of wooll, of a whitish yellow colour, where after come somewhat large and thicke huskes, like unto the *Lupine* or flat beane cods, blacke when they are ripe, and bunched forth against the places where the feedes lye, in some three or foure, and in some more, each as bigge as a small wild Beane, round, and of a grayish or ash-colour, almost shining: the tree abideth alwayes with greene leaves thereon, and yeeldeth of it owne accord a white gumme in small curled peeces like great wormes, and greater round peeces if it be wounded.

2. *Acacia Americana Farnescena*. The West Indian *Acacia* or binding Beane tree.

This Indian *Acacia* groweth like unto the *Hæll nut* tree saith *Aldinus*, with many stemmes if they be not cut away that it may rise to be a tree, with slender and flexible branches, covered with a smooth thinn barke, like the *Hæll*, the young ones being of a greenish ash-colour on the North side, but that next the Sunne more pale, spotted with white spots: the leaves hereon are variable, which although they be all winged, yet some have but foure leaves on a side, some have five, sixe, seven, or eight, with an odde one at the end, each paire set opposite, and

Qqqqqq 2

like

1. *Acacia vera* sive *Spina Egyptiaca*.
The Egyptian Thorne or binding beane tree.

2. *Acacia Americana* *Farnesiana*.
The VV. Indian *Acacia* or binding beane tree.

like unto Lentilles, closing or foulding themselves upon the Sunne setting, and opening againe after the rising, having at the foote of every stalke two long thornes set, reddish at the first, and white after: the first flowers come forth in the beginning of *July*, after some few leaves have shot forth from the old wood, but not in any plenty, yet bring the fruite to ripenesse after: but in the beginning of *September* more plentifully, yet without any fruite following them: these flowers at the first are Greene, and like a small Strawberry, growing yellowish after, and whitish within two or three dayes like unto a pill, or small round ball, consisting of a flocky or woolly substance, many of them set together, and have many small threds in the middle with yellow tips, of a very sweete sent, like unto the sent of Wall flowers, which hold their sent long after they are dry: from the middle of the flower come forth divers cods, yet sometimes but one or two, or three, and sometimes more, Greene at the first, and blacke when they are ripe, like crooked round hornes, while they are Greene, of a very harsh and binding taste, but growing ripe they are lesse astringent and the huske more sharpe, and then doe somewhat resemble the cods of *Lupines*, but a little crooked, being halfe a foote long, and about an inch thicke, somewhat round and bunched out, where the feedes lye, which huske is very tough when it is dry, wherein are divers hard blacke feedes, like unto those of the sweete Beane or *Carob* tree, thrust thicke together without order, the wood hereof is hard and whitish, but blackest at the heart, without either sent or taste: this doth in many things agree with the former, but the greatest difference is in the huskes with feedes, this having many, and the other but three or foure at the most, The like hereunto *Lobel* mentioneth in his *Adversaria*, pag. 409, that he saw with Master *Morgan* Queene *Elizabeths* Apothecary.

3. *Acacia secunda* sive altera *Dioscoridis*. The true second *Acacia* of *Dioscorides*. This bush hath an upright stemme three cubits high or more, covered with a smooth sad Greene barke, the wood being soft and easie to breake, and not very thicke of long thornes, the leaves are small, standing three together upon the branches, the flowers are small and yellow, whose succeeding feede seated in small huskes, are round, hard, flat and yellowish, somewhat like to Broome seed: This shrub seemeth very like to the *Aspalathus secundus* of *Dioscorides*, but differeth notably therefrom, in that the *Aspalathus* is thicker set with greater whiter and sharper thornes, with fewer and smaller leaves, flowers, and feede vessels, and the wood thereof is hard, and not easie to be broken.

The Place and Time.

The first groweth in *Arabia* plentifully in many places, and mount *Sinai*, and in *Egypt* also, and flowreth and beareth fruite twice a yeare, whereby we may well say it beareth ever Greene leaves: the other came out of the West Indies, *Aldinus* saith his came from *Saint Domingo*, but from whence that which Master *Morgan* Queene *Elizabeth* her Apothecary had long agoe, as *Lobel* setteth it downe in *Adversaria*, is not knowne whether it came from thence or no, the feedes springing in *Cardinall Farnesim* his Garden in *Rome* as it is set forth by the said

said *Aldinus* in his description of some rare Indian plants growing therein, and flowered and bore fruit as it is expressed in the description. The last in *Candy* and *Gracia*, as *Pona* saith.

3. *Acacia secundula* seu altera *Discoridis*.
The true *Acacia* of *Discoridis*.

The Names.

Discorides calleth it in Greeke *ἀκασία*, and *Acacia* in Latine also, and *Theophrastus* *ἀκας* & *Spina* simply without any other adjective, whereof he maketh two sorts as I said, *alba* and *nigra*, the white being weaker and quickly rotting, the blacke being strong, fit to build houses, and ships, &c. *Alpinus* maketh them to be *mas* and *femina*, the male fuller of thornes and without fruit, the female having fewer and gentler thornes, and those within the branches, bearing plentifully. *Pliny* also calleth it *Spina Egyptia* in some places, distinguishing it from the *Arabica*, and in others confoundeth it with the *Spina Arabica*, which are much differing, this being a Thistle as it is shewed among them, and that a Thorny tree: Some have thought that the *Acanthus baccifera* of *Virgill*, mentioned in the second of his *Georgicks*, in these words *Quid tibi odorato referam sudantia ligno Balsamaque & baccas semper frondentis Acanthi*, should be this tree, as *Servius Grammaticus*, and *Christoferus Landus* both of them Commenters upon *Virgill* say; but without true judgement as *Guilandinus* noteth it, who would referre it to the *Acanthus Egyptia* of *Athanasius*; *Maranthia* referreth it to that kinde of *Ebenus*, whereof *Pliny*, lib. 12. c. 5. maketh mention, but there is as little certainty in this, as in the former, for concerning this it is not specified by *Pliny*, that it either beareth berries, or yet abideth ever greene, and for the former, this *Acacia* beareth not berries, such as no doubt *Virgill* meant: but it is most probable he intended, the *Pyracantha*, that we most usually call, for *Pliny* so called it also, and *Spina* as some have it, or *Spinus* lib. 15. c. 24. where he saith *Bacca Aquifolij & Spine sine succo*. But now concerning the juyce of *Acacia*, the true and not the substitute should be used in those two famous compositions, *Mithridatum*, and *Theriaca Andromachi*, and there is no doubt, but our Apothecaries might have sufficient of the true to use, and expunge the substitute, if they would bespeake the true to be brought, being made there in *Egypt*, where the tree groweth of the greene cods, which *Acacia* will be reddish, such as I have scene with Master *Boae* the Druggist, which is the best: or else made of the cods which will be blacke, for if the Apothecaries would themselves extract the juyce out of them, and condense it *secundum artem*, they might have enough of the cods brought them for that use. *Lobel* mentioning the *Acacia*, in the place before recited, saith that *Sequinus Martinellus*, a Physician and Apothecary of *Venice* sent his brother *Albertus*, divers sakes full of these cods, whereof some was reduced into juyce, and some of the seedes were planted and grew into trees, as *Lobel* there mentioneth. The hardned juyce likewise is called *Acacia*: some have called it *Spina Christi*, thinking that *Christis* Crowne was made of the boughes of this tree, but it is more probable it was made of the *Palurus*, it is now generally through all *Turkie* called *Acacia*, and so likewise of the *Egyptians*, as *Alpinus* saith, and *Sant* also: *Ranwolffius* saith that the *Arabians* at *Halepp*, call it *Scamuth*, and *Schacke*. The Gumme that cometh out of the tree, whether voluntary or by incision is called *Gummi Arabicum*, although divers doe doubt that the gumme that beareth that name, is not the gum of this tree but some other, yet it is assured to be right by *Alpinus*, *Belonius*, and others, yet there is a small sort of gumme likewise brought to us, of the like whitenesse and clearenesse with the other, but is *Vermiculosum*, in small crooked peeces like unto short thicke wormes. The second is called by *Aldinus* *Acacia Indica Foruesiana*, who hath made a long comparison betweene it and the former *Egyptian*. The last is remembered by *Pona* in his *Italian Baldus*.

The Vertues.

The hardned juyce extracted by decoction out of the cods of this tree, and called *Acacia* as I said, with the gumme thereof are the most especial parts thereof we know are used. yet the juyce of the leaves and the rest worketh like them. but farre weaker: the juyce being used in all such diseases as neede binding, cooling, and strengthening, and staying vomiting, used inwardly or outwardly: and is available in the defluxions of hot humours into the eyes to stay them, and the abundance of womens courses, with the falling downe of the palate, and of the fundament, and the flux of the belly, and the spitting of blood, and all bleedings, it resisteth also creeping ulcers, *Saint Antonies* fire in the beginning and helpeth the ulcers of the mouth, and secret parts, kibes, and chilblases, and the growing of flesh over the nailes, and to fasten loose teeth, and the fluxe of humours to the joynts, that weakeneth them, and when they have bene bruised or put out of their place: the same also made into a decoction and the haire rubbed or washed with it, maketh it blacke, and is much commended to those that have the gout: the gum hath a property of thickening and cooling, and to repress and coole the heate, and sharpenesse of humours, and to binde or close up the open passages of the skinn, and keepeth the places from blistering that

Qq9999 3

that are burnt with fire, being used with the white of an egge: it serveh also for Limmets to fasten their colours for Dyets also in their Dying, for inke, and many other externall civill uses.

CHAP. C I.

Arbores alie spinose & filiquose Indice. Certaine other thorny Indian trees, bearing cods.

Have certaine Indian Thorny trees to bring to your consideration that beare cods, whereof some have beene entitled *Acacia*, but I call *Pseudoacacia*: Another very like thereunto, called by our Colony in *Virginia*, *Locus*: whereunto I have adjoyned a third which hath growne with us, and a fourth called the *Corall tree*, and because they are differing much from those in the former Chapter, I have thought it fit to make a Chapter of them peculiarly.

1. *Pseudoacacia Americana Robini.* *Robinus* his false *Acacia* of *America*.

Because *Jacobus Cornutus* in his Booke of *Canada* plants, hath entituled this tree *Acacia*, although with little judgement; I have given it a place with another *Virginia* like it, but not with the true ones as is most fit. The body (saith he) is smooth, covered with a comely smooth blackish barke, without any thornes thereon at all, spreading the armes and branches very farre, which while they are young are pichy within, beset with many cruel sharpe thornes, flat at the bottome, ending in a small sharpe point: the leaves are many set on both sides of a middle ribbe, from seven or eight, to tenne or more on a side, and an odde one at the end, each leafe foulding it selfe double every evening upon Sunne setting, and opening againe upon the rising: the flowers are white, somewhat like Pease blossomes, or those of *Cytisus* Tree Trefoile, many set together on a stalke, standing upright and not hanging downe, the wing themselves in *August*, after which follow hard rough prickly pods, but I and others had from *Robinus* such smooth pods as is expressed in the figure, under the other, in each whereof was enclosed one or two small browne Lentill-like feedes. By this description you may plainly see how much it differeth both from the true *Acacia* of *Dioscorides*, and the other *American* of *Aldinus*, having nothing therein but thornes answerable; and therefore in my judgement it doth better agree with some *Spartum spinosum*, then *Acacia*, but that it is a tree.

2. *Arbor filiquosa Virginensis spinosa, Locus nostratibus dicta.* The *Virginian Locus* tree,

A very like tree hereunto hath beene sent and brought us out of *Virginia*, growing to be a very great tree, and of an exceeding height with Master *Tradescant*, whose body is covered with a smooth barke, the young branches being Greene, and set with somewhat sharpe prickles at every joynt, where the winged leaves come forth,

1. *Pseudoacacia Americana Robini.*
Robinus his false *Acacia* of *America*.

2. *Arbor filiquosa Virginensis spinosa Locus nostratibus dicta.*
The *Virginian Locus* tree.

which

3. *Arbor spinosa Indica muricata filiquis.*
The prickly coddled Indian tree.

4. *Siliquosa ex spinosa trifolium Indica arbor dista.*
The Indian Corall tree.

which are set in the like manner with the other, with an odde one at the end, and some not, but are somewhat shorter and rounder: we have not seene the tree to beare any flowers with us as yet nor fruite, but the cods that came to us, were small, long, and somewhat flat like unto the pods of *Laburnum* Beane, close, but longer thinner and blacker, containing small grayish shining flat and round seee.

3. *Arbor spinosa Indica muricata filiquis.* The prickly coddled Indian tree.

The seee taken out of the prickly huskes of a tree that was brought from the West indies, was sowne by Master *George Willmer* at *Stratford Bow*, and rose up that yeare to be three or foure foote high, branched forth on all sides, and set with small sharpe crooked thornes, both on the maine steame and branches, having sundry winged leaves set on them, very much resembling the last *Virginian Locus*. I can give you no further relation hereof, in that the plant perished in the next Winter after the first springing, for want of such due keeping as was fit for such tender plants, that come out from warme Countries: The figure of the prickly huske or pod, you may see set on the side of the figure, with the grayish pefe taken thereout also, which was as hard as a stone, with a white kernell within them, yet not fit king in the water.

4. *Siliquosa ex spinosa trifolium Indica Coral arbor dista.* The Indian Corall tree.

Clusius first, and since him *Baptista Ferrarius* by the sight thereof, growing both at *Rome* and in *Spaine*, hath enlarged the description of this tree, which I will contract into one, and tell it you thus. It riseth up with many stemmes, whose younger barke is smooth and Greene, the elder paler and more rugged, spreading fairely with branches, armed with small crooked whitish thornes, and with faire broad fresh Greene and almost round leaves, like unto those of *Arbor Indica*, tree, but that they end in a point, whose footstalkes also as *Clusius* hath expressed, have the like crooked thornes on them, which leaves are three alwayes set together, the two lowest opposite on short footstalkes, the end one on a longer: the flowers are Pease fashion, or like those of *Phaseolus* the Kidney Beane, of an orient red colour like Corall, of which colour also are the Beanes or fruite in pods, like unto other *Phaseoli*: it is very tender to keepe, not abiding the least cold aire, for as *Clusius* setteth it downe *Sig-nior de Tonar*, the chieft Physician of *Sevill* in *Spaine* in his time, having two trees hereof growing, which by one Winters overtharpenesse had them both spoyled therewith. I have not altered the name hereof, whereby it is generally knowne, but if I might adopt one, as I thinke more fitting thereunto, I would entitle it *Phaseolus arboreus spinosus Indicus flore corallino*.

The Place and Time.

All these foure sorts came from the severall part of *America*, but we cannot tell you where distinctly, for the two last, but the first it is likely came from *Canada*, the French plantation, and the second from *Virginia*: The flowering and seeding is likely to be at the time of other trees at the Spring and Fall.

The

The Names.

The first as I said *Conutus* calleth *Acacia Americana*, such a glorious title doth he set upon so unbecoming a Plant, I have put *Robini* name thereto, because it is generally called *Acacia Robini*. The second is called *Locus* by our Nation resident in *Virginia*. The third came to us without name, but it is likely to be the *Bonduch Indiano*, of *Pona* in his *Italian Baldus*, which he referreth to *Clusius* his first strange fruite in the 30. Chapter of his second Booke of *Exotickes*, as also to the first in the 15. Chapter of his third Booke. The fourth was first set forth by *Clusius* in his Appendix to his History of Plants, sent him by *Tovar* out of *Spaine*, and enlargeth the description thereof, especially of the flowers in his second Appendix: *Baptista Ferrarius* in his *Flora*, or *deslorum cultura* setteth it forth bravely, but without flowers; as having not as then shewed them.

The Vertues.

None of these have beene tryed to what griepe or disease they are a remedy, but onely the third, which if it be *Pona* his *Bonduch*, as I am certainly perswaded it is, then he saith, these particulars are attributed unto it to ennobel it: The *Egyptians* in *Alexandria* account it the guardian of their children, in tying it about their neckes, to defend them from all evill chances; to preserve one from the venome of the Scorpion, to helpe the Megrime by taking some of the poulder into the nose, and the torture or writhing of the mouth, is available also against the falling sicknesse, by taking the quantity of two Pepper cornes at a time: the quantity of a Cich Pease taken in Wine helpeth the chollicke and the quartaine ague, is a remedy for any poyson, which saith he I have nor yet tryed: the fruite saith he was sent from *Constantinople*, and these Vertues affirmed to be in it, and there esteeme it of great worth.

CHAP. CII.

Gossipium. The Cotton tree or plant.

Have foure sorts of Cotton trees or plants to shew you that have come to our knowledge, or that we can be assured of, although *Bauhini* saith there is one with a white feede, which is his first, whereof I never heard or read, and is likely to be mistaken, for all those Authours that he doth cite for it, doe all intend the annuall Cotton, whose seed is in lumps, and blacke.

1. *Gossipium arboreum*. The tree of fine Cotton.

This Cotton riseth up with a woody steame, to be nine or ten cubits high, spreading woody branches, and many broad greene leaves on them, parted on the edges into three or five divisions, somewhat like a Vine leafe, but softer and whiter, at the ends of the smaller sprigges come forth the flowers, two or three at a place, but

1. *Gossipium arboreum*.
The tree of fine Cotton.

2. *Gossipium frutescens an. num.*
The bush or Lump Cotton.

3. *Gossipium indicum spinosum.*
Thorny Indian Cotton.

4. *Gossipium javanense longifolium.*
The long leaved Cotton tree of Java.

each upon a slender footstalk, set in a broad huske of two leaves, very much jagged at the toppes, and containing therein a large yellowish flower, somewhat like a bell flower, broad above and small at the bottome, parted to the bottome into five very thinne leaves, with a stiffe reddish middle pointell, compassed with five or six yellow threds, which is thrust of by the fruite, rising under it, and growing to bee a small round head or ball, covered with a hard skinne, which opening when it is ripe, sheweth forth a lumpe of pure white wooll, having divers small blackish feedes, of the bignes of Pepper cornes, but not so round, lying disperfedly through the lumpe, and singly but one in a place, with a sweet whitish kernell within them, the roote disperfeth under ground and abideth, not perishing nor losing the branches as the next doth.

2. *Gossipium frutescens annuum.* The bush of lumpe Cotton.

This Cotton is yearly sowne, even in the warmest Countreys of *Asia minor*, and within foure monethes or little more is gathered againe from the sowing, shooting an upright stemme, nothing so woody or great as the former, but brancheth forth divers wayes, set with large and broad soft leaves, like the former, and parted alike, the flowers also stand in the like manner, and yellow, with purple bottomes, with huskes of fine leaves under them, after which commeth the fruite like it, but set in a shorter, smaller, thicker, and harder rough blackish huske parted into three cells, with whitish hard shining skinny or woody partitions on the inside, containing each of them a round ball of fine white Cotton, with a lumpe or bunch of greater blacke feedes by the halfe, in the middle, sticking close together in two rowes, with white sweete kernells within them: The roote as I said is annuall, and perishing as soone as it hath perfected the feedes.

1. *Gossipium indicum spinosum.* Thorny Indian Cotton.

This kinde of Cotton hath a stemme about three cubits high, set with small prickles, and having many faire broad leaves set thereon upon long footstalkes, divided into seven parts, somewhat like those of *Stravisacre*, the flowers are like to Bell flowers with five corners, the Cotton is very fine, and the feedes are somewhat like the Thorny Mallow.

4. *Gossipium javanense longifolium.* The long leaved Cotton of Java.

This as *Clasius* relateth it from *Franciscus Roxarigues*, native of *Bengala*, groweth on a great high tree, with many farre spread armes and boughes, and stored with long and narrow leaves, neerer resembling Rosemary then Willow leaves, but that they are much longer, whose fruite was like a long pod of fixe inches long, and five in compasse, growing great from the stalke upwards, opening and ending in five pointed parts, whose skinny barke was of an ash colour, and rugged, but full of most pure white soft wooll, and divers blacke round feedes within, not involved with the Cotton like the rest, but growing by themselves upon fine long woody partitions, extended all the length of the cod: the wooll or Cotton was shorter then of the other, and not fit to be spunne into thred to make cloath, for the Natives use it not to that purpose, but put it to another use, namely to stufte cushions and the like, being softer then any wooll, cotton, or feathers.

The Place and Time.

The first groweth not naturall'y in all the lesser *Asia*, but as *Alpinus* and *Bellonius* and others say in the greater *Asia*, and *India*, and *Brassill* also, and *America*, and brought into *Egypt* and other Christian Countries, but as a rarity: The second hath for many yeares beene planted in the severall Countries of *Asia minor*, *Phrigia*, *Cilicia*, and other the parts thereabouts, and in *Apulia* also, and in many of the Isles in the *Mediterranean* Sea, and sowne not untill the end of *Aprill*, and gathered againe in the end of *August* or in *September*, the third came out of *India* like wife, and the last from about *Bantam* in *Lava*, the former sort ripening the fruitie somewhat more early then the other.

The Names.

It is called in Greeke *Σίσαμ* and *γασσάνιον*, and so likewise in Latine, *Xylum* and *Gossipium*, and of *Serapio Coto*, and *Bombax*, as it is so also called in the Apothecaries shoppes: Some doe thinke and that not without good ground of reason; that the *Byssus* of the Auncients, is this first Cotton, from whence was made the *Byssina tela*, the fine white Callico cloath, that cometh out of the East Indies: All Authours call them in generall *Xylum* or *Gossipium*, and the first *Gossipium arborum* by *Alpinus*, and by the *Egyptians* as he saith, *Gorne msegari*, it is more likely that *Bellonius* meant this tree by his *Arbor lanifera*, then that of *Clusius* in his Exotickes brought out of *Lava* and fittest for cushions, and *Gossipium perenne arborum sive Asiaticum*, and *Brasilianum* by others. The second is called *Gossipium herba*, to distinguish it from the former, *Bauhinus* calleth it *Gossipium frutescens semine albo*, for sure he can meane no other sort, citing those Authours that he doth, who all I think say it is black. The third is exant only in *Pona* his *Indianus Baldus* by the name of *Bombage Indiano*, that is *Gossipium Indicum*. *Bauhinus* calleth it *Gossipium arborum caule spinoso*, and saith the seede is in lumps like the ordinary sort, when as *Pona* himselfe saith it is like the seede of *Subarise*, that is, the thorny Mallow, and pictureth the seede like thereunto, at the side of the figure, and is not like the lumpe sort. The last *Clusius* mentioneth in the foureteenth Chapter of his first Booke of Exotickes, calling it *Arbor lanifera peregrina*. *Bauhinus* that he might say somewhat, referreth it to the *Cylis* of *Ovidius*, and questioneth whether it be not *Bellonius* his *Lanigera arbor*, calling it himselfe *Gossipium lavanense salicis folio*. The Arabian *Serapio* as you heard, calleth it *Coto*, and *Bombax*, and others *Algodon*, as the Spaniards doe; the Italians *Bombaxia*, the French *Cotone*, the Germans *Baumwool*, the Dutch and we *Cotton*, and *Cotton* will.

The Vertues.

The kernells of the seedes is used to lenefie the hoarsenesse of the throat, and to helpe those that are shortwinded, to open the passage, and for those that have sharpe distillations on their lungs, and for coughes, to make the slegme the easier to be expectorated, and encrease the sperme also: it is used also in gripings, and gnawings of the stomacke, yea though they come by poyson, and are good also in all hot agues, the Cotton it selfe is hot and dry, and being burned blancheth bleedings in wounds wonderfully: the oyle drawne out of the seed doth smooth the skin, and taketh away spots and blemishes therein.

CHAP. CIII.

Arbor Indæ. Indus tree.

Arbor Indæ. Indus tree:

Five the *Indus* tree there hath beene observed two sorts, one with crimson, and the other with white flowers.

1. *Arbor Indæ flore purpureo*.*Indus* tree with crimson flowers.

This *Indus* tree riseth up sometimes to be high, and of a good size, and sometimes to be but as an hedge bush spreading armes and branches, covered with a blackish red barke, the leaves that come forth upon the young reddish branches one at a place, are large and round, greater, but thinner then the leaves of *Alarabacca*, of a whitish Greene colour on the upper side, and grayish underneath, falling away in Autumne: the flowers grow not at the ends of the branches, but at the joynts, and sometimes out of the very body, many standing together upon a long footstalk, of fashion somewhat like unto Pease blossomes, of an excellent deepe crimson colour, after which follow sundry long flat and large thinne cods, of a reddish browne colour, with flat blackish browne hard seede within them: the roote groweth deepe and spreadeth farre.

Of this sort there is one growing in *Virginia*, not differing from it in any thing, that I can as yet perceive.

2. *Arbor Indæ flore albo*.*Indus* tree with white flowers.

This other groweth as great as the former, but with a whiter barke, and the branches Greene, the leaves and flowers are like for forme, but of a white colour, and the cods after them; nothing so browne as in the former, and the seed likewise paler.

The Place and Time.

These kinds grow in *Narbone* and *Provence* in *France*, and in *Spain* and *Italy* in many places: the flowers generally appeare before the leaves breake forth, yet bringeth not the cods to maturity in our Country, yet we have had them growne large and very reddish, but contained not any ripe seed within them.

The Names.

It is not certainly knowne that either *Diocorides* or *Theophrastus*, have made mention of this tree in all their Workes, for although some have taken it to be that *Colytea* of *Theophrastus*, which he mentioneth in his third Booke and foureteenth Chapter, but unto this he attributeth a leafe like unto Willow, which this is utterly unlike, others againe, that is, those of *Mompelier* as *Clusius* saith, unto that *Colytea* of *Ida*, that *Theophrastus* mentioneth in the seventeenth Chapter of the said third Booke, whereunto he attributeth the leafe of the larger leaved Bay tree, but larger, rounder, and somewhat like the Elme leafe, yet somewhat long with all, Greene above and whitish underneath, and whereunto saith *Clusius*, he in the foureteenth Chapter of the said third Booke attributeth cods, the descriptions of both which saith he, being contracted into one, agree well unto this *Arbor Inde*: but by *Clusius* his leafe, this cannot hang together; for although they in both those Chapters, that is, the 14 and 17, are called *Colytea*; yet they are plainly distinguished by *Theophrastus* both in their leaves, the one like a Willow, the other like a Bay leafe, but rounder; and also in their fruite, that with the Willow leafe hath cods saith *Theophrastus* like unto Pulses: but that with broad Bay leaves, hath a *Chachrys* or *Amentum* as *Gaza* translateth it, and is said to be without flower or fruite, and besides hath yellow rootes: so that you may see plainly both those cannot be contracted to make one plant, their leaves being declared to be so divers: Some therefore will referre this tree unto the *Cercis* *Theophrasti* mentioned in two places, the one in the said foureteenth Chapter of his third Booke, where he saith it is like the white Poplar tree, both in greatnesse and whitenesse of branches, with the leafe of Ivy, &c. which *Clusius* thinketh is but an ample description of the third kinde of Poplar called *Lybica* the Aspen tree (which *Gaza* translated *Alpina*) the other place is in the first Booke and 18 Chapter, where he reckoneth *Cercis* to be one of those trees that beareth fruite or seedes in cods, as *Colytea* of *Lipara* doth, so that you see in this *Clusius* was also mistaken, as *Matthiolum* was also before him: but indeed this description of *Cercis* cometh nearest unto this *Arbor Inde*, of any other tree that hath bene likened unto it. Some have called this tree in Latine *Fabago*, from the likeness of the cods unto Beane cods, and some to be *Laburnum* or some kinde thereof; but the most currant name is *Arbor Inde*, yet *Clusius* calleth it *Siligna sylvestris*, nor as he saith, because it doth agree with the *Siligna* of the Auncients, but because the Spaniards called it *Algarovo Loco* which is as much as *Siligna fatua*, and those of *Castile* *Arbold amor*, the French call it *Gnainier* because the cods are like knife sheathes, we have no other English name to call it by, then *Indas* tree, untill some other can impose a more apt for it. It is judged by many that *Matthiolum* his first *Acacia*, in his former editions, was but a counterfeited figure of this *Arbor Inde*, whereunto he caused thornes to be put to make it seeme the more probable.

The Vertues.

There is no remembrance of any Physicall property appropriate hereunto either by ancient or moderne Writers, nor hath any later experience found out any: but from *Virginia*, we heare they account the flowers to be an excellent saliat ingredient.

CHAP. CIV.

Vitis. The Vine.

Here is a wondrous great variety of Vines that are manured, as I have shewed else where in my former Booke, some there are that grow wild, which shall be declared in this Chapter, with a recitall of some of the choyest of the other.

1. *Vitis Vinifera*. The manured Vine:

The manured Vine in places where it hath stood long, hath a great stemm as bigge as ones arme sleeve and all, spreading without end or measure if it be suffered, many slender weake branches, that must be sustained from falling downe, the young being red, and the old of a darke colour, with a pith in the middle, at the sundry joynts whereof, grow severall large broad Greene leaves, cut into five divisions and dented also about the edges, at the joynts likewise against the leaves come forth long twining tendrels, clasping or winding about whatsoever it may take hold of: at the bottomes of the leaves, come forth clusters of small greenish yellow flowers, and after them berries, thicke set together in bunches of severall formes, greatnesse, colour and taste, in some the clusters are close, and others are more open, and some being round, others more long, and some tending to a square; some likewise are very small, as the Curran Grape, others great, and some a meane betwene both: some againe are white, others blacke, or blewish, or red, or parti-coloured, and for tastes, they are so variable that I cannot describe them, both sweete according to the severall climates they grow in, and lower or harsh, or mixt, more or lesse pleasant one then another, within which there are usually one two or three kernels: They that keepe their Vines in the best manner doe keepe them low, and cut them off ten, both Winter and Summer, whereby they grow the better, and take up lesse room, bringing their Grapes both fairer and sweeter.

2. *Vitis laciniatifolys*. The Parsly Vine or Grape with thin cut leaves.

This also groweth as other Vines doe, the difference chiefly consisting in the leaves, which are very much incised or cut into many parts, even almost to the middle, and dented, the Grapes which are white and great, are like unto the white Mulcadine Grape, and of as good a relish, bearing great bunches, and ripening with the middle sort of Grapes.

3. *Labrusca sive Vitis sylvestris Europea*. The wild Vine of Europe.

The wild Vine in regard it is natural, and therefore neglected, lyeth for the most part on the ground, and therefore is made lesse fruitfull, unless it meete with some hedge or tree, whereon it may cline, and then spreadeth as the

1. *Vitis Vinifera*.
The manured Vine.

Vitis Laciniatis folijs.
The Partly Vine or Grape.

the manured, being both in branches, leaves, and tendrels, like unto the manured Vine, as also in blossomes, but beareth either little or no fruit, or seldome comming to ripeness, and what it doth is small and blacke, and no way comparable unto any of the manured Vines, being rather binding and fower then sweete.

4. *Vitis sylvestris Virginiana*. The wild Vine of Virginia.

This one sort of the Vines of Virginia, like all other wild sorts runneth on the ground, and taketh hold of whatsoever it meeteth with, being in all things like the former wild sorts, but that the Grapes are small and white, and with little sappe or juyce in them, and the kernell twice as bigge as others. There is another sort that hath bigger blew Grapes, and fower in ralle. A third they call the Foxe Grape, and hath a more rugged barke, a very broad leafe, without any division almost but dented, and the Grape is white, but smelleth and tasteth like unto a Foxe.

5. *Vitis sylvestris trifolia Canadensis*. The wild Vine of Canada.

This wilde Vine of Canada groweth like unto other the wilde Vines of those parts with slender reddish branches, climbing where it can get whereon; but the leaves on them being little more then halfe so large as the manured Vine, hath onely three partitions in every leafe, but each cut in deepe, even to the long smooth stalke, whereon they stand, making them seeme as three leaves, which are of a darke greene colour, and somewhat thicke also: the fruit is like the other wild sorts, having more skinne and kernell then substance or juyce.

The Chiefest Grapes are these:

The Damasco white Grape, which is the true *Vitis Zibeba*, that the Apothecaries should use in sundry of their compositions.

The Muscadine Grape both white and red.

The Frontignacke or Muske Grape.

The partly coloured Grape.

The Raisin of the Sun Grape.

The Curran Grape is the small blew Currans that the Grocers sell, and have no kernells, whereof there is another sort that beareth red berries, almost as small but not so sweet, or rather a little tarter.

The small carely blacke Grape.

The blacke Grape of Orleans.

There is a Grape without stones growing in sundry places, as by the River Sorek neere Ascalon in Palestina, giving a red wine, as also in divers places of Arabia, &c. and in the Madras, &c.

There is reported also to be one that beareth greene leaves continually, yet yeeldeth fruit but at the time that others doe.

There is said likewise to be some that beare twice in a yeare, and some oftener, having both ripe and greene fruit together at one time upon the tree.

The Place and Time.

The manured kindes are planted every where, and according to the soile and climate is both the relifh and strength of every sort, for the Vine that groweth in the Canary Islands, is the same with that at Malaga and Sheria, and yet the one still excelleth the other in strength and sweetnesse. The other wild sorts are all expressed in their titles: the first wild sort in sundry places of Europe, both Italy, France and Germany. The wild sorts flower somewhat later then the tame or manured, and therefore what fruite they beare, must likewise be later ripe then others.

The Names.

The manured Vine is called in Greeke *αμπέλ* *amphēl*, and in Latine *Vitis Vinifera*, and *sativa* or *cultā*: the wilde is called *ἀγρία* *agria*, and in Latine *Vitis sylvestris*: *Vitis a vino, vel quia invitetur ad vineam dicitur*, but there is another *Vitis sylvestris* of the Grecians, that is the *Clematis virens* of the Latines by some, and the *Amaradiscus* by others, when as this is called *Labrusca*, to cause it to be knowne asunder: the juyce of the unripe Grapes of the manured Vine, or rather of the Grapes of the wilde Vine, which come not to ripenesse are called *omphacium* in Greeke *Omphacium*, and *Agrēta* in Latine, in English Varjuyce: The Grapes when they are dried in the Sunne are called *Uva passa*, and *Passula solis* Raisins: the juyce or liquour pressed out of the ripe Grapes is called *Vinum* wine: the kernels are called *præputia acini*, the dregs or settling of the Wine, are called *Vinifeces*, Wine lees while they are moist, but being dyed is called *Tartarum*, *Tartar* or *Argell*, the distilled Wine is called *Spiritus vini*, or *Aqua vite*, the spirit of Wine or *Aqua vita*. In the wild Vine the flowers are called *ἀνθή*, and *Oenanthe*, that is *Viniflos* in Latine, which was of much use in former times, but now is wholly neglected. The Arabians call the Vine *Harin*, *Karin* or *Karni*, the Italians *Vite vinifera*, the Spaniards *Vida* and *Parra*. The French *Vigne*, the Germans *Wein*, the Dutch *Wijn* gaert oft *Wijnstake*.

The Vertues.

The Vine hath in it divers differing and contrary properties, some cold, some hot, some sweete, some sower, some milde and some sharpe, and some moistening, and others drying: for the leaves and young branches are cooling and binding, and good to be put into lotions for sore mouthes, or other parts, and in drinckes against fevers: being bruised, and with Barley meale applied to the temples easeth the head ache comming by heate; and applied to the stomacke, easeth the inflammations; and heat thereof: the juyce of them being drunke stayeth the laske, castings, spittings of blood, and womens immoderate longings. The ashes of the burnt branches, or pressing, made into a lye and drunke, is very effectuell for the stone and gravell in the kidneies: being mixed with a little vinegar, it consumeth the warts of the fundament, and the inflammation thereof being bathed therewith, it doth marvellously ease the paines, and taketh away the swelling. The said lye of Vine ashes, is good to wash places out of joynt, or burnt with fire, and used with Rue and vinegar, is good for the swelling of the spleene: and used with wine, it helpeth Saint *Anthony's* fire: the said lye also helpeth frettings and gallings in any place: the ashes made up with *axungia*, is good against hard tumours, clenseth fistulacs, and hollow ulcers, and healeth them up afterwards, helpeth the paines and shrinking of the sinewes, and being mixed with oyle easeth those places that are bruised by falls or otherwise, and cureth the bitings of Scorpions, and dogges: used with vinegar and niter, it wasteth away Wens and other excreffences in the flesh. The water that droppeth from the Vine, when it is cut out of due time, being drunke helpeth to expell and wash downe the gravell and stone in the kidneies. The Gum that issueth out of it selfe sticking to the barke, being drunke in wine doth the same, (but that we seldom see any such in our country, and therefore may safely use the water in the stead thereof) and being bathed on the skinne taketh away scabbes, tetters, the morphew, and the leprous scurfe, if the places be first washed with niter: The said Gumme or the water that droppeth from the Greene branches, when they are burned, being used with a little oyle taketh away haire and warts. The fresh Grapes being eaten, doe breede a little windinesse (which is incident unto all sorts of raw fruite) but stirre up the appetite, and are pleasant to the stomacke, helping to stay spittings of blood, but affect the head and the bladder: and are forbidden in agues: being hung up and dried a little, or made into Raisins, they doe helpe to loosen the belly, especially if they be taken without the kernells, which are more drying and binding, to be taken in powder of themselves then any other part of the Vine: Those which are called Raisins of the Sunne are the best for this purpose with us, and for any other use in Physicke: and herewith are made Tisane drinckes, to helpe coughes, hoarsenesse of the throate, shortnesse of winde, toughnesse of flegme, causing it the more easily to be expectorate, and doe lenefie sharpe and nauoseous humours, that offend the mouth of the stomacke: they serve likewise to open the obstructions of the liver, spleene and bladder, and taken by themselves they nourish much, by reason of their thicke sweete and temperate substance, whereby also they stay not long nor pruritis in the stomacke. The small Raisins or Currans are very nourishing likewise, and somewhat opening the belly, especially being stewed with some other things conducing therunto, as with a decoction of Sema, Rubarbe, and other such like things, according as occasion shall neede: The Damasco Raisins have a little tartnesse in them, whereby they are most grateful to the stomacke, and excellen the Raisins of the Sunne for all the purposes aforesaid. The juyce of the Grape is of two sorts, that is, made of unripe Grapes which is called Varjuyce, or of the ripe Grapes called Wine: The Varjuyce is a fine tart liquour fit to be used in brothes, meats, or lawces, to sharpen the stomacke, to get an appetite, and to refresh and quicken fainting spirits: Of this juyce is made a syrupe of especial use in the like causes: the Wine is of so many sundry sorts, as not onely the Grapes, but the severall climates and soyles wherein they grow are. The weake Wines are very rheumaticke, and clenfe much: the strong wines are very heady, and enflame the blood very much: those of a middle temper are most proper for our bodies (who use not willingly or ordinarily, to allay or temper our wine with water, unless the Vintner doe it without our knowledge or consent) and most wholesome for our health, and most in use for Physicke, both to boyle in drinckes, and to serve as the *Fibiculum*, to extract the Vertues of whatsoever shall be steeped in it, And is distributed into many parts, for of it is made both *Sapa* and *Defreyum*, in English Cure, that is to say, boyled wine, and both made of *Mustum*, new Wine, the later boyled to the halfe, the former to the third part. Then there is *Lora* which is a small kind of wine, like our small beere, by putting water to the pressings, and pressing them over againe, but because we have no use of such with us, I forbear to speake further of it, *Acetum*, Vinegar, that is, lowre wine, which is as the other ingenij non naturæ opus, as Pliny speaketh of the former, for it is made by setting in the Sunne, which exlia-

ling the purer spirits, and by the heate cauterth the other to grow acide, and is of great use, both in health and sicknesse, both in meate and medicine: but now adayes we have such a bastardizing, and falsification thereof, that we scarce can get any right to use. The *Sapa* and *Defrutum* differing but onely in the manner of boyling, I may comprehend them both under *Chute*, and was devised to serve instead of hony, as *Pliny* saith, it helpeth the cough and shortnesse of breath, and to expectorate tough flegme from the chest and lunges, it also easily passeth through the belly, and maketh it soluble, Vinegar contrariwise is cooling and drying, as the *Chute* is heating and moistening, and therefore serveth to correct the heate in feavers, and to resist putrefaction, it cureth tough flegme, that is hard baked, and not easily brought up and spit forth: it is sharpe and penetrating, and very useful in scabbies, itches, tetters, ringwormes, and fretting and creeping ulcers, to correct their malignity, and extirpate their corroding quality, but is offensive to the sinewes, by its piercing and drying property, causing them to shrinke. But the distilled vinegar is of a more fiery and penetrating quality, which it gaineth by the distillation thereof, the manner and order in this being quite differing from the distilling of Wine, wherein the purest and strongest spirits doe first rise and come forth, when as in vinegar almost two third parts are taken from it, which are the weakest, before the last and strongest riseth, but not the last which is the *Empyreuma*, and serveth even as the vinegar it selfe doth, but with more force, and as the *Vehicle*, wherein the tincture and spirits of simple medicines are reserved: But to speake of Wine, from whence all these are made and derived, is to enter upon a little sea of matter: for to shew you all the severall colours, sents, strengths, ages, and talles of simple wines, were too tedious and needlesse also, and so is it likewise to shew you all the sorts of compound or artificiall wines which are as infinite as the herbes, rootes, seedes, or other parts of them are, and take their names from the severall ingredients that compound them, as for example Wormewood wine, Eyebright wine, Scammoniate wine or wine of *Squiller* & so in infinitum, as I may to say, each whereof hath the property of that herbe, roote, &c. that was put into it, while it was Must, that so they might worke together, but simple Wine being not made with us, these artificiall Wines are not in use with us, yet might be paralleled almost, if the things were put into our new Ale, or Beere, to worke in them, as wee use to doe with our dyet Beere. Yet other sorts of compounded Wines might be made for sundry physcail uses, after the manner of our Hipocras wine, which is according to the spices put thereinto, cordiall and comfortable, &c. Metheglin is a *Welsb* (strange) drinke, not made of Wine, and therefore I would not reckon it among these Wines, being fit for some stout *Welsb* stomacks that affect it. The receipts of many whereof are extant in *Labels Appendix* to his *Adversaria*, whereunto I referre you. I will therefore touch onely the particular properties of wine it selfe, both as it is medicinable and nourishing, for taken moderately, and by them that are of a middle age, or well steeped in yeares, or are of a cold and dry disposition, and (not very young, and so their blood too hot for to abide Wine) it encreaseth blood and nourisheth much: it procureth an appetite, and helpeth to digest being taken at meate, it provoketh urine and driveth forth raw humours thereby, strengtheneth the vitall spirits, and procureth a good colour in those that want it, or are macilent, drawing to a consumption, so as it be not accompanied with a fever, it expelleth feares, cares, and heaviness, and breedeth alacrity, mirth, and bodily pleasure, and by the moist warme vapours, causeth quiet rest and sleepe, both to the sound and sicke that lacke it; it likewise comforteth and warmeth all the cold infirmities of the stomacke, liver, spleene, and wombe, and helpeth windy swellings in the body, and generall evill dispositions thereof, the Greene sicknesse, and the dropsie, and the overtravelled, over wearyed body and minde, it is also the remedy against Hemlocke, Coriander, Poppy, and Opium, Wolfcane, Muskaromes; and Mandrake, or whatsoever cold poyson or dangerous herbe, or roote is taken; These be the effects of the moderate drinking of Wine: when as on the contrary side, the excessse thereof breedeth a distraction in the senses, the Apoplexie, and Lethargy or drowlie evill, the trembling of the joynts, the palseie and the dropsie, but is used to heale up old ulcers, and sores, no other moisture being admitted in the cure. The spirit of Wine and *aqua vite*, were of so neere affinity in former times one unto another, that there was no more difference betwene them then betwene the stronger and the milder Wine, for *Aqua vite* being made wholly of Wine, with the addition of spices made the spirits to be the stronger, and the wine simply without spices to be the milder; but now there being not one droppe of Wine in the *Aqua vite*, is wholly distilled from the tilts or dregges of Ale or Beere, being their low Wines as it is called, and after distilled againe with a few Annefeedes, or as some doe with a little Ginny Pepper, to make it the stronger without any other spice, cometh farre short of those auncient receites for the making of that which was good and wholesome: to tell you therefore the effect of our *Aqua vite*, were not to tell any part of the nature or quality of wine, but of Barley and Hoppes, which make Ale and Beere, I will therefore shew you the properties of the spirit of Wine, which if you will transference to *Aqua vite* you may, but to farre weaker effects: for hereby shall you know the goodnesse and strength by setting it on fire, with a paper lighted, the pure spirits burning fiercely, and will almost be wholly consumed: the other burning but little, and leaving an insipide and much watery part behind it: the purer therefore that it is, the stronger it is, and the lesser of it to be taken at a time, and that not of it selfe, but in some Wine or other liquour, for feare of inflaming the blood and spirits, and chiefly upon symptoms and passions of the heart: and then taken with respect and good consideration, it worketh much more effectually then the Wine it selfe doth, to all the purposes aforesaid, in comforting and nourishing the naturall heate in elder persons, giveth strength and quicknesse to the senses, and nerves, repaireth memory, and the cold and moist diseases of the braine, helpeth the fainting and trembling of the heart, warmeth a cold and moist stomacke, helpeth digestion, expelleth winde from the sides and belly, and all cold poysons: being outwardly applied to the temples, it easeeth the paines in the head, and cold distillations, and the toothach, being gargled a little, and cicatrileth all sores, yet respect must be had, that it be not given where any fever is, or where the disease proceedeth of heate, or is necessary thereunto, for feare of hardning the liver and spleene, and making chollerick persons the more enflamed: These spirits of Wine, as well as the Wine it selfe, serves as a *Vehicle* or menstrue, to draw out the tincture of divers things. And now lastly to speake of the Lees of Wine, which being hardned is called *Tartarum*, *Tartar* or *Argoll*, and that which is taken from the whitest Wines is accounted the principall best for any medicine: but the red sort serveth Goldsmiths and others, to polish their silver, and Dyers in setting their dyes: the best white *Tartar* is either given of it selfe simply being made into poulder and taken, the quantity of a dramme at a time in some convenient drinke or broth, for some time together in dropies or evill dispositions of the body, to expell both by urine and siege, those wheyish

whyeish watery humours thereof, and applyed to womens breasts that are over full of milke, doth dry them up, but the *Cremor Tartari* which is the purer part thereof, and especially if it be made as cleare as Cristall, (the highest worke of art in that kinde) doth worke more safely and more effectually then the *Crude Tartar* can doe: but this *Tartar* that is calcined untill it be white, hath then put of all purging quality, and hath gained a cansticke burning property, that will corrhode and eate away scabbed nailes and warts, and soone be brought into a salt, and will also soone be resolved into an oyle or liquour, if it be either laid upon a stone, or hung up in a linnen bagge, in a moist feller to be received as it droppeth downe, and is the most admirable *opifex* in Alchimy that ever was knowne, and not to be paralleld with any other thing, that I know: but to shew the operation of it in severall medicines by precipitation or otherwise, is not for this Worke, it must be sought out of those professed Authours of the *Spagyricke* Art, to whom I must referre you: There is another kinde of oyle of *Tartar*, of a farre milder temper and is more like unto a cleare water, which is very effectuell to cleanse the skinne from all manner of spots, fearres, morpew, or discolourings whatsoever, and maketh it smooth and amiable, and where there is cause to apply it, will helpe to bring on haire on the places decayed. The wild Vines are in property no lesse cooling, but more binding then the branches of the manured, staying the laske and spitting of blood, provoking urine, and pleasing to an hot stomack, or that loatheth meat: the leaves hercof are as good for loriens, as of the other for fores in the mouth the privy parts and the fundament; the ashes of the branches are likewise used to cleare the eyesight of filmes, and what else may offend them, to cleanse fores and ulcers, and to take away the over growing skinnings of the nailes of the hands or toes.

Labrusca.
The wild
Vine.

CHAP. CV.

Berberis. The Barbary bush or tree.

THe Barbary bush shooteth forth many slender stemmes or stalkes from the roote, sometimes to a great height, covered with a smooth whitish rinde or barke, and yellow next the Wood, which is white easie to breake, and pithy in the middle, set full of sharpe small white thornes, and three at every leafe almost, which are somewhat small and long, finely dented about the edges, and of a fresh greene colour: the flowers come forth at the joynts with the leaves, many standing on a long cluster, yellow while they are fresh, which turne into small long and round berryes, hanging downe in long bunches, upon a small stalk white at the first, but very red when they are through ripe, of a sharpe sowre taste, able to set their teeth on edge that shall eate them, the roote is yellow and spreading.

There is another sort, whose berryes are thicke so bigge as the former, not differing in any other thing.

There is another also, whose berryes for the most part are without any stones or kernels in them, or but here and there some.

Fruita major.
Abusque arbor.

Berberis. The Barbary bush or tree.

The Place and Time,

It groweth in many of the woods in *Austria*, *Hungaria*, and in *France* also, the blossomes come forth in *May*, and the fruite is ripe in *September*, and *October*.

The Names.

It hath formerly beene held by very good and learned Authours, that this bush is the *Oxyacantha* of *Dioscorides*, and hath continued to this day, especially among the Apothecaries, yet *Cordus* accounted it an error, and therefore would rather call it the *Oxyacanthos* of *Galen*, then the *Oxyacantha* of *Dioscorides*, and so doth *Camerarius* also, but we have shewed elsewhere what the true *Oxyacantha* of *Dioscorides* is, even the *Pyracantha* which hath ever greene leaves, and red friable berryes, neither of which can agree with this Barbary bush. Others againe have taken it to be the *Spina appendix Plumij*, but *Clusius* hath shewed the unlikeliness of that opinion. *Matthiolus* and *Cesalpinius* call it *Crespinus*, because the vulgar *Italians* doe call it *Crespino*, and some thereafter in *Latine* *Vuarespina*, which some attribute to the Gooseberry, but many others doe call it *Berberis*, and to the generall vore goeth now adays. The *French* call it *Espine vinette*, the *Germanes* *Erbfel*, *Sawracke*, and *Fering* the *Dutch* *Sawerboom*, and we in *English* *Barberryes*.

The Vertues.

The leaves of *Barberries* make a fine tart savise like unto those of *Sorrell*, and serve to coole and refresh a fainting hot stomacke and liver, and repressing sowre belchings of choller, and is therefore good for aguish people: but the fruite is much more cooling and binding, quenching thirst, and restraining chollericke and pestilentiall vapours, and is of very good use in either

of the agues of that nature, if the conserve or the depurate juyce, or the syrupe thereof be taken with the syrupe of Violets: the said juyce also or the beryes themselves preserved, is often used for those that loath their meate, to procure an appetite, and repress the force of cholier, rising from the liver thereinto, and that which passeth into the bowells procuring sharpe laskes: it helpeth likewise to stay womens immoderate courses, and if it be taken with a little Southernwood water, and sugar, it killeth the wormes in the body: it is good also for those that spit blood, and to fasten loose teeth, strengthen the gummies, and coole the inflammations of the palate and throat, and stayeth rheumes and desillations upon those parts: it helpeth likewise to dry up moist ulcers, and to foder up greene wounds: the said depurate juyce called wine of Barberyes, serveth to dissolve many things chymically: the inner yellow barke of the body, branches or roote is with good successe given to those that have the yellow jaundise being boyled and drunke. *Clausius* setteth downe a secret that he had of a friend, which is, that if the yellow barke were laid in sleepe in white wine for the space of three houres, and afterwards drunke, it would purge one very wonderfully.

CHAP. CVI.

Uvacrispa five *Grossularia*. Gooseberries.

Here are sundry sorts of Gooseberries, chiefly varying in the fruite, some being larger or smaller then others, some red some greene or yellow, some blew, some round, some long and some smooth, and some hairy or prickely, which although I have shewed them elsewhere, yet it shall not be amisse, to remember them here againe.

1. *Grossularia vulgaris*. The common Gooseberry.

The common Gooseberry bush seldom riseth up to the height of a man, with a stemme as big as ones thumb, or more, at the lower part, covered with a smooth darke coloured barke, cleere of thornes thereon, and so likewise for the most part on the elder branches, or with a few onely, but the younger are whitish, armed with very sharpe crooked thornes, which no bodies hand can well avoid that toucheth them, whereon grow small cornered greene leaves, cut in on the sides, but broad at the bottome next the stalke: the flowers are small, and grow at each of the leaves, one or two together, of a purplish greene colour, hollow and turning up the brims a little: after which follow the beryes, bearing the flowers on their heads, and are of three sorts, that is small, or great that are round, or that are a little longer then round, greene before they are ripe, and with a thicker skinned then the other, but of a greenish yellow colour when they are ripe, striped in divers places, cleere and almost transparent,

poies
ret.

1. *Uvacrispa* five *Grossularia sylvestris*.
The common Gooseberry.

2, 3. *Grossularia rubra* & *cerulea*.
Red and blew Gooseberries.

with

with small blackish feede lying within the pulpe, which is of a pleasant winy taste, acceptable to the stomacke, and without offence, although one doe cate many of them: the longer berry hath the thicker skinne, and the worst taste.

2. *Gossularia rubra*. Red Gooseberries.

The red Gooseberry is of two or three sorts: one hath slenderer stemmes and fewer thornes on the younger white branches, which bend downe more then the former: the leaves are made after the same manner, but a little larger, the flowers and berries are like the other, but are of a darke brownish red colour, almost blacke when they are through ripe, of a fullsome sweetish taste, and never beare many in a yeare, which make them the lesse regarded: Another sort is like the former in growing with little difference: onely the berries are smaller, redder, and of a pretty tart taste, and sweet withall: A third sort groweth very like the ordinary sort of yellow, both in height, branch, and leafe, the berries are as large as the largest size of the other, and of a very fine red colour, untill they be suffered to hang long on the bushes, which then are of a darkish red colour, very pleasant in taste.

3. *Gossularia cerulea*. The blew Gooseberry.

The blew Gooseberry riseth up to be a small bush, having broader and redder leaves at the first shooting out, then the second red Gooseberry, the berries are more sparingly set on the branches also, and for bignesse neere unto the small red Gooseberry, but lesser, and somewhat sweeter, and of a blewish colour like a Damson, before the colour be wiped off.

4. *Gossularia viridis hirsuta*. The hairy or prickly Greene Gooseberry.

This Greene Gooseberry is very like unto the ordinary Gooseberry, in stemme and branches, but not furnished with such sharpe prickles as it, the younger branches also have smaller Greene leaves: the flowers are alike, and so are the berries; of a middle size, but Greene when they are through ripe, with a shew of small haire or prickles on them, which yet are as harmelesse as if there were none, but of a more pleasing relish then any of the other: the feede hereof hath produced bushes bearing smooth berries, with few or no haire on them.

The Place and Time.

The ordinary sorts grow usually in the hedges, in sundry places of France, but I thinke rather planted there for defence onely, rather then that they are naturally to the Countrey, for even there as well as here, they are planted in Gardens and Orchards also: all the other sorts likewise are kept in Gardens: they all flower very early in the Spring, presently after the leaves begin to come forth, and the berries are ripe from the middle of July to the end of August, or as the yeare proveth.

The Names.

It cannot be certainly knowne that any of these fruites were knowne to any of the ancient Greeke or Latine writers, for although some have referred some of them unto the *ios* or *ios*, *Ilos*, or *Oelos* of Theophrastus, whereof he saith one hath a white flower and fruit, and another both blacke, yet he remembreth no thornes in it, as that hath, which so curious a Writer would not have omitted, and therefore is not likely to be this: some againe would have it to be *Vitis precia* of Pliny, but that cannot be, because he numbred it among the other sorts of Vines, that beare wine as one of them: Gesner in his *hortis* taketh it to be the *Ceanothus spina* of Theophrastus, but *Angustifolia* rather judgeth his *Ceanothos* to be a kinde of Thistle, whereof we have entreated among the Thistles: it is called *Uva crispata* by divers, and *Uva crispina*, because the leaves seeme to be crisped or curled, and *Gossularia* by others, because they are like *Grossos* small Greene Figges, and by some also *Uva marina*, but I know not upon what cause. The Italians call it *Uva spina*, the Spaniards *Uva crespeta*, and *Esquina*, the French *Groffeller*, the Germans *Krussbeer*, and *Kruselbeer*, the Dutch *Stekelbesien* *Kuselen*, and *Croesbesien*, and we in English Gooseberries, but in some places Peaberries, and Wineberries.

