The true *Petroselinum* saith *Dioscorides* provoketh urine and womens courses, and is profitable against the winde and belchings of the stomacke and against the winde Collicke also, and easeth the griping paines and torments of the belly, as also the paines in the sides and the raines and in the bladder being taken in drinke, it is put also into those medicines that provoke urine. The seede of this stone Parsley saith *Galen* is most in use, the herbe and roote also is used alike, but are of a weaker propertie but the seede is very sharpe in taste and bitter also, hot in qualitie, and of a cutting propertie withall, and hereby it mightily provoketh urine and womens courses, and driveth forth winde, and is therefore hot and dry in the third degree. This saith *Galen* in *lib. 8. simplicium medicamentorum*: but in his first booke *de antidotis* he doth prosecute this subject more fully, which although it bee somewhat large, yet I am the more willing to insert it here for young students sake, that they might be acquainted with *Galenus* minde (who was in his facultie almost absolute) in this matter: As concerning *Petroselinum* stone Parsley (saith he) the best is knowne to all to be that of *Macedonia*, which some call also *Estreaticum*, imposing that name from the place wherein it groweth: yet it is but very little that groweth there, the place being very dangerous by rocks and small in compasse withall: and therefore this *Macedonian* stone Parsley that is of *Estrati*, and carried unto all nations (is but small in quantitie to be had in the countrey of *Macedonia* it selfe: but it happeneth to this stone Parsley of *Macedonia*, in the like mannēr that falleth out with the hony of *Athens* and the wine of *Falerno*. For as the Merchants doe export into all countries of the world the *Athenian* hony and the *Falerno* wine, so doe they this stone Parsley of *Macedonia*, when as there doth not grow such a quantitie thereof in *Macedonia* as may suffice all nations: but there groweth much of this Parsley in *Epirus*, as there is much hony gathered in the Ilands called *Cyclades* or *Sporades* (which are in the *Aegean* Sea) and as the hony is carried from the Iles to *Athens*, so is this stone Parsley first brought out of *Epirus* into *Macedonia*, and much of it if not all into *Thessalonica*, and from thence is carried forth as if it were of *Macedonia*: the same thing happeneth to the wine *Falerno*, for growing in a small peece of ground in *Italy* called *Falerno*, yet cunning Marchants doe so prepare the wine that they carry to all the subject Nations of the *Roman* Empire that they make it seeme the very same of *Falerno*. If you therefore at any time shall want this *Estreaticum Petroselinum*, doe not esteeme the Treacle the worse if you shall put therinto others: for although another is not so fit against deadly poysons or the bitings of venomous beasts, yet against other diseases it may be not a little profitable, such as are the paines and torments in the body or bowells, the weakenesse of the stomacke, the Dropisie and divers other such like, which diseases the Treacles chiefly intent doth not promise to cure. And besides this *Estreaticum Petroselinum* doth make the Treacle more bitter, especially being used while it is fresh, for it differeth from other stone Parsleys, in that as it is most sharpe so it is most bitter of all other Parsleys: the seede whereof is thus described from *Dioscorides*, *Galen*, and *Pliny*, without any relation of herbe, that it differeth in kinde from all others, the seede being like unto *Ammi* Bishops weede which is whiter and lesser then Cumin seede, but of a bitter sent, of a sharpe taste, and smelling atomatically, and as *Galen* addeth most bitter.

I. *Apium vulgare* five *Palustre*. Ordinary Smallage.

The ordinary fmallage groweth up with greater hollow and more crested stalkes then Parsley, and greater and larger winged leaves; one against another, broader, and of a darker greene colour and shining more then Parsley but dented somewhat unevenly about the edges, at the toppes of the stalkes and branches stand large tufts of small white flower, which turne into smaller feede then Parsley: the roote is greater but not so long and slender, with a number of blackish fibres set thereat: the whole herbe and roote is strong in smell, and much more unpleasant and bitter in taste then Garden Parsley, not to be endured to be eaten alone, but being boyled and otherwise dressed it favoureth better.

2. *Selinum* fr. *Apium dulce*.
Sweete *Selinum* or Smallage.

The sweete Smallage or Parsley call it which you please, groweth up in the same manner that the former Smallage doth but larger then it, the leaves likewise are larger but not of so deepe a greene colour the flowers and feede likewise are like those but somewhat larger: the roote is great and long with divers fibres set therat, white and much more fappie and pleasant than eyther Smallage or Parsley, with a very warming and comfortable relish also nothing offensive, but the whole herbe is to pleasant as if Sugar had bene mixed with it: This both relish and forme wee have found it hath held for the first or second yeare, the feede hath bene sown with us that cometh from beyond sea, but as sweete Fennell doth degenerate more and more in our Land, and onely continueth sweete in warme countries, so doth this, the leaves also decay in their verdure and become nothing so fresh, but are more fullen or sad like Smallage.

The Place and Time.

The first groweth naturally in wet and marshy grounds, but if it be planted or sown in gardens it there prospereth well: the other is familiar in Greece and Italy, where they eat it with great delight both herbe and roote, and is onely sown and replanted in all those places, the naturall place being not knowne to us: they both abide greene all the winter and feed in August with us.

The Names.

[illegible]

The Virtues.

The Vertues.

Pliny hath erred much and caused others to follow his tract, in following and allowing *Chrysippus* and *Dionysius* their writings, by mistaking the various acceptation of the word *Apium* of the Latines from the Greeks, and

and from the *Arabians*, for he doth referre that to the *Apium hortense*, which is to be understood of this *Apium pastre*, viz. that it is an enemy to the eye sight, condemned as not fit to be eaten: that it would breed the Falling sicknesse and many other such like things, which if they were true of Smalage whereof very few doe beleve their writings, yet can be no way true of Parsley in any part. Smalage is hotter and dryer then Parsley and is much more medicinable: for it much more openeth the obstructions both of the Liver and Spleene, rarifieth thicke flegme and clenseth it and the blood withall: it provoketh urine and womens courses and is singular good against the yellow jaundies: it is also very effectuell against *tertian* and *quartane* agues, if the juice thereof bee taken, but especially made into a Syrupe: the juyce also put to hony of Roses and some Barley water, is very good to gargle the mouth and throate of those that have sores and Vicers in them, and will quickly heale them: the same lotion also doth cleanse and heale all other lowle Vicers and Cankers else where, if they be washed therewith: the feede is especially used to breake and expell winde, to kill wormes and to helpe a stinking breath: the roote is effectuell for all the purposes aforesaid, and is held to be stronger in operation then the herbe but especially to open obstructions, and to rid away an Ague if the juice thereof be taken in wine, or the decoction thereof in wine bee taken: *Pliny* saith it hath an especiall propertie against the payson of Spiders. The sweete Smalage is chiefly used as a Sallet both herbe and roote eaten eyther raw or boyled: the roote being scraped is sliced and so eaten with oyle and vinegar, it much warmeth a cold stomacke to digest their meate, and helpeth cold windy bodies to expell winde.

CHAP. XXVIII:

Oreoselinum sive *Apium montanum*. Mountaine Parsley.

Have three sorts of mountaine Parsley to shew you in this Chapter as they are taken by the judicious, and thereunto referred.

1. *Apium montanum vulgatum*. The more common mountaine Parsley.

The first mountaine Parsley hath divers reddish stalkes of large spread leaves, divided into sundry parts lying like a bush on the ground next the roote, very like unto Garden Parsley but somewhat larger smelling well, from among which riseth up a short sticke of about a cubit height, with divers the like leaves upon it, branching towards the toppe, and bearing thicke tufts of white flowers, after which come small feede like Smalage smelling somewhat sweete sharpe in taste and bitter withall: the roote is long great and thicke with a bush of haire at the toppe being sweete sharpe and aromaticall.

2. *Apium montanum verius*. The truer Mountaine Parsley.

This other mountaine Parsley shooteth forth a hollow kexie stalk in some places, tall and high in others, short and low according to the soyle wherein it groweth, bearing sundry large spread leaves cut and divided somewhat like unto the leaves of Hemlocke bearing umbells of white flowers, and after them somewhat long blackish feede, like unto Cumin feede, being sharpe in taste and sweete in smell: the roote is small long and white.

3. *Apium montanum Parisienum*.

The Parisians mountaine Parsley.

The Parisians mountaine Parsley hath a large, thicke, white roote, tasting and smelling much like unto the roote of Herbe terrible, the whole herbe doth resemble Parsley lying thicke bushing on the ground, the umbells of flowers are white and the feede is sharpe in taste, but smelling very sweete.

The Place and Time.

The first groweth neare unto Vienna in Austria as *Clusius* saith and on the mountaines among the rocks in Germany and other places. the next is found in the borders of the fields on the mountaines of Burgundie, the last on the sandy top of the Suren hill by Paris: they flourish in the Summer, and give feede soone after.

The Names.

The Greeke name *ἀρεοσέλινον* is given to these plants, and so likewise *Oreoselinum* and *Apium montanum* in Latine, although the first and the last differ as well in leafe as in the feede from *Dioscorides* description of it, and yet is called *Oreoselinum* of many, whereas the second onely commeth nearest to the true *Oreoselinum* both in leafe and feede: The first is called *Oreoselinum* by *Dodonæus* (who also saith it is called by the *Silesians* *Veel gutta*: i. multi boni good for many things) *Lob-el* and *Clusius*, and by *Lugdunensis* *Oreoselinum majus* and *Apium montanum Dalechampii*: the second is the *Oreoselinum aliud* of *Lugdunensis*, the second *Selinum peregrinum* of *Clusius*, as *Bauhinnus* fetch it downe and by himselfe *Apium peregrinum* *Cicuta folio*: I have as I presume rightly referred it to be the true *Oreoselinum* of *Dioscorides*, agreeing so well therunto: the last is called also by *Lugdunensis* *Oreoselinum Parisienum*, and by *Bauhinnus* *Apium montanum nigrum*.

1. *Apium montanum vulgatum*.
The more common mountaine Parsley.

The Vertues.

Dioscorides saith that the mountaine Parsley provoketh urine, if the roote and seede be broken in wine: it bringeth downe also womens courses, and is put among those medicines that are made to expell gravell, and those that doe warme any cold part. *Galen* saith it is in working like unto Smalage, but more effectnall. *Dodonæus* setteth downe that the first mountaine Parsley called *Veelgusta*, that is good for many things, is hot and drie in the end of the second degree, that it doth extenuate and make thinne the thicke grosse clammy humours, that it cutteth tough flegme, openeth obstructions of the liver and spleene, and provoketh urine, breaketh and expelleth the stone, moveth womens courses, and helpeth the yellow jaundise, and being chewed in the mouth, it draweth much water and spittle into the mouth, and easeth the tooth-ach.

CHAP. XXIX.

Thysselinum sive Apium sylvestre. Wilde milkie Parsley.

His kinde of wilde Parsley, hath sundry large spread leaves, somewhat resembling garden Parsley, but they are divided intomore parts, and each division hath swaller leaves, from among which riseth up an hollow straked stalke a yard high, reddish toward the bottome, sometimes with the like leaves at the joynts where it brancheth forth diversly, bearing large thicke umbells of white flowers, reddish on the one side and pale on the other, and after them fat seede, somewhat like unto Parinæpe seede, but a little lesse hot in taste, and somewhat aromaticall, the roote spreadeth divers long strings, blackish without, but white within, and deepe into the ground, somewhat like unto the *Menum* Spignell, and abideth many yeares. The whole plant and every part thereof, yeeldeth a milkie juyce, if it be broken in any part.

The Place and Time.

It groweth in moist and marshy grounds, and water-courses, and much also in the moist woods where Alders doe grow: it flowereth in *June* and *July*, and seedeth soone after.

The Names.

Both *Dioscorides* & *Theophrastus* have a *ακνιον άγριον* *Apium sylvestre*, but they differ much one from another, for *Dioscorides* his is that kinde of *Ranunculus*, hee calleth *Herba Sardinia*, but *Theophrastus* doth not number his among his other *Selina*, and peradventure may be this that hath bene referred both by *Dodonæus* and *Lobel* unto the *Thysselinum* of *Pliny*, which *Lobel* calleth *Thysselinum* *Pliny*, supposing the name *Thysselinum*, better to agree with the forme of this plant as comming neereſt to a *Selino*, but howsoever if it be not the same with *Pliny* his *Thysselinum* it cometh so neare it, that no other is yet found so neare, especially in the forme of the leafe and property of the roote as you shall heare by and by; *Lobel* and *Dodonæus* doe both say, that this was in former times used in all the shoppes of the Low Countries in stead of *Menum*, taking it to be the right; and therefore *Dodonæus* did also call it *Apium sylvestre* as *Lugdunenſis* doth likewise; *Gesner* in *hortis* calleth it *Daucus palmifris*, and *Cordus* in *historia* *Oſenichium* from the German word *Oſenich*, wherehy they so called it; *Bauhinus* calleth it *Apium sylvestre lacteo succo turgens*; and thereupon I have entituled it in *English*, Wild milkie Parsley, to distinguish it from other sorts of wilde Parsley.

The Vertues.

The roote hereof is hot and drie in the third degree, which being chewed in the mouth, draweth downe much flegme from the head to be spit out, and easeth the tooth ach: and this quality, *Pliny* saith, the roote of his *Thysselinum* is endued withall: the other properties appropriate to the other kinds of *Apium* are no doubt to be found herein, and that to no lesse effect, as both to extenuate, cut, and open, and to provoke urine, and womens courses.

CHAP. XXX.

Selinum sive Apium peregrinum. Strange Parsley.

His strange Parsley hath from along whitish roote, sharpe in taste, well smelling, and tasting like Parsley; growing woody, and perishing after seede time, divers long stalkes of leaves lying on the ground, which are almost round, yet a little pointed and dented about the edges, five usually and more also, yet sometimes but three on the stalkes, set by coupes and of a sad Greene colour, the stalkes, is straked and hollow

Selinum sive *Apium peregrinum* Clusij.
The first Strange Parsley of Clusius.

Selinum sive *Apium peregrinum* primum Clusij.
The first Strange Parsley of Clusius.

hollow, three or foure foote high with diuers leaues, shooting from it, diuided much, and into long parts, and branched likewise, at the toppes whereof grow umbells of small white flowers, bowing downe their heads almost double before they rise to be in flower, which better expressed in the former figure, after which come very small seede not so bigge as Smallage seede, but quicke and hot and of a good smell: this by the shedding of its owne seede doth easily abide in a garden if it once seede therein.

The Place and Time.

This groweth, saith *Clusius*, in the borders of the Vineyards, and by the paths and wayeside in the countrey of *Salamanca* in *Spaine*, and that it flowreth in *Iuly*, and the seede is ripe in *August*, but with us it is more late before it ripen.

The Names.

Clusius who found it in *Spaine*, called it *Selinum peregrinum*, and is the first with him, *Bauhinus* calleth it *Apium peregrinum folijs subrotundis*; and is the third *Saxifraga* of *Cesalpinus*, and the third *Daucus* of *Dioscorides* with *Columna*, which he maketh the second with *Pliny*.

The Vertues.

The qualities of heate and drinesse perceived in the taste of both leaues and roote, but especially of the seede doth argue it to be no lesse effectuell to provoke urine, and to helpe to breake and to expell the stone than some of the former Parsleys, and besides may be also good for other diseases, as they are formerly remembred, and the name of *Saxifraga* also, as *Cesalpinus* giveth it, sheweth the same: these things are probable, although we have had no certaine experience by triall.

CHAP. XXX.

Hippoeselinon sive *Smyrniolum*. Allifanders.

Under this title of Allifanders, I must comprehend two sorts of herbes, each of them called *Smyrniolum*, and the last *Creticum*, as shall be shewed.

1. *Hippoeselinum* sive *Smyrniolum vulgare*. Garden Allifanders.

Our common garden Allifanders groweth the greatest of all the *Selina* mentioned by the old authours, having diuers large spread leaues, cut into many parts greater and rounder than Smallage, and of a darke greene colour, and dented about the edges, of somewhat an hot and spicie taste, and a little bitter withall, the stalk that riseth up amongst them is thicke and round, a yard high and better, with sundry leaues on them, parted into smaller diuisions, with branches also rising from the joynts, each bearing large tufts or umbells of white flowers, and after them great blackish seede, not full round, but a little flaked on the backe, hot and bitter, as the leaues and roote also is, which is great, thicke, long, and blackish on the outside, spreading into many parts underground, and whitish within.

Kkkk 3

2. *Smyrniolum*

1. *Hypopeltium* five *Smyrniū* vulgare
Common Allifanders.

2. *Smyrniū* Creticum.
Candy Allifanders.

2. *Smyrniū* Creticum. Candy Allifanders.

The Candy Allifanders is the strangest in the growth of any plant upon the ground, by the alteration of the upper from the lower leaves, for before the stalks riseth, any one would take the leaves to be some kinde of *Selinum*, the whole leafe being large and more divided into smaller parts than the former, as if it were some great Parsley, of a darke Greene shining colour and dented about the edges: the stalks is round and stiff, firme and not hollow, foure foote high or better, usuall having at the joynts whole, and almost round leaves, yet sometimes longer than round, and here and there cut in on the edges, of a yellowish Greene colour which doe not so much con-passe the stalks at the bottome of them, as that the stalks in a manner groweth through them: from the joynts likewise rise sundry branches, with the like yellowish round leaves on them, and the stalks running through them to the toppes, where stand thicke tufts or umbells of yellowish flowers, which afterwards turre into small round blackish feede, about the bignesse of Radish feede: the roote is at the first almost round, as bigge as a great pease, yet a little long withall, and white on the outside, which afterwards groweth thicker and longer, and greatest at the toppes, ending small, but perishing quite after it hath borne feede, which hath nothing so hot, bitter, or spicie a taste as the former hath, especially in our country, but as some might thinke that it hath altered the quality, yet *Fabius Columna* saith, that even in *Naples* where it is naturall it hath no sharpe or bitter taste, nor the feede is neither with us. *Bauhinus* maketh another sort hereof, the difference only consisting in the upper leaves, which are longer than the other and more cut in, both which sort hath risen in my garden from one kinde of feede, and therefore I hold them to be both one, and make no more differing sorts.

The Place and Time.

The first hath beene found wilde in some of the Iles about our own Land by Mr. *William Quicke*, a worthy Apothecarie in his time, who gave me and Mr. *William Cois* a famous Gentleman, and a great lover of plants, some of the feede, supposing it to be differing from the common sort, but after they were grown up, we all saw there was no difference. It is usuall sown in all the gardens of *Europe*, as farre as I heare, where they have it: the other came from Candy. They both flower in *June* or *July*, and the feede is ripe in *August*.

The Names.

ἵπποπελόνιον in Greeke, is called *Hypopeltium* alto in Latine, *Gaza* rendereth it *Equapinum*, because, as I said it is the greatest of all other their *Selina*, *Dioscorides* saith it was called by some in his time *Σμύρνη* *Smyrniū*, yet as he saith the true *Smyrniū* is an other herbe, which he described in the Chapter following, and is this *Smyrniū* Creticum. There is some controversie among Writers about this *Hypopeltium*; first, whether it should be the true *Hypopeltium* of *Dioscorides* or no, then whether it or the other *Smyrniū* Creticum be the *Smyrniū* of *Dioscorides* or no: for the first, *Matthiolum* sheweth the error of *Ruellius* in taking the *Paludapinū* to be the *Ma-*
cerone

cerone of the Italians, and faith he findeth not what herbe this *Hypposelinum* should be, unless it be *Levisicum* Louage, which yet he acknowledgeth not to answer *Dioscorides* his notes thereof, because it is in forme so like unto a great *Selinum*, and for this opinion *Lobel* yerkes him too critically, shewing that *Levisicum* is too hot and sharpe, and in no place used to be eaten as a wort or faller herbe, and that he did unworthily taxe *Brasavolus* for taking the *Macerone* of the Italians to be this *Hypposelinum* by the false translation of *Marcellus Virgilius*, in giving the roote of *Hypposelinum* to be blacke without and white within, when as *Dioscorides* maketh no mention of any blacknesse in the roote: *Lobel* also saith that it is the true *Hypposelinum* as they affirmed by the judgement of the most learned in these dayes, and yet by all their leaves, the roote of *Dioscorides* is different from it, who faith it is white when as this is blacke, that it is small, but this is not so, which maketh *Columna* in the scanning of *Smyrnum*, to say that he would further search what *Dioscorides* his *Hypposelinum* should be, as not holding this that we account of to be so. Now concerning the other doubt whether this *Hypposelinum*, or the other plant called *Smyrnum Creticum* should be the true *Smyrnum* of *Dioscorides* or no, the currant opinion of most Writers in these times, is that this *Smyrnum Creticum* is the same, and yet as *Columna* hath in the said place very worthily, and thoroughly examined the matter, it is nothing so; for *Dioscorides* describeth his *Smyrnum*, first that it was called *Petroselinum* in *Cilicia*, and that it hath leaves of a good smell, sharpe or quicke on the tongue, with some pleasantnesse therein alfor that the seed is round like to Colewort seed, (wherein *Columna*, thinketh some, mistaking of the Greek word to be that *καρπὸς* is set down in stead of *καρπός*, for as he saith, the seed is as like to the seed *Canchrys* as may be, except the black colour) black & of a sharpe taste like *Myrrhes* sweete Chervill, so that one may be used in stead of the other, and that the roote is blacke without and of a whitish Greene colour on the inside, of a sweete smell, and of a sharpe taste, heating the mouth, both roote, seed & leaves being of an heating propertie: not any one of all these markes or notes except in the seed to be blacke and round, is to be found in this *Smyrnum Creticum* and therefore it cannot be the right: whether then the *Hypposelinum* of *Dioscorides* can be *Smyrnum*, *Dioscorides* himselfe denieth it, and faith that although some called it *Smyrnum*, yet the true *Smyrnum* was another herbe, even the same that I have out of *Dioscorides* his description set downe a few lines here before unto you: *Theophrastus* hath set forth an *Hipposelinum*, lib. 9. c. 5. and spoken of it in other places, which is plainly differing from the *Hipposelinum* of *Dioscorides*, and needst unto, if not the same with his *Smyrnum*: for *Theophrastus* saith that his *Hipposelinum* (rendred by *Gaza Equapinnum*) doth yeeld a juyce from the roote like unto *Myrris* or *Myrsi*, as *Dioscorides* saith of his *Smyrnum*: so that this that hath bene said (although it be somewhat tedious, yet I could not more briefly declare them) we finde that *Smyrnum Creticum* is not the true *Smyrnum* of *Dioscorides*, as *Matthiolus*, *Camerarius*, *Dodonaeus*, *Lobel*, *Lugdunensis*, *Tabernmontanus*, and *Gerard* hath set it downe, nor that the *Hipposelinum* of *Dioscorides*, which is called also *Oliv atrum* with us is sufficiently knowne, although some authors call it *Hypposelinum*, nor is that which it is taken to be, by the defect of some of the notes or markes that *Dioscorides* giveth it, and lastly that the *Hipposelinum* of *Theophrastus* doth agree with the *Smyrnum* of *Dioscorides*, but not with his *Hypposelinum* being different plants, and so *Matthiolus*, *Cordus* on *Dioscorides*, *Gesner* in *hortis*, *Camerarius* and *Columna* set it downe: *Columna* his Iudgement is, that the seede of this *Hipposelinum*, or *Smyrnum* may more fitly be used for *Petroselinum Macedonicum* (if his other fine leaved herbe that hath the smell of Garden Parsley be refused, or not to be had) than either the common Parsley seede, or that of *Venice* called *Petroselinum Macedonicum* by many, and by him *Daucus secundus Dioscoridis*. The Italians call the first *Macerone*, the Spaniards *Perexil Macedonico*, the French *Alexandre*, the Germans *Gross Epfsich*, the Dutch *Peterselie van Maecanien* and *Groote Eppe* and *Peterselie van Alexandrien*, and we in English *Allisanders*.

The Vertues.

Our Allisanders are much used to make broth with the upper part of the roote, which is the tenderest part, and the leaves being boiled together, and some eat them either raw with some vinegar, or stew them, and so eat them, and this chiefly in the time of Lent, to helpe to digest the crudities and viscus humours are gathered in the stomacke, by the much use of fish at that time, it doth also warme any other cold stomacke, and by the bitterness helpe to open obstructions of the liver and spleene, to move womens course, to expell the after birth, to breake winde, to provoke urine and helpe the strangury, and these things the seede will doe likewise if either of them be boyled in wine or taken in wine, and is effectuell against the bitings of Serpents. Wee know of no good propertie the other hath, being in a manner incipiente.

CHAP. XXXI.

Selinum Segetale. Corne Parsley.

O finish these *Apia* Parsleyes, let me joync this unto them, which *John Goodier* first gave me the knowledge of, with some seede which springeth in my garden I thus describe unto you; it is a small low herbe having sundry winged long leaves lying on the ground, many being set one against another, finely dented about the edges, with one at the end, which are each of them longer than Burnet leaves and pointed at the ends, among which rise sundry round stalkes halfe a yard high with the like, but lesser leaves on them, branching forth likewise from the joynts, and all of them bearing small umbells of white flowers, which turne into small blackish seede lesse than Parsley, but as hot and sharpe in taste as it: the roote is small, long, and white, and perishing every yeare after it hath feeded, and riseth againe of its owne sowing.

The Place and Time.

This groweth in the fields among the corne, or where corne hath bene sowne in divers places of the land: it flowered not with me untill *August*, and the seede ripened a month after at the least.

The Names.

Mr. *Goodier* first gave it me by the name of *Sium terrestre*, and after that I found it an umbelliferous plant, I thought it might best be referred to the *Selina* or *Apia*, and called it then *Apium Sisifolius* from the composition of

of the leaves like unto *Sium odoratum Tragi*; but since that I heard it, I suited it with *Scilium Segetale*, which is Corne Parsley, but it is called in some places of the land Honewort.

The Vertues.

Because the seede is both in forme like Parsley, and as hot in taste, there is no doubt but that it is very neere of the same propriety with Parsley, but because I have not made any triall thereof my selfe, I can say no more, but what Mr. Goodyer related to mee, that the use of the iuyce of a handfull of the leaves to be drunke in a draught of beare every morning for a fortnight, did cure one that had a swelling in her cheek yearly there arising sometimes, but whereof it proceeded I could not be shewn.

Scilium Segetale. Corne Parsley.

CHAP. XXXII.

Cicuta. Hemlocke.

Here are many sorts of Hemlockes to be shewed you some greater, others lesse, some growing in the marshes, and others by the hedge sides, &c.

1. *Cicuta vulgaris maior*.

The common greater Hemlocke.

The common great Hemlocke groweth up with a hollow Greene stalk four or five foote high or more, full of red spots sometime, and at the joynts very large winged leaves set at them which are divided into many other winged leaves. one set against another, dented about the edges, of a sad Greene colour branched toward the toppe, where it is full of umbells of white flowers, and afterwards with whitish flat seede, the roote is long, white, and sometime crooked and hollow within, the whole plant, and every part, hath a strong headdy illfavoured sent, much offending the senses.

2. *Cicuta minor sive fatua*, Foolish Hemlocke or counterfet Parsley.

This small Hemlocke riseth not a yard high, with whiter and smaller stalkes not spotted at all: the leaves are much smaller coming neare unto Parsley, so that many are mistaken in gathering one for another, being often found as a wilde weede in gardens of a paler Greene colour, and with few branches, the flowers and seede are both white as the roote is, but small, and perishing every year: the sent hereof is much lesse or offensive.

3. *Cicutaria maxima*. The greatest Hemlocke.

This Hemlocke hath much larger winged leaves than the former, thicker set, more spread, and of a sadder Greene colour (for the smell whereof, which *Lobel* calleth a *feridissima*, I that have had it growing in my garden for many yeares could never take offence by the smell of it, if it be the same that *Lobel* meaneth) the stalk is great, but riseth not so high as the common sort doth, and beareth large umbells of white flowers, whereafterwards grow large and thicke white crooked seede of no ill sent that ever I could perceive: the roote is very great and white both growing deepe in the ground, and spreading many great branches therein, which sometimes dieth after it hath given seede, and yet not alwayes, but at sometimes, and in some places will abide. *Lobel* hath joynted to this another, which he calleth *maxima Brancionis*, but he himselfe doubteth whether it be not the same with this last, and therfore I thinke good to make no further mention of it.

4. *Cicutaria palustris alba*. White wilde Hemlocke.

The white wilde Hemlocke hath a white long thicke roote like Fennell, but divided into many parts, being of a sweete sent, and an hot sharpe taste, from whence rise divers stalkes of winged leaves much cut in on the edges, among which riseth a tender branched and crumpled stalk, a cubit high, bearing umbells of white flowers, and long blacke well smelling seede, after tasting sharpe, two alwayes joynted together with a small thread betwene them.

5. *Cicutaria palustris rubra*. Red wilde Hemlocke.

This other red Hemlocke hath a thicke blacke, and jointed roote with divers fibres thereat, the leaves are in forme like the last, but larger, and not so much cut into parts, and paler of colour, the stalk is round and joynted a foote high, bearing star umbells, with pale red, or bluish flowers, and long blacke seede after them, sweete in smell and sharpe in taste.

6. *Cicutaria palustris tenuifolia*. Marsh or Water Hemlocke.

The Marsh or Water Hemlocke hath a great thicke hollow stalk, two or three cubits high, full of joynts and leaves at them, at the joynts with the leaves which are cut into divers parts somewhat like unto Parsley but smaller come forth the branches up to the toppe, bearing small umbells of white flowers, the seede is sweete in smell and blacke, somewhat greater than Aniseede: the roote is long and blackish, with sundry joynts and fibres growing from them.

7. *Cicutaria bulbosa*. Bulbous rooted wilde Hemlocke.

This bulbous Hemlocke hath divers stalkes of fine cut leaves, more jagged than the upper leaves of Parsley, and coming somewhat neare unto the *Bulbocastanum*, Earth Chestnut leaves, of a little sharpe hot taste, the stalk is a foote

1. *Cicuta vulgaris major*.
The common greater Hemlocke.

2. *Cicuta minor seu sativa*.
Foolish Hemlocke or counterfeit Pailey.

3. *Cicuta maxima*.
The greatest Hemlocke.

4. *Cicutaria palustris tenuifolia*.
Marsh or Water Hemlocke.

a foote and sometimes a cubit high, having thicke and knobbed joynts and leaves at them, at the toppes wherof standeth an umbell of white flowers, and after them somewhat long feede like Chervill feede: the roote is round and tuberous, somewhat like unto the roote of the round *Arifolochia* Birthwort, knobbed or bunched forth in some places, blackish browne without and white within of the taste of a Parsnep roote, but growing somewhat longer like a Turnep roote, when it runneth to feede and perisheth yearly, being sayded of it owne sowing.

The Place and Time.

The first groweth in all countries by walls and hedge sides in waste grounds and untilld places, the second is found as well abroad also as in gardens, and the third in Gardens alone in these parts, the fourth and fifth in moist grounds and marshes and by watersides in *France*, the sixth by our *Thames* sides in many places; and the like Rivers sides in our owne Land, and the last as *Cusum* saith in *Hungaria* and *Austria*, both wilde abroad and in their gardens, they all flower and feede in *Iuly* or thereabouts.

The Names.

It is called *καίτοι* in Greeke *καίτοι* *καίτοι*, a circum vertendo, quod vertiginem & imaginem earum rerum que respiciuntur, tanquam circumagantur ac in tenebras inducat ijs qua eam biberunt, ut fufius declarat *Nicander*: in Latine *Cicuta*. The first is called *Cicuta* and *Cicuta major* by all writers, yet *Clusius* calleth it *Cicuta*: the second is the *Cicuta minor* of *Cordus* and *Camerarius* *Cicuta fatua* by *Lobel*, *Apium cicutarium* by *Thalium*, *Petroselinum* by *Tabernmontanus*, *Petroselinum vitium* by *Tragus*, and *Apium comes vitium* by *Gesner* in *hortis*: the third is called *Cicuta latifolia fetidissima*, and *Cicuta maxima Brancioni* by *Lobel*, for as I said he judgeth them both one, and *Cicuta Myrrhis* by *Thalium*; by *Matthiolus*, *Gesner* in *hort.* *Lugdunensis* and others *Sejels Peloponensis*, which *Lobel* contradiceth, but without just cause as I suppose, as I said before: the fourth and fifth is called by *Lugdenensis* *Cicuta alba*, and *Cicuta rubra*, and by *Camerarius* and *Bauhinus* *Cicuta palustris flore albo* and *Lugdunensis* *Cicuta alba*, and *Cicuta rubra*, and by *Camerarius* alio as *Bauhinus* saith, the sixth is called *Cicuta palustris* and *aquatica* by *Cordus*, *Gesner* and *Thalium*, and *Cicuta palustris* by *Lobel* and others, and taken to be *Phellandrium* of *Pliny* by *Dodonaeus* and *Lugdunensis*, who make it also a kinde of *Sium* or *Laver*, and *Ligusticum Sylvestre* by *Thalium*, and *Silau* *Pliny* by *Casalpini* and others: the last was first found out and named *Cicuta Pannonica* by *Clusius*, *Camerarius* calleth it *Bulbonastium Coniophyllum*, *Tabernmontanus* *Myrrhis* *Cicuta*, and by *Bauhinus* as I doe also *Cicuta bulbosa*. The *Arabians* call it *Snearam*, the *Italians* *Cicuta*, the *Spaniards* *Ceguda* and *Canbeja*, the *French* *Cigue* and *Cocue*, the *Germanes* *Wurtzerling* *Scirling* and *Witterich*, the *Dutch* *Scharhak* *dullekernell*, and we in *English* *Hemlocke* and *Kexes*.

The Vertues.

Hemlocke is exceeding cold in qualitie and very dangerous, especially to be taken inwardly; For the *Athenians* adjudged the most wise *Socrates* to dye by taking the juice thereof, for not thinking rightly of their Gods as *Arifus* and *Melitus* accused him: yet as it was then well knowne some countries hred it stronger to kill then other, and although some doe appoint it to be applied outwardly to the cods of those that have venterous dreames or the like, or to maidens and womens breasts to repress their swellings and repell their milke, yet by reason the places are so tender and full of vitall spirits, it often proveth that the remedy is more dangerous then the disease, it may safely be applied to inflammations, tumors and swelling, in any other part of the body, as also *Saint Antho* nies fire, wheales, and pusses and creeping Vicers that rise of hot sharpe humors by cooling and repelling the heat: the leaves bruised and layd to the brow or forehead is good for their eyes that are red and swollen, and doth soone ease the paine and take away the swelling and rednesse, as also to take away a pinne and web growing in the eye, this is a tryed medicine, to take a small handfull of the herbe and halfe so much bay Salt beaten together and applied to the contrary wrist of the hand for 24. houres doth within thrice dressing remove it. If the roote of *Hemlocks* be roasted under the Embers wrapped in double wet papers untill it bee soft and tender, and then applied to the gout in the hands or fingers will quickly helpe this evil. The remedy for *Hemlocke* if any shall by mischance cate the herbe in stead of Parsley, or the roote in stead of a Parsnep, whereby happeneth a kinde of frensie or perturbation of the senses, as if they were stupified or drunke, is to drinke of the best and strongest pure wine before it strik to the heart, as *Pliny* adviseth, or Gentian put into wine as others say, but *Tragus* saith that he holpe a woman that had eaten the roote, by giving her a draught of good Vinegar, but if it be given with wine it procureth death without remedy: *Matthiolus* sheweth that Asies by chance eating of the herbe fell into so deepe a sleepe that they seemed dead, which when some came to slay them they slung from them in the doing it, to their amazement and merriment.

CHAP. XXXIII.

Myrrhis. Sweete Chervill or sweete Cicely.

Here are three or foure sorts of this *Myrrhis* to be shewed you in this Chapter some whercof are of later invention then others.

I. *Myrrhis major sive vulgaris*. The ordinary Garden sweete Chervill.

This sweete Chervill by reason of the so neare resemblance unto *Hemlockes*, I thought good to joyne next them, which groweth not so high, but hath large spread leaves cut into divers parts, somewhat resembling the greatest *Hemlocke* but of a fresher Greene colour, tasting as sweete as the *Aniseede*, the stalks riseth up a yard high or better, being crested or hollow having the like leaves at the joynts but lesser, and at the toppes of the branched stalks umbells or tufts of white flowers, after which come large and long crested blacke shining feede pointed at both ends tasting quicke, yet sweete and pleasant like the leafe or *Aniseede*: the roote is great and white growing deepe in the ground, and spreading sundry long branches therein, in taste and smell stronger then the leaves or feede and continuing many yeares. Of this kinde wee have another much greater and larger that was brought from *America*, especially the leaves, which are foure times as large as the former, not differing else.

*Latifolia
Americana
forma.*

Myrrhis

1. *Myrrhis major vulgaris* frue *ceresfolium majus*.
The ordinary greater sweete Chervill.

2. *Myrrhis altera minor*.
The lesser sweete Chervill.

2. *Myrrhis altera minor*. The lesser sweet Chervill.

The lesser sweete Chervill is somewhat like the former, but the whole winged leafe is much lesser, and divided into fewer and lesser leaves also, and softer in handling, the stalkes are lower and the umbells of white flowers smaller: the seede that followeth is long but much smaller, and not blacke but tasting neare unto the former: the roote is a bush of many blackish fibres.

3. *Myrrhis sylvestris*. Wilde sweete Chervill.

The wilde sweete Chervill is likewise a low plant, and not much differing from the last in the forme of leaves but that it is somewhat hairy and whiter, the flowers are white, but in more thinne and sparsed umbells, and the seede that followeth is small, long and smooth: the roote is thicke and blackish and liveth many yeares.

4. *Myrrhis sylvestris Neapolitana & etiam Anglicana*. Wilde sweete Chervill of England as well as Naples.

This kinde of Chervill is so like in leafe unto the common Hemlocke, that before it be growne up to stalke it deceiveth many that gather it, for the stalke is spotted sometimes with white and red, yet seldome so with us as that of Hemlocke is but whitish, at the joynts whereof with the leaves which are lesser come forth small tufts of white flowers, and not at the toppes of the stalkes as in all other umbelliferous plants saith *Columna* which we have not observed in ours, after which the seede followeth which are somewhat long and with a long point more rough and hairy, and cleaving faster to garments then the wilde Carrot seede doth, and is of an aromaticall sharpe sweete taste, mixed with a bitterneffe as *Columna* saith with them but nothing so much with us: the roote is small long and white, not bigger usually then a Parsley roote dying yea rel.

The Place and Time.

The first is thought to grow wilde in some fields of Germany, but I doubt the report was onely true for the third sort here, which groweth wilde with us as well as with them, neare unto ditch sides and other water courses, for the first is onely kept in Gardens with us and them too as I heare: the second is naturall of *Genova* and the parts thereabouts as *Lobel* saith, but was sent also by *Aicholzius* from *Vienna* to *Norimberge* to *Camerarius* as hee saith in *horto*, and is likely to be naturall of those parts also: the last *Columna* found upon some of the hills in *Naples*, and we have often seene it growing with us in waste places by way sides, in the fields sometimes and wallsides.

The Names.

It is called in Greeke *μύρρις* as well as *μύρρα* and *Myrrhis* and *Myrrha* likewise in Latine, in imitation of the Greek, *Pliny* saith that some called *Myrrhis* by the name of *Smirnasusa* and others *Myrrha*, yet some have it *Smyrrhiza* from the likenesse unto *Smyrnium*, as before the *Smyrnium* was likened to *Myrrhis*, some also call it *Ceresfolium magnum* and some *Cicutaria* from the likenesse of the leaves, and of some *Conilans*; the first is generally called *Myrrhis* by most authors, yet *Anguilara* calleth it *Seseli Peleponense*, and is *Cesalpinus* his *Cicutaria tertia*, and by *Tabernmontanus* *Ceresfolium Hispanicum*, and by *Bauhinus* *Myrrhis major vel Cicutaria odorata*: the second *Lobel* calleth *Myrrhis altera parva* and *Camerarius* *Myrrhis sativa minor*; and is the second *Cicutaria* of *Cesalpinus*, and by *Tabernmontanus* *Myrrhis montana*: the third is the *Myrrhis* of *Fushius* and others which *Camerarius* calleth *sylvestris*.

Myrrhis sylvestris, and *Gesner* in *hortis* *Cicutaria similis* *Cicuta herba* that grew in the fields, and was not hurtfull which *Bauhinus* calleth *Myrrhis sylvestris seminibus levibus*, because hee calleth the last *Myrrhis* *(syl. seminibus asperis)*, which *Columna* called *Myrrhis sylv. nova Equicolum*, and I have added to the title *Anglicanum* because it is so like his. The *Italians* call it *Mirrhida*, the *French* *Persil d'asne*, the *Germans* *Wilder keyffell*, the *Dutch* wilde *Kervell* and we in *English* sweete Chervill, great Chervill and sweet Cicely.

The Vertues.

Galen saith that *Myrrhis* is hot in the second degree with some tenuitie of parts: both leaves, feede, and rootes are so fine and pleasant in Sallets as no other is comparable to it, and give a better relish to any other herbe is put with it: the feedes while they are fresh and green sliced and put among other herbes make them taste very pleasant: the roote boyled and eaten with oyle and Vinegar, or without oyle if any mislike oyle, doth much please and warme a cold or old stomacke oppressed with flegme or winde, or those that have the Tifficke or Consumption of the Lungs: the roote dranke with wine is a remedy against the biting of the venomous Spider Phalangium, as also the Plague or Pestilence: the same also provoketh womens courses, and expelleth the afterbirth: it also procureth an appetite to meate and helpeth to expell winde: the juice is good to heale the Ulcers of the head and face: the candid rootes of this Chervill are held as effectuell as *Angelica* to preserve the spirits from infection in the time of a Plague, as also to warme and comfort a cold weake stomacke.

CHAP. XXXIII.

Levisticum vulgare. Ordinary Lovage.

Having finished the two former ranks or order of umbelliferous plants, I am comē now to speake of the third and last sort which is of such as have broader leaves like *Panax* or *Angelica*: and because I could not well place the Lovage among the *Selina* or *Apia* although it be most like unto them, and not to be accounted one of them, let it set it in the forefront of this broad leaved order, whose description is thus. It hath many long and great stalkes of large winged leaves, divided into many parts, somewhat like unto Smalage, but much larger and greater, every leaf being cut about the edges, broadest forwards and smallest at the stalk, of a sad greene colour, smooth and shining, from among which rise up sundry strong and tall hollow greene stalkes five or six foote high, yea eight foote high in my Garden, full of joynts and such like but lesser leaves set at them then grow below, and with the leaves come forth toward the toppes long branches, bearing at their toppes large umbells of yellow flowers, and after them flat brownish feede bigger by much then Dill, and lesser then Parsneps and thicker also: the roote groweth great and deepe, spreading much and enduring long, of a brownysh colour on the outside and whitish within: the

Levisticum vulgare.
Ordinary Lovage.

Levisticum vulgare Germanicum.
The Lovage of Germany.

whole plant and every part of it smelleth somewhat strongly and aromatically, and of an hot sharpe biting taste. Having another figure of *Levisicum* which *Camerarius* in his *Epitome* upon *Matthiolus* exhibiteth, I could not but insert it here, that the difference from the other may be seene, our rootes being great and thicke, and nothing so fibrous, and in the flowers which they say are white, and are yellowish with us, which *Dodonæus* noteth *German.* also, so that either they observed it not well when it was in flower, or theirs doth differeth from ours therein, even as it is noted in the *Panax Heracleum*.

The Place and Time.

It groweth no where wilde in *Europe* that I can here of, but is onely planted in Gardens where it will grow huge and great if it be suffered: it slowreth in the end of *Iuly*, and seedeth in *August*.

The Names.

It is called usually in Latine *Levisicum* (for Greeke name it hath none) and not *Lignisticum*, being farre differing plants, although some have taken them to be both one, deceived chiefly by the vicinitie of the name, as namely, *Cordus*, *Gesner*, *Tragus*, *Camerarius* and *Tabernmontanus*, who all call it *Lignisticum*, either *sativum* or *vulgare*; *Fuchsius* calleth it *Libysicum* and *Smyrniun* also, for which he is reprehended by *Matthiolus*, *Anguilara* tooke it to be *Laserpitium* and *Dodonæus* saith it is likely to be a kind of *Laserpitium*, and *Lobel* calleth it *Laserpitium Germanicum*, but *Lugdunenſis* maketh it to be *Hypoſelinum*, after *Matthiolus* his opinion, who saith, if this be not *Dioscorides* his *Hypoſelinum*, he knoweth no other: *Matthiolus*, *Dodonæus* and *Lobel* doe call it *Levisicum*, *Banbinus* setteth it among the *Libanotides*, and called it *Lignisticum vulgare*; and *Libanotis fertilis* *Theophrastus*. For the true *Lignisticum* called *Siler montanum*, and in shoppes *Siselicus*, I have shewed you here before. The *Italians* call it *Levesico*, the *French* *Levesche*, the *Germanes* *Libstockel*, the *Dutch* *Laverſe* and *Lavus*, and wee in *English* *Lovage*.

The Vertues.

Lovage is hot and drie in the beginning of the third degree, and is of thinne parts also, and thereby doth open cut and digest humours, and doth mightily provoketh womens courses and urine, as much as any of the kindes of *Parſley*: the dried roote in powder taken to the weight of halfe a dramme in wine, doth wonderfully warme a cold stomacke, helping digestion, and consuming all superfluous moisture and raw humours therein, easeth all inward gripings and paines, dissolveth winde, and resisteth poyson and infection effectually: the greene roote hereof bruised in a stone mortar, and steeped for twelve houres in faire water, then strained and drunke first in the morning and last at night two or three spoonefulls at a time, asswageth any drought or great desire to drinke more than a carouse of cold drinke, found true by often experience, although the roote is well knowne to be hot: it is a knowne remedy, and of much and continuall experience in divers shires of this Land to drinke the decoction of the herbe for any sort of ague, whether it be quotidian, tertian or quartaine, and to helpe the paines and torments in the body and bowells coming of cold: the seede is effectual to all the properties aforesaid, except the last, and worketh more powerfully: the *Germanes* and other Nations in times past, used both the rootes and seede instead of Pepper to season their meates and brothes, and found them as comfortable and warming to the stomacke: the distilled water of the herbe helpeth the quinsie in the throate, if the mouth and throate be gargled and washed therewith, and helpeth the pluresie, if it be drunke three or foure times; the said water also dropped into the eyes taketh away the rednesse or the dimmenesse of the eyes, it likewise taketh away spots or freckles in the face: the leaves of *Lovage* bruised and fried with a little hogges larde, and laid hot on any borch or bile will quickly breake it: the greene rootes may be kept in pickle made with salt and vinegar for a long time, but preserved with Sugar is more pleasant.

CHAP. XXXV.

Laserpitium. Laserwort.

Because *Lovage* was called *Laserpitium Germanicum*, I thought good a little to declare the true *Laserpitium* or *L ser* of the ancients, both to shew what it was, and what with divers it is now taken to be; and withall to joyne both the *French* kinde and that which *Alpinus* hath set out for the true.

Laserpitium Gallicum. French Laserwort.

The *French Laserwort* hath a great long roote, bigger than that of *Ferula* Fennell giant, of a grayish or ash colour on the outside, and white within, full of a fat or thicke jnyce, and smelling sweete, from whence rise up great stalkes as thicke and high as the *Ferula*, whereon are set divers stalkes of winged leaves like unto *Smallage*, but thicker, harder, and of a darker greene colour, somewhat deeply dented about the edges, and sometimes more deeply jagged than others: at the toppes of the branches and stalkes stand large umbells of flowers like unto *Ferula*, and after them large flat winged seede like unto *Angelica*, of the colour of *Boxe*, and smelling sweete.

2. *Laserpitium Alpino. Alpinus* his *Laserwort*.

The stalke of this *Laserwort*, saith *Alpinus* groweth to be of three cubits in height, hollow, and of the bignesse of a great *Ferula* stalke, having large winged leaves set thereon, somewhat like the great *Selinum*, or sweete *Parſley*, and greater than those of wilde *Angelica*, yeelding a milke being broken; the umbells of flowers at the toppes yeeld large broad flat seede, as *Theophrastus* saith of his: the roote is great, and as thicke as ones arme, yeelding also a milke when it is broken, which is white at the first, but groweth yellow being drie: the proportions hereof is extant upon some of the ancient copines of *Iupiter Ammon*, as *Alpinus* saith.

3. *Laserpitium antiquorum. The true Laserwort of the ancients.*

Dioscorides describeth the true *Laserpitium* in this manner: it groweth, saith he in *Syria*, *Armenia Media* and *Lybia* with a Ferulous stalke (which they call *Maspetum*) and leaves like to *Apium*, and with a broad seede: the *Laser* or juyce is taken from the roote and from the stalke by scarifying them: that is preferred to be best, that is somewhat red, transparent, like unto *Myrrhe* and not greene, of a strong sent and sweete taste, which being moi-

1. *Laserpitium Gallicum*.
French Laserwort.2. *Laserpitium Alpino*.
Alpinus his Laserwort.

stened with water quickly becommeth white, if any shall taste the Cyrenian sort it will move and stirre all the humours in the body to a sweate, with a moist sweet sent, so that his breath shall smell well that hath tasted but a little: that of *Media* and *Syria* is not so forcible or good, and giveth a stranger unwholsome sent. All the sorts of *Lafer* are adulterated with *Sagapen*, or with Beane flower before they are dried, the falsehood whereof may be found out by the taste, by the smell, by sight, or by the wetting or washing it in water. Some doe call the stalke *Silphium*, the roote *Magdaria*, and the leaves *Maspelum*; the most effectuall is the *Lafer*, the next are the leaves and the stalkes last. This is *Dioscorides* his text: but *Theophrastus* doth more largely expresse it, and *Pliny* from him, which is too tedious to insert here: I will therefore but onely mention a few of those things that are most pertinent, and not expressed before, which are these: the feede is broad spread like a leafe, and called *selium* and is as yellow as gold; the stalke is annuall as is that of *Ferula*; the flesh of the cattie that feede thereon doth taste most savoury, the stalke is eaten by men sundry wayes dressed or boyled: it groweth wilde by nature, and will not abide to be manured or transplanted. *Pliny* saith that in his time it was not to be had but after the weight of silver, and that it was so much destroyed, that onely one branch was brought unto the Emperour *Nero* of all that could be found in his time; and *Pliny* saith also that it groweth in plenty on mount *Parnassus*. Thus saith *Theophrastus* and *Pliny*, whereby it may be seene what losse there is of it by the great esteeme was made of it, and by the vertues it had which they have expressed, and how hard a thing it is to find out the true plant of all that are knowne now unto us, although divers have referred sundry herbes therunto as is formerly set downe, and yet still is by divers: for some would make *Benzoin* the sweete gumme to be the *Lafer*, and called it *Asa dulcis*, which is a word but derived from *Lafer* as it is most likely, and is so farre from reason, that I wonder how men could be drawn so to thinke the *Benzoin* being the gumme of a great tree in the *East Indies*, as all may know that will enquire after it, and is neither hot, sharpe, nor bitter as *Lafer* is said to be: but it is very probable that the Apothecaries, who had many of their names from the *Arabian* authors, had these likewise of *Asa dulcis*, and *Asa fetida*, and peradventure rose from *Serapio* his two sorts of *Lafer*, one pure, and the other impure, but that he saith the pure is of a stronger sent, and the impure of small sent. The *Arabians* call the plant *Anjuden*, the juyce *Alrub* and *Avicen* *Almarut*, and the *Indians* *Imga* and *Imgara*.

The Place and Time.

This former sort was found about *Marselles* in *France*, as *Lobel* in *Adversaria* saith, and adjudged the truest by *Rondeletius* of any other that he had seene before, flowering and seeding in the end of the yeare as *Ferula* doth, the other is expressed in the narration before, *Alpinus* saith it was first seene in *Cardinall Bembo* his Garden, and afterwards in that of the *Mussuros*.

The Names.

It hath not found any other names since the first invention, than *Laserpitium* and *Silphium* which was given it at the first by *Lobel*, onely *Bauhinus* calleth it *Gallicum*, and *Tabernmontanus* *Maffilioticum*; the other is declared in the description sufficiently.

The Vertues.

There is not extant in any that hath written of the *French* kinde for what disease it is effectuall, and therefore we can say no more thereof: but of the true *Lafer* *Dioscorides* hath given a very ample recitall, which although I thinke it almost needlesse to set downe the vertues of an herbe which is so little likely to be had as this is, for

ignori nulla cupido, yet to satisfie those that are curious, these they are: the roote, saith he heateth, and is hardly digested, it hurteth the bladder, and healeth knots and kernells of the throate. called the Kings evil, if it be made into a cerot or plaister, and laid to with oyle, taketh away blacke and blew spots that come by bruises or strokes: it helpeth the Sciatica if it be made up with *Ceratum Irinum* or *Cyprium*: it taketh away the outgrowings about the fundament, if it be boiled with vinegar in the rinde of a Pomegranat: it resisteth the force of deadly poisonfull medicines. The *Lafer* of *Media* and *Syria* is weaker than that of *Cyrene*, & hath a loathsome sent: it is a iuyce that is windy and sharpe in taste, and cureth the falling of the haire, if it be annointed with it Wine, Pepper, and Vinegar, it sharpeneth the sight, and discusseth the pinne and webbe in the beginning; it is put into hollow teeth being tied up in a litle linnen cloth, with some white Francumfence, and being boiled with Hysope and Figges in Vinegar and Water, it is good to wash the mouth; it helpeth the biting of mad dogges, if it be applied to the wounds, also the venome of any other creature, or envenomed darts or arrowes, if it be either drunke or outwardly applied: it cureth the wounds of Scorpions if it be relented in oyle and annointed; it is put into those ulcers that are ready to runne into a Gangrene if they be first scarified: it breaketh carbuncles or plague sores being applied by it selfe, or used with Rue, Niter and Honey: it taketh away warts, cornes, and hard skinnies growing in any place being first pared, and it mollified with a cerote, or the pulpe of a dried Figge, and healeth tetter and ringwormes while they are yong being applied with vinegar: it healeth the polypus in the nose, which is a peece of flesh growing there, if it be annointed for certaine dayes with it, made up with *Coperas* or *Vardigraale*, or other superfluous wens or outgrowings in the flesh being first clipped off: it helpeth a continuall hoarsenesse in the throate, and cleareth the voyce that is suddenly growen hoarse, being delaied in water and supped off: it staeth the falling of the palate of the mouth; being applied with honey, and helpeth the quinsie if it be put into honied water, and the mouth gargled therewith: being taken in meates, it maketh one better coloured: it helpeth the cough being taken in a reare egge, and being put into broathes with dried Figges, it is very profitable for those that have the dropsie or the yellow jaundise: it taketh away the shaking fits of agues being taken with Pepper and white Francumfence in wine: it is given to those that have strong crampes or crickes in their neckes, halfe a scruple weight rowled up in waxe and swallowed: it draweth out horse-leeches that by chance are got into the throate and there sticke, if the mouth be gargled with it and a litle vinegar: it helpeth those who have the milke curded in their breasts, and the falling sicknesse being taken with Oxy mell, or vinegar and honey: it provoketh womens courses being taken with Peppet and Myrthe, and helpeth the chollicke being eaten in a Raisin, and being drunke in lye it suddenly helpeth crampes or convulsions, and burstings: it is dissolved with bitter Almonds or with Rue, or with hot bread, to be given in potions: the iuyce of the leaves worketh the like effects but lesse powerfully: this is eaten with Oxy mell, to helpe the windepipe when the speech is lost. *Pliny* declareth many of these things out of *Dioscorides*, but varieth from him in his remedy for teeth-ach, for I cannot thinke, saith he, that any author would appoint it to be put into hollow teeth to take away the paine, when as we have sene the experience thereof in a man, that for the same cause threw himselfe downe headlong from an high place: for it inflameth oxen if it be put into their noses: and being mixed with wine, it bursteth those Serpents that take it, who are most greedy of wine, and therefore, saith he, I would perswade men not to be annointed therewith, although they doe appoint it. *Galen* also *lib. de simpl.* briefly speaketh thereof thus: the iuyce of *Silphium* is very hot (saith he) the leaves, stalkes, and rootes, doe sufficient stoutly heate any cold part, but they are all of stultent windinefles: heteby it is hard of concoction, but applied outwardly it is of more effect, & the iuyce is the strongest of all other, having a mightie drawing facultie, yet it holdeth a certaine power to take away excrefences in the flesh, by reason of the temperature is said to be in it, thus farre *Galen*: *Serapio* likewise speaketh of the *Greekes* *Laferpitium* in this manner: *Lafer*, saith he is knowne to the *Indians* to be of two sorts, the one sincere shining and cleare, like to *Electrum*, of a stronger sent and greater price, which is brought, as it is thought from *Guzarate*, *Patane*, *Maudon*, *Chitor*, and *Dely*, which is a cold countrey, and extending unto *Chervam*: the other is foule and muddy smelling lesse, which they say is brought from *Corasone* to *Ormus* in *Persia*, and from thence is carried to *Pegu Malaca*, *Tanassiris*, and the countries next adjoyning: the *Baneans* of *Cumbaya*, who were in times past Phylosophers, and are now Merchants, and forbore to eate of any living creature which was the institution of *Pythagoras* doe buy this *Lafer*, according to their abilitie, and put it into their broathes and sallats, rubbing the vessels therewith first, and use no other sawse to their meates being pleasant to them, both in taste and smell, yet doth it not breede any loathing in any that are not accustomed to it: the taste thereof is at the first somewhat bitter as pickled Olives are, but being chewed a while longer it is very pleasant, that which is impure, Porters and others of meane qualitie that live on bread and water only doe buy, because they cannot for the greatnesse of the price buy that which is sincere, and the *Baneans* who deale in this kinde of merchandise doe purge and cleanse the impure, and doe not suffer it to be used in meates before they have cured it by their skill; and thus much *Serapio*.

CHAP. XXXVI.

Angelica. Angellica.

Although I have spoken of Angelica in my former booke, yet having more to say thereof, and to shew likewise some other sorts thereof, I will here insert it with the rest.

I. *Angelica sativa*. Garden Angellica.

The Garden Angellica hath divers large and faire spread winged leaves, three foote long or better sometimes, made of many great and broad ones, set usually one against another on a middle ribbe, of a pale, but fresh greene colour, and dented about the edges, from among which usually riseth but one round hollow stalk being very thicke, and five or sixe foote high, with divers great joynts and leaves set on them, whose foote stalkes doe compasse the maine stalk at the bottome, and from thence also towards the toppe come forth branches with the like, but lesser leaves at them, and at their toppes, large round spread umbells of white flowers, but *Brasius* describeth his with yellow flowers, which I never saw; after which commeth the seede which is somewhat flat, thicke, short, and white, two alwayes set together, and is usuall in all these umbelliferous plants, and a litle

1. *Angelica sativa*. Garden Angelica. 2. *Angelica sylvestris*. Wilde Angelica. 3. *Angelica sylvestris montana daurica succitrum*.
Two sorts of Mountain Angelica. 4. *Archangelica*.
The great water Angelica.

crested on the round seede: the roote groweth great and woody when it flowreth, with many great long branches to it, but perisheth after seede and will rise and spring againe, better from the seede that doth fall of it selfe, then what is sown by hand at any other time: the whole plant both leafe and seede and roote is of an excellent pleasant sent and taste very comfortable, being not fierce or sharpe but rather sweete, and giveth a most delicate relish when it is tasted or used: the leaves be the weakest and some hold the seede to bee next, and the roote to be the strongest, especially being not ready to grow up for stalke. Of this kinde wee have another sort in our Gardens called sweet Angellica, not differing in any thing from the former, but in that it hath a sweeter relish then the other.

2. *Angelica sylvestris*. Wilde Angellica.

The wilde Angellica groweth up with large spread leaves on the ground having smaller stalkes and lesser divided leaves by much, of a darke greene colour, not smelling halfe so strong as the garden kinde, yet favouring so much like Angellica that by the smell one may soone see and know it to be a kinde of Angellica though wilde: the stalkes are much slender and smaller, yet growing three or foure foote high with smaller joynts and lesser leaves thereat: at the toppes grow lesser umbells of white flowers, which turne into smaller seede and blacker: the roote is nothing so great as the former neyther are the strings so great or long, and of a blacker colour on the outside not smelling halfe so well.

Of this kinde likewise there is some varietie, one growing likewise wilde with us, not much differing in the leaves, but being smaller and not so much divided, the stalkes being reddish and the seede thicker and longer, the roote being great and thicke.

3. *Angelica sylvestris montana*. Mountaine wilde Angellica.

Mountaine Angellica groweth like the former wilde kinde, but much lower and smaller in every part, the roote hereof differeth most in that it is nothing so great, but sendeth forth many small brownish strings from the head round about it, yet holding the same strong sent of Angellica that the former doth.

I give you here the figures of two other sorts of Angellica, taken out of Doctor Foxes booke of dried herbes, which he had from *Padua* garden, and might seeme to be the *Laserpitium* of *Alpinus* set forth before, but that they had severall denominations to them.

4. *Archangelica*. The greater water Angellica.

This Angellica groweth with a taller and much greater stalke sometimes reddish, the leaves likewise being more in number and smaller divided, and of as deepe a greene colour as the first sort: in the tufts of white flowers it is like the first garden Angellica, and so is the seede but greater and blacker, the roote is great according to the plant, and endureth many years without perishing.

The Place and Time.

The first sorts are with us sown in Gardens, the second sort is wilde both in many places of *Essex*, *Kent*, and neare *Kentish Towrie* by *London* also, and in other places: the third groweth on divers mountaines in *Germany*, *Hungary* and the rest: the last is not onely naturall to grow in watery ditches, but in moist grounds also in many places with us, and in the Marsh ditches by *Rederiffe*.

The Names.

This herbe hath gained many worthy names from sundry worthy persons: for some have called it *Sancti Spiritus radix*, *Lacina*, and *Dodonaeus* thinke it some kinde of *Laserpitium*, *Cordus*, and some others take it to be *Smyrnum*, and *Cordus* to be *Panax Heracleum*, but all in generall call it *Angellica* from the Angell-like properties therein. All these sorts are so called by most Authors as their titles beare, and therefore I neede not explaine them further, onely the last is called *Archangelica* by *Clausus*, and *Angelica aquatica* by *Gesner*: All Christian nations likewise in their appellations hereof follow the Latine name as neare as their Dialect will permit: onely in *Sussex* they call the wilde kinde *Kex*, and the Weavers winde their Yarne on the dead stalkes.

The Vertues.

Angellica is hot and dry, some put it in the second and others in the third degree. It resisteth poyson by defending the heart, the blood and spirits, and giveth heate and comfort to them: it doth the like against the Plague and infection of the Pestilence, if the roote be taken in powder to the weight of halfe a dramme at a time, with some good Treacle in Cardus water, and layd to sweate thereupon in their bed: if Treacle be not at hand take the roote alone in Cardus or Angellica water, the stalkes or rootes candid and eaten fasting are good helpes also in time of infection and at other times to warme and comfort a cold or old stomack: The root also steeped in Vinegar, and a little of that Vinegar taken sometimes fasting, and the roote smelled unto are both good preservatives for that purpose, a water distilled from the rootes simply, or steeped in wine and distilled in glasse, is much more effectuell then the water of the leaves, and this water being drunke two or three spoonefulls at a time doth ease all paines and torments that come of cold or winde, so as the body be not bound: the said water taken with some of the roote in powder helpeth the Plurisie being taken in the beginning, as also all other diseases of the Lungs, and breast, as coughes, and shortnesse of breath, Tiffickes, and so doth the Syrupe of the stalkes mentioned in my former booke: it helpeth likewise the torments of the Chollicke, the strangury and stopping of the urine, procureth womens courses and expelleth the afterbirth: and briefly easeth and discusseth all inward tumors and windnesse: it openeth the obstructions of the Liver and Spleene: and the decoction thereof being drunke before the fit of an Ague, so that they may sweate if it be possible before the fit come, will in twice or thrice taking rid it quite away: it helpeth also digestion in the stomacke, and is a remedy for a Surfet. The juice or the water dropped into the eyes cleareth the dimnesse of sight if any filmes doe begin to breed in them, and helpeth deafnesse by dropping it into the eares: the juice also put into hollow teeth easeth the paine; the rootes in powther made up with a litle pitch into a plaister, and layd on the biting of a mad dog, or any other venomous creature doth wonderfully helpe them: the juice or the water dropped or tents wet therein and put into old and filthy deepe Vicers, or the powder of the roote in want of the other, doth cleanse them and cause them to heale quickly by covering the naked bones with flesh: the distilled water applied to places pained with the Goute or Sciatica, doth give a great deale of ease: the wilde Angellica is not so effectuell as the Gardens, although it may safely bee used to all these purposes aforesaid: the roote of the Garden Angellica is a better substitute in *Theriaca Andromachi* and *Michridatium* then many other that have bene formerly accepted.

CHAP. XXXVII.

Imperatoria sive Asfantia. Maisterwort.

OF this herbe there are two sorts, the one well knowne, and the other set forth first by *Camerarius* in his Epitome on *Matthiolus*, and *Bauhinus* after him in his *Matthiolus*.

1. *Imperatoria sive Asfantia vulgaris.* The common Maisterwort.

Common Maisterwort hath divers stalkes of winged leaves, divided into sundry patts three for the most part standing together at a small footestalk on both sides of the greater, and three likewise at the end of the stalk, each of which leaves are somewhat broad & cut in on the edges into three or more divisions and all of them besides dented about the brims, of a darke Greene colour, and doe somewhat resemble Angelica leaves at the first sight, untill they bee better regarded and that they grow lower to the ground, and upon lesser stalkes, among which rise up two or three short stalkes in comparison of Angelica, being about two foot high and slender, with such like leaves at the joynts as grow below, but lesser and with fewer divisions, bearing umbells of white flowers, and after them small thinn flat blackish seede bigger then Dill seede: the roote is somewhat great and rather groweth sidewise then downe deepe into the ground, shooting forth sundry heads which tasteth sharpe biting on the tongue, and is the hottest and sharpest part of any of the rest of the plant, and the seede next unto it, being somewhat blackish on the outside and smelling well.

2. *Imperatoria Alpina.* Mountaine Maisterwort.

The mountaine Maisterwort groweth somewhat like the former, but lesser in every patt, having nine leaves standing on each stalk by three and three, but they are smaller and narrower, and have fewer incisions in them, but finely dented about the edges: the flowers and seede are alike, and the roote groweth in like manner, with a blackish outside, but is more sharpe and hot biting on the tongue then the former by much.

The Place and Time.

The first is found on sundry hills in *Italy*, as also in *Germany*, yet it is usually kept in Gardens, with them as well as with us: The other was found on the *Alpes* in *Switzerland*. They flower and seede late with us, as not untill the end of *August*.

The Names.

It is called by the latter Writers generally *Imperatoria*, from the excellent vertues it hath, yet many have referred that name to sundry plants of the Auncients, not thinking that an herbe of such rare qualities should be unknowne to them, and therefore *Anguilara* tooke it to be *Ligusticum*, and *Ruellius* and *Fuchsius* to be *Laserpitium*, yet not finding it fully to answer thereunto, calleth it *Laserpitium Germanicum*, *Tragus* referreth it to *Smyrnum*, and calleth it *Smyrnum hortense*, and *Osseritum*; and yet nameth other herbes by that name also, and *Cordus* in his *historia* unto *Struthion*, *Matthiolus*, *Gesner* in *hortis*, *Lobel* *Lugdunensis*, *Tabernmontanus* and others, call it *Imperatoria*, *Brunfelsius*, *Dodonaeus* and *Clusius* call it *Asfantia*, *Camerarius* *Magistrantia*, and *Cesalpinus* *Herba rena*, as the vulgar with him did. The other *Camerarius* calleth *Imperatoria*, vel *Asfantia Alpina*, and saith, the *Germanes*

1. *Imperatoria sive Asfantia vulgaris.*
Common Maisterwort.

2. *Imperatoria sive Asfantia Alpina.*
Mountaine Maisterwort.

call it *Bergstrens*, and the former *Meisterwort*, and thence it is like they derived their *Magistrantia*, We in English call it usually *Maisterwort*, and by some *Pelletory of Spaine*, but falsely.

The Vertues.

The roote of Maisterwort is hotter then pepper, even to the third degree compleate, and is of very subtil parts, it is very available in all cold griefes and diseases, both of the stomacke and body, dissolving winde very powerfully, both upward and downward, it is also used in a decoction with wine, against all cold rheumes, or distillations upon the lungs, and shortnesse of breath to be taken morning and evening, the same also provoketh urine and helpeth to breake the stone and expell gravell from the Kidneyes, it procureth womens courtes and expelleth the dead birth, and is singular good for the strangling of the mother, and other the like womens diseases: it is effectually also against the drop sicke, crampes, and the falling sicknesse, for the decoction in wine being gargled in the mouth doth draw downe much water and flegme from the braine thereby, purging and easing it of what oppressed it: it is of a rare qualitie against all sorts of cold poysons, to be taken as there is cause either more or lesse and provoketh sweate, the feede worketh to the like effect, although not with the like efficacy if they can brooke the taste thereof: and therefore many doe distill the water from both herbe and roote that they may take it with the better content: the juice hereof dropped or tents dipped therein and applyed eyther to the greene wounds or rotten ulcers, yea although they fret and creepe, and be almost gangrenated, and those also that come by envenomed weapons doth soone cleanse and heale them, or if they be bathed with the distilled water: the same also is very good to helpe the Goute coming of a cold cause. *Tragus* saith that the decoction of the roote in wine being drunke doth revive the abilitie of generation being almost extinct, which you may truly beleve and try to be certaine as he saith: but by his leave this is against *Galens* rule, for hee saith that those things that are so hot to expell winde doe not helpe but hinder nature: the other sort as I said before is more effectually and in especiall for quartaine Agues, to expell the dead child, to purge the braine, and to expell winde and helpe the Collicke.

CHAP. XXXVIII.

Podagraria sive herba Gerardi. Goutwort or herbe Gerard.

F this herbe likewile there are two sorts, the one knowne but to few, yet the other is two well knowne especially where it getteth into any ground, and although for their likeness one to another, divers have joyned this and the foregoing Maisterwort in one Chapter, yet because they are differing plants in many notable parts, I have thought good to part them into two.

1. *Podagraria vulgaris.* Common herbe Gerard.

The common herbe Gerard is a low herbe seldome rising halfe a yard high having sundry the like leaves standing upon brownish greene stalkes by threes as in the former, but they are smaller narrower and not cut in on the edges at all, or very seldome but snipped about and of a strong unpleasant favour: the umbells of flowers are white and the feede blackish and lesse: the roote runneth and creepeth like Quinch in the ground, soone occupying a great deale of roome.

2. *Podagraria hirsuta.* Hairy herbe Gerard.

This hairy herbe Gerard hath a thicke fibrous roote of a blackish browne colour on the outside, & white within enduring many yeares and of a good sent, from whence springeth up a stalk about a cubit high, blackish at the bottome and a little hairy, spreading into divers short branches, bearing much divided leaves thereon like to wilde Angellica or the last herbe Gerard, but more deeply gashed, of a greene colour and hairy all over: the footstalkes as also the umbells of flowers are small and white, and followed with blackish feede.

The Place and Time.

The first groweth by hedge and wall sides and oftentimes in the borders or corners of fields and in gardens also sometimes, if it be not rid and weeded out: the other groweth in a part of Germany called *Lusatia*, and flower and feede somewhat earlier then the Maisterwort.

The Names.

This herb hath found sundry appellations as every ones judgement led him, for *Brunfelsius* calleth it *Pycnomos*, *Gesner in hortis Coroborus quibensdam*, *Cordus* on *Diocorides Elaphobosco similis*, *Tabermontanus Agopodium*, *Tragus Osteritium sylvestre*, and *Angelica visium*, *Camerarius Angelica sylvestris communis*, *Thalium Angelica erratica*, *Bauhinus Angelica sylvestris minor sive erratica*, *Dodonaeus herba Gerardi*, because the *Brabanders* call it *Geraert*, and *Lobel Podagraria Germanorum*, which as he saith the Dutch call *Flercincruit*, and *Camerarius* saith the Germans call *Strentzel* or *Giersick* and *Tragus Hynfuss* and *Wilscherle wettsch*, and wee in English Goutwort or herbe Gerard after the *Brabanders*, and of some in our Land Aisweede or Axeweede as *Lyte* and *Gerard* say: the other is onely remembred by *Bauhinus* who numbred it among the Angellicaes, and calleth it *Angelica sylvestris hirsuta inodora*, and herbe *Podagraria cognata*.

1. *Podagraria vulgaris.*
Common herbe Gerard.

Two

The Vertues.

Goutewort had not his name given as it seemeth at randome, but upon good experience to helpe the cold Goute and Sciatica, as also joynt aches and other cold griefes, for as *Lobel* saith his vulgar in taking it to bee *Ebutus* Danewort, applyed it for the same diseases that Danewort was good for.

CHAP. XXXIX.

Pastinaca Latifolia. Parsnep.

OF Parsnepps there are two sorts, the tame or Garden kinde, and another that groweth wilde in divers places beyond the Seas, as well as in our owne Land.

1. *Pastinaca latifolia sativa.* Garden Parsnepps.

This Garden Parsnep hath large winged leaves, that is many set on both sides of a long stalk, each of them for the most part standing directly one against another, and one at the end, being much larger then those of the Skieret, and closer set together and rougher, and dented about the edges: the stalk groweth five or six foote high, with divers the like leaves and branches thereon but lesser: the flowers are yellow that grow in tufts and umbells at the toppe, which turne into brownish thinnish flat feede, smelling reasonable well, the roote groweth greater and larger in some grounds then in others, being white within and without, very sweet and pleasant to be eaten, when they are sodden tender and are dressed afterwards many wayes as every one list. Of this kinde I have declared in my former booke another sort differing in nothing but the roote, which is thicker at the head and shorter, and not so favourie as the former.

2. *Pastinaca latifolia sylvestris.*

Wilde Parsnep.

The wilde Parsnep differeth little from the former, but as a wilde plant, not growing so faire and large, nor hath so many leaves and that the roote (as all writers affirme of their countries) is shorter more woody, and not so fit to bee eaten, and therefore the more medicinable, but as I said in my former booke it is the garden kinde is found wilde in many places of our Land so sweete and so tender after the sowing, that by being manured it proveth as good as the Garden kinde.

The Place and Time.

The first is every where in these parts nursed up in Gardens: the other growing wilde as I sayd in divers places, as in the Marshes by *Rochester* in the grounds of Sir *Iohn Leveson* there, and flowreth in *Iuly*, the feede being ripe about the beginning of *August* the second yeare after the sowing, for if they doe flower the first yeare, the countrey people call them made Neepes.

The Names.

The later writers generally call it *Pastinaca latifolia* to put a difference betwene it and the Carrot which is called *Pastinaca tenuifolia*, as I said before, some authors calling it *sativa* or *domestica* or *vulgaris*. *Fuchsius* calleth it *Sisarrum sativum magnanum* and *Tabermontanus* *Elaphoboscum sativum*; but *Columna* taketh it to be the *Sifer* of *Dioscorides*. The wilde sort is called by many *Pastinaca sylvestris* or *latifolia sylvestris* as *Dodonaeus* doth, *Cordus* upon *Dioscorides* calleth it *Pastinaca sylvestris Gallica*, *Matthiolus* *Dodonaeus* and *Tabermontanus* *Elaphoboscum*, *Fuchsius* calleth it *Sifer sylvestre*, and *Lobel* *Bancia Pastinaca sylvestris Arabum* an *Elaphoboscum*: but whether this should be the *Elaphoboscum* of *Dioscorides*, I shall referre you to the next Chapter. in the Apothecaries shops of *Italy* and *Germany* it was usually called *Bancia*, *Tragus* saith and so doth *Dodonaeus*, that some in their time did call it *Staphylinus* as well as the other *tenuifolia*. The *Italians* call it *Cavotta bianca*, the *Spaniards* *Canaoria Blanca*, the *French* *Pestnade*, the *Germans* *moren weiss*, *Pastene* and *Pastinaken* the *Dutch* *Pastinaken*.

The Vertues.

The Garden Parsnep nourisheth much, and the nourishment is good and wholsome, but a little windy, whereby it is thought to procure bodily lust, but it fatteneth the body much if it be used: it little respecteth any physick use as most of those herbes and rootes doe that are much eaten, which made *Dioscorides* and *Galen* not to insist much upon them: onely it is conduible to the stomacke reins and bladder and provoketh urine: but the wilde kinde is more physickall, having a cutting, attenuating, cleansing and opening qualitie therein: it resisteth and helpeth the bitings of Serpents: it easeth the paines and stiches in the sides, and dissolveth winde, both in the stomacke and bowels which is the chollicke and provoketh Urine, the roote is often used but the feede much more.

CHAP. XL.

Sifer. Skirret.

Have two sorts of herbes to shew you under this title of *Sifer*, whereof the one hath beene fetcht as farre as from *Syria*.

1. *Sifer vulgare.* The common Skirret.

The common Skirret hath sundry stalkes of winged leaves, somewhat like unto those of the Parsheppe, but that they are smaller and farther set in sunder, smother and greener, and likewise dented about the edges, among which riseth up the stalkes, little more than halfe the height of the Parsheppe, bearing at the toppes umbells of white flowers, which afterwards turne into small darke feede, somewhat bigger than Parthey feede, the roote is composed of divers small long round white rootes, set together at one head, like the Asphodill, bunched out, or uneven in sundry places, and rugged, or as it were wrinkled with all, and not smooth as other rootes are, with a small pith within them, and very pleasant to be eaten.

2. *Sifer alcerum Syriacum.* Skirrets of *Syria*, or white Carrots.

The *Syrian* Skirret hath a long, tender and smooth roote, grayish on the out side, and white within, and easie to be broken as thicke as ones finger, and twice the length, having sundry small bunches or knottes thereon, like unto wartes, of a pleasant sweete taste like unto our Carrots, from whence rise many stalkes of leaves, much divided and cut into sundry parts like unto Carrot leaves: the stalkes likewise have such like leaves at the joynts and umbells of flowers at the toppes like unto them for forme, but of a yellowish colour.

The Place and Time.

The first is not naturall in any places of *Italy* or *Germany* that I can understand, but in the countrey of *Narbonne* in *France*, as *Lobel* saith, and is every where sowne or planted in Gardens, and with us rather sowne than planted, for sowne among Onions, the one will not hinder the growth of the other, the Onions being still drawne away that the Skirrets may have the full growth against Winter: the other groweth wilde in *Egypt* by *Cairo*, but not in their gardens, as *Kaemolius* saith: they flower and feede later than the Parsheppe.

The Names.

It is called in Greeke *Σίσερος*, and in Latine also *Sisarrum* and *Sifer*: the first is called *Sifer* by *Matthiolus*, *Cordus*, *Gesner*, and *Camerarius*, and *Sisarrum* by *Tragus*, *Dodonaeus*, *Lobel* and others. *Casalpini* calleth it *Sifer Germanicum*, and taketh it also to be the *Elaphoboscum* of *Dioscorides*, as *Columna* also doth: but assuredly herein they are both deceived, for *Dioscorides* describeth *Elaphoboscum* at large, and howsoever the manner of the leaves deceived them, that they were like unto the leaves of the Turpentine tree, yet neither is the stalke of this Ferulous, that is strong and great as that of the Parsnep is, nor hath any umbells of yellow flowers, nor feede like Dill, both which the Parsheppe hath; for this Skirret hath white flowers and feede like Parthey, so that I wonder how such wise and judicious men, that in other things will scanne the text of *Dioscorides* thoroughly before they give their judge-

1. *Sifer vulgare.*
The common Skirret.

2. *Sifer alcerum Syriacum.*
Skirret of *Syria*, or Wilde Carrot.

ment

ment, and yet in this have failed much, as you may understand by this that hath beene said: now whether the manured or wilde Parsneppe should be *Dioscorides* his *Elapheboscum*, I incline to thinke rather the wilde than the tame, although he saith, it is sweete and fit to be eaten; for as I said before, even the wilde might be good with them, as we have shewed it to grow wilde with us. Another controversie there is among many learned men, whether this be the true *Sisarum* of *Dioscorides* or no, in regard that neither he nor any other of the ancients, have given almost any touch of forme or lease or roote it had, because it was so familiar and well knowne in their time, and so it falleth out in many other things that were so common with them, that they thought it needlesse to describe them, that they are now most unknowne to the succeeding times, and to us yet in our time: the greatest probability that we have, is that, as *Dioscorides* saith, *Sisarum* is pleasant to the pallate, profitable to the stomacke, provoking urine, and procuring an appetite if it be boyled (for he doth not say eaten raw as divers other rootes are) all which agree to the Skirret: but *Pliny* in setting forth his *Siser*, which assuredly is all one with *Dioscorides* his *Sisarum* sheweth plainly that it hath a nerve or string in the roote, which is to be taken away after the boyling, that the rest may be eaten with the more pleasure, and such hath this Skirret and no other roote, that either then was or now is edible but it: and therefore there is no doubt but that it is the true *Sisarum* or *Siser* of the ancients: the other *Ranvolfus* saith is called in *Egypt* by the *Arabians* there *Secacul* as *Scorapio* did, and therefore this may cease all controversies concerning it, that our Parsneppe roote is not *Siser*, as it formerly was taken, nor our ordinary *Siser* neither to be *Secacul*: the *Arabians* call it *Sisarum* and *Sisarum*: the *Italians* *Sisaro*: the *Spaniards* *Chiribis*: the *French* *Cheruy*, the *Germans* *Gierlin*: the *Dutch* *Snycker wortelen*, that is Sugar roote; and we in *English* Skirret.

The Vertues.

Skirret rootes (for no other part is in use as I know) being dressed according to every ones liking doe nourish well, but not so much as the Parsneppe, it being of a stronger taste, and this more delicate and pleasant, and is also very wholesome, yet engendreth a little winde, and provoketh to ventry: it doth somewhat respect the Kidnies and bladder by moving to urine, and a little to consume the stone and gravell in them: and this is all that we have learned it to be available: for those herbes and roots that are temperate and most used to be eaten, are the lesse physically applied for any disease; the other as *Ranvolfus* saith, is used to be eaten also by the *Egyptians*, as other rootes are and is common with them.

CHAP. XLI:

Saxifraga Pimpinella. Burnet Saxifrage.

WE have foure or five sorts of this burnet Saxifrage, to shew you here, some being of our owne countrie, and some of others, and some greater or lesser than others.

1. *Pimpinella Saxifraga hircina major.* Great *Germane* Burnet Saxifrage.

This great Burnet Saxifrage of *Germany* hath divers large and long stalkes of winged leaves, one set directly opposite to another on both sides, each being somewhat broad, alittle pointed and dented about the edges somewhat deeply, of a fresh Greene colour almost shining, from among which rise up one or more round hollow stalkes, three foote high or more, set at the joynts, with the like, but lesser leaves, and bearing at the toppes small umbells of small white flowers, after which come small blackish round feede like unto Parsley feede, but much hotter in taste, and sharper upon the tongue, the roote is small long and white, very like unto a Parsley roote, but much hotter in taste, and perisheth not after feede time, but endureth long.

2. *Pimpinella Saxifraga major flore rubente.* Great Burnet Saxifrage of *Germany* with a reddish flower.

This sort differeth little from the former, either in forme or greatnesse of leaves or tallnesse of the stalkes, the chiefest difference consisteth in the flowers which are reddish or of a bluish colour.

3. *Pimpinella Saxifraga major nostras.* The greater *English* Burnet Saxifrage.

The greater sort of our *English* Burnet Saxifrage groweth up in the same manner that the former doe, the forme of whose leaves is all one likewise, but that they are usually not more than halfe so bigge or large, and not so deeply dented about the edges, but of a sadder Greene colour; the stalkes likewise are smaller and shorter than the other, the umbells of flowers are white also and the feede small and blackish, but sharper than the former: the roote is long and whitish enduring long.

4. *Pimpinella Saxifraga hircina minor.* The smaller Burnet Saxifrage of *Germany*.

This lesser Burnet Saxifrage of *Germany* hath likewise sundry shorter stalkes of finer cut leaves by much than the former, every one set against other, being very narrow and much cut in or deeply dented about the edges, which maketh the leafe seeme as if it were made of many fine cut and jagged leaves set on both sides of a foote stalke, which sometimes groweth reddish, and is very neere of the same fresh Greene colour that is in the first: the stalkes rise as high almost, and the umbells of flowers white like the former; the feede also is blackish but smaller than the former: the roote is long and white but smaller, but more hot, quicke and sharpe as the feede hercof is also.

5. *Pimpinella Saxifraga minor nostras.* The lesser *English* Burnet Saxifrage.

Our lesser *English* Burnet Saxifrage hath much finer cut leaves than the last, so that there is not halfe that breadth to be seene in them that there is in the leaves of the former, but yet divided after the same manner, and of as darke a Greene colour as the greater *English* sort: the umbells of flowers are white, and the feede that followeth smaller than of the last, the roote likewise is smaller, but as hot and quicke in taste as it.

The Place and Time.

The *Germane* kindes grow as well in their fields, as on the mountaines, and in rockie grounds, and as it is affirmed unto me by divers in our owne land likewise; the other of our owne land, are usually growing in moist meadowes of this land to be easily found of them that know them, and will looke for them, for they lie hid among the grasse oftentimes scarcely to be discerned: they doe all flower about *Iuly*, and their feede is ripe about the end of *August*.

The Names.

The ancient Writers neither *Greekes* nor *Latines* had any knowledge of any of these plants, but are called of the

1. *Pimpinella Saxifraga Hircina major*.
Great Germane Burnet Saxifrage.

4. *Pimpinella Saxifraga Hircina minor*.
The smaller Burnet Saxifrage of Germanie.

the moderne Herbarists *Pimpinella* simply by many, as *Cordus*, *Tragus*, *Fuchsius*, *Gesner*, and *Lobel*. & *Pimpinella Saxifraga* by *Matthiolus* and *Camerarius*, or *Saxifraga hircina*, as *Gesner* & *Clusius* do, some also *Bipinnella Saxifraga*, as *Lobel*, or *Bipennula* as *Lacuna*, or *Tragoselinum majus* as *Tabernaemontanus*; the second is remembered by *Gesner* in *hortis*, & in *descriptioe montis fracli*: the third is the second *Pimpinella* of *Tragus*, yet is greater than that kinde that groweth in our owne land; and so is the fift, and is most likely to be *Bauhinnus* his *Pimpinella Saxifraga tenuifolia*; the fourth is the third *Pimpinella* of *Tragus*, and is called *Pimpinella minor* by divers, and *Saxifraga hircina minor* by others, taken by *Cordus* to be *Daucus Selinoides*, and by *Lugdunensis* *Dauci tertium genus*, and by *Columna* to be *Tragium Dioscoridis*. There is growing at the rootes of these Saxifrages in some countries certaine graines that will give a fearle die, as *Lacuna* and *Angulara* have set it downe, and by them called *Coccus radicum*, but *Amatus Lusitanus* saith that the like graines are found at the rootes of many other herbes. *Fragosus* seemeth in reciting these graines growing at the rootes of these Saxifrages, to thinke that these graines are the Cochenill that the Diers use to die their lilke and cloth in graine colours; for he saith, *lib. 3. c. 15.* that the Cochenill that commeth from *Peru* be the graines that grow at the rootes of certaine plants like unto our common Burnet Saxifrage, wherein he was much mistaken, for as *Oviedus* saith, they are gathered from the leaves of great trees in the *West Indies*, called there *Tunil*, and with us *Ficus Indica*, and as it is set downe in the eight part of the *West Indian History*, the fourth Booke and thirteenth Chapter (and in the *Classis* of the trees in this Worke) from whence it seemeth *John de Laet* of *Anwerpe* in his fift Booke and third Chapter, pag. 229. of the *West Indian History* tooke his relation thereof, which is somewhat too large to insert in this place. I will therefore but briefly touch what he there saith, that there are divers sorts of *Ficus Indica*, some that beare no fruit growing wilde, or so thorny that he serveth to no use; others that are manured and beare fruit, which are eaten, and are either white, which are the better, or of a reddish purple colour dying their hands that gather them, like as *Mulberies* doe: and there is another manured sort that beareth no fruit, but is of greatest worth, and most carefully kept, because that certaine Flies doe breede thereon (which are that graine called by the *Spaniards* *Cochenill*, derived from the *Coccus* of the ancients, and this as a diminutive thereof) which they gather twise or thrice in a yeare, and kill them by casting cold water on them, and afterwards drie them in the shadow: but of this he saith there are foure sorts, some better or worse than others, the worse being gathered from the wilde plants, the best from those are planted in order like an orchard, and tended carefully. *Tragus* calleth this Saxifrage *Piper Germanicum*, and saith that no other plant can be more fitly referred to the *Petroselinum Macedonicum* of *Dioscorides* than it, who compared the feede thereof unto the feede of *Anoes*, yet to be sweeter in smell like unto spice, and sharpe and hote in taste, and to grow in rockie places, and hereon complaineth that men more willingly spend their cost on strange things fetched from farre, than upon their owne hombred and country plants: and assuredly the feede hereof is so aromatically, and sharpe piercing withall that I thinke he had reason so to thinke as he did, when as it farre surpasseth either the old *Petroselinum Macedonicum* of our modernes, I meane our *Allisander* feede or the new *Petroselinum Macedonicum* that commeth from *Venice*, and is now a dayes in so great account, as though it were the true *Petroselinum Macedonicum* not to be doubted of, or none to goe beyond it: but I am in doubt I shall finde among my brethren some Critickes that will taxe me for inferring this noveltie: if it please not them, let the judicious censure it as they shall finde cause and reason. *Tragus* also saith that some others referred this to the *Oreoselinum* or *Apium montanum* of *Dioscorides*.

The Virtues.

These sorts of Saxifrages are hotter than any the former kinds of *Apia* Parties, and as hot as Pepper, and as *Tragus* saith, more wholesome, by his often experience: it hath the same properties that the Parties have, but in provoking Urine, and easing the paines thereof, or of the Wind and Collicke is much more effectually, the rootes or seede being used either in powder or in decoction or any other way, and likewise helpeth the windie paines of the Mother, and to procure their courses, to breake and avoyde the stone in the Kidnies, to digest cold viscous and tough flegme in the stomacke; and is a most speciall remedy against all kinde of venome. *Castoreum* being boyled in the distilled water hereof, is singuler good to be given to those that are troubled with Crampes and Convulsions: some doe use to make the seede into Comfits, as they doe Caraway seede, which is effectually to all the purposes afore sayd, and some doe distill the water that the more tender stomackes may take it, being a little sweetened with Sugar: the juyce of the herbe being dropped into the most grievous wounds of the head, doth dry up their moysture and healeth them quickly: the experiment is taken from Hennes whose combs and head being pierced through, so as the braine was not hurt, were soone helped hereby: some women also use the distilled water to take away freckles, or other spots in the skinne or face, and to make it the more cleere and smooth.

CHAP. XLII.

Pinax. Alheale.

Dioscorides maketh mention of three sorts of Panax, *Panax Heracleum* with Figge-like leaves, whereof I intend to intreate in this Chapter, and with it some others that for their likeness may be referred thereunto: *Panax Asclepium* with Fennell-like leaves, but I have spoken hereof in the fourth Chapter of this Classis, and *Panax Chironium* with Marjerome-like leaves, I have shewed you in the 84. Chapter of the fifth Classis of this Worke, but *Theophrastus* maketh foure sorts, for unto these three he added a fourth, which he calleth *Syriacum* but doth not describe it. I have to shew you in this Chapter many other sorts, that for their likeness have obtained that epithite.

1. *Panax Heracleum verum siculneo folio.* The true All-heale of Hercules.

The true *Panax* hath divers large broad Greene leaves growing next the ground, cut into three or more parts, resembling a Figge leafe each standing on a long footstalk, web as well as the leafe is somewhat rough or rugged, from whence riseth up a stalk foure or five foot high, having such like leaves as grow below but lesser & lesse divided bearing a large tuft or umbell of yellow flowers, and somewhat large flat seede after them: the roote is white with divers branches thereat: the whole plant smelleth somewhat strong and as it were fower. From this it is probable the Gum *Opepanax* is gathered which commeth out of Syria and the parts thereabouts to the chiefe Mart townes, as *Damasco*, *Cairo*, *Alexandria* and others the like, to be transported else where. And the like plant answering very notably to this description have I had growing in my Garden, the seede whereof was sent me among other rare seeds by some of my divers friends from Italy, but perished by some extreme hard winter.

2. *Panax Heracleum alterum sive peregrinum Dodonai.* The more ordinary Alheale of Hercules with us.

This *Panax* spreadeth many very large winged leaves round about upon the ground, most of them two foot long, consisting of foure, five or six couples of rough winged leaves, set each against other on a round great footstalk, turrowed on the upper side, each of them winged, consisting likewise of three or foure couple of rough but large faire fresh yellowish Greene leaves & one at the end, broad below, and narrow to the end, the one of the lower sides of the leafe, being alwayes deeper at the bottome then the other and finely dented about the edges, tasting a little hot and biting in the mouth, and yeelding forth a yellowish juice in the Sommer much more gummy, hot and bitter than the leaves; from among these leaves riseth up one strong great round Greene stalk foure or five foote high or more, with some joynts and leaves thereat, and a few branches towards the toppes, where breake forth small yellow umbells of flowers, which afterwards give whitish yellow flat short seede: the roote groweth somewhat great and deepe downe into the ground, with two or three long branches from it, whitish yellow on the outside and more white within, full of that yellow sap issuing from it if it bee cut or broken, of a little strong sent and hot bitter taste more then eyther leafe or seede: this description is from the plant growing in mine owne Garden where it abideth the extreamest winter without harme.

3. *Panax Heracleum alterum Americum splendente folio, Laserpitium creditum quibusdam.*

American Alheale of Hercules with shining leaves, supposed to be the true Laserwort.

This *Herculean* Alheale groweth for the forme very like unto the last, having such like winged leaves set in the same manner, and the wings with foure or five or six couple of leaves, but differing in greatnesse and colour, for neither is the whole stalk above halfe so long, nor are the leaves themselves eyther halfe so great so broad or so long, but are rather somewhat short, and of a deepe Greene colour, very much shining on the upper side and paler Greene underneath, much hotter and sharper in taste then the former and not bitter drawing water into the mouth: the stalk hereof is seldome above a yard high, with joynts and leaves thereon, and more branches towards the toppes then the other bearing larger umbells of yellow flowers succeeded by flatish but almost round seede, of a pale browne colour the roote is white and great at the head with sundry long strings thereat with a pith in the middle and endureth not after seede time which sometimes is the second year after the springing and sometimes the third.

At 10
pur-
pura.

4. *Panax Costinum sive Plendostum Matthioli.* Costus-like Alheale.

This *Costus*-like Alheale differeth not much in forme from the second but in the greatnesse and substance of the yellow juice which this giveth not and therefore is not of that kind, for this hath such like large winged leaves, set in the same manner but lesser together, each leafe whereof is larger then a Parsnep leafe, thicker, rougher and more crumpled also and dented about the edges: the stalk is small and about two cubits high, full of joynts and lesser leaves set at them, branched towards the toppes and bearing round tufts of yellow flowers, after which follow flat and somewhat round seede: the roote is sappie with a thicke fleshy barke, and of a shining ash colour, bitter and sharpe in taste.

5. *Panax*

1. *Panax Heracleum verum*.
The true Alheale of Hercules.

2. *Panax Heracleum alterum* sive peregrinum *Dodoni*.
The more ordinary Alheale of Hercules with us.

3. *Panax alterum Americanum* splendens folio *Lasertium* creditum quibusdam.
American Alheale of Hercules with shining leaves.

4. *Panax Cofirum* sive *Pseudocoffus* *Mattioli*.
Coffus like Alheale.

5. *Panaci Heracleo similis Tataria Ungaris dicta.* The Hungarian Alheale of Hercules.

This Hungarian or rather Tartarian herbe hath the leaves much cut in and gashed on the edges somewhat like unto Turneps, but more nearly resembling those of the Alheale of Hercules, full of a rough hairynesse, of a pale greene colour, with other smaller ones lesse divided and lesse rough also, among whom riseth a rough crested hollow stalke two foote high, and of the thicknesse of ones thumbe, full of joynts and such leaves set thereat as grow be ow, but smaller and more divided compassing the stalke at the bottome: at the toppe of the stalke cometh forth umbells of yellow flowers, after which follow the feede very sparingly set on the umbells (for every flower doth not perfit the feede many more failing then holding) which is very great and thicke, resembling thote of the Cachrys, and straked like thereunto: the roote is very great and long even as thicke as ones arme, and of the cubits length which perisheth after feede time, and doth smell very foully that one cannot well endure the smell, but rather cast them out of the garden, yet this before it be growen to feede is taken and eaten both by the Hungars and Tartares in stead of bread, and is pleasant to them being of great use with the Tartares, for with-out it they could not make their long journeys through the Desarts where no foode is to be found.

6. *Panax xerophyllum seu racemosa Americana.*

The cluster berry Allheale of America.

This herbe of America riseth up with a round pithy brownish purple stalke, set at the joynts with large leaves divided into many parts, usually by three at a space, little dented about the edges, bearing both at the joynts with the leaves and at the top, on sundry branches, many tufts of flowers made of small threads like Vine blossomes, at the first greenish, but whiter after-wards, which turne into small bunches of greene berries, which grow to be darke red, when they are ripe, full of a pleasant tasted juyce, with many feedes therein: the roote is of the thicknesse of ones thumbe, and very long: it looseth both stalke and leaves every yeare, and new spring up againe after winter: The whole plant both leaves and rootes, are eaten as sallets and potherbes, of the Indians where it is naturall, and the French also that live amongst them, and taste more pleasantly then the berries themselves.

7. *Panaces moschatum Americannum.*

Sweete sented Allheale of America.

The first leaves of this Panax are large and about a foote long, onely dented about the edges, somewhat like unto Costmary leaves, lying on the ground, and compassing the long white roote at the head, but those that follow are so deeply cut in that they reach to the middle ribbe almost, the stalke riseth to be two cubits high, without any leaves thereon save onely about the middle, where it hath a knot and a leafe that compasseth it of a differing forme from the rest, the toppe branches are so heavily laden with umbels of white flowers, that before they open they hang downe their heads, which have so excellent a sweete smell, that they smell like Muske, a great way of the place where it groweth: the feede that succede are like, but not so broad as the ordinary Panax. The leaves taste sharpe, and a little bitter, but the roote lesse.

The Place and Time.

The first groweth in Naples as Matthioli saith, on the Apperine hills also and the Sea coasts by Siena: the second is thought to grow in some places of Italy also but generally in our gardens: the third came first from America, & the feede being imparted to sundry persons it received sundry names, and came to me out of Italy for *Lascripium an-tiquorum*, and is set downe in Cornutus for *Angelica lucida Canadensis*, and the other sort thereof for *Angelica atro-purpurea Canadensis*: the fourth as *Matthioli* saith groweth on mount Garganus in Apulia: the fifth in Tartaria and Hungaria, the two last in America, and doe all flower and feede in the end of Summer.

The Names.

It is called in Greek *πανάκιον*, and Panax or Panaces also in Latin, because it is a remedy for all diseases, and not as *Pliny* taketh it from Hercules, to be the first founder of it, and some would have it named rather from Hercules a City in Candy, but the name Panax is referred to many plants, as *Theophrastus* saith, there are many other Panaces, and *Dioscorides* saith *Origanum sylvestre*, called also *Cunila bubula*, and *Cunila gallinacea*, which is like to *Origanum Heracleoticum* was called also Panax Heracleum *Centaurium magnum* also and *Ligusticum* were called Panax Heracleum. The first here set downe is the Panax or Panaces Heracleum of Matthioli, *Angulata*, *Gesner* in hortis, *Lobel*, *Lugdunensis*, and others, but *Dodonaeus* taketh that Panax Heracleum that grew in the low Countrey Gardens, bearing white flowers, to be rather another sort of *Sphondylium*, to whom I must consent, for that plant with such broad leaves and white flowers, is a greater *Sphondylium* then the ordinary, as I shall shew you in the next Chapter save one, that which *Lobel* saith he saw in the gardens of some Franciscans, with yellow flowers, is a differing plant from it, and may be the true Panax Heracleum or Hercules of *Dioscorides*, the second is the Panax Alterum recentiorum *Olusatris* aut *Pastinace folio* of *Lobel*, the Panaces peregrinum of *Dodonaeus*, but mistaken by *Lugdunensis*, who calleth it Panax Chironium *Dodonaei*, when as *Dodonaeus* taketh the Panax Chironium to be the *Helianthus* or *Helianthemum* of *Pliny* as it is, and so by *Clusius*, *Cordus* and others, *Bashium* thinketh it may be the

the *Panax Syriacum* of *Theophrastus*, whereof there is great probability, for the seede of this plant as *Lobel* saith was found among the gum *Opopanax*, and sown by *Condenergius* a famous Apothecary in *Antwerpe* which no doubt was from the plant that brought forth that gum *Opopanax*, out of which it was taken, which as you see differeth much in forme of leaves from that of *Dioscorides* and *Theophrastus*. The third was sent to us by the name of *Lasercpitium verum*, but having well considered it, I found it remembred by *Cornutus* among his *Canada* plants, calling it *Angelica lucida Canadensis*, but not rightly, for the smell of the root with me, is more like unto Turpentine then *Angelica*, the other sort hereof he calleth *arvo purpurea*, I cannot referre it better to any plant, then to the last *Panax* it carryeth so like a face thereunto, and therefore call it *Panax Heracleum alterum Americanum*, &c. The fourth *Matthiolus* first set forth by the name of *Pseudocostus*, and so, many others have called it since, and *Costus spirius*, but *Camerarius* in *horto* saith, that some called it in his time *Panax Chironium*, and *Tabernmontanus* calleth it *Panaces Costium*, and *Costus Illyricus*, but *Cesalpinius* *Herba Costa*, and *Bauhinus* *Panax Costium*, whom I follow: the fifth *Clusius* setteth forth by the name of *Tataria Ungarica*, and *Bauhinus* thinketh it may be the *Baltracan*, which *Iosephus Barbarus* saith he saw in *Tartaria*, whereof he speaketh in his journey into *Persia*, that the *Tartarians* of the decoction of the leaves make their drinke, and the *Hungarians* their bread of the roote, and *Bauhinus* thereupon calleth it *Panaci Heracleo similis Ungarica*. The last are so named by *Cornutus*, as they are set downe in their titles. The *Arabians* call it *Stensir Iensir*, and *Giaufir*. The *Italians* *Panace Heracleo* and thereafter all other Christian nations that know it, and we in *English* *Allheale of Hercules*, according to the Greeke signification of the word.