The Vertues.

The Greene and unripe fruites of the ordinary sorts are somewhat sharpe and tart, and serve to relish brothes for the sicke (as neede requireth,) as well as the sound to stirre up a fainting or decaying appetite, or overcome with chollerick humours, but otherwise yeeld small nourishment to the body, and that but cold and crude, for they doe a little helpe to binde the belly and stay fluxes of blood in man or woman, and stay their longings; yet they are not to be tolerated to cold or windy stomackes, least by breeding more winde they bring the chollerick, and griping paines in the belly: the juyce of the berries or of the leaves, is helpfull to coole and restraine hot swellings and chollerick inflammations, called Saint Anthomes fire: the ripe fruites are more pleasant, and more desired for the sweetnesse to be eaten at pleasure, then for any proper or special effect for any disease, but by reason of their good and sweete relish, and moist lubricity, they easily descend out of the stomacke without any offence at all.

CHAP. CVII.

Ribes fructu rubro, albo, nigro. Red, white, and blacke Currans.

The stemme or stocke of the red Curran bush, hath a very thinne brownish ouer bark, and greenish underneath, and of the bignesse of a good great staffe, wholly without thornes on any branch, whereon grow large cornered blackish Greene leaves cut in on the edges into five parts somewhat like a Vine leafe, but a great deale lesse, the flowers come forth at the joynts of the leaves, many together on a long stalk, hanging downe about a fingers length, of an herby colour, after which follow round berries, Greene at the first, and of a cleere red colour when they are ripe, of a little pleasant and tart taste withall, where in lye small seed: the roote is woody, and spreadeth diversly.

There is another sort hereof, whose berries are twice as bigge as the former, and are of a better relish.

The white Curran bush hath a taller straighter stemme, a whiter bark, smaller leaves, and such like berries upon long stalkes, and of the same size and bignesse with the first or most ordinary, but of a shining transparent

Fructus rubro major.

Ribes albo White.

R R R R R

1. *Ribes fructu rubro majore*. The greater red Currans.2. *Ribes fructu albo*. White Currans.

whitenesse almost like Pearls, the seed within them being plainly to be discerned as they hang on the bushes, and of a more pleasant winy taste, much more acceptable then the former. And is called *Goxel* as I am informed, in some places of *Kent*.

The blacke Curran riseth higher then the last, more plentifully stored with branches round about, and more plant also, the younger covered with a paler, and the elder with a browner bark: the leaves are somewhat like the former but smaller, and often with fewer cuts or divisions therein, the flowers also are alike, but of a greenish purple colour, which turne into small blacke berries like the former: both leaves and fruite have a kinde of strong evil sent, but yet are wholesome, although not so pleasant as any of the former, and eaten by many.

3. *Ribes fructu nigro*. blacke Currans.

The Place and Time.

All these sorts have beene found growing naturally wild, some in *Savoy*, and *Switzerland*, as *Gesner* saith, and some in *Austria* as *Clusius* saith he observed: the white sort is not knowne, or at least recorded by few, but kept in Gardens as the more rare sort and last knowne to us. They flower and fructifie at the same time with Gooseberries but abide longer on the bushes before they fall or are withered.

The Names.

The name of *Ribes* and *Ribesius frutex* is generally given to these plants for some likenesse, not onely in the berries, but much more in the properties: to the *Ribes* of *Serapio*, which as he saith hath reddish Greene tendrels large round Greene leaves and berries, whose taste is sweete with some tartnesse, and are cold and dry in the second degree: This is the description of *Serapio* his *Ribes*, and although all doe generally consent it is not that of *Serapio*, as not having tendrels nor large round leaves, yet is it generally received in the Read thereof, onely *Dodonaeus* would frame it into the same mould, but I doubt his skill is too weake, and his allegations too much wrested or too selfe conceited. Some have thought this to be more answerable unto *Theophrastus* his *Iso* because this hath no thornes as the Gooseberries have as *Lobel* doth also. But *Bellonius* in his Booke de *coniferis arboribus*, and *Rauwolfius* doe both say they found the *Ribes Arabum* on the mount *Libanus*. *Bellonius* describeth it with fixe or seven leaves of a Docke, but greater and rounder, rising from the roote, and with red berries hanging downe in clusters, coming out from the middle of a lase, like as the *Ruscus*, and *Laurus Alexandrina* doe. *Rauwolfius* saith

saith, he found it onely with two large round leaves like unto the *Petasites*, from whose stalkes a lowre juyce is pressed that is pleasant, and used of the richer sort; whereof because we have no further knowledge, we here leave them. *Gesner* calleth this *Ceanothus levis*: most doe account it a kinde of *Grossularia*, and therefore call it *Grossularia rubra*, and *Grossularia ulmariana*. *Clusius* only and *Besler* in *horto Eystetensi*, make mention of the white *Ribes*, and *Bauhinus* who calleth it *Grossularia hortensis margaritis similis*: The blacke sort is generally called *Ribes fructu nigro*, yet *Gesner* in *horto* sheweth that some would make it to be a sort of *Anomum*, and therefore called *Anomum falsum* or *Pseudoanomum*, and some *Pipirella* as *Lugdunensis* saith. The *Italians* call it *Vnettarosse*, the *French* *Groiselles doustemer*, the *Germans* *St. Iohans trenblin* and *Sant Iohans beertlin*, and *Keozbeer*, as *Gesner* saith, the *Dutch* *Besiekens over zee*, and we *Red Currans*, the white *Ribes* as I am given to understand, is called *Gozell* in some parts of *Kent*.

The Vertues.

The red and white Currans are good to allay the heate and fainting of the stomacke, to quench thirst, and to provoke an appetite, and therefore are safely permitted in hot and sharpe agues, for it tempereth the heat of the liver and blood, and the sharpenesse of choller, and resisteth putrefaction: it taketh away likewise the loathing of meate, and the weakenesse of the stomacke by much casting, and is good for those that have any loosenesse of the belly: *Gesner* saith that the *Swissers* about *Berne* where it naturally groweth, use it for the cough. The blacke Currans are used in sawfes and so are the leaves also by many, who are well pleased with the taste and sent of them, although some doe mislike them for both.

THE LAST TRIBE.

CHAP. I.

Agallochum sive Lignum, Aloës.

ENTRING now into my last quarter, so to consummate this revolution, I must use another manner of Method, then formerly I have done in the precedent Tribes; for intending to shew you as well those Out-landish Plants, that are called spices and drogues in our Apothecaries Shoppes, as other fruites and strange trees, growing in the East or West Indies, I would first perfect the more usuall Physical part of them in an Alphabetically order and with them inferre a few other, the more principall things, although not plants, or taken from them that are for the most part in our shops used in medicines, shewing the place and names of them all in a continued stile, and not in fractions, as in the foregoing parts.

Lignum Aloës, or the wood of the Aloe tree.

Αγαλλοχον ή Ευροαχον Agallochum and Xyloaloe in Greeke, is called also *Agallochum sive Lignum Aloës* in Latine, and so in *English*, or the wood of the Aloetree, is a drogue rare to be had, and of much worth: but (as it is with many other things that come out of the East Indies unto us) of small knowledge what it is, and where and how it groweth. For but that *Garcias ab Orta* saith, that the tree is like unto an Olive tree, and sometimes greater, and that he had the branches of the tree brought him to see, but neither flower nor fruit, the places being very dangerous by the haunt of Tigers therein, we should not know what forme it bore; none of the Ancients either *Greekes* or *Arabians*, having set downe any thing thereof, although they have all mentioned it, and the choyce of the best, with the Vertues: onely *Serapio* in the 197. Chapter of his Booke of Simples, saith it beareth small berries like unto Pepper, but red: yet *Garcias* maketh some doubt thereof, as he doth of sundry other his relations in that Chapter. For although *Serapio* in that place reckoneth up divers sorts, and *Ruellius* speaketh of foure; yet *Garcias* saith, he knew but one true sort of *Lignum Aloës*, which grew in India, and that the other sorts that were so called, were but sweete woods assimulating it, but were not the true and right wood, which the *Arabians* call *Agalagin* and *Hand*, and they of *Suerrat* and *Decan*, &c. as it is likely from the *Arabians Hand*, which word with them properly signifieth but *Lignum* wood, and *κατ' εἶδος*, *praestantissimum*; but they of *Malacca* and *Sumatra* where the true groweth, call it *Garro*, and the best

Agallochum sive Lignum Aloës.
Lignum Aloës, or the wood of the Aloe tree.

Calambag

Calambac: yet as *Garcus* saith, that that sort of sweet wood that cometh from *Comorin*, and *Zeilan*, and there called *Agnia braua*, that is to say, *Lignum Aloes sylvestre*, is not true *Lignum Aloes*, which true sort as all the Auncient Authours doe set it downe, is a blackish wood in peeces, some accounting the greater peeces to be the better, but yet somewhat discoloured with veines: (some Authours saying it is so weighty and heavy, that it will sinke and not swimme being put into water: but others doe not allow of that note, saying that the best that is will swimme) and full of an oyleous substance, of a fine sweete and aromaticke sent, which it will (weat forth), when it is burned: Now to come to our later times and shew you, that for many yeares together (as many other such like rare drogues) true *Lignum Aloes* was not knowne to the Physitions or Apothecaries of Europe, for they used instead thereof a kinde of *Lignum Rhodium*, which *Ruellius* tooke to be *Aspalathus*, and but that the Venetians of late dayes by their travell and searck, both in *Cairo* and the East Indies, caused some of the true sort to be sent unto *Venice*, and was upon view and tryall approved, the Portugall Sea voyages to the East Indies, did first make it knowne in these later times to Christendome: but now in our Droguilt and Apothecaries shops there is much variety and counterfeited stuffe obtruded on the ignorant, divers sorts being to be seene, and yet scarce one of them true *Lignum Aloes*, having those markes and notes formerly set downe, and acknowledged by the Ancients, which are the onely true notes whereby to know the best: and such no doubt is our best sort, which are knobbed or uneven peeces, very brittle, and breaking short, somewhat blacke on the outside, and more gray and discoloured within, of a very small sent, untill it be burned; yet I have seene with Master *Tradescant* the elder before he dyed, a great peece of true *Lignum Aloes*, and of the best sort, as bigge and as long as a mans legge, without any knot therein, which as he said our King *Charles* gave him with his owne hands, but was here kept before, and accounted by many, as a great religious relicke, even to be a peece of the wood of that Crosse, whereon our Saviour was crucified, and therefore was fetched away againe from his Sonne, to be kept as a monument or relicke still: but this is like all the other relickes in the world, even mere Impostures, for assuredly if all those peeces of wood, that are or were to be found in the world, said to be parts of that Crosse, were all set together, they would goe neere to make one, yea many cart loads full: yet so fond and superstitious are men to believe lies rather then truths, that they will rather kill the gainesayers, and thinke that therein they doe God good service, then be wise to see their errors. The other sorts which are smooth and plaine, with long graines, are no true *Lignum Aloes*, although so called, being neither of that worth in price, nor goodnesse in effect. The properties whereof are very cordiall for the heart, and comfortable for the head and braine, helping the memory, and warming and drying up the defluxions of rheumaticke humours on those parts, for it is hot and dry in the second degree, a little altringent and bitter, and of subtil parts, it much conduceth to weake livers and fainting spirits, and strengtenth also a languishing stomacke, helpeth dysenteries or laskes, and the Pleuresie.

Although the subject matter of this whole worke is the description of Plants, and of no other things; yet I thinke it materiall to this Classis and among the other Physicall Drogues, to treat of a few others that are not so; especially such as are best knowne.

CHAP. II.

Ambra Citrina. Yellow Amber.

ellow Amber is called *ἄμβρα* by the Greekes, *Succinum* by the Latines, and *Carabe* by the Arabians, and in the Apothecaries shops, and is of sundry colours, some peeces being whitish, some yellow, paler, or deeper, and some of a very deepe red colour, and darke, all the other being cleere and transparent, but much more being polished: It is generally taken to be a kinde of liquid *Bitumen*, whose Springs and Fountaines are in the Germane Seas, and running into peeces, some greater and lesser then others, and is taken up with iron hookes, being soft under water, but hardning in the aire like Corall: that which is white, as being accounted the lighter and sweeter is the best for medicine, as the yellow for mechanick uses, and being rubbed a little while, will then draw unto it strawes, and other such like small things, as the Loadstone doth iron, it will also burne like Rosin or *Bitumen*, with a strong heady sent, and the poulder thereof cast into the flame of a candle or other light, will make a sudden flash like lightening, and being so bituminous it yeeldeth an oyle, being distilled in a retort, which although at the first it is very red, and smelleth very fierce and strong of the fire, almost odious, yet by being sundry times re-distilled, it becometh so rectified, that both sent and colour is so farre amended, that it is then fit to be used. The Physicall properties of Amber are many, for being moderately hot and dry, being burned on quicke coales, the fumes received to the head, doe much helpe the moist distillations thereof on the eyes, teeth, nose, or stomacke, and is very convenient for those that have the falling sicknesse, to lessen their fits, and to restore them: it is good to provoke womens courses, and singular good to helpe the strangling of the mother, and helpeth women with child, both to goe out their full time with ease, and to hinder their miscarrying that are subject thereunto, to take halfe a dramme of the poulder in a reare egge, or in Wine three or foure mornings together, and this also helpeth them that have the whites, and men that have the gonorrhoea or running of the reines, constraineth the flux, and strengthening the parts very much, and is a certaine remedy for those that have their urine stopped many dayes together, causing it to avoid plentifully, being taken in Saxifrage water: it is also very good for old coughes, and those that are fallen into a consumption, to take the poulder thereof mixed with Conserve of red Roses in the mornings fasting, and is very available for joynt aches, and the running gout. The Chemicall oyle of Amber being taken inwardly, three or foure drops in a little Muscadine doth wonderfully ease the stone, and the stopping of urine, or strangury making it by dropes: two or three drops used outwardly on the temples, the nape of the necke, or behind the eares, doe warme and dry a cold moist braine, discusseth winde in the eares and head, and strengtenth the memory, and is a singular helpe in all cephalicall diseases.

CHAP. III.

Amber grisea. Ambergrise.

Ambergrise is better knowne to most by sight what sort is better then other, then what it is, or whereof it commeth: the opinions of Authors are very variable hereof, some supposing it to be the spawne of the Whale, others the excrement of long continuance in the belly of the true Whale (that hath no teeth and eateth soft fishes) which it calteth forth at certaine times, and by the agitation of the sea is cast on shore: some others take it to be the excrement of certaine great sea fishes, and some to be the fume of the sea: all which opinions are utterly erroneous, having no shew of truth in them: for although Amber in the *Ethiopian* language, signifieth a Whale, as well as Ambergrise, and yellow Amber also, from whence rose that vulgar opinion of being the spawne of the Whale, or because that in the belly of a Whale (as *Monardus* relateth it) taken about the *Canary* Islands, there was neere an hundred pound weight of Amber found, but in an hundred more taken afterwards, was none at all found; Yet the most likely and certaine received opinion of the most judicious is, that it is a kind of *Bitumen* (as the yellow Amber is before said to be, and therefore have both the one name of Amber, being so nere one to another in their originall) whose springes are in the Rocks of the Sea (or as some of the Ancients supposed grew on the Rocks, like Mushromes on trees) condensate into that forme and substance usually observed, having that oyleinesse or unctiounesesse in it, from it owne originall, and being light is carried by the waves of the sea, unto the shores of sundry Countries and climates: *Iosua Ferrus* relateth the originall thereof as of his owne knowledge, and that untill it hath attained the full maturity, it hath not that true sent of Amber, as after, and saith that he had seene divers such great peeces, that had not attained their true sent. And although the *Ethiopian* coast, from *Mozambique* and *Sofala* to the Islands of *Maldiva*, and beyond them to the East, doe most abound with Ambergrise, yet are not the coasts of the West Indies in sundry places without it, nor yet these of *Europe*, in severall parts, and even our owne, and the *Irish* coasts have yeelded it oftentimes, and in severall peeces and quantity, yet neither so much nor so great as in other Countries: for *Garcias ab Orta* saith, the greatest peece that ever he saw, was a peece of fiftene pound weight, but there hath beene severall as it is set downe by Authors, some peece well neere an hundred pound weight. For the choyse thereof, seeing there is much variety in the colour, and some in the substance, as white mere or lesse, or gray lighter, or darker, or inclining to rednesse or blackenesse: that which is not very white, as being usually very dry, but grayish more or lesse, and either with spots and veines, or without, so as it be fat, that is, upon a knives point, or such like thing, heated will shew oyle, is accounted the best, having the peculiar sent belonging thereto, which is most neere unto dry cow dung, in my opinion, the blacke sort is the worst. The properties of Ambergrise are these: it is hot and dry in the second degree, it warmeth, resolveth, and strengtheneth, what way soever it be taken: it easeth the paines in the head, being dissolved in a warme mortar, and mixed with a little oylment of Orange flowers, the temples and forehead being annoynted therewith: it comforteth also the braine, warmeth and resolveth the cold defluxions of humours thereon, and on the nerves and sinewes: it doth likewise comfort and strengthen the memory, the vigour also and spirits of the heart, it is singular good for women troubled with the mother, to be applied to the place, it helpeth barrennesse proceeding from a cold cause: it is conducing to Epilepticke persons, to smell often thereunto, which causeth their fits to be both lesse violent and permanent: it doth most conveniently agree with aged persons, to warme, comfort, and strengthen their cold decayed spirits, adding vigour and lustinesse to them, and is accounted conducing to venerous actions.

CHAP. IV.

Anomum. Anomum.

As I said before of *Lignum Aloes*, and in the last Classis of the true *Balsamum*, so much more may be said of *Anomum*, that the foregoing rimes for many ages had utterly lost the knowledge thereof, and is yet to this day held doubtfull, as the *Balsamum* is, with many learned men, both in other and our owne Country, whether the right be to be found in *rerum natura* or no, and therefore formerly many did obtrude divers things for it, as the *Rosa Hiericutilina* by some, and *Pescolumbinum* by others, which is a kind of Cranes bill, called Doves foote, both which errors *Martiolus* hath sufficiently confuted, *Quatrinus* also took the *Myrris Brabantica* our Gauls to be it, and then as *Martiolus* saith, a small seed came to be taken for it, and therefore called *Anomum Germanicum*: but *Garcias ab Orta*, who lived many yeares in the East Indies, declareth that he saw a branch of *Anomum*, which the Physicians of *Nizamulco*, the King of *Decan* gave him, being brought as they said among other drogues out of *Asia*, *Persia*, and *Arabia*, for the Kings use, which as he saith, he found agreeable to *Dioscorides* his description thereof, and which was very like unto a Doves foote, and called *Hamama* by the *Arabians*, which signifieth the same thing, that is, a Doves foote: but both he and *Valerandus Donres* were deceived with the same thing, brought from *Omus*, in being so taken there generally, & both the *Anomum* & *Anomia* are set forth in the figures by *Clusius* in his *Scholia* on the same place in *Garcias* and here also. All these opinions and every of them are utterly false, and no way answering the truth of the thing, and *Dioscorides* his description: for of late dayes there hath been sent to *Venice* from the East Indies, by one *Martinellus* a famous and curious *Italian*, in the search of rare drogues, the true *Anomum*, which although it hath bene opposed by divers learned men, yet *Maronius* of *Padoa*, hath in a little treatise thereof, so exemplified it and commented upon every part of it, and comparing *Dioscorides* with *Pliny* together, that it is now generally accepted of almost every where, to be the right and genuine thing, the description whereof, I meane so much as was sent, is on this wise: It is a bunch or cluster of whitish round berries, somewhat like unto Grapes for the outward forme and bignesse, but else very like unto *Cardamomes* within, yet bigger and rounder, having within the outer whitish thinne shell or skinne, sundry blackish browne feedes close thrust

Anomum geniculatum & *Spinosa*.
True and false *Anomum*.

2. *Anomum aliud quorundam* & *Gargophylon* Plinij *Clusio*
suspectum. Another sort of ballard or false *Anomum*
suspected by *Clusius* to be *Pliny* his *Gargophylon*.

thrust together, very like to the inner seedes of *Cardamomes*, but larger and of somewhat a fiercer piercing sent, smelling somewhat like unto oyle of spike, which made *Clusius* to thinke it had bene seasoned therewith, and of a sharpe hot and quicke taste. The properties whereof are these: It is heating, binding, and drying, procuring sleepe and rest, and easing paines in the head, being applied to the forehead, it digesteth and disencloseth inflammations and Impoethumes, and helpeth those that are stung by Scorpions: being used with *Basilij*, it helpeth gouty persons, and marvellously easeth the griping paines in the belly and bowels by reason of wind, to swallow three or foure of the seeds, and for the mother in women, taken in that manner, or made into a p. ssary and so used, or else in a bath, it is convenient both for the liver and reines, and is an ingredient of chiefe account, in great Antidotes that are preservatives. The false or ballard *Anomum*, which as it is likely is the same that *Garcias* saith was held for true in the Indies, and which *Clusius* saith in his Annotations upon that Chapter of *Anomum* of *Garcias*, *Valerandus Donnes* received from *Ormus*, is by him thus described. They were like the toppes of some bushes consisting of a number of small branches, so thicke set with very small leaves that scarce any stalkes could be seene but leaves onely, somewhat like unto the stalkes with leaves of the sea Spurge, the ends of them so closed that they did in some sort resemble a flower or Rose, and the whole branches together, the foote of a feather footed Dove, from which likenesse it is probable arose the falsification, this had no singular good sent or taste to commend it. The very like hereunto saith *Clusius* he received at *Vienna* in *Austria* from *Constantinople*, which they there used for *Anomum*.

2. *Anomum aliud quorundam* & *Gargophylon* Plinij a *Clusio* suspectum.

Another sort of ballard or false *Anomum* suspected by *Clusius* to be *Pliny* his *Gargophylon*.

Because this also hath bene by divers received for *Anomum*, and so sent to our Druggists, I thinke good to adjoyne it therewith, for some resemblance of the whole branch, although *Clusius* setteth it with the Cloves, which as he saith it is somewhat like in sent, but I thinke he referreth it to the Cloves, rather for *Pliny* his name of *Gargophylon*, for in my sent and taste, it hath little affinity therewith, but yet hath some correspondence with *Pliny* his briefe notes or description thereof, and therefore I will give you *Clusius* his figure and description. *James Garret* while he lived, an Apothecary after he had bene a Druggist in *Limestreete London*, in the yeare sixteene hundred and one, sent *Clusius* some of this fruite as they grew, which were somewhat like Pepper cornes (but those that I have by the name of *Anomum*, and I thinke are the same with his, are browner and bigger all for the most part, then any Pepper graine,) some bigger and lesser, rugged and browne, and easie to be broken, which had blacke round seedes within them, to be divided into two parts, smelling as well as tasting like Cloves: this fruite or berries grow many clustring together like a bunch of Grapes, (each whereof hath a little crowne at the head, somewhat like an Hawthorne berry) two or three sometimes together on a stalk: this had likewise some leaves still abiding on the branch, and were of sundry sizes, although all of one forme, that is somewhat long and round, and round pointed, not dented at all about the edges, but smooth, and many veines therein, of a brownish ash-colour, and growing opposite on the stalkes. This is the chiefe parts of his description. We have not knowne it used for any disease, more then that being obrudred for *Anomum*, some more audacious then

wise

wife, have put in their compositions instead of the right, but by the taste as *Clusius* also noteth it, it might seeme to be available to many good uses if they were tryed.

CHAP. V.

Anacardia. Anacardes or Malacca Beanes.

Anacardium is a fruite like unto an heart, growing on trees plentifully in *Cannor* and *Calecut*, *Cambaya* and *Decan*, as *Garcias* saith, (and as some say on those mountaines in *Sicilia* that cast forth fire, but I somewhat doubt thereof) greater then our greatest Beane, and called by the *Portugals* *Fava de Malacca*, of the *Arabians* *Badador*, and of the *Indians* *Bibo*, whose outer skin or huske is of a darke red colour,

betweene which and the white edible kernell, lyeth a certaine liquor or viscous substance, of a fiery red colour while it is fresh, and of a sweetish, but somewhat hot taste, which is the true *Mel Anacardinum*, but instead thereof, because we cannot have them so fresh, that we might take forth this substance, some use to boyle the fruite being broken or bruited in honey, and then call it *Mel Anacardinum*, but of farre lesse effect.

The whole fruite saith *Garcias*, is familiarly eaten while they are fresh, as also being pickled like *Ollives*, in all those parts where they grow, but as he saith, when they are dry, they use them as a causticke, to take away wens, &c. The qualities hereof are set downe by *Serapio* and *Avicen*, who although they make it to be of a deliterary and poysoning property, by overheating and burning the blood, being hot and dry in the third,

if not in the fourth degree, which *Garcias* beleeveth not; yet they say that the fruite helpeth the senses that are weake, and the memory that is decayed, and comforteth the braine, and nerves that are subject to the palse that commeth through cold: *Garcias* saith that in *India* they use to give the whey whetein the fruite hath bene steeped, to those that are short winded, and to those that have the wormes,

Anacardi. Anacardes or Malacca beanes.

CHAP. VI.

Cajou arbor, cum suo & tenella planta.

Cajou. The *Cajou* or Apple Beane.

Because this fruite comming from *Brasil* and called by the people there *Cajou*, is in divers things like unto the *Anacardes*, I thought it not amisse to give you the knowledge thereof next therunto, with the description of it, as *Clusius* hath recorded in his *Scholia*, on the *Anacardes* in *Garcias*, for I finde some other Authours to have made mention of it, as *Christophorus a Costa*, *Lugdunensis*, *Linseboten*; *Baptista Ferrarius* who set forth a small plant thereof of one yeares growth, yet none have added any thing unto him. This tree (saith he) is great, having leaves like the *Peare* tree, but rather like *Bay* leaves in those that are new sprung up, thicke and of a pale greene colour: the flower is white like to the *O-rence* flower, but thicker with leaves, but not so sweet as they, the fruite is like unto a *Goose* egge, both for forme and greatnes, of a very yellow colour, & sweet, full of a liquor like unto that of a *Citron*, that is called *Lima*, which is eaten by them with great delight, yet somewhat sharpe, and *Acofta* saith the same, and as it encreaseth the more growth lesse (although *Thevet* in the 61. Chapter of his description of *America*, contraryeth this manifest truth) not having any seed within it, but at the end of this fruite groweth forth this nut, which being put into the ground doth spring up like the stones or kernells or any other fruite, being of the fashion of an *Hares* kidney, of an ash-colour sometimes declining to rednesse: this nut hath a double rinde, or shell betweene which is a certaine spongy substance, full of a most sharpe and burning oyle, the kernell within being as sweet as a *Pistack* nut, covered with a thin ash coloured skin, which is to be taken away, and is said to be a stirrer up of *Venerious* actions, and therefore

used by them, being first lightly roasted: the sharpe liquor or oyle is used by them against scabbes, and is good also for running tetters, and ringwormes. I have here given you the figure of the nut it selfe, and of the first yeares shooting of the tree, as *Baptista Ferrarius* hath exhibited it in his Booke *de stiracum cultura*. *Acosta* further saith, that they use in the Indies to pickle them as they doe Ollives, and eat them to procure an appetite, to stay calings, and to helpe the weakenesse of the stomacke.

CHAP. VII.

Anisum exoticum Phillippinarum Insularum. A strange Anisseede like seede of the Indies.

WE can give you no knowledge of either roote lease stalke, or flowers of this strange plant, brought from King *Phillips* Islands neere unto *China*, and thereupon called *Phillippinas*) but of the toppes onely, with the huskes and seed in them, brought by *Sir Thomas Candlish*, in his voyage of the Globes circum-navigacion, and given to *Master Morgan*, *Queene Elizabeths* Apothecary, and to *Master James Garret*, of whom *Clusius* received them, and giveth this description thereof. It was a stalke with flat umbels of seed, as large as those of *Archangelica*, and peradventure larger, sustained by thicke footstalkes, and set round at the toppe, in a round forme one by another, consisting of sixe, eight, or more huskes of seed, which were not parted in two like our ordinary Anisseede, but each of them had divers round smooth shining ash-coloured seed within them, like unto *Orobis*, the huskes were about an inch broad of a brownish colour on the outside and rugged, opening at the toppe into two equal parts, and although divers were empty, yet some contained such seed as aforesaid, the smell and taste of them was very like unto Anisseed, whereupon it was called Anise by them that sent it: but *Master Garret* sent the right name, whereby it was called in the Islands, one of them being brought along with them, who set the name in *China* Characters, which as *Clusius* saith he could not imitate, but was *Damor*, every letter being written under the other downwards.

Anisum exoticum Phillippinarum Insularum.
A strange Anisseed like seed of the Indies.

CHAP. VIII.

Asa dulcis & fetida. *Assafetida* and the other *Asa*.

ALthough I have spoken somewhat of *Asa dulcis* five *oderata* & *Assafetida* in the Chapter of *Laserpitium* among the umbelliferous plants, yet because I said but little of them there, reserving them for this place, I will here entreate of them more largely. There is none of the ancient Authours either Greeke, Latine, or Arabian, that hath made any mention of *Asa*, either *dulcis* or *fetida*, but was first depraved by the Druggists and Apothecaries in forraigne parts, that in stead of *Laser* said *Asa*, from whence ever since the name of *Asa* hath continued, and afterwards divided into *Dulcis* or *oderata*, and *fetida*, from the differing sorts of goodnesse purenesse and sent thereof, when as they are both of a strong smell, yet one much more then another, the *Asa fetida* being of so evill a sent, that the Germanes call it *Tenffellz drech*, that is, *diaboli sterqus*, Devils durt, and is very neere the sent of *Storax liquida*, if it be not the same, relented and brought into a liquid forme, the foote or sediment declaring it plainly, and is accounted with them to be sweet, being of a strong unpleasant favour, rather then sweet to us, so is the *Asa dulcis* & *oderata*, called sweete in comparison of the other, called *fetida*, because being purer, it hath a more unpleasant sent and taste. For as *Garcias* saith *Asa* is called *Alsihe* by the Arabians, which is the *Laser* of the Greekes and Latines, as the plant being called by them *Anjuden*, and *Silphium* by the Greekes and Latines, but *Jingui* and *Imgara* by the Indians, the one when it is clensed and purified from the drosse being cleere and yellow as Amber, the other foule and impure, and are so familiarly eaten, as *Garcias* saith by the Indians, in their meates, brothes, and sallets, and medicines, that they scarce eat any thing, that is not seasoned therewith, and is very pleasant to them being used unto it, but loathsome to others, the richer sort using the purer, and the poore the course: divers heretofore have mistaken *Benzoin* for *Asa dulcis*, and I doubt the error is not yet quite extinguished, and *Matthiolus* confesseth his former error therein, which upon better consideration he amended, *Benzoin* being the gumme of a tree, and being not so hot as *Laser*, which by *Galen* his appointment had for its substitute *Euphorbium* being growne old. The *Asa dulcis* being in former

SSSSS

sternes

times well knowne and uled, is now adayes quite lost and forgotten, being not brought into these parts, but the *Assafetida* hath a continuall residence and recourse unto us, and is as *Garcias* saith, the true and onely *Laser*, or *Laserpitium* of the ancients, and so accepted generally by the *Arabians* in India, and say they erre mightily that make them differing. It is generally used in our dayes for the rising of the mother in women, as all strong and evill sented things be, which depreesse it, and is singular good to be put into hollow aking teeth, to ease and take away the paines: One saith he tasted of it for a tryall in a cold time of the yeare, and after a little walking he found himselfe possessed with a gentle sweate, both head, armes, and body, and shortly after found his stomacke better disposed to his dinner then at other times before, and digesting it better. *Garcias* saith the Indians use it to take away the loathing of the stomacke to meate, and to strengthen the weakenesse of it also, and is much used by them to provoke unto Venerie, and causeth one to expell winde mightily, which thing was tryed by a *Portugall* as *Garcias* relareth it upon an Horse, whom the King of *Bispager* would have bought, but that he was over subject to breake winde, but after that the *Portugall* had cured him thereof the King bought him, and asking how he cured him, he answered him with *Assafetida* given in his provender, no mirvaile said the King, if he were cured with the gods meate, yea rather with the devils said the *Portugall*, but softly, and in his owne language for feare of being overheard.

CHAP. IX.

Balsamum Peruvianum, The West Indian *Balsamums*.

F the true *Balsamum* I have entreated in the last foregoing Classis or Tribe, but there have bene divers other sorts of liquours called *Balsamum* for their excellent vertues, brought out of the West Indies, every one of which for a time, after their first bringing were of great account with all men, and bought at great prices, but as greater store was brought, so did the prices diminish, and the use decay, when as it was the same thing and of the same vertue it formerly was, such is the instant course of the world in all things. One sort of *Balsamum* which is of most frequent

use with us, is called blacke or browne *Balsamum*, because the colour is blackish, and tending to browne being dropped forth, which as *Monardus* saith is gathered from a tree, somewhat bigger then a Pomegranet tree, (whose fruite or long pod I here shew you, as I received it, with a very browne almost blacke colour, and smelt so like this *Balsamum* or *Benzoin*, that I am certainly perswaded it was gathered from this tree) not by incision, as the juyces, liquours, and gummes of other trees (which yet this tree doth also in small quantity, yet being white, and so precious with the Indians, that they will not part with any of it) but made after the manner that the Indians use to draw forth the juyces and liquours out of all their other trees, which is by cutting the branches, and the bodies also sometimes of trees into small peeces, which after the boyling in a great quantity of water, the oyle swimming on the toppe, after it is cold is skimmed off by them and reserved. This is of a thicke, yet running consistence, and of a sharpe and somewhat bitter taste, but of an excellent fine sent, comming neere unto *Benzoin*, but will not long endure, being rubbed on any thing that is kept in the ayre, but never loseth its sent being kept close in a glasse or the like. This is used inwardly and outwardly for divers good uses, and although in some it causeth a kinde of loathing to the stomacke, if it touch the tongue, in drinking foure or five droppes in wine fasting, yet it helpeth the weakenesse of the stomacke, the Tisicke, and shortnesse of breath, those that are purtie and the paines and difficulty in making water, it moveth also womens courses, and causeth a good colour, and a sweete breath, rectifieth the evill disposition of the liver, openeth obstructions, and preserveth youthfullnesse even in aged persons that have much used it, and helpeth the barrennesse in women: being outwardly used, it is singular good to heale any fresh or greene wound, and old ulcers, and sores also: it causeth paines in the head or necke, and swelling in any part of the body, the places thereof being annoynted therewith, or a cloth wet therein and applyed: it helpeth digestion, strengtheneth the stomacke, dissolveth winde, easeth the spleene, and the Sciatica, the strangury and stone, and dissolveth all nodes and hardnesse of tumours, being applyed warme to the places pained: it warmeth and comforteth the sinewes, and keepeth them from shrinking.

Another white and very cleere Balsame of a very sweet sent *Monardus* saith, was brought likewise from the continent of *America* in some good quantity, which was taken by incision from very great trees full of branches to the bottome, whose outer barke is thicke like Corke, under which there is a thinner, from whence being slit the *Balsamum* droppeth forth, the fruite hereof is very small even no bigger then a Pease, and of a bitter taste, inclosed in the end of a long thinne white cod, wherewith the Indians doe smoake their heads against the paines thereof, and rheumaticke distillations: This liquour or *Balsamum* is accounted of much more vertue then the former, one droppe being said to be of more force and effect then a great deale of the other. There is another sort of precious *Balsamum* saith *Monardus* brought from *Tolu*, which is a Province betwene *Carthagena* and *Nombre de Dios*, and is gathered by incision from small low trees, like unto low Pines full of branches, but with the leaves of the *Carob* tree abiding greene alwayes, the manured yeelding more liquour then the wild, and is of great account with the Indians and *Spaniards*, being taught by them: it is of a gold red colour, of a middle consistence and very clammy or glutinous, of a sweete and pleasant taste, not provoking vomit, as other sorts of *Balsamum* will doe, and of an excellent sent like unto a Lemmon, whereof a droppe being let fall into the

Fructus sine theca Balsami Occidentalis arbori. The fruite of the West Indie Balsame tree,

Balsamum album.

Balsamum de Tolu.

hand, will smell egregiously through all the place. Vnto this *Monardus* attribureth all the vertues of the true *Arabian* Balfame, and much more then unto any of the former, which because I would not make a double repetition of things, I referre you unto them.

CHAP. XI.

Bdellium. The Gumme called *Bdellium*.

Although *Dioscorides* hath given no description of the tree that beareth *Bdellium*, nor any part thereof, yet *Pliny* in his twelfth Booke and ninth Chapter setteth it downe, that it is blacke or of a sad forme, and of the bignesse of the white Olive tree, having leaves like an Oke, and fruite like the wild Fig tree, which how truly expressed resteth doubtfull, for *Lobel* setteth forth a stick of a thorny tree, found among drugges, with diuers peeces of gumme cleaving to it, most likely to be *Bdellium* or Myrrhe, which are very like one unto another, being both gathered from cruell thorny trees, and *Thevet* saith,

*Bdellij fructus quibusdam acceptus quem peris
cui Theophrasti fructum optatur.*

that he saw in one wood of trees, two thousand of these sorts growing mixed together, and that in such countries that are subject to snow, yet the best Authours say that *Arabia* is the chiefe place where they grow, which I thinke never saw or felt know, yet in *Genesis* 2. verse 12. we read that *Bdellium*, and the Onix stone, beside Gold, grew in the Land of *Havilah*, which is interpreted to be Eastward from *Persia*: so that both the tree and the gum thereof are called by one name, for the choyse wherof *Dioscorides* setteth downe that it should be cleere like glew, fat on the inside, easily melting or dissolving, pure or cleane from dross, sweete in the burning like unto *Vnguis odoratus*, (for so I construe it although diuers Authours doe diuersly interpret those words, some making *Vnguis* to be a note of white peeces in the gumme, like the nail of ones hand, but in my judgement the *Vnguis* is referred by *Dioscorides* to the sweete fumes of *Bdellium* in the burning, wherunto it is like, for having said that it was *suffitu odoratum*, he would rather shew what sent it had, namely of *unguis odoratus*) and bitter in taste, which are such no es as we can hardly find in any that is brought to us, for we find little bitternesse in any, and lesse sweetnesse in the burning of it or *Vnguis odoratus*, but strong and unpleasant rather, neither is it soft or easie to be dissolved, but hard and not to be dissolved equally, but into graines or knots without warmth, yet is ours of a sad browne colour somewhat like glew, and much like unto Myrrhe, so that they are often mistaken one for another, but that *Bdellium* is harder, dryer, and browner: but there are sundry sorts thereof as *Matthiolus* sheweth, and *Bauhinus* in his note upon him, that he hath seene, for not onely in former times there was much adulterating of drogues by the Indians as it was supposed, but most probably by the *Arabians* who were the chiefe Merchants for those places, and for those things, and I thinke the Iewes learned that art of them, and have exceeded them in cunning. The properties hercof are heating and mollesifieth hard tumours, and the nodes of the necke, throat, or sinewes, or of other parts, any way applied; it provoketh urine and womens courses, and breaketh the stone: it is good for the cough, and for those that are bitten or stung by Serpents: it helpeth to disperse the windnesse of the spleene, and the paines of the sides: it is good also for those that are bursten and have a rupture: it mollesifieth the hardnesse of the mother, and dryeth up the moistnesse thereof, and draweth forth the dead birth.

CHAP. XI.

Benen album & rubrum. White and red Ben.

The ancient Authours have bene both very briefe in declaring these two sorts of Drogues, and are also not at one among themselves what the true *Ben album & rubrum* should be, for *Aetnarius* and *Myrepsus* make the *Hermodactylus* to be Ben, how then can any of our Moderne Writers, find out the true Ben of the Ancients, yet diuers have appropriated sundry herbes unto them, but they have all come farre short thereof, not onely in the thing, but especially in the properties, *Clusius* setteth forth a kinde of wild *Campion*, which as he saith: the learned Professours at *Salamanca* in *Spain* tooke to be the *Ben album* of the ancients, but is nothing so: *Dodonaeus* setteth downe the *Papaver spumum* which he calleth *Polemonium* to be it, and some take the wild *Parnep* to be it: for the *Ben rubrum*, they of *Mompelie* call a finall sort of wild *Campion*, others the red *Valerian* of *Dodonaeus*, *Matthiolus* the *Limomum*, and others take the *Bisfort* roote for it; *Garcias* saith that some tooke the *Zedaria* for one of them; *Anguilara* and *Camerarius* also suppose that the garden red Car-

ret, and the white wild kind of it, which the *Italians* call *Carotta bianco* are the red and the white Ben, which they and I also suppose may passe reasonable well as substitutes for them, untill the true may be knowne. But those things that goe under their names in the Druggists, and Apothecaries shops, are not knowne, what they are, but are certainly false, and not the things they should be. *Rauwolfius* saith that he found the true white Ben growing at the foote of mount *Libanus*, in a moist shadowy place, which the Inhabitants call *Behmen Abiad*, as they call the red *Behmen ackmar*: the description of the white sort he setteth downe thus: the leaves are great long and thicke, like unto the sharpe pointed Docke, upon long footestalkes, but having at the bottome of each leafe, foure other small ones standing by couples each against other, those that grow on the stalke are lesse, and without any footestalke, the toppe of the stalke is parted into some branches, each bearing at the toppes a knap or yellowish scaly head, out of which breaketh a yellow flower: the roote is long and full of joynts, but without any or very few fibres, very like unto *Licoris* both for forme and greatnesse, but white inwardly. They are say *Serapio*, *Mesues*, and other *Arabians*, hot and moist in the first or second degree, they comfort the heart, and are stirrers to Ventry.

Behmen abiad. White Ben.

CHAP. XII.

Benzoin. Benjamin.

THe tree from whence this sweet gumme *Benzoin* is taken, is very great, faire, and high, largely spread and set full of branches, in a comely order, the leaves whereof are somewhat like unto those of the Citron tree, but lesser and not so Greene, but grayish on the under side: from the body hereof which is great and thicke, and the wood very hard and firme, by wounding it as they doe other trees, is drawne forth the gumme, which is of divers sorts, for some is very red, and full of barks and stickes which some take to be the sweetest, others is more pure or cleane, nothing so red, having many great and small white peeces of gumme in it, which is called the Almonds of the gumme, another sort is blackish, which is said to come from the younger trees, and called as *Garcias* saith *Bummi de Boninas*, and is sweeter then the last. Some saith he, call *Benzoin Ben jaoi quasi filius Iavae*, (which *Scaliger* correcteth, saying *Garcias* was mistaken in thinking that *Ben* in the *Arabian* tongue, signifyeth *filium*, when as he saith it is *lachryma*, and so *Ben jaoi*, is *lachryma Iavensis*) and some, as *Ruellius* *Ben Iudaum*, deceived either by the neerenesse of the name, or because he thought that *Iudea* was the naturall place thereof, and that it was a kinde of *Asa dulcis*, but without any truth or ground of reason, which opinion is yet held with divers who will still use it inwardly in place of *Lasor*: it is usually called in shoppes *Benjaminum*, and of some *Belzoinum*, and *Benzoin*, or *Benzoinum*: and of the *Indians* *Cominham*: There hath been sundry errors among learned men, about this gumme, for finding it to be so sweete, and of so delicate a substance and shew, they straight imagined that it could not be but of some singular vertue, and not unknowne to the Auncients: some therefore thought it to be *Cancamum* of *Dioscorides*, but yet as *Garcias* sheweth, it chiefly groweth in *Sumatra*, and *Sian*, and *Martaban* neere thereunto, of the *Arabians* *Loan jaoi quasi thui ex Iavae*, and *Vao at Surrai*, &c. and not in *Arabia*, as *Dioscorides* saith *Cancamum* doth: some tooke it to be the best *Myrrha* called *Myrrha Aminea*, and some as I said before to be *Asa dulcis*, but *Benzoin*, besides that it was not knowne to the Auncients, it is not used inwardly in Physicke, neither by the *Indians*, nor by us that mistake it not, but is wholly spent in perfumes either water or oyle, poulder, Pomanders, burning perfumes or the like, and is of an excellent sent, where or howsoever it is used. *Bauhinus* seemeth to referre that slender long fruite of *Clusius*, *Exot. lib. 4. c. 11.* unto *Alpinus* his *Felsel tavil*, and that it was naturall of *Florida*, but *Veslingius* sheweth it to be farre otherwise, as shall be shewed in the Chapter of Pepper, but I rather thinke it is the fruite of this *Benjamin* tree, or of the browne *American* Balsame before set downe.

CHAP. XIII.

Bitumen Indaicum, Dry Pitch of *India*.

THe *Bitumen* or dry Pitch, which the dead Sea in *Judea* casteth up at a certaine time of the yeare is for downe by *Dioscorides* to be of a shining purple colour, but that which is blacke, is adulterate; and *Matthiolus* saith that the *Asphaltum*, or *Bitumen* of the shops in *Italy* (and so with us is a mixture, and not the true thing) *Dioscorides* saith it is had from *Phenicia* (whereof *Judea* is but a part) from *Babylon*, the Island *Zacynthus* and *Sidon*: but that of *Babylon* which hath beene seene by many in these dayes, is held to be another thing, even the same that the builders of *Babel* used instead of mortar to cement their bricks; but that of the dead Sea is only in use and the best, which dead Sea or Lake is of a great extent, yet diversely proportioned by Writers thereof, for *Pliny* as I find *Matthiolus* quoteth him, maketh it to be an hundred miles long, and in the broadest place five and twenty miles over, but *Sir Walter Raleigh* in his Chronicle, relateth *Pliny* to make it lesse then our Moderne Travellers doe, who judge it to be eightene *Dutch* miles in length, that is 72. of ours, and two *Dutch* miles and a halfe in breadth, that is tenne of ours, accounting one *Dutch* mile to be foure *English*; *Iosephus* saith it is 180. Furlongs in length, that is two and twenty and a halfe of our miles, and 150. Furlongs in breadth, that is eightene miles and somewhat more of ours, such variety there is in Writers: This Lake or dead Sea is (called by *Galen* *Lacus Asphaltinus*) the same place where *Sodome* and *Gomorrah* with the other Cities stood, mentioned in *Genesis*, being then the pleasantest and most fruitfull valley of all those parts, exceeding *Hiericho*, and the parts thereabouts, which is about fiftene miles from it, and whose River runneth into it, and to drowned therein, yet no fish entereth into it; but now the tract of ground about it for a great compass beareth a sad face, and is either utterly barren and fruitlesse, or beareth such fruit as is onely faire without and dust within, and the aire noysome and pestilent, by the thicke infectious vapours arising from it, and is neither moved by the wind, nor will suffer any thing to sink therein, but will swimme on the toppe, and is not onely of a salt but bitter taste, which will corrupt any thing rather then preserve it, as salt Sea water will. There are other sorts of *Bitumen* in the World, as Historians report, as in *Cuba*, and sundry Fountaines neere the sea shore, calling it forth as blacke as Pitch. Another sort is in a Province of *Pernu*, where the place is voyd of rice or plant, and giveth a fat liquid *Bitumen* in this manner: Turfes of the earth, being laid on hurdles, the liquor dropping from them, by being set in the Sunne, is kept to heate and comfort any place affected with cold humours and tumours, cureth wounds, and is used for those griefes whereunto *Caranba*, and *Tecamabaca* serve: it is of a strong smell, and of a blackish red colour. The Inhabitants about this Lake, gather this *Bitumen* or Pitch, being an oyle or liquid substance on the water, and hardened by the aire, and spend it chiefly in pitching their Ships, but medicinally it discusseth tumours, and swellings, and mollifyeth the hardnesse of them, and keepeth them from inflammations, and is of singular good use for the rising of the mother, and for the falling sicknesse, to be burnt and the fumes thereof which are strong smelled unto: it bringeth downe womens courses taken in Wine, with a little *Cassoreus*, it helpeth the biting of Serpents, the paines of the sides and the hippes, and dissolveth congealed blood in the stomacke and body.

Petroleum quasi petra oleum or oyle of *Peter*, is a thinn reddish liquor, thinner than oyle of *Ollives*, and almost as thin as water, and is accounted to be a liquid *Bitumen*, and thought to be the *Naphtha* of *Dioscorides* by *Matthiolus*, because it is so apt and easie to take fire, even by the ayre thereof, and is gotten in sundry places of *Italy*, distilling of it selfe out of a Mine in the Earth, and in *Hungary* also, in a certaine place, where issuing forth in a well together with the water, the owner of the place thought to have the chinkes stopped up with mortar, which could not be done without light, the workman therefore taking a close lanthorne with a light in it, went about it, and being gone downe into the well to stoppe it, very suddainly, the *Peter* oyle taking fire, flew round about the sides of the Well, and with a hideous noyse and smoke, like the cracke of a peece of great Ordinance shot of, it not onely cast forth the Workman dead, but blew up the cover of the Well into the aire, and set on fire also some bottles of the oyle that stood by the Well, and many persons that stood thereby were scorched with the flame. This oyle of *Peter* is a speciall ingredient to make wilde fire, and is of a very hot and piercing sent and quality, and therefore is used for cold aches crampes and goutes, and to heale any greene wound or cut, suddainly, a little thereof being put into the oyle of *Saint Iohns* wort and used.

CHAP. XIV.

Blatta Byzantia sive *Unguis odoratus*. The sweete Indian sea fish shels.

THis Indian shell, of some sea fish, hath beene the subject of some controversie among the learned: for *Fuchsius* would make the *Onyche* of *Dioscorides*, and the *Blatta Byzantia* or *Unguis odoratus*, to be differing things, and then againe, he would make the *Blatta Byzantia* to be a bone in the mouth or fore part of the nose of the shell fish *Purpura*, or purple Periwinkle, and this he doth twice expresse in his Annotations on *Nicholaus Myrepsus*, in the composition of *Aurea Alexandrina*, and in *Diamargariton*, into both which compositions the *Blatta Byzantia* are to be put, but *Matthiolus* contesteth against this his opinion, and saith that these sweete shells called *Conchilia Indica* or *Unguis odoratus* are taken by *Serapio* and *Avicen*, and the latter Greeke writers, to be no other thing then the *Blatta Byzantia*. And againe that never any Writer accounted that bone in the nose of the fish *Purpura*, to be sweete or numbered among other sweete things, but that the ashes of their shells being burned was drying, and served to cleanse the teeth, and to retrain the excressences in the flesh, to cleanse ulcers, and to bring them to skinning: but on the contrary side, the *Arabians* have alwayes used the *Blatta Byzantia*, because they were of an, astringent quality.

quality, of thin parts & did participate of a kind of sweetness, and is good in the diseases and weakenes of the stomacke, the ill disposition of the Liver, the fainting of the heart, and the rising of the mother in women, and as *Dioscorides* saith is good also for the falling sicknesse, to burne them under their noses, that the fumes may ease their fits, and that none of these qualities were ever attributed to the purple Periwinkle shell. *Dioscorides* writeth that the best come from the red sea, and are white and fat, that is, will easily burne (but such did I never see) and that those that come from *Babylon* are blacke, but the fumes of both are like unto *Cassoreum*, which argues those not to be right that are in our shops, although some doe differ from others in the size, as is expressed in the table. Yet *Matthiolus* setteth forth in his Commentaries on *Dioscorides*, a certaine small long hollow shell, almost like a tooth, which I rather take to be the *Dentalis* of the ancients for *Unguis odoratus*, being likely such as were used in his time, which I have here expressed, in the same table with those sorts that our Drugists impose on us, being of two sorts, of broad and somewhat hollow brown shells, the one smooth, and the other rugged, and the one smaller then the other.

Blatta Byzantia seu *unguis odoratus*.
The sweete Indian Sea fish shell.

CHAP. XV.

Bolus Armenius, Bolarmoniacke.

He severall sorts of Bole or Bolarmoniacke that are to be seene at sundry times with us, doe testifie that we scarce know which to accept for the right, for *Galen* saith it is of a pale colour, and *Pliny* making three sorts, red, and lesse red, and a middle sort, sheweth that both red and pale were so called, and used alike, and most of the sorts that we have, have the notes and markes of the true, that is, it is a firme or close earth, heavy without gravell or stone, and for the most part wholly of one colour, without discoloured parts, which doth shew that not onely that *Bolus Armenius* which some call *Orientalis*, but many other of the finer sorts, found in other places, not onely as a mine of it selfe, but in the mines chiefly of iron, and some in those both of gold, silver, and copper, may faley be used for some of the same purposes: but because they all or most of them doe colour the hands or fingers of them that touch them, many have supposed that it may not unfitly be referred to *Galen's Rubrica Lemnia*, which was differing from the *Terra Lemnia*, because it coloured the touchers hands, which *Terra Lemnia* did not: or may be the *Rubrica Sinopica* of *Dioscorides*, which was of a liver colour, although peradventure in his time the *Alexipharmicall* qualities were not knowne to him or in his time; as his *Rubrica Fabrilis*, so called because Carpenters did use to strike their lines therewith, as we doe now with chalke, may be our common Bolarmoniacke, which is courser, more brittle, and used onely outwardly to stanch bleedings. All the best sorts of Bole with us, have such a clammy or sticking quality, which the ancients mention not, that is, if it be touched with the tippe of the tongue, it will cleave very fast thereto, and the stronger it cleaveth, and the harder it commeth from the tongue, the better is the Bole accounted of. And is used as a speciall remedy in all contagious diseases of the pestilence, small poxe or the like, and in pestilent fevers, and against poysons, and the venome of Serpents: it hath also a binding property to re-
strain all fluxes of the belly or of the sperme, or of womens courses.

CHAP. XVI.

Borax. Borace.

BORAX or BORAX called by the Greekes *Chrysocola* from the property of sodoring of gold; and *Tincal*, or *Tincal* by the Arabians, is said by *Garcias* to be a Minerall matter, gotten out of a Mine of earth, in a mountaine, about an hundred miles off from *Cambayette*, but this is not the *Chrysocola* of the Auncients, *Dioscorides*, *Galen*, and *Pliny*, which in their times was of a Greene colour, found in Mines ofundry mettals, made into pouther and washed often, and prepared for the purpose; but ours is made by many in our owne land as well as in others, by art as *Allome* is, into small pure white peeces. of no taste or but wallowish; and is easily beaten into pouther; the substance whereof it is made, being brought us out of the East Indies, and no place else that I know, and is certaine white stones, put into, or wrapped in fat or greafe, which is called unrefined Borace, and so brought to us, untill it be refined, as we have it to use: the properties whereof besides the sodoring of gold, silver, copper, &c. is of good efficacy, not onely inwardly taken to binde fluxes of the belly, as askes and the like, but the gonorrhea *passio*, or running of the reines, but outwardly to sodor up any cut or fresh wound in the flesh, and is often used also with other things as a *sum* for the face, &c.

CHAP. XVII.

Cambugio quibusdam Catharticum aureum. The golden yellow Indian purger.

THIS *Cambugio* as it is of late importation, so it is likewise of small knowledge unto us, whereof it is made, for but onely what we see of it to be a solid peece of substance, made up into wreathes or routes, yellow both within and without, and giving a yellow colour upon the moistening of it, we know not as yet, neither can we learne truely, whether it be a gum or hardned jayce, which it is the more likely to be of the two, because it will so easily dissolve in water, although some suppose it to be the juyce of *Euphorbium*, others of the purging Thorne: some thinke it to be made of *Scammony*, or *Tithymall*, others of Spurge, and some of the greater *Celandine*, other of the middle rinde of the Alder tree, and lastly *Banbinus*, because he would say somewhat, maketh a *quid si forte*, what if it be not the juyce of the flowers of *Ricinus* dried, and I say it is most likely to be the juyce of a peculiar herbe of that Country, that giveth such a yellow juyce as *Aloes*. I hath gained a number of names, partly from the sundry nations languages, and partly from the mistakings and ignorances of people: as *Ghitta jamaa*, or *Gutta gemou*, or *Gama gitta*, or *Gutta gamandra*, or *Cattagauma*, or *Cambici*, or *Cranbici* or *Cambugio*, and some others also, which I willingly omit: it is brought unto us out of the East Indies, and some say from *China*. The properties hereof are to purge both by stoule and by vomit, and is of much use with divers persons of good judgement and quality, who give from three or foure graines unto ten or twelve, or to a scruple or halfe a dramme, according to the age and strength of their bodies, and worketh gently with some, evacuating forth crude flegmaticke humours from the stomacke, and wheyish from the bowels without any trouble: but contrarily with others it worketh very churlishly, and with much perturbation of the stomacke: Some also use to make small pilles of it, and give it in that forme, especially if the humours be thicke, and not easie to be avoyded, and for that cause some will adde a little *Scammony* unto it to helpe the flow working in some bodies, some also to correct for the tenderer bodies will give it in the pulpe extracted from Currans in white Wine, as a corrector of the qualities, and some in the infusion of *Roses*.

CHAP. XVIII.

Champhora. Camfire.

CAMFIRE, called *Capbura* from the Arabians *Casar*, is such a subtle thing, both in substance and nature, that although it is the gum or liquour of a great vast tree, (like to a *Wallnut* tree, whose wood is somewhat solid and firme, and of an ashe colour like unto *Beech*, or somewhat blacker, the leaves are whitish like unto *Willow* leaves, but neither flower nor fruite have beene observed, yet is likely to beare both) partly distilling forth of it owne accord, but chiefly by incision, which commeth forth cleare and white, and hath no spot therein, but what it acquireth from their foule hands that touch it, yet what we have and use, seemeth plainly to be so made by art, being cast as it were or sublimed into broad round pannes or dishes, and little above the thicknesse of ones thumbe, cleere, white, and transparent, but not to be made into powther of it selfe, (although it is somewhat brittle, and will breake into many small peeces) without the helpe of a blanchd *Almond*, or some other such like naughtons thing, which hereby will reduce it into fine pouthers: neither will it be easily dissolved in cold water, but by warmth will be resolved like unto fat, being easily set on fire, and will burne in the water, serving for wild fire with the other things, and is of a very strong fierce sent, both lent and substance vanishing away, if it be exposed for a while to the open aire; yet the wood being made into severall workes, will smell thereof a long time: Some take it to be hot, because it is of such tenuity of parts. *Rhazes* saith it is cold and moist, but *Avicenna* saith it is cold and dry, and that it causeth watchings and wakelullnesse, and quieteth the senses of those that are hot, which are contrary one to the other, as *Garcias*, and *Scaliger* upon *Garcias* noteth it. Camfire doth coole the heate of the liver and backe, and all hot inflammations and distempers of heate in any place of the body, easing the paines in the head, and restraining fluxes, either of blood out of the head and nostrils, being applyed to the forehead with the juyce of *Houfelecke* or with *Plantaine* water, and some *Nettle seed*, or the fluxe of sperme in man or woman, using it to the reines or privy parts, and extinguisheth *Venery*, or the lust of the body: It is a preserver from putrefaction, and therefore is put into divers compositions and antidotes.

does to resist venome, poysons, and infection of the plague or other diseases: it is good in wounds and ulcers to restrain the heate, and is of much use with women that desire to preserve their beauty, by adding a lustre to the skinne.

CHAP. XIX.

Caranba. The Gumme Caranba.

Aranba, Caranna, or Caragna, is a gumme brought from the West Indies, whose tree is not described by any that have written of it, but is a soft kind of Gum, wrapped up in leaves that one peece should not stick unto another, for it is very cleaving, and is of a darke or muddy greenish colour, having somewhat a sharpe piercing sent: but there is another sort as *Monardus* saith, that is as cleere as Christall, which I never saw: It is a most especiall and speedy helpe, when *Tacamabaca* could not as *Monardus* saith be had, for all cold aches, and paines in the nerves and joynts, and the swellings and paines therein, the defluxions also of humours on them, or on the eyes, or on any other part to be laid on the temples or behind the eares: it is also used as well as *Tacamabaca* for the toothach to be laid on the temples like Masticke.

CHAP. XX.

Cardamomum. Cardamomes.

Here hath bene formerly much controversie concerning Cardamomes, whether we have either that of the *Grecians*, or those of the *Arabians*, some supposing we have neither, and that the Cardamomes we daily use, agree with neither of all their descriptions. *Theophrastus*, *Dioscorides* and *Galen*, among the auncient Greekes, and *Pliny* among the Latines mentioning but one sort, and the *Arabians* two,

Ateliguette sive *Cardanomonum maximum* et *Grana Paradisi*,
Ginny granes.

Cardanomonum minus & *vulgare*,
The ordinary lesser sorts of Cardamomes.

Cardanomonum majus vulgare,
The greater sort of Cardamomes.

Cardanomonum medium & minimum,
The two smallest sorts of Cardamomes.

a greater and a lesser, but *Fuchsius* and *Ruellius* thought the *Capficum* or *Stiliquastrum*, our red Indian Pepper in long horned huskes, was the *Arabians Cardamomum minus*, which *Mathiolus* disproveth as improbable, yea impossible, the difference both in forme and property so farre disabling it, and some supposing the *Melegueta* or *grana Paradisi*, which we call usually graines, or Ginney graines, to be the *Grecians Cardamomum*, and the Monkes that commented upon *Alesius*, tooke the said *Melegueta* to be the lesser *Cardamomes of Serapio*, all which and many other opinions may now be buried, and we better retolved that *Dioscorides* his *Cardanomonum*, not onely agreeth with *Galenus*, whereof divers made a doubt, because *Dioscorides* maketh his to be sharpe in taste, and fierce in sent, piercing the senses, and *Galen* pleasant, and not so sharpe or hot as *Cressles*: for *Galen* no doubt understood the same of *Dioscorides*, when in a receipt that he had from *Pamphilus*, 7. de comp. med. secund. locor. c. 3. he appointeth *Cardamomum delibratum*; *Cardamomes* that were husked to be taken, as also in *secundo antidot.* *Zeno* casteth away the huskes, and in the *Theriaca* of *Democritus* in verse, *Cardamomes* in huskes are named, and *Dioscorides* mentioneth not any huskes, or other forme thereof, because it was so familiarly knowne in his time, but that it was not easie to be broken, which the huske being tough doe declare: but it also agreeth with those we use in our shoppes, and with that which *Pliny* mentioneth, who as I said in the Chapter of *Anomum*, saith *Cardamomum* is like therunto, that is to *Anomum*, both in name and growth, but that the seed is longer meaning the huske with the seed in it, as it is used to be taken by him and others in many things. And that of *Dioscorides* agreeing with that we use in our shops, cannot be any other also then that of the *Arabians*, usually brought to all these Christian parts, from the East Indies as *Garcias* confesseth, and especially the lesser, which as *Garcias* saith is the better, although as he saith, they be both of one kinde, differing in bignesse, the bigger sort being some what longer and rounder, and the small shorter and not so great, but as it were three square. Now as concerning *Garcias* his opinion that the *Arabians Sacolas quibir*, and *ceguer Cardamomum majus & minus* was not knowne to the ancient *Grecians* or *Latines*, assuredly he was mistaken therein, for the notes and markes of *Dioscorides* his *Cardamomum* doe in all things agree both with ours in use, brought from India, and that of *Pliny* as I said before, so that now seeing both *Greekes*, *Arabians*, and *Latines* are thus reconciled together, there needeth not rest any further doubt hereof to use our *Cardamomes* in any of their receipts: but the *Melegueta* or *Grana Paradisi*, which is in forme like to a Figge, and full of reddish seed, although it be good and safe spice to be used, yet can it not be the *Cardamomum majus*, as divers have formerly taken it, and to this day is so supposed by many, but as *Garcias* saith, it may be the *Combabogue* of *Avicen*, the greater and lesser *Cardamomes* differ not in kind but in greatnesse, the one from the other, and is called as *Garcias* saith by the Merchants of *Malabar* *Erimelli*, by them of *Zeilan* *Ensal*, in both which places it groweth plentifully as *Garcias* saith, in *Bengala* and *Surrat* *Hil*, and of some *Elachi*, but generally of the common people *Dore*, in all those places: The Vertues whereof are these: it is hot and dry in the third degree: it breaketh the stone, provoketh urine when it is stopped or passeth with paine: it resisteth poyson and the sting of the Scorpion, or other venomous creatures, and killeth the birth if they be perused therewith: it is good against the falling sicknesse, the cough, the broad wormes, and the torments or griping paines in the guts, or bowels, and expelleth winde powerfully, both from the stomacke and entralls, easeeth those that by falls or beatings are bruised and broken, those that have loose and weake sinewes, and the paine of the Sciatica or hip gout, and used with vinegar it is good against scabbies: it is used in many of our compositions, cordials, Antidotes and others: the *Indians* as *Garcias* saith, put this to the composition of their *Betre* leaves, which they continually chew in their mouths.

CHAP. XXI,

Caryophylli. Cloves.

Although Cloves and Nutmegs, and some other spices and drogues were not knowne to *Dioscorides*, *Galen*, and the other ancient *Greekes*, for *Serapio* in citing *Galenus* authority for Cloves, is either false or mistaken, for *Paulus Aegineta* a later Greeke writer doth not mention it, neither yet doe the *Latines*, or *Pliny* in his time (for his *Caryophyllon*, or *Caryophyllon lib. 12. c. 7.* is a round graine like Pepper, as is shewed before with the *Anomum*, but greater and more brittle, and was taken by some in these dayes to be *Anomum*, and by others *Carpobalsamum*) yet were they knowne to the later *Greekes* by means of the *Arabian* Authours, who have brought a more ample and exact knowledge of the India commodities, and of many other things, then were formerly knowne, so that now what by the *Portugals* travels, the *Dutch* and ours by sea unto those parts; the tree hath bene well observed, to be great and tall, covered with an ash-coloured bark, the younger branches being more white, having leaves growing by couples one against another, somewhat long and narrow like unto the Bay tree that beareth narrow leaves, with a middle rib, and sundry veins running there through, each of them standing on a long footstalk, the ends of the branches are divided into many small browne sprigs, whereon grow the flowers on the toppes of the Cloves themselves, which are white at the first, with their sprigges, Greene afterward, and lastly reddish before they be beaten off from the tree, and being dried before they be put up grow blackish as we see them, having foure small toppes at the heads of them, and a small round head in the middle of them, the flower it selfe standing betwene those, consisteth of foure small leaves like unto a Cherry blossom, but of an excellent blew colour, as it is confidently reported with three white veins in every leaf, and divers purplish threads in the middle of a more dainty fine sent then the Clove it selfe, which is a small slender fruit, almost like a small nayle, and therefore called *Clavus* by many, and from thence the *Dutch* call them *Natgelen*, being of a hot quicke and sharpe taste, which are first ripe and gathered, and those that doe abide longer on the trees, doe grow somewhat thicker and greater, and are not of halfe the others goodnesse, being called by most *Fusses*, yet some call the stalkes of the Cloves *Fusses*, and grow of their owne falling, and are not grafted: Hereout likewise cometh a certaine darke red gum, and are found usually put together; These grow chiefly in the *Malacca* Islands, where they gather them twice every year, that is, in *June* and *December*, the leaf, bark and wood, being nothing so hot in taste as the Clove: they grow also in *Amboyna*, where they grow well, and beare plentifully, being there planted

Caryophyllorum asperes spuria.
A false figure of the Clove tree.

Caryophyllorum termela genuina effigie.
A branch of the Clove tree with the fruite truly expressed.

planted by the *Dutch*, in other places of the *Indies* more scarcely and lesse fruitfull then there, which are called generally by the *Indians* *Calefar*, and by those of the *Maluccas*, and in some other places *Chanque*. The properties of Cloves are many and excellent, being hot and dry in the third degree, yet some say the second, and of much use both in meate and medicine, comforting the head and the heart, and strengthening the liver, the stomacke, and all the inward parts that want heate, helping digestion, to breake winde, and to provoke urine: The oyle chymically drawne is much used for the tooth-ache, and to stop hollow aking teeth, as also to be put into perfumes for gloves, leather and the like, the Cloves themselves for their excellent sent, serving as a speciall part in all sweeter powders, sweet waters, perfuming pots, &c. *Garcias* saith that the *Portugall* women distill the Cloves while they are fresh, which make a most sweeter and delicate water, no lesse usefull for sent, then profitable for all the passions of the heart, the weakenesse of the stomacke, &c. and with the pouther of Cloves applyed to the forehead helpe the head ach coming of cold, as also by eating them procure a sweet breath: Some as he saith procure sweating to those that have the *French* disease, by giving Cloves, Nutmegs, Mace, long and blacke Pepper, but this hath no use with us. *Christophorus a Costa* saith that they binde the belly, and sharpen the eye sight, cleansing them and taking away filmes or clouds that darken it, if their water be dropped into them, and that foure drammes of the pouther of Cloves taken in milke, will procure and stirre up venery or bodily lust.

CHAP. XXII.

China radix officinarum. The roote China.

The roote called *China*, is like to the roote of a great reed, some flattish, others round, not smooth, but bunched or knotty, reddish for the most part on the outside, and whitish, or sometimes a little reddish on the inside, the best is solid or firme, and somewhat weighty, fresh and not worme eaten, and without any taste, but as it were drying: it groweth up with many prickly branches, of a reasonable great bignesse, like unto *Sarsa parilla*, or the prickly Bindeweed, winding it selfe about trees, and hath divers leaves growing on them like unto broad Plantaine leaves, the rootes grow sometimes many together, and may be eaten while they are fresh, and so the *Indians* doe with their meate, as we doe Carrets or Turneps: it not onely groweth in *China*, but in *Malibar*, *Cochin*, *Crauganor*, *Tanor*, and other places there, and is called *Lampatan* by the *Chineses*, and *Chophchina* by the *Arabians* and *Persians*. The properties whereof are many, and of great use with us in divers cases: it was at the first knowledge thereof to the *Christians*, and others that dwelt in *India*, chiefly used for dyet drinks in *Lna Vexerea*, the *French* disease, but since it is found profitable in agues, whether quotidian or intermittant, or pestilentiall, and also hec ticks and consumptions,

China radix officinarum. The true China roote.*Pseudochina.* Bastard China.

sumptions, to rectifie the evill disposition of the liver, the inveterate paines in the head and stomacke, and streng-
theneth it, and to dry up the defluxions of rheumes, to helpe the jaundise and the burstings in children or others,
by drying up the humour, which is the cause thereof: it helpeth also the palse, and all the other diseases of the
joynts and bladder, the gout and Sciatica, and the nodes also, and ulcers of the yard, and is good in all cold and
melancholicke griefes, some take it to be a great incendiary to lust: the manner of taking it is divers, for some
boyle it being sliced thinne, and steeped for a good while in water onely, and some adde wine thereto, and some
boyle it in the broth with a chicken, tyed up in a linnen cloath, and to take from a quarter to halfe an ounce or
more at a time, as the quantity of drinke or broth you will provide, or as the party can beare. We have had a
kinde of roote brought us from the West Indies in forme somewhat like unto this true, but harder, redder, and
more knotty, which some called bastard China, and was not used by any that I know, *Monardus* saith that the
true was planted in the West Indies, and brought from thence very fresh into *Spaine*.

CHAP. XXIII.

Cinamomum, Canella & Cassia. Cinamon and Cassia.

Know that divers learned men are of opinion that Cinamon, Canell, and Cassia are three distinct
things, differing each from other, and that we have no true Cinamon brought to us (which con-
troverisie is too long to insert in this place) but that which we usually have, is as they call it Canell
or Cassia, and not Cinamon, yet *Garcias* sheweth that the *Chinesse* and *Arabian* Merchants, and
others were the cause of this plurality of names given to one thing, and of the fables that are ex-
tant in *Herodotus* and others of it, and other things; and that the diversity of goodnesse, either thick-
nesse or blacknesse, or other outward forme, or quicke and sharpe taste, or dull and lesse sapid, or the place of grow-
ing made the severall sorts that passe under severall names, both now and heretofore with the ancient writers;
for if one would be curious now to search among the great store of Cinamon, that cometh from the East Indies
yearly unto us, as *Clusius* and others have done, he might finde as much diversitie both in goodnesse and colour
as he or any other did at one time or another: for being the barke of a tree, the goodnesse followeth usually, ei-
ther the place of growth, one being better then another, or the oldnesse of the trees, the younger being the thin-
ner and still having the quicker taste and the fresher colour; all the *Arabians* as *Garcias* saith doe generally call it,
be it of what sort soever, *Quersaa*, or *Quersa* (or *Korpha*, which in *Avicen* is a worse sort, as *Scaliger* noteth,
in *Zeilan Cuards*, by the *Persians* *Darjini*, that is, the wood of *Sina*, which the *Portugalls* first corruptly called
China, and from thence is the name China used by all others: but whereas *Garcias* saith that the name of *Cina-
momum* was given by those of *Ormus* that bought it of the *Chineses*, as though it were *China Amomum*. *Scaliger* in
his

Species from Cinamon, called Canell in some countreys resteth to be shewed: both *Garcia*, and *Monardus* speaking of the West Indian commodities in the 25. Chapter of his Booke, say that the tree is but one that beareth both these sorts, and that the variety of places maketh the difference onely: but because *Discorides* and the other ancient Authours have not onely made them as it were two kinds, but appointed them both to be put into one medicine, especially *Mithridatum*, and *Theriacale Andromachi*, and in the holy annoynting oyle in *Exodus*, we will a little more exactly scan the matter, for although we finde that all the Cassia or *Cassia lignea*, that cometh to us or was formerly knowne is the barke of a tree, and either rouled together like Cinamon, or not rouled but in small or great smooth peeces, and therefore may well be perceived to be a sort of Cinamon, yet the taste being glutinous lesse sharpe and quicke, and more stipticke then Cinamon, argueth it to be the barke of another sort of tree, although of the same kinde, and peradventure may be that kinde whereof I entreated in the 64. Chapter of the last Classis of trees, which I there call *Laurus Americana*. And although that which we have alwayes used come to us from the East Indies, yet that letteth not but that it may grow also in the West. And however both *Virgili* and *Pliny* call that herbe Cassia, which was sowne or planted in Gardens, as well for Garlands as to feed Bees with their flowers, as hath beene shewed before, yet they both doe mention a tree Cassia, *Virgili* secundum *Georgicorum* understandeth this tree Cassia, as it is likely in these words, *Nec Cassia liquidi corruptionis usus Olivi*. And *Pliny lib. 12. c. 9.* in these words, Cassia that groweth where Cinamon doth, is a shrub of three cubits high, but on the hills whose thicke branches have their barke more like unto leather, which must be emptied or hollowed in a contrary manner, unto that of Cinamon, for being cut into stickes of two cubits long, they are sowed into fresh beasts skinned, that the wormes may eate out the wood, and leave the barke whole, by reason of the sharpnesse and bitternesse: the three sorts of colour therein sheweth their goodnesse, that which is white for a foote high next to the ground is the worst; the next thereunto for halfe a foote is reddish, which is next in goodnesse, from thence upward which is blackish, and the best, and is to be chosen freshest, of a milde fence and of a very sharpe taste rather then biting, of a purplish colour, light in weight, and with a short pipe, not easily broken: Thus saith *Pliny*, which for the most part he borroweth out of *Theophrastus*, *lib. 9. c. 5.* where he saith Cassia is a shrub, like the *Salix Americana*, which because it is hard to be barked, men have invented the way by beasts skinned, as is before said out of *Pliny*: The barke being onely to be used, which I rather thinke to be a fable of report then truth: the rest that followeth in *Pliny*, is out of *Theophrastus* in his narration of Cinamon, where *Theophrastus* maketh five sorts, the lowest the worst, because it had least barke, and the uppermost the thickest as the best (which how likely it is that the barke of any shrub or tree, should be thinnest below, and thickest above, when as the contrary is alwayes seene in all sorts of trees, with us and others too I thinke) *Galen* in acknowledging Cinamon to be a tree with sundry branches, saith he hath observed not onely the branches of Cinamon to be converted, and very like those of Cassia, but those of Cassia also to be in all parts like Cinamon, and that which bore the name of *Zigi*, was so like to Cinamon, that divers told it for Cinamon, when it was but true Cassia. And againe saith that the *Junior Andromachus* mentioneth a kind of thicke grosse Cassia, which he called *Cassia fistula*, because it was rouled together like a Pipe. And therefore *Scrapio*, *Acicen*, and *Mesues*, in their compositions appointing *Cassia fistula* to be used, which as *Matthioli* doubteth whether it were their owne or their transcribers fault, this Cassia is not to be taken, but that which hath hard canes, and a blacke pulpe, more fitly termed *Cassia solutiva* or *nigra*, and which many yet doe use in stead hereof; but as *Leovicenus* saith, their error is too great to be excused, that appoint the shels of that *Cassia solutiva*, to be used to move womens courses, to helpe their hard travells in childbirth, and to expell the secondine or afterbirth. By all which that is now said, you may see plainly that Cassia differeth not much from Cinamon, and yet that is differing from it. *Lobel* giveth us the figure of another sort of Cassia, which was as thick as ones thumb rugged & in taste like unto the thick courser sort of Cinamon. Having thus shewed you the whole description of these things, and the various passages of them, let me also give you the Vertues which are these. Cinamon is hot and dry in the second degree, of very subtle parts, and very aromaticall, it is very cordiall, comforting the heart and strengthening a weake stomacke, easing the paines of the winde chollicke, especially the distilled water of it, the stopping of the urine and womens abounding courses, it causeth a good colour in the face, and a good sweet breath, and resisteth the poyson of venomous creatures, it is much used also in laskes to binde the body, the distilled water is most effectuall in all these griefes, but the chymicall oyle thereof is much more hot and piercing.

Xylocassia Lobelia

I thinke it not amisse in this place to make mention of some other barks of trees and rootes, that have beene brought both out of the East and West Indies: The first whereof called white Cinamon, being in long roule, white both within and without, turned together like unto Cinamon, is thicke and more tough then Cinamon, the taste is somewhat hot, and resemble Cloves rather then Cinamon both in taste and sent, being very aromaticall, yet lesse in each quality, then Cloves, so that one would thinke he had smelt and tasted weake Cloves.

Another sort rouled like Cinamon, not very thicke, which the *Dutch* as *Clusius* said *lib. Exor. 4. c. 2.* brought out of India, coming from the *Moluccas* and *Tava*, and which he doubteth whether it be not the Cassia of the ancients, or some of the sorts whereof *Discorides* maketh mention: some of it was whitish on the outside, and some more browne, like the worst sort of Cinamon, of no unpleasant taste, yet not so sharpe as Cinamon, and having a little clamminesse in the chewing, the people use the poulder in their meates.

Another *Clusius* maketh mention of in the same Booke and third Chapter, which was a foote long or more, and three inches in circuite at the lower end, and two inches at the top, had the outer barke thinner, then the inner, for it had two, and was very rugged, full of chinkes and with some holes, and sometimes two at a place in a certaine order, all the length thereof but set a thwart thereon, which seemed to be the places where the leaves grew, both the barks were of an excellent sweete and aromaticall sent and quicke taste especially the outermost.

Monardus speaketh of a Canell of the new world, growing in *Quito*: the trees saith he that beareth this Cinamon are of a meane bignesse and ever greene (as most of the Indian trees are) the leaves are like to those of the Bay tree, the fruite is like unto a little hat, as broad as a Doller, or *Spanish* peece of eight, and sometimes greater, the brimmes being of their thicknesse, and both inside and outside, of a darke purplish colour, smooth within and

Tree

Canella novioriel

rugged

rugged without, the toppe being higher, and had a stalke whereby it did hang, and was fastened to the tree, this fruit was in taste very like unto that of Cinamon, with some attraction joyned thereto, and the poulder of them strewed on their viands, was used for Cinamon, the barke of the tree was thicke, and had no taste or smell of Cinamon, the fruit onely being of use, and good to comfort the heart and stomacke, dissolve winde, mend a stinking treach, procureth a good colour in the face, and to provoke womens courses.

CHAP. XXIV.

Coculus Indus. Cocculus Indi.

These berries or round seed the *Italians* call *Cocco di Levante*, and the *French* accordingly, they are of a blackish ashy colour on the outside, having a white kernell within them of an hot taste, drawing water into the mouth, and as it seemeth grow many together like Ivy berries, yet each by it selfe on a stalke, some thinking them to grow upon a kinde of Nightshade, others on a kinde of Tithymall, or Spurge. *Casalpini* calleth them *Galla orientalis*, others *Bacca orientales*. They are wholly spent either to make baits to catch fish, with other things for that purpose, or the poulder used to kill lice and vermine in childrens heads.

Coculus Indus. Coccus Indi.

CHAP. XXV.

Costus. Costus.

These hither parts of *Asia minor*, and *Africa*, besides all *Europe* as it is supposed for many ages of these later times, have wanted not onely the use, but the knowledge of the true *Costus*, of any of the three sorts, that *Dioscorides* mentioneth, especially *Europe*, and it was the *Arabians* that first brought in the division thereof into sweete and bitter, when as neither *Dioscorides* nor *Pliny* make any men-

Costus Indicus Cl. fist.

Costis diversae species.

Divers sorts of Costes exhibited for Costus:

tion of bitterneſſe, although *Galen* doth, but of ſweeteneſſe in taſte, none of them all but *Aluarius* onely, who is one of the later Greeke Writers: *Garcias* to excuſe the *Arabians*, of this their diſiſion of *Coſtus* into *dulcis* and *Amarus* ſaith, that it might be that while the *Coſtus* was freſh it is white, and hath no bitterneſſe in it, but growing old, it groweth blacke and gathereth ſome bitterneſſe to it, by the decaying, but the Apothecaries ſhops, eſpecially in *Europe*, ſhew two ſorts, farre differing the one from the other, both in forme and ſubſtance. Of late dayes indeed they have bene more carefull and induſtrious to know the right, and to ſearch for it and uſe it, the *Portugals* therefore from the Indies brought in one ſort, which as *Garcias* ſaith was onely uſed there and no other, but as *Cluſius* noteth it in his *Scholia* thereon, this being a ferulous ſpongy ſtalke, with the toppes onely of the roote to it, differeth from thoſe of *Dioſcorides* and *Pliny*, the one intimating it to be a roote, by ſaying it was uſed to be adulterated or falſeyed by obtruding the rootes of *Helemium Comagenium* for it, which were neither very hot, nor very ſweete in ſent, and *Pliny* ſaying plainly it is a roote: but there hath bene very lately brought unto us a ſort of roote called *Coſtus*, and taken by many to be the *Syriacus*, yet ſome thinke it to be the *Arabicum* of *Dioſcorides*, being ſomewhat yellowiſh on the outſide, and white within, ſmelling and taſting ſomewhat ſweete like *Orris*, which therefore I judge cannot be right, which as *Pliny* ſaith is very hot in taſte and very ſweete in ſent, and *Galen* giveth it ſuch a degree of heate, beſides the bitterneſſe, that it will exulcerate the ſkinne: many therefore have ſubſtituted *Zedoaria* in the want thereof, which is the beſt ſubſtitution that can be, agreeing both in forme and degree, moſt of all thereunto; and therefore divers have contended that it was the true *Coſtus*, but in regard *Zedoaria* hath more bitterneſſe and leſſe ſweeteneſſe therein, it cannot be *Coſtus*, yet may be admitted as the ſubſtitute thereof, but *omne ſimile non eſt idem*: Some againe hold *Angelica* to be the blacke or Indian *Coſtus*, but being a homebred plant ſo, it cannot be, and beſides hath no ſuch bitterneſſe and ſharpenneſſe therein, as *Galen* giveth to *Coſtus*. The *Arabians* call it *Coſt* or *Caſt*, thoſe of *Syrat* *Uplot*, and in *Malacca* where they much uſe it *Pncho*. The Vertues hereof as *Dioſcorides* hath ſet them downe of the true *Coſtus*, (which as is beforeſaid is doubtfull whether we have or no) are theſe. It provoketh urine and womens courſes, and helpeth the diſeaſes of the mother, as well by bathing as fuming: two ounces thereof being drunke, helpeth the biting of *Vipers*, and is good againſt the paines of the breaſt, convulſions, or the windy ſitches, ſwellings or puffings in the ſtomacke, ſides or body, being taken with wormewood in wine, and being taken with ſweet wine it provoketh Venerie, it killeth the broad wormes of the belly: it is uſed with oyle to annoynt the body, before the cold fit of agues to warme it, and thereby to expell it, as alſo againſt the weakeneſſe of the ſinewes, and the hip-gout, and amendeth the diſcolouring or blemiſhes of the ſkinne and face, uſing it with hony and water, and as *Galen* addeth by reaſon of the light bitterneſſe, and much ſharpenneſſe and heate, it will exulcerate.

CHAP. XXVI.

Cubebe. *Cubebs*.

Cubebs are ſmall berries ſomewhat ſweete, no bigger then *Pepper* cornes, but more rugged or creſted not ſo blacke nor ſolid, being either hollow or with a kernell within it, of a hot glowing taſte, not ſierce as *Pepper*, and having each a ſmall ſhort ſtalke at them like a taile, and therein very like to a kind of *Pepper*, was for a while wont to be brought to us, which the *Portugals* called *Pimenta del rabe*, *Piper caudatum*, *Pepper* with a taile, and was forbidden by the King of *Portugall* to be brought any more leaſt it ſhould ſpoyle the ſale of the other *Pepper*: this ſaith *Garcias* groweth on trees

Cubebe. *Cubebs*.

leſſe then *Apple* trees, with leaves thereon narrower then thoſe of *Pepper* running on trees like *Ivy*, or rather like *Pepper*, but not like unto *Ruſcus*, called *Alyrtus ſylveſtris*, as *Matthiolus Silvaticus* thought, as *Serapio* ſet it downe but falſely: the flower is ſweete, and the fruit groweth cluſtring together, yet not in bunches as *Grapes*, but more ſeparate. *Ceſalpinus* tooketh them to be *Amomum*, many others out of *Avicen* and other Authours, tooke them to be the *Carpesium* of *Galen*, and ſome to be the ſeed of *Vitex*, or *Agnus Caſtus*. The *Arabians* call them *Quabebe*, and *Quabebe chini*, but in *Java* where they grow plentifully enough, and are there of ſo great account, that it is ſaid, they boyle them in water before they part with them, fearing they might be ſowne and grow in ſome other place and uſe them much to ſtirre up Venerie, and to warme and ſtrengthen the ſtomacke overcome with ſlegme or winde, and doe purge the breaſt of thicke tough humours, helpe the ſpleene, diſſolve wind and are very profitable for the cold griefes of the wombe: being long chewed with *Malticke* they draw much ſlegme and rheume from the head, and ſtrengthen the braine or memory.

CHAP. XXVII.

Curcama. *Turmericke*.

It is very likely that *Turmericke* is *Dioſcorides* his *Cyperus Indicus*, which he ſaith hath a roote like *Ginger*, giving a yellow colour like *Saffron*, being bitter in taſte, and a preſent helpe to take away haire: all which notes agree notably hereunto, the roote being much liker to *Ginger* then unto any kinde of *Cyperus*, and therefore we may marveile the more why *Dioſcorides* ſhould reſerre it to *Cyperus*, unleſſe he had underſtood of thoſe that had ſeene it, that it did grow like unto a *Cyperus*, and is very yellow both within and without, bitter in taſte, and may ſerve for the haire, as it is ſpecified, although peradventure the force is halfe loſt by the long carriage, but this is not the *Curcuma* of *Serapio* or *Avicen*, as *Matthiolus*

T t t t t a

thiolus

thiotus hath well noted, which is no other then the greater *Celandine*, whose roote is yellow, and therefore the Apothecaries in former times tooke it for *Cucuma*, and put it into the composition called *Diacucuma*. *Garcias* and *Christophorus a Costa* call it *Crocum Indicum*, and say that the Indians call it *Alad*, and *Manjale*, the *Arabians* *Hobet* and *Cucum*, the *Turkes* and *Persians*, *Sareh*, and *Darfard*, that is *lignum luteum*: it beareth larger and thinner leaves then *Miller*, of a paler greene colour, a stalk full of leaves, compassing one another to the toppe: the roote is slender and yellow, neere unto the forme of *Ginger*, nothing so bitter, being freshly reason of the moisture in it, as when it is dry. It is of great use with many for the yellow jaundice, either the poulder or the decoction being taken, for it doth open the obstructions of the gall and other parts, it is of very good use in old and inveterate griefes and sickneses, and an evill disposition of the body called *Cachexia*, and is very profitable against the dropic: it is much used to colour divers small workes of wood instead of Saffron, the Indians use it much both to season and colour their meates and brothes, because it is to be had better cheape than Saffron, and as *Garcias* saith is put into those medicines made for the eyes, and for the itch, if some juyce of Orrenge, and the oyle of the Cocar or Indian nut be mixed with it.

Cucuma, Turmericke.

CHAP. XXVIII.

Folium Indum five *Malabathrum*. *Folium Indum* or Indian leafe.

That *Dioscorides* and the other Auncient writers had divers false relations of drugges and other things brought unto them; which they have set downe in their writings, may be well discerned by this called *Malabathrum*, which they said as they were informed, did grow in ponds and watery places swimming thereon as the *Lens palustris*, Ducks meate doth: for it is well knowne now and so set downe by *Garcias ab Orta*, and other the later writers, that they ate the leaves of a great tree growing on land farre from waters in *Cambria*, as well as in divers other places of the East Indies, and called *Tamalapatra* by them, which by corruption was first changed into the Greekes *tauaradaca*, and then into *Malabathrum* but by the *Arabians* *Cadegi Indi*, that is, *Folium Indum*, and are faire broad leaves with three ribbes onely in them, a little pointed at the ends, which have beene brought unto us, although very sparingly, and among them some yet abiding on their branches, two usually at a joynt taking somewhat hot like unto Bay leaves; the barke of the branches also taking like unto them; among these leaves likewise have beene found sometimes a small fruite like unto an Ackorne in the cup, which it is most probable is the fruite of the tree, and gathered with the leaves: but hath beene formerly supposed by some to be the fruite of the Cinamom tree, and by others obruded for *Carpobalsamum*: Some have taken these to be the leaves of the Clove tree, but they are therein much deceived, for they have not those three eminent ribs in them that these have, which is a note to distinguish them from all other leaves almost, but some more probably have taken the leaves of the tree called *Betre* or *Tembul* to be *folium Indum*, because they have also some ribs in them, as *Marcus Oddo* doth in his examination of *Theriaca Andromachi*, but is also deceived, for the *Folium Indum* is not familiarly eaten as the *Tembul* or *Betre* leaves are: but whereas the substitute for these by our later Physitians appointment is the *Macis* which is the skinny covering of the inner shell of the Nutmegge, I find that *Avicenna lib. 2. c. 259.* appointeth *Thalisafar* to be taken, which he describeth in the same Booke, and 687. Chapter, and by the most judicious is the *Macer* of the ancient Greekes, which they knew better then *Macis*, which was utterly unknowne to them, but as if they were one and the same thing, it hath beene generally appointed, and is yet so taken to this day by most, but that *Macer* is not *Macis*: *Pliny* in his time sheweth plainly *lib. 12. c. 8.* saying *Macer* is the reddish barke of the roote of a great tree, called by the said name, comming from India, but there would

Folium Indum five *Malabathrum*.
Folium Indum or Indian leafe.

need fewer substitutes by many in our medicines as well *Mythridatum* as others, if our Apothecaries would be most carefull and industrious to give instructions to the Merchants travelling into those parts, and out of those Authours that have written of them to give the Arabian or Indian name, whereby they might get the *genuine* drugges: for as *Garcias* saith there might easily be procured so much of this *Folium Indum*, as would serve all *Europe* if it were but sought after, and so I may say likewise for divers other things. The properties are to provoke urine powerfully, and is very beneficiall to the stomacke, warming and strengthening it, and maketh a sweet breath, it resisteth the force of venomes and poysons, and therefore is put into Antidotes and other compositions that are cordiall or stomachicall: it hath the properties of *Nardus*, but more effectually being heated in Wine, it helpeth the inflammations and rednesse in the eyes being bathed therewith.

CHAP. XXIX.

Galanga major & minor. The greater and lesser *Galanga*.

Here are two sorts of *Galanga* a greater and a lesse: the greater is the weaker and duller in operation, and groweth in *Iava* and *Malabar*, to be two cubits high, having leaves foulding about the stalke at the lower end, being somewhat long and narrow, and pointed at the end somewhat like a speares head, of a sad Greene colour on the upper side, and paler above: the flower is white but without any sent, the seed is small and neglected: the roote is somewhat great at the head like the reed (but *Clusius* taketh it to be more like unto a Flower de luce, then unto an Asphodill as *Acofta* compareth it, and that the plant may be a kind of *Iris*) of a blackish colour on the outside and whitish within, and use it familiarly in their meates as well as in their medicines: The lesser kind riseth not above a foote high, having leaves like the Mirtle, the roote is small and bunched, firme and somewhat tough, red both within and without, and smelleth a little sweet or aromaticall, it groweth in *China*, where it is called *Lavandou*, the greater being called in *Iava* *Lancimaz* yet both of them are usually so called: it is more commonly planted by the roote as Ginger is, then of the seed, yet is both wayes encreased: There is great controversie among the later writers, concerning *Calamus*, *Acorus*, and *Galanga*, for some have held opinion, and is yet continued by many, that the *Galanga major*, is the true *Acorus* of the Ancients, which is an error easily confuted if they that so thinke would but compare the notes of *Acorus* given by *Dioscorides* with this *Galanga*: others deny our *Calamus* in the Apothecaries shops, to be the true *Acorus*, which *Matthiolus*, *Clusius* and others have most evidently maintained, and as I have shewed before in the end of the first Classis of this Worke. Some also have set downe in their writings that *Galanga* is the roote of *Schananthos*, but I may say *enarrasse est confutasse*. The lesser *Galanga* is both of more use, and of greater effect, and indeed is to be used onely in all the compositions wherein *Galanga* is appointed, and is very profitably given to cold and weake stomackes, and in the griping paines of the belly by winde, the diseases of the mother, and stop:

ping of urine, in which disease it hath a marvelous speedy operation, to cleanse the uritories from slimy slegme and stones gathered in them, or the passages in the necke of the yarde, as also to waste and consume away fleshy excrecence in the necke of the bladder or yarde: it also causeth a sweet breath, being sometimes chewed in the mouth, and helpeth a cold moist braine: it helpeth the trembling of the heart, and the wind chollicke.

CHAP. XXX.

Gummi Elemi. Gum Elemni.

His Gum being not mentioned with the former because we have not as yet attained the knowledge of the tree, from whence this Gum *Elemni* is taken; I reserved for this place: for although some have taken it to be the liquor or gum that floweth out of the wild *Ethiopian* Olive tree, yet it is most certaine it cannot be it, for it is said that the gum of the *Olives* will not burne like Rosin, nor melt with the heate of fire, as the Gum *Elemni* will doe, which is a yellowish kinde of Gum, cleere and transparent, which being broken sheweth more white and gummy within, quickly taking fire, and both burning and melting thereat, of a little quicke sent and taste. It is of especiall use in all wounds and fractures of the head and skull, to be mixed with the Balmes and oynments used for that purpose: it is also often used for the tooth ache, when the paines come by the defluxion of rheume into them, to lay a plaister thereof on the temples as they doe with Masticke.

CHAP. XXXI.

Guajacum sive Lignum Sanctum. Lignum Vite.

He *Lignum vite* that groweth in some parts of the Indies, is much better then in others, yet is the wood of all, hard, firme, close and heavy, so that it will sinke in water more then Ebony and not swim, of an hot sharpe and resinous taste, somewhat burning in the throate: the blacker or browner is better then the yellow, being in a manner all heart, the yellow being as it were but the sappe: The tree groweth great with a reasonable thicke greenish gummy barke, spread with sundry armes and branches both great and small, and on them winged leaves set by cou-

*Guajacum sive Lignum sanctum.
Lignum Vite.*

*Guajaco Oceldisco similis arbor.
A West Indian tree like Guajacum.*

ples one against another, which are but small thicke, hard, and almost round, with divers veines in them, abiding ever Greene on the branches: at the joynts and ends of the branches come forth many flowers, standing in a tuft together, every one on a long footstalk consisting of sixe whitish yellow leaves, not very great with some thirds in the middle, which afterwards turne into flat yellowish gristly fruite, of the fashion of the seed vessell of a *Thlaspi* or *Bursa pastoris*, that is, with two divisions, and in the one side a hard gristly seed, as hard as an horne almost, the other being for the most part empty, hanging downe together by their long footstalkes: it yeeldeth forth also a gumme or Rosin, of a darke colour, which will easily burne; it groweth in sundry places of the West Indies, where they call it *Guajacan*, and wee in Latine thereafter *Guajacum*, by some *Lignum Sanctum*, and *Lignum Indicum*, and taken by some to be a kinde of Ebony, for the firmesse and weightinesse, others a kind of Boxe. But as I have said heretofore in sundry places of this Worke, most of the Trees and Herbes that grow in the Indies are differing from those that grow in *Europe*.

Guajaco Occiduo similis arbor. A West Indian tree like Guajacum,

The branch of this tree I have here exhibited unto you, as *Lobel* hath set it forth before, not having had the like brought since his dayes that I know, which sheweth a more supine negligence in all our Sea men, then heretofore was usuall, which he hath described in this manner. The tree is great from whence this was taken, growing upright, whose barke was like unto that of the *Indus* tree: the Greene leafe, of the forme of a *Pomecitron* leafe, but thicke and smooth like unto the Bay, but larger and shorter, with sundry veines running therethrough, at the toppes of whose branches grow cods, of a leather like substance, and round forme in a manner flat like a peece of mony, in whose middle is contained flattish seed, like unto a Lenti'l, both for colour and forme, and bitterish taste.

Palus Sanctum India Occiduo. A differing Indian Guajacum.

Lobel hath remembered this also in his *Adversaria* after this fashion: Divers have thought this to be a *Palme* like the last, or *Palus Sanctus*, a stake of such a holy tree, which yet is differing from it or *Guajacum*, howsoever it was so signified: for the tree is not very great like unto an *Ash*, but smaller, and the barke much like it in colour: the leaves were like *Plaintaine* leaves but thicker, fatter, smaller and shorter: the fruite was of the bignesse of a *Wallnut*, which served them to purge their bodies.

The diseases for which the usuall *Guajacum* is appointed, that is, both the wood, the barke and gum, are sundry, helping all cold flegmaticke and windy humours, and although they are good, and with effect used for Epilepsies or the falling sicknesse, catarrhes, rheumes and cold distillations on the lungs, or other parts, coughes also and consumptions, the gout and all other joynt aches, and many other the like diseases, and to make the reech white and firme, if they be often washed with the decoction thereof: yet was it first only used for the French disease, as we and the *Spaniards* call it, the *Neapolitane* as the French call it, the *Spanish* pippe as the *German* call it, but as it is indeed the Indian contagion: for when *Christophorus Columbus*, commonly called *Columbus*, first opened the West Indies to the *Spaniards*, they companying with the Indian women, got this their familiar and naturall country disease from them, and brought it with them from *Santo Domingo*, being the first place the *Spaniards* possessed there, unto the King of *Spaines* campe, which was then at *Naples*, treating of a peace with the French King, in Anno 1493, bringing of the Natives with them, both men and women: The Physicians in those times not knowing this disease or the causes thereof were of divers opinions, some taking it to proceed from the corrupt victualles that the souldiers were forced to eate, which bred melancholicke and adust blood, and humours, others to the conjunction of *Saturne* and *Mars*, and thereupon (not knowing it to be a new disease) they called it by divers names, as the Leprosie, the running scabbe, the poxe and the like, referring it to some of the ancient knowne diseases, but all in vaine: the cure hereof by this wood, first was knowne from whence it first sprung: for a *Spaniard* being plagued with this disease, having an Indian that played the Leech, to be his servant, was cured thereof by drinking the decoction of the wood given him by the Indian, which cure was presently divulged, not onely to the rest of the *Spaniards* in the Indies, but in *Spain* also, and so consequently to the whole world.

CHAP. XXXII.

Hermodactylus. *Hermodactiles*.

Hermodactiles are to be numbred among the unknowne Drugges, the shame of the Physicians in all ages and countries, who (although they put of the matter to the Apothecaries, and the Apothecaries to the Merchants that bring many sackes full into their Countries with other commodities, but they also take no further care to know what they are, or where or how they grow to declare it) should be skillfull in the knowledge of all Plants, and should give order that the unknowne might be made more manifest: but what doe I in so saying? runne my Barke on the Rockes and put her in danger of splitting. Divers of the later Writers, as well Greekes, as *Arabians* and Latines have made mention of the *Hermodactile*, (although none of the Ancients) and have set downe the properties, well knowne by experience unto them, but no one hath ever declared either the place or manner of the growing thereof, but onely *Mesues*, who maketh a shew of description, which is almost as good as nothing, saying it is a roote of a mountaine herbe, whereof some are long like a finger, and are round, white both within and without, which every one may see by the sight, but that any should be long like a finger, is but rather his supposition from the name, then that he ever saw such indeed, and therefore divers have imagined diversly, some taking them to be the rootes of *Colechicum*, but they are dangerous if not deadly, besides the unlikenesse in forme, colour and substance: others take the *Dens Caninus* to be they, but they are more unlikely, for they are small and long, not thicke and short, as the *Hermodactiles* are: besides the quality no way agreeth, therewith *Martholus* first tooke the *Orchis Serapias*, called *Palma Christi*, the handed teetle to be they, because the word *ἑρμῶδαι* signifieth *Hermes* or *Hermi* dactylus, *Hermes* fingers, and these rootes being like the fingers of ones hand, may well be so called, but having

having himselfe refused this error, he fell into another as bad, taking *Iris tuberosa*, the Velvet Flower de luce to be *Hermodactyles*, for the same cause that the rootes thereof runne out like fingers, which are such silly opinions that he may justly be beaten with his owne rod, that is, be taxed as he doth others, that in referring Plants doe not examine and well perpend each part, rather then any one, before they determine of any thing: for *Hermodactyles*, notwithstanding the Etimology of the word, have no shew or likensse of fingers, but are small and somewhat flat, thicke and short white rootes, yet some are blackish which are not good, of the fashion almost of an heart, as it is painted on the Cardes, of substance firme, yet soft and easie to be cut or made into poulther, and of little or no taste, but drying, Master Finch our London Merchant was her-in deceived, by taking the kernells of the *Tribulus aquaticus* Water Caltrope, for *Hermodactyles* as I thinke, as I have shewed you in that Chapter: Yet I would we might be better informed of the truth herein, that if any can finde that bigger fruite, growing in any of the ponds or waters in our Land or elsewhere, by breaking the woody shells of them, and comparing the kernells with our *Hermodactyles* in shops, that so thereby we be fully assured of the truth hereof. It is most effectuall in purging flegmaticke, slimy, and watery humours from the joynts, and therefore conduceth to helpe the gout and other running joynt aches, it is also of much use with other things for dyet drinckes, that are made of *Gnaphacum*, *Sarsa* and the like, and to very good purpose.

CHAP. XXXIII.

Lacca. Gum Lake.

Lacca is no gumme distilling out of trees as other gummes doe, although it will melt with heat and burne with fire as they will, but is a certaine peculiar matter, elaborate and wrought by certaine great winged Ants that breed in the ground, and sucking out from great trees of divers sorts but especially from that which is called *Mala Indica*, hereafter set downe, from which they take the substance of what they work, about the smaller branches (as Bees doe their hony and hony combs) and make this *Lacca*, which is a darke red substance, somewhat transparent, somewhat like, but harder then any Gumme, which being chewed will make the spittle looke red, and is first wrought on stickes by the Natives of the Countries (the Ants I meane) then melted being cleared from the stickes, and the wings of the Ants, and made into cakes or thin peeces, which are so brought tous as well as on the stickes, and is the originall of the hard waxe, wherewith Letters are sealed by the helpe of a candle, whose collours of red, Greene, yellow or blacke, are added in the new melting of it againe, and making into such roulees as we buy it to spend, but some to adulterate it, and make it cheaper, put usually waxe into it, which maketh it softer and runne quicker: it is called as *Garcias* saith by the Indians in *Pegu*, and *Martaban*, where the best is made, *Tree*, but elsewhere generally by the *Arabians*, *Persians*, and *Indians* *Lac*, and *Lac Sumutri*, as though it were made in *Sumatra*, but that saith he is not so, for it is but imported thither, and exported againe into other Countries. Great controversies are extant about this *Lacca*, whether it should be the *Cancanum* of *Dioscorides* or no, for the name of *Lacca* was neither knowne to him, nor any of the *Grecians* or *Latines*, nor yet to *Paulus Aegineta*, a later Greeke writer, or in the age where in he lived, as *Scaliger* setteth it downe in his notes upon *Garcias*, although *Avicen* and *Serapio* seeme to cite *Paulus* to be of that opinion: but *Garcias* saith that neither *Avicen* nor *Serapio* knew *Lacca*, because they make it to be like *Myrrhe*, and that it is sweete (as *Dioscorides* saith *Cancanum* is) and therefore used as a perfume, both which properties are wanting in *Lacca*, and further saith *Avicen*, that it hath some properties of *Carabe Amber*, although unlike it in substance, and yet *Carabe* is knowne to be drying and binding, and *Lacca* is an opener of obstructions: And againe he saith that *Lacca* falleth from the aire, upon Service trees, when as neither any Service nor Medier trees grow in India as *Garcias* saith, and that it is the gumme of a tree growing in *Arabia*, and that it is brought from *Armenia*, which things if they be true concerning *Cancanum*, they are not so for *Lacca*, for so they say it is the *Cancanum* of *Dioscorides*, and from their opinions have the succeeding ages beene led to hold the same error for the most part: for the Monkes that commented upon *Mesues*, substituted *Sanguis draconis* for *Cancanum*, whom *Matthiolus* confuteth sufficiently: Some againe tooke *Benzoin* to be *Cancanum*, which is as cronnious as any: *Amatus Lusitanus*, and *Garcias* doe both agree, that the true *Cancanum* is the Gum *Anime*, called by some *Anijum*, especially that sort that is whitish and cleere, like unto white Amber, for there are three sorts brought from *Ginny*, and those parts by the *Portugals*: The second sort is blackish, somewhat like unto *Colophony*, which *Amatus* taketh to be the *Myrrha Aminea* of *Dioscorides*. The third sort is yellowish and dry like *Rosin*, but all smell sweet being burned, and are good against cold griefes. The *Lacke* or *Laake*, which is a colour for Painters, is made of *Brassill* or other dying stufes, & hath in former times been put very ignorantly by some Apothecaries into the composition called *Dialacca*, but that error is well reformed since the true *Lacca* was brought and made knowne to them. *Lacca* is hot in the second degree, it strengtheneth both the stomacke and liver, and freeeth them from obstructions, and dissolveth the hardnesse of the Liver, helpe the yellow jaundise and driveth forth

Lacca. Gum Lake.

forth the watery humours of the drop sic, provoketh urine and helpeth to breake the stone both in the kidneyes and bladder. Turners may herewith let a firme and dainty red colour into their Workes, by holding it therteto in the turning,

CHAP. XXXIV.

Lapis Bezar. The Bezar stone.

He Bezar stone that is now frequent with us, but not that minērall Bezar stone of *Serapio*, and the other *Arabian*, whose knowledge is now quite lost, is of so high esteeme, even next unto Vnicornes horne, and of so much and excellent use in Physicke that I could not leave it out from the number of those especiall drugges we have for use in our shoppes. There are two sorts thereof to be had, the one brought from the East, the other from the West Indies, and knowne by the severall names of their Countries: the East Indie Bezar is the best, both in estimation and use, and commeth to us in sundry formes, and of sundry sizes, for some are great, and those are for Princes and great persons, because they are not onely more rare to be found, but thought to be of the more efficacy, and therefore as Diamonds, Pearles, &c. the price of them riseth according to their greatnesse, *Garcias* saith he had one weighing almost five drammes, as if it were rare to have one of that bignesse, but I have seene some that have weighed above foure ounces, and some much more (but I am in doubt that they were counterfeited, and made so great by art, that they might be of the more esteeme, for I accounto the small ones or those of a meane size to be the truest and best, if any be) some are round, others long or somewhat flat, yet all of them for the most part of one colour, that is of a darke ash-colour, or Greene darke Olive colour, and smooth shining, (as if they were made out of one masse of stuffe and polished) with sundry coates, scales or fouldes like Onions, some more, some lesse, according to the greatnesse of the stone, and the scales thicker or thinner also thereafter, having in some a straw or peece of haire wrapped close together, or a little poulder in the middle whereabouts the stone is formed, and is accounted the best and truest, others have small stones of fruites, or other things in the middle of them, which are not thought so good, but rather counterfeited, being of a firme substance being broken, I meane the scales: the best is gritty, and easie to be bruised into poulder, and as some say dissolving in water, if it lye long therein (which I am in doubt is a signe of imposture) and is insipide without any taste at all. The West Indie Bezar is likewise of divers formes, sizes, and colours, some having scales thicker or thinner, and some none, with either poulder or peece of a roote, or some other thing in the middle of the stone, but is of nothing that account with us as the East Indian Bezar is, although some thinke they are taken from one kind of beast, and as *Iosua Ferrus* saith in his Booke of secrets, Printed in the Italian tongue, (on whose relations concerning these beasts, and the Bezar taken from them, *Baptista Cortesius*, hath commented in his eighth decade *Miscelaneorum medicinalium*.) there are six sorts of these beasts, in the West Indies in whom they breed, but that those onely are of most vertue that are taken from those beasts that live on the hills and mountaines, and feed on the more vertuall herbes there growing, and namely *Contrayerva* as the Spaniards call it, which maketh the stone to be the more effectuell (for as *Ferrus* saith, some of the roote hath beene found in the middle of the stone,) they for the most part grow in the Plaines and Champion grounds: the beast as *Monardus* describeth it, being but one of the fixe sorts, is almost as bigge as a stagge, and of the like quicknesse and agility, but bodied like a Goate, with hornes turned backwards (the figure whereof as *Clusius* was informed, he hath set forth with the forme of an hoofe, as it is in his *Scholia* upon *Garcias*, and I here exhibite their formes unto you with the stones) and therefore the Natives call them mountaine Goates (ye shall have *Ferrus* his full relation of them all, in another worke hereafter) but more properly peradventure as *Clusius* saith, *Rapi capre* Rocke Goates, (but *Petrus de Osmia* in his Letter to *Monardus* describing that beast or Goate, which onely as he saith breedeth in the Mountaines of *Peru*, and in no other Countreyes in those Indies beside; and out of which they gathered their

Lapis Bezar cum ungula & cornuaria malis.
The Bezar stone with the hoofe and horne of the beast.