The Vertues.

From the rootes and stalkes of this *Panax Heracleum*, being cut saith *Galen*, commeth forth that juyce or gum called *Opopanax*, which is of much more use then any other part of the plant, and is hot in the third degree, and dry in the second, being of an heating mollesying, and digesting quality, the barke of the roote is heating and drying likewise, but in a meener degree, having withall a little clenning property, whereby it is good for virulent and maligne ulcers, and to cover with flesh the bones that are bare: the seede also saith he is hot, and is mixed with those medicines that procure womens courses, the juyce or gum saith *Mesues* hath a speciall property therein to purge thicke and clammy flegme from the more remote parts, as the braine, nerves, sensitive parts, joynts and breasts, and therefore profitably applied to all the cold greefes incident to any of those parts, as to helpe a weak fight, an old cough, shortnesse of breath, purfinesse and wheeking and is good also for the Sciatice, the gout in the knees and feete, it is good likewise for crampes, convulsions, paines, and fitches in the sides, by the windinesse, swelling and hardnesse of the Spleene, for the strangury also and difficultie in making urine: it likewise discusseth the windinesse hardnesse and suffocations of the mother provoketh their courses and expelleth the dead birth: being also drunke in mede or wine it helpeth the itchings and sores in the bladder: it breaketh carbuncles or Plague sores, and is profitably applied with mollesying salves, and those that cure wounds and sores in the head, it helpeth the toothach, being put into an hollow tooth, and helpeth the biting of a madde Dogge, and against all other poisons of venomous creatures. The leaves of the *Hungarian Tataria* boyled in water is a familiar & usuall drink with the *Tartars* as the roots are bread to the *Hungarians* as is before said; the operation of the *American* plants are found to be more alimentall then medicinall, being familiarly eaten by the natives and *French*. *Matthiolus* doth recount the properties of his *Pseudocostus* or *Panax Costium* in this manner. It is saith he hot & dry in the third degree compleat, it openeth, clenseth, cutteth & maketh thin, and seeing it is bitter, sharpe and somewhat sweet, it may performe all those things that are related of it, that is, it helpeth all cold greefes of the head and nerves, and is also helpfull for the cough, shortnesse of breath and the like, as also for the winde Collicke and against the obstructions of the Liver and Spleene, the Stone and gravell in the reines and bladder, and the diseases of the mother, to bring downe the courses, and to expell the dead birth: it likewise helpeth all old greefes of the head, the swimming and turning of the braine, the falling sicknesse, the Lethargie, Convulsions, Crampes, Gouts and the like: it killeth also the wormes; and provoketh urine, and helpeth all joynt aches.

CHAP. XLIII.

Libanotis latifolia. Herbe Francumfence with broad leaves.

Of that kind of *Libanotis* that hath Fennell-like leaves with all the sorts thereof, I have spoken before in the fourth Chapter of this Classis, there remaineth such to bee entreated of that beare broad leaves which shall follow in this as I there promised.

1. *Libanotis Theophrasti major*. The greater white herbe Francumfence.

This greater *Libanotis* hath many great long stalkes with wings of large broad leaves some eight inches long a peece and almost foure broad, five being set together whereof one at the end, one against another, three or foure inches broad below and smaller to the end, being somewhat hard in handling, of an overworne greenish colour and a little dented about the edges, among which riseth up a strong round stalk, foure or five foot high oftentimes, having such like leaves on the joynts but fewer and lesser then grow below and a few branches rising from the upper joynts bearing large spreaden bells of whitish flowers, and after them somewhat flat and round light seede two joyned together, white on that side where it is joyned, and straked with rough crumpled strakes on the backe or round side, and of a pale browne colour when it is ripe but a little purplish before: the roote groweth great and long, whitish on the outside with a tuft of haire at the toppe, abiding long, smelling and tasting somewhat strong as many other umbelliferous rootes doe, but the seede much stronger.

2. *Libanotis Theophrasti minor*. The lesser white herbe Francumfence.

This lesser *Libanotis* agreeth with the former both in the forme of leaves, flowers, seede and rootes, but that they are all lesse, and the number of leaves are more set together on every stalk, being also more deeply dented about the edges, the roote is white but more bitter then it.

There is another sort hereof which *Bauhinus* calleth *Libanotis latifolia minor semine crispo*, and differeth onely in having fewer leaves on the stalkes, although as small and but one or two deepe cuts on the edges.

M m m 2

3. *Libanotis*

3. *Libanotis Theophrasti Apij folio Cretica*,
The truest herbe Francumfence of
Theophrastus.

This plant which I take to be the truest *Libanotis* of *Theophrastus Apij folio*, that is yet extant, hath a stalk about a cubit high, divided into some branches, with leaves both below and above set sparingly, somewhat resembling Smalage for the largenesse of the leaves, and dented about the edges, bearing white flowers, and large, rough, crooked brownish feede: the roote is covered with a blackish barke, and very white underneath, smelling strong like Francumfence.

4. *Libanotis latifolia Aquilegia folio*,
Columbine leaved herbe Francumfence.

This herbe Francumfence hath a thicke rugged browne stringie roote, with a white pith in the middle, smelling somewhat sweete and bitter in taste, having a tuft of blackish haire at the toppes, from whence rise sundry leaves upon long foote stalkes, broad & hollow at the bottome like a skinnie huske, compassing one another as those do also on the upper stalkes, and are hard in handling, yet of a shining darke greene colour above, and whitish underneath, with divers purplish veines running through them, not all of them divided like unto Columbine leaves, but many of them parted into five leaves, with three divisions apeece, others into three leaves, each standing on a stalk: it hath one white round stalk, straked with purple, rising up more than three cubits high, with divers joynts thereon, and branched towards the toppes, bearing every one a large umhell of small white flowers, and after them long and broad striped feede, of a purplish colour somewhat bitter, hot, and drawing water into the mouth, if it be a little chewed therein, and somewhat sweete in smell.

The Place and Time.

The two first sorts are found in many places in *Germany*, and the parts neere adjoining, the third in *Candy*, and the last it is likely came out of *Aethiopia*, by the name was given it. The two first feede with us yearly, after they are well growne; but the two last very seldom, unless the yeare prove hot and kindly.

The Names.

It is called *μαβανισμ* in Greeke, from the sent of Francumfence which it hath, and *Libanotis* in Latine, and some *Cervina alba*, and *Cervicaria alba*, but generally *Libanotis latifolia*, that it may be knowne to differ from the former, which is called *Ferula folio*, it is translated *Rosmarinus* by divers, when as properly the *Rosmarinus* of the Latines, is but the first kinde of *Diocorides* his *Libanotis*, called *Stephanematis*, that is, *Libanotis Coronaria*, because it onely was put into garlands, and so *Galen* did account it: the two first here set downe, are accounted by most of the later Writers to be the *Libanotis fertilis* of *Theophrastus*, which is set downe in his 9. Booke and 12. Chapter, with leaves of Smalage, but much greater; the fruit or feede whereof was called *Cachrys*, with a great white thicker roote smelling like *Thus* or *Olibanum*: but how any can well make the leaves hereof to resemble Smalage I cannot see, or that the seed hereof was ever called *Cachrys*, having a caslick qualitye, or the roote the smell of *Olibanum*. I onely touch this as a *Quare* further to be considered of: and it is probable that the figure that *Matthioli* giveth for his *Ligusticum alterum*, was intended for this *Libanotis*, the five leaves being mistaken in the placing, for that they should not be set so close together, or else he intended it for the *Aquilegia folio*, for he calleth this *Libanotis*, *Seseli Aethiopicum Matthioli*, and therefore to helpe the matter *Dodonaeus* calleth it *Seseli Aethiopicum herba*: it is also *Tragus* his first *Seseli*, and the *Dauci alterum* gem of *Fuchsius*, *Turner*, and *Lugdunensis*: the third *Camerarius* saith that it was sent him out of *Italy* by the name of *Siler Creticum*, and is the *Rosmarinus Selini folio*, that *Honorius Bellus* maketh mention of in his first Epistle to *Clusius*, & saith is fully called *Siler Creticum* by many, but is by him taken to be the true *Libanotis Theophrasti*, to whose judgement I adhere thus farre, that it is the truest and the likeliest of any other we know extant; the last is called by *Camerarius* in *horto Seseli Aethiopicum alterum*, and saith the feede was in smell and taste somewhat like Cinamon: *Bauhinus* calleth it; as I doe, *Libanotis latifolia Aquilegia folio*. *Bauhinus* in his pinax maketh another lesser sort of *Libanotis* which he calleth *Apij folio*, and referreth the *Daucus anguloso caule* of *Cordus* in his history thereunto, and likewise the *Libanotis alba minor* of *Thalys*, whereas both it and that of *Cordus*, as also that *Libanotis Theophrasti minor* of *Lobel* are all comprised under his *Latifolia altera five vulgairo*, and are not severall plants, as I thinke.

The Vertues.

This herbe Francumfence is of a mollifying and digesting qualitye, helping the old griefes of the breast and lungs, the falling sicknesse, and the jaundise, if it be taken with Pepper in wine: it increaseth milke in Nurseries, breast,

breasts, if the roote be taken in wine, it likewise easeth the paines of the stomacke and belly, and the biting of venomous beasts and Serpents, procureth womens courses and the urine being stopped: the leaves being bruised and applied staich the bleeding of the piles or hemorrhoidall veines, the heate also and swelling of the fundament, and bringeth those hard tumours and impostumes to ripenesse, which doe hardly yeeld to be easily cured: the dried roote mixed with honey and put into foule ulcers cleneth them thoroughly: it helpeth likewise those that are bursten, or that have convulsions and crampes, and the gout, being bruised and applied with the meale of Darnell and some vinegar, and being used with vinegar, it taketh away the morphew or discolouring of the skin, or the leprye also: the iuyce of the leaves and rootes cleareth the eye-sight, and sharpneth it, and also the rheume fallen into them, applying it to the forehead: the feede also of any of these sorts doe the like, but if it be that feede, which is called *Cachrys*: that is forbidden to be taken inwardly, by reason of the causticke and burning qualite therein to inflame the mouth and throate being taken or drunke.

CHAP. XLIIII.

Spondylium, Cow Parsneppe.

Although formerly there was but one sort of the Cow-Parsneppe knowne and divulged to the world, yet there are now divers others found out, some in our owne land, and some in others, all which shall be entreated of together in this Chapter.

1. *Spondylium vulgare*. Ordinary Cow Parsneppe.

The ordinary Cow Parsneppe groweth with three or foure large spread winged rough leaves, lying often upon the ground or else raised a little from it, with long round hairy foote stalkes under them, parted usually into five divisions, the two couples standing each against other, and one at the end, and each division or leafe being almost round, yet cut in somewhat deeply on the edges, in some leaves and places, and not so deepe in others, and of a whitish Greene colour, smelling somewhat strongly; among which riseth up a round crested hairy stalke two or three foote high, with a few joynts and leaves thereon, and branched at the toppe, where stand somewhat large umbells of white flowers, but sometimes a little reddish, and after them flat whitish thinne winged feedes, two alwayes joyned together, as is usuall in most of these umbelliferous plants: the roote is long and white, with two or three long stringes growing downe into the ground, smelling likewise strongly and unpleasant.

1. *Spondylium vulgare*.
Ordinary Cow Parsneppe.

2. *Spondylium majus* sive *Acanthus Germanicus* major.

The great Cow Parsneppe of Germany.

This greater sort differeth onely from the former, in the largenesse both of leaves and stalkes, being neere twise as large, I meane every single leafe or division, which are seldome above three on a great long foote stalke, above halfe a foote long, unto the leafe, which is hairy and rough, of the like evill Greene colour, and a little foulded in or crumpled, and dented besides on the edges, the flowers and feede are alike, but larger, as I said, growing higher, of an hot unpleasant taste; but not so unpleasant as the other: the roote is white, and like the other but greater.

3. *Spondylium majus* aliud *Laciniatis* folijs.

Jagged Cow Parsneppe of our owne Land.

This jagged Cow Parsneppe groweth as high or rather higher than the last, and with greater stalkes, and a white hairinesse on them, the lower leaves grow very large and much spread, divided into five parts or winged leaves, two couple standing directly each against another, but of another forme, for each of these leaves or divisions are parted into distinct parts, yet closely joyned at the bottome, the two sides leaves or divisions being not of halfe that length that the middlemost is, which is in some above fixe inches long, in others above five, and not above halfe an inch broad, each of them having a deeper cut or notch at the bottome, than is on the rest of the leafe, which yet is dented with greater notches than in most usuall herbes, the upper or end leafe being usually parted into five long divisions or leaves, dented in the like manner, little or nothing hairy, but of a deeper Greene colour on the upper side, and grayish underneath, the umbells of white flowers are as large as in the last, and the flat thinne, white, feede is so like, but a little whiter, that they are hardly discerned one from another, but onely in the taste and smell, which is little or nothing in either: the roote is great, thicke, and white, living with me after feede time, and springing a new every yeare.

4. *Spondylium Alpinum parvum*. Small mountaine Crow Parsneppe.

This small sort hath a stalke a foote high, parted into two or three branches, and pale Greene great leaves on them, some whereof are parted into three divisions, and others into five, being somewhat round some of them, and

2. 3. *Spondylium majus* & aliud *Laciniatis folijs*.
The greater Cow Parsneppe of Germany:
and another with jagged leaves.

5. *Spondylium Alpinum glabrum*.
Smooth mountaine Cow Parsneppe.

and others pointed, hairy likewise, and dented about the edges, the flowers on the umbells are white, and the seeds thinne and broad.

5. *Spondylium Alpinum glabrum*, Smooth mountaine Cow Parsneppe.

The roote hereof is white and great, the stalke joynted, and two foote high, the leaves are like unto Figg-leaves and smooth, being a hand breadth long and two broad, besides the foote stalkes which are a little rough, usually divided into three parts, but not to the middle and dented about the edges: the toppes of the branches have umbells of smaller white flowers standing on them than in the other: the seeds is flat and round, but having a small pricke or point at the end.

The Place and Time.

The first groweth in moist meowes, and the borders or corners of fieldes, and neere ditches generally through the land: the second is proper onely to Germany, as I thinke: the third was found by Mr. George Bowles a worthy and industrious Gentleman in Shropshire, as I take it: the fourth on the *Alpes* of Austria: the last on the *Alpes* of Bassil: they doe all flower in July and seeds in August.

The Names.

It is called in Greeke *σπονδυλίον* and *σπονδυλίον* *Spondylium* and *Spondylion*, for both are extant in good authours, derived as it is thought from *σπονδυλ*, a flie stinking like this: *Matthiolus*, *Gesner*, *Lobel*, *Dodonæus*, and others doe call it *Spondylium*; but *Tragus*, *Cordus*, and some others call it *Branca ursina*, and *Fuchs* *Acanthus vulgaris* sive *Germanica*, and so is most usually the second sort called by divers; and this is the plant, as I thinke, that *Dodonæus* in his Chapter of *Panax*, did rather take to be *Spondylium alterum*, because it bore white flowers, and as I said, is very likely, for that which *Lobel* saith, he saw with yellow flowers was a *Panax*, and not this: the third as it is a plant lately found out to grow in our owne land, so I have given it a name, correspondent, as I thinke to the forme, yet I thinke verily it is the same that *Bauhinus* hath described in his *Prodromus* by the name of *Spondylium hirsutum folijs angustioribus*, and is, as I also verily thinke the same that *Matthiolus* set forth for his fourth *Crithmum* and *Lobel* in his Observations (finding fault with *Matthiolus* for so calling it) *Eryngium montanum recentiorum alterum*, which why they should set it, the one with the *Eryngia* bearing an umbelliferous toppe, such as none of them doe, or that it should be called an *Eryngium*, the other with the *Crithma* I somewhat marvelle: the two last are specified by *Bauhinus* in his *Prodromus*, by the same titles that I give them: the *Italians* call it *Sfondilio*, the *French* *Brance ursine*, the *Germanes* *Bernclaw*, the *Dutch* *Beerenclaw*, and we in *English* *Cow Parsneppe* and *Meadow Parsneppe* by some.

The Vertues.

The seeds of Cow Parsneppe, as *Galen* saith, is of a sharpe and cutting qualitie, and therefore is a medicine fit to be

be given to those that have the cough and shortnesse of breath, or the falling sicknesse, or the jaundise; the roote is of the like qualitie, and avaleable to all the purposes aforesaid, and besides, is of great use to take away the hard callous skin that groweth on a Fistula, if it be scraped upon it: the seede likewise hereof being drunke doth cleanse the belly from tough flegmaticke matter abiding therein, easeth them that are liver growne and womens passions of the mother, as well being dtunke, as the smoke thereof when it is burned received underneath, and likewise raiseth such as are fallen into a deepe sleepe, or have the lethargie by burning it under their nose, and if it and the roote be boiled in oyle, and the head rubbed therewith, it helpeth not onely those that are fallen into a frensie, but those that have the lethargie or drowisie evill, and those that of long time are troubled with the head-ach, if it be likewise used with Rue: it helpeth also the running scabbe, and the shingles: if the juyce of the flowers be dropped into the eares that runne, and are full of matter, it cleanseth and healeth them. It is said that the people of *Polonia* and *Litwania* make a certaine decoction of the leaves and seede hereof, putting barme there- to as is used in beate with us, whereof the poorer sort doe usually make their drinke.

CAR.

CARDUI ET SPINOSÆ PANTÆ. THISTLES AND THORNIE PLANTS.

CLASSIS NONA, THE NINTH TRIBE.

CHAP. I.

Cardui & Spinosæ Plantæ. Thistles and Thorny Plants.

Unto the Thistles I thinke meete to joynē such prickly or thorny Plants, as werē neither fit for any of the former or subsequent Classis; yet I must except out of this number (although they pertain to the Classis) those Thistles, or other prickly plants, as I have entreated of in my former Booke, referring those that would be informed of them to the Booke it selfe; whose names are these: *Acanthus sativus*, and *sylvestris*, *Eryngium Pannonicum* five *montanum* flore ceruleo & flore albo, *Carduus mollis*, *Carlina humilis*, *Carduus Spheroccephalus* five *globosus* major & minor, *Carduus Erioccephalus* five *Tomentosus*, id est, *Caput manachi* five *Corona fratrum*, *Cimara diversarum specierum alimentosa*, & *Carduus benedictus*.

1. *Carduus pratensis latifolius*. Broad leaved field Thistle.

The broad leaved field or meadow Thistle sendeth forth sundry large and long leaves cut in on the edges, and every part finely dented, and set with small prickles that are very tender, of a whitish Greene colour: those that grow up higher upon the stalkes are smaller, two of them set together at a joynt where they so compasse it, that they will containe water in them, even as the Teasell doth, at the toppes upon long stalkes grow single Greene prickly heads, out of which start pale coloured thrummes, compassing a few purple threads in the middle, and after they are faded and gone, small whitish feede somewhat bigger than those of *Cyanus*, Corne flower, or Blew-bottle wrapped in downe, as all the sorts of Thistles are: the roote is somewhat long and great, abiding divers yeares.

2. *Carduus pratensis Acanthi folijs laciniatis*. The yellow jagged meadow Thistle.

This meadow Thistle hath very large leaves, almost a foote long and somewhat broad, cut in on both sides into foure or five deepe gashes, even to the middle ribbe, set with prickles at the dents of the edges, from whence riseth up a straked stalke about two foote high, set with a few lesser leaves, at the tops whereof stand divers small Greene prickly heads, and out of the middle yellow threads or thrummes, which after wards give feede inclosed in downe: the roote is great, long, crooked, and speading in the ground.

3. *Carduus bulbosus Mongelienisum*. The French bulbed Thistle.

The whitish leaves of this Thistle are of an hand breadth long, somewhat fat and thicke cut in on the edges, but not very deepe, armed at every dent with small sharpe prickles: the stalke is two cubits high hairy and slender, with few or no leaves thereon, at the toppe whereof stand harmelesse prickly heads upon long foote stalkes, and out of them pale purplish thrummes, wherein after wards lie the feede inclosed in much downe: the roote is composed of divers tuberous small long clogs like unto those of the Asphodill fastened together at the head.

4. *Carduus Pratensis Asphodeli radicibus*. Meadow Thistle with Asphodill rootes.

This Thistle hath divers blackish cloggie rootes like unto the Asphodill or Piony, which whither and perish every yeare (but give encrease from it before) which sendeth forth divers thicke, and long pale Greene leaves.

N n n n

Cut

cut into many parts, armed with sharpe prickles on all sides, every pricke ending in three points, from whence riseth up a tall stalke, somewhat branched with one or two prickly heads at the toppes of every one branch, out of which come purplish flowers, and afterwards small long seede wrapped in downe.

5. *Carduus pratensis polycephalos*. The many headed meadow Thistle.

This Thistle hath but few leaves lying next the ground, being both short and narrow, armed with sharpe and long prickles, the stalke is round straked and without prickles, spread into sundry small branches bearing many small heads with purplish flowers, made of thrummes or threads thrusting out of the middle of them, but set with large and sharpe prickles: the seede is inclosed in downe as the rest are: the roote is long, hard and woody.

6. *Carduus palustris*. The moist Medowes Thistle.

The roote of this Thistle is single, the stalke three cubits high, straight and full of prickles, thicke set with darke Greene leaves unevenly waved, and sometimes more deeply cut in on the edges, having a few prickles at them, and branched toward the toppe, with many small heads upon slender stalkes, and reddish purple flowers like others, and then turne into downe.

7. *Carduus Ceanothos five viarum & vinearum repens*. The Creeping way or Vineyard Thistle.

The rootes of this Thistle are very small and whitish, running both deepe and farre about under ground like unto quiche grasse, but have no knotted joynts therein like it, but shooteth up heades of leaves from the branches of the roote, so that it will be as ill, or worse than Quiche to weede out, if it be once got into a ground: the leaves are of a pale Greene colour, somewhat like unto the rough or prickly Sowthistle, a little cut in, and as it were crumpled on the edges, armed with very swall, and sharpe hard prickles, the stalke groweth to be a yard high, straked and prickly, with some such like leaves thereon as the lower be, but smaller to the toppes where it is stord with cruell sharpe prickly heads and purple flowers made of thrummes in the middle passing into downe.

8. *Carduus Avenarius five Muscatus*. The Oaten land or Muske Thistle.

This Thistle that riseth sometimes to the height of a man among the corne, is found growing lower in other places, having divers very sharpe prickly jagged leaves set round about the stalkes, and at the toppes where they are branched many small short heads set close together, out of which come the flowers consisting of threads or thrummes, as in other Thistles, some whereof will be white, some of a deeper, and others of a paler purple colour tending to a bluish in many places smelling sweete like Muske, which being faded, the seede followeth wrapped in much downe like the rest.

9. *Carduus Creticus minimus*. The small Thistle of Candy.

This small Thistle hath rising from a small long roote divers long leaves, somewhat like unto the *Attrastylis* or Distaffe Thistle, but smaller, and armed with sharpe prickles: the weake leaning stalkes are divided usually into two other, betweene which groweth on a foote stalke a small Thistle-like head armed with a dozen very small long prickles standing up round about it, being so finely netted that it maketh admirable the Workemaster, the middlemost head, ever growing lower than the rest round about it: when these heads open, the blew flower appeareth never spreading much, after which come small white seede inclosed in a little downe, which will flie away with the winde, the heads are sweete and edible before they flower.

The Place.

All these sorts of Thistles grow in fields and medowes in Vineyards and grounds sowne with corne, as well in our owne Land, as beyond the sea, some of them also on Heäthes, Greenes, and wast grounds in many places, as the *Ceanothos* on Kentish Towne Greene abundantly.

1. *Carduus pratensis latifolius*.
Broad leaved field Thistle.

3. *Carduus bulbosus Montpelien sum*.
The French bulbed Thistle.

4. *Carduus pratensis Asphodeli radicibus.*
Meadow Thistle with Asphodel roots.

7. *Carduus Ceanothus sive viarum & vinearum repens.*
The creeping way or Vineyard Thistle.

8. *Carduus Avenarius sive Muscatus.*
The Oatland, or Muske Thistle.

9. *Carduus Crinitus minimus.*
The small Thistle of Canoe.

2. *Cirsium majus latifolium.*
The great soft Melancholy Thistle.

3. *Cirsium aliud montanum.*
Another soft Melancholy Thistle.

4. *Cirsium Anglicum primum.*
The first English Cirsium.

5. *Cirsium aliud Anglicum.*
The other English Cirsium.

time while it perfecteth the seede, which is of a meane bignesse lying in the downe: the roote hath many long strings fastned to the head or upper part which is blackish and perisheth not.

5. *Cirsium aliud Anglicum.* The other *English Cirsium.*

This other *English Cirsium* is very like unto the former *English* kinde, whose leaves are as little prickly; but more hoary underneath and more Greene above: the stalke also which is about two foote high beareth but one large scaly head with many purple theads and Thistle like seedes lying in downe: the roote is somewhat tuberos at the head, and blackish on the outside with divers fibres thereat, and shooting forth long strings which send forth heads for encrease.

6. *Cirsium angustifolium Germanicum.*

Narrow leaved *Cirsium* of Germany.

This *Cirsium* hath divers long and narrow darke Greene leaves lying on the ground, dented and set with a few prickles, the stalke riseth to be two foote high, set from leafe to leafe with sharpe filmes which make the stalke seeme winged, having shorter leaves, more prickly and more divided on them then those below, branched into many parts, each bearing naked long stems and single small heads at the toppes which are prickly like the rest, and have purplish red threads in the middle of them as the others.

7. *Cirsium montanum capitulis compatis.*

Mountaine *Cirsium* with tufted heads.

This mountaine *Cirsium* hath softer leaves then the former, and somewhat more cut in on the edges, being long and somewhat narrow, and set with small prickles: the stalke rising to be two or three cubits high hath divers the like leaves thereon but lesser and lesse divided, bearing at the toppe a tuft of many small scaly and prickly heads set together with purplish red threads in the middle: the roote is made of many long strings and abideth long.

The Place.

The three first sorts grow in those fields that are on the mountaines in Germany in many places: the fourth and fift in many moist meadowes of our owne Land as well in these Southerne as in the Northerne parts: the sixt was found on the hill *Walsersfall* not farre from *Basil*: the last by *Mompelier* in the moist grounds neare the outer towne.

The Time.

All these Thistles flower about *July* and some in *August*, their seede ripeneth quickly after.

The Names.

It is called in Greeke *κίρσιον* and not *κίρσιον* as divers suppose for it commeth from *κίρσιον* i. *varices quas sanet ut Dioscorides refert*, the Latines also call it *Cirsium* and some *Spina mollis*. *Fuchsius*, *Ruellius*, and *Lonicerns* in their times thought that the great *Euglossum* was both in outward shew and inward qualities not much differing from it, but herein they were much mistaken as *Martiholus* observed and objected against them. *Lobel* supposeth that none of these come so neare the description of *Dioscorides* his *Cirsium* as the third sort here expressed. The first *Clusius* maketh his first *Cirsium*, whereunto the former *Cardus bulbosus Monspelienis* was like, which *Bauhinus* calleth *Cirsium maximum Asphodeli radice*: the second is the first *Cirsium* of *Dodonaeus*, as *Lugdunensis* setteth it downe from his French booke, and the third in his *Pemptades*, which *Bauhinus* calleth *Cirsium Latissimum*, making it another sort, whereby he confoundeth the next which is my third together, which is the first *Cirsium* of *Dodonaeus* in his *Pemptades*, and the third *Cirsium* of *Clusius* which *Bauhinus* calleth *Cirsium singularibus capitulis parvis*: the fourth and fift are generally called *Cirsium Anglicum primum* and *alterum*, and of *Clusius* *Cirsium Pannonicum primum pratense*, and *Cirsium Anglicum* or *Britannicum secundum*, the sixt *Bauhinus* entitleth *Cirsium angustifolium*: the last is the *Cirsium* of *Martiholus*, *Gesner* in *hortis*, *Lacuna*, *Lobel* and *Lugdunensis*, and is the second *Cirsium* of *Dodonaeus* in his *Pemptades*, and the fourth of *Clusius*, which *Bauhinus* calleth *Cirsium folijs non hirsutis floribus compatis*. The Italians call it *Cirso*, and so doe all other nations, but with little varying termination, and because I would have it beate an *English* name in some sort answerable to the effects and use I have entituled it, The soft Melancholy Thistle.

The Vertues.

There are no other properties found out or knowne whereunto any of these Thistles may be applied then such which *Dioscorides* setteth downe taken from *Andreas* (who brought in many figments and untruthes to be used in Physicke) that the roote thereof being bound unto the veine in the legge or other parts of the body swollen with Melancholy blood doth quickly helpe and heale it.

CHAP. III.

Atractylis. The Distaffe Thistle.

His *Atractylis* or Distaffe Thistle is accounted a wilde kinde of *Cnicus*. The sorts whereof I have set forth in this Booke here before, and the *Cardus Benedictus* Blessed Thistle in my former Booke accounted another sort of this *Atractylis*, which I shall not need to describe againe; the other sorts I shall shew you here.

1. *Atractylis flore luteo*. The yellow Distaffe Thistle.

This wilde bastard Saffron or Distaffe Thistle (for so it may by both names fitly be called) hath the lower leaves somewhat long and narrow, much cut in on the edges, very hairy, or as it were a little hoary, and not prickly while they are young, and before the stalke riseth, but then are harder and more prickly, and still the higher, the more sharpe set with prickles, which rising to be three or foure foote high, are rough, round, and branched, from the middle upwards, & hath at the top of every branch a few smaller, but more prickly leaves, under every prickly head, which from the middle of them shoote forth a few pale yellow threads, which are the flowers, and being past have in them divers blackish hard seeds somewhat bigger than those of the Garden *Cnicos* or bastard Saffron, and lesser than those of *Cnicus alter Clusij* lying in downe, but nothing so much as in it: the roote is whitish and woody, perishing every year after feede time: the leaves hereof before they grow hard and old being gently broken but not bruised, will yeeld a reddish or bloody juyce.

2. *Atractylis flore purpureo*. Purple Distaffe Thistle.

This Thistle differeth from the last in the flower, which is of a purplish red colour, and in the leaves that they are not hairy or hoary, and in the stalke that it riseth seldome so high, in all other things it is so like it, yea even in the bloudy juyce also, that one would say it were the very same.

3. *Atractylis purpurea Cypria*.

The purple Distaffe Thistle of Cyprus.

This Thistle that *Angulata* setteth forth, and *Lugdunensis* after him hath leaves like unto the manured *Cnicus*, or bastard Saffron, but lesser and somewhat rugged or crumpled, from among which riseth up a stalke, bearing a Thistle-like head at the toppe, from whence spring slender branches, bare or without leaves, halfe a foote high or more, having on each of them a small prickly head, with a purple flower in the middle (like unto an *Avenone*, as they say, but how truly I cannot tell) but in other places inclining to yellow: the whole stalke and branches rise to a cubits height, and have white seede like unto *Cnicus* of bastard Saffron,

The Place.

Clusius saith he found the first in the corne fields of Seville and Corduba in Spaine: the second and third grow in many countries, as about Mompeliser, and Narbone in France, in Italy, Greece, &c. the last is said by *Angulata* to be found in the Ile of Cyprus, and *Lugdunensis* saith it is also found in France, but somewhat differing in the colour of the flower.

The Time.

They flower towards the end of Summer, and the seede ripeneth in the end of August, yet the last doth flower and seede sooner than the other sorts.

The Names.

The Greeke call the manured kinde *κνίκος Cnicus*, and so doe the Latines also, and *Cnicus* of some, it is thought *κνίκος* quod mordere aut pungere significat, vel *κνίκος* quod pungendo pruriginem excitat quod de sylvestri potius quam de sativo, dici potest: or rather from the colour of the flowers, Cum *κνίκος* expo natur croceus vel rutilus: the Arabians call it *Kartam*, from whence the names *Carthamus* is deduced, whereby it is knowne in the Apothecaries shoppes, hereof there is two principall kinds, the manured or tame, and the wilde; as *Discozides*, *Theophrastus*, and *Pliny*, from them doe set downe; of the wilde kinde there are two sorts recorded by *Theophrastus*, and *Pliny* from him, the former more upright, and like unto the manured kinde, which of divers is taken to be *Atractylis*, the other trailing on the ground, and more like a Sowthistle, which of all in generall is taken to be our *Cardus benedictus*, unto the former *Theophrastus* giveth a blacke and a greater fruit, and more bitter than the other: but *Pliny* unto his former giveth a white great and bitter seede, which because that *Pliny* saith the former *Cnicus sylvestris* was called *Atractylis*, hath bred much controversie among many worthy Writers, some affirming the *Cnicus sylvestris* prior to be *Atractylis*, and others refusing that opinion, because that *Theophrastus* speaketh distinctly of them both in severall places: but notwithstanding, that allegation, which is the same that *Matthiolus* useth, who so shall heedfully observe the said places in *Theophrastus* (*Guilandinus* in Papyro, giving this note, that there are many things twise spoken of in him, by sundry names) shall certainly finde that the *Atractylis* here set downe, both is the same *Atractylis* with him and *Discozides*, and the *Cnicus sylvestris* prior of *Theophrastus*, and *Pliny* notwithstanding, the divers relation of the seede, as is shewed before: for there never could be heard of any that could shew any *Cnicus sylvestris* with a white seede; and our *Atractylis* doth to fitly answer in

1. *Atractylis flore luteo*.
The yellow Distaffe Thistle.

all things the unto, the seede being blacke and bitter also that none can doe more, as also in that property peculiar to *Atracylis*, as *Theophrastus* recordeth, which yeeldeth a bloudy juce as ours doe, and therefore, as he saith, was called *πρωτοκρυσ*, and is taken from the leaves, not by bruising and wringing out the juce, as the juce of other herbes are taken, but droppeth out of the veins of the leaves of it owne accord, being broken off and laid in any thing to receive it, in the same manner as I have shewed you here before the juce of *Alces* is prepared, and that I may enforme you thoroughly how to doe it, the time is chiefly to be regarded, that is, while the leaves are young, or before they grow hard and saplesse upon the stalkes when they are old; for both leaves, stalkes, and the young heads being broken off will yeeld that red or bloody juce. The *Atracylis* is in some copies of *Discozides*, as *Matthiolus* sheweth, called *Cnicus sylvestris*, and derived from *ερεβρις*, id est *fusus*, whereupon *Gaza* translatheth it *Fusus agrestis*, the dried stalke whereof, as *Discozides* saith, the women in ancient times used in stead of a Rocke or Distaffe, yet *Columna* thinketh it tooke the name from the head, which being stored, as he saith, with hoary downe, the rest of the stalke underneath being bare resembleth a Rocke or Distaffe with wooll upon it, and thereupon some called it also *Colus rufica*, howsoever *Matthiolus* thinketh, that the diversitie of these names should certainly demonstrate two severall plants, for you see they are indifferently used, and so called by the oncient Authors themselves, viz. either for a Rocke or Distaffe, or for a Spinde. The first here set downe, is called by *Clusius* *Cnicus alter*, because, as he saith, it is so like the first *Cnicus* called *sativus*, and from him *Camerarius*, *Lobel*, *Lugdunensis* and others doe so call it, or *Cnicus carneus*: the second and third is called *Atracylis lutea* & *purpurea* by many Authors, but *Banbinus* in striving to shew a *Cnicus sylvestris* differing from *Atracylis*, hath in my opinion erred much: for as I said before, the most judicious of our times can finde no other *Cnicus sylvestris*, but the *Atracylis* which he doth not so acknowledge, but maketh the *Atracylis* of *Matthiolus* (whom *Castor Durantes*, *Lacuna*, *Lugdunensis* and *Gerard* do follow, exhibiting the same figure of his, which is acknowledged by *Camerarius* to be a false one) to be the true *Atracylis*, which *Matthiolus* himselfe did not so acknowledge, because, as he said, it wanted the true propertie of *Atracylis* to yeeld a bloody juce, and moreover confoundeth the *Carlina sylvestris* of *Clusius*, with the *Carduus vulgarissimus viarum* of *Lobel*, and his *Cirsium luteum Sequanorum*, and maketh the *Acarus* of *Lugdunensis*, and the *Scolymus* *Pliny* of *Dodonaeus* to be the same *Atracylis* of *Tragus*, *Fuchsius*, *Cordus*, *Gesner* and others, which he would rather call *Cnicus sylvestris spinosior* than *Atracylis*, as also making the *Atracylis* of *Columna*, to be a differing herbe from that of those former Authors, when as his description and notes thereof shew it to be the same and no other. *Banbinus* againe maketh the *Atracylis* *Cypria* of *Angulara* and *Lugdunensis* to be the same *Atracylis* flore *purpureo* of *Lobel*, *Dodonaeus*, and *Lugdunensis*, when as they plainly distinguish them; and lastly, he maketh the *Chalochierni* of *Honorius Bellus* mentioned in the first Epistle he wrote to *Clusius*, to be a differing plant from *Atracylis vulgaris*, when as *Clusius* himselfe saith that saw it growing with him that it was like the ordinary *Atracylis*. It may be called in *English*, either wilde bastard Saffron, as referring it to *Cnicus* or Distaffe Thistle unto the *Atracylis*.

The Vertues.

The *Atracylis*, as *Galen* saith, is of a drying faculty, and moderately digesting, *Discozodes* saith that they shall feele no paines of the stinging of the Scorpion for so long as it is held by them, but that the paines returne as soone as they lay it by. *Pliny* saith that it helpeth greatly against the venome of all creatures, as also against the harme that commeth by eating Mushromes: I finde no propertie expressed of the other bestard Saffron of *Clusius*. The properties of the Spanish Saffron or garden bastard Saffron called *Cnicus*, is briefly set downe in my former book: but because I was therein more short than was convenient or expected, I thinke good to set downe the vertues thereof in this place somewhat more amply. *Galen* saith little of it, the seede onely, saith he, is used onely for purgations, and is hot in the third degree being outwardly applied: but *Mesues* speaketh more largely thereof in this manner: it is hot in the first degree, and dry in the second; the pulpe or kernell of the seede is chiefly used, yet the flower is not unprofitable, which being taken inwardly purgeth flegme and water by vomit, and so doth it also being used in a glister, which therefore is profitable against those diseases are bred thereof, as also the collicke and the like: it cleanseth the stomacke and lungs of tough flegme sticking therein, especially being made into an Electuary or Lohoc, with the oyle drawne from the seede, which also maketh the voyce cleare that was hoarse, as also encreaseth the sperme, if be much used, but it is of evill nourishment, very hurtfull to the stomacke, and procureth loathing and trouble therunto, he therefore adviseth to use stomachicall helpes, as *Aniseede*, and *Galanga* or *Masticke* if neede be, or of those that are more forcible, that is, *Cardamomes*, *Ginger*, and *Salgemme*, which quicken his operation, and preserve the inward parts from harme: the flowers thereof taken with sweete wine helpeth the jaundise, for it cleanseth and openeth, yet in a meaner degree than the milkie herbes, (which I understand to be the *Tithymales*) the Lohoc that *Mesues* so much commendeth against the defects of the chest and lungs is made in this manner. Take three drammes of the inner kernells of the seede of *Cnicus* or *Carthamus*, one dramme of Almonds, and halfe a dramme of Pineapple kernells, these being made into an Electuary with honey, wherein the dried scales of *Scylla* have bene boyled is admirable good for the said purposes. This note is given also of the seedes hereof, that those that come out of the *Levant* countries are more quicke in purging, and more powerfull in operation than those of these neerer parts.

CHAP. IIII.

Acarus. The Fish Thistle.

Because this Thistle is said to be so like unto the *Atracylis* and *Cnicus* that it might bee the same, onely differing in the colour of the leafe and juce, I thinke it not amisse to joine it next therunto: but because the ancient Writers thereof, which are *Theophrastus* and *Pliny* have beene very brieft in the description thereof, or rather have given none at all, or but by comparison, the moderne authors have referred divers Thistles therunto as every ones opinion led them, of all which it is not amisse to speak in this Chapter, and whichall to shew you which of them is held to come neereft unto that of the ancients.

Acarus

1. *Acarna flore luteo patulo*. The fifth Thistle with a broad yellow flower.

This first Thistle hath many leaves lying in a compasse upon the ground, smaller, narrower, harder and more prickly then either *Cnicus* or *Atractylis* of a yellowish Greene colour on the upper side and grayish underneath, whose prickles are small and yellow, and when the stalk being one or more riseth up are set thereon on all sides up to the toppe without order, where it brancheth forth into two or three parts bearing small prickly heads, from whence come forth the flowers composed of many small leaves of a yellow colour standing as a pale or border about a more yellow thrum, in forme of an After or Starwort, which when they are past the seede being small and grayish is found wrapped in downe: the roote is about a foote long of a fingers thickenesse, and of a whitish colour with divers fibres growing thereat, smelling sweet and yelding also a white milke sweet in taste and viscusous or clammy quickly growing thicke.

2. *Acarna flore purpureo rubente patulo*. The fifth Thistle with broad red dish flowers.

This small Thistle hath shorter and broader leaves then the former demed or cut in on the edges, and set with small sharpe prickles Greene on the upper side and grayish underneath: the stalk riseth nothing so high as the former, bearing smaller leaves thereon but not lesse prickly and such like heads and flowers at the toppes as in the other but that the pale or border of leaves are not yellow but reddish set about a middle yellow thrumme.

3. *Acarna altera Apula*. The Neapolitane Fifth Thistle.

This Neapolitane Thistles lowest leaves are spread on the ground somewhat like unto the *Atractylis* or distaffe Thistle, but broader and set with more and sharper prickles, from the middle of whom rise up divers somewhat reddish stalkes about a cubit high, having such like leaves set thereon which yeeld a white milke like the last, and bearing at the tops (not severall heads like the last but) a tuft or umbell of many small prickly heads set together, some what like unto the toppes of the blacke Chamæleon Thistle, and out of them rise small leaves as beards of a deepe yellow colour set about a middle thrum, of a paler yellow colour, the milkie juice that this giveth being condensate and made thicke is like unto Gum.

4. *Acarna globosis capitulis*. Round headed fifth Thistle.

This Globe Thistle is a small plant about a foot high shooting forth from the head of the roote which is long and small many leaves some of an inch or more, or two inches long, and scarse halfe an inch broad, much cut in on the edges, and thicke set with prickles, growing round about the stalk without order, at the toppe whereof is set a round head, netted as it were all over, and composed of many very small and narrow leaves, armed on both sides with long sharpe prickles, out of whose middle starteth forth a small yellow flower, from the toppe of which stalk springeth forth sometimes two other stalkes bearing each of them a round head like the other but lesser: the whole beauty of the plant consisteth in those round heads formed like a net.

5. *Acarna humilis caule folioso*. The low fifth Thistle with winged stalkes.

The stalk of this low thistle is winged from the bottome to the toppe that is having a jagged prickly filme set on both sides thereof, and long narrow jagged prickly leaves two set at a joynt, from whence it brancheth forth in divers places unto the toppes, and bearing thereon shining yellow flowers like those of *Cnicus* or *Atractylis* rising.

1. *Acarna flore luteo patulo*.
The Fifth Thistle with a broad yellow flower;

3. *Acarna altera Apula*.
The Neapolitane Fifth Thistle;

5. *Acarna humilis* caule folioso.
The low Bush Thistle with winged stalks.

6. *Acarna major* caule folioso.
Clusius his Chamaeum Thistle of Salamanca.

7. *Acarna major* caule non folioso.
The supposed true *Acarna* of Therophrastus.

8. *Acarna minor* caule non folioso, sine *Leo Carduus ferox*.
The cruel sharp Thistle.

ling out of long prickly heads, with such like leaves under them : the seede that followeth is small and blackish, but like unto the *Atractylis* or bastard Saffron : the roote also is not much unlike it perishing every yeare.

6. *Acarna major foliis caule*. *Clusius* his *Chamæleon Thistle* of *Salamanca*. The stalk of this Thistle likewise is winged like the last but not with so large a filme nor so much jagged, from whence shoot forth branches on all sides with longer and narrower leaves thereon, somewhat hoary and not so deeply jagged, but set with long & sharpe prickles, at the tops of the branches stand many such like sharpe prickly leaves, from among which rise five or six small prickly heads as it were in a tuft set together, out of which come pale purplish flowers consisting of threads, in which after they are past lye the seede wrapped in downe, in forme like unto the *Cnicus* or bastard Saffron but smaller and of a blackish gray colour.

7. *Acarna major caule non folioso*. The supposed true *Acarna* of *Theophrastus*. The true *Acarna* of *Theophrastus* as it is supposed by divers, hath sundry leaves lying on the ground in a compasse, which begin to wither as soone as they rise up with the stalk, being sometimes but one, and sometimes more, reddish and covered with downe, the leaves that are set thereon without order are long and narrow, and deeply endented, hoary or white underneath, thicke set with short prickles very like unto the upper leaves of *Atractylis* or *Dittasse* Thistle, whose toppes are set with such like leaves also, and very pale yellow flowers made of threads, rising out of the midst of small prickly heads, after which come small slender seede of the fashion of *Cnicus* : the roote is small short and white, with divers fibres thereat.

8. *Acarna minor caule non folioso* *seve* *Leo & Carduus ferox*. The cruell sharpe Thistle. This cruell prickly Thistle that is almost wholly composed of sharpe prickles, groweth little above an hand breadth high, whose leaves are long and narrow, thicke set with most cruell sharpe prickles on all sides, at the toppes stand yellow thrummy flowers in sharpe prickly heads, so strongly armed that the most cautious cannot touch it without being pricked : the roote is long and stringie.

The Place.

The first groweth in *Spain* as *Clusius* saith : the second and third in the kingdome of *Naples* : the fourth in *Spain* from whence *Gnilaume Boel* brought it, & shewed it us as well as *Clusius* who doth remember both him & it in the 66. page of his *Cure Posteriores* : the fifth *Lobel* saith groweth in the countrey of *Cran* among those of *Salon* in the Province of *France* : the sixth as *Clusius* saith about *Salamanca* in *Spain* : the seventh on the heath grounds among the *Sequanis* as *Lobel* saith, and the last on the *Appennine* hills, and in some places of *Italy*.

The Time.

Some of these Thistles flower very late with us so that there is seldome ripe seede to be gathered from them, others flower and seede in *July* and *August*.

The Names.

It is called in Greeke *ἀκάρνα* and *ἀκάρνα* and so likewise *Acarna* and *Acorna* in Latine, reckoned by *Theophrastus* and *Pliny* to be a species of *Cnicus* or *Atractylis* because it is so like that it might be said to be the same but, that the *Atractylis* is whiter and this more browne or yellow, and that it giveth not a blooddy juice which is proper onely to *Atractylis*. The first here set downe is thought to be *Eryngium Archigenis* which hath the leafe of *Atractylis*, and the yellow flower of *Bubibalthum*, with *Clusius* and *Dodonæus* it is *Carlina sylvestris minor*, with *Lobel* *Acarna* *seve* *Sequanorum* *Cirsij* *Carlinae* varietas, with *Lugdunensis* *Acarna* *similis* *Carlinae* *sylvestris* *minor*, and with *Bauhinus* *Acarna* *flore* *luteo* *patulo* : the second is called by *Columna* *Acanthoides* *parva* *Apula*, and by *Bauhinus* *Acarna* *flore* *purpureo* *rubente* *patulo* : the third is called by *Columna* *Acarna* *altera* *Apula*, and by *Bauhinus* *Acarna* *capitulij* *parvis* *luteis* *in* *umbella* : the fourth *Clusius* setteth forth in the 66. page of his *Cure posteriores*, by the name of *Carlina* *aliud* *genus*, but called by *Bauhinus* *Acarna* *capitulij* *globosis* : the fifth is called by *Lobel* *Picnomo* *Creta* *Salonen* *Gallop* *provincia*, by *Lugdunensis* it is called in his Chapter of *Atractylis*, *Atractylis* *marina* *Picnocomon* *Pene*, but in the Chapter of *Chamæleon* he giveth another figure with the same title of *Picnomo* *Creta* *Salonen* *Pene*, accounting it there to be a kinde of *Chamæleon* *niger* as *Lobel* and *Pena* themselves say it may best bee referred unto, yet *Bauhinus* maketh thereof no mention among the *Chamæleons* but in the *Scolymus* *Theophrasti*, by *Tabermontanus* and *Gerard* *Chamæleon* *niger*, and by *Bauhinus* *Acarna* *humilis* *caule* *folioso* : the sixth is the *Chamæleon* *niger* *Salmanticensis* of *Clusius*, *Dodonæus* and *Gerard* who follow him, by *Tabermontanus* *Chamæleon* *hispanica*, and by *Bauhinus* *Acarna* *major* *caule* *folioso* : the seventh is the *Acarna* *Theophrasti* of *Anguilara*, *Lobel*, *Lugdunensis* and *Tabermontanus*, called *Cirsium* *luteum* *Sequanorum* as *Pena* saith, and *Eristhales* of *Anguilara*, and is the most likely to be the true *Acarna* of *Theophrastus* and *Pliny*, as by all these mens judgements doth appeare, and called by *Bauhinus* *Acarna* *major* *caule* *non* *folioso* : the last is called by *Dodonæus* *Leo* *Carduus* *ferox*, and by *Lobel* *Phanix* *Leo* *Carduus* *ferox*, and by *Bauhinus* *Acarna* *minor* *caule* *non* *folioso*.

The Vertues.

The Vertues of *Acarna* either of the one or of the other are not set downe by any that have made experience of them, but as they are in forme nearest unto *Atractylis*, so they may be in qualities also, unto it therefore it may be referred untill more certaine prooffe hath beene declared of them.

CHAP. V.

Chamæleon & Carlina. The Chamæleon or changeable Thistle, and the Catline Thistle.

THe Chamæleon Thistle is divided by the ancient writers into white and blacke, both which I intend to shew you in this Chapter but the true knowledge of them and their right distinctions hath troubled many, as also whether the Carline Thistle be a different plant from the white Chamæleon Thistle.

1. *Chamæleo albus verus acanthus*. The true Chamæleon or changeable Thistle without a stalk.

The true Chamæleon or changeable Thistle without a stalk (which differeth from the Carline Thistle without a stalk as you shall heare by and by) hath sundry large leaves lying on the ground a foote long or more cut in on the edges and more prickly then the Carline Thistle, whose cuts or divisions are more like unto those of the Artichoke

Artichoke being white and as it were hoary and sometimes Greene, and reddish when they grow old, which variety (as *Dioscorides* saith was the cause of the name) would make many to believe they were differing plants and some had hairy underneath: among these leaves riseth a round hoary prickly head without any stalk, of the bignesse of a great Thistle head in which the flower is contained, and is not composed of a border of leaves with a middle thum as the Carline Thistle hath, but out of the head rise divers flowers made of threads, every one ending in five parts or points, in the same manner as is to be seene in the flower of the Artichoke, whereunto it is most like, but not of such a purplish blew, but rather of a pale reddish colour which withering, there groweth in the head small long and grayish shining seede, lying as it were at the foote of every flower as is usual in most Thistles, but are not thicke and round or cornered as *Cnicum* the bastard Saffron seede, and many other Thistles seede are, which when they are ripe the head openeth it selfe as other Thistles doe, and they together with the downe are carried away with the winde: the roote is somewhat thicke and long, reddish or brownish on the outside and white within, yielding plentie of milke if it be never so little broken or cut, which became it is very thicke and viscous hardeneth quickly and falleth into small droppes or peeces, of a strong but aromatically sent not unpleasant, and quickly piercing the senses, whose taste is sweete and fit to be eaten: about the leaves and prickly heads also hereof, is sometimes and in some places found a certaine peece of gumme sticking, which at the first is soft and glewif, and being dried is harder like unto the milkie gumme of the roote.

2. *Carlina humilis acutis.* The low Carline Thistle.

The low Carline Thistle (which is usually accounted for the white Chamaleon Thistle) hath many long and large leaves lying on the ground cut in on both sides, and set with sharpe prickles, but not cut in so deepe nor so sharpe as the former or true white Chamaleon Thistle, among which riseth a large head without any stalk, compassed about with divers long and narrow leaves, cut in on the edges and as prickly as the undermost, and both of a whitish Greene colour not varying as in the former, the head hath a number of whitish not purplish leaves unless it be a little purplish underneath, set about with leaves like a crowne or border as in the corne Marigold and many other the like flowers, which leaves are thinne somewhat long hard smooth and shining, the umbone or middle thumme being flat and made of many small and thicke yellow flowers like threads: this hath in some places a kind of viscous or glewif gum issuing from the roote as also about the Thistly head which being hardened resembleth white Mastick very notably; the head before it seedeth openeth in the day and closeth at the night.

3. *Carlina canescens.* The Carline Thistle with a stalk.

This Carline Thistle never groweth low like the last, but beareth a reddish stalk about a foote high, and thereon narrower greener and more prickly leaves then the low kinde, the heads of flowers at the toppe of the stalk are many, every one standing on his owne foote stalk, composed of a border of smaller leaves being hard, thin, smooth and whitish like the former, whose middle thumme is yellowish before the flowers therein begin to open but then are of a reddish purple colour, which thing unless one heede it well hee may thinke them divers plants: the roote is blackish on the outside, but whitish within, and as it were bitten off, which being cut or broken yeeldeth such like thicke white viscous milke, and hardeneth into a gumme as in the former, but of no sent

2. *Carlina humilis.* The low Carline Thistle.

3. *Carlina canescens.*
The Carline Thistle with a stalk.

at all, yet a little sweeter in taste, whereupon (saith mine author) we may judge it to be of the same kind but not the same plant.

4. *Carlina acaulis Septentrionalium*. Our low wilde Cerline Thistle.
This low thistle doth yearly send forth divers very long and narrow leaves very much cut in on the edges into many parts, set with small prickles and of a duskie Greene colour, not lying flat upon the ground but a little raised

4. *Carlina acaulis Septentrionalium*.
Our low wilde Carline Thistle.

7. *Carlina glauca major*.
The greater Carline Thistle.

6. *Cardus Pinea sive Ixine Theophrasti*.
The Pine apple Thistle.

Cardus Pinea capitulatus.
The head of the Pine apple Thistle.

up from it, among which at the latter end of Sommer commeth forth a short stalk scarce two inches long, bearing thereon a large round scaly and prickly head with many bright purplish threads rising out of the middle, which abide in their colour a long time, and being past among the downe in the head lye many small whitish or silver coloured seede, somewhat like unto the first Chameleon Thistle but shorter and smaller: the roote is great thick and blackish on the outside and whitish within enduring many yeares.

5. *Carlina sylvestris major.*

The great wilde Carline Thistle.

This wilde Carline Thistle hath sundry slender round but prickly stalks rising from a small long roote, bearing divers narrow long leaves thereon very prickly and somewhat like unto the former Carline Thistle, but lesser, and at the tops of each a flower, whose bordering leaves are yellow and the thrumme reddish.

6. *Cardus pinea seu Ixine Theophrasti.*

The Pine Thistle.

This brave Thistle hath a long thicke blackish yellow roote, of the thicknesse of ones thumb, growing smaller downe to the end, but white within, smelling sweete and tasting hot, somewhat like the Carline Thistle, but of a weaker and pleasanter smell: the many leaves that rise from thence are long and of a fingers breadth, with a middle rib therein, somewhat like to the leaves of Cyperus, but harder whiter and broader, without either dents, incisure or prickles; in the middle of which eaves lyeth hid a prickley head, armed fully with long prickles or thornes in manner of crosses, which growing ripe hath within it a hard white flockie substance, wherein as also from among the thornes without on the head, issueth forth a yellowish sweet gumme much like unto Mastick of a hot taste. *Alpinus* saith that both *Bellus* and *Bellonius* & *Dalechampsius* likewise took this thistle to be *Chameleo albus*, but untruly, for *Theophrastus* maketh mentiō of *Chameleo albus* in another place: but saith *Alpinus* *Chameleo albus* differeth not from *Chameleo niger* but onely in the colour of the leafe & therefore (saith he) I doubt not to affirme that the *Carlina* having blacker leaves then *Chameleo albus* which hath white leaves is the *Chameleo niger*, but *Theophrastus* putteth not any such difference in the leaves to be blacker or whiter, for that hee referreth to the rootes, and the leaves of the white *Chameleo* to bee greater and the blacke smaller then those of *Scolymus*, and such distinction in the leaves *Dioscorides* also maketh, but in shewing their differences more amply there *Theophrastus* saith, that the white *Chameleo* hath no stalk, and the blacke a stalk of a cubit height, the white hath purplish flowers and the blacke variable coloured flowers, and like a *Jacinth*, which by *Alpinus* his leave are not to be seene in *Carlina*.

7. *Chameleo niger verus.*

The true blacke Chameleon Thistle.

The blacke Chameleon Thistle hath many long leaves lying about the roote, much thinner and lesse prickly then the white Chameleon Thistle, much cut in also on the edges into many fine parts or jagges, which as the stalk that riseth up among them are sometimes Greene, and sometimes whitish, and sometimes reddish, which brancheth forth on all sides, and beareth at the toppes of them many small prickly heads in a tuft together, somewhat scaly, out of which come divers small long blew flowers, ending in five and sometimes in six sharpe prickly points or ends, somewhat like unto those of the Orientall *Jacinth*, with five or six white threads in the middle of them: the roote groweth great and thicke at the head ending in many great long strings, and is of a blackish colour on the outside and pale yellow within, of a most sharpe taste as the leaves are also, procuring itching, burning pimples, and almost exulcerating the skinne if the face or other tender part be touched therewith, or if the hands that have handled it doe touch the face as *Bellonius* hath observed.

The Place.

The first is not so frequently found in these Westerne or transalpine countries as the second which is usually found upon the hills and mountaines in many places of *Germany*, and the *Alpes*, where it is generally taken to bee the Chameleon Thistle, though called the Carline Thistle; but the true Chameleon Thistle is more frequent in *Italy*, *Greece*, and those parts where the Carline is more rare: the third is oftentimes found in the same places with the second and oftentimes by it selfe and in other countries also; and this wee have observed also that from the seede of the low kind sown in our gardens sometimes it hath growen high and not abidden low: the fourth is as frequent in our country, especially in *Kent* every where almost, as the former are in others, and is also found in *Germany* and *France*, especially the more Northerly parts: the fifth also many times with us, but the sixth onely in the warmer countries: the last is found but in *Greece* and *Asia* and those hotter countries.

The Time.

All these doe flower late in the yeare with us, but in Sommer in their naturall places, but the Carline Thistle will well abide the cold of our climate, although the white Chameleon will hardly, but the blacke and the Pine Thistle seldome doe abide.

The Names.

The Chameleon Thistles both the white and the blacke are called in Greeke *χρυσάινον* and *κόκκινον*, and in Latine *Chameleo* or *Chameleo albus* & *niger* (*Gaza* translateth them both *Vernilago*) and so called from the various appearance

appearance of the leaves, *Dioscorides* saith it of the white, but *Pliny* both of the white and blacke, the *Carline Thistle* is called in Latine *Carlina quasi Carolina*, for it is supposed that the great Emperour called *Charlemaine* had this herbe shewed him in his sleepe by an Angel, with the roote whereof he might cure his Army infected with the Plague: it is thought as I said of many to be the *Chamaeleo albus*, but of others observing the differences, it is thought not to be knowne to the ancient writers. *Lugdunensis* striveth with many words, and by altering and correcting the Greeke text of *Dioscorides* to prove them both one plant, yet lastly hee saith that many skillfull Herbarists did call *Carlina* *Ixine* *Theophrasti*: and so doth *Fabius Columna* indeede judge, and that the *Ixine* spina of *Theophrastus* (mistermed *Helxine* by *Pliny*) which *Gaza* translateth *Cardus pinca* & *Ixia* also, better doth agree with our *Carlina* then with the *Chamaeleo albus* of *Dioscorides*: and that because as it is likely hee never saw the true *Ixine* of *Theophrastus*, which is a much differing plant: but *Dioscorides* saith the white *Chamaeleo* Thistle was called *Ixia* by some in his time, because in some places there grew about the roote a kinde of birdlime, which the women used in stead of Masticke, and *Pliny* saith the *Cretanes* especially tooke a little thereof after supper, to keepe them waking in working in the night, but being a by name I thinke it also a false name, for *Ixia* is said to be a deadly poyson by *Dioscorides* himselfe, who sheweth it with the remedies thereof, in his sixth booke and 21. Chapter, and the roote of the white *Chamaeleo* is said by *Dioscorides* to be an *Alexipharmacum* or counterpoyson, so that it or any thing growing from it can no wayes be accounted deadly or dangerous: but that clammy gum or birdlime (call it what you will) indeede that groweth at the roote of the blacke *Chamaeleo* is truly called *Ixia* and *Ulophonon*, that is, the corruption or corrupter of the blood, and *Pliny* in his 22. Booke and 18. Chapter doth say that the roote of the blacke *Chamaeleo* was called *Ulophonon* and *Cynoalon* (mistaking *Dioscorides* his *Cynoalon*) and as it is set downe in the divers appellations of herbes attributed to *Dioscorides*, the blacke *Chamaeleo* also is called *Ulophonon* by some, and *Ixia* by others, and *Cynoalon*. Some also have affirmed as *Matthiolus* sheweth in his comments upon the *Ixia* of *Dioscorides*, that *Ixia* should be the *Ixine* of *Theophrastus* whom he confuteth effectually, shewing that *Theophrastus* in describing *Ixine* doth not declare any evill quality therein, but more then so, he saith that it yeeldeth a *Lacryma* or Gum that is of a good taste, and called *Acanthine* or *Spinallis Masticke* because it was so like Masticke, and grew on a Thorne or Thistle, and although as *Matthiolus* saith, he had not seene any Gum about the roote of *Ixine* (which hee mistooke for the white *Chamaeleo* both in that and in other places) in *Italy*, yet saith that such was sent him both from *Cortusius* of *Padoa* and *Calzolarius* from *Verona*, and saith also that hee under stood by a *Candidus* Herbarist, that the *Fletchers* in *Candy* did use the said Gum to fasten Feathers to Arrowes as others doe with Glew; *Matthiolus* setteth forth the *Carlina caulescens* (as it is judged by the best) to be the true *Chamaeleo niger* of *Dioscorides* and *Theophrastus*, although himselfe findeth some defect therein and likewise impugneth that which *Maranta* sent him from *Naples*, as not answering the description thereof, which is now received by the most judicious to be the indubitate blacke *Chamaeleo*. *Columna* seemeth to thinke in the discourse of *Chamaeleo albus* and *niger* that *Ixia* (and not *Ixine*) was a small low plant, more agreeing with the blacke then the white *Chamaeleo*, especially seeing that *Dioscorides* in the end of his Preface to his sixth booke numbred *Ixia* as well as *Chamaeleo* among the roots that are venomous. The first here set downe is the *Chamaeleo albus* *Apulus* *purpureo flore* *gummifer* of *Columna* differing from the usuall *Carlina* which is taken by many to be *Chamaeleo albus* as is evident the by description, it is also the *Chamaeleo albus* *gummifer* *Mastix ferens* of *Honorius Bellus*, expressed in his first Epistle to *Clusius*: but *Bauhinnus* calleth it *Carlina acaulis* *gummifera*, whereof I much marvaile that he should continue that opinion of *Chamaeleo albus* and *Carlina* to be both but one plant, knowing that *Columna* shewed them plainly in his booke to be different, although that *Carlina* as well as *Chamaeleo albus* giveth a like gum also: and that *Theophrastus* his *Ixine* hath such likewise which *Columna* as is sayd being deceived thought to be *Carlina*: the second is the *Carlina humilis* of *Columna*, taken by him to be the *Ixine* of *Theophrastus* as *Anguilara* did before him and *Dodonæus*, and called by *Lobel* *Carlina herbaceum* (yet thought by him & *Clusius* to be the *Chamaeleo albus* of *Dioscorides* as *Gailandinus* in *Papyro* did thinke before) as also by *Matthiolus*, *Cordus* and *Lugdunensis*, by *Cesalpinus* *Carlina vulgo*, and by *Gesner* in *hortis Cardopatum caule nullo*, by *Ericius Cordus* *Cardus pennis seu pacis*, by *Camerarius* *Carlina sessili flore*, by *Dodonæus* in former times taken to be *Spina Arabica*, and by the Monkes that commented upon *Mesues* *Acanthe* lence of *Dioscorides*, and by *Bauhinnus* *Carlina acaulis magno flore*: the third is the *Carlina caulescens* of *Columna* and *Camerarius* both in *hortis* and in *Epitome* by *Dodonæus* *Carlina five* *Leucacantha*, by *Cesalpinus* *Carline alterum genus*, by *Clusius* *Carlina major & elatior*, by *Lugdunensis* *Carlina caulem habens*, and taketh it also to be *Crocodilion*, by *Gesner* in *hortis Cardopatum flore albo caulem habens*, and called by *Lobel* *Chamaeleo albus cauledonatus*, but *Chamaeleo niger* by *Lacuna*, *Matthiolus* and *Lugdunensis*, *Chamaeleo niger vulgaris* by *Tragus* and *Besler* that set forth the *Hortus Eystensis*, by *Brunfelsius* as *Bauhinnus* saith in his *Matthiolus Eberwurtz*: that is, *Apri radix* (and from hence came the name of *Cardus Sniarius*) and *Cardopacis*, but in his *Pinax* he referreth this name of *Brunfelsius* unto the *Carlina acaulis*, so that it seemeth the *Germans* call both sorts *Eberwurtz*, he himselfe calling it in his *Pinax* *Carlina caulescens magno flore*, and in his *Matthiolus*, *Carlina caule donatus*: the fourth is called *Chamaeleo albus seu exiguus* by *Tragus* and *Lugdunensis*, and *parvus* by *Lonicerus*, by *Columna* *Chamaeleo Septentrionalium exiguus* appellatus, by *Lobel* *Cardus acaulis Septentrionalium*, by *Clusius* *Carlina minor purpureo flore*, who saith that some were of opinion that it did not seeme unlike unto the *Chamaeleo* of *Theophrastus* in his sixth Booke and third Chapter, and by *Bauhinnus* *Carlina acaulis minor purpureo flore*: the fifth is the *Carlina sylvestris vulgaris*, the sixth *Carlina sylvestris* of *Dodonæus*, and the *Acarua vel* *Cirsium luteū* *Sequanorum* of *Lobel*, &c. the sixth is set forth by *Alpinus* in his booke *de plantis exoticis*, and called also by him as *Gaza* did *Cardus Pinca*, but is not, although somewhat like the *Iacea pinca* called *pumila* *Narbon* of *Lobel*: the last is called *Chamaeleo niger* *Dioscoridis* by *Anguilara*, *Marantha*, *Cortusius*, *Camerarius*, *Lobel* and *Columna*, and *Chamaeleo niger* alter by *Matthiolus*, *Chamaeleo niger* *versus* *Dalechampy* by *Lugdunensis*, but thought to be *Crocodilion* by *Taber montanus*, and called by *Bauhinnus* *Chamaeleo niger umbellatus flore caruleo hyacinthino*. The *Italians* call the white and blacke *Chamaeleo* Thistle *Cameleon bianco* and *novo*, and the white more usually *Carlina*, the *Spaniards* call both sorts *Cardo pinto*, the *French* call the white *Charline* and *Chamaeleo blanc*, but the blacke *Chardonnette*: the *Germanes* as is said before call all sorts *Eberwurtz* as the *Dutch* doe *Eberworte*, and wee in *English* *Chamaeleo* Thistle or Changeable Thistle, white or blacke, or as they are set downe in their titles, and the rest accordingly.

The Vertues.

The roote of the white *Chameleon* Thistle, saith *Dioscorides*, taken to the quantitie of a spoonefull in red wine, wherein *Origanum* hath bene boyled killeth the broad wormes in the belly: a dramme thereof taken in wine helpeth dropie persons, for it extenuates their belly: the decoction thereof is profitable for them that cannot make water orderly; *Theophrastus* and *Pliny* from him saith, that the roote hereof cut into peeces & hung up on strings to drie, & after wards boyled in broath, or otherwise taken doth help the defluxions of rheume that fall from the head the eyes, teeth, nose, or lungs. If any, saith he, would trie whether a sicke person should die or live, if he beare and endure three times washing with the decoction of the roote he shall not die: it is as a Treakle or an antidote against poison being drunke in wine, and from hence it is supposed that the *Carline* Thistle roote was used against the plague in the Emperour *Charles* his army (although it be suggested to be declared by an Angell, without an Allegory or allusion to the good Angell from due observation and practise, which hath since found it very effectual both to resist the infection, as also very powerfull against the biting of a mad dogge, or the sting of Serpents, and yet *Dioscorides* saith, the roote of *Chameleon albus* given to dogs, swine, or mife, killeth them, which propertie is also found in divers other things, as on the contrary side divers creatures do feede on these things that are poysonous to men. The blacke *Chameleon* Thistle is said by *Dioscorides* to cure the itch, the roote being beaten and mixed with *Axungia* and so used, and being boyled in vinegar and some brimstone put to it killeth tetteres, and ringwormes: it clenseth the face and kinne from all blemishes, deformities, and discolouring being used with some brimstone: it is put with other things that doe digest and mollifie, and also with those that consume and eate the flesh, and therefore is used to helpe foule sores, and stinking ulcers; hereby you see he doth not appoint it to be used inwardly for any disease, by reason of the virulent qualitie therein, but onely alloweth of the decoction thereof to gargle the teeth in the extreme paines of them; or by the roote bruised and boyled in vinegar to helpe the tooth-ach and to breake them if they be touched therewith. Of our wilde *Carline* Thistle I have not knowne or heard of any that have made any experiment, although I am pertwaded that it commeth neere to the qualities of the low *Carline* Thistle, that is so much commended, as you heard before: and of the gummies, either of the white *Chameleon* or *Carline* Thistle, there is no other speciall propertie set downe by any than is declared before, that as it is called *Malticke* of the Thistle, so it is used as *Malticke* to chew in the mouth, both to amend the evill favour of the breath, and by reason of the glewing qualitie to stay rheume, and to strengthen loose teeth: for the juyc doth follow the propertie of the herbe or tree from whence it is taken: and although the gumme of the white *Chameleon* be called *Ixia*, as *Dioscorides* saith, yet the *Ixia* that is poysonous is another thing quire differing from this, for neither *Dioscorides* nor *Theophrastus* doe attribute any venomous or evill qualitie thereunto. Of the qualities both of the white and blacke *Chameleon* *Galen* in 8. *simplicium med.* saith thus: in the roote of the blacke *Chameleon* Thistle, there is somewhat that is deadly, and therefore the use thereof is outwardly for scabs, itches, tetteres, &c. and to cleanse the skin: but the roote of the white *Chameleon* Thistle, besides that it killeth the broad-wormes in the body or belly; it is given also to those that have a dropie, and is somewhat like in the temperature unto the blacke *Chameleon*, but that it is more bitter than the white. *Paulus* and *Aetius* in their Treatises of poysons, after they have spoken of the poysons in both sorts of *Chameleon* Thistle, and of their cures, doe entreate of the poysonous *Ixia* in the same manner that *Dioscorides* doth, wherefore we may conclude that *Ixia* hath a double interpretation, and doth as well signifie the harmelesse gummies of the white *Chameleon* and *Carline* Thistles, as the poysonous gumme or roote which is deadly: but because we are not sure that it is taken from the blacke *Chameleon* Thistle, I thinke it needlesse here to set downe the cure of it.

CHAP. VI.

Castor *Theophrasti*, id est *Scolymus Dioscoridis* & *Scolymus Theophrasti* qui *Eryngium luteum* est.
The prickly or wilde Artichoke Thistle, and the golden Thistle.

F All the sorts of manured Artichokes, whether prickly like Thistles, or not being fit to be eaten, I have sufficiently spoken in my former Booke; and intend not further to speake of them againe: but of some other kindes that are more prickly, and more like Thistles, whereof there are two or three sorts which shall be here expressed.

1. *Scolymus Dioscoridis*. The prickly or wilde Artichoke Thistle.

This prickly or wilde Artichoke Thistle hath divers long thicke, hard, but narrow leaves, ending in long points somewhat cut in on the edges, set with strong and sharpe great prickles, which growing on the stalkes compass them at the bottome, and are of a darke Greene colour: at the toppe of each stalk and branch standeth one scaly and prickly head lesser than those of the *Chardons* that are kept to be eaten, from the middle whereof put forth divers bright purplish crimson threads, which after they have stood some time passe away, the seede in their heads being flat and like other Thistles: the roote is great and spreadeth much.

2. *Cynara sylvestris Cretica*. The Candy wilde Artichoke.

This wilde Artichoke from among the long and hoary white leaves somewhat broader than the former, cut in on the edges, and thicke armed with long & sharpe prickles, rise up sundry round stalkes, set with but few leaves, and branched into two or three parts some times, at the toppes bearing small scaly sharpe prickly heads, which are eaten by the Peasants of the countrey, both Greene and boyled after the scales and sharpe prickles are cleared, with salt, oyle, and pepper, and are as pleasant to their palate, as a daintie Artichoke to ours: the roote is very long, and groweth deepe.

3. *Scolymus Theophrasti* sive *Eryngium luteum Monspeliensium*. The golden Thistle.

The golden Thistle shooteth forth divers skinny & prickly stalkes, which in some places, as *Spain*, &c. stand upright, and in other countries, as *Mompelier*, and ours also, bendeth with them unto the ground, beareine at every joynt both a branch and a leafe, which is long and somewhat narrow smaller at the bottome than any where else, much cut in on the edges, and set with small white prickles in some places marked with white spots on the deepe Greene leaves, but in others & in my garden none at all: at the joynts betweene the leaves and the stalkes, and at the toppes also come forth severall small heads, smaller than any of the former, composed of small scales with

1. *Scolymus Dioscoridi.*
The prickly or wilde Artichoke Thistle.

2. *Cynara syvestris cretica.*
The Candy wilde Artichoke.

with very sharpe prickes at the ends, out of the middle whereof start forth many gold yellow threads, which abide not long, and wherein when they are past the feede is contained, being small and thinne scales lying close together: the roote is long, of the bignes of a finger, very sweete and pleasant to eate like unto *Eryngium* Sea Holly: both roote and leaves doe yeeld a white milke, especially when they are young, and perish every yeare.

The Place.

The first is found about *Mompelier* and the last in *Spaine*: the second is naturall of *Candy*.

The Time.

They doe all flower in the end of Sommer, and their feede ripeneth quickly.

The Names

Dioscorides calleth the first in Greek *Σκόλυμος* *Scolymus*, which the Latines generally traslate *Carduus* simply, and *Theophrastus* so calleth the last also, yet there is great difference betweene them, for that of *Dioscorides* was knowne unto *Theophrastus*, who called it *κακτὸν Κάκτος* (being the same that is called *carduus* and *cardus* *Cynara* and *Cinara* for it is written both wayes by divers, and as *Columella* and *Palladius* thinke tooke the name *acinere* wherein they delight to grow, but is not likely that the Greekes derived their names from Latine appellations, but contrariwise the Latines from the Greekes, for so the ancient both Poets and Orators doe declare, as *Sophocles*, *Hecateus*, *Milesius*, *Callimachus* and others: and *Athenaeus* in his second Book maketh mention of *Cyrana Spina*, some Poets have therefore invented a tale of a faire maid called *Cyrana*, metamorphosed into an Artichoke, and some againe thinke it tooke the name from *κακτὸν κατὸν*, and that *Locrus* a King asking counsell at *Apollon* Oracle at *Delfos* it was answered him that hee should there build him a City where he should be bitten by a wooden Dog, who after wards being hurt in the Legge by a wilde Artichoke,

3. *Scolymus Theophrasti* sive *Eryngium latum* *Montpeliensum*. The golden Thistle.

where it grew did there build his City : but *Diadymus* in *Athenaeus* saith it was the *Cynosbatus Canis sentis*, the Bryer bush, but the *Scolymus* of *Theophrastus* was not knowne unto *Dioscorides*. *Pliny* lib. 9. cap. 22. confoundeth both the kinds of *Scolymus* together, as if they were both one plant, giving the vertues of both as unto one, and saith moreover that the *Scolymus* of the *Gracians* is called also by another name *Limonium*, which is the *Limonia* of *Theophrastus* lib. 6. c. 11. which *Gaza* very falsely tranflateth *Beta sylvestris*, whereas *Theophrastus* numbred it among the Thistle-like plants, and is a differing Thistle from *Scolymus* set downe in the same place. *Lobel* calleth the first *Cynara sylvestris*, because as he saith it doth so nearely resemble the *Cynara aculeata*, as also *Scolymus sylvestris* five *Chamaeleontha Monspelienisum*, and *Lugdunensis Scolymus Dioscoridis*, but *Bauhinus* *Cynara sylvestris latifolia* : the second is called by *Honorius Bellus* (as it is set downe in his second Epistle to *Clusius*) *Cynara sylvestris*, the *Cretanes* as hee saith calling it *Agriocaninari*, and by *Pena* in his Italian *Baldus Agriocinara Cretica*, by *Bauhinus* *Cynara sylvestris Cretica*, and thinketh it may be the *Cynara sylvestris Betica* of *Clusius*, set downe in his *Curae posteriores* in quarto, fol. 66. the last is called by *Clusius* *Scolymus Theophrasti* (whereof hee giveth two figures, the one of the *Spanish* plant growing upright, the other of that which groweth at *Mompelien* leaning downewards, and called by him *Narbonensis*, whom *Dodonaeus* followeth, giving both his figures and calling the one *Cardus Chrysanthemus*, and the other *Cardus Chrysanthemi alterius* icon : and so doth *Lobel* (who also saith it is the *Eryngium luteum Monspelienisum*) *Camerarius*, *Casalpinius* and *Tabernmontanus*, *Anguilura* calleth it *Eryngium Vegeti*, and *Belonius* saith it is called in *Candy* *Alcolymbros*, and by the *Latines* *Glycyrrhizon* as hee saith, wherein I thinke he is deceived, *Bauhinus* calleth it *Scolymus Chrysanthemos*, and saith it is the *Atractylis marina* of *Lugdunensis*, which as I said before in the Chapter of *Atractylis*, he saith was the *Picnemos* of *Lobel* and *Pena*, and yet as I shewed you in the Chapter of *Acarna* he maketh it an *Acarna* likewise, calling it *Acarna humilis canle foliosa*, but it cannot be both an *Acarna* and *Scolymus*, this double denominations of plants is not agreeable to *Dioscorides* minde, who is never found of himselfe to name one plant in two severall places or to call one plant by two severall names, although he shew the divers appellations of others. The *Italians* as *Belonius* saith doe in *agro Romano* call the last *Spina borda*, and thinketh it to be that plant which the ancients did call *Glycyrrhizon*, the *Spaniards* of *Salamanca* did call it *Sylbium*, but as he saith it cannot be *Sylbium* of *Dioscorides*, and in their owne Language *Cardon lechal* or *lechar*, id est, *Carduus luteus*, because of the white spots upon the leaves : the *French* call the first *Char donnee*.

The Vertues.

Dioscorides saith that his *Scolymus* is good to expell strong and stinking Urine, and to amend the strong or stinking savour of the Armocholes, or of the whole body, if the decoction of the rootes in wine be drunketh the young shootes also are eaten like unto *Asparagus*, and the young heads also in *Spain* before they flower : but they use to raise up the earth over the young shootes untill they bee risen to a good height, which then are not onely white but more tender and delicate, to be eaten raw as their usuall manner is with Oyle, Pepper and Salt, or boyled or stewed : the flowers are used by the *Italians* as *Lobel* and *Pena* say to curdle milke, whereof they make Cheese, as also are perswaded that the sayd flowers given to women with child in their broth or to drinke doth hinder abortifment, and cause them to goe out their full time in good plight, and also is very good for those that doe not teeme or are barren, and cause fertilitie. The *Cretanes* used their wilde Artichoke in the same manner that the *Italians*, *Spaniards* and *French* use their *Cardoni* or *Chardons*. *Theophrastus* also saith that the roote of his *Scolymus* is most pleasant being boyled or eaten raw, but then chiefly when it is in flower, as also that the inner substance of the heads are eaten. *Clusius* saith that they of *Salamanca* use to eat the young plants rootes and all, being washed eyther raw or boyled with flesh, and that with the milkie juice thereof they doe coagulare or curdle any milke, and with the flowers doe counterfet Saffron, for the like uses as in other places they doe with the flowers of *Bastard Saffron*.

CHAP. VII.

Acanus Theophrasti. The ancients Thistle.

His Thistle riseth up with a great thicke prickly stalk three or foure foote high, branching forth on all sides from the very bottome, set at the joynts with somewhat large leaves, broad and long, cut in on the edges, and set with sharpe prickles at the points and corners : at the toppes of the branches come forth severall small Thistle-like heads, out of the middle whereof thrust forth the flowers, composed of many deepe purplish threads, after which come some what round and flat seede, of a brownish colour lying in downe : the roote is thicke with divers long strings at it.

The Place.

It groweth in *Candy* from whence the seede hath beene sent into divers other parts of Europe.

The Time.

It flowereth in the end of Sommer, that is, somewhat late as other sorts of Thistles that come out of hot countries.

The Names.

It is called in Greeke *Ἀκανὺς* *Acanus*, which doth as well signifie a peculiar plant of it selfe, such as this Thistle here set downe as the head of any thistle, or any other Thistle-like head of any other plant ; *Theophrastus* onely (and *Pliny* from him) making mention both of this and that, for in his first Booke and sixteenth Chapter he nameth it among the *πικρὰ καὶ ἀκαναὶ*, those plants that beare prickly leaves, thus, *ἀκαναὶ δὲ ἀκαναὶ*, and in his sixt booke and fift Chapter, some saith he, have prickly leaves as *ἡ ἀκανὰς ὁ ἀκαναὶ*, and then making *Acanus* to be the head of a Thistle also (which *Dioscorides* calleth *ἐχίνος* *Echinus* from whence cometh *Echinacea*, as from *Acanus* *Acanacea* signifying all Thistles or Thistle-like plants) in his ninth Booke and thirteenth Chapter, where speaking of the *Chamaeleon* Thistle he saith thus, *τὸν δὲ κατὰ τὸν ἔχει ἑκατὸν ἀκανὰς μετὰ μὲν δὲ δὲ ἀκανὸν καὶ ἀκαναί*, *caput huius magnum Acano simile, unde quidam Acanum dixerunt*, and in his sixt Booke and fourth Chapter speaking

ing of *Ixine* he saith, *ἀνὰ τὴν μέσην τῆς ῥίζης ὁ ἀκανακίος ἀναστρέφεται*, *de media radice seminalis acanus velut malum extuberat*, and therefore ἀκανακίος doth signifie as much as *Acanum ferre*, as in the same Chapter hee saith *ἀκανακίον ἀκανακίον* *Acanum (id est Acanaceum caput) fert Chameleon*, the Chameleon beareth a Thistle-like head; but how this Thistle here exprest should bee thought to bee the true *Acanus* of Theophrastus, seeing hee hath thereof given no description, as being then so well knowne that hee thought it needed none, *Honorius Bellus* in his fift Epistle to *Celsus* sheweth; first that in *Candy* the Inhabitants call this Thistle *Agavano*, as they doe also the heads of other Thistles, in the same manner as *Theophrastus* doth his *Acanus* as is shewed before: and then that the name *Agavano* is but a corrupted word from *Acano*, for the naturall language of the *Cretanes* is a bastard or corrupted Greeke speech: both which reasons are not onely forceable, but sufficient to confirme any ones opinion in this truth; *Guilandinus* in his eight member and 128. page of his commentaries de *Papryo* the Paper rush, after that he had shewed that *Theophrastus* used divers names for one thing (in many whereof by his leaves hee is thought to be mistaken) saith that the *Ixine* of *Theophrastus* is his *Acanus* also, whom *Honorius Bellus* although hee had bene his scholler contradicted, not allowing of that opinion for the reasons aforesaid, *Pliny* saith lib. 22. c. 3. that some thought the *Acanus* should bee *Eryngium* being a broad sharpe prickly heibe with broad thornes. I cannot finde that *Anguilava* or *Lugdunensis* did know any plant peculiarly called *Acanus*, although *Bauhinus* setteth them both downe to call this plant so, but that they tooke the name onely to signifie the prickly head of Thistles: *Pona* in his *Italian Baldus* giveth the figure thereof somewhat rudely done, but no other description then that of *Honorius Bellus* in the place aforesaid, *Bauhinus* calleth it *Carduus latifolius echinos obsoleta purpurea ferens*: because I could not finde a more proper appellation to call this Thistle by, then that I have given of The ancients Thistle in *English*, I will not refuse to alter it if any can give a better.

Acanus Theophrasti.
The Thistle of the ancients,

The Vertues.

I cannot finde any propertie peculiar imputed to this Thistle by cythar ancient or moderne writer, and therefore untill I can be better informed I must be silent as others are.

CHAP. VIII.

Silybum sive Carduus lacteus. Our Ladies Thistle, or the stript milkie Thistle.

Although formerly there hath bene but one sort hereof knowne to Herbarists, yet of late by the diligent search and observation of some that have bene curious, there are some other sorts found which together must be handled in this Chapter.

1. *Carduus Mariae vulgaris.* The common Ladies Thistle.

The common Ladies Thistle hath divers very large and broad leaves lying on the ground, cut in and as it were crumpled but somewhat hairy on the edges, and of a white Greene shining colour. wherein are many lines and strakes, of a milkie white colour running all over, and set with many sharpe and stiff prickles all about, among which riseth up one or more strong round and prickly stalkes, set full of the like leaves up to the toppe, where at the end of every branch commeth forth a great prickly Thistle-like head, strongly armed with prickles and with bright purple thrummes rising out of the middle of them: after they are past the seede groweth in the said heads lying in a great deale of fine soft white downe, which is somewhat flattish and shining, large and browne: the roote is great spreading in the ground with many strings and small fibres fastned to them, all the whole plant is bitter in taste and therefore supposed not to be without very good effects.

2. *Silybum majus annuum.* Great Milke Thistle or a year.

This Thistle riseth up with one round stalke almost a yard high with somewhat large green leaves, not halfe so large as the former, nor halfe so much marked with white lines, somewhat cut in also on the edges, and set with prickles but fewer: the stalke hath few or no branches, but beareth at the toppe and the upper joynts two or three prickly heads, out of which rise reddish purple threads or thrummes, and somewhat great browne seede afterwards lying in Downe: the roote is long and perisheth as soone as it hath given seede.

3. *Silybum minus Beticum.* The small Spanish milke Thistle.

The first leaves of this Thistle are somewhat broad and smally cut in on the edges, of a pale Greene colour, with some small white lines and markes thereon having footstalkes upon them, but those that presently rise up with the stalke are somewhat longer and broader forwards then below, where being narrow they compass the stalke

1. *Carduus Marie vulgaris*.
The common Ladies Thistle.

2. *Silybum minus Beticum*.
The small Spanish Milk Thistle.

and are more cut in on the edges and set with some small sharpe prickes, and marked with white lines as the other, the upper leaves being still more divided and lesser at the upper joynts, and at the toppe come forth very small prickly heads with purplish threads breaking out of the middle, and after they are past come very small white seedes lying in some downe, which by reason of a kind of cleare white Gum that issueth out of the head, sticketh so fast to the seede that they can very hardly be pulled in sunder, especially after they grow ripe and the Sunne hath dried them; the roote is small and woody and perissheth every yeare.

The Place.

The first is frequent on every ditch banke in the fields every where: both the second and the last I received among divers other seedes that *Guillaume Boel* brought out of *Spaine*, and I beleieve the last may be the same, that *Camerarius* saith he picked out of *Epithyrum*, and that *Rauwolfius* gave him brought out of *Syria*, because the seede being white in both and the leaves marked white doe demonstrate them to be both one.

The Time.

They flower and seede in *June*, *July* and *August* when other sorts of Thistles doe.

The Names.

This is generally supposed to be the *Σίλβον Silybum* of *Dioscorides*, but thereof he hath made so breefe a relation that it is hard to say which is the right indeede; for he saith onely thus, *Silybum* is a broad Thistle whose leaves are like unto the white *Chamaeleon*: *Pliny* in a manner saith the same in effect for the description; but saith in *Cilicia*, *Syria*, and *Phenice* where it groweth it is hardly boyled tender, and that it hath no use in Physicke; but surely the white lines and markes in this Thistle is such an evident note and so remarkable, that I thinke it could not be overpast in silence by all the old writers if they had knowne it and described it: some therefore doe thinke that it more fitly agreeth with *Lencacantha* and *Spina alba*: *Lacuna*, *Matthiolus*, *Cornarius*, *Dodonaeus*, *Fuchsius* and *Lugdunensis* take it to bee *Leucographis* *Pliny*, *Brinsfelfius* calleth it *Carduus albus* and *Chamaeleon*, *Matthiolus* and *Lobel* *Carduus Laticus*, some *Carduus argentatus* and *Carduus ramparius*, *Tragus*, *Lonicerus*, *Fuchsius*, *Gesner* and *Camerarius* call it *Carduus Marie*, *Cordus* on *Dioscorides* and *Tabernmontanus* *Carduus Marianus*, *Dodonaeus* *Carduus Leucographus*, *Anguilara* and *Lobel* *Silybum*, *Cesalpinius* *Cardui Sylvestris* aliud genus and *Acantho Theophrasti*: but *Bauhinus* *Carduus albus maculis notatus vulgaris*: the second is not set forth by any author before now, and from the likenesse thereof unto the former, I have so called it as it is in the title, *Silybum majus annuum*. The last as I sayd I had out of *Spaine*, and in regard it doth so nearely in all things resemble the *Carduus Laticus Syriacus* of *Camerarius*, I presume it is the same which *Bauhinus* referreth as well as *Camerarius* to *Carduus Laticus* or *Bedegnar Arabum* of *Rauwolfius*, which *Bauhinus* saith came to him by the name *Agas Cretenjensis*, and calleth it *Carduus albus maculis notatus exoticus*; our wilde kinde is generally called *Carduus Sanctae Mariae* in Latine, by the *Italians* *Cardo di Santa Maria*, by the *French* *Chardon nostre Dame*, by the *Germans* *Marien distel* and *Lothar an a stell*, by the *Dutch* *Onser Vrouwen distel*, and wee in *English* our *Ladies Thistle* and Thistle.

The Vertues.

Our Ladies Thistle is thought to be as effectuell as *Carduus benedictus* for all the purposes whereunto it is put, as namely for Agues and for the infection of the Plague both to prevent and cure it, as also to open the obstructions of the Liver and spleene, and thereby is good against the Jaundies, and provoketh Urine, breaketh hard expelleth the stone, and is good for the Dropisie; some doe hold that the young stalkes peeled and dressed as the stalkes of the other Chardons and wilde Artichokes are, and eaten doe helpe to encrease milke in Nourishes breasts: It is effectuell also for the paines in the sides, and many other inward paines and gripings: the seede is held as powerfull if not more for the purposes aforesaid and so is the distilled water also, and besides is often applied both inwardly to drinke and outwardly with clothes or sponges to the region of the Liver to coole the distemperature thercof, and also to the region of the heart against swoynings and passions of it.

CHAP. IX.

Carduus Spherocephalus sive Globosus. The Globe Thistle.

N my former Booke I have given you the knowledge of two or three sorts of Globe Thistles, that is of the greater and the lesser Globe Thistle, and of the Fryers Crowne Thistle which is accounted one of them, although the head be a little more flat at the toppe then the rest: there remaine some other sorts to be shewen to you in this Chapter.

1. *Carduus Spherocephalus acutus minor.* The smaller Globe Thistle with long prickles on the head.

This small Globe Thistle hath divers long and narrow leaves, so much cut in on both sides, that every jagge or part seemeth a leafe, so to make the whole leafe winged each part cut in also, and the corners set with sharpe prickles growing on the whitish stalke up to the toppe, where stand divers round heads each upon a long foote-stalke, composed of bearded huskes in the same manner that the two sorts of Globe Thistles expressed in my former Booke doe, but that the ends are longer and sharper, out of which rise more blewish flowers than are in the lesser sort.

2. *Carduus Spherocephalus acutus major.* The great prickly Globe Thistle.

This other greater prickly Globe Thistle hath larger leaves and broader, somewhat like unto the former great Globe Thistle expressed in my sayd booke being nothing so much cut in on the edges, in all other things it is not unlike the former here set downe, but that the flowers out of these prickly heads are of a deeper blew colour.

3. *Carduus Spherocephalus minimus acutissimis folijs.*

The smallest Globe Thistle with the most prickly leaves

This small Thistle hath the smallest jagged leaves and most cut in of any of the rest, and most sharply set with prickles on the edges: the stalke groweth lower then any of the other, and the round heads at the toppes smaller

1. *Carduus Spherocephalus acutus minor.*
The smaller globe Thistle with long prickles on the head.

2. *Carduus Spherocephalus acutus major.*
The greater prickly globe Thistle.

also, but not armed with such long sharpe prickes as the former out of the huskes whereof come whitish flowers.

4. *Carduus spinosissimus sphaerocephalus*
Cardui Arabici nomine missus.
 The Arabian Gloe Thistle.

This Thistle hath a winged prickly stalke two foote high having large leaves thereon somewhat broad and long, set thicke with sharpe prickes, but sparingly placed on the stalkes bearing round sphericall heads, thick and strongly armed with long prickes; out of the midst whereof breake forth white threads somewhat twete: the seede is long and crested or corneted.

The Place.

All these Thistles are strangers to us, neither is their naturall places certainly knowne, but imparted and sent by friends with whom as rarities they have beene accepted.

The Time.

These flower at the same time with the rest, that is, in June and July.

The Names.

Wee cannot finde certainly that they were knowne cyther to the ancient Greeke or Latine writers, but *Angularia* and *Lobel* suppose that the first is the *Arabis* *Spinosa* of *Dioscorides* (some also take the greater kinde mentioned in my former booke to be *Spina alba*, as *Camerarius*, *Matthioli* and *Lugdunensis*, which as he saith is the *Bedeguar* of the Arabians; and some tooke it to be *apocynum* *Crocodylion* *Dioscoridis* as *Lacuna* and *Lobel*, and some to be *chalcidion* *Theophrasti*, which *Gaza* translateth *Aeraria* as *Lugdunensis*, and some to be *tyrtanion* *Tetralix spinosa* *Theophrasti*, as *Lugdunensis*, and is called *Spinosa* as a distinction from *Tetralix Atheniensium* which is *Erica*, of both which *Pliny* maketh mention, and some to be *Arabis* *Spinosa Arabica*, as the sayd *Lugdunensis* also and in some to be *Pulsatilla* *Rutibros* or *Rutibros* *Theophrasti* as *Lobel*, and some to be *Silybum* as *Lugdunensis* according to the description, and some to be *Chamaeleon verus* as *Tragus* and *Fuchsius*, and some to be *Echinopus* as *Gesner* in *hortis*, but *Cordus* in *historia* as I take it first called it *Carduus Sphaerocephalus* or *globosus* most properly, and from him *Camerarius*, *Dodonaeus* also calleth it *Spina peregrina*, and *Tabernaemontanus* and others call it so: the lesser sort also of that *Carduus Sphaerocephalus* mentioned in my booke is called by many of the said authors: these things I thought good to note hete having to fit an occasion, although I have a little digressed from the matter in hand) but *Dodonaeus* and *Lugdunensis* from him call it *Carduus Sphaerocephalus acutus*. *Dodonaeus* maketh the second here set downe to be his third *Carduus Sphaerocephalus acutus*: the third is the said *Dodonaeus* his *Carduus Sphaerocephalus quartus*, and *Lugdunensis* also mentioneth them from him as *Banhius* doth also: the last *Banhius* calleth *Carduus spinosissimus Sphaerocephalus rigidus aculeis armatus*. & saith it was sent him under the name of *Carduus Arabicus*. Although the *Carduus Erioccephalus* sive *Tomentosus* be with most herbatists now a dayes called *Corona fratrum* that it doth somewhat resemble the bald or shorne head of a Fryer, yet this is not that Thistle which *Bartholomaeus urbe venetanus* and *Angelus Palea Franciscan* Fryers say they saw growing in the confines of *Aragon* neare *Castile*, which while they were digging up demanded of a country man there passing by them if he knew the name thereof, who answered they called it vulgarly. The Fryers Crowne, which say they had leaves spread upon the ground like to those of the Carline Thistle, it bore divers heads of Thistles set close one unto another without any stalke under them, whereof the middlemost was greatest, and the rest to the number of eight or ten or more or lesse smaller ones standing round about it, of the bignesse of a Walnut or greater: which name say they may not inconveniently be given to it, in that the middle head seemeth as a father and the smaller as his children, that so as brethren they doe compassse their father in fashion of a Crowne. The roote say they when they had digged up part of it was of the bignesse of a staffe being white and tender and of a pleasant taste, yet with some astringency: *Dodonaeus* reciteth this, but *Lugdunensis* hath set the true figure of it in the Chapter or *Myacanthos* for *Iacea lutea capitis spinosis* of *Clusius* and others, but hee saith withall that the *Carduus tomentosus Anglicus* of *Lobel* is the the same also, when as it is his other *Carduus tomentosus* that he calleth *Corona fratrum herbariorum*, and *Banhius* thinketh that his *Acanthium montanum* *Dalechampii* is the same also.

The Vertues.

I finde nothing recorded by any that have written of these Thistles that they are applied to any Physicall use, neither have I any thing to declare of them by particular experience.

Carduus tomentosus Corona fratrum dictus.
 The Fryers Crowne Thistle.

CHAP. X:

Acanthium & Carduus Tomentosus. The Woolly or Cotton Thistle.

Here be divers sorts of woolly Thistles, although there bee but one or two that can fitly bee referred to *Acanthium Dioscoridis* which is also woolly, I have therefore put the other herunto in one Chapter.

1. *Acanthium vulgare.* The common Cotton Thistle.
The common Cotton Thistle hath many large leaves lying on the ground, somewhat cut in, and as it were crumpled on the edges, of a Greene colour on the upper side but covered over with a long hairy wooll or cottony Downe, and not much more white or hoary underneath, set with most sharpe and cruell prickles, from the middle of whose heads thrust forth many purplish crimson threads, and sometimes white, but much more seldome, the feede that followeth in these heads lying in a great deale of fine white Downe is somewhat large, long and round, resembling the feede of *Sylbium* or Ladies Thistle, but somewhat paler: the roote is great and thicke spreading much, yet usually dyeth after feede time.

2. *Acanthium Illyricum.* The greatest Cotton Thistle.
This great Cotton Thistle (remembered by *Lobel* and *Pena* in their *Adversaria* that *Valerandus Dornes* of *Lile* in *Flanders*, brought out of *Sclavonia* and sowed at *Lyons* in *France*) groweth to be two or three cubits higher then any man, almost to the height of a *Speare* or *Pike* branched forth on all sides, set with a prickly filme all along like in forme to the other, and with large and long torne leaves fully fraught and armed with as cruell prickles and prickly large heads with purple flowers and feede like the former.

3. *Carduus tomentosus Anglicus.* Our English woolly Thistle.
This woolly Thistle hath divers large and long leaves all covered over with a wooll or dowre, cut in very deeply on the edges at certaine distances into severall parts or leaves even to the middle ribbe almost, making each leafe seeme winged with small and long leaves on each side, and set in divers places with long sharpe prickles: the woolly stalke riseth up to the height of two or three cubits, with few leaves set thereon, and with but few branches, bearing at their toppes a large round hoary head somewhat flat, covered over as it were with fine woolly threads like unto a net, not very prickly, with many purplish threads in the middle like unto those of the *Artichoke*, after which succede Thistle-like feedes, greater and rounder then those of the first: the roote is great and thicke, brownish on the outside and white within, not unpleasant to the taste.

4. *Carduus tomentosus minor.* The lesser woolly Thistle.
This lesser woolly Thistle hath many whitish woolly or hoary long leaves, much cut in on the edges into many parts, and each part also divided and set with small prickles: the stalke is not very great, nor much above two foote high branched towards the toppes, white and woolly also, bearing on them small prickly roundish heads having many purple threads rising out of the middle, and small Thistle-like feede after them.

1. *Acanthium vulgare.*
The common Cotton Thistle.

2. *Acanthium Illyricum.*
The greatest Cotton Thistle.

5. *Carduus*

5. *Carduus tomentosus capitulis minime aculeatis* five
Arcophyllos Dalechampi Lugdunensis.

The fine Cotton Thistle without prickly heads.

This fine Cotton Thistle hath long and somewhat narrow whitish or hoary leaves, larger at the lower end of the small stalk, which is about a foote high then they are above, somewhat cut in on the edges, but much & thick set with small short and soft prickles in some places: from the middle of the stalk up to the toppe at every leafe commeth forth a small whitish feely head somewhat rough, but not prickly, and at the toppe likewise three or foure such like heads, out of which rise purplish flowers made of threads as in other Thistles whereunto the feede is like also. I doe thinke this doth rather resemble a *Lacea* then a *Carduus* but that I have not seene the plant, and therefore doe follow mine author.

6. *Carduus tomentosus capitulis spinosis* five
Leucacantha Mompeliensium.

The French supposed white Thistle.

This supposed *Leucacantha* of the Mompelier Herbarists, sendeth forth from a thicke sappie roote meanelly set with fibres, many stalks about a cubit high, branched from the middle upwards, set with many long hoary or woolly leaves, much cut in or torne on the edges, and armed with divers sharpe prickles: the heads that grow at the topes are small, somewhat long and prickly, sending forth many bright red purplish threads from the middle, after which come the feede which are somewhat long and round like unto the other Thistles feedes.

The Place.

The first groweth on divers ditches, bankes and in the Cotnē fields and high wayes generally every where throughout the Land, it is also often found growing in Gardens: the second as is said was brought out of *Illyria*: the third groweth in divers barren fields in *Sommerfetsiere* as *Lobel* noteth it, and in divers other places: the fourth *Dodonæus* saith he onely saw in some Gardens in the Low Countries, and *Matthioli* saith it was sent him by *Cortusius*: the fifth groweth in *France* in dry and sandy grounds, the last about *Mompelier* where some young students tooke it to be *Leucacantha* of *Dioscorides*.

The Time.

They all flower and beare theit feede about the end of Sommer, when other Thistles doe flower and feede.

The Names.