Bezar

Bezar, said that they had no hornes) and are of a reddish browne colour for the most part, so swift of foote that they were onely to be caught when they were killed or shot with their Musquets, the stones grow as he saith there, in a certaine purse or skinne in the maw of the beast, wherein the wholesome herbes that they eate are received and kept, untill by rumination and chewing them anew, they passe them into their bodies, and saith moreover, that the stones that breede in the beasts that feed on the mountaines, are of much more vertue then of those that feed on the plaines: those of the East Indies as *Garcias* saith are had from *Malacca*, and divers other places, as well as *Persia*, but none are like in goodnesse unto those that are brought from *Persia*: The Moores he saith are so excellent in the knowledge of them, that by sight they can tell of what Country breeding they be, and whether they be counterfet or no, by crushing them in their hand a while, and then breath on them, and if any wind passe through them they pronounce them false. The stone is called as *Garcias* saith *Pazar* by the *Arabians* and *Persians* from *Pasan* which signifieth a Goate, but we call it corruptly *Bezar*, and the *Indians* *Bazar*, (but *Scaliger* correcteth this error in him, and sheweth that the *Arabians* unanimously call it *Balzabar*, that is *Alexipharmacum*, for they tooke the word from the *Persian* word *Bedezabar*, because it resisteth poyson, and we thereupon doe call all those things *Bezardica* that are resistors of poyson, as *Antidotes* and the like. But the ancient *Arabians* had a minerall *Bezar* of divers colours, which they celebrated to be of as great or greater efficacy then this stone, the true knowledge whereof as I thinke is either utterly lost, or as *Monardus* saith of his owne experience of no worth. This *Bezar* stone is not onely used against poysons and venomes, but against the pestilence, and contagious diseases, in malignant fevers also, and in many other diseases to provoke sweate, and thereby to expell evil vapours from the heart and vitall spirits, and for swoonings, and against melancholly also, and the diseases that rise from thence, and to preserve strength and youth, by taking it foure or five dayes together, ten graines or lesse at a time, after the evacuation of the body: the poucher thereof put on the place that is bitten by any venomous creature, doth free them from danger of death, and likewise put into a plague sore that is opened, it doth the like, *Monardus* hath set downe many experiments of the *Bezar* stone, upon sundry and severall persons infected with sundry diseases, as who will may read them at length in that treatise which he wrote concerning this *Bezar*, and the herbe *Scorfonera*: but especially against poyson or venome, and citing the testimony of *Rabbi Moses Egyptianus*, saith, these three are by experience the most effectually in the world therefore, that is the seed of the Citron fruite, the *Smaragd* or Emerald stone, and this *Bezar* stone. These testimonies I thinke are sufficient to evince that opinion is held by many that there is no vertue, or at least no such vertue in the *Bezar* stone as it is related, which they thinke by some tryall that they have made thereof, and not answering their expectation doth confirme them the more in that opinion: but if they have orderly proceeded, and heedfully observed, not for one but many times, and in many persons, and have been sure of right and good stones, that they have given, and yet have done no good, I would rather say there is some defect in the constitution of our bodies, by the moisture, &c. of our climate, then disabie the verity of such reports of famous and worthy men.

CHAP. XXXV.

Liquidambar. Liquid amber.

Liquid Amber is a thicke Rosinlike Gumme, dropping of it owne accord onely by incision from certaine huge great trees in the West Indies that are full of branches, covered with a thicke ash-coloured barke, having leaves like unto Ivy leaves, which gumme is of a very strong sweet sent, somewhat like unto *Storax liquida*, and may well be used instead thereof, but there is another courser sort, made by boyling the branches, and scumming of the uppermost fannesse that is gathered there, which is thought to be that *Storax liquida*, that is usually sold in the Druggists and Apothecaries shops: out of the first sort while it is fresh and laid in the Sunne, there droppeth a certaine cleare reddish yellow oyle, called the oyle of Liquid Amber, and of some that know no other, Liquid Amber it selfe: which because it is the purer part is more effectually and of the milder sent, some using it with other sweetes to perfume gloves withall, but is of singular good use, either of it selfe or mixed with other things, to comfort and warme a cold moist braine, used like unto an ointment, and easeth all paines and griefes that rise of a cold cause, being applied thereto: it wonderfully comforteth and strengthneth a weakke stomacke, helping digestion and procuring an appetite, but more effectually if it be mixed with some *Storax*, and a little Muske, and Amber, and laid as a plaister to the stomacke: it likewise is profitable in all cold griefes of the mother, warming mollesying and dissolving all tumours, and opening the obstructions and the courses that are stopped, it is hot almost in the third degree, and moist in the first.

CHAP. XXXVI.

Macer Gracorum. The Gracians Maecr.

Many taking *Macer* to be *Macis*, and both one thing have erred egregiously for of *Macer*, *Dioscorides*, *Galen*, and *Pliny*, have written and shewed the faculties; but of *Macis*, which is one of the barkes or coverings of the fruite of the Nutmegge tree, they have not made any mention, being a thing utterly unknowne unto them, for if they had knowne it, they must needs have heard and knowne of the Nut or Nutmegge, whole covering it is; but *Macer* is as they all say, a yellowish barke, which must needs be understood of some tree, *Galen* saith that *Macer* is of a cold and earthly essence, and but little hot: but *Macis* is of much heate and no cold. And *Pliny* saith plainly that it is the barke of a great roote, and *Avicenna* and *Serapion*, both knew the difference, and entreate of them distinctly in severall Chapters, calling this *Thalysifar*. This *Macer* being called *Macre* by the *Indians* as *Acofia* saith, is a vaste

and large spread tree, (the barke onely of whole rootes they use) greater then any Elme, whose leaves are fixe or seven inches long, and two inches broad, of a pale Greene colour on the upper side, and deeper Greene on the under side, bearing a small yellow fruite no bigger then a penny, heart fashion, tasting like an Allmond or Peach kernell, covered with a double thin transparent skin like a bladder, close joynd together, and growing out of the middle of a leafe, which is as bigge as the rest on the tree, but that it is a litle rounder pointed, and narrower towards the stalke, being of a colour betweene red and yellow, and crumpled with divers veines therein, and like unto the bladders of the Elme tree leaves: every part of this tree giveth milke as the Mulberry tree doth, and hath very great and faire spread rootes like the *Ilex* or Evergreene Oke, covered with a thicke, rugged and hard barke of an ash colour on the outside, and white within, full of milke while it is fresh, but turning yellowish when it is dried, very astringent and a litle sharpe or biting withall, which vanisheth quickly: it loveth to grow in moist sandy grounds, and killeth all the herbes that would grow about it, and is found in *Malabar Cochlin*, *Crangaror*, and many other places and Islands in the East Indies; the *Portugals* call it *Arbore delas Cameras*, and some *Arbore de Santo Thome*, and *Macruyre*. The barke of the roote is used much in all the Hospitals, and of great account with the Indians to cure laskes and fluxes of the belly, or blood, and give it either in poulder mixed with some sower milke, or steeped in whey all night and taken in the morning, and sometimes if it be needfull as *Acosta* saith, they put some *Opium* to it to make the medicine the stronger, and the *Arabians* put both *Opium* and Nutmegs to it and so cure them: the said barke also stayeth vomitings or castings, and strengthneth the weake stomacke.

CHAP. XXXVII.

Manna granata & liquida. Manna in hard graines and liquid or thin.

Manna is of two sundry sorts, the one hard and in peeces, either greater or lesser, the other liquid or thin like the thinner or at least lesse thicke honey, yet some have thought that the *Manna thuris* was that Manna that was used in shops, but *Monardus* in one of his Epistles confuteth that error, shewing that it is but the small peeces and dust of the *Thus* or *Obbanum*, that became so by the bruising and rubbing of one peece against another in the carriage. Of the dryer or hard sort there is some diversity for that which is gathered in *Arabia* differeth from that in *Persia*, and called *Transchibil*, being in small graines somewhat like unto Coriander seed, and is gathered as *Ranvolius* saith, from those trees the *Arabians* call *Agall* or *Alhagi*. Another sort is reddish and gathered from herbes and plants. That of *Persia* is called *Xiroast*, that is, *Lac arborum*, the milke of trees and is white like that of *Calabria*, whereof some is as small as Hempe seed, others as big as Allmond Comfits, yet *Garcus* saith that the liquid sort is so called by them. Another sort is gathered in *Armenia*, in great lumps as *Ranvolius* saith of a brownish colour. Another sort is affirmed by *Aphrodisius*, cited by *Niger*, that falling as an honie dew on mount *Libanus* in *Syria*, is by the heat of the Sunne congealed into a hard Sugar which the Inhabitants call *Sacchar*, from whence came the Latine word *Saccharum*. All these sorts are recorded by sundry Authours, some contrarying one another as is aforesaid, and might be much more amplified, if this place were fit for it, and therefore as I take it I have taken the truer reports: but whereas some have thought that some of these smaller white sorts might be the Manna of the *Israelites* wherewith they were fed, and therefore called bread, and that from heaven, yea Angels food, not that Angels feed thereon, but *ut spon*, per excellentium, the choyselt and chiefeft, for forty yeares together in the wilderness of *Sinai* and *Arabia*, it sheweth that such have had little conversation with the holy Scriptures, as a learning not fit for them to understand, which is flat against such conceites divers wayes. First that this of theirs had no purging, but a nutritive quality: secondly it was not so Sugar sweete as ours in taste: thirdly it fell not on certaine dayes, that is on their Sabbaths, although it did all the weeke after: fourthly it fell all the yeare long, and not the Summer onely as our Manna doth: fifthly it vanished away as soone as the Sunne grew hot upon it, but ours is condensate thereby: sixthly it would putrefie if it were kept but two dayes except the Sabbath: And lastly as it is in *Jobna*, the 5. Chapter, and 22. verse. That Manna ceased to fall any more, after they had eaten the corne of the Land, which was the morrow after the Pascheover, whereby you may see how vaine the conceites, and long altercations of men are, about those things whereof they are ignorant, or not sufficiently instructed: this is but *obiter*, and therefore to proceed. In *Europe* we have Manna, and called *Calabrina*, as being thought not to be found in any Country besides, but both *Matthiolus* and *Bellonius*, and some others also doe testifie there against, upon their owne sight and knowledge, as *Matthiolus* that in *Goricensi*, and *Tridentino agris*, hee gathered it himselfe and *Bellonius* in *Briancon*, and others in other places, but there is a great controversie and contention amongst many learned men: first whether it be onely a dew of heaven condensate by the cold of the night, or whether it be as a gumme issuing from trees, being incised or wounded as other trees are that yeeld gummes: The Monckes that commented on *Moses*, and to likewise divers others were confident that it issued from wounded trees like gumme, and was no dew from heaven, for proove whereof they alledge that the trees being over spread or covered with any cloath or the like, there would not be found in the morning that any dew had fallen thereon, and yet the trees yeilded the Manna, which *Matthiolus* thinking to disprove, saith it cannot be found to reason or the course of nature, but rather that the matter happeneth in this sort, that the dewes falling on the dry barks of those trees were drunke up by them, and was forced forth againe in small peeces like gumme in the heate of the yeare, not being the proper juyce of the trees, but what it had gained as aforesaid, and that this kinde of Manna was more loose and spongy, and lesse operative then the other, and that this happeneth by the secret and hidden property in nature, especially of those trees to containe this dew in them in lumps, and not to be liquid as on others all about them: A second controversie is whether Manna be gathered onely from the mannered or wilde Ash or no, some affirming it strongly, and others denying it as stoutly, as is before said, that *Matthiolus* and *Bellonius* doe declare: A third controversie is, whether it be onely peculiar to *Calabria*, and *Apulia*, or not, which although some affirme for *Calabria*, yet ye heare as before, it is to be found in many other places. The other sort that is liquid or thin, is gathered both in *Asia* and *Europe* alike, but that of the *Levant* is both more plentifull

plentiful, and more both usefull and operative, for although in many *European* Countries, and in our Land likewise a kind of honey or sweet dew hath beene found on trees and herbes in the heate of Summer, and in some places so clammy, that the Mowers sithe cold hardly cut the graisse, for the clamminesse thereon, untill the Sunne had beene some time thereon to consume it and dry it up. The *Arabians* and others call it *Terenjabin* and *Tran-jabin*, the *Greekes* as *Galen* saith *ῥοκισμα & σιχημα*, and *Cordus* thereafter *Drosomeli*, *Pliny* calleth it *Mel ex aere*, or as others, *Mel acreum*, *Mel roscidum*, or as *Hippocrates*, *Cedrum mel*, and others *Manna liquida*, or as *Matthi-olus*, *Manna purgatoria*: but a little to shew you my minde concerning these sorts of Manna, that as the liquid sort is both for substance and property alike, but that the *European* is not so plentifully to be gathered: So I verily thinke that the diversities in the other dryer, both for forme of greater or smaller peeces, or colour of white browne, or reddish, is rather from the climate and dispositions of the Heaven to be hotter or more temperate: but it seemeth to me very strange if true, that in *Calabria* onely the *Fraxinus* or *Ornus* should sweat out Manna, by lancing their barkes, when as in other countries both of *Europe* and *Asia*, it is gathered from sundry other trees, where no sort of Ashes grow, and that no Author mentioneth any cutting of their barkes, to cause them yeeld Manna. You heare my opinion, whether true or false, I leave to them that can verifie or disprove it, by prooffe, and true judgement. The properties of both these sorts of Manna are neere alike in purging, being of a meane temper, yet a little more enclining unto heate, or as *Averrhoes* saith, hot and moist, for by their gentle working they may safely be given to children, and women with child, and put with other purgers they helpe their working and evacuate choller: but because the grained Manna is both more frequent and more of use with us (the other being seldome seene or used) I will rather insist on the properties thereof which is that beside the purging quality, it quenchech thirst and doth lenifie the hoarsonesse of the throat, and allay the sharpnesse of choller, and the nauseous humours in the stomacke: the often use thereof for those that are much given to be collicke is very profitable, to be either taken alone or to be put instead of Sugar into brothes, drinckes, or other things.

C H A P. XXXVIII.

Moschus. Muske.

Muske is a precious matter, and both is and hath beene of great worth and esteeme, not onely to perfume things with, but for medicine to great good use: The beast is deciphered out by some to be a kind of wild Goate, or Bucke Goate, that is, betwene a Bucke or Deere and a Goate, and therefore some call it *Dorcus Moschi*, others *Gazella Indica*, and some *Capreolus Moschi*, others make it to be like a Foxe, others like a Greyhound, and some a goodly reddish beast *Gudderi*, some againe say it breedeth onely in *Golebanda*, and some say in *Pegu*, a Country in the East Indies, and molt sore in the Country of the *Tumbacanes*, others say in *China* or *Cathaya*, others againe say none breedeth in *China*, but is brought thither from other places: It hath a big body, and two tuskes say some, others say two above and two below, in the lower mandible of the jaw, sticking forth like a Bore or Hogge, and without hornes say some. This beast as it is said by some, when it is in the heate of lust hath a certaine swelling rising thereby: the stomacke, the blood and matter gathering together, raiseth an Impostume or bile, which the beast desirous to be eased of, refusing meate and drinke in the meane time untill it be ripe, doth then rub it selfe against the stones and stumps of trees, whereby the Impostume breaking the matter congealed sticketh on those things, which by the heate of the Sunne and temper of the climate is hardened, and all the ill sent (if it have any) consumed thereby, the perfect sweet sent remaining, and this is the best and choyest Muske is to be had, and gotten by great persons, chiefly to serve their use. Others report that every full Moone it hath neere the navell under the belly an impostume, or bladder full of blood, which the hunters after they have taken them, doe cut of and dry them in the sun, which becometh the best Muske. But there are other sorts besides those that are more plentifully to be had and sold to the Merchants, gotten and made by art: for having hunted those wilde Goates and killed them, they cut them in peeces, presse out the blood and dry it, and sometimes putting a little of that purer Muske thereto, they put it up into small purses as it were made of the said beasts skin, and this is the usual Muske sold by these counterfeiters and false deceivers. Besides the great use of Muske, for all sorts of perfumes, and to weare about one, it is very beneficiall to comfort the heart and fainting spirits, and taketh away the passions and trembling thereof, maketh it merry and joyfull, and helpeth to expell sadness, it comforteth warmth and refresheth the braine and senses, quickening the dullnesse thereof, and is a helpe unto Venery: it is put into many cordiall pouthers in our shops, and into many other compositions for the same purposes as also for delight into many other things. It hath beene observed by some that the dung of a small beast, that is like a Weasell called a *Marterne*, smelleth somewhat like Muske. The female Crocodile also hath a small bladder or skin about the maw, which smelleth so strongly of Muske, that the waters wherein they breed, and are plentifull of them smelleth so strongly thereof, that few can abide to drinke thereof, and molt doe refuse it therefore. There is also a kinde of great water-Rat that smelleth like Muske, &c. But I reserve the relation of the many wonderful Workes of God in nature, to another Worke.

C H A P. XXXIX.

Mumia. Mumme.

Mumie which is called *Mumia*, of *Pomponius Mela*, *Conditia corpora & Medicata sanera*, of *Pliny*, *Servatus corpora* (being of much and excellent use in all Countries of *Europe*) is the very body of a man or woman; (brought chiefly from *Egypt* or *Syria* adjoining, and no other part of the world so good) Embalmed after the manner was used in those Countries onely, (and not with Aloes, Myrrhe, &c. as being

being those things the *Jewes* and others used to embalm their dead bodies, nor yet with *Pissalphaltum*, as it is likely other nations did) which was with *Cedria* and *Nitar*, that did so consume the moisture of the carcase, and preserve it from putrefaction, that it was thereby made to endure entire and unconsumed for ever: for the *Egyptians* in former times being wonderfull ingenious, and of a most subtile knowledge in all humane wisdom, (as it is recorded of *Moses* to be learned in all the wildome of the *Egyptians*, *Act. 7. 22.*) mistaking as it should seeme the custome of the *Latines*, which was to burne their dead bodies to ashes, and to preserve them in an urne: as also that of the *Greekes* to bury them whole in the ground: would to excell them take another way to preserve their bodies, (expecting a resurrection as it is thought) from either fire (which as they were taught by their Phylosophers was a monitrous beast, that devoured all things untill it was full, and then perished or dyed with that which it had devoured) or water, or earth that wormes should not consume them, and therefore with *Nitar* as with salt they preserved the carcase from corrupting and stench, and with that Tarre, and Tarre water, called *Cedria* (which was made from the stickes of both the Cedars burnt, as is used to make Pitch, and Tarre, from Pine and Pitch tree stickes with us) they besmeared oftentimes the body all over, and wrapping them in many fouldes of linnen, which did so burne as it were, and consume by time all the moisture both of

Mumia. Mumme.

the *Arabians* taking *Mumia* to be *Pissalphaltum*, and so did *Matthiolus* also, *Brassavolus* to be *Asphaltum Indicum*, and to be used instead thereof, which *Matthiolus* mistaketh, and seemeth to allow better of the *Pissalphaltum*, or the *Aloes*, *Myrrhe* &c. wherewith the bodies were stuffed, being altered in time by the moisture of the carcase in the grave, as is before said then of the body it selfe, which is called *Mumia*, and therefore would have bodies to be so embalmed and kept, that the embalmings might be used, but assuredly, neither the one nor the other can be called *Mumia* rightly, nor are of that effect, for although *Serapio* and *Avicen* say that *Pissalphaltum* and *Mumia* are all one, and therefore whatsoever property *Dioscorid's* appointeth unto *Pissalphaltum*, the same they attribute unto *Mumia*, which was their error, yet *Galen* and *Panlus Aegineta*, by saying that *Pix liquida*, is a fit substitute for *Pissalphaltum* doe intimate that it is of another quality then *Mumia* is, and commeth farre short thereof: It is hot and dry in the second degree, and easeth the paines in the head, comming of cold and moisture, the Megrome swimings, and falling sicknes taken in a decoction of Marjetome, & helpeth a cough taken in pisan drinke, it is cordiall for the heart and preventeth the danger of poyson, or the venome of the Scorpion and other serpents, dissolveth winde both in the stomacke, spleene and bowels, stayeth the hickocke and bleedings, both inward and outward, dissolveth the congealed blood of bruises by fals or otherwise, and helpeth the ulcers of the bladder, and the retention of urine, being taken in Goates milke: it is also very profitably used against pallsies, crampes, and distentions of the mouth, the hardnes and shrinking of the sinews, and lamenes in the feete through cold and wet.

CHAP. XL.

Myrrha. Myrrhe.

MYrrhe is the gum of a certaine tree growing in *Arabia Ethiopia*, and other places, as it is thought *Theophrastus* and *Pliny* declare the various reports of the face or shew it beareth, one contrary to another, so that it may be doubted whether any of them be true, seeing they be but guessees at the likelyest report. I have not heard or read, that any now adayes hath seene the tree that beareth it. *Dioscorides* saith that it is not unlike to the *Egyptian* Thorje, meaning *Acacia*, without mentioning any report, and is got

VVVVV

tem

ten by cutting or wounding the tree, that the gumme may flow forth, in the canicular dayes, as other gummes are gotten. We have many sorts thereof, in good nesse some better or worse then others, as in great and small peeces, fat and dry, pulverilientous like, pale and more red all alike, or else discoloured, with some whitish peeces in it, which is the best, for whereas *Dioscorides* commendeth that which is somewhat Greene, I have not seene any such, nor read that any hath ever seene it, and it is very likely that the Greeke word *υπ'χλωες*, which *Dioscorides* useth, may be used *pro colore palliditate*, as well as *subviridi*, and so *Rondeletius* noteth it in his Chapter de *Gobio pisce*, and to be taken here in the former sence. Myrrhe as I said before is in sight so like unto *Bdellium*, that they are tooe mistaken by those that are not expert, but hath these notes and differences: it is extreame bitter, and so is not *Bdellium*, it is paler, fatter, easier to be broken, and of a more quicke sharpe sent, so that the best Myrrhe, may be both knowne of it selfe and hereby from *Bdellium*, that it is of a purplish browne colour, in great peeces and fattish (for the greater peeces retaine their fatnesse longer, and are not so soone dried by the ayre) with some whitish peeces or veines therein, extreame bitter in taste, and smelleth somewhat sharpe and bitter withall. Divers have diversly thought of Myrrhe, some supposing Myrrhe to be *Benzoin*, and *Bdellium* to be Myrrhe, and that we had no true Myrrhe, &c. *contra*, that we had Myrrhe and no true *Bdellium*, because so little that was good, was formerly brought to be used, that they might be plainly distinguished, and the rather because that *Galen* saith Myrrhe, will be sometimes changed into *Opocarpasum*, which is venomous and deadly, and is so like it, that as he saith in his time many were killed therewith, who yet finding it to be very effectuell for sundry diseases of the eyes, thought it might be as effectuell for inward diseases: the notes of which *Opocarpasum* (as *Galen* calleth it, or *Opocarpasum* the juyce of *Carpasum* as *Dioscorides* calleth it in his sixth Book and 13. Chapter among the venomous plants, but maketh no description thereof in any of his former Bookes) as I finde them set down in *Weckers Antidotarie* in the examination of Myrrhe) are these: because saith *Wecker* true *Opocarpasum* is not usually to be seene to compare it with Myrrhe, yet if you shall perceive in Myrrhe some peeces to be much differing both in sent and taste from true Myrrhe, you may wel & not without good reason judge that it is changed into *Opocarpasum*, for although both in colour and substance it be like to the best Myrrhe, with whitish veines therein like unto the nailes of ones hand, yet examining it more thoroughly, it will be found not to be Myrrhe, and that there will likewise some reddish cleere spots appeare therein: it behoveth therefore to be cautelous in the choyse of Myrrhe, that you be not deceived with the shew or likenesse, but observe that it have all the true notes of true Myrrhe, least while you thinke you have the true Myrrhe, you have this poyson, if it be inwardly taken, which consumeth the corrupt mattering and watering of the eyes to be used outwardly: which metamorphosis (if it be true, or that *Gathanum* should be changed into *Sagapenum* or *Cassia* into Cinamon were very miraculous yet herein the

old Authours are very frequent, but I thinke of these miracles, which are the conversions of substances, as I doe of their transmigration of soules) *Dioscorides* maketh no mention of it, but saith that the juyce of *Carpasum* (whether herbe or tree) was venomous as *T-xuu*, *Cicutia*, and many other was, and to be cured with the same remedies that *Cicutia* was. *Dioscorides* saith that out of the fattest Myrrhe called *Pediasmos*, being pressed is taken *Strache*; yet *Pliny* saith that the trees doe sweate out *Strache*, of their owne accord before they be cut, which is accounted to be the *Styrax liquida* of our shoppes, both by the *Arabians* and other later writers as *Matthiolus* saith, himselfe also being of that opinion, whereof I cannot but mervaille that he or any other duely considering our *Styrax liquida*, both the forme and sent so farre differing from Myrrhe, should thinke it to be pressed out of fat Myrrhe, being of so fine a sharpe bitter aromaticall sent, and the *Styrax liquida*, rather loathsome then pleasant. *Dioscorides* maketh mention of one sort of Myrrhe called *Aminnea*, which *Galen* calleth *Minea* (*Matthiolus* taking them to be divers, and not one sort of Myrrhe) which some thinke to be the Gumme *Anise*, called by the Portugalls *Gum Anijum*, coming from *Ethiopia*, for there is another of the West Indies whereof I shall intreate hereafter, but herein I thinke they are deceived. *Galen* saith that Myrrhe is hot and dry in the second degree, and therefore is good for wounds in the head: and by the bitternesse which is not little, it killeth the wormes in the belly, and the living childe, expelling the dead: it hath in it also a binding quality, whereby being mingled with eye medicines it helpeth ulcers and great scarres, and for the same cause is good to be put among those things are good for an old cough and shortnesse of breath, the bitternesse not harming the winde pipe or throat, but gently clenning and heating, it helpeth the roughnesse of the winde pipe or throat, saith *Dioscorides*, and those that are hoarse, and have lost their tongue as we call it: it is good also against the paines of the sides, the laske and bloody flux, and rheumaticke distillations; it speedily procureth womens courses and mollifies the hardnesse of the matrix; it also taketh away the shivering fits of agues, being taken two houres before it come: but *Matthiolus* saith that by taking a dramme of Myrrhe in Muscadine, using it three times, an houre before his fits, he was cured of a quartaine ague, but he did therewithall presently after the taking thereof sweate moderately in his bed: pilles likewise saith he made with it and Treacle, is effectuell for the same purpose, to take one at a time as bigge as a pease, an houre before the fits for many dayes together: it is also a great preservative in the Plague or pestilence, and against the venome or poyson of Serpents and harmefull creatures, and therefore is put into Antidotes and counter poysons: it is a singular remedy for a stinking breath, fasteneth loose teeth, and stayeth

stayeth the shedding of the haire, being used with *Liduum*, and the wine of Mirtles, it helpeth mattering eares and watering eyes, and taketh away the filme or skinnie that beginneth to grow over and darken the sight, it helpeth to breede flesh in deepe wounds, and to cover naked bones, *Matthiolus* commendeth it as a singular *fucus* for the face to take away wrinkles that come by age, and to make it smooth and youthfull to be made into an oyle as it is called, or rather the liquour of Myrrhe, which is made with egges boyled hard, cut in the middle, the yolkes taken forth and filled up with poulder of Myrrhe, then put into a glasse and set in a Wine celler or moist place, and with this liquour to be bedewed: As also another way, that is, by sprinckling with white wine, a new iron dish or pan made hot in the fire, and taking first the fumes thereof unto the face, being covered over with a cloth, and then the fumes of Myrrhe in poulder, afterwards cast on it being heated againe, and the head covered as before, and this still to be used before bed time, for eight dayes together.

CHAP. XLII.

Nardus Indica five *Spica Nardi*. Spicknard.

Garcias ab Orta, intreating of this Spikenard testifieth that there is but one sort knowne, and used as well by the Indian and *Turkish*, as the *Persian* and *Arabian* Physicians, and although some would intimate that this is not that was used by the Ancients, in that *Pliny* setteth it downe lib 12. c. 12. that it was not to be had but at an excessive price, yet that hindereth not, in regard both all the Countreyes of the Indies are better husbanded then heretofore, and especially that since the *Portingalls* had opened the way by Sea, all sorts of Drugges were provided better and better cheape by much, the charge of *Caravans* being excessive chargeable by their long journey and travaile, but I thinke both the Drugges and the Indies, by being more sought by *Venetians* and other Christians was the beginning of the reformations, for when *Arabians* and the like were the chiefe Merchants,

Nardus Indica. Spicknard.

much bad Merchandize was dearly sold, howsoever cheapely bought, and I thinke much more adulterated both by them and Jewes, and the Indians also were not behind to sophistlicate whatsoever they could, which the Christians I verily suppose did somewhat alter, when they became great Merchants for Europe, and since is rectified more and more, when onely the sincere and pure is bought, and the other left on their hand to mend if they can, but yet it falleth out that the blinde eateth many a flye, I meane the ignorant is often deluded, who through covetousnesse oftentimes letteth passe the better to take the worser at cheaper rates: but to the purpose in hand. This Spicknard groweth not in many places, and where it doth, it is not very plentifully it is a roote yet called a Spike, because it shooteth up hairy stalkes of hairy like Spikes, many set together, of a brownish colour, and whereas *Dioscorides* saith the roote is of no use, yee must understand the word in a double sense: the rootes that *Dioscorides* meant, be the short fibres, whereby it draweth its nourishment and encrease from the earth, and these indeed be unprofitable and of no use; but the rootes that *Galen* speaketh of, are the Spikes themselves or Spicknard, for so he calleth them both, lib. 1. *De Antidotis*, thus saying; *Inter Andromachus adijcere Nardum Indicam, ea vero est quam spicam vocant non quod spica sit radix enim est, sed quod spica formam referat.* And in lib. 9. *de comp. med. sec. locos.* He useth somewhat neere the same words: but in that some object, it is not of a sweet sent, such as *Dioscorides* recordeth of it, *Garcias* saith while it is fresh it is sweete, but time may decay some part of the sent, and besides sweete smells were otherwise taken with the Ancients then with us, witnesse many things, as *Galbanum Alium*, &c. were reckoned sweete, much differing from the opinions now received, but thus I have shewed you the acception of the roote and Spike of this *Nardus* and the sweetnesse: Both *Dioscorides* and *Pena*, have recorded that it doth beare a stalke and leaves, yet have not mentioned what flowers it hath, neither is the other bastard or French Spikenard of *Lobel* shewed to have any, which I have exhibited in the first Classis of this Worke, but the like was found in *Virginia* by Master *John Tradescant* the younger, with such like long Greene leaves as is deciphered in that, the roote also answering so neere unto the French *Nardus*, but of a paler blackish colour, and without any sent that I could perceive, and besides all this, he found it with the spike of flowers and seed at the toppes of the stalkes, which were turning or winding, the head standing on a small naked stalk, somewhat like (I meane in the turning) unto the *Scurvula prassum anguinum*, or *Convolutio capite*, the great Turkey Garlicke with a twined head, consisting of two or three rowes of small bright brownish chaffie huskes, hairy as it were at their ends, and standing all on one side of the stalkes, for foure or five inches long. This bastard kinde bearing such an head, doth perfwade me to thinke

VVVVVV 3

this

this Indian kinde to have also some other whether the like or no is not to be determined but by sight. The properties of this Indian Spikenard are these: It is of an heating and drying quality, provoking urine, and slaying laskes, and both the reds and whites in Women: it taketh away the loathing to meate, and the gnawing of the stomacke usually called the heart-burning, it conduceth helpe to swellings, to the stone in the kidneys, and to the Kings Evil: the decoction helpeth the inflammations of the mother if they sit therein: it helpeth to bring haire on the baire eye lids: it is not only an ingredient into the two famous Antidotes, *Theriaca Andromachi*, and *Mithridatum*, but into sundry other compositions appointed by the Ancients, but because I would not make a double repetition of the same things, having declared the properties hereof at large in the 42. Chapter of the first Classis of this worke, I must referre you thereunto.

CHAP. XLII.

1. *Palma sive Nux Indica vulgari ferens Cocos*, The ordinary Indian Cokar Nut.

Here cannot be found in the world, a tree that hath so many necessary commodities for mens uses to be had from it as this Cokar Nut: the tree groweth to be huge great and vasse, whose body or stem is covered with a smooth barke, bare or naked without any branch to a great height (for which cause the Indians doe either bore holes therein at certaine distances, and knocke strong pegs into them which sticke out so much as may serve for footing to get up into the tree, to gather the juyce or liquor and the fruit, or fasten ropes with nayles round about the tree at spaces which serve as steppes to goe up into it) and toward the top spread sundry great armes which bowe themselves almost round, with large leaves on them like the Date tree but greater, whose middle ribbe is very great, abiding alwayes greene, and with fruit also; continually one succeeding another: from betweene the lower boughes come forth smaller stalkes hanging downe, bearing sundry flowers on them like unto those of the Chestnut tree: after which succeed large great three square fruit or nuts, ten or twelve, or sometimes twenty thereon together, as big as ones head, or as a small Pompon almost round, but a little smaller at the end, covered with a hard tough darke ash-coloured barke, and within it an hard round woody brownish shell, but blacke being polished, having at the head or toppe thereof three holes, somewhat resembling the nose and eyes of a Monkey, betweene which outer barke and this shell, grow a number of grosse threds or haire, or such like stuffe, whereof is made cordage, stronger and more durable in the salt Sea, then any made of hempe; within the woody shell, there is a white kernell, cleaving close to the inside thereof, of the thicknesse of ones finger or thumbe, or thinner, as sweete and pleasant as an Almond while it is fresh, having in the middle thereof a pint, two or three, of cleare dainty sweet water, as pleasant as milke,

but as it groweth either to be over ripe, or being kept to be older, so much lesse pleasant will this liquour be, and either grow sower or thicke by time, and be quite spent and consumed, it hath bene observed that sometimes there will be floating in this liquour a small lump or ball, as cleere as a pearle, and very sweet in taste, which is as the sprout, which have sprung forth a stalk rising through one of the holes at the head, and rising two palmes above it hath shot forth fibres for rootes. The name and uses whereunto this tree, and the fruite, and those things that are made thereof serve, are these. The tree it selfe is called generally by the Indians *Maro*, in *Malacca* *Trican*: but in *Malabar* *Tengamaran*, by *Avicen* *Giausi* al hend, which is *Nux Indica*, by *Serapio* and *Rhasis*, as *Garcias* saith, *Iavelnare*, yet that word is not found saith *Celsus* in our Bookes, but *Neregil*: the Latines call it *Palma Indica* & *Coccifera*, to distinguish it from the *Palma Dactylifera*, the timber whereof is not spongy or like the *Fernulas* as *Garcias* saith, but solide and firme, blacke and shining like the *Walnut* tree, fit for building of houses or ships, and other things, as *Garcias* himselfe saith a little after, this tree saith *Garcias* is of two sorts (or rather as I thinke kept for two uses) the one to beare fruite, the other to extract the liquour issuing thereout, when the branches are cut, or when it is bored and received into Gourdes, or other such like things tyed thereto, which liquour they call *Sura*, and is like troubled Wine in shew, but in taste like new or sweete wine which being boyled is called *Orragua*, and being distilled is made like unto *Aqua vite*, which they use to the same purpose that we doe ours, and will burne like it, and is called *Fula*, and being set into the Sunne will become good vinegar, but that which runneth last being suffered to abide in the Sunne untill it grow hard, or boyled to the hardnesse will be Sugar, which they call *Iagra*. The branches saith *Garcias* (but *Ferdinandus Lopes* saith the leaves) are called *Olla*, and serve as umbrells to keepe off Sunne and Raine, and in such like leaves, saith he, was written the first Letter that the King of *Calecut* sent to *Emanuel* King of *Portugall*, upon the *Portugals* first arrivall into his Country, they serve likewise to cover houses, to be defended from raine, the fruite is called by the Indians generally *Narel*, which is common both with the *Persians* and *Arabians*, but in *Malabar* *Tenga*, and while it is Greene and not ripe *Eleni*, the *Portugals* call it *Coguo*, that is a Monckey, of the likenes of a Monckys face, and from thence hath risen the word *Cocus* or rather *Cogu*, which the three holes represent, and at *Goa* *Lamba*, of the hairy stuffe or hardes which is next the outer barked of this Nut, called by the Indians *Caira*, are made not only Cordage and Tackle for ships, but cawking stuffe, which is better to cawke ships then any other stuffe, and being beaten, the finer stuffe is made into girdles and cawles for women (sailes clothes also, but not any fine stuffe or cloath like any fine linnen) both of the meaner and better sort at *Lisibone*, as *Celsus* saith he saw and observed, but as *Garcias* saith, while this Nut is young it hath a tender barked which may be eaten, and tasteth like an *Artichoke*, of the browne hard inner shell, being polished and made blacke and shining, is not onely made cups, to drinke in, set in silver or other metall, which made *Sepulveda* to draw the *Portugalls* to thinke that it doth helpe those that have the Palsie to drinke out of them, but *Garcias* saith it hath no likelihood: but being burned into coales serve the Goldsmithes for their uses: who goe about in the streetes crying for worke, and carrying some necessary tooles for the purpose with them, of the inner white kernell, which is hollow, cleaving falt to the inside of the hard woody shell, which is an inch or two or lesse thicke, firme and falt tasteth sweet like an *Allmond*, they make bread especially while it is fresh, for the fresher the Nuts are, the sweeter will the meate thereof be, and doth nourish much, being good for macilent bodies, and to encrease sperme and Venerie, and is good to lessenie the harshnesse of the thoroate, and the hoarsenesse of the

Nucula Indica altera.
A little Indian Nut, and another called
Nichenbetbenes.

the voyce, and eaten oftentimes with *Iagra* before recited, or with Sugar, or else being broken and bruised they draw forth a milke, like unto Allmond milke, wherewith they boyle Rice, and is as sweet as the milke of Kine, or Goates, or else herewith, and the flesh of beasts or birds, they make certaine meates, which they call *Carib*. The fresh kernels being broken and dried after the outer rinde is pared away, are called by them *Copra*, and is sent as a merchandise into other Countreys, that have either none or not sufficient store to serve their use: which taste much pleasanter then any of those that are brought from thence into these parts, it is used also as a stirrer up of Venerie, and to encrease sperme or seed: Out of this *Copra* or broken kernells is made two sorts of oyle, the one pressed forth (after the same manner that oyle of Allmonds is made) and is a most cleare oyle in good abundance, which serveth not onely to burne in Lampes, but to put to their boyled Rice: the other is made by putting warme water to them after they are broken to peeces and boyled, by skimming off the oyle that swimmeth above the water, after they are pressed together, which oyle is used as a gentle purgation to evacuate the bowels, some put thereunto the pulpe of *Tamarindes*, which maketh it a little tarter, and fitter for hot and cholericke bodies, the other oyle serveth to mollifie the hardnesse and shrinking of the sinewes, and old paines in the joynts and for this purpose they use to put the patient after he is annointed, into a great and capacious tub or vessell being heated, that may hold him, and therein suffer him to abide for a good while, untill he have slept therein, and this bringeth him a great deale of ease and comfort: but whereas *Avicen* saith, that it killeth wormes, *Garcias* saith he had not tryed it, neither thought it probable, because it is well knowne, that the eating thereof ingendreth wormes, in all the Inhabitants that ate much thereof, and is a disease incident unto them: and whereas *Serapio* saith, by the authority of *Mesues*, that by the eating of these Nuts, the loosnesse of the belly is stayed; it disagreeeth not with reason, saith he, that the Nut it selfe, which hath much earthy parts in it, should binde the body, and the oyle which is of many thinne and acerious parts should loosen it: in the middle or hollow part of this kernell is contained, as is before said, a great quantity of cleere sweet liquour, pleasant to drinke, and not bringing any offence to the stomacke, but rather refresheth the spirits, the other sort of these trees are reserved saith *Garcias*, that the head sprout or top thereof is taken to be eaten, which tasteth more pleasantly then either tender Chesnuts, or the head of the wild or dwarfe Date tree, called *Palmito*, and by the *Italians* *Cefaglioni*: The older the tree is, the pleasanter is this head, but when it is taken away, the tree dyeth, so that he may well be said to devour the whole tree, that hath eaten one of these heads.

Nucula Indica racemosa. A small Indian Cokar Nut many growing together.

This small Indian Nut which *Clusius* described singly, in the second Booke of his *Exoticke*, the six and twentieth Chapter, and 54. page, and the second Nut was afterward sent unto him from Monsieur de *Peiresc*, in *Provence*, but came a while after his death. The tree that beareth these fruites is in great account with the Natives where it groweth, for with the leaves they make their drinke, being boyled with water, and of the kernels of the fruites they make their bread, that is sweet and pleasant, which fruit groweth in a tuft or spike, many together, and all upon a great thicke stalk, they are inclosed in a certaine hairy huske or skinn, breaking open upon the ripening, and each one also hath a hairy huske or covering, under which was another shell or covering, not much unlike to a Filberd, being an inch long, and an inch or better in compass, being firme and solid, not having any loose or broken kernell within it, whereby to make any noise, but a firme white kernell fit to be eaten, which inner shell had an oyliness about it, like unto oyle of Allmonds.

Nucula Indica altera. Another small Indian Cokar Nut.

The tree that beareth this Nut groweth in great plenty about the *Castell de minas* in *Girney*, called *Palme* by the inhabitants, being tall and as great as a good ships mast, bearing leaves at the toppe, of a dozen or fiftene foote long, hanging downewards, cut in like unto Reed leaves, from under which leaves grow branches, the fruites being then as bigge as a mans head, containing within them many divers small nuts greater then Plummes of a gold yellow colour, from whose kernels being bruised, they draw a cleere oyle, which they call the oyle of *Palme*, which they put into their viands, both for the colour and sents sake: this oyle brought into these parts groweth thicke like butter, and is very yellow, which some that brought it used for the cure of their fresh wounds, and annoynted their arteries and sinewes pained with crampes, and convulsions, whereby they finde much helpe and ease. *Clusius* describeth these Nuts to be three square, and to have three holes as it were, at the heads of them like unto the Cokar Nut, covered with a hairy huske, but the shell saith *Lobel*, is harder then a bone and blacke, whether these be all one I am in some doubt. Further it is said that the Inhabitants by boring the tree, there cometh forth a sweet liquour, almost like the whey of milke, unto which they put a little wild honey, and thereof make their drinke, which they call the wine of the *Palme*, which will inebriate being largely taken.

Mehenbethene. The Indian Nut *Mehenbethene*.

This Indian Nut which *Clusius* saith *Cortusius* sent unto him for *Mehenbethene*, but did little agree, saith he; unto the description thereof, *Lobel* saith it was found among Nutmegs at *Antwarpe*: It is saith *Lobel* both in colour, forme, and greatnesse like unto a Nutmegge (which therefore *Clusius* saith it might be better referred to the kinds of Nutmegs, yet very untowardly I thinke) being about an inch long, and three square, whose shell was hard and woody like a Cokar Nut, and being broken had three cels or divisions within it, in each whereof was a small long white kernell, of a sweet and pleasant taste.

2. *Coccum de Maldiva.* The Cokar Nut of *Maldiva*.

This kinde of Nut is accounted as another *Coccus*, it is in many things so like the other, for although it was never seene growing on any tree, as the Indians doe report, the Nuts being onely found upon those Islands of the *Maldiva's*, as the Sea casteth them on the shores, and in no other part of the world besides, and are not lawfull to be reserved by any, on the paine of their heads, but are all brought to the King or his Officers, in that all wrackes &c. pertaine to him, and are onely sent by him as presents of great account to other Indian Princes and great persons, &c. Vnlesse by stealth and concealment, some are diverted otherwayes, nor was never seene to have any such rough huske as the Cokar Nut hath, yet in the inner hard shell, inclosing the inner kernell it is almost in all points like the other: the whole Nut carrying this proportion: it is farre greater, longer, and rounder then the other (yet there are of smaller sizes also) and of an ovall forme, containing two parts which are so conjoynd together

Coccu de Maldiva. The Cockat Nut of Maldiva.

together in the middle almost all the length, that it is but a little separate both above and below, the upper part being somewhat bigger then the lower, that it seemeth as if two long nuts were set together, but cannot be separated by strength of hands onely, but must be sawed in sunder, the shell being so hard that it scarce yeeldeth thereunto without great labour, it is also on the outside much blacker then the other and being polished with the stone *Tripoli* (which we call it) in poulder with water, rubbed with a woollen cloth, (but not with oyle on no hand, for that will give it an evill savour) it will become both blacker and more sweeter and shining then the other, as also much thicker, it hath also two holes at the toppes, no lesse then the other *Coccus*, and may be cut into two long boatlike cups, to be edged and footed with silver, &c. as every one please, or else each of them again cut into two other, to be bordered with metall, the lower brims to be taised there with, and the holes stopped, as it pleaseth every one to doe, or to keepe them for boxes. *Clusius* setteth forth in the 19. page of his Booke of Exotickes, the figure of the one halfe of these Nuts curiously set in silver, which as he saith, he received from *Jaques Garret* of London, being taken by us in a great Carracke of the Portugals, comming from the East Indies, which was fourteene inches long, and seven broad. The inner kernell hereof is also somewhat white on the inside, but is covered with brownish skinnes both outside and inside, which hath some rifts or clefts, the outside having none, but is much harder then the other, even almost as hard as a bone, and is a little separated from the wooden shell, which may soone be perceived when it is opened, but may also before, being as it were loose, as may be knowne by the shaking: it is hollow also as the other, as if it contained liquour likewise, but was never seene with any being as it should seeme, wholly consumed by the long time before they were gotten: it hath likewise a small lump, as white and cleare as a peate, sticking to the head of the inner kernell, as the other, which no doubt is the bud which would spring: the kernells on both sides are conjoynd in the middle also. It is usually called by all the Christians and some others in those parts. *Coccu de Maldiva*, by *Angerius Clusius* in his Treatise thereon, *Nux Medica Maldivensis*, but by the Islanders *Tavarcare*. The properties both of the kernell and outer shell, is as *Garcias* saith, generally held to be good against poysons of all sorts and pestilentiall diseases, to be taken the weight of ten graines in fine poulder (which is best to be made in a mortar, by beating it, for it very hardly yeeldeth to a File, or any other iron raspe or tole, the kernell being almost as hard as the outer shell) more or lesse according as the case requireth: divers great personages have a peece tyed to a chaine, which they put into their drinke letting it abide therein a little while before they drinke, which they account to be as effectuali. It is also saith he, held by divers worthy persons to be available against the chollicke palsey, and falling sicknesse, and other the diseases of the head, nerves, and sinewes, and by the use thereof, either of the drinking out of the cups thereof, or the drinke, wherein a peece of the kernell hath bene steeped as is aforesaid, to keepe them safe and sound from all other diseases: yet *Garcias* scarce beleeveth any of these things, and *Clusius* as being led by his ill sample accounteth such relations to be fabulous and commentitious: but *Angerius Clusius* before spoken of, in his treatise of this Nut is bold to publish the sundry cures he performed hereby, that is, both the Nut and the shell, not onely for the poyson of Arsenicke, but in Feavers, Epilepsies, Cachexia's, and many other diseases there mentioned, but especially in the sore and tedious travailes of child-birth, giving halfe a dramme of each, or two scruples for aduse, either alone or with other co-adjuvants.

Some thing yet remaines, wherein I would deliver mine opinion concerning some particulars, belonging to this History of the Nut of *Maldiva*. First concerning that opinion is held, that all those Islands have bene formerly joyned to the Continent, which is said to be 150. Leagues distant from them, and broken away by tempests, and inundations, which may be as likely as that our Isle of great Brittain, was also joyned to the Firme-land of France, and both I thinke alike true, for *Cesar* found them thus in his Progresse hither, and the Sea hath not in this part gained from the Land, as can be shewed by any good Record. Then that these Nuts because found onely upon the shores cast up by the Sea, that the trees either grow on some of the drowned Islands, their rootes abiding still firme in the ground, yielding the fruite yearly, and so swimming to Land is taken, where the winde and waves drive them, or that they grow in the bottome of the Sea, as Amber doth, which may be both alio alike true, that is neither. Again, that there is a certaine Island called by them *Palloyer*, whereon some others thinke that the tree that beareth these Nuts should grow, and falling when they are ripe, are carryd

by

by the winde and waves to those Islands are next thereunto, (which I thinke in some part may be probable) but that they adde, that this Island is seene by some that looke not for it, but cannot be found by them that seeke it, although as they say, the King hath caused sundry times search to be made for it, till they that have bene sent have returned affrighted and terrified by spirits, that they have given it over and returned with such answers, which in my opinion are meere fables and noyed of purpose to keepe the Nut in more estimation. But in my judgement if the truth might be searched exactly, by stout and not timorous persons, by religious not superstitious, as most of the Indians are, and by judicious and industrious men, and not weakelings, and fooles, the tree that beareth these frutes would be found to grow on the Land, whether Continent or Island is no matter, and that if it be true that these Nuts are onely found on the shores, as the Sea casteth them up, for even of that report I am more then halfe doubtfull) when they are ripe and fallne, the windes carry them from off the Land whereon they are fallne, into the Sea, and so are taken up on those Islands: but yet me thinks it is somewhat hardly to be beleevd, that these Nuts should be carried by the Sea to the coastes of no other Countries, but these Islands although they be so many, for the report is that they are not found in any part of the world besides. And lastly, to finish this tedious discourse to shew my opinion how these (if they be fables) may be blowne away, and the truth certainly knowne, viz. if either these Islanders, that is, the King, or some of the Naturalls, or else some Christians, or others in those parts would make choyse of the freshest they could finde of these Nuts, and to put both divers of them, and at sundry times into the ground, to see whether they would sprout forth, and spring, for it is probable, that as they are in the inner kernell, like to the ordinary Cokar Nut, which hath a bud therein that hath and will grow, as is shewed before, This Nut also so neerely resembling it, as is shewed, might at one time or another spring and grow, and take away all other doubts and fables, whatsoever are forepassed: This my opinion how it will be accepted I know not, but if any by the tryall thereof should raise a tree or more, it would prove a worke no lesse gainfull then memorable to all posterity.

CHAP. XLIII.

Nux Moschata. The Nutmegg tree,

The Nutmegg tree, and so likewise the frute are of two sorts exactly observed by *Clusius*, and by him called *mas* and *femina*, the *mas* beareth the greater and the longer Nutmegg, the lesser and rounder the female, and the most ordinary with us, the tree whereof is reported by them that have seene them, to be very great, and as tall almost as our Pearre trees, spreading many branches, which are Greene while they are young, having faire broad leaves set thereon, some what longer then Bay leaves, or to compare them more truly, like unto the Orrenge tree leaves, but without the lower peeces, and

Nutis Moschatae termes genuina.

Nux Moschata seu fructus integer cortice cum tegumento
Macis, cortice nigro & nuce interiore retardo & longo.
The whole Nutmegg cut in the middle, the hard shell with the
Macis both on it, and of it, and the Nutmegs both long & round.

not so hard nor dented about the edges, but set on a short stalk not one against another, but unequally on the branches, and abide alwayes greene thereon, the fruite (for flowers have not bene observed) groweth at the end of the young branches, and not as *Matthiolus* setteth them forth, among the leaves, which are as bigge as Peaches, standing singly for the most part, but sometimes two together on a long thicke footestalke, having an outer thicke huske furrowed in the middle, which divideth it selfe into two parts, and growing ripe openeth it selfe, shewing the Nut within, covered with the Macis, cut into severall peeces as it were, and so strictly cleaving to that blacke hard shell whereon it lyeth, that it leaveth the print of the lying of it thereon, and is of an orient crimson colour, while it is fresh and the huske newly separated for it to lye open, but by little the ayre, changeth the colour to be more dead and yellowish, as we see it brought dry unto us, being taken of from that blacke, thinn, hard shell, that enloseth the Nutmegge it selfe within it, which is somewhat round and firme or solid, diversly discoloured in veines within, somewhat heavy also, I meane the best, and not light or hollow, and yeelding an oylie moisture upon the pricking thereof with a pinne or needle, and of an excellent aromaticall both sent and taste, yet not so quicke and hot as either Pepper, Ginger, or Cloves.

The other whole Nutmegge is longer and accounted the male, a branch whereof *Clusius* exhibiteth a part from the other, and describeth it as he received the branch, which was of a foote and an halfe in length, and as thicke as a writing pen of a goose quill, retaining some of the old wood of the last yeare, whose barke was of an ashy-colour, but the new sprung branch of a brownish red colour, and very pichy in the middle, this branch had seven or eight leaves on it, being much larger and with a thicker footestalke then the former, and were neere a foote long, but not much thicker then they, and three or foure inches broad, somewhat hoary underneath and greene and shining above, with divers veines thwarting the middle ribbe: the fruite groweth in the same manner as the former, at the ends of the branches, but more in number set together, in all things like the former, but longer and greater, and nothing so aromaticall in sent and taste, yet it is said that the Macis of this sort is much more orient in colour then the last. They have received sundry names, for in *Banda* where they grow best they call them *Palla*, and the Macis *Bunapalla*, but in *Decan*, *Iapatri*, and the Macis *Jaisol* of *Avicenna* *Lausi band*, that is, *Nux Bandonis*, and the Macis *Befbaf*. This was not knowne to the ancient Greeke writers, *Theophrastus* or *Dioscorides*; no nor to *Galen* or *Pliny*, for although some have thought it might be *Galen* his *Chrysobalanos*, yet they are farre away therein, the later have called it *Nux Aromatices*, *Nux Myrsica*, and *Moschata*, as if it were derived a *Musco*, for the sweetnesse thereof. They are used in all the cold griefes of the head or braine, for palsies, the shrinking of sinewes, and the diseases of the mother, they are hot and dry in the second degree, and are somewhat astringent, serving to stay the laske, they cause a sweet breath and amend a stincking, they helpe to disperse winde, either in the stomacke or bowels, it helpeth to quicken the sight, and to comfort the spirits, and provoke urine, and are comfortable to the stomacke, and helpe those that are feeble or macilent to grow fat as also helpeth Venery and encreaseth sperme, they helpe to procure rest and sleepe by allaying the distemper of the spirits, being applied to the temples. The Macis are of the same property, but somewhat more warming and comforting, the thicke oyle that is drawne both from Macis and Nutmegges, are either of them of good use in pectorall griefes to warme a cold stomacke, and the cough, and to dry up rheumaticke distillations of raw and cold flegme thereunto or upon the lungs. The chemicall oyle of either is of more efficacy both for pectorall and cephalicall diseases, but must be cautiously and sparingly used.

CHAP. XLIV.

Nux Vomica. The Vomiting Nut or *Nux vomica*.

Although we have no true knowledge of the tree that beareth these Nuts (as they are called now a dayes ordinarily in our shops) more then what *Serapio* saith of it, that the tree of the *Nux methel*, is like the tree of the *Nux vomica*, whereby we thinke that our *Methel*, which is the *Stramonium minus* with us so called, is the *Methel* of *Serapio*, but are much deceived, for his differeth much from it that we so call, in that *Serapio* saith of his *Methel*, that it beareth an oily fruite like *Mandragoras*, with a hairy skin or barke, and of no unpleasant taste, and of his *Nux Vomica* he saith also (differing notably from ours) that as one *Abraham* had informed him, it was a fruite bigger then an *Hafell* Nut, full of nodes or bunches, and of a colour betweene white and blew, and speaking of the properties of them both, he saith that the *Methel* is cold in the fourth degree, so that if two drams be taken inwardly it killeth, if a lesser quantity it causeth a kinde of stupefying like drunkenesse: and of the *Vomica*, he saith onely that two drammes thereof taken with a decoction of dill, or with salt, doth marvellously provoke vomit, but giveth no deadly quality unto it, as he doth to the *Methel*: whereby it is thought that his *Methel* is our *Vomica*, and that his assimilating it to *Mandrake* is rather to be understood of the quality then of the forme, whereunto it answereth, but *Avicenna* describeth the *Nux Methel* to have short and thicke prickles upon it, and a seed like unto *Mandrake*; and such indeed is the *Stramonium* so; that you may plainly see that *Serapio* confoundeth both these together, both for forme and property: and is likely that he never saw either of them, and therefore the Physicians and Apothecaries were in former times as much mistaken in appointing the one for the other: both *pro & contra*: but now seeing that they are better knowne, and well distinguished in kind, they are used each according to their property: yet because

Nux Vomica. The Vomiting nut.

the

the fruite or nuts are not usuall in our shoppes, but hath beene formerly appointed to bee put into Antidotes and Alexipharmica's (asnamely into the *Electuarium de Ovo*, according to the Phisitions of *Augusta* their receipt: but for their dangerous qualitie thought fit by our Phisitions in the *Pharmacopœa Londinensis* to be expunged and left out.) I thought good to shew you them and the uses they are put to for the most part withus: The fruite, as is generally seene are flat, round, of the thickest of halfe ones finger, almost like unto Lupines but greater, hollowish on the one side, and a little bunched round on the contrary, of a grayish colour with a kinde of Freeze or soft Cotten covering the whole, and of so hard a horny substance that they will no way bee beaten into pouther, but must be grated on a small Spice grater, but take heed not to grate Spice thereon after. The chiefe use that they are put unto is to kill Dogs and Cats, and other creatures, by mixing some of it with their meate; as also to give unto Crows, Ravens, and other such like troublesome birds that by their noyse disquiet mens sleepe or studies, or upon pleasure to strew thereof upon flesh, a little sprinkled over with *Aquavite*, tied fast to some stake or other such like thing, which will make them after they have eaten thereof seeme as it were drunke for a time, tumbling off from the poast or tree upon the ground, there fluttering for a while unril the operation is past and then they will fly away. Some that give it inwardly three or foure graines at a time say that it expelleth pestilentiall vapours from the heart, and procureth sweate but not vomit as *serrie* as I can learne, notwithstanding the name, and therefore *Matthiolus* would have it called *Nux Canina* rather then *Vomica*.

CHAP. XLV.

Olibanum sive Thus. White Frankumscence.

THe generall tenet both of old or ancient and new writers is, that the Frankumscence tree doth grow in *Arabia*, yet *Dioscorides* saith in *India*, but *Garcias* saith none groweth there; and as some say, the Mirrhe and Frankumscence grow in the woods promiscuously together, but the description of the tree in particular was kept close (as it was anciently related) religiously by those that gathered the Gum, but those no doubt were but meere fables and tales to hold it in estimation, as that of the religious *Assirian* youth, slaine through envy, and therefore *Thus* the more accepted by the gods; for since the rites of Gentilisme here ceased, and Turcisme crept in place, the knowledge thereof by access unto places is as hard now as before, onely *Theophrastus* saith the leaves are like Bay leaves: but *Thevet* maketh it like the Pine tree, and *Garcias* saith that it is a low tree with leaves like the Masticke tree, and that the Gum of the mountaine fort is the best, and lastly, *Lobel* and *Pena* in their *Adversaria* give us the figure of a strange leafe to bee the leafe of this tree which consisteth of a double fould from the lower end, where it is small and pointed, to the toppe being broad and wide, like unto a Funnell, having as it were a small flippet or peece hanging down, which of all others is the most unlikely to be the leafe of this tree, the forme being of such an extraordinary likeness, and may more likely be the leafe of *Cusius* his *Limonio conger*, as I have before shewed you. I have therefore here given you the figure of the tree as *Lugdunensis* setteth it forth. Some have thought that the bark of this tree may be the *Narcaphitum* (which as some say should be rather *Nascaphitum*) of *Dioscorides*, and called *Thus Iudeum*, for the lews use it as Incense, and to such uses *Dioscorides* saith it was applyed, and for the Mother in women. The Gum droppeth from the tree in reasonable plentie into round peeces, some bigger and lesser then others, and scarce any exceeding the end of ones thumbe, the best is pure, without cyther barke, wood or any other thing, white, yea and the whiter the better, reasonable gummy or fat, not dry like Rosin, and consuming quickly and wholly into smoake. It is hot in the second degree and dry in the first and binding withall. It restraineth bleedings, stoppeth the laske and the Gonorrhœa, helpeth the memory, avoideth sadnesse and melancholly, and comforteth the heart mixed with other things for that cause; it is also very pectorall and good for the cough, for thinne rheumes and distillations, and the Plurisie also, mixed with conserve of Roses and taken salting, the fumes thereof when it is burned, being taken in at the mouth and nose, the head being covered is very availeable both for the Cough of the Lungs, and those thinne distillations thereon causing it: the fumes thereof taken beneath, or the application of it in ointment, helpeth the Piles and the *Tenasmus*, which is a disease provoking one often to the stoole without doing any thing, it is a singular good medecine for the rednesse and paines in the eyes, or in the eares: Mirrhe and *Olibanum* mixed with the white of an egge being beaten and laid on the temples helpeth the Meagroue and paines in the head: it is of especiall use and account in Balmes, Salves, Plaisters, and Ointments for wounds and Vlcers, after their cleansing to incarnate and heale them speedily, and in fractures of the skull most effectually, so that the *pia mater* be not perished. The barke

Arbor Thusifera.
The *Olibanum*, or Incense tree.

of the tree was in former times in much use by the ancients but is utterly neglected now a dayes which was more drying and binding then the Gum it selfe : they had also *Manna Thuris*, which some tooke to be a sort of that dewy Manna that is gathered from trees but were deceived, for it is but the small peeces of ponthier of the *Olibanum* which is broken by the carriage : they used also the *fuligo* or soote of it when it was burned being made as blacking for shooes. &c. is made, but is wholly out of use now a dayes.

CHAP. XLVI.

Piper ejusque species nigrum album longum, &c. Divers sorts of Pepper, as blacke, white and long, &c.

How *fabulous* and untrue were the relations of *Indian Drugs* brought to the ancient writers, *Dioscorides* and others may be plainly discerned, by their description of the plant of Pepper, and the fruit thereof, for *Dioscorides* saith of it, that it groweth on a small tree, and that the fruit at the first is long, which is the long Pepper, having within it small graines like unto Millet seede, which in time growing ripe becometh blacke Pepper, by spreading forth the branches and the graines of Pepper upon them as they are seene : and that the white Pepper is taken before it is ripe, the roote is like unto the *Coffin* and not to *Ginger* as some say, thus farre he : but the truth is farre otherwise : for Pepper, whether blacke or white differeth not either in manner of growing, nor in forme of leafe or fruite ; the long also groweth after the same manner, but differeth in the fruit : now all the sorts are sufficiently knowne by our Navigations and frequent trafficke into the East *Indies*, to grow each on a severall climbing bush, but after one manner, that is, as *Hoppes* doe with us, so that if they be not sustained by some tree, pole, cane or the like, whereon they may clime and spread, will lye downe on the ground, and thereon runne and shoo forth small fibres at every joynt, as hath bene truly observed ; but the usuall manner is to plant a branch taken from the bush, neare unto some tall and great tree, or as I said some great Cane or such like, and so it will quickly by winding it selfe about it (but not with tendrells as a Vine doth) get to the very toppe thereof, being full of joynts, and shooting forth faire and somewhat large leaves one at a joynt, being almost round, but ending in a point, greener above and paler underneath, with a great middle ribbe, and foure other ribes somewhat lesser, spreading from it two on each side, and smaller veines therein also unto the edges which are not dented but smooth and plaine, not thicke but somewhat thinne, and set on a pretty long footstake, the fruit or Pepper it selfe, whether blacke, white, or long, groweth at the same joynt, but on the contrary side opposite to the leafe, and not betweene the stalke and the leafe, as some have falsely set it downe round about a long stalke, somewhat thinly set all along thereon, or not so thicke as a bunch of Grapes : the roote hath sundry joynts creeping in the ground with fibres at the joynts, the white Pepper is very hardly

Piper nigrum vel album.
Blacke or white Pepper.

Piperis albi racemus.
A branch of white Pepper.

distinguished

distinguished from the blacke by the very inhabitants and planters thereof, untill it came to ripenesse (for the white and the blacke Pepper doe grow on severall trees or bushes) but that the leaves are of a little paler Greene colour: the graines or berries are white, solid, or firme without wrinkles, and more aromaticall. *Clusius* hist and *Barbini* from him would make a certaine strange fruit brought to *Clusius* to be the *Bresma* or *Brasma* of *Disco-*
rides, as *Lib. exot. 2. cap. 22. fruct. 4.* but surely *Clusius* and *Bauhinus*, yea and *Cordus* also as I verily thinke were

Tipti Longum. Long Pepper.

Fructus Piper longam.

Piper Athiopicum Matthioli & *Piper candatum Orientale*; *Matthioli* is Ethiopian Pepper, and a kind of East India fruit called Pepper with a tale.

deceived in this their opinions, to thinke that *Discozides Bresma* was a sort of Pepper differing from the blacke, when as it is but the light graines of Pepper that have no substance in them, as it happens to many other graines or berries, some to idle and nothing worth, and therefore wee call it light Pepper. The long Pepper hath leaves very neare to the same forme and largenesse, but a little longer pointed, of a paler Greene colour, thinner also, and with a shorter footstake, and not having foure so eminent ribs passing from the middle one, as in the other, but foure or five on each side or more sometimes according to the largenesse of the lease, with many other smaller veines therein likewise, and of little lesse acrimony and hot taste then the blacke: the fruite of this also groweth in the same manner as I sayd before opposite to each leafe at the joynts, which are closer set together then in the blacke, some being greater or lesser, shorter or longer then others, yet none thicker or longer then ones finger, consisting of many small graines as it were set close together in rowes, and not open and sepeate as in the blacke and white Pepper, of an ash colour when it is ripe

Piper longum maritimum Africanum fructus *Felsel* corall *Alpice*. Long Pepper of Africa.

as is plainly seene in all that is brought unto us. The blacke Pepper is of much use both with the *Indians* and other nations for they use to cate the leaves, chawing them a while and spitting them out againe and the Pepper it selfe also doe they use to chew, and from the branch take every graine one after another while they are fresh and therein take great pleasure, we use it most in our meats and sauces to season them, and because it is moderately hot, if not taken too much at once, it is the better accepted and more pleasing to warme the cold stomacke, and to stirre up an appetite and to consume crude and moist humours therein, or distilling from the head; it helpeth to breake and dissolve winde in the stomacke or bowels, to provoke urine, to helpe the cough and other diseases of the breast, and is effectuall against the bitings of Serpents and other poisons, and is therefore put into the great Antidots: but the white Pepper as being more hot, sharpe, and aromaticall is of more effect in medicines, and so is the long also being more used to be given for Agues to warme the stomacke before the accesse or coming thereof, thereby to abate the rigour and shaking; all of them are used against the Quinsie being mixed with hony, and taken inwardly as well as applied outwardly, and disperiseth the kernells as well in the throate as in any other part of the body. *Matthioli* maketh mention of a kinde of Pepper, as he called it *Piper Ethiopicum*, *Piper* *ethiopicum* *Matthio.* or *Ethiopicum* brought with other wates from *Alexandria* into *Italy*, and groweth in long cods like beanes or peas, but many cods set together at a place, whose graines within them being like Pepper both in forme and taste, but smaller, and stick very close to the inside: this sort *Serapio* setteth downe by the name of *Grannum Zelin*, which some crroniously tooke for *Carpesium* and some for *Amonum*, *Alonardum* also maketh mention of a kinde of long Pepper that groweth in all the tract of the continent of the West Indies which is halfe a foot long, and of the thicknesse of a small rope consisting of many rows of small graines set close together as in the head of Plantane and is blacke being ripe, and hottet in taste, more aromaticall and more pleasant and sweet then *Capsicum*, *Alonardum*, and preferred before blacke Pepper, it groweth saith he on high trees or plants.

Piper longum maritimum Africanum sive Felsel rasil Alpino. Long Pepper of *Africa*. This strange plant shooteth from the roote a great many low round stalkes somewhat like unto Rushes, having here and there some other smaller springing from them, like branches almost as thick as a finger, having thereon a few small leaves in the Spring time, but quickly falling away, scarcely abiding a moneth, and at the tops of some of them come forth small whitish flowers, each standing in a small long huske, in which after groweth the seed, the stalkes being cut or broken, yeeld out a whitish yellow milke or juyce, of a very hot and burning taste, more then ordinary Pepper, *Ranunculus*, or *Tithymall*, which caused *Imperatus* to retere it to the *Tithymall*. Yet some tooke it to be *Xabra*, or *Canariennes* of *Rasus*, *Bauhinus* calleth it *Piper longum angustifolium ex Florida*.

Piper Candianum racemosum. Pepper with a taile in bunches About the year 1590. there was brought to *Lisborne* by the *Portugale*, from some parts of the East Indies, which afterwards wee understood to bee *Guinney*, a kinde of graine, which they called *Pimenta del rabo*, that is Pepper with a taile, and grew many together on a long stalk, thicker set, then in the ordinary Pepper, every one by it selfe on a short footstalk, being blackish, round, and firme like Pepper, with a little point or end, wherein it chiefly differed from blacke Pepper, and tasting hot, somewhat like Pepper, but of a sharper and differing aromaticall relish, and a little lesse then the best sort of Pepper, but with a rugged skinn thereon like it, whereth it grew after the same manner of Pepper, none could tell that brought it, but as it is probable by the sight of some of the stalkes, they seemed rather to grow from some upright bush. The King of *Portugall* forbade the bringing home any more of that sort, lest it should yillifie the other.

Piper Canarinum cavum. A hollow kinde of Pepper of *Canara*. *Garcias ab Orta*, maketh mention of this kinde of Pepper, which in the *Malabar* language is termed of *Canara*. It is a kind of hollow graine, of a blewish colour on the outside, and having sundry graines within the hollownes thereof, which the poorer sort of people doe cate, and therefore as it is thought called *Canarinum* as if you should say Rusticall or Clownes Pepper for the meanenesse thereof, and therefore not used to be exported.

CHAP. XLVII.

Santalum album, citrinum & rubrum. White, yellow, and red Sanders.

We have in our shops for our use in physickē, onely these three sorts of Saunders, whereof the white and the yellow are sweet woods, and the yellow is the sweetest, the red hath no sent. The Saunders tree, as *Garcias* saith, groweth to be as bigge as the Walnut tree, having fresh greene leaves like unto the Masticke tree, and darkish blew flowers, the fruite being like unto Cherries for the size, but without any taste, blacke when they are ripe, and quickly falling away, the wood it selfe is without sent, as it is said, while it is living, and fresh, and smelleth sweete onely when it is dry, the white and the yellow woods, are so hard to be distinguished before that time, as it is said, that none but those Indians that usually sell those trees, doe know their difference before hand, and can tell which will prove better then others: the chiefest part, and smelling sweetest being the heart of the wood, and as the trees doe grow in severall places, so are their goodnesse, being more or lesse plentifull in the substance of the heart, for thereafter are they accounted: The ancient *Grecians* have made no mention hereof, but the *Arabians* onely, who generally call it *Sandal*, but the Natives in the Island *Timor*, and all the Provinces of *Malacca*, *Chandama*, and those of *Canara*, *Decan*, and *Surrat*, *Sercanda*; the Latines call that sort *pallidum*, which others call *Citrinum* from *Avicen*, who reckoning three sorts, *Citrinum Rubrum & Citrinum alterum* ve gens ad albedinem quod quidam nominant *Makassari* quod alij dicunt *melius & validus*, which words in *Avicen* explaine the word *Makassari* which *Garcias* saith he could not understand, and the *Pandettarij* converted *odoriferum*: they of *Malabar* have a certaine sweete wood like unto white Saunders (as there are many other sweete woods in other places) but yet is not the right, although they use it as the true is, and instead thereof, calling it *Sambarane* in the *Malabar* language. The red Saunders differeth much from both the former, both in place, growing faire one from another, and in forme, also colour and sent: it differeth also from the *Brassill* wood, in that Saunders is neither

Xxxxxx

sweete

sweete in taste, nor giveth any Dye as the Brastill doth. and besides the Saunders is heavier then it, and will sinke in water, it is also a harder and shorter grained wood, and more brittle in breaking shorr. They are all both cooling and cordiall, and used together in sundry cordiall medicines, but the white, and the yellow are the more cordiall and comfortable by reason of their sweetnesse, and the red more cooling and hindring, which quality yet neither of the other want, although in a lesse proportion; for the red is used often to stay defluxions of thinne rheume from the head, and to coole hot inflammations, hot guts, and in hot agues, to coole and temper the heat: but the white and yellow are both cordiall and cephalicall, applied with Rosewater to the temples, procuring ease in the head ache, and are singular good for weake and fainting stomackes, through heate: in the hot fits of agues also, they are very profitably applied in Epichemes or Fomentations, both for the stomacke, and for the spirits, and palpitations of the heart, which also doe comfort and strengthen them, temperate the melancholly humour, and procureth alacrity and mirth, which qualities are attributed to the yellow more then the white, which is used more to stay and binde fluxes of the sperme in man or woman, for which purpose, either the pouther taken in a rare egge or mixed with other things for the purpose, or steeped in red Wine, and kept in an hot Balneo. or in hot embers close stopped all night, and strained forth and drunke in the morning and evening, both stayeth the Gonorrhoea, or running of the reines in men, and the whites in women: applied also to Maides or womens great breasts, mixed with the juyce of Purslane, abatech their greatnesse, and represseth their overmuch growing,

CHAP. XLVIII.

Pseudosantalus Cretica Abolicea dista.
Bastard red Saunders of Candy.

Pseudosantalus Cretica Abolicea dista.
Bastard red Saunders of Candy.

His tree groweth in Candy, and made knowne to *Alpinus*, whose figure was sent him as I here shew it you, with this description following. It is a tree that groweth to a reasonable great height, & straight upright, furnished with many armes and branches, very beautifull to behold, set with faire greene leaves one at a place, like unto those of *Alaternus*, but rounder and deeplier indented about the edges: the flowers were not observed what forme or colour they bore; but the fruite was round, and of the biggenesse of Pepper cornes, of a darke greenish colour which were not perfectly ripe, when this tree was found. The wood it selfe is somewhat sweete, hard, and reddish so that it seemed like red Saunders especially being made into pouther from whence I thinke saith he, it may not unjustly be called Bastard red Saunders of Candy, some of the wood saith *Pona*, hath beene brought into *Italy*, and there sold for Saunders: but it differs from it in that it is nothing so heavy as the true red Saunders is.

CHAP. XLIX.

Sassafras. The Sassafras or Ague tree.

The first knowledge of this Sassafras or Ague tree came by the *French* to our Christian world, and to the *Spaniards* by driving out the *French*, who had seated themselves somewhat neerer the *Florida*, which they claimed for themselves for they having gotten Agues, and swellings in their legges, and other diseases by lying on the ground in the open aire by bad victualls and raw drinke of water, as the *French* before them had, by a *French* man that remained among them, were taught the use of this tree, which he and his Country men had learned before of the Natives,

to helpe themselves in these extremities: some Indians call the tree *Pavane*, and some *Winanke*: but the French (whom the Spaniards and all other Nations since that use it follow) *Sassafras*, upon what ground or cause is not knowne. The tree groweth great and tall, bare of branches unto a reasonable height covered with a grayish browne barke somewhat thicke, being in taste hotter and quicker then the wood or roote by much: towards the toppe it spreadeth forth many goodly armes and branches into a round compasse or forme, having large darke greene leaves growing thereon one at a place: standing on the contrary side, each to other, tasting like the roote but more weakely, some cut into three divisions, somewhat resembling Figge tree leaves, but lesser by the halfe for the most part, with a middle ribbe running through each division, and two others to the inner cuts, with veines besides, and some with little or no division at all upon them, for both sorts wee have seene growing on the same tree, smooth also and not dented about the edges: the flowers are small and yellow made of threds very like to the Male Cornel tree as Master *John Tradescant* saith and the fruite small blackish berries, set in small cups upon long footstalkes many clustring together: the rootes are not very great nor grow deepe, in the like manner as all other sorts of Indian trees doe, but are covered with the like brownish barke, that the trunkes and branches are but somewhat redder, which are most in use, being of greater force and efficacy then any other part of the tree, and taste somewhat spicelike, relishing Pennell seede withall, but *Clusius* compareth the taste thereof unto the herbe *Tarragon*, and is hot and dry in the beginning of the third degree. The decoction whereof is familiarly given in all cold diseases and obstructions of the Liver and spleene, as also in cold rheumes and effluxions of the head, on the teeth, eyes, or lunges, warming and drying up the moisture, and strengthening the parts afterwards, and therefore is available in coughes, and other cold diseases of the brest, stomacke, and lungs, and restraineth castings, and helpeth digestion, breaketh and expelleth winde, the gravell and stone in the kidneys, and provoketh urine, and womens courses, it also watmeth, heateth, and dryeth up the moisture of womens wombes, which is in most the cause of barrenesse, and causeth them to be the more apt to conceive: it is of especiall good use in tertian and quotidian agues that come of humours, or are of long continuance: it is thought also to be good in the time of the pestilence, to weare some thereof continually about them, that the smell of it may expell the corrupt and evil vapours of the pestilence: it is generally used in all the diseases that come of cold and raw, thin, and corrupt humours, the French disease, and other of the like foule nature: the Indians use the leaves being bruised to heale their wounds, and fores of whatsoever quality they be.

Sassafras. The Sassafras or Ague tree

CHAP. L.

Spermaceti. Parmasitty.

S *Permaceti*, that is the spawne of the Whale, usually called in *English* Parmasitty, is found in the head of one onely sort of Whale fish called *Trumpa*, which hath no finnes in his mouth, but teeth about a spanne long, and as thicke as ones wrist: it lyeth in a hole therein, as it were a Well, which is taken out and brought home, after their fishing for Whales, in barrels, and is afterwards pressed in a presse, that the thinne oyle may runne from the thicker substance, which is that Parmasitty we use, and the more it is pressed the whiter it will be, and of little or no smell, yet the oyle is somewhat strong: this sort of Whale hath but one hole in the head, whereby it spouteth out water, all other sorts having two, his head is bigger then others, and bigger then his whole body besides, which is also of a more gray colour: in this Whales entralls, Ambergreise is said often to be found in more plenty then in other, which it is more likely that they swallow as food, finding it swimming on the Sea water, then that it should breed in them, as divers have supposed, for I have here shewed you the generation of Ambergreise: this Whale also yeeldeth a kind of oyle, as other Whales doe, but it groweth both white and hard, when it is cold, when as all other are liquid like oyle, and never grow hard like it, and therefore it is alwayes kept by it selfe, and not put to others.

CHAP. LI.

Tacamahaca. The Gum Tacamahaca.

His Gum, which the West Indians call *Tacamahaca*, the Spaniards and all other Nations retaining the same name, is said to be gathered from a great tree like unto a Poplar, that is, very sweete having a red fruite or berry like unto those of the *Peony*, more we cannot as yet learne of it. The Gumme is of good and much use for outward remedies, not being knowne to be given inwardly for any infirmity, although I doubt not but that it might safely and to good purpose, if judgement were joyned with the triall thereof, but as it is now generally used, it serveth much, yea and most of all in womens diseases to retaine the Mother in its place, by laying a plaister thereof upon the navell: as also when it riseth up and is ready to strangle them, and for the strengthening thereof, some put Muske and Amber to it, or a little Civet in the middle of the plaister: This Gumme being spread on leather and applied to the side or spleene, that is growne hard and windy, dissolveth the tumours, disperseth the winde and bringeth much ease and helpe to the disquieted part, and is no lesse effectually in all tumours, griefes, paines and torments in the body or joynts, proceeding of cold raw, and windy humours, applyed plaisterwise thereon: to be applied to the stomacke, with a third part of *Siorax*, a little Ambergriefe, and some waxe, is a singular helpe to strengthen the weakenesse thereof to helpe digestion, to provoke the appetite, and to dissolve wind: it is of excellent use in the head-ache, and to strengthen the braine and memory, as also in all defluxions from the head, into the face, eyes, eares or teeth, causing swellings therein, with paines, rednesse, and much perplexity, to be applied to the temples, or put into the eare, tyed in a little fine silke or cloath: it helpeth also all running humours, and paines thereby in the shoulers or armes, or any other part of the body, the joynts likewise, goutes and Sciatica, giving besides the scattering of the humours, much ease of the paines, and by the attrition whereof it partaketh not a little, strengtheneth the parts wonderfully against the virulency of the humours: it mayellously helpeth all punctures and wounds in the joynts, and that speedily, healing them and hindering any spisme or convulsion that may happen therein, so that this gumme serveth as a remedy in most outward griefes that doe not rise from much heate, and yet therein is not defective, being warily applyed, that is in the declination of the heate to discusse those humours that remaine: for being hot to the entrance of the third degree and dry in the second, with much attrition also, it is most proper for those before recited griefes, and others of the like property. The choyse of the best is, that it be pure and cleane without drosse, cleare also, in some sort of a whitish browne colour, and more whitish in some parts, of no strong but a little quicke and sharpe sent, and quickly consuming into smoake being cast on quicke coales.

CHAP. LII.

Terra Lemnia vel sigillata. Terra sigillata or sealed earth.

Because this is, and hath bene a drugg of much respect and use in physicke, although no herb, I could not over passe it, but shew you the thing, and the many doubts and falsifications with the uses thereof, that my Brethren in profession, and all others also that shall have occasion to use it, may both know the right and refuse the counterfet and false: for that is the whole scope of my labours in this Worke, viz. to enforce all of the genuine and right things, that they may desire, and know them, and also the best true uses whereunto they serve. First for the Place it is cer-

tainly agreed by all, that the Isle of *Lemnos* seated in the *Aegean* Sea, called by the *Italians* and others in these dayes *Stalimene*, was in all former ages and yet is in these times, the place where onely this earth is to be had, which hath bene and still is of much estimation in physicke, for the excellent Vertues therein above all the earthes in all other places, and therefore the severall ages had severall rites whereby to ennoble it the more: *Dioscorides* saith of his time that they used to mixe the blood of a Goate with the earth, which *Galen* in his time (which was long after *Dioscorides*) being desirous to know, and what proportion of blood was put to the earth, he sailed twice to *Lemnos* for that purpose, but missing of the place the first time, at the second he came both to see the place from whence it was taken, and the manner of ordering of it, which was differing from *Dioscorides* his relation, for neither blood nor any thing else was mixed therewith, and *Galen* as he saith him selfe, was laughed at by the people of the better sort, who well understood the course of their Country for many foregoing ages, for asking such a question of the mixing of Goate blood with it: but the Priest that was then ready prepared to fetch home a cart full thereof, upon his arrivall there, onely cast a certaine number of Wheate and Barley comes to the earth, as a pacification therewith, and some ceremonious rites, according to the Religion of his Country, caused it to be carryed home, where, having put it into water, they washed the pure earth from the stones and sand, or any other thing in it, which afterwards being dry againe, they make it into small cakes, some bigger or lesser then others, and seale them with the figure of a Goate, the badge of *Diana*: and therefore they were called *Sphragida agior*, that is *sigillum caprae*, or *Sphragis Lemnia sigillum Lemnijum*, and the La-

Terra Lemnia vel Sigillata.

times *Terra Lemnia* or *Terra sigillata*: Those rites of Gentilisme being ceased, others were brought in and used by the Christians, and when the *Venetians* were Lords of this Isle, as of many other in those Seas, they imposed this order, that but only one day in a yeare the earth should be digged and carryed away to be used: Forbidding any upon great penalties to take any privily without leave: which custome the *Turkes* strictly observe to this day, but the hill in this Isle is much controverted, being suspected not to be the same from whence the earth was taken in *Galen's* time, yet the *Greekes* of the Isle affirme constantly, they never heard or knew of any other place: The earth as *Galen* saith of it in his time, was called of some *Miltos Lemnia*, *Rubrica Lemnia*: because it was in colour reddish like *Rubrica* Ruddle, but that it did not colour the fingers, as *Rubrica* Ruddle doth, and this the Priest onely as is before said sealed: Another sort is the *Rubrica* which wee take to be our ordinary *Bolearmoniacke*, and some thinke that our finest and best *Oriental Bole*, is the true *Terra Lemnia*, because it is of the same reddish colour, not tainting the fingers, and that the *Terra Lemnia* or *sigillata*, that we have in these times much differeth from it, and very divers in it selfe one unto another, for some is whitish or very pale red, and that in lumps or peeces not sealed, others that are sealed now adays with *Arabian Characters*, which are interpreted *Tinimaciton*, that is *Terra sigillata*, are not without some doubt of counterfeiting, so that of two and twenty sorts of these small cakes of sealed earth, which *Belonius* saith he had sought out and gotten in the shops of the Druggists in *Constantinople*, it was hard to judge which of them, or whether any of them were right or no, for as he saith, some cakes were much greater then others, and some of a pale brownish colour, of a fatty substance like tallow, easie to be chewed, and without any grittiness therein, which some others have, that were more red, and somewhat acide in taste: Some againe had divers red spots in a whitish earth; and some smell so sweete that it may be thought to be so made; And some againe of a wan colour, rending to yellow, others very gritty betweene the teeth being chewed: these and divers other varieties, doe shew that covetousnesse (this being of much esteeme) is the cause of counterfeiting, and besides experience sheweth us, that the earthes of sundry other Countries are found to be of excellent properties, both to provoke sweate, to resist poyson, and notably to dry and bind fluxes, catarrhes, &c. all which are attributed to the best *Terra Lemnia*, but *Galen* in his time had the tryall of the *Bolus*, or *Terra*, or *Lapis Armenius*, which you please to call it, for sundry especiall remedies wherein it was effectuell, as also in a great Plague time in *Rome*, which he compared to that was in *Greece* in *Thucydides* time, for as he saith, whosoever tooke of that *Bolus Armenius*, dissolved in thinne wine or water, were saved if they were to be saved, for no other thing could if that did not: and therefore seeing we have so little right *Terra Lemnia* or *sigillata* wherein to trust, and so much counterfet, whereof we have cause to beware, my advise is rather to use the best fine Bole (which both in forme and quality cometh nearest to the true *Terra Lemnia*), then any other substitute or new found earth, going under the name of the right, although they have divers good properties in them. Let no man impute this as a temerity in me, for could I be assured that we could have true *Terra Lemnia*, or that the true that now is to be had were of that excellency that *Dioscorides*, *Galen* and others report of that in their times, I would spare my advise and speake othervise: But seeing I have commended the fine Bole for the best substitute unto *Terra Lemnia*, let me also declare unto you, although I have said somewhat before of Bole, the speciall uses of both of them, that by comparing their properties, you may see how little they differ in quality: The chiefest effect of *Terra Lemnia*, according to *Dioscorides*, is to resist the venome of Serpents, and other deadly poysons, for which cause it is put into the great *Annidotes* against them, and is good also against laskes and fluxes: but *Galen* setteth them forth more largely, for as he saith, having had a Booke given him when he was in the Isle of *Lemnos*, by one of the chiefest men, containing all the properties of *Terra Lemnia*, he sheweth that besides the remedies of venome and deadly poysons, he had experience of the helpe it gave to those that had eaten of the Sea Hare, or of *Cantharides*, defending them from all the fits that doe accompany those that have taken of them, as also the biting of a mad dog, and that it wonderfully helpeth old sores that are hard to be cured, and fresh wounds also to consolidate them. The fine Bole of *Armenia*, *Galen* sheweth to be admirable effectuell in the plague, as is before said, it also is singular good in laskes, bloody fluxes, and spitting of blood, for the catarrhe, or defluxion of rheume and thinne humours upon the breast and lungs, and shortnesse of breath, marvellously drying and helping them, and likewise against the foule ulcers in the mouth, the ulcers in the lungs or other parts, and the fistula in any, without applying any other thing that might cleanse it, or take away the callous skinneth therein, this onely dried it, and healed it up.

CHAP. LIII.

Turbith officinarum. The usuall Turbith.

AVING said something before in the Classis of purging Plants, concerning the various sorts of Turbith, as divers did take them and account of them, whereof I meant not to speake againe in this place, but yet I thought good here, to say somewhat more of the true Turbith, which is a forraigne Druggie, and used in the Apothecaries shops, not knowne to us or any other certainly, that hath written thereof, what forme or face the plant truly beareth, whose roote it is: for although *Garcias* saith, that he saw the plant growing greene and in flower (yet he saith himselfe that it differeth from that which we use in our shoppes) which he describeth to have no great or long roote, whose stalke is like unto Ivy, spreading on the ground, of a fingers thickenesse or more, and two hands long, and some times much longer: the leaves are like unto those of the *Althea*, Marsh Mallow, and so are the flowers of a reddish white, and sometimes all white, but not changing three times a day, as some report of it: that part of the stalke that is next unto the roote and is gummy, is onely used, the rest being too small is of no use: sometimes the roote is gathered with the stalke, which is unprofitable, the stalke onely being of use in Physicke: the whole is insipide without taste: so that you may perceive by this description, that this Turbith of *Garcias*, is but the stalke of an herbe as it see meth (but our Turbith in shops is plainly deferred to be a roote, yet somewhat small, and of an ash-colour on the outside, and white within, having a pith in the middle, which is cut out and cast away as unprofitable,

Xxxxxx 3

profitable,

profitable, and some peeces, but not all gummy at the ends having no manifest taste) which by bruising of it while it is Greene, as he saith, yeeldeth forth a Iuyce that hardeneth into a gumme; yet doth *Garcias* appropriate this Turbith in his following discourse to that which was with them of daily use, saying that the *Arabians*, *Persians*, and *Turkes* call it all by the name of Turbith, by the Indians in *Surat*, where it groweth plentifully *Bacaman*, and in *Canara*, whereof *Goa* is a part *Tigmar*: It groweth also as he saith in other places of India naturally wilde: but that of *Bisnager* or *Gua*, is not used by the Physicians there, but that of *Guzarate*, which is the best, from whence also as he saith, it is transported into *Persia*, *Arabia*, *Asia minor* and *Portugall*. In this discourse of *Garcias*, I finde some contrariety as I take it, at least such intricacy, as maketh me doubt it was not so advised-

Turbith officinarum. The usuall Turbith.

to chuse the best are these; but first he saith that it is the roote of an herbe, which hath *Ferula* like leaves but lesse (which how true it is I cannot say, *Mesues* peradventure never having seene the plant growing, giveth that note rather by information, which *Garcias* it may be sheweth by his owne sight but of the roote, which served him for his daily use, he was an eye-witnesse and testifyeth of it) and was of the kind of those plants that give milke (and yet not of any *Tithymall* for divers other plants give milke that are not hot in taste as the *Tithymalls*) and was of divers sorts, manured, and wild, great, small, white, blacke, and yellow, and growing in dry places as may be perceived by the thicknesse of the Iuyce (the gumminesse he meaneth) and both greater and smaller rootes, white, and blackish, and yellow, are many times seene altogether with us (which blacknesse or yellownesse may come by the ill drying of the roote, or the taking of some wet in the drying or after) he maketh two markes of the choyest: that it be white (within) hollow within like a reed or cane (that is when the hard pith of the roote is taken out) gummy with an ashy-coloured barke or outside, smooth, and not rugged, easie to be broken, fresh, and not very great or thicke, which is not so good, these notes doe all agree to our *Turbith officinarum*. Turbith is more used to be given in powder, and that seldome alone but mixed with other things, or else made into an electuary, then in decoction, and purgeth flegme very notably, and tough clammy humours that fall on the joynts, or on those parts that are more remote: it looseth the belly of those excrements that sticke close thereto, and clenseth the brest from thicke flegme: it is very profitably given to those that have a dropisie, the leprosie, or the French disease, as also those that are troubled with those diseases that rise from adult humours, the blacke jaundise and the like, it helpeth day agues, and in generall all other diseases bred of flegme,

CHAP. LIV.

Unicornus sive Cornu Monoceros. Vnicornes Horne.

Vnicornes Horne likewise is a precious Jewell of high esteeme, and with Princes kept alwayes in their treasury to be used upon occasion for themselves, whose worth poore men could not easily reach or attaine unto. There are divers bealls that beare two hornes both male and female, as the Oxe, others the males onely, as Deere, Sheepe &c. Some beare three hornes, as certaine Oxen in India, as *Solinus* reporteth, and some foure, as divers Rammes in sundry Countries hath bene observed, yet casually, not by kinde, and some againe beare but one, whereof some beare it on their nose, as the Rhinoceros, and some in their forehead, as the Indian wild Ass, with a whole hoofe as other Asses have, whereof *Aristoteles* and *Pliny* speake, and *Orix* with a cloven hoofe, related by them also and *Columella*: as also certaine Kine in *Zeila*, a City in *Ethiopia*, and *Camphur*, a certaine beast plentifully breeding in the *Molucca* Islands, that liveth both in the water and on land. Some other creatures also there are that beare but one horne, as certaine Fishes, breeding plentifully in the Indian Seas, whereof *Plerif* so called (which I take to be the Sea Vnicorne) is one, and the Sword fish, and certaine birds in *Ethiopia* as *Alianus* maketh mention: but of all these creatures with one horne, none are said or found to have white hornes but the Vnicorne (of the Sea as well as the Land) called by the Hebrewes *Rem* and *Reem* (famous in the Scriptures) by *Avicen* *Achercheden*, by some other *Arabians* *Barkaran*, by the Greekes *Monoceros*, and by the Latines *Vnicornus*, for some are said to be blacke others red, *Alianus* describeth the Indian Ass to have his horne to be whitish at the bottome, reddish at the toppe, and blacke in the middle: the received opinion of the Vnicorne is, that it is a beast of the size of a meane horse (but I thinke it cannot be possible but he must be much greater, to beare so large so long, and so massie a horne, such as are to be seene in sundry places of *Europe*, (if such be the horne of any beast) for as *Belonius* saith there are twenty whole hornes, and as many that are not whole but broken, to be seene in severall places in *Europe*, one whereof which is the greatest and most noble, is that which is kept in the Church of Saint *Dennis* by *Paris*, which is seven foote long at the least, so that a tall man can hardly reach the toppe thereof with his hand, it weigheth 13. pound and foure ounces, no man can graspe it wholly in his hand, being five inches in the diameter or thicknesse, and an handbreadth, and three inches in the circumference, it is straight like a torch or staffe, but writhed about on the outside, from the right hand to the left smooth, smooth and not bunched out, save at the lower end next unto the head, where it is greatest, and falling still smaller unto the end, of a brownish colour on the outside, but white like Ivory within, without any line in it, and having but a ring about the outside, it is also hollow at the bottome, a foote upwards, whereby it may plainly be discerned that it falleth not off of it owne accord, which maketh it to be of the more account) the beast is said to be of the colour of a Weasell, or somewhat more red (yet some say grayish) having a head like a Hart, the necke and maine not very long, with thinne haire, and falling to one side, with a small beard like a Goate but lesser and shorter, the thighes and legs, not great, the hoofe parted and the taile like a Boare: but none of the auncient Writers, have made mention of any Physicall properties therein, *Alianus* onely accepted *lib. 4. c. 52.* who yet saith the horne is blacke. The property of the Vnicornes horne is chiefly to resist poyson, and the bitings of venomous creatures, it is also given against the plague, and other contagious diseases, to expell melancholly likewise, and to cherish, exillitate, and strengthen the vitall spirits, and more noble parts. It hath alwayes bene accounted of great worth, and not but for great persons and Princes, for the beast being rare and seldome to be seene or had, being so wilde and fierce that he is not to be made tame (howsoever some have written that they will grow milde at the sight of young Maidens, and be brought to sleepe neere unto them) and the hornes not to be had (in that they doe not cast them as some other beasts doe) but by the death of the beast, that liveth so farre remote from these parts, and in huge vast Wildernesnes among other most fierce and wilde beasts, Tigers, and Panthers, &c. and especially because the Indians hunt them not either for their pleasure, or to make any profit by them, the Merchants not seeking after them, the hornes I say, must needs be rare and scarce to be had, and of great worth and price, if they be had, which keepeth them in the more high esteeme. And therefore there want not Imposters, that for lucre sake, doe counterfet it, and worke Ivory, and other hornes artificially into peeces of severall shapes and formes, and obtrude them for Vnicornes horne, to many ignorant persons, but the true and right horne is in part described here before, but to adde further, that the true horne being broken, sheweth to have some thicke fouldes or coates one over another, the inside is white, though the outside is not so white but brownish, and a very smooth graine, without any line veine, or curled waving therein, having onely a circle sometimes about the edge or brimme. Much Vnicornes horne as they say, is to be had with our Druggists and Apothecaries, which is in small long round peeces, some no thicker then ones finger or thumbe at the most, or seldome bigger, that is very white, somewhat heavy and solid, with a smooth graine, which because I cannot thinke so much of the right Land Vnicornes horne is to be had so readily, and so small: I verily beleieve it to be of the Sea Vnicorne, which whether it hath that efficacy that the other is said to have I know not.

And it is somewhat probable that even all those hornes formerly mentioned both in *France*, *Venice*, or elsewhere, and that also of our Kings, kept at *Windor*, or the Tower, is but of the Sea Vnicorne, for even such as is before described was brought home by Sir *Dudley Digges*, as I take it found on the shore, and cast up by the Sea in some place towards the North-West, and given to our King *Charles*, who for the tryall caused his Physitians and others to view it and make report thereof to him. And my selfe having seene it, did well perceive it to be writhed on the outside, in the manner before said, and was wonderous white within also, and of a close firme graine: The horne was not fully whole, but broken off a little at the end, and hollow at the bottome.

CHAP. LV.

Zedoaria & Zerumbeth. Setwall.

He Setwall that we have usually in our shops, doth not alwayes hold one uniforme face and fashion, but divers, for some is thicke and short, others more long and round, some great, others small, some whole, others broken, as it is usuall in all things almost, either forsaigne or domesticke, and yet the severall varieties of formes, being of so little difference cannot make them severall things, especially seeing their taste and quality is all one or but so little differing that any judicious may soone determine the controversie. *Garcias ab Orta* distinguisheth betweene *Zedoaria* and *Zerumbet*, making them to be two divers things and therefore speaketh of them in two severall Chapters, wherein as it seemeth he maketh *Zedoaria* to be the *Geiduar* of *Avicen*, which yet he saith *Avicen* knew not, because it groweth in the *Chineses* Country, and is very rare to be seene or had, but from such vagabond Indians, called *logues*, as travaile begging through all those Countries, which *Geiduar* or *Gedwar*, as *Garcias* saith is of the bignesse of an Ackorne, and neere unto the same forme, weighing about halfe an ounce, and of a cleere colour, but *Clusius* giveth us the description and figure of it a little larger, which as he saith he had from *Pona* of *Verona*, and compareth them to the smaller rootes of *Asphodill*, or the rootes of *Anthora* of an ashy-colour on the outside, and yellowish within, and of an hot sharpe taste. *Zedoaria* is called *Zerumbet* by *Serapio*, and saith they are rootes like unto the round *Aristolochia*, but of the colour and taste of Ginger, and brought from *China*: *Avicen* saith that *Zedoaria* is like unto *Aristolochia*, but lesser, and afterwards saith, that it is likely to be *Geiduar* or *Algeiduar*, and giveth unto it the same qualities that *Serapio* doth to his *Zedoaria* or *Zerumbet*: *Rhasis* maketh *Zedoaria* and *Zerumbet* all one, and *Mesues* also seemeth to agree unto them, but differeth onely in a degree of heate; so that you may plainly see that all these sorts are made by these Authours to be of little or no difference, and so they seeme unto me, as they have also to others before me, who have as I have done, seene all these diversities of forme come over together unto us: *Lugdunensis* setteth downe very truly the figure of *Zedoaria* and *Zerumbet*, as they grow together, the longer peeces joyning to the round like the *Asphodill* rootes, to one round head. *Garcias ab Orta* saith, that *Zerumbet* (or *Zerumba*, although he maketh them differing as I said, in one Chapter, yet all one in the next) groweth plentifully wild in *Malabar Calecut*, and *Cannor*, and is also planted by divers in sundry places, calling it wild Ginger, those of *Surrat*, *Decan*, and *Cannara* call it *Chaboran*, and those of *Malabar* *Sua*, and hath leaves like unto Ginger but greater, longer, and broader. There have beene some that have thought *Zedoaria* to be some of the kindes of *Costus* that *Dioscorides* describeth, because it agreeth in many things therewith, *Zedoaria* being not specified by him, or the auncient Greeke; and indeed both forme and quality comming so neere may cause it well to be accepted as the substitute thereof. All these sorts as they are made divers by the writers of them are said by them to be effectually against poysons of all sorts, and venomes of virulent creatures, and we have found them of much use and profit in the pestilence and other contagious diseases, as also to warme a cold stomacke, and to expell winde mercuriously, to repress vomitings, to dry up and consume catarrhes and defluxions of rheume, to dissolve the impostumes of the matrix, and to stay the loosenesse of the belly, and is also very powerfull to stay or disperse the unfavoury belchings of those spirits that Garlike, Onions, &c. or wine have caused.

Zedoaria longe & rotunda genua effigies itemque & Geidwar Arabum. The true figure of the long and round *Zedoaria*, and of the Arabians *Geidwar*:

CHAP. LVI.

Zingiber. Ginger.

Ingër as *Garcias* saith groweth in all the Countries of the East Indies, either planted by the roote or sowne of seed, (the roote saith an *English* rare traveller, spreadeth in the ground, and hath leaves like wild Garlike, which they cut every fortnight, to put into their brothes and meates :) It groweth saith he, with leaves like the water Flagge, or Come Flagge, and not like the Reed, thus saith he, and so saith *Monardus* also, but *Acosta* saith that it hath leaves very like to the greater sorts of Millet, *lobes* teares, and with a thicke stalk like *Asphodill* leaves thereon, close to the stalk, so that it seemeth to be a small Reed, and *Lobel* setteth

Zingiber orientale flore scens.
The figure of the orientall Ginger with the flower.

setteth forth the figure of Ginger as it grew he saith with *Adrian Meuleneere* in the *Prince Mauritijs a Nassau* his Garden, having sundry stalkes about a foote high, shewing like unto a Reed new sprung up, and condemneth that old figure as false, that was formerly accounted the right, which had leaves of the fashion of an *Iris* or Flowerdeluce, which contraries are as some may thinke, hardly to be reconciled, yet I will endeavour to make both these assertions to be true although they seeme so much to vary, thus: We have two sorts of Ginger brought unto us, plainly differing in the substance and colour of the rootes, but not in the forme, saying that the one is more slender which is the blacke, then the white, for the one is white within and cutteth soft, which is the Ginger wholly in use for meates and medicines with us, the other is hard and almost wooddy, and cutteth blackish within, so that it is very likely that the one sort which I take to be the East Indie sort, with the soft white roote, hath Flagge-like leaves, and hath beene seene in flower in *Germany*, as *Emanuel Zwerts* hath set out the figure (and I here unto you, and the seed vessell also, with the seed not much unlike that of an *Iris*) with this title *Zinziber flore albo folio Iridu*. The other roote that is more slender and blacke,

yet of the same fashion, may be that which beareth Reed-like leaves, as *Lobel* hath set it forth, rather to be preserved then for ordinary use with us, and which as I thinke is the *Mechinum* of *Lobel*, or *Zingiber fuscum*: whereof he giveth the figure of a more excellent sort, that was joynted like *Doronicum* parts, and therefore accounted by *Pona* to be the true *Doronicum*, as is shewed before in this worke, in the Chapter of *Doronicum*, and brought from *Brassill*: So that the matter being thus reconciled, and each of them sorted as they should be, let me shew you that both sorts are preserved while they are fresh and greene, and the blacke sort as well also, after it hath beene dried, by new steeping it, and boyling to make it render, but I cannot finde that the white sort will so well serve to be preserved after it hath beene dried, but is the best being preserved greene, such as the *China* and *Bengala* Ginger is. The properties of Ginger is to warme a cold stomacke, and to helpe digestion, to dissolve

dissolve wind both there and in the bowels, while it is fresh it is eaten in sallets with the Indians, the roote being sliced and put among the herbes, and helpeth to mollesse and loosen the belly by the moisture therein, which then abateth much of the heate which being dry it hath, and helpeth to bind the belly. The preserved Ginger is most acceptable and comfortable to the stomacke, and is available to all the purposes aforesaid.

CHAP. LVII.

Zibetum. Civet.

Iver, called *Algalia* by the Indians, and the beast from whence it is taken *Algali* or *Alijali*, is well knowne now adays to all, to be an excrementitious moisture, or condensate sweate of a certaine beast somewhat like unto a great Cat, and thereon called a Civet Cat, gathered from a peculiar place or purse in that Cat, prepared by nature for that speciall purpose, and is taken forth with small spoones of Ivory or wood, and that by strong hand, the beast being held very close and hard for feare of biting, while they are in taking it forth, for it is very fell and fierce, being moved and angered, and then most when they are about that businesse. I shall nor need to describe the beast unto you, which *Clusius* hath done in figure very exactly in his *Cura Posteriores*, and is so frequent, not onely in our Land, with a great many that keepe them for the profit or use of the Civet, but in divers other Countreies in *Europe*. The Civet is used as a perfume or sweete sent generally, either by it selfe or mixed with other sweete things, it is used also to comfort the head and braine, and to helpe the deafenesse and disfinesse in the eares, being put thereinto, wrapped in a little blacke wooll, it is much commended against the suffocations or rising of the mother, to be used in a plaister, or bur put on the middle of the plaister and laid on the Navell, or some put into the Navell. I know none that ever used it inwardly, but in outward remedies: it is said that women are much delighted therewith, and helpingundry of their defects.

Having thus shewed you here most of the chiefeest Drugges in our Apothecaries shops, that comē to us from forraigne parts, that are not formerly expressed in this Worke in severall places: Let me now lastly to close up this whole Worke, shew you other strange and rare Plants, both Herbes and Trees, with their Gummes, Seeds, Rootes, and Fruites, &c. growing in the East and West Indies, and those parts neere unto them, as they have bene observed by those that in their travells saw them, and brought many of them into *Europe*, that wee may contemplate the wonderfull Workes of God, that hath stored those Countreies with such differing Herbes and Trees from ours, and yet it is very certaine that there is much more unknowne then is already made knowne unto us. I will first beginne with Herbes, and the parts thereof, as seedes and rootes, whether medicinable or admirable, and then with the Trees and their fruities that are pleasant to eat; and lastly with those which for the most part have some medicinall use.

CHAP. LVIII.

Payco herba. Indian Plantaine for the stone.

Herba al-
renum mor-
bu utilis.
Lactuca si-
milis.

Cachos se-
mica.

Here groweth in *Peru* in the West Indies, an Herbe whose leaves are like unto our Plantaine, which being dried are very thinne, and taste hot and extreme bitter. The poulder of them taken in Wine, helpeth the chollicke and the stone, whether proceeding of wind, or of any cold cause, the leaves boyled and applyed warme to the pained part, worketh the same effect.

Another Herbe likewise was sent from thence like unto Lettice new sprung up, and of the same colour, being without taste and very profitable for the stone in the kidneyes, coming from heate, the juyce being applyed to the place mixed with some oymtent of Roses, and the leaves also laid thereto: the juyce thereof likewise cooleth inflammations, Saint *Anthonyes* fire and the like hot eruptions in the skynne, and easeth the paines.

From *Peru* likewise saith *Monardus* came the seed of a bushy plant, there called *Cachos*, being very small and taken from the fruities thereof, which was like unto the *Malva insana*, Madde Appels, flat on the one part, and round on the other, of an ash colour on the outside, and of an excellent Greene colour but thinne, and of a round forme. It is of much esteeme with the Natives, for the especiall vertues thereof, in provoking urine, and expelling gravell and the stone, yea and breaking the stone in the bladder, if it be not growne hard by long continuance, dissolving it into sand, and casting it forth with the urine, the seed in poulder being taken in some water convenient for the purpose, whereof they have had very many and notable experiences, which sand after it is expelled will grow hard as into stones againe.

CHAP. LIX.

Coca. The herbe Coca.

The seed of this Coca is sowne with great care by the West Indians in beds, by rowes, and riseth to be a plant of three or foure foote high, with a stalk as bigge as a good wand, and somewhat greater leaves then the Myrtle, having as it were another leaf in the middle thereof, being soft, and of a pale Greene colour: the berries are red before they be ripe, but blackish afterwards, growing clustering together, and then they gather the leaves, laying them to dry, that they may be kept all the yeare and

and carryed to and fro into severall Countreys, for thereof is the Natives chiefe Merchandise to provide them of all necessaries for life, being instead of money, which is generally used by the *Americans* to be chewed, as well in their long journeyes to preserve them from hanger and thirst abroad, as for pleasure at home, which they use after this manner: they burne Oyster shells, and with the powther of them they mixe the pouther of the leaves of this *Coca* first chewed in their mouthes, and so made up as it were into a paste or dough (but take lesse of the powther of the Oyster shells then of the leaves) whereof they make small pellets *trochisses* or *troffir*, laying them to dry, and so use them one by one, holding them in their mouthes, rolling them to and fro, and sucking them untill they be quite spent, and then take another, which maketh them able to travaile many dayes with strength, without either meate or drinke, through uninhabited places, where none is to be had: If they stay at home, they use the *Coca* alone, chewing them sometimes a whole day without ceasing, untill the substance be sucked forth, and then use another: if they would have them to be stronger, able to intoxicate their braines like unto drunkenesse, or to be as it were senselesse, they put the leaves of Tobacco to it and take great pleasure in those courses.

CHAP. LX.

Betre, Beile, Beiele, five Bethle. The Indian Bindweed called *Betle* or *Betre*.

The East Indians doe use the leaves of this *Betle*, much after the same manner that they of the West doe the last recited *Coca*, and therefore I thought good to joyne them together. It groweth very like unto a Bindweede, wrapping and winding it selfe about the trees, up to the toppes almost, or other things that it is planted against to uphold it, or lye on the ground and rot, and therefore they for the most part, plant it against the tree *Fausel* or *Areca*, or such other like tall and great trees, in the same manner as they doe Pepper, whereunto it is so like that a farre off, those that are not well exercised in the knowledge of them, may soone mistake one for another (and therefore *Gerard* called it Bastard Pepper, when as it is neither in fruite, taste, or use like unto Pepper) having onely leaves somewhat like to Pepper, but more like unto

Bindweed, yet thicker, of a yellowish Greene colour, with three great thicke ribbes therein (which the Indians with the nailes of their hands, kept long and pointed for this purpose and not round like ours, doe nippe or pare away before they dry them, whose taste is somewhat aromaticall but bitter; the fruite is slender, and about two inches long, writhed or consisting of five couds, writhed one about another like unto a cord or rope, of a yellowish colour, tasting pretty spicy or aromaticall, the plant is much tended and often watered to cause it grow the better, and because it delighteth not in any very hot or cold Country, and seldome groweth in the upland Countreys, but continually neere the Sea side, or not farre distant from it. Physically this is used to strengthen the head and stomacke, after the cleansing of them from rheume and flegme, to comfort the heart, and to breake or disperse winde in the stomacke or bowels: it fastneth loose teeth, and maketh them yellow, causing also a sweet breath, yet their breath stincketh fowlest that using daily to take it, doe forbear for a while from it: but generally throughout all the East Indies, the leaves are used both of the Princes and people, the greater persons make certaine compositions for themselves, with the leaves hereof, Camfire of *Burneo*, *Lignum Aloes*, Muske, and *Ambergrie*, others put *Cardamomes*, and *Cloves* to them, but the ordinary manner of preparing them is, that after the ribs be taken away with their nayles, they chew those leaves in their mouthes, and spit out the first juyce that commeth from them, which is like blood, and put unto them a little of the calke of burnt Oyster shells, and the fruite of *Areca* or *Fausel* beaten small which give them a pleasant taste, and is generally eaten by them all, and none of the meaner sort or others that have not presently before eaten thereof, will in civility speake with any great person, but they will hold their mouthes that their breath doe not offend them. It is called *Betre* in *Malabar* and *Pam*, in *Decan* and *Guzarat*, but in *Malaya Siri*, *Garcias* saith that he as well as others tooke these leaves to be the *Folium Indum*, or *Malabathrum* of the Greeke Authours; but was deceived therein,

Betre five Bethle.

The Indian Bindweed called *Betle* or *Betre*.

CHAP. LXI.

Gnacatan. Indian Pilewort.