The first is taken by most of our moderne writers to be *Acanthium* of *Dioscorides* which name the Latines keepe also, no other being found that better agreeth therewith, as *Matthioli*, *Dodonæus*, *Durantes*, *Camerarius*, *Lobel*, *Tabernmontanus* and *Lugdunensis* doe all agree, yet *Tragus* taketh it to be the *Achantha leuce Spina alba* of *Dioscorides*, and *Fuchsius* calleth it *Spina alba sylvestris*, *Angulara* and *Gesner* in horti *Onopordon Athenæi*, as also *Onogyros Nicandri*, *Cesalpinus* calleth it *Carduus sylvestris*, and *Lugdunensis* by his figure maketh it to be *Silybum* five *Leucacantha Loniceri*, and *Bauhinus* *Spina alba tomentosa latifolia sylvestris*, the second is the *Acanthium Illyricum* of *Lobel*, & peradventure may be the *Acanos Bellonij*, *Bauhinus* doth certainly set it downe for the *Onopordon* of *Dodonæus*, *Camerarius* and *Lugdunensis*, and as certainly for the third *Onopoxus Dalechampi* of *Lugdunensis*, and saith also it is the *Cardum viarum* of *Gerard* and others, in all which I am perswaded he is much mistaken, for however the severall Thistles of these authors may be in some things like it, yet they are not *idem* the same. Of the third, *Lobel* first made mention in his *Adversaria*, and called it *Carduus tomentosus Anglicus*, *Bauhinus* doubteth whether it be the *Spina Arabica* of *Angulara*, but saith it is the *Spina Arabica Dioscoridis & Plinii* of *Matthioli* in his last corrected edition, as also *Spina Arabica* of *Cesalpinus*, and he himselfe calleth it *Carduus tomentosus capitulo minore*: the fourth is the *Carduus Spherocephalus quintus* of *Dodonæus*, who saith that some referred it to the *Spina alba* of *Matthioli* and *Lugdunensis* and others, to the *Spina alba altera* of *Matthioli* and *Cesalpinus*: *Bauhinus* calleth it *Carduus tomentosus capitulo minore*: the fifth is called by *Lugdunensis* *Carduus Arcophyllos Dalechampi*, and by *Bauhinus* *Carduus tomentosus capitulis minime aculeatis*: the last is the *Leucacantha Mompeliensium Dalechampi* as *Lugdunensis* saith and called by *Bauhinus* *Carduus tomentosus capitulis echinatis*: The Italians call the first *Acanthio*, the French *Cardon argent*, the Germanes *Weiß wegedistell*, the Dutch *witte wech distell*, and we in English The white Cotton Thistle.

The Vertues.

Dioscorides and *Pliny* in the same manner write, that the leaves and rootes of *Acanthium* the common Cotton Thistle taken in drinke, doth helpe those that have a cricke in their necke, whereby they cannot turne their necke but the whole body must turne likewise. *Galen* saith that the roote and leaves hereof are of an heating qualitie, and good for such persons that have their bodies drawn together by some Spasme or Convulsion, or by some other infirmities, which disease is truly to be called the Rickets, which happening sometimes to children doth so binde them in their Nerves, Ligaments and whole structure of their body, that it sufferech them not to grow or prosper eyther in height strength or alacritie.

CHAP. XI.

Cardui quidam sylvestres spinosissimi. Certaine very prickly wilde Thistles.

Here are some other wilde Thistles that are very prickly, to be intreated of, which have not yet beene mentioned, which I thinke fit to place together in a Chapter, which are as followeth.

1. *Onopryus.* The common way Thistle.

This common Thistle hath divers long leaves lying compasse wise on the ground, very hairy all over, especially while they are young, of a deepe or sad greene colour, long, and somewhat narrow, rent and torne on the edges, and set with many very sharpe prickles, from among which rise up very prickly stalkes armed or fenced with sharpe prickly filmes, branching forth in divers places, and set with the like leaves up to the tops, where stand divers heads exceedingly stored with sharp prickles on all sides, from out of the middle thrust forth many purplish threads, of an excellent lively colour, after which come somewhat small feede like unto other Thistles lying in downe: the roote is blackish, hard, and woody, where the stalke riseth and perishing every yeate after feede time.

2. *Onopryus alter angustifolius.* Another narrow leaved way Thistle.

This other common Thistle differeth from the former, in that the leaves hereof are longer, natterwer, more gathered or rent on the edges and not hayrie, but smooth all the leafe over; in the flowers which are purple and sometimes white, in the feede and roote, and in the prickles like a Thistle, it differeth little or nothing.

3. *Onopryus parum aculeatus.* The gentler way Thistle.

This also differeth from the other, chiefly in the heads which grow many together, and are but smally set with prickles, and nothing so much as the other, but the leaves, are more jagged, and set very thicke with short prickles; the stalkes are round and a little prickly, but not filmed as the other, the flowers are purple like others.

4. *Onopordon.* The Asses cracking Thistle.

This Thistle hath many long leaves set on the cornered woolly stalkes, which grow as high as any man, but not branched at all, the leaves seeming like branches being a foote long, and much divided into many leaves, some long and narrow, and others smaller and shorter set with them at certaine spaces, each ending in a sharpe long pricke: from the upper joynts of the stalkes, with the leaves, and at the toppes also come forth woolly heads upon small foote stalkes, set with long prickles, from the midst whereof thrust forth divers bright reddish purple threads: the feede that followeth is like unto other Thistles: the roote is a foote long, thicke and blacke with some fibres set thereat.

5. *Polyacanthos.* The most prickly Thistle.

This most prickly Thistle is as it were composed wholly of prickles, for the leaves are short and narrow, so thicke set on both sides with small sharpe prickles, that they rake away all shew of leaves: the stalkes also and branches are so plentifully stored with sharpe prickles up to the toppes, that nothing else is to be seene: the heads also are in the same manner thicke set with prickles, out of which rise purplish threads, as in other Thistles.

6. *Carduus Polycephalos.* The many headed Thistle.

The stalke of this Thistle hath neither filme nor pricke thereon like the last, but branched forth into divers parts, and they againe parted into other smaller branches, on which stand many heads and smaller ones under them, with divers small prickles about them, out of which rise purplish flowers of short threads, as in others, the leaves are but few on the stalkes being short and narrow, but as thicke set with prickles as the last almost: the roote is hard and woody.

7. *Drypis Theophrasti Anguilara.*

Anguilara his launcing Thistle of *Theophrastus*.

The leaves of this Thistle seeme to be composed onely of long sharpe thornes, like unto Juniper leaves, many set together on both sides of the middle ribbe in tufts at certaine spaces: the stalkes are small, a cubite high, with two such winged leaves at each joynt: the toppes of the stalkes are set as it were, with bunches or tufts of such long leaves like thornes, out of which come many small white flowers, consisting of small leaves, and not of threads, like other Thistles: the feede lying in the downe of the heads is small covered with a brownish barke, very like unto Rice in the huskes, but when the huske is taken away, it is very yellow, and like in forme unto the Come-flower feede: the roote is small like Couchgrasse spreading farre about.

8. *Drypis quorundam Lugdunensis.*

Another *Drypis* or launcing Thistle.

This launcing Thistle riseth up with divers slender stalkes sometimes to a mans height, whose long leaves and narrow are made up of many parts, smally cut in or divided

2. *Onopryus alter angustifolius.*
Another wilde way Thistle.

4. *Onopordon.*
The Asses cracking Thistle.

5. *Ficaria verna.*
The most prickly Thistle.

7. *Drypis Theophrasti Angulata.*
Angulata his thorny Thistle of Theophrasti.

9. *Carduus lanceolatus latifolius.*
The greater broad speare Thistle.

into many small points: with a short foote stalk, compassing the stalk at the lower end, at the toppes grow single scaly, Greene and prickly heads, from the middle whereof thrusteth a number of long threads, which in some plants are purplish, in others whitish, and in other very red, or of a bright crimson colour, the seeds that followeth is small, smooth, and reddish: the roote is white and thicke, and groweth not very deepe.

9. *Carduus Lanceatus latifolius sive major*. The greater broad speare Thistle.

The stalk of this speare Thistle is armed with prickles like many other wilde Thistles, and the leaves set thereon are very long, cut in or divided on the edges in two or three places, set at distances one against another, and the severall parts cut into five or sixe points or corners, sharpcly armed, the end being long and narrow, pointed like the head of a Javeline or Pike, whereof it tooke the name, the flowers are purplish in scaly and prickly heads.

10. *Carduus Lanceatus angustifolius*. The narrow Speare Thistle.

The narrow speare Thistle is like unto the last in the skinny prickly stalkes, being strong and standing upright two cubits high, stord with few leaves, but jagged, prickly, and narrower than the last, yet the end is somewhat broader than the other, of a darke Greene colour on the upper side, and hoary gray underneath, the heads are many small and scaly set at the toppes of the stalkes as prickly as they, with purplish, and sometimes white flowers of threads rising out of the middle of them, as in other Thistles.

11. *Carduus Chondrilloides*. The jagged Succory-like leaves.

The leaves of this Thistle are long and very much jagged very likē unto the jagged, Gumme Succory leaves, and prickly at the corners, the stalk riseth up a foote high, with such leaves on them up to the toppe, but shorter, broader and lesse jagged, where it brancheth forth in two or three parts, each bearing a huske but no Thistle like scaly head, out of which groweth a yellow flower made of many leaves, set in compass like a starre, which passing away the huske containeth within it much downe wherein the small seeds lieth, and is carried away with the winde: the roote is white, long, slender, and woody, set with some fibres, and perishing after seede time.

12. *Carduus palustris*. The Marsh Thistle.

The Marsh Thistle hath a prickly round stalk, two or three cubits high, with some branches towards the toppe, set with long and narrow darke Greene leaves, somewhat jagged about the edges, with a few prickles on them: at the toppes of the stalk and branches stand many Thistle-like heads with purple threads, as in other Thistles.

The Place.

The five first sorts are found in divers places of our owne countrey, upon ditch bankes, about hedges and wayes sides: the sixth groweth in the fields of *Michelsfield* by *Basil*: the seventh not farre from the sea, in the *Marais* countrey in *Italy*: the eighth in corne fieldes, as well of oates as other graine: the ninth, tenth, and twelfth, *Wiesla* and *Michelsfield* marshes about *Basil*: the eleventh in craggy and stony places about *Lyons* in *France*.

The Time.

They doe all flower and seede much about the time that other Thistles doe.

The Names.

ὄνυκος in Greeke, and *Onopryus* in Latine *quasi asinus buxus*, and so *Gaza* rendereth it out of *Theophrastus* *quod sit asinus cibis gratissimus*; & *summo pere expetitus*; yet some thinke it should be rather *ὄνυκος quod ad eum pascendum asinus perpetuo defigatur & haret* *ὄνυκος* *Onopordon*; the signification thereof is rendred by *Pliny*. *quod si comederint asini crepitus reddere dicuntur*, which Greeke name, saith *Dalechampius*, they about *Paris* keepe to this day, calling the said Thistle *Pet d'asne*, all thereabouts constantly affirming, that when Asies feede thereon, they will be more subject to cracking, and breaking winde backwardes, than at other times when they doe not feede on them, *ἄνυκος* *Drypis* ἀνύκος δὲ πύλαις δεικνύμεντα λανθάνοντα, *quod aculeis suis attrahentes & colligere volentes vulnerat*. *Πολύανθος* & *Polyanthos*, *quasi spine multe*, *Gaza* translateth *Aculoosa*, and *πολύκεφαλος*, *Polycephalos*, *quasi plura capita*, of the many heads, as the other of the many thornes or prickles: the derivations and significations of the rest are easie enough to be understood. The names likewise are most of them, as other Authors call them; only the *Onopryus* is called *Carduus sylvestris* by *Dodonaeus* and *Carduus asinus* by *Gesner* in *hortis*, and the *Polyanthos* *Theophrasti* of *Lugdunensis* and *Tabermontanus*, is by *Ruellius* called *Agriacantha*, by *Label* *Carduus spinosissimus* & *Onopordon* by *Gerard*, and the *Carduus Chondrilloides*, doth in my opinion better resemble an *Hieracium* or *Chondrilla* than a *Carduus*.

The Vertues.

The chiefest properties attributed to any of these Thistles, are to the most common way Thistles that are hot and drie in the second degree, and the rootes boyled in wine and drunke, are good to expell stincking urine, and to amend the ranke smell of the armeholes and whole body, as also good against a stincking breath, if the joyce thereof, saith *Pliny*, be taken before it floweth; and if the place be bathed therewith where the haire is gone, it helpeth to bring it againe.

CHAP. XII.

Dipsacus sive Carduus fullonum. The Teafell or Fullers Thistle.

F the Teafell there are two kinds, the tame or manured and the wilde: of the tame or manured there is no varietie or differing sort, but of the wilde there are two or three sorts, as shall be shewed in this Chapter.

1. *Dipsacus sativus*. The garden or manured Teafell,

The manured Teafell hath the lower leaves for the first yeare very large and long, fashioned somewhat like unto Letice, of a pale Greene colour, more gentle or not so hard, as those that are set on the stalkes; but dented about the edges, and the middle ribbe on the backe or under side, set very thicke with short prickles, among which rise up the stalkes, three or foure foote high, armed from the bottome to the toppe, with hard short and sharpe prickles joynted in severall places, and two such leaves set thereat, both of them so joynted together at

the bottome, and so compassing the stalke about that they doe containe the raine and dew that falleth, and are somewhat harder and stiffer and more prickly then the lower: from betweene the leaves and the stalkes on each side rise branches prickly also. and joynted with the like compassing leaves, but lesser on them, and from their joynts rise long stalkes bare of leaves but not of prickles, bearing on each of them a round head somewhat long, armed with stiffe short and crooked prickles fashioned like hookes bending downwards, greene at the first and white being ripe, from about which come forth whitish hooded flowers appearing in circles flowring by degrees for the most part beginning in the middle and so downwards and upwards, in the severall cells whereof which contained the flowers grow small and whitish round seede somewhat long, the middle part of the head being often hollow, and containing sometimes small whitish wormes like unto Magots: the roote is white long and somewhat great at the head with divers long strings and small fibres set thereat and dyeth every yeare after the heads be ripe.

2. *Dipsacus sylvestris*. The wilde Teasell.

The wilde Teasell is in all things like unto the manured saving in the heads, whose prickles are small soft and upright not hooked or stiffe (which is contrary to the nature of all other wild plants almost, which are harsher and more prickly then the manured) and in the flowers which are of a fine bluish or pale carnation colour.

3. *Dipsacus sylvestris laciniatis folijs*.

Wilde Teasell with jagged leaves.

This wilde Teasell (whereof I have no knowledge and but follow mine author, whom I will not so farre mistrust as to say there is none such, for who knoweth all the diversities that other countries doe produce) is in all other things like the last saving in the leaves which are not whole and onely dented about the edges but torne in on both sides into deepe gashes.

4. *Dipsacus sylvestris*. The wilde Teasell.

1. *Dipsacus sativus*. The garden or manured Teasell.

4. *Virga*. The Shepherds staffe.

4. *Virga pastoris.* The Shepherds staffe.

The Shepherds staffe is a kinde of Teasell also, but differeth therefrom in many notable parts, for the leaves hereof being large are of a sadder Greene colour, and not so prickly on the backe ribbe, but finely dented about the edges: the stalkes grow higher and not so prickly, yet having some thereon, and leaves set by couples at the joynts but not compassing the stalk to hold water in manner like the former: the severall branches beare small heads not much bigger then Wallnuts, with soft prickles thereon and bluish flowers like the wilde Teasell.

The Place.

The first is onely manured and sown in gardens or fields for the Clothworkers use, by raying the Wooll of cloth with the crooked prickles of the heads, make it fit for their sheeres to cut it smooth and thereby leave a fine nappe thereon pleasing to all: the other sorts except the third grow in moist places neare ditches and rills of water in many places of this Land; the third sort in some places of Germany and the last in sundry places of our owne Land.

The Time.

They flower in July and are ripe in the end of August.

The Names

It is called *Διφάκος* *Dipacus* in Greeke, *quasi sitibundus, quod nomen a contrario invenit* (say divers authors) *quoniam concavo alarum sinus rorem vel imbrem recipiat, quo veluti ad abigendum sitis injurias abutitur*: but I thinke not so, for the water contained in these leaves groweth bitter by standing in them, & therefore not fit to quench but to encrease thirst rather: the Latines also call it *Dipacus* and after the Greeke *ἀπόδιδος δούρεσς*, *Labrum veneris*, *cujus nomenclatura a carinato foliorum habitu contraxit, qua se ambe anfractuosa sinuantia pelvis speciem constituunt*, & *intra se humorem retinent*: but I am of a different opinion that it tooke the name of *Veneris* lips from the effects of a whores lippes, which as the leaves the raine, so they are ready to receive all mens offers, and as the heads or Teasells, so they ready to carde and tear all mens skins that have to doe with them, untill they leave them bare and thin: pardon I pray this extravagancie who follow *Camerarius* and other good authors herein, that in the midst of their naturall phylotophie doe sometimes mix a little moralitie: it is called also *Carduus Veneris* and *Lavacrum Veneris* it may be upon the like insinuation; it is thought also to be the *Gallidragen Xenocratis* of *Pliny* & *Carduus fullonum* also, and some *Virga pastoris*, but that is more usually given unto the last sort, and so called because the dried stalk cleften from the prickles, for so much as might be held in ones hand served the Shepherds to guide their sheepe withall, transferring the name of *Virga pastoris* to the *Dipacus sylvestris*, calling in *Virga pastoris major* and this other *minor* as *Bauhinus* doth. Some, saith *Lugdunensis*, take it to be *Plumbago* *Pliny*, *Lobel* maketh doubt whether it should bee the *Spina Selenitis* *Theophrasti* *Guilandino*, *Camerarius* calleth it *Dipacus fatuus*, and *Dalechampius* upon *Pliny* taketh it to be *Molybdena* *Pliny*: The *Arabians* call it *Chir* and *Moleta*, the *Italians* *Dissaco* and *Cardo*, the *Spaniards* *Cardo penteador* and *Cardencha*; the *French* *Chardon de foulon* and verge a bergier, the *Germanes* *Karten distell* *Bubenstrall* and *Weberkerten*, the *Dutch* *Caerden* and *Voelder* *Caerden*, and we in *English* Teasell or the Fullers Thistle.

The Vertues.

Dioscorides saith that the roote bruised and boyled in wine untill it be thicke, and kept in a brassen vessell or pot, and after spread as a salve and applied to the Fundament doth heale the clefts thereof, as also Cankers and Fistulae therein: the same also saith he, taketh away warts and wennes: *Calen* saith it is drying in the second degree, and hath withall some cleansing facultie: others hold it to be cold and dry, and therefore they say the leaves applied to the forehead and temples qualifieth the frenzie or madnesse: the juice of the leaves dropped into the eares killeth the wormes in them: the distilled water of the leaves is good to bee dropped into the eyes, to take away the rednesse in them and such mists as darken the sight: the said water is often used by women to preserve their faces in beauty, and to take away all rednesse and inflammations, and all other heate or discolourings. The Shepherds staffe is held profitable for no disease that wee know of.

CHAP. XIII.

Eryngium. Sea Holly.

Although *Dioscorides* hath made mention but of one sort of *Eryngium* (which is suspected by many to be appropriate rather to the *Mediterraneum* or *campestre* because he saith that it groweth in fields and rough places and not at the Sea side, when as his description may as fitly be referred to the one as the other) yet *Pliny* maketh mention of the Sea kinde also, and this later age hath added divers others which for some resemblance in leafe, head or roote, they have so termed. The *Eryngium Pannonicum* flore ceruleo & flore albo, I have exhibited in my former booke, which is assuredly the *Eryngium Genevense* of *Lobel*, and *Eryngium planum* of *Matthiolus*, although *Bauhinus* doth make them different: the rest shall bee shewed in this Chapter.

I. *Eryngium marinum.* Our ordinary Sea Holly.

The first leaves of our ordinary Sea Holly are gentle or nothing so hard and prickly as when they grow older, being almost round, and deeply dented about the edges, hard, sharpe prointed and a little crumpled also, of a blewish Greene colour, every one upon a long footestalk, but those that grow up higher with the stalk doe as it were compass it at the bottome, the stalk it selfe is round and strong yet somewhat crested with joynts and leaves set thereat but more divided, sharpe and prickly, and branches rising from thence which have likewise other smaller branches, each of them bearing severall blewish round prickly heads, with many small jagged prickly leaves under them standing like a starre, and are sometimes found greenish or whitish: the roote groweth wondrous long even to eight or ten foote in length, set with rings or circles towards the upper part but smooth and without joynts downe lower brownish on the outside and very white within, with a pith in the middle, of a pleasant taste but much more delicate being artificially preserved and candied with Sugar.

1. *Eryngium maritimum*. The Sea Holly. 3. *Eryngium planum* L.
The small smooth leaved Sea Holly. 2. *Eryngium mediterraneum* sive *caespitose*.
Upland Sea Holly. 4. *Eryngium punctatum* Hoffm.
Small brittle Sea Holly or spurge.

2. *Eryngium mediterraneum* five *campestre*. Vpland Sea Holly.
This other Sea Holly (which groweth in upland grounds is therefore more answerable unto *Dioscorides* his *Eryngium*, but else as I sayd before his description doth answer them both directly) hath slenderer or not so thicke stalkes as the former, and hath the leaves more divided, more prickly and lesse aromaticall: the heads are blew but smaller, and the roote slenderer and shorter, neither so sweete nor fit to be preserved, nor so aromaticall in taste, in other things it is very like the former.

3. *Eryngium planum minus*.

The small smooth bastard Sea Holly.

This bastard Sea Holly hath the lower leaves smooth and whole of a pale greene colour, somewhat long and round pointed narrow at the bottome, and somewhat deeply indented at the edges: the weake stalkes that trayling upon the ground take roote againe at the joynts and rise not above a foote high, have with the like leaves that grow below, others that are finely jagged into many parts and sharpe pointed, from out of which all along the stalkes and at the toppes also, come forth blew heads lesser than those of the upland Sea Holly: the roote is composed of many thicke and long strings which perish not after seede time, but abide many yeares.

4. *Eryngium pumilum* *Hispanicum*.

Small bastard Sea Holly of Spaine.

This small bastard Sea Holly hath divers leaves lying in a compasse upon the ground somewhat long, broad toward the middle smallest at the foote, and deeply dented but not jagged about the edges and somewhat soft withall: but those that are set at the joynts of the stalk which is branched from the very bottome, are cut or divided into many small narrow leaves dented about, hard also and sharpe pointed or prickly: at the toppes of the stalkes and branches, upon every one standeth one round prickly head, with six or eight narrow, long prickly leaves under it spreading like a staire, which together with the head and flowers that come out thereof are of a faire blew colour, which give small fiat chaffie seede like the *Hungarian* kinde: it is seldome seene to have eyther the lower leaves, or almost any on the stalk and branches when it is in flower, but they all wither and are dead and dry before: the roote also perishing as soone as it hath given seede, and is small long hard and woody.

5. *Carduus Eryngioides*, five *Carduncellus montis Lupi* *Lobelio* & *Pena*.

The small French Thistle of *Lobel* and *Pena*.

I put this small Thistle like plant among the *Eryngia* (herein following *Bauhinus* and *Alpinus lib. de exoticis plantis*, which else as *Lobel* and *Pena* in *Adversarijs* say might be accounted a species of *Atractylis purpurea*, if as they say it be not the very same, but I would rather referre it to the *Iacca* or *Cyani*) which sendeth forth divers long and winged leaves, somewhat prickly, among which a slender smooth stalk ariseth scarce a spanne high with the like leaves thereon, at the toppe whereof out of the middle of some long leaves stand two or three large, great, greenish yellow scaly heads bigger then may seeme proportionable to the plant, set with sharpe hard white pricks, which are often eaten by those where it groweth naturally, from the midst whereof issueth forth divers purple threads like unto the *Atractylis* or Distaff Thistle saith *Lobel*, but *Alpinus* saith they are like unto *Cyanus* the Come flower, after which come yellow Thistle-like seede; the roote is edible white and fleshy, thrusting downe deepe into the ground with divers fibres thereat.

6. *Eryngium trifolium*. Trefoile Thistle.

This unknowne plant sendeth forth at the first many long hard and narrow leaves from the roote which is like unto a Rampan and aromaticall, whereof some are parted into three, but those that are set on the stalk have all for the most part three long leaves joyned together at the end of the foot stalk at distances: at the top of the stalk stand two or three heads somewhat like those of *Eryngium montanum* with purple flowers, and long leaves under them: the seede also is broad long and small like unto it: the rootes encrease Venery and provoke Urine.

The Place.

The first is found about the Sea coasts almost in every countrey as well hot as cold, as *Spaine*, *Italy*, *France*, on our coasts almost every where and low countries also, and others more Northerly: the second groweth as *Camerarius* saith in *Franconia* in the vineyards and high wayes every where, but not about *Norimberge* where he lived as he saith: as also in the up and farther remote parts from the Sea in *Narbone* in *France*, as *Lobel* and *Pena* say: the third *Lobel* saith he never saw but in *Joannes Monnus* his garden the seede hath bene imparted to friends, but it is likely to come out of some hot countrey, because it flowreth late in these colder countries, and seldome cometh to perfection, even as the fourth doth also, which *Clusius* saith, he gathered at the foot of certaine hills neere *Salamanca* in *Spaine*, and in no other place: the fifth *Pena* saith groweth on that side of *Monti Lupis* that faceth the Sunne, neere unto a small brooke of water,

The

The Time.

The first and second flower in the end of Summer, and give ripe seede within a moneth after : the other flower later with us, and therefore seldome doeth their seede ripen with us.

The Names.

It is called in Greeke *Ερύγγιον* *Eryngium*, quasi *Ερύγγιον* sive *νίσσον*, dictum nimis fabulose autumant, for I thinke that *Plutarke* was the first author of the fable, that one *Coate* cropping a branch of *Sea Holly* causeth the whole flocke to follow him, untill he spew or spit it out againe; or as others say untill the Shepheard take it out of his mouth: the *Latines* keepe the same name of *Eryngium*, yet in many Apothecaries shoppes it is called *Iringus*, and of some *Centum capita*, *Pliny* calleth it *Erynge*, and saith that some did referre *Acanos* unto *Eryngium*, and *Lobel* doth thereof make some doubt, and others referre it to *Drypis* *Theophrasti* as he saith also: *Cesalpinus* unto the *Crocodilion* of *Dioscorides* and *Pliny*, *Lacuna* calleth it *Glycyrrhiza spinosa*, all other authors generally call the first *Eryngium marinum*, onely *Bauhinus* and *Gesner* in *hortis* call it *Eryngium maritimum*: the second is called *Eryngium vulgare* by *Camerarius*, *Clusius* and *Bauhinus*, because in *Germany* there is no other so frequent, the former being not so well knowne as being faire from the Sea side where onely it is naturall: *Fuchsius*, *Anguilara*, *Lacuna*, *Cordus* upon *Dioscorides*, *Cesalpinus* and *Tabernmontanus* call it simply *Eryngium* without other epithite, *Tragus* and *Lonicus* make it their first *Eryngium*; *Martholus*, *Durantes* and *Lugdunensis* call it *Eryngium montanum* sive *ampestre*, *Turner*, *Gesner* and *Gerard* *Eryngium mediterraneum* and *Lobel* *Eryngium campestre mediterraneum*: the third is the *Eryngium pusillum planum* *Missoni* of *Lobel*, *Lugdunensis* and *Clusius*, which *Bauhinus* calleth *Eryngium planum minus*: the fourth is called by *Clusius* *Eryngium pumilum hispanicum*, whom *Dodonaeus*, *Lugdunensis*, *Tabernmontanus* and *Gerard* do follow: the fifth is called by *Lobel* & *Pena* *Carduncellus montis Lupi*, and *Lugdunensis* *Carduncellus Pene* sive *Cardui minimi species*, and *Bauhinus* *Eryngium montanum minimum capitulo magno*, *Alpinus* lib. de exoticis as I take it mentioneth this, calling it *Cardus Eryngioides*: the last is mentioned by *Alpinus*. The *Italians* call the first *Iringio marino*, The *Spaniards* *Cardo corredor*, the *French* *Chardon a cent testes* according to the *Latine* *Centum capita*, and of some also *Para casti*, the *Germanes* *Wallendistill* *Brakendistill* and *Maas trewe*, the *Dutch* *Meere wortele*, *Endeloos* and *Cruys distel*, and we in *English* *Sea Holly*, or *Sea Hulver*.

The Vertues.

Both the *Vpland* and *Sea Holly* are temperate in heate somewhat drying and clearing, but our *Sea Holly* is more effectual than the *Vpland* kinde in all things whereunto it may serve, yet it is so neare thereunto that it is accepted in the steed thereof, and that to very good purposes, being not much inferiour, what therefore I shall shew you of the *Sea kinde*, you may transferre to the other, as divers other good Authours doe. The young and tender shootes are eaten of divers, either raw or pickled: the decoction of the roote in wine being drunke is very effectual to open the obstructions of the spleene and liver, and helpeth the yellow jaundise, the dropsie, and the paines in the loynes and winde collicke in the guts and bowell, provoketh urine, and expelleth the stone, and procureth womens courses: the same also, or the powder of the roote, to the quantitie of a dramme at a time, with some wilde Carrot seede drunke in wine, or as *Apollodorus* doth appoint in the broth of boyled Frogges, or as *Heraclides* saith, in the broth of a Goose, is available against the sting or biting of Serpents, and other venomous creatures, the poyson also of the *Aconite*, and other poysonous herbes: the continued use of the decoction for fifteene daies taken fasting, and next to bedwards, doth helpe the strangury, the pissing by dropes, the stopping of the urine and the stone, and all defects of the reines and kidneys, and if the said drinke be continued longer, it is said perfectly to cure them that are troubled with the stone, that the paines shall never returne againe, the experience on them that have beene troubled along time therewith, declaring it to be true: it is usually taken to helpe Venereous actions, and is good against the *French* disease: the rootes bruised and applied outwardly helpeth *Scrophulous*, or the kernells of the throate, called the *Kings evil*, or taken inwardly either, and applied to the flung or bitten place of any Serpent, &c. healeth it speedily: if the roote be bruised and boyled in old *Acungia* or salted lard, and applied to broken bones, thornes, &c. remaining in the flesh, doth not onely draw them forth, but healeth up the place againe, gathering new flesh where it was consumed, or almost fallen away: the juyce of the leaves dropped into the eares helpeth impostumes therein. The distilled water of the whole herbe when the leaves and stalkes are young, is profitably drunke for all the purposes aforesaid, and doth helpe the melancholy of the heart, and is available in *quartaine* and *quotidian* agues, as also for them that have their neckes drawne awry, or cannot turne them, without they turne the whole body therewith also. The other sorts are farre lesse effectual to be used in Physicke, but the two last sorts are much used by the Natives to incite Venery both rootes and heads.

CHAP. XIII.

Cardus Stellaris. The Starre Thistle.

Of the *Starre Thistles* there are two or three sorts, some whereof have beene but lately found out, and exhibited to be knowne; the other of more ancient cognizance, the *Spina* or *Cardus Solstitialis* being one of the number in that it doth so meereley resemble them, as shall be presently shewed: but in my opinion these plants, but that custome hath entituled them *Thistles*, might as well be referred to the *Laceas* or *Knapweedes* with prickly heads, as divers others there placed are, and even *Clusius* placing his *Lacea flore luteo capitulis spinosis*, at the first among the *Thistles*, doth afterwards change his minde, and set it among the *Laceas*.

1. *Cardus stellaris vulgaris*. The ordinary Starre Thistle.

The common *Starre Thistle*, hath divers long and narrow leaves lying next unto the ground, cut or torne on the edges, somewhat deeply, into many, almost even parts, soft or a little woolly all over the Greene, which is somewhat white, among which rise up divers weake stalkes parted into many branches, all lying or leaning downeto the ground, rather than much raised up, that it seemeth a pretty bush set with divers the like divided leaves up to the toppes, where severally doe stand long and small whith green heads, set with very sharpe
long

1. *Carduus stellaris* five *Calcitrapa vulgaris*.
The ordinary Starre Thistle.

4. *Carduus solstitialis* Dodonae.
St. Barnabies Thistle by Dodonae.

Carduus Solstitialis Lobelio.
Lobelus St. Barnabies Thistle.

long white prickles, no part of the plant being in any place else prickly, which are somewhat yellowish, and as sharpe as in any other Thistle; out of the middle whereof riseth the flower compoted of many small reddish purple threads, and in the heads after the flowers are past, come small whitish round feede lying in downe as others doe: the roote is small, long, and woody perishing every yeare, and raising it selfe from it owne feede sowing.

2. *Carduus stellaris flore albo*.
The white flowered Starre Thistle.

There is no difference in this Thistle from the former, but in the white greencesse of the leaves, and the white threads in the flowers.

3. *Carduus stellatus latifolius*.
The broad leaved Starre Thistle.

This Thistle hath broader and shorter leaves than the former, but not much or so deeply cut in on the edges, with a few prickles set here and there at the corners; the stalk is but little divided, having few branches set with the like leaves, and at the toppes small round thicke white heads, set thicke with prickles, many set together, in the fashion of a Starre, seven for the most part set spreading in every place, the longest of them being middlemost, and the other on each side being shorter; out of the middle of the head rise reddish purple threads like unto divers other Thistles: the roote is small and annuall.

4. *Carduus solstitialis* Dodonaei. Dodonaeus his Midsummer Thistle or St. Barnabies Thistle.

This Thistle of Dodonaeus as hee saith hath long leaves lying next to the ground, deeply cut in on the sides into many long and narrow parts, the lower part being somewhat broad and ending in a long point, of a blewish Greene colour, from among which rise up divers upright stalkes two foote high, with divers long and narrow leaves, somewhat divided but the uppermost without division, and all of them without any prickles upon them; at the toppes stand sundry small sharpe prickly heads, whose prickles are as white or rather more then in

Solstitialis
Lobelii.

in any of the other, and are so cruelly sharpe that they prick the Thighes and Legges of those that unadvisedly passe thereby, in the middle whereof stand a few yellow threads; the seede is white and long not much unlike those of the former starre Thistle: the roote is blackish, long, and slender not growing deepe, joynted or kneed in divers places somewhat woody and bitter in taste, somewhat like unto the long Ciperus grasse roote. *Lobel* giveth a figure hereof whose lower leaves are as little jagged as the upper, which I have here set to let you see the difference.

The Place.

The first groweth in the fields about *London* in many places as at *Mile-end greene*, in *Finsbury* fields beyond the *Milles*, and in many other places: that with white flowers is much more rare and not to be met with in a great compasse: the third is found about *Narbon* in *France*, and the last about *Mompelier* in good plentie but is not to be found wilde with us.

The Time.

The first flowreth early and feedeth in *July* and sometimes in *August*: the last is usually in flower about Midsummer or a little after.

The Names.

It is very probable that the *Carduus Stellatus* or *Stellaris* is the *πλάγινθος* *Myacanthus* of *Theophrastus*, lib. 6. c. 4. (and not the *πλάγινθος* either of *Dioscorides* which is *Asparagus petreus* or *Phry* which is *Corruda* or *Sylvestris* *Asparagus* which is *tota spina* a bush onely of thornes) which hath thornes or prickles not upon the leaves, but besides them, as *Capers Ononis* and *Tribulus*, for with them he setteth *Myacanthos* as being of a likeness, and so called because the prickly heads being sticke upon salted flesh that was hung up, would sufficiently defend it from Mice or other vermine that would devour it: *Brunfelsius* calleth the first *Eryngium* and so doth *Guilandinus*, *Tragus* maketh it his *Eryngium alterum*, *Matthioli* calleth it *Cacatrepol* quasi *Cacotribulus*, id est, infestus *tribulus* and so doth *Cesalpinius* also: who thinketh withall that it may bee the *Starre* *Theophrasti* whereof ye shall heare more a little after: *Dodonaeus* and *Camerarius* call it *Carduus Stellatus*, and so doth *Lobel* also, and *Calcitrapa*, as the shops beyond the Sea in divers places doe. *Horatius Angerius* calleth it *Stellaria* and *Gesner* in his *hortis*, *Carduus Stellatus* sive *Stellari*, *Cardus Polyantha*, *Tabernmontanus* *Spino stella*, *Lugdunensis* *Myacanthus* *Theophrasti* *Dalechampsii*, *Clusius* *Carduus muricatus*, *Columna* *Hippophaestum* vel *Hippophaes*, *Dioscorides* and *Bauhinus* *Carduus stellatus folijs papaveris erratici*: the third is called by *Lugdunensis*, *Carduus stellatus Dalechampsii*, and *Bauhinus* *Carduus stellatus latifolius caulescens*: The last is thought by some to be the *ἀστὴρ βασιλικὸς*, *Spina regia* *Theophrasti*, and is called by *Gesner* in his *hortis* *Spinacitryna* sive *lutea*, and *Spina Solstitialis* and so doe *Dodonaeus*, *Lobel* and *Camerarius* who also call it *Carduus Solstitialis*, *Lugdunensis* *Leucacantha quorundam*, who as *Lobel* also saith, the French call it *Aurioles* in divers places, *Cesalpinius* *Calcitrapa altera*, and *Columna* *Spina Solstitialis* minor *Apula* sive *Carduus stellatus minor*, and *Bauhinus* *Carduus stellatus luteus folijs cyani*, *Gerard* his figure thereof is not right, for it is but the first *Carduus stellatus* which *Mr. Johnson* hath noted, yet giveth a figure for *Solstitialis* little or nothing differing from the *Stellatus*, when as this true figure hereof is extant in *Lobel*, and whereas *Gerard* his *Solstitialis lutea peregrina* is supposed to be *Acanthium peregrinum* of *Tabernmontanus*, which *Bauhinus* knew not what to make of; it is plaine by *Gerard*'s owne words that hee ment it by *Clusius* his *Jacea lutea capitulis spinosis*: many such faults have passed *Mr. Johnson*'s correction, which I am loth in every place to exhibit, knowing that none of us all can publish any thing but there may bee slips and errors in many places thereof. The *Italians* call the Starre Thistle (as I sayd before) *Calcitrapa*, the French *Chaussetoppe*, the Germans *Wallendistel*, the Dutch *Sterre distel*, the other we call in English *S. Barnabies Thistle* or Midsummer Thistle.

The Vertues.

The seede of this Starre Thistle made into powder and drunke in wine doth provoke Urine, and helpeth to breake the stone and drive it forth: the roote in powder given in wine is good against the Plague or Pestilence, by drinking thereof daily fasting for some time together is very profitable for a Fistula in any part of the body. They about *Frankford* doe use the rootes hereof in stead of *Eryngium* which groweth there together with it as *Camerarius* saith. *Baptista Sardus* doth much commend the distilled water hereof being drunke to helpe the French disease, and to open the obstructions of the Liver, and cleanse the blood from corrupted humors, and is also profitably given against eyther quotidian or tertian Agues: The Midsummer Thistle is used by the *Savoyars* as *Camerarius* saith, and both flowers and roote admirably commended against the evill disposition of the whole body called *Cachexia*, against the Drop sicke, daily Agues, maidens pale colour by reason of the greene sicknesse, or other obstructions, the countrey people saith here, doth much use the distilled water or the decoction thereof, both against the swellings of the spleene and prickings in the sides, as also to provoke sweating and to helpe the hip-gout or paines in the huckle bones called the Sciatica.

CHAP. XV.

Carduus mollis. The gentle Thistle.

None of these kinds of gentle Thistles I have published in my former booke and therefore shall not neede to speake againe thereof in this place, but of the rest as they follow.

1. *Carduus mollis laciniato folio.* The gentle Thistle with jagged leaves.

This jagged gentleman hath many leaves, some lying on the ground, others standing more upright much jagged or cut in on the edges, even to the middle ribbe, greene on the upper side, hoary white and woolly underneath like unto the younger and softer leaves of the first starre Thistle, not having any shew of prickles on them, of a little drying and bitter taste: from among which rise up one or two round striped stalkes about two foote high, of a reddish colour yet covered with a fine Downe or Cotton, set with divers leaves, the lowest whereof are like those on the ground but smaller, and those up higher are narrow and long without division, the ends and points of them being usually reddish, at the toppe of the stalk which is more usually without branches, groweth one head composed of many scales, set together with very soft and gentle prickles thereon.

1. *Carduus mollis laciniato folio.*
The gentle Thistle with jagged leaves.

2. *Carduus mollis Helenij folio Camerarij.*
Camerarius his gentle Thistle.

thereon, out of the middle whereof riseth a reddish or stamell flower made of divers soft and woolly threads : the seede that followeth is great and somewhat cornered : the roote is somewhat long and of the bignesse of ones finger, brownish on the outside with some fibres thereat.

2. *Carduus mollis angustifolius.* Narrow leaved gentle Thistle.

This other Thistle hath shorter stalkes and narrower leaves then that sort I have set forth in my other booke, greene above and hoary underneath, having a few soft prickles about the edges, at the toppes of the stalkes standeth one scaly head greater then any of the other, from the middle whereof commeth many fine blewish purple threads like wooll of the said colour.

3. *Carduus mollis Helenij folio Camerarij.* Camerarius his gentle Thistle.

This Thistle groweth very tall having large leaves next the ground, very like unto those of Elecampane, of a darke greene colour on the upper side, and whitish hoary or woolly underneath, those on the stalkes are like the other but lesser having no prickles on the edges, the toppe whereof is furnished with small scaly heads upon short footstalkes, with reddish threads for the flower in the middle : the roote is blackish and spreadeth it selfe, encreasing by new shootes from it.

4. *Carduus mollis latifolius Lappe capitulis.* The Burre headed Thistle.

The stalk hereof is about a cubit high, set with divers soft and short prickles, with divers long and broad leaves like unto Docke leaves, being smooth thimne and full of veines, and with a shew of some small prickles about the edges, at the toppes of the stalkes stand divers small prickly heads like unto Burres, both for the forme and bignesse, out of which start reddish stamell coloured threads which are the flower.

The Place.

The first *Clusius* saith he found on all the hills that runne from *Callenberg* unto the *Alpes* and in other places in *Hungary* : the second on the hill *Sacalben* : the third *Camerarius* saith is frequent on all the hills of the *Hermoduri* ; and *Bauhinus* saith the last was found on the hill *Tauerus* in *Austria*.

The Time.

They doe all flower in *Iuly* and *August*.

The Names.

These plants as *Clusius* saith are not fity termed Thistles wanting prickles, but might more justly bee referred to the *Jacens capitulis spinosis*, &c being plants lately found by the diligent search of *Clusius* and others they have no ancient Greeke or Latine Epithete whereby they may be called, *Camerarius* therefore and *Clusius* have imposed names on them as they thought most fitying to their naturall formes. *Clusius* calleth the first *Carduus mollis tenuifolius*, and *Bauhinus* *Carduus mollis laciniato folio* : the second *Clusius* calleth *Carduus mollis angustifolius vel tertius*, and *Bauhinus* *Carduus mollis folio oblongo Cirsij capitulo* : the third *Camerarius* calleth *Carduus montanus folijs Helenij non spinosis*, *Clusius* calleth it *Carduus mollis Camerarij*, and *Bauhinus* *Carduus mollis folio helenij* : the last *Bauhinus* setteth forth by the name of *Carduus mollis latifolius Lappe capitulis*.

The

The Vertues.

We have not knowne or heard unto what disease any of these plants have bene applyed, and therefore untill we have somewhat worthy the relation we must be silent, leaving them to every ones judgement to apply them according to discretion.

CHAP. XVI.

Acanthus five Branca ursina. Beares-breech.

Here are two sorts of this herbe, the one smooth and without prickles eyther on the leafe or head: the other very prickly in the leafe but not on the head: which although I have set forth in my former booke, yet I thinke good to repeat them here againe, in that I would a little more comment upon them, and shew you more fully their specifick vertues.

1. *Acanthus sativus*. The garden gentle or manured Beares-breech.

This gentle Thistle (as it is accounted) shooteth foote many very large thicke smooth and sad greene leaves upon the ground with a thicke middle rib, and parted into sundry deepe gashes on the edges, from among which after it hath stood long in a convenient place, riseth a reasonable great stalk 3 or 4 foot high without either joynt, branch or leafe thereon, but onely from the middle upwards, set with a spike as it were of white hooded or gaping flowers standing in brownish huskes, somewhat sharpe at the points, and a small long undivided leafe under each flower: after which come in the hotter countries (but not in ours as far as I can learne) broad, flat, round, thicke, brownish yellow seede; the text of *Dioscorides* hath them somewhat long but such did I never see, which having put into the ground hath sprunge with me and growne, the rootes are many great thicke and long strings, spreading farre and deepe in the ground, of a darkish colour on the outside and whitish within, very clammy and more then the leaves, so full of life that a small peece left in the ground, will spring up againe, but will require shelter or defence from the extremitie of the winter wether.

2. *Acanthus Sylvestris*. The wilde or prickly Beares-breech.

This other wilde or prickly sort hath likewise sundry long leaves, lying on the ground but much narrower more divided on the edges into smaller parts, and each part with small incisions, and very sharpe white prickles at them, from among which a lesser and lower stalk ariseth, with the like spiked head of flowers, and a few prickly leaves thereon in their way coming up, standing in more sharpe and prickly huskes than the former, after which the seede that it produceth, is as small as a little Pease, hard, blacke, and round: the roote hereof spreadeth not so deepe, or farre as the former, nor groweth so great but is more tender to keepe from the Winter coldes.

The Place and Time.

They both grow naturally in many places of *Italy*, *Spaine*, and *France*, but are onely nursed up in the gardens

1. *Acanthus sativa*.
Beares breech. 2. *Acanthus sylvestris*.
Prickly Beares-breech.

of the curious with us: the first flowering in June sometimes or in July but giveth no perfect seede with us, the other later flowreth and seldome or never yet gave us any shew of ripe seede.

The Names.

They are called in Greeke *ἀκανθὸς* & *ἀκανθα*, *Acanthus*, and *Acantha* and *ἑρπαικάνθα* *Herpicantha* by some, and the smooth sort *μυρτιάς* & *μαμαρῶν* *Pederos* and *Melampylos* as *Oribasius* and *Pliny* have it, *Fuchius* also saith that it was formerly called *Marmoraria* by the *Romanes* which is corruptly turned into *Mamolaria* among the bastard names of *Dioscorides*, because the forme of the leaves was usually the patterne for many engravings, &c. in pillars and other workes, their pots and cups also siewed with the same: The first is called *Acanthus verus sativus*, *hortensis* and *lavis* by all others, or *mollis* *Virgili*, and *Branca ursina* by the *Italians*: there are some that make a doubt whether this be the true *Acanthus* of *Dioscorides* partly for the difference of the seedes as you have it before, and partly of the colour of the rootes to be red, but all other parts so exactly agreeing thereunto hath decided that doubt: some againe make a question as *Bauhinus* mistaking the matter, whether the garden kinde be not the *Acantha* of *Theophrastus* lib. 4. c. 11. which he putteth among the herbes; but he in disjoyning *Acantha* (from *Ceanothus* to make them two things altereth the same wonderfully, as you may see it in *Bauhinus* his *Pinax* in his *Scholy* upon *Acanthus*, and comparing it with *Theophrastus* his Text: but I thinke I may more truly wonder why the first *Acanthus* should bee numbred inter *Spinus* & *Carduus*, being so smooth an herbe without any shew of prickles or thornes in leafe or heads; which if I might give an answer thereunto, might rather proceede from the likenesse of the thyrsus or spike of flowers unto the wilde or prickly sort then of it selfe: the other was first set forth by *Dodonaus* and *Lobel* who call it *Acanthus styvestris* and *Scolymo* *Dioscoridis* *similis aculeatus*: some terme it *spinus* and some *aculeatus* but it cannot bee *Chamaeleontha* *Monspeliensis* which hath a prickly Thistle or Artichoke like head, although the title over it in *Lobels Icones* importeth so much. The *Italians* as I said before call it *Branca ursina* and *Acantho*; the *Spaniards* *Terva gigante* and *Branca ursina*, the *French* also *Branche urse*, the *Germans* *Welsch Berenklaw*, the *Dutch* *Beeren clawn*, and wee in *English* *Beares breech* and not *Beares foote*, which is another herbe shewed you here before to be *Helleboraster minor*.

The Vertues.

By reason of the mucilagines in the leaves they are often used in our times in the decoctions for glisters, so to make the passages more easie and slipperie: but *Dioscorides* saith that they binde the helly, and are good for those members that are out of joynt to confirme and strengthen them which no doubt it may doe by the slimy matter in the leaves and rootes, and soone convertible by heate into a binding quality; for as *Galen* saith 6 *simp*, the roote hath a drying as well as a gentle cutting facultie, being of thinne parts and the leaves often meanely digesting withall: the rootes say *Dioscorides* and *Pliny* are applyed to helpe those places that are burnt with fire, and also those that are bursten, Crampes likewise and the paines of the Goute, to be outwardly applyed, and the decoction of them taken inwardly provoketh urine, and is good for those that are falling into a Consumption.

CHAP. XVII.

Anonis five Resta bovis. Rest Harrow or Cammaok.

After I have shewed you all the Thistles that are usually knowne, let me to finish this Classis include those shrubbes or bushes that are thorny and prickly, some of which number are already entreated of in my former booke, and those are the Roles of all sorts for a Garden, the Raspberries, the Gooseberries, and Barberries, the Paliuras or Christs Thorne, the Pyracantha or overgreene Hawthorne and Savine of one sort, the *Ficus Indica* or *Indian Fig*, and the *Indian Iucca* which hath a prickly pointed leafe, & in the second Classis of this worke the purging *Rhamnus* or Buckes thorne: of the rest I shall speake here in order as they come next to hand, and first of the Rest Harrow which is distinguished into two kinds, the one thorny, the other gentle without thornes which is to be joyined to the other for the names sake, of each whereof there is some varietie as the succeeding Chapter will shew.

1. *Anonis spinosa flore purpureo.* Common Rest Harrow with purplish flowers.

The common Rest Harrow that is frequent as well in arable as waste grounds and by lanes, riseth up with divers tough woody twiggies, halfe a yard or a yard high, set at the joynts without order, with little roundish leaves sometimes more then two or three at a place, of a darke greene colour, without thornes while they are young, but after wards armed in sundry places with short and sharpe thornes: the flowers come forth at the tops of the twiggies and branches whereof it is full, fashioned like Pease or Broome Blossomes, but lesser, flatter and somewhat closer, of a faint purplish colour, after which succede small pods containing within them small flat and round seede: the roote is blackish on the outside and whitish within, very tough and hard to breake while it is fresh and greene, and as hard as an horne when it is dryed, thrusting downe deepe into the ground, and spreading likewise, every little peece being apt to grow againe if it be left in the ground.

2. *Anonis spinosa flore albo.* Rest Harrow with white flowers.

This Rest Harrow differeth in little else from the former then in the leaves which are a little fresher greene, and in the colour of the flowers which are very white in some places more then in others, in other things they are alike.

3. *Anonis spinosa montana lutea major.* The great yellow prickly Rest Harrow.

This likewise differeth from the former onely in the leaves which are somewhat larger and longer and in the flowers which are yellow like the other yellow kinde without thornes.

4. *Anonis spinosa lutea minor.* The lesser yellow prickly Rest Harrow.

This other yellow Rest Harrow that hath thornes or prickles thereon is like the last yellow sort, but lower and smaller arising little above halfe a foote high, differing not in any other greater matter from the last.

5. *Anonis non spinosa flore purpureo.* Purplish Rest Harrow without Thornes.

This Rest Harrow hath no other difference in it from the most common, but that this hath no thornes or prickles upon

upon the sprigges, no not in Autume when the other will have very many. Of this sort there is one likewise that beareth white flowers which maketh all the difference.

6. *Anonis non spinosa lutea major.*

The greater yellow gentle Rest Harrow.

This great yellow gentle Rest Harrow shooteth from the roote which is long rough and blackish, divers flexible woody twiggies branching forth on all sides, covered with a brownish red barke set reasonably thicke with leaves, which are for the most part three standing together upon a long footstake somewhat like unto Trefoile, but somewhat narrow and long with notches at the ends so much overspread with a strong fented clamminesse that it will stick so fast to their hands that touch them, especially in the heate of the yearé, and in the hot countries that it will hardly be taken off againe: at the toppes of the branches stand many Pease blossome-like flowers, of a faire yellow colour, after which come small & long cods with a crooked point at the end of every one of them, wherein is contained small flattish seed. Of this kind we have had from Boel of Lisbonne a lesser sort, whose flowers smelt better then the former; the roots of both are annuall perishing yearly. As also another with a more reddish flower.

Minor flore odorato & fl. purpurea, etc.

7. *Anonis non spinosa lutea variegata.*

Variable yellow gentle Rest Harrow.

This differeth in no other thing from the last yellow, but in the flower which are of a paler yellow colour, striped all the length of the flowers with reddish stripes, which make them the more conspicuous and regarded.

8. *Anonis viscosa minor luteo pendula.*

The lesser yellow gentle Rest Harrow.

This lesser yellow, gentle Rest Harrow groweth very low and small not much above an hand breadth high, having many branches of two or three inches long a peere, with leaves set thereon, three joynd together for the most part and clammy also like the other yellow sorts, the flowers stand in like manner at the toppes of the branches

6. *Natrix Plinij sive Anonis non spinosa lutea major.*

The greater yellow gentle Rest Harrow.

1. *Anonis aut Oacnis spinosa flore purpureo.*
Common Rest Harrow with purplish flowers.

7. *Anonis non spinosa lutea variegata.*

Variable yellow gentle Rest Harrow.

Yellow

yellow but smaller and hanging downwards: the seede that followeth is much like the other, but smaller and in smaller cods. Of this sort also wee have had from the said Boel two other sorts with reddish flowers both of the one growing low and small, the one being but annuall and the other abiding.

The Place.

The first second and fift with the varietie thereof grow in many places of our Land, as well in the arable as waste grounds, but the third and fourth I never met with growing naturally any where in our countrey, although Lobel saith of the fourth that it groweth as well about Bristow as London, Gesner saith the third groweth on the hill Gemma among the Valefians, and Columba saith the fourth groweth in the kingdome of Naples: the sixth, seventh and eighth with their varieties groweth as well in Narbone in France, and about Niompelier as in Spain and Portugall.

The Time.

They doe all flower about the beginning or middle of Iuly, and their seede is ripe in August.

The Names.

Dioscorides and Pliny call it *Anonis*, Theophrastus and Galen *O'vovis Ononis* the Latines keepe both names, *Anonis* quasi non juvando quod nullam utilitatem p. abeat, dici videtur, siquidem aratoribus inimica est, vivaxq; nimis fruges opprimis & suis aculeis nocet nisi quis ex adverso nomen inditum putaverit: Ononis vero r. quasi d. cas. asini oblationem, nam ex Græcis quidam affirmant asinos in ea se volutare & dorsum sub ejus aculeis libenter extere. It is also called *Arefa bovis* and *Resta bovis*, and *Remorum atrii*, because the roots are both so tough that the Plough Share cannot easily cut them, and so deeply and strongly fastned in the ground, that the Coulter happening under it causeth the Oxen to bee at a stand for the first twich, not being able without more then ordinary strength to pull them forth, Cordus on Dioscorides calleth it *Acutella*, because the thornes doe prick those that unwarily goe by it. Gesner in hortis adviseth not to bring *Ononis* into a garden least it prove *Anonis* that is not helpfull but hurtfull, being not easie to rid it out againe. *Anguilara* tooke it to be *Agippros Cratena*. All writers else call it eyther *Anonis*, *Ononis* or *Resta bovis* with the severall distinctions of *spinosa* or non *spinosa*, and according to the colour of the flowers onely the great yellow without thornes is taken of most herbarists to be *Natrix* Lin., which yet Lobel seemeth to doubt of, saying hee will neither guess nor divine by what argument it is supposed, nor trouble himselfe much to disprove them, yet *Anguilara* doth rather thinke the *Fraxinella* should be it. The Italians call it *Anonide Bonaga* and *Resta bove*, the Spaniards *Gatillos* and *Gattinos*, the French *Arresse brus*, the Germans *Hanbackell* and *Ockjenbeck*, the Dutch *Frangmortele*, oft *Stalcruyt*, and wee in English *Rest Harrow* *Euphorbie gratia* rather then *Rest Plough* or *Rest Oxen* as it is in other languages, in some countries also *Cammock* and *Petty whin*.

The Vertues.

Galen saith that the roote of *Rest Harrow* is hot in the third degree having some clensing and cutting facultie therein also. It is singular good to provoke urine when it is stopped, and to breake and drive forth the stone, which the powder of the barke of the roote taken in wine performeth effectually; for *Matthiolus* writeth that he knew divers freed from those diseases that used the sayd powder in wine for many dayes together, and the same also to be that disease called *Romez* or *Heirna carnosia* the fleshy rupture, that is, that fleshy carnositie by little and little consumed, in taking the said powder for some moneths together constantly, when as the Physicians and Chirurgions had given them over, as desperate or no otherwise to be cured but by cutting or burning: the decoction thereof made with some vinegar and gargled in the mouth easeth the paines of the toothach especially when it cometh of rheume: some also affirme that the decoction hereof drunke doth helpe the painefull hemorroides: but it is certainly found true that the said decoction taken is very effectually to open the obstructions of the Liver and Spleene, and the other parts: a distilled water made in *Balneo* with foure pounds of the rootes of *Rest Harrow*, first sliced small, and afterwards steeped in a Gallon of Canay wine, is singular good likewise for all the purposes aforesaid, and to cense the passages of the urine, not suffering any matter that is clammy to gather together or harden to become a stone: the said quantitie of the rootes sliced and put into a stone pot close stopp'd with the like quantitie of wine, and so set to boyle in a *Balneo Mariæ* for 24. houres is as dainie. a medicine for tender stomacks as any the daintiest Lady in the Land can desire to take, being troubled with any the aforesaid griefes: the powder of the said roote made into an Electuary or Lozenges with Sugar, as also the barke of the fresh rootes boyled tender and afterwards beaten into a Conserve with Sugar worketh to the like effect: the powder of the rootes shrowed upon the hard callous, brims of ulcers, or the said powder mixed with any other convenient thing and applyed doth consume the hardnesse and cause them to heale the better: it is recorded that in former times the young shoots and tender stalkes before they became prickly were pickled up to be eaten as a meate or sawse, wonderfully commended against a stinking breath, and to take away the smell of wine in them that had drunke too much. Pons in his Italian *Ealdus* saith that divers Apothecaries with them there in Italy doe use the flowers of the yellow *Rest Harrow* in stead of Mellilot eyther through want or ignorance.

CHAP. XVIII:

Tragacantha. Goates Thorne.

Cannot but dissent from Bauhinus who dissenteth from Clusius and others, that make *Poterium* another or lesser sort of *Tragacantha*, and differing from the *Pimpinella spinosa*; for I must doe contrary to him, and thinke I have good reason for it, as shall be shewed by and by, and speake of the *Pimpinella spinosa* in a Chapter by it selfe, because I finde the difference betweene *Poterium*, *Tragacantha* and *Pimpinella spinosa* to consist in many things.

I. *Tragacantha vera*. The true Goats thorne.

The true Goats thorne is a small bushie plant rising up with many tough plyant or flexible woody stemmes not much above a cubit or two foote high divided into many slender branches, covered with a white hoarinesse, set with divers long white thornes in a double row, among which rise up divers winged leaves that is, many

small long and round leaves set on each side of a middle ribbe, which abide on all the winter long and fall not off, untill the spring doe bring on fresh, and then fall away. at the toppes of the branches and among the leaves come forth the flowers which are of a whitish yellow colour, fashioned somewhat like unto the flower of a Trefoile, after which come small short upright white cods, wherein are contained small whitish cornered feede: the roote is very great and long, spreading much and farre in the ground, which being broken or wounded yeeldeth a tough pure shining white gumme, in small crooked peeces tasting somewhat sweete. There is another sort hereof whose stalkes and branches are blackish and woody, having small thinn leaves all set on one side, and not opposite as in the former, the flowers and feede is somewhat like, but the roote yeeldeth no gumme.

Altera non gummosa

2. *Tragacantha altera seu minor Poterion forte Dioscoridis.* The small Goates thorne.

This other Goats thorne is so like the first that it is often mistaken for it, growing lower, and smaller then the former, yet spreading and shooting forth pliant flexible stalkes, covered as it were with scales about a foot high, from whence springeth up a cottony or woolly head, which breaketh into sunny winged leaves in the spring of the yeare, made of many small and almost round leaves being set on both sides of a middle ribbe, which are very hoary and as it were woolly at the first budding forth, which the former hath not and so continue hoary as long as they abide on the ribbe, which proveth a thorne very cruell sharpe and prickly at the end when they are fallen away, so that all the winter long no leafe is seene on any, and the thornes that have cast their leaves never have any more growing on them. but abide bare and naked thornes ever after, the bush seeming all the winter long nothing but long sharpe white thornes: from the upper parts of the stalkes come forth two or three whitish flowers standing together, made of two leaves a peece an under and an upper, both formed somewhat like hoods, each flower in a hoary huske or hose; the pod that followeth is hoary, white, thicke, short and somewhat broad, ending in a point wherein is contained whitish feede, somewhat like unto a *Medica* feede: the roote is great long and tough, blackish on the outside and white within, somewhat sweet and gummy, yet yeelding but little gumme and that more yellowish. There is another sort hereof whose branches are very sharpe, not rising much above the ground, but they are many and thicke growing together, the roote being wounded yeeldeth a gumme like unto *Tragacantha*.

Poterion albid.

3. *Tragacantha Syriaca flavescens.* The yellow Syrian Goates thorne.

This Syrian thorne differeth very little from the last but in the flowers which are yellow, standing in round yellowish huskes, and that the whole plant groweth lower.

4. *Tragacantha Syriaca purpurascens.* Purple Syrian Goats thorne.

This other Syrian kinde is as low as the last, having many browne thicke stalkes, thicke set with leaves and many white heads at the toppes, out of which come purple flowers like the former which are very beautifull.

The Place.

Both the former sorts with their varieties have beene found as well in Candy as about *Marselles* and *Mompelien*: the first anciently knowne both there and in other places sufficient plentifully, but the other was also found by *Clusius* in the kingdom of *Granado*, a more exact figure whereof was sent unto him after his death from *Aquasextius* which is not farre from *Mompelien*, and is published in his *Care posteriores* in quarto, pag. 113. the other two last sorts *Rauwolfius*, and *Lugdunensis* from him in his *Appendix* setteth forth to grow in *Syria*.

1. *Tragacantha vera.*
The true Goates thorne.

2. *Tragacantha altera seu minor Poterion forte Dioscoridis.*
Small Goates thorne.

The Time.

All these sorts are very tender to keepe with us, not enduring the cold of these cold climates without extraordinary care and provision, but in their naturall places flower and seede in the beginning of Autumne.

The Names.

The first is undoubtedly knowne to be the *Tragacantha* of the ancients, *id est*, *Hirci spina* not from any strong sent of a Goate as the *Tragum* and *Tragoriganum* have, but from the sharpe forme of the bush with thornes as it groweth representing a Goates beard, the gumme likewise that is gathered from the rootes when they are cut or broken in the heate of the yeare is called *Gummi Tragacantha*, and in the shoppes of Apothecaries in France, &c. *Gum dragant*, the varietie thereof is mentioned by *Alpinus* in *Libro de exoticis plantis*: the second is adjudged by the best herbarists in these times to be the *Poterion* of *Dioscorides*, which as hee saith (some called *videtur Nervus quod nervis amica sit* & *Poterium quod potrix herba paludosum rigumque solum amat*, as some say, *Pliny* saith it was called also *Phrynium*: this differeth from the *Tragacantha* but yet commeth nearer thereunto then unto the *Pimpinella spinosa* as you shall heare in the next Chapter, the chiefest difference betwene the *Tragacantha* and *Poterium*, consistin in that it keepeth no greene leaves in winter as *Tragacantha* doth, is more hoary or woolly and spreadeth more abroad with the branches then *Tragacantha*, which groweth more close and upright, but agreeth therewith in the small leaves and sharpe thornes and in the roote which yeeldeth a gumme, somewhat like to gumme *Tragacantha* but the *Pimpinella spinosa* hath both differing leaves branches and fruit, with smaller and lesser prickly thornes and a dry saplesse roote which yeeldeth no gumme, and abideth ever greene. Now let others judge whether this be more fidly referred to *Pimpinella spinosa* as *Bauhinus* or to *Tragacantha* as *Clisius* doth who calleth it *Tragacantha altera forte Poterion*, and so doe *Lobel*, *Tabernmontanus*, *Alpinus* and *Lugdunensis* and *Bellonius* likewise as it is likely, *Bauhinus* himselfe although he sever it from the *Classis* of *Tragacantha* yet calleth it *Tragacantha affinis*, *Matthiolus* calleth it *Poterium* and so doth *Tabernmontanus* and *Lugdunensis*. *Rauwolfius* maketh it his first *Tragacantha* and *Lugdunensis* in his Appendix in the like sort after him: the two last sorts are set downe by *Rauwolfius* in his second booke and in the said Appendix of *Lugdunensis*.

The Vertues.

I doe not finde that the leaves flowers, seedes or rootes of *Tragacantha* are used to any purpose, but onely the gumme it selfe, which besides the physickall uses serveth to many purposes as a kinde of Starch or Glew to binde or stiffen things withall: the gumme dissolved is often mixed with pectorall Syrupes, hony or juice of Licoris to helpe the cough or hoarsenesse in the throate salt, and sharpe distillations of rheume upon the Lungs, being taken as an Electuary or put under the tongue so to distill gently downe: the said gumme dissolved in sweet wine a dram at a time and drunke, is available for the gnawing paines in the bowells and the sharpnesse and frettings of urine, eyther in the revines or bladder, especially if some harts horne burnt and walt be mixed therewith: the said gum also is an ocular medicine helping therunto, being used alone or mixed with other things for the purpose, to allay the heate and sharpenes of hot rheums falling into them, and strenetheneth and bindeth more then *Sarcocolla*, the said gumme mingled with milke taketh away white spots growing in the blacke of the eyes, the itching also of them and wheales and scabbes that grow upon the eyelids: being somewhat terrified and mixed with the juice or wine of Quinces and used in a glister is good against the bloody flux. And generally used where there is cause of making smooth any of these parts that is the Lungs, Chest, Throate or Windpipe grown hoarse or sharpe by rheumes or to repress or dry up defluxions of sharpe and thinne matter to the throate, jawes, &c. as for Ulcers in any of these parts it is an excellent and approved remedy: the rootes of the second which as I sayd is verily held to be the true *Poterium* of *Dioscorides* boyled in wine and drunke is profitable against the poyson of the red roade, and being made into a pultis and applied to any of the Nerves or Sinewes that are wounded cut or hurt doth heale them and soder them together, as also all other sorts of wounds and cures: the said decoction of the rootes in wine is also effectfull for the said purposes to bee drunke, and for inward wounds and veines that are broken.

CHAP. XIX.

Pimpinella spinosa. Thorny Burnet.

The thorny Burnet (taken of divers to be *Poterium* but much differing therefrom, as I have said before, and shall here more presently) spreadeth divers woody whitish twiggy stalkes round about, not rising much above a cubit high branching and interlasing it selfe one within another very much bearing sundry winged leaves of many set together on both sides of a middle ribbe, which upon the first appeare are closed together, and afterwards spread themselves more largely and dented about the edges, very like unto small Burnet leaves, greene on the upper side and hoary white underneath, with many small prickles or thornes, not very strong or sharpe. set confusedly upon the stalkes and at the ends, at the toppes whereof and the branches stand divers small reddish greene flowers set together, after which come small berries divers growing together like unto small Blacke berries, or Mulberries, greene at the first and reddish afterwards: the roote is not great but long and slender, spreading much under ground, being tough and not easie to breake, saplesse also or without any gum comming therefrom when it is broken.

The Place.

This groweth in Candy as *Honorius Bellus* saith and *Alpinus* also upon the hills where Time, Savory and Asparagus grow, and with them having Dodder growing upon it also: and upon the side of mount *Libanus* in Syria as *Rauwolfius* saith, and as *Dalechampius* saith in the vallies beneath the hilly woods in Savoy about *Marra* which is but a little distant from *Gratianople* but is never found in wet or marshy places.

The Time.

It flowreth in the end of Summer, and the fruit is ripe in Autumne when the young leaves beginne to spring forth.

The Names.

Pimpinella spinosa. Thorny Burnet.

This plant is generally called *Pimpinella spinosa*, and by some as is aforesaid *Poterium* but falsely for *Poterium* as you have heard before hath very strong and long white thornes, the leaves are like Lentills, the fruit are cods wherein lye the seede and the roote yeeldeth a kinde of gumme all which are contrary herein as you may perceive by the description, the leaves hereof being dented about, and in shew very like Burnet which together with the prickles hath caused the name of thorny Burnet. *Honorius Bellus* in his second Epistle unto *Clusius* sheweth verily learnedly and by sound and good reasons, that this plant being called *astibda Stabeda* not onely in Candy but of the Greekes in generall (which name is but corrupted from *Stabe*) is the true *Stabe* of *Dioscorides* although hee hath not given any description thereof (but differeth much from the *Stabe* of *Galen*) first because the names are so like, then that the drying qualities herein are answerable to the *Stabe* of *Dioscorides*: next hee sheweth that the *Phleas* of *Theophrastus* lib. 6. cap. 1. called also *Stabe* of some as he, saith (and not *Phleum* which is a marsh or water plant, the affinitie of the names having deceived many learned men in taking them to be both one) is numbered by him among the thorny plants that have thornes beside the leaves as this Burnet hath (and not as *Gaza* translate it, at the thorny leafe hath another leafe placed with it) comparing it therein unto *Ononis* and *Tribulus*: and that *Stabe* is a thorny plant, *Plutarke* in the life of *Theseus* sheweth, where saying, *Ioxus* the sonne of *Menalippus* taking care to plant a colony at *Caria* from whence the *Ioxides* had their originall, have this custome among them that they neither burne the thornes of *Aparagus* nor of *Stabe* but have them in reverence and honour: *Etius* also in his third booke and 29. Chapter affirmeth that *Epithymum* (or rather *Cuscuta*) groweth upon *Stabe*: but whereas *Theophrastus* in his sixth booke and third Chapter seemeth to make it peculiar to *Phleas*, *Capparis* and *Tribulus*, to have not onely a thorny stalke but a prickly leafe also, hee differing herein much from him: for in the same booke and fifth chapter hee saith, that *Phleas* and *Hippopheas* (which *Gaza* translate *Lappago*) have gentle leaves and not prickly as *Intaris* or *Capparis* hath: but *Pliny* in his 21. booke and 15. Chapter not rightly considering what *Theophrastus* had written of *Stabe*, hath not onely erred himselfe but hath bene the cause of many other mens errors. Now concerning *Phleum* that it is a plant farre differing from *Stabe*, and reckoned alwayes by the Greeke writers among the marsh plants and not among the thorny, these things may sufficiently induce. First *Plutarke* in his second booke of naturall questions saith thus, *Layus* must know that all marsh plants such as *Tipha*, *Phleum* and *Ulna*, doe neither spring nor grow in the raires fall not in their proper season. *Aristophanes* also saith the same in his Comedy of Frogs, where the quire saith, we have bene skipping among the *Cypirus* and *Phleum* rejoycing in their songs: and *Theophrastus* lastly in his fourth booke and eleventh Chapter numbrell *Phleum* among the plants of the lake *Orchomenus*, and appointeth two kinds, the male that beareth fruit and the female that is barren serving onely to binde things withall, and saith also that the fruit of this *Phleum* is called *Anshella*, whereof they use to make a lye, and is a certaine flat thing like a Cake soft and reddish, which plant is yet unknowne to the best herbarists of these times. *Angulara* tooke this *Pimpinella* to be *zadusi* or *Chalceos* sive *Evavia* *Theophrasti*, and *Clusius* doth so entitle it also, *Ranwolffius* saith that the Moores of the country about *Libanus* call it *Bellan* and saith it may well be the *Sanguisorba spinosa* of others: *Clusius* and *Camerarius* call it *Pimpinella spinosa*, and *Baubin* *Poterio affinis folijs Pimpinella spinosa*, as though there were another *Pimpinella spinosa* and that this had leaves but like unto it.

The Vertues.

This is of a very drying and binding qualitie, and therefore is taken to stay laskes and fluxes of the body, the herbe being boyled and the decoction taken fasting, which *Honorius Bellus* saith that they of Candy doe account to be a sure medicine to helpe them, whensoever they neede for that purpose.

CHAP. XX.

Aspalathus, *Spalatos* thorny Bush or Broome.

Dioscorides maketh mention of two sorts of *Aspalathus*, the one reddish or purplish under the upper bark, the other white, both which are almost unknowne to the most judicious at these times, yet *Pona* in his Latine and Italian *Baldus*, hath expressed the figure of the first *Aspalathus*, and in his Italian the figure also of the second differing from those of *Clusius* and others, growing with *Signor Contarini*, all which I thinke fit to shew you here.

I. *Aspalathus alter Mompeliensis*. *Dioscorides* his second *Aspalathus* according to those of *Mompelie*. This *Aspalathus* or thorny bush of *Mompelie* (where the learned did judge to be the second *Aspalathus* of *Dioscorides*)

scorides) is a small low bush or shrubbe, not rising much above a cubit high, stored with divers branches and sharpe short crooked thornes, bending downewards set on them, as also many small Greene leaves, divers set together on both sides of the middle ribbe, no bigger then Lentill leaves, and such likewise the young branches have, but smaller: the flowers stand on the stronger thorny branches, three or foure or more standing together of the fashion of Broome flowers, sometimes more yellow and sometimes paler, after which come small seedes in small pods.

2. *Aspalathus alter secundus Clusij.*

Clusij his other sort of *Aspalathus*.

This other *Aspalathus* of *Clusij* groweth greater higher and stronger then the former, and set with sharpe crooked thornes as plentifully as it, with small leaves on them in the same manner, at the toppes whereof grow the flowers like the other, but alwayes of a paler colour, in the rest there is little difference to be discerned betweene them.

3. *Aspalathus alter tertius hirsutus.*

Small *Aspalathus* with hairy leaves.

This small *Aspalathus* groweth usually lower then the first, as not exceeding a foote in height furnished with more slender yet prickly stalkes, but divided into many such smaller branches, that they seeme almost as small as those of Southernwood, being hard and prickly; from the elder branches shoote forth in the Spring of the yeare other smaller stalkes bearing many hoary leaves like those of Lentills but softer and larger then those of the first sort: the flowers likewise being yellow like the other are greater then they by a little: the seede likewise keepeth a proportion like unto the rest.

4. *Aspalathus secundus Dioscoridi legitimus Pona.*

Dioscorides his true second sort of *Aspalathus* according to *Pona*.

The true *Aspalathus alter Dioscoridis* first described by *Honorius Bellus* of Candy in his first Epistle to *Clusius* and the figure thereof afterwards exhibited by *Pona* in his *Italian Baldus*,

4. *Aspalathus secundus Dioscoridi legitimus Pona.*

Dioscorides his true second sort of *Aspalathus* according to *Pona*.

1. *Aspalathus alter Monsteliensis.*
Dioscorides his second *Aspalathus* according to those of *Monpellier*.

5. *Aspalathus primus Dioscoridi odoratus.*
The first and sweetest *Aspalathus* of *Dioscorides*.

wherein is many more rare plants set forth then is in the Latine, and received from *Signor Contarini*, who hath a Garden stored with the rarest plants that can bee gotten from all parts) is as the said *Bellus* saith generally knowne through all *Grecia* retaining yet the old name, wherewith they not onely make hedges and fences to their grounds but in some places whole Groves are found stored therewith: and is a small hedge bush rising up with many upright stemmes, branched forth into many parrs, set full of small sharpe white thornes on all sides without order, and at every thorne on the young and tender branches one triefole pale Greene leafe upon a long footstalkke, whose ends are round and dented in in the middle: the flowers stand at the toppes divers set together which are fashioned like unto Broome flowers at some times, and places, wholly yellow, and at others more reddish or inclining to purple, of so sweete a sent that with the winde it is felt a good way off: when the flowers are fallen there come up in their places small pods, containing within them foure or five small round seede like Vetches, lesser then those of *Acacia altera*: the roote is wooddy and brancheth forth in the ground, sending forth suckers whereby it is plentifully encreased: the substance of the wood is very hard heavy and white, the heart or core whereof is blackish and utterly without any sent while it is Greene, but dry tentheth better.

5. *Aspalathus primus Dioscoridis odoratus*. The first and sweete *Aspalathus* of *Dioscorides*.

Although this plant be not thoroughly described and set forth as the former is with the leaves, flowers and seede being but declared with the trunk or body and with an arme and a few branches cut short with thornes thercon appearing, yet I thought it not inconvenient to set it forth as it is extant with so much description as is added unto it, that others may understand thereof and have thereby some knowledge of it, to further them when they shall happen to meete with it. The bark of the tree is of a blackish ash colour, of an astringent and somewhat bitter taste and biting withall, which being taken off, the inner bark is of a faire purple colour, especially the innermost which is very thinn. fine and full of small strings or threads, the substance of the wood is firme and heavy but sinketh not in water as Ebony doth, of a pale colour and blackish for the most part in the middle, of a strong sent, somewhat quicke or fierce: There have bene formerly divers woods shewed and taken to bee true *Aspalathus* as by some the *Lignum Rhodium* and by some the wilde Olive, &c. but all have erred in their judgement, every one of them wanting the notes of the true in some part or other, and this onely comming nearest thereunto in every thing.

The Place.

The first groweth about *Salamanca* in *Spaine*, as also about *Mompelier* and in *Narbone* of *France*: the second in old *Castile* in *Spaine*: the third at the foote of the *Pyrenean* hills towards *Spaine*: the fourth in *Candy* in divers places in *Greece*: the last is not declared from whence it came.

The Time.

They all flower somewhat early in their naturall and warme countries, and give their fruit or seede in Summer; but in these colder climates they will hardly endure the first colds of our Autumne as my selfe have proved who have had them sprunge from the seede that I sowed and have abiden onely the Summer Season.

The Names.

The Greekes call it *ἀσπλάθος Aspalathus*, and so doe the Latines also, yet *Pliny* from *Dioscorides* saith it was also called *Erythroscopum* and of some *Sceptrum*. The first three sorts *Clusius* doth acknowledge are none of them the true *Aspalathus alter Dioscoridis*, yet because saith hee others did call the first so (and the others are likest unto it) he calleth it and them *Aspalathus alter primus secundus & tertius*. *Bauhinus* entitleth them all *Gemfaspantium spinosum* as *Lobel* doth, set forth in his *Icones*; but in his *Observations* he calleth it *Aspalathus secunda Monspeliensis*, and *Lugdunensis Aspalathus primus Monspeliensis* but should be *secundus* being the Printers fault; *Angulara* tooke it to be *Acacia altera*, and *Tabernaemontanus* calleth it *Scorpius minimus*: the fourth is the *Acacia altera* of *Matthiolum*, *Lacuna*, *Lonicern*, *Lobel*, *Lugdunensis*, *Gesner* and *Camerarius*; but *Honorius Bellus* in his fift Epistle unto *Clusius* sheweth (as *Pona* also from him doth, and as I sayd in the description) that in *Candy* and throughout all *Grecia* it is called *Spalathos* to this day, and therefore is confident to call it *Aspalathus secundus Dioscoridis*, as *Guilandinus* in his Epistles did before him, who was *Bellus* his Tutor: but *Bauhinus* because he would go with the greater although not the better number as it should seeme (for he quoteth the same authors himselfe that I doe here, both that call it *Acacia* and *Aspalathus*) calleth it *Acacia trifolia*: the last onely *Pona* hath set forth in his Latine and Italian description of Mount *Baldus*, who saith that the wood is pale, and yet *Bauhinus* in setting it downe in his *Pinax* as having received a peece thereof from *Pona* himselfe saith thus of it, *Aspalathus cortice cinereo ligno purpureo* making the wood to be purple when as nothing but the inner rinde is so. *Clusius* saith that the *Spaniards* call the first *Enlala*, the second *Anlaga*, and the third *Hallada*.

The Vertues.

Avicen saith that *Aspalathus* is hot in the first degree and dry in the end of the second, almost to the third. *Dioscorides* saith it hath an heating qualitie with some astringion, but *Galen lib. 6 simpli medicament*, saith thus. *Aspalathus* is in taste sharpe, together with some astringion also, the faculties therein being of unlike parts, to wic sharpe whereby it is heating; a harsh or towre, whereby it is cooling by both which it is drying, and thereby good against putrefactions and Fluxes of all sorts: a decoction thereof made in wine and gargled in the mouth is singular good to heale the fowle Vicers thereof, as also those in the nose to bee snuffed up or injected, as also those Vicers of the genitories or secret parts, if they bee bathed therewith: the said decoction stayeth the flux of the belly and helpeth the spitting of blood, it helpeth also those that cannot make water, and dissolveth windy swellings. *Pliny* saith the same, and further saith that it helpeth the chappes in the hands or other parts, and that the bark is effectuell against the strangury, as also availeable to binde the belly, and the decoction thereof stayeth bleedings.

CHAP. XXI.

Genista Spartium spinosum. The pliant thorny Broome.

F this kinde of Plant *Bauhinus* maketh many sorts, some whereof I have placed in the former Chapter as fittest for that place in my opinion rather then this, the rest shall be declared here.

1. *Genista spartium spinosum minus*. The lesser pliant thorny Broome.

This small thorny bush riseth about a foote high set with most sharpe thornes, placed in order two alwayes together one against another, of a pale Greene colour, many branches of these thornes springing from the maine stemme up to the toppe, at the ends whereof stand three or foure such yellow Broome-like flowers as are to be seene in the Furze bushes, after which come small short pods so enclosed in a hoary woolly downe that they seeme as it were covered with copwebs, wherein lie small seede lesser than Vetches: the roote is long and spreadeth much.

2. *Genista spartium spinosum Syriacum*. The pliant thorny Broome of Syria.

This thorny bush riseth up more then a cubit high, set with divers branches and small long ash-coloured thornes yet more soft and gentle then the other, and more sparsely placed also, having divers long and narrow blewish or ash-coloured leaves with them like unto those of Knotgrasse: the flowers are of a purple colour, standing in small red huskes, after which come small long pods like unto the Scorpion podded seede vessels, containing reddish seede within them: the roote is long and browne.

3. *Spartum spinosum Creticum*. The pliant thorny Broome of Candy.

This thorny Broome riseth up with a woody stalke or stemme covered with a blackish barke, spreading sundry slender blackish branches, and they againe divided into smaller like rushes, all ending in sharpe thornes, besides divers others, set here and there at the joynts of the branches, where also come forth fine small hoary leaves fit together the flowers are small and yellow succeeded by small long pods and small seede in them.

4. *Spartum spinosum aliud Creticum*. Another pliant thorny Broome of Candy.

I have joynted the figure hereof with the foregoing plant, and that it should not passe undescribed, but take it briefly thus: It groweth very tall & high, busheth and brancheth forth very much, the slender flexible Greene branches are sprinkled with small white spots, having three small leaves at a joynt, with yellow flowers and small pods afterwards: each branch and twigge ending in a long thorne at the last.

5. *Erinacea Hispanica Clusij*. Clusius his Spanish Hedgehog Thorne.

This no lesse rare then daintie bush groweth to be scarce a foote high spreading many stalkes and branches one interlaced among another, and all set in a round forme or compasse replenished with a number of cruell sharpe Greene thornes: at the toppes of the branches stand three or foure flowers alwayes together of the same fashion with the former, but of a blewish purple colour set in rough and hairy hoary huskes, while it flowreth there are

1. *Genista Spartium spinosum minus*.
The lesser pliant thorny Broome.

3. 4. *Spartum spinosum Creticum dulavum specierum*.
The two thorny pliant Broomes of Candy.

5. *Erimaea Hispanica* Luff.
Clusius his Spanish Hedgehog thorne.

some few small leaves to bee secret upon it in sundry places, but they prickly wither and fall away, leaving the bush without a leaf thereon all the year after, which by the round forme of the branches with the thornes sticking forth, doth represent a Hedgehog to fely that the inhabitants thereupon have termed it *Erizo*, that is, an Hedgehog, the roote spreadeth many long fibres and fibres on them under ground.

6. *Echinopoda frutex Creticus.*

The Hedgehog Thorne of Candy.

This other small Thorne bush groweth up with many thorny greene spriggs and branches set close together, having alwayes three prickles or thornes growing together at every place, and is seldome seene likewise to have any leaves thereon because they fall away so quickly; (*Alpinus* saith it never beareth any) the flowers hereof groweth at the toppes of the branches in great plentie (but *Alpinus* denyeth it and saith it beareth but very few) are yellow but like the other in forme, thereof the Bees never doe taste, standing in whitish greene huskes, a little hoary all over, and afterwards small pods with very small seede in them; this is very tender to keepe, not enduring any cold place Sommer or Winter.

7. *Echinus Creticus.*

The small round Hedgehog Thorne of Candy.

This Thorne (saith *Alpinus*) doth better resemble a *Tragacantha* then the former *Echinopoda* as *Honorius Bellus* would have it: for this round formed thorne is not much bigger then a hand Vrchin or Hedgehog, scarce rising above two or three fingers from the earth, but spreading the blacke branches halfe way within the ground, very thicke set together, and shooting out small roores at the joints as they spread, all which end in small short white and broad sharp thornes thwarting one another thereby forming as it were crosses or starres, not having any leaves at all upon them, but innumerable small flowers like unto *Hyacinths* for their forme, but much smaller, after which succede small long pods like unto those of the other *Tragacantha*: it groweth round and spreadeth not further out of that forme: the *Candiot*s call it *Caloschirida*.

The Place.

The first as *Clusius* saith groweth on the hills neare the kingdome of *Granado* going to *Corduba*: the second *Raunolfus* found about *Aleppo* in *Syria*: the third *Clusius* found in the kingdome of *Valentia* in *Spaine* about a small towne called *Siete aguas* most plentifully, which is in the way to *Medrill*: the last *Bellonius* saith groweth in *Candy*, and *Honorius Bellus* saith in all *Gracia* likewise besides.

The

6. *Echinopoda frutex Creticus.*
The Hedgehog Thorne of Candy.

7. *Echinus Creticus.*
The small round Hedgehog Thorne of Candy.

The Time.

All these doe flower in the beginning of Sommer, yet *Clusius* saith hee found the third in flower in April where it grew naturally.

The Names.

Bauhinus as I said incitleth all these plants *Genista spartium spinosum*, calling the first *minus*, because he made the three first in the last Chapter to be *maius*. *Clusius* calleth it *Scorpius secundus*, and thinketh it may be the *Echinopoda Cretica* of *Honorius Bellus* for that as he saith it grew very like it, and *Lugdunensis* termeth it *Aspalathus secundus*; *Lobel* calleth it *Genista spartium spinosum alterum*, *Gesalpinius* *Spina Christi* and *Udanius* *Genista spinosa altera* icon, and *Tabernmontanus* *Scorpius tertius*: the second *Lugdunensis* in his Appendix sheweth out of *Ranwolffius* journal, that the Moores of *Aleppo* did call it *Albagi*, on whose leaves a kinde of Manna called by the *Arabians* *Terenjabin*, and by the Moores *Trunschibin* was used to be gathered, especial y in *Persia*, and calleth it *Planta spinosa Maurorum Albagi*; and *Bauhinus* *Genista spartium folijs polygoni*; the third *Alpinus* *de plantis exoticis* calleth *Spartium spinosum*, and the fourth *Spartium Creticum*; the fift *Clusius* calleth *Erinacea* from the Spanishe word *Erizo*, for the likeness in the growing round with prickles and thornes unto an Hedgehog, *Cesalpinius* calleth it *Genista rotunde alterum genus*, *Lobel* *Spartium aphyllon fruticosum junceis aculeis lanatis folijs*, *Tabernmontanus* *Scorpius quartus* and *Spartium aculeatum aphyllon*: *Gerard* maketh it his fourth *Genista spinosa humilis*, and saith it groweth in the South and West parts of this Land, but (sure I am) he is much mistaken therein, for in his description hee saith it hath yellow flowers which this hath not: *Bauhinus* calleth it *Genista spartium spinosum folijs Lenticule, viribus ex carneis purpurascens*; the sixt is mentioned by *Bellonius* in his first booke of Observations and 18. Chapter calling it *Achinopoda*, and as he there saith is very like unto *Aspalathus*, but *Honorius Bellus* in his second Epistle to *Clusius* contrarieth him therein, shewing that *Echinopoda* differeth much from *Aspalathus* both in the greatnesse of the plant or bush, being much greater then *Echinopoda*, as also having fewer thornes, and three leaves set together, long abiding contrary to *Echinopoda* and sheweth it to be very common in all *Grecia*, and in the Iland *Cypr* or *Sio*, and that *Dalechampius* was much deceived herein in his marginall note upon *Athenensis*, in taking *Echinopoda* to bee *Cardus Chij* genus, and that it may appeare to bee commonly growing there, and knowne, *Plutarke* in his *Symposiack* and *libro de auditione* towards the end, setteth downe this old *Distichon*,

Inter Echinopodas velut asperam & inter Ononis,

Interdum crescunt mollia Leucoia.

And so doth *Athenensis* likewise mention it in his third booke of *Dipsosaphistes*, as still growing among *Ononis* and thornes it selfe being one, *Pliny* also in his eleventh Booke and eighth Chapter mentioneth it under the name of *Chenopos*, *Melchior Guilandinus* knew it not, for in his Epistle to *Langius* he numbrell it among the unknowne plants to him.

The Vertues.

The second *Ranwolffius* saith is hot and dry, and that the *Syrians* with an hand full of the leaves make a decoction in water and drinke it, whereby they purge themselves: but I doe not finde any mention of the vertues of any of the rest of these plants, eyther used by the learned or by the inhabitants where they grow, and therefore untill I can learne more of them I must be silent also.

CHAP. XXII.

Scorpius sive Genista spinosa. Thotny Broome and Furse.

Having as well before in this Worke as in my former Booke shewed you all the sorts of smooth Broomes or without thornes, and in these two last Chapters divers thorny bushes comming nearest to the thorny Broomes, it remaineth for me to declare them also, which although some grow so wild on barren heaths and dry grounds in our owne Land that they are not thought fit to be planted in a Garden, yet there be divers others that are, let me not therefore sever them into many places, but set them together in this Chapter, the common Furse bushes being of the same tribe or family.

1. *Genista spinosa major vulgaris sive Scorpius Theophrasti quædam Gaza Nepam transfudit.*

The ordinary great Furse bush or Scorpions Thorne of *Theophrastus*.

Our ordinary Furse or Gorse (as it is called in some places) is well knowne to grow much higher in some places then in others, yet still keepeth his forme, which is to send forth many woody grayish stalkes full of branches, and set with sharpe long thornes on all sides, so thicke that it seemeth nothing but thornes, and is seldom seene to have leaves on it, for if they be not heeded in the Spring when they come forth on small stalkes, being small and almost round, yet pointed at the ends, and some a little narrower and longer, many set together on both sides of a middle rib, of a grayish Greene colour above, & silver like or hoary white underneath, they quickly fall away and are not seene, so that many have thought it never bringeth forth any: the flowers are many standing at the toppes of the branches, like unto those of Broome and almost as yellow, but not so shining, after which succede thicke and short pods covered with a whitish hoary freese, and with a twining point or end, wherein are contained small brownish seede: the roote is long tough and spreading.

2. *Genista spinosa flore albo.* The white flowered Furse bush.

In the North parts of this Land I heare that in divers places, the Furse or Gorse bushes as they there call them beare very white flowers, differing in nothing else from them that beare yellow, for they are oftentimes seene both growing together in one ground.

3. *Genista spinosa minor.* The lesser Furse bush.

The lesser Furse bush groweth alwayes lower, full of branches, and with smaller and shorter thornes thereon then the former, this hath many small Greene leaves standing in the same manner which abide much longer on the thornes before they fall away, which is not untill the end of the Spring or beginning of Summer, so that both leaves and flowers are oftentimes seene a good while together: the flowers are smaller then the former and

of a paler colour: the cods are small and short without any freese upon them, blackish when they are ripe, and the seede reddish within: the roote is long, tough and woody.

4. *Genistella aculeata*. The small prickly Broome.

This small Broome fendeth from the roote divers upright slender greene stalkes set with many small sharpe and short prickles on all sides from the bottome upwards, and branching forth into divers parts, having many small hard greene leaves growing on the younger branches, at the toppes whereof stand many small pale yellow flowers, much smaller then any of the former, and small long pods a little pointed with small seede therein following them: the roote groweth not very deepe, but spreadeth tough long strings.

5. *Genistella Monspelica spinosa*.

Small thorny Broome of Mompeliey.

This French thorny Broome hath divers slender pliant twigs bending downewards, of a spine long or more, whose lower part is divided into many very short branches which are nothing but thornes, and from the middle upwards spread also into branches that are hairy, but without any thorne or prickle on them, having many small hoary leaves set on them and some smaller also with them: at the toppes grow such pale yellow flowers like unto the last. A greater sort hereof hath beene brought out of

Spain or Hispania.

6. *Genistella minor Aspalatoides*.

Small prickly Broome like *Aspalathus*.

This small bush groweth a foot high or more, with a round woody stein covered with a reddish bark, set here and there very sparingly with some few small thornes divided into branches, which likewise are parted into other smaller branches, whereon are set a few small and long leaves, and some more round also, the flowers stand not all on the toppes, but some from the bosome of the stalkes and leaves, not much smaller then the last, and of a pale yellow colour, the branches not ending in a thorne as it doth.

The Place.

The foure first sorts grow in our owne Land on dry barren

3. *Genista spinosa minor*.

The lesser Furze bush.

1. *Genista spinosa vulgaris*.
The ordinary great Furze bush.

4. *Genistella aculeata*.

The small prickly Broome.

heaths and other waste gravelly or sandy grounds, and so doth the last as also about *Orleance*: but the first is found about *Mompelie* and hath beene brought out of *Spaine* likewise.

The Time.

They all flower in the Sommer moneths but the greater sorts somewhat earlier then the lesser.

The Names.

The first is generally taken to be the *scorpion* *Scorpius Theophrasti*, which *Gaza* translateth *Nepa* in *lib. 6. cap. 1.* where he saith *Corruda* and *Scorpius* are wholly composed of thornes, but not that *Scorpius* *lib. 9. c. 14.* whose roote he saith doth represent a Scorpion, and is good against the sting thereof, and which hee calleth *Telephorum* in the 19. Chapter of the same ninth Booke, which doth most properly decipher out the *Doricum* whose rootes are very like unto Scorpions as I have shewed before, so that the word *Scorpius* is *madrius Polysemos dictio* a word of many significations in *Theophrastus*, but *Gaza* doth most improperly make them both *Nepa*, thereby confounding this prickly *Scorpius* with the other: The first is the *Scorpius primus* of *Clysius*, *Scorpius alter* and *secundus* of *Lugdunensis* and *Tabermontanus*, and *Genista spinosa* of *Dodoneus*, *Bauhinus* calleth it *Genista spinosa major longioribus aculeis*: the second is as I take it peculiar to our owne Land, and not mentioned by any before *Gervard*, yet *Bauhinus* referreth it to the next: the third is the *Nepa Theophrasti* of *Lobel*, *Camerarius* and *Tabermontanus*, and *Scorpius Theophrasti* of *Lugdunensis*, *Scorpius sive Nepa* of *Angulara*, and called by *Bauhinus* *Genista spinosa major brevibus aculeis*: the fourth is the *Genistella* of *Tragus*, *Fuchs*, *Dodoneus*, *Lugdunensis* and *Tabermontanus*, *Genista vel Genistella spinosa* of *Gesner* in *hortis Genistella aculeata* of *Lobel* (who thinketh it may be also *Vlex* *Plinij lib. 20. c. 4.* *Tabermontanus* and *Lonicerus*, called by *Casalpini* *Coroneole similis suffrutex*, and by *Bauhinus* *Genista spinosa minor Germanica*: the fift is called by *Bauhinus* in his *Pinax* *Genista spinosa minor Hispanica villosissima*, but in his *Prodromus* *Genistella Mompeliaca spinosa*, and saith that some of *Mompelie* called it *Corruda lutea*: the last *Bauhinus* calleth *Genistella minor Aspalatoides vel Genista spinosa Anglica*. saying it was sent out of *England* by the name of *Genista spinosa* (which is probable was found in some place of our Land unknowne to us as the plant it selfe is, and sent him as a raritie, who saith the like thereunto was found about *Orleance* in *France*. The *Italians* call the first *Scorpione herba*, the *Dutch* *Guspeldoren*, and wee in *English* *Furfe*, *Corfe*, and of some *Whinne*, and thorny *Broome*, but that may be generally given to all these thorny bushes, and more particularly is appropriate to the fourth sort, which the *French* call *Geneste piquant*, the *Germanes* *Stechend Pfrimmen*, and the *Dutch* *Stechende Brem*, and we in *English* the small prickly *Broome*.

The Vertues.

The first and third are held to be hot and dry, good to open obstructions of the Liver and Spleene, some have used the flowers of eyther in a decoction against the laundies, as also to provoke Vrine and to cleanse the Kidneyes of gravell or stones ingendred in them. The others no doubt are participant of the same qualities.

CHAP. XXIII.

Rhamnus. Buckes thorne.

Nnder the name of *Rhamnus* are comprehended divers sorts of shrubbes, some much differing from other: the elder age in *Theophrastus* his time acknowledged two sorts, the one white, the other blacke and both ever Greene: *Dioscorides* in his time acknowledged three which have beene controverted by writers in these later times, wherein there are some sorts found out; some of our later writers have called one *Rhamnus solutivus*, that is, purging Ramme, as a distinction from the other that are not so, whereof I have entreated in the second Classis of this worke, and of the third *Rhamnus* of *Dioscorides* (as the most judicious doe account it) called *Palmaris* Christs thorne, I have entreated in my former booke: the rest that are referred therunto and called *Rhamnus* by other authors shall follow in this Chapter, and beginne with that which is most frequent in the Low Countries by the Seaside as well as in the upland countries, and in our owne Land by the Sea coasts in many places also.

1. *Rhamnus primus Dioscoridis Lobelio sive littoralis*. Sea Buckes thorne with Willow-like leaves.

This Buckes thorne shooteth forth many and sundry pliant twiggie stemmes branched into divers smaller branches, whereon are set many long and narrow leaves without order, covered as it were with a white dust or powder as the stalkes are also, with divers small thornes standing among them: at the joynts with the leaves from the middle upwards grow sundry small greenish mossie flowers together, which come into round berries, Greene at the first, and of a yellowish rednesse when they are ripe, having a juice or fleshy substance within the outer skinne, and a flattish round gristly kernell within, of a blackish browne colour: the roote is tough, long, and spreading much under ground: this abideth with the leaves on the twiggies all the winter long, and so doth the fruit also.

Bauhinus upon *Matthioli* setteth downe that this *Rhamnus* doth varie in some places neare the *Rhynus*, viz. that the one sort hath broader and longer leaves hath but one or two berries set together upon a stalke: but that sort that groweth by the *Danow* and the River *Lyons* hath shorter and narrower leaves, and hath divers berries set together.

2. *Rhamnus secundus Mompeliensis sive primus Clusij*. White flowered Buckes thorne.

This Buckes thorne is a bush fit to make hedges withall, rising up with divers straight upright stems, divided into many branches, armed with very strong and sharpe thornes standing out, from whence the small long and narrow thicke fleshy leaves come forth foure or five standing together, almost round at the point seldome falling away before other have sprung forth: the flowers stand at the sayd joynts with the leaves in hoary huskes three or foure together, being somewhat long and round ending in five leaves, of a pure white colour where after they are fallen a certaine round thing groweth like unto that of the *lasune* which seldome commeth to beare any fruite: the roote is thicke and long creeping farre away.

3. *Rhamni primi Clusij altera species*. Red flowered Buckes thorne.

This other buckes thorne is like unto the last in most things, onely growing not so high, bushing with more branches

Rrrr

1. *Rhamnus prinos* Dioscoridis Lobeliae. *ætiolia*.
Sea Buckthorn with willow-like leaves.

3. *Rhamnus prini* Cuspi species altera.
Red flower'd Buckthorne.

2. *Rhamnus secundus* Dioscoridis Otonspæien sive
sive primus Cuspi. White flower'd Buckthorne.

Paliurus sive *Rhamnus tertius* Dioscoridis.
Christ's Thorne.

branches and somewhat lesser leaves, thicker whiter and of a more saltish taste: the flowers stand in the same manner but are of a purplish red colour.

4. *Rhamnus niger* Theophrasti.

Blacke berried Buckes thorne.

The blacke Buckes thorne groweth unto the bignesse of a Blacke thorne bush, having a blackish barke covering the greatest armes and body, set with divers narrow and long thicke greene leaves together at the joynts like unto the other before, but of a more astringent taste like unto Rubarbe, armed with long sharpe thornes, each branch ending also in a long sharpe thorne: the flower is small and of a greenish colour, coming forth in the spring of the yeare, and the fruit followeth in the Sommer which is small and blacke like unto a Bloe and harsh also in taste.

5. *Rhamnus Bavaricus*.

The Bavarian Buckes thorne.

The Bavarian Buckes thorne groweth to the height of a man with a reddish barke, with many very sharpe long thornes, thicke set on the branches, and leaves thereon of a pale greene colour, somewhat broad and long like unto the *Ilex* or evergreene Oake finely dented about the edges, and with some smaller and rounder leaves set with them also, each twigge ending in a thorne: what flowers or fruite this beareth is not yet come to our knowledge, but for the likeness of the growing, and being a thorny ever-living plant it hath beene accounted a species of *Rhamnus* and so called.

6. *Rhamnus Myrsifolius ex Insula Sancti Christophori*

Saint Christophers Myrtle leaved Ramme,

In the naturall places this groweth great and tall, but in France whether it was brought scarce a cubit high, the barke being greene and smooth, the leaves many set together on the stalkes by couples, somewhat like as the

4. *Rhamnus niger* Theophrasti.
Blacke berried Buckes thorne.

6. *Rhamnus Myrsifolius ex Insula Sancti Christophori*.
Buckes thornes with Myrtle-like leaves of Saint Christophers Island.

Walnut tree leaves grow, but each leafe resembling those of the greatest Myrtle: at each knot on the branches where the leaves shoot stand one or two small short weak thornes on each side: the further relation wee cannot give y. u because the plant perished through the intemperature of the climate.

The place.

The first as I sayd groweth not onely neare the Sea coasts in the low countries and in our Land also, but in the uplands also of the higher and lower Germany also by rivers sides, as *Cordus*, *Gesner*, *Clusius* and others have set it downe: the second as *Clusius* saith groweth in divers places of Spaine, Portugal, and Narbone in France: the third he saith he onely found at the farther border of the kingdome of Valencia in Spaine about the Citie *Horiuela* neare the River *Sagura* and in no place else: the fourth he likewise saith he found plentifully among other shrubbes in the waste grounds of the kingdome of Granada and Murcia.

The Time.

They flower in the Sommer, and the fruit is ripe in September.

The Names.

There is great controversie among our moderne writers as I said before concerning this *Rhamnus*, as the Greekes and Latines call it, every one almost appropriating one thorny bush or other therunto, for *Camerarius* and *Tragus* judge the *Grossularia* or *Vnaeripa* our Goose berry bush to be the *Rhamni* *tertium* genus of *Dioscorides*, and call the *Spina infectoria* before set forth in this worke to be *Rhamni* *alia* species, not knowing any purging qualitie therein as others afterwards did, and thereupon called it *Rhamnus* *Carbaticus* or *solutivus*. *Marthiolus* setteth forth likewise a kind of prickly bush for the *Rhamnus* *secundus* *Dioscoridis* which *Pena* and *Lobel* mislike, giving another in the stead thereof, which they say cometh nearer to the description of *Dioscorides*: and even the ancient authors themselves are not constant nor free of variation herein: for as before said *Dioscorides* hath three sorts of *Rhamnus* (whereof the third sort is much doubted of by divers, some thinking the Text of *Dioscorides* to be corrupt, and the third sort to be added or superfluous) *Theophrastus* hath but two sorts, white and blacke and mentioneth *Palurus* as a peculiar plant by it selfe, saying also it is of many sorts, and *Galen* maketh mention but of one sort, as if there were but one or that the rest were comprehended under that one. *Pliny* maketh two sorts, but he without consideration referreth them to the *Rubus* or Bramble. The first here set forth is the *Rhamnus* *secundus* *Dioscoridis* of *Marthiolus*, *Dodonaeus*, *Clusius*, *Lugdunensis*, as also of *Lacuna* and *Lonicerus*, but *Pena* and *Lobel* in *Adversariis* make it the first of *Dioscorides*, *Cordus* upon *Dioscorides* and in his history also calleth it *Oleaster Germanicus*, and in his *Observationum Sylva*, *Oleas tri peculiare genus*: *Camerarius* in *horto* and in *Epitome* calleth it *Rhamni* species, and *Casalpini* *Rhamni alterum genus*, *Beloni* in his *Observations* maketh mention of a *Rhamnus* *baccis rubentibus* which it is probable is this. *Columna* taketh it to be *Hippophae* *Dioscoridis*, and *Bauhinus* calleth it *Rhamnus* *Salicis folio angusto fructu flavescente*: the second is the *Rhamnus* *primus* *Dioscoridis* of *Marthiolus*, *Angulata*, *Lacuna*, *Lonicerus*, *Clusius*, *Dodonaeus*, *Lugdunensis* and *Rauwolfius*; *Lobel* calleth it *Rhamnus* *alter* *Dioscoridis* *Montepeliacus*, *Cordus* upon *Dioscorides* and *Bauhinus* call it *Rhamnus* *candida* *Theophrasti*, as also *Rhamnus* *spina oblongis flore candicante*. *Rauwolfius* saith that the *Arabians* call it *Haoser*, and they about *Tripoli* in *Soria* or *Syria* *Hanlegi*: the third is *Clusius* his *Rhamni* *primi altera species*: the fourth is his *Rhamnus* *scrtius*, and so also it is of *Dodonaeus* and *Tabernmontanus*, and of *Lobel* *Rhamnus* *prima species* *tertius* and is likely to be the *Rhamni* *genus* *baccis nigris* in *Gracia* of *Beloni*, *Bauhinus* calleth it *Rhamnus* *niger* *Theophrasti* and *Rhamnus* *tertius* *flore herbaceo baccis nigris*: the fifth *Lugdunensis* exhibiteth from a skillfull Herbarist as hee saith that brought it to *Dalechampsius* gathered in *Bavaria*, and not knowing unto what plant to referre it better called it *Rhamnus* *Bavaricus* which name doth so continue untill it can be better disposed of: the last *Jacobus Cornutus* onely exhibiteth in his *Canadensium plantarum historia*. The *Arabians* call it as is aforesaid: the *Italians* *Ramno* and *Mauryca* the *Spaniards* *Scambrones*, the *French* *Bourgespine* in some places, for that name is given to divers plants in sundry places: *Angulata* saith that generally *Dioscorides* his first *Rhamnus* is taken to be that plant which at *Rome* is called *Spino santo*, and of others *Spino de Christo*, *Marcellus* in his booke *de re medica* calleth it *Salutaris herba* and *spina alba*: *Cordus* also witnesseth that *Rhamnus* is called by the Latines *Spina alba*, but wisely advieth that this shrub *Spina alba* be not confounded with the other two sorts of Thistles so called also. *Ovid* also speaketh of it *lib. 6. fustorum* shewing the use of it in his rime to expell incantations in these verses,

Sic fatus, spinam qua tristes pellere possent

A foribus noxas, haec erit alba, dedit.

And in another place not farre from the former he saith the same of the same plant, otherwise called *Virga Ianae* in this manner;

Virga; Ianae despinat sumitur alba,

Qua lumen thalamis, parva fenestra dabat.

The Vertues.

These thorny plants are in qualitie one much like another, being as *Galen* saith cold in the end of the first degree or in the beginning of the second and drying and digesting in the second, and thereby helpeth inflammations, saith *Antonius* fire and other fretting and eating Cankers and is good against pusses, wheales, &c. in using the young leaves whiles they are fresh. A decoction of the leaves and inner barke thereof made in water whereunto a little allome is put is very good to wash the mouth when there is any inflammation or Ulcer or other distaste therein. (*Clusius* saith that the *Spaniards* doe eat the young shoots of his first *Rhamnus* as a Sallar herbe, and that they use the decoction of the Blacke berries of this fourth sort, to bathe those places that are out of joynt, and to helpe the paines of the Goutte.

CHAP. XXIII.

Lycium five *Pyzacantha*. Box thorne.

Although we are not certaine that any of these thorny shrubs here set forth in this Chapter is the true and right *Lycium* of *Dioscorides* agreeing therunto in all things, yet because all of them have some correspondence therewith in divers particulars, they have bene by the judicious finders out of them referred unto it as shall be shewed.

1. *Lycium*

1. *Lycium vulgatum*. The more common Box thorne.

The more common Box thorne is a shrubbe or low tree yet growing sometimes foure or five cubits high, with many branches spreading therefrom, covered with a darke Greene barke, somewhat grayish in the body and older boughes set somewhat thicke with small hard and almost round leaves like Box, two for the most part at a joynt, from whence also thrusteth forth a small sharpe thorne: the flowers grow many together in a cluster at the severall joynts upwards of a greenish colour, after which come small berries, Greene at the first and blacke when they are ripe, of the bignesse of Privet berries but full of a bitter unpleasent sappe: the roote spreadeth diversly.

2. *Lycium Italicum*. Italian Box thorne.

The Italian Box thorne is a smaller and lower shrubbe, whose older barke is rugged and of a darke colour, but the younger have it thinne smooth and greenish, the branches ending in a thorne, whereupon are set small leaves dented about the edges ver like unto those of the Sloe bush, and of a darke Greene colour, harsh in taste and somewhat bitter withall: at the joynts with the leaves come forth a few flowers of a whitish Greene colour, made of foure leaves a peece, after which follow small Greene berries and blacke when they are ripe, with two and sometimes with three leaves as it were on the berrie: the roote is woody and spreadeth.

3. *Lycium Hispanicum folio Buxi*. Spanish Box thorne with small round leaves.

The Spanish Box thorne hath divers slender but yet upright stemmes about two foote high, covered with a reddish barke parting into many branches every one not onely ending in a thorne, but having divers thornes set also here and there upon them, many times but weake and short, and at other sharpe and strong with many leaves growing on them, somewhat like unto the small Box Myrtle leaves being of a clammy acide taste, somewhat biting, neyther flower nor fruit hath bene observed hereof.

4. *Lycium Hispanicum folio oblongo*. Spanish Boxthorne with longer leaves.

This other Spanish Box thorne riseth up but with one stemme, parted into sundry branches whereon grow long and narrow leaves set without order.

5. *Lycium latifolium Mompeliacum*. Broad leaved Box thorne of Mompelier.

This cruell thorny bush groweth and spreadeth like an hedge bush, set thicke with sharpe long thornes, and divers leaves somewhat broad with them, whereat likewise come forth small flowers which turne into small berries, blacke when they are ripe, three for the most part standing together, having a reddish yellow juice within them, giving that colour on paper, leather, &c. and with three seedes in them, and of a quicke sharpe taste.

6. *Lycium Gallicum Avenionense*. The yellow graine of Avignon.

This thorny shrubbe groweth to the height of three or foure cubits, whose lower barke is of a grayish ashe colour, spreading divers branches ending in thornes, set at the joynts with many small leaves very like both for colour and thicknesse unto the small Box but somewhat narrower and longer, whereat also come forth small flowers and after them small berries upon short foottalkes some being three square and others foure square according to the number of graines within them, at whose head is set a small cup or cover, and is of an altringent taste, somewhat bitter, which being dried are much used of Diers and others to give a yellow colour.

1. *Lycium vulgatum*.

The more common Box thorne.

2. *Lycium Italicum*.

Italian Box thorne.

4. *Lycium Hispanicum folio oblongo.*
Spanish Box thorne with longer leaves.

6. *Lycium Gallicum Avenionense.*
The yellow grain of Avignon.

7. *Lycium Creticum primum Belli.*
The first Box thorne of Candy.

8. *Lycium Creticum alterum.*
The other Box thorne of Candy.

10. *Lycium Indicum creditum Alpino.*
The supposed Indian Box thorne.

11. *Agialatid Egyptæa Lycio affinis.*
The Egyptian Tree like unto Lycium.

7. *Lycium Creticum primum Belli* The first Box thorne of Candy.

This *Candian* thorne groweth to be foure or five cubits high covered with a rough or scabbed barke, of a grayish colour, stored with sharpe thornes, three alwayes growing together at a joynt, where the leaves also come forth three or foure together which are small somewhat neare unto Box leaves, and lesser then those of the Barbary bush, lightly snipped or dented about the edges: the flowers are yellow coming forth at the joynts with the leaves which turne into small long berries not fully round, therein somewhat like unto a Barbary but blacke when it is ripe, each of them standing singly by it selfe upon a small footestalke, of a taste betweene sweete and sower: the wood hereof is yellow and the roote much more giving an excellent yellow dye: divers have accounted it a kinde of mountaine Barbary for the resemblance thereunto more then unto *Lycium*: but it differeth from the Barbary in that the leaves thereof are greater then of this, and the Barbary hath the berries growing many together in a long cluster, and this but singly one at a place as is before said, and from the true *Lycium* it differeth in the fruit not being round like Pepper, and is not bitter as the berries of most sort of *Lycium* are.

8. *Lycium Creticum alterum.* The other Box thorne of Candy.

This other *Candian* bush riseth up not above two or three cubits high thicke set with branches and thornes, and small leaves upon them, the berries are round, as small as Pepper and blacke when they are ripe, whereof is made an excellent yellow colour.

9. *Lycium legitimum Rauwolfij.* The true Box thorne of Syria.

The true Box thorne as *Rauwolfius* setteth it forth in the fourth Booke of his Journall or Itinerary is a small shrubbe having many shoots from the rootes, set full of thornes and small leaves somewhat like unto Sloe leaves or betweene them and Box.

10. *Lycium Indicum creditum Alpino.* The supposed Indian Box thorne.

This Box thorne supposed to be the right *Lycium Indicum* by *Prosper Alpino* in his Booke of Egyptian plants, shooteth from the rootes divers upright woody stemmes three or foure cubits high, set thicke with joynts, as every one whereof come forth both long and sharpe thornes, and foure or five small long whitish greene leaves longer, narrower and whiter then those of the Olive tree: at the joynts likewise with the leaves stand two or three small whitish flowers, very like unto those of the Orientall Iacynth, which turne into small and blacke berries very like unto Wallwort berries of an astringent and bitter taste.

11. *Lycium Indicum putatum Garfas.* Garfas supposed Indian Box thorne.

Garcias ab Orta in his first booke and tenth Chapter of his Indian history of Drugges sheweth that the *Indians*, *Persians* and other nations of *Asia major*, use a certaine juice which they call *Cate* or *Cato*, mixed with *Beere* and *Astreca*, as an usuall familiar junket continually to chew in their mouths, which he thinketh to be *Lycium*, having the

the properties of the true *Lycium*, the juice the cof being drawn forth in the same manner that the ancients did shew the true *Lycium* was made: but the tree as he describeth it doth much differ from that of *Dioscorides* for as *Garcias* saith his is a great tree as bigge as an Ash tree, having fine small leaves thereon like unto Heath or Tamariske (whereas *Dioscorides* saith that his *Lycium* is a shrubbe with leaves like B x, full of thornes and alwayes abiding greene) it beareth flowers but no fruit as the inhabitants reported unto him: the roote of the tree is firme heavy and strong, neyther subject to rottenesse exposed to the weather, nor swimming in the water, and thereupon called by them *Lignum sempervivum* Evergreene wood.

12. *Agialalid* *Egyptiaca* *Lycio* affinis. The Egyptian tree like unto *Lycium*.

This tree groweth to the heighe of a wilde Pearc tree, having but few armes or branches crooking many wayes in the growing, set with many long and very sharpe thornes and small Box-like leaves with them but somewhat broader, seldome but one and usually two at a joynt, the flowers are small and white like Orientall Iacincts but lesser, whereafterwards stand smal blacke round berries both bitter and astringent: the leaves also are somewhat fower and astringent.

The Place.

The first groweth on the *Alpes* of *Liguria* and in *Dalmatia* as *Lugdunensis* saith: the second on Mount *Baldus* and in divers places of *Italy*: the third *Clusius* saith he found neare unto *Complutum* in *Spain* by the Rivers sides: the fourth *Lobel* saith was brought from *Spain*: the fift as *Lobel* saith groweth not farre from *Altempher* neare the River *Lanus*: the sixt as is sayd about *Avignon* and *Carpentoracte* in *France*: the seventh and eight in *Candy* as *Honorius Bellus* setteth it downe in his first Epistle to *Clusius*: the ninth on Mount *Lybanus* and other places in *Syria*: the tenth in *Egypt* by the banks of that arme of *Nilus* that is called *Calig* that runneth into the Sea: the eleventh groweth as *Garcias* saith in many places in the *Indies* where it is of great use: the last *Alpinus* saith hee saw in the garden of a *Turke* in *Cayro* which was brought out of *Ethiopia*.

The Time.

Their times of flowering and fructifying are according to the countries where they grow, some earlier and others later.

The Names.

The Greeke name *Λύκειον* *Lycium* (and *πυρακάνθα* *Pyracantha*) is imposed on the dried juice as well as on the bush, so called as it is thought because it was brought out of *Lycia* and *Cappadocia*, and was of much use in former times but not of later dayes, because what was brought was well knowne and perceived to be counterfeit, being made of the berries of Privet or of the Honyfuckle or Doggberry fruite or of them all together, and had none of the notes of the true *Lycium* which are these: it is blackish on the outside of the whole cakes or peeces, but being broken of a brownish yellow colour within, and quickly growing blacke againe having no virulent sent, but of a bitter taste astringent withall: the *Indian* kinde which is the best will have a Saffron like colour, and this especiall note the true and best will have, that being put into the fire it will burne and flame, and being quenched it will give a reddish (summe say some and others a reddish) fume or smoake: but that sophisticated or adulterate *Lycium* which of late dayes hath bene used hath none of these true properties in it: and *Dioscorides* and *Galen* do both shew that there wanted not impostoris in their time, to counterfeit the true and would mixe *Amurea*, that is, the Grounds or Lees of oyle with it to make it turne, and with the juice of Wornewood or the Gall of an Oxe to make it bitter, and as *Galen* saith they did so cunningly counterfeit it that it was hard to know the fals from the true. The first as the most frequent is thought by divers and *Lugdunensis* standeth mainly for it to be the right, notwithstanding that *Angulara* saith it is not the right *Lycium* although it be taken by divers. *Matthiolus* & *Tabernmontanus* call it *Lycium*, & *Lugdunensis*, *Lycium* *Alpinum*, *Didonau*, and *Lonicerus* *Pyracantha*, *Lobel* in *Adversarij* setteth forth a *Lycium* sive *Pyracantha* *Narbonensis*, which it may be is this, *Bauhinus* calleth it *Lycium* *Buxifolium*: the second *Matthiolus*, *Lugdunensis* and *Tabernmontanus* call *Lycium* *Italicum*. *Pona* sheweth in his description of *Mons Baldus* that it is the same that *Clusius* calleth *Spina infestoria pumil: altera*, and *Bauhinus* *Lycium* sive *Pruniflorum* sive *Italicum*: the third *Clusius* calleth *Lycium* *quorundam*, and saith the Spaniards where it grew call it *Tamugos* and *Tamucos*, and thereof make Broomes and heate their Ovens and Kills &c. but *Lugdunensis* is much mistaken in thinking this of *Clusius* to be the same that *Lobel* in his appendix to his Observations calleth *Lycium* *Hispanicum*, which is my fourth sort here, and hath longer & narrower leaves then that of *Clusius* which hath rounder leaves more like Box and *Bauhinus* observing well the differences calleth the one *Lycium* *Hispanicum* *folio buxi*, and the other *Lycium* *Hispanicum* *folio oblongo*: the fift *Lobel* in *Adversarij* calleth *Palurus alter peregrinus*, but hath mistaken the figure thereof in his *Icones*, putting the figure of *Pyracantha* (that is of *Oyacantha* *Dioscoridis* which as he saith hath an ever greene leafe, and is not the *Barbary* as divers do mistake it) for it, which he setteth downe in his *Adversaria*, but in his *Icones* the said figure of *Pyracantha* is put under both the title of *Palurus alter peregrinus* and of *Rhamnus tertius* *Dioscoridis* also, *Bauhinus* not taking it to be any species of *Palurus* calleth it *Lycium* *latifolium*: the sixt *Lugdunensis* saith *Dalechampi* tooke to be a *Lycium* hee therefore calleth it *Lycium* *Dalechampi* and withall saith that some called it *Tindorium* *granum*, that is in French *Graine de teindre* and others call it *Graine jaune* and some *Graine d'Avignon*; *Bauhinus* calleth it *Lycium* *Galicum* and may be called *Granum* *Avenionense*: the seventh *Honorius Bellus* of *Candy* saith it is there called *αλζία* *Loutzia* of the inhabitants, but he himselfe calleth it *Lycium* *Creticum*, yet saith also because it is not the right *Lycium*, it may be called *Berberis Alpina* aut *montana*. for *Silvius Tadeschius* reported unto him that he found the very same very frequent on Mount *Lybanus* in *Syria*. *Pona* followeth *Bellus* in his *Italian Baldus*, and calleth it by the same names. *Bauhinus* referreth it rather to the *Barbery*, making it another species thereof and not of *Lycium*: the eighth as *Bellus* saith is also another sort of *Lycium*, and called by the *Candians* *αλζία* *Lazegiri*, and *αλζία* *Petroamygdala* hoc est *petra amygdala*, but yet hath no resemblance to our *Almond* tree: the ninth is called of *Clusius* *Lycium* *legitimum* *Rauwolfij*, and by *Rauwolfius* himselfe *Frutex spinosus peregrinus* *Aralium* *Hadbad*, incolis *Zarua*. *Bauhinus* *Lycium* *Indicum* *folij pruni*: the tenth is by *Prosper Alpinus* called *Lycium* *Indicum* *credulum* and saith it is called *Useg* by the Egyptians: *Bauhinus* calleth it *Lycium* *Indicum* *alterum*: the eleventh is called by *Garcias* *Cate* sive *Lycium*, and saith the true is called *Hattych*, which thereupon I have intituled *Lycium* *Indicum* *putatum* *Garcia*, and by *Bauhinus* *Lycium* *folij Erica*: the last *Alpinus* saith is called by the Egyptians *Agialalid* and may not unfitly be accounted a *Lycium*, *Bauhinus* thereupon calleth it *Lycio* affinis *Egyptiaca*.

The

The Vertues.

The condensate juice of *Lycium* is that that onely is to be used, of all the parts of the tree, which was made as *Dioscorides* sheweth of the leaves and berries, but *Pliny* saith of the roote and branches, which being steeped three dayes in water was afterwards boyled and strayned, & then evaporated untill it came to the thicknes of honny, and so to be kept as a liquid medicine as *Galen* seemeth to intimate, or else dried up to the thicknesse of *Opium* and made up in that manner into Cakes, which as is sayd were to be broken to know the goodnesse: the scumme saith *Dioscorides* taken away in the boyling is put with other medicines that serve for the eyes, the rest is put to other uses, yet the *Lycium* it selfe is also set downe by him, to be effectuell to take away the dimnesse and filmes that hinder the sight. It stayeth Fluxes of all sorts both of the belly and humours, as the Laske and Bloody flux, the abundance of Womens courses, and the whites, bleedings at the mouth or nose and spitting of blood: it is effectuell also for all fowle and creeping Cankers, Vicers and sores, whether in the mouth throat or other parts of the body, as also for the loosensse of the gummies, chappes in the lippes or clefts in the fundament, and at the rootes of the nayles of the hands: but especially for all sores in the privie parts of man or woman: it is good for the cough being taken with water, as also against the bitings of a mad Dogge: being put into the eares that runne and matter, it helpeth them: it is good also against the itch and scabbes, and to cleanse the skinne: it coloureth the haire yellow, and giveth a yellow dye not onely to Leather and skinnes, but serveth Dyers also and Painters in their workes.

CHAP. XXV.

Rubus. The Bramble.

OF the Brambles there are are divers sorts, some having thornes or prickles upon them, others few or none, some growing higher and lower then others, some also carefully nursed up in Gardens which are the Raspies berries of divers sorts, whereof I have in my former Booke given you the knowledge sufficiently and shall not be here againe described.

1. *Rubus vulgaris major*. The common Bramble Blacke berry bush.

The common Bramble or Blacke berry bush is so well knowne that it needeth no description, every one that hath seene it being able to say that it shooteth forth many very long ribbed or straked branches, which although a great part thereof standeth upright, yet by reason of the length and weaknesse they bend againe downe to the ground, there many times taking roote againe, all of them thicke set with short and crooked thornes, and leaves like wise at severall places upon long prickly footestalkes, three and sometimes five set together, hard and as it were crumpled with small prickles on the middle under rib, of a darke Greene colour and grayish underneath, which seldome fall away all the winter, untill all the sharpe frosts be past (whereby the countrey men doe observe that the extremity of Winter is past when they fall off) and that new leaves shortly after beginne to shoot forth againe: the flowers are many set together at the ends of the branches, which consist of five whitish leaves like those of the wilde Bryer bush, and sometimes dasht with a little Carnation, with small threads in the middle, after which come the fruit every one by it selfe, but consisting of many graines or Berries as it were set together in a round head like a Mulberry, Greene at the first, reddish afterwards, and blacke and sweete when they are ripe, which else are harsh and unpleasant: the roote groweth great and knottie.

1. *Rubus vulgaris major*.
The Bramble or Blacke bush.

2. *Rubus minor Chamerubus sive Humirubus*.

The small low or ground Bramble.

The branches hereof are very slender, alwayes lying and trayling upon the ground, never raising it selfe up as the former doth, and often rooteth as it creepeth, set with crooked thornes, but much smaller then the other. & with the like leaves and flowers of a pale Rose colour, and berries but smaller, and of a blewish blacke colour when they are ripe like unto a Damson, and as sweete as the other Blacke berry almost, but with lesser sappe or juice in then: the roote hereof creepeth about, and from the knotty joynts send forth new branches. Of this kinde there is another fort.

3. *Rubus montanus odoratus*.

Sweet mountaine Bramble or Raspis.

This mountaine Bramble or Raspis (for to eyther it may be referred) hath sundry long stalkes rising from the roote without any thornes on them, but set thicke with soft haire, from whence shoot forth the broad and large leaves without order, set upon long hairy footestalkes divided into five parts almost to the middle ribbe, and sometimes but into three or more, each a little dented about the edges of a very sweet sent but falling away in winter: the flowers are somewhat large like the Eglantine of a delayed purplish violet colour, with divers yellow threads in the middle standing

2. *Chamaerubus fruticosa*.
The small or low Bramble.

4. *Rubus saxatilis* Alpina.
The stony Bramble or Rocks Rasp.

6. *Chamaerubus Anglica*.
Our Knot berry.

7. *Chamaerubus Cambr*o Britanica.
The welsh Knot berry or Lancashire Cloud berry.

standing at the toppes of the branches, after which come the fruit very like unto Bramble berries but reddish as Raspis but not so well relished: the roote spreadeth much about under ground.

4. *Rubus fruticosus*. The Deaw berty or Winberry.

The Deaw berry hath slender weake branches like the last more often lying downe then being raised up with fewer prickles and thornes thereon then in the last, the leaves likewise are usually but three set together, more separate on the branches, yet almost as large as it and nearer set together on long footstalkes: the flowers are white and small, the berries usually consist of three small berries or graines set together in one, yet many times foure or five lesse fapple but not lesse sweete or blew then the other: the roote hereof creepeth under ground more then the last.

5. *Rubus saxatilis Alpinus*. The stony Bramble or Rocke Raspis.

This small low plant which by *Clusius* is more fitly referred to the Raspis then the Bramble hath divers slender reddish twiggy hairy branches little more then a foote high, without any thorne at all on them, set here and there with rough leaves upon footstalkes three alwayes joyned together and denred about the edges of a very harsh and binding taste: the flowers stand at the toppes of the branches three or foure together consisting of foure and some of five leaves a peece, of a pale or whitish Rose colour which afterwards turne into small fruit, composed of three foure or five graines or berries set together greater then cyther in the Raspis or Bramble of a reddish colour when they are ripe, almost transparent, full of a most pleasant sweete and acid juice gratefull to the palate, having in each of them a white rough kernell or stone: the roote creepeth all about and shooteth forth sundry branches from the joynts as they creepe.

6. *Chamaemorus Anglica*. Our Knotberry.

The Knotberry riseth up with slender brownish stalks not a foot high, set with foure or five large leaves one above another at severall winged joynts, each of them divided into five parts, and each of them somewhat deeply jagged and dented also round about the edges, rough and as it were crumpled each upon a long footstake, which at the joynts have two small peeces like eares set thereat: each stalk being furnished at the top with one flower made of five round pointed leaves of a darke purple colour, after which followeth a large berry like unto a Mulberry of divers graines set together, of a reddish colour when it is ripe and of a fowrish sweet taste, the roote creepeth much and farre shooting forth small fibres at the knotty joynts whereby it is fastned in the ground and from thence divers new shoots for stalkes.

7. *Chamaemorus Cambro-Britanica* five *Lancastrense* *Vaccinium nubis*.

The Welsh Knotberry or Lancashire Cloud berry.

This small and low Bramble that scarce appeareth above the ground mosse among which and the blacke berried Heath, &c. it groweth hath small creeping rootes running under ground, and shooting forth here and there faire large leaves almost round a little divided as it were into five parts, and a little unevenly dented about the edges, being somewhat rough and full of veines of a darke Greene colour on the upper side and paler underneath, as also some slender stalkes with two or three the like but lesser leaves on them, and at the toppe a purplish small Rose-like flower which changeth into a Raspis-like fruit, in some smaller in others greater consisting of sundry berries set together, sometimes more and sometimes lesser, of a pale reddish Orange colour tasting reasonable well, although not so good as a Raspis.

8. *Chamaemorus Norwegica*. The Knotberry of Norway.

This Knotberry of Norway is very like unto our first Knotberry, having many slender brownish twigges rising not much above a foote high, whereon are set divers broad leaves upon long footstalkes more round then the first and parted into three or more short divisions, each snipped or dented about the edges, and having 7. great ribs on the under side with divers small veines from them to the edges: from the toppes of the stalkes rise divers flowers, each upon a long footstake composed of five white leaves for the most part, with divers white threads tipped with yellow in the middle: after which follow the fruite, of the bignesse of a Strawberry. some reddish and others more pale, of a soft pulpy substance somewhat clammy, yet not unpleasant with small kernells therein.

9. *Chamaemorus Norwegica altera*. Another Norway berry.

The likenesse of the leaves of this small bush unto the last which are very like unto those of the Riles or red Currant hath caused the name to be joyned thereunto, the stalkes are of a like shortnesse, of a blackish colour whose leaves are broad, and cut in somewhat more deeply into sundry parts, the berries stand at the toppes of the stalkes many clustering together as it were in a tuft every one upon a short stalk, red when they are ripe and somewhat tart in taste.

The Place.

The first is frequent every where: the second groweth sometimes by woods and hedge sides and sometimes in the middle of fields in many places in this Kingdome, the third groweth on the hills and higher grounds: the fourth is well knowne in the North parts of this land, as *Cheshire*, *Lancashire*, & *Yorkshire* the fifth in stony and rocky places, both in the Ile of *Thanes* and other places of *Kent*, as also in *Huntington* and *Northamptonshire*: the sixth groweth on the high hills in *Lancashire* and *Yorkshire*, the one called *Ingleborough* the other *Pendle* the two highest hills in *England*: the seventh was first made knowne unto us by *Thomas Harker* a painefull Chirurgeon and Simplick of *Lancashire*, who gave us a rude draught thereof, but *Doctor Lobel* going both into *Wales* and the Shires neare thereunto found it there growing, and on *Ingleborough* hill in *Lancashire*, as *Mr. Bradshagh* a Gentleman of the Country did likewise and sent it up to us, where the people call the fruit cloud berry, because the hill seemeth as it were continually covered with clouds: and the two last are declared by their titles to grow naturally in *Norway*.

The Time.

All these flower about *July* and their berries are ripe in the end of *August* or beginning of *September*.

The Names.

The Bramble is called in Greeke *ῥαβδος βατος*, the Latines call it *Rubus* and *Sentis*. *Theophrastus* hath three sorts *Batos Rubus*, *Chamebatos Humilis rubus*, or *Humirubus* and *Cynobatos Rubus caninus* or *Canis rubus*. *Pliny* hath three also but in a different manner: the two first sorts of *Theophrastus* are generally knowne of all but of the third there is some controversie, for *Tragus* maketh the *Spina appendix* or *Oxyacanthus* our white thorne or Hawthorne to bee *Cynobatos*, and so doth *Dodonaeus* also. *Cordus*, *Lachna*, *Mercatus* and others thinke the *Rosa*

Canina or *Sylvestris* to bee it, *Pliny* as I thinke being the author of that opinion, l. 14 c. 13. where he saith there is another kinde of *Rubus* whereon a Rose groweth called *Cynobatos* by *Dioscorides* growing in hedges with other Brambles; againe *Pliny* lib. 16. cap. 27. saith thus, *Rubi Mora ferunt* & in *alioginere* *smittudinem* *Rose* que vocatur *Cynobatos*, but in lib. 15. cap. 2. hee describeth *Cynobatos* to have a leafe like unto a mans footstep, bearing a blacke fruit or Grape, in whose kernell there is a nerve or sinew whereof it was called *Neurospalos*; but *Matthiolus* contradicteth them and sheweth that *Pliny* in setting downe the wilde Roses calleth one by a peculiar name *Cynorhodos* *Rosa Canina* and not *Cynobatos* *Camirubus*, and the description of *Dioscorides* (saith he) sheweth he meant no sort of Rose for else it had bene easie for him to have said *Cynobatos* is like a wilde Rose, but he compareth the leaves to Myrtle leaves, and the fruit to be like Olive stones wherein lyeth downe hurtfull to the windpipe by sticking thereto if it should be drunke, but speaketh of no seeds or kernells to lye in that Downe but saith the fruit being dryed and drunke in wine doth bind the belly. *Theophrastus* lib. 3. cap. 18. saith *Cynobatos* beareth a reddish fruit like unto a Pomegraner, and a leafe not unlike to *Agnus castus*; *Serapio* speaketh of *Cynobatos* *Caninus* *Rubus* among the other sorts of Brambles, whereby it is plaine as he saith that *Cynorhodon*, the wilde or dogge Rose doth much differ from *Cynobatos* the dogge Bramble, and yet *Lugdunensis* in contrarying *Matthiolus* his reasons striveth by finding fault with the text both of *Dioscorides* and *Theophrastus* and amending them as he thinketh fit, to reconcile them and make the *Cynobatos* to be the wilde or Sweet Bryer but very unhand- somly in my opinion. There is little variation of names among writers concerning the two first, but of the third and fourth I doe not finde that any hath written being bushes more peculiar to this Land then others: the fifth *Classius* calleth *Rubus saxatilis* sive *petraeus* sive *Alpinus*. *Gesner* in *hortis* calleth it *Rubus Alpinus humilis*, *Thalys* *Rubus minimus* and *Banbinus* *Chamerubus saxatilis*: the sixth and the two last are mentioned by *Classius* by the names of *Chamerubus* *Anglica*, *Norwegica* altera as they are in their titles: the seventh hath a name or title gi- ven it as is fittest to expresse it, and to put all out of doubt concerning *Gerards* Cloud berry as hee hath expressed it from the rude draught of Master *Hoskerts* doing as it is very likely, but the more exact figure is here exhibited. The *Arabians* call the Bramble *Buleich* and *Haleicho*, the *Italians* *Rovo*, the *Spaniards*, *Carca* (*salsa*) the *French* *Ronce*, the *Germans* *Brombeer* *Bremen* and *Bramen* *Braemen* also, and wee in *Englis* Bramble or Blacke-berry bush: the fruit or berries are called in Greeke & *na* as *Galen* saith which some have made *Vatina* in Latine, *Mora rubi*, but in the Apothecaries shoppes *Mora bati*, and of some *Mora busti*, the betries of the Mulberry tree being called by them *Mora selfi*.

The Vertues.

Galen lib. 6. *simpl. med.* saith that the buddes, leaves, flowers, fruit and toothe of the Bramble are all of a great binding quality but yet somewhat in a diffeting manner, for the buddes, leaves and branches while they are fresh and greene have a cold earthly quality joyned with a warme watery substance, but little binding, and there- fore they are then of good use in the Vlcers and putride sores of the mouth and throat, and for the Quinsie, and likewise to heale other fresh wounds and sores but the fruit when it is ripe because it is sweet hath a temperate warming juice therein, whereby and by that small astiction is in it it is not unpleasant to be eaten, but being not yet ripe it is of an exceeding cold and earthly substance, fower and very astringent, and being kept doe more strongly bind then when they are fresh: the flowers are of the same propertie that the unripe fruit is of, both of them are very profitable for the Bloody flux, Laskes and the weakenesse of the parts comming thereby, and is also a fit remedy against the spitting of blood: the roote also beside the binding quality therein hath a thinne ef- fence whereby it is available, eyther the decoction or the powder taken to breake and drive forth gravell and the Stone in the Raynes and Kidneyes: the leaves of Brambles as well greene as dry are excellent good for lo- rions, for the sores in the mouth and secret parts: the decoction of them and of the branches when they are dried doe binde the belly much more, and is good for women when their conies come downe too abundantly: the berries saith *Pliny* or the flowers are a powerfull remedy against the most violent poyson of the Piestor or *Diplas* (which are most violent Serpents) the Scorpion and other venomous Serpents, as well drunke as outwardly ap- plied, and helpeth also the sores of the fundament, and the painfull and bleeding Piles: the juice of the berries hereof mixed with that of Mulberries maketh the medicine more effectfull to bind and to helpe fretting or eating sores and Vlcers where soever, and is good for the stomacke, the sores in the mouth with the loosenesse of the gummies and teeth: the same being taken alone or mixed with some *Hipocistis* and Hony saith *Pliny* is a remedy for choller when it gnaweth the stomacke which some call hartburning, and is good also against the passions of the heart and faintings: the distilled water of the branches leaves and flow- rs, or of the fruit is as sweet as that of Violets, and is very effectfull besides the facilitie and pleasantnesse in taking, in all hot fevers or distempera- tures of heate in the body, the head, eyes, and other parts, and for all the purposes aforesaid: the leaves of Bram- bles boyled in lye and the head washed therewith doth heale the itch, the mattering and running sores thereof, and maketh the haire blacke: the powder of the leaves strewed on cancerous and running Vlcers doth wonder- derfully helpe to heale them. Some use to condensate the juice of the leaves and some the juice of the berries to keepe for their use all the yeare for the purposes aforesaid: the other sorts are very neate in qualitie unto it and therefore worke the same effects no doubt: but the *Norway* Knotberry is much commended against the Scor- bute or Scurvey, and other crude putrid and melancholy diseases wherewith thote Northerly people are much afflicted, which *Classius* out of *Hierus* Epistle declareth at large, and the manner of the cure of a number infected therewith as well in Winter as in Sommer, whereunto I refer them that would understand it more fully.

CHAP. XXVI.

Rosa sylvestris. Wilde Roses or Bryer bushes.

Having given you the knowledge of all or most of the manred Roses in my former Booke and with them some of the wilder kinds also as the Sweet bryer or Eglantine, the evergreene Rose which is very like thereunto, and the great Apple Rose which shall not be further related here, I am to shew you all the rest in this Chapter,

I. *Rosa*

Rosa Damascena.
The Damask.

1. *Rosa sylvestris inodora five Canina.*
The ordinary wilde Bryer bush.

1. *Rosa sylvestris inodora five Canina.* The ordinary wilde Bryer bush.

The wilde Bryer bush groweth of it selfe in the hedges very high, with upright hard woody stemmes covered with a grayish barke especially the old ones, set with sharpe thornes up to the toppes but not so thicke as the sweete Bryer, having divers leaves somewhat larger thereon and not so greene on the upper side nor so grayish underneath as the other, the middle ribbe whereof hath divers small crooked thornes and without any sent at all, the flowers stand at the toppes of the branches divers set together, of a whitish bluish colour, made of five round pointed leaves somewhat longer then the Sweet bryer or Eglantine Rose, standing in such like huskes as they or other Roses doe: after the flowers are past come the fruit somewhat long and round, of a yellowish red colour or reddish yellow colour when it is ripe, having a soft sweetish pulpe under the skinne, and feedes lying therein also, which berries are much devoured by the poorer sort of women and children that eate them gladly: the roote runneth deepe and farre in the ground growing somewhat grear. Upon this Rose as well as upon the Eglantine is often found a burr or ball of browne threads, and I have often scene it also upon the greater Apple Rose which is extant in my former Booke.

2. *Rosa sylvestris odorato carneo flore.* The wilde bluish Bryer Rose.

This wild Bryer Rose is so like the former that it is hardly discerned from it, eyther for the height of the stem or flore of thornes or smalnesse of the leaves but onely for the flowers which are somewhat larger, and of a deeper bluish or pale purple colour somewhat sweet withall.

3. *Rosa sylvestris Russica.* The wild bryer of Muscovia.

This wild bryer hath sundry reddish yellow stalkes rising from the roote spotted or rather bunched out as it were with blisters in divers places with thornes set thereon like a Bryer or wilde Rose; the leaves are not many but small like the wilde hedge Bryer or rather smaller, and turning red in Summer: the Roses are single and small of a deepe incarnate colour.

4. *Rosa sylvestris Virginensis.* The Virginia Bryer Rose.

The Virginia Bryer Rose hath divers as great stemmes and branches as any other Rose, whose young are greene and the elder grayish, set with many small prickles and a few great thornes among them, the leaves are very greene and shining small and almost round, many set on a middle ribbe one against another somewhat like unto the single yellow Rose: the flowers stand at the toppes of the branches consisting of five small leaves, of a pale purple or deepe incarnate colour like unto those of the sweet brier, which fall away quickly as they and others doe.

5. *Rosa campestris flore albo odoro.* The single sweete white Rose.

This single Bryer Rose hath woody stemmes about two cubits high, set as thicke with sharpe thornes as eyther the common wilde Bryer or Eglantine is, and set with the like leaves but not so greene, at the tops of whose greene branches stand usually but one flower a peece, consisting of five white leaves reasonable large and of a sweete sent, with divers yellow threads in the middle: in their places come such like round and short heads or berries

5. *Rosa Canadensis* fluitans odor.
The single sweet wild Rose.

6. *Rosa sylvestris Austriaca* flore pheniceo.
The Vermillion Rose of Austria.

8. *Rosa Pimpinella* seu *Pomifera* minor.
The small Burnet Rose or Pimpernell Rose.

10. *Rosa simplex parvula* seu *spina*.
The single dwarf Rose without thorns.

berries as are in other Roses, but are blacke when they are ripe and not red, with white feedes lying in flocks of downe as others doe.

6. *Rosa sylvestris Austriaca flore pheniceo*. The Vermillion Rose of *Austria*.
The younger branches of this Rose are slender and reddish, the elder brownish gray, set with divers thornes but not very thicke great or sharpe: the leaves are somewhat larger then those of the single yellow Rose, else not much unlike: the flowers are single and as large as of that yellow Rose whereof I take it to bee a species but differing in colour for this is of an excellent Orange tawny colour, with an eye of Vermillion cast over it, and of a paler yellow on the outside, after which succede the fruites.

7. *Rosa pumila rubra Austriaca*. The single dwarfe red Rose of *Austria*.
This dwarfe Rose groweth not much above halfe a yard high, with slender Greene stemmes, set with few or no thornes below, but furnished up higher with many, having whitish Greene leaves upon them like the ordinary red Rose and grayish underneath five or seven set together upon a stalk: at the toppes of the branches come forth very great bearded huskes, wherein stand large flowers made of five leaves a peece, somewhat sweet, red at the first but decaying with standing, growing much mote pale before they fall away, with yellow threads in the middle, after which come the fruit which are red as the others but greater then any of those before declared, formed somewhat mote like unto a pearre then others.

8. *Rosa Pimpinella sive Pomifera minor*. The small Burnet Rose or Pimpinell Rose
This small Rose seldome riseth above a foote high being of two sorts, whereof the one hath but few thornes on the stalkes, and the other full of small thornes (both which are oftentimes found in one ground, but the thorny more frequent) set with long winged stalkes of leaves, being many small round greenish leaves set one against another upon the stalk finely dented about the edges, seeming like unto a Burnet leafe for the forme and number set together: the flowers are single small and white without any sent, after which come small round heads but blacke when they are ripe full of feede as in other Roses.

9. *Rosa pumila campestris alba*. The Dwarfe single white Rose.
This is one of the smallest Roses scarce rising a foote above ground, being set with small thornes and leaves according to the proportion of the plant and the wildnesse of the kind, the flowers are white and small giving heads and feede like the rest: the foote creepeth about more then others.

10. *Rosa simplex pumila sine spina*. The single Dwarfe Rose without thornes.
This Dwarfe Rose also groweth very low, even almost upon the ground with Greene stalkes without any thorn: thereon, set with small leaved leaves, so small that they seeme scarce to be leaves of a Rose: the flower is small and of a pale reddish colour and single, in some places very sweete, and in others little or nothing, flowering also in some places both in the Spring and Autumne.

The Place.

The two first grow in the hedges of our Land every where almost, yet the second not so frequent as the first: the third came from *Muscovy*: the fourth from *Virginia*: the fift from *Germany* in sundry places: the sixt and seventh from *Austria*: the eight is found in divers places of our owne Land both in batten beathy grounds, and by woods and hedges sides: the ninth on some of the hills among the *Switzers*, and the last neare unto *Lyons* in *France* upon *Pilats* hill there.

The Time.

Some of these Roses flower earlier then others, for some come in *May* others not untill *June* when other Roses doe.

The Names.

The Rose is called in Greeke *ῥόδον* *Rhodon* quod largum odoris effluviu[m] emittat, from the great sweetnesse therein as *Plastarch* saith, in Latine *Rosa*; *Theophrastus* and *Pliny* have very diligently observed the severall differences and varieties in their times, *Theophrastus* in generall termes and in the number of the leaves, some few some many, in the thornes in the colour and sent, and *Pliny* by severall names, yet not expressing all their colours, which divers authors formerly have appropriated to those Roses were extant with them: but if I shall undertake the taske to shew their correspondencie with ours herein, as I shall endeavour in declaring my opinion to shew the likeliest and agree with them in some of them, so I shall (how free from error I leave to others to scanne) dissent from them in others: but first because I intend to make *Pliny* my author to comment upon I thinke it fit to set downe the text of *Pliny* in order as it lyeth *lib. 21. cap. 4.* The Romans (saith he) have in greatest account the *Prænestina* and *Campana*, some have added unto them the *Milesia* which hath the reddest colour not exceeding a dozen leaves, next hereunto is the *Trachynia* not so red, then the *Alabandica* more vile or of lesse esteeme with whitish leaves: the meanest (*viliissima sed ut alij legunt utilissima*) with very many but very small, even the smallest leaves is *Spinicola*. there is a kind thereof called *Cenisfolia*, and a little after he saith there is also one that wee call *Græca*, and the *Græci* *Lychnis* growing but in moist places never having above five leaves, of the bignesse of the Violet without any sent; another is called *Græcula*, with leaves as it were closed or alwayes ready to open, but openeth not unlesse it be pulled open having the broadest leaves: Another hath a Mallow-like stemme and leaves like the Olive tree, called *Moschenton*, among these is that which beareth in Autumne of a middle size, called *Coroneola*; all are without sent save the *Coroneola* and that which groweth on a Bramble, Thus saith *Pliny*. Now let us see how aptly other authors have fitted the Roses of these times unto those of *Pliny*, and first for the *Prænestina* it is generally taken to be our Damaske Rose, yet *Lugdunensis* saith it is the red Rose, among which is the *Milesia*, which as hee and *Camerarius* say the French call *Rose de Provins*. The *Campana* is generally held to be our great white Rose. The *Milesia* is generally held to be the best red Rose, the deepe colour that *Pliny* saith it hath, being a true note to know it by, and is called by many in *Germany* *Rosa fina* as *Camerarius* saith, because it keepeth both colour and sent best when it is dried, whereof as hee saith there is both single and double. Some take our Velvet Rose to be it; first because the colour is deepe though the sent be small, and it never exceedeth a dozen leaves. The *Trachynia* is our pale red Rose which *Lugdunensis* saith the French call *Rose incarnate*, but *Camerarius* in *horto* saith it is a purple Rose of a deepe or blackish red colour with a pale violet colour mixt therewith, some Germans he saith call it *Kolresen*, and differeth little from the *Milesia* but that it is greater; but truly so deepe a red colour as *Camerarius* alloteth unto it cannot agree unto *Pliny* his *Trachynia* which he saith is *minus rubens* of a paler red colour, and therefore I thinke it is the worst sort of our red Rose, whole

Cordus upon *Dioscorides* mentioneth in the first Booke and 24. Chapter, *Cynosbates* and *Cynorrhodos*, being his third sort, saying it is the least and may be called *Chamerhodos* and is called by the *Germanes* *Erdrosen*, *Bauhinnus* calleth it *Rosa campestris repens alba*: the last is taken by *Longdanensis* to bee *Rosa Giaca* fröe *Lycenia*, *Græcorum* *Pliny*, and if it be not so, yet it may fitly as he saith be called *Cynorrhodon lene*. *Bauhinnus* calleth it *Rosa campestris spinosa carens biflora*. A Lecture of much moralitie might be read upon the Rose, the parts delivered by many authors both Greekes and Latines all which to insert in this place is not my minde, onely I will reice a few of many to give you a taste of the plenty and excellencie.

*Ut Rosa mane viget, tamen & mox vespere languet,
Sic modo qui sumus, cras levis umbra sumus.* And againe,
*Vidi ego mane Rosam solis cum lumine nasci,
Et vidi rursum sole cadente mori.*

The miserably infauated Turkes will not suffer a Rose leafe to lye upon the ground, or any to tread on them in honour of their Mahomet, from whose sweate they are perswaded the Rose sprang up; somewhat like unto the old Pagans, who held the Rose which formerly was white to become red from the blood of *Venus*, falling thereon from her foote hurt by a thorne, as shee ran among the bushes to helpe her *Adonis*, *Philostrotus* dedicated the Rose to *Cupid* whom it doth represent in every part. It is fresh young and delicate as *Cupid*, it is crowned with gold yellow haire, it beareth thornes as darts and leaves as wings, the Crimson beauty of the flowers as his glory and dignitie, neither the Rose nor *Cupid* keepeth any time, and besides this he calleth the Rose the light of the earth, the faire bushie toppe of the spring, the fire of love, the lightning of the Land. *Anacron* his Greeke verse latined by *Stephanus* are sufficiently knowne being these,

Rosa honor, decusque florum: *Roseis puer Cytharis.*
Rosa aura, amorque peris: *Caput implicat coronis*
Rosa calvus est voluptas. *Charitum choros frequentans.*

The Vertues.

Because I have spoken so much of the manured Roses in shewing their denominations, I thinke it not impertinent also before I entreate of the qualities of the wild sorts, to set downe the properties and vertues of the Garden kinds somewhat more amply then I have delivered them in my former book. Both the white and the red Roses are cooling and drying, yet the white is taken to exceede the red in both those properties, but is seldome used inwardly in any medicine: the red as *Galen* saith hath a watery substance in it, and a warme joyned with two other qualities, that is, an astringent and a bitter: the flowers thereof (which wee call the feedes; but rather the yellow threads in the middle) doe binde more then the Rose it selfe and more drying also. *Mesues* sheweth that the Rose is cold in the first degree and dry in the second, compounded of divers parts or substances which yet may be separated, namely a watery meane substance and an earthly drying, an aerie substance likewise sweet and aromaticall, and an hot also, whereof commeth the bitternesse, the rednesse, perfection and forme, and yet the force of the heate is stronger, which hath caused the forme and rednesse then that which causeth the bitternesse, for being dried that bitternesse vanisheth when the other two doe abide: the bitternesse therefore in the Roses when they are fresh, especially the juice purgeth choller and watery humours (which qualitie the Greeke authors it seemeth knew not) but being dried and that heate that caused the bitternesse being consumed they then have a stopping and astringent power. Those also that are not full blownen doe both coole and binde more then those that are full blowne and the white Roses more then the red. The decoction of red Roses made with wine and used is very good for the head-ache and paines in the eyes eares throat and gums, the fundament also, the lower bowels and the matrix being bathed or put into them: the same decoction with the Roses remaining in them is profitably applied to the region of the heart to ease the inflammations therein, as also *Saint Anthonyes* fire and all other diseases of the stomacke: being dried and beaten to powder and taken in steeld wine or water doe helpe to stay womens courses, they serve also for the eyes being mixed with such other medicines that serve for that purpose, and are sometimes put into those compositions that are called *Antheras* as is before said. The yellow threads in the middle of the red Roses especially (which as I said bee erroneously called the Rose feedes) being powdered and drunke in the distilled water of Quinces, stayeth the abundance of womens courses, and doth wonderfully stay and helpe the defluxions of rheume upon the gummies and teeth, and preserveth them from corruption, and fastneth them being loose if they bee washed and gargled therewith, and some Vinegar of Squilles added thereto: the heads with seed being used in powder or in a decoction stayeth the Laske and the spitting of blood. Red Roses doe strengthen the heart, the Stomacke and Liver, and the retentive qualities: they mitigate the paines that arise of heate, assuage inflammations procure sleepe and rest, stay womens courses both white and red and the *Gonorrhea* the running of the reines and the fluxes of the belly: the juice of them doth purge and cleanse the body from choller and flegme: the huskes of the Roses with the beards and the ralles of the Roses are binding and cooling and the distilled water of eyther of them is good for the heate and rednesse in the eyes, to stay and dry up the rheumes and watering of them. Of the red Roses are usually made many compositions all serving to sundry good uses which are these. Electuary of Roses, Conserve both moist and dry which is more usually called Sugar of Roses, Syrupe of dried Roses and Hony of Roses: the cordiall powder called *Diorrhodon Abbas*; and *Aromaticum rosarum*: the distilled water of Roses, Vinegar of Roses, ointment and oyle of Roses: and the Rose leaves dried which although no composition, yet is of very great use and effect to be last of all spoken. To entreate of them all exactly I doe not intend for so a pretty volume of it selfe might be composed, I will therefore only give you a hint of every one of them, and referre the more ample declaration of them to those that would entreat onely of them. The Electuary is purging, whereof two or three drams affie selfe taken in some convenient liquor is a competent purgation for any of weake constitution, but may be increased unto six drammes, according to the qualitie and strength of the patient: this purgeth choller without any trouble, and is good in hot Fevers, in paines of the head arising from hot and chollericke humours and heare in the eyes, the laundies also and joynt aches proceeding from hot humours. The moist conserve is of much use both binding and cordiall, for untill it be about two yeare old it is more binding then cordiall, but after wards it is more cordiall then binding: some of the yonger conserve taken with *Mithridatum* mixed together is good for those that are troubled with the distillations of rheume from the braine into the nose, and defluxions of rheume into the eyes.

eyes, as also for fluxes and Laskes of the belly, and being mixed with the same powder of Masticke is very good for the tunning of the reines, and for other loosenesse of humors in the body: The old conserve mixed with *Diarrhodon Abbatis* or *Aromaticum rosarum* is a very good cordiall against faintings, swoownings and weaknesse and tremblings of the heart, it strengthneth also both rhem and a weakke stomacke, helpeth digestion, stayeth casting, and is a very good preservative in the time of infection. The dty Conserve which is called Sugar of Roses is a very good Cordiall to strengthen the heart and spirits, as also to stay defluxions. The Syrupe of dtyed red Roses strengthneth a relaxed stomacke given to casting, cooleth an overheated Liver and the blood in Agues comforteth the heart and resisteth putrefaction and infection, and helpeth to stay Laskes and fluxes. Hony of Roses is much used in gargles and lotions to wash sores eyther in the mouth, throate, or other parts, both to cleanse and heale them, and stay the fluxes of humors falling upon them hindering their heating, it is used also in glisters both to coole and cleanse. The cordiall powders called *Diarrhodon Abbatis* and *Aromaticum Rosarum* doth comfort and strengthen the heart and stomacke, procureth an appetite, helpeth digestion, stayeth casting, and is very good for those that have slippery bowels to strengthen and confirme them, and to consume and dry up their moisture and slipperinesse. Red Rose water is well knowne and of familiar use in all occasions about the sicke and of better use then Damaske Rose water, being cooling and cordiall, refreshing and quickning the weakke and faint spirits, cyther used in meates or brothes, to wash the temples or to smell unto at the nose, or else by the sweete vapours thereof out of a perfuming pot, or cast on a hot fire shovell, it is also of much use against the rednesse and inflammations in the eyes to bathe them therewith, and the temples of the head also against paine and ache therein: Vinegar of Roses is of much use also for the same purposes of paine and ache, and disquietnesse in the head, as also to procure rest and sleepe, if some thereof and Rosewater together be used to smell unto, or the nose and temples moistened therewith, but more usually to moisten a peece of a red Rose cake cut fit for the purpose, and heated betweene a double foulded cloth with a little beaten Nutmeg and Poppy seede, strewed on that side shall lye next the forehead and temples, and so bound thereto for all night. The oyntment of Roses is much used against heate and inflammations in the head to annoint the forehead and temples and being mixed with some *Populeum* to procure rest, as also it is used for the heate of the Liver, of the backe and reines, and to coole and heale pusshes wheales and other red pimples rising in the face or other parts. Oyle of Roses is not only used by it selfe, to coole any hot swellings or inflammations and to binde and stay fluxes of humors unto sores, but is put also into many other compositions both oyntments and plaisters that are cooling and binding, and restraining the flux of humors. The dried leaves of the red Roses are used both inwardly and outwardly both cooling, binding, and cordiall for with them are made both *Aromaticum rosarum*, *Diarrhodon Abbatis* and *Saccharum rosarum*, each of whose properties are before declared: Rose leaves and Mints heated and applyed outwardly to the stomacke stayeth castings and strengthneth a weakke stomacke very much, and applied as an Epitheme or fomentation to the region of the Liver and Heart doth much coole and temper the disemperate in them, as also in stead of a Rose cake to the head and temples to quiet the overhot spitts, which will suffer no sleepe or rest to fasten on the sicke patient. Of the Damaske Roses are not made so many medicines or compositions, for beside the Conserve and Preserve, the Syrupe and Hony of those Roses (each whereof is called *Solutivum*) the water and the distilled oyle or spirit which serveth more for outward perfumes then inward Physicke, as the dried leaves to fill sweete bagges and the like, I know not any other use made of them, and yet there is by many times much more of them spent and used then of red Roses, so much hath pleasure outstripped necessary use. The Syrupe of Damaske Roses is both simple and compound and made with *Agoricke*: the simple solutive Syrupe is a familiar safe and gentle easie medicine, purging choller taken from one ounce or two unto three or foure, yet this is remarkable and wonderfull herein, that the distilled water of this Syrupe should notably binde the belly: the Syrupe of Roses with *Agaricke* is more strong and effectuell in working then the simple Syrupe, for one ounce thereof by it selfe will open the body more then of the other, and worketh as much on segme as choller: the compound Syrupe is more forceable in working on melancholicke humors, and available against the Lepry, Itch, Tetter, &c. and the French discafe also. Hony of Roses solutive is made of the same infusion that the Syrupe is made of, and therefore worketh the same effect in opening and purging, but because the hony is neither so familiar to many or convenient to hot and agnish bodies, it is oftener given to flegmaticke then colleticke persons, and is more used in Glisters then potions as the Syrupe made with Sugat is. The Conserve and Preserved leaves of these Roses are operative to the same effect in gently opening the belly. The simple water of the Damaske Roses is of so much use for fumes to sweeten all things as also to put into meats and broths, &c. that it hath left almost no use for any Physicall purpose, yet it hath bene well observed by *Cossetus* in his commentary upon *Mesues*, that tenne ounces of Damaske Rose water drunke in the morning doth open and purge the belly, the dyed leaves of the Damaske Roses serve mo't to make sweete powders, and to fill sweete bagges or the like, yet the same *Cossetus* in the same place sheweth that the dried leaves powdered and drunke in the whey of Goats milke worketh to the same effect in purging. The Muske Roses both single and double doe purge more forceable then the Damaske, and the single is held to be stronger then the double, for although none of the Greeke writers have made any mention thereof, yet *Mesues* especially of the *Arabians* doth set it downe: twenty of the leaves of the single Rose must be taken saith *Camerarius*, but more of the double kinde to open the belly and purge the body. The wilde Roses are few or none of them used in Physicke, but yet are generally held to come neare unto the nature of the manured Roses, both in the earthy and binding facultie, *Pliny* setteth downe in his eighth booke and fourth Chapter that the roote of the wilde Rose is singular good to cure the biting of a mad Dogge, which as he saith, (but how wee may believe him I know not) was found out by miracle: the fruit of the wilde Brier which are called Heppes being thorough ripe and made into a Conserve with Sugar according to the manner of divers other fruits, besides that it is very pleasant to the taste, doth gently binde the belly, and stayeth defluxions from the head upon the stomacke, and dryeth up the moisture thereof, and helpeth digestion: the pulpe of the Heppes dried unto a hard consistence like to the juice of Licoris, or so dtyed that it may be made into powder and taken in drinke stayeth speedily the whites in women. With the fruit Cookes and their Ladies and Mistresses doe know how to prepare many fine dishes for their tables. The Brier ball is often used being made into powder and drunke to breake the Stone to provoke urine when it is stopped and to ease and helpe the collicke: some appoint it to be burnt and then taken for the same purpose: in the middle of these balles are often found certaine white wormes, which being

being dried and made into powder and some of it drunke, is found by long experience of many to kill and drive forth the Wormes of the belly.

CHAP. XXVII.

Capparis. Capers.

The Caper tree or bush that was knowne to *Dioscorides* and *Theophrastus* being but one sort was thorny, but there hath beene since some other sorts knowne, both that are and are not thorny, which for affinitie sake I thinke meete to joine together, and with the Capers another plant, which for some likenesse beareth also the name of *Capparis fabago* or *leguminosa*, Beane Capers, not intending to joine it to the pulses as some might thinke it should be.

1. *Capparis spinosa folio rotundo*. Round leaved thorny Capers.

This Caper sendeth forth divers long, weake trayling woody stalkes lying round about upon the ground, set with crooked thornes like hookes or as the Bramble, at each joynt come forth two round leaves like unto *Asarum* opposite one unto another, from whence springeth also a small round head upon a pretty long footstake, which is the bud from the flower before it open (and is that small round Caper which wee doe usually eate at meate) which being then gathered and pickled up with great salt, are kept in barrells and brought into other countries, and are taken out of the salt afterwards and kept in Vinegar to be spen: at the table as all know: but when it is open consisteth of foure white sweete smelling leaves, with foure other Greene ones as the huske wherein they stand, having many yellowish threads and a long stile or petticle in the middle, which afterwards groweth to bee the fruit, and is long and round like unto an Olive or Acorne when it is ripe (which also are brought pickled to us, and are the long Capers which are used) wherein are contained divers hard browne feede somewhat like unto the kernells of Grapes: the roote is great, white, long and somewhat woody covered with a thicke barke running and spreading much in the ground, so that it will quickly spread a whole field in the warme countries and make it barren, and is somewhat sharpe and bitter: the stalkes perish in Winter every yeare, and arise againe afresh in the Spring.

2. *Capparis spinosa folio acuto*. Thorny Capers with pointed leaves.

This other Caper differeth from the former neither in the thorny growing nor in the flowering, nor in any other thing then in the leaves, which with the roundnesse are pointed at the ends, and this is sufficient to know it by.

3. *Capparis non spinosa fructu majore*. Egyptian Capers without thornes.

The Egyptian Caper differeth not much in the manner of growing from the former, but that the stalkes grow

1. *Capparis spinosa folio rotundo & acuto*.
Thorny Capers with round and pointed leaves.

5. *Capparis fabago sine leguminosa*.
Beane Capers.

greater

greater and more upright without any thornes on them, the leaves are round and stand two at a joynt like the former, the buds are greater and so are the white flowers in like manner, and the fruit greater then any of the former: this looeth not the leaves in Winter as the others doe, and herein consist the chiefe differences.

4. *Capparis Arabica non spinosa*, Great Capers of Arabia.

The Arabian Caper is a small shrubbe growing up with many upright stemmes without thornes, the leaves, flowers and fruit are greater and larger then the last Egyptian kinde, the fruit being of the bignesse of an Egge or Wallnut with divers seeds therein, of a sharpe and biting taste as *Dioscorides* hath noted, and others since his time of our later writers.

5. *Capparis fabago sive leguminosa*, Beane Capers.

The Beane Caper riseth up with divers Greene herby and not woody stalkes like the other, branching forth from the very bottoime, at the severall joynts whereof grow two leaves opposite one unto another which are alwayes two together at the end of the footstalk, being somewhat like unto Puttane leaves but in the posture and colour resembling the leaves of Beanes: the flowers come forth singly one at a joynt with the leaves, which before they are blowne open are very like unto Caper blossomes, being white standing in a Greene huske and with many yellow threads in the middle, after which the fruit followeth somewhat long and round, and opening into severall parts, wherein is contained small brownish feede: the roote is long and woody shooting forth long strings and branches under ground many wayes.

The Place.

The two first sorts grow naturally in the stony places of Italy, Spaine and some parts of France, as also in most of the hot countries Eastward, yet that with pointed leaves not so frequent as the other. *Theophrastus* saith that it will abide two together at the end of the footstalk, being somewhat like unto Puttane leaves but in the posture and colour resembling the leaves of Beanes: the flowers come forth singly one at a joynt with the leaves, which before they are blowne open are very like unto Caper blossomes, being white standing in a Greene huske and with many yellow threads in the middle, after which the fruit followeth somewhat long and round, and opening into severall parts, wherein is contained small brownish feede: the roote is long and woody shooting forth long strings and branches under ground many wayes.

The Place.

The two first sorts as I said before shoot forth their stalkes and leaves in the Spring, and their flowers shortly after, when as their fruit is not ripe untill the end of September: the other two keepe the same times of flowering and fructifying, but keeping their old leaves on and shooting fresh every Spring: the last floweth and feedeth in the end of Sommer.

The Names.

It is called in Greeke *καπάρει* and *Capparis* also in Latine, *Gaza* *Theophrastus* his interpreter calleth it *Intusis*, *Pliny* seemeth to thinke it was the *Cynobatos* of *Dioscorides*, because among the bastard Greeke names in *Dioscorides*, *Cynobatos* is one which hee saith was given to the Caper in his time. The first is mentioned by most writers, but the second but by a few, *Alpinus* in his booke of Egyptian plants, and *Belonius* in his second booke of Observations and Chap. 21. maketh mention of the third by the name of *Capparis non spinosa* and *arborescens*: the fourth is also remembered by *Belonius* in the said second booke and 66. Chapter, and by *Ranwolffius* in his *Itinerarie*: the last is called by all moderne writers *Capparis Leguminosa*, or *Capparis Fabago*, by *Lugdunensis Fabago Belgarum*, by the *Syrins* as *Ranwolffius* saith *Morgani*, and taketh it to be the *Andrian* of *Rhasis* and the *Al-distrigi* of *Avicen*: *Columna* thinketh it most properly to agree unto the *Telebium* of *Dioscorides*: *Banbinus* calleth it *Capparis Portulaca folio*, and saith it was called *Peplus* at *Paris*, and therefore *Lugdunensis* calleth it *Peplus Parisiense*; all nations call Capers according to the Greeke and Latine, varying but the accent according to their dialect.

The Vertues.

The Capers, such as come over to us pick'd up in salt doe nourish nothing, yet doe a little move the belly, but being washed from the Salt and steeped in Vinegar and so eaten doe stirre up the appetite dejected or decayed and doe a little cleanse the bowells of stegme sticking to them and avoyd it, as also doe helpe to open the obstructions of the Spleene and Liver: *Galen* sheweth in *septimo simpl. med.* that the Barke of the roote of Capers consisteth of various qualities, namely first extreme bitter, next sharpe, then fower, by the bitterness it cleanseth, purgeth and curteth, by the sharpnesse it heateth, cutteth, and digesteth, and by the fowernesse it contracteth, thickneth and bindeth, and thereupon saith it is a medicine above all other available for the hardnesse of the Spleene, whether it be applied outwardly of it selfe, or mixed with other things to annoint the place, or the rootes boyled in Vinegar or Oxymell and taken inwardly, or the powder of the roote mixed with the said decoction and taken, for it is certaine that it avoyderh grosse and viscus humors, not only by the urine but by the belly also, and oftentimes it bringeth away with it congealed and corrupted blood, and thereby giveth much ease to those that are troubled with Gouts or Palsies, with the Spleene or paines in the Hipples or Sciaica, weakenesse in the Nerves and Sinewes, and for women that have their courses stopped to procure them: it draweth from the head and other parts those offensive humors that are the originall cause of Ruptures, Convulsions and Crampes, and thereby give them much ease: the barke of the roote of Capers is an especiall remedy to helpe fowle Ulcers, being made into a Pultis and applied, for it cleanseth and mightily dryeth them, and is also good for hard swellings and kernells under the eares and the Kings Evil: the fruit is also effectually for the said purposes, and so are both leaves and stalkes, but all of them weaker then the roots: the feede bruised and heated in a little Vinegar and held betwene the teeth easeth the tooth-ach: the same rootes also boyled in oyle and dropped into the eares easeth the paines and killeth wormes breeding in them: the leaves and flowers, but especially the barke of the roote steeped or boyled in Vinegar cleanseth the skinne of all morpew, freckles, spots or any other discolouring of the skinne whatsoever: the oyle that is made of Capers is of very good use against the paines of the sides and Spleene. The Arabian sort is much more sharpe and almost exulcerating, and therefore as *Pliny* well saith, it is not fit to use so violent a stranger, better it is to use our owne European kinds. The Beane Caper is used by the *Syrins* as *Ranwolffius* saith to kill the wormes in children and to drive them forth.

CHAP. XXVIII.

Oxycantha Dioecoidis quibusdam, idest, Spina acuta seu potius Spina appendix Plinij.
The white Thorne or Hawthorne.

He Hawthorne hath not beene knowne formerly to be of any more sorts then one, but wee have in our time had the knowledge of two other which shall be presently shewed you.

1. *Spina appendix vulgaris.* The ordinary Hawthorne.

The common Hawthorne groweth up in some places to be a tree of a reasonable height if convenient dressing, pruning and keeping helpe it forward, otherwise it groweth to be but a shrubbe or hedge bush, with divers shoots armes and branches, whereon are set in divers places sharpe thornes and faire shining leaves, some what broad, and cut in on the edges into divers parts: the flowers are many standing together, comming forth both at the tops of the branches and upper joynts with the leaves, consisting of five white leaves a peece, with divers white threads in the middle, tipped with red, and of a very pleasant sweete sent, after which come berries somewhat long, with the roundnesse of a lively red colour when they are fully ripe and somewhat sweete in taste, containing within them divers white seedes lying in a flocky or downie substance which make it harsh in tasting, and if it should be eaten it would sticke to the throat and hurt the winde pipe: the roote groweth farre and deepe.

2. *Spina acuta humilior.* The low Hawthorne.

The low Hawthorne never groweth so high or great as the former, the leaves are smaller but longer divided on the edges in the same manner: the flowers also are white and sweete and grow in tufts or clusters, but the fruit that followeth is yellow tending to a Saffron colour, in other things it differeth not from the other.

3. *Spina acuta biflora Britanica.*
Englands Hawthorne.

We have another sort of Hawthorne growing in divers places of our Land well knowne to those that dwell about the places where they grow, yet not greatly regarded or wondered at by them nor yet by many of those that have seene them growing: but I doe not thinke fit that it should be so slightly passed over or so smally respected, for I suppose it a strange worke of nature, or of the God of nature rather, to cause such a tree being in all parts thereof like unto the common Hawthorne, to blossome twice every yeare, the one time usually in *May* as all others of the kind doe, the other about Christmas, eyther somewhat before or somewhat after, according to the temperature of the Winter at that time, for if the Winter before be milde without either great frosts or other hard weather, it will be in blossom white all over as in *May*, sometimes in *November*, or else in *December*, but if it be hard and sharpe weather it will not blossome untill *January* that the hard weather be over: it beareth also after these flowers are past greene berries, even in the Winter before any greene leaves doe appeare or blossomes in *May*, so that it will have both ripe fruit and greene at one and the same time upon the tree: there hath not beene observed any other difference betweene this kind and the ordinary Hawthorne. Some might thinke as it hath beene disputed among divers that this happeneth, by reason of some hot springs that take their course by the rootes of this tree, which reason I grant hath some appearance of likelihood, but wisely scanned and considered, is too light I thinke to hold weight, for how should one tree only blossome in a place, and none of all the other trees in the same tract or compasse of the same springes running; and besides this there are of these trees in divers places of the Land, as in *Rumney Marsh* in *Whey street*, as it is vulgarly called, but should be rather *High street*, where it standeth in a moorish ground though upon a banke beaten with cold and Northerly blasts, and exposed to the furious winds on all sides, having no shelter or defence, but standing in a flat and open soyle, where I thinke no hot spring eyther doth or is likely to breake forth or tunne neare it: let the wise and judicious scan it thoroughly, if this come to passe by the nature of the soyle and springs, or the naturall kinde of the tree.

The Place.

The first groweth every where in the hedges and borders of fields and woods: the second in *Germany*: the last at *Glastenbury Abbey*, and as is before said in *High street* or *Whey street* in *Rumney Marsh*, and neare unto *Nantwiche* also in *Cheshire* by a place called white greene, which tooke the name as it was thought from the white bushes of thornes which there they call greenes.

The Time.

The time of these to flower is specified to be ordinarily in *May* and extraordinarily about Christmas, sometimes a litle before and sometimes a litle after: the fruit is ripe on the ordinary trees in *September*, and doe hang on them all the Winter as meate for birds, or untill the frosts doe make them fall.

The

The Names.

Very many (as *Matthiolus*, *Lacuna*, *Turner*, *Bellonius*, *Lobel*, *Dodonæus*, *Camerarius*, *Cesalpinus*, *Ramusius*, *Thalium*, *Tabernmontanus* and some other) doe take this Thorne to be *Oxyacantha* of *Dioscorides* which hee describeth to be like the Peare-tree but lesser, and very thorny, bearing a berry like unto those of the Myrtle, but red, soft and easie to breake, having a stone or Kernell within it, some also thinke that it is *myrica* of *Dioscorides*, others take it to be the *Oxyacanthus* of *Galen*, which he likewise saith is like unto the wilde Peare-tree in forme, and not unlike it in qualitie, so that the ones masculine the others feminine are but one bush or tree, by the judgement of many the best Herbarists although some take them to bee divers, as *Camerarius* who doth make the Barbary bush to be the *Oxyacanthus* of *Galen*, and not the *Oxyacantha* of *Dioscorides*, and so doe also *Cordus* upon *Dioscorides* and *Tabernmontanus*, *Hermolaus* and *Ruellius* likewise doe take the Barbary to be *Oxyacantha*, and so doe *Fuchsius*, *Tragus*, *Cornarius*, and some other whom *Matthiolus* justly gaine sayeth, for there is no likeness in the Barbary excepting the thornes (and yet in them there is a difference) unto *Oxyacantha*, being neither in forme of body like the wilde Peare, nor in the fruit like unto a Myrtle, dry and fryable easie to breake, the Barbary being moyst and full of juice. *Tragus* saith that some tooke the Hawthorne to bee *Arbutus*. But *Theophrastus* his *Oxyacantha* is neither Barbary nor Hawthorne, which in his first Booke and 15. Chapter hee putteth among those trees that are ever greene, which cannot be said of eyther Barbary or Hawthorne for that in no place or country they are knowne to keepe their leaves, but to loose them in Winter, but by the judgement of the best and most expert Herbarists in our times, the *Pyracantha* as I have declared in my former booke is the true *Oxyacantha* both of *Dioscorides* although hee hath not mentioned any sempiternitie of leaves, and *Theophrastus* also agreeing thereto in all things: Some there be also that would make the *Spina appendix Plinii* to bee the Barbary bush as *Lugdunensis*, but *Clusius* is against that opinion for that therein there are these two doubts, first that *Pliny* if hee had meant the Barbary by his *Spina appendix* would not have forgotten the three thornes that grow together in the Barbary which is eminent enough therein: and next hee would not have forgotten the yellow colour, both in the barke of the branches and rootes: but the most judicious of these later times, among whom is *Gesner in hortis* and *Clusius in historia* have determined that *Spina Appendix Plinii*, which sometimes also be calleth *Spina* simply, can be no other thorne then this Hawthorne, which *Tragus* and *Lonicerus* tooke to bee *Cynobatus Theophrasti*, and *Cordus in historia* calleth it *Sorbus aculeata*, *Angulara Spina alba vulgo*, and *Spina acuta* as *Dodonæus* doth also. *Bauhinius* placeth it among the Medlars calling it *Alephilus apij folio sylvestris spinosa sive Oxyacantha*, and as a kinde thereof like as he putteth the *Pyracantha*, but in my opinion he had done better and more rightly, to have referred them both to the kinds of *Services* whereunto they better agree then unto Medlars, in that *Services* are smaller fruits as these are: the second here expressed is mentioned by *Dodonæus* under the name of *Spina acuta humilior*: the last as a kind peculiar to our owne countrey as I thinke, I have here set forth unto you more exactly then *Gerard*, who onely had a superficiall notion or rather relation thereof. The Hawthorne is called by the *Arabians* *Amirberis*, by the *Italians* in some places *Bugaia*, and in others *Amperle*, and *Pan d'orso*, by the *Spaniards* *Pirlitero*, by the *French* *Aubespín* (*Ruellius* saith that the vulgar sort doe call it *Senelle*, yet *Quercetanus* setteth a fruit downe in some of his receipts by the name of *fructus Senellorum* in his *Pharmacopœa restituta* to be *Paliurus* unless hee thought the *Paliurus* to be the Hawthorne:) by the *Germans* *Hagendorn*, by the *Dutch* *Hagendoren* and by us in *English* Hawthorne, or Hedgeborne, Whiteborne and *May* or *May-bush*, because our ordinary sort seldome or never flowieth before *May* and never after.

The Vertues.

The berries or the seedes in the berries are generally held to be a singular good remedy against the stone, if the powder of them be given to drinke in wine: the same is also reported to bee good for the Dropie: but whereas divers have attributed herunto a binding or astringent qualitie *Angulara* his judgement was (whom *Matthiolus* consulteth) that *Tragus* who saith that the leaves, flowers & fruit are drying and binding, and that if the flowers be steeped three dayes in wine, and afterwards distilled in glasse, the water thereof drunke is a soveraigne remedy for the Plurisie, and for inward tormenting paines: the distilled water of the flowers by an ordinary way stayeth, saith he, the Flux or Laske of the belly: the seedes cleared from the downe bruised and boyled in wine and drunke performeth also the same effect: the said distilled water of the flowers is not onely cooling but drawing also: for it is found by good experience that if clothes or sponges be wet in the sayd water and applied to any place whereinto thornes, splinters, &c. have entered and bee there abiding it will notably draw them forth: the vertues given by *Galen* unto *Oxyacantha* doe not pertaine herunto, for saith he the fruit thereof is not softer or harsh, especially when it is ripe, but sweet and therefore more fit to open then to binde the belly, and fitter to bring downe then to stay womens monethly courses: but the last evinceth this error.

CHAP. XXIX.

Sabina. The Savine tree or bush.

Ne sort of Savine I have expressed and set forth in my former Booke, the figure whereof I here shew you againe, the other sorts shall be exhibited in this Chapter.

1. *Sabina baccifera major*. The greater berried Savine tree.

The greater Savine tree that groweth with us spreadeth not so much as the former Savine doth, but riseth more upright to a mans height (but *Bellonius* saith in *lib. de coniferis* that he saw it as high as an Almond tree on the mountaines *Amavus* and *Olympus* in *Phrygia*) spreading forth armes and branches fully furnished with leave, which at their first comming forth are somewhat like unto *Tamariske* leaves, but being grown old they are more like unto the leaves of the *Cypresse* tree, hard and pricking, and of a darke greene colour with an eye of blew shadowing them of a sent lesse strong and nothing so sharpe as the ordinary: it hath not bene observed to beare any flowers but small round berries like unto *Juniper* berries, but greater and of a sharpe taste, blacke when they are ripe with an eye of blew upon them like the *Juniper* or the ordinary Savine, which divers have held to be barren, taking their authority from *Pliny*, who also saith that *Rosmarinus* beareth no seede both

Sabina vulgaris.
The ordinary Savine Tree.

1. *Sabina baccifera major*
The greater berried Savine Tree.

2. *Sabina baccata altera.*
Gentle Savine with berries.

Lugdunensis

both which are found untrue by good experience, as *Fuchsius*, *Coradus*, *Gesner*, *Dodonaeus* and *Lugdunensis* doe testifie, yet *Camerarius* saith it is true in one kind that it beareth no fruit, but not in the other, but *Lobel* saith the ordinary doth beare berries although but in a few places and but seldome, and both of them holding their fruit on the branches all the Winter, untill greene ones grow on them, and never loosing their leaves.

2. *Sabina baccata altera.* Gentle Savine with berries.

This other Savine groweth somewhat higher then the last as it groweth in Europe, and almost unto the height of the *Phenician* or *Cypresse* like Cedar, spreading more slender and weake branches whereon are set small and long leaves, of a more gentle favour then the rest: on the branches among the leaves come forth such like berries as the other, and very like unto Juniper, blacke also when they are ripe, and but little bitter in taste, not altogether unpleasant.

The Place.

The first groweth in *Candy*, *Misic*, and other those East countries, the second on the mountaine *Taurus*, *Amanus* and *Olympus*: the other upon the mountaines in *Apulia* and *Calabria* of *Naples*, as also on the plaines of the *Alpes* neare unto *Gratianople*.

The Time.

They abide ever greene, and shew their ripe berries not untill the Winter.

The Names.

It is called in Greeke *Βερίβο*, *Βερίβου* and *Βαλεβου*, *Brathus*, *Brathy* and *Barathion*, in Latine *Sabina* and *Savina* and of some *Savinera*; why *Pliny* should call *Sabina* an herbe all doe much wonder, for all knew and himselfe could not bee ignorant that both sorts heretofore mentioned by him were trees or shrubbes and not herbes. *Dodonaeus* seemeth to allude unto the Greeke name, where he saith that *Pliny* in his 12. Booke and 19. Chapter mentioneth *Bruta arbor*, and thinketh as divers others did, that *Bruta* was taken from *Brathu* by the transposition of a letter, and is *Pliny* his *Savina altera*, which he saith was called *Cupressus Crestica*: but

Lugdunensis denieth that *Bruta arbor* Pliny can be *Thuja prima Massiliensis*, the *Oxycedrus* or *Cedrus Lycia* of *Belonius*, or *Cedrus Phenicea altera* of *Pliny* and *Theophrastus* according to *Lobel*, and the *Sabina major* *Monspeliensis*, which shall be shewed in the thirtieth Chapter. *Tragus* reporteth the wonderfull superstitions used in and before his time in his countrey, about the branches of the Savine tree on Palme Sunday, to be conjured or hallowed as they say by the Priests, and then powerfull to drive away divells, and to keepe those houses that have it in them safe from lightning, and that those leaves that touched the Crosse or came nearest thereunto while the Priest was in hallowing it, should preserve them that shall weare them (more then the rest of the same branch that did not touch the Crosse) from charmes or witchcraft, and from the snares of the divell, and from the dangers of the edges and points of swords and weapons, thus to draw their mindes from trusting in God to trust unto these conjured superstitious devises of men. *Matthiolus* much blameth *Bellonius* that *libro de coniferis arboribus* placed the great Juniper tree, which he found on the mountaines *Taurus*, *Amanus* and *Olympus* among the resiniferous trees, but I would faine know if the *Vernix* or *Gum Juniperi*, be not to be accounted a *Rosin* as well as *Mastiche* which is so accounted of all; but he is much more to be blamed as he saith also, for making the said Juniper tree to be the *Bruta arbor* Pliny. The first is *Sabina baccifera* of *Matthiolus*, *Camerarius* and others, *Sabina altera* by *Dodonæus*, *Sabina Cnpresso similis* by *Cordus* upon *Dioscorides*, and *Lugdunensis*, the other is called *Sabina altera baccata* by *Lobel* and *Lugdunensis*, *Sabine alterius altera* by *Dodonæus*, and *Sabina femina major* by *Tavernemontanus*. The *Arabians* call it *Abhel* but not *Albarur*, the *Italians* and *Spaniards* *Sabina*, the *French* *Savinier*, the *Germanes* *Sevembaum* and *Sibenbaum*, the *Dutch* *Savelboom*, and we in *English* The Savine tree.

The Vertues.

Savine saith *Galen* is hot and dry in the third degree, and of very thin parts, by the strong drying and heating qualities it suffereth no consolidating or glewing propertie to be in it, but by reason of the great acrimony therein it digesteth the more, and hath lesse bitterness then is in the Cypresse: it resisteth putrefactions as powerfully as the Cypresse, especially if they be of long continuance, and not easie to be holpen, for mixed with some Hony and applied, it clenseth the filth of Vicers, and taketh away their blacknesse. It breaketh also or dissolveth Carbuncles and Plague sores: *Matthiolus* saith that a dram in powder mixed with three uncies of Niter and two uncies of Hony doth wonderfully helpe those that are short winded: the decoction thereof drunke doth provoke the courtes, and draweth forth the birth and secondine, and destroyeth the living: the same outwardly applied, or the fumes thereof taken underneath worketh to the same effect: the said decoction taken expelleth blood by Urine, & is profitable for the Kings Evil: it killeth the wormes in children, but it is safer to use it outwardly and to apply it to the Navell, or to annoint the belly with the oyle of Savine. The powder of the leaves of Savine mixed with Creame, or the greene leaves boyled in Creame and annointed on the heads of children, which have scabbes or running sores or dry sores, clenseth them throughly and healeth them, as also *Saint Antonies* fire: the fresh leaves braised and layd upon running and fretting Cankers and the like, killeth and destroyeth them: the powder of the leaves used with some other things, or strewed upon doth helpe those blisters that rise on the yard by inordinate luxury, after they have bene bathed with the decoction of the leaves. The distilled water thereof is singular good to cleanse the skinne from spots or markes therein, and other deformities, and helpeth those that have a giddinesse in their braine: the smoake thereof cureth Hens that have gotten the pippe, and is effectuell for the Bottes in Horses or cattell to give it in their drinke: but it must bee warily given for feare of danger.

CHAP. XXX.

Juniperus. The Juniper Tree.

Here are two or three sorts of Juniper Trees some greater others lesser, whereof I meane to entreat in this Chapter and shew you their varieties.

1. *Juniperus vulgaris seu minor*. The common Juniper Tree.

The common Juniper Tree (in some places groweth nothing so high as they doe in others, even in our owne Land as well as in *Germany*, but of an exceeding great length in *Italy* and *Spaine* as *Matthiolus* and *Clusius* say, so that they doe there make Rafters and Beames for houses thereof) riseth up with a Lemme or stocke covered with a reddish barke which often cleaveth and falleth away, the wood underneath being somewhat yellow hard and very durable (for as *Pliny* saith that *Dianæes* temple at *Ephesus* had the Beames and Rafters thereof for the more durabilitie and very sweet when it is burned; the coales that are made of the wood being burned and covered with its owne ashes, keepe fire in them a whole yeare as it is reported) from whence spread divers branches set with very small and long narrow blewish greene leaves, three for the most part alwayes together which are almost like unto thornes, but not so hard or pricking: the blooming is to be perceived like a little yellow dust falling round about in the Spring of the yeare, after which come small greene berries, not ripening fully untill the second yeare after their first coming forth, which then will be blacke with an eye of blew thereon easily wiped away with touching, as it is in a ripe Damson, (some sort is round and of the bignesse of a Pepper corne, others as great as Sloes, and some a little long withall) so that there will be alwayes upon the bearing trees both greene and ripe berries, wherein are contained small hard seedes: the root is somewhat reddish and spreadeth many branches: this doth alwayes abide greene, and in the hotter countries of *France*, *Spaine*, *Italy*, &c. doth yeeld a certaine hard and dry gumme in small peeces, somewhat like unto *Masticke* and whitish while it is fresh and growing yellowish by age, not cleaving together like *Masticke* when it is chewed but going to powder, and is of much use as you shall heare by and by. There is another sort of this Juniper growing in sundry parts of this kingdome which bringeth onely yellowish threads for flowers, without any berries succeeding.

Sterilis.

2. *Juniperus Alpina*. The low or mountaine Juniper.

This low Juniper seldome riseth to two foote high, but groweth low spreading neare the ground, having short and thicke armes and branches as the former, which yet are plyant and easie to bend but not to breake: on these branches grow the like three leaves together, but they are shorter broader thicker and not so much prick-

ing

1. *Juniperus vulgaris seu minor.*
The common Juniper tree.

3. *Juniperus maxima Illyrica.*
The great Slavonian Juniper.

ing or sharpe as they, and of the same blewish green colour underneath but green above: the fruit or berries are altogether like the other but a little longer, of a sweet sent and sweetish taste at the first but bitter afterwards and unpleasent like the other.

3. *Juniperus maxima Illyrica.* The great Slavonian Juniper.
This great Juniper Tree riseth to the height of a great tree, whose leaves are greater and harder more like unto thornes then the other: the berries likewise are much larger, of the bignesse of an Hasle nut in some places and of an Olive in others somewhat long with the roundnesse, and more blew when it is ripe then the other which is not wiped away, but abideth firmly thereon.

4. *Juniperus major Americana.* West Indian Cedar or Juniper.
This tree which they of our English colonies in the Bermuda and Virginia, &c. call Cedar groweth very great and high (for I have seene boards of above twentie foote long, and halfe a yard broad brought from the Sommer Ilands) fairly spread with branches, and small short leaves like those of the greater Juniper growing thereon: the berries are small and blewish not much bigger then our ordinary Juniper berries: the wood is more red and of a stronger sent both burnt and unburnt then our ordinary Juniper.

The Place.

The first groweth especially in Woods in Kent and sundry other places in the Land: the second groweth on the Rocks and stony places of the Alpes as *Clausius* saith: the third groweth on mount *Taurus* in Syria as *Belonius* saith, and neare the Sea shore of the Venetian Gulph and *Illyrium* as *Angulara* saith, and as some say also in Provence of France: the last as is said in the West Indies in sundry places.

The Time.

In May the dustie flowers cover the ground being blowne from the branches, and as I said the berries are not ripe until they have growne on the bushes two Sommers and a Winter.

The Names.

It is called in Greeke ἀρνυδὴς and ἀρνυδός, *Arcenthus* and *Arcenthos*, in Latine *Juniperus* sic dictum putant quod *juniores* & *novellos* fructus pariat antiqui marcescentibus: solum enim fere arborum status suos in biennium provocare aiant. *Discorides* and others doe make two sorts or kinds, a greater and a lesser, concerning the greater there is much controversie among many of our moderne writers, about the text which saith, the berries are as great as Wallnuts, which *Marcellus* and *Ruellius* thinke is mistaken, and should be *maxima* as great as a Beane, for there was never any berry seene of halfe the bignesse of a Wallnut: but out of Greeke some have witnessed to have seene Juniper berries of the bignesse of a Beane or Hasle nut almost. The berries are called in Greeke ἀρνυδὴς *Arcenthus*, and in Latine *Bacca Juniperi* or *Grana juniperi*: The gumme that runneth from the tree when it is wounded, is called of some *Vernix* or *Vernia quasi veris ros*, issuing forth in the Spring, as also *Sandaracha Arabum* but not *Gracorum*, for their *Sandaracha* although alike in name yet is quite another thing, even *Auripigmentum rubrum*, otherwise called *Cinabrium minerale*: the Latines call it as I said *Vernix* but *Cornarius* saith that it is falsly apply-

apply to this gum, for *Vernix* is a made thing of *Amber* and *Linseed* oyle: for saith hee the name *Vernix* is derived from the *Germane* word *Vernissen* or *Bernissen*, which is with them the yellow *Amber* as it commeth from the place where it is gotten, and tooke the name from the propertie therein, that as that so this being kindled will burne like a Candle or Torch: *Vernix liquida*, in *English* *Varnish* is a certaine liquor that Painters, Joyners and others doe use to lay upon their workes, and Smithes upon their polished painted Iron workes, to keepe their colours the longer from fading, the best whereof for their use is made of this gumme of the Juniper tree and of *Linseed* oyle: *Pliny* in his eleventh Booke and seventh Chapter mentioneth another *Sandaracha* which is found in Bee-hives, being their food whereon they live while they worke, and is called *Erihace* (as *Aristotle* doth) and *Cerintus*, but by divers others learned men *Vernix* and *Vernilago*, *Bauhinnus* maketh two sorts of the ordinary Juniper tree, the one he calleth *Juniperus vulgaris fruticosa*, the other *Juniperus vulgaris arbor*, when as *Clusius* sheweth that there is no other difference betweene them, then the largenesse of the growing in a hotter climate, in the like manner as the Turpentine and the Storax trees, like shrubbes in some places and tall trees in others. The second *Clusius* calleth *Juniperus Alpina* and *Gesner* in his *Juniperus minima*: the third is called by *Lobel* in his Observations and Icones, *Juniperus maximus Illyricus carylea bacca*, by *Lugdunensis* *Juniperus major*, and by *Tabernmontanus* *Juniperus major Illyrica*: the last as I said is called Cedar by all our *English* inhabiting in the *Bermuda*, &c. & with us from them who never leanned it sufficiently, nor knew to give it the true denomination, for all the sorts of Cedar doe much differ in sundry particulars from this, and therefore I have presumed thus to intitle it untill some other can give it a truer epithite. *Serapio* calleth it *Habbagar*, the other *Arabians* *Arornas* and *Archenas*, the *Italians* *Ginepro*, the *Spaniards* *Enebro*, the *French* *Genève* and *Genemier*, the *Germanes* *Weckholderbaum*, and the berries *Weckholder beer* and *Kramer beer*, of Blacke birds who are called in the *Germane* tongue *Kramer vogell* because they feede upon the berries all the Winter long, the *Dutch* *Genever boom*, and wee in *English* the Juniper tree.

No man saith *Tragus* can easily set downe all the Vertues of the Juniper tree, preferring the berries before *Peper*: the Juniper it selfe both leaves and wood as *Galen* saith are hot and dry in the third degree: but the berries although they be in the same degree of heate, yet are but in the first degree of drinesse: the gumme is hot and dry in the first degree: The leaves and young tender branches of the Juniper tree, or the juice of them or of the berries, or the berries themselves taken in wine, are very effectuell against the biting of a Viper or Adder, as also against the Plague or Pestilence or any other infection or poyson, the *Germanes* use it much, for their Treakle is made of the condensate juice of the berries, which they commend in all diseases almost, both for inward and outward remedies: the same also is profitable against the Strangury and stopping of the Urine, and so powerfull against the Dropisie, that as *Matthiolus* saith hee hath knowne divers to avoyd so much water by Urine, by taking foure or five ounces at a time of the Lye made of Juniper ashes, that they have bene holpen thereby: it doth also provoke womens courses being stayed, and doth helpe the rising and other paines of the mother: the berries are good for the stomacke and to dissolve the swellings and windinesse thereof: and are likewise profitable for the cough and shortnesse of breath, and other diseases of the Chest and Lungs and to ease the griping paines and torments in the belly, they are also prevalent to helpe Ruptures, Convulsions and Crampes: to procure a safe and easie delivery unto women with child, for which purpose *Matthiolus* adviseth to take seven Juniper, and seven Bayberries, halfe a dramme of *Cassia lignea*, and a dram of Cinamon, these being grossely bruised put them into the belly of a Turtle Dove to be rosted therewith, let it be basted with the fat of an Hen, whereof they are to eate every other evening: The scrapings of the wood saith *Dioscorides* being eaten doth kill men, which clause both *Matthiolus* and *Tragus* before him finde much fault with, seeing it is contrary to the former part of the Text and thrust therein by others, for as he saith neither the best copies have it therein, neither doe *Galen*, *Paulus Aegineta*, nor *Serapio* who wrote wholly after *Dioscorides* his Text word for word make any such mention of the properties of the wood, and more saith he it is found false by tryall made thereof: but *Scaliger* in his 15. Booke and 18. exercise, maintaineth the Text of *Dioscorides*, in that although the decoction of the wood is wholesome, yet the scraping or course powder by the drinesse thereof sticking to the guts doth suffocate, in the same manner as *Colocythin* which to bee rightly prepared must bee beaten and finely sifted least it cleave to the bowells and blister them: the berries are very comfortable to the braine and strengthen the memory and sight, and all the senses and the heart also: being eyther drunke in wine or the decoction of them in wine taken: the same also is good against a quartane, and dissolveth the winde in the belly and in generall is effectuell for all diseases as well outward as inward proceeding of any cold cause, if they shall take of the berries two or three times a weeke three or foure at a time in wine, which must bee gathered in the fit time of the ripenesse, moistned with and after fairely dried upon a cloth: the Salt made of the ashes of the Juniper wood is a singular remedy for the Scurvey, the putrefied and spongy gums, and generally resisting all putrefaction: The Chymicall oyle drawne from the berries while they are Greene is as effectuell if not more to all the purposes aforesaid: there is an oyle also drawne out of the Juniper wood *per descensum* as they call it, which is very good against the toothach and for the Goute, Sciatica and resolution of the Nerves or Sinewes coming of cold. The gumme of Juniper is used like as *Amber* is to stay cold rheumaticke distillations, defluxions and Catarrhes upon the eyes or Lungs, &c. the fumes thereof upon the burning on coales being taken into a cappe (the head also holden in the meane time over the said fumes) at night and to lie covered therewith: or the powder thereof with other things fit for the purpose, strewed upon Flax and to be quilted into a cappe to bee worne in the night chiefly, and in the day also as neede shall require: the said gumme in powder taken in wine doth stay vomitings, inward bleedings and spitting of blood, womens courses also, and all other the fluxes of the belly, and of the hemorrhoides or piles: the same also killeth the wormes in children, and mixed with some oyle of *Roses* and *Myrtles* healeth the chappes of the fundiment, kibes also and chilblanes on the hands and feet: the powder of the gumme mixed with the white of an Egge, and applyed to the forehead stayeth the bleeding at the nose: the same also burned upon quicke coales, and the fumes thereof taken thorough a funnell upon an aking tooth taketh away the paine: it is effectuell in moist Vicers and Fistulaes, and weeping running sores, to dry up the moisture in them which hindereth their cure: the liquid Varnish is an especiall remedy against scaldines with water or burnings with fire, and to helpe the painefull and bleeding Piles, and Palsie, Crampes, Convulsions of the Nerves and Sinewes: The smoake of Juniper wood being burned, besides that it yeeldeth a good sent to perfume any house, it is of good use in the time of infection, and driveth away all noysome Serpents, Flies, Waltpes,

Wasps, &c. the ashes of the wood or bark made into a Lye with water doth cure all itches, scabbies pustules or other eruptions in the skinne, yea and the Leproy also if the places be bathed therewith. The *Germanes* Treacle of Juniper berries is made in this manner. Take what quantitie you will of fresh but ripe Juniper berries, bruise them and boyle them in a reasonable quantitie of water untill they bee well boyled, straine and presse them hard in a presse with pulpe and liquor set to the fire againe in a glased earthen vessell and evaporate away so much of the humiditie, stirring of it continually untill it become of the thicknesse of an Electuary, which then put into pots or glases to be kept for your use, whereof a small quantitie taken morning and evening doth wonderfully helpe them that are troubled with the stone in the Reines or Kidneyes, with the Chollicke, with the paines of the mother, and the stoppings of their courses, is good against Catarithes and rheumes, the shortnesse of breath and winde, the straightnesse of the breast, the cough, the cruditie rawnesse, and indisposition of the stomacke against the Plague and other infectious diseases, for it preserveth and defendeth the heart and vitall spirits from infection and venome, and against swoownings and faintnesse, the paines, twimming and giddinesse in the head, against frensie also and madnesse, for inflammations and rheumes into the eyes, and preserving the sight, deafenesse in hearing, and stench of the gums mouth or breast, helpeth the Drople, Jaundies, Falling sicknesse, Palsie and Goute, healeth inward Impostumes: in briefe it not onely helpeth all diseases wherewith the body is possessed, but keepeth it in health and free from all diseases. This one thing is memorable thereof if it be credible that *Virgill* saith thereof in his tenth *Eclouge*, that the shadow of the Juniper tree is hurtfull both to man and the come in these verses,

*Surgamus, solet esse gravis cantantibus umbra,
Juniperi gravis umbra nocent & frugibus umbra.*

CHAP. XXXI.

Oxycedrus minor. The prickly or small Cedar.

Doe not intend in this place to speake of the great Cedar, in that it neither hath thornes nor prickly leaves, but of some of the lower and lesser sorts which are prickly as they follow.

1. *Oxycedrus*. The prickly Cedar.

This prickly Cedar groweth in some places to be a tall tree, but most usually not much above a mans height, whose body is crooked and bending covered with a scabbed or rugged reddish barke, upon the branches grow long and narrow, sharpe and prickly leaves like unto those of Juniper but longer and bigger, three for the most part set together, among the leaves come small yellow flowers which turne into round berries greene at the first and yellowish after, but of an excellent red colour when they are thorough ripe, larger then Juniper berries

1. *Oxycedrus*. The prickly Cedar.

2. *Cedrus Phænicea folio Cupressi*.
Cypresse like Cedar.

by much as the other Cedars that follow, sometimes growing as great as Hasell nuts, bunched out in divers places, with three or foure small uneven white seedes within them, greater then those in the Juniper berries, which berries abide on the tree all the Winter, and fall not away untill yong ones are budded and growne greene.

2. *Cedrus Phenicea folio Cupressi.* Cypresse-like Cedar.

This other Cedar hath likewise a crooked stemme seldome growing above a mans height spread into many armes and smaller branches covered with a rugged reddish barke, the lower leaves, especially of a young plant before it be fit to beare fruit are long and sharpe pointed, like unto Juniper leaves but longer, but the upper leaves or when the trees groweth elder doe change their forme and become flat and plaited like unto Cypresse leaves, not sharpe or prickly at all, so that one would thinke verily that seeth them at severall times, that these trees were not of one but of different kinds, which being rubbed smell sweet and resinous: at the end of every branch cometh forth a yellowish flower, which afterwards turneth into a round berry, greene at the first and reddish when it is ripe, being somewhat mellow, tasting more bitter but aromaticall, containing within it three or foure seeds,

3. *Cedrus Phenicea minor.* The lesser Cypresse-like Cedar.

This little Cedar is in all things like the last, but lesser both in body and leaves, the fruit also is like thereunto, and reddish when it is ripe, but smaller, even no bigger then Juniper berries.

The Place.

All these sorts grow as well on the mountaines *Taurus*, *Amanus* and *Olympus*, as neare the Sea side, and the mountaines not farre from *Mompelien* in *Narbon*, and in *Naples* also, and in *Moravia* *Matthiolus* saith,

The Time.

They blossome in the Spring of the year which soone fall away, the fruit followeth but will not bee ripe untill the next year after, the first springing like herein unto the Juniper.

The Names.