His small herbe as *Monardus* saith was sent out of that part of *America* or the *Hispania nova* being white like unto *Polium montanum* but without any sweet sent, and is much commended to helpe the swelling and falling downe of the Piles or hemorrhoidal veines: if the herbe be boyled in wine so as there be no heate, or else in water and the grieved place fomented with the warme decoction for a while then gently wiped and the poulder of the herbe cast thereon being bound thereunto: it also easeth aches and paines in any part of the body if the grieved place be first annointed with molten Rosin not too hot, and the poulder of the herbe strewed thereon (which is an homely manner of dressing) and cloathes layd presently upon it which will sticke so fast as that untill it hath wrought the effect it will not be plucked from the skinne and flesh: the poulder of this herbe cast upon any small wound or sore, especially those in the groine, doth cleanse them and heale them afterwards.

CHAP. LXII.

Herba Indica adrupturam utilis. Indian Rupture-wort.

Nother small herbe was likewise sent from those parts, whose forme could not be discerned by reason of the ill carriage and breaking thereof being dry: but highly commended to helpe Ruptures or burstings in young or old: the herbe being fresh bruised and applied to the place whereunto a trusse afterwards was bound that had no shoulders, yet fast as close as those that had, and this *Ligatura* the *Indians* use, which kind of trusse saith *Monardus* lying so firme and close as he reported that was cured thereby, is sufficient of it selfe to helpe any Rupture without any other medecine, and as he saith he saw a leech of *Corduba* that helped all burstings with such unshouldred trusses or bindings onely, and many hee knew then living that were so cured.

CHAP. LXIII.

Planta Indica sanguinis Panacea, id est, sanguineos sudores excitans.
The Indian Allheale, blood sweating plant.

Certaine Indian Leech as it is recorded in *Petrus de Osma* his letter to *Monardus* did usually in the City *Pasto* cure all manner of diseases onely with the juice of a certaine herbe annointing the Arteries and the grieved place therewith, and afterwards laying them to sweate in their beds being well covered, whose sweate was well nere as blood, & in this manner he proceeded untill he saw they had sweate sufficiently, causing them to use in the meane time an excellent fine diet of wholesome meats: sundry desperate diseases were cured by him, yea they seemed more young and lustie than used this order then they were before; but no intreatie or promise of reward, nor all the meanes that could be used to him, would make him reveale this secret to any, or tell what herbe it was whose juice he used.

CHAP. LXIII.

Herba vitamant mortem in morbis prænuntiatis. The Indian Fortune teller of life and death.

Certaine Indian of chiefe account coming into the count de *Nieva* his house that was in *Pera* upon some occasion of businesse, saw a woman servant of the house very sad and sorrowfull, for that her husband lay then very sicke of a grievous disease, he asked her if shee would faine know whether her husband should thereof live or dye, she saying yea, he sent her a branch of an herbe which he willed to be put into his left hand, and there to hold it fast, which would make him seeme pleasant and merry if he were to live, but sad and sorrowfull if he should dye, which shee so using it and finding her husband sodainly to become sicke that she thought he would presently have departed this world, she pulled the herbe out of his hand and threw it away, but within a short time after this her husband dyed: but *Monardus* saith he doubting of the truth thereof enquired of divers and it was affirmed unto him by a noble man that had long lived in *Pera* that it was true, and that it is usuall with the *Indians* to doe so in diseases, which is a matter of great admiration and wonder.

CHAP. LXV.

1. *Herba Viva*. The Herbe of life or love.

Here are two sorts of this kinde of plant that are to be distinguished in sunder, and not to be accounted all one as divers have thought that are knowne to us of late (and yet I thinke verily there be some others of the same nature, not sufficiently yet made knowne to us, which I gather out of the writings and relations of divers. The one is an herbie plant without any prickles or thornes thereon, for any thing that I can learne thereof, and is this I am now about to shew you: The other is both a shrubbe, or as some say a tree, and thorny also which shall follow. *Garcias ab Orta* first maketh mention thereof to grow in divers places of the East Indies but giveth it no name. *Acosta* saith it is called by the Christians there generally *Herba viva*, and of the Indians *Herba amoris*, of the Arabians and Turkes *Suluc* and *Suluque*: The leaves are compared by them unto the leaves of *Pollipody*, but *Acosta* rather compareth them to the leaves of *Orobanch*, foure or five, or divers rising from the roote, each upon its footstake, being winged with many smaller ones then those of *Orobanch*, set on both sides of the stalkes, which are about two inches long a peece, of a pleasant Greene colour very beautifull; among which leaves rise up divers slender bare naked stalkes, each of them bearing one flower at the toppe in forme somewhat like unto a Pinke, but of a yellow colour without any sent at all. The admirable propertie hercofis, that if any shall touch it with their hand, and some say that if any man doe but breath upon it, it will presently draw it selfe together, and if one would take it into their hand it will close together as if it were dead. But that which is more admirable is, that if they shall withdraw their hand it will quickly after as it were revive againe and spread it selfe as it was before it was touched, and this it will doe many times in a day if it be touched and let alone againe without touching. Other properties it is sayd to have, as to restore Virgins that have bene deflowered, if ye will beleve it, to procure love betweene man and woman, and as *Acosta* saith he was informed by an Indian Phisition of good credit, that he would cause any woman to be at his will and pleasure, so that he would but declare her name, and use it (or rather abuse it) as he would appoint him, but the fact being unlawfull, he refused the condition.

2. *Frutex sensibilis Herba Mimosa dicta*. The Mimicke herbe called the sensitive thorny shrubbe.

This other Mimick, Mocking or Sensitive plant groweth to be a woody Shrubbe, yea some say to be a tree, having divers sprigs rising from the roote, and branching forth sundry leaves set here and there, with short thornes or prickles, leaning as *Acosta* unto other trees or walls, but *Clusius* saith it spreadeth on the ground taking roote at the joynts, and sundry wings of fresh Greene leaves thereon, which upon the touch of any man, or his breathing onely, and not of any thing else would shrinke and seeme as withered; but neither flower nor fruit hath *Acosta* mentioned, but I am informed from Mounseur *John de Laet* out of a Spanish relation thereof in a booke printed at *Mexico*, that it beareth flowers and fruit somewhat like unto the Chesnut, many of them hanging downe together in a cluster, being Greene at the first and afterwards red, these be others relations: but let mee shew you what I have seene of the living plant as it grew in a pot at *Chelsey* in Sir *John Davers* Garden, where divers seeds being sowne therein about the middle of *May*, 1638, and 1639. some of them sprang up to be neare halfe a foot high, yet others were inferiour, the tallest shot two or three stalkes from the roote, somewhat hard and woody, with divers joynts on each side, and severall branches thereat, as also a small short thorne at each

1. *Herba Viva*. The herbe of Life or Love.

2. *Frutex sensibilis Herba Mimosa dicta*. The thorny sensitive Shrub or Plant.

Yyyyyy

joynt,

joynt, which branches had severall paues of winged leaves set opposite each unto other, containing some eight some ten small leaves on a side without any oede one at the end, set very close together, being narrow, smooth, and of a full but fresh greene colour, not fully round pointed nor dented, foulding themselves upward close to the middle ribbe, upon any touch thereof, this in the elder growne plant, but in that which was young the whole stalke with leaves would fall downe and shrinke up the leaves: this I proved in those two severall yeares before recited: the former yeares plants as they grew in the por, I caused a cunning hand to draw to the life, which I here exhibite unto you with the other, that you may see the difference betweene it and others formerly set forth from the sight of a dryed plant. If this could have beene preserved in our Winters, our Summers would have declared a more ample and full demonstration thereof. This is said to be not so quicke in apprehension as the former. It is said also that the stalkes have the smell and tast of *Licoris*, and are used by the natives usually to helpe the cough, shortnesse of breath, hoarsenesse of the throat and voice, to cause flegme easily to be expectorate, as also to ease the paines of the stone in the Kidneyes, and healeth up fresh wounds. That Spanish Author before recited relateth also that it procureth sleepe being applyed to the head, but sooner with the *Americanes* then the *Spaniards*: said also by them to procure love, but could not shew how or by what way; it helpeth the Flux or Laske of the belly by that astringent and glutinous qualitie therein perceived by the taste; as *alfo* *terrian* Agues, and the inflammations and rednesse of the eyes. The said author saith that he understood, yet hee knew not how truly that in the *Philippinas* they have such another plant yet differing in some particulars, for it is said theirs shooteth forth ten or a dozen straight twigs from a root, each of the bignesse of an Hens quill, one whereof had a dozen leaves on them in foure rowes set at distances, six inches betweene, being like unto Reddish leaves: the flowers were blew like unto a birds tongue before they were open, and divided it selfe afterwards into three leaves. This upon touch or breathing thereon would not fall downe as in the former and rise againe, but said to fall away, that is, the lower leaves and so likewise the upper leaves if they were touched agayne, but the stalke also would breake off and fall downe upon the touch or breathing, and if they should be broken by any ones hand, the place would seeme as black as if it were burne: but that it would not doe so if it were toucht with a stick or wand. The *Herba Mimosa* seemeth likely to be the *Aechinomenes* of *Apollidorus*, whereof *Pliny*, lib. 24. c. 17. maketh mention. As also that tree that *Theophrastus* saith, lib. 4. cap. 3. grew about *Alempsis* in *Egypt* which differed not from other trees, either in forme leaves or branches, but in the event for the outward face thereof was thorny, and the leaves like Feine (as *Gaza* translateth it) but *Pliny* much better, like feathers, which being touched shrank as withered and dry, and by and by after revived againe. The Earle of *Cumberland* in *Queene Elizabeths* dayes brought from the sacke of *Portricco* some of these plants, but lived not long in the ayre of *England*; some of the dried and dead ones being afterwards sent to *Clusius* by *Iaques Garret*, whose figure is that he exhibited in his *Christophorus Acosta*.

CHAP. LXVI.

Stirpimans seu Frutex impatiens. The shrinking shrubbe.

Somewhat like unto those before remembred is this shrubbe, which our English which went with Sir *James Lancaster* found by chance travailing neare the Sea shore, on the East side of the Ile of *Nicobar*, as also on *Sombro*, an Iland which is neare *Nienbar* & *Samatra*, the younger sized, being like small bushes, halfe a yard or two foote high, at the toppes of whom grew foure or five branches full of leaves somewhat round like unto Mirtle leaves, as greene as Sorrell and full of sap or juice; which bushes being stricken by ones foot or other wise as they passed by, were observed to shrink downe as low as the branches would let them, and rise againe by and by after to the former height; the reason hereof was, that every plant grew out of the mouth or belly of a long living worme within the earth, which drew downe the plant being stricken; but in the elder or greater growne plants the worme was consumed, and the rootes of these bushes being plucked up after they had remained a day two or three above the ground, became as hard as Corall: the rest of the bushes remaining as woody as other shrubbes. This threefold change or alteration in nature, first from a living worme to a vegetative plant, and then to a stony substance, maketh it more admirable above any.

CHAP. LXVII.

Planta animal seu Borametz Agnus Scythicus. The Scythian Lambe.

His strange living plant as it is reported by divers good authors, is called by the Natives *Borametz*, quasi *agnellus*, by others either *Planta Ruthenica agno similis*, or *Agnus Scythicus*, or by some *Planta animal*; it groweth among the *Tartares* about *Samarcanda* and the parts thereabouts, rising from a seede somewhat bigger and rounder then a Melon seede, with a stalke about five palmes high, without any leafe thereon, but onely bearing a certaine fruit on the toppe, in forme resembling a small lambe, whose coate or rinde is woolly like unto a Lambes skinne, the pulpe or meate underneath which is like the flesh of a Crevise or Lobster, having as it is sayd blood also in it; it hath the forme of an head, hanging downe, and feeding on the grasse round about it, untill it hath consumed it and then dyeth, or else will perish if the grasse round about it bee cut away of purpose: it hath foure legges also hanging downe: the Wolyes much affect to feede on them.

CHAP. LXVIII.

Manihot Brasilianorum. Indian earth nuts, or Pease.

Here is growing in sundry places in *Brasil* and in *America* also, neare the River *Marathon* a certaine fruit or Pease breeding under the ground like as pusses doe, without either leafe or roote as it is sayd, but they are no bigger then great Pease, and inclosed in a small grayish thicke and short cood, very like a small Pescod, with one or two Pease therein, of a pale reddish colour, on the outside and white within, tasting like unto an Almond, which will rattle being shaken in the skinnè, growing many together and tyed by small strings. The fruits are eaten as junkets with great delight, for their pleasant tastes take eyther fresh or dryed, but a little costed make them relish much better, and are served to the table of the better sort as an after course, and doe dry and strengthen the stomacke very much, but taken too liberally breed head ach and heavinesse.

CHAP. LXIX.

Radix Sanctæ Helenæ. Saint Helens beads, or Indian round sweet Cyperus.

Near the Port of Saint Helens which is in *Florida*, grew certaine rootes very long and full of knots, of round joynts as great as ones thumbe, blacke without and white within, tasting somewhat aromaticall like *Galanga*, which when they are dry are as hard as an hornè, the leaves are large and very greene, growing on stalkes that spread on the ground: it groweth in moist grounds, and is drying in the beginning of the second degree, and heating in the end of the same, the pouther of them taken in wine is used against the paines of the stomacke and bowels, easing the collicke and stone in the Kidneyes, and provoking urine. The Indians use to sprinkle the pouther of the rootes all over their bodies, being ready to goe into the Baths, because as they say, it bindeth the skinnè and strengtheneth the members of the body by its sweet sent. They use therè to disjoynt these round knots of the rootes, which being drilled and strung serve them in stead of Beads to tell God how many prayers they will give him at a time. *Clusius* thinketh these roots may not unfully bee referred to some kind of *Cyperus*, but I thinke the large leaves contradict it.

Radix Sanctæ Helenæ.
Saint Helens Beads, or Indian round sweet Cyperus.

CHAP. LXX.

Radix Quimbaya. Carthagenas purging roots.

Petrus Cicea maketh mention of these roots in the first part of his *Peruvian* history that they are slender, of about a fingers thickenesse, growing among the trees in *Quimbaya*, a Province in *Peru* whose cheife city is *Carthage*: if some of these roots be taken and steeped in a good quantitie of water all night, they will drinke up most of the water, but yet three ounces thereof remaining being drunke doe purge the body so gently and without trouble or perturbation, as if it had beene purged with *Rubarbe*, this hath beene often tryed. *Clusius* thinketh that these rootes were the same or very like unto such as was sent him by a friend by the name of *Bexugo vel Fern*, which he tooke to be no other then the branches of *Atragene* or *Viorna* of that Countrey, they were so like.

CHAP. LXXI.

Rhabarbarum Americanum. Rubarbe of *America* or West Indie Rubarbe.

Monardus saith, that among other things werè sent him out of the maine of the West Indiës he had a peece of a roote which they called there by the name of *Rubarbe*, and was very like the East Indian kind, for as hee saith it was round, with a brownish coate and reddish core or inside, which being broken, had some whitenesse mixed among it, and coloured the spittle yellow like *Saffron*, being bitter withall, but what leaves it bore was not signified. This is not the white *Rubarbe* of *America*, for that as is sayd in its place is the *Meconean*.

CHAP. LXXII.

Carlo Sancto. The Indian Hoppe-like purger.

Of the Province of Mexico commeth this roote which they there call *Carlo Sancto*, for what cause is not well knowne, it groweth after the manner of Hoppes, climbing on poles or other high things, or else it will lye on the ground: the leaves are like unto Hoppe leaves, of a very sad Greene colour, and of a strong heady sent: it is not knowne whether it beare cyther flower or fruite: the roote is great at the head, having sundry smaller sprays issuing from it, each of the bignesse of ones greater finger and white, the barke or rinde whereof is easily sepeared from the rest, and is of most use, smelling somewhat sweet, and tasting bitter and somewhat sharpe withall: the pith of the roote consisteth as it were of

Carlo Sancto. The Indian Hoppe-like purger.

many small and very thinne filmes which may easily be sepeared one from another: it is hot and dry in the beginning of the second degree. The barke of the roote being a little chewed in the mouth draweth downe from the head much flegme, whereby rheumes catarrhes and desillations therefrom are voyded, and the parts much eased of paines and other griefes, in some also it causeth a vomit, avoyding thereby much choller and flegme from the stomacke, that oppressed it before and strenghtned it afterwards, the decoction thereof worketh better thereon; if a purgation fitting the person be taken before this evacuation upwards, it will doe the more good: the barke being chewed helpeth loose gummes, putrid and rugged teeth, and maketh a sweete breath, but it were good to wash the mouth with a little wine afterwards to take away the bitteresse: the pouter thereof taken in a little white wine, or the decoction thereof with Maiden haire and a little Cinamon easeth women of the obstructions of the mother, the staying of their courses, and consumeth winde in their bodies being formerly purged and prepared, and using *Liquidambar* & *Ung Dealbea* of equal parts mixed together, to annoint the lower parts of the belly all the while: the same also helpeth the Symptoms of the heart, as swoonings and other the passions thereof, especially rising from the defects of the mother. This decoction likewise is very beneficiall for them that are so troubled, that is to take two drams of the barke, and boile it in three pints of faire water, putting in at the end thereof foure drammes of the barke of Pomcitrons and two drammes of Cinamon, which afterwards being strained, six uncies of this decoction is to be taken with a little Sugar every morning, the body being purged before hand. This pouter and decoction is commended likewise against the French disease, the Epileptic or falling sicknesse in the younger sort: the pouter thereof hath bene often found to cause women to have a speedy delivery, and to take away the passion and faintings in their tedious travailes, being taken either in wine or in some Orange flower water, the continuall use thereof hath bene tried to amend a cold and weake stomake, and to helpe such as could digest no meate: the like use hath given remedy and perfect cure to those that have bene bursten, so that they have not used any Trusse to themselves being perfectly helped thereby.

CHAP. LXXIII.

Faba five Phascoli purgantes. Purging Beanes.

Onardus speaketh of certaine purging Beanes that grow about *Cartagena* and *Nombre de Dios* very like unto our ordinary Beanes but lesser, with a thinne outer skinne, dividing it in the middle which was to be cast away, least it might procure too violent evacuation both upward and downward, even to the hazard of life. With the Indians this is a famous and familiar medecine, purging without trouble flegme, and choller, and grosse humors, and that very gently, the quantity to be taken is from foure of them or more according to every ones abilitie, but you must regard that every one of them bee rosted well before they be used, but *Clausius* saith he could never see such beanes as are here described, but hath had a certaine kind of *Phascoli* Kidney beanes sent him under the name of *Faba purgatrice*, whose figure is here exhibited, being round and flat on both sides, about a fingers thicknesse and two in breadth or more, yet a little hollow on that side where it grew to the huske: the outer huske is hard, and in a manner woody, smooth, and of a darke red colour, being white, and of a firme substance within parting

Faba five Phascoli purgantes. Purging Beanes.

into two as most other pulses do, of the like taste also at the first, but quickly hot and sharpe upon the tongue, from whence commeth as it is likely the purging quality: because in some sort these resemble the forme of a heart, therefore some called them *Cor Divi Thomæ*, Saint Thomas hearts, and besides because they grow in Saint Thomas Island. *Clusius* thinketh that this is the Beane of the *Phaseolus Brasiliensis*, whose pods I have shewed you in page 1057.

Monardus also speaketh of purging nuts, which he calleth *Avellana purgatrix*, which grew in *Santo Domingo* *Avellana purgatrix* that were very like unto Hassell nuts, but three square and browne on the outside, with a tough thin shell the kernell being white and sweete withall, whereby many were deceived: for they purge very violently both upwards and downewards choller and flegme, even almost to the danger of life, which by roasting of them before the taking is avoyded: they helpe the Chollicke, and expell winde, and are often put into glisters for that purpose; but I have knowne a glister given in this manner to good purpose: a glister being ready to be given with a bladder, the small end of a Tobacco pipe was put into the bladder and tyed (but so that it might bee drawne closer after the pipe is pulled out) that had Tobacco in the Bole, which only blowing the smoake thereof into the bladder and so given hath given present ease.

CHAP. LXXIII.

Fasilin Theveti. Mombazas Antidote or Counterpoyson.

A *Ndræus Thevet* mentioneth this herbe in his *Cosmography* to grow in the Island of *Mombaza*, having many long leaves like unto *Elecampane*, which Island as it aboundeth with many singular good herbes, both for meate and medecine, so it doth also with venomous Serpents: for whose remedy it is also especially provided of other powerfull herbes, among whom this one is accounted a principall: the experience whereof saith hee I have seene upon divers people biten by a most virulent Serpent, there called *Alefah*, partly living in the waters and partly upon land, whose venome was present death, if the patient were not suddenly succored herewith.

Fasilin Theveti. Mombazas Antidote or Counterpoyson.

CHAP. LXXV.

Herbs Malucana. The poore mans Chirurgery.

T His herbe riseth usually to be two or three cubits high, but in more fertile places to be above five cubits, of a fresh Greene colour, the stalk is slender weake and hollow, leaning unto something to uphold it, or else it will lye on the ground, where it will take roote againe, it spreadeth into sundry branches, having tender soft leaves thereon like in forme and bignesse unto Elder leaves, but dented about the edges, the flowers are like Camomill but all yellow and greater; it is Greene all the yeare through; those of *Canaria* call it *Brungara aradua*, and the vulgar sort, Poore mens remedy and Chirurgions baine, because the common people of India doe generally plant it being naturally of *Maluca*, and use it for all hurts, eyther alone or mixed with other things that serve for the purpose: the manner whereof is thus, They boyle the bruised leaves in oyle, which after it is well boyled and strained they make an ointment thereof with a little yellow Wax; and herewith they dresse their sores, be they old or young, bloody, putrid, malignant or fistulous, and especially is good in the foule sores of the legges, Another way they have to use it by taking the middle or inner rinde, the outermost being taken away, which is as easily done as in Hempe, and anointing

sanguinem
huo fittens.
Gramen
quod ad pi-
uitiam.

it with the oyle of the Indian Nut, they rowle it in the leaves thereof, and roſt it under the hot embers, which being growne ſoft, they beate it and then apply it to all ſuch wounds and ſores aforeſaid, which are perfectly cured within a few dayes, without inflammations or Impoſtumes, to the wonder of all that knew it not before: it like wiſe eaſeth all paines, and ſtayeth all fluxes of blood, and is a ſingular helpe to the joynts that are pricked or wounded, and briefly ſerveth the people that uſe no other remedy to helpe themſelves in any caſe of neceſſity, without the uſe of a Chirurgion, and truſt thereto as unto an undoubted remedy; the oymntment is carryed into ſundry other Countreyes alſo. Another herbe called *Centella* groweth in the Weſt Indies, mentioned by *Monardus* out of *Petrus de Oſma* his Letter to him, who without any deſcription thereof, ſaith that the Indians doe familiarly uſe it, and the *Spaniards* from them, being bruifed and laid to any tumour in the legges or thighes, comming from a cold cauſe, would cure them by railing bliſters that the humours might be let out, and the ſwell- ing aſſwaged. Another herbe alſo *Monardus* there remembreth from him likewiſe, that would ſtanch the blood of any wound ſuddenly, ſcene, and tryed by certaine captive Indians, that through hunger cut off the calves of their owne legges and did eate them, and preſently applied the leaves to them, which ſtanchd the blood to the great admiration of all that ſaw it. The ſame *de Oſma* ſaith there, he uſed a kinde of herbe growing like graſſe, which of himſelfe tooke the name, which being chewed would draw downe much ſlegme, and there- fore good for rheumes in the head, and deſluxions into the throate, and to make lotions to helpe thoſe diſeaſes thereof.

CHAP. LXXVI.

Herba Ioannis Infantis. Iohn the Infants herbe.

His is a ſmall herbe growing in the Weſt Indies having leaves like unto Sorrell, but ſomewhat rough and hairy, and tooke the name from one *Iuan Infanta* an Indian, the ſonne of a *Spaniard*, who uſed it to cure wounds, and to ſtanch their bleedings, helping all hurts, prickes, and wounds in the ſinews, or in any other part of the body, digeſting, clenſing, and healing them by laying ſome of the greene herbe bruifed thereunto: or elſe the poulder of the dried herbe ſtrowed thereon, which is thought to be better then the greene herbe.

CHAP. LXXVII.

Lactucaſylveſtris pumila. A Lettice for the tooth achi.

Nother herbe was ſent unto *Monardus* out of *Peru*, that was like unto Lettice leaves, but of a darke greene colour, and very bitter in taſte, the decoction whereof kept a good while in the mouth, on that ſide that the tooth doth ake, will eaſe and take away the paine: the joyce of the greene leaves put into an hollow tooth will doe the ſame.

CHAP. LXXVIII.

Mungo. Indian Coriander like ſeed for an Ague.

He Indians of the Eaſt have a ſmall round ſeed very like unto Coriander ſeed, which is greene before, but blacke when it is ripe, being fodder given to horſes, and men doe alſo eate of them: they of *Guzarate* and *Decan*, uſe the decoction thereof againſt agues, and giving the ſeed alſo being huſked, and boyled like Rice, unto their aguiſh patients cauſing them to abſtaine from either meate, of bread of Wheate, for many dayes together: It is held that *Avicen* mentioneth this in the 481. Chapter of his ſecond Booke, by the name of *Meſſe*, *Bellunenſis* his interpreter hath it *Ment*, but *Garcias* ſaith it ſhould be *Mex*, and ſo in another place he nameth it.

There hath beene ſent alſo another ſmall creſted graine or ſeed, of the bigneſſe of Pepper cornes, ſo like unto Coriander ſeed, that at the firſt ſight, one might be ſoone miſtake, but that it is greater and blacke, this might be thought to be the former *Mungo*, but that this is hot, and the *Mungo* is cold, as it is thought fit for ſuch patients,

Mungo ſimilis ſiſtina.

Indian Coriander like ſeed

CHAP. LXXIX.

Arbor Boncum fructu ſuo Buna. The Turkes berry drinke.

Ipirus in his Booke of *Egyptian* plants, giveth us the deſcription of this tree, which as hee ſaith, hee ſaw in the garden of a certaine Captaine of the *Ianiſſaries*, which was brought out of *Arabia felix*, and there planted as a rarity, never ſcene growing in thoſe places before. The tree ſaith *Apianus*, is ſomewhat like unto the *Evonymus* Prickerimber tree, whoſe leaves were thicker, harder, and greener, and alwayes abiding greene on the tree; the fruit is called *Buna*, and is ſomewhat bigger then

then an Hazell Nut and longer, round also, and pointed at the one end, furrowed also on both sides, yet on one side more conspicuous then the other, that it might be parted into two, in each side whereof lyeth a small long white kernell, flat on that side they joyne together, covered with a yellowish skinne, of an acide taste, and somewhat bitter withall and contained in a thinne shell, of a darkish ash-colour: with these berries generally in *Arabia* and *Egipte*, and in other places of the *Turkes* Dominions, they make a decoction or drinke, which is in the stead of Wine to them, and generally sold in all their tappe houses, called by the name of *Caava*; *Paludamus* saith *Choava*, and *Rauwolfius* *Chanbe*. This drinke hath many good Physicall properties therein: for it strengtheneth a weake stomacke, helping digestion, and the tumours and obstructions of the liver and spleene, being drunke fasting for some time together. The *Egyptians*, and *Arabian* women use it familiarly while their courses hold, to cause them to passe away with the more ease, as also to cause those to flow that are stayed, their bodies being prepared and purged aforehand.

Arbor Eon cum fructu suo Budo.
Turkes berry drinke.

CHAP. LXXX.

Curcus. White Nuts.

Here groweth saith *Garcias* in divers places of *Malavar*, a certaine Plant which is sown and hatched the fruite thereof hanging downe from the branches that are like unto Hazell Nuts, but not so round, and white of colour, whose kernell is sweet somewhat like unto Mushromes, or *Spanis* puffs, when they are boyled and dressed: they call it *Quiviquilenga* in some places (which signifies saith *Garcias* a small Inhame, but *Clusius* saith he knoweth it not, except it be the *Traf* dolce, or *Juncia avellanada*) and in *Malavar* *Curcus*, and in *Cambaya* *Carpara*: these saith he, are not put to any use in physicke that he knew: he doth conjecture that *Serapio* meaneth this fruite by the name of *Habacontcont*, which saith he, breedeth abundance of sperme, but bringeth the passion of the chollicke therewith.

CHAP. LXXXI.

Caceras Indorum. Indian *Traf* rootes,

His roote groweth within the ground like as *Traf*s doe, shooting forth stalkes in the dry time of the yeare, having leaves like the water Flagge, or Corne Flagge, one foulded within another: these rootes being dried taste like unto Chestnuts: but while they be Greene or before they be dried, they are unpleasant. *Clusius* thinketh that these rootes be the *Malsinathalla* of *Theophrastus*, lib. 4. c. 10. or the *Anthalim* of *Pliny*. About the River *Maragnon* in *Pern*, grow certaine fruits under the ground like *Spanis* balles, of the length and bignesse of halfe ones fingers, round and somewhat wriched, of a brownish colour, having within it a small nut like an Allmond, which will rattle being shaken when it is dry, browne without and white within, parting in two parts as an Allmond, of as good a taste as a Filberd, both raw and roasted, but procuring headache if too liberally eaten: they dry and strengthen the stomacke, and are esteemed as junkets with the Indians and *Spaniards*.

Fructus sub
terraneous
as. Quere
an Manobi
supra.

CHAP. LXXXII.

Bague. The Indian dreamer.

His herbe groweth up with hard stiffe square stalkes like unto Hempe, yet tough and not easie to breake nor so hollow as Hempe, whole barke may be drawne into threds as well as Hempe (yet *Garcias* saith the stalke is woody, with but a little barke) of a pale Greene colour: the leaves are like unto those of Hemp, dented about the edges, Greene on the upper side, and gray or hoary underneath, of a dry insipide taste: the seed is like unto Hemp seed, but lesse and not so white. The Indians of the East Countries use both leaves juyce and seed thereof, for many purposes both good and bad to stirre up an appetite to meate, and the validity of venterious actions, whereunto they are mighty prone and proclive, and wherein is their chiefe felicity, eating the leaves or seed alone, or with some Sugar, divers also doe diversly compound or mixe it, some putting thereto in poulder *Fusfel* or Nutmegges, or Cloves, or choyse Camfire or Muske, or Ambar, according to every ones fancy and ability, or as they would be intoxicated, for it will drive them into sleepe, and then grow great dreamers according to their humours and dispositions, but if they take it with *Opium*, as the great men and Souldiours oftentimes doe it, will cause deepe sleepes to make them the more able to undergoe their fore labours, travaille, and watchings in the warre, and to forget them also. But the women oftentimes abuse their husbands hereby in giving it them to fulfill their lust before their faces. Although this plant be in face like unto Hempe, yet the qualites are quite contrary.

Bague. The Indian dreamer.

CHAP. LXXXIII.

Hiucca sive Mandioca ex qua Casavi fit. The true Indian Hiucca whereof the Indians bread Casavi is made.

The plant hereof groweth like a small shrub or bush of Elder, and is accounted to be of two differing sorts of leaves, and riseth to be sixe or seven foote high, with sundry woody stalkes, bearing many faire broad leaves thereon, divided into sundry parts, like unto *Hellebaster*, or the fingers of ones hand, seven or eight together, upon a long footestalke, each part of them being halfe a foote long, and three inches broad, but not endented about the edges, abiding alwayes Greene: the one sort of leaves are somewhat broad towards the points, the other narrower, it hath saith my friend that gave me the intelligence, a small spotted flower, but what fruite followed, hath not yet bene signified by any: the roote groweth quickly great, for it is usually planted every yeare, or every other yeare, and becommeth as great and long as a good great Carrot roote, browne on the outside, and very white within, the manner to propagate it is, to cut off a stalke about a foote long, and put it more then halfe way into the ground, where it will quickly take roote, and within a yeare or little more be fit to take up and use againe. Of this roote did the *Americanes*, notwithstanding in many places they had *Ma'x*, which is Indian Wheate, both in the Isles and in the Continent, for many hundreds of yeares make their bread whereon they lived in this manner: Having pared away the rinde, they scraped or broke small the roote, which is white, sappy, and full of substance, from whence they pressed out the juce which they kept by it selfe, having an evill smell, whereof whosoever tasted, either man or beast, dyed without remedy, and that quickly, but if they boyled it to the halfe, it would become a good wholesome drinke although like small Ale, and if set in the Sunne it would be as good vinegar as might be of Wine, and if it were boyled thicke, it would be sweete as hony, and serve for that purpose: the masse from whence the juyce was pressed, they did put into a panne and set it over the fire to make it grow thicke, and being dry, they made it into poulder, and putting water thereto they formed it into small cakes, and dyed them in the Sun, which they kept for their use, and would abide good for a long time, twenty yeares without corrupting, giving good nourishment to the body, although it would exasperate the jawes and throte in eating thereof, for which purpose they had need of water, or other liquour, to moisten it often, or else it would be hard to swallow, being somewhat harsh and sharpe in the throte. This ordering of the roote to make poyson wholesome, is no lesse admirable then that

Huacca five *Mandiocæ* genuine, *Mexicana* species duas *folijs Cannabinis*. Two sorts of the true West Indian Henpe leaved *Huacca*.

Herich Americanum. Mallow leaved Potarocæ.

that the juyce of this roote groweth on the Vpland in the Continent, is not any whit hurtfull, as it is said, although it be hurtfull in the Islands: & this bread was used by all the people of *America*, from *Florida* to *Peru*, and about the Straights of *Magellane*, above a thousand miles, yet had they *Maiz* also, that is, Indian or Turkey Wheate, in most of those places, The Names hereof are very various, according to the Country, for it is called *Manihot* by some, *Huacca*, *Huicca*, or *Lucca*, according to others, and *Cazavi*, as they call the bread which the Spaniards doe write *Cacavi*, that is *Casavi*, which is the most general name through all places. We have not heard that the Indians used either herb or roote to any Physicall remedy.

Like hereunto is that which is called *Herich* by the Indians, whose leaves are round like Mallowses, and the roote like unto great long Turneps, being of two sorts, the one being yellowish the other white, when they are boyled or baked into bread, and is planted from peeces cut off from the roote. Some would referre this to the *Vingum* of *Theophrastus*, which *Pliny* calleth *Ocymum*.

Herich Americanum. Mallow leaved Potarocæ.

CHAP. LXXXIV.

Cevadilla five *Hordeolum causticum Americanum*. The Indian causticke tree.

Cevadilla five *Hordeolum causticum Americanum*. The Indian Causticke Barley.

Onardus saith that among other rare seedes and plants, that were sent him from *Hispaniola*, he had this also, which they there called *Cevadilla*, that is to say *Hordeolum*, Small Barley, from the likenesse of the spiked head of seed unto an eare of Barley but lesset, having the seed enclosed in the like chaffie huskes, but is like unto Linseed, yet greater, whose property is more admirable then ever was heard of in any other herbe or seed, for neither *Sublimatum* nor fire it selfe can effect more in a cautery to be used, therefore it will kill the wormes that breed in foule ulcers, and clenseth those that are foule and stincking, by casting some of the powder thereinto, yet with discretion, according to the greatesse and foulness of the sore, and using those remedies that are fit for it, but if it chance to worke too eagerly or sharply they use to dippe tents in Rosewater, or Plantaine water, and put them into the ulcers, it is used in the like manner, for the sores of beastes: this seed is hot in the fourth degree, and beyond it, if there were any further degree to be reckoned.

Millo is a graine or kind of Corne like Millet, used both for bread and drinke in the Kingdome of *Sabô* in *Guinea*, remembered in the Sea voyages of *Vanderbague*, in *Celsus* his *Cure posteriores*.

Millo.

CHAP. LXXV.

Anana seu Pina. The West Indian delicious Pines.

THe Pines (so much esteemed for the most excellent and pleasant sweete fruite in all the West Indies) is the fruite of a kinde of Thistle, growing with many long, hard, rough stiffe and narrow leaves, thickest in the middle, and thinne, cut in and dented about the edges, with reddish points, seeming prickly like a Thistle, but are not, from the middle whereof riseth up a round and shorter stalke, then that of the wilde sort set with the like leaves but lesser, and at the toppe one head, of the bignesse of a reasonable Muske-Melon, or Pome Citton, of a yellowish Greene before it be ripe, and more yellowish, being through ripe, shewing as it were scaly like an Artichoke at the first view, but more like to a Cone of the Pine tree, which we call a Pine Apple for the forme, yet the outside hath no hardnesse at all therein, but may be pared and cut like unto a mellow Corone Peach, being so sweete in smell that they may be perceived where they be as farre off, of a farre more pleasant sweete taste and substance then it, tasting like as if Wine, Rosewater, and Sugar, were mixed together, having no seede at all in it, whereby it may be encreased: but as some others say, it hath whitish seed like a Muske-Melon, but lesser and longer: this fruite beareth a bush of leaves at the toppe, and some small heads on small branches underneath it, which being taken from it and planted halfe way deepe in the ground will take roote, and beere fruite the next year, which is the onely manner of propagating. In *Brassill* is said that they have sundry sorts hereof, one they call *Iajama*, which is longer and pleasanter then any other, and of a yellowish substance: another they call *Bonjama*, being whiter within, and of a mawmish taste, with the lusciousnesse: a third they called *Iajana*, white also within, but tasting like sweete Wine with a litle tartnesse. The roote is great with many strings thereat, but perisheth with the stalke after the fruite is ripe. It was first brought from *Santa Cruise* in *Brassill* where it is naturall, into both West and East Indier, being not naturall to either of them, but is onely manured there, and now is growne plentifull: they of *Brassill* call it *Nana*, others *Anana*, the *Spaniards* and *Portugalls* *Pinas*, from the likenesse, and so doe most Countreyes, following that name, *Oviedus* in his History calleth it *Iajama*, and *Thevet* in his singularities maketh mention of another fruite very like hereunto but growing upon a tree like the Mulberry, with long broad leaves like Angelica, in an Island of the East India called *Necumere*, which fruite they call *Melenken*, and tasteth as if Sugar and a little Nutmegge were mixed together, which the Natives eate to quench their thirst. The chiefest time of their ripenesse is in the Lent, when they are sweetest. But this *Pina* as I said, surpasseth all other fruites of the West Indies, for pleasantnesse and wholesomenesse, so that many eate them abundantly, and thinke they cannot sufficiently be satisfied with them,

Anana seu Pina.
The West Indian delicious Pines.*Anana styvesii.*
Wild Indian Pines.

but the tartet of them is dangerous, even as it is usuall of the best fruits: it is not used Physically hitherto that I can learne, but *obsporiū gratiam* wholly spent and eaten: the Physicians there forbid it their sicke patients, because it is somewhat too hot and might breed inflammations. Some admirable things are reported thereof, one is that if one of these fruits be cut through the middle with a knife and they joyned together againe, the peeces will joyne and stick so fast together as if it had not bene cut at all: another propertie it hath, that if one cut the fruit with a knife and leave the knife sticking therein untill the next day, so much of the blade thereof as stucke within the fruit will be found wholly consumed and wasted, or as it were eaten away: the knife also that did cut one of them if it be not foddainly wiped but let alone unwiped will seeme as if it had bene eaten in with *Aqua fortis*.

There is another wild kinde of *Pinas* growing naturally both greater higher and more prickly or Thistlelike, having a great tuft of leaves at the bottome of their stalkes or stems next the ground seeming to be Aloe leaves a far off but lesser, and of a pale Greene colour set with sharpe prickes, it is encreased by the off-sets, one rising from another: from the maine stem grow sundry branches bearing at their ends, heads of soft tender leaves closed round together, which are nothing but the flowers, and are of a yellowish colour smelling very sweetsour of these heads rise spikes not unlike to those of the Reede but thicker, closer set and farre more beautifull, smelling like the Cedar: from the branches hang downe the fruit called by the *Portingalls*, *Ananas brava*, that is, wild *Ananas* or *Pinas* which doe somewhat resemble the former or manured kinde, of the bignesse of a Melon, of a beautifull red colour very pleasant to behold which is divided into parts like unto Cipresse nuts when they are dry, and set with bunches or knobs, very neare resembling a Cone or Pine Apple, which are nothing so good although a little pleasant, yet somewhat harsh wichall, whereof few doe eate or take pleasure in them, and give as little good nourishment when they are eaten, and is therefore more Physically used, for six or eight ounces of the juice taken in a morning falling with some Sugar, is a most present and certaine remedy against the heate or inflammation of the liver or baके, as also against the Vicers of the Kidneyes, and foule purulentous urines and the excoriations of the yard: all which diseases this cureth upon three times taking.

CHAP. LXXXV I.

Melo carduus Americanus. The Melon Thistle.

His admirable plant or fruite hath neither leafe nor stalke, but riseth immediatly out of the ground, from a small whitish rough stringy roote and many small fibres thereat, into the forme of a Muske

Melon for the bignesse, but made Cone fashion, that is, broad and flat below, and smaller up to the toppe, having round about it foureteene ribbes set with sharpe crooked prickes ten or twelve together like a starre in six, seven or eight places of every ribbe and furrowed betweene, of a yellowish Greene colour: from out of the toppe whereof thrusteth forth sundry silkelike downe or Cottony threds, as the Artichokes and other Thistles doe, within which lyē when they are ripe small long slender pointed sheathes or cods, of a perfect crimlon colour, resembling the long codded *Capiscum* or Ginny Pepper, wherein is contained small round seed like the *Amaranthus*, set with hard yellowish prickes at the head: the rinde hereof is hard and thicke like unto a Melon, which may be pared away like it, under which the pulpe or meate lyeth white in colour, fatty in feeling of an unfavory sower taste, waterish and cooling. This plant groweth neare the Sea shores in divers Islands of the West Indies as Saint *Margerts*, Saint *Iohns*, and others neare unto *Pnerco ricco*. One of the fruits hath bene brought from thence to us that hath weighed seven pounds and twelve ounces. We know of no other use this fruit is put unto, but that in the hot time of the yeare they eate it to quench their thirst and coole the heate of their stomackes.

Melo carduus Americanus.
The Melon Thistle.

CHAP. LXXXVII.

Cardus Pitahaya Americanorum. The blood red ball Thistle.

His Thistly fruit is described by *Oviedus*, growing in the Island of *Hispaniola* which is round, and as bigge as ones fist, and somewhat long, having a shew of scales on the outside: the barke or rinde whereof is thick but may easily be cut or pared, under which the pulpe or meate is like unto a Figge with graines or kernells among it, as it hath, but of a pleasant deepe crimson colour, which coloureth their fingers like Mulberries that cate them, and after two or three houres that they have eaten them their urine will looke whitish, the fruite hath neither leafe nor branch, but riseth up in the middle of many great foure square armes of six foot long a peece channeld in the middle, and both there and at the edges set full of most sharpe but small prickes, three at a place together at certaine distances one from another, the whole plant and fruit is of a pale Greene ash colour.

Cardus Pitahaya Americanorum.
The blood red ball Thistles.

CHAP. LXXXVIII.

Cereus spinosus Americanus. The Torch Thistle of America.

His small plant seemeth somewhat like the last, but that it riseth up with divers stalkes 19. or 20. cubits high, with some outward ribbes all the length of them, and set at severall spaces with small short thornes standing like small stattes, the forme of them very like unto the Melon Thistle, these stalkes have some short branches, and at the toppes flowers like the purple Foxglove, and fruite following of a bright crimson colour like a Figge, but without taste, the stalkes are wooddy of the bignesse of ones wrist of a gristly substance, and of a bitter gummy tast like Aloe.

Cereus spinosus Americanus.
The Torch Thistle of America.

CHAP. LXXXIX.

Planta pinnata arundinacea spinosa. The winged thorny Reede.

THis Reedelike thorny plant came likewise with the two last recited plants from the West Indies which was like a staffe of a Reede full of pith of eight or ten cubits in length having a threefold waved skinny welt of a fingers breadth set thereon all the length thereof and at the outer ends of the waved welt small starres of sharpe pricks or thornes : more hereof cannot be said for that more was not brought, but that thereby you may behold the admirable workes of God in plants as well as in all his other creatures.

Hereunto is adjoynd another thorny plant brought from these parts, which seemed either the body or the branch of a blacke berry like tree, being a solid firme heavy wood, armed very thicke with great long and stronge thornes at certaine tubers or knots, the bark being thicke and blackish.

Observe I pray you that the former of these two descriptions belongeth to the *Cereus spinosus* and that description to be set in the place of it.

Planta pinnata spinosa & Rubusacis senicosa planta.
The Ruse Thistle-like plant of America, and a bramble bush like staffe of America.

Canne Indice portentoſe longitudinis. Indian Reede ſtaves.

IN the Western ſide of *Sumatra* and in other places alſo of thoſe Indies grew Canes (for wee know not how elſe to terme them) or Reedes called by them *Rutan* of an incredible length, for riſing from the ground, they will mount up to the toppe of the higheſt tree in growth there next unto them, and deſcending to the ground againe, it will runne thereon on a great way, and ſometimes divide it ſelfe to ſeverall wayes, and afterwards coile it ſelfe as a Cable is laid on ſhipbord or elſe where, to the length of thirtie fathome by computation, and then runne againe over a tree ſometimes or elſe coile it ſelfe againe as formerly, ſo that neither beginning or end thereof is found : it hath not bene obſerved that it hath any leaves on it, but are very plyant and bending as one will while they are freſh and greene, and would ſerve in ſtead of ropes : but when they are old and dry, they will ſerve in ſtead of walking ſtaves, as they are much uſed with many of us now a dayes or to any other ſuch purpoſe, they are no harder or bigger then an ordinary cudgell, yet may one ſtrike fire from them by ſtriking one againſt another, which nevertheleſſe are porous and hollow as it were in the middle, ſo that one may blow winde through them at never ſo great a length, and at a reaſonable ſtaves length almoſt ſo ſtrongly, to blow out a candle ſet at the further end, at the leaſt ſenſibly to be felt, yet no appearance of holes therein. I take it to be the ſame that is called *Iuncus Indicus poroſus* in *Cluſius* his *Curia poſteriores*, but why *Iuncus* I ſee no reaſon,

CHAP. XCI.

Canna ingens Mambu vel Bambu dicta. Huge great tree-like Canes or Reeds.

Here hath beene brought us from the East Indies Canes or Reeds of a wondrous bignesse and height, (as may be guessed by the broken peeces) growing in *Malabar* chiefly about the Sea coasts, whereof the inhabitants make posts to build their cottages withall, as also doe cut them at a certaine length like unto a Cowlestaffe to beare burthens, and bend them while they are fresh that they may bee a little crooked and hollowish, to hange a Palankin, that is a couch or litter wherein persons

may bee caried in their journeying from place to place or otherwise for state or ease, by two or foure Indians: one peece having six joynts was eight foote long, each space betweene the joynts being a foote and foure inches: it was five inches over at the bigger end, and almost as much at the lesser: the circumference or compasse about at the lower end; being sixteene inches and almost as much at the upper: the thicknesse of the woody compasse of the Cane was about three inches by measure: and was all overlaid with *Lack* or *Gum Lacca*, or hard Wax to keepe it from the weather, and from cracking in the Sunne, being found in the great Admirall Carrack or Shippe of the *Portugalls*, that brought home the Viceroi of the Indies, and was taken by our English 1593. as a Prize; but greater and longer Reedes were brought from those parts by the *Hollanders*, yet not whole but broken, the least whereof was 26. foot long, with 19. joynts therein, being 17. inches about at the lower end and 14. at the upper: a greater was a foote and a halfe longer and three inches more in compasse than the former, the distance betweene the joynts being neare the length of the circumference, or not much differing any where; the thicknesse likewise being three inches or thereabouts as in the former: by these peeces may bee guessed of what huge height these Canes were: at the plants of their Pepper doe they oftentimes fasten downe these Reedes, that the Pepper in the growing may leane thereunto, and be sustained by them, which without some Proppe or stay would lye downe on the ground and become unprofitable.

In some places of the Indies say both *Garcias* and *Acofta* these Reed like trees grow so great, that sometimes of them are made small boates, sufficient to hold two naked Indians, which they cleave in the middle and cut off beyond the two joynts, so that an Indian sitting at each end, joynd knee to knee, and a small Oare in each of their hands of halfe a yard long, they will so nimble force the Boate, yea even against a streame that it is wonderfull to behold, which as *Acofta* saith he saw in the River *Cranganor* where many Crocodils breede which are most fierce and terrible, and will assaile shippes and other smaller vessels to get some prey out of them: but as it is said will never make assault against any of the boats made of this tree or reede, nor against them in it. Of the roote of this tree being burned is made *Tabaxir*, that is, the *Spodium* of the ancient Authors, as *Avicen* thought, and so *Gerardus Cremonensis* and *Bellumenfis* doe alwayes translate the word *Tabaxir*, but *Garcias* sheweth that it is a very false interpretation, there being but one *Spodium* of the Greekes which is our *Lapis tutia* used by them onely in outward medicines, for *Tabaxir* being a Persian word signifieth nothing else but a milky juice or liquor growne thicke, and hereby the *Arabians* do still call that concrete or hardened liquor that groweth betweene the joynts of this Reede or Tree, but the Natives of *Sacar Mambu*, that is Sugar of *Mambu*, but is not found in all places as *Garcias* saith, but in *Bisnagar*, *Batecala*, and some part of *Malabar* chiefly, and is seene to be of sundry colours, as white like Starch which is the best, yet is it found sometimes of an ash colour or blackish, which yet is not to be misliked, for so it is to be taken out of the Canes, and hath beene in former times esteemed of the value of silver, and yet holdeth a great price even with the Indians, &c. there had neede therefore of great caution of using *Spodium* (as it is taken) in the *Arabians* medicines, which are for the most part all inward which is farre differing from *Tabaxir* as you here see, and of all is taken for the fittest *Antispodium*, and those other of Oxe bones burned and the like to be utterly cast away. The tree hath leaves saith *Garcias* like an Olive but longer: the properties whereof are effectually eyther in outward or inward heates, hot chollerick Agues and fluxes that come of choller to coole, temper and binde them. And now that I have shewed you all the Physicall herbes let me descend to the trees and prepose them that have delightfull and pleasant fruits, that you may take therein some pleasure to mix with the profitable or admirable that shall follow: and the first that I will propound as *Garcias* saith is the chiefest and choysiest fruite in all the Indies.

Canna ingens Mambu vel Bambu dicta.
Huge great tree-like Canes or Reeds.

CHAP. XCII.

Mangas. The Indian hony Plumme.

His tree groweth tall like a Peare tree, with somewhat long leaves, more like unto a Peach then a Plumme: the flowers grow from among the leaves, many being set on a long footstalk like the long Birds Cherry, or cluster Cherry, after which follow the fruites, some being as bigge as a small Melon, and weigh neere about two pound, the lesser about the bignesse of a Goose egge, and others betwene these sizes, as the climates and fertility of the soile causeth them, all of them being longer then a Plumme, and with a thinne skinne, Greene before they be ripe, but of a yellowish Greene and some reddish when they are ripe and shining withall, succling very well, but tasting much better, and sweeter, so that some are to be eaten when others are reserved to stand, having a long stone in the middle, like unto a long Almond in the shell, but covered with a whitish downe or freeze, and a white bitter kernell within: Some trees beare twice a yeare, in the Spring and Fall: but generally they are ripe according to the heate, and temperatensse of the climate even from *April* unto *November* in one place or another, for they are found in many Provinces of India, as *Malabar*, *Balagate*, and *Bengala*, *Guzarate*, *Pegu*, *Malaca*, *Goa*, & *Ormuz*, which are accounted the best, and called generally *Mangas* by the Indians, yet by some *Ambo*, and by the *Turkes* and *Persians* *Amba*. The fruites is ordered many wayes, as either preserved in Sugar, or pickled up like Ollives before they be through ripe, and are then somewhat harsh and binding: or eaten fresh, being cut into slices and dipped in Wine or without and so eaten. They are cold and moist, and yet the Indian Physicians, as well as the vulgar doe hold them to be hot, saying they breed chollerick feavers, inflammations, itches, and scabbes, unto all which diseases they are subject, which eate none of them at all, in respect of the heate of the yeare, when those fruites are chiefly ripe and are eaten. *Acofta* pictureth this tree with flowers, and the fruites much differing from this of *Linschoten*.

There is another kinde found growing in some places, but much more rarely, whose fruites hath no stone within it, else not differing.

There is likewise a wild kind hereof called *Mangas brava*, whose tree is lesser then the manured, with shorter and thicker leaves also, and the fruites is of a pale Greene colour, having a thicke skinne, and but little pulpe therein, of the bignesse of a Quince, and with a hard gristly stone within it, yet give they store of milke: they grow generally through all *Malabar*. If any one eate of these fruites although it be but a little, it is to present a poyson that they dye instantly, and herewith the Indians usually destroy one another, some putting oyle thereto, which maketh it the more speedy in operation, but howsoever it is taken it doth so quickly dispatch them out of this life, that there hath not bene hitherto found a remedy against it. Boyes, there doe usually in sport throw these fruites one at another, as in *Spain* they use to doe with Greene Orrenge.

Mangas. The Indian Hony Plumme.

Mangas fructu.

CHAP. XCIII.

Genipar. The twining American Peach.

His tree is of two sorts, the fruites of the one is edible and greater then the other, which is not to be eaten bearing leaves like the Walnut tree, and fruites at the end of the branches, being both for colour and bignesse like unto Peaches, one set up - another in a wonderfull manner: that which is not edible hath a certaine cleare ble with jayce therein like unto Indico, wherewith the Savages dye or colour their bodies when they have any solemne meeting of friends or goe to the slaughter of their enemies, and they with this ornament thinke themselves as finely decked as we in our bravest silkes.

CHAP.

CHAP. XCIV.

Guanabanus Oviedi. The Indian Scaly Muske Melon.

His delicate fruite groweth on a goodly tall tree in sundry places in the West Indies, whose wood is but weake, having large and long leaves, like unto those of the Pomecitron tree, and very green: the fruite is sometime, as bigge as any Melon, and sometimes of the largenesse of a middle sized Melon, covered with a thinne scaly greenish tinde, somewhat like to a Pine apple for the forme, which may as easily be pared away as a peate, the meate or pulpe within is very white, sweete, and delicate, and relenting in ones mouth like unto cream: the feedes within are great, like unto Gourdes seed, but somewhat larger and blackish, and are dispersed through the inner pulpe. This fruite is cold and moist, and therefore of especiall use in the heate of the yeare to coole their thirst, and giveth no offence to the stomacke, although one should eat an whole one.

Anon.

Oviedus mentioneth another fruit called *Anon*, which he compareth with the *Guanabamus*, saying that not onely the tree, but the fruite are very like but exceedeth it in goodnesse, being of a firmer substance.

Thevet maketh mention of one very like hereunto called by those of the Iland of *Zipanga* where it groweth *Chivey*, which in the *Syrack* tongue signifyeth a Figge. The branch being ripe is yellow, and very pleasant in taste, like unto Manna, melting in ones mouth, containing seede within them like unto those of Cwcombers. The leafe is very round and greene.

Guanabamus Oviedi.
The Indian Scaly Muske Melon.

CHAP. XCV.

Guanabamus Scaligeri. The Ethiopian fowre Gourde.