The first is called in Greeke *ΟΨΥΔΡΟΣ* & *ΚΙΣΣΟΣ* *oxycedrus* and *Cedrus Lycia*, of some *Cedrus baccifera* and *minor Phenicea* to put a difference betwene it and the great *Cedrus*, which is called *Phenicea* also, and *conifera* because it chiefly groweth on the hills in *Phenice*, some also call it *Cedrus Phenicea folys Cupressi*. The first is called by *Clisius*, *Lugdunensis*, and *Dodonæus* in his French booke *Oxycedrus*, but by him in his Latine worke *Oxycedrus Phenicea*, by *Matthiolus* and *Tabernmontanus* *Cedrus Phenicea*, by *Gesner* in *hortis Cedrus minor* and *Cedrula*, by *Castor Durantes*, *Cedrus minor vel Phenicea*, by *Anguilara* *Juniperi prima species sive Dioscoridis Juniperus*, by *Lobel* *Juniperus major Mompelienensis* and *Oxyarcentis sive Juniperus acuta*, by *Cordus* on *Dioscoridis Cedrus magna sive Juniperus peregrina*, by *Casalpini* as it is likely *Juniperus montana fructu flavo*, and as likely by *Camerarius*, *Juniperus major Italica baccis rubris*. I doe not so much wonder at the variable opinions of divers of our later authors (who not knowing or not thoroughly considering each herbe whereof they wrote to compare them exactly by those of the ancients (in that herbarisme or the knowledge of herbes was not so exactly knowne unto them, they living but in the dawning of the light of knowledge) have some of them as you may see here related called that a Juniper which others afterwards have most truly referred to the *Oxycedrus* of *Galen* and *Theophrastus*, who also as I said before called it *Cedrus Lycia* as *Tilius* also did) as I doe at *Bauhinus* of whom every one did expect in a worke of fortie yeares gathering, a true definition of every plant, that hee should rather make this tree a Juniper (all the sorts of Juniper giving blacke or blewish berries which in my opinion is a certaine note to know them from the Cedars that give red berries) and place it among their sorts calling it *Juniperus major bacca rufescente* then among the Cedars, when as yet he himselfe doth acknowledge it a Cedar, and doth set it downe for the *Oxycedrus* *Theophrasti* and *Galenii*; the second is variously intituled by divers, *Pliny* calleth it *Cedrus Phenicea* *Bellonius* *Cedrus pumila folijs obtusis* and *Cedrus Phenicea*, *Matthiolus*, *Gesner* in *hortis* and *Durantes* *Oxycedrus Lycia*, *Lobel*, *Cedrus Phenicea media* & alter *Dodonæus* *Oxycedrus folio Cupressi aut Sabina major Mompelienensis* (but the same note that I gave to know Juniper from Cedar which is the Blacke berries, may serve also for *Savine*, all the sorts of them likewise giving blacke berries and not red) *Clisius* *Juniperus major*, *Lugdunensis* *Thuja quatuor genns*, for which *Clisius* doth justly taxe him for his confident boldnesse to make this and others that beare berries to be *Thuja*, when as *Theophrastus* who onely giveth the description thereof *l. 3. c. 5.* to be like the Cypresse both in leafe and fruit, the tree being of all writers reckoned *inter coniferas* whose fruit as all know is more like unto a small Cone or Pine Apple with scales before it open and separateth then a berry) and the same also as *Bauhinus* thinketh is his first *Thuja* or *Thuja Massiliensis*: for both *Clisius* and he doth note it as a thing fit to be knowne that this *Cedrus Phenicea* while it is young differeth in leafe from it selfe when it is old, and therefore *Bauhinus* in making two sorts of them when himselfe doth acknowledge them to be but one, doth but fill up roome needlesse. The last *Lobel* calleth *Cedrus Phenicea minor vel tertia*, and *Bauhinus* *Cedrus folio Cupressi minor*: The Grecians call the berries of the Cedar tree *κεδριδες* *Cedrides*, and so doe the Latines also: The French call the second *Serbin*, and the first *Cade* as *Lobel* saith, and by burning the greene wood after the manner of making Pitch and Tarre doe make a certaine liquor or Tarre which is very strong and stinking, by them called *Huile de Cade*, but *Lugdunensis* saith that the said Tarre or oyle is made and drawn as well from Juniper being so ordered, or from *Ash*, or both the *Sabines*, or the prickly Cedar as from this. These Cedars also yeeld a certaine Gum somewhat like unto the Gum of Juniper and brittle also as it is.

The Vertues.

The small Cedars as *Galen* saith are hot and dry almost in the third degree, the berries are sweet as of the former Juniper, and in like manner are of small nourishment to be eaten, yet too liberally taken as *Galen* saith they cause headach and raile heate and gnawing in the bowells, especially the two last which doe more heate and dry then the other: the said berries bruised and made up with hony cureth the cough, and being boyled in wine and drunke provoketh urine, helpeth the Strangury and is effectuell in the diseases of the mother the suffocations and stranglings thereof to be drunke upon the fits, and to be injected when it is exulcerated: it is also given to those that are bitten or stung with Serpents or venomous creatures, especially the Sea Hare: the same also stayeth Laskes and fluxes of the Belly, and is of good use in Ruptures, Crampes and Convulsions, swellings and inflammations, and are thought to be no lesse effectuell then Juniper berries for all the purposes whereunto they are pnt, and also to be but a little inferiour to the properties of the great Cedar: for that water which forerunneth the liquid Pitch or Tarre, when the greene wood is burned is called *Cedria* as well as that which cometh from the great Cedar.

Cedar, and is almost as strong and powerfull to condite or enbaulme the bodies of the dead, to preserve them from putrefaction as it : the *huile de cade* or abominable stinking Tarre, is used not onely of the Shepherds to cure their Sheepe and Dogges of the mangy, scabbies, lice, &c. but helpeth also to kill lice, and cure the scabbies in childrens heads, and is used eyther of it selfe alone, or with a little Vinegar to an aking tooth to ease the paine, or else to breake it or cause it to fall out : the same also is effectuall to cleanse and dry up watering, corrhoding or creeping Vlcers : it is also used to bee laid upon wood to preserve it from Wormes, and the smell thereof driveth away Mothes and other noysome Flies.

CHAP. XXXII.

Prunus sylvestris. The blacke Thornē or Sloe bush.

Et the blacke thorne or Sloe bush here take up a place, because it is so thicke stored with thornes. It never groweth to the greatnesse of a tree but alwayes abideth as an hedge bush, in some places rising higher then in others, having usually divers stemmes rising from the rootes, branched forth into greater armes and smaller sprayes, stored with strong short and sharpe thornes, set with and besides the small darke greene leaves finely dented about the edges : the flowers are very white, many set on the branches in divers places and not wholly at the toppes, consisting of five leaves as all other Plummes and Cherries have, with divers white threads tipt with yellow in the middle, after which follow the fruit, which are as all know, blacke and small when they are ripe, and with the harshnesse a little sweete, but before that time so harsh that none can indure to taste them : these are all of one forme, that is round, and of one size or bignesse in a manner but to be much bigger or else as big as a Bulleis, or to be long with the roundnesse as a Dampson or other larger Plum I did never see : the roote is great and woody, spreading under ground and shooting forth againe in divers places, if it be not cut and pruned.

The Place.

It groweth in every place and country, in the hedges and borders of fields, and is for their devision a sure defence.

The Time.

It flowreth early, that is, alwayes in Aprill and sometimes in March, so strong and hardy it is against all the injuries of the weather, but ripeneth the fruit after all other Plummes whatsoever, for it is not fully ripe and fit to be eaten and used untill the Autumne frosts have mellowed it.

The Names.

It is called in Greeke *κοκκυμίσσα ἀγρία* *Coccymelea agria* and *ἀγριοκοκκυμίσσα* *agriococcymelea* quod *magritudine & rotunditate coccimala ferat*, and the fruit *ἀγριοκοκκυμάνδρι* *agriococcymelon* : but Galen saith that they call it in Asia *προυνόν* *Prunum*, in Latine *Prunus sylvestris* and *Prunellus*. Virgill quare *Georgicorum* calleth it *Spinus* in the masculine gender in these words,

Et Spinus jam pruna ferentes.

And so doth Servius and divers other authors since their times. The Bulleis is accounted a kind of wild Plumme, of the kinds whereof I have spoken in my former booke. The Italians call it *Pruno salvatico*, the French *Prunier sauvage*, *Prunelier* and *Polesser*, the Germanes *Schlehdorn* and *Haberslehen*, the Dutch *Slehdoren* and wee in English Blacke Thorne or Sloe tree, or Bush.

The Vertues.

All the parts of the Sloe bush are binding, cooling and drying, and all effectuall to stay bleedings at the nose or mouth or any other place, the Lasse of the belly or stomach, or the Bloody flux, the abundance of womens courses, and helpeth to ease the paine in the sides, bowells and guts, that come by overmuch frowning, to drinke the decoction of the barke of the roote, or more usually the decoction of the berries eyther fresh or dried. The Conserve likewise is of very great use and most familiarly taken for the purposes aforesaid : but the distilled water of the flowers first steeped in Sacke for a night, and drawne therefrom by the heate of a Balneum, is a most certaine remedy tryed and approved, to ease all manner of gnawings in the stomacke, the sides heart or bowells, or any other griping paines in any of them, to drinke a small quantitie when the extremities of paine are upon them : the leaves also are good to make lotions, to gargle and wash the mouth and throat, wherein is swellings, sores or kernells, and to stay the defluxions of rheume to the eyes or other parts, as also to coole the heate and inflammations in them, and to ease the hot paines of the head, to bathe the forehead and temples therewith. The simple distilled water of the flowers is very effectuall also for the said purposes, and so is the condensate or thickned juice of the Sloes : the distilled water of the greene berries before they be ripe is used also for the said effects of cooling binding and staying the flux of blood and humours, and some other purposes, *qua studiose pretereo*. The juice of the fruit of Sloes is taken as a Substitute for the juice of *Acacia* in all our Apothecaries shoppes, which substitution although it bee not much to be disliked, as having one and

Prunus sylvestris.
The Blacke thorne or Sloe bush.

but one qualitye of the *Acacia* in it which is the binding, yet is it deeper in the degree of cooling: but divers learned men in sundry places and namely the Physicians of *Padoa* and *Naples* have accounted the condensate juyce of *sumach* or of *Mirtles*, to be a better substitute answering to the qualities of the *Acacia* in more than the juyce of *Sloes* doth: for substitutes had neede of much consideration and judgement, not onely to be alike in the first qualities, that is a roote for a roote, a seede for a seede, a juyce or gum, for a juyce or a gum, &c. and not a juyce or gumme in steede of a roote or seede, or contrariwise: but in the second qualities also of a substitute that is in heate and cold, that contraries be not admitted, either of cold for hot, or hot for cold; yea and in the third quality likewise, that they may answer as neere as may be possible, the same degrees that they neither want nor abound in any degree. And although *Galen* did appoint the double quantity of *Cassia* in the stead of *Cinamen* which made *Quintus* to cast into his dish, that by the same rule he might take double the quantity of course bread, in the stead of so much fine, as was appointed to make a medicine, yet *Galen* answered to him standeth good, that the respect of substitutes, standeth not in taking twice so much, of that which is worse in stead of that which is good, but as in the actions of men, when as the strength of one man is not sufficient to beare, lift, or move, a stone or engine, we put two or more to doe it: but there are other substitutes admitted among our Apothecaries, into these two great Antidotes of *Mithridatium* and *Theriaca Andromachi*, which are no way to be allowed or tolerated, nor ever would be in any of the famous Citties of *Italy*, which is to suffer the *Camelia alba* (falsly called *Cortea Winterani*) which is the barke of a tree, to be the substitute for *Cassia* which is a roote, in one mans dispensation, when as the like was never seene before, and to deny a genuine and right Simple, to be put into another mans composition, because the thing was scant, and not for every one easily to obtaine, nor the price low, that every one might have cheape, and therefore in steade of an aromaticall rosine, use an unctious or fat Oyle, quite contrary to the rules of Art, the rule of substitutes, and the course of other famous and worthy professors in other Countries, who by sparing no cost to obtaine such genuine drugges as are rare, scarcely to be had, and yet of especiall use, have made themselves and their compositions famous through the whole world: whereas others by being too greedy of gaine, and too envious of any others better proceedings than their owne, have used, and still doe, farre meaner things than they should: but *hola*, what hath just anger against the errors in my profession drawne me to utter? It is rather in hope that all will amend being forewarned, than to touch any in particular, that will hereby take himselfe to be taxed, for thereby he shall shew himselfe guilty of the crime, although none doe accuse him.

CHAP. XXXIII.

Tragus sive *Tragum Matthioli*. The Sea prickly plant.

His fragling fellow I have followed to the Sea side to bring to your view, and have therefore thrust in the end of this Classis, being neerest to this tribe of prickly plants, although it selfe be somewhat gentle or lesse offensive, whose description is in this manner. It spreadeth divers crooked greene stalkes, variously branched, and the branches foulded one within another, thicke set with small shorr, and somewhat sharpe, pale greene leaves, three or foure set together, thicke and closing the stalke at the bottome, forming as it were a great joynt, resembling the fruite of the *Calcepole*, in some plants and places the leaves will be twice as long, but in gardens are never so sharpe or prickly, as in the naturall places; at the joynts upwards stand severall small yellowish greene flowers, which afterwards turne into small flat feedes, within a three square prickly huske: the roote is small and long, perishing every yeare utterly, so that if it sow not it selfe, as in the naturall places it doth, it must be new sowne every yeare: the whole plant is almost without any taste, either of heate, or cold, or drying, yet more enclining to heate than cold, as many sea plants doe.

The Place.

This plant groweth neere the Sea side, not onely in other hot Countries where by the heate of the climate, the branches are harder, and the leaves more sharpe and pricking, but on our owne coasts also in divers places, although nothing so sharpe yer somewhat prickly.

The Time.

It flowreth not usually untill the middle of *July*, and the seede is ripe in the end of *August*.

The Names.

Tragus is *πολύπυλός* *diſſio*, a word of many significations, for this is neither the *Tragus* of *Dioscorides*, which he saith some also called *Scorpius*, nor yet of *Pliny* which hee maketh the *Scorpius* of *Theophrastus*, nor yet the *Tragus Cerealis*, whereof you shall heare further in his place, nor yet the *Tragus* or *Targum vulgare* of *Clusius*, which is our *Dittander*: but a prickly sea plant adjudged by *Lobel* and others, to be a kinde of *Kali*, and call it *Kali spinosum*, which *Mat-*

Tragum Matthioli.
The Sea prickly plant.

thiolus set forth for the right *Tragus* or *Scorpius* of *Dioscorides*, but confoundeth it with the *Scorpius* (or *Nepo* as *Gaza* translateth it) of *Theophrastus*: and therefore all others since his time call it *Tragus*, or *Tragum Matthioli*, and *Lobel Tragus* in *Probus Matthiola*. *Angulara* calleth it *Drypis* and saith *Tragon non est*: *Lobel* hath set forth the figure hereof with longer leaves, and *Camerarius* also saith it did grow with him, then *Matthiolus* or *Lugdunensis* set forth this, yet *Lugdunensis* in his Booke of Sea plants giveth a figure differing from the former, *viz.* standing with leaves in rowels like *Gallinor* or *Rubia*: but the true *Tragus* of *Dioscorides* I have shewed you before by the name of *Polygonū bacciferū minus* or *Vna marina minor*, which by the judgement of most the exercised in herbarisme doth best agree with *Dioscorides* text in all points. *Banbinus* in this as he doth in many other places putteth two titles hereunto as if they were two plants, calling it *Kali spinosum cochlantium* and *Kali spinoso affinis*, and appropriateth authors unto each, when as himselfe acknowledgeth they doe amisse that make them to bee but one, howsoever the figures doe vary. I have called it in *English* the Sea prickly plant untill a fitter can bee given.

The Vertues.

I cannot finde or learne of any property physcally whereunto this plant is serviceable, (onely *Camerarius* saith it is used as young *Asparagus* for a sallet herbe to be eaten) but serveth to contemplate the Creator in his creatures as many other the herbs and plants that grow out of the ground, whereof although we know no use in many or not halfe the use in most, yet he hath not made the least in vaine, and if we would be as industrious to search out their faculties as our forefathers have beene in their times we should know much more then we doe; and surely if we did not enjoy their labours, in what a world of darkenesse and ignorance should we abide? Let therefore the old adage worke effectually in all *Non nobis natissimus* and let every one endeavour to augment the talent that hath beene lent him, not for his owne particular onely, but for the benefit of others, so shall the favour of such a sweet ointment spread farre, whereof others receiving the sent as well farre of as neare at hand, perpetuall odour of praise will rise from them and glory will crowne them from whom it cometh.

FELICES

FILICES

ET

HERBÆ CAPILLARES.

FERNES AND CAPILLARIE
HERBES.

CLASSIS DECIMA.
THE TENTH TRIBE.

CHAP. I.

1. *Filix mas vulgaris*. The common Male Fernē.

Of the Male Ferne there is some diversitie as shall be shewed. The Male Fernē sendeth forth divers hard rough unbranched stalkes of winged leaves, naked or bare at the lower end, consisting of many leaves up to the toppes, with one at the end, set on both sides thereof, not fully opposite but as it were in the middle betwene two on the contrary side, each leafe not fully devided but deeply nicked in on the edges, all of them of a pale greene colour, hard and dry or without sappe, broadest at the bottome and smaller toward the toppes, on the backe side of whom there are certaine brownish small spots which are the seeds, for by the falling of them young ones are encreased: this and all other sorts of Fernes and Capillarie herbes in this Classis mentioned, have no flowers nor other seeds then such spots, or scales whereby they as I said are encreased, although many have denyed that any of them have eyther flowers or seede, and some have beene reclaimed upon my instance of the place in *Genesis* 1. 11. 12. and so have declared it: the roote hereof is made of many thicke blacke threads descending from a browne scaly thicke head.

2. *Filix mas aculeata*. The prickly Male Ferne.

This other Ferne differeth not from the former, but onely that the winged leaves are not dented in, but whole, having a small pricke at the end of each of them and growing not so high.

The Place.

The first groweth as well on Heathes and open places of hills, as in shadowy places by the sides of fields, reasonable frequent in all countries, but the second groweth very few yet in the like places also.

The Time.

These seldome hold their stalkes with leaves greene in the Winter: but shoote out new from the roote in the Spring which at their first rising are brownish and foulded in round: The time when those heads on the backe of them are ripe and doe fall is Midsummer, and falling on the ground doe spring, for whereby else should it be encreased, seeing God in the beginning appointed every herbe and tree, to have the seede of their kind (and not of another) within them.

1. *Filix mas vulgaris*. The common male Ferne:

The Names.

' It is called in Greeke simply *ῥίσις* and *ῥίσιον*, *pteris* and *pterion*; because the leaves are like unto the wings of birds, *Nicander* in *Theriacis* calleth it *ῥίσις* and *ῥίσιον*, in Latine *Filix mas* of most authors, yet *Angustura*, *Gefner* in *botan* and *Cesalpini* call it *femina*, not onely contrary to all other in our times, but quite contrary also to *Theophrastus* his true distinction which he sheweth is betweene the male and female in his ninth booke and twentieth Chapter in these words, *differt femina filix a mascula, quod folium unico artu porrectum hæc habeat, &c.* the second is remembered by *Thalys* and is his third sort of the male kind, for his second species is but a small difference of the first; and by *Bauhinus* in his *Prodromus* as I take it calleth it by the name of *Filix mas aculeata minor*, and it may be also his *major*, for he describeth it with little difference. The male Ferne is called by the *Arabians*, *Sarav*, by the *Indians* *Felce maschio*, by the *Spaniards* *Helecheyorua*, by the *French* *Fongee* and *Feuchiere masle*, by the *Germanes* *Waldfarres*, by the *Dutch* *Varren manneken*.

The Vertues.

I finde that all authors have appropriated the same vertues to the male Ferne that they have to the female, and therefore to avoyd a tautologie or rehearfall of the same things againe; I will referre you to the next Chapter for them. Of the ashes of Ferne is made a kinde of thicke or darke coloured greene glasse in sundry places in *France*, as in the *Dutchy of Mame*, &c. (and in *England* also as I have bene told by some) out of which they drinke their wine. The seede which this and the female Ferne doe beare, and to be gathered onely on Midsummer eve at night with I know not what conjuring words is superstitiously held by divers, not onely Mountebanks and Quacksalvers, but by other learned men (yet it cannot be said but by those that are too superstitiously addicted) to be of some secret hidden vertue, yet I cannot finde it exprest what it should be: for *Bauhinus* in his *Synonymies* upon *Matthiolum* saith these rales are neither fabulous nor superstitious, which he there saith he will shew in his History: but *Matthiolum*, *Lugdunensis* and others declaime against such opinion: experience also sheweth that they beare seede, although *Theophrastus*, *Galen*, *Dioscorides* and *Pliny* following him, say they neither beare flowers nor seede, for if about Midsummer (for then usually it is ripe) you gather the stalkes of Ferne and hang them upon a thread with some faire white Paper or cloth under them, you shall finde a small dust to fall from them which is the seede, and from them doe spring plants of the same kindes, and such young plants risen from the fallen seede have bene seene growing about the old plants, for as I said before no herbe growing on the earth or in the water (except some with double flowers which are encreased by the roote) but doe beare seede, &c. *Dioscorides* relateth a great contrarietie in nature betweene the Ferne and the seede, that each one will perishe where the other is planted, as if it were by a naturall instinct, which thing I thinke happeneth rather from the soiles, a Reede not joying in a dry ground nor the Ferne in a wet. *Pliny* in his 24. booke and 11. Chapter saith, that the roote of the Reede laid to the Ferne driveth it forth, as the roote of the Ferne in like manner doth the Reede: and *Celsus* before him sheweth that each of them is a remedy against the other, and *Theophrastus* that sheweth whereas Corne and other herbes doe delight and are furthered by dung, the Ferne onely perissheth thereby.

CHAP. II.

1. *Filix femina vulgaris*. The common female Ferne.

Filix femina. The female Ferne.

OF the female Ferne likewise there is some diversitie more then formerly hath bene observed by others as you may here see.

1. *Filix femina vulgaris*.

The common female Ferne.

This Ferne riseth up with one or two, and sometimes more almost round stalkes from the roote somewhat higher then the former, and branched with such like winged leaves growing on both sides therof equally for the most part one against another, every leaf being lesser then the male, and more divided or dented yet not sharpe but round pointed, of as strong a smell as the former, and having the like spots on the backside of them which stalke if it be cut a slope somewhat long will in the white pith thereof shew some marke of a splayed Eagle: the roote hereof is long and slender then the former, of about a fingers thickness and blackish for the most part creeping under the ground.

2. *Filix femina pinnulis dentatis*.

Dented female Ferne.

This other female Ferne hath the small winged leaves which are set on each side of the middle ribbe, somewhat sharpe pointed, of a sadder greene colour and narrower then the former, yet spotted on the backside, but the maine stalke is fuller of branches, and not growing up so straight nor so high, and differeth little in any thing else.

3. *Filix femina aculeatis pinnulis*.

Sharpe pointed female Ferne.

This sharpe pointed female Ferne hath the maine stalkes about a foote long, branching out into wings each whereof is not dented but whole, ending in a small pricke or point.

The

The Place.

The first groweth more frequently than the male on barren heaths, and shady hedge sides, &c. the other two grow rather on moist rocks and in the shaded hills.

The Time.

They flourish at the same and perish in Winter, I meane the leaves.

The Names.

It is called in Greeke *δρυφίτης* & *ρυφιασφόει*, the *lypteris* and *nymphae-pteris* in Latine *Filix femina*: the first is generally by most authors called *Filix femina*, yet *Gesner* in *hortis* calleth it *Mas*, and *Bauhinus* in his *Pinax* *Filix ramosa pinnulis obtusis non dentatis*: the second is called by *Thalium*, *Filix femina altera tenuis folia*: the last is called by *Bauhinus* in his *Pinax*, *Filix ramosa minor pinnulis dentatis*, which *Cordus* in *historia* calleth *Pteridium masculum*, as *Thalium* noteth it likewise, it is called in Italian *Felce femina*, in Spanish *Helecho*, and French *Faugiere fenelle*, in high Dutch *Grosse Farnkraut*, in low Dutch *Varen Wiffken*, and we in English *Brak* or common *Ferne*.

The Vertues.

The rootes of both these sorts of *Ferne* are somewhat bitter with some astringtion, being bruised and boyled in Mede or honyed water, and drunke, killeth both the broade and long wormes in the body; the same also abateth the swelling and hardnesse of the spleene: the Greene leaves eaten, are sayd to open the belly and moveth it downwards, yet it troubleth the stomacke, and purgeth chollerick and waterish humours: they are very dangerous to women with childe, by destroying the birth, and provoking aborsment, yet is it but a fable to be any danger unto them to goe or stride over it: for *Lacuna* sheweth that the Greeke text is faulty in that word, which bred that errour; yet the use of it procureth barrennesse in them: the rootes being bruised and boyled in oyle or Hogs grease, maketh an oymntment very profitable to heale wounds punctures or prickes in any part; and the powder of them used in fowle Vulcers, dryeth up their malignant moisture, and causeth their speedier healing: the rootes hereof with other things that goe into the oymntment, called *Agrippe* are appointed as helping hydropicke persons: the fume of *Ferne* being burned driveth away Serpents, Gnats, and other noisome Creatures that in the Fenny Countries much molest both strangers and inhabitants that lye in bed in the night time, with their faces uncovered. They use in *Warwicke* shire, above any other Country in this Land, in steed of Sope, to wash their clothes, to gather the female *Ferne* (for that is most frequent with them) about midsummer and to make it up into good bid balls, which when they will use them they burne them in the fire, untill it become blewish, which being then layd by, will dissolve into powder, of it selfe, like unto Lime: foure of these balles being dissolved in warme water is sufficient to wash a whole bucke full of clothes.

CHAP. III.

Osmunda regalis sive *Filix florida*. Osmund or Water *Ferne*.

Although this *Ferne*, doth never grow naturally but in Bogs, wet Moores, and the like watry places, and therefore may fitly challenge to be placed with those of the like nature: yet because I would not transpose it alone, from the rest of this Tribe, let it take his place here with the rest of the *Fernes*. It shooteth forth in the spring time (for in the winter the leaves perish) divers rough hard stalkes, halfe round and hollowish or flat on the other side, two foote high, having divers branches of

1. *Osmunda regalis* sive *Filix florida*. Osmund or water *Ferne*.

Osmunda regalis summitatibus cum floribus.

Winged

winged yellowish Greene leaves on all sides, each whereof standing one against another, are longer narrower and not dented or nicked on the edges as the former, but somewhat like to the leaves of *Polli-pody*: from the top of some of these stalkes, grow forth a long bush of small and more yellowish Greene scaly aglets as it were, let in the same manner on the stalkes as the leaves are, which are accounted as the flower and feede: the roote is rough thicke and scaly, with a white pith in the midst which is called the heart thereof.

The Place.

It groweth as I before sayd on Moores, Bogges, and watery places, in many places of this Land, I tooke a roote thereof for my garden from the bogge on *Hampstead Heath*, not farre from a small cottage there.

The Time.

It is Greene all the Summer, and the roote onely abideth in winter, to shoote forth a new in the Spring.

The Names.

It is called in Latine (it hath no Greeke name) *Osmunda regalis* of the singular properties therein: it is also called by some *Filicestrum* & *Filix florida*, or *strepens*, *Filix palustris* or *aquatica*, and as *Gesner* saith, *Filix Lunaria*, and *Lunaria major* by *Chimistes*, by *Ruellius Sideritis forte*, by *Angulata Filix Mas*, and by *Cordus* in *historia Filix latifolia*: it is called in Italian *Osmunda*, in French *Osmunde* and *Fengiere aquatique*, in high Dutch *Wasser Farn* and *Grosse Farn*, in low Dutch *Groote Varen*, and *Wilt Varen*, some in English *Osmund Ferne* *Osmund* the waterman, *Osmund royall* and *S. Christophers herbe*.

The Vertues.

Osmund is not particularly remembred by the ancients, although it is probable enough they knew it, and comprehended it under the male *Ferne*, for *Galen* commendeth the roote of *Ferne* to be very profitable, and therefore the later times added a Royall title unto it, in that it had rather more effectfull vertues than others, and both for inward and outward griefes, as is mentioned in the foregoing *Fernes*, and is accounted by most to be singular in woundes, bruises and the like, the decoction to be drunke or boyled into an oyntment, or oyle, as a Balsame or Balme, as also singular good against bruises and broken bones, or out of joynt; and giveth much ease to the Collicke, and Splenetick diseases, as also for ruptures and burstings.

CHAP. IIII.

I. *Polypodium vulgare*. Common Polli-podie of the Oake.

Ollipody is a small herbe consisting of nothing but rootes and leaves, having neither stalk nor flower, nor feede, as it is thought. It hath three or foure leaves, rising from the roote, every one singly by it selfe, of about an hand length, which are winged, consisting of many small narrow leaves, cut into the middle ribbe, standing on each side of the stalk, each being large below and smaller up to the toppe, very like unto the *Osmund Ferne*, not having any dents or notches at all on the edges,

1. *Polypodium vulgare*. Common Polli-podie of the Oake.

3. *Polypodium Ilucense*. Iland Polli-podie.

as the Male Ferne hath, of a sad Greene colour on the upper side and smooth, but on the under side somewhat rough, by reason of certaine yellowish spots, are set thereon: the roote is smaller than ones little finger, lying a slope or creeping along under the upper crust of the earth, brownish on the outside and greenish within, of a certaine sweetish harshnesse in the taste, set with certaine rough knags or excrescences on each side thereon, having also much mossinesse or yellow hayrinesse upon it, and some fibres underneath it, whereby it is nourished.

2. *Polypodium alterum seu minus*. Small Polipodye.

This small Polipodye differeth not from the former, neither in roote or leafe, or markes on the under side of the leaves, but onely that the roote is smaller, and slenderer, and the leaves also not so long or large, and this smallnesse ariseth rather as I suppose, from the place where it groweth, than from a diversity of kinde, for although in some places the leaves may seeme to be a little waved on the edges, yet it is but accidentall.

3. *Polypodium Iluense*. Iland Polipodye.

The Iland Polipodye is rather differing from the other, by the nature of the place (as it is supposed, because the Iland of *Ilu*, bringeth forth many other plants, differing in the forme from those of other places, though not in quality) the stalkes rise up sometimes with two or three leaves at a joynt or place, and sometimes but one, somewhat hayrie at the bottome of them, each leafe being about a foote long, whose middle ribbe is of a blackish browne colour, the leaves, or rather the divisions or parts of the leafe, are more seperated one from another, not standing close together as in the former, but distant unequally on both sides, each part also being longer and dented on the edges, of a Greene colour, and smooth on the upper side, and spotted with a yellowish dust on the under side, as the former are; the roote is like the other.

4. *Polypodium Indicum*. Indian Polipody.

Clesius setteth forth this in the fourth booke of his *Exoticks*, being brought out of the East Indies, the certaine place not knowne, by on Doctor *Cole*, who dying in comming home, his Paper booke of herbes came to *Clesius* his hands, where he found this among the other without name. The roote he saith was halfe a foote long and an inch thicke almost, rugged browne and long like other Polipody; it had three large leaves rising together from it, two of them bigger than the other, and of eleven inches a peece, with a great middle ribbe, and each side of it contained five inches in bredth, the edges much divided, and many veines therein. This I thought good to mention here although it is likely it will never grow in these Countries, and to shew the diversities of others.

The Place.

Polipodye groweth as well upon old rotten trunks or stumps of trees, be it Oake, Beech, Hasell, Willow, or any other, as in the woods under them, and upon old Mudde walls, as also in mossie, stony, and gravelly places, neere unto woods: the larger groweth where it hath most mellow moyst earth to spring in, and the slenderer where the place is dry and hard: the best is accounted that which groweth upon Oakes onely, but the quantity thereof is scarce sufficient for the generall use: the other as is sayd groweth in the Isle *Ilu* which is in the *Mediterranean* sea, the last in *India*.

The Time.

It being alwayes Greene, and bearing neither flower nor seede, as it is thought it may be gathered for use at any time, yet it shooteth forth Greene leaves onely in the spring.

The Names.

It is called in Greeke *πολυπόδιον* *Polypodium* so called a *poly* *porum* *cirr* is saith *Dioscorides*, a cavernous acetabulis, *cen cirrh* is *polyporum* saith *Pliny*, & *Filicula quesi parva filix* and in Latine *Filicularis herba*, *Cato* hath it *Felcular*; of the Arabians *Bisfere* so hath *Scrapio*, and *Desfers* & *Budeig* by *Avicen*, yet others set it down *Aibeig* and *Beffaig*; of the Italians *Polipodio*, of the Spaniards *Filipodio*, and *Polipodio*, of the French *Polipode*, of the Germanes *Engelsas* *Dreppswintz* and *Baumfarn*, of the Dutch men *Boomvaren*: in English Oake Ferpe, and Wall Ferne, according to their places of growth, but generally *Polypodie*. The first is generally called *Polypodium* of all writers, and is thought by *Lobel* to be the *Herba Radioli* of *Apuleius*: the second *Matthiolar* calleth *Polypodium alterum*, and *Dodonaeus* *Polypodium minus*: the third *Lugdunensis* setteth forth, with the name *Polypodium Iluense*; which *Bauh* thinketh to be the same, which he setteth forth under the name of *Lonchitis aspera Iluensis*, and yet *Lugdunensis* in the description of the *Polypodium Iluense*, saith that the Iland of *Ilu*, bringing forth many strange rare plants, as this Polipody, a *Lonchitis aspera*, and an *Hemionitis* that doe differ from others, so that he that saw them and set them forth, saith that they are divers plants, and that it hath the same qualities that the other Polipodie hath, but *Lonchitis aspera* hath no purging quality; but *Bauh* in so saying sheweth that he never saw the living plants, but the effigies onely, and I thinke the figure of the roote if it be truly set forth, sheweth the truth of the matter, for that the one is long and thicke, like unto other Polypodies, and the roote of the *Lonchitis* is stringie.

4. *Polypodium Indicum*.
Indian Polipody.

The Vertues.

Polypodie is generally used with other opening and mollifying things, to purge the body, for it is held by most of our later Physicians to be very weake of it selfe. *Mesues* who is called the Physicians Evangelist for the certaintie of his Medicines and the truth of his opinions saith, that it dryeth up thinne humours, digesteth the thicke and tough, and purgeth blacke or burnt choller, and especially tough and thicke flegme, and thinne flegme also, even from the joynts (which the inhabitants about the Rivers of *Rheine* and *Mosa* doe finde to be true, as *Dodonæus* relateth it, who by using the decoction of Polypody a good while together are freed from those tumors in their hands, feete, knees and joynts wherewith they are much troubled) and is therefore good for those are troubled with Melancholy or Quartaine Agues, especially if it be taken in Whey or Mede, that is honied water, or in Barly water, or the broth of a Chicken with *Epithymum* or with Beetes and Mallowes, it is also good for the hardnesse of the Spleene, and for those prickings or stiches that happen in the sides, as also for the chollicke taken any manner of wayes, some use also to put to it some seedes of Fennell, and Anise or Ginger, to correct that nausea, or loathing that he saith it bringeth to the stomacke and to strengthen it the better, yet some hold it is so free of danger that it bringeth no trouble to the stomacke, but is a safe and gentle medicine, fit for all seasons and persons, which daily experience confirmeth, and yet a greater quantitie may be given in a decoction then he appointeth, even an ounce or more, if there be not Sene or some other strong purger put with it: a dramme or two if neede be of the powder of the dried rootes taken fasting in a cup full of honied water, worketh gently and for the same purposes aforesaid. The distilled water both of rootes and leaves is much commended for the quartaine Ague, to be taken many dayes together, as also against Melancholy, and fearefull or troublesome sleepes and dreames; and with some Sugar Candy dissolved therein against all the ill affects of the Lungs, as the Cough, shortnesse of breath and wheezings, and those thinne distillations of rheume upon the Lungs, which often turneth into a Consumption or Tisicke: Some commend the salt made thereof to be mixed with the water; *Tragus* saith that a decoction of the Polypody made with wine, or the rootes themselves rather as I thinke given unto Hogges preserveth them from the Plague or Pestilence, whereunto they are subject by purging them therewith, which thing without doubt is effected as hee saith, by the purging of flegme, wherewith they are most troubled: the fresh rootes beaten small, or some in the stead thereof take them dry in powder, mixed with hony and applyed to the joynts of any member or part out of his place doth much helpe it: applyed also to the nose cureth the disease called *Polypus*, which is a peece of flesh growing therein, that by time and sufferance stoppeth the passage of breath through that nostrill: it helpeth also those clefts or chappes, that happen to come betwene the fingers of the hands or toes of the feete.

CHAP. V.

Dryopteris. Oake Ferne.

OF the Oake Ferres there are two sorts, one set forth by *Lobel*, the other by *Dodonæus*, whereof I meane to entreate in this Chapter.

1. *Dryopteris repens*. Creeping Oake Ferne.

This small Ferne sendeth forth divers slender blackish stalkes little more then halfe a foote high, bearing many small winged leaves each against the other, somewhat like unto those of the female Ferne but much smaller and finer, and of a darkish Greene colour, the backside of whom have not browne but white spots on them set in a double row, as *Lobel* saith which others mention not: the roote is small and blackish creeping under the upper crust of the earth, with divers small blacke fibres growing from them, and are some what like unto the rootes of Polypody but much smaller and slenderer, of a more austere harsh and stipticke taste then Polypody.

2. *Dryopteris alba*. White Oake Ferne.

This other Ferne groweth not much higher then the former, but the leaves are broader shorter & more deeply cut in on the edges, and of a paler Greene colour, spotted also on the backside of them like unto the male Ferne: the roote is composed of many blackish threads or fibres issuing from a thicke roote.

The Place.

Both these sorts grow in the shadowey thicke woods on the mountaines, and sometimes in the open valleyes neare them, and sometimes also out of the mosse of old bushes and other trees.

Dryopteris sive Filix querna repens. Creeping Oake Ferne.

VVVV

The

The Time.

They both loose their leaves in Winter and spring up a fresh late in the Spring.

The Names.

It is called in Greeke *Δρυοπτερίς*: *Dryopteris*, that is *Filix querna*, yet *Oribasius* calleth it *Βρυοπτερίς* *Bryopteris* *quasi Filix muscosa*, Mousse Ferne of the growing among the Mousse on trees, the first is simply called *Dryopteris* by *Lobel*, *Matthiolum*, *Gesner* and others; *Dryopteris* sive *Filix arborea* by *Tragus*, and *Pterion femina* by *Cordus* in his first Booke and eighteenth Chapter, and so also by *Tbaltius* in *Harcynia sylva*: but is not the *Filix pumila saxatilis* *prima* of *Clusius* as I shall shew you in the next Chapter save one, although it seeme to bee like it for the rootes shew their difference. The other is called *Dryopteris caudata* by *Dodoneus*, and as *Lobel* saith is the *Adiantum album* *Plinij*, and of the Shoppes also: by *Bauhinus* *Filicula fontana major* sive *Adiantum filicis folio*.

The Vertues.

The first as *Lobel* saith was in former times used by the Apothecaries beyond Sea, in stead of *Pollypody* as not knowing a righter, neyther were they shewed by their Physicians to forbear it and use any other, but rather appointed by them so to do, which as he saith some affirmed *Rondeletius* to say, that in stead of a purging quality proper to *Pollypody* it had a pernicious operation in some of his sicke patients: it is a remedy to take away haire as *Theophrastus* saith, if the rootes and leaves bee bruised together and applyed after sweating, *Matthiolum* saith that the rootes in powder with a little salt and Branne is given to Horses for the wormes. The other sort is moderate in taste, somewhat drying, and therefore may safely be used in stead of the true *Adiantum* or *Maidenhair*, as it is usuall now a dayes, *Lobel* saith that the last sorts was safely used in the Apothecaries shoppes of divers countries for *Adiantum album* and *nigrum*.

CHAP. VI.

Lonchitis aspera. Rough Splenewort.

These Spleneworts there are divers sorts described by divers authors as shall be shewed, and first of the greater kinde of *Matthiolum*.

1. *Lonchitis aspera major* *Matthioli*. The greater rough Splenewort.

This greater Splenewort hath divers stalkes of leaves somewhat like unto *Miltwast* but nearer unto *Pollypody*, about a spanne long cut on both sides with uneven divisions, dented about the edges with sharpe points, and rough on both sides without such spots on the backs of them as *Pollypody* and *Miltwast* have: the roote is composed of many reddish strings or fibres like as *Harts tongue* is.

2. *Lonchitis aspera minor*. The smaller rough Splenewort.

The lesser Splenewort is somewhat like unto the former, but that the divided leaves set on each side of the soft brownish stalkes are narrower and longer, each separated from other, but not fully to the middle ribbe: in

1. *Lonchitis aspera major* *Matthioli*.
The greater rough Splenewort.

2. *Lonchitis aspera minor*.
The smaller rough Splenewort.

the middle of those outer leaves, rise up other bigger and blacker stalkes of narrower leaves, like unto them, but fully separated, and finely dented about the edges that they seeme curled with brownish spots, or scales on the backs of them as in other Fernes: the roote hath a thicke head covered with scales, lying one upon another, with divers fibres at them. There is another of this sort lesser than this, found about Colchester in Essex, and in other places, growing in the wet borders of fields, and by the hedge sides.

3. *Lonchitis aspera Maranthæ*. Bastard rough Splenewort.

This bastard Splenewort hath browne rough stalkes a span long, with winged leaves on them, somewhat like unto the female Ferne, but thicker and greater, by much greene on the upper side, and spotted with browne rough scales on the other, like Milt-walt, the roote is small, composed of many long fibres.

4. *Lonchitis aspera Ilvensis*. Island rough Splenewort.

This small Splenewort hath browne stalkes, little above halfe a foote long with leaves set opposite one to another, and each cut in on the edges, but not so deeply as the last, greene on the upper side, and rough with browne scales or dust on the under: the roote is a small bush of blackish fibres.

The Place and Time.

The first groweth in the moist Moores of Italy, the second and third, in moyst groves both there and in Germany, and in some places with us, if my memory fail me not: the last in the Island of Ithia which is in the Thirohene sea, and flourisheth when others doe.

The Names.

The Greek name from *Dioscorides* is *λεοντις ἄσπερα* and so in Latine *Lonchitis aspera* five *aspera*, for his first *Lonchitis* is scarce knowne: The first is the *Lonchitis aspera* major of *Matthioli* and others, or *Lonchitis aspera minor* of *Matthioli*, by *Tragus* *Asplenium sylvestre*, *Cordus* and *Thalys* *Struthiopteris*, as if you would say the *Efridges* Ferne for the fine wings of the middle leaves, by *Clusius* *Lonchitis altera Neotericorum*, this is called Foxe Ferne in many places of this Land: the third is the *Lonchitis Maranthæ*, or *altera Maranthæ* by *Clusius* and others, and *Matthioli* *Pseudolonchitis Maranthæ*: the last is remembered by *Lugdunensis*, but *Bauhinus* as I sayd before in the chapter of *Pollipodye*, first confoundeth the *Polypodium Ilvense* of *Lugdunensis*, with his *Lonchitis aspera Ilvensis*, making them to be both one plant, and againe maketh the *Lonchitis Maranthæ* to be one with the *Lonchitis aspera Ilvensis* and differing but in greatnesse which I am verily perswaded, differeth from it, although it seeme somewhat to resemble it.

The Vertues.

The dried leaves of this taken in Vinegar, is held to be good to dissolve the hardnesse of the Spleene, and the greene leaves to be singular good for wounds, and to keepe them from inflammations.

Aspera minor.

CHAP. VII.

Filix Saxatilis. Small or Stone Ferne.

The small or Stone Ferne also have some diversities as here shall be shewed.

1. *Filix pumila saxatilis prima Clusij*. The first small Stone Ferne of *Clusius*.

This first small Ferne hath a long blacke and slender roote, creeping and spreading allope, under ground, with a few slender hard fibres thereat, from whence spring divers stalkes a foote high, branched into sundry divided leaves, like unto Female Ferne, but much lesse, more finely divided, and farre tenderer or delicate than they, and spotted on the backs of them like other Fernes.

2. *Filix pumila saxatilis altera Clusij*. The second Stone Ferne of *Clusius*.

This other small Ferne hath divers straight round stalkes, greene at the first, but blackish being full grown, about an hand breadth high, shooting forth leaves from the middle upwards, with divisions on both sides, like unto the Male Ferne, but much lesse and finer, spotted on the backs of them as the former: the roote from a head such as the Male Ferne hath, sendeth forth many blacke heads, threads, or fibres.

3. *Filix saxatilis foliis non serratis*. Small Stone Ferne with whole leaves.

This is small and groweth somewhat like the Male Ferne, but the leaves are not dented, but whole like unto the water Ferne.

1, 2. *Filix pumila saxatilis prima & secunda c. lufit.*
The first and second Stone Ferne of Clusius.

5. *Filix saxatilis baccifera Americana.*
Berry bearing Ferne of America.

4. *Filix saxatilis crispata.* Small curled Stone Ferne.

This small curled Ferne hath a roote compoted of many blackish threds or fibres, growing from above, whence spring up small stalkes, scarce an hand breadth high, set on both sides with tender soft strings of very small leaves so finely divided and dented, that they seeme curled, of a darke greene colour upwards, and paler below towards the bottome, having redish or brownish dust-like spots on the backe sides as the Miltwatte hath, the figure hereof is by chance left out, you shall finde it in the Appendix.

5. *Filix saxatilis baccifera.* Berry bearing Ferne of America.

This Ferne of America riseth up with sundry long, round, hard stalkes of winged leaues, each leafe consisting of many parts as it were, or cut in deeply on both edges into many divisions, and of a fresh greene colour, having in sundry places, all along of the middle rib on the backe side of them, small round feede like berries set, greene at the first, but blacke and sweetish being ripe, which then are so easily gathered that a small touch with the hand, or the shaking of the stalkes with the winde, will cause them to fall on the ground, where they will soone take roote and grow: the roote is composed of many browne fibres, somewhat harsh in taste: the leaves dye downe at the end of Autumne, and spring up new in Aprill, the berries being ripe about Saint Iames tide.

6. *Filicula fontana.* Small rocke Ferne.

This small Ferne groweth low, bushing with many very small and darke greene leaves, resembling the common fort, but much lesse than any of those before.

7. *Chamaefilix marina Anglica.* The small English Sea Ferne.

This small Sea Ferne from a thicke brownish roote, composed of a multitude of threads, rise diverse bright shining blackish stalkes, two or three inches high, whereon are placed many rough, thicke, shining, blackish, greene leaves, after the manner of the Male Ferne, finely snipt about the edges, and with brownish markes on the backe of them as other Fernes have.

8. *Filix saxatilis Tragi.* Naked Stone Ferne.

This Stone Ferne from a thicke tufted roote, sendeth forth many hard and rough stalkes, bare or naked without leaves, with some spots on them as other Fernes have, and onely forked at the toppes, into two or three short parts, bowing or bending downe their heads, it agreeth, saith Tragus, with Ferne in smell and taste.

The Place.

These all doe grow in rocky and stony places, and the sixt, seaventh, and eighth kinde as Lobel saith neere the sea in Cornwall, in moyst rockie places.

The Time.

They flower with the rest of the Fernes.

7. *Filix marina Anglica.*
The small English Sea Ferne.

8. *Filix saxatilis Tragi.*
Naked Stone Ferne.

The Names.

The first here set downe, is the first *Filix pumila saxatilis* of *Clusius*, according to his description, but the second figure doth answer thereunto, and not the first, as you may observe by the creeping rootes in the second figure, which he that onely regardeth the figure, and doth not compare the description therewith, may soone bee deceived, and this transposition *Bauhinus* observed well, although he doth not speake of it, but onely entitleth it *Filix saxatilis ramosa nigra maculis puncta*, and questioneth if it be not the *Filicula candida* of *Gesner* in appendices: the second is the second of *Clusius* by the former name, and by *Bauhinus* *Filix saxatilis non ramosa nigra maculis punctata*, and questioneth if it be not the *Filicula saxatilis* of *Camerarius*; but the first figure in *Clusius* is set forth like the female branched Ferne: the third is the third *Filix petrea femina* of *Tabernmontanus*, and called by *Bauhinus* as it is in the title: the fourth is the *Filix saxatilis crispa* of *Pona*, in the description of Mount *Baldus*: the fifth is mentioned by *Cornutus* among his *Canada* plants, which *Mr. John Tradescant the younger*, brought home with him from *Virginia*, this present yeare, 1628. presently after the death of his father: the sixth is the *Filicula fontana* of *Tabernmontanus*: the seventh is the *Chama filix marina Anglica* of *Lobel*: and the last is the *Holostium alterum* of *Lobel*, and the *Holostium petreum* of *Tabernmontanus*, *Tragus* calleth it *Filix nuda sive saxatilis*, and *Thalys Adiantum* *axeboas* seu *furcatum*, and *Bauhinus* thereupon *Filix saxatilis corniculata*: but why he should referre it also to the *Muscus corniculatus* of *Tabernmontanus* and *Gerard*, being different plants I know not.

The Vertues.

The faculties of these Fernes may be referred to the former.

CHAP. VIII.

Asplenium sive Ceterach. Smooth Splene-worte, or Milt-walle.

He smooth Splene wort (I so call it in regard of the former which is rough) from a blacke threddy and bushy roote, sendeth forth many long single leaves, cut in on both sides, into round dents, even almost to the middle ribbe, which is not so hard as that of *Pollipodye*, each division being not alwayes set opposite unto the other, but betweene each, smooth and of a light Greene on the upper side, and with a darke yellow with roughnesse on the backe, foulding or rowling it selfe inward, at the first springing up, as many other Fernes doe, and therein resembleth that Beare Worme that anglers use.

The Place and Time.

It groweth as well upon stone walls, as moyst and shadowie places, in many places of this Land, as about *Bristow*, and other the West parts plentifully, as also on *Framingham Castle*, on *Beckensfield Church* in *Barkeshire*, *Stromde* in *Kent*, and else where, and like *Pollipody*, abideth Greene in the winter.

The Names.

It is called in Greeke *σπληνιον* and *σπληνιον* *Asplenium* and *Splenium* quod *splenem* juvat, which it holdeth also in Latine, in Greeke also *σκολοπενδριον*, *Scolopendrium*, & *Scolopendra* in Latine from the likenesse of the Worme so called as I sayd before: *Theophrastus* calleth it *σπλην* and not *σπλην*, as it is in the vulgar copies, as also *ημισιον* *Hemionum* which *Galen* tranſlateth *Mula herba* in the Apothecaries shoppes *Ceterach* from the Arabians, in the *Antidotarium Bononiense* it is called *Digitis citrini*: the Apothecaries and Physicians in former times held the Harts-tongue to be the true *Scolopendrium* of the ancients, but that error is now sufficiently manifested and left, as theirs also who held formerly that *Asplenium* was not *Ceterach*: it is called of the later Arabians and *Mores* *Scolopendrium*, of the Italians *Aspleno* and *Scolopendria*, and *herba inodorata*, of the Spaniards *Doradilha*, of the French *Ceterac*, of the Germanes *Steinfarn*, of the Dutch *Steenwaren* and *Milternit*, in English *Spleenewort*, *Miltwart* and *Scale-Ferne*.

The Vertues.

It was and is generally used against the infirmities of the Spleene, and as *Ficuvius* saith, the Swine in *Candy* where it grew by feeding thereon were found to be without Splenes, when as others that did not eat thereof had them as the rest: it helpeth the Strangury or pissing by droppes, and walteth the Stone in the Bladder, and is good against the Yellow Jaundies and the hicket: but the use of it in women hindereth conception. *Mutibilis* saith that if a draught of the dult that is on the backe of the leaves, be mixed with halfe a dram of Amber in powder, and taken with the juice of Parsley or Plantaine it will help the running of the Reines speedily, and that the herbe and roote being boyled and taken helpeth all melancholicke diseases, and those especially which rise from the French disease. *Camervarius* saith that the distilled water thereof being drunke is very effectually against the Stone both in the Reines and Bladder; and that the Lye that is made of the ashes thereof being drunke for some time together helpeth Splenetick persons: it is used in outward remedies also for the same purpose.

Asplenium five Ceterach.
Smooth Spleenewort or Miltwart.

CHAP. IX:

1. *Phyllitis sive Lingua Cervina vulgaris.*
Ordinary Harts-tongue.

Ordinary Harts-tongue hath divers leaves rising from the roote, every one severall, which as the last and other Fernes fold themselves in the first springing and spreading, when they are full grown are about a foote long, smooth and Greene above but hard or with little ſappe in them, and straked on the backe a-twihart, on both sides of the middle ribbe, with small and somewhat long brownish marks, the bottomes of the leaves are a little bowed on each side of the middle ribbe, somewhat narrow with the length, and somewhat small at the end: the roote is of many blacke threads fouled or interlaced together. Some doe make two sorts hereof, and distinguish them into *latifolia* and *angustifolia*.

2. *Phyllitis laciniata.* Jagged Harts-tongue.

This Harts differeth in no other thing from the former then in the division of the toppes of the leaves which are diversly as it were torne or jagged, some leaves much and some little, according to the place of growing and time of abiding.

3. *Phyllitis ramosa Alpina.*

Branched Harts-tongue according to *Alpinus*.

The rootes hereof are somewhat woody with the blacke fibres thereat, shooting forth many slender broad stalkes, of leaves two cubits long, a little downy at the bottome, divided into many long and narrow leaves, dented about the edges, set one against another with an odde one at the end, each resembling the heads of a Javeling, marked thicke with straight lines

2. *Phyllitis sive Lingua Cervina vulgaris.*
Ordinary Harts-tongue.

Phyllitis laciniata.
Lagged Harts tongue or Finger-Ferne.

3. *Phyllitis ramosa* Alpino.
Branched Harts-tongue according to Alpino.

on both sides unto the middle ribbe: the whole plant is without sent, but of an austere taste, containing some heate which is not presently felt but continueth long.

The Place and Time.

They are greene all the Winter but spring new leaves every yeare.

The Names.

It is called in Greeke *φύλλις* *Phyllis* *quasi foliosa*, in Latine also *Phyllitis* and *Lingua cervina*, and in former times in the Apothecaries shoppes *Scolopendrium*, as I said in the foregoing Chapter: in all other European Dialects they follow the Latine name; wee in *English* call the former Harts-tongue, and the other Lagged Harts-tongue and Finger-Ferne, in some places *Gerard* calleth it Finger Harts-tongue; the last is onely remembered by *Alpinus* lib. de exoticis by the name of *Phyllitis ramosa*.

The Vertues.

Harts-tongue is much commended against the hardnesse and stoppings of the Spleene and Liver also; and against the heate of the Liver and Stomacke, it is very good likewise against Laues and the Bloody flux: divers doe also commend the distilled water thereof to bee taken against the passions of the heart, and to stay the hicket, and to helpe the falling of the Pallate, to stay the bleeding of the gums if the mouth be gaggled therewith, *Dioscorides* saith it is good against the sting or bitings of Serpents.

CHAP. X.

Hemionitis. Mules Ferne.

Here is some varietie in this plant as in the former, and although some doe conjoyne them, yet for the diversitie of their forme I have thought good to separate them.

1. *Hemionitis major*. The greater Mules Ferne.

This berbe doth much resemble Harts-tongue both in forme and colour but that it is somewhat broader or larger, and that the leaves being broadest below have a large hollow bowing like unto an halfe Moone on each side of the middle ribbe, and the strakes on the backe of them are more aslope.

2. *Hemionitis altera seu minor*. The lesser Mules Ferne.

Lebel saith that he found on Saint Vincents Rocke not farre from *Bristow* in a hollow cave or hole, a smaller kinde hereof whose leaves exceeded not the breadth of three fingers, not hard nor rough but smooth and gentle, and

and without any markes on the back side of them, yet with a hollow roundnesse at the bottome of them as the former, and besides somewhat unevenly dented about the edges: the roots were very small and thready quickly withering. *Clusius* saith that *Lobel* having sent him some of those plants, after hee had kept them in a pot because of their tenderesse, two yeares they changed their forme into the jagged Harts-horne, whereof he much marvelled, for afterwards as he saith when he came into England, hee gathered with his owne hands in the same place the like plants, which there held the forme of *Hemionitis*.

3. *Hemionitis peregrina Clusij.*
Strange Mules Ferne.

This differeth from the first in no other thing but in the bottomes of the leaves, which have a small eare or peece of leafe set on each side of the arched or hollowed bottomes.

4. *Hemionitis Ilvensis Dalechampi multifida folio.*
Mules Ferne with divided leaves.

This kinde of *Hemionitis* (if it pertaine thereto) hath sundry stalkes of leaves, rising from a tuft of blacke short haire or fibres, each whereof is about a foote long, divided into seven or nine parts, two or three couple standing lowest, one set against another, and the three uppermost a little rising above them, each of these leaves are long narrow and pointed, and somewhat dented about the edges with an eminent middle ribbe: these have no markes on the backes of them as the others of this kinde have.

The Place and Time.

The naturall places of all these are shadowy rocks and moist hollow places where little heate of Sunne commeth, and are Greene all the yeare as the former Harts-tongue.

The Names.

It is called in Greeke *ἡμιόνις* *Hemionitis* & *σπληνίον* *Splenium*, the former *quasi* mularia and *Splenium* volunt quod ejus folium medicorum *splenia*, nimirum oblongas plagulas figura imitetur. The

5. *Hemionitis peregrina Clusij.*
Strange Mules Ferne.

1. *Hemionitis major.* Th greater Mules Ferne.

4. *Hemionitis Ilvensis Dale. humpij multifida folio.*
Mules Ferne with divided leaves.

first is called *vulgaris* by *Bauhinus* and *vera* by *Clusius*, the second is called by *Lobel Hemionitis five sterilis*, and by *Lugdunensis Hemionitis minor Fene*: the third is the *Hemionitis peregrina* of *Clusius*, *Lobel. Dodonaeus* and others since them: the last as *Lugdunensis* saith growing in the Iland called *Illa*, was called of certaine Herbarists *Hemionitis altera Dalechampii*.

The Vertues.

It is especially good for the Splicene, and may fitly be used in the stead of the Harts-tongue going before to all the uses it serveth for.

CHAP. XI.

Adiantum. Maidenhaire.

Here be divers herbes accounted to be Maidenhaire by divers authors, one whereof I have set forth unto you before by the name of *Dryopteris candida Dodonaei*, which is most usuall in the higher and lower *Germany* and with us: some others I shall shew you in this Chapter and the rest in the following.

1. *Adiantum verum seu Capillus Veneris verus*, The true Maidenhaire.

The true Maidenhaire according to *Dioscorides* his description is a fine small low herbe not above a span high, whose stalkes are smaller, finer, redder and more shining then those of *Trichomanes* or our common *Engl. Maidenhaire*, whereon are placed delicate fine leaves without order on both sides one above another, somewhat like unto the lower leaves of *Coriander*, or like the leaves of *Anise* but larger, cut in unequally on the edges and spotted on the backe with very small browne markes scarce to bee discerned, the roote is a number of blackish browne threads.

2. *Adiantum nigrum vulgare*. Common blacke Maidenhaire.

This Maidenhaire differeth little or nothing from the *Dryopteris* (or rather *Omopteris*) *candida Dodonaei*, set forth in the Chapter of *Dryopteris* before, but that the stalkes of this are blacker, and the leaves of a sadder greene; whereas that is greener and paler, so that eyther that might fitly be joyned to this or this or that, the rest of the description needeth not againe to be repeated.

3. *Adiantum fruticosum Americanum*. Forraine or strange Maidenhaire.

This strange Maidenhaire groweth up like unto a *Ferne*, with a slender blackish browne stalke branched forth into others, where abouts on each side stand from 12. to 20. fresh greene leaves, small and somewhat long joyned together by their small footstalkes, somewhat like unto the first true Maidenhaire, but cut in on the outside as

1. *Adiantum verum seu Capillus Veneris verus*.
The true Maidenhaire.

2. *Adiantum nigrum vulgare*.
Common blacke Maidenhaire.

3. *Adiantum fruticosum Americanum.*
Forraigne or Strange Maidenhaire.

4. *Ruta Muraria sive Salvia vite.*
Wall Rue.

the toppes of the leaves onely and not at the bottome. One verry like unto this if it be not the same hath Mr. *Iohn Tradescant* the younger brought out of *Virginia* presently upon the death of his father, whose long stalkes have many fine fresh greene leaves a little dented or cut in on the one side and plaine on the other, spotted underneath with browne speckes.

4. *Ruta muraria sive Salvia vite.* Wall Rue, or ordinary white Maidenhaire.

This small herbe is generally accounted one of the *Capillarie* herbes or Maidenhaire, and that not of the least account, I must therefore joine it unto them with this description: it hath very fine pale greene stalkes almost as fine as haire, set confusedly with divers pale greene leaves on very short footstalkes, somewhat neare unto the colour of garden Rue, and not differing much in forme but somewhat more like unto the true *Adiantum* being more and more diversly cut in on the edges and thicker, smooth on the upper part and spotted finely on the under.

The Place and Time.

All these sorts grow both upon stone walls and by the sides of Rockes or gravelly Springs, and other shadowy and moist places: the first in no place so plentifully as *Pena* and *Lobel* say then about *Montpellier* in *Narbonne* of *France*; some have reported that it is found in *Glocestershire*: the last is found in many places of this Land, as at *Dartford* and the bridge at *Ashford* in *Kent*, at *Beckonsfield* in *Buckinghamshire*, at *Walley* in *Huntingtonshire*, on *Frankenburgh* Castle in *Suffolke*, on the Church walls at *Mayfield* in *Sussex*, and on the Rockes neare *Weston* super mare in *Somersetshire*, and are greene in Winter as well as Summer.

The Names.

It is called in Greeke *Ἀδίαντον* *Adiantum*, quod à διὰ νεῖον in aquis non madescat, the leafe is not wetted with water (which by tryall is found untrue) but *Nicander* his Greeke verses doth shew rather, that the raine reflecteth not on them, which rendred in Latine are thus,

Inopollunt Adiantum quod denso imbre cadente,
Destillant tenuis folijs non insidet humor.

Dioscorides calleth it also *πολύτριχον* *Polytrichum*, quasi multicomum, quod capillos multos & densos faciat, & *Apuleius* *Callitrichon* quasi pulchricomum, quod capillos tingit pulchrioresque reddit: it is called also *Capillus Veneris* in Latine, a species reddendis capillis: and by divers other names as *Cincinnati*, *Terre capillus*, *Supercilium terre* & *Crinita*. The first is called *Adiantum* by *Matthiolus* and many others, and although some give another figure and entitle it *Syracium*, yet it is but one and the same herbe, and species: though somewhat larger, in that countrey, *Lobel* calleth it *Capillus veneris verus*, and *Cordus* on *Dioscorides* *Adiantum nigrum*: the second is the *Onopteris nigra* *Dodonaei* and *Adiantum pulchrum Lugdunensi* simile of *Thalium*: the third *Banbinus* hath mentioned in his *Prodrömus*: the last *Tragus* calleth *Capillus Veneris*, and *Brunfelsius* *Saxifraga major* and so doth *Fuchsius*, *Matthiolus* first called it *Ruta muraria*, and afterwards tooke it to bee *Paronychia Dioscoridis*, *Cordus* calleth it *Adiantum album*, *Dodonaeus*

Dodonæus Ruta muraria, and *Lobel* and *Lugdunensis Salvia vicia*, and many call it *Adiantum album*, white Maidenhaire.

The Vertues.

Maidenhaire is of singular good use against the diseases of the Breast the Liver and Reines especially, yet much conducing to others: the decoction of the herbe drunke helpeth those that are troubled with the Cough, shortnesse of breath, the yellow Jaundies the diseases of the Spleene, stopping of urine, helpeth exceedingly to breake the Stone, provoketh womens courses and stayeth both bleedings and fluxes of the stomacke and belly, especially when the herbe is dry for being Greene by the thinnesse of the parts, it looseth the belly, and causeth choller and flegme to be voyded both from the Stomacke and Liver, and by freeing the stomacke by spitting it out wonderfully clenseth the Lungs, and by rectifying the Liver and Blood causeth a good colour to the whole body, and expelleth those diseases that breede by the obstructions of the Liver or Spleene: it is also said to resist and to cure the bitings of venomous creatures: the herbe boiled in oyle of Camomill dissolveth knots, alayeth swellings and dryeth up moist Vlcers, the Lye made thereof is singular good to cleanse the head from scurfe, and eyther dry or running sores, stayeth the falling or shedding of the haire, and causeth them to grow thicke, faire, and well coloured, for which purpose some boyle it in wine, putting some smalledge feede thereto, and afterwards some oyle. The Wall Rue is held by those of judgement and experience to bee as effectually a Capillarie herbe as any whatsoever, being of the same temperature, and therefore both boldly and safely use it in the stead of any of the other that is not at hand: For experience hath shewed that it is very effectually for the cough and diseases of the Lungs, for the stopping of the Urine and to breake and expell the Stone and therefore divers have placed it among the Saxifrages, and briefly as available as the former Maidenhaire for all the uses there expressed and besides helpeth the burstings in children, for *Martholius* saith that he hath knowne divers holpen by taking the powder of the herbe in drinke for forty dayes together.

CHAP. XII.

Trichomanes. English Maidenhaire.

Very common Maidenhaire doth from a number of hard blacke fibres send forth a great many blackish shining brittle stalkes hardly a spanne long, in many not halfe so long, on each side set very thicke with small round darke Greene leaves and spotted on the backe of them like *Ceterach* and other small Fernes.

The Place and Time.

It groweth much upon old stone walls in the west parts and *Wales*, in *Kent* and divers other places of this Land, it joyeth likewise to grow by Springs and Wells, and other Rocky moist and shadowy places, and is Greene alwayes.

The Names.

It is called in Greeke *Τριχomanes* *Trichomanes* quod rara cute fluentem capillum explet, for *uavis israrum* and *tris capillum*, *Gaza* translatheth it *Filicula*, *Fidicula* as some have it: the Apothecaries beyond the Sea did use to call it *Polytrichum* and *Capillaris*, wee usually call it in Latine *Trichomanes*, and in English common Maidenhaire.

The Vertues.

This Maidenhaire in our Land being more plentifull then the rest, is of more use and of as good effect as any of the former, and severeth well for all the said purposes, but especially against the stopping and dropping of Urine and those that have the Stone in the Kidneyes, and both stayeth the shedding of the haire and causeth it to grow thicke.

Trichomanes. English Maidenhaire.

CHAP. XIII.

Polytrichum aureum. Golden Maidenhaire.

Although there be divers authors that reckon these herbes amongst the Mosses, and so call them, yet there bee againe others as authentically that put them among the Capillarie herbes, and so doe I at this time also.

1. *Polytrichum aureum majus. The greater Golden Maidenhaire.*

This small herbe hath a company of small brownish red haire to make up the forme of leaves, growing about the ground from the roote, and in the middle of them in Sommer rise small stalkes of the same colour, set with

very

very fine yellowish Greene haire on them, and bearing a small good yellow head lesser then a Wheate Corne, standing in a great huske, the roote is very small and thready.

2. *Polytrichum minus & minimum.*

The two lesser sorts of Golden Maidehaire.

These two other sorts are very like the former, but that the stalkes grow not to much more then halfe the height, the one of them being lesser then the other.

The Place and Time.

The first groweth usually on bogges and moorish places, and also on dry places that are shadowy, where the second groweth likewise on *Hampstead-Heath*.

The Names.

The two first are called by many *Polytrichum aureum*, of some *Adiantum aureum*, of *Thalium Adiantum aquinos*, of others *Atuleus capillaris*, and *Bauhinus Polytrichum aureum*, making three sorts, *maius, medium & minus* as *Thalium* doth, but I thinke that diversitie rather riseth from the place then nature of the plant. *Fuchsius* taketh it to bee *Polytrichum Apulei*.

The Vertues.

The Golden Maidehaire is of a temperature betweene heate and cold yet it dryeth rarifieth and digesteth: it helpeth to expectorate tough flegme from the Chest and Lungs no lesse then the other Maidehaires being boyled and drunke: it also provoketh urine, and helpeth to expell the stone, is profitable for Splenetick persons and those that have the Falling sicknesse, the herbe boyled in water or Lye and the head washed therewith strengthneth the rootes of the haire, stayeth it from shedding, and causeth them to grow thicke where they are thin: briefly it is held to be as effectual as any of the maidenhaires, many other incredible things are reported hereof which are rather superstitious and therefore I forbear to relate them,

Polytrichum aureum majus & minus.
Golden Maidehaire the greater and the lesser.

CHAP. XIII.

1. *Ros solis sive Rosella vel Rosa solis.*
Sundew or Rosa solis.

Et mee place this plant with the rest being usually reckoned among the number of the Capillarie herbes for the nearenesse unto them, being of high esteeme formerly, and tell you that it hath divers small round hollow leaves, somewhat greenish, but full of certaine red haire that make them seeme red, every one standing upon its owne footstallke reddish hairy likewise, the leaves have this wonderfull propertie that they are continually moist in the hottest

1. *Rosa solis sive Rosella vel Rosa solis major & minor.*
Sundew or Rosa solis the greater and the lesser.

2. *Ros solis sive Rosella longifolia.* Long leaved Rosa solis.

day, yea the hotter the Sunne shineth on them the moister they are, with a certaine sliminesse that will rise into threads or rope as wee usually say, the small haïres alwayes holding this moisture: among these leaves rise up small slender stalkes, reddish also, three or foure fingers high, bearing diuers small white knoppes one above another which are the flowers, after which in the heads are certaine small seede: the roote is a few small haïres. Some have made a greater and lesser but I thinke it needeth not, yet I have expressed the varietie if there be any.

2. *Ros Solis sylvestris longifolius*. Long leaved Rosa folis.

This was sent me by Mr. Zanche Silliard an Apothecarie of Dublin in Ireland, which sort wee have growing by *Ellestmere* in *Shropshire* by the way sides (the report of Mr. Doctor Coote) whose largenesse and longnesse of the leaves shew the difference.

The Place and Time.

They grow usually on bogs and wet places, and sometimes in moist woods, and flower in *June*, the leaves being fittest then to be gathered.

The Names.

It is of our later writers called *Ros folis* and *Rorella*, and *Rorida* by *Lobel*, and by some *Salserora*, and corruptly *Rosa folis* as wee in *English* doe: the *Germanes* call it *Sunder*, the *Dutch* *Loopicheruyt*, that is, Lustwort, because if Sheepe feede thereon they will goe to Ramme: yet in the North of our Land they call it the red rotte, because as they thinke their Sheepe feeding thereon runne to rotte, some call it also Moore-grasse.

The Vertues.

It is in taste sharpe and quicke, yet a little acide drying and binding: it is accounted good to helpe those that are troubled with salt rheume distilling on their Lungs, which by waisting them breedeth a Consumption, and therefore the distilled water thereof in wine is held profitable for such to drinke, which water will bee of a gold yellow colour: the same water also is held to be good for all other diseases of the Lungs whether it bee Tisicke, wheezing, shortnesse of breath, or the Cough, as also to heale the Vicers that happen in the Lungs, the same water is accounted to comfort the heart and fainting spirits: diuers have much controverted these opinions, because the leaves being applied to the outward skinnie will raise blisters, but so will many other things, and yet are not dangerous to be taken inwardly so it be with discretion. Wee have an usuall drinke made hereof by many with *aqua vite*, and sundry spices frequently used in qualmes and passions of the heart, without any offence or danger that ever I heard of, but rather to good effect and purpose.

Xxxx

LEGV.

LEGUMINA PULSE.

CLASSIS VNDECIMA. THE ELEVENTH TRIBE.

CHAP. I.

Intending to shew you a little world of Pulses, let me for your better apprehension, and my more methodicall declaration, divide them into two principall or primary heads; that is, first into such kindes, as either have claspers, whereby to clime upon what stake, tree, &c. standeth next it, or without claspers, twine or winde themselves about stakes, &c. or any other standeth neare therby. And secondly, into such kindes as have no claspers, doe either stand more upright of themselves, or bend downewards or lie upon the ground, whercunto I will adjoyne the kindes of Trefoiles, as nearest in neighbour hood unto them, with some *Medicas* and *Scorpioides*.

1. *Faba minor sylvestris* The common wilde Beane.
This common wilde Beane groweth upright like the Garden Beane, and kaneth not downe, yet being thicke

2. *Faba sylvestris graecorum, sive Faba veterum.*
The old Greekish Beane.

1. *Faba minor sylvestris* The common wilde Beane.

some the small tendrells at the ends of the stalkes and branches sustaine them the better : it hath leaves like unto the Garden Beane, without any dents on the edges, but smaller, more at a joynt, and growing closer : the flowers stand also more at a joynt, more purplish and lesser : the cods succeeding them, are long and round, smaller than the garden kinde, standing upright, within which are small round beanes, some paler or blacker than others when they are ripe : the roote perisheth yearly. Of this kinde there are some bigger or lesser than others.

2. *Faba sylvestris Græcorum sive Faba veterum.* The old Greekeish Beane.

This Greekeish Beane shooteth forth two or three long flat stalkes, with two edges, lying or running on the ground, if it have nothing whereon it may rampe or rise, which branch out on every side in to stalkes of leaves foure usually set thereon by two and two, with a distance betweene them, like unto the Garden Beane, and each branch ending in a long claspe the flowers are set singly at the joynts of the branches under the leaves, and are of a dead or fullen purple colour, with some palenesse at the bottome of them : after which succede long and somewhat flat pods, with two sharpe edges and dented about, a little hooked or bowing, greene at the first, but blacke and hard when they are ripe, wherein are contained foure or five or more round seede as bigge as Pease, and very blacke, so that one may well say they are rather Pease than Beanes ; the roote groweth not deepe, nor faire with some stringes or long fibres thereat, dying yearly.

3. *Faba veterum ferratis folijs.* The Greeke Beane with dented leaves.

We have had another difference hereof sent us by this name, which onely setteth forth the distinction betweene them little differing in any thing else.

The Place.

The first (wheresoever it is wilde we know not) we sow it generally through the Land, to serve horses for their foode ; the other groweth naturally in Spaine from whence *Guilloum Boel* sent me seedes.

The Time.

These flower in *July*, and their fruit is ripe a moneth or more after.

The Names.

This Beane is called *Κάλαμος ἄγριος* in Greeke, and *Faba sylvestris* in Latine, and *ἑλληνικὸς* in Greeke is added unto the other, and *Faba Græca* in Latine to distinguish it from the *Ægyptia*, a *feracitate dista*, say some. There hath bene much disputation and alteration among our later Writers concerning the *Faba veterum* or *antiquorum Græcorum*, some referring the delineations thereof to our Garden Beane, but with more words than needed, for the ancients comparison of the seede unto that of *Lotus*, *Terebinthus*, and the berries of *Taxus* doth evince all their words and reasons, whereof I doe not intend to say any more here ; for *Lobel* and *Lugdunensis* have shewed the errors and mistakings : the first here set downe, is the *Bana sive Phaselus minor* by *Didonæus*, *Faba minor* by *Lobel*, and *Faba sylvestris* by *Matthiolus*, *Camerarius*, *Lugdunensis*, and others : the other is the *Bana sive Phaselus sylvestris* by *Didonæus*, *Faba Græcorum sylvestris* by *Lobel*, *Pisa nigra* by *Camerarius*, and *Vicia Romana* by him also : Out later Herbarists call it usually *Faba veterum*, or *Græcorum*, and *Lugdunensis Phaselus sylvestris*. Many worthy families among the ancient *Romanes* had their names from Beanes and Pease ; and no doubt first rose from their predecessours, sowing and selling of them, as *Fabius Potens*, *Quintus Fabius Maximus*, or from other accidents, as *Piso*, *Cicero*, and divers others ; and the use to number with Beanes doth continue among the *Venitians* to this day : it was also an usuall custome in former times in *Italy*, and other places adjacent to chuse their Governors by casting Beanes into a Bason, the affirming party calling in a white Beane, those denying a blacke one, and from hence came the manner of choise of officers in many places by the billeting boxe to put in certaine bullets, the greater number in a partition carrying the choise.

The Vertues.

The Garden Beanes are with us more used for foode than for Physicke, yet the lesser also in many other countries is used with a little Wheate and Rie to makethem bread, and being greene nourish more than when they are drie but are more windy, and ea en after they have bene dried or fried engender lesse winde, but are then of harder digestion : the distilled water of the flowers of garden Beanes is used of many to cleanse the face and skinne, and to take away both spots and wrinkles, the same doth the meale or flower of it, as well as of the small : the water distilled from the greene huskes, is held to be very effectuell against the stone, and to provoke urine : Beane-flower is used in pultisses that do assuage inflammations rising upon wounds, as also the swelling of the cods or of womens breasts caused by the curding of their milke, or by inflammations, and represseth their milke, and keepeth backe children from growing too forward being laid to the share : if the flower of Beanes and Fenugreeke be mixed with hony, and applid to felons, biles, blew marks by blowes or bruises, and the impostumes in the kernells of the eares, it helpeth them all, and with Rose leaves, Frankincense, and the white of an egge laid to the eyes that swell or grow out helpeth them, as also the watering of them, or stripes upon them, if it be used with wine : if a Beane be parted into two, the skinne being taken away, and then laid on the place where a Leech hath bene set that bleederh too much, it staieth the bleeding : Beane-flower boiled to a pultisse with wine and vinegar, and some oyle put thereto, ceaseth both paine and swelling of the cods : if fried Beanes be boiled with Garlike, and daily taken as meate, it helpeth inveterate coughes almost past cure, the hoarseness of the voyce, and the impostumes in the breast : the huskes of them boiled a good while in water, that is to the thirds staieth the laske : the ashes of the huskes made up with old hogges greafe, helpeth the old paines, contusions and wounds of the sinewes, the Sciatica also and the Gout. What hath bene spoken of the greater, is also effectuell to the lesser Beane without more repetition. The *Faba veterum* is without doubt that true Beane which *Dioscorides*, *Galen*, and other Greeke authors intended when they set downe all the remedies they set downe of it ; and therefore although we use our ordinary Beane-flower for all the purposes, and to good effect, yet theirs is the most proper, which vertues every one may trie as they see cause.

CHAP. II.

Phasolus. The French or Kedney-Beane.

Have in my former Booke giving you the knowledge of the ordinary *Phasolus*, or Garden French-Beanes of divers colours, but there are sundrie other sorts; some mentioned by *Clasius*, and some by others; whereof with those wee have seene our selves, wee entend to give you in this Chapter a briefe view.

1. *Phasolus flore coccineo*. The Scarlet flowered French-Beane.

The Scarlet Beane riseth up with sundry branches twining about stakes that are set for it to runne thereon, still turning contrary to the Sonne, having three leaves on a foote stalk, as in other of the same kinde: the flowers are for fashion like unto the rest, but are many more set together, and of a most orient scarlet colour: the Beanes are larger than the ordinary kinde, and of a deepe purple turning to be blacke when it is ripe and drie; the roote pe- rish eth like the rest in Winter with us.

2. *Phasolus filiqua hirsuta*. The hairy Kidney-Beane called in *Zurrate* where it groweth *Conhage*.

We have had an other of this kinde brought us out of the *East Indies*, which being planted, was in shew like the former, but came not to perfection, the unkindly season not suffering it to shew the flower, but the cods which were brought, some were smaller shorter, and rounder than our garden kinde, others much longer, and many growing together as it were in clusters, and covered all over with abrowne short hairinesse, so fine, that if any of it be rubbed or fall on the backe of ones hand, or other tender parts of the skin, it will cause a kind of itching, but not strong nor long enduring, but passing quickly away without either danger or harme, the Beanes were smaller then the ordinary, and of a shining blacke colour. There are sundry other strange sorts of Kidney-Beanes, whereof *Clasius* maketh mention: the first, (as most of the rest) groweth up with winding stalkes and branches, and with three leaves set together on long foote stalkes, and many white flowers in clusters, after which succede much broader and shorter cods, with white Kidney-like Beanes in them, spotted with blacke lines. His second sort is not much differing in forme or colour of flower from the former, but that it is somewha paler, and the Beanes are very white, smaller, and more full or swelling than the ordinary white kinde. A third sort is somewhat reddish at the end of the foote stalkes, the flowers stand by couples being larger, pale on the outside, and of a blewish purple within, succeeded by reddish Beanes, thicke and short, and somewhat full and round. A fitt sort hath reddish Greene stalkes, and smaller darke Greene leaves; the flowers were great and many, of a yellowish colour, the Beanes were smaller, contained in shorter and narrower cods,

1. *Phasolus indicus flore coccineo*.
The Scarlet flowered French Beane.

Phasolus fructu diversis et parvis & nigro albis venis.
French or Kidney Beanes of divers sorts.

and

4. *Phascolus erectus*. Upright Kidney Beanes.

1. *Phascoli Americani Purgantis*. 2. *Lati magni albi*.
3. *Egyptij*. 4. *Brasiliani*.
Four sorts of Outlandish Beanes.

Phascolus Brasilianus magna. A great Brasil Beane.

Phascoli parvi ex America,
Small Kidney Beanes of America.

and short, and somewhat full and round. A fift sort hath reddish Greene stalkes, and smaller darke Greene leaves, the flowers were great, and many of a yellowish colour, the Beanes were smaller, contained in shorter and narrower cods, and of a darker colour. A sixt had narrower leaves, with smaller reddish Beanes, & flatter than the other. A seventh grew not so high as the ordinary, or his first, the leaves were as narrow as the last, and the flowers white, the cods short and yellowish being ripe, with white Beanes in them spotted or striped, to the length or arthwart, more great or lesse in some than in others, and in some all blacke, with a few white lines in them, or else parted halfe white and halfe blacke. An eight in leaves and white flowers was like his first, and the Beanes not so white as the ordinary, and sometimes spotted, either directly or confusedly, or becoming blacke wholly. A ninth had great white Beanes spotted with reddish veines. A tenth had purplish flowers, whose hoods were darker, and various coloured Beanes turning blacke in broad flat and brownish cods. An eleventh had blacke lines or veines running in the reddish Beanes diversly marked. The Beanes of the twelfth were of a paler red, with blacke stripes on them. The thirteenth wee have had from *Brasil* the least sort that ever was seene; for although it hath the same forme of three leaves, & twining it selfe, yet are the Beanes blacke shining, and lesse than Tares by the halfe. Another had large white flowers, slender cods, and white Beanes with blacke spots. Another, the least of many whose Beanes were smaller than Pease and round. Divers others might be set forth, but that divers of them came not to maturitie, most of them that sprang had twining branches: yet some grew upright, whereof the fourth sort had short and firme stalkes, not needing any

thing to uphold it, and not above a foote high, whose trefoile leaves had shorter foote stalkes, the flowers were white, and the fruit either white, with a blacke spot, or reddish or pale, or else of a shining swartish colour, which kind, as it is most likely, is the *Phasolus*, or *Phascolus Cordi*, which he describeth in the 43. folio of his Annotations upon *Diocorides*, and in the 127. folio of his History of Plants, although he doth a little vary from himselfe in one of these two places. There hath come likewise unto us and others, both from *Africa*, *Brasill*, the *East* and *West Indies*, *Virginia*, &c. Sundry other sorts and varieties of the Creator in those his creatures: *Lobel* also maketh mention in the 395. page of his *Adversaria* of many rare varieties of these Kindes of Beanes that the *Lady Killegrew* shewed him, which were taken up, and yearly gathered on the sea coasts of *Cornwall*, where it is not knowne that ever any shippe was wracked, but as it is thought were driven thither by the windes from the coasts of *America*; for the inhabitants thereabouts doe yearly gather new forts, some floating on the waters, others raked from under the sandes of the shoare.

The Place and Time.

The first here described grew in the *West Indies*, and first grew with Mr. *Tradescant*, yearly flowering in the usual Season, and giving ripe fruit: the second here described came from the *Magols* countie in the *East Indies*, and onely sprang up with us, but continued not.

The Names.

Diocorides calleth this *σμάλαξ βορηνensis* *Smilax bortenensis* quod *Smilacis* modo conscendit; *Theophrastus* and others *Δολιχός*, or as some write it *Δολιχός*, *Dolichus*, or *Dolicus*, which many Latine Authours follow: some also *Λόβος* and *λβος* propter filiginarum longitudinem. Some also take it to be *Diocorides* his *καμώδης*, or as *Galen* writeth it *καμώδης*, where of there hath bene much controversie among former Writers, as *Matthiolus* against *Manardus*, that thought the *Phasolus* of *Diocorides* to be *Ervilin*, and the *Smilax bortenensis* to be the ordinary *Phasolus*, as it is now adays so called, which opinion, howsoever *Matthiolus* contradicted, and would force his owne, which was *Cordus* his also for he trusteth that the ordinary white Kidney Beanes were the *Phasoli* of *Diocorides*, (which can no wayes stand with reason, seeing *Diocorides* setteth his *Phasolus* among those Pulses that grow wilde, and besides saith, that they are hard of digestion, and move vomiting, which is not proper to these Kindes, but to many wilde sorts of Pulses, and in the Chapter of *Spartium frutex*, compareth the feedes thereof to those of *Phasolus*, and that his *Smilax bortenensis* was the other discolored sorts of Kidney Beanes, but they are as well for me as in effect in my judgement the same. Another doubt there is with some, whether *Theophrastus* his *Δολιχός* and *Diocorides* his *Smilax bortenensis* be but one or divers; but *Galen* in *primi alimetorum* hath decided that long agoe, where he saith, that because *Theophrastus* saith his *Δολιχός* needeth long poles or stakes to uphold it that it may prosper, he surely delineateth these *Phasoli*, or *Diocorides* his *Smilax bortenensis*: so that you see it is without doubt that *Smilax bortenensis*, *Δολιχός*, and our ordinary *Phaseolus* to be all one: *Etim* also in his first Booke saith the same, for assuredly *Diocorides* his *Phasolus* is the same with *Galen* his *Phasolus*, which in the same Booke he joyneth with *Olebens* speaking of *Phaseolus* afterwards, and *Lobel* taketh it to be that Pulse, which is called by *Lugdunensis* *Phasolus sylvarum*, and by *Clausius* *Orobis Pannonicus*: *Cordus* in the places before mentioned maketh *Phaselus* and *Phasolus* to be but one kinde of plant, and differing from *Phaseolus*, which mounteth upon poles, the *Phaselus* nor rising: *Virgil* and *Columella* doe both make mention of *Phaselus* as of a small and vile Pulse: *Virgil* in *Georg. secundo*, in these words, *Scupingum Viciam seres, vilemque Phaselum*. *Dodonaeus* maketh our ordinaty garden Beane to be *Phaselus major*, and the wilde kinde to be *Phaselus minor*, and saith without doubt they are the right: but by his leave they are not right, wherein I referre me to others judgement, considering what I have here before written, and especially in that the Lentill-like feedes of *Spartium frutex*, are by *Diocorides* compared to those of *Phasolus*, when as the lesser blacke Beanes are farre bigger than any Spanish broome feede, or the pods comparable.

The Vertues.

The Kidney Beanes that are nursed up with us of all sorts, and come to maturity, being of easie digestion, and hot and moist in the first degree, doe move the belly, provoke urine, enlarge the breast that is streightned with shortnesse of breath, engender sperme, incite venery, especially if Sugar, Pepper, Genger and Galanga be added thereto: for they are well knowne to most to be a familiar dish of meate taken while they are young, boyled, and stewed, or fried, & some Verjuice put to them, and spice strewed thereon: *Matthiolus* saith, that if the Greene pods be chewed in ones mouth, and applied to any place that is bitten by an horse it will helpe: he also sheweth that the *Italian* dames made a water or *fucus* for their faces of the pods and feedes of these Beanes, with a fresh gourd, crummes of bread, and Goates milke, &c. distilled. The fish called *Scarns* (which is somewhat like a *Barbell*) as *Belonius* doth set it downe in the eight Chapter of his first Booke of Observations is much delighted to feede upon the leaves of this *Phaseolus* or French-Beane, and that therefore the Greekes of *Candy* that dwell neare *Milopotamo* and *Cigalinas*, where this fish doth abundantly breede betwene the rockes, doe use to put the leaves of this Beane into their Weeles, or Bow-nets, as a baite for this fish, knowing that they can hardly be taken by line or hooke but onely with this herbe, and therefore in their Language they call it *Scarovotamo*.

CHAP. III.

Pisum. Pease.

F All the sorts of Garden Pease, I have spoken sufficiently in my former Booke, there remaineth now that I should shew you here the wilde Kindes which are these.

1. *Pisum sylvestre primum*. The first wilde Pease.

This wilde Pease doth little differ from the manured, either in ramping cornered stalkes, or in the broad little Greene leaves, two alwayes being set at a joynt, and sixe or more lesser ones on the branches, which end in a clasper, the flowers are white, many standing on a foote stalke together, which turne into so many cods, each much smaller than the manured, and the feede within, farre lesse also, and of no pleasant taste; the roote is

as bigge as ones finger, and long, with many small fibres thereat.

2. *Pisum sylvestre alterum*. The other wilde Pease.

The branches of this other are scarce halfe a foote long, with broader and shorter leaves on them, but like the former, and more pale, the Pease and cods, likewise not differing in forme but much lesse, the roote abiding many yeares. Of this kinde there is another found to grow somewhat larger.

3. *Pisum sylvestre nigrum maculatum Baticum*. Spanish blacke spotted wilde Pease.

This Spanish Pease is in many things like the first, but that it is lesfer, and the flowers are of a pale yellowish Greene colour, the Pease being of a darke colour, spotted with very blacke spots like velvet: the roote perisheth every yeare.

4. *Pisum spontaneum maritimum Anglicum*. Wilde English Sea Pease.

This Sea Pease differeth not much from the second sort of wilde Pease, but is somewhat greater, and bearing many flowers together in a tuft, mixt of purple and ash colour: the succeeding huskes are small and long, the roote is living.

5. *Pisum alind maritimum Britanicum*. Suffolke Sea Pease.

This kinde of Sea Pease hath a stalke of a trianguler forme full of joynts, bending to the ground, with two leaves at every joynt, branched forth in divers places with winged leaves at them, consisting of teene or twelve darke Greene leaves, set by couples on a middle ribbe, with a small clasper at the end, consisting of teene or twelve unlike unto the Sea Purslane: the flowers grow towards the toppes of the branches, eight or tenne set together in a cluster, upon a small long stalke, which both for forme and colour are very like to the wilde Pease, but with a whitenesse in the middle when it is full blowen, the fruit that followeth is lesfer than the common field Pease, containing eight or tenne Pease in a cod, each whereof hath the whitenesse called the eye, compassing halfe the Pease like a semicircle, which being ripe and drie, are of a darkish colour: the roote runneth downe incredible deepe into the ground, and spreading infinitely therein, even two fathome deepe, at the least, within the very stones and baich of the Sea (yet about a yard or more deepe, there is found some sand wherein it spreadeth) and is not great but slender pliant and flexible, not sweete, but bitter as the whole plant is, and the Pease also: the old stalkes die every yeare, and from the old head will shoote many long white tendrells like the roote of the small Bindeweede whereby it encreaseth wonderfully, and not by the feede, as I am perswaded, for that the shingle forbiddeth their growth falling thereon, in not having any nourishment or moisture of sand, before one digge two or three foote deepe, and the birds for the most part devoure them up. I have also put some of the Pease into the ground of my Garden, but none would spring.

1. *Pisum sylvestre primum*.
The first wilde Pease.

3. *Pisum sylvestre nigrum Batikum maculatum*.
The Spanish blacke spotted wilde Pease.

4. *Pisum spontaneum maritimum Anglicum.*
Wilde English Sea pease.

5. *Pisum aliud maritimum Britannicum.*
Another English Sea Pease.

The Place.

The first is often found in sundry places of this Land: the second on the chalkie hills at *Kings Hay* in *Kent*, not farre from the *Thames*, and the larger sort hereof in some barren fields in *Essex*: the third in *Spain*: the fourth in *Kent* also neere *Rumney*: the last was first made knowne in the yeare 1555 being the third yeare of *Queene Mary* to the Country dwelling thereabouts, that is betweene *Orford* & *Alborough*, where it grew upon the batch of the sea, where nothing, no not grasse was ever seene to grow, and by the dearth of that yeare the people in necessitie of foode, searching every where to take what came next to hand (for as it is said many were forced at that time to make their bread of Acornes) gathered many quarters full of these Pease to serve their use; yet did the neighbouring people acknowledge that they had observed and knowne them to grow there of long time before that deare yeare. Mr. *Stow* in his *Cronicle*, and Mr. *Camden* in his *Britanica*, pag. 354. make mention of these Pease, but both stumble at one stone, that these might come thither by some shipwracke, which cannot be so: and Mr. *Stow* more especially in saying the rootes are great and sweete, for that it is *sui generis*, a speciall kinde differing from all other of that kinde; and as it is probable naturall only to those places about the Sea shoare, for it is found also at *Rie*, at *Pemise* in *Sussex*, at *Gilford* in *Kent* over against the *Comber*, and at *Ingolne Mille* in *Lincolne shire*: Mr. *Iohn Argent* Dr. of Physicke, of the Colledge in *London*, brought from thence also the whole plant, such as you see is here figured, which he gave to Dr. *Lobel* in his life time, to be inserted in his *Workes*, but he prevented by death failing to performe it, I have by purchasing his *Workes* with my money here supplie'd.

The Time.

These flower and beare their fruit with the later kinde of Field Pease; but the last flowereth in the end of *July*, and hath both blowne flowers, and ripe cods in the end of *August*, and blossomes also not halfe forward to blow.

The Name.

Pease are called in Greeke *πιον*, in Latine *Pisum*; the names in their titles are sufficient to distinguish them. for except the first, none of these have beene mentioned by any former Author: the *Italians* call them *Piselli*; the *French* *De pois*, the *Germanes* *Erbse*.

The Vertues.

Pease are lesse windy than Beanes, but passe not forth of the body so soone as they: if the wilde kinde be boyled in Lye, and the head washed therewith, it clenseth it from scurffe and scabbes: the same also clenseth the skin of spots: the meale of them, and Barley mixed with honey and used, healeth foule ulcers; and the meale boiled in water with Vetches, breaketh tumours, and easeth their paines being applied. *Camerarius* saith, that in *Francia*, they call it *Daringicht kraut*, and use to take some of the Pease against the collicke: and apply the herbe outwardly and give it their cattle also for the same purpose, that is, if they vent much,

CHAP. IIII.

Lathyrus. The great wilde Cicheling or Pease everlasting.

OF this kind of Pulse called *Cathyrus* there are two specificall differences, the one that continuē in their roote, and perisheth not, the other annuall perishing continually after seede time : many of the living forts I will intreat in this Chapter, and of the annualls in the next.

1. *Lathyrus major perennis*. The greater Pease everlasting.

This kind of Pease sendeth forth many long flat trayling stalkes, winged on both sides which must be sustained, divided into sundry branches with two leaves at the joynts which are somewhat long and not very broad, with some claspers at the ends of the branches, at the joynts likewise come forth pretty long stalkes with five or six or more Pease-like blossomes, of a fine pale purplish red colour, and of a fine smell, after which succcede small long and hard whitish cods, with small round blackish seede in them, the roote groweth great, blacke and rugged on the outside and runneth downe deepe into the ground. This is that which *Label* calleth *Lathyrus latiore folio*, and hath bene found wilde in divers places with us.

2. *Lathyrus angustifolius*. Narrow leaved wild Cicheling.

This differeth not in durability, forme of growing, or colour of flowers from the former, but in having some what paler flowers and in the Greene leaves which are narrower then they.

3. *Lathyrus sylvestris Dodonæi*. The wilde Cicheling of *Dodonæus*.

This hath longer winged stalkes and somewhat larger leaves, but shorter claspers then the last, the flowers are of a deepe purple, and the cods are long and slender, with small hard round seeds within them : the roote is long and abideth.

4. *Lathyrus arvensis sive Terre glandes*. Pease Earth-nuts.

These Earth-nuts have divers weak and small square stalkes running upon the ground foure or five foote long the leaves are small usually two set together upon a branch with a clasper at the end of each, taking hold of what standeth next to it : the flowers come forth from the joynts towards the toppes of the stalkes upon long footstalkes, many growing together being narrow, and of a deepe reddish purple, somewhat bright, the cods that succcede them are small and long with small round seedes in them, the rootes are tuberosus, blacke and small fastned to long strings, which spread much under ground, in taste somewhat like to a dry Chestnut, *Bambinus* maketh it and the next to be both one plant.

5. *Lathyrus sylvestris lignosior*. Our Wood Earth-nuts.

This creeping wilde Pease-nut hath not onely greater, longer and harder rootes almost woody then the

1. *Lathyrus major perennis*.
The greater Pease everlasting.

4. *Lathyrus arvensis sive Terre glandes*.
Pease Earth-nuts.

former

5. *Lathyrus sylvestris lignosior.*
Our Wood Earth-nut. 6. *Terra glandes Americanae five Virginianae.*
Virginia Earth-nuts.

former, but the crested stalkes also are harder and lye on the ground with foure smooth long and narrow leaves usually, and sometimes five on a branch, smallest at both ends, and one clasper at the end: the flowers are purple or crimson, and the cods are narrow long and somewhat browne in the beginning, and paler as they grow older, within which are small round feede no bigger then a Vetch or rather lesse, and of a wan colour, this is the *Astragalus Silvanicus Thely.*

6. *Terra glandes Americanae five Virginianae.* Virginia Earth-nuts.

Let me adjoyne this plant to these two later sorts for the rootes sake, whereunto in forme they are most like, although differing in the Greene long leaves which are many set on both sides of a middle stalk: the maine stalk it selfe winding it selfe upon any thing standeth next unto it, and rising from a tuberos brown root, which multiplyeth it selfe into sundry others: at the joynts of the stalkes with the leaves and in other places of the stalkes likewise come forth the flowers many standing together spike-fashion, of a fullen bluish colour made almost like hoods, which fall away with us not bearing any fruit, and the leaves and stalkes perishing before Winter, new raising themselves in the Spring.

7. *Lathyrus sylvestris flore luteo.* Tare everlasting.

This ramping wilde Vetch or Tare as the country people call it, because it is the most pernicious herbe that can grow on the earth, for come or any other good herbe that it shall grow by, killing and strangling them: it groweth somewhat like unto the first but the leaves are smaller, the flowers are yellow many upon a stalk and after small round cods with blackish small feede in them: the roote is small and rough running infinitely under ground not to be destroyed.

The Place and Time.

The first and second are usually cherished in Gardens for the beauty of the flowers as I said in my former booke, and like wise hath bene found wilde with us as is before said, if it be not the third which is entituled of *Dodonaeus*, the fourth is said by *Gerard* to grow in many places with us as *Hansfeld*, *Coume Parke*, &c. but we rather thinke it was the next, for the rootes of those wee have hitherto found in our woods and hedges sides have bene more woody then the other sorts, which growing in our Gardens wee have seene to be more tender, and came to us from beyond Sea: the last is found oftener then men would have it, being a plague to Field or Orchard whereinto it once getteth: they all flower from the end of *July* to the end of *August*.

The Names.

This Pulse the Greekes call *Λαθύριον* *Lathyrus*, but is diversly called by divers moderne writers in Latine, for some call it *Lathyrus five Cucircula* and by *Bauhinus* *Ciceracula*, by others *Lathyrus* as *Lobel*, &c. but unfitly for *Lathyrus* is generally taken for Spurge, againe *Aracium* or *Cicera* as *Dodonaeus*, yet *Tabermontanus* to put a difference betweene them calleth them *Lathyrus leguminosa*: *Matthiolus* calleth the first *Chymenum*, *Cesalpini* *Ervum*, *Tragus* *Pisum Graecorum*, *Fuchsius* *Ervum sylvestre*: The fourth is called *Apios* by *Fuchsius* and *Tragus*, but *Pseudoapios* by *Matthiolus*, *Chama balarus* by *Dodonaeus* and *Tabermontanus*, *Terra glandes* by *Lobel* and *Pena*, *Glandes*

Glandes terrestres by *Clausius*, and *Araëbidna* *Theophrasti* by *Columna*, who saith hee can finde none come so neare that of *Theophrastus* as this: the last is called by *Dodonæus* in the Chapter of *Terra glandes Legumentosa glandibus simile*, by *Thalins* *Lathyrus sylvestris floribus luteis*, and *Bauhinus* addeth thereunto *folijs Pici*, the rest are specified with their descriptions.

The Vines.

Galen saith that *Lathyrus* is in substance much like to *Ervilia* and *Phaselus*, and that the countrey people in his countrey of *Asia* did use them not onely as they of *Alexandria* and other Cities did their *Phaseli* and *Ervilia*, but made them into a pultage as they did *Lentills*, but saith hee it is of a thicker consistence then they and therefore nourisheth more.

CHAP. V.

Lathyrus annuus. Yearely or Annuall Cichelings.

He other sorts of *Lathyrus* which are annuall as I said before in the devision of *Lathyrus* in the former Chapter, I reserved to be here set together, distinct from the former.

1. *Lathyrus annuus major Beticus*. The great Spanish annuall Cicheling.

This hath two or three flat stalkes a yard long or more welted as it were with skinnies or filmes on both edges, having two small leaves at each joynt where shoote forth the branches, bearing two reasonable long and broad leaves about the middle thereof one against another, with a twining clasper running out betwene them, the flowers stand singly upon long footstalkes, of a deeper purple colour but lesser then the Garden kinde first described in the last Chapter, after which succede long pale coloured cods very like unto them as the seede within them is likewise: the roote is small not running deepe nor growing great but perissheth every yeare.

2. *Lathyrus Beticus elegans filiquia Orobi*. Spanish partie coloured Cichelings.

This springeth up into divers branches a fadom long, with such like welts or skinnies membranes on both sides, at every joynt whereof come forth long leaves divided at the toppe into two other smaller leaves, and higher upwards, set with six leaves on both sides, and on the middle betwene them commeth forth a small clasping tendrell whereby it catcheth hold of every thing standeth next unto it, at the joynts likewise come forth the flowers, either one or two at the most upon long footstalkes like unto the other of his kind, the upper leafe of a fine Crimlon or Orange colour, and the other in the middle of a perfect white: after the flower is past commeth the fruit in long pods, every seede bunching out like the pods of *Orobis* and as bigge almost as the smaller Peate.

3. *Lathyrus major filiquia brevi*. The greater short coddled Cicheling.

This in manner of growing differeth little from the former, onely the flower hath the inner leaves white

1. *Lathyrus Beticus elegans filiquia Orobi*. Spanish partie coloured Cichelings.

3. *Lathyrus major filiquia brevi*. The greater short coddled Cicheling.

and the outer somewhat purplish: the cods that follow are thicke and short, with small round blackish Pease within them.

4. *Lathyrus minor siliqua brevi.*
The lesser short codded Cicheling.

The difference betweene this and the last consisteth more in the smallnesse then in any other thing saving that the cods hereof have a little roughnesse on them. Wee have another smaller then the last agreeing in most things else saving the cod which is longer and smaller.

5. *Lathyrus major angustissimo folio.*
Grasse leaved Cicheling.

The stalke hereof is slender and weake, the leaves long and narrower then grasse, sometimes two and sometimes three together: the flowers stand each upon a stalke of a blewish purple and sometimes reddish, the fruit is small and blackish contained in small short coddess, crooked at the ends.

6. *Lathyrus minor angustissimo folio.*
Fennell-like leaved Cicheling.

This is smaller weaker and tenderer in all parts then the last, the leaves are as small thin and long as Fennell, the coddess and feede are like the last onely the flowers are of a pale reddish colour.

7. *Lathyrus palustris Lusitanicus.*
Spanish Marsh Cichelings.

This in the beginning differeth little from the first but that the flowers stand usually two together, the outer leafe of a bright purple and the middlemost of a pale purple: the cods are slenderer and as long as the first, of a pale colour with small spotted Pease within them turning blacke when they are dry.

8. *Lathyrus Baticus flore luteo.* Yellow Spanish Cicheling.

This Spanish kind is in bignesse, forme of stalkes and leaves like the first of these here set downe, onely the flowers are all yellow with purple veines in them, after which follow cods very like, and of the same bignesse with the first, but the Pease are smaller and rougher, or as it were netted.

The Place and Time.

All these sorts except the first (which I found in clensing of Anneeseede to use) grow in Spaine, and from thence were brought with a number of other rare feedes belides by *Guillaume Boel* and imparted to Mr. *Coy* of *Stabbers* in *Essex* in love, as a lover of rare plants, but to me of debt, for going into Spaine almost wholly on my charge hee brought mee little else for my mony, but while I beate the bush another catcheth and catcheth the bird: so while I with care and cost sowed them yearly hoping first to publish them, another that never saw them unlesse in my Garden, nor knew of them but by a collateral friend, prevents me whom they knew had their descriptions ready for the Presse.