He Ethiopian fowre Gourde groweth in *Mozambique*, and other parts of *Ethiopia*, on a faire great tree, having large fresh greene leaves, larger then Bay leaves, & comming neerest to those of the Pomecitron tree, the flowers are of a pale whitish colour, and the fruite as great as a Melon, but longer then it, and ending in a round point, whose rinde is hard and thicke, with sundry ribs thereon, and covered with a greenish-freeze or cotton: the pulpe or meate within is whitish while it is fresh, but somewhat reddish being dry, and then is very brittle also, that it may be easily rubbed into pouther, having diverse large seed running through it of the forme of a thicke short kidney or the feedes of *Anagyris*, the great beane Trefoile fastened therein with small fibres to the hollow middle part which pulpe as well dry as greene is of a pleasant sharpe taste, yet more tart or fowte, when it is dry then greene: this is used in the extremities of the hot weather to coole and quench thirst, and is effectually also in all putride and pestilentiall feavers, the pulpe or juyce thereof taken with Sugar, or the dried pouther put into some Plantaine water, or the decoction or infusion thereof, both for the aforesaid causes and to stay the spitting of blood, or any other hot fluxe of blood or humours in man or woman; this is very like to be the *Abava* that *Honorius Belius* writeth of in his fourth and fifth Epistles to *Clusius* and the *Bahobab* of *Alpinus*.

Ficus Nigritana.

Somewhat like hereunto is that fruite which *Thevet* calleth *Ficus Nigritana*, the leaves of the tree are larger then any of those former sortes, and hath some divisions therein very like unto Figge leaves: the fruite is sometimes two foote long and thicke, according to the proportion.

Higuro Oviedi.

Not much unlike also is the *Higuro* of *Oviedus*, which he describeth in his Indian History: The tree (saith he) is as great as a Mulberry, and the fruite sometimes like unto a long Gourde, & sometimes unto a round, of which round sort the Indians make themselves dishes, platters, and sundry other vessels: The timber whereof is strong

Guanabamus Scaligeri. The Ethiopian fowre Gourde.

Higuera fructus Clusij
Mortice like Bells.

Above fructus.
The poysonous fruite of the stinking tree.

and fit to make stools, chaires, saddles, and the like: the leafe is long and narrow towards the stalke, and broader towards the end, but growing lesse from thence to the point: the meate or pulpe thereof is like unto Gourds, which they often eate in want of better food: This tree groweth in *Hispaniola*, and other the Islands of the West Indies, as well as on the Continent also. *Clusius* setteth forth other certaine fruites tyed unto strings and stones within to sound in dancing with them, which he entitul:th *Higuera*, farre differing from this.

Above fructus. The stinking tree with his poysonous fruite.

It groweth as high as a Peare tree, with leaves three or foure inches long, and two broad, yeelding white milke, if any branch bee broken: the wood stinketh most abhominably, bearing a white three square fruite, somewhat like unto the Greeke letter Δ, whose kernell within is most poysonous and deadly, and therefore the Indians doe give great caution to their children that they eate none of them, and themselves abstaine also from using of the wood to burne, but having taken the kernell they putting small stones within the shells, and tying them with strings they serve them for bracers for their legges to dance with, as Moris dancers doe with bells with us.

CHAP. XCVI.

Mamay. The West Indian Peach plumme.

Calger saith this tree is like the Chestnut tree with like leaves yet greater: but *Oviedus* in his history of the West Indies, describeth it to be a faire great tree like unto the Walnue tree, and with such like leaves, but larger, thicker, and greener on the one side then on the other: the fruite is either perfect round or a little longer then round, as bigge as a good great Quince, some greater, others lesser, covered with a yellow thicke skin or coate, that is somewhat rough and not smooth, the pulpe or meate whereof is very pleasant like unto a Peach, but firmer, and not so sappy as a Plumme, of a yellowish colour, and is of a finger or two in thicknesse, having in the middle two or three kernels, separated by shinne skinnies, that are of a peeled Chestnut colour and taste, but very bitter in the inner kernell.

CHAP. XCVII.

Guajava arborescens & fructus. The West Indian Bay Plum.*Guajava.* The West Indian Bay Plumme.

This tree (which is very frequent and well knowne through all the West Indies, and which they call *Guajabo*, as they doe the fruite *Guajaba*.) groweth great like unto an Orrenge tree, but thinner of branches, bearing large leaves on them, two alwayes set together, and opposite which are like unto Bay leaves but larger, even foure inches long, and one and a halfe, or two inches broad, gray or of an hoary ash-colour underneath, with great ribs and smaller veines therein, but of a sad greene above, smooth and without any shew of veines almost, somewhat hard in handling, and both smelling and tasting somewhat like a Bay leaf: the flowers are like those of the Orrenge or Pomecitron tree, smelling sweete like the lasmine; after which followeth the fruite, as great as a small Apple, and like unto a Plum, that is, somewhat long, greene before it is ripe, and yellowish after (yet *Clusius* saith that he received one from Doctor *Tovar* out of *Spaine*, that was blackish, light and shrunk, which he imputeth to the unripenesse of it) some having a reddish pulpe within, and some a white, very sweete and delicate in taste, divided as it were into foure parts, in each whereof lye many small graines or hard white kernells. The properties of the fruite besides the delicacy to be eaten, hath an astringent power therein to stay laskes, especially if they be eaten while they are greene and not ripe.

CHAP. XCVIII.

Ambares. The hard gristly Plumme of India called *Ambare*.

The leaves that grow on this great tree, called *Ambare* by all the Nations there abiding, although they seeme somewhat like those of the Walnut tree for the largenesse, yet are they not of that fashion, for being small at the bottome, and they are broadest at the end, and a little dented in in the middle thereof, elaborate with many veines, and of a pale greene colour: the flowers are small and white, and the fruite that followeth of the bignesse of a Walnut, with a smoother and paler greene skinne, of a strong heady sent, and fowre harsh taste being unripe, but yellow when it is ripe, and of a more pleasant sent, containing a hard gristly substance within them, with sundry crosse hard nerves or threds running through, yet of so pleasant a tart sower taste that commendeth it much, and therefore are used by the Natives and Strangers also instead of vinegar, or such like sawse, to relish their meate, and stirre up an appetite, being eaten with salt and vinegar, while they are fresh or pickled to serve for the yeares following, which endure very well: they use to give the fresh fruite also to those that have hot agues, to coole their blood and humours.

Ambares: The hard gristly Plumme of India called *Ambare*.

CHAP. XCIX.

Melo Corcopali. The American Quince Melon tree.

Corcopall, is a Province of the Indies, wherein as also neere the *Promontori Comari*, groweth a tree like unto the Quince tree, both for forme and leafe, bearing a large fruite as great as a Melon, with ribbes on the outside like thereunto, very sweete and pleasant to be eaten, and physicall also, within which lye three or foure graines or kernells like Grape stones, which are as bitter as Cherry stone kernells: the sicke as well as the sound doe eate of this fruite, having a quality therein to evacuate evill humours. In the same Province also of *Corcopali* groweth a white Medlar as great as an Apple.

Megilana alba.

CHAP. C.

Darian. The Melon like bearing Orrenge.

This Melonlike bearing Orrenge is a fruite called in *Sumatra*, *Darian*, is also somewhat like unto the former *Corcopall*, which is as great as a Citrull Cowcumber, having within it five fruites in shape and biggenesse like Orrenge but longer, and taste like unto fresh sweete butter.

CHAP. CI.

Carcapuli. The Indian yellow Orrenge of Malabar.

A Costa maketh mention of a great tree in *Malabar* called *Carcapuli* differing from the *Darian*, for the fruite he saith is like an Orrenge, when the outer pill is taken away, which consisteth of sundry lumpes of pulpe, not to be separated as they may be in the Orrenge, whose rinde is thinne, smooth, and shining as gold when it is ripe, of an austere taste, and binding quality, yet pleasant, and are good to stay fluxes of all sorts, and to refresh a dejected appetite, taken with fowre milke or boyled Rice; the Midwives give it women in hard labour, to cause a speedy delivery, as also to expell the afterbirth: the juyce is profitably used to cleare the eyes of mists and rheumes.

CHAP.

CHAP. CII.

Mala Indica Lusitanis Ber & Bor Acoffa. Small Indian Apples.

He tree that beareth this fruite is great, full of branches and leaves, which are somewhat like Apple-tree leaves, but longer and not so round of a sad green on the upper end, & hoary or woolly on the underside, astringent in taste: the flowers are white, made of fine small leaves without any sent, the fruite is of the bignesse and likenesse of the *Injube* fruite or plant, some greater and lesler as well as pleasanter then others, yet in the ripest (which it is seldome seene, that they come to perfect maturity, neither will they last to be transported into other Countries) they hold a certaine binding property, and are good therefore to binde the loose belly, but are not so good as *Injubes* for the stomacke. In *Canara* and *Decan* they call the tree *Bor* or *Ber*, and in *Malio Videras*, but the *Portugals* *Manjanas de la India*, that is *Mala Indica*, whom wee have followed: those that grow in *Malaca* are preferred before those of *Malabar*. In Summer these trees are continually seene loaden with those flies (or winged Antes) that worke gum *Lacca* thereon.

Mala Indica Lusitanis Ber & Bor Acoffa.
Small Indian Apples.

CHAP. CIII.

Iamboloins. Indian Ollives.

His tree is somewhat like the *Lentiske* tree in the barke thereof, but the leaves are like the *Strawberry* tree with dented leaves, raising like the *Mistle* leaves when they are Greene, the fruite is very like unto ripe *Ollives*, but of an harsh and binding taste, able to draw ones mouth awry, yet being pickled up like *Ollives*, they relish reasonable well, and serve to procure and whet the appetite, being eaten with boyled *Ryce*.

CHAP. CIV.

Carambolas. Furrowed tart Indian Apples.

He fruite, which they of *Malabar* call *Carambolas*, and *Camaria* or *Carabelis*, by those of *Canara* and *Decan*, and *Bolimbs* in *Malayo*, groweth on a tree much like to a *Quince* tree, whose leaves are longer then *Apple* tree leaves, of a sad Greene colour, and bitterish in taste: the flowers are of a dainty bluish colour, but without sent, and of a sower or tart taste like to *Sorrell*: the fruite is of the bignesse of a good egge, but somewhat long withall, yellow on the outside, hanging by a short

and short stalke, and set in the small huske, that formerly held the flower, being pointed at the end, divided as it were into foure parts, with furrowes, which being deeply impressed therein, make it the more gracefull, of a pleasant tart taste, very pleasing to the palate and stomacke, in the middle whereof are contained small seedes. These fruites are much used as well to please and stirre up the appetite by reason of their pleasant sharpnesse, as in hot and chollericke agues also, either the juyce of them made into a Syrupe, or the whole fruites preserved in Sugar, or pickled up in brine to serve for aftertimes: some use the juyce thereof with other ocular medicines for to take away the haw, or the pinne and web in the eyes, or any filme beginning to grow over them.

Catanboas. Furrowed tart Indian Apples.

CHAP. CV.

Iambos. Blood red, and bluish Peares of India.

Here is another Indian fruit worthy to be remembered as well for the beauty it beareth in the shew thereof, and the sweete sent and taste it carryeth to the other senses, as chiefly for the excellent medicinall properties is now daily found out more and more in it. The tree groweth valse, or huge equalling the greatest Orrengetree in *Spaine*, largely spread with great armes which make a spacious shaddow: the body and branches are covered with a grayish barke, the leaves are very faire, and smooth an handfull long or more with a thicke middle ribbe, and other smaller veines therein, of a sad greene on the upper side, and paler greene underneath, the flowers are of a lively purplish red colour, with divers threds in the middle, very pleasant and standing in a great huske, and tasting like Vine branches: the fruites is of the bignesse and fashion of a King Pear, growing out of that large huske, wherein the flower was formerly seated, and are of sundry kiades, for some are of so deepe a red colour that they seeme almost blacke, some have no kernell or stone within them, when others have one, which are the best: another sort is of a whitish red colour, and shining cleare, having a hard stone within it like to a Peach stone, but smooth, and covered with a white rough skinne, which although it must give place to the former, yet may well be

Iambos. Red and bluish coloured Peares of India.

accepted

accepted to a dainty palate, the skinne being so tender that as in a Plumme or Cherry, it cannot be pared a way, the smell of each resembleth the Rose, and in property is cold and moist. The tree is never without Greene and ripe fruit thereon, and blossomes also at all times, which falling abundantly on the ground, make it seeme all red therewith, the ripe fruit by the shaking of the tree are soone made to fall, and gathered from under it, as also easily gathered by hand. The Indians of *Malabar* and *Cunara* call it *Iambolin*, the *Portugalls* that dwell there *Iambois*, the *Arabians* and *Persians* *Tupha*, and *Tuphat*, the *Turkes* *Alma*. They there use to eat this fruit before meate most usually, yet they are not refused at other times also: both flowers and fruit are preserved with Sugar, and kept to give to those that have hot agues to coole their stomackes and liver, and to quench thirst.

CHAP. CVI.

Langomas. Indian Services.

Langomas are Indian fruites like *Services*, growing on trees not much unlike our *Service tree*, both in leaves and flowers, but set with thornes, and are manured or planted in Orchards as well as found wild abroad: the fruit is harsh like an unripe *Sloe* when it is ripe, and must therefore be rowled betwene the fingers, to make it mellow before it can be eaten, and is generally taken to binde or restrain, whensoever there is cause of such an operation.

CHAP. CVII.

Lencoma. The Indian Chestnut.

His tree groweth very great, and the wood is strong and firme, having leaves like to the *Strawberry tree*, the fruit is very like to our *Chestnut*, as well in colour as bignesse, as also in that white or spot thereon, but it seemed to have the kernell loose within it, for that it giveth a noyse in shaking, the fruit is edible and pleasant, yet a little astringent.

CHAP. CVIII.

Charamis. Purging cornered Hasell nuts.

Here are two kindes of this tree, called *Charamis* by all the Indians generally, but the *Persians* and *Arabians* *Ambela*, the one is as great as the *Medlar tree*, with *Pear tree* pale great leaves, and yellowish fruit, somewhat like to *Hasell* or *Fillberd Nuts*, ending in sundry corners, of the taste of *sowre Grapes*, yet more pleasant, which they pickle up as well being ripe as unripe, and usually eat them with salt. The other kinde is of the same bignesse, but hath lesser leaves than the *Apple tree*, and a greater fruit, which the Indians use being boyled with *Saunders*, & give the decoction against feavers: the bark of the roote of the former kinde, which groweth by the water sides, is chiefly used (so as it grow farre from the sea) which yeeldeth milke, by taking foure fingers length thereof, which being bruised with a dramme of *Mustard seed*, they give to those that are purle and short winded: for it purgeth mightily both upwards and downwards: but if a superpurgation chance thereupon, they give one of the fruits of *Carambolus* to helpe it, or else a draught of the vinegar of *Canara* (which is nothing else but the decoction of *Rice* set by for a day, two or three, untill it grow sower. The fruit is familiarly eaten through all parts, unripe as well as ripe, and pickled, or eaten with salt and vinegar to procure an appetite, putting it to their meates to give them a relish by reason of its tartnesse.

CHAP. CIX.

Iasca or *Iaca*. The Diamond fashioned Chéfnut Gourd.

THis tree groweth in sundry of the Indian Ilands neare the water sides to be of a vaste bignesse, having leaves of an hand breadth with a thicke hard ribbe all the length thereof, and of a pale greene colour: the fruite is very great (not growing from the younger branches or with the leaves, but out of the body, and elder boughes thereof) long and thick, the least whereof is greater then the greatest Gourd, having a hard thicke rinde of a darke greene colour, set with short Diamond pointed like blackish prickles, which a farre off threaten danger in the handling, but shewing favour in doing no harme, which when they are ripe smel sweet, and grow somewhat soft, that they will yeeld to the pressing of ones hands, and being cut longwise, not athwart, have a thicke yellowish white meate within them, divided into sundry cells or partitions full of long and thicke Chéfnut like fruites, greater then any Date, with an ash coloured outside, and white substance within like a Chéfnut, which while they are raw taste harsh and breed much winde, but being roasted as Chéfnuts use to be, or sodden, taste savory and stirre up ventry, for which purpose the people ate them much: the whitish pulpe or substance wherein these lye is of a pleasant taste but hard of digestion, and breedeth that pestilent disease called *Moxi*, if they be much or often eaten, or that they lye corrupted in the stomach: Those that grow in *Malabar* are accounted the best, and better then those of *Goa*; *Linschote* saith the two sorts hereof are called *Girasol* and *Chambasol*, but *Paludanus Barca* and *Papa*, and that those other names doe signifie the goodnesse or meannesse of wares.

Iasca vel Iaca. The Diamond fashioned Chéfnut Gourd.

CHAP. CX.

Cachi & *Ciccara*. The Pine apple like Chéfnut Melon.

THere is a prickly or thorny tree growing in *Malabar* which they call *Cachi* & the fruit thereof *Ciccara*, the tree is as great as a Fig tree, with Datelike leaves, and hard wood like Box, which they put to many uses: the fruit groweth not on the branches, but out of the body, and elder boughes as the true Sycamore or *Egyptian* Fig doth, and is a foote in length, of the thicknesse of ones thigh, and of a brownish yellow outside when it is ripe, being formed somewhat like a Pine apple, and having many severall cells or partitions within it as a Pomegranet hath; the inner substance whereof is somewhat nimmé and well sented, but tasting like a Muske Melon, a Peach, a sweete Orrenge and hony together; these cells containe in them 250. or 300. small fruits in shape and taste like Figges without skinnes, within every of which fruit is another lesser, resembling a Chéfnut, which is eaten roasted by the fire as Chéfnuts are, and will cracke like them in the roasting.

CHAP. CXI.

Duriones. The prickly fruitfull Melon.

He *Duriones* may seeme the same with the former *Jaca*, because they come neare in some things but they much differ in others, as you shall perceive by this description. The tree groweth to be very great and tall, the Timber whereof is strong firme and sound, covered with a thicke ashy-coloured barke, spreading plentifully into branches and store of fruit, having leaves that are somewhat long and pointed, dented about the edges, of a brownish Greene colour on the upper side, and pale Greene underneath: the flowers are of a pale or whitish yellow colour, and the fruit

groweth to the bignesse of a Muske Melon, with a thicke greenish rinde set full of shorthe and thicke but sharpe prickles, having some strakes thereon as the Melon hath: it hath within it being opened foure cells or divisions all the length of it, in every one of which lye three or foure white fruits as bigge as Hens egges (for if they containe five a peece they are not held to bee so good, neither yet if they looke yellowish, and not white they judge them spoiled by the wet falling into the chinkes) like unto the *Mangar blanco* of the *Spaniards*, but not so soft or mucilagie and taste like unto Creame, smelling somewhat sweet also: each of these fruits have enclosed within them a kernell like unto that of the Peach stone, which is somewhat long and insipide, yet making the throte harsh like unto an unripe Medler, and therefore are not eaten: These fruits are to be lightly troden on to breake them because of the prickles, which to them that never did smell them or eate of them before, may seeme to smell like rotten onions, but having tasted of them will thinke them both to taste and smell better then other meats: for among the natives they are held in so good account that they thinke they can never be satisfied with them: but if any by eating too liberally of them shall leare to fall into a Sufteit, or to take any other harme by them, they shall be instantly helped and eased, if eyther they lay a leafe of *Betre* upon the stomack or eate some of the leaves thereof: for so great an antipathy there is between these two plants, that if some leaves of *Betre* be brought into a shippe or house, where these fruits are layd and kept, they will all rot and putrefie: so that it hath not beene knowne that any have taken harme by eating of them.

Duriones. The prickly fruitfull Melon.

CHAP. CXII.

Totoca Americana Peruvana. The Indian fruitfull Gourd bearing Almond, or the Indian Almonds of *Cusius*.

He tree that beareth this fruit groweth very great and high, the body being bare of branches or leaves unto a very great height whereit spreadeth into branches standing in compasse together almost like a Crowne, with faire great broad long leaves set on them greater than ones hand, somewhat like but much greater then those of *Diepanboome* of a darke Greene colour on the upper side, and somewhat white or mealy underneath: the flowers breake forth among the leaves in severall places, and are of a darke Greene colour, after which come the fruit, very great when it is ripe and round like a Bowle, but flat on one side whose shell is as hard as a bone, hardly admitting to bee bored or filed, and of a darke brownish colour dented in, striped and crumpled almost like unto Corke, so great that one can hardly compasse it with both ones hands and the fingers stretched out at length, the height also being neare the same size; this fruit in the inside is divided into six cells or partickions by hard skinnies, in every one whereof is contained eight, ten or twelve nuts lying orderly piled as it were one upon another, each of which are three square, somewhat

what long, and pointed more at one end then another, not so much rugged as the outer shell nor so hard but they may be crackt with the teeth, some of them greater then others, and all of them two or three inches in length, and an inch and a halfe in thicknesse, the kernell within being in taste not so like an Almond as a Walnut, more oily in a wet yeare then a dry, which the Indians by pricking sundry of them upon a stick, and lighting of them, they will burne like a Torch to shew them their way, and continue long in burning, and give an Oily or Turpentine-like flame, having a blacke coale which turneth to ashes: The outer shell hereof is of the thicknesse of halfe an inch, containing within it a pint and a halfe of liquor *Antwerpe* measure, and weighed 17. ounces or more the emptie shell. The Indians seldome gather these fruites, but gather them after they are fallen, for they are afraid least they should fall upon their heads which were sufficient to beate out their braines, and when they are forced to passe them as in their warres, &c. they carry Bucklers over their heads to defend them. They make much account of these kernells, and use to eat them chiefly to provoke them to venery, whereunto they are too much proclive of themselves, and make it their chiefest felicitie having this proverbe with them *Pinnean sacrum à pingean Totocka*, which is, *Si ambires venerem ede Totockam*. It groweth in high places and not in low grounds under the Line and on both sides thereof in the West Indies, and beareth fruit twice every yeare, that is, about *Aprill* and in *November*, and call it *Totocke*. It is very probable that this is *Clusius* his *Amygdala Peruviana*, as any by comparing that little he hath delivered thereof may soone determine.

Totocka Americana sive Amygdala Peruviana Clusii forte.
The Indian fruitfull Gourd bearing Almond,
or the Indian Almonds of *Clusius*.

Many other fruites, as well Melon like as Gourde like and others, are used by the Indians and the Christians likewise living there among them in some sort, but these here mentioned are the choicest and chiefest of them; I will now therefore lastly shew you sundry other sorts of fruites of trees that have medecinnall qualities for the most part in them, and so finish this worke.

CHAP. CXIII.

Pinci nuclei Maluccani, Malucca Pine Kernells.

Pinci Nuclei Maluccani, Malucca Pine Kernells.

Some Orchards in *Malabar* as well as the wild woods doe nourish up a certaine tree growing to the bignesse of a Pearre tree, whose leaves are soft and tender, of a darke Greene on the upper side and pale underneath, tasting very sharpe and biting upon the tongue for a good while, the fruit is of the bignesse of a Pilberd and triangular, divided on the inside into sundry partitions, containing within them small white hard kernells, like unto the kernells of Pine apples, whereupon they have so called them, and which the Indians use as well in the cure of diseases, as to performe their wicked designs: they use to give two of these kernells, the skins that cover them being first taken away mixed up in a glister, to purge and procure ease to those that have the Sciatica or hip gout, & in the broth of a Chicken to those that have their urine stopped or make it with paine, and to cause tough, thicke and cold humours to be avoyded: they give them likewise to those that are short winded or have a cough, for which they much commend them, and often use them being dissolved in water, and the face or other parts of the body annointed therewith doth give helpe and heale Tetteres, Ringwormes and Scabbes, being a little rubbed before the using, for they are causticke or burning as experience sheweth: Wicked women and harlots give foure graines or kernells of them to their husbands or others thereby to kill them: those of *Canara* doe call them *Cepala*, and are in frequent use with the Indians where they grow plentifully for purgations:

A a a a a a

Monardus maketh mention of another kinde of purging Pine kernells, growing in *Hispaniola*, &c. within such like cones but greater and longer, thinner sheld and blacker then the usuall sort, whose kernells being white and sweete, tempt divets to eate of them without suspicion of evacuation, yet five or six according to the ability of the patient, being given in wine doe purge strongly both upwards and downewards, avoyding grosse humours especially; but being a little terrefied at the fire they worke not so violently or with such torments and gripings:

CHAP. CXIII.

Pennisetum. The Apple bearing poysonous Almond tree.

Heret sheweth in his description of *America*, that in some parts thereof there groweth a tree, the barke whetof is of a strange and marvelous sent, having leaves like unto Purslane, very thick and alwayes greene: it beareth fruite as great as large sised Apples, and as round as an hand-ball which are not to be eaten for they are poyson: but they containe within them six other fruits, very like unto Almonds but flatter and broadet, each lying in a severall cell, which are wonderfull profitable to the people, to heale their wounds by darts or otherwise in their warres, for out of these fruits they presse a kind of red oyle with which they are quickly cured.

CHAP. CXV.

Cacao five Cacavate. The Peare bearing wholsome Almond tree.

Enas in his description of *America*, remembreth a tree growing in *Nicaragne* a Province of the West Indies somewhat like unto the last described, but because it is another sort you shall have the relation thereof as he setteth it downe. It is the fruite of a meane sised tree growing onely in warme and wey yet shadowed places, and therefore must be defended from the sight of the Sunne by having a tall tree planted to the Sunne ward of it, which must be fitted and plashed that it may be as an Arbor unto it, or else it will wither and perishe: the fruite doth somewhat neatly in forme resemble a Peare, or Peare fashioned Gourd, with a thicke shell or rinde, and within lyeth an Almond like fruite, halfe as big againe as a Walnut, inclosed in a hard round shell, the kernell being blackish without, and brownish ash coloured veines within, but bitterish and unpleasent, yet very sweete and pleasant to the Indians. After they have gathered the fruite they beake the outer rinde and lay the inner fruite upon Mars to dry in the Sunne, untill the moisture within them be consumed, and then they keepe them both for their meate and merchandise, for shippes loaden with them are carried from *Guatimala* to new *Spaine*, and other places thereabouts, and trucke with them for other commodities in stead of mony, and give of them to the poore in stead of an almes. A drinke likewise the Indians make thereof called *Chocolate*, well pleasing and accepted with the greatest among them, who account nothing of more esteeme; but to the Christians, at the first it seemeth a wash fitter for hogs, yet by use even accepted by them also in the want of better.

Cacao five Cacavate.

The Peare bearing wholsome Almond tree:

CHAP. CXVI.

Arca five Fasel seu Avellana Indiana versicolor. The discoloured small Indian Nut.

This tree groweth great and very tall, but the wood thereof is spongy and not easie to breake, without any branches unto a great height, and rowards the toppe spreading many faire branches, and leaves thereon greater and longer then the Coker Nut tree, the flowers are white without sent, and grow many together on a long stalk hanging downewards from the lower branches, the fruit following on every one, being longer but smaller then the Nutmeg with all the outer rindes and shells, and hath the outer rinde covered with a yellow Cotton like silke, the inner kernell being very like unto a Nutmeg, somewhat round, and small at one end and flat at the other, with the like discoloured veines therein, but without any heat in taste or sent, and is therefore held to be cooling and drying: it groweth in sundry places of the Indies more or lesse plentifull in one or another place, and chiefly neare the Sea coasts: With the twigs hereof that are of two fingers thicknesse the Natives use to hunt the Crocodils as well in the water as on land, for if they can thrust these stickes into their mowthes they are sure they cannot breake them, because they are so lithye and spongy, and thereby they doe terraine and take them, it is called *Fasel* by the *Arabians*, but some falsly *Fisel*, by the chiefe Indians *Arca*, by those of *Gazarate*, and *De-can Supari*, in *Malabar Pac*, in *Malaca Pinan*, in *Cochin Chacani*: it is profitably used in all hot diseases, to helpe the tooth ach, and to fasten loose teeth in the head or the loose gummies: the Indians use this fruite abundantly eyther unripe to stupefie their senses like to drunkennesse, or ripe, being mixed with the leaves of Betell or

Betre

Areca vel Fausel five Avellana Indiana versicolor.
The discoloured small Indian Nut.

Nux Fauselcum suo in voluero et eodem exempto.

Betre, the ribbes therein being first taken away, some put sundry other things to them, as *Lycium*, *Campshire*, *Lignum Aloes* and *Ambegrite* according to their qualities that take delight in it, which is generally through all the countries of India, with the chiefe persons most, and with the inferiour in some sort also. *Garcias* saith he distilled a water from them being fresh, which he used with good successe in all hot or chollericke fluxes of the belly.

Areca five Avellana Indica versicoloris genus oblongum Clusij.

A kind of small long discovered Indian Nut of *Clusius*.

Clusius in his *scholia* upon the *Fausel* of *Garcias* exhibiteth another kind of *Areca* or *Fausel*, whose kernells hath discoloured veines therein like a Nutmeg, or the former sort, and with a blacke covering over it, the chiefe difference from the other consisteth in being longer then the other. *Lobel* suppoeth it may be the kernell of a nur of his *Palma Pinus*.

Linshoten also saith that there is another sort of *Areca* which is smaller, blacker and harder then the former, and called by the Natives *Checaninas*, which causeth a lightnesse in the head.

Clusius also relateth of another as large as a Walnut, with the outer greene rinde, but the shell was hard and smooth of a Chestnut colour, long and pointed at both ends, flat on the one side and banching out on the other, the kernell within being white and sweete. Another was about a finger long, and as thicke as two, flattish on the lower end, and of a rugged ash colour, the upper end being smooth and of a brownish colour, seeming like some small ricke, covered with a thicke hard shell, having a kernell within it.

Divers other fruits are mentioned by *Clusius* and many others wee have seene our selves, but because wee doe not know any use of them or propertie in them, I rather forbear their relating, then stuffe the worke with unprofitable matter, it being growne so voluminous already.

Areca five Avellana Indica versicoloris
- genus oblongum Clusij.
A kind of long (small) Indian discoloured Nut.

CHAP. CXVII.

Arbor Brasilia. The Brasill tree.

Arbor Brasilia. The Brasill tree.

He tree that beareth the Brasill wood which serveth the Dyers use, and to make Inke is a goodly faire great tree growing in divers places of the country of *Brasill*, and in no other place as it is thought, and the chiefest about *Fernambuck* from whence have risen the appellations to the wood: the leaves wherewith it is clothed are as small as Box leaves, thicke and evergreene like them, the barke is of an ash colour, and the wood red, especially the core or heart thereof which is the best, and as it is said is no bigger then a mans heigh, though the tree be so bigge in compasse that three men cannot fathome it. This as it is said also beareth neither fruit nor gum, but I wonder then how so many could be found growing there? could the earth of it selfe thinke you without seede bring forth that abundance? or will not time consume them all? surely it cannot be but that it beareth seede, and is thereby propagated although not observed, &c.

CHAP. CXVIII.

Arbor Trifida. The sorrowfull tree.

He tree that beareth this name from the properties riseth to be a reasonable tall, spreading sundry slender branches and faire leaves set by couples on them, very like unto the large or great Myrtle leaves and smaller then those of the Plum tree, little or nothing snipt about the edges, a little rough, and greene on the upper side and gray underneath: at each joynt with the leaves towards the ends of the branches on both sides come forth slender reddish yellow footstalkes wherewith they colour their broths and meates yellow like Saffron, bearing three or foure, or more flowers together thereon, composed of sundry small white leaves pointed at the ends, making a double flower, with divers small threds in the middle, smelling so sweet that they are thought to exceede cyther the Orrange or *Jasme* flowers, whose propertie is never to blow open in the day time, but in the night onely (when its time of flowring is) for so soone as the Sunne shineth thereon in the morning, they all for the most part fall downe under the tree, and the whole tree with the branches seeme as withered and dead untill the evening, cyther through the tenderesse of the stalke, or by a naturall antipathy unto the Sunne, nor to abide the shining face thereof, for some of the flowers doe abide on these branches that are most shadowed from the Sunne: the following fruite they give is flat somewhat like a Lupine with a thicke skinne, (it must be but small store, for what quantitie of fruite can this tree beare if all or the most of the flowers doe fall away) yet heart fashion, and of a greenish ash colour, with a division in the middle, in each part whereof is contained small flat beanes or kernells, like unto those of the sweet beane or Carob tree, heart fashion likewise, and covered with a greenish skinne or peeling, the inner kernell being white and somewhat bitter. This tree hath been much desired to be transplanted into our Christian world, but as some have sayd it would not abide, notwithstanding all the care of earthen and wooden vessels, wherein it was planted to be

Arbor Trifida. The sorrowfull tree.

brought

brought into *Spaine* or *Portugall*, neither ever would the seede spring as it is affirmed, but I have lately understood by a catalogue of the Plants growing in the garden of *Signor Corvino* of *Rome* that it groweth there, being one of the plants named therein. It plentifully groweth in *Malabar* and brought thence to *Goa*, and sundry other places of the *Indies*, where every branch being put into the ground will take roote and grow. It is called in *Malabar* *Mogli*, in *Malayo Singad*, in *Decan Pul*, of the *Arabians* *Guart*, of the *Persians* and *Turkes* *Gul*, but at *Goa* and *Canarin Parizataco* from a certaine Nobleman so called (as the Natives thinke and therein very neare intimating one of *Ovids* fabulous metamorphosis) whose faire daughter the Sun having espied fell in love withall, and having deflowred her & forsaken, for another, she slew her selfe; from whose ashes of her burnt carcaske rose up this tree, which is ever since ashamed to behold the face of the Sunne. In many places of the *Indies* they distill the flowers for their sweet sent sake, and keepe it for use; which in *Malabar* they call the water of *Mogli* after the trees name: the said water is good for sore eyes to coole their heate and rednesse, if linnen cloathes being dipped therein be layd upon them: the Indian Physicians doe hold opinion that both flowers and fruite doe comfort the heart, and refresh the fainting spirites thereof, for they have some bitternesse in them, it hath not bene observed that the Indians apply this tree to any other use then is formerly expressed, and the colouring of their meates like as *Saffion* is used for the same purpose in *Spaine* and other countries.

CHAP. CXIX.

Arbor folijs ambulanti bus. Walking leaves.

Earē unto the Ile of *Cimbubon* and in the Ile it selfe, there groweth a tree bearing leaves like unto those of the Mulberry tree, having two small short and prickly feete as it were set on eyther side of them, which falling to the ground doe seeme as it were to creepe as if it were some living creature, and being touched by any will presently move it selfe. Master *Anthony Pigafetta* saith that he kept one of these leaves in a continuall motion in a platter for eight dayes (the motion whereof is likely to come by the ayre) and then it ceased.

CHAP. CXX.

Arbor aqua fundens. The fountaine tree of water.

None of the Ilands of the *Canaries* called *Ferro*, there groweth a reasonable great but faire spread tree bearing leaves like unto *Walnut* tree leaves but larger, abiding thereon and ever Greene: it beareth fruite like unto an *Ackorne* hanging downe from the branches, which hath a kernell within of a very pleasant taste and almost like spice. In some parts of the world besides are found the like trees, the

leaves whereof and branches doe perpetually droppe water (in the whole Iland there being no other water to be had) a thicke mist as it were or cloud encompassing it continually, except when the Sunne shineth bright thereon; which water being kept as it were in a fountaine made for the purpose to retaine it, serveth the whole Iland for their use. Our Countrey man Master *Lewis Jackson* dwelling in *Holburne*, told Master *Purchas* as he hath set it downe in his seventh booke of *Pilgrimages* Fol. 1639. that in the yeare 1618. he had bene in the said Iland *Ferro*, and had seene that tree, and saith it is as bigge as an *Oake* of a middle size, the bark white like *Hardbeame*, six or seven yards high with ragged boughes, the leafe like that of the Bay, white underneath and green above: it beareth neither fruit nor flower: thus saith he, but it hath some other different relations which who so would see, let them read the place before rected: the Ilanders call this tree *Garoe*, the *Spaniards* *Arbor Sancta*: but the ancient Historians call it *Til*. It is thought that *Solinus* and *Pliny* in his lib 6. c. 32. meant this Iland under the name of *Ombria* and *Pluvialis*, for hee there saith that in the Iland *Ombria* grow trees like unto *Ferula*, from whence water is wrunge out, from the blacke ones commeth bitter water and from the white that which is sweete and pleasant to drinke.

I might here insert the *Barnacle* tree but that it is found to be a fable, and that the Geefe hatch their young as other Birds and fowles doe, and therefore I forbear to speake of it.

Arbor aqua fundens. The fountaine tree of water.

Arbor anatisifera.
The *Barnacle* tree of the *Goose*.

CHAP. CXXI.

Quercus natalis Diuicens. The Christide greene Oake.

In the new Forrest in *Hampshire* near a place called the Castle of *Malwood* groweth an old great doating Oake, which by the relation of the neare Villagers, is alwayes observed to shoot forth fresh but small greene leaves every yeare a little before Christide, which abide not long thereon after that time, but fall away, others springing out in the due time that other Oakes doe, bearing both leaves and fruit as usually other Oakes doe in their season. King *James* in his time understanding of this tree, went and saw it, and caused it to be paled about and benches made thereat, both for people to sit and contemplate the wondrous workes of God therein, and to keepe unruly persons from breaking and spoiling it; but (*utimus invictum semper*) the more it was intended to be preserved, the more wilfull people were bent to breake and spoyle it (being the more famous by that provision) and breake downe the pales and carry them away. I have had both leaves and Ackornes brought me from this tree, taken by Master *John Goodier* each in their season.

CHAP. CXXII.

Arbor Venereos stimulos domans. The Chaste making tree.

Etrus de Osina in his letter to *Monardus* maketh mention of a certaine tree growing there in the West Indies whole timber was of a spongie substance whereof the Indians would never take a stick to burne, neither by any meanes, although they were treated to death could be brought to burne it or abide where it was burned, for they said that whosoever came neare the fire or flame thereof, or whomsoever the smoake onely touched, was made utterly impotent and unable to any venereous acts.

CHAP. CXXIII.

Arbor Farinifera. The Bread tree.

Some that accompanied Sir *Francis Drake* in compassing the whole world did relate that in the Iland of *Ternate*, which is neare the Equinoctiall line, towards the North pole groweth a strange kinde of tree about ten foot high, whose topp is formed like unto a Cabbage, in the middle whereof is found a fine white meale which the poore Ilanders gather, and by putting a little water thereto and letting it ferment they make past or dough, whereof they make thinne flat square Cakes, and bake them in certain long earthen pans, with fire put round about them which they eat while they are hot, for when they are growne older and hard, they steepe them in warme water, and bring them to a kinde of pottage and so eat them, but this Cake or bread is in a manner without taste or relish, but when some Pepper or Cinamon with Sugar is put thereto, it is a pleasant food to many, but *Marcus Polus Venetus* recordeth a more strange bread tree growing in the kingdome of *Fanfara*, whose trunk two men could scarce fadome, the barke whereof being thicke, and taken away, the wood thereof about three inches thicke in compasse is as hard as Iron being so heavy that it sinketh instantly in water, whereof the natives make them short pikes or speares sharpening and burning them at the end, so that they will be able to pearce Armour; but the whole middle of this tree is soft like unto a meale, which putting in water and stirring it to take away all the drosse that swimmeth above, they mould up the residue into cakes, and divers other sorts of viands fit to be eaten, and whereof as hee saith he brought some with him to *Venice*.

*Arbor
vissifera
sinifera.*

CHAP. CXXIII.

Arbor sive Palma saccifera.
The Bagge bearing Nut tree.

Certaine Dutch Marriners having by a casualtie lost their shippe, wherein they with others were sayling to the West Indies, in their returne home, in their shippe boate lighted on a desert Iland called *Coronopez*, wherein they found whole woods full of these kinde of strange trees, and others growing among them whose fruits being round Nuts, as bigge as Walnuts with their greene outer shell, and within them other smaller Nuts so round as balls and with so hard a shell, yet not very thicke that they could hardly be broken with an Iron hammer, and a white hollow kernell in the middle tasting

tasting like Pease at the first, but a little bitter afterwards, like a Lupine, were inclosed in a long sheathe or hollow hole, resembling an *Hipocras* or Syrupe bagge, some being twenty two inches long, others two foot and a half long, yet all being very small at the end and growing larger up to the toppe, where they were about seven inches wide, and composed of a number of brownish threds or haire dispersed all over the case, some running at the length and some crosswise by a wonderfull worke of nature.

Arbor fœcupalma saccifera. The bagge bearing Nut tree.

CHAP. CXXV.

Arbor metrosideros. The Iron hearted tree.

S Caliger maketh mention of a certaine small tree, is reported, to grow in the Ile of *Lava major*, whose heart or core is as impenetrable as Iron, from the bottome to the toppe: and the fruit which it beareth is likewise as hard, but the report saith he, is of so little credit and so neare a falstie, as I am from beleeving it: yet *Nicholauus Cossinus* in his Journall doth report the same thing.

CHAP. CXXVI.

Arbor Gebaph. The Splene tree of *Sumatra*.

IN the Ile of *Sumatra* anciently called *Trapobana* or *Taprobana* as *Thevet* relateth it, groweth a tree not very great, called there *Gebaph*, and in the Indies *Cobbam*, whose leaves are many small ones set on a rib together, somewhat like unto the *Cassia solutiva*, or purging *Cassia* leaves, set on short branches covered with a yellowish barke: the fruit is somewhat ricker and as round as a ball, where under is contained a Nut as big as an hase! Nut, with a very bitter kernel within it, yet tasting like an *Angelica* roore: they use the fruit to quench thirst: but the bitter kernel is the most effectual in the diseases of the Liver and Splene, where with they are much afflicted, and therefore draw an oyle out of the kernells of the Nuts, which they take for eight dayes together, in which time the disease is much abated and quickly after cured: those that cannot by reason of the bitterness take it so willingly, as women and children, it is appointed unto them to be annointed with the oyle on the belly, back bone and sides, which worketh the cure alike: the said oyle is in much use with them also, and of great account for the singular helpe and remedy it giveth to all joynt aches, gouts and the like: the gum likewise of this tree being dissolved with a little oyle and spread platterwise is applied to the grieved places with good effect. The inhabitants doe plant this tree neare their Houses in their Orchards and Gardens for to have the benefit thereof nigh at hand.

Arbor Gebaph. The Splene tree of *Sumatra*.

CHAP. CXXVII.

Beretinus frullus. The Beretine Ackorne.

Cortius in his second booke of Exoticks and seventeenth Chapter, maketh mention that he obtained some of these fruites, from those that accompanied Sir *Francis Drake* in his Circumnavigation of the world, returning in the year 1580. by the meanes of some of his friends here, as Master *Garth* and Master *Morgan*, which were affirmed to be gathered in some Islands (whereinto they put both for fruit and victuall standing in neede of both) from very great and tall trees bigger then Oakes, whose leaves were like unto Bay leaves, not dented at all about the edges but thicke and shining: the fruit were like the Ackornes of the *Ilex* or evergreene Oake, but without any cup, for as hee saith he enquired thereof of some of them, whose outer rinde was thinne and of an ashe colour, and some blackish, the inner kernell being somewhat long and white, without any manifest taste within but covered with a thinne skinne, which they found good to be eaten without any harme following, and therefore in their want being taught by the Islanders they boyled them like Pulse or Pease, and so ate them, or beate them to poulder and boiled them like Rice or Wheat, untill it became a pultage and so ate them for hunger: yet afterwards they found the like trees and fruit to grow in the Islands of the *Moluccas* as they affirmed: But with what other propertie they were indued, neyther they nor any other hath manifested to any that I know.

Beretinus frullus.
The Beretine Ackorne.

CHAP. CXXVIII.

Febefasou. The Indian Hony tree.

Hermet maketh mention of this tree among his other *American* singularities to be very tall, spreading the branches so uniformly, that it is a great pleasure to behold, in that they seeme so disposed by art and not by nature, having leaves on them like to Coleworts, (which I beleeve is mistaken, the figure not expressing such a forme) and fruit of a foot long. In the hollow parts of this tree above other, the Bees doe make their Hony and Wax, whereof the naturalls make much account, for with it they season their foode made of roots, &c. Vnto this tree resorteth familiarly a certaine beast somewhat like a Cat, but of a browne colour, called by them *Heyrat* that is the Hony beast to feed on the honey, which it carefully pulleth out with the feete without hurting the Bees or being stung or hurt by them.

Febefasou. The Indian Hony tree.

CHAP. CXXXIX.

Pruna insana que Noces insana a Clusio dicuntur. Mad Indian Plums or Nuts.

THis Indian fruit mentioned by *Clusius* in second booke of *Exoticks*, page 53. and 54. is thus related by him. The *Dutch* after much wandering in the unknowne Seas fell by chance into a certaine Bay, situate in 11. degrees 45. minuts of Northerly Latitude where they found certaine trees as big as Cherry trees, with long and narrow leaves like Peach leaves, whose fruits they saw the Monks there eating, wherupon divers of them gathered some and eate them, which were fully round, grow-

ing for the most part singly each upon its stalk, and sometimes two together, being about two inches or not much more either longwise or round, with a firme but not very thicke shell, brownish on the outside and not very smooth, but smooth within, and of a brighter colour, containing a certaine fruit within somewhat like unto a blacke Sloe, both for forme and size, spotted with somewhat a large white spot at the bottome where it stood upon the stalk, having a stone under that Plum which was grayish and hard, and a kernell with it, those persons which had eaten of these Plums felt no harme, but some of the company sleeping both stones and kernells, and boyling and eating of them fell into divers distemperatures, according to each mans severall humour, one thought his Cabin was made a Brew-houise, and bad take away the woman that was there: another called his Mates together, asking them if they would buy his fish, whereof he had varietie: another lying in his Cabin complained that his flesh was torne from his bones, another cryed out loudly that they were building a great ship in his Cabin, another in his Cabin broke foure or five *Chinny* dishes, saying that many men were coming to take away his Cabin from him, another calling to the Maister of the shippe said, doe yee not see the Divell sitting in the Sterne catching Fish; another sayd that he saw the Anchors in the bottome of the Sea through the bulke of the Shippe; the Masters sonne said to his father, O my father I see a number of little men running upon your nose, but after they had slept all these imaginations vanished, yet some of them slept for a day and a halfe, and some two whole dayes before they waked, and some thereby were troubled with the laske: many other fancies fell among the rest which were too long to recite; but among them all saith he as it were in scorne among the rest there was an English man distracted, who looking upward said he saw the heavens open and cryed with a loud voyce, O Lord I will willingly follow thee, and with divers other gestures moved the company to laughter. *Clusius* sheweth that in the same table with these Plums or Nuts hee set another small Nut not much unlike an Haffell nut which made no noyse of any kernell therein, and knew not whether it had any cup to hold it as an Acknotne hath or no.

Pruna insana que Noces insana a Clusio dicuntur.
Indian Plums or Nuts.

CHAP. CXXX.

Mamocra mas & femina. The male Dugge tree.

Mamocra mas & femina.
The male and female Dugge tree.

THe forme of these two sorts of trees are both alike, not differing the one from the other, but in this that the male beareth no blossomes, but fruit like unto a small Pompion many growing together towards the toppe out of the body of the tree which hath no armes or branches but onely large broad leaves much like unto the Plane tree or Maple tree leaf, each standing on a very long stalk: the trunk or stock of the tree is neare two foot thicke, and about nine foote high: the flowers are of a pale yellow colour like unto Elder blossomes which serve to no use, the fruit is round and fleshy, yellowish when it is ripe, and serving them to loosen the belly when they are eaten and containe within them many round blacke shining graines as bigge as Pease which likewise are put to no use with them. The propertie of these trees is said to be, that unlessse the male kinde bee planted to grow neare the female it will beare no fruit at all; of which nature a kinde of Date tree is said to be also. This tree groweth in that part of *Brazil* that the *Portugalls* calle *Baya de todos los Santos*.

Clus.

CHAP. CXXXI.

Moringa. The Bezar tree.*Moringa.* The Bezar tree.

His tree groweth not great, nor spreadeth with many branches, but is like unto the Lentiske or Masticke tree both for greatness and leaves, being full of knots, very easie to be broken, of a very faire but sad Greene colour and of the taste of Turnip-leaves: the fruit is a foot long, and of the bignesse of a Reddish root having eight edges or corners of a greenish ashe-colour with a white substance within divided into certaine cells wherein lye small round seede like unto small Pease but Greene and tender, and of a sharper taste then the leaves: the whole fruit sliced in peeces is boyled in the broth of flesh and sundry other wayes. But the roote of this tree is a soveraigne Antidote or Counterpoison, as effectuell as Vnicorne's horne or Bezar stone or any Treacle, for the natives doe usually take thereof, both against all kindes of poisons and the bitings of the most venomous creatures, yea even that serpent which the Portugalls call *Culebras de capillo*, which is accounted the most dangerous of all, taking thereof both inwardly and applying it to the outward place. They have found it also to bee singular good against the winde chollick, and to be no lesse effectuell against the Leprosie, for many have bene thereof cured by often using of it, it is mixed also with those medicines that purge melancholy. It groweth plentifully in all the Province of *Malabar*, where they bring the fruit into the market to sell as beanes and pease or elsewhere. The *Arabians* and *Turkes* call it *Morian*, the *Persians* *Tame*, but they of *Gazurata* *Turcia*.

CHAP. CXXXII.

Negundo mas. The Male wound tree of the Portugals.

Negundo mas & femina.
The male and female wound tree.

The Indians make two sorts hereof, the one they call *Varolo Nigundo*, that is, the male, and the other *Niergundo* the female, in *Malabar* *Noche*, in *Balagute* *Sambali*, in *Decan* *Beche*, and so also by the *Persians* and *Arabians*, but *Ait* by the *Turkes*, and *Noreila* by the *Portugalls*: these trees are of much esteeme in the province of *Malabar*, and of so frequent use with all sorts of people, for all their griefes and diseases, that if they were not great increasers, and that every branch thrust into the ground will take roote and grow, they had bene wholly consumed or growne so scarce that they would have bene at an exceeding great price. The male groweth like the Almond tree with rough leaves like unto Sage, Greene above and hoary underneath, and dented about the edges, somewhat resembling Elder leaves a farre off. The female kind groweth greater and hath larger and rounder leaves, resembling those of the white Poplar tree and not dented about the edges: the leaves of both sorts smell and taste like Sage, but yet are more sharpe and bitter, many of them having a white froth on the backside of them, comming on them in the night: the flowers of both are of a pale blew or ashe-colour much like unto those of *Rosemary*: the fruit of both likewise is like unto blacke Pepper but nothing so sharpe and hot as Pepper comming nearer unto the taste of Ginger. Both leaves flowers and fruit bruised and boyled in water or oyle are usually applied to

all diseases by the vulgar sort, but especially to all joynt aches, tumours and contusions proceeding from any hot cause, and that with singular good effect: the leaves also bruised and laid upon old Vicers doth wondrously helpe to digest the matter, cleanse them and bring them to cicatrising, so as the body be not foule but prepared and purged before hand. And certainly they are found to available in all wounds, Impostumes and bruises, that the people using these, seeke for no Chirurgicalian. The women use to wash their whole bodies with the decoction of these leaves at all times and seasons, and are so perswaded of their effect to helpe them to conceive children, that they that should goe about to perswade them the contrary, they would stone them to death.

CHAP. CXXXIII.

Nimbo, Another healing or wound tree.

THis other tree is more rare and scarce then the last, called by those of the countries in India where it is knowne *Nimbo*, but by those of *Malabar* *Bepole*, and is of much account both with the Christians there and Gentiles.

It is as bigge as an Ash, whereunto a farre off it is very like, the leaves are very Greene on both sides, dented about the edges and pointed at the ends, it is plentifully stored with both leaves and flowers which are small and white, with five leaves apeece and some yellow threads in the middle, and of the smell of the *Trifolium odoratum*, sweet Trefoile, after which the fruit appeareth which are like unto small Ollives with a yellow thin skinne. The leaves are somewhat bitter, but very wholesome being bruised and mixed with a little juice of Lemons, & dropped into foule Vicers or those that are hollow or fistulous, or with hard skins therein eyther of man or beast, doth helpe them by digesting, cleansing, healing and skinning them: the juice of the leaves is a most familiar and knowne remedy in *Malabar* to kill the wormes of all sorts in the body, whereunto they are much subject, whether taken alone or with other things for the purpose into the body, or used outwardly to the Navell: the flowers & fruit also are much used against the gout and the paines, swellings, weaknesse and impostumations of the joynts or parts, the Oyle likewise pressed out of the fruit is singular good in the paines and greefes of the sinewes, and therewith doe those of *Malabar* cure both wounds in the flesh, punctures and pricking of the Nerves and Sinewes, and contractions or distortions of the members.

Nimbo, Another healing or wound tree.

CHAP. CXXXIII.

Hyovavabe, The Americans vice Guajacum.

THis tree is very tall having a barke of a whitish silverlike colour, but the wood is reddish under it of a little brackish or salt sweet taste, resembling the woody part of *Licoris*: it beareth fruite of the bignesse of a meane Plum, and of a good yellow colour, with a kernell within it, of a most sweet and delicate taste: but which maketh it the more wonderfull, so seldome bearing fruite that as it is said, a man in his life time shall scarce see the fruit above foure or five times on the tree, being fiftene yeares betweene one and the others bearing. The barke of this tree is of a wonderfull vertue and effect in curing the Indian (which we call the *French*) disease and is of the same account with the Indians where it groweth that Guajacum is with us, and while it is fresh cut or peeled from the tree giveth a white milke, this barke being cut in slices, they boyle in water three or foure houres untill it become of a Claret wine colour, which decoction they drinke for fiftene or twentie dayes together, using in the meane time a spare diet, by which meanes they are not onely cured of that disease but of any other that proceedeth of cold and flegmaticke humours: the kernell of the fruit is much used by the sick whose appetite is lost to quicken it and get it againe. Neare all the coasts of the continent saith *Monardus*, is gathered by the Indians a certaine white liquor like milke taken from the branches, and small Apple like trees being wounded, which they call *Prispinichi*, which soone groweth thicke, and is somewhat clammy, three or foure drops whereof being taken purgeth very violently, being taken in wine: but if any finde it to worke above their strength or desire, by taking eyther a little broth, wine or other drinke, it stayeth the working presently.

CHAP.

CHAP. CXXXV.

Achinaca Treveti. The blacke Moores Guajacum.

The *Esthiopians* on both sides of the River *Senaga*, neare unto *Cape verd* as *Treuet* saith, doe abound with the Venerous disease, which holdeth them chiefly in the privie members which in men is called *Asub*, in women *Asabates*, the disease it selfe *Boroxail* or *Zail*: but by the skill of the Physicians of whom they have many, and skilfull in their profession called *Biarins*, they have found out growing with them an herbe of assured helpe and remedy therefore, which groweth up with a great stalke as bigge as a mans legge, and many great leaves thereon, cut in or jagged on both edges, somewhat resembling a Colewort leafe, but nothing so thicke eyther in the leafe or middle ribbe and double pointed at the end, from among whom groweth the fruit, of the bignesse of an egge, and of a yellow colour, which they call *Alford*, the decoction of this herbe above all others, although they use divers, is of sufficient validitie to cure it, for they have no other Guajacum for their helpe, and therefore use this in stead thereof.

CHAP. CXXXVI.

Winteranus cortex. Captaine *Winters* Cinamon.