The Names.

Their severall names are expressed in their titles, none of them being published before, except you may referre the first unto *Bambinus* his *Lathyrus major angustissimo folio*, described in his *Prodromus* whereunto it is most like.

The Vertues.

I have not understood that they serve for meate or medicines to any of the people where they are naturall: but utterly neglected and should never have beene further knowen, as it in like manner falleth out in all countries unlesse a cunning curious searcher, such as this *Boel* was, happen to pry carefully over the coasts of them.

CHAP. VI.

Cicerula. Winged or cornered Cichelings.

Have you see divided this Chapter from the two former, (although they may bee and are called *Lathyrus* by many good authors) upon good grounds as I take it: for although in growing they are like *Lathyrus*, yet some of them have their cods winged, and others not winged, and all have square or cornered Pease within them: I thinke therefore these formes doe argue a specificall diversitie fit to be distinguished, being all annuall also.

1. *Cicerula five Lathyrus sativus flore albo.* White flowered winged Cicheling.

This Cicheling hath weake winged stalkes trayling on the ground if they be not helped like as all the former have, with two small leaves at the joynts and two other narrower leaves likewise on the branches which end in divided clasps, the flowers are white that stand on long footstalkes, and after them somewhat flat and short cods with two little narrow filmes all along the backe of them, the feede within them is somewhat larger then the wild sorts, flat white and cornered: the roote is small and fibrous perishing every year.

2. *Cicerula flore purpureo.* Blackish purple winged Cichelings.

This other is in manner of growing like the former, the flowers onely and the fruit declare the difference, for the

the flowers are of a darke dead purple, and the cods that follow are small and with filmes at their backes, like the last, the feede within them are cornered but of a darke colour almost blacke.

3. *Cicerula Betica & Egyptiaca Clusij.*

Blew flowered Cichelings.

This also differeth in nothing from the former but in that it hath larger leaves and the flowers pale, blew on the outside and the inner leaves more blew, the cods are small and almost round winged at the backe like the former, wherein lye browne cornered feede.

4. *Cicerula flore rubente.*

Red flowered winged Cichelings.

The manner of the growing hereof is in all things like the former, but that the greene leaves are narrower and longer then the last, and the flowers are of a kind of dead Orange colour after which follow some what short round cods with brownish cornered feede.

5. *Cicerula sive Lathyrus Beticus Asmetorum.*

Spanish bush Cichelings.

Vnto these kinds of Cichelings let me adde this as coming nearer unto them then unto Vetches, for this hath divers long weake stalkes with filmes on the edges, at the joynts are two small leaves, and from betweene them come forth the branches, having divers small darke greene leaves set on them, somewhat round at the ends, sometimes three on a side and sometimes but two, yet not alwayes one against another, from the bosome of the stalke and the branch commeth forth usually two flowers on a long footestalke the upper leafe being reddish and the other purplish, after which come long smooth cods without any filme at the backe having within them round but depreised or somewhat flat feede of a brownish colour.

3. *Cicerula Betica sive Egyptiaca Clusij.*

Blew flowered Cicheling.

1. 2. *Cicerula flore albo vel purpureo.*
Winged Cichelings with white or blackish purple flowers.

4. *Cicerula flore rubente.*
Red flowered Cichelings.

The Place and Time.

All these sorts were brought us out of *Spaine* although they grow in other countries also: they flower and beare ripe fruit when the former doe.

The Names.

The three first are remembered by our moderne writers, *Dodonæus* calling the former *Aracum sive Lathyrus minor* and *Cicerula*, *Lobel Lathyrus angustiore gramineo folio*, *Camerarius Lathyrus flore albo*, *Lacuna* called it *Ervum*, *Fuchsius Ervum album sativum*, by *Tragus Pisum Gracorum sativum*, and by *Cordus* on *Dioscorides Phaeolus minor*, aliquibus *Ervum angulosum*: the second *Dodonæus* calleth *Aracum sive Cicerula*, and *Camerarius Lathyrus flore purpureo*: the third *Clusius* calleth *Cicerula Egyptiaca*, and *Camerarius Aracum Hispanicum sive Lathyrus Egyptiacum*: the fourth was called by *Boel Lathyrus Beticus flore miniato*, and the last by him also *Lathyrus Beticus Dume-*

The Vertues.

All of them as *Boel* saith are eaten by the poore people in *Spaine* in the want of bread, for where these are food seldome doe they taste of any bread of Corn: they are all of a compact substance, and therefore nourish more but are hardlier concocted.

CHAP. VII.

Orchys sive Ervilia. Winged wilde Pease.

Of this kinde of Pulse I have onely seene and nourished up with me two sorts much differing in the manner of growing and finite from any of the other Pulses as shall be shewed.

1. *Ervilia flore & fructu albo.* The white winged wild Pease.

This kind of Pease hath two or three stalkes at the most which are broad and flat, welted or winged at the sides with some what long leaves shooting from them small at the setting to the stalke and broader to the end, as it were growing from the middle ribbe of the other, at the toppe whereof standeth two or three twining claspers: this never shooteth forth any branches that ever I could see, but the leaves from almost the bottomes of the stalkes upwards are parted as it were at the toppe of them into one or two smaller leaves, or rather one or two smaller leaves grow at the toppe of them with the claspers between them. at the foote of these leaves come forth single flowers, like the former *Cichelina*, wholly white which turne into small round and long cods, with small crooked points at the ends, and filmes at the backes, wherein are contained small round whitish pease, somewhat bitter, the roote is small and long, with some fibres which wholly perish yearly.

2. *Ervilia altera.* The black sh winged wilde Pease. This other differeth in nothing from the former, but in the flowers which are tending to a reddish purple, and the Pease in the Cods, which are more duskie declining to a blacke.

The Place and Time.

These we onely nurse up in our Gardens, having received them from friends, that are lovers of rarities, yet *Lobel* saith they grow naturally in *Lombardie*, they flower and give ripe fruit from the middle of *Iuly* to the end of *August*.

The Names.

That which *Theophrastus* in *quarto de causis plant.* 2. calleth *Ochrus*, *Gaza* translateth *Cicera*: but by *Pliny lib.* 18. c. 7. *Ervilia*, by which name it is usually called in these later times by most Herbarists. *Lobel* saith it seemeth to be so called *quasi eruenda & ejcienda*, *Matthiolus* calleth it *Aracum niger* but erroneously; *Dodonæus* calleth it *Ervilia sylvestris*, *Lobel Ochrus sylvestris sive Ervilia*, and *Lugdunensis* saith the Herbarists in his time called it *Cicer ervinum*, the other hath not bene mentioned by any before.

The Vertues.

We finde that *Galen* writeth in *lib. alimentorum* that *Ochrus* hath a meane or middle property, betweene those that be of good & bad nourishment, and between those that are of easie and hard digestion, breeding and not breeding wind, and nourishing much or little, and nor of any speciall quality: in these later times, it is held to have a drawing, digesting, cutting and clensing faculty, for it is moderately hot and moylt and a little bitter withall, whereby it is available to purge the Liver Spleene and Reines, and to cleanse the skinne from morpew, scurfe, leproy and running tetters, it dissolveth hard tumors in the cods, and healeth Impostumes and foule sores being used with honey.

1. *Ochrus sive Ervilia flore & fructu albo.*
The white wilde winged Pease.

CHAP. VIII.

Aphaca. The yellow wilde Vetch.

Have thought it fittest to place this Pulse alone by it selfe, and before the Lentills, as partakin thereof, not finding any other of the former or following Pulses, to be answerable thereunto, and therefore take the description thereof here in this manner. It riseth up higher than Lentills, with many weake slender and cornered stalkes full of joynts, with small leaves at them set by couples close together untill they be well growne, which then stand more separate in sunder, each whereof is broad at the bottome, as it were closing the stalke, and small at the end, somewhat like unto the small Binde-weede leaves branching upwards, and every one ending in a small clasper, the flowers come forth at the joynts of the leaves, and claspers with them, from the middle upwards, of a pale yellowish colour, and afterwards small and somewhat flat cods, longer than those of Lentills, wherein lie foure or five hard blacke round flattish shining seede, the roote is small and long, with many fibres and endureth not, perishing every yeare.

The Place and Time.

It groweth in divers corne fields in Kent, and else where, bloweth in July, and the seede is ripe in August.

The Names.

It is generally held to be the *Aphaca* of *Dioscorides*, *Galen*, and *Pliny*, the name being deriued from the Pease and the Lentill, both which it doth in some parts resemble, but not that of *Theophrastus*, which is accounted *interintubacea*, but that in *8. Hist. Plant. c. 5.* among Lentills, Pease, and other Pulse, it is taken also by *Lugdunensis* to be his *Orobancha lib. 5. causam c. 22.* that groweth among *Orobancha* and strangleth it, *Anguilara* and *Camararius* take it to be his *minor pinese*. *Dodonaeus* and *Lobel* call it *Aphaca Dioscoridis*, *Lugdunensis Orobancha legumen*, because he acknowledged another *Orobancha Tabernmontanus* *Elatina tertia*, and *Bauhinus* *Vicia lutea folijs convolvuli minoris*.

The Vertues.

Dioscorides saith that it hath an astringent proprietie, and that therefore being parched, broken and boiled, after the manner of Lentills, they stay the fluxes, both of the stomacke and belly. *Galen* saith it is binding as the Lentill, & is used to be eaten as the Lentill: but it is harder digested, yet it drieth more powerfully, and healeth moderately, which astringent qualitie, saith *Dodonaeus*, we have found true by our owne experience in this *Aphaca*.

Aphaca. The yellow wilde Vetch.

CHAP. IX.

Lens Lentills.

Here are three sorts hereof, a greater, a lesser, and a spotted one, as shall be declared.

1. *Lens major.* The greater Lentill

The greater Lentill hath sundry slender weake branches somewhat hard, two foote long, from whence shoote forth at severall paices long stalkes, of small winged leaves, that is, many on each side of a middle rib, without any odde one at the end; for the middle ribbe of each stalk endeth in a small clasper: the flowers are small, and rise from between the leaves and the stalkes, two for the most part at the end of a long foote stalke, of a sad reddish purple colour, somewhat like to those of Vetches, after which come small short, and somewhat flat cods, within which are contained two or three flat round smooth seede, of a pale yellowish ashe colour: the roote is fibrous, and perisheth yearly.

2. *Lens minor.* The lesser Lentill:

This other is lesser both in stalke, leaves, and seede, the flowers are more pale, and the seede in the cods is whiter, wherein consisteth the whole difference.

3. *Lens maculat.* Spotted Lentills.

This likewise sheweth little difference from the last in any thing, but the seede which is blackish, spotted with blacker spots.

The Place and Time

These 2. former even beyond the seas, are onely sowne in the fields as other manured Pulses are, and so are they in forme

Yyy 2

some countries in our land, especially the smaller sort, which is every where, the more pleasant and acceptable, but the greater doth very hardly come to maturitie with us, if the season be not kindly and drie: the last is wilde in Portugall.

The Names.

It is called in Greeke *φάσις* and *φαση*, *Phacos*, and in Latine *Lens* and *Lenticula*, *Pliny* saith, lib. 18. cap. 12. that the Etymon thereof seemeth to be taken, *quasi lenis dicta sit, lenitatisque significationem habeat, & equanimitatem fieri vescentibus ea*. The Arabians call it *Hades*; the Italians *Lenticchia*, the Spaniards *Lenteias*, the French *Lentille*, the Germanes *Linsen*, and so doe the Dutch also, and wee in English *Lentills*, but the country people in *Hampshire*, and other countries, where they sow it in their fields for their cattles foode, call it *Tills*, leaving out the *Lent*, as thinking that word agreeth not with the matter, *Ita sicut Minervam*.

The Vertues.

Galen saith, that Lentills hold a meane betweene heate and cold, yet doe they drie in the second degree, the outer skinn being binding, and the inner meate also, yet a little harsh and bindeth the body, but the outer skinn much more: it is, saith he, of contrary qualities, for the decoction thereof doth not binde, but loosen the body, and therefore they that would have it to binde, cast away the first water, and use the second, which staeth laskes, and strengtheneth the stomacke and all the inward parts. Lentills husked, saith hee, lose with their shells, the strength of binding, and the other qualities that follow it, and then nourish more than those that are not husked, yet so giveth a thicke and evill nourishment, and slowly passe away, neither doe they stay fluxes and disenteries as those that are not husked. *Galen* further setteth forth the qualities hercof: largely to ease the broth of Lentills, saith he, breedeth the Leprosie and cankers, for grosse thicke meate, is fit to breede the melancholike humour, and therefore it is profitably given to those that are of a waterie disposition, and evill affected thereby: but is utterly forbidden to those that have dry constitutions: it is also hurtfull to the sight dulling it by drying up the moisture, and is not convenient for women that want their menses, but rather for them that have them in too much abundance. *Dioscorides* further addeth, it breedeth troublesome dreames, and is hurtfull to the head, the lungs, and the sinewes: with other binding herbes, as *Pur-troble*, *red Beeres*, *Mirtles*, *dried Roses*, *Pomegranat rindes*, *Medlers*, *Services*, &c. taken with vinegar, it is the more powerfull to binde and stay laskes and fluxes: the decoction thereof with wheate flower applied caseth the gout, used with bony it closeth up the lippes of woundes, and cleanseth foule sores: being boyled in vinegar it dissolveth knots and kernells; and being boiled with Quinces, Mellilot, and a little Rosewater put thereto, it helpeth the inflammations of the eyes and fundament, but for the chappes thereof which neede a stronger medicine, it is boiled with dried Roses and Pomegranate rindes, adding a little hony to it: it likewise staeth those creeping cankers that are ready to turne to a gangrene, putting thereto some sea-water, and so it is good for wheales, and running or watering sores, *S. Antonies fire*, *kibes*, &c. being used with vinegar: it is good also for womens breasts, that by abundance of milke have it crudled within them, if it be boyled in sea-water and applied to them: the decoction thereof is a good lotion for ulcers, either in the mouth, privie parts, or fundament, adding a few Rose-leaves and Quinces.

Lens major vel minor. The greater or lesser Lentill.

CHAP. X.

Aracis five Cicera. Wilde Cichling Pease.

Have two sorts of Pulses to bring to your consideration, better agreeing with this title, in my judgement than any other, let them of better learning and knowledge judge of them.

1. *Aracis major Batianus.* The greater Spanis wilde Cichling Pease.

This greater Pease spreadeth on the ground, with divers square hairy, and crested stalkes, sometimes a yard long or more, at the severall joynts whereof, grow many darke greene hairy pointed leaves, on each side of a middle ribbe, which endeth in a clasper like the former Lentills or Vetches, at the foote of the leaves come forth single flowers on very short foote stalkes, of a duskie whitish purple colour, with deeper purple veines therein and of a deeper purple at the bottome of the upperleaves next to the stalkes, which when they are past, there come in their places short, thicke, and almost round blackish cods, covered with a short hairinesse thereon, within which lie three or foure round blackish seede or Pease, almost like unto blackish velvet as bigge as the *cicerula*, but not cornered: the roote is small and fibrous, and perisheth yearly.

2. *Aracis minor Lusitanicus.* The lesser wilde Cichling Pease.

This other agreeth much with the former, but lesser in all parts, and nothing hairy; the flowers are of a pale white

white in my Garden, or whitish yellow colour in others, and the cods, smooth, smaller, not hairy, with smaller and blackish coloured Pease within them: the roote hereof perisheth likewise.

The Place and Time.

Both these Pulses were brought and sent me among other seedes by Boel before mentioned: the first out of Spaine, and the other out of Portugall, and flowered in the end of July, giving their seede in August and September: but as he said, he gathered the ripe seede in Aprill and May, in the naturall places.

The Names.

Galen in putting a difference betweene *degras* and *epoyus*, *Aracus*, and *Arachus*, the one with *x*, the other with *z*, (and saith that *Arachus* is a wild weede or plague in corne, and that they picke it out of the corne, and cast it away as they doe *Securidica*, the hatchet Fetch: and Theophr. 8, Hist. c. 10. saith also that it is a hard and rough thing growing among Lentills; but of *Aracu* hee speaketh, *lib. de alimentorum facultate*, in an other place) giveth me occasion to referre these Pulses thereunto, especially because judicious Authors have rendered it *Cicera* in Latine; and *Columella* saith that *Cicera* differeth not from *Cicerula* in taste, but in colour, because *Cicera* is darker or blacker than *Cicerula* and *Palladius* also in *Martio* saith the same thing: but *Arachus* which is rendered *Cracca* in Latine, is more like a Vetch, both in growing and in bearing many flowers in a spike at the toppe, which this doth not: thus have I endeavoured to distinguish these plants, which I finde so many learned Writers before me have confounded, but *Dodorus* his *Aracus* or *Cicera*, as I have shewed you before, pertaineth to an other kinde: the first of these came to me from Boel, by the name is in the title, to whose opinion I wholly incline, having often found him in our naturall search for simples in sundry places to be one of singular judgement and experience; the other hee sent me out of Portugall, where he had the knowledge of it by *Nunnez Braddon*, a lover of rare plants, and therefore according to his title of *Legumen pallidum*, he added *Norij Braddonij*, by which name it hath bene knowne to others, and I now thinke fit to referre it to the other.

The Vertues.

Wee have yet learned nothing concerning their faculties.

4. *Araculus minor Lusitanicus.*
The lesser wilde Cicheling Pease.

CHAP. XI.

1. *Arachidna Cretica.* Under ground Candy Cicheling Pease.

His pulse (which for the wonderfull growing thereof hath amazed some, and made them search if it were not mentioned in any former author (as I shall shew you by and by) riseth up with divers stalkes, about a foote high, having on them both winged leaves, that is, eight or tenne set on both sides, of a middle ribbe, ending in a clasper, very like unto Lentills or Vetches, very variable or differing one from another, for some of them are small and pointed, others a little round, and some (the stalkes will have but two leaves, either round or pointed, and others will have foure: the flowers are of a reddish purple, standing singly at the joints, which afterwards yeeld small long cods bigger than those of Vetches, wherein lie foure or five hard round, and very blacke seede: the roote is composed of many small pods, as it were like unto Lentill cods, hanging by small strings, wherein is contained in some one seede, in others two, in some one very blacke, in others paier, and in others of differing colours, or partly coloured; each whereof being planted a new will spring and beare a plant like the mother.

2. *Arachis sub terra siliquifera Lusitanica.* Portugall underground Pease or Cichelings.

Somewhat like unto the former have we received from Portugall another sort hereof, whose slender branches rising not much above a foote high, lying for the most part upon the ground, had many small narrow leaves (set thereon without order up to the toppes, where and with the leaves also come forth small reddish flowers which turne into small & long cods, containing small round seed within them: the roote shooteth down right with many fibres thereat, and at the head of the roote, as also at the other parts spring thicke and short whitish pods, especially while they abide under ground, but changing darker afterwards, containing within them one or two seedes at the most, bigger by much than those in the pods above ground, and somewhat speckled.

3. *Arachis sativa Americana.* Underground Cicheling of America or Indian Earthnuts.

The Indian Earth-nuts (the figure whereof, I give you together as they are termed to us by them that have brought them us) are very likely to grow from such like plants as are formerly described, not onely by the name but by the sight and taste of the thing it selfe, for wee have not yet seene the face thereof above ground, yet the fruit, or Pease-cods (as I may so call it) is farre larger, whose outer huske is thicke and somewhat long, round.

at both ends, or a little hooked at the lower end, of a tullen whitish colour on the outside, striped, and as it were wrinkled, bunching out into two parts, where the two nuts (for they are bigger than any Filberd kernell) or Pease doe lie joyning close one unto another, being somewhat long, with the roundesse firme and solide, and of a darke reddish colour on the out side, and white within tasting sweet like a Nut, but more oily.

The Place and Time.

The first was sent out of Candy by Honorius Bellus, who found it growing there among corne & Pulse, unto Ioannes Pona of Verona, who set it forth in the description of Mount Baldu, and flowered in the end of Summer, as the second did that was sent us from Lisbon by Boetius, and the last groweth in most places of America, as well to the South, as West parts thereof, both on the maine and Islands.

The Names.

The first is truly taken by Bellus, aforesaid, to be the *Arachidna* (or *Arachidna* as *Columna* hath it) or *παραχιδνα*, *Aracoides*, or *Araco similis* of Theophrastus mentioned in his first Booke and eleventh Chapter, no other plant yet knowne, agreeing so rightly thereunto, and describer it, but the fruit groweth as much neere under the ground joyning to the small fibres thereof as above: and yet he there saith also, that neither of them beare any leafe, nor any thing like leaves: which bow this can stand with fence and reason I know not, and therefore many doe suspect the text to be faultie, or else he is contrary to himselfe, for he saith they beare no lesse fruit under ground than above, and then they must beare fruit above ground, which how it can be without leaves I see not, for I never read, heard, or saw, that any plant bore fruit above ground without stalkes and leaves; the comparison unto *Aracis* also carrying the more probabilitie: but surely he was misinformed by those that gathered the rootes with the fruit on them when the stalkes and leaves were withered and gone, he never seeing the plant, as it is likely, or gathering it himselfe: the etimologie also of the name being composed of *ἄραχος* and *πύριον*, *Aracis* and *hudson*, which is *tuber*, confirmeth a supposall in me, that he meant this underground fruit was like the fruit of the foregoing *Aracis* above ground, and such like is the underground fruit hereof in cods with pease in them: but *Columna* maketh the *Terra glandes* before declared to be rather this *Arachidna*, both from the solid rootes under ground, and the likenesse of the plant unto *Aracis*; and surely it may be that both these were meant by Theophrastus, for he maketh two sorts, and both alike in bearing fruit under ground, that is, *Arachidna* and *Araco similis*, or *Aracoides*: and we have also two plants, as I here shew you, *Aracis* before this, and *Arachis* after it, unto which they may be referred: the other two sorts are entituled as I thinke it fittest for them: the *Candiots*, as Bellus saith, call the first *ἄραχος*, *Agriophaci*; the second was sent me by the name of *Lathyrus sub terra siliquifera*; the last is generally called by our English Sea-men that goe into those parts Earth-nuts, erroneously enough, as they doe most other things that they there meete with.

The Vertues.

There is no propriete found out where with this is invetted that we can understand of as yet.

1. 2. 3. *Arachidna Cretica* Honorij Belli: Sub terra siliquifera Lusitanica, & Americana magna. Under ground Pease or Cichelings of Candy, Portugal, and a great kinde of America.

CHAP. XII.

Arachis sive Cracca. Wild Vetches or Tares.

Of these wilde Vetches there is a greater and a lesser knowne differing from the manured kinde, or those referred thereunto, whereunto I adjoyne another stranger.

1. *Arachis sive Cracca major.* The greater wilde Vetch or Tare. This greater kind of wilde Vetch hath a few slender crested stalkes lying on the ground, if it finde nothing whereon to rampe, or take hold of; at the joynts come forth winged leaves, that is, many set on both sides of a middle ribbe ending in a clasper, but lesser than those of Lentills, or the manured Vetch; the flowers are purple like the Vetch, and grow usually but one at a joynt, after which come small long blacke cods, lesser than Vetches, and so is the seede within them, but round, and not flat as Vetches are: the roote is small and periseth.

2. *Arachis sive Cracca minor.* The lesser wilde Vetch or Tare. This other wild Vetch differeth in no other thing from the former but in smalnesse, except that this hath whitish flowers standing in tufts at the toppes of the stalkes, and the cods that follow are shorter and somewhat hairy, and the seede within whitish: the roote hereof hath small whitish kernells hanging among the fibres.

3. *Arachis*

1. *Arachis seu Cracca major*.
The greater wilde Vetch or Tare.

3. *Arachis Indicus seu Africanus*.
Corall beads of Guiney.

3. *Arachis Indicus seu Africanus*. Corall beads of Guiney.

This brave plant too tender for our climate groweth like the former but with more store of leaves and flowers and fruit, ten or twelve growing together in thicke, short and rough brownish red cods, the Pease within being roundish and as red shining as if they were polished Corall beads, but with a blacke spot on the one side as hard almost as a stone, and enduring being strong for bracelets a long time. Lobel long before Clusius set out this plant, whose pod with the seede being misser is in the next Chapter.

The Place and Time.

Both these sorts are often found in the fields among Corne, where they will in a rainy time quickly overspread and choke the Corne or any other herbe it groweth by, they flower in *Italy* and giveth seede presently after, the other came out of *Africa* towards the *Indies*.

The Names.

This is rightly adjoined to be *ægyptus Arachis* of *Galen* and the other old *Græcians* writers, and hath his name according to his nature, for as *Lobel* defineth it as *ægyptus quasi pestes perniciosæ leguminosa frugis unde ægyptus*: The two first are generally called by all authors *Arachis* or *Cracca* except *Tragus* who callth them *Vicia major* and *minor*, or *quarta* and *quinta*, and *Dodæus* that thinketh it may be that kind of Pulse growing among Corne which the *Greekes* call *ægyptus Arachis*, and contesteth against *Fuchsius* and others that called it *Cracca* the especiall note saith he of difference from the other sorts of *Vicia* is that this seede is exquisite round and all other sorts of *Fetches* somewhat flat: the last is mentioned by *Clusius* in his fourth booke of *Exoticis* and 15. Chapter by the name of *Vicia Africana*, and *Lobel Pisum Coccineum Americum*.

The Vertues.

The properties of these are referred to the other sorts of *Fetches* and therefore I shall put you over to the end of the next Chapter to be informed thereof to avoyd a double recitall of one and the same thing, onely this is a certaine knowne Pulse to Doves wherewith they are much delighted, and although they be wild, yet where the Dove houses are served herewith they also will resort and become tame with the rest, and therefore some country people knowing it sow some fields therewith to serve to that use.

CHAP. XIII.

Vicia. Vetches or Tares.

He Vetches are of divers sorts, some manured or sowed, others wild growing in woods or hedges besides those before specified which shall be declared in this Chapter.

1. *Vicia vulgaris sativa*. The manured Vetch or Tare.

The manured Vetch or Tare hath divers square stalkes rising somerimes two foote high, entangling themselves one with another that they stand in the field without neede of any other proppe, the leaves

leaves are winged thicker set together then the former wild kind, or set on both sides of the middle ribbe, the end whereof runneth out into a divided clasper and are larger also then they: the flowers stand two together and are long and narrow of a darke purple colour, the cods that succede them are long and somewhat broad, wherein lyve five or six flat blackish seede and in some grayish: the roote is stringy and perisheth every yeare.

2. *Vicia sativa alba*. The white manured Vetch.

This other differeth not from the former in growing but is tenderer, the leaves not so thicke and the flowers and fruit more white.

3. *Vicia maxima dumetorum*.

The great wilde Vetch of the hedges.

This great Vetch groweth like the former, but is larger both in number and size of the leaves: the flowers likewise are somewhat large but shorter and more wan or pale, the cods succeeding are shorter also and blacke and so are the feedes within them.

4. *Vicia sylvestris alba*. White wild Vetches.

The white Vetch groweth in forme like the other but the winged leaves have a hoary downe upon them, the flowers are white with darke purple veins running through them, the seede is flat as the other but the roote hereof liveth as many of the wild kindes doe.

5. *Vicia multiflora sive spicata*. Tufted Vetches.

The tufted Vetches hath such like trayling branches as the other have but weaker, the winged leaves are more in number 12, 20, or more on a ribbe, longer and narrower then the former, and standing more upright, and not alwayes set opposite one to another but unequally, the flowers likewise that stand upon the long naked footstalkes are more in number sometimes twentie together but smaller, somewhat like unto the flowers of *Onobrychis* Cocks head, and of a bright blewish purple colour, and sometimes of a darke purple with some white in them, the cods succeeding are long and the feede blacke within them: the roote creepeth under ground farre about, shooting new branches every yeare for the old ones perish.

6. *Vicia sylvestris vulgaris*. Strangle Tare or Tync.

The Strangle Tare groweth like the former Tares but is rougher both in leaves and stalkes, it is smaller also and not so high, the flowers are purple and the cods blacke, small and long with many small feedes within them: it riseth every yeare of it owne sowing, and choketh the Corne or any other herbe it groweth neare.

1. *Vicia vulgaris sativa*.
The manured Vetch or Tare.

4. *Vicia sylvestris flore albo*.
White wild Vetches.

Silqua cum semine Aracii Indiarubri.
The pod and seede of the red Indian
Vetch or Corall benche.

Place and Time.

The first two sorts are sown in fields as Beanes and Pease to serve for cattells foode, both in our owne Land and others, whereof in necessitie the poore are forced to make their bread, and are sown, and reaped when the other Pulses are: Some of the other wilde kinds are also found in woods and moist ground with us, among hedges and bushes; but the Indian kind as Mr. Gerard tooke it to be in Germany as it is likely.

The Names.

Galen his *Bisur Bicium* of the *Africans* his country people is generally taken to be *Vicia* of the Latines, a *vincende* as *Uarro* will have it: those of *Athens* called it *oxor* and *uauor* *Syracum* and *Cyamum*: the first is called *Aphode* by *Matthiolum* and both it and the second specially were formerly taken for *Orobun* by the Apotbecaries, and the other learned and Doctors both in the upper and lower Germany as *Brunfelsium* and *Tragus* doe shew, and crope over hither also, untill they being reformed beyond Sea by getting the true *Orobun*, or at least that which is nearest thereto, hath made both them & us to forsake the old error and joy in the true; the white one being most likely that Pulse which *Gerard* had by the name of *Pisum Indicum*, & is set forth by the name of *Vicia Indica fruticosa* in the new *Gerard*: the third is called by *Bauhinus* *Vicia maxima dumetorum*, and I doe so too, but others *Cracca major*, and *Osmunda*, and because *Galen* joyneth *Aphaca* with *Vicia*, divers did follow him and call it *Aphaca*: but *Tragus* calleth it *Vicia sylvestris altera*; the fourth is that which *Clusius* calleth *Vicia sylvestris in flore albo*, & the fifth he also calleth *Vicia sylvestris flore spicato*, and is the same both with *Dodonaeus* his *Galega altera*, and *sylvestris Germanica*, which *Bauhinus* calleth *Multiflora*, and the same also with his *Vicia Onobrychidis flore*, as any that shall read their severall descriptions and compare them may see, it may also bee called *Vicia sylvestris nemorum* the wilde wood Vetch: the last is called by *Matthiolum* *Vicia* as it is indeede the worst of all, but not the great or manured one. The *Italians* call it *Ueccia*, the *French* *Vesce*, and the wild kindes *Vesce sauvage* and *Vesceon*, the *Germanes* *Wicken* and the wild kind *Wald Wicken*, and the greatest *S. Christoffelz kraut*, the *Dutch* *Witten*, and wee in *English* *Vetches*, *Fetchees*, *Tares* and the wilde kind *Time*.

The Vertues.

If these be eaten by men (as *Galen* saith in time of dearth as some did when they were greene) they yeeld a thicke clammy nourishment, are hard of digestion, and bind the belly, and therefore fit to breede melancholy, the meale thereof is used with other things to stay running Vicers and Cankers that are ready to Gangrene: and made into a Pultis and layd on the belly they binde a laske.

CHAP. XIII.

Lupinus. The flat Beane or Lupine.

HAVING finished the number of climbing or ram-
ping Pulses, it remaineth to shew you the rest
which have no claspers and first to begin with
the Lupine or flat Beane, for the great Garden
Beane which should stand in the fore front I
have shewed you in my former Worke with the greater
and smaller blew and yellow Lupine, yet I thinke it not
amisse to give you some of their Figures here.

1. *Lupinus sativus albus*. The great white Lupine.

The great white Lupine riseth up with a strong upright
round hollow soft or woolly stalk set confusedly with di-
vers soft woolly leaves upon long footstalkes, each being
divided into five, seaven or nine severall parts, narrow long
and soft, greenish on the upper side and woolly under-
neath: the maine stalk divideth it selfe into two parts, after
the flowers are grown from the uppermost joynt, and are
like unto the great Garden Beane but wholly white with-
out any spot, the branches flowering after the first flowers
have given slender long soft or woolly cods, lesser then of
the Garden Beane, containing within them foure or five flat
white Beanes somewhat yellowish within and very bitter
in taste: the roote is somewhat long and hard with divers
fibres annexed thereto perishing yearly.

2. *Lupinus albus*. The spotted white Lupine.

This other Lupine differeth from the former in the great-
ness and in the flower which is spotted with blew, on
the head of the innermost leaves, and the hollow of the
uppermost.

3. *Lupinus minimus caruleus*.

The smallest blew Lupine.

This small Lupine is very like unto the former blew Lu-
pine set forth in my former Booke, in the manner of grow-
ing being little or nothing woolly also but smaller both
stalkes and leaves, the flowers likewise are wholly blew
as they, or very seldome with a white spot in it: the seeds
is smaller likewise and a little spotted.

Faba major hortensis. Our ordinary Garden Beane.

q. Lupinus

Lupinus flavescens. The yellow Lupine.1. *Lupinus varius albus*. The great white Lupine.

2. *Lupinus minimus ceruleus*.
The smallest blew Lupine.

6. *Lupinus medius ceruleus*.
A middle sort of the great blew Lupine.

4. *Lupinus Gadenfis marinus flore ceruleo.* The blew Sea Lupine.

This Sea Lupine is somewhat like unto the smaller blew Lupine described in my former Booke, but lesser, or betweene it and the smallest blew last of all described: the flower is of a most excellent blew colour, with some white spots in them, the feede is small and round.

5. *Lupinus Arabicus.* The Arabian Lupine:

Having well considered this Lupine, I finde that I have described it among the Cinquefoiles, because the leaves did so nere resemble a Cinquefoile, and comming to me by that name, but since that having read *Pona* his description of *Mons Bauldus* in the Italian tongue, I finde it there described by the name of *Lupino Arabico*, or it you will, *Pentastillo peregrino*; unto either of which it may be referred, but seeing it doth more resemble a Lupine than a Cinquefoile, I have so entituled it here, yet referre you to the description thereof in that place, because I would not repeat that there set downe, being, as I tooke it growing in my owne Garden, but yet because in some things it is defective, as in the cods &c. and might be bettered, I will from *Pona* supply it: the leafe doth better resemble a Lupine leafe, the flowers are more purple than they shewed with me; and the middle pointell in them also is purple: the pods are long and pointed at the ends, full of small blacke feede and little: this I thought good to advertise you, that they are but one plant, although it hath two titles.

6. *Lupinus Indicus medius ceruleus.* A middle sort of the great blew Lupine.

This sort of Lupine is very like the greatest blew Lupine described in my former Booke, both for the tallnesse, woodnesse, and largenesse of the leaves, or a little lesser in all as the flower is also, and of as orient a blew colour, with a whitish spot in the middle, which changeth to be reddish before the flower decayeth: the pods likewise are woolly, and almost as large, and so is the feede also, but still smaller, and a little discoloured, with a dent or hollownesse in the middle.

7. *Lupinus flore carneo.* Blush flowered Lupines.

Somewhat like unto the last is this Lupine also, but lesser and lesse woolly: the flowers which make the chiefest difference, are of a kinde of delayed reddish colour, which we usually call a blush: the pods also are lesse woolly and smaller, and the feede likewise.

8. *Lupinus flore obsoleto.*

Wee have had another sort of Lupine sent us from *Boel* by this name, but perishing in an intemperate yeare, we can describe it no further.

The Place and Time.

These Lupines grow naturally wilde, but wee doe nourish them all in Gardens; and doe flower in the end of July or in August, in which time, or quickly after the feede will be ripe.

The Names.

It is called in Greeke *σιπυ* *Thermos*, in Latine *Lupinus*; *Pliny* thinking it tooke the name and qualitie from *Lupus*; but I finde no likelihood in that supposition, and therefore forbear to expresse it any further; the two first are so called by the Authors that have written of them: the third was brought me by *Boel* out of *Africa*, and the fourth out of *Spain*, but were both so tender, that I onely sowed a little feede the first yeare I had them, and have lost them since: the fifth is declared in the description: the three last have not bene remembered by any before: the *Arabians* call it *Tarmis* or *Tormis*; the *Italians* *Lupino*, the *Spaniards* *Entramosos*, the *French* *Lupin*, the *Germanes* *Figbonen*, the *Dutch* *Vijchboonen* and *Lupines*, from whence came the *Faba ficulnea Germanis* by *Lobel*: and we in *English* Lupine or flat Beene.

The Vertues.

Lupines by reason of their bitternesse, do open, digest, dissolve, & cleanse, being steeped some daies in water, untill they have lost their bitternesse, they may be eaten, & so are, as *Galen* saith, for necessitie, but they breede grosse and crude humours, are very hard to digest, and slowly passe through the body, yet doe they not binde any fluxe: the same being so steeped, and afterwards dried, beaten, and taken with some vinegar, taketh away the loathing of the stomacke to meate and provoketh the appetite: the decoction or infusion of Lupines taken with hony and vinegar killeth the wormes in the belly, but if you mixe Rue and Pepper thereto, you shall make it the more effectuell: the meale or powder taken with hony and vinegar or in drinke doth the same: the said decoction taken openeth the obstructions of the liver and spleene, provoketh urine and womens courses, if it be taken with mirre, and expelleth the dead childe: the decoction of them cleanseth all scabbes, morpew, cankers, tetters, and creeping or running ulcers and sores, and boyled in lye it cleanseth the head from ulcers, scurfe, &c. breeding therein: it also cleanseth the face, and taketh away the markes that the Poxe doe leave after their healing, and all other markes, and blacke and blew spots in the skinne: and to cleare the face, and make it more amiable, many women doe use the meale of Lupines mingled with the gall of a Goate, some juyce of Lemons and a little *Alumen saccharinum* made into a forme of a soft ointment: the meale thereof being boiled in vinegar and applied, taketh away pimples, and scattereth the nodules or kernells that rise in the body, and breaketh carbuncles and impostumes: the burning of the huskes driveth away Gnats, Flies, &c. whatsoever. The wilde Lupines are stronger and more effectuell to all purposes.

CHAP. XV.

Cicer sativum. Garden Cich Pease, or Rammes Ciches.

If the Pulse called *Cicer*, there are two sorts, the Garden and the wilde, but although I gave you the description of two or three sorts of the garden kind, in my former Booke: yet I thinke it not amisse to give you the descriptions of them here againe, with their properties more amply.

Cicer sativum sive arietinum rubrum nigrum vel album.

Garden red, blacke or white, Cich Pease, Rammes Ciches, or Cicers.

All the sorts of Rammes Ciches, bring forth stalkes a yard long, whereon doe grow winged leaves that is many

many small and almost round leaves dented about the edges, set on both sides of a middle ribbe: at the joynts come forth one or two flowers upon short foote stalkes, Pease fashion, either white, or whitish, or else purplish red, lighter, or deeper, according as the Pease that follow will be, that are contained in small thicke and short pods, wherein lie one or two Pease more usually, a little pointed at the lower end, and almost round at the head, yet a little cornered or sharpe: the roote is small, and perisheth yearly.

The Place and Time.

They are sowne in Gardens, or the Fields, as Pease, both in our owne and other countries, being sowne later than Pease, and are gathered at the same time with them, or somewhat after.

The Names.

It is called in Greeke *ερεβινθος* *Erebinthus* and *αρις* is added of some, because *αρις* is *aris* in Latine *Cicer*, of the Arabians *Champs Hamos*, or *Alhamos*, of the Italians *Ceci*, of the Spaniards *Gravanfos*, of the French *Ciche*, & *pois Ciche*, & *pois bechu*, of the Germans *Kuchem* and *Kucherebs*, of the Dutch, and we in English *Cicers*, *Ciches*, *Rammes Ciches*, and *Ciche Pease*: *Dioscorides*, *Theophrastus* and *Pliny* doe much vary one from another in setting downe the sorts of these *Cicers*, *Dioscorides* divideth it into *sativum* & *sylvestre*, & of the *sativum* he nameth *Arentinum* to be the other sort; *Theophrastus* saith it hath many differences, as in greatness, taste, colour and forme, as *Arietinum* and *Columbinum*, &c. *Pliny* doth somewhat follow *Theophrastus*, and maketh more sorts; but to avoid long disputes and controversies, wee doe now generally hold but two sorts of the manured *Cicers*, white and red, or three, at the most as *Matthiolus* saith white, red, and blacke, but the red changeth blacke with time, and therefore is not differing; *Columbinum* and *Venerium* are all one with the white; and the *Cicer Orobanum* of *Theophrastus* & *Pliny*, is another plant, as shall be shewed hereafter: *Matthiolus* saith, that the Germans heretofore erred much in taking Pease to be *Cicer Columbinum*, we have shewed before that *Tragus* and others tooke Vetches to be *Cicers*.

The Vertues.

Cicers, as *Galen* saith, are no lesse windy meate than Beanes, but yet nourish more, they provoke venery, and is thought to increase sperme, and therefore they give it their station horses. *Cicers* have in them a more cleansing faculty than beanes, whereby they breake the stones gathered in the kidneyes: to drinke the creame of them being boyled in water, is the best way, it moveth the belly downward, provoketh urine, and womans courtes, and increaseth both milke and feede: the decoction of either of them saith *Dioscorides*, made with Rosemary, is good for the Dropie, and the yellow jaundise, and to ease the paines in the sides, for which purpose this medicine is very powerfull: an ounce of *Cicers*, two ounces of French barley, and a small handfull of Marsh Mallow rootes, cleane washed and cut, being boyled in the broath of a chicken, and foure ounces taken in the morning, and fasting two houres after: the white *Cicers* are used more as meate than medicine, yet they have the same effect, and is thought more powerfull to encrease milke and feede: I have knowne it given with good successe, to women that were barren through an over hot constitution, an orderly course proceeding and following the taking thereof. *Dioscorides* saith that *Cicers* are hurtfull to those that have ulcers in their reins or kidneyes, or in the bladder. *Plutarch* giveth this note, that no wormes breed in these *Cicers*, when as all other pulses are subject to them, and therefore in their nuptiall ceremonies, those were given in an allegoricall sense, of their mutuall incorruptible affections.

Cicer sativum sive aretinum nigrum rubrum vel album.
Garden red, blacke, or white Cich Pease,
Rammes Ciches, or Cicers.

CHAP. XVI.

Cicer sylvestre. Wilde Cicers.

He wilde Cicers are of three or foure sundry sorts, as shall be shewed in this Chapter.

1. *Cicer sylvestre majus.* The greater wilde Cicer.

The greater sort hath very long winged leaves set on the stalkes, composed of many, every one of them being small, and longer than of the former garden kinde, not dented at all about the edges, and of a sad greene colour: at the toppes of the stalkes come forth many tufts of flowers, thicke set together, of a pale yellowish colour, almost white, after which follow rough skinnie cods, in tufts also, each of them small pointed at the end, with in which are contained other small smooth huskes, which have many small flat round seede, so saith *Thalins*, but *Lugdunensis* maketh the first of *Dalechampsii* to have blackish flat seede, and not like unto the manured Cicers, and yet I take them to be both one, and that of *Matthiolus* also: the

Cicer sylvestre majus.
The greater wilde Cicer.

5. *Cicer sylvestre triphyllum.*
Three leaved wilde Cicers.

the roote is hard and woody; yet spreadeth farre about and living long. There is another sort in all things like the former, but much lesser in every part.

2. *Cicer montanum Lanuginosum.* The woolly mountaine Cicer.

This mountaine Cicer hath upright round stalkes a foote high, and soft or woolly, branching forth into small branches, whereon stand winged leaves, tenne or twelve on a side of the middle ribbe, with an odde one at the end, each whereof is soft or woolly and long like unto the Vetches, some broader and narrower then others: on the toppes of the branches stand a spike of tough pale coloured flowers, and the cods that follow are somewhat long and woolly, with a crooked thread at the end of them, and have small blacke feede in them.

3. *Cicer montanum agrostoides.* Another mountaine Cicer without stalke.

This other mountaine Cicer hath a root growing deepe if the rocky ground where it groweth hinder it not, from whence sundry hairy footstalkes of leaves which are 12. or somewhat more on a side, somewhat round yet longer then those of the Garden Cicer, the edges of them being hairy, some of them being equally, others unequally set one against another, and an odde one at the end: the flowers grow hard above the roote, being somewhat long and pale, and after them come swollen cods, having two partitions, full of small yellow feede like unto those of the *Medica* that is Kidney fashion.

4. *Cicer Alpinum.* Mountaine Ciche Pease.

This from a long roote parted below hath the leaves on the stalkes like the true Cicers, but rounder and dented: the flowers are blewish and the cods smaller then of the former, being somewhat hairy and groweth on mount *Iura*.

5. *Cicer sylvestre triphyllum.* Three leaved wild Cicers.

The three leaved wilde Cicer hath stalkes about two foote high divided into some branches spreading abroad, whereon are set upon long footstalkes one above another, leaves divided into three parts like the wild Trefoile and each of them bigger, thicker and rounder then those of the Garden Cicer, a little dented also about the edges: the flowers grow two or three together from a long footstalk at the joynts with the leaves, which are like the Garden Cicer flowers but larger: the cods that follow are small like unto the Garden kinde, but somewhat flatter, having some small leaves at the bottome of them, within which lye much smaller feede and more flat, and rather like to those of *Cicerula*.

6. *Cicer sylvestre alterum triphyllum.* Another three leaved wilde Cicer.

This other wild Cicer hath a thicke long branched roote, blackish without and white within: the stalkes are full of branches with leaves like unto Cicers, but three alwayes set together and no more: the flowers are red and the cods are like unto the other wilde Cicers but hairy and spotted with red spots.

Zzzz

The

The Place and Time.

All these sorts grow upon hills and in the woods, and sometimes by the hedges in fields, and flower and give fruit in *July, August and September*.

The Names.

The first is the *Cicer sylvestre* of *Matthioli*, and so called by *Dodonæus*, *Lugdunensis* and others, being the *Cicer sylvestre herbariorum* of *Lobel*, and is also the first *Cicer sylvestre* of *Dalechampi*, and the *Cicer sylvestre majus* of *Thalins* as I said before: the lesser of this kind is *Thalins* his least kind: the second and third bee *Basilinus* out of his *Prodromus*: the fourth is not mentioned by any before: the fifth is the *Cicer sylvestre verum* of *Lobel*, and called by others *Cicer sylvestre alterum*: the last is the *Cicer sylvestre secundum Dalechampi* by *Lugdunensis*.

The Vertues.

The wild *Cicers* are so much more powerfull then those of the Garden, by how much they exceede them in heate and drynesse, perceived by their sharper and more bitter taste, whereby they doe the more open obstructions, provoke urine, breake the stone, and all those other properties of cutting, opening, digesting and dissolving that are attributed to the former, and that both more speedily and more certainly: yet saith *Pliny* if they be too largely taken they loosen the belly and cause torments and breed wind.

CHAP. XVII.

Orobus. The bitter Vetch.

Of this Pulse there are properly in my judgement but three sorts which shall be declared in this Chapter: but unto them I will adjoyne that small wild pulse for the names sake that is called *Ervum sylvestre*, or *Catanance*.

1. *Orobus vulgaris*. The ordinary bitter Vetch.

This small pulse shooteth forth divers weake slender branches leaning to the ground, and scarce rising up about a foote high, beset on all sides with many winged leaves, each whereof is very little, and a little longer then round set one against another as the *Cicers*, *Vetches* and divers other Pulses are, the flowers are small and whitish (for I never saw any purple) standing singly every one by it selfe at the joynts with the leaves, after which come small round long pods no bigger then the tagge of a point, bunched out in three or foure parts where the seede lyeth, which is almost full round small and of a pale colour: the roote is small and perisheth every yeare.

2. *Orobus Creticus*. The better Vetch of Candy.

This *Orobus* in the manner of growing is altogether like the former, but whereas *Matthioli* and others fol-

3. *Cicer Orobicum*. Cornered Ogybus.

1. *Orobus vulgaris herbariorum*.
The ordinary bitter Vetch.

lowing him say it is lesser, I have alwayes found it to bee rather larger then lesser, yet there is so little difference betweene them, that but for the names sake of Candy, I would make them both but one kind without diversitie of species...

3. *Cicer Orobeum. Cornered Orobus.*

Divers would rather make this a *Cicer* than an *Orobus*, and indeede *Lobel* and *Pena* much doubted, whether they should call it the first of *Dioscorides* his *Cicers*, although they were confident that it was *Pliny* his *Cicer*, that was the sweetest and likest to *Orobus*; but I rather referre it to the kinds of *Orobus* from the forme of the cods more like to *Orobus* whose description is thus. It riseth up with a crooked or leaning hollow stalke halfe a yard high and full of joynts set with many leaves on each side of a middle ribbe, which are somewhat long like to those of the *Lentill*; at the joynts, towards the top come forth long footstalkes, with many flowers set on them close together, which after give long and round cods, bunched out and dented in betweene where the feedes lye twice as bigge as those of *Orobus* a little cornered and not so round, of a pale or yellowish colour and differing little from them but in the darke colour.

4. *Ervum sylvestre sive Catanance.*

Wilde grasse leaved Orobus.

This wilde Pullie hath sundry branches rising from the roote neare two foote high especially if it grow in any fertile soile, beset unorderly with many long and narrow darke Greene leaves: smaller then divers grasses, at the toppes of the stalkes and branches grow pretty large Pease Blossom'd flowers of an orient shining Crimson colour, after which come small slender long and almost round cods, containing within them divers hard blackish feedes: the roote is long and slender, with some fibres thereat, and perissheth every yeare as I ghesse by those that grew in my Garden from the feede sownen, whereof some bore white flowers and then perished towards Winter.

The Place and Time.

The two first are onely nourshed up in Gardens with us, the second being naturall of Candy: the third as *Lobel* saith groweth wild in *Narbone* and Province in *France*; the last is usually growing in the fields about the hedges and bushes towards *High-gate*, *Pancras Church*, &c. and are all flowering and feeding in the end of Summer.

The Names.

This is called in Greeke *ὀρέβος* *Orebus* *ορέβος* *orebos*, quod *boves eo saginentur* as *Galen* saith, in Latine *Ervum* and *Orobus* also: the first is called *Orobus sive Ervum* by *Matthiolus* (who saith it was but lately in his time made knowne in Italy) and by most other writers, onely *Dodoneus* calleth it *Cicer sativum* and *Mochus* when as *Mochus* indeede is this *Orobus* but not *Cicer*, *Lobel* calleth it *Orobus receptus herbariorum*, because the generall vote of these later times doth so call it not having found or knowne any truer: the second is called *Orobus Creticus* by *Matthiolus*, as if it differed from the former, but is not so as I have shewed in the description before: the third is called by *Lobel* *Cicer Orobeum Theophrasti*, &c. by *Banbinus* *Orobus semine obtuso triangulo*. The last is called *Catanance* by *Gesner in horti*, by *Dodoneus* in his *French Herball* and *Lugdunensis*: but *Ervum sylvestre* by *Dodoneus* in his Latine *Pemptades* and *Ervum sylvestre herbariorum* by *Lobel*: but why *Banbinus* should call it *Lathyrus sylvestris minor* I see no cause seeing it is not like any of the other nor hath no claspers as all the other *Lathyrus* he there expresseth have, and besides breaketh that order he had proposed to follow, namely to set downe all such Pulses as had claspers in the first place, and then those that had none, and yet this having none is put above among those that have, because he would vary the title if he could by any meanes: It is called by the *Arabians* *Erbum Kessene* or *Kersene*, by the *Italians* *Ervo*, by the *Spaniards* *Iervos*, by the *French* *Ers*, and wee in *English* may call it the bitter Vetch, for *Pliny* confounds this with *Vicia* the Vetch, and from the quality of bitterness which the ancients say is in it, although ours have little that can be perceived: or *Orobus* after the Latine if you will.

The Vertues.

Orobus is dry in the second degree and hot in the first, and by the bitterness cutteth clenseth and openeth obstructions, and was used in *Galen*'s time as hee saith to be steeped like *Lupines* (and that was to take out the bitterness) before they were eaten by men or given to their beasts, and that but in a dearth and great necessitie, because they are not onely very unpleasant to the taste but be of bad nourishment. Wee use saith *Galen* the *Orobus* with Hony as a medicine to cleanse the breast and Lungs of thicke humors that offend them, the manner of the ancients preparation of the meale thereof was in this manner: being steeped in water a good while they after fryed or parched them untill the rindes broke, which then being ground and passed through a boulder they keepe this meale as of great use, both to move the belly downewards and to provoke urine, and to cause them that use it to be of a good colour, yet if it be two largely taken it causeth headach and paines in the belly, and causeth bloody.

Z z z z

bloody urines, *Pliny* saith it is recorded in the Emperour *Augustus* Epistles that he was cured by *Ervum*, (whole grieft it is probable was tough flegme, condensate in the Lungs and hard to be avoyded and spit forth) this *Orobis*, *Pliny* saith that good authors doe affirme that if any take *Orobis* fasting every morning it will consume the Spleene: the meale hereof mingled with hony clenfeth foule Vlcers, and taketh away the spots freckles and other discolourings of the face or other parts of the body: it suffereth no Cankers, Gangrenes or spreading, eating fores to breede in the body: it molifieth the hardnesse of the breasts, and taken in wine or Vinegar as *Pliny* saith it helpeth the bitings of Serpents and mad dogges and men, and taken with Vinegar it helpeth the strangury, and that disease where one doth oft desire to goe to the stoole but can doe nothing, the said parched meale mixed with hony and taken helpeth those that relish not their meate, and are hickockly disposed that is ready to fall into the hesticke Feaver or Consumption: a cream made of the meale of them & the places bathed therewith that is troubled with an ich cureth it through the whole body, and made into a plaster with wine will breake Carbuncles if it be laid thereon: the greene cods stalkes and all before they grow hard, being bruised together juiced and applied to the haire doth colour it blacke.

CHAP. XVIII.

Orobus sylvaticus. Wood or wild *Orobus*.

Ext to the true *Orobanch* I thinke good to joine the wild or wood kindes for the names sake, and be-
cause *Glossifera* both exprest divers differences as he found them.

Orob. sylvaticus major purpureus. The greater purple Wood Orob.

H This first kinde that I here propoſe groweth not much above a foote high, bearing many ſquare ſtalkes and ſtriped all along: the leaves that are ſet one by another on each ſide of a middle ribbe being ſix, eight or ten in number, are a great deal larger then any *Orobns* namely two or three inches long, and an inch or two broad, with three nerves or ſinewes running through them: the flowers grow at the toppes many ſtanding together in faſhion of a ſpike or buſh being larger then thoſe of the Vetch, and of a daintie blew with purple colour, and when they begin to fade they will change their colour a little and become more pale, then ſo low ſmall long ſlender browne cods with ſmall round ſeeds within them yet ſometimes they will be more long then round and variably coloured: the roote is long blacke and hard, bunching forth in ſome places with ſome ſmall long ſtrings and fibres faſtned thereunto, and liveth many yeares.

Orobns. The annuall white wild or wood *Orobns*.

2. *Orob. sylvaticus annuus flore albo.* The annuall white wild or wood *Orob.*

1. *Orobis sylvaticus annuus flore albo.* The annual white wind or wood *Orobis*.
 2. *Orobis sylvaticus annuus flore albo.* The annual white wind or wood *Orobis*.
 Ths other wood *Orobis* hath divers straight and striked stalkes a cubit high bearing stalkes of leaves one above another but not opposite, each stalk having foure and sometimes five leaves on them reasonale large and pointed at the end with veines running in them: the flowers grow at the toppe from the uppermost joynts, five or six standing together on a short stalk which lookes all one way of a whitish colour: when they are past rise long slender cods like the former, with brownish but larger feede in them then in any of the other sorts: the roote liveth not but perishest after feede time.

3. *Orobis sylvaticus angustifolius*.
Narrow leaved Wood Orobis.

This narrow leaved root hath slender but straight crested stalkes a foote high, the leaves stand foure on a stalked couples and are long and narrow : the flowers grow above on long stalkes many together of a pure white colour : the seeds that follow are long and blacke, with some what large blacke feede in them : the roote consisteth of five or six long slender tuberous clogs like unto those of the *Apollon* of *Penny* but smaller, blackish on the outside and white within.

4. *Orob. sylvaticus Venetus.*
The Venetian wood Orob.

This *Venetian Orobau* is very like unto the first Wood *Orobau* here described growing in height and forme of leaves nearest therunto, not having any end leafe on the stalkes but of a paler Greene colour: the flowers are small and purple like unto them also: the cods are reddish, long and small with round whitish feede in them: the roote is hard and woody with many fibres thereat and endureth. There is another of this whorle stalkes and leaves are paler and the flower wholly white not differing else.

5. *Orob. Alpinus latifolius*.
Mountain Wood Orob.

This also is very like unto the first sort, but the leaves are broader and have their end not so sharpe, the flowers hang downe and are an inch long, of a pale yellowish colour, the uppermost being somewhat reddish.

3. *Orobis sylvaticus angustifolius*.
Narrow leaved Wood Orobis.

4. *Orobis sylvaticus Venetus*.
The Venetian Wood Orobis.

The Place and Time.

The three first sorts grow as *Clusius* saith in *Hungary*, *Austria* and the parts neare thereunto: onely the fourth was sent unto *Clusius* as he saith from *Venice*, the sith *Bauhinus* saith hee had from the *Pyrenean* and *Helvetian* hills, they all flower in *Aprill* or *May* and their seede is ripe in *June*.

The Names.

All these sorts are referred to the *Orobis*, both from their manner of growing and forme of the seed being round; and therefore *Clusius* called them *Orobis Pannonicus*, and *Bauhinus* *Orobis sylvaticus* whom I have followed. The first is the sith *Orobis Pannonicus* of *Clusius*, which *Thalys* calleth *Orobis sylvestris vernus*, *Lobel* as I take it meaneth this by his *Phaselus*, *Lugdunensis* calleth it *Phaseolus sylvaticus*, as is before sayd, *Dodonaeus* *Arachis latifolius*, and *Columna* *Astragalus*; the second is the fourth of *Clusius* which hee saith may well bee referred to some kind of *Phaselus*, or else some kind of *Vetch*: the third is *Clusius* his third sort of *Orobis*: the fourth is his *Orobis Venetus*: I doe verily thinke that the sith which is *Bauhinus* his *Orobis Alpinus latifolius*, and *Lugdunensis* his *Galega montana* be all one, the colour of the flowers in each being like, and the rest agreeing or not farre disagreeing from it.

The Vertues.

Clusius hath made no mention that he heard of any propertie did belong unto any of these Pulses among the country people where they grew, but were wholly neglected, yet *Lugdunensis* saith of his *Galega montana* that it was accounted available against poysons and the Plague no lesse then the other *Galega*, and that it was good against the falling sicknesse, and would kill the Wormes.

CHAP. XIX.

Onobrychis. Cockes-head.

Unto this title of *Onobrychis* are referred divers plants by many good authors, the most likely whereof I will comprehend in this Chapter.

1. *Onobrychis vulgaris*. The ordinary Cockes-head.

The ordinary Cockes-head hath divers weake but rough stalkes leaning downwards halfe a yard high, beset wih winged leaves, each being longer and more pointed then those of *Lentills* and whitish underneath, from the toppes of these stalkes rise up other slender stalkes, naked without leaves unto the toppes, where there grow many small flowers in manner of a spike, of a pale reddish colour with some blewnesse among them, after which rise up in their places, round, rough and somewhat flat heads: the root is tough & somewhat woody.

Minor. yet liveth and shooteth a new every year. Of this sort *Baninus* setteth forth a lesser differing not from the former, but in the smallnesse thereof.

2. *Onobrychis spicata flore purpureo.* Spiked Cocks-head with purple flowers.
This Cocks-head hath such like weake stalkes lying or leaning to the ground, whereon grow winged leaves very likethe former, but hairy or hoary: from the joynts rise other branches with the like leaves on them, and above them rise up the flowers in a longer spike or tuft at the toppe of a naked stalke, like in forme unto the other, but of an excellent shining purple colour, with many small leaves set among them, which turne into short, blacke, and hard heads parred in the middle: the roote liveth as the former.

3. *Onobrychis floribus caeruleis.* Blew flowred Cocks-head.
This third Cocks-head riseth somewhat higher than the former, the leaves are smaller and shorter pointed: the flowers are fewer, and of a pale blew, and in some of a blewish purple colour, and beare after wards slender long cods foulded double, wherein lie small blacke seede, like unto those of *Medica*.

4. *Onobrychis folijs Vicie longioribus.* Cocks-head with long Fench leaves.
This Fitchling hath longer and narrower leaves somewhat woolly or hoary, and more store set on each side of the middle ribbe; the flowers stand in a large spiked head, being more long than others, and somewhat resembling the flowers of three leaved grass, of a pale colour, with darke veines in them: the cods that follow are folded like the last, but the seede which is blacke is cornered or square like Fenegreke: the roote is woody and living.

5. *Onobrychis quarta Clusij.* Mountaine Cocks-head.
This fifth sort hath likewise many winged leaves growing from the stalkes, but smaller than the rest, and both stalkes and leaves though Greene, yet covered with an hoarinesse: the flowers grow at the tops of bare stalkes, as the others doe, but fewer in number, and of a purplish blew colour: the cods are long and foulded like the two last: the roote is great, thicke and long.

6. *Onobrychis globoso capite.* Round headed Cocks-head.
This strange Cocks-head which *Clusius* saith, hee first saw in Mr. *Riches* Gardē, *Queene Elizabeths* Apothecarie in his time, was very like the last, for the smallnesse and hoarinesse of stalkes and leaves, yet the stalkes were longer, tough and blackish, which lay bare on the ground before it had leaves, and then branched it selfe, shooting forth at the toppes short stalkes an inch long, bearing at the toppes a round head of many flowers set together, of a whitish colour, somewhat like unto those of *Tragacantha*, Goates thorne; after which followed small cods, not bigger than those of *Orobis*, containing one seede within, each like Fenugreke.

7. *Onobrychis clypeata aspera minor.* The lesser buckler Fetchling.
The greater sort hereof is set forth in my former Booke, under the title of *Hedysarum clypeatum*, The red Sattin

1. *Onobrychis vulgaris.*
The ordinary Cocks-head.

2. 5. *Onobrychis spicata flore purpureo & quarta Clusij.*
Spiked Cocks-head with purple flowers, and mountaine Cocks-head.

3. *Onobrychis floribus ceruleis.*
Blew flowered Cockes head.

9. *Onobrychis minima.*
The least Cockes-head.

flower: but this lesser groweth very low, not above an hand breadth high; the leaves likewise are small and narrow, the flowers are small, and of an excellent crimson colour, the seede vessells that follow are flat and rough, containing small seede within them, the roote is thicke and thready.

8. *Onobrychis clypeata levis.*
Small buckler Fetchling

This smooth Fetchling riseth up but with one stalk, or two at the most a foote high, set with joynts, where stand winged leaves, consisting of many smooth long leaves, and an odde one at the end: from the joynts of the leaves, spring up small and long stalks, whereon the flowers stand in a spike fashion, of a blewish purple colour, and have afterwards flat and smooth huskes buckler fashion, three for the most part standing one above another, with small seede within them.

9. *Onobrychis minima.* The least Cockes-head.

This small plant, *Pena* saith, he found on the hills of *Pennance*, with a small roote downeward, but thicke at the

head, and a thicke barke, having many hairy stalks, two or three inches long, with small leaves on them like unto Lentills or *Astragalus*, hoary, hard, and bare towards the toppes, and many small pale yellowish white flowers set together in a tuft of a drying taste, like Birds foote. *Lobel* in *Adversaria* calleth it *Astragalus perfoliatus palmaris pusilla planta*.

The Place and Time.

The first groweth under hedges, and sometimes in the open fields, in divers places of our Land, but all the rest are strangers and kept in Gardens with us, by them onely that are curious conservers of rare plants: and flower from the end of *June* to the end of *August*, and the seede ripeneth in the meane time.

The Names.

It is generally taken now adayes by all those that are judicious Herbarists to be the *Oxybrychis* of *Dioscorides*, and *Caput gallinaceum* in Latine: the first is called *Onobrychis* by *Dodonæus*, *Clusius*, *Thalius*, and many others, *Gesner* in *hortis* calleth it *Glaux* sive *Onobrychis*, *Lobel* *Caput gallinaceum Belgarum*, *Lugdunensis* saith it was called *Polygala* by many, the lesser hereof is called by *Bauhinus* in *Prodromo* *Caput gallinaceum minus*: the second here is the first *Onobrychis Pannonica* with *Clusius*, which *Pona* in the description of *Mount Baldus* calleth *Cicer Astragaloides*: the third is the second with him: the fourth is his third: the fifth is his fourth *Onobrychis*, and the sixth his fifth: the seventh is, as I said before. The lesser sort of that *Hedysarum clypeatum* of *Lobel*, that I have set forth in my former Booke, being generally so called now adayes with most; and which *Dodonæus* calleth *Onobrychis altera*, and *Camerarius* *Securidaca clypeata*; but *Bauhinus* calleth it *Onobrychis clypeata asperat minor*, as he doth the next, *Onobrychis clypeata levis*: the last is called by *Lobel*, as I said, *Astragalo planta perfoliatis*. The *Italians* call it *Upparia di Maghi*: the *French* *Saint fein*: and we in *English* Cockes-head or *Medicke Fetchling*.

The Vertues.

Galen saith hereof that it hath a power to rarefie and digest, and therefore the greene leaves bruised and laid as a plaister disperfeth knots, nodes, or kernells in the flesh, and if when it is drie it be taken in wine; it helpeth the strangury, and being anointed with oyle it provoketh sweate. *Dioscorides* and *Pliny* saith, the same things, and therefore neede not be repeated: it is knowne generally to be a singular foode for cattle to cause them to give store of milke.

CHAP. XX.

Astragalus. The milke Vetch.

THE knowledge of the true *Astragalus* hath troubled most of our moderne Writers, many of them having set forth divers plants for it, which others have misliked, and therefore in such a confusion it is hard to determine of any certaintie, yet the most likely I will endeavour to shew you here,

1. *Astragalus Baticus Clusij*. The *Spanish* milke Vetch of *Clusius*.

This *Spanish* plant hath sundry stalkes afoote high, of the bignesse of ones little finger being five cornered or crested. All the length of them hard, somewhat reddish and hoairy with all: the leaves are woolly or hoary many set oneach side of a middle ribbe, of an astringent taste at the first, and afterwards hot; the flowers stand at the tops of long footstalkes that shoor out from the joynts, and grow into a very long spike of large flowers, each as large as of the Beane or *Lupine*, wholly, of a white colour when they are blowne open, but of a brownish yellow being in the bud: after they are past, there follow full swollen long cods, of two inches and a halfe long, and one thicke like unto those of the wilde Pease, which being shaked when they are drie, the round feede in them will make a noise, and being talted doe inflame the mouth and tongue mightily: the roote for the smallnesse of the plant is very great, about the length of ones hand, of the thicknesse of ones arme, and thence branching forth into sundry other smaller ones, rugged and blacke one the out side, and whitish within hard and woody, which when it is drie is harder than an horne.

2. *Astragalus marinus Batius*. The Sea *Spanish* milke Vetch.

This Sea *Spanish* milke Vetch (which *Boelius* brought me, with very many other things at my charge out of *Spaine*) groweth often upright, and sometimes leaning downe with one or two round reddish stalkes, a little hairy, set with sundry winged leaves on both sides of the stalkes, one above another, consisting of tenne or a dozen small fleshy Greene leaves, somewhat like to those of the lesser Sicklewort, from betwene the stalke & the leaves, and at the toppes of them also come forth branches of the like leaves in some places, and at others many small pale coloured flowers, which turne into so many three square cleare skinned whitish cods, the inner edge being thinner, and a little bowing, the other two forming, as it were a backe, dividing it selfe into two parts, with divers small hard yellowish feede within them, almost like *Fenugreek* feede: the roote is small, long, and divided, perishing yearly with us. I had from *Boelius*, above named, another sort hereof which he named *Astragalus marinus Batius supinus*, but what other chiefe difference it had from the other, but the leaning to the groundward, I know not, for the plant dying with me that rose from the feede, I could not so exactly observe the varietie, and since then could never get of the same feede againe.

1. *Astragalus Baticus Clusij*.
The *Spanish* milke Vetch of *Clusius*.23. *Astragalus marinus Batius*.
Spanish Sea milke Vetch.

3. *Astragalus Syriacus*.
The milke Vetch of Syria.

5. *Astragalus Alpinus claviculatus magno flore*.
Great flowered mountaine milke Vetch.

3. *Astragalus Syriacus*.
Milke Vetch of Syria.

The Syrian milke Vetch hath such like weake stalkes lying on the ground, or not rising much above it, and winged leaves also, but smaller and shorter: the flowers are larger, and growing into a thicker bush, of an excellent red colour very beautifull, the roote is great and thicke, spreading about.

4. *Astragalus Alpinus*.
Mountaine Milke Vetch.

This hath from a single roote divers slender stalkes sometimes standing upright, and other whiles leaning downe; the leaves are longer, but more sparingly set on the middle ribbe than the Cicers, and not dented at all about the edges, but very neare resembling those of the first wood *Orobys*: the flowers are like to the Vetch or Cicer, of a blewish purple colour: after which come long pods like to Vetches: the roote is tuberous or knobby, blacke and hard, with other such like smaller peeces growing unto it, fastened by long strings, this differeth much from the *Chamaebalanus* or *Terra glandes*, which is accounted by *Columna*, for the true *Arachidana* of *Theophrastus*.

7. *Astragalus purpureus montanus*. The purple mountaine Milke Vetch.

5. *Astragalus Alpinus Claviculatus magno flore*. Great flowered mountaine milke Vetch.

This hath a long thicke, blacke, waddy roote two foote long, with some fibres thereat, divided above into thicke scaly heads, from whence rise sundry long winged small leaves lying on the ground, like unto those of Lentills: the flowers are large and grow many together at the toppes of naked stalkes, of a yellow colour, faith *Eugdunensis* of his, but *Baobinus* saith, that that which grew with him (if it were the same) was of a purple colour; after whom follow small, long, blacke pods, with a small twining thread at the end like a clasps.

6. *Astragalus*

8. *Astragaloides herbariorum*.
Base Milke Vetch.

9. *Astragaloides Helvetia*.
Germane base Milke Vetch.

6. *Astragalus purpureo caeruleo Hispanicus*.
Purple Spaniards Milke Vetch.

The Spaniards, saith *Clusius*, held another plant to be *Astragalus* which answered thereto in the faculties, but differing in the forme of the roote, it had many short and hard hoarie stalkes growing neare the ground, with small winged leaves like unto Cicers or Lentills, all hoary likewise, and of an astrigent taste: the flowers are small, growing in thicke tufted heads, of a blewish purple colour: the roote, saith *Clusius* is usefully but single, and no way agreeing with the roote of *Astragalus*.

7. *Astragalus purpureus montanus*.
The purple mountaine milke Vetch.

This milke Vetch hath a great long woody roote, with some fibres set thereat, blackish without, and white within, from whence rise many hard stalkes, some lying as it were upon the ground, and others standing upright

about halfe a foote high, the winged leaves that grow thereon are many, small and hoary, still keeping an equall number, upon every foote stalke, somewhat resembling the *Astragalus Syriacus* but longer, the stalkes are naked or bare of leaves from the middle upward, saving a few, that under the tuft of flowers at the toppes are round, and are like unto other Pulses, of an excellent purple colour, and the feede follow in small cods: it slowreth in May and June on the high hills of *Sevena*, but most plentifully neere a small towne called *Mernes* in the grove of wood next unto it, in *horto dei*, and the hills neere it thereto about *Mompelie*: it is utterly without any sharpe taste, and but onely a little saltish that can be felt.

8. *Astragaloides s herbariorum*. Base milke Vetch.

The base milke Vetch riseth up with sundry upright hard crested stalkes, a yard high set on all sides with winged leaves foure or five couple against the middle ribbe, with an odde one at the end, of a very fad Greene colour, no bigger than those of the Lentills: the flowers stand at the toppes of the stalkes and branches many set together which are small and short, of a dead purplish colour turning wanne with standing, and change into small blacke cods almost round; but pointed, within which are foure or five small blackish feede: the roote groweth great and thicke at the head, tough and woody, descending deepe, and abiding many yeares, but all the stalkes perish every yeare, fresh rising in the Spring.

9. *Astragaloides Helvetie*. Germane base milke Vetch.

The slender stalkes of this plant, that beare many Pease blossom'd flowers at the toppes of them, are not much above three inches high without any leaves upon them; the leaves themselves standing singly upon long foote stalkes, being somewhat long, broad, and round pointed, as the figure doth plainly delineate forth.

The Place and Time.

None of these grow wilde in our Land, that ever I could understand, but are nurfed up with those that are curious lover of rare plants: they flower in July, and their feede is ripe in August or September.

The Names.

It is called *ἀσράγανος* in Greeke, and *Astragalus* in Latine: the first is called by *Clusius* *Astragalus Beticus*, and by *Lobel* and others *Astragalus Lusitanicus* *Clusij*, by *Bellus* that sent it out of Candy to *Clusius*, as it is set downe in his fift Epistle *Phaseoli novum genus*, as *Clusius* in his *Scolea* under it thinketh, which I can not fully evince, not having seene either of them (if they be divers as I thinke they be) growing: but *Bellus* there relateth that the feede was flat like unto a Kidney Beane, and that the Marriners did eate them while they were Greene, and *Clusius* saith of his that the cods are long, and the feede round within them, burning and enflaming the mouth, for which cause it is probable that *Amarus Lusitanus* called it *Apocynum*: & the Spaniards *Atramofos de can*, as being fit to kill dogs, so that these contrarieties doe rather argue them to be divers plants: the second was brought me out of Spaine by *Boel*, by the name expressed in the title, but came to us also from *Leiden* by the name of *Astragalus marinus* *Pauw*, either because *Pauw* was the President of the Garden there had it from *Boel*, or from Spaine, where *Brel* gathered

gathered it: & is also very likely to be the plant, that *Bauhinus* in his *Prodromus* calleth *Glauci Leguminose affinis* being sent him from *Verona* by *Pona* who called it *Aracus Beticus*, as by comparing may be seene. And likewise as I thinke is the *Vicia Sesamacea Apula* of *Columna*: the third is called by *Lobel* *Astragalus Syriacus*, and may be that of *Anguilara* and *Cesalpinus*, and very probable also to be that *Astragalus Dioscoridis* that *Rauwolfius* found in *Syria*, as it is set forth by *Lugdunensis*, and is as he saith called *Christiana radix* by the *Germanes*: the fourth is the second *Astragalus* of *Clusius* and called also *Alpinus*, which *Pona* calleth *Cicer Astragaloides*: *Bauhinus* also saith it is the *Polygala* of *Camerarius* in his *Epitome*, but surely his figure doth truly expresse the *Glaux vulgaris*: the fifth is taken by *Bauhinus* to be the *Anthyllis claviculata* of *Lugdunensis*, and calleth it *Astragalus Alpinus magnus* fore I adde *claviculata* thereto: the sixth is the third *Astragalus* of *Clusius*, which some as he saith called *Onobrychis*, but untruly, and grew for some time with him in the Low countries or *Belgia*, with the *Astragalus Monspeliensis* (which we usually call *Hedysarum minus*) but perished before his going out of the country, and therefore (I beleeve *Clusius* his judgement herein) could not be the same, although somewhat like as *Bauhinus* thinketh, nor is it the *Astragalus purpureus* of *Lugdunensis* as *Bauhinus* also thought, for that is my seventh here set downe, *Clusius* saith the *Spaniards* called it *Terva di Santo Lorenzo*: the eight is the second *Orobis Pannonicus* of *Clusius*, called by *Dodonaeus* *Astragaloides*, and by *Lobel* *Astragaloides altera herbariorum*, but *Bauhinus* not onely maketh it his sixt *Orobis*, but calleth it also *Polygala major Massiliotica*, and besides referreth it to the *Polygala Matthioli*, which formerly he had called *Astragalus*, as also to the *Polygala Valentina* *Clusius*, but surely *Clusius* would not be so variable (as *Bauhinus* sheweth himselfe in many places) to call one herbe both *Polygala* and *Orobis*: the ninth is not mentioned by any before: the last *Lobel* so called as is in the title: but *Bauhinus* maketh it to be like a kind of *Ferrum aquinum* and calleth it *Ferro equino Gallico affinis*.

The Vertues.

The true *Astragalus* is as *Dioscorides* and *Galen* say astringent, and that the roote taken in wine stayeth the laskē and doth also provoke urine, it dryeth and closeth up old Vicers if the powder bee strewed or cast into them, it doth also stay bleeding, *Pliny* addeth that it is very profitably used against the foulness of the gummies. But *Clusius* saith that the *Portugalls* doe familiarly use the sixt sort here set forth, being first dried in an Oven and powdered, to cast it into wounds and Vicers.

CHAP. XXI.

Hedysarum sive Securidaca. Hatchet Vetch.

He ancient writers exhibited but one sort hereof which is the greater, our later have added divers more as shall be declared: that which is usually called *Hedysarum clypeatum* I have described in my former Booke, yet I thought good to give you the figure of it here.

1. *Hedysarum majus sive Securidaca vera major*. The greater Hatchet Vetch.

The greater Hatchet Vetch (which is the truest the rest being but supposed from the likeness) groweth not a

Hedysarum clypeatum vulgaris.
French Honeylucke.

2. *Hedysarum majus sive Securidaca major vere*.
The greater Hatchet Vetch or Sicklewort.

bove

bove a foote high, with divers winged leaves growing on the stalkes, which are weake and not standing upright, each of the leaves is small not very long and round at the end, at the toppe stand many small yellow flowers (*Matthioli* saith reddish but I thinke he was therein mistaken as he was also in the pods to say the ends were blunt) which turne into so many long flat thin cods and reddish, with a small crooked point: the feede is flat and reddish within them, so lying in them that they may be discerned in the cod where they lye, but not like an Hatcher as many have set it downe, thinking it therein to agree with *Dioscorides* his description, for he doth compare the whole cod and not the feede thereunto: the root is small and perisheth yearly.

2. *Hedysarum minus* sive *Securidaca minor*.

The lesser Hatcher Vetch or Sickle-wort.

The lesser Hatcher Vetch is like unto the former but somewhat lesser, yet not much lower if it grow in any good ground, the flowers grow many together of a pale yellow colour, and after them come small crooked cods bowed as it were almost together, wherein lie pale browne feedes not fully round but square and lesser, the roote hereof likewise perisheth yearly with us.

3. *Securidaca major articulata*.

The greater joynted Hatcher Vetch.

This Plant groweth greater and higher then the two former, and so are the winged leaves more in number and somewhat larger: from the joynts rise long stalkes with a great many flowers at the toppes of them, smelling somewhat strong, of bluish and white mixed together, after which follow long round and not flat cods, a little hooked with divers joynts as it were, or bunched places like the true *Orobanch*, wherein lye red feede somewhat long: the roote creepeth farre abroad and endureth not.

4. *Securidaca articulata minor*. The lesser joynted Hatcher Vetch.

This lesser is like the former, but lower and lesser in stalkes, and fewer also in leaves upon the middle rib; the flowers also are smaller, but as many or more growing together at the toppes of the stalkes that rise from the joynts of the leaves, and are of a pale red or bluish colour, in their places grow small round heads with crooked toppes much resembling a Billhook, such as labouring country men doe use to cut their hedges withall; wherein lyeth but one feede as having but one bunch: the roote is hard and woody spreading under ground and endureth long.

5. *Securidaca peregrina Clusii*. Strange Hatcher Vetch.

This stranger groweth lower then any of the former being not a foote high with divers winged small branches, bearing some such like leaves on them but smaller, and at the toppe sundry small whitish flowers, and after them long broad thin and flat cods waved in on both edges, wherein lye divers flat browne feedes: the roote is small and stringy perishing yearly.

6. *Securidaca minima*. The least Hatcher Vetch.

This least sort hath stalkes a foote long spread on the ground, having divers leaves set on a stalke, but the end hath alwayes three standing together, it hath many flowers on a stalke: the feede is reddish and biforked, lying in very small hooked short cods striped overthwart, this groweth by *Mompelher*.

7. *Hedysarum argenteum Creticum*. White Hatcher Vetch of Candy.

This *Candiot* riseth up with a slender stalke, branching forth on all sides and winged stalkes of leaves thereon, somewhat like to those of the Ciche Pease: the flowers grow at the toppes many on a bush or round tuft together, neare resembling those of the meadow Trefoile, of a white silver like colour of a reasonable good sent, after the flowers are past there succede in their places small slender cods, wherein are contained the feede which is small and round: the roote consisteth of many strings and fibres which abideth many yeares: and holding greene leaves all the Winter.

8. *Sophora sive Egyptiaca vitiosa*. The dangerous Hatcher Vetch of Egypt.

Honorius Bellus in his fourth Epistle to *Clusius* which is set at the end of his *rariorum plantarū historia*, saith that *Alpinus* hath erred in setting forth the Figure of this plant (which yet in want of a better I am faine to use) in that the leaves on every stalke are even without any odde one at the end, and that the pods do grow upright and do not hang downe: It is, saith he, a goodly shrubby plant, rising two or three cubits high, spreading sundry branches of winged leaves set one against another, and closing themselves every night, opening with every mornings Sunne: the flowers are yellow and the pods long and slender standing upright and of a fingers length: the roote is woody, divers wayes dispersed under ground but abideth with greene leaves all the Winter, and abideth long with the flowers thereon.

One very like hereunto we have received from *Virginia*, by the name of *Lentills of Virginia*, but that this hath at every joynt with the leaves a small harmlesse pricke, which quickly falleth away from the lower and elder parts, abiding onely a while on the upper and more tender stalkes.

9. *Sesban sive Securidaca Egyptiaca articulata*. Hatcher Vetch of Egypt with long joynted cods.

This kinde of Pulse groweth somewhat like a shrubbe in the hotter countries, with sundry hard and woody slender

3. 4. *Securidaca articulata major & minor.*
The greater and lesser joyned Harchet Vetch.

5. *Securidaca peregrina Clusj.* Strange Harchet Vetch.

7. *Hedysarum argenteum Creticum.*
White Harchet Vetch of Candy.

8. *Sephera five Securidaca Egypti a villosa.*
The dangerous Vetch of Egypt.

9. *Sesban* five *Securidaca* *Egyptiaca* *articularis*.
Hatchet Vetch of Egypt with long joynted cods.

10. *Hedysarum* *triphylllum* *Americanum*.
Americas Trefoile Hatchet Vetch.

Slender stalkes, and many long stalkes of winged leaves like unto a *Securidaca*, yet each of them somewhat longer and narrower: the flowers come forth from the bosome of the stalkes and leaves many clustering together in a long spike of a deepe yellow colour, and succeeded by long joynted cods, containing many Fennugrieke-like feedes therein: the roote spreadeth well under ground, and abides many yeares. This is that Plant which *Clusius* compared his *Anil* unto, or rather was mistaken, the title *Anil* being imposed for *Sesban*: but assuredly by the sight of the true feede of *Anil* received from the East Indies so like unto Fennugrick feede, and the growing thereof to like unto this *Sesban* with many winged leaves, compared by *Camerarius* unto those of *Barbafoutis finex*, and to those of *Senecio* by *Mt. Finch*, as it is before set downe where I spake of *Indico*, which is *Nil* or *Anil* of the Arabians, this *Sesban* being either a species of that *Nil Anil* or *Indico*, or that a species of this.

10. *Hedysarum* *triphylllum* *Americanum*. *Americas* Trefoile Hatchet Vetch.

This kinde of Vetch groweth higher in shadowy then in sunny places, with many stalkes a foote or two high, and leaves set thereon, three usually at a place, which are larger then those of *Trifolium bituminosum* and of a reddish greene colour: at the toppes stand the flowers in a long spike, like, but much larger then the flowers of the ordinary Hatchet Vetch, whose uppermost leaves are much redder then the edges and ridges which are pale red, after which come rough crooked pods with reddish veines both above and below, set as it were with joynts, having small feede within them like those of Broome: the roote is a bush of blackish threads or fibres, this hath no sent to commend it, and dyeth downe every Winter rising anew in the Spring: the taste of the greene plant is not so easily perceived to bee hot and dry in the first degree as it is in the dry, having a little purging qualitie therein: for if an ounce of the dried leaves bee put into a purging decoction it furthereth the purging propertie, causing not onely thirne and whayish humors to be avoided, but those that are tough and clammy also: it doth much helpe likewise to digest cold humors.

The Place and Time.

None of these doe grow naturally but onely in curious Gardens with us, yet the third and fourth had neede to be set in some out corner where their running rootes may doe no injury to better herbes, and flower and feede in July and August.

The Names.

It is called in Greeke *ἡδύσαρον* *Hedysarum*, and *πικνύρον* *pelecinum* as *Dioscorides* saith, and in Latine *Securidaca*, for *securus* signifieth *securis* and from thence the name *role*, *Turnebus* thinketh it should rather be read *Securidaca*. The first is generally of all writers held to be the true *Hedysarum* of *Dioscorides*, for in his time there were no more knowne, and *Clusius* saith that hee saw Hatchets at *Madrid* in *Spaine* made after the fashion of those cods, that is, thick in the middle where the handle was put in, and thin at both edges: the second also is of all called *Hedysarum minus*, or *Securidaca minor*, yet *Clusius* as I shewed you in the former Chapter giveth the figure hereof for

for his, and calleth it *Astragalus Monipellianus*: the third *Clusius* referreth to the greater kind, yet differing in the fashion of the cods, and because it is greater then the fourth I have given it the title of greater, it seemeth to resemble the greater *Ornithopodium* of *Dodonæus*, *Camezarius* calleth it *Hedysarum*, *Scorpiurum*, and as *Bauhinus* thinketh it is not much unlike the *Lotus enneaphyllus* of *Dalechampsius*: the fourth *Clusius* saith hee had from Dr. *Penny* a Physician of our London Colledge, who gathered it neare unto Geneva and imparted it to him, thinking it to be the true *Hedysarum* of *Discorides*, *Bauhinus* nameth it *Securidaca dumeretorum minor pallide carulea*, when as the flower is bluish and not blew: the fift *Clusius* set forth having received it from *Cortius* by the name of *Scolopendria leguminosa*, *Hedysarum peregrinum* which last title hee kept as fittest, and I have perished the defect in his description, for it in my former dayes I had thought to have published the fruits of my Garden, I had then beene more curious to have taken the descriptions of a number of Plants, which have perished with me and now I want: the sixth is called *Hedysarum minimum* by *Lugdunensis*: the seventh is mentioned by *Alpinus* lib. de exoticis: the eighth and ninth by him lib. de plantis Egypti: the last is mentioned by *Cornutus* among his *Canada* plants by the name here expressed, onely the eighth and ninth I have rather referred to the *Securidaca* then to the *Galega* as *Bauhinus* doth, although I acknowledge that not they onely but divers others of them here set downe, and entituled *Hedysarum* or *Securidaca* have little conformitie in their pod or seede unto a *Securis* or Hatchet but more unto a Vetch. It is called in English Hatchet Vetch, Axe seede and Axewort.

The Vetches.

All the sorts of *Hedysara* especially the feedes are bitter, and thereby as *Discorides* saith of the true or first sort, that it is profitable to the stomacke, and is put into those medicines that expell poyson or venome, and purgeth the obstructions of the intralls and so doe the leaves and stalkes of the greene herbe, *Matthiolus* saith the feedes of both sorts helpe the bitings of venomous creatures, and that they helpe to expectorate both tough and thinne flegme, being taken with a little hony or new wine, and openeth the obstructions of the Liver and Spleene being boyled and drunke, it killeth likewise the wormes in the belly if it be taken with some sweete lye, or in wine with a little Saffron put thereto: the meale of them clenseth foule Vicers, and taketh away freckles, spots and the like markes in the skinne. if the said meale be made up into an ointment with the best hony and often annointed. *Alpinus* saith that the feedes of *Sopora* or the eight were accounted poysonous to men and that the feede of the *Sesban* or ninth were used by the *Egyptians* to strengthen and dry up the over moisture of the stomacke, as also to binde any laske and womens immoderate courses: the *Egyptians* hee saith doe plant hedges herewith to defend their grounds.

CHAP. XXII.

Ferrum equinum, Horse shoe Vetch.

Here are a few small plants that some have referred to those in the foregoing Chapter but for their formes sake being different, I thought good to sever them and set them by themselves.

1. *Ferrum equinum majus*. The greater Horse shoe Vetch.

The greater Horse shoe Vetch hath divers small winged leaves set on small weake stalkes not a foote high, leaning or rather lying on the ground, each leafe being a little long and almost round at the end, and of a whitish Greene colour: at the joynts with the leaves come forth flowers single, that is one at a place on every short footstake, being small and yellow, after which followeth a long flat cod a little bowed but parted at the inner edge into foure, five or six divisions, each being cut in round, somewhat like the Letter C. or as it tooke the name formed like an Horse shoe, wherein lye so many feedes as there are spaces betweene the cuts or divisions, which are small, somewhat long and crooked: the roote is slender, three or foure inches long, white and hard, and liveth divers yeares.

2. *Ferrum equinum minus*.

The smaller Horse shoe Vetch.

This other is in all things like the former, but lesser by the halfe, the stalkes being not above three or foure inches long and lying close upon the ground, and is a little whiter then the last.

3. *Ferrum equinum polyceraton*.

Many codded Horse shoe Vetch.

This also differeth little in the growing from the last, being almost as small, but herein chiefly consisteth the difference betweene them, that this beareth foure or five flowers and so many cods also together upon a long stalke rising from the joynts, which are a little browner then the former.

4. *Ferrum equinum comosum*.

Bush headed Horse shoe Vetch.

The bush headed Horse shoe Vetch groweth as great as the

1. *Ferrum equinum majus*.
The greater Horse shoe Vetch.

first both in stalkes and leaves, and full of branches: from the toppes of the stalkes and branches onely, and not from the joynts with the leaves as in the former, come long naked stalkes almost halfe a foote long, bearing and hanging downe about their toppes a bush of flowers, of a yellowish Greene at the first & of a deeper yellow colour after, with some Greene veines in them: after they are past there followe such crooked and mooned cods as the other, but not very deeply cut in, wherein lye feedes like the other, the roote hereof is somewhat blackish, but as hard and great as the first.

5. *Ferrum equinum Gallicum*,
The French Horse shoe Vetch.

This hath a small short blacke thready roote and diuers weake stalkes lying on the ground, with nine leaves usually set together on a foottalke: the flowers are yellow many growing at the head, which give small feede in small crooked hornes.

The Place and Time.

The first and second are naturall to our owne Land, being often found upon dry heaths as beyond *Desford* and *Swanescombe* in *Kent* and sundry other places, the other three in *Italy*, *France*, &c. flowering in *June* and feeding in *July* and *August*.

The Names.

It hath no Grecke author to speake for it, but being of later invention it is generally called *Ferrum equinum*, after the manner or forme of the cods, in *Italian* *Sferro cavallo*, and of the *Chimicks* there and in *Germany*, *Lunaria filiquata*, *Matthiolus* calleth the first *Securidaca montana* as well as *Ferrum equinum*, *Gesner* in *hortis* tooke it to be a kinde of *Medica*. *Lugdunensis* calleth it *Solea equina* and *Tabernmontanus* *Hedysarum* sive *Ferrum equinum*: the second as a lesser sort thereof hath his name in his title; *Fabius Columna* calleth the third *Ferrum equinum polyceraton*, and the fourth *Ferrum equinum Comosum* or *Capitatum*, which *Bauhinus* calleth *Germanicum filiquis in summitate*: the last *Bauhinus* calleth *Ferrum equinum Gallicum*, and as he saith is the *Lotus emnaphyllos* of *Dalechampi*, differing but in the smallnesse from the *Germanicum* of *Camerarius*.

The Vertues.

It is wholly bitter as the *Hatcher Vetch* is, and therefore somewhat partaketh of the properties thereof: it is also used by some in wound drinke, and the juice thereof to make salves for wounds.

2, 3, 4. *Ferrum equinum diuersæ species*,
Divers sorts of Horse shoe Vetches.

1. *Ornithopodium majus*. The greater Birds foot.

CHAP. XXIII.

Ornithopodium. Birdes foote.

Here are two or three sorts of small herbes called Birds foote, unto which I thinke fit to adjoine some other small plants comming nearest to the former if not the nature of them in this Chapter together.

1. *Ornithopodium majus*. The greater Birds foote.

This small herbe (although it bee greater then the next) groweth not afoove a spanne high, with many branches spread on the

2. *Ornithopodium minus*.
The lesser Birds foote.

ground, set with many winges of small leaves, in manner as the last Vetches but much smaller, the flowers grow upon the branches, many small ones of a pale yellow colour, being set at a head together, which after turne into so many small jointed cods, well resembling the claws of a small Bird, and from thence took the name, with many small round seeds in them.

2. *Orni-*

2. *Orinthopodium minus*. The lesser Birds foote.

This is in all things like the former, but lesse, growing with the branches and leaves in a more comely manner, and this maketh the difference.

3. *Orinthopodium nodosa radice*. Knotted Birds foote.

This other groweth in all things like the first, but a little larger, the flowers are of a pale whitish red colour, and the cods distinct by joynts as the other, but a little more crooked, and the rootes doe carry many small white knots or kernells among the fibres.

The Place and Time.

These grow on Heathes and open untilld places in many places of our Land; and flower and feede in the end of Summer.

The Names.

They have their names of *Ornithopodium Pes avis*, according to the forme of their small cods; being like unto small Birds feete, as I said before, and in that one groweth greater than the other, they are made two sorts: the third *Lugdunensis* calleth *Orinthopodium tuberosum Dalechampij*, and some, as he saith, *Herniaria* from the Pro-
prie.

The Vertues.

The Birds feete have a little drying and binding qualitie in them, and thereby good to be used in wound drinke, as also to apply outwardly for the same purpose; but the last, as *Lugdunensis* saith, is found by daily experience to breake the stones in the backe or kidneyes, and drive them forth, if the decoction thereof be taken: and that it wonderfully helpeth the rupture, to be used both inwardly and outwardly to the place.

CHAP. XXIV.

Planta Leguminosa alia parva. Some other small Pulses.

Here are yet a few other Pulse-like Plants, which can not well be referred to any other kinde of plant, and therefore thinke fit to set them promiscuously in a Chapter together, leaving every one to their owne judgement, unto what *genus* they will referre them.

1. *Anthyllis leguminosa vulgaris*. The ordinary Kidney Vetch.

This small plant which groweth scarce a foote high, hath many leaves comming from the roote, that are somewhat small and long, soft pointed and sappy, greene on the upper side, and woolly underneath.

1. *Anthyllis leguminosa vulgaris*.
The Ordinary Kidney Vetch.

2. *Anthyllis leguminosa marina*, *Betica* sive *Auricula maris* *Comaricis*.
Sea Kidney Vetch of Spain: or Candy.

4. 3. *Anthyllis leguminosa falcata Cretica, & Vesicaria Hispanica.*
Crooked Kidney Vetch of Candy, and the bladder Peafe
or Kidney Vetch of Spaine.

5. *Stella leguminosa.*
The Starre coddled Pulle or Birds foote.

not alwayes set orderly juſt one againſt another, but conſuſedly, the greateſt and longeſt being at the end which ſome have compar'd to Lentills leaves, but bigger, (which I comparen pleaſeth me as little as the title of *Anthyllis*) among the leaves riſe ſoft ſtalkes divided into branches, with the like leaves on them, & at the tops of them a tuſt of many ſmall yellowiſh pretty ſweete flowers, and ſometimes white or pale purple, which *Cluſius* ſaith he receiv'd from *Alphonſus Pancius* of *Ferrara* formed like thoſe of the meadow Trefoile ſtanding in white hoary huſks: after the flowers are paſt come in the ſaid huſkes ſmall round and a little flat ſeede, very like to the meadow Trefoile, but a little redder, and uſually but one in a cod within that huſke: the roote is blackiſh on the cut ſide and white within parted many times into two or three, or more long parts.

2. *Anthyllis leguminosa marina Batia vel Cretica ſive Auricula muris Camerarii.*
Sea kidney Vetch of Spaine or Candy.

Having well conſider'd this ſmall plant, whoſe ſeed *Boel* brought me out of Spaine, and call'd it *Anthyllis Batia marina ſpinoliſ ſiliquis*: I find it ſo neere to agree to that which *Camerarius* call'd *Auricula muris ſimine & leporis foliorum figura*, that I dare ſay it is the ſame: for the leaves are very like the former *Anthyllis*, both for ſite and forme, but a little hoary or woolly, and yellow flowers, within a flat round huſke, a little prickly about the edges, with kidney like ſeede within them: the roote is annall as it is likely, for it periſhed yearely with me.

3. *Anthyllis leguminosa vesicaria Hispanica.* Bladder Peafe or Kidney Vetch of Spaine.

This ſmall plant groweth low and leaning downe to the ground, with a few leaves next to it, which doe ſometimes conſiſt but of three leaves, but uſually of five, the loweſt whereof are ſmaller than the end leafe that is largeſt, and is ſomewhat broad, and round pointed, and a little hairle withall: on the ſtalkes grow the like leaves, and at the joynts with them come forth three or foure ſomewhat hairy ſoft ſwelling huſkes, and at the toppes of them whitish flowers ſcarſe appearing, which being paſt, the ſeede groweth in thoſe huſkes that then are more ſwollen and ſeme like bladders, wherein uſually are contained two ſmall round peafe like to thoſe of *Orolus*: the roote is long, ſlender, and annall. *Camerarius in horto* calleth it *Trifolium Halicacabum*, but ſaith it is rather a *Lentis*: *Proſper Alpinius* in his Booke *De Plantis exoticis*, calleth it *Trifolium veſicarium*; but *Boel* from whom I had it, *Anthyllis Batia veſicaria*.

4. *Anthyllis falcata Cretica.* Crooked Kidney Vetch of Candy.

This Kidney Vetch of Candy hath ſundry leaves ſpread upon the ground, every one whereof is very like the longeſt or end leafe of the laſt, from among which riſe up the ſtalkes, beſet at the joynts with leſſer leaves, ſometimes but two at a place, otherwhiles three, foure, or five, ſtanding ſome places cloſe together, reſembling the Trefoile or Cinquefoile leafe, without any foot ſtalke to them; and ſome alſo will have the leaves ſeparate on both ſides of the ſtalke, one above and againſt the other: the flowers ſtand three or foure together at the tops of a yellow colour, like thoſe of the horned Claver, after which come crooked cods of a ſkinny ſubſtance with ſmall ſeede within

6. *Glanx Hispanica Clusij.*
Clusius his *Spanish Milkewort.*

7. *Scorpioides leguminosa.*
 The *Scorpion-like Pulse.*

within them: the roote consisteth of small strings and fibres: *Alpinus* calleth it *Trifolium falcatum*, but because I finde both this and the last better to agree in face with *Anthyllus*, have therefore put them together.

5. *Stella Leguminosa.* The starre coddled Pulse or Birds foote.

This starre fashioned Pulse groweth also about halfe a foote high with uptight stalkes, whereon are many winged leaves set, consisting of very small leaves like unto the Birds foote, from the joynts of the stalkes with the leaves come a tuft of small pale yellow flowers at the toppes of small prickly fading stalkes, which turne into five or sixe small, long, crooked, pointed cods, standing one against another, like unto a starre, from whence rose the name, but not joynted as the Birds foote, having within them small brownish seede, of the taste of other Pulse, but a little clammy with all: the roote is small and yellowish.

6. *Glanx Hispanica Clusij.* *Clusius* his *Spanish Milkewort.*

The *Spanish Milkewort* of *Clusius* riseth up with three or foure hoary weake stalkes not a foote high, whereon grow many soft leaves, made of many small ones set together on both sides of a middle rib, like as those other Pulses here before, of a Greene colour above, and hoary white underneath, and a little bitter in taste: the stalkes are bare towards the toppes, where they beare a short spike of flowers set close together, each rising out of a hoary huske, and are of pale blewish purple colour, after which come short round pods, with 4. or 5. small round seedes within them; the roote is small and threddy.

7. *Scorpioides Leguminosa.* The *Scorpion like Pulse.*

This also is a small Pulse with winged leaves like the last, but rounder: the flowers also are small and yellow, standing on long naked stalkes, one or two together, which turne into long and flat joynted cods, ending in a small long crooked point, somewhat like a *Scorpions* taile: some have taken it to be a *Scorridaca*.

The Place and Time.

The first is found in many places in this Land, and so is the fift, if I be not much deceived; the rest are strangers, their titles declaring it in most: they flower towards the end of Summer, and seede also.

The Names.

These Plants have not beene knowne to any of the ancient Greeke or Latine Authors that we know. The first is diversly named by diverse of our moderne Writers: *Dodonæus* calleth it *Anthyllis prior*, and *Anthyllis Lentsimilis*, *Lobel*, *Clusius*, and others *Anthyllis leguminosa*, by *Tabernmontanus* *Lagopodium*, by *Thalins* *Arithetica Saxanum*, by *Gesner* in *hortis Vulneraria rusticæ* because his Country husbandmen called it *Wundkraut* or *Klein Wundkraut*; and those of *Berne Guichbail*, and *Bauhinus* *Loto affinis Vulneraria pratensis*: the second *Camerarius*, as I said, called *Auricula muris*, and *Boel* that brought it us, as it is in the title, and so likewise the third, which *Camerarius*, as I said, although hee called it *Trifolium Haticacabum*, as *Alpinus* did *Trifolium vesicarium*; yet judged it rather a *Lotos*: the fourth is onely mentioned by *Alpinus*, *lib. de exoticis*, by the title of *Trifolium falcatum Creticum* which with the former I have rather thought fit to referre hither: the fift is called by *Lobel* *Stella leguminosa*, and as *Bauhinus* thinketh the *Vicia Sefaracæ* of *Columna*: but is much mistaken therein, as I shewed you before in the Chapter of *Astragalus*: the sixt is called by *Clusius* *Glanx Hispanica*, and thinketh that no others so called, came so neare that of *Dioscorides* as this: it is very likely to be the *Glanx maritima* of *Alpinus*, *lib. de exoticis*; *Dodonæus* calleth it *Anthyllis altera lentisimilis*; *Bauhinus* maketh it to be the *Cicer sylvestre minus* of *Thalins* or very like it: the seventh is called by *Lobel* *Scorpioides leguminosa*; but both this and the *Stella leguminosa* are referred by *Bauhinus* to the *Orinthopodia*, calling them *Orinthopodia affines*: *Bauhinus* among the *Polygalas*, doubteth whether *Angulata* his *Polygala* should not be the *Polygala Valentina prima Clusij*, which he saith hath leaves like *Lentills*, but fatter, a yellow flower and seede in pods, which I thinke more likely to be this *Scorpioides* than any kinde of *Polygala*.

The

The Vertues.

The first is of much use among the *Germans* for their wounds and hurts, inward and outward, and so doe both wayes apply them, whence came their name : *Thalus* also sheweth by his name imposed thereon, that it was used for the gout.

CHAP. XXV.

Fenum Gracum, Fenugreece.

He ancient Writers made but one sort of Fenugreece, the latter have added some others unto it, and although some have set them among the Trefoiles, whereunto they are somewhat like, yet because *Galen* and others say, that they were eaten as Lupines, and the *Egyptians* and others ate the feedes yet to this day as Pulse or meate, and that *Banhus* thereupon, as I guesse placed them among the Pulse, I am content to doe so likewise.

1. *Fenum Gracum sativum*, Manured Fenugreece.

The same Fenugreece riseth up sometime, but with one, & sometimes with two or three hollow Greene stalkes, parted into divers branches, whereon grow at severall spaces, many leaves, but three alwayes set together on a foote stalke, almost round at the ends, & a little dented about the sides, Greene above, and grayish underneath: from the joynts with the leaves come forth white flowers, and after them crooked flattish long hornes, small pointed, with yellowish cornered feedes within them, smelling somewhat strong and loathsome; the roote is made of many fibres perishing still before Winter.

2. *Fenumgracum sylvestre*, Wild Fenugreece.

This wilde Fenugreece hath the like one or more stalkes branched, the leaves stand three together, and are somewhat like the former, dented about the edges, the flowers likewise are whitish, but stand more together at the end, and so doe the long cods, somewhat like unto them, with smaller and darker feede in them.

3. *Fenumgracum alium sylvestre*, Another wilde Fenugreece.

This other Fenugreece hath but one slender stalke, seldome branched, of a foote high, and scalyas it were at the bottome, whereon grow such like leaves as the former, and at the joynts flowers like unto the manured standing single and lesser, but broader hornes afterwards, more flat, and ending in a small thread, the feede within is likewise lesse.

The Place and Time.

The first is manured every where that I can heare of: the others grow wilde in *Spain* and other countries: they flower with us in the beginning of *July*, and give their feede in the end of *August* and *September*.

1. *Fenumgracum sativum*,
Manured Fenugreece. 2. *Fenumgracum sylvestre*,
Wilde Fenugreece.

The Names.

It is called in Greeke by *Dioscorides* *πίσις*, and by other Greekes *πίσις* and *πίσις*, but *Theophrastus* calleth it *Εύερος*, a cornu, *similitudine fovee sit capri vel bovis*, the crooked seede vessels being so like unto horns; in Latine *Fœnugrecum*, because that, as *Columna* saith, it had two times of sowing, the one before Winter to be fodder for cattle, the other in February for seede, and simply calleth it *Siligua*. *Varro* calleth it *Silicula*; and *Pliny* *Silicia*; all other now adays call the first *Fœnugrecum* or *fativum*; and the second *Fœnugrecum* *silvestre*, and *Bauhinus* *Fœnugrecum* *silvestre* alterum *polygeration*; and thinketh it is the *Hedysarum minimum* of *Lugdunensis*; the Arabians call it *Olba* *Hebbe*, and *Helbe*, the Italians *Fiengreco*; the Spaniards *Alfornas*; the Germanes *Bockshorn*; the French, Dutch, and English, *Fenugreece*.

The Vertues.

The seede of *Fenugreece* is onely in use with us, the herbe it selfe never used that I know, because it is seldome seene growing with us; and as *Galen* saith, is hot in the second degree, and drie in the first; it clenseth, digesteth, dissolveth and mollifieth: the powder of the seede taken with a little hony driveth forth many noysome humors out of the body, mollifieth inward Imposthums and Vlcers in the Lungs and breasts. and easeth the griping paines of the intralls, but it doth overturne and breedeth a loathing in some stomackes, especially if they bee tender, but may well serve to robustious and countrey people invred to strong labour, for I know no Physicians in our dayes doe use it inwardly, yet *Alpinus* saith that the Egyptian women doe use to eat the seede, which *Galen* and divers authors said was used in their times (being buried a little in earth to make them sproute, whereof many Sackes fulls are sold in the markets daily) to make them grow fat. But outwardly applied it hath many good uses of familiar and daily experience, for the meale thereof heated with Vinegar and applied outwardly to the Region of the Spleene, doth mollifie and waste the hardnesse thereof, as also other hard tumors and swellings; the decoction thereof mollifieth likewise the hardnesse, and other paines or heate of the mother, and openeth the obstructions of it, if they sit therein as in a bathe, or receive the hot fumes by sitting over it: the decoction thereof clenseth the head and haire from scurfe, dandriffe and the running sores thereof: it helpeth the disease called *tenasmus*, that is an often desire to the stoole without doing any thing, as also the Bloody flux when the excrements smell strong: a Pulvis made with the meale thereof and Linseed, and the decoction of Mallowes, and a little oyle or *Axungia* put thereto asswageth the swelling and paines of the cods or privy parts of women, and generally all other swellings and tumors: the same also helpeth the Goute and other joynt aches that come of cold: the Mucilage of the bruised seede steeped in water and strayned forth, boyled in oyle or *axungia* is of much good use for many of the foresaid griefes: the decoction or the mucilage applied to the forehead with clothes dipped therein stayeth the flux of humors to the eyes, and easeth the paines and inflammations in them: used also in Glisters it is effectual in the Stone by opening and mollifying the inward parts. *Lobel* saith, that of the seede is made an oyle of more vertue then would be beleaved, to dissolve scirrhus swellings in the intralls, and other hard knots and kernells.

CHAP. XXVI.

Tribulus terrestris. Land Caltrop.

He Land Caltrop (for that of the water shall bee spoken of in another Classis or Tribe) riseth up with divers small hard branches, with divers winged leaves on them made of many small leaves set on both sides of a middle ribbe like *Orobis*: at the joynts stand singly small pale whitish yellow flowers which turre int small rough prickly heads, of five or six corners, wherein lyeth a small kernell or seede: the roote groweth downewards with many long fibres thereat.

The Place and Time.

It groweth in the sandy fields among Corne beyond Sea as also among rubbish, and the ruines of buildings and by wall sides; wee finde it many times in our owne Land: it flowreth in July and ripeneth in August.

The Names.

It is called in Greeke *τρίβυλος* *μυρτίς*, and in Latine also *Tribulus terrestris* *quod siligua plante muricata est*. The Arabians call it *Hafsch* or *Haferk*, the Italians *Tribulo terrestre*, the Spaniards *Abroins* and *Abrolhos*, the French *Saligos terrestre*, the Germanes *Walds Kletlin*, the Dutch *Land Caltrop*, and wee in English *Land Caltrop*, from the forme of the fruit like those instruments of warre, that were calt in the enemies way to annoy their Horses: but why *Pliny* should account *Tribulus*, *Lolium*, *Cardum* and *Lappa* no lesse then *Rubus*, to bee the diseases of Corne rather then Plagues and faults of the earth, I see no cause; and yet it seemeth it was a generall error growen strong by tradition in thole elder ages, as many other things were about the Metamorphosis of

Tribulus terrestris. Land Caltrop.

herbes. &c.

herbes, &c. and *Virgil* seemeth to expresse the same of *Pliny* in these verses,²

*Lappaque Tribulique, niterque intentiacula,
Infalix Lolium, et steriles dominantur Avena.*

For the Corne was no way otherwise hindered or spoyled, then as other Weeðes would doe by their plentifull growing, to hinder the growth of the Corne, in sucking away the nourishment from the earth that should feede it, but by tearing the Legs of the Reapers; which faults or plagues rose from the earth wherein the seede of them lay hid ready upon occasion to spring, and not in the Corne, which if it were sown in a ground namely a well weeded Garden cleare of such weedes, would have none of them among it.

The Vertues.

The Land Caltrops are of an earthly cold qualitie and thereby astringent and hindering the breeding of inflammations and Impostumes, and against the flux of humors: more over being of thinne parts it doth much helpe to breake and waste the Stone in the Kidneyes: a Lotion made therewith healeth all sores and Vicers in the mouth, and all corruptions that breede in the gummes and throate: the juice doth cleanse the inflammations and other hot rheumes in the eyes: it likewise cureth the venome of the Viper and other poysons, if a dram thereof bee taken in wine. The *Thracians* saith *Pliny* and *Galen* that dwell neare the River *Sirimon* did feede their Horses with the Greene herbe, and lived themselves of the fruit or kernells, making them into a sweete bread which bound the belly; *Pliny* addeth that the roote being gathered by a caste persons doth consume Nodes and Kernells: the seede bound to the swollen veines in the Legs, or other parts of the body taketh the swellings away, and easeith the paines.

CHAP. XXVII.

Glaux leguminosa sive *Glycyrrhiza sylvestris*. Licoris Vetch.

Of this kinde of wild Licoris we have two or three sorts to set forth unto you, and unto these I will adjoyne the other two sorts of manured Licoris, which some good authors have likewise reckoned among the Pulses as I doe here.

1. *Glaux vulgaris leguminosa*. The most common Licoris Vetch.

This kind of Licoris Vetch sendeth forth many weake round hard stalkes trayling on the ground, branched upwards, set somewhat thicke with winged leaves made of many, set on both sides a middle ribbe, somewhat like as the Vetch hath, but much larger and pointed: the flowers come forth at the joynts, at the end of a long stalke many together, of a bleake white colour tending to yellow, which turne into crooked cods, con-

1. *Glaux vulgaris leguminosa*.
The most common Licoris Vetch.

3. 4. *Glycyrrhiza vulgaris siliquosa & echinata*.
Codded and rough headed Licoris.

teining two rowes of feede, cornered and grayish, of the taste of other Pulses: the roote is thicke and long, dividing it selfe into two or three long strings running very deepe into the ground, sweete in taste like unto Licoris, which dyeth not but abideth long, shooting forth new branches every yeare in the Spring.

2. *Glaux altera leguminosa*. Another Licoris Vetch.

This other wilde Licoris hath such like stalkes and leaves as the former, but not spreading so farre, nor leaning downe so much, the winged leaves also are not so large, of a darker Greene on the upper side, and gray underneath, the flowers are of a purplish colour, the cods are brownish long and round, and the feede within them more round: the roote is like the former growing deepe and spreading, and as sweete as the other. *Thalium* saith that this is very like true Licoris except in some few things.

3. *Glycyrrhiza vulgaris siliquata*. Common Licoris.

This Licoris riseth up with many round woody stalkes, set at severall distances with many winged leaves, made of many small long ones set on both sides of a middle ribbe, very well resembling a young Ash risen from the feede: the flowers appeare at the joynts, after it hath stood divers yeares in a place without removing, set upon long stalkes, many set together one above another spike fashion, of a pale blew colour, which turne into long browne, and somewhat flat cods, with three or foure small, round hard, feedes in them: the roote groweth deepe into the ground, as great as a mans thumbe or more at the head, spreading divers long rootes from it, both downewards, and likewise suckers from the sides, whereby it will quickly encrease, browne without, and yellow within of a sweete taste.

4. *Glycyrrhiza echinata*. Rough headed Licoris.

This other Licoris groweth in the same manner that the former doth, with the like leaves and flowers, but of a deeper blew colour, and growing for the most part at the toppes of the branches, which are followed by rough browne heads, like to the burres of the *Platanus* Plane tree, as *Dioscorides* compareth them, being many rough cods like those of Lentills, set together in a bunch, with one browne flat feede in every cod: the roote groweth as deepe as the other, but brancheth not under ground like it, and is of a stronger or more bitterish sweete taste.

The Place and Time.

The first groweth in many places about Cambridge, in *Claringdon* Parke by *Salisbury*, and *Thrapstone* in *Northamptonshire*, and many other places of our Land, the other I have not heard hath beene yet found with us, but in *Germany*, &c. The first sort of Licoris is said to grow chiefly in *Germany* about *Noremberg*, the other in *France*, *Spain*, *Italy* &c. and flower with us late, and feede as late, if at all. *Camden* in his *Britannia* saith, that Licoris groweth wilde at *Worsop* in *Nottinghamshire*, but I beleieve he was mistaken therein, for that they of that countrey plant great store in their fields, and thereof make good profit, as we doe in many other places in Gardens.

The Names.

The first is called *Glycyrrhiza sylvestris* by *Gesner* in *hortis*, by *Camerarius*, and by *Lugdunensis*, *Polygonum* by *Cordus* on *Dioscorides*, and in his *Historie Polygonum Cordis* by *Thalium*, *Glaux*, and *Glaux vulgaris* by *Lobel* and *Clusius*, *Fanumgeracum sylvestre* by *Tragus* and *Dodonaeus*, & *Hedysarum glycyrrhizatum* by *Gerard* and many *Herbarists*, and by *Bauhinus* *Glycyrrhiza sylvestris floribus luteo paleiscentibus*: the second is the *Glycyrrhiza sylvestris* of *Thalium*, and also of *Camerarius* in *hortis*, by *Lobel* *Glaux vel Glaux quadam leguminosa herbariorum*, & by *Bauhinus* *Glycyrrhiza sylvestris altera floribus puniceis folijs*. *Arabi*: the third is called *Glycyrrhiza Germanica* by some, & *Levius*, or non *Echinata* by others, and *siliquosa* by *Lobel* and others, *Dulcis radix* by *Tragus* and *Cordus*, and *Liquiritia* in the *Apothecaries* shops: the last is called *Glycyrrhiza echinata* *Dioscorides* by *Lobel* and *Lugdunensis*: *Glycyrrhiza Italica* by *Gesner* and *Dodonaeus*, and simply *Glycyrrhiza* by *Matthiolum* and others; *Theophrastum* calleth it *Herba Scythica*; the *Greekes* γλυκύριζα and to the *Latines* *Glycyrrhiza*, that is, *dulcis radix*, and of some *Glycyrrhizon*: of the *Arabians* *Sus*, of the *Italians* *Regolizia*, of the *Spaniards* *Rogoliza*, of the *French* *Reclisse*, and *Regalisse*, of the *Germanes* *Susboliz*, of the *Dutch* *Suethout*; and we in *English* *Licoris*.

The Vertues.

The two sorts of wilde Licoris are not knowne to be used in Physicke by any, but are wholly neglected: for the other two sorts of true Licoris, their properties being both alike, I shall not neede to entreate distinctly as if the one had some other faculties that the other had not, for they are therein both alike, and as *Galen* saith, is very familiar to our temperature in that it is sweete, and having a little attraction joyned with it, making it temperate in heate and attraction, that it is the nearest unto our temper, and by both these qualities, as he saith, it doth lenise the hoarsenesse of the throat, and is helpfull for the ulcers in the bladder; it hath also some moisture therein by reason of the sweetnesse, and thereby good to quench the thirst: Licoris is often boyled in faire water, with some Maidenhaire and Figges, which maketh a good ptisane drinke, for those that have any dry cough, and to digest the flegme, and to expectorate it, or hoarsenesse, wheezing, and shortnesse of breath, and all other griefs of the breast and lungs, the tickle or consumptions caused by the distillations of salt humours on them, which doe wattle and consume them: it is good also in all the paines of the reines, the stranguy, and heate of urine. The *Scythians* are said by chewing this in their mouthe, that it keepeth them from thirst in their long journeyes through the desarts for tenne or twelve dayes, and staith hunger also: Licoris boiled in water, with a little Cinamon added to it, serveth in stead of drinke in many places, especially if it be set to worke with barme as beere is, and then tunned up, and will grow cleere, strong, and heady by time as beere will doe: the fine powder of Licoris blowne through a quill into the eyes that have a pinne and webbe, as they call it, or rheumaticke distillations into them, doth cleanse them and helpe them: the juyce of Licoris is as effectuell in all the diseases of the breast and lungs, the reines and bladder as the decoction: the juyce dissolved in Rosewater with some Gumme Tragacanth, is a fine lohoc or licking medicine for hoarsenesse, wheezings, and all other roughnesse in the mouth or throat, and to expectorate tough flegme, as also to condensate thinne rheumes, falling on the lungs: our *English* Licoris is more pleasant to the taste, wanting much of that attraction is in that which commeth to us from beyond sea.

The *Galega* or Goates Rue should have taken up his place here, as being proper to this Classis, but as you may see before, I have drawne it and others into another Classis, for the reasons there specified. There yet remains a number of Trefoiles to be spoken of, as being nearest to the Pulses, especially those that are peoperly called *Lotus siliquosus*,

siliquosi; because their long cods are more eminent to be seene, which shall next follow, and the rest in their order.

CHAP. XXVIII.

1. *Lotus edulis Creticus*. Trefoile Pease of Candy.

his Trefoile Pulse or Pease shooteth forth divers slender stalkes set with brownish Greene leaves at severall distances thereon; three alwayes standing on a foote stalke, which are sappy, a little thicke and pointed, the flowers are yellow, but like unto small Peaseblossomes, which are followed by round cods, somewhat crooked, and great in comparison of the smallnesse of the plant, wherein lie round Pease of a sweete taste, like unto our ordinary Pease, and while they are young and Greene usually fold in their markers, and as much desired of them, as our Pease with us: the whole Plant with stalkes and leaves are a little hairy: the roote is small, thready and annuall growing among their corne, and in the borders of their fields.

2. *Lotus quadripinnatis siliquis*. Square codded Pease.

This kinde of Pulse or Pease I have shewed you in my former booke, that it hath a crimson blossome, and long round cods, with toure siliques, two at one side, and two at another.

3. *Arbus seu Lotus Aegyptica*. The Egyptian toure leaved Lotus.

This small herbe growing not much above an hand breadth high, hath divers round Trefoile-like leaves growing on the hairy stalke foure most usuall together, at the toppe whereof standeth sundry white flowers, after whom the seede followeth that is like unto Peare kernells in the huskes.

4. *Lotus sylvestris Creticus*. Candy wilde Trefoile.

This wilde Trefoile riseth up with stalkes a foote high, having at each joynt two small leaves, and from thence three other small darke Greene leaves, upon very short or no foote stalkes at all; the flowers are small and yellow, coming forth both at the joynts and toppes of the stalkes, usually two together, and so many cods likewise come up in their places, being very small, and long, with seede in them, as small as Mustard-seede: the roote is small and hard, yearly perishing, the whole plant tasteth somewhat like a Pulse, yet with a little bitterens and fourenesse therein which quickly vanish away.

5. *Lotus pratenis Monspeliensum*. Smooth codded Trefoile of Mompelier.

This riseth up with cornered and joined stalkes a foote high, with leaves, usually three together, more long than round; the flowers are yellow, growing both at the joynts and toppes of the stalkes, after which come large and long cods, with feedes like Fenigreeke in them: the roote is small and long.

6. *Lotus asperior fruticosus*.

Rough Trefoile of Mompelier.

This is like the last, but that the stalkes grow bigger, harder, and rougher, the leaves are narrower and hoary: the flowers are yellow set in hoary huskes smaller than the former, and the seede lesser also.

7. *Lotus fruticosus Granatensis*.

Spanish hoary hard Trefoile.

This Trefoile found by *Clusius* in *Granado* & *Valencia* in *Spain*, and referred by him to the *Oxyterphyllum* of *Scribonius Largus* riseth a cubite high, with many branches, and three leaves alwayes set together, saith *Clusius*, (but sometimes foure saith *Lobel*, if his be the same:) the flowers are small & whitish, many growing in a round tuft together, with small seede, after them contained in small long cods; the roote is somewhat great and thicke, and astringent: Of this he maketh two sorts, one whose stalke is Greene and the roote white, growing in moist places; the other with reddish stalkes and branches, and the roote somewhat reddish, wherewith, as he saith, they use in those places to make a syrope of good effect against the bloody fluxe.

8. *Lotus hamorrhoidalis major sive Trifolium hamorrhoidale majus*.

The greater Pile Trefoile.

The greater of these pile Trefoiles, hath a long straight roote, somewhat woody, with very few fibres at it, from whence riseth up usually but one stalke a cubite or two high, branched into divers hard weake flexible twiggies, and they againe into other small branches, bearing at every joynt five leaves, two whereof stand close to the stalke, each upon a small foote stalke, and the other three rise betweene them, and higher than they upon another foote stalke like a Trefoile, the leaves and stalkes being all hoary, yet in the younger plants, onely the three leave stand together on a stalke

1. *Lotus edulis Creticus*.
Trefoil. Pease of Candy.

2. *Lorus quadrilobatus* fistulosus. Square codd. d. P. aff.

3. *Abus* seu *Lorus*: *Egyptiaca*.
The Egyptian four-lobed *Lorus*.

4. *Lorus stuebelii* *Creticus*.
Candy wild: Trefoil.

without the other two at the bottome of them, the flowers grow many together in a tuft, of a whitish red or bluish colour somewhat large, which turne into long and round cods, greater and thicker than the next that followeth, of a blackish red colour, somewhat swollen, and very well representing the hemorrhoidall veine, as it appeareth, swollen and fallen downe, from whence it in part tooke the name, and partly also from the singular propertie it hath to cure the piles, within which are divers small round blacke seede.

9. *Trifolium hamorrhoidale alterum sive minus* seu *Lorus Dalechampij*. The lesser pile Trefoile.

This other lesser pile Trefoile hath a tall stalke, two or three foote high, parted into long branches, with tow somewhat large leaves both close set to the foote of every branch, and to the joynts where the leaves grow forth, from whence come other leaves, as large as the ordinary Trefoile leaves, three standing together upon a long

B b b b

foote.

foote stalks : the flowers grow in tufts at the end of the branches of a light bluish colour, which are followed by small round and shorter pods than the former, with such like seede in them : the roote is somewhat thicke and woody, full of strings, yet yearly dying withus, and hardly, but in a kind yeare giving ripe seede.

10. *Lotus Corniculatus frutescens.*

Bush horned Trefoile.

This Trefoile hath small smooth and Greene stalks a foote high or more, spreading many short branches, with three leaves on their foote stalks, being long and very narrow : the flowers are yellow that shoote forth at the toppes two or three together, and sometimes more, after which come thicker and shorter pods than the next, ending in a long point, wherein are contained small seede ; this is found sometimes to have broader cods, and ending in a shorter point, it groweth about *Mompelier* and in *Italy* also, and with us also in some places.

5. *Lotus pratensis Mompellensis.*
Smooth codd'd Trefoile of *Mompelier*.

8. *Lotus hemarrhoidalis major sive Trifolium hemarrhoidale majus.*
The greater pile Trefoile.

6. *Lotus asperior fruticosus.*
Rough Trefoile of *Mompelier*.

9. *Trifolium hemarrhoidale alterum minus sive Lotus Ibyca Dalech.*
The lesser pile Trefoile.

11. *Lotus*

11. *Lotus corniculatus minor pilosus*. The lesser hairy horned Trefoile.

This other hath slender stalkes, covered with very small reddish haire, the leaves likewise are hairy, small, and sharpe pointed, three on a foote stalk, and two at each joynt, from whence spring the flowers, one or two at the most on a small stalk like an haire, of a deepe yellow, tending to a saffron colour, unto each whereof succeedeth a very slender long eod, with very small feede therein: this likewise is found in the woods and medowes about *Mompelier*, and the hills adjacent, and as frequent with us.

12. *Lotus Corniculatus incanus*. Hoary horned Trefoile.

This groweth low, bar with a little larger leaves and flowers, of as deepe a saffrony yellow colour as the other, or rather, with a shadow of crimson on them, growing three or foure together and small long crooked eods following them with round feede in them: this is found also in divers medowes.

13. *Trifolium corniculatum Lusitanicum flore rubro*. Horned Trefoile of Portugall with red flowers.

This horned trefoile of Portugall hath divers long and narrow leaves, three set together lying on the ground, and so likewise are the lowest upon the stalk that riseth about a cubit high, with others upwards standing cyther single or two at a place very narrow and long: the flowers grow at the toppes of the stalkes and branches one at a place on a short footstalk, composed of five leaves of a deepe red colour, with the shew of a little horne in the middle, which growing greater the flower oftentimes abideth still at the foote of the horne for a good while, which falling away at the last, and the pod growing ripe containeth within it very small brownish feede: the roote is slender and perisheth, but by the feede that is shed it yearly springeth againe.

The Place and Time.

The most of these are declared by their titles, or after their descriptions where they grow, their times of flowing and feeding are in the Summer seasons.

The Names.

Lotus in Greeke and *Lotus* in Latine is of two kinds, for there is *Lotus arbor*, the Lote tree, and there is *Lotus herba* the herbe *Lotus*, which as *Dioscorides* *Galen* and *Pliny* doe all agree is a Trefoile or like a Trefoile (and yet not the *Trifolium* whereof he had made mention before) and whereof *Dioscorides* and *Galen* make two sorts *Lotus urbanus* and *Lotus sylvestris*: of the *Lotus urbanus* as it is generally taken to be I have spoken before in the end of the fifth Classis of this Worke: but this kinde of *sylvestris* is more controverted, divers writers supposing that which they bring and shew forth to be the right. The first here expressed was sent by *Honorius Bellinus* from Candy where the people call it *Hieranzuni*, & *Pona* in his *Italian* *Baldus* calleth it *Lotopisum* and by *Bauhinus* *Lotus cretica*: the second is called *Lotus filiquosus rubro flore* by *Clusius*, and *Lotus tetragonolobus* by *Camerarius*, and *Sandalida Cretica* and usually with us *Pisum quadratum*: the third is mentioned by *Alpinus* lib. de plantis *Aegypti* by the name of *Abfus*, which *Bauhinus* calleth *Lotus affinis Aegyptiaca*: the fourth the *Italian* *Pona* calleth *Lotus sylvestris Dioscoridis*, and was sent out of Candy for a Candy: the fifth the *Italian* *Pona* calleth *Lotus sylvestris Dioscoridis*, and is called by *Camerarius* *Lotus peculiaris filiquosus*, and as he saith by some *Cicer sylvestre* and *Dorychnium* but both erroneously: the sixth is the *Lotus pratensis filiquosus* of *Clusius*, called by *Lobel* *Lotus trifolius pratensis filiquosus*, and *Lotus trifolius corniculatus* by *Gerard*: the sixth is so called by *Lobel* and *Lugdunensis* as is in the title: the seventh *Clusius* saith he found in the kingdome of *Granado* and *Valencia*, and is the same or very like unto that *Lobel* and they of *Mompelier* called *Lotus sylvestris*, and by some thought to be the *Oxytriphylum* *Scribonij Largi*, but *Lobel* thinketh the *Trifolium bituminosum* to be the true *Oxytriphylum* and that this may be the *Oxytriphylum alterum* *Scribonij Largi*, *Clusius* also saith he received this out of *Italy* by the name of *Lotus fruticosus* and that *Plas* tooke it to be *Perempsa Arabum*, whereof hee saith there are two sorts, the one with a white and whiter branches, the other with a red roote and reddish branches, which the Moores of *Granado* called in their language *Eucina*, and of the rootes of both which were somewhat great and astringent, but especially of the red, they made a Syrupe singular good for the disenterie or bloody flux: the eighth is called *Trifolium Hamorrhoidale* by those of *Mompelier* for the causes mentioned in the description, whereunto I have added *majus* by the same authority, for they doe account the ninth which is the *Lotus Lybica* of *Delechamps* to be the lesser sort of the former: the tenth and eleventh is the 22. and 21. *Trifolium* of *Bauhinus* in his *Prodromus*: the twelfth is usually called with us *Trifolium Corniculatum vulgatissimum*: the last we had from *Boel* in Portugall by the name of *Trifolium filiquosum rubrum Lusitanicum*.

The Vertues.

The wilde *Lotus* as *Dioscorides* and *Galen* say is of an heating and drying quality, and thereby effectfull against the paines in the bladder if it be taken of it selfe or with Mallow feede drunke in wine: the powder of the herbe mixed with some Hony and annointed taketh away the markes and blemishes in the face, &c. the eight sort here expressed as I said before is held about *Mompelier* to be of singular good effect against the Piles or Hemorrhoides, for it hath a manifest astringent taste without any manifest heate or acrimony: the usual dose of the dried herbe (but the feede is much better) made into powder, and the quantitie of a dram or halfe a dram according to the age and disposition of the Patient taken in red wine which effect the learned there knowing have much reasoned the ease among themselves, whether it worketh this effect by any hidden propertie, or by the astringent facultie to either of which opinion some have inclined: the *Lotus Lybica* as *Galen* saith is in the second degree of heate, and doth a little denser, the rest have no especiall propertie recorded by any or knowne to us.

CHAP. XXIX.

Trifolium montana. Mountaine Trefoiles.

He next Trefoiles that are to be entreated of are those that grow on hills and the dryed grounds, whereof there are sundry varieties.

1. *Trifolium montanum majus purpureum*. The greater purple Mountaine Trefoile.

This greater Trefoile groweth scarce a foote high, with divers leaves thereon which are large and three inches long sometimes, three alwayes together on long footstalkes, sharpe pointed and a little finely snipped about the edges, at the toppes stand large and somewhat long heads of gallant purple flowers, like unto the meadow Trefoile but greater: This is also found with longer and narrower leaves, and a longer spiked head of flowers.

B b b b b a

2. Tri-

1. 2. *Trifolium montanum majus flore purpureo & albo.*
The great purple and white mountain Trefoile.

4. *Trifolium angustifolium Alpinum.*
Narrow leaved Trefoile of the Alpes.

2. *Trifolium montanum majus albo flore.* The great white mountain Trefoile.

The stalk hereof is not so great or high, the leaves are smaller yet somewhat long and dented about the edges, growing many below, and few and smaller on the stalk, at the toppe whereof grow one or two short branches, with each a spiked head of small white flowers somewhat sweete: the roote is long and about a fingers thicke, nesse, brownish on the outside and white within, with some fibres thereat.

3. *Trifolium montanum obtuso crenato folio purpurascens.* The bluish mountain Trefoile.

This Trefoile is fuller of leaves on the stalkes then the last, which are long and narrow, not sharpe but round at the ends, and dented round about, but up higher on the stalkes they are very narrow, the flowers are fewer that stand at the toppes, and of a pale purple colour.

4. *Trifolium angustifolium Alpinum.* Narrow leaved Trefoile of the Alpes.

This mountain Trefoile hath a long roote, somewhat hairy or scaly toward the toppe, and ending in some long fibres, whitish on the outside and somewhat hard and woody, of a sweete bitter taste like unto Licoris, (from whence some have called it *Spanish Licoris*: but farre unfitly as most of the vulgar appellations bee) from whence rise divers long small slender stalkes of leaves bowing downe to the ground, with two or three small narrow threads of leaves on them towards the bottome, and three long narrow leaves at the ends of them, with small dents at the edges sensibly to be felt, from among these leaves rise one or two naked slender stalkes three or foure inches high, bearing large flowers as it were in a round spike, of an excellent purple crimson colour standing in five cornered huskes.

5. *Trifolium Alpinum argenteum.* Silver leaved Trefoile of the Alpes.

This Silver Trefoile hath a great long reddish woody roote, shooting forth divers great branches with a number of small narrow leaves, three together at the toppes of them next the ground standing on short footstalkes which are soft and of a Silver-like hoariness all over, from among which rise short stalkes not above foure fingers breadth in height, naked untill a little under the flowers they have three lesser leaves then those below: each stalk beareth but one flower, which is not after the fashion of all other Trefoiles, that is, with Pease-like blossome (and therefore I the more suspect that this cannot properly be referred to the company of Trefoiles but rather to the *Ranunculi Gerania* or some other according as the seede shall shew it to be which wee have not seene) but laid open like unto a Crowfoote or Cranes bill, and of a Rose or Peach colour, with many like coloured threads in the middle tip standing about a small hoary head.

6. *Trifolium montanum lupulinum.* Hoppe-like Trefoile.

The Hoppe Trefoile riseth with smooth slender weake stalkes a cubit high, set with few leaues on them, which are small and round pointed for the most part, like the common meadow trefoile standing severally on their footstalkes, the flowers stand at the toppes, made as it were of brownish yellow scales laid one upon another, very well resembling the head of an hoppe, whereof it tooke the name, and from whence some have called it *Lupulus sylvaticus* a wilde Hoppe, and groweth as *Bauhinus* saith on the hills above *Ilff* in Germany, where it is likely *Thalins* also found it.

7. *Trifolium*

6. *Trifolium montanum* Lupulinum.
Hoppe-like Trefoile.

9. *Trifolium Glycyrrhizites*
Licoris Trefoile.

7. *Trifolium saxatile* hirsutissimum. The hairy rocke Trefoile.

The root of this Trefoile is woody and creepeth under ground, with a reddish barke, and is but as it were the stocke of many heads or plants set together, being not above two or three inches high: the leaves are small, soft, woolly, and as it were Silver-like, in forme like a Trefoile, dented about the edges, and standing on short but very hairy footstalkes, among which rise small round heads standing on long stalkes, in the middle of whom rose short and very soft yellow haire; wee have not yet seene any other flower it beareth nor seede: it was gathered on the toppes of the highest of the Helvetian mountaines.

8. *Trifolium Scorpioides*. Scorpion-like Trefoile.

The leaves of this Trefoile are not much unlike the first Trefoile, but narrow and endented, the flowers are yellow and grow in a small tuft three or foure together which afterwards beare small crooked coes like a Scorpions tail, or the *Scorpioides leguminosa*. This Beel gathered in Spaine and with it another like therunto, but the flowers were of a paler colour.

9. *Trifolium Glycyrrhizites*. Licoris Trefoile.

This sweete or Licois Trefoile hath a great and long deepe spread roote, very like unto Licoris, from the head whereof groweth out sundry short armes halfe a foote long, and divers leaves issuing therefrom, three alwayes together which are somew hat long and narrow, plaine on the edges, and each standing on a short footstake, from among which rise short stalkes like the meadow Trefoile, bearing such a like bush or tuft of purplish flowers: this faith *Lobelius* is not that of *Pona* or *Alpinus* yet very like.

The Place and Time.

These all grow on hills and mountaines, some in Spaine others in Germany, and the last on a hill by *Nempel* called *Hortus Dei*, they flower and seede in the time that the others doe.

The Names.

Clasius and *Thalys* have made mention of the first and second by the names of *Trifolium majus* and *montanum*: the third is from *Bauhinus*, *Pona* in his *Italian Baldus* mentioneth the fourth, and is to be called by *Pona* as it is in the title which *Bauhinus* calleth *flore magno radice dulci*, and by some *Glycyrrhiza Astragaloides*: the fifth by that name is in the title; the sixth is called by *Thalys* *Lupulus sylvaticus*, and *Bauhinus* *Trifolium montanum lupulinum*, for I take them to be both one: the seventh *Bauhinus* mentioneth in his *Prodromus*: the eight of both sorts is not mentioned by any before now: they of *Nempel* call the last *Trifolium dulce montanum*.

The Vertues.

The properties of none of these are recorded by any that have written of them, but it is likely they much participate of the qualities of the former.

CHAP. XXX.

Lagopus. Hares foote.

He next sort of Trefoiles that are to bee handled is of those whose flowers grow in close spiked heads, called *Lagopus* Hares foote, where of there are halfe a dozen.

1. *Lagopus maximus flore rubro*. The greatest Hares foote.

This great Hares foote hath divers trefoile leaves rising from a small long thready and annuall roote, each standing on a long footstake being almost round and dented about the edges, very like to the meadow trefoile as well in the bignesse as forme, very soft, and of a pale Greene colour, among these risen up weake bending stalkes a foot high or more, branched and bearing the like but somewhat longer leaves on them, and at their toppes close spiked heads, with many small flowers round about them, each in a five cornered cuppe of an excellent crimson colour, in which huskes after the flowers are past grow small yellowish round seede, one onely in a huske, whose brims or corners then stand displayed somewhat like unto a starre.

2. *Lagopus major folio pinnato*. The longer headed Hares foote.

The Leaves of this Hares foote are hoary, large, and longer then the former, with divers conspicuous veins in them making them shew like wings, the middle ribbe on the backe of them being somewhat great also: the flowers are like the former both in forme and colour, but the whole head is longer.

3. *Lagopus major angustifolius*. Great Hares foote with very narrow leaves.

This Hares foote hath stalkes a foote high, set with very narrow leaves almost like grasse, yet in some places they are found to be larger, but still long and narrow, three set together, at the toppes whereof grow as large a spiked head of flowers as the first, but the colour of them are paler, and the ends or cornered toppe divisions of the huskes are hard and almost prickly if not wholly. *Lugdunensis* calleth this *Alopecurus Graminea* Dalechampi.

4. *Lagopus angustifolius Hispanicus*. Spanish narrow leaved Hares foote.

The Spanish Hares foote is one likewise of the greater kind, having a firme straight stake but slender, with divers branches thereat, with three somewhat long, narrow and pointed hoary leaves, with great ribbes on the backes upon long footstalkes set at each joynt, which are somewhat broad at the bottome of them, compassing the stake and branches with a little care thereat likewise, the flowers are of a pale red colour set in a long spiked head, but more loose and not so compact as the former: this I had by Boel out of Spaine by the name of *Tenuifolius*.

1. *Lagopus maximus flore rubro*.
The greatest Hares foote.

2. *Lagopus major folio pinnato*.
The longer headed Hares foot.

4. 5. *Lagopus angustifolius* & *summitas florum ruberrimi*.
Bright red Hares foote.

6. *Lagopus vulgaris*.
Common Hares foote.

5. *Lagopus minor flore ruberrimo*. Bright red small Hares foote.

This small Hares foote hath small woolly or soft leaves as small but nothing so long or narrow as the last and groweth little more then halfe a foote high, the spiked head is small but larger then the wilde kind, and the flowers on them are of a most excellent crimson colour, the corners of whose woolly huskes stand out like starres when the feede within them are ripe: this is but annuall perishing yearly as the former: this also came to me out of Spaine by the name of *Lagopus pratensis Baticus*.

6. *Lagopus vulgaris*. Common Hares foote.

The common Hares foote is well knowne to be a small plant growing greater and higher in some places and smaller in others, with whitish woolly small trefoile leaves set upon the stalkes, and many branches it hath, the heads at the toppes are small and somewhat long with the roundnesse, composed as it were all of a hairy hoary downnesse, whose flowers in some are of a white in others of a bluish colour: it is annuall as the rest, and this is one especiall note of this family of Hares foote, or that beare spiked heads of flowers that they perish yearly, when as the other sorts of Trefoiles that are to follow or that went before are not so: This also I had from Boel, *Sapient*, but grew larger, and another that stood not upright, with many other sorts out of Spaine which are perished with me by some unkindly yeares have happened.

The Place and Time.

These have beene all found, some in Italy, others in Spaine, some in France and others in Germany, but are preserved with us in the Gardens of such as are curious: and the last almost every where in dry grounds in our owne Land, and flourish in the Summer moneths onely.

The Names.

It is called *Lagopus* in Greeke, and so likewise *Lagopus* in Latine a *Leporis hirsuto pede* of the hairy foote of an Hare; as also *Lagopodis* and *Pes Leporis* *Leporis cuminum*, and *Trifolium humile*. Hippocrates called it *Lagopyron quasi Trifolium Leporinum* because it grew among Corne: the first is called by most writers *Lagopus maximus* & *Lobel* by *Clusius*, and *Lagopus maximus* or *major folio Trifolij* by *Lobel* himselfe and *Dodonaeus*: the second is called by *Lobel* *Lagopus altera folio pinnato*, which *Clusius* maketh the other sort of his third *Trifolium majus*, *Tragus* called it *Cyrisus* and so did *Columella*, *Lonicerus* and *Cordus* *Trifolium magnum* the commentators on *Aleſius* in their *Pandeſis* *Pes milvis*: and *Thalys* *Trifolium spicatum*: the third is called by *Lobel* *Lagopus altera angustifolia*, and so by others, but as I sayd by *Lugdunensis* *Alopecurus graminea Dalechampi*: the fourth *Clusius* so calleth as it is in the title: the fift is not remembred by any before: the last is generally called *Laogopus* or with little variation, *Tragus* onely calleth it *Lotus campestris*.

The Vertues.

All the parts of these Hares feete, that is, leaves, stalkes, &c. but especially the spiked heads doe dry and binde, and

and of the first faith *Lobel* wee have had most certaine experience to stay Fluxes and Laskes of the belly, being drunke in wine or in water if the patient be feverish, and being bound to the Share it taketh away the inflammations thereof, it is profitable faith *Muschiolus* besides the aforesaid qualities, to stay chollicke belchings of the stomacke and paines of the belly, if the heads and feede in powder be taken in red wine: the herbe boiled with Mallows in wine is very good for the paines of the bladder, the heate of urine and scalding. The feede also raken helpeth the spitting of blood: the ashes of the heads being burnt is good to apply to the piles to stay their bleedings, and some also thinke that if the fundament bee but wiped with the herbe it will stay their bleeding. *Pena* saith that the facultie of drying is so powerfull besides the binding that it wonderfully stayeth the running of the Reines: it is also profitably used in all foule and hollow Vlcers, being first clested to raise up flesh in them and to cicatrize them, and is of great good use to helpe burstings.

CHAP. XXXI.

Trifolia capitulis stellatis globosis, &c. Starry headed, and round headed Trefoiles.

These sorts of Trefoiles are likest to the last in their heads chiefly, but they are not so closely compacted, but stand somewhat looser one flower from another.

1. *Trifolium stellatum Mompeliensium*. Starry headed Trefoile of *Mompelier*.

This Trefoile of *Mompelier*, hath a small white long & down-right root, with some fibres therat, from whence rise diuers leaves upon long weake hoary foote stalkes, not standing upright, made of three soft hairy and hoary parts, formed somewhat like unto an hearr, (whereon some have rashly taken it to be *Trifolium cordatum*) and a little dented about the edges, from among which come up three or foure or more low stalkes seldome a spanne high or branched, but naked up to the toppe, where there usually grow three such like leaves as the lower are, set under the head, which is a small round spike or umbell, with many long flowers appearing, of a whitish red, or flesh colour, out of woolly or hairy and hoary huskes, every one by it selfe, which when they beginne to fade, the whole head becommeth more round, and the huskes shew their fine long sharpe points, whereinto the toppes of them were divided, more apparent laid abroad like a starre, in each whereof is contained one blackish flat feede: in the place about *Mompelier* where it groweth naturally, it flowreth in *May*, and the feede is ripe in *June*, but with us it will neither flower nor feede of a moneth after.

2. *Trifolium clypeatum argenteum*. Buckler Trefoile with silver-like flowers:

This small plant spreadeth many branches upon the ground set with Trefoile leaves like the common meadow Trefoile, every branch bearing at the end diuers silver like flowers, and long round blacke and flat feede like unto the old *Venetian* Bucklers, which are hot and drie in taste, for which cause I should rather make it a *Thlaspi*: but in that I have not seene the plant, I can say no further of it, but give it you as my author *Alpinus* hath set it downe.

3. *Trifolium globosum capite*. Globe or round headed Trefoile.

This round headed Trefoile from a long white fibrous and hairy roote, sendeth forth diuers slender round stalkes a hand breadth high, and sometimes a foote long divided into branches, somewhat hairy beset with small triparted leaves, a little hairy, with two small leaves at every joynt, and dented about the edges: the flowers are small and yellow that grow at the toppes, out of the browne sharpe huskes of the round head.

4. *Trifolium globosum repens*. The creeping Globe Trefoile.

This other globe Trefoile, whose root is small, creeping reddish and hairy, hath sundry weak branches lying upon the ground, three or foure inches long, being soft, woolly, and somewhat reddish, which but few small Trefoile leaves set on them, a little waved about the brimmes: the toppes of the stalkes and branches are garnished with faire round heads, whose flowers are of a reddish yellow colour, standing in hairy huskes, wherein a small feede is contained.

5. *Trifolium fragiferum Frisicum*. Strawberry headed Trefoile of *Friseland*.

This Trefoile groweth up with diuers stalkes, and broad pointed Trefoile leaves upon them, dented in in the middle like a heart, set on long foote stalkes, bare towards the tops, and bearing a small round head, with small bluish flowers, rising out of the huskes, which are like small bladders made of thin skinned, which after the flowers are past swell somewhat bigger, and come downe their brimmes, forming a head like a Strawberry, of many red graines set together, but greater, in each huske whereof is contained a few small yellow feedes, the rootes spread themselves

Alpinus.

with many long fibres at them. There is another sort hereof whose head is of a deeper or darker colour; (but I never saw any of a violet colour, as *Clusius* saith) and so are the flowers also in other things little differing from the former: both these sorts *Beel* brought with him out of *Spaine*, in the year 1608, and entituled them *Trifolium Vesicarium*, which he gathered there with above two hundred other sorts of feedes, besides diuers other rare plants, dried and laid betweene papers, whereof the feedes were not ripe, of all which feedes I had my part, and by sowing them saw the faces of a great many excellent plants, but many of them

5. 6. *Trifolium fragiferum* *Friscum*, & *Lusitanicum tomentosum*.
Strawberry headed Trefoiles of *Frisland* and *Portugall*.

12. *Spica trifolia festuacea mirabilis*, & *altera*.
The rare spiked rushie Trefoile.

came not to maturitie with me, and most of the other whereof I gathered ripe seede one yeare, by unkindly yeares that fell afterwards have perished likewise.

6. *Trifolium fragiferum Lusitanicum tomentosum*.
Strawberry headed Trefoile of *Portugall*.

This other hath somewhat larger leaves than the last, and pointed at the ends: the heads likewise at the toppes of the stalkes were somewhat large and round like the last, but all woolly, as it were or hoary: this perisheth yearely, with mee, and Mr. *Tradescant*, who had it from *Boel* at *Lisbone*, without bearing us ripe seede, and have not since procured it from him againe.

7. *Trifolium vesicarium leve*.

Smooth skiny headed Trefoile.

This small Trefoile riseth little above halfe a foote high, it hath three or foure stalkes with small leaves thereon, very sharply dented about the edges, with long foote stalkes under them, the heads are made of small smooth hoary skinned in fashion of little bladders, set close one unto another, and out of each a small yellow flower, having small round flat seede afterwards in them; the roote is small, long white, and fibrous.

8. *Trifolium vesicarium asperum majus*. The greater rough skiny headed Trefoile.

The leaves hereof are somewhat round like the meddow Trefoile growing from the roote, among which come weake stalkes two cubits high, upheld by the bushes that it groweth among bare or naked to the toppes, bearing every one a small round head, covered over with rough threads, made of many small round skinned like the other, and deeper yellow flowers rising out of them.

9. *Trifolium vesicarium asperum minus*. The lesser skiny headed Trefoile:

The roote hereof groweth aloope under the ground fastened therein by many threads: the branches likewise creepe upon the ground with bare stalkes, two or three inches long growing from them, bearing on each a small round head made in the like manner of many small round greenish rough skinned, out of which the flowers proceede of a reddish yellow colour, and within which a small browne seede lieth.

10. *Trifolium capitulis hymi*. Time headed Trefoile.

This Trefoile from a small long white thready roote sendeth forth stalkes halfe a handfull long spread on the ground, with three small and round pointed leaves dented about the edges, and small round heads on the toppes of them somewhat like the heades of Time, whose flowers are of a deepe yellow, enclining to red, and being ripe, grow hard containing reddish seede within them.

11. *Trifolium capitulo oblongo aspero*. Long rough headed Trefoile.

This rough headed Trefoile hath also a long white thready roote, and from them many stalkes of a foote long, being round smooth, and joynted, stored with but few round leaves; from the severall joynts grow forth many small yellow flowers set together, and after these rise somewhat long and round heads, armed, as it were, with crooked sharpe prickes, which grow hard and rough being ripe, under each whereof is set a small leafe, parted into three: the seede of this is small as the former.

12. *Spica Trifolia festuacea mirabilis* & *altera*. The rare spiked rushie Trefoiles.

These rare Trefoiles are like one unto another in nature, but a little differing in face and outward forme, both of them have slender long rootes, from whence rise sundry reddish spiked heades, out of which come many fine rush-like sprigges, and from among them, in the one a very few small Trefoile leaves, upon very small long white foote stalkes, as fine as haire; in the other a great number of the like small green Trefoile-like leaves, on such thready or haire-like stalkes, a little dented about the edges: from among which rise sundry flowers on the like slender foote stalkes, being somewhat long, and white, like unto those of the flarre Hyacinth smelling sweete while they are fresh, standing in huskes, wherein afterwards grow small, white, round seede. I have placed

placed the figures of them both together, that the diversitie may the better be observed: they are of a drying facultie, as by the taste may be judged.

The Place and Time.

The most of these grow about *Mompelien* in *France*, others in *Spaine*, as hath beene shewed in their descriptions; and some in *Germany* and *Candy* also. which flower and seede when the rest doe.

The Names.

The first is called by *Bauhinus* *Trifolium stellatum*, and I have added *Monspeliensium*, and the figure not extant before: the second by *Alpinus* *Trifolium chycatum argenteum*: the third is *Bauhinus* his *Trifolium globosum* sive capitulo *Lagopi rotundiore*: the fourth is so called by him, as it is in the title: the fifth is mentioned by *Clausius* in his *Cura posteriores*: the sixth comming among other seedes from *Boel*, I have so entituled, as it is set downe; and it may be is a kinde of the seventh which *Bauhinus* termeth *Trifolium spumoso capitulo laeve*, the eighth and ninth *Bauhinus* calleth *Trifolium Capitulo spumoso aspero majus & minus*: but I have entituled the *Vegetarium asperum majus & minus*: the tenth and eleventh are so called by *Bauhinus* as they are in their titles: the last two sorts of Ruskie spiked Trefoiles are mentioned by *Alpinus* in his Booke of strange plants, by the names here exhibited.

The Vertues.

I doe not finde any other propertie in Phyicke that these are applied unto, than hath beene before spoken, for being all of late invention have had no further triall made of them.

CHAP. XXXII.

Trifolia pratensis, Meadow Trefoiles.

Of the Trefoiles that usually grow in meadowes, Besides those that grow in our owne Land; there be others that grow not with us, which are fit to be set together.

1. *Trifolium pratense vulgare purpureum.*

Common purple meadow Trefoile called field Hony-suckles.

The meadow Trefoile hath many leaves, rising from the roote, three set together, and each almost round, among which rise up short stalkes of flowers, not much higher than the leaves, bearing many deepe purplish crimson flowers together in a tuft rising smaller up to the toppes, which turne into little cods with small seede in them, the roote spreadeth much, and endureth long. Sometimes this is found with halfe round spots of white in the leaves.

1. *Trifolium pratense vulgare purpureum.*

Common purpl. meadow Trefoile, called field Hony-suckles.

2. *Trifolium pratense album.*

White flowered meadow Trefoile.

And

3. *Trifolium pratense* Salamanicum Clusij. Medow Trefoile of Salamanca. 5. *Trifolium luteum minimum*.
The smallest Trefoile. 6. *Quadrifolium purpureum fuscum*.
Four leaved or purple Grassie.

And there is another sort whose leaves are all longer than the former and pointed, the flowers are of a paler *Altera* purple. Of this sort likewise some are spotted with blacke spots. It is likewise sometimes found, having a tuft *diversa* of Greene leaves on the stalkes, which as I take is but accidentall, and rather *Lusus nature*, than any speciall sort.

2. *Trifolium pratense album*. White flowered medow Trefoile.

This usually groweth lesse than the former, and the flowers are white, and lesse as the head is also, and herein chiefly differeth, yet I have seene it sometimes with longer leaves than in others: but this is not *Clusius* his *Trifolium primum flore albo*, as *Bauhinus* thinketh, making it the same with that of *Matthiolum*, *Dodonaeus*, *Lecl.* &c.

3. *Trifolium pratense Salamanicum*. Medow Trefoile of Salamanca.

This Trefoile differeth little from the second sort of the former kinde, but that the leaves are smaller according as the climate giveth them, dented about the edges, and with a blackish spot on them, the branches traile on the ground

Album
Clusij.

ground and from the joynts rise the small stalkes that beare many crimson red flowers smaller then ours and rounder set together, the small red feede is contained in thin huskes.

4. *Trifolium pratense minus purpureum*. Small purple meadow Trefoile.

This small Trefoile hath small hard stalkes a foote high, full of branches bearing on some three leaves, on other branches and joynts, foure small leaves like a *Lor*, the flowers grow many together at the toppes of the sprigs, being very small and in a loose umbell of a purplish red colour; the roote is slender white and threddy.

5. *Trifolium luteum minimum*. The smallest yellow Trefoile.

This small Trefoile hath a few slender weake stalkes, little bigger then small Rushes lying on the ground, whereon grow small Trefoile leaves sometimes more then three on a short footstalk, a little dented about the edges: the flowers are small and yellowish set close and round together, after which follow small blackish flat and crooked feede, almost like a *Medica* in the huskes: the roote is small and threddy.

6. *Quadrifolium fuscum*. Fowler leaved or purple grasse.

The purple grasse spreadeth on the ground, the leaves are in some three in others foure or five on a stalk, of a sad Greene colour, with a shadow of darke purple cast over them, the flowers are white; I never saw this but in Gardens where women keepe it with confidence to be good for the Purples in children or others.

The Place and Time.

The two first sorts grow every where in our owne Land, the third in *Spaine, Portugall, &c.* the fourth in many of the meadowes in *France*, the fifth in divers of our meadowes here: the last onely in Gardens as I sayd, for the wilde that is thought by some to be the same is not it, and flower and feede in the Sommer.

The Names.

It is properly called *τριφυλλον* in *Greece*, and *Trifolium* in *Latine* because three leaves are alwayes joyned together, and it is probable that although *Dioscorides* doth not peculiarly make a Chapter thereof as he doth of *Lor*, yet he knew it and made mention thereof, both in describing the *Lor sylvestris*, which as hee saith some called *Lybica*, as also the *Medica* whose leaves were like unto the *Lor trifolia pratensis*, which sheweth plainly he knew it by comparing other herbes unto it. There needeth no great explanation of these Trefoiles for all authors call them by this peculiar name of *pratense* as being most common therein: the third is remembered by *Clinijus*, the fourth by *Lugdunensis*: the fifth *Dodonæus* calleth *Trifolium agrarium*, and *Lobel Trifolium luteum minimum*: and the last by *Lobel* in his *Adversaria*: It is called in *Italian Trifoglio*, in *Spanish Trebol de prados*, in *French Treffle de pres*: in high *Dutch Wyfenkle*, in low *Dutch Claveren*, and in *English* Claver or Clover grasse, and Meadow Trefoile or Three leaved grasse, and of many also Hony suckles, because Bees feede much on the flowers.

The Vertues.

Meadow Trefoile both leaves and flowers are thought to be cooling and binding: but others thinke them to be of a digelling and suppurating qualitie; but *Dodonæus* who holdeth with the first opinion saith that they are held to be good to ease the griping paines of the guts and to avoyd those slimie humours that sticketh unto them if the herbe be boyled and used in a Glister, which I thinke it cannot doe by any cooling or binding propertie: if the herbe be made into a pulvis and applyed to inflammations it will ease them: the juice of it dropped into the eyes is a familiar medicine with many countrey people to cleare them of any filme that beginneth to grow over them and to take away the pin and web as they call it growne in them: it also allayeth the heate and blood-shooting of them. Countrey people also in many places doe drinke the juice hereof against the biting of an Adder, and having boiled the herbe in water they first wash the place with the decoction, and then lay some of the herbe also to the hurt place: the herbe also boyled in Swines greafe and so made into an ointment is good to apply to the biting of any venomous creature: the herbe also bruised and heated betwene two Tiles and applyed hot to the Share causerh them to make water who had it stopped before: it is held likewise to be good for wounds, and to take away scarres: the decoction of the herbe and flowers with the feede and roote taken for some time helpeth women that are troubled with the whites: the feede and flowers boyled in water, and after made into a Pulvis with some oyle and applied helpeth hard swellings and Impollumes.

CHAP. XXXIII.

Trifolia alia. Other sorts of Trefoiles.

Here are some other sorts of Trefoiles which could not well be placed in any of the former ranks, nor in that which must follow, and therefore I thought good to place them together in this.

1. *Trifolium falcatum*. Hooked Trefoile.

The leaves hereof are small and like a Trefoile growing on weake stalkes spreading on the ground, at the joynts with the leaves on all sides of the stalkes and so at the toppes, come forth foure or five small yellow flowers set upon short footstalkes, which turne into small crooked cods with very small feede in them.

2. *Trifolium odoratum peltatum Creticum*. Sweete buckler Trefoile of Candy.

This Trefoile from a long slender roote full of fibres sendeth forth small stalkes an handfull high almost bare of leaves, having but few below and fewer on them, yet made into three round parted ones, a little dented about the edges, and standing on long footstalkes: at the toppes of the stalkes grow foure or five small pale yellow flowers standing one above another on short stalkes, after which succede yellowish flat skinny cods almost halfe round with a prick or pointell at the end, with one or two small flat feede within them, which cods while they are young and greene are very sweete, and eaten by poore people, but when they are full grown and hard are very bitter.

3. *Trifolium Creticum spinosum*. Thorny Trefoile of Candy.

The whole plant hereof lyeth spread round above the ground, sending forth divers square stalkes about a span long or more, full of joynts and branched out from them, where they are of a greenish purple into sundry branches, having foure small crooked thornes standing at each joynt, two above and two below, at the joynts likewise come

2. *Trifolium viciifolium peltatum Creticum.*
Sweete Buckler Trefoile of Candy.

3. *Trifolium spinosum Creticum.*
Thorny Trefoile of Candy.

come forth on both sides two small stalkes of small and long greene leaves of three parts, each ending in a small pricke, with which also shooteth forth the small stalkes with flowers, each one singly by it selfe, made of five small blewish purple leaves standing open like unto the flowers of Pimpernell but greater, with divers threads ripe with yellow and a long stile in the middle, after which succcede small round heads pointed at the ends, which when it is ripe benderth and hideth it selfe under the leaves, and openeth into five parts, in each whereof lyeth one flat and reddish seede, the roote is long with many fibres therat.

The Place and Time.

The first *Clusius* saith was sent him by *Gregorius de Reggio* from *Bononia*, whereabouts he found it growing : the second and third were of *Candy*, their time of flourishing being in the end of Summer.

The Names.

The names of these Trefoiles are expressed in their titles as their severall authors have called them, for *Clusius* as I said made mention of the first in the *Appendix altera* unto his History, and in his *Cure posteriores* and *Baubin* of the second in his *Prodromus*. Of the last, both *Clusius* in his History, and *Baubin* in his *Phytopinax*, *Martialis* and *Prodromus* make mention, and say it is called *Orbitochorto* in *Candy*, *Clusius* is much perswaded that it is the *Tribulus terrestris* of *Dioscorides*.

The Vertues.

There is nothing particularly mentioned of these Trefoiles what physcally propertie they have, but being of the family may be referred unto them.

CHAP. XXXIV.

Trifolium Cocleatum sive Medica. Snail Claver or Trefoile.

Of these *Medicas* I have given you many varieties in my former Booke, but there are some other omitted that shall be shewed in a Table together with those formerly expressed, and there are others to be spoken of in this place which were not fit for that, and first with smooth shells, and then of those that are prickly.

1. *Fenum Burgundiacum sive Medica legitima Dodonaei Clusio et alij.*
Snail Trefoile of Burgoine.

This snail Trefoile or Claver hath divers weake greene stalkes, with divers small sad greene Trefoile leaves set thereon without order : the flowers grow upon long stalkes coming from the joynts and toppes of the branches many clustering in a thicke short tuft of a blewish purple in those that grow in these parts, but in others

Cecce

of

of divers and severall colours as more purple neare a violet, or paler blew, or of a brownish blew, or of mixt blew and yellow colours, parted, and in some places of *Spaine* and *Narbone* in *France* with yellow flowers also: after which come divers small snail-like round cods set together not so much twined as many other *Medicæ* are wherein lye small pale seede: the roote groweth somewhat deepe with some strings and fibres thereat abiding long.

2. *Trifolium Cochlearium polycarpon sive Medica racemosa*. Clustering Snail Trefoile.

This hath branches lying on the ground a foote long and more, set with small round Trefoile leaves on pretty large footstalkes, the flowers come forth at the joynts upon long footstalkes, small and many clustering together and after them small snail-like shells a little rough. There is another hereof whose leaves are dented, whereas the former is not, and differeth not else.

Alterum.

3. *Medica frutescens sive flavo flore Clusij*. Woody Snail Claver.

This Snail Claver hath sundry hard, round and flexible weake stalkes not able to stand upright but lying on the ground, a foote long, divided into many branches, whereon grow small long and narrow leaves by three on a long footstalk, with a thicke middle ribbe on the backe of each, the flowers are small and many together of a

1. *Fenum Burgundiacum sive Medica legitima & alia Species*.
Snail Trefoile of Burgandy with other sorts.

3. *Medica frutescens sive flavo flore Clusij*.
Woody Snail Claver.

4. *Medica marina*. Sea Claver.

yellow

yellow colour and somewhat sweete, which are followed by divers small flat twined cods like unto those of the first but smaller, with smaller seede like wise in them: the roote is long consisting of long strings which abideth long, shooting new stalkes every yeare.

4. *Medica marina*. Sea Claver.

The Sea Claver hath sundry hoary trailing branches spread on the ground a foote or two long, with many small and very hoary round trefoile leaves on short footstalkes: the flowers are many small and yellow standing at the ends of the branches and many small writhed shells doe follow like unto other small Snail Clavers the roote is somewhat thicke and abideth long.

5. *Medica marina major spinosa*.

Hard and thorny shield Sea Claver.

This Claver groweth bigger and greener then the last, the flowers are small and yellow coming from the joynts of the branches, and but one at a place which are followed by small hard and round prickly heads, whose windings are hardly to bee discerned, this perisheth yearly. There is another sort hereof that differeth onely in the finalnesse, which are the third and fift figure in the generall table of *Medicus*.

6. *Medica Arabica Camerarij sive Trifolia cordatum*.

Hart Claver of Arabia.

This heart Claver hath very slender and small weake branches full of joynts, and round greenish Trefoile leaves upon long footstalkes at them, broad at the end and dented in, making the fashion of a Hart as it is usually expressed, with red spots in each of them: the flowers grow two or three together at the end of a stalke coming from the joynts small and yellow, which turne into small prickly twining heads like unto other small *Medicus*: the roote is but annuall.

6. *Medica Arabica Camerarij sive Trifolium cordatum*.
Hart Claver of Arabia.

Minor

8. *Medica Lunata & altera spinosa*.

Moone Claver and Another thorny one.

Cccc 2

7. Ma

7. *Medica echinata parva recta & echinata rotunda supina*.
Luz. lunensis his creeping round prickly Claver of two sorts.

7. *Medica echinata rotunda sive Tribulus terrestris minor repens Lugdunensis.*
Creeping round prickly Claver.

This round prickly Claver hath very long branches trayling on the ground, with very small trefoile leavēs on them, the flowers are yellow, two or three at the molt standing together, which turne into round rough or prickly beads, with small or no shew of twining to be seene on them, the roote is small white and thready. There is another growing more upright and with foure or five such small burres set together, else not differing from it.

8. *Medica lunata.* Moone Claver.

The leaves hereof are small somewhat like unto the first true Claver, and dented about the edges, the flowers are yellow and the pods very like to those of *Marantha* his *Cytisus*, but yet is not the same, this being an herbe

and that a shrubbe or bush growing high. Other sorts of *Medicas* or Clavers are set downe in my former Booke of flowers, which together with all the other sorts are not there expressed, but since obtained, I have thought good to set in one table, those are not formerly mentioned are these, which *Medica tornata*, &c.

9. *Medica tornata major*
& *minoris levis.*

The greater and lesse smooth *Medica*, turned like a Tun.

These two sorts differ not in their growing from the others but onely in their fruite, the greater whereof standeth singly one at a place, turned like to a Tun, and the lesser hath many together smaller, which two are expressed the two first in the generall Table.

10. *Medica tornata spinosa.*

The Thorny Tun like *Medica*.

This also hath the chiefe difference in the fruite, which is somewhat like a Tun, but a little thorny or more like unto a fine wrought haire button, many together which is the sixth figure in the Table.

The Place and Time.

The first groweth naturally both in many places of *Spaine* and in *France* neare *Mompelier* also, yet is it sowen in many places both there and in other countries, to serve for Hay for their Cattell and Horses and cut it often, for in *Spaine* they have no other hey which feedeth their Horses and maketh them exceeding fat, and so doe they in the Low countries, whereby their Kine give the more abundance of Milke: the others grow some in *France* others in *Spaine* or *Germany*, and some of them also are found in our fields and marshes, as at *Woolwich*, *Deptford*, &c.

The Names.

The first is taken by the most judicious of our later writers to be the *usum* of *Dioscorides*, which as *Pliny* saith was brought from the *Medes* into *Greece* by the *Persian Dariu* his warres there, from whence came the name *Medica* as the *Medicum malum* the Pomecitron was also: but now from *Italy* being brought and sowen for the benefit thereof in the fields of *Belgia* and the bordering places, and first in *Burgonie* or *Burgundy* hath altered the old name into *Fenum Burgundiacum* and of late regained the old name, and called *Medica legitima*, none as it is said better agreeing with *Dioscorides* his description in all things then this: *Gerard* was much deceived in saying that *Lobel* his *Fenum Burgundiacum* was the *Trifolium cochleatum primum* of *Dodonæus* in his last edition, for it is his *Medica* in the next Chapter following, as any that will compare them shall soone finde: the second is of *Bauhinus* in his *Prodromus*, but we having it growing plentifully in our land doe usually call it *Medica racemosa*: the third *Clusius* calleth *Medica flavo flore*, and *Bauhinus* *Trifolium sylvestris luteum siliqua cornuta sive Medica frutescens*, and *Tabernmontanus* *Lens major repens* as he saith: the fourth *Clusius* first called *Medica marina* and so doe *Lobel*, *Camerarius* and others: the fift is of the number of *Boel* his Spanish *Medicas*, whereof wee had a dozen or fometeene sorts: the sixt *Camerarius* calleth *Medica Arabica* and is generally called *Trifolium cordatum*: the two next are *Lugdunensis* his *Tribulus terrestris minor repens* and *rectus*, which *Camerarius* calleth *Medica pusilla*: the two last are lately knowne. The first of these is by *Avicen* and the *Arabians* called *Cot* and *Alfalsasar* but corruptly by the Spaniards *Alfalsaga* and *Alfaser*, but by these of *Castile* *Mielguas*: by the French *Sainelfoin* and *Foin de Bourgogne*, we call it *Medick*, *Fodder* and *Snail Claver*, or *Trefoile*.

The Vertues.

The use of this first herbe was in former times more to feede Cattell then in medicines, for it was held to be so powerfull to fatten their Horses and other beasts that they would stint them to a quantitie for feare of suffocating them, by growing thereby too fat, the greene herbe saith *Dioscorides* hath a cooling propertie, and for that purpose chiefly to be used, yet *Avicen* commendeth the oyle made of *Cot* or *Alfalsasar*, against the tremblings of the heart, *Gesner* saith that a liquor drawn by fire out of the Alfalsies of the Spaniards is good against the Stone, I suppose he meaneth an oyle drawn out of the feede, as the oyle from Almonds. *Plutarch* in his booke against *Epicurus* reciteth a pretty similitude taken from this *Medica*. Even as (saith he) the feed of *Medica* abideth a long time by reason of his many winding branches creeping on the ground, and by his sharpe roughnesse, even so greeke having fastened his crooked rootes in ones body, cleaveth thereto not for a day or a night, but for many yeares, and is hardl expelled out by other greekes as by stronger nailes. The rest here mentioned in this Chapter are not used against any disease that I know.

CHAP. XXXV.

Scorpioides. Scorpion grasfe or Caterpillers.

BEcause these plants come nearest unto the *Medica*, both in their flowers, pods, & seedes, although differing in their leaves, yet I thinke I doe not greatly erre to set them at the taile of the rest of the Pulses, but I have given you the knowledge of two sorts of these Scorpion Grasfes in my former Booke, there remaine three more to be remembred in this Chapter to finish this Classis of the Pulses.

1. *Scorpioides Bupleurifolio pluribus corniculis asperis.* Small ordinary Caterpillers with many cods. This small Caterpillar also groweth in the same manner with trailing long branches as the first small rough sort doth, the leaves are likewise of a fresh Greene colour, and of the same fashion, but somewhat lesser: the flowers also are small, and of a deepe yellow, foure or five oftentimes standing together, which are of the same bignesse and fashion with the other, but that it hath as many rough crooked cods together as there were flowers, the roote is very stringy but annuall.

2. *Scorpioides Bupleurifolio siliquis lenibus.* Smooth coddled small Caterpillers. This other is in all things like this former sort, but that it hath feldome two flowers together on a stalk, and the wormes that follow as few, being crooked and winding in the very same manner, are small and smooth, without any roughnesse at all, & of the same pale browne colour that it is, the figure whereof is with the *Medica*.

3. *Scorpioides Matthioli five Portulacæ folio.* *Matthiolus* his Scorpion Grasfe, or with Purslane leaves. This Scorpion Grasfe of *Matthiolus* hath divers upright pale Greene stalkes, and pale Greene leaves set thereon, each whereof is somewhat long, broad, and round pointed like a Purslane leafe, sometimes having two small leaves joynted at the bottome of the greater, and oftentimes in many without them; at the toppes of the stalkes, and out at the joynts likewise stand small pale yellow flowers, much resembling those of *Medica* after which follow small long slender and crooked hornes, small at the end, joynted or parted, as it were, all the length of it somewhat resembling the long crooked cod of the *Colutea* a *Scorpioides*, but this is more conspicuously joynted; and of a pale colour, within which lie small long whitish yellow seedes: the roote is long and fibrous, perishing yearly.

The Place and Time.

Both the first were brought us out of *Spaine* by *Boel*, as the great one was also expressed in my former Booke: the last *Pena* saith groweth neere unto *Mompelier*, as well in their manured fields, as in their Vineyards plentifully.

Scorpioides Bupleurifolio major & minor.
The greater and smaller rough Caterpillers or Scorpion Grasfe.

3. *Scorpioides Matthioli five Portulacæ folio.*
Matthiolus his Scorpions taile or Caterpillers with Purslane-like leaves.

The Names.

No author hath made any mention before now of these, except the first by *Lobel*, who called it *Scorpioides Bupleuri folio repens*, & the last by *Matthiolus* by the name of *Scorpioides*, & the bare figure without any description, and referred it himselfe unto the *Scorpioides*, yet as he saith, it was controverted in his time by some learned men, that from the authoritie of *Nicander* his *Scholaste* would have it to be *Telephium Dioscoridia*, *Dodoneus* refuteth that opinion: saying, it neither pleased him, nor many other learned, yet *Guilandinus*, *Angulara*, and *Cesalpini*, and with them *Bauhinus* hold it to be the true *Telephium* of *Dioscorides*: *Lobel* putteth it to the question, whether it be that *Telephium* of *Cratæus* or no, and seemeth to leane to their opinion, saying they are not led thereunto by weak reasons; yet because *Dioscorides* giveth to his *Telephium*, and *Galen* confirmeth it a drying and cleansing qualitie, yet not very hot, and thereby conducing to heale foule ulcers, and the taste of this pulse is rather like the meadow Trefoiles, I may, as I thinke yet continue it in suspence; but that it should be the *Clymenum* of *Dioscorides*, as *Columna* seemeth to thinke, being in my judgement mistaken, in making the leaves of this to be like the small Ribwort Plantane, when as the other *Bupleurifolio* commeth neerer thereunto, then this, not having three ribbes to be seene in the leaves, I see lesse reason, for *Dioscorides*, saith *Clymenum* hath a stalke like the Beane, foure square, but so hath not this, nor hath it those *Polyporum cirrhi*; but that *Bupleurifolio*, hath indeede some resemblance of these rough prickles, but not this which is smooth: *Bauhinus* also seemeth to make two sorts of this, the other which he referreth to this which is usually called *Scorpioides Matthioli*: the other he calleth *Scorpioides Portulacæ folio*; but I thinke he can finde no other *Scorpioides Portulacæ folio*, but this of *Matthiolus*, I have given my reason, let others correct with better if they can.

The Vertues.

The two first sorts being plants lately made knowne to us, we know of no propertie they have: the last is, as I said of the taste of the Meadow Trefoiles, and cannot therefore but be neare of the same effects. If it were the *Telephium* of *Dioscorides*, it should have a propertie in it to cleanse the body from the foule scurfe or leprosie: but must after sixe houres that it hath bene annointed, be washed away with Barly water, but this herbe hath no such cleansing facultie therein, nor yet to heale up foule ulcers, as is spoken before, that the propertie should be in *Telephium* by *Galen*s judgement.

CEREALIA.

CORNES.

CLASSIS DVADECIMA.

THE TWELFTH TRIBE.

CHAP. I.

Triticum. Wheate.

AVING finished the Classis of the Pulses, the next to follow in order unto them is of the *Cerealia*, that is, all the diversities of graine and Corne, whereunto I will adjoyne with all the severall Pultages and orderings of them, as the old *Romanes* and *Greekes* used them in their times for their food, as meate or drinke, or for medicine which are *Alica* or *Chondrum Crimmon*, *Tragus*, *Pisana*, *Zythum Curmi*, and the rest: after which must follow the Grasses (for that all the sorts of Cornes are the most noble and usefull kindes of Grasses, and therefore preferred before them) Rushes, and Reedes.

To beginne then with the most noble Graine of all others, namely Wheate, it is of divers sorts, some with bearded or aulnes, others without, some of a white colour, both stalke and eare, others with a redder, called red Wheate, and some blew or of other colours, some flat, others square, some with single heads, others with many, some with single rowes, others with double; and some to be sowne before Winter, and therefore called Winter corne, others onely in the Spring, called Sommer corne; to give you ample descriptions of every ooe particularly, were to enlarge this Volume, and yet to small purpose: I will therefore give you a description of one that may serve for a generall explication of all the rest, with onely such differences as may not be omitted, and yet in as compendious a manner as may be.

1. *Triticum spicatum*. Bare or naked hite Wheate.

The white Wheate riseth up from the creeping joynted roote, with three or foure or more stalkes, with faire broad and long Greene glasse-like leaves, at every joynt one, & at the fourth joynt usually commeth forth the long eare or spiked head, one likewise on a stalke without any branches, which while the head standeth upright bloo- meth small yellow aglets, and when it is full ripe, boweth downe the head a little with the weight thereof, and is set with two double rowes of seede or corne, wrapped up in divers chaffie skins or cotes, and is when it is densed of a firme compact substance, somewhat yellowish and cleare with all, and is the chiefeit Wheate of all making the purest white bread. We have in some countries of this Land another sort of bearded Wheate, which the country men call a red strowed Lammis; because the stalkes are redder, or else little difference in the eare.

2. *Triticum arisatum*. Bearded or red Wheate.

This sort differeth not in the manner of growing in any respects from the other, onely the head hereof is larger and redder than the former, with foure sides seeming to be foure square, and bended also: the meate whereof maketh not so pure white bread. *Lobel* calleth this *Triticum Loca*, from the *Dutch* appellation, and peradventure may be the *Favor Adoreum* of *Pliny*, &c.

3. *Triticum Lucidum*. Bright eared Wheate.

The eare hereof sheweth plainly the difference, which is somewhat longer and greater, of a right browne blewish colour, long and rough, with bearded and aulnes, and the graine harder, and of a browner colour: this kinde is a coarfe graine, yeelding much more brannage than the former, making also a heavier and blacker bread. *Lobel* calleth this *Triticum Loca alterum*. *Longumensis* seemeth to call it *Tragus*, and called, as he saith by the *French* *Ble turgnet*.

4. *Triticum multiplici spica*. Double eared Wheate.

The double eared Wheate is likewise unto the second sort, and differeth in the eare, chiefly which is shorter, and hath divers other small eares rising from the sides of the greater, the beards or aulnes are shorter, and so is the stalke also; the graine it selfe is looser and lesse compact.

5. *Trifolium Creticum*. The wilde Wheate of *Candy*.

The wilde Wheate of *Candy* groweth in stalke and leafe like unto ordinary Wheate, the eares are somewhat rougher and blacker, the beards also shorter, and the cornes lesser and blunt at one end, more like to *Rie* than Wheate.

6. *Triticum*

1. *Triticum spica nuda*.
Beard or naked white Wheate.

2. *Triticum aristatum*.
Bearded or red Wheate.

3. *Triticum Lucidum*. Bright eared Wheate.

4. *Triticum multiplex*.
Double eared Wheate.

5. *Triticum Creticum*.
The wilde Wheate of Candy.

6. *Triticum Tripolitanum*.
Tripoly Wheate.

6. *Triticum Tripolitanum*.
Tripoly Wheate.

This Wheate being brought into England from Tripoly, was sowne for experience onely to see what it would produce, it had stalkes two cubits high, with broader leaves than our Wheate, and eares an handfull long, with very long beards, and blackish graines like Rie within them. Peradventure this may be the *Zea Theophrasti*.

7. *Triticum trimefre*.
Summer Wheate.

This kinde hath narrower eares, longer beards, and smaller graines, and is onely to be sowne and reaped as Barley is with us, yet as it is earlier sowne in the warmer countries, so it will be the sooner ripe, but will not endure the coldnesse of our Winters. Wee have other seeming diversities of wheate growing in our owne Land, well knowne in divers countries which they call by severall names, as Duckes-bill Wheate, and Cone Wheate, &c. but I cannot say unto which of the Cornes, either of the ancients or of our times they may agree: And I finde that *Lugdunensis* sheweth some other kindes also of red wheate growing in the severall parts of France and Italy, as namely one sort growing about Lyons, which they call *Blerune*, and *Grosble*, whose eares have have no beardes, and whose graine is the largest and fullest of all others, yet not so good to make into bread as others, and therefore they there carefully husband it, that when they have hulled it, they boyle into a pultage with milk (as our furmentie pottage is) which they greatly affect, and he there saith also, that some would take it to be the *Far* or *Adoreum* of the old Romans, whereof when it was hulled and boyled they lived for many yeares in the beginning of the citie, as *Pliny* saith, *Primus antiquis Latii cibum, magno argumento in Adoreis donis ut diximus, pulte autem non pane vixisse, longo tempore Romanos manifestum est*, &c. for they lived on Pultage

7. *Triticum trimefre*.
Summer VVheate.

and

and not bread for a long time, thus saith *Pliny*: an other is called *Far Clusum* brought out of *Italy*, which being sowne in fat ground, bare a stalke as high as a man, or higher, with fixe joynts, and as many leaves thereon: the eare an handfull long, the beardes very long and rough, the huskes many thicke and great, that contained a long slender graine, with a deepe furrow, & hard to be thrashed seth, wherof *Pliny* thus saith, it is not to be thrashed as Wheate and Barly, but must be parched as Millet and Panicke is, to be cleafed, and therefore must be sowne with the huskes on it. There is another also which they there call *Froument a six quaires*, that is, Wheate with fixe rowes of corne in an eare, and that in some places of *Savoy* they call it *Ble rignet*, because the eare is the strongest and roughest, and hath fixe rowes, when others have but foure: there is also another kinde of red Wheate about *Matisco* in the moist grounds, whose corne is slender and long, and therefore they call it *Long graine*, whereof for necessitie they make bread, but else they feede their Swine and Pullen therewith, and this may seeme like to *Galen* his *Bryza* of *Thracia*. There are also divers other varieties of Wheate, as *Lugdunensis* saith, with divers Nations which are very hardly knowne by their doubtfull and double significations.

The Place and Time.

Many of these sorts of Cornes have growne with us; but from whence some of them were brought, we know not, saving the double Wheate which groweth about *Lyons*, and that of *Candy*; the double Wheate, Summer Wheate, and that of *Candy*, are to be sowne in the Spring, the rest in Autumne, and are reaped in *August*, or the end of *July* at the soonest.

The Names.

It is called in Greeke *πυρρίδις*, in Latine *Triticum quod tritum ex specie fit*, as *Varro* saith, as also *στρίδις*, that is, *frumentum a frundo*, id est, *vescendo dictum quod culmus extulit ut ait Varro*. The first is generally called by all *Triticum* or *aristis* carent, and some take it to be *Robus*, *Lebel* calleth it *Siligo spica mutica*: the second (as also the other sort thereof) is called *Triticum aristis circumvallatum*, & *Loca* by *Lebel*, but most likely to be the *Robus* of the ancients *a rubore grani*, as this is; *Deodonius* seemeth to make it *Triticum Tiphinum*, and *Tiphacerealis*: the third is the *Triticum Loca alterum* of *Lebel*, and set forth to be *Tragus* by *Lugdunensis*, and by others called *Triticum linidum* or *Lucidum*: the fourth is called *Triticum ramosum* by *Pliny*, and *Triticum multiplici spica*, by *Lebel*, but by *Tabernmontanus* *Triticum Tiphinum multiplici spica*: the fifth *Honorius Beckus* sent unto *Clusius* from *Candy* by the name of *Agrioflari*, and so *Pona* in his *Italian Baldus* doth call it, and *Frumentum sylvestre Creticum*, but the figure that hee hath thereof doth not, in my minde, answer the description thereof not having any beardes: the sixe wee have called *Triticum Tripolitanum*, of the place from whence it was brought, but as I said, it may, in my minde be referred to *Zea*, as well from the place, as from the greatnesse of the growth: the last is called *Setanium*, and *Triticum trimestre* by *Lebel*. The *Arabians* call it *Henta* and *Hencha*, the *Italians* *Fourmento*, and *Grano*; the *Spaniards* *Trigo*; the *French* *Froument*, the *German* *Weyßer*, the *Dutch* *Terre*, and we in *English* *Wheate*. It cannot but admire mee to reade the conceits of some of the ancients concerning corne, why some should have beardes and others not, supposing that in a fertile field, the same kind would be without beardes or aunes, & in a leane ground it would have aunes: and againe, that in a drie time or yeare it would be bearded, and in a moist not againe, that great windes cause their beards to be broken, which the quieter doe not: and lastly, that the thicke sowing and growing, doth cause them to be without beardes, when the thinner bringeth them. *Galen* also writeth in his first Booke and last Chapter of the faculties of Nourishments, that both he and his aged father, who tooke delight in Husbandry, having sowed both Wheate and Barly very well clefened from any other seed scattered or mixed among them, of purpose to prove whether they would change their natures into Darnell and Haver grasse; or whether these were naturall seedes of their owne kinde: found that much Darnell rose among the choise Wheate, and but little among the Barly: and that much *Egilops* or Haver Grasse rose among the Barly, whereby it seemeth he doth confirme that curant opinion, that these and other graines & seed will change into others, either better or worse; but surely I could never meete with that Countrey or Husbandman that could certainly prove it (although some have averred it verbally & earnestly) that there was any such *Metamorphosis*, but that these & such like weedes too many by a great many; do spring up in the Corne fieldes, notwithstanding the greatest industry any man can use, I doe verily beleve, because of the first curse of God upon the earth: and therefore to cleare the corne, they are faine to weede the fieldes; for the ground it selfe hath so much of the seedes of these weedes inclosed therein, that sowed it selfe before, and were not, nor could not be weeded out thoroughly, that although every seede were pickt that should be sowne, yet when it is Sprung, it will not want these weedes; and in this one point I doe beleve was *Galen* and his Father deceived, who although they chose and cleafened their seede, yet they cleafened not sufficiently the field wherein they sowed their seed. And this may also serve for an answer to *Marthiolus* country men of *Anania*, who by tradition had received that opinion, as many also in our Land have, which sheweth the world is still willing to continue the old errors, but no certaine truth of transmutation or transubstantiation, or transmigration, call it what you will, of their Barly into Haver-grasse, or wilde Oates: for let any man trie the truth hereof in his Garden that is well weeded before hand, and so continually kept weeded, and having sowne his Barly or Wheate, or any other graine each by it selfe; and so likewise Darnell, Haver-grasse, or any other seede, if he doe not finde the same seedes doe every one keepe their own kind, but degenerate into other kindes, let him then beleve that opinion, and so will I, but not till then: for the barrennesse or fruitfulnessse, the moisture or drynesse of the earth with such like casuallya may make any herbe to grow smaller or bigger, which may seeme to be a kinde of change; but yet is no change of nature or kinde; but the alteration of herbes and flowers to be double, or to want a part of the forme from his original, is but as we call it *Lusus* or *luxus nature*, and they will *redire ad ingenium*, as we say, as a man that is borne with some mishape or deformitie, as to have sixe fingers on a hand, or se borne with teeth, and such like, when as neither the parents, nor the succession proveth such continuall: For the word and appointment of God in nature must stand firme, who in the Creation, set this law to the Herbes and Trees that they should have their seede in them according to their owne kinde, and not according to another kinde.

The Vertues.

Galen saith, Wheate is in the first degree of heate, but neither drieth uor moisteneth evidently. yet *Pliny* saith it drieth. To eat the cornes of greene Wheate, saith *Dioscorides*, is hurtfull to the stomacke and breedeth wormes: a plaister made of leavened bread doth more digest, than that which is made of the Wheate it selfe, by reason of the

the leaven and salt therein, for leaven hath a power to draw and digest that which is farre off, *Pliny* saith that *Sextus Pompeius* that was troubled extremely with the Goute, did put his Legges up to the knees into a great heape of Wheate, and thereby was eased often and holpen. *Pliny* saith also that the Cornes of Wheate tosted upon an Iron pan, and eaten is a pleasant remedy for those that are shilled with cold: the oyle pressed from Wheate betwene two thicke plates of Iron or Copper heated, doth heale all dangerous tetters and Ringwormes on the face or chin, or other parts of the body, being used warme, and hereby saith *Galen* wee have knowne many to be cured: *Matthiolus* commendeth the same oyle to be put into hollow Vicers to heale them up, the same also is used for the chappes of the hands or feete by reason of cold, as also to make a rugged skinne smooth: the greene Cornes of Wheate being chewed and applyed to the bitten place by a madde Dog helpeth it: slices of Wheate bread foked in red Rose water and applyed to the eyes that are hot, red and inflamed, or that are blood-shot helpeth them: hot bread applyed for an houre three dayes together, to the throate troubled with kernells or the Kings evil healeth it perfectly: the flower of Wheate mixed with the juice of Henbane doth stay the flux of humors to the joynts being layd thereon: the said meale boyled in Vinegar helpeth the shrinking of the finewes saith *Pliny*, and mixed with Vinegar and Hony boyled together healeth all freckles spots and pimples on the face: Wheate flower being mixed with the yolke of an Egge, Hony and Turpentine doth draw cleafe and heale any bile or Plague sore or any other toule Vicer, the Branne of Wheate meale is often boyled in the decoction of a sheepes head, and it given in Glisters to cleafe and open the body, and to ease the griping paines of the intrails: the said Branne steeped in sharpe Vinegar and then bound in a Linnen cloth and rubbed on those places that have the morpew, scurfe, scabbe or leprosie will take them away, so as the body bee well prepared and purged before; the decoction of the Branne of Wheate or Barly is found of good use to bathe those places that are bursten by a Rupture: the said Branne boiled in good Vinegar and applyed to swollen breasts doth helpe them, and stayeth all inflammations, it helpeth also the bitings of Vipers, and all other venomous creatures. The Leaven of Wheate meale hath a propertie to heate and to draw, and in especiall it rarefieth the hard skins of the feete and hands, as also warts and hard knots in the flesh, being applyed with some salt: Starch moistned with Rosewater and laid to the cods taketh away their itching: the Waters that are made of the purest and finest volatile flower being put in water and drunke doth stay the Laske and Bloody flux, and is profitably used both inwardly and outwardly for the Rupture in children; and boyled with Roses, dry Figs, and some Iujubes maketh a fit Lotion to wash sore mouthes or throats, and when the kernells thereof are swollen and sore: the same also boyled in water unto a thicke gelly and taken, stayeth the spitting of Blood, and boyled with Mints and Butter it helpeth the hoarsenesse of the throate.

CHAP. II.

Zoopyrum sive Tritico speltum.
Bastard wheate.

Zoopyrum sive Tritico speltum Lobely, Bastard Wheate.

Vnto those kinde of wheate I thinke it meete to adde this kinde yet a part by it selfe, being as a meane betwene *Zea* and Wheate, or Wheate and Barley, for as *Galen* saith in 2. *Aliment.* it groweth in the coldest places of *Bithynia*; as also neare unto divers citie in the further parts of *Phrygia* which *Homer* also speaketh of, and as the name so is the nature thereof, for the bread of it is by so much worse then Wheate, by how much it is better then *Bryza* of *Thrace*, thus much is *Galen*'s relation. *Dodonaeus* from *Tragus* hereunto applyeth the figure of a Corne, which as *Tragus* saith the *Germanes* call *Kernand* *Drinkelkern*, and is the same that *Lugdunensis* calleth *Zoopyrum gymnocriton*, and *Lobel* taketh to bee that kinde of Graine which is brought from beyond Sea unto us and sold at the Apothecaries by the name of *Hordeum nudum* or *mundum*, French Barley, *Tragus* describing it saith thus, it is in stalkes, joynts and eares likest unto *Zea*, the Corne is not much differing from Wheate, but yet is not enclosed in Huskes as *Zea* is, but is easily rubbed forth, and is of a yellowish colour like Wheate: it is sowed saith he in certaine places of *Germany*, to serve both for bread, & for the Kitchin to boyle in brothes and Tisanes, for which purposes it serveth in the stead of Barley; *Lugdunensis* also thinketh that this is very like if not the same kind of Wheate that *Ruellius* saith the French call *Scourgeon*, as if it were said *Succisum* or *Subsidium gentium*, whose Graine is small, lank and of a darke colour.

The Place, Time, Names and Vertues hereof are sufficiently expressed in the description, and therefore there neede no more to be said of it.

CHAP. III.

Zea. Greeke Wheate.

T Here are some other sorts of Cornes that more properly may be accounted kindes of Wheate; then of any other sort of Graine, and therefore are to be entreated of before either Rie or Barley in their severall orders, and first of that Graine which the ancients called *Zea* a distinct Corne offering from others, and by *Dioscorides* said to be of two sorts (although *Theophrastus* and *Galen* have made mention but of one, (which is the *Dicoccos* of *Dioscorides* as it is thought, the one *Dioscorides* calleth *Dicoccos* the other *simplex* but first I thinke good to set downe the *Zea* of *Theophrastus* as he describeth it.

1. *Zea Theophrasti & antiquorum.* The *Zea* of the antients or Greeke Wheate.

The Greeke Wheate riseth up with many strong joynted high stalkes and leaves on them most like unto Wheate: the Earre is plentiful in Cornes as *Theophrastus* saith, (bare without beards as *Lobel* and some others have thought yet *Lugdunensis* setteth it forth if his bee true *Zea* with beards, for *Theophrastus* maketh no mention thereof) whose Graines are inclosed in many chaffie huskes, being the lightest of others which are not so easily beaten out as wheate, and is very pleasant to all creatures: the rootes are many, and strongly fastned in the ground whereby they draw much nourishment out of the ground, desiring a rich soile, and thereby quickly draweth forth the heart of the ground. This is the truest description of *Theophrastus* and the ancients *Zea*, especially drawn out of the ninth Chapter of his eighth booke of the history of Plants. Vnto which of all our graines or of those that the later writers have referred it unto, this may agree thereto in all parts I cannot finde, for neither *Matthiolum* his *Spelta* nor *Lugdunensis* his *Zea* are naked but bearded, nor can it agree with *Camerarius* his *Zea spicamutica*, nor yet with *Tragus* his third *Zea spicamutica*, having neither strong nor tall stalkes, nor yet many growing from such a bushie roote as *Theophrastus* giveth to his, unlesse it may be said it is degenerated, for *Theophrastus* in the eighth Chapter of his eighth Booke saith that no Corne is so apt to be metamorphosed wholly into others as *Tipha* and *Zea*, but I thinke their transmutations of plants are as likely as their transmutations of foules.

2. *Zea dicoccos sive Spelta vulgo.* Spelt Wheate or Spelt Corne.

The Spelt Corne is in talke and leafe somewhat like unto Wheate but not rising so high, the Earre is smaller and not orderly set in rowes: the Cornes grow double, that is two together, but not inclosed in one huske as many have thought, but in severall huskes and hardly to be thrashed out, which then somewhat resemble Wheate: the roote is plentiful in strings and fibres.

2.3. *Zea dicoccos spica mutica & monococcos aristis mutica.*
Spelt Wheate and S. Peters Corne.

3. *Zea monococcos sive simplex sive Bryza*
S. Peters Corne.

This springeth up with a single slender and short stalk, but firme, bearing a small thinne spiked earre, set with rough beards like Barley also, being as it were flat, with the Cornes set onely on two sides, every one contained singly in a huske, which are as *Tragus* saith of a darke red colour, and the Earre also, but in shape like Wheate or Barley, which maketh blacke bread, and of an ill taste as *Ambrosius* told *Galen*.

The Place and Time.

The first was anciently sowed in Greece, Asia and the East countries, and accounted by them to bee next in goodnesse unto the finest Wheate, being a Winter Corne: the second is sowed in many places of Italy and France, and will abide in a moist ground holding firme the Winters injuries, yet prospereth best in a more fruitfull dry soile, and is a Winter Corne sowed in September and October and reaped in July. The last is a Summer Corne growing in many places of Italy, &c. where but in want of Letter they make no bread of it.

The Names.

It is called in Greeke *Zea* and *Zea* in Latine also *Zea* which *Gaza* translateth *Semen*, taking it as it is likely from *Pliny*, who before him said that *Zea* was *Far* or *Adoreum*, which was called also *Semen*, as the most singular Corne of any other. The second is thought by many to be the *Zea* of *Theophrastus* and *Galen*, but as I said it is more likely to bee the *Zea* of *Dioscorides* (for these two authors have in many things given names to Plants the one farre differing from the other as may bee knowne by the *Mandrages*, the one so farre differing from the other as though they had not lived in one and the same countrey or rather in one and the same world) and is therefore generally called by most writers *Zea dicoccos*, and peradventure was the old *Romanes* *Far* and *Ador*, or *semen Adoreum* of the later *Romanes*, and is now called *Spelta*: the last is variably called by divers. For *Matthiolum* calleth it *Zea simplex* and referreth it to *Dioscorides* his second *Zea*, which most do call *Monococcos* and is thought to be that *Briza* of *Galen* which he saw in the fields of Thracia and Macedonia and tooke it to be

be *Zea*, which is a forcible argument in my judgement, that *Zea* is bearded, and called *Spelta* by *Dodonæus*, *Lobel* and *Lugdunensis*, as also by *Tragus* and *Cesalpini*, or *Fruentum Monococcum* by *Dodonæus*: the French call the second *Espeaute*, the Germanes *Spelt*, *Welsche Weyson*, and *Romische Weyson*, and the last *S. Peters Korn* and *Ein Korn*, the Italians *Pirra*, and in some places *Biadaa*, *Matthiolus* saith, and by that name have I received such a Corne out of Italy as you shall finde it set downe at the end of the description of the second sort of Barley.

The Vertues.

Galen saith his *Zea* is in a meane betweene Wheate and Barley, and *Dioscorides* saith it nourisheth not so much as Wheate, yet more then Barley yet is acceptable to the stomacke.

CHAP. IIII.

Tipha sive *Triticum Tipbinum*. Light Wheate.

Tipha riseth up with a single and slender stalke or straw, the eare is long and round, bearded with long hard sharpe aunes somewhat elosely set together, the graine is small and light but hard, and of a redder colour then Wheate, inclosed in divers chaffie huskes hard to be beaten out: this groweth well in a leane soyle and desireth not a ritche or fat ground as *Zea* doth.

2. *Triticum Tipbinum alterum sive Hispanicum*. Spanish Light Wheate.

This other light Wheate differeth from the former in these particulars, the stalkes are shorter then Wheate, and slenderer, the eare is small and bearded, with long and sharpe aunes like Barley, the Graine or Corne is somewhat like Wheate but lesser and yellower, and is inclosed but in single huskes easie to be beaten out, which sheweth it to be differing.

The Place and Time.

Tragus saith that the first is most sown in the mountainous places of *Asiatic* and seldome in any other of the countries of *Germany*, and especially because their wilde Swine that will bee feeding upon and destroying any other Corne will not touch this or very hardly, because the sharpe aunes will prick them, and if they should take much of it, it would quickly hurt them and oftentimes choake them: the other groweth in *Spain* and in the *Canaries* as *Lugdunensis* saith, for it is often found among the Canary seedes that is brought from thence, and are both Summer Cornes, that is, sown in the Spring and reaped in the end of Summer.

The Names.

It is called is Greeke *τιψη* and *Tipha* in Latine, but of our later writers *Tipha cerealis* and *Triticum Tipbinum*, that it may bee distinguished from the other *Tipha* the marsh plant called *Reede Mace*. The first is not knowne to any in our Land but remembered by *Dodonæus* and *Tragus* as his third sort of Wheate: *Lugdunensis* saith that *Dodonæus* is much deceived, in thinking this *Tipha* was that which the French men called *Meisel*, and they of *Lyons* de la *Mescla* (that is our *Maslin*) being a mixture of Wheate and Rie sown together.

The Vertues.

Galen sheweth that the bread that is made of *Tipha* is pleasant, and much desired both by country men and citizens, if it be eaten hor, & is better then that which is made of *Olyra*, yet if it grow to be two or three dayes old and then eaten, it will lye heave on the stomacke and hard to bee digested: some doe thinke that this is the sweeter Corne, that *Homer* sheweth *Hector* speaking to his Horfes promiseth to give them, for as it is said it may bee given Horfes without any harme when as Wheate cannot.

1. 2. *Tipha Dodonæi* & *Triticum Tipbinum Hispanicum*. *Dodonæus* his Light Wheate and that of *Spain*.

CHAP. V.

Olyra. Soft Wheate.

His soft Wheate (or *Amelkern* as *Dodonæus* saith the Germanes called it) groweth as great and high as wheate, the eare is sharply bearded like Barley, whose graines or cornes being inclosed in chaffie huskes like unto *Zea*, are being clenched like unto Wheate.

The Place and Time.

This groweth saith *Galen* as well as the other in *Asia*, &c. and *Pliny* saith in *Egypt*, *Syria*, &c. as also in *France* and *Italy*, but *Matthiolus* saith he knew of none growing there in his time. It is saith *Dodonæus* sown in divers places

D d d d

places of Germany, and is a Summer Corne as many thinke, yet saith himselfe *Olyra* and *Far Clusinum* are Winter Cornes.

The Names.

Olyra in Greeke is called *Olyra* also in Latine, *Gaza* tran-
slateth it *Siligo* (which *Pliny* saith maketh the sweetest
bread and hee altered it to *Siligo* which maketh the finest
white bread) yet *Pliny* doth not say that it is *Siligo*, although
Hermolani, *Budeus* and *Ruellius* did so thinke, for *Lugdunensis*
saith he can finde no such thing in *Pliny*; who saith it is the
Arinea of the *Gauls* being proper to their country. *Dodonaeus*
calleth it *Amylum frumentum* from the Germanes *Amelkern*
as is said before, and thinketh it also to bee the *Far Halica-*
strum of *Columella*, and not much to differ in any thing from
the *Oriza Germanica* of *Tragus*, who called it also *Far can-*
dium, and *Tragus cerealis*, thinking *Tragus* to bee a kind of
graine of it selfe, when as it is but a kinde of meate or pul-
rage made of Corne, as *Alica*, *Chondrus*, &c. are, as shall bee
shew'd hereafter. I have rather called it Soft Wheate after
the minde of *Theophrastus* who calleth it *prædictis mollior*,
then Starch Corne after the Germane name.

The Vertues.

It is to neare the propertie of *Tipha* as *Galen* saith that it
is in goodnesse next unto Wheate, and that the worst *Olyra* is
equall to the best *Tipha* after the bread made of it is a day or
two old, but else being eaten hot *Tipha* is farre better then
Olyra. *Pliny* saith that of *Olyra* is made the sweetest bread;
Tellonius declareth through all *Turkie* they much delight to
eate hot bread or cakes, and some sop them in wine and so
eate them.

Having now shewed you all the kindes of Wheate, let me
a little enforme you (although not without some trouble to
my selfe, but much varietie and discordance among the old
writers) of the severall sorts of meates, or pultages, and
drinkes made of these kindes of Wheate (for those things
that are made of Barley shall be shewed after Barley) which the ancients used for their sustenance and medicines
for many hundred yeares, whereof most if not all are quite exiled from use now a dayes, and first of *Far*.

Olyra. Soft Wheate.

CHAP. VI.

Of *Far*.

His word *Far* is very variably understood and applyed by the old writers: for first it is taken for a
kinde of Wheate or *Zea* as some take it, as *Pliny* sheweth in his 18. Booke and 8. Chapter, where
reckoning up the diversities of Wheate, *Vulgatissima* (saith he) *Far quod Adoreum veteres appellavere*,
Siligo, *Triticum*, *hæc plurimis terris communia*, and in the tenth Chapter of the same Booke hee saith,
Ex Arinea dulcissimus panis, ipsa spissior quam Far & majore spica, eadem & ponderosior, and in other
places, but I desire with what brevitie I can to shew it. Secondly for the pultage made of that Wheate as *Pliny* in
the seventh Chapter of the said eighteenth Booke saith, *Populum Romanum tantum ex farre è frumento trecentis*
annis usum Verrius tradidit, quo tempore nullus fuit Alica usus. Thirdly it is taken for all other kinds of graines
themselves as some thinke, or rather as I thinke for the Pultages made of them as by *Columella* appeareth, who
hath *Far Adoreum*, *Far Triticum*, *Far Hordeaceum*, and *Pliny* saith *ex Olyra in Ægypto Far conficitur*.
And lastly it is taken for the fine meale of that Wheate called *Far* or *Adoreum*. *Dionysius Halicarnassensis*
saith that the old *Romanes* did call their marriages *cahænia*, because the married couple did eate of that
Far together. Some of our moderne writers have taken *Far* to bee the same with *Alica*, because of the neare
manner of their preparations; but as shall be shewed this of *Far* differeth from that: *Archigenes* in *Ætius* set-
teth downe the manner of the preparation hereof in this manner. The Wheate is steeped a while in water, and
being taken from thence is cast into a Morter where it is clenfed from the huskes and afterwards layd in the Sun
and rubbed with the hands untill it bee fully clenfed, which being done it is broken a little grossely, so as every
graine may bee broken into foure or five peeces, and being dried is kept to use after the manner of *Alica* that is
boyled. Some also take the greene eares of Wheate and thereof make more pleasant meate and desired then the
other. This pultage doth very well resemble our boyled Wheate, which cuntry people doe put into dishes
while it is hot, and so bring it to sell in our *London* markets by the name of Dish Wheate, and Bowle Wheate,
and being boyled in milke maketh pottage called *Furmentie* pottage.

CHAP. VII.