Captaine *William Winter* that in a shippe by himselfe accompanied Sir *Francis Drake* in part of his voyage over the whole world, but left him at the *Straights of Nagellon* returning from thence home into *England* againe in the yeare 1579. in the parts thereabouts cut downe certaine trees, whose barke was somewhat like unto the thicker sort of Cinamon, both for substance and colour, yet for the most part thicker, and some of it of an ash colour, and some brownish on the outside and rugged like *Elme* barke, some of it having chinkes or riftes on the inside, and some smooth and firme, of a smell not unpleasant, but of a very sharpe taste like many spices together, heating the mouth more then *Pepper*; the leafe of the tree is of a whitish greene, not unlike the *Aspen* leafe, the berries grow in clusters like the *Hawthorne*, with divers seedes in each of them. They at the first knew not of any properties therein, and therefore boyled some of it in hony, to make it the more pleasant to be taken and dried other some and made it into poulder, putting it in stead of Cinamon in their meats: but afterwards they found it to be singular good against the *Scurvey*, for divers in the shippe being troubled with that disease found remedy thereby in using it a while. Some of our company of Apothecaries, and those not of the meanest doe use to call the *Canella alba* mentioned here before *Cortex Winterani*, and have used it in their dispensation of *Mithridatum* as a substitute for *Coffus*, whereof I gave you a touch in the *Classis of Cardus* and *Spinosi*, in the last Chapter thereof save one, but now by comparing the one with the other you may easily see the error, for the *Canella alba* is a white barke, rowled like Cinamon, and not much thicker then it,

Winteranus Cortex. Captaine *Winters* Cinamon.

of an hot taste but neither like Cinamon nor Pepper, and this *Cortex Winteranus* is thicker then the thickest Cinamon, not caste into rowles or hollow pipes like it, and tasting much quicker, besides the colour is of a duskie browne in most, comming nearest unto Cinamon, I thought good a little to explaine this matter here, because I finde many possessed so strongly with that errour that *Canella alba* is *Cortex Winterani*, that all may see how true their opinion is. This barke might seeme to be that whereof *Monardus* saith he had a peece from *Bernardino de Burgo* an Apothecary, but that his had a more excellent smell and taste, excelling that of the Nutmeg, and as pleasant as Cinamon, and more cordiall, which is not found in this barke of *Winters*, *Monardus* likewise maketh mention of another thicke barke which was taken from a tree as great as an Elme and like in forme, growing scarce in any other part of the West Indies, then neare the Rivers sides about 25. leagues distant from *Lima*: it is hot faith be above the second degree: the Indians use to put it up into their nostrills, the fine poulder of the barke when they are troubled with rheumes and defluxions from the braines, or with other paines in the head, for it plentifully draweth downe humors whereby they finde ease.

CHAP. CXXXVII.

Cornu arbor. The costive or binding tree.

T His tree is somewhat like unto a dwarfe Otrenge tree both for forme and leafe, but having a thicker middle ribbe and eight or nine other smaller ones running to the sides: the flower is yellow without sent, the barke of the roote onely is in use which is of a pale Greene colour, and being broken yeeldeth much milke, which is somewhat clammy, having little taste, but some bitteresse, & is more drying then cooling. The juice or milke of the barke of the rootes hereof, although unpleasant is much used by the natives of *China*, *Japan*, *Malacca* and *Bengala* as well as *Christians* in all manner of Fluxes and Laskes comming from what cause soever. Those of *Canarin* call it *Cornu*, they of *Malabar* *Curo* and *Curo dypala*, and the *Brachmenes* *Cura*.

CHAP. CXXXVIII.

Pavate. Another Costive tree.

T His other tree which is more frequent to be had then the last, and called *Pavate* in *Malabar* is therefore in more use though not altogether of so strong and speedy effect, for the staying of Laskes and Fluxes, but is of excellent propertie to coole all hot inflammations, and eruptions of cholericke matter in the skinne and *S. Antho-*
nies fire: the roote of this tree is of chiefest use, and sometimes the wood steeped in the decoction of Rice, which will grow softer after it hath stood a few houres, and then they call it *Cania*, with this decoction they wash also the outward parts inflamed or spotted which cooleth much, and helpeth all those heates: it is also drunke being steeped as aforesaid against the heate of the Liver, and in hot Fevers: a few leaves of Tamarinds being put thereto they use to wash the sides of Vicers and wounds that are inflamed, and have defluxions of humours to them to stay the Flux and coole the heate. The tree is not greater then the former, having but few branches and such like leaves of the Otrenge, but without that small leafe underneath it, and of a fresh Greene colour: the flowers are whitish like unto the Hony suckle with small round blackish teele like unto those of the Malticke tree: the barke is of an Ash-colour, and the root white. The *Brachmenes* and those of *Canarin* call it *Vasaveli*, the *Portugalls* *Arbol contra las erisipelas*.

Pavate. Another Costive tree.

CHAP. CXXXIX.

Pacal. The Tetters tree.

T His tree groweth neare the Rivers sides in the West Indies, part whereof being sent to *Monardus* had this commendations that the ashes of the wood mixed with a little Sope, the Indians used to annoint on those places that had Tetters, Ring-Wormes or the foulest spreading Vicers, and scatures that could be, either in the head or any other part of the body to cure them and leave the place faire againe.

CHAP.

CHAP. CXL.

Lignum Nephriticum. The tree against the stone.

From *Hispaniola* and the parts thereabouts hath beene, often sent many yeares since as well as of late, though now in farre lesse esteeme, a certaine smooth light and white wood, the tree whereof is as bigge as a Pearre tree, without knots: the wood being sliced small and put to sleepe in pure Conduit or Spring water will within halfe an houre, or thereabouts (if it be right) discolour the water into a fine light blew colour, which lying longer therein will cause it grow of a deeper colour, this infusion so made, although it be altogether insipide and without any taste as if nothing had beene put into the water, is found yet to be hot and dry in the first degree, and singular availeable against the stone in the kidneyes and the difficultie in making urine, and is found also by good experience to open the obstructions of the Liver and Splene, the water or infusion is leing drunke of it selte, or mixed with wine and so taken; but there is another wood very like unto this, which often obtruded on many in stead thereof which, being infused in water in the like manner will discolour the water yellow, and therefore without tryall the right is hard to be discerned.

CHAP. CXLI.

Lignum Moluccense. The Mollucas tree against venome and poyson.

In the Ilands of the *Moluccas* is a certaine tree rather planted every where in Orchards then growing naturally being as bigge as a Quince tree, whose leaves are broad and cut into divisions, somewhat like unto those of the Mallow, the fruit is like to Hazell nuts but lesser, and with a softer and blacker shell, whereof the natives make so great account that they will scarce suffer any strangers to see it, much lesse to know any of the properties of it, which they keepe from others as secret as may be: but yet this their secrecie hath caused it to be sought for and searched into nearer then otherwise peradventure it would have beene: For some *Portugalls* have found out in part by the sight of the cures the Indians performed, and partly by their relations, which by meanes they made unto them they obtained of them, and partly by their owne judgement and practise also at sundry times in the Spittles there, and in the shippes among Mariners, that the wood made into pouther and taken in a convenient quantitie, according to the strength of the venome and the patient that shall take it, so as the quantitie for a time exceede not ten graines taken in broth or water, or other liqour, is a most certaine speedy remedy against the venome of the most virulent Serpents that are, even the Viper *Regulus* (that is a Serpent that hath like a cappe or crowne on the head) the *Aspis* or any other, and the pouther strewed on the bitten place: they use to file the wood small either with the Sea dogges skinne, or a fine Iron file: in the same manner likewise they give halfe a scruple of the pouther in warme water, or the broth of a Chicken or Hen to them that are wounded with poisoned arrowes, which they much use one against another and put on the pouther into the wound: being taken in the morning beimes fasting, having made a spare supper over night before: it helpeth to evacuate all tough thicke and melancholy humors, and herebe helpeth quartaine and quotidian Agues, prevaileth against the Mucke and Chollick passions of winde or humors, the dropie also, the gravell and stone in the backe or kidneyes, the difficultie of urine and the most cruell chollerick passion, and other old griefes likewise in the joynts and legges, as well scitrous as scrophulous, that is, have hard swellings or nodes and knots in them, the same also killeth the wormes in the body of all sorts: it regaineth a dejected or lost appetite, and if the purgation worke too fiercely upon any to the patient is given halfe a small cup full of *Cama* (that is the decoction of Rice) to stay the working suddenly, or else by eating a small Birde, so that it is in the Patients power, to be purged as much as they will: by the taking of this medicine there hath bin found any trouble to the stomack, or other ill symptoms, although taken without observing any diet, or detraining their businesse abroad, yea in the working thereof living most loosely: it is observed likewise to be availeable in the old paines and griefes of the head, the Megrime, Falling sicknesse and Apoplexye, in the diseases of the belly and wombe, as also the shortnesse of breath, the noyse and singings in the eares, and the gout or joynt aches; it is given in all seasons to all ages to differing natures or dispositions, and that without eyther danger or trouble: but that onely in chollerick persons and that have hot stomackes and Livers, it breedeth some perturbations in them untill that they have taken some meate, and in some it hath procured a vomit; but to the hot and chollerick persons being given with the Syrupe of Vinegar or in the fruit of a *Charambola* being preserved, or in a Piss with Conserve of Roses, it taketh away all those troubles. In some also it causeth an itch in the fundament, and sometimes excoriation, and the Piles also in some, but very few, which are soone helped by other remedies. These cures have beene often performed, and yet the Indians performe many other no doubt, which they conceale from the Christians all that they can. This wood is called by them *Panava*, the seede hereof is much used through all the Provinces of the Indies to catch birds, being carryed thither to bee sold, for some thereof mixed with boiled Rice and cast to the wild Birds causeth as many as take it to fall downe to the ground, as being stoned for a time, but if any take thereof too greedily, it will kill them if they bee not helped by cold water put on their heads, but Dawes above all other Birds are soonest kild hereby.

CHAP. CXLII.

Lignum Colubrinum, Snake wood.

Here are divers sorts of Snake woods, *Acofta* hath set forth two or three, that he knew used by the Indians against the bitings of Vipers, Water Snakes, or the like Serpents, and yet as *Clevis* saith none of those agreeth with these three that *Garcia* maketh mention of, *Bauhinus* calleth them all *Clematis Indica*. The first of *Garcia* is rather a roote then a wood, and groweth with foure or five slender branches, about two foote high, the leaves are like Peach leaves, but more shining, the flowers grow many together on a long stalk in clusters, of a brave red colour, the berries are like those of the Elder, clustering together, and red and hard. The roote, which is most in use, is full of knots or heads, growing above ground, with many small strings under them, being of a whitish ash-colour, and of a firme substance, with a little bitterness in the taste: it is called by the Inhabitants *Lametal*, and by the Portugals *Pão da cobra*, that is Snake wood: This roote being beaten into powder is given in wine or some cordiall water to those that are bitten by any Serpent, and likewise taketh away spots and pushes, or wheales, or other fretting sores in the skinne, and is held to be good against that cruell disease, which they call *Mordexi*, and some take to be Plague, or other dangerous infectious disease, and some call it the Chollericke passion, it is held also to be good against agues, an ounce thereof bruised and steeped in water, purging much choller by vomit. His second sort as he saith when it standeth alone, groweth to be a tree, and is like the Pomegranet tree, set with thicke, short and hard thornes, with a whitish thicke and firme barke, full of rifts, and a little bitter, but not so much as the former, the leaves are of a yellowish Greene colour, very pleasant to behold: but if it grow by any other tree, it will clime thereon by the branches unto the toppes like a Gourd: they use to give both the wood and the barke hereof, but especially the roote in the same manner aforesaid, and for the said purposes: it groweth in the Isle of *Goa*. His third sort was *Tertium*, brought to the Vice Roy, in certain small bundles of wood with their rootes to them, being slender, hard, blacke and sweete smelling, which rootes they of *Lasana patan*, being an Isle nigh unto *Zeilan*, did wonderfully commend against venome or poyson. It groweth up with a few slender branches, foure or five cubits long, which if they be not tyed or held up will lye on the ground, having a few thinn long leaves like unto those of the Masticke tree for the forme, yet not Greene but spotted, with whitish blacke markes upon them. The first of these as *Garcia* saith, was found to be effectuall against the venome of those virulent Serpents, by this meanes. They have there breeding with them, a certaine small beast, as great as a Ferret, which they call *Quil*, or *Quirpole*, being a deadly enemy unto the Serpent *Regulus*, with whom when soever it fighteth, it eateth of the heads of one of those rootes, that is bare above ground, which having chewed, he casteth his spittle upon his head, and over the rest of his body, and his fore feet also, and then fighteth with that serpent, and will not leave it untill he have

Lignum Colubrinum primum Acofta,
Acofta his first Snake wood.

Lignum Colubrinum secundum Acofta,
Acofta his second Snake wood.

Bbbbbb 2

killed

killed it. Many *Portugalls* at severall times have bene eye witnesses to these battels: for they not onely keepe this small creature in their houses, to sport themselves with these combats, but to kill their Mice, whom they most eagerly hunt and kill. There are also certaine wandering beggers called *Jogues* who doe often carry about with them these serpents *Regulus* tame, making men beleve they have enchanted them, and some likewise that are fierce, whom for a reward they will suffer these Ferret-like beasts to fight with.

Lignum Colubrinum primum Acofta. Acofta his first Snake wood.

The first sort of Snake wood that Acofta maketh mention of, groweth in *Malabar*, somewhat after the manner of Ivy, spouted like unto the stalke of Dragons, and so like unto a serpent, that he that should see it at the first, not having seene it before, would take it for a very serpent, especially beholding it in the Moone light. The first leaves it hath are broad, and whole without any cut or deviation on the edge, but those that come after are like almost unto Bryony leaves with a ribbe in the middle of them, and five or six others, running from thence to the edges, and lastly, some cut into divisions like a Vine leaf, all these sorts of leaves being to be seene at one time on the stennes and branches, that they would seeme not to be the leaves of one and the same plant: This wood is held to be the most soveraigne remedy against the venome of all sorts of serpents where with they abound, that by the onely sent thereof, carrying it continually about them, the serpents will flye from them as they walke in the fields, and if they doe touch any of them there with, it will make them to breake in peeces and dye.

Lignum Colubrinum secundum Acofta. Acofta his second Snake wood.

Another sort groweth low and small, having onely three leaves set together, which are soft, long, and narrow, smooth, and of a darke Greene colour, it hath not bene knowne to beare either flower or fruite; the roote is long and slender, smaller then ones little finger, running along under the surface of the ground, and knotted in divers places; the outer rinde being very thin and of an ash-colour, having at the first little or no taste therein at all, but after a while it yeeldeth a fine sent and taste like Muske, this bark chappeth in many places, shewing under it another thicker, and yellow, of the sent of *Trifolium odoratum*, Sweete Trefoile, and tasting sweete like Licoris, but not abiding long, the substance whereof is woody, and called in *Canarin*, *Duda Sali*: this roote being beaten into poulder and taken in Wine or Water, is said to be a certaine and present remedy against the bitings and venome of any serpent whatsoever: it is much used likewise in tertian and day agues, the weaknesse of the stomacke, the trembling and passions of the heart, or twounings, and against all sorts or poysons: many have affirmed that no serpent had power to doe him harme that but held it in his hand, and that the sight thereof would make the serpents flye from it to some other place: it is held also to be good for those that have stinking breathes, or have stinking foule hollowteeth that give an evill savour, to hold it in their mouthes, or to put it into the hollownesse of the tooth.

A third sort is found in the same Provinces, and is a tree of a very large size and greatnesse, whereof peradventure that was a peece that *Clusius* saith he had of Doctor *Heñor Nunes*, the *Portugall* Physicion here at *London*, the wood being like a peece of Ash, firme or close, with certaine veines running therein, the rinde or outer bark being of a whitish ash-colour, and tasting somewhat bitter.

CHAP. CXLIII.

Cohyne. The Indian rattling God.

Cohyne. The Indians rattling God.

The *Portugalls* possesse a certain Country in *America*, called *Murpian*, which is full of very good fruits, and among the rest the *Nana* or *Pinas*. There is also growing a tree whose fruite they call *Cohyne*, having leaves like to those of the Bay tree, and fruit as bigge as a Melon, formed like unto an Elstridge egge, which although it is not eaten by any of them yet is very beautifull hanging on the tree. The Savages use to make drinking cuppes of them, but besides that they commit Idolatry there with, which is wonderfull, and to be lamented, for having emptyed and made hollow these fruites, they fill them with the feedes of *Milium* or some other thing, which being shaken with ones hand, or with the winde, will make a noyse: then doe they fasten a pole into the ground, and sticke this fruite full of those feede on the toppethereof, and fasten about it the most beautifull feathers of birdes they can get: Every house hath two or three of these fruites decked up in this manner sticking on the poles, which they have in great reverence, thinking some god to be in them, because when they are shaken they make a noyse and their priests and prophets make them beleve their God, whom they call *Toupan*, speaketh and telleth them what they should doe, and what shall come to passe, and it is not to be found that they worship any other thing, *Clusius* saith that this fruite is called *Maraka*, and *Tamara-ka*; but I thinke these names smell somewhat of a

Greece Godfather, as the *Tamalabathra* from *Tamalapatra* : yet others say they are their hand rattles wherewith they dance.

CHAP. CXLIV.

Palma Hairi. The thorny American Palme tree.

His tree groweth in some parts of *America*, both in shape of body and leaves like unto the Date tree, but full of sharpe thornes, bearing fruite as bigge as an hand-ball, but pointed at one end, having within it a fine snow white kernell: the wood of this tree is as blacke as blacke marble, and sincketh in water because of the heavinesse, and therefore some have thought it to be Ebony, but *Thevet* contradicted that opinion with these reasons: first that Ebony is a wood more blacke or shining, and then that Ebony beareth no thornes, and lastly, Ebony is not found in *America*, but in *Ethiopia*, and the East Indies, about *Calicut*, &c. The Indians of this wood make them swords, which for the massinesse give a mighty blow, and will breake both scull and bones, where it lighteth on any, although it doth not cut as our swords doe: they make also arrowes of them, which by reason of their hardnesse like iron, and the points of them burned, to make them so penetrable, that they will be able to pierce a good corselet.

Palma Hairi. The thorny American Palme tree.

CHAP. CXLV.

Palma scriptoria & alie arbores, cujus folia & cortices chartæ vicem præbent.
The writing Palme tree and sundry others, whose leaves and barks have supplied the office and want of Paper.

Here are sundry sortes of trees growing both in the East and West Indies (although none of the Nations of the West Indians, except the *Mexicanes* know any use of writing, or Letters, before the *Spaniards* first entrance among them, but the *Spaniards* there made use of divers in the want of paper) whose leaves and barks have beene used to write on (besides the ancient paper Reed, which served the former *Greekes* and *Latines* to that purpose for many ages, whereof *Pliny* hath largely intreated, and *Guilandinus* as largely commented upon him, and whereof I have entreated also in another place of this Worke) as namely sundry dwarfe Date trees, whose leaves have so smooth a surface that they served them very finely to write on, that is, with a small pointed iron, to engrave their characters: herein. There is also growing in the Country of *Mangi*, which is neere the *Tartars* *Tal*, and *Chineses*, a certaine tree called *Tal*, and *Vguetel*, whose leaves are very large, and through all those Countries are used to be written on: it beareth fruite like unto great Turneps, whose meate under the outer rinde or bark is tender, sweete and edible. *Oviedus* maketh mention of two certaine trees growing in *Hispaniola*, the lesser called *Gusjabara* by the Indians, and by the *Spaniards* *Unuro*, because the fruite thereof are like Grapes: the wood whereof is reddish, sound, and thicke, and fit to make coales, it beareth the fruite more loosely separate in fander then the Grape, and of the colour of the Mulberry or Rose, having little substance thereon to be eaten, for they be as great as an Hasell Nut, and a stone within it is almost as great as the leaves of this tree are

*Palocita
humilis
Cajuputa.*

Tal.

Gusjabara.

brod

broad and round, as bigge as the palme of ones hand, as thicke as two Ivy leaves, and greene, and sometimes reddish, whereon the *Spaniards* used to write with an iron pen or pointell on both sides of the leaves, but they must be fresh gathered and presently written upon, which Letters then will appeare white, in the greene or reddish leaves that they may be easily read, notwithstanding the middle ribbe, and the other veins therein, in that they will not hinder ones hand very much. The other tree they call *Copey*, growing greater and taller, whose leaves are round like unto the other, but twice as large and thicke as they, and therefore better to write on, the middle

Guibora. New Spaines
thin writing leaves.

so much the lesse: these leaves also the *Spaniards* made use of for playing cards, engraving the formes of Kings, Queenes, &c. thereon, and would not easily be broken. *Nicholaus Cofinus* in his journall setteth downe that neere the City *Cael* where pearles are found, there groweth a tree, whose leaves are so large that two or three men may be kept dry in their journeyes, having one of them spread to cover them, for they are of fixe braces or fathomes in length, and as many in breadth, which leaves also serve them very fitly to write upon, each of them being so thinn and plyable withall, that being foulded up hand-somely together, one may carry one of them in their hand. *Durer* also among his admirable plants remembreth the *Mel* and *Magey* of the *Mexicanes*, or rather *Mel* and *Maguey*, which is the *Aloe Americana*, set forth in the second Classis of this Worke, of whose leaves they made use to write or engrave what Records they would keepe, or what else they thought good. *Clusius* also maketh mention in his first Booke of Exotickes, and fourth Chapter, of two sorts of barks of trees fit to write on: the one white and like unto the thinnest parchment which was gotten in *Iava*, by those that returned home with *Sir Francis Drake*, in his long voyage over the world, which by tryall was found fit to write on. And as he saith it might be was taken from that tree that *Antonius Pigafetta* maketh mention of in his journall, that in the Island *Tidore*, the women cover their privy parts, with a certaine cloath made of the barke of a tree in this manner: after it hath bene steeped so long in water that it is growne soft, they beate it with woodden mallets unto what length and breadth they please, making it so thinn as silke, having the crosse veins running through it: And it may as likely be such as the *Chineses* make their paper, some Bookes of herbes being brought into the Low Countries as *Clusius* saith, having both the figures of the herbes in them, and the descriptions, and vertues also peradventure, for they had *Chineses* Characters on the sides of the figures. The other barke of the tree was not white, but somewhat reddish, but of so smooth and fine a polished surface, as no paper could be smoother and plainer, and was not thicke or grosse but without any difficulty might be parted into six leaves, each of them very well enduring to be written on with our ordinary inke, and yet not sinke any whit through it, which barke as he saith might have bene separated into more leaves if one would have been curious about them.

CHAP. CXLVI.

Palma pinus five Conifera. The Pine or Conebearing Palme tree.

His strange kinde of tree being brought by certaine *English* Merchants, or Matriners, from the parts of *Guinea* where they traded, was of a wonderfull compofure, for the toppe bough with the fruite thereon, was as it were mixed, of the nature of the *Dare*, and *Pine* tree together, the wood being light and spongy, and wholly made of threds or haire, the outside or barke being like scales: it had about forty or fifty round yet somewhat flat branches, a foote long in the same manner scaly, or as it were set with hollow joynted cuppes or boxes, and from the joynts broke forth small cones like to those of the *Cedar* tree, set with thicke scales of a polished shining brownish colour, the outer shell being of the thicknesse of the *Indian Nut shell*, containing within it a certaine kernell like unto a long *Ackorne* or *Chestnut*, of two inches long or lesse, very hard and not easie to be made into meale, yet serving the *Natives* instead of bread.

Fruilus squamisus Palma altera similis. Another kinde of scaly fruite like the other *Palme*.

Another scaly fruite like hereunto was sent unto *Clusius*, but came a little after his death, which sheweth the shalke of the fruite divided into long fibers, the fruite also divided, whose inner substance betweene the outer shell and the inner kernell was blacke, the smaller end of which kernell lay next the bottome of the fruite, differing from those in the *Cokar Nuts*.

Chameriphes peregrina Clusij. The strange dwarfse *Palme* of *Clusius*.

This branch *Clusius* referreth to the kindes of *Palmetos* as thinking it to partake with them: it rose up faith-
he

Palaeopinus five Costifera.
The Pine or Conelike bearing Palme tree.

Frax. squamosa Palm e altera similit.
Another kinde of scaly fruite like the other Palm.

he, with forty stalks or more bigger and lesser, and longer or shorter than others, containing many appearances of flowers or fruites growing thereon, which were all rubbed off, onely the places where they stood, appearing and shewed as if they had bene all contained within a huske or covering, for the whole branch rose from a certaine thicke barke, made as it were of shards like unto that of the outer shell of the Cokar Nut, or like unto that huske that covereth the *Palmeto* head, which barke was of a yellowish colour, smooth both above and below, but the stalks were of a brownish colour: this seemed to be plucked from some tree, but what or where is not expressed.

Chamaerophy pergrina Cl. fj.
A strange dwarf Palm of *Clajus*.

CHAP. CXLVII.

Gum Copal & Anime. Of Gum Copal, and Gum Anime.

Here two Gummies are gathered in the West Indies, as *Hispaniola*, &c. being very like one unto another: the *Copal* is of a fine cleare translucent pure white gum in somewhat great peeces, and pretty sweete, although not so much as the *Anime* is, with this Gum the Indians used to perfume their sacrifices instead of Incense in their temples, and when the Spaniards first came among them, they perfumed them therewith: it is hot in the second, and moist in the first degree, for it hath some watery parts therein, it resolveth swellings, and mollifieth hard tumours: *Gomara* maketh two sorts hereof, the one more rugged and folt then the other. But there hath been brought of late dayes, an oiely or liquid substance called *Oleum de copal Iva*, and is of two sorts, the one yellowish, and of a more thicke substance somewhat like unto that *Balsamum* that commeth from *Hispaniola*, the other whiter and more liquid, but of as sweete a sent as the former, both of them being excellent good for wounds &c. The *Anime* is also a whitish gumme, running out of great trees, and is not so cleare or pure white as the *Copal*, but more fatty like unto *Thur* or *Olibanum*, yet in greater peeces then *Olibanum* and being broken is somewhat yellowish, and of a most sweete and pleasant sent being set on burning or cast on quicke coales, and is soone consumed. There is another Gum *Anime* of *Ethiopia*, bordering on *Africa*, which is called *Orientele*, to distinguish it from this West Gum, and is both clearer, whiter, and in greater peeces then this, and is so like unto white Ambar, that divers have taken it to be melted Ambar, and thereof have made beads, and bracelets, &c. the tree from whence it commeth is great, having leaves like Mirtles: but I have here before shewed you the true originall of Ambar, even to be a *Burmen*, which hath his fountaines in the *Germane* Sea, and becommeth hard, after it hath bene a while in the aire: Of this *Orientele Anime* also, I have shewed you the opinion of divers, both in the Chapter of *Lacca* and *Mirba*, first that there is three sorts thereof, brought from *Guiney*, &c. by the *Portugals* and others, whereof that which is white is taken by *Garbia*, *Amatus Lusitanicus* and others, to be the true *Cavacumum* of *Discorides*, and called *Animum* by the *Portugals*, serving for perfumes and censings: Another sort which is browne is taken by divers to be the *Myrrha Ammonia* of *Discorides*, as is before said: The third sort is dry, of a pale colour, and is easily broken like Rosin. The West Gum *Anime*, is of much use in the defluxions of rheume from the head, and other diseases of the head, rising from a cold cause, the head ache also and megrime, and where there is want of sleepe to burne it, on a few quicke coales and airt ones head and their night cap with the smoke, which warmeth and comforteth the parts very much: and is herein very like unto *Thur*: it is used likewise in plasters to warme and strengthen the cold and weake sinews or any other part of the body afflicted with cold: it comforteth also a cold stomacke and helpeth to dissolve winde: it is also hot in the second and moist in the first degree.

CHAP. CXLIX.

Resina Americana quedam, Certaine West Indie Rossins.

Here are divers other sorts of guma Rossins; and liquours brought both from the East, but especially from the West parts, some whereof by good experience have given much helpe they to those that have used them: many other more then they have beene brought, whereof wee have knowne no use or name, nor have made any tryall what effect they carry, and therefore to avoyd tediousnesse, and that this Worke being growne great, should not be over charged with needlesse and unprofitable matter. I will onely in this Chapter shew you some of the chiefest that have bene either mentioned by others, or not set forth before now. The first is the *Resina Carthaginensis* set forth by *Monardus*, that was gathered by *Carthago nova* in *America*, and is a most cleare and most sweet liquid Rosin excelling either the Venice or the true Turpentine in the effects. For it is by often experience found to be singular good for wounds in the nerves and sinewes, and the joynts or for old sores in the legges and feete: women by washing and preparing it in a convenient manner, doe use it on their faces to take away wrinkles, spots, &c. and to preserve their youth and beauty. Another sort is called also by *Monardus* *Resina Abigua*, that is Firre tree liquid Rosin or Turpentine and is gathered from great wilde trees that can neither be said to be Firre or Cypress, being rather then Pine trees, and straight, growing up like the Cypress: towards the toppe of these trees grow certaine bladders or skinne some greater and others smaller, which being broken this admirable liquour droppeth forth, which the Indians carefully doe gather into shells, but with a great deale of labour and trouble, and but a little in a great time. The use hereof is as effectually as *Balsamum*, for all the causes for which *Balsamum* is used, for it excellently healeth all sorts of wounds, and easeth all paines and griefes rising from cold or stulent matter: it is also singular good against the paines or winde in the stomacke and bowels, to take some in white wine. A third sort of liquid substance is called *Liquor Ambia* and came to him in the hollownesse of a cane or Reece, and was taken out of a spring or fountaine in the ground, farre from the sea, being thin and yellow like hony, and smelling like *Tacamabacca*, which was signified unto him to be of excellent vertues, especially in cold inveterate griefes, and aches in any part of the body, and taketh away the cold shivering fits of ague: it resolveth also all kindes of hard tumours, and performeth whatsoever either *Caranba* or *Tacamabacca* can doe: it is of soft sticking and cleaving a substance, that it will not be pulled from the place whereon it is set, untill by time the vertue is spent and it growne dry. *Gum Colliman* or *Caramam*, is a kinde of blacke gum almost as blacke as pitch, that *Sir Walter Raleigh* first brought from *Guiana*, and those parts, and brought it also first into use for a cold moist and rheumaticke braine, and giddinesse thereof, and for defluxions of humours, as aches in the joynts or other parts, into the shoulders or other parts of the body, or for windinesse in them running from place to place, eyther by it selfe or sometimes mixed with *Caranba*: Of it selfe it is very hard, and smelleth sweete, but being distilled is much sweeter, especially the last part, that commeth forth after the two first stinking oyles, and is used by some perfumers as an excellent perfume.

Carthag-
inensis.Resin
Abigua
Indica.Liquor
Ambia.

fume. It is good also for resolutions, or as some call it the dead pallsie, and for the paines of the mother, and the lower part of womens backs, which must be spread upon leather as a plaister and laid thereon, and not taken away till it fall of it selfe: it is also singular good to ease the paines of the gout, and of excellent vertue in the cure of wounds: all these properties have beene found certaine by good experience.

Barratta, is a most soveraigne *Balsamum* farre exceeding all others yet knowne, which by true Experience is found to be of especiall operation in the cure of Greene wounds, and being burned upon coales is a most sweet perfume.

And thus to finish this whole Worke and bring it to a period, let me onely shew you some of those things not spoden off before in this volume, which have beene made knowne to us to grow in our severall plantations of *Virginia*, the *Barmudas*, *New England*, or elsewhere among our owne peoples habitations: and first,

The poysoned weed is like our *English Ivy*.

The purging Beane is a kinde of Woodbind, running on trees neere the Sea side.

The Mancinell tree beareth a small apple like fruite, sweete in small, but poyson to eate.

The Guane tree beareth a fruite as bigge as a Peate, and good to eate.

They have also Apple trees differing from ours.

Cherries likewise as bigge as Damsons, and yellow Plummies divers from ours.

There is a bush like unto a Bramble that hath long yellow fruite within a hard shell.

Another tree they have that groweth great like a Pine tree that beareth fruite as great as a Muske Melon, is alwayes Greene, and hath both blossomes, Greene fruite, and ripe, all at a time.

Wilde Figge trees likewise they have, wherewith they feede their swine.

Then have they small red berryes which they call red Pepper.

Goodly great trees which they call Cedar, because the wood is red like Cedar, but the berryes are small like unto Juniper berryes.

Fusticke trees, which give a yellow colour fit for Dyers,

A great tree with whose leaves they make Mustard.

A kinde of roote which they tooke to be *Sarsa parilla*, but is not, although somewhat like it, being hard and woody, and hath no use that we know.

Mucos nuts grow close to the ground like unto Hazell Nuts.

Penimaw is a kinde of filke grasle.

Waghsacan, with the roote they cure their hurts and diseases.

Messaminus are Grapes as great as Cherries, but with little joyce in them.

Rawcomens are like to our Gooseberryes.

Oconghtawmins ate berryes like unto Capers.

Checinkamins like to Chestnuts.

Tockabongb is the Cassada roote whereof they make bread.

Pappaw is a fruite as bigge as an Apple, of an Orenge colour, and good to eate.

And now unto God Almighty *Triuno*, and *Yno in Trinitate*, who I hope hath beene at the beginning of this Worke, and holpen me through all the passages thereof, notwithstanding the *multa discrimina rerum mortalium*, whereof I have felt my part, to bring it to the end, for the benefit of others (who that they may make good use thereof, and not pervert it to any sinister course, is my earnest desire) be given all the praise, honour, and glory, for I am but (like the Bee, that workes out waxe and hony for others, not his owne good:) his instrument to accomplish it, receiving all from Him. *Amen.*

FINIS.

THEATRO BOTANICO APPENDIX.

An Appendix to the Theater of Plants,
or Addition of those things have beene over-
slipt, mistaken, or to be amended in the Worke
Precedent, to be referred as the number of
the Pages declare.

Where observe that p. standeth for Page.

15. *Hyssopus Grecorum* so called by *Alpinus*, is that fiftenth sort in page
the third, there called *Hyssopus folijs Origani*. Round leaved Hyssope.

6. *Thymbra Legitima Alpina*.
The true Savory by *Alpinus*. Page. 5.

6. *Thymbra Legitima Alpina*. The true Savory by *Alpinus*.

The differing forme and face that *Alpinus* giveth this small herbe from the former, hath made me insert it
here to be referred to the other sorts. it so be it be another. It is very like unto the true Tyme as he saith, but
hath smaller and slenderer branches, and Tyme like leaves, many being set on them by couples, but thinner and
softer, and of an herby Greene colour: the flowers are purple like Tyme and grow in spikes: it groweth lower
then Tyme, smelleth very like it, and tasteth as sharpe as Tyme, when it is dried.

19. *Morus*

10. *Marum Aegyptium Alpinus*. The Egyptians
Marum by *Alpinus* to be referred to p. 13.

the matter) and describeth it in this manner. This dainty plant riseth up to a footes height, with straight stalkes and soft tender Marjerome like leaves, upon them, covered with a whitish downe, or wooll, being almost round but pointed at the ends, with sundry pale coloured veines in them: It beareth many white flowers at the tops of the stalkes, bowing their round heads a little, which are made of many small leaves set together. It is somewhat aromaticall in taste with some pleasing acrymony, and a little astringent withall, but exceedeth in sweetnes that of *Candy*.

2. *Origanum Onithi Matthioli*.
 White Organy of Greece. p. 15.

10. *Marum Aegyptium Alpinus*.

The Egyptians *Origanum* by *Alpinus* without sent.

This plant saith *Alpinus* accounted a *Marum* with the Egyptians and growing among rubbish and in dry places doth somewhat resemble a wild Clary in the leaves and growing, being voyd of taste or savour, especially the lowest, yet those that rise up with the stalks and flowers, are strong and not unpleasant, the leaves thereon being of a cubits height are white and hoary, and the flowers like those of Clary, the seedis small and round like Calbage seed. They use to lay it among their garments, and Physically to expell winde powerfully, and to abate swellings.

5. *Origanum Indicum*. Indian Organy,
 or bastard Marjerome.

Prosper. Alpinus in his Booke of Egyptian plants setteth forth one, he saith is there called *Zatarendi*, and describeth it to grow slowly with sundry branched stalkes and almost round, thicke whitish leaves on them, full of sap or juyce, and very sweet, bearing neither flower nor fruite: they use it in their meates as others doe *Origanum*: thus much *Alpinus*. But *Veslingius* taking upon him to correct and amend him saith, that the plant called *Satarbendi* by them is this plant (whose figure I here give you from him, and as he saith did spring with *Signior Contarini* of Venice, it there be not some fallacy or mistake in the matter, for besides that *Alpinus* figure hath little similitude unto this, he saith, who it is likely observed it long by saying it grew slowly, he observed in all the time of his abode in Egypt that it bore nothing: but as soone as it came into *Contarini's* hands, it bore according as other sorts of *Origanum* both flowers and fruite yet larger. I put this but as a doubt in

5. *Origanum Indicum*. Another Indian Organy,
 or bastard Marjerome. p. 15.

10. *Polium Gnaphaloides*.

The hoary *Poley* mountaine.

This kind of *Poley* mountaine is wholly very hoary white all over, and having small leaves like small Myrtle leaves, a little dented about the edges, so thicke set on the lower crooked stemme, that they cover it, from whence arise divers other stalkes or branches, thinly set with the like leaves, and at the toppe of each of them a round head or umbell, upon a long bare stalke, consisting of divers yellow flowers, standing in their small cups, which growing ripe are turned into downe, and with the yellowish small seed is carried away with the winde: the roote is small, slender, and long. *Alpinus* only maketh mention hereof lib. de plantis exoticis.

10. *Polium Gnaphaloides*.

Hoary *Poley* mountaine. p. 15.

13. *Origanum fistulosum* Cornuto sed potius *Mentastrium fistulosum Americanum*. A wild Mint of America.

The roote of this plant is wholly composed of long and small fibres, which shooteth forth sundry square hairy stalkes halfe a yard high, set with two long and somewhat broad leaves at the joynts, somewhat resembling those of the Willow herbe: at the joynts come forth also divers branches with such like leaves thereon, but lesser up to the tops, where stand ten or twelve small leaves in compass, under the round head, composed of a number of pale reddish purple flowers, resembling the head of a Scallion, each flower being long and hollow, biforked at the end, with two or three threads tip with purple: in the middle of this round head shooteth forth sometimes such another round head of flowers, with leaves under them: the whole plant both stalke and leaves are covered with an hoary downe, and smelleth like Savory but tasteth sharpe and fiery like Arisart, yet the roote hath no taste at all.

13. *Origanum fistulosum* Cornuto sed potius *Mentastrium fistulosum Americanum*. A wild Mint of America. p. 34.

2. *Stachys flore albo*.

Scordium

Scordium spinosum edratum. Thorny sweet
Scordium, or Water Germander. p. 110.

2. *Nuda montana ret. 2.* Mountain Nardus of Candy. p. 120.

Scordium spinosum edratum.

Thorny sweet Scordium, or Water Germander.

This annual Scordium riseth up with square soft and hairy stalkes full of joynts or branches, which are fatty or clammy, wherea grow sometimes two, but at the greater joynts three leaves, which are variously formed, the lowest being largest, are dented or cut on the edges, like unto the ordinary or Water Germander, but still up higher the smaller and lesse dented, at the joynts of the branches grow many times long thornes, but alwayes end in a small long soft pricke or thorne, and at the leaves also come forth small Germanderlike flowers, but whitish, with three small threads witt in them: in the buskes that contained the flowers, being false rise fowre small seeds which must be sowne every yeare: the roote is very long and fibrous, and perishing after seed time: the whole plant smelleth almost as sweet as Basil, and was gathered upon some of the dry, barren and sandy mountaines in Spaine, and mentioned onely by Cornutus in his Canadi relations.

Having another figure of this Valerian by me, differing in some things from the former, I thought good to exhibit it likewise unto you, that you may see how the alteration of climates causeth such small diversities as are here perceived in rootes, leaves, and flowers.

18, 19. After Americus praecoxior & servitimus latifolius
& 2. 24/1/10/10. Two sorts of Virginia
Dianthus. p. 132

2. *Scammonia macrothyris* Cretica.
Long rooted Scammony of Candy. p. 164.

4. *Laurus sylvestris* Cretica Alpina.
The shrubby wild Bay of Candy. p. 167.

To the end of the 25 Chapter of the second Classis, page 216. adde these words. But *Petrus Castellus* hath published a Tractate Printed at Rome 1612. in quarto, or as he calleth it an Epistle to *Iohannes Menelphus*, and *Aetius Cletus*, wherein he contesteth, that the *Heliebom* simply so called, as well in the Workes of *Hippocrates*, as other Authours entreating thereof, is to be understood of the white kinde, wherewith both the mad daughters of *Petrus* King of the *Argives* were cured, as also *Hercules* madnesse by the *Anticyrean* medicines (whose seed being like unto *Chicor* was called *Sesamoides*) whose assertions I am sure are quite contrary to *Dioscorides*, that directly approprieth the cure of *Petrus* daughters unto the blacke Ellebore, and therefore called also *Melampodium*, because *Melampus* the Goat-headed plaide the Physition therein.

3. *Acacalia* *Camerario* *Bollonio* & *alij*. A Syrian plant like unto the Carob tree.

Being omitted in page 236. whete it was intended to be set forth, that it be not utterly left out, accept it in this place. *Paludanus* saith *Bauhinus*, in his returne from his *Egyptian*, *Syrian*, &c. peregrination Anno 1579. brought some seedes of a Syrian plant, called there *Kismisen*, which being sowne brought forth round leaves, which he doubred was the *Acacalia* of *Dioscorides*. *Camerarius* also saith that he (as it is likely having received of the same seeds from *Paludanus*,) sowed some seed that was eight yeares old, sent him by the name of *Acacalia*, and called in the *Syriack* tongue *Kismisen*, and *Sifine*, from whence rose a tender plant. somewhat like unto the Catob tree, upon the first springing of it, having gained that yeare onely foure round leaves, set by couples, each opposite to other on the middle rib, whose stalks was somewhat hairy: This perished also at the beginning of Autumne, so that no more can be said thereof, but that the seed was somewhat broad and round at the one end, and pointed at the other. But although this bore the name of *Acacalia*, yet did it not answer to *Dioscorides* Text, (or *Aginera* that transcribed it from him) that saith it is the fruite of an *Egyptian* plant, that is somewhat like unto *Tamariske*. *Cordus* commenting on *Dioscorides*, saith it was not knowne in his time, unless some would referre it to the *Elmblick* or *Bellirick* *Myrobolanes*, which is as farre from truth, as an Oake from an Apple. *Belionius* also remembreth it, but giveth no description of it: So that neither being perfectly described by *Dioscorides*, nor certainly knowne of our Modernes, I can say no more thereof.

CCCCC 2

Myrobalani

2. *Myrobalani Chebuli ut fertur Icon vera.*
A true figure of the purple Myrobalane
or purging Indian Plumme.

Veslingius in his survey of *Alpinus* his Egyptian plants saith, that he often saw in the Orchard of a certaine chiefe Turke, a tree growing, which the keeper thereof called *Dileg el chebul*, growing to be as bigge as a Plum tree, with a smooth pale coloured barke, the wood being whitish and somewhat sweet, the branches spread fairely and thicke, bending easily and hardly breaking, armed with sharpe long thornes: the leaves are set by couples together on a short footstalk, being somewhat long with the roundesse, and a little round pointed (nothing like unto Peach leaves, as is formerly set downe) the lower ones being larger then those upward on the same branch: and without any dent on the edge. The fruite is of a reasonable great esse, bigge in the middle, and small at both ends, and of a darke or blackish red colour, and somewhat sapide. They use to preserve them, and so impart them to those of the greatest rapke, and have a purging quality in them.

8. *Rubia sylvensis argentea Cretica.*
Silver-like wilde Madder of Candy.

This small Candy white Madder, from a small long slender roote shooteth forth divers stalkes, not halfe a foote long, with sundry small, long, soft and silyer coloured leaves set by spaces, some times but two, other whiles foure at a peece, and with them upwards to the toppe, small yellowish flowers, it is without any other taste then a little astringent, and is said to be profitable for fluxes in man or woman.

8. *Rubia sylvensis argentea Cretica.*
Silver like wild Madda of Candy. p. 77.

2. *Myrobalani Chebuli ut fertur Icon vera.*
A branch of the true Chebul Myrobalane, or purple purging
Indian Plumme as it is thought, to be referred to p. 246.

Capnos rubra radice.
Becongens Holanortel, or small round rooted Fumiterrey. p. 288.

Page 380, Line the sixteenth, put out *Panaces Carpinon* five *racemosum Canadense*, but why *Panax* being no wound herbe, I see no cause, unlesse it be for want of a better name, put out as I said all this, because it pertaineth to another place.

Page 380. Line the sixteenth, put out those three last lines in the *Nomes*, and instead of them put *Aconitum baccanibet & rubrin*: but I thinke I have more truly referred it to the *Christophoriana*. In the *Vertues* likewise put out the *Panaces Carpinon*, and all that followeth, and in the place thereof set these lines. *Cornutus* saith, they gave it the name of *Aconitum*, rather from the likenesse unto an Aconite then from any deliteriall quality they knew to be in it, and suppoeth that the white berries should rather portend good then harme.

Page 387. Lines put of the 18 19 and part of the 20, are to be stricke out, not being intended for that place, as may plainly be discerned by the relation. And in the stead thereof read these lines: The fourth is called by *Clusius* *Apocynum Syriacum Palestinum*, & forse *Egyptium*, because he referreth it to the *Beidfar* of *Alpinus* in his Booke of *Egyptian* plants, and to the *Ossar frutex* of *Honorius Bellus* in his third Epistle to him, saying withall, that Doctor *Christophe Weixius*, gave him the dyed branch, which he set forth, and that as he told him he gathered it neere the River *Jordan*, in *Palastina* where it grew, and the people there called it *Beidfar*: this is *Clusius* his relation and judgement thereof: I have said somewhat hereof in my former Booke, page 444. But I would to explaine it the better, adde somewhat more thereunto. First that it is not probable to me that this plant which *Clusius* setteth forth (and is without all question the very same that rose with me from the seed was brought out of *New England* upon the first discovery thereof, both stalkes, leaves, and flowers, agreeing so exactly thereunto, and both forme and colour of the flowers answering it in every point, onely the pods white seed answereth not unto this, which I doubt therefore is but mistaken) should be found naturall to those parts, seeing as I said it is naturall to *Virginia*, or *New England*, and especially that the name *Beidfar* should be given to it, which is most probable belongeth to that of *Alpinus*, and *Bellus*, which is quite a differing plant from this as I shewed in my former Booke, both from the growing hereof, which dyeth downe every yeare, and from the milke it giveth, which is not causticke like the *Ossar*, and in the rootes which are running under ground, which the other doth not. And thirdly, they say that the *Ossar* or *Beidfar* beareth yellow flowers, and not expressed to grow in clusses as this doth; and lastly, that the pods of this *Apocynum* are crooked, according to the forme expressed in the figure, when as those of *Ossar* are round like Testicles, and those that *Clusius* setteth forth are not crooked like unto these. *Banhius* in following *Clusius*, sheweth that he never saw the plant, and therefore taketh it for granted whatsever he said, or *Weixius* informed him, when as by this that I have here delivered it is probable *Weixius* was mistaken, and that hath caused all these errors: as also that of *Banhius*, that would make it a kinde of Docke, calling it *Lapathum Egyptianum* *laetescens* *siliqua Asclepiadis*, which hath so little correspondence with reason and judgement, that I wonder that so famous an Herbarist as *Banhius* was, should relye upon anothers foolish opinion in the denomination thereof, and so divulge it to the world, whereof I have formerly said something: The fifth is remembered by *Cornutus*, among his *Canada* plants,

Ranunculus sylvorum five *Anemone sylvestris* flore pleno albo. The double white wilde Anemone to be inserted in p. 325.

6. *Pseudopapaver Virginianum*, alijs *Gelsemium Atricanum* maximum flore pheniceo. The great Orange coloured *Virginia* *lalmine*. to be inserted p. 385.

Of *Phalangium* in p. 418.

The Vertues.

Spiderwort is of especiall property against all venome and poysons, as well of animalls, the Scorpion Spider *Phalangium*, and other Serpents, as of herbes and evill ayres or other quality whatsoever: it is held also to be preservative againt infection, to continue the taking of the whole herbe, with the rootes either the poulder in wine or the decoction for a time, or to be tunned up with some *Angelica*, *Goates Rue*, and *Zedoaria*: it is singular good also against the winde and chollicke, to ease the tormenting paines thereof, and to avoid urine being stopped, or the paines of the stone.

R. *dux Contrajerva Hispanorum* ut a Baptista Cortesio exhibetur.
The roote of the Spanish *Contrajerva*, as Cortesius
fetched it forth, to be returned to p. 471.

6. *Polygonum Serpallifolium* Lobelij.
Lobels Knotgrasse with Mother
of Time leaves. p. 446.

1. *Prunella vulgaris*.
Common Selfheale. p. 526.

5. *Hermium sive strum vulgare*.
Our ordinary wilde Clary, or *Oculus Christi*. p. 551.

5. *Galium*

5. *Gallum montanum Creticum*. Mountaine Candy Gillium. p. 565.

16. *Sideritis Heraclea Dioscoridis*, five *Sideritis marina Salusfolia nostra Donato*.

Another Sage leaved sea Iron wort.

The roote is of the bignesse of ones little finger, wrinkled and of a yellowish colour: the stalk is woody and square, at the bottome whereof come forth leaves like unto Sage, but somewhat greener, the leaves that grow upwards upon the stalk, are like unto the Candy Horehound, round about the tops of the branches doe the flowers stand somewhat like unto Sage, yet in certaine cups being of a whitish or yellowish ash-colour. It healeth any wound or sore, not suffering humours to flow thereto, and some *Arabians* say it stayeth womens courses: the leaves chewed doe taste like Malti. ke. There is another hebre growing in the same Isle of *Lio* of the *Venetians*, very like to this, but that the leaves are smaller, the stalk is slenderer, and the flowers that grow at the tops, are more like unto thole of the Common *Calamint*.

Altera.

Alyssoides Cretica major.
Great Saint Peters wort of Candy. p. 574.

16. *Sideritis Heraclea Dioscoridis*, five *marina Sideritis Salusfolia*:
Sage leaved Sea Ironwort. p. 583.

2. *Alyssum*.

3. *Alyssum montanum* Columnar.
Radwort of Columnar. p. 590.

5. *Hebeia Panonica* Columnar.
Valley Daisy Violets of Hungary. p. 618.

7. *Alfaca major* & *minor* Columnar.
Great Chickweed, which with some is called a middle
fo. r. p. 762.

Viola tricolor flore dupli Heartsal with a
double flower. to be related to p. 756.

Page. 733. Line the fixt, before the last, insert these references left out by oversight: The fourth with both the sorts thereof are mentioned by *Clusius*, under his second *Cotyledon* and the species thereof; The fifth is onely remembred by *Columna*, who calleth it *Semper vivum rubrum montanum gnaphaloides*, *Bambinus* not making any mention thereof that I can find: The fixt is the third *Cotyledon* of *Clusius*.

The figure of *Alpin minor* is to be taken away, being the *Anagallis femina flore caruleo*, unto whose family it should have beene referred but was negligently thrust in here instead of the *Alpin major & minor*.
Hieracium montanum tomentosum sive lanosum.

A mountaine hoary and woolly Hawkweed, to be inserted in p. 779.

This woolly Hawkweed (which I know not by what chance it was left out of its due place, and therefore here to be inserted and not to be utterly neglected) riseth up with sundry soft hoary round stalkes about halfe a yard high, set at each joynt with one long, somewhat narrow and waved leafe, whitish also, soft and woolly, and pointed at the ends: the flowers are small of a pale yellow colour, consisting of threds rather then leaves, sundry of them set together at the tops of the branched stalkes, which in time turne into downe, which with the seed is carryed away with the winde: the roote is whitish and stringy, perishing every yeare, and must be yearely sowne, and if the yeare prove not kindly, that the seed may be gathered thereof (as oftentimes it so happeneth) you are to seeke new seed, or sow the old if you have any. This came among *Boels* seed from *Spaine*, where it is likely he gathered it, and sent both to *Maister Coys* and my selfe onely, howsoever another prevents me in the declaration.

Melo vulgaris. The ordinary Melon. p. 772.

1. *Thapsia quadrilobata* folio.
Another broader leaved Fennell *Thapsia*. p. 877.

Libanotis

3. *Thlaspi bifidum* with long stem and white flowers.
Spurce Horned Buckler *Thlaspi*. p. 845.

Ligusticum Galbanum petalon germinum
A true figure of a branch of the Fennell leaved Eranthisence. p. 931.

4. *Pastinaca Echinophora Apula*.
Prickly wild Carrots of Naples. p. 951.

S. Line 674. 17. *S. dulcis petalon*. A leaf of the Sweet Selinum or Carilage p. 926

It may be a question whether this *Selinum* be not of the same quality with the sweet Fennell, and sweet Cumin, &c. The sweetness only caused by the heat of the climates which altereth in the colder.

Page 964. Line 15. All that first relation of *Cnicus* alter is to be blotted out, and the second and third, is to be made the first and second.

Having

Having the same figure of *Lasertium* by me, that *Alp* ~~was~~ set forth, I could doe no lesse then shew it you, that you may see the difference of that stalke of leaves formerly exhibited, taken lineally from the vive Plant, and that of late from this of *Alpinus*, whose flowers and seed, is yet hid in the Embryon.

Page 1086. Inset this, 10. *Astragallo similis palmata pusilla planta Lobelij.*
Lobels French small Milke Vetch like plant.

This small plant saith *Lobel*, he gathered on some of the hills of *Province in France*, having long woody rootes, covered with a thicke barke thereon, foulding one within another, and thickest at the head, from whence sprung many stalkes that are hard, and but two or three inches long, whereon are set sundry winged hoary small hard leaves, like unto those of *Lentils*, the milke Vetch or the Goates Thorne: at whose tops stand tufts of yellowish or whitish flowers, like unto those of *Birds foote*, the plant is of a drying harsh taste.

2. *L. serpentinum Alpinus.*
Alpinus his *Lasert* wort. p. 937.

Carlina capitulum c'ausum. The closed head of the Carlina Thistle. p. 568.

This

3. *Scolymus Theophrasti* seu *Eryngium luteum* Monspeliensium.
The Golden Thistle. p. 572.

This true figure of the golden Thistle was I know not by what chance
left out, and this one put in the place, let it is therefore supply the o-
thers defect.

4. *Flix saxatilis creta*. Small curled Bone Fern. p. 104.

3. *Rubus montanus odoratus*.
Sweet mountain Bramble or Rapis. p. 1013.

5. *Lathyrus arvensis caucibus tuberosis*. A differing sort of Earth nuts.

This sort differeth chiefly from this former fifth in having all the
leaves onel set by couples, whereas the former hath more, and the
ends of the peduncle more twined. This is *Thalys his Astragalus*
arvensis. p. 1062.

14. *Trifolium corniculatum* Creticum flore luteo.
Horned Trefoile of Candy with yellow flowers.

This other horned Trefoile that came from Candy, where it is naturall, came to *Alpinus* as he saith, among other of their seeds, rising up with long and slender stalkes lying for the most part on the ground, having sundry small Trefoile leaves like a *Cytisus*, and somewhat broad forwards: The flowers grow at the ends of small stalkes, pease fashion, but small and yellow, with small round slender crooked pods succeeding, containing foure or five small yellow pease, which are eaten by the Natives even as the first sorts, yet is it not the same, for the pods hereof are slender and round although crooked, when as the other are flat and bigger. *Alpinus* onely hath made mention hereof, and differeth also as he saith from the *Trifolium Italicum corniculatum*, which is our *Lotus corniculatus incanus*, and the twelfth sort here.

Because I gave you not the figure of this Aphodill in my former Booke, although I gave you there the description, I thought good to shew it you now and referre you for the description to my former Booke. Yet this may take place for the present here, and accompany the greater Bastard kindes in page 1218.

12. *Linum umbilicatum*, Strange wild white flowered Flaxe.

This strange kind of Flaxe but annuall, rising up with slender hoary greene stalkes, branched towards the tops, having sundry whitish or hoary greene soft long leaves, set singly on them; somewhat broader and thicker then the ordinary wilde sorts, and with every leaf usually a small white flower, made of fine round pointed leaves, with a few threds in the middle, after which commeth the feede, set in the same huske that bore the flower, being somewhat like in forme and posture unto those of Hounds tongue, but not rough.

Page 1269. Line the fifteenth, read it. We have another whose chiefest difference, &c.

Aphodetus minor albus. The small white Aphodill. p. 1218.

12. *Linum umbilicatum*. Strange wild white flowered Flaxe. p. 1336