Of Siligo.

His also is diversly understood by the ancients, for first it is taken for a kinde of Wheate as *Pliny* saith, *lib. 18. cap. 9. Siliginem proprie dixerim Tristici delicias conveniens tractibus humidis*, and againe *cap. 10. Siligo nunquam maturefcit pariter, &c.* and *Columella* saith that after *Robus*, which is chiefly to be sowed: the second sort saith he is *Siligo*, which is the chiefeft for bread: and in another place nameth *Siligo* and *Hordeum* that they can endure *veris tepores*. Secondly it is taken for a faultie or degenerate Wheate, as *Columella* saith, *Omne triticum solo ulignofo post tertiam sationem vertitur in Siliginem*. Thirdly it is taken for the finest flower of Wheate both by *Pliny* in divers places, by *Celsus* and *Iuvenall*. By *Pliny* thus, *Iustum est & grano Campanie quam vocant castratam, & modio redire sextarios quatuor Siliginis*. And in another place *Prisiana antem Siliginis sextarios quinque*. *Celsus* saith *Ex tritico firmissima Siligo deinde Simila, infirmior ex poline: infirmissima cibarius panis*: where note that *Pollen* is here taken by him to be a courter sort of flower then *Simila*, as *Cicero* saith *panis* is said to be the worst, and *Iuvenall* in his *Satyr*s saith,
Sed tamen & nivens mollique Siligine factus
Servatur domino.

CHAP. VIII.

Of Crimmon.

We finde much diversitie recorded of *Crimmon*, first that as *Galen* saith it was wont anciently to be made of Wheate, as *Alica* or *Chondrus* was of *Zea*: then that *Crimmon* of the Græcians, and *Simila* or *Similago* of the Latines is the courter meale of the husked graine called *Far* whereof they made their pultage; againe *Dioscorides* saith *lib. 2. c. 83. and 84. that Crimmon* is the courter meale of *Zea*, and of white Wheate, as also of *Olyra*. It (saith he) nourisheth much, but it is (hardly made some reade, but others) hardly digested, and it bindeth very powerfully, especially if the *Zea* whereof it is made be first parched.

CHAP. IX.

Of Chondrus or Alica.

Oris Of the Græcians seemeth to take the name *quasi granum* for the excellencie, and *Halica* or *Alica* of the Latins, *ab alendo* for nourishing, for all authors have so translated *Chondrus*, (although *Ægineta* maketh *Chondrus* & *Alica* to be two severall sorts, but he is contradicted by all Latine writers); & is diversly also understood by the old writers; first for a kind of graine, as *Pliny* in reckoning up the kindes of former Cornes nameth *Millet*, *Panick*, *Lentills*, *Cicery*, *Alica*, and *Galen primo alimento*, saith *Alicæ ex genere tritici est*, and *Paulus Ægineta* saith *Chondrus* is like unto Wheate but more glutinous; but more usually for the most excellent meate or pultage that was used in those times: *Dioscorides* saith *Halica* is made of *Zea* called *dicoecos*, *Galen*, *Paulus Ægineta* and *Ætius* shew in many places of their workes that it was made also of Wheate and other sorts of Corne: but that *Far* and *Halica* were different sorts of meate is shewed sufficiently by *Pliny* and others, for *Pliny* saith *lib. 18. cap. 8. Aliud esse Zeam & qua fit Alica, aliud vero Far*, and in the Chapter before, the old *Romanes* lived onely of *Far* made of Wheate 300. yeares, and in the 22. Booke and 25. Chapter he saith that *Halica* was a meate lately knowne, and as he thinketh not in use before the time of *Pompeius magnus*. The manner of making it *Pliny* setteth downe *lib. 18. cap. 11. Alica* saith hee is made of *Zea* first steeped in water, then beaten in a wooden mortar, for a stone mortar would breake it too much: the best is made by the painefull labour of those that were bound to their pestell (yet the chiefe men had one of Iron) the huske being beaten off it was againe beaten in the same manner, that the naked graine might be broken, and is of three sorts, the smallest, the second and the greatest, yet saith he it had not the whitenesse that commended it unill *Chalke* were put to it, which gave it colour and tendernes, and afterwards a fourth part of *Gypsum* (whereof it seemeth that *Pliny* himselfe seemeth to wonder they should added) but it is likely they were washed away before they were used as *Galen* sheweth, that their brothes must bee heedelessly observed to bee made of *Alica* being washed. *Dioscorides*, *Galen* and *Pliny* doe much commend the good nourishment it maketh; for saith *Pliny*, no man doubteth but that it is exceeding profitable, whether it bee taken washed with Meade or boyled in broths (which *Galen* calleth *Chondropsiana*) or portage, and that if the old Græcians had knowne it, they would not have written so much in praise of *Prisiana*. *Dioscorides* saith it nourisheth more then Rice & bindeth more also, and is more profitable to the stomacke: being boyled in Vinegar and applied it helpeth the Leprosie, taketh away the ruggednesse of the nailes, and is helpfull in the beginning of a Fistula in the eye, the decoction thereof easeth their paines that have a Laske or the bloody flux.

CHAP. X.

Of Athera.

Dioscorides saith that *Athera* is made of *Zea* finely ground, but is made into a kinde of supping like liquid pappe, and given to Infants, and is also used in pultesses to be applied outwardly. But there be some authors that affirme it was made also of Wheate, *Olyra* and *Amylum*, and thereupon have set it down that the Booke Binders Page is this *Athera*.

CHAP. XI.

Of *Tragus*.

THis also hath beene diversly interpreted by writers, some taking it for a kinde of graine by it selfe, namely the *Triticum lucidum* as is said before, because *Dioscorides* seemeth to say it carrieth a shew of the graine *Alica*, and herein *Galen* also followeth him, but in stead of *opius* of *Dioscorides* hee hath *onysia* when as *Alica* as I shewed you before, is not properly a graine by it selfe but is made of Corne: and *Galen* himselfe in the said Booke *primo Aliment.* saith that *Tragus* is a thing made, and like unto *Alica* of the best *Olyra*, husked as it ought to be, then boyled in water; which being poured away, eyther sweete wine or honied water was put to it, and Pine kernells steeped in water untill they were much swollen: he likewise saith *lib. 1. H. p.* de rat. viii. in morbis acutis. *Pisana* an *hyant* velle *preferri frumentaceis edulis, pami scilicet, chondro & Zea ex qua fit Tragus*: and *Pliny lib. 18. cap. 7* *Ex tritico Tragus pisana conficiende vulgar ratio est.* And againe, *Simili modo ex Tritici semine Tragus fit in Campania Kantaxat & Egypto. Cassianus Bassianus in Geoponicis lib. 3. cap. 13.* saith it was made of the Wheate of *Alexandria*, which by most authors is *Olyra* (for it there groweth best) steeped and husked, and dried in the Sunne often untill it were cleane from the shales: whereby wee may plainly see that all sorts of graine were husked, and to ordered into divers manners of meate, and called by divers names according to the graine or countrey: it is hard of digestion as some reade, or as others, it is hardly made, and doth loosen the belly more.

CHAP. XII.

Of *Amylum*.

THis was made as *Dioscorides* sheweth of Summer Wheate, and also of *Zea*, steeped three dayes and nights till it be soft and tender, the water then powred gently from it, and other fresh water to bee powred on it, and then troden with the fecte till all the courle huskes be cleane taken away, by letting the finer part passe through a Sive, which then being dried in the most hot scorching Sun is to keepe to be used. *Cato* sheweth that it was made of *Siligo*, *Pliny* saith of all sorts of Wheate as well as of *Siligo*, but the best of Summer Wheate; it was so called saith he because it was made without a Mill. It is used against defluxions into the eyes to heale hollow Vleers therein, being drunke it stayeth the spitting of blood, being put into Milke and taken it helpeth the roughnesse or hoarichesse of the throate. *Amylum* saith he is made also of *Zea* (and so saith *Cato* also, and of Wheate saith *Pliny*) steeped and washed as is above said: but saith he it hath no use in Physicke: but we use it often for coughes and in defluxions.

CHAP. XIII.

Secale. Ric.

This kinde of graine besides the common knowne sort, there is two other remembred, the one by *Tragus*, *Dodonaeus* and *Langdunensis*, the other by *Barbimus* as you shall presently understand.

Secale vulgatum. Common Ric.

Our common Ric is so well knowne in all the countries of this Land and to the countrey people in especiall who feed most thereon, that I shall seeme as it were but to teach them that which they know

1. Secale vulgatum. Common Ric.

1. Siligo Stecina. Burnt Ric.

better than I, that is, that it first springeth up somewhat reddish, which afterwards groweth Greene, and bringeth forth divers jointed stalkes, somewhat higher than Wheate, bearing at their toppes smaller eares than Wheate, set in short rowes, with shorter and sharper, rougher, and more prickly awnes: the graine within being smaller and sancker, and blacker than Wheate, and is not wrapped in huskes like Wheate, but easily falling out of it selfe out of the eare when it is ripe: while it floweth the eare standeth upright and being neare ripening it bloweth it downe: the rootes are many, but not so thicke bushing as Wheate, nor consuming the fertilitie of the soyle so soone as Wheate.

2. *Secale aestivum seu minus*. Small or Summer Rye.

This other Rye groweth lower with fewer stalkes, a shorter and lesser eare, yet armed with awnes as the other but fewer; the graine or corne also is lesser, and is sowne in the Spring onely, and herein consisteth the difference.

3. *Secale latifolium*. Rye with great leaves.

This Rye hath whiter stalkes then others, round also and straked, the leaves that are set at the joynts are much larger then the common sort, being a cubit long and an inch broad, somewhat sharpe or rough about the edges like the ordinary Rye: the eare at the toppe is large and great, set with sharpe long awnes, and as it were deuted like the vulgar a full hand breadth, the graine within is also like unto Rye, blackish but greater then it, being almost like Wheate: the roote likewise busheth like the roote of Wheate.

The Place and Time.

The first is generally sown in all these Northernne regions and more in *Denmarke*, and those more Northerly parts then elie where, their climate not serving so well for Wheate, and sowne in *October* and *November*, and the second in *April* onely, and are all ripe in *August* usually: the last is brought out of the East countries, and *Bauhinn* saith he had onely the leaves and the Eare out of *Signor Contarino* his Garden.

The Names.

This hath not found as yet any Greeke Father to name it, but is generally called in Latine *Secale* of *Pliny*, and is his *Farrago* also, yet *Farrago* is in many places of him, *Varro*, *Columella*, and others, taken for a greene fodder for cattell, as *Pliny* sheweth how to make a *Farrago* of Wheate, *Columella* of Barly. *Varro* saith, *Farrago* was so called, either *quod far ferro casum fuit*, aut *quod primum a Ferris segete Farrago sericepta fuit*; but the true *Farrago* is understood by the best Authors now adayes to be no other things than Barly. *Tragus* and some others took it to be *Siligo*; *Cordus* on *Dioscorides* to be *Olyra*; some others to be the *Tipha* of *Theophrastus*, which for distinction sake is called *Typha cerealis*, and because the Dutch call it *Rogge*, therefore *Dodonaeus* maketh a Latine name of it, and calleth it *Rogga*: Both in our countrie, and in others, they have a custome to sow Rye and Wheate neare of equall parts in their fields, which they call *Maslin*, as well in the fields, as in the meale: the French *Meteil* & *du Masele*, as I said before, *quasi Miscelanea seget*; and the country people and meaner sort with us make it their usuall bread corne, being better than cleane Rye, and worse than Wheate. The first is remembered by all Authors, the second, both by *Tragus*, who calleth it *Siligo aestiva*, *Dodonaeus* *Secale aestivum*, *Lugdunensis* *Secale latifolium*, and *Bauhinn* *Secale vernum vel minus*: the last is mentioned onely by *Bauhinn*, who calleth it *Secale latifolium*, and saith he had it out of the noble *Contareno* his Garden, a *Magnifico* of *Venice*. The *Italians* call it *Segale*; the *Spaniards* *Centeno*; the French *Secle*, and *Segale*: the *Germanes* *Rocken*, and the Dutch, as I said, *Rogge*, and we in *Engl.* Rye.

The Vertues.

Rye is of a more clammy substance than Wheate, and neither is digested so quickly, nor nourisheth so well, yet it is accounted to be next in goodnesse unto Wheate, especially if the corne be sweete and good, and the bread well fermented and baked, and giveth a solide and firme nourishment to the body. The medicinable qualities are, it is more digesting than Wheate, the bread and the leaven thereof ripeneth and breaketh impostumes, bites, and other sores with more speede. The meale of Rye put betweene a double cloth, and moistened with a little vinegar, and heated in a pewter-dish, set over a chaffingdish of quicke coales, and bound fast to the head, while it keepeth heate in it, doth much ease the continuall paines of the head: the ashes of Rye straw put into water, and flattered therein a day or a night, and the chappes of the hands or feete washed therewith, doth heale them, saith *Marshallus*.

CHAP. XIII.

Hordeum, Barly.

We have two or three sorts of Barly growing with us in sundry parts of the land, which I meane here to shew unto you, and with them one other not so well knowne unto us.

1. *Hordeum distichum*. Beare Barly or common Barly.

The common Barly hath shorter and tenderer stalkes than Wheate, the leaves are shorter, broader and rougher, the eare is short set with two rowes of cornes in very good order, each enclosed in a huske, and having a long rough awne or beard thereat, which is greater and longer than Wheate, and whiter also, and doth not easily, or of it selfe fall out of the huske: the roote is great, and spreadeth much, having the more store of stalkes rising there from, to supply the slenderesse of the eare.

2. *Hordeum distichum minus*. Bigge Barly.

This other differeth not from the former, but that it is smaller, both stalk, eare, and corne, and is sowne the latest, and reaped with the soonest; some doe take this to be *Turkie* Barly, but I somewhat doubt that, for having a graine growing in my Garden, taking by some to be *Turkie* Barly, which is somewhat like this *Hordeum distichum*, that is with a small bearded eare of two rowes: the corne it selfe was like a Barly, but smaller: the huskes were brighter and channelled as it were, or furrowed on the one side, and round on the other, the kernell being nearer to a Wheate than a Barly, and easily coming forth of the huske; I am more than halfe perswaded it is the *Zea Monococcus* or *Briza*. We have another sort here of likewise, whose corne is a little smaller and whiter,

D d d d 3

called

1. *Hordeum Diffichon*.
Beare Barly, or common Barly.

2. *Hordeum polyfitchum*.
Square Barly.

called Sprit Barly not differing else; if there be a Barly that hath no ailes or awnes saith *Lobel*, and so doe I, I know it not.

3. *Hordeum polyfitchum sive hybernium*. Winter Barly, or square Barly.

This kinde groweth like the former, both in stalkes and eares, differing onely in not having so many stalkes rising from the rootes, and that the eares are set with more rowes of cornes, in some fodre, in some five or sixe, and that it is sowne earlier than the former.

4. *Hordeum hexafitchum vernum*. Naked or bare Barly.

This other Barly that hath many rowes of cornes in the eare, differeth not from the last, but in these two particulars, the cornes inclosed in the huskes, have not that skinne on them that the other hath, being lanke small, yellow, and short, almost like Wheate, but lesse, and is sowne in *April* and not before, and is not seene or sowne by any almost in this land.

The Place and Time.

The first is our usuall Barley in all the South parts of this Kingdome; the other in the North parts onely; the third is likewise reasonable frequent in our Land; but the last, although it be rare, yet we have had and sowne it in our Gardens, and was ripe in the beginning or middle of *August*: we have not heard by any, that any kinde of Barly hath bene sowne before Winter in our Land, although *Lobel* saith so.

The Names.

It is called in Greeke *ῥυζιον* in Latine *Hordeum*: the first is generally so called as it is in the title: *Tragus & Cordus*, *Hordeum minus*, and by *Columella* *Hordeum Galaticum*, as I thinke, or else the smaller sort of this kinde, because it is whiter: the third *Lobel* saith is reasonable frequent in this Land, he meaneth in the West parts where his chiefe residence was in his former dayes, for it is scarce seene or knowne in the parts about *London*, *Tragus* calleth it *Hordeum majus*, *Cordus hyemale*; and others *polyfitchum*: the last is called by *Lobel* *Hordeum polyfitchum vernum*, & is most likely to be that which *Galen* calleth *Gymnocritikon*, that is *Hordeum nudum*, by which name I had it from a friend, and may be also the *Cantherinum* of *Columella*, which hee saith, the country men called *hexafitchum*: wee have a small kinde of graine brought from *Germany* to our Druggists in great quantitie, termed *French Barly*, and is probable to be this Barly, which *Cordus* saith, was first sent them out of *Italy*, having sixe rowes in the eares, and not much unlike Wheate, but lesse. *Cordus* hath set downe more sorts hereof, which I thinke fit to shew you here: the two sorts of Barly *Diffichon* and *Hexafitchon*, this of sixe rowes, that of two in the eare, saith *Cordus*, is common with us, fol. 42. in *Dioscord.* yet that which hath but two rowes in the eare, maketh a recompence in the roote by the greater number of stalkes that rise from thence, for saith he, I have nombred sixtie stalkes and above rising from the roote of one corne, but it usually hath twentie, thirty, and fortie stalkes; but besides these two, saith

saith he, they have in *Germany* foure other sorts: the first hath the whitest, heaviest, and greatest graine of all the rest, and called by the country men of *Hassia Andachi*: the second beareth a little smaller graine, and hath fewer rowes, and is a *Semestre*, and is therefore called by the *Germanes* *Winter-gerste*, that is, Winter-Barly: the third is sowne in the Spring, and is ripe in Summer, and therefore they call it *Summer-gerst*, that is Summer Barly: the fourth may properly be called, saith he *Trmisstre*, because it is eatly, and cut ripe in the third month after it is sowne: this they call *Kleine Gersten*, and *Zeygerste*, or as the *Saxons* doe *Tigerste*, that is a small Barly, or one for the present: they sow it either three dayes before, or three dayes after *Pentecost*. Thus much *Cordus*, the *Arabians* call it *Xabber*, or *Shair*, the *Italians* *Orze*, the *Spaniards* *Cevada*; the *French* *Orge*, the *Germanes* *Garsten*, the *Dutch* *Gerste* and *Soverion*, as *Lobel* saith; and we in *English* Barly.

The Vertues.

Barly and Wheate are the prime graines of all others, and the most profitable and useful for mans life, both for meate, drinke, and medicine, all the rest being as it were but degenerated from them, and partaking of the one or other of the natures and qualities of them; yea Barly may seeme to contend with Wheate for priority, as well as use, for although Wheate be the staffe of our life for bread now adayes in our *Europe*, yet it was not so with the antient *Athenians* in the *Levant*, and other of those parts of the world now, where Barly holdeth a further extent than Wheate; but this place will not permit that ample discourse might be said of it; & howsoever we acknowledge according as the antients have recorded of it, that it nourisheth lesse than Wheate, because it is a drier graine, yet besides the medicinall qualities in it, it maketh more wholsome drinke for our bodies, than what can be made of Wheate alone, which is too sweete, and too much stuffing the body with humours, and posseth it up with loose spongyous fat and flesh, making them that use it unweldy and unfit to follow their necessary affaires; but hereof enough for this place. Barly in all the parts and compositions thereof, except Mault, is more cooling than Wheate, and a little cleansing, being in the first degree of cooling and drying: it provoketh urine, saith *Discorides*, it breedeth windinesse, and is aduersive to the stomacke; but all the preparations thereof, as Barly water, or creame *Tisane* drinke, or those other things made thereof, doe give great nourishment to macilent and hecticke and diseased persons, or troubled with feavers or agues, and heates in the stomacke, &c. and many of them have bene, and still are received for good noutishment to the healthfull: the preparations, as they were anciently used, and those that are now in use with us, I meane to speake hereafter severally; I onely meane to shew you here how it is other wise used. A pultis made of Barly-meale or flower boyled with vinegar and hony, and a few drie figges put to them, dissolveth all hard Impostumes, and asswageth inflammations being applied: and being boyled with Melilot and Camomill-flowers; and some Linseede, Fenugreeke, and Rue in powder, and applied warme, it easeth the paines in the sides and stomacke, and the windinesse of the spleene: the meale of Barly and *Psyllium* Flea-wort boyled in water made into a pultis, with hony and oyle of Lillies, applied warme, cureth tumors under the eares, throate, necke, and such like places: a plaister made thereof with Tarre, Waxe, and Oyle, helpeth the hard swellings of the throate, called the Kings Evil: boyled with sharpe vinegar into a pultis, and laid on hot, helpeth the leprosie: being boyled in Red-wine with Pomegranate-rindes, and Mirrills, staeth the laske or other fluxe of the belly: boyled with Vinegar and a Quince, it easeth the hot paines of the gout: Barly-flower, white Salt, Hony, and Vinegar mingled together, is used by divers to take away the itch speedily and certainly: the water distilled from the Greene Barly in the end of *May*, is very good for those that have defluxions in the eyes, to lay the humours, and to ease the paines being dropped into them, or white bread laid to steepe therein, and bound thereto: if Barly halfe sodden be given to Hennes, that hardly or seldom lay Egges, it will cause them to lay both greater and more often.

Now I am come to shew you both what hath bene in former times made of Barly, as what is used to be made thereof among us in these dayes: first I thinke it fit to speake of those preparations the antients used; and then of those which we use.

CHAP. XV.

Of Polenta.

Polenta (which may well be called parched Barly) was antiently made after divers manners, for *Pliny* in his 18. Booke and 7. Chapter, sheweth that some Grecians used to make it as well of Greene Barly taken out of the care before it was ripe, steeped in water, and after beaten in a Morter, and washed in Baskets to take away the huskes, then dried in the Sunne, and afterwards steeped and beaten againe, untill it was thoroughly clenfed, and then dried and ground small, unto twentie pound whereof howsoever made, was put of Linseede, and Coriander seede, of each one pound and a halfe, and about two ounces of salt, all being well bruised, they mingled together. The *Italians* made it of parched Barly, without any moistening, ground small, and those things added thereunto aforesaid, and some Millet seede also. Other *Grecians* saith *Pliny*, made it of Barly moistened for a night, and then dried it, and parched or fried it the next day, and then ground it. *Galen* commendeth that most that was made of fresh Barly, before it was thoroughly ripe, and the beades or awnes over-dry, and but indifferently parched, and addeeth nothing else unto it. Sundry Nations did use this *Polenta* in stead of bread, and namely the *Cypriots*, who although they had Wheate growing with them, yet most used this. This drieth more than Barly it selfe, and bindeth the belly, being drunke with red wine, and allayeth inflammations; and drunke with water it quencheth thirst: it was often eaten with a little new wine, or sodden wine put unto it as every one liked.

CHAP. XVI.

Maza.

Maza is but *Polenta*, parched Barly moistened with some liquor, as every one thought meete, for some used nothing but Water, others put to it both water and oyle together, as *Hesychius* saith, and some as *Hippocrates* sheweth, did put sweete wine to it: and some put honey also: *Galen* declareth that *Maza* of it selfe doth hardlier digest in the stomacke, and doth trouble the belly with winde, if it abide long therein, but it doth the sooner passe downe if it be much turned, and honey be put to it.

CHAP. XVII.

Of Ptisana.

P*tisana* the most prayfed and prayse-worthy drinke, supping or pultage (call it how you will) was used anciently to be made of divers sorts of graine, and not altogether of Barly, for they had their *Chondro Ptisana* made of Zea, *Pyrina Ptisana* made of Wheate, and *Pliny* saith that *Italy* which was abounding in Rice, made *Ptisana* thereof, which others made of Barly, and *Galen* also sheweth it was made of Pulse, for he nameth *Phacoptisana* that is made of Lentills, but *Ptisana* simply without any other addition, is alwayes understood of Barly, onely husked for the excellency thereof. The manner of making it is set downe by divers authors, as *Pliny*, *Galen*, *Dydimus*, and others, but because *Hippocrates*, who is accounted the Prince of Physitions, wrote a whole Treatise in prayse thereof, I will here set downe his words of making it fit for meate or medicine. Take, saith, he of the best Barley, and moisten it with water, let it so rest for 3. or 4. houres, then put it into a course bagge, and beate it with a mallet or pestell of wood, untill it have cast off the huskes, which then being washed, to take them away, drie it in the Sunne, and keepe it to use as occasion serveth as *Polenta*: but to make it *Ptisana*; it is to be boyled gently in water untill it breake, and that the liquor be thicke like creame, which then is lenifying sweete and lubricke or slippery, and being moderately liquid, quencheth thirst, it hath no astringtion, nor moveth perturbations, nor swelleth in the stomacke, for all the swelling is tooke away in the boyling, it ticketh not in the breast or stomacke, but by the lubricitie is easily digested and quencheth thirst, by the moistening qualitie: these properties, saith *Galen*, recorded by *Hippocrates*, are available, both for the sicke and for the sound: *Dioscorides* further addeth, the creame of *Ptisana*, by reason of the boyling, yeldeth more nourishment than *Polenta* that is made of Barly, and is profitable to helpe the sharpnesse and roughnesse of the throat, and all exulcerations. This was the manner of the ancients *Ptisana*, for their manner of making and using; but our Physitions in these times use onely Barly husked and boyled in water, and then beaten and strained, putting some blanched Almonds or Pompion seede, or other cold feedes beaten, and strained with some Sugar and Rosewater; and this is their most usuall *Tisane* or Barly cream. Some appoint Barly to be lesse sodden, which is called Barly-water, and therewith is made either *Tisane* drinckes by adding Licoris, Raisons of the Sunne, Maidenhaire, or the like, for such as are troubled with coughes, shortnesse of breath, &c. or else with Almonds or cold feedes, make it into an Almond milke, with Sugar and Rosewater, or given to hesticke or macilent and weake bodies: the Barly water alone, or made into a Ju'p with Syrope of Violet, or Lemonds, or the like, is a fit drinke for those that have hot or burning fever on them, or are otherwise disordered with heate, or used with some pectorall Syrupes for the cough, shortnesse of winde, hoarsenesse, or the like. There yet remaineth *Zythum*, and *Curmi* of the ancients to be spoken of, and both, as *Dioscorides* saith made of Barly, which because wee suppose in these dayes, they did point to our Ale and Beere, which are made with Mault, the substantiall part of the drinckes; I thinke meete first to speake of Mault.

CHAP. XVIII.

Byne sive Malum. Mault.

M*altum* onely used this word *Byne* which by all is referred to Mault, and as the by manner of making set downe by him is shewed plainly: *Malum* is a word made Latine from the *German* *Mamb* and our Mault, both signifying one thing, that is, that manner of prepared Barly, as is fit therewith afterwards to serve to their use, that would make of it either Ale or Beere: the manner of making is as I take it in all countries alike without difference, and so well knowne to all that it is in a manner needlesse for me to set it downe, thereby to enforme any that having spent their time wholly thereon as being their profession, can tell better how to enforme me, but as in all the rest of this Worke, my endeavours are to enforme & shew those that not knowing wil not refuse to heare and understand, and thus it is Barly is laid in water to soake for two or three dayes and nights, which being swollen in that time, the water is drained from it, and is after wardes spread equally on the floore of a garner, or such like place that is close, about halfe a foote thicke, and covered with clothes or other things warme, untill it beginne to sproute ready as it were to grow, (which will be performed within two or three dayes, if the weather be warme, or not very cold, or else it will lye longer) then doe they turne it before it grow too hot, two or three times a day for a weeke or tenne dayes, both to coole and to drie it, then doe they bring it to the kill, and there dry it througly with fire made of straw, or other such like light stuffe, to cause it to have the sweeter relish, for being dried with bayens or wood, the mault will taste bitter of the smoake and is soone perceived in the drinke, which will taste bitter. This mault before

before it can be used, is to be ground a little, and then serveth it for the Brewer to use. If Mault being ground, be fried and applied in a bagge, or double cloth bot to the sides or belly, pained with stiches or gripings, occasioned by cold or winde, it giveth much ease and helpe, and being made into a pulvis, asswageth tumors and swellings.

CHAP. XIX.

Of Zythum.

Heophrastus and *Dioscorides* onely, and no other authors before them, that I can finde, have made mention of *Zythum*, what it is, or whereof it was made, and yet they are so short therein, that we rather understand this by others relation, which thing sheweth it was so common a drinke there in those places of Greece, &c. that they thought it not worth their labour further to exp- plane it, even as *Dioscorides* hath done the like with many herbes that were most common in those times, for he onely saith it is a drinke made of Barly and no more: *Diodorus Siculus* saith that

Zythum is a drinke made of Barly, and was used in *Galatia* where was neither wine nor oyle: *Pliny* after him hath a little further explained it by saying, Of sundry sorts of Graine drinke is used to be made, as *Zythum* in *Egypt*, *Celia* and *Cerea* in *Spaine* (which as it is likely was so in *Pliny* his time, and that before their planting of Vines there which hath generally now banished that Barly broth, they now drinking eyther faire water alone or with a little Sugar, or to their water put more or lesse wine as they desire to drinke it) *Cerevisia* and other kinds of drinkes in *Gallia*, and other countries, thus saith *Pliny*: Now the generall Tenet of our times is that it is the same drinke which we now call Beere or Ale, or but varied according to the manner of the country where it is made, and according to the goodnesse, quantitie and diversitie of the graine whereof it is made, and also of the water: for first for the water, it is well knowne that there is no Beere can bee made in the low countries by reason of their brackish water, but will taste thereof, and be farre inferiour to that is made in *England*; and againe it is observed by many, that the water of our River of *Thames* about *London* doth make better and stronger drinke (keeping equall proportion in all things) then that which is made of other Spring or River water else where: and for the goodnesse of the graine and the well ordering and making it into Mault, it is well knowne also to make the drinke better or worse stronger or weaker; the diversities of graine also causeth diversitie of drinke: for if it should be made of Wheate alone it would be too thicke, too sweete and fulsome as I said before, or of Oates alone it would be too poore and thin: and for the quantitie that is all in all to make it mightie & durable, even two or three yeares, or poore and weake not to laste a moneth. But *Petrus Bellonius* in his second booke of observations 98. Chapter is of opinion that this *Zythum* of the ancient Gracians is the same drinke that the Latines called *Posca* or *Pusca*, whereof *Columella*, *Scrapio* and *Avicen* also make mention: but differeth as hee saith from *Cerevisia* Ale, because it is white like milke, thicke and of a good nourishment, and fuming into the head causing drunkennesse if it bee too largely taken: and this kinde of drinke saith hee is usually fould in all the cities of *Asia* in the tappe houses appointed for it, and generally called with them *Chouffet*; and to strengthen his opinion alledgeth the place in *Suetonius*, where hee relateth that *Cesar*'s bondman that fled from him, was found at *Capua* selling *Posca* in a tappe house, and therefore that *Posca* could not bee *Oxyeratium* (which is Vinegar and water) but this *Zythum* but *Scaliger* in his annotations upon *Bellonius* as they are extant in *Clusius* his *Exoticke*, sheweth his manifold errors in this his saying: the manner of making this *Chouffet* of the Turkes I thinke not amisse briefly here to set downe, that you may see the differences of the compositions of drinkes in severall places. It is made saith he of meale made into paste and boyled in a great Caudron, and then being made into small balles is cast into water, which will presently boyle up of it selfe and grow hot without the helpe of any fire, and become a kinde of thicke drinke: The spume or yest thereof, saith he, is white and light, wherewith the *Turkish* women use to annoint themselves, especially when they are in bathing, making the rough skinne smooth and delicate, and this facultie the ancients attributed unto *Zythum*; and further *Dioscorides* saith, *Zythum* provoketh Urine but hurteth the reines and the sinewes, especially the tunicles that cover the braine, it breedeth windineffe maketh ill blood and humors, and engendreth the falling sicknesse.

CHAP. XX.

Of Curmi.

His likewise hath no further relation or explanation from *Dioscorides*, then that it is also a drinke made of Barly and was often used for drinke, nor yet by *Pliny* further then as is shewed before, that *Cerevisia* was made in *Gallia* and other kinds in other countries. We therefore in these times refferre this *Curmi* to our Ale as wee did formerly *Zythum* unto Beere, and withall let me shew you that Ale was the most ancient drinke was made in this Land, whereof the *Welsh Curm* (which is Ale with them in their Language) hath a shew of neare correspondance to *Curmi*, and that our

good Ale was better knowne to other nations by the word then by the forme or taste, but with us became a proverbe, that it would make one have a rich face and nose (meaning by the red pimples it would raise on their faces and noses that did use to stand to it and drinke it stoutly) yet a stranger both seeing it and tasting it here in *England* gave his verdict thereon in these words, *Nihil spissius dum bibitur, nihil clarius dum mingitur, unde constat multas faces in ventre relinquere*. But *Cerevisia* which we more properly transferre to Ale is as it seemeth by *Pliny*, a word well knowne before his time, and more proper to *Gaul* or *France* then to *Italy*, as the matter it selfe also was, and which from them as it is likely hath beene transferred to us. This old *English* drinke hath lost much of his reputation since that *Biera* Beere came in use, and nothing to much desired as formerly it was, partly because

our Ale in most places of this Land now adayes is not so well boyled to make it cleane and cleare drinke, being so muddy sweet & fulsome, that many loath it, at least refuse it for that cause, and in especial because Beere is a clearer drinke and of better relish by the boyling, but chiefly that the hoppers make it more durable without sowing, lesse fulsome and much more wholesome. It remaineth now that I should shew you the properties of Beere and Ale for medecine what diseases they will helpe and what cures they will performe. The graines, that is, the Mault that is left after the drinke is drained therefrom, besides the fodder it yeldeth for all Cattle or Pullane, are of singular good use for those that are troubled with lamenesse in their Legs or Feete, through cold or evill humors fallen into them, or by the shrinking and paines in their sinewes or joynts, if they set their Legs up to the knees into a Barrell or Firkin filled with these graines while they are hot, or heated againe if they be cold, which will by using three or foure times as occasion requireth, abate both swellings and painers and restore the joynts and sinewes to their proper strength. Strong or good Ale sodden so thicke, that as hony it may be spread like a salve, and applyed warme to the necke or throate troubled with the Kings Evill giveth much ease; and sundry by the use thereof have also found much comfort for their sinewes and joynts that have had much paine and weakenesse in them; the Yeast of Ale serveth our white Bakers of London in stead of Leaven, to cause their bread to rise as Leaven doth, which else would be sad and heave unfit to bee eaten: Of good Ale likewise distilled with other herbes, seedes, spice, as of Balme, Angellica, Aniseed, &c. and divers other the like is made an excellent good *Aquatite* as they call it, or strong Balne water, &c. but of the dregs of Ale or Beere distilled the vulgar sort of *Aqua vite* is made. The properties of Beere and Ale are very like, and therefore whatsoever is said of the one may very well be referred to the other, For of them is made Dier Beere or Ale, by putting in Spices or purging things, according as the patients disease requireth, and as the Physicians can appoint.

CHAP. XXI.

Avena. Oates.

Here are onely two sorts of Oates that may justly challenge any place among the Graines or Cornes which are the ordinary sown field Oates, and the naked Oates, for the wild Oates are most truly reckoned among the Grasses.

1. *Avena vesca. Manured Oates.*

The ordinary Oates groweth up with divers tall joynted stalkes and leaves somewhat resembling Wheate, bearing at the toppes a large spread tuft of many pointed agets, hanging downe like small winged birds from small thread-like stalkes, within every one of which huskes lyeth a small and long round graine, somewhat like unto Rie, but longer and more pointed: the roote is small and thready.

1. *Avena vesca. Manured Oates.* 2. *Avena nuda. Naked Oates.*

2. *Avenanuda*. Naked Oates.

The Naked Oates grow in all points like the former, saving that the graine being somewhat smaller and whiter, lyeth not so fast enclosed in the huskes, but is very easily rubbed out with ones hand.

The Place and Time.

They are both sown in our fields in sundry places, yet the naked Oates nothing so frequent, and doe love rather a moist cold ground then either hot or dry, and are usually the first seede is sown upon these grounds that were woods and stocked up, they are Sommer cornes, that is, sown in the Spring and mowen in Autumne.

The Names.

It is called in Greeke *Αραβις* and *Αραβις*, and in Latine *Avena* peradventure say some it may come of *Αραβις*, *quod cibum significat*, because as *Pliny* saith the people of Germany lived hereof: but I am no *Pythagorean* to beleve *transmigration animarum*, nor of *Theophrastus* or of *Pliny* his beleefe, that Oates are made of Zea as *Theophrastus* saith, or that Barly is changed into Oates as *Pliny* saith, but it is wonderfull that so great learned men in naturall Philosophie should be carried away with such strange and erronious opinions: but these and many more the like were too frequent with most of the old writers, as is plainly seene in many places of their workes. For howsoever there is a *lusus naturæ* many times, and in many things and plants, as by over abundance or by defect or lacke of the iust parts, yet that any one transmutation of one species in plants should be into another, I never saw nor can beleve any can shew, naturally so growing other then casually as before said, unlesse as God of stones can make bread and of water wine, it come miraculously, which if it should so happen supernaturally it, must not be accounted any law or course in nature: but of this enough here, I have spoken else where somewhat more to this effect. All authors that have written of these two graines, doe so little vary their titles of them that they may easily be knowne: the Arabians call it *Charall*, the Italians *Vena*, the Spaniards *Avena* and *Avea*, the French *Avoine*, the Germanes *Habern*, the Dutch *Haver*, and we in English Oates and Haver also.

The Vertues.

Oates as *Galen* saith are somewhat cold and drying withall, and thereby doe helpe the laske of the belly, yet is it temperate and nourisheth little, like unto Barly saith *Galen*, but *Pliny* saith the Germanes lived thereon which is very true, for to this day they doe so in many places, and even in some countries with us also, as *Lincolneshire*, *Lancashire*, &c. they make it not onely their bread corne or make cakes, &c. thereof, but they make it also into Mault, and thereof make their drinke, and are thereby sustained & live in as good health and strength of body, as those that live on Wheate onely, whereby wee may well perceive that it hath a warming qualitie rather then a cold in nourishment, howsoever it may have a cooling in medecament. Oatemeale in broth is usually given to binde those that have a Laske or other flux, and with some Sugar is to good effect given to those that have a cough or cold. Whole Oates fryed with bay salt and applyed to the side, takes away the paines of Stitches and winde in the sides or belly, a pulvis made of the meale of Oates and some oyle of Bayes put thereto, helpeth the Itch and the Leprosie, as also the Fistulaes of the Fundament, and dissolveth hard Impostumes, the meale of Oates boyled with Vinegar and applyed taketh away freckles and spots in the face or other parts of the body.

I should next unto these graines (if I thought it fitting to make a Chapter as others have done) speake of the burnt Cornes of these severall sorts before specified, but because there is nothing in them that is worth the Description or Place indeede among the rest, being but certaine eares of Corne here and there among the rest that are blasted by casualtie, I thinke them not worthy of more relation then that such are sometimes to be seene, or as our English proverbe is to make a long harvest of such bad Corne, yet I think it not amisse to give you the figures of them here.

Of this Triū & Horde
Burnt Wheate and Barley.

CHAP. XXII.

Oryza. Rice.

Rice is numbred among the graines or Cornes that are used for sustenance, and therefore must bee set next to Oates, because it beareth the seede in a sparred *juba* or tuft, yet in a different manner.

It riseth up with a stronger stalke then Wheate about a yard high, with sundry joynts and a large thicke leafe at each of them like unto the Reede, at the toppes it beareth a spiked tuft spread into branches, whose blooming is said to be purplish, with the seede standing severally on them, enclosed in a hard browne straked huske, and an aunc at the

head of every one of them which being hulled is very white, of the bignesse almost of Wheate cornes, blunt at both ends.

The Place and Time.

The originall fourse hereof came out of the East Indies, where it is their chiefest if not onely Corne they live upon, and not with them onely but through all *Ethiopia* and *Africa* and from thence hath bene brought into *Syria*, *Egypt*, *Italy*, &c. whereloever it is seene to bee sown, and loveth onely to grow in moist grounds, or such as may be overflowen in the Summer time, and the waters let out againe, being but a Summer Corne, and is yearly sown and gathered in the middle or end of Autumne with us, but twice a yeare in divers places of the East Indies, whose goodnesse chiefly consisteth in the largenesse and whitenesse, which the hotter countries onely produce.

The Names.

It is called in Greeke *Oryza*, and so in Latine *Oryza* by all authors, yet some doe call it *Italica* for a difference to the *Oryza Germanica*, (which *Cordus* on *Dioscorides* saith is called *Schmeden* with rheum, or being a kinde thereof at the least, although lesler, having the same taste and use, and the same proportion in stalkes, leaves, and spikes, with a *juba* like *Milium*, growing also in marshy and plashy places as Rice doth) yet *Hermolaus*, *Ruellius* and some other have thought it to bee the *Hordeum Galaticum* of *Columella*, but I have shewed you what that is in the Chapter of Barly: why *Galen* should account Rice *inter legumina potius quam inter cerealia*, as he did before of Oates, and of Panick afterwards, many doe wonder, seeing their formes are so different, but himselfe I thinke rendereth the reason, because it was not made into bread as the rest of the other Cornes are: The Arabians call it *Azza* and *Arzi*, the Italians *Rizo*, the Spaniards *Aroz*, the French *Rys*, the Germanes *Reiss*, the Dutch *Rys*, and we Rice.

Oryza. Rice.

The Vertues.

Rice is chiefly used medecinally to stay the Laskes or fluxes of the stomacke as well as of the belly, especially if it be a little parched before it be used, and Steele quenched in the milke wherein it shall be boyled, being somewhat binding and drying: it is thought also to encrease seed, being boyled in milke and some Sugar and Cinamon put thereunto: the flower of Rice is of the same propertie, and is somerimes also put into cataplasmes that are applied to repell humors from flowing or falling to the place, and is also conveniently applied to womens breasts to stay inflammations when they begin.

CHAP. XXIII.

Milium. Millet.

OF Millet there are divers sorts, some familiarly growing in Europe others brought out of the more remote countries, as shall be declared.

1. *Milium vulgare album.* Common white Millet.

This Millet groweth with many hard joynted tall stalkes full of a white Pith, yet soft and a little hairy or downy on the outside, with long and large Reede-like leaves at them compassing one another, the toppes of the stalkes are furnished with a number of whitish yellow long sprigges like feathers, bowing downe their heads, set all along with small seede inclosed in a whitish huske, which being taken forth are of a shining pale yellowish or whitish colour, somewhat hard little bigger then the seede of Fleawort: the roote busheth much in the ground but perisheth yearly.

2. *Milium nigrum.* Blacke Millet.

This other Millet differeth little from the former, being somewhat lesse with us, saving that as the *juba* or tuft is brownish, so is the seede also blackish and shining, very like else to the other.

3. *Melica sive Sorghum.* Indian Millet.

This Millet is in all the parts thereof larger, greater and higher then the former, rising to be five or six foot high or more, the stalkes are full of joynts and large long leaves at them, the *juba* or tuft standeth upright and boweth not downe the head as the other, whereon stand the seede as big but not flat as Lentills somewhat round, and eyther whitish, yellow, red or blackish, hard and shining, the roote busheth more then the other yet perisheth also.

The Place and Time.

Millet, of all the sorts came first into Europe out of the Easterne countries, the two first sorts long before the last kinde, and the sortes of it, and require a strong ground well watered, for they soone empoverish a ground if it be not still enriched, nor will it prosper in leane drie soile; it is to be sowne in April, and the graine in the hotter climates will be ripe in August or September.

The

1. 2. *Milium vulgare album vel nigrum*;
Common Millet with white feede or blacke.

3. *Melinis indica*;
Indian Millet.

The Names.

Κερατ in Grecke, is called *Milium* in Latine, a *miliaria summa derivatum* ait *Festus*, *Galen* calleth it *Paspalus*, and others *Paspale*, *Varro* thinketh it is *Meline*; but *Dioscorides* and *Galen* make *Meline* to be *Panicum*. All Authors call the two first sorts *Milium* with their distinctions of blacke and white: the last is called *Milium Indicum*, by *Matthiolum* and others, and *Sarafenicum* by *Fuchsius*, and *Melica* by *Dodoneus*, *Sorghum* also, and *Sorgho Italicum* by *Lobel*, *Gesner* calleth it *Panicum Indicum*, and *Tragus Panicum* *Dioscoridis* and *Pliny*, *Belonius* also saith that in *Cilicia* they call it *Hareomen* as the *Arabians* doe, whereof they make their Bread or Pultage, and of the stalkes their fire in want of other fewell, it is called *Mazzo di Congo* by the *Portugalls* finding it in that Kingdome: the *Arabians* call it *Geguers* and *Giavers*: the *Italians* *Asiglio* and *Sorgho*, the *Spaniards* *Milho* and *Migo*, the *French* *Mil* and *Millet*, the *Germanes* *Hirse*, the *Dutch* *Hirs*, and wee is *English* Millet; and the last *Turkie* or *Indian* Millet, and of some *Italian* Millet.

The Vertues.

Galen saith it cooleth in the first degree and dryeth in the third almost, and hath withall a little termitie of parts: the graine saith *Theophrastus* if it be kept from winde and weather will ever last and abide: it is sometimes made into bread but it is very brittle, not having any tenacitie in it whereby it nourisheth little, but dryeth up moist humors, yet is it much used in *Germany* boyled in milke with some Sugar put unto it: *Matthiolum* saith that at *Verona* the bread thereof is eaten with great delight while it is hot, by reason of the sweetenesse, but being old it is hard and utterly unpleasant: the gruell or pultage saith *Dioscorides* bindeth the belly and provoketh urine: the *Apozeme* made there of called *Syrupus Ambrosianus*, or as *Wecker* hath it *Syrupus Ambrosy*, taken warme with a little white Wine procureth sweating mightily being covered in bed, and is effectuell to coole hot Fevers and to quench thirst: being put into a bag and fryed hot easeth the griping paines of the Collicke and of the sides if it be applied, the paines also in the joynts and sinewes: in *Italy* and other places they give the graine to their Pullen and Pigeons to fatten them. The *Indian* Millet stalkes saith *Matthiolum* are good to helpe those that are troubled with Kernells under the eares or else where, in this manner: Take the pith out of ten of the joynts of the stalkes of this Millet, which being burned with a new red sponge, take the powder of them with twelve graines of Pepper, and an ounce of Wheate Paste or Dowe, all which being made up with a new laid Egge into a cake, let it be baked under the embers, this cake being divided into six parts, let the patient take one part of it every other night when the Moone is in the wane as they go to bed, and not drinke after it that night: this must be repeated two or three Moones, and hereby saith he hath knowne many to be cured: the red flowers saith he taken in red wine to the weight of a dram cureth women of the reds, as the white flowers doth the whites: it is also good for all fluxes of the belly.

CHAP. XXIV.

Milium Indicum maximum Maiz dictum, five Frumentum Indicum, vel Turcicum aliquotum. Indian or Turkie Wheate.

A Sa kinde of Millet although farre greater and differing notably from the former I must joyne this graine although some have made divers sorts thereof, yet I cannot perceive any more then two speciall differences, the one beareth eares at the joynts of the stalkes, the other at the tops following the flowers: the other differences consist not in any other things then the colours, of the blooming first and of the graines afterwards.

1. *Maiz Frumentum Indicum vel Turcicum vulgare.* The usuall Indian or Turkie Wheate.

This Indian Wheate shooteth from the roote which is thicke and bushie, sundry strong and tall stalkes six or eight foote high, as thicke as a mans wrest if it grow in any ranke ground, full of great joynts with a white pith in the middle of them, the leaves are long, twise as large and great as of Millet; at the toppes come forth many feather-like sprigs, bending downward, like unto the toppes of Millet, which are either white or yellow or blew, as the graines in the eares will prove, which fall away, nothing appearing after them; but while they are in flower at the joynts of the stalkes with the leaves, from within two or three of the lower joynts up towards the toppes, come forth the eares, one at a joynt will have many leaves foulded over them smallest at the toppes, with a small long bush of threads or haire hanging downe at the ends, which when they are ripe are to bee cut off: which foulds of leaves being taken away, the head appeareth much like unto a long Cone or Pineapple, set with six or eight or ten rowes of Cornes, orderly and closely set together, each being almost as bigge as a Pease not fully round, but flat on the sides that joyne one unto another, of the same colour on the outside as the bloomings were, hard but brittle and easie to bee broken or ground, with a white meale within them somewhat dry and not clammy in the chewing. *Leb-l* expresseth the figure of another sort as he thinketh because as hee saith it grew greater and higher, and the roote grew greater, and with more separate tufts, the roote not differing in any thing else: but I thinke it no specificall difference, nor understanding by any that it is taken for another sort, and therefore I have omitted it and speake no more thereof.

2. *Milium Indicum maximum Maiz dictum, five Frumentum Indicum vel Turcicum.* The usuall Indian or Turkie Wheate.

2. *Frumentum Indicum alterum five minus.* The other lesser Indian Wheate.

This other Indian Wheate is like the former both in stalkes and leaves, but not halfe so high or great, the eares likewise are not halfe so bigge, of a differing colour as it, but they doe not grow at the joynts of the stalkes as the other, but at the toppes following the flowers, which maketh a specificall difference betweene them: the graine it selfe is being made into bread not of that nourishing qualitie that the greater sort, is but weaker by much, nor is so strong to breede so much blood as it.

The Place and Time.

The first groweth in the East and West Indies, and from both places have beene brought unto us, and have growne with us, and sometimes borne ripe eares but not alwayes, and will desire a strong rich ground as the Millet doth, sowne early in the Spring and ripe in September: The other is a stranger, and seldome seene with us.

The Names.

It is very probable that this graine is that which *Theophrastus* maketh mention of to grow in *Baëria*, which he saith was reported to be as bigge as Olive stones, and *Pliny* following him relateth the same thing out of him, but altereth the Olive stones into eares of Wheate, which sheweth how subject it is to errour, to goe upon hearsay and bare report, for *Theophrastus* relateth the greatnesse of the graines but by report, which might increase by the way as it did betweene *Theophrastus* and *Pliny* his time, to be as bigge as Wheate eares, *Matthioli*, *Dodonæus*, *Lugdunensis* and others condemne *Fuchsius* for calling it *Frumentum Turcicum*, according to his Countries dialect are found more just to be blamed themselves, for no doubt but this very Indian Wheate which plentifully is found

found to grow in all the tract of the West Indies, yet not found naturall in any place, but planted every where by the natives, &c is the same with Theophrastus and Pliny their *Frumentum* or *Triticum*, and *Atilum* *Baltrianum* *Indicum*. They of the West Indies call it *Maiz* generally. The last is onely remembered by Tabernmontanus and Bauhinus after him, which Acosta saith the Spaniards in the Indies or the Indians call *Moroche*: The drinke made of *Maiz* is generally in the Indies called *Chica*, but by some *Acua*.

The Vertues.

Many doe condemne this *Maiz* to be as dry and of as little nourishment as Millet or Panicke, but they doe not as I thinke rightly consider the thing, for although the graine be dry, yet the meale thereof is nothing so dry as of the *Turkie* Millet, but hath in it some clamminesse, which bindeth the bread close and giveth good nourishment to the body, for wee finde both the Indians and the Christians of all Nations that feede thereon, are nourished thereby in as good manner no doubt, as if they fed on Wheate in the same manner: the sweetnesse also of the bread sheweth the greater power of nourishment in it, and as some doe thinke breedeth thicke blood and humours, able to suffocate at the least to breede obstructions, and therefore will not unfitly be put into cataplasmes that are made to ripen Impostumes: Acosta saith that by feeding too much thereon it engenders grosse blood, which breedeth itches and scabbes in those that were not used to it. Of it is made drinke also, both in the Indies and our *Englishe* plantations, that will intoxicate as quickly as our strong Beere if it bee made accordingly: but is found to be very effectuall to hinder the breeding of the Stone, so that none are troubled therewith that doe drinke thereof, the leaves thereof are used also to fatten their Horses and cattle.

CHAP. XXV.

Panicum. Panick.

Here is but one sort of manured Panick growing with us in Europe howsoever some have set it forth with a larger and lesser spike as the place produced it where it grew, but of *Indian* sorts there are very many brought us continually from the backe of *Africa* and *Ethiopia*, and from *America* also whereof to make any large mention were to small purpose, and but to fill up roome; I will onely give you the descriptions of a couple, the one more frequent the other more rare as they grew with us, with a briefe remembrance of some others.

1. *Panicum album vulgare*. Ordinary Panick.

This Panicke groweth up with a reasonable strong joynted stalke full of pith, but not downie as Millet is, having somewhat large leaves on them greater by much then of Wheate, and very neare unto those of Millet that they can hardly be distinguished, at the toppe of the stalke commeth forth a whitish long round close spike, round at the end, soft, and as it were hairy, with small short branches all the length of it when it is full ripe and opened,

1. *Panicum album vulgare*.
Ordinary Panick.

Panicum Indicum panicula villosa.
Indian Panick with a hairy spiked head.

full of hairy soft huskes which include a small white seede lesse then Millet but not shining so much, the roote is bushie like unto it but smaller and dying yearly.

2. *Panicum Indicum pannicula villosa*.

Indian Panick with a more hairy spiked head.

This kinde of Panicke being brought to *Bristow* from the West Indies as *Lobel* saith in his time of abiding there, and there sown, was like in stalke and leafe to the former but greater, and the spiked head grew to bee a foote long but more hairy, bending at the toppe a little, somewhat like the great *Amaranthus*, or flower Gentle.

3. *Panicum Indicum cernuum*.

Blew Indian Panick.

This blew Panick groweth to the height of a man, with strong and great joynted stalkes like unto a Reede, full of spongie white pith, which neare the ground are of a shining purplish blew colour and spreadeth sundry branches with large and long leaves on them compassing the stalke at the bottome, and thicke ribbes in the middle of them: from the joynts towards the toppe as also at the toppes come forth short round Panick-like heads closer then the former, of as blewish a shining purple colour as the stalke below, or rather much more orient and fresh, full of hairy huskes, and small long blewish round feedes in them like unto naked Oares.

There hath beene brought us from sundry parts both of the East and West Indies by Mariners and Chirurgions divers other sorts, some with white heads as big as ones fist, thicke and short, with round white feedes, having an hole or dent in every of them. Another whose head was a foote long and with a bowing toppe, as hairy as the second sort. Another that was slender a foote and a halfe long, small at the upper and bigger below like unto that *Panicum Americanum* that *Clusius* hath set forth. Wee have had also another brave spiked head that hath beene bigger then both ones fists, and a good span long, the stalke being as thicke as ones finger, of a fine whitish yellow colour. Many

Panicum Indicum due species
Two sorts of Indian Panick.

3. *Panicum Indicum cernuum*.
Blew Indian Panick.

Panicum Americani species & sorghum cujusdam.
A kinde of Indian Panick, and of a strange Millet.

other sorts we have had and seene which not having kept any particular figure or note of them are slipt out of our knowledge and remembrance further to describe them, and therefore let this suffice to have said so much of them: yet having kept the figures of some of them I here exhibite them unto you.

The Place and Time.

The most common is onely sown in Europe wheresoever it groweth, and as it is likely came out of the Eastern countries towards India, from whence have come likewise some of the other, and the rest from the West: they are not to be sown untill April, and unless the yeare be hot the third sort seldome cometh to maturity, although the first oftentimes doth, and doe both require strong fat ground.

The Names.

It is called in Greeke *ῥυμι* and *Panicum* in Latine, and *usum* according to *Dioscorides* and *Galen*, *usum* as *Diocles* hath it, which as most doe gather is rather deduced from *πῦλον* quod *meileum* quidpiam significat them from *πῦλον* which is blacke, and it may be thereupon *Pliny* calleth it *Melistrugum*, yet *Theophrastus* speaketh both of *Elymus* and *Meline* as of severall plants. *Pliny* saith *Panicum a paniculis dictum fuit*, and putteth it among the Cornes as *Dioscorides* and *Columella* doe also, but *Galen* as is before sayd among the *Legumina* Pulses for the reasons before shewed. *Bauhinus* maketh two sorts of the first, the one hee calleth *Germanicum panicula minore* because it may be growing in Germany, the head was lesse which *Tragus*, *Fuchsius*, *Cordus* and others set forth, and yet as I said in the beginning they cannot be two different plants: the second is remembered by *Clausius*, *Dodonæus*, *Lobel*, *Lugdunensis* and others. The Arabians call it *Dochan*, the Italians *Panico*, the Spaniards *Panso*, the French *Panis* and *Panic*, the Germans *Pfenick* and *Heydelpfenick*, the Dutch *Penic*, and we *Panick*.

The Vertues.

Panick is as *Miller* cold and dry, and giveth little nourishment, and as *Galen* saith *Milium* is better to all purposes then *Panick*, sweeter also and easier to digest, yet saith he the country people feede thereon being boyled in milke even as they doe Wheate, but saith he, that of Italy exceedeth ours of Asia: *Ioannes Leo* in his History of Africa saith, that in some places thereof they make very fine bread of *Panick*, of what sort he mentioneth not: it stayeth Fluxes as *Milium* doth, it is given to Pullen, Pigeons and other small birds, but hath no further use in Physicke then to dry up moist and fluxible humors.

CHAP. XXVI.

Tragopyrum. Bucke-wheate.

As a Complement to finish this History of Cornes and Graines I must set this in the last place, because although the forme and manner of growing be differing from all the former, yet because the feede serveth to the same use, it is reckoned by the later writers deservedly to bee joyned unto them. It riseth up with divers round hollow, brittle, reddish stalkes a yard and more high, set with divers leaves each by it selfe on a stalke, which is broad and round and byforked at the bottom, small and pointed at the end, somewhat resembling an Ivie leafe but softer in handling; at the toppe of the stalkes come forth divers clusters of small white flowers which turne into small triangular blackish feede, somewhat like unto a Beech nut but much lesse, with a white pulpe within: the roote is small and thready.

The Place and Time.

It is thought to have beene first brought out of Africa into Italy, but it is now generally sown in most of these Northerne countries, where for the use and profit is made of it many fields are sown therewith, and that usually not untill April, and is ripe in August, and will not refuse to grow in an hungry ground, but is held generally to bee as good as a dunging to the ground whereon it is sown, the straw thereof also being turned in thereto.

The Names.

It is generally taken to be the *ῥυμιον*, *Erysimum* of *Theophrastus*, which *Gaza* translateth *Trionum*, as also to bee the *Iris* of *Pliny* some to put a difference betweene this *Erysimum* and the other, call this *Erysimum cereale*: it is called by *Matthiolus*, and *Lugdunensis* *Frumentum Saracenicum*. *Dodonæus* *Tragopyrum* and *Tragopyrum*, *Tragotriticum* and *Fagotriticum* as the Dutch names doe import *Buckweyde* and *Buckenweydt*, *Tragus* calleth it *Ocy-*

Tragopyrum. Buck-wheate.

mum veterum, and *Clevis* and *Tabernmontanus* *Ocymum cereale*, but *Dodonæus*, and *Lugdunensis* doe mainly contradict that opinion, labouring to prove that the *Ocymum* of *Varro*, *Columella*, and the other Latines is no particular herbe, but rather the name of greene fodder. cut before it grew ripe, to feede catell and to purge them, or else severall sorts of Pulse and Oates, mingled together and sowed to feede them, but *Tragus* proveth it substantially from *Varro*, that *Ocymum* was sowed to fatten and purge cattle, and that to be taken while it was in flower, whereby it is evident that it could not be a medley of corne and pulse sowed together for the purpose, which never are in flower altogether at a time, but some particular herbe, and this herbe looner then any other, which the soone springing of it from the seede, which is within three or foure dayes alter the sowing, doth argue the name *Ocymum* to be proper thereunto from *οκυς*, the Greeke word signifying *cito* quickly, from whence *Ocymum* is derived, and the quality answerable also.

The Vertues.

Buckwheate is a graine that as *Dodonæus* saith nourisheth lesse, then either Wheate, Rye, or Barly, but more then Miller or Panicke, and the bread or cakes made of the meale of the seede doth easily digest, yet some say contrary) and quickly passe out of the stomacke, and giveth small nourishment, though not bad, and is withall a little flatulent or windy, yet Country people in divers places of *Germany* and *Italy*. doe feede hereon almost as their onely bread graine, and are strong and able persons following strong labour, for the bread or cakes are pleasant, and doe somewhat presse or lye heavy on the stomacke, as Millet and some other the like will. And both is, and was used generally to fatten cattle and poultry, of all sorts exceedingly, and quickly, yea it is an observation among a great many in our owne land, that what cattle or pullaine soever is fatted there with, if it be not killed within a short time after they are thus fatted, they will dye of themselves, being suffocated with their owne fat: it provoketh vrine, encreaseth milke, looseth the belly, and being taken in wine, is good for melancholly persons: the juyce dropped into the eyes, cleareth the sight.

GRAMINA, IVNCI,

ET

ARVNDINES.

GRASSES, RVSHE S,

AND

R E E D E S.

CLASSIS DECIMATER TIA.

THE THIRTEENTH TRIBE.

CHAP. I.

Gramina Triticea. Corne-grasses.

THE next Tribe to be entreated of, is of the severall sorts of Grasses, which are almost infinite, but because some are growing on the Vpland grounds, others in the low and moorish, some in the waters, and others by the sea side, I must divide them; and for a more methodicall and orderly proceeding in them, I thinke it fittest to ranke them under severall heads, that so they may be better exprested and apprehended. I will first therefore set downe those grasses that are neerest in likenesse unto the Cornes in their spiked heads, and after of those that are like the other sorts of graine, and then of the rest in their order: but because these Grasses are of small use, although of much variety and curiositie, I shall endeavour to be the briefer in them: and first of those Grasses that resemble Wheate and Rye.

1. *Gramen latifolium spica triticea compakta.* Close eared white Wheate Grasse.

The stalke hereof is about halfe a yard high, set with two or three joynts, and faire Wheate like leaves at them a foote long, bearing at the toppes a longerspike than Wheate, and broader, made of severall parts like the huskes of corne, but more separated in sunder, shewing it to be a Grasse and no Corne indeede, yet closer than the next, and without any shew of bearded or awnes thereon.

2. *Gramen latifolium spica triticea divisa.* Thinne eared red Wheate Grasse.

This differeth little from the former, but in the spike which hath the small parts thereof more separated and set on both sides the stalke, and armed every one with a small short beard or awne.

3. *Gramen angustifolium spica triticea compakta.* Closed eared red Wheat-grasse.

The stalke hereof is smooth and round, two foote high, set with long narrower white leaves, rough and pointed, the spike is about a spanne long, somewhat like unto red Wheate, closely set, but each of the huskes hath a sharpe rough awne therat.

4. *Gramen angustifolium spica triticea mutise simili.* Rush-leaved white Wheate-Grasse.

The leaves hereof are long and round like Rushes, and pointed at the ends, set on the round stalkes, a foote and a halfe high, whose spiked toppes is long and slender, without any awnes at the toppes of the huske, and somewhat like unto white Wheate, that is without bearded, the roote is white, knottie and creeping.

5. *Gramen spica Brize major.* The greater Spelt-wheate grasse.

This hath rootes and stalkes like unto corne of a mans height, with narrow leaves, the toppes of the stalkes have sundry long spikes, about a hand breadth long, set on both sides of them one above another, each whereof is very like a small care of Wheate, armed with small awnes, but very short.

6. *Gramen spica Brize minor.* The lesser Spelt Wheate-Grasse.

This other groweth not above an hand bredth-high, with small short, soft, and hoary leaves, the toppes hath sometimes but one, otherwhiles, two or three spikes, of an inch long and bearded.

7. *Gramen*

1. 3. *Gramen latifolium*. & *angustifolium*
spica triticea compacta.
 Close eared white and red Wheate.

4. 5. *Gramen angustifolium spica triticea*
sumi & *spica Bryze majora*.
 Ruste lased white Wheate Grasse; and the greater Spelt wheate Grasse.

7. *Gramen Secalinum maximum*.
 Rye-Grasse, two great sorts.

The stalks hereof riseth sometimes to be two or three foote high, having but few and short leaves thereon; the spike is of two, three or foure inches long, bearded, and very like unto an eare of Rye, but with running rootes and joynted. Of this kinde there is a lesser sort also not differing from them before but in the smallnesse, and that the roote is theaddy.

The Place and Time.

Most of these grasses have beene found in our owne land, in pastures and corne grounds in *Kent*, not farre from the Thames, and flourish when others doe.

The Names.

Each of these hath the name in the title that *Bauhinus* in his *Prodromus* doth call them by, or with very little varietie which is according to *Lobels* intention.

The Vertues.

We know of no use that these are put to in Physick, and therefore we can say no more of them.

7. *Gramen Secalinum maximum majus & minus*.
 Rye-Grasse of three sorts:

CHAP. II.

- Lolium & Gramen loliaceum*.
 Darnell, and Darnell-Grasse.

BEcause the spiked head of Darnell doth somewhat resemble the spikes of some of the former, I thought it meete to joyne it, and the former.

1. *Lolium album*.
 White Darnell.

The Darnell it selfe hath all the Winter long, sundry long fax and rough, leaves (which when the stalks riseth, which

is slender and joynted, are narrower but rough still on the toppe, groweth a long spike composed of many heads set one above another, containing two or three huskes, with sharpe, but short beardes or awnes at the ends, the seede is easily shaked out of the eare, the huske it selfe being somewhat rough.

2. *Lolium rubrum* sive *Phoenix*. Red Darnell.

The leaves hereof are shorter and narrower than of Barly, the stalkes are reddish, sometimes halfe a foote high, with reddish joynts also, the spike is very like the former, but smaller and shorter, and sometimes reddish also, especially in the drier grounds.

3. *Lolium alterum avenacea gluma*. Another Darnell with Oaten toppes.

This differeth little from the first in rootes, leaves, or stalkes, but somewhat higher, onely the toppes hereof differ in that the severall heades are more like to winged Oaten heades, with sharpe pointes set on slender foote stalkes.

4. *Phoenix simplicis & rarissima gluma*. The smallest single Darnell-Grasse.

This is very like the red Darnell, but that it hath very few slenderer and shorter stalkes than it, and the leaves also narrower, the spiked head hath a few single huskes, set very sparsely thereon.

5. *Phoenix altera brevioribus densioribusque spicis*. The greater single Darnell-Grasse.

The leaves and rootes hereof are like the red Darnell, the stalkes grow two cubits high, joynted and straked, the spike is thinly set with chaffie heades, but they are bigger, rounder, and thicker.

6. *Phoenix acrosta aculeata*. Small prickly Darnell-Grasse.

The stalkes hereof are five or sixe inches high, being rough, hard, full of joynts, pointed or prickly at the ends, and with a few short leaves on them, and with all, have small short, rough, and chaffie like tongues, sharpe at the ends, set at the joynts: the rootes are small white threads or fibres.

7. *Phoenix multiplici spicata panicula*. Branched Darnell-Grasse.

This hath slender joynted stalkes, a cubite or more high, and narrow leaves, the spiked head is as it were branched into others, and herein consisteth the chiefest difference.

8. *Phoenix multiplici spicata nutante*. Double Darnell-Grasse with a bowing toppe.

This differeth little or nothing from the last, but in the spiked heades, which are thicker set together, and the toppes of them bow downe or turne a little round.

9. *Phoenix palustris & longius spicata*. Branched Marsh Darnell-Grasse.

This Darnell-Grasse from a creeping white joynted roote, with many fibres thereat, shooteth forth two or three joynted stalkes, two foote high at the least, the spiked head is a foote long, branched as the seventh is, each branch of a fingers length with winged huskes like unto Oates.

The Place and Time.

All these grow, either in the fieldes of corne, or in the borders and path-ways of other fieldes that are fallow,

1. *Lolium album*.
VV White Darnell.

2. *Phoenix sive Lolium rubrum*.
Red Darnell.

3. 5. *Lolium alterum* au *nacea gluma*,
& *atera brevioribus folijs*.
Darnell with Oaten toppes, and the greater
single Darnell-Grasse.

6. *Phœnix acrota aculeata*.
Small prickly Darnell-Grasse.

7. 8. 9. *Phœnix multiplex* / *spicata panicula*,
& *longius spicata*.
The two sorts of branched Darnell-Grasse,
and the double kinde with a double toppes.

and the last sometimes in marsh and wet groundes, as well as in the edges of plowed groundes, *Virgil* calleth it *Infelix Lolium*, because of the harme it did the fieldes.

The Names.

Darnell is called *alga* in Greeke by most Greeke Authors, yet *βίλα* by some, and *Lolium* in Latine, yet *Pliny* calleth it *Ara* as well as *Lolium*; and of some *Triticum temulentum*, and by *Lonicerus* *Triticum sativum*, it is called also *Zizania* from the *Arabians* that so call it; the *Italians* call it *Gioglio* and *Loglio*; the *Spaniards* *Taio*, and *Zizania*, the *French* *Toraye*, the *Germans* *Rueweissen*; the *Dutch* *Luleh*, and we in *English* *Rye* and *Darnell*: the second is called also *Phœnix* by *Dioscorides*, and so divers authors doe call it in Latine, a *femina* colore *phœniceo*, others call it *Lolium rubrum* to distinguish it from the former called *Lolium album*. *Dodoneus* from *Pliny* calleth it *Hordenum marinum*, and thereupon the *Germans* call it *Musf Korn*, *Bauminus* calleth it *Gramen Loliaceum*. All the rest are entituled according to *Lobel* his intended illustrations, and are some of them mentioned by *Bauminus* in his *Pinax* and *Prodromus*.

The Vertues.

Common Darnell, as *Galen* saith, is held to be hot in the beginning of the third degree, and drie in the end of the second, it thereby attenuateth, resolveth, and cleanseth, it troubleth the braine and senses, procuring troublesome dreames, if the seedes happen into bread, and if the seede happen into drinke, it will cause a kinde of giddy drunkenness: the meale of Darnell is very good to stay gangrenes, and other such like fretting and eating cankers and pained sores: it also cleanseth the skinn of all leproyes, morphewes, ringwormes, and the like, if it be used with salt and raddish rootes: and being used with quicke limstone and vinegar it dissolveth knots and kernels, and breaketh those that are hard to be dissolved, being boiled in wine with Pigeons dung and Linfeede: and is profitable for the Sciatica, if it be bathed in the decoction thereof made with water and hony: it is likewise thought to help conception, if a woman be perfumed with it, and the meale of Barly, Myrrhe, and Francumense; yet *Cornariss* thinketh Darnell is unprofitable to be used in suffumigations, and therefore addeth the Myrrhe, and Francumense to the decoction for the Sciatica: Darnell meale applied in a puitis draweth forth splinters and broken bones in the flesh: if the seede be cast into the fire it will cause such a manner of smoake, that it will make all that are in the roome to fall a coughing, and willingly to depart to be eased of the smoake: the red Darnell boiled in red wine stayeth the laske, and all other fluxes, and womens bloody issues, and restraineth urine when it pisseth too suddenly from one. Some doe hold that if it be bound unto a woman being put in a crimsone earthen, or a scarlet cloath, it will stay the abundance of the courses. *Ovid* sheweth by this verse, *Et caveant lolij oculis viciantibus agri* that it was accounted to be hurtfull to the sight, and therefore *Plinius* objected to one that was ill sighted, that he fed on Darnell.

CHAP. III.

Hordeum sparium. Way-Barly.

Although heretofore there was but one kind of this wilde or Way-Barly knowne yet by the diligent fear. h of others, there are some others found, which shall be shewed together.

1. *Hordeum sparium vulgare.* Common Way-Barly.

This hath divers Grasse-like leaves, but somewhat hard, and among them sundry benry stalkes, a foote high, bearing small whitish yellow eares, with long and somewhat rough beardes, whose seede within the huskes is lancke and small, the roote is thready and periseth not.

2. *Hordeum spontaneum elatius sive majus.*

Great Way-Barly.

This other doth in all things resemble the former, but that it is greater and taller, and commeth so neare unto the former middle Rye-Grasse, that many have taken it to be the same, as the former may well be so called also.

3. *Hordeum spontaneum pusillum.* Dwarf wild Barly.

This dwarfe kinde groweth scarce halfe a foote high, with smaller grayish leaues than the common sort, and the spike or eare so nearely resembling common Barly, both in the double rowes and beardes, that one would surely say it was sowne Barly, but that onely the smallnesse of all the parts contradicted it.

The Place and Time.

The two first sorts are found in sundry places with us, yet the first more usually than the other, but found by those that are expert upon madde walles, and at the foote of other walles, and the wayes sides in the fieldes every where: the last was onely found by Boel in Spaine, and communicated to us.

The Names.

It is generally taken to be *Holcus* *Plinij* by the best Herbalists now adayes since *Angularia* first so called it; and that you may understand how *Pliny* describeth his *Holcus*, I will here set it downe as it is lib. 27. cap. 10. *Holcus in saxis nascitur siccis, aristas habet in cackmine tenues, culmo quale Hordeum resiliens; hec circa caput adaligata, vel circa lacertum educit e corpore aristas, hanc quidam ob id Residam (others have it Aristidam) vocant: others call it Hordeum sparium or spontaneum; and some others Hordeum murinum: Thalus calleth it Graminis Loliacei 3. genus; it is called by the Dutch Hase coren, and by us Wall-Barly, Way-Barly, or Way-Bent or Bennet.*

The Vertues.

It hath power, as *Pliny* saith to draw thornes, &c. out of the flesh: some say that it causeth haire to grow; but *Lobel* saith that the lye thereof maketh haire yellow.

Hordeum sparium hoc spontaneum.
Way-Barly.

CHAP. IV.

Avena sterilis & Egiops. Wilde Oates and Haver-Grasse.

Here are divers Grasses that are like unto Oates, some more or lesse, whereof these that are neerest thereto shall be shewed here in this Chapter, and the rest in the two next that follow.

1. *Bromus herba seu Avena sterilis.* Common wilde bearded Oates.

The ordinary wilde Oate groweth both in leaves and stalke somewhat like unto the manured Oates, but that it seldome riseth so high, being slenderer, smaller, and softer, the tufted heade is spread in the like manner, having such like winged huskes, with longer awnes at the ends of them, but gentle, and not prickly, standing by tender small foote stalkes, the seede is small and lancke, as though it had no substance in it: the roote is thready.

2. *Avena sterilis minor.* Small wilde Oates.

This wilde Oate is very like the former, but lesser in stalke and leafe; the sparfed toppe consisteth of many slender long chaffie eares, bearded onely at the ends, and hanging downe their heads with small seede on them like the former. Of this kinde there is another that beareth not his Oaten toppe untill the other be past.

3. *Egiops Narbonensis.* French Haver-Grasse.

This Haver-Grasse hath divers Grasse-like leaves of a pale Greene colour: the stalke is joynted in three or foure places with leaves at them, and at the toppes two or three heads, set one above another, which are round and somewhat long, hard and striped with divers beards at the ends of them, wherein when they are ripe and looked whitish lie two or three small graines or seede; the roote is composed of a small head, with many long fibres growing from it.

Scrotia.

4. *Egiops*

1. *Bromus horridus* fœc *Avena sterilis*.
Common wilde bearded Oats.

2. *Avena sterilis* minor.
The small wilde Oats.

3. *Festuca fœc* *Eglops* Narbonensis.
Finnish Haver-grass.

4. *Eglops Bromoides* Belgarum.
Dutch Haver-grass.

4. *Agilops Bromoides Belgarum*. Dutch Haver-Grasse.

This other Haver-Grasse is very like the last, both in stalke and leafe, the toppe onely is in part like unto the naked Oate, and in part to the last Haver-Grasse, having some bearded set at every huske, within which lye long rough browne seede: the roote also is somewhat like the last, but the head from whence the fibres proceed, is not so conspicuous.

The Place and Time.

Both the former and the latter, are found in many places with Vs, among Rye and Barley, but the second most plentifully by hedge sides, the third is frequent in *Provence*, and *Narbonne* in *France*, among their corne, and are all ripe in *July* and *August*.

The Names.

The first is called in Greeke *ἄγριος πῖτος*, that is *Avena herba*, to distinguish it from the graine, or Corne: it is called also by *Dodonæus* *Bromos herba*, and by *Lobel* *Bromos sterilis longissimus arifus*, *Festucago* by *Gaza*, and *Festuca*, and *Avena sativa*, and *Gracaby* others, by *Matthiolus* *Agilops*, and by *Tragus*, *Loli primum genus*, according to his description. The second is called by *Lobel*, *Bromos sterilis altera*, and *Festuca altera* by *Dodonæus*, *Tarbertmontanus* calleth it both *Bromos herba*, and *Syphonium*. The third *Lobel* calleth *Festuca five Agilops Narbonensis*, and thinketh it to be the true *Agilops* of *Dioscorides*, and conducing to that ulcer in the eyes, as hee ordaineth it: and by *Matthiolus* and othes, *Agilops* likewise, but by *Casalpini*, *Fruentum sylvestre in Sicilia*. The last is called by *Lobel*, *Agilops Bromoides Belgarum*, although hee found it as plentiful in *England*, as the Low Countries; it is *Dodonæus* his *Festuca prior*, and *Thalys* his *Avena sylvestris five nigra*. The first is called by the *Italians* *Vena vana*, *Vene cassi*, and *Orzo Salvatico*, by the *French* *Averon*, by the *Dutch* *Tdel haver*, and by Vs, *Wilde Oates*, & powre, or rather Poore Oates. The second is called both by the *Dutch* and us, *Dravick*, and *Dravick Oates*.

The Vertues.

Lobel saith that he hath often tryed the *Agilops* to be effectual, to helpe that *Distula* or hollow Ulcer that happeneth in the corners of the eyes, so called; for it hath a drying quality without sharpenesse, hee also saith that the seede thereof put into drinke procureth a kinde of drunkenesse: and that the burnt ashes of the stalkes are good against the flegmaticke swellings of the Goutte, to bathe it with the lye made thereof, it also dissolveth hard tumours and kernels in the flesh, and affwageth the swellings in the joynts. *Dodonæus* teacheth to make a medicine for the foule Vlcers in the nose, by boyling the whole herbe with the roote of the first wilde Oates in water, untill a third part be consumed, which being strained, is to be boyled againe, with as much hony unto the thickenesse of a Sirupe, some as he saith put some Aloes in powder to it, and wetting tents there in to be put up into the nostrils: the same herbe also he saith, being boyled in Wine with some dryed Roses, helpeth a stinking breath: the rest are not knowne to be used to any Phisicall use.

CHAP. V.

Gramina Avenacea arborum. The field Oatē Grasses.

Here are some other sorts of Grasses resembling wilde Oates, and called Oatē Grasses, whereof some grow in the Fieldes, others on the mountaines, of those that are found in Corne grounds, and other fields, we will speake of in this Chapter, and of the other in the next.

1. *Gramen Bromoides maximum hirtum*. Great hairy Oate Grasse.

This great Oate Grasse is all hairy, the stalkes and leaves are greater then of Oates, foure or five cubits high, whose panicle at the toppe spreadeth into many chaffy bearded eares hanging downe their heads, the roote is bushy, this groweth in the pastures about *London*, as also in *Essex*.

2. *Gramen Bromoides segetum latiore panicula*. Great Corne Oate Grasse.

This Corne-Grasse hath Oate-like stalkes, three or foure cubits high, the leaves are shorter and narrower, the toppe is spread much, divers stalkes with chaffy bearded eares in branches, comming forth at a joynt, broadest below, and spiring small upwards.

3. *Gramen Avenaceum incanum*. Great hoary Oate Grasse.

This hath short narrow leaves, somewhat hairy and a little hoary withall, the stalke hath few joynts, the panicle is spreade like the last but lesser, and is somewhat hoary: This is sometimes found lesser, and are both found in *Stamus*, the borders of Cornefields, both in *Kent* and *Essex*.

4. *Gramen Avenaceum pratense*. Meadow Oaten Grasse.

The leaves hereof are many, growing next the roote, long and narrow, the stalke is lesser and lower with such a pannicle at the toppe, but lesser spread and not hoary: this is in many Medowes.

5. *Gramen Avenaceum squamosa gluma*. Scaly eared Oaten Grasse.

This hath narrow leaves, a little hairy, a spanne long, the slender stalke hath such alike panicle as the last, but that the scaly eares stand single, every one upon his owne small thredlike footstalk.

6. *Gramen Avenaceum pinnata longiuscula spica*. Winged Oaten Grasse.

The stalke hereof is slender, sometimes higher, and sometime lower, the leaves are narrower than the last, the pannicle is somewhat long but small, and not much spreade, each part being as it were winged or divided into sundry peeces, upon one ribbe or footstalk.

7. *Gramen Avenaceum filicea panicula Xerampelina*. Red Fernelike Grasse.

This beareth red shining stalkes a foote high, the leaves are soft and narrow, the pannicle at the toppe, is three or foure inches long, of a whitish Greene colour, divided into many winged branches many parts being set on both sides of the branch, and each part divided like a *Ferne* leaf.

8. *Gramen Avenaceum murorum erectum*. Vpright Wall Oatē Grasse.

This Grasse groweth upright, a spanne and sometimes a foote high, the leaves are almost as small as any Grasse the spiked head is a handbreadth long, sparfed or divided, each small eare being bearded, the roote is thready: this is often found upon old mud Walles that close in Fieldes.

FFFF

9. Gra

1, 2. *Gramen Bromoides spicatum hirsutum* &
alterum latiore panicula.
 The great hairy, and great Coine Oate-Grasse,

9. *Gramen Avenaceum supinum arvense.*
 Low Meadow Oaten Grasse.

The leaves hereof are as small as the last, an inch, or an inch and a half long, the stalkes are slender and weak, leaning downwards with a few bearded huskes spike fashion at the toppe.

10. *Gramen Avenaceum supinum foliocolo Secalinis.*
 Long winged Oate Grasse flowering like Rye.

This Grasse spreadeth many stalkes not being able to rise up, of a cubic long, full of joynts, and small short leaves on them, of a whitish Greene colour, the toppes are furnished with foure or five Oate like heads, but more winged and with short aunes, somewhat hard and flowering like Rye.

11. *Gramen Avenaceum exile mollicellia folijs.*
 Small soft leaved Oaten Grasse.

This small Grasse is very like the *Gramen exile durum*, that it may easily be mistaken, and differing from it onely in the leaves, that are longer and soft, as the whole plant else is not halfe a foote high, and in the spiked toppes, whose parts are winged.

12. *Gramen Avenaceum altero alteri innatum.*
 Small Oaten Grasse one head set on another.

This fine small Grasse resembleth well the *Gramen Britanicum maritimum*, having divers haire like leaves and hard, with such like span long stalkes, some whereof beare their small sharpe huskes at their toppes onely as others doe, and others out of a tuft of leaves in the middle of the stalke, sanderth forth an other short stalke with such like. sharpe huskes on them as the other.

The Place and Time.

All these sorts grow in the fieldes of this Land, some in one place, and some in another, as they have bene observed either of plowed or fallow grounds, and flower in the Summer season.

4, 5, 6, 7. *Gramen Avenaceum pratense* & *Avenaceum squarrosum* & *gluma* & *Pinnata longiuscula* & *Filicea panicula*, &c.
 Meadow, lealy eared and winged Oaten-Grasse, and the red Ferne-like Grasse.

12. 11. *Gramen Avenaceum altero alteri innatum* & *exile mollicellia folijs.*
 Small Oaten Grasse, one head set on another, and small soft Oaten-Grasse.

The Names.

Grasse is called in Greeke *ἀγροστέριον* *ἀγροστέριον*, quod in agris proveniat, and *πός*, id est, herba by Theophrastus, which is common to all herbes: in Latine *Gramen a gradiendo*. The severall names of all these Grasses, are expressed in their Titles, as much as is convenient for them, being all of late observation, not specified that I know, by any before.

The Vertues.

There is no especiall property knowne to be in any of them but are as yet onely knowne by their face and name.

CHAP. VI.

Gramina Avenacea nemorum & montana. Wood and mountaine Oaten Grasses.

THE rest of these Grasses, that doe resemble Oates shall be expressed here, whether they be found in Woods or on hills and mountaines, &c.

1. *Gramen montanum Avenaceum Clusij.* Mountaine Oate Grasse with hoary huskes.

This hath slender joynted stalkes a cubit high, with very narrow and long leaves, and at the toppe a long spiked head, bowing the head clove with woolly short huskes, containing feede like unto those of naked Oates, the roote is made of divers long fibres.

2. *Gramen montanum avenaceum alterum.* Mountaine Oate Grasse, without hoary huskes. This other differeth not in any thing from the former, but in the spiked head, whose huskes are not hoary as the other are.

3. *Gramen Avenaceum variore gluma spicatum.* Oate Grasse of Denmarke.

This grasse hath slender weake cleare stalkes, a foote high, with long leaves on them, and at their toppe a weake bending spiked head, thinnely or sparsedly set with small huskes, containing Oatlike feede, the roote is stringie, and hairy, running under ground. The like hereunto, but with rush-like leaves, and woolly heads, *Bambusa alterum* calleth *Gramen avenaceum lanuginosum glumis rarioribus*.

4. *Gramen avenaceum Xerampelium Danicum.* Red Oate Grasse of Denmarke.

This is somewhat like the last, but with much lower stalkes, cleare and reddish, the huskes at the tops of them are more upright and longer, having the like Oatefeede in them. A lesser sort hereof was found about *Greene-
wich*, in a hungry soile.

1 3. *Gramen montanum Avenaceum, & Avenaceum variore gluma spicatum.* Mountaine Oate Grasse, and Oate Grasse of Denmarke.

4 5. *Gramen Avenaceum Xerampelium Danicum & Avenaceum locustis rubris.* Red Oate Grasse of Denmarke, and Oate Grasse with red huskes.

E f f f 2

5. Gra-

6. 7. *Gramen glumis varijs, & Bromoides five*
Avenaceum nutante coma spicata.
 Partly coloured Oate Grasse. And with few seedes.

10. 8. *Gramen Avenaceum villosa gluma, &*
Avenaceum sylvarum.
 Hairy wood Oaten Grasse, and the other
 Wood Oaten Grasse.

5. *Gramen avenaceum locustis rubris.* Oate Grasse with red huskes.
 The roote hereof is long and white, like unto Quiche Grasse creeping in the ground, having next the ground narrow short leaves, where the stalke is reddish, but longer up higher, the huskes that are set sparsedly at the tops, all on one side for the most part, are of a darke reddish purple colour, and white within, with small seedes in them.

6 *Gramen glumis varijs.* Particoloured Oate Grasse.
 The leaves hereof are Greene, long, and narrow, from among which rise two or three, smooth and brittle naked stalkes, a foote high, bearing a short spike of small huskes of divers colours, the roote is thicke, covered with a rough white barke.

7. *Gramen Bromoides five Avenaceum paucigranum nutante coma spicata.* Oate Grasse with few seedes.
 This is somewhat hairy all over, the leaves are of a sad Greene colour, set on stalkes two or three cubits high, and at the toppes a spiked bending head, having seven or eight small long huskes, with few seedes in them, this groweth neere woods sides in many places.

8. *Gramen Avenaceum sylvarum.* Wood Oaten Grasse.
 The weake stalkes hereof are halfe a yard high, with soft long narrow leaves on them, and at the tops of them a few short huskes, and open like unto some of the Oate Grasses before: the roote runneth creeping in the ground.

9. *Gramen Avenaceum exile.* Small Wood Oaten Grasse.
 This is slenderer and smaller in all the parts thereof, but standing a little more upright, the roote hereof is fibrous, and therein differeth most from the other.

10. *Gramen Avenaceum villosa gluma.* Hairy Wood Oaten Grasse.
 The stalkes hereof are two cubits high, with small narrow leaves, foure or five inches long, the spiked head hath somewhat long and hairy huskes, distinctly set one above another, this is often found lesse by the halfe, the rootes are threddy and yellowish.

The Place and Time.

These doe all grow in Woods, and by Wood sides, on hills and the like places, where they flourish all the Summer time.

The Names.

The first is remembred by *Clusius*, the fifth, and sixth by *Baubin*, the rest have not bene specified by any other before.

The Vertues.

None of these are used in Physicke to any purpose that I know.

CHAP. VII.

Gramen Miliaceum. Millet Grasse.

Here are divers Grasses, whose Featherlike toppes, doe in some sort resemble the bushy toppes of Millet, whereof I meane to entreate in this Chapter, and unto them adde one or two other, which are called *Sorghinum*, because they are more like unto *Turkie* or *Indian* Millet then the former.

1. *Gramen Miliaceum vulgare.* Common Millet Grasse.

The common Millet Grasse, riseth up with a joynted slender stalke, with two or three somewhat large leaves thereon, and at the toppes, a bushy spreading tuft of many long Featherlike sprigges, consisting of many small chaffie huskes, within which lye small feedes, which the small birds greedily devoure: the roote is bushy and fibrous.

2. *Gramen Miliaceum alterum.* Another Millet Grasse.

This other Millet Grasse, hath a small weake stalke, a cubit high, with a few narrow leaves, foure or five inches long growing at the bottome, and two or three thereon at the joynts, the featherlike tuft at the toppes is spread like the former, but the chaffie huskes are much smaller and finer: the roote is fibrous and reddish.

3. *Gramen Arundinaceum panicula miliacea.* A third sort of Millet Grasse.

This third sort hath sundry reede like leaves, growing from a white fibrous roote, yet shorter then the last, among which riseth up a stalke or two, about a cubit high, with two joynts thereon towards the toppes, and narrower and longer leaves standing at them, at the toppes whereof standeth such a featherlike toppes as the first, of about three inches long.

4. *Gramen Sorghinum.* Indian Millet Grasse, or Pipe Grasse.

The Indian Millet Grasse, which the *Flemmings* call Pipe Grasse, and *Lobel* thereupon *Gramen Sonorum Flammorum*, because the boyes there make them pipes of the hollow reedlike stalkes, growing halfe a yard high or better, with faire long Lilly-like leaves thereon, and a spread spiked toppes of many parts above, somewhat like unto the Indian Millet, and larger feedes therein then in Millet, the roote is fibrous.

5. *Gramen Sorghinum alterum.* Another Indian Millet Grasse.

This other sort hath hollow stalkes like the last, but they are weake, bending downe to the ground, and shooting out fibres therein, whereby it rooteth a fresh, having narrow long leaves on them, the stalke seeming, as if were to runne through them, like to a pipe, and at the toppes such a like spread spiked head as the former, whose huske in the severall parts are smaller.

The Place and Time.

They doe all grow in Fieldes, and by the hedge sides, as well in our Land, as in any others, although observed

1. *Gramen Miliaceum vulgare.*
Common Millet Grasse.

4. *Gramen Sorghinum.*
Indian or Turkie Millet Grasse.

but by few, that are curious in these minutes, and flourisheth at the same time with the rest.

The Names.

The first is called *Gramen Miliaceum*, by Lobel and others, and is the fourth kinde of Grasse by Dodonæus, the two next are mentioned by Bauhinus onely, in his *Pinax* and *Prodromus*: The fourth is called *Gramen Sorghi* effigie by Lobel, and *Gramen sonorum Flandrorum*, as is before said, and is the fifth Grasse by Dodonæus, and *Gramen Sorghinum* by Tabernmontanus and Gerard, who calleth it in English Darnell Grasse, but I follow the Latine or Dutch name. The last is of Bauhinus his relation likewise.

The Vertues.

All these Grasses are neglected, as not usefull in Physicke, and therefore left to the small Birdes to feede upon, as they doe upon many other sorts.

CHAP. VIII.

Gramen Panicum. Panicke Grasse.

Here be sundry sorts of Grasses that resemble the head of Panicke, some newly, and others longer, knowne, some large, some small, all which cannot be comprehended in one Chapter, I must therefore shew you some here, and the rest after them.

1. *Panicum sylvestre herbariorum. Wild Panicke of France.*

This Wild Panicke hath some neere resemblance unto Millet, in the spreading of the tufted head, being composed of sundry parts, each neere resembling a Panicke head, and yet called *Milium sylvestre* by some, the joynted stalke with leaves thereon are very like unto Panicke, yet much lesse in all, and therefore is by many likewise referred to Panicke, the roote is fibrous also like unto Panicke.

2. *Panicum sylvestre simplicis spica. Panicke corne Grasse with single eares.*

This single Panicke Grasse, hath weaker and smaller stalkes then the former, and scarce rising upright, with shorter leaves on them, the toppes of the stalkes are severally furnished with a spiked rough head, sticking to any garment it toucheth, and small at the toppe full of small whitish feede.

3. *Panicum sylvestre Dalechampij. Wilde Panicke Grasse of Dalechampius.*

This Panicke Grasse differeth from the last in that it groweth more upright, two foote high, the stalkes have sundry Grasse like leaves on them, but longer and broader, with one usually under the hairy spiked head, which *Alca duo*, sticke so fast, to their garments that it toucheth, that it is hardly plucked off. There are two other sorts hereof,

1. *Panicum sylvestre herbariorum. Wilde Panicke of France.*

4. 2. 3. *Panicum sylvestre aristu longis, spica simplicis. Sylvestre Dalechampij, & ejus varietas. Bearded, single eared, and wild Panicke Grasse.*

the one found in our owne Land, which is smaller, the other at *Santa Cruz* in *Africa*, which is larger, and with a longer spiked head, else little differing.

4. *Gramen Panicum aristis longis armatum.* Bearded Panicke Grasse.

The bearded Panicke Grasse, hath stalkes and leaves, not much unlike to the second sort of Panicke Grasse, but larger and taller, having divers browne heades at the tops, one above another, armed with long and sharpe bearded or aunes like unto corne: the roote consisteth of many long fibres.

5. *Gramen Panicum minus.* The lesser Panicke Grasse.

This is lesser then any of the other before, having low bending stalkes a spanne long, and sharpe long leaves thereon, with small long brownish chaffie spiked eares, like unto those of Cockes foote Grasse, set sparsedly at the toppes.

6. *Gramen Panicum sylvestre Anglicum, & Africum.* Wild Panick Grasse of England and of Barbary.

We have in divers woods with us, a wilde sort of Grasse, whose spike doth well resemble the Panickes before, and we have had one like it, brought out from Barbary, differing onely in the largenesse thereof, both in leafe and head from our English.

The place and Time.

These Grasses grow usually among rubbish, and in waste grounds, and sometimes also in good and manured fieldes, bearing their toppes in Sommer, as others doe.

The Names.

The first as I said, is taken by *Clusius* to be *Milium sylvestre*, by *Matthiolus Camerarius* and others called *Panicum sylvestre*, and thereupon *Label* addeth *herbariorum*, because it was so accounted by the most. *Cesalpinus* calleth it *Panicastrella species*. *Lugdunensis* taketh the third to be the *Herba alba Plinij*, and *Tragus* the second to be *Miliaria herba Plinij*, which *Cesalpinus* calleth *Panicastrella*, and *Label* *Panici effigie gramen simplicis speciei*. The fourth and fifth, are *Labels* second and third *Panici effigie gramen*. And the last hath not beene mentioned by any before.

The Vertues.

If the second or third, or any of their species be the *herba alba* of *Pliny*, then he saith it is hurtfull and dangerous for cattell, but especially for sheepe to feede thereon: there is nothing else recorded of them by any.

CHAP. IX.

Gramen Paniculatum pratense. The Meadow tufted Grasse.

OF the kindes of Grasse that are called *Paniculata*, (that is with small heades like Panicke, or round and long Catkines, called Panickles) there are divers sorts, some growing in the fields and Meddowes, others in the plowed and Corne grounds, a third sort is distinguished by growing on hills and in woods, and a fourth sort in the moist plaines of fields, and in the waters: In this Chapter I will first speake of

1. 3. *Gramen pratense paniculatum molle, & aureum coma nutante.* The soft Meadow tufted Grasse, and the golden tufted Grasse.

2. *Gramen Paniculatum Germanicum odoratum.* Sweete Dutch Grasse with a tufted head.

those

those that grow in the Fieldes and Medowes, and then of the rest in their order.

1. *Gramen pratense paniculatum molle*. The soft Meadow tufted Grasse.

This soft Meadow Grasse, hath sundry long and somewhat broad soft or woolly Grasse-like leaves, rising from a small tuft of short white fibres, and from among the leaves rise up a stalks, two or three, about a cubit high, with some few leaves upon it, and at the toppe breaketh forth a soft woolly spiked head, much divided, whose bloomings are reddish.

2. *Gramen paniculatum Germanicum odoratum*. Sweete Dutch Grasse with a tufted head.

The roore of this Grasse doth creepe in the ground, being white, and full of joynts, shooting our fibres at every

4. *Gramen pratense vulgatum majus*.
The greater ordinary Meadow Grasse.

4. *Gramen pratense minus*.
The lesser tufted Meadow Grasse.

4. *Gramen pratense minimum album*.
The least white Meadow Grasse.

4. *Gramen pratense minimum rubrum*.
The least red Meadow Grasse.

Joyn't, the stalkes are two cubits high, with but few joyn'ts on them, whose leaves are almost as long, and some of them exceede the height of the stalkes, being narrow and small at the ends, bearing on each a much more close and nothing so much spread a Panicle, as the former, and which for the sweetenesse of them, are tyed in small bundles, and laide among garments, or linnen to perfume them.

3. *Gramen paniculatum aureum nutante comz.*

Golden tufted Grasse.

This golden headed Grasse hath many long narrow leaves, like unto other small Grasses: the stalkes are a cubit high, with a long tufted toppe, made of sundry Pannickles or spikes bowing downe the head, and of a faire but pale yellowish colour: the rootes are many and blacke, spreading here and there under ground.

4. *Gramen pratense paniculatum majus.*

The greater tufted Meadow Grasse.

This common Meadow Grasse, hath many Grasse-like leaves and among them sundry stalkes halfe a yard high, bearing a sparled tuft at the toppe of them, somewhat resembling the feather-like head of the Water-reede. Hereof there is another lesser sort, and two other sorts smaller then they, the one with white tufted tops, and the other with reddish tufted heades.

5. *Gramen panicula multiplici.*

Meadow hard grasse with manifold tufts.

This riseth up with divers spannelong stalkes, joyn'ted, and a little bending downewards, the leaves are small like grasse, and the tufted head or Panicle is very much divided, and when it is ripe, groweth hard and of a sad reddish colour, the rootes are a thicke bush of white threds.

The Place and Time.

These grow all of them in Fieldes, and Medowes, and are in their perfection in the Sommer time, when others are.

The Names.

The first is called by Lobel, *Gramen paniculatum molle*, and by Lugdunensis, *Gramen lanosum Dalechampij*, the second is called by Bauhinus, *Gramen paniculatum odoratum*, and *Germanicum* is also added, usually by divers other Herbarists, and *Gramen Mariae*, by the Inhabitants where it is natural. The third is called by Lugdunensis, *Gramen aureum Dalechampij*, & by Bauhinus, *Gramen panicula pendula aurea*: The fourth is called both by Lobel and others, *Gramen pratense majus vulgarij*, whereof as I said, some are in degree lesser and lesser then others: the least red sort, being the *Gramen minimum* of Lugdunensis, which Bauhinus maketh the last of the *Gramina tremula*, calling it *Gramen minimum panicula elegantissima*. The last Bauhinus calleth *Gramen panicula multiplici*, and saith that they of Mompelier called it *Gramen minus durissimum*, and that there is a greater and a lesser.

The Vertues.

The Meadow Grasse is of most use in Physicke, next to the Quiche-grasse, yet the seedes of these, and not the rootes, as the rootes of the other, and not the seedes, serve to open the obstructions of the bowels, and to expell the stone, if the decoction thereof be drunke: being used outwardly they helpe to discusse windy swellings, and hard tumours, that will hardly be repressed or dissolved, the Greene herbe it selfe, is never used Physically that I can learne, but the dried herbe, when it is made Hay, is boyled in water a good while, and then bound to the Jewes of Horses, or Cattle that are chappesalne by too long abstinence from meate, and doth presently helpe them.

*Gramen
minimum
alia.*

CHAP. X.

Gramen Paniculatum aruorum. Corne Grasses with Panickles.

The next sort of these Panicle Grasses to be entreated of are those that grow in the Corne fieldes, or those that have beene plowed, and doe lye Ley.

1. *Gramen arvense panicula crispia.* Curled Panicke Grasse.

This Grasse hath descending from a threddy root, reddish scaly heads, and thence rise narrow Grasse leaves, and low stalkes, bearing a head of many tufts, set one above and against another, consisting of soft and curld reddish threds, issuing from a smal huske. I have thought good to adde the figure of that Grasse that Lugdunensis calleth *Bulbosum Dalechampij*, because Bauhinus saith it is this, but not well expressed, but surely I doubt it is another sort.

2. *Gramen segetum panicula speciosa.* The great Corne Grasse.

This goodly Grasse groweth up with a few long soft Greene leaves, like to those of Millet, some below, and others upon the tall stiffe, round, smooth, Greene stalk, a yard and a halfe high, bearing a brave tufted toppe, spread out into many slender sprigges, very like to the tufted head of the Millet grasse, but more beautifull: the rootes a small tuft of fibres.

3. *Gramen*

1. *Gramen bulbosum, Dactylis arvensis.*
Corney or bulbous Panicle Grass.

1. *Gramen arvense panicula crispata.*
Curled Panicle Grass.

2. *Gramen segetum panicula perispa.*
The fare green Corn Grass.

3. *Gramen agrorum venti spica.*
The Corn Reed Grass, or Bent Grass.

3. *Gramen agrorum veni spica*. The Corne Reede-grasse, or Bent grasse.

This Feather-like Grasse shooteth forth, joynted tall stalkes, and faire leave; almost like the last, the toppē of the stalke is furnished with a long and large tufted head, spread like unto sprigges of feathers, are somewhat like common reedes, standing for the most part all one way, and hanging downe their heades, and are of a fine browne Greene shining colour, which are (being fine and slender) easily shaken with the winde.

The Place and Time.

These grow in the borders of Corne fields, and grounds that have beene plowed, and flourish chiefly in the beginning of Summer.

The Names.

The first of these is the *Gramen* of Matthioli, the *Gramen minimum* Xerampelium of Lobel, called *Gramen arvense panicula crispa* by Bauhinus, and by him taken to be the *Gramen bulbosum* Dalechampi of Lugdunensis, but as said before, I make a quere thereof. The second is the *Gramen segetum panicula speciosa latiore* of Lobel, Bauhinus alleth it *altissimum panicula sparsa*. The third is called by Lobel, *Agrorum veni spica Flandrorū*, because the Flemings call it so, and *Gramen agrorum latiore arundinacea comosa panicula*, as also *Triclinarium gramen*, because the stalkes being tyed in a row together, one by another serveth in the Summer to be set in chamber chimneys, standing upright, when no fire is made therein, to coole, decke up, and refresh the roome, it is usually called in English, Bent-grasse, and of some Windle-strawes, it is the *Gramen Arundinaceum arvense* of Tabernmontanus: and the third *Gramen pratense* of Dodonæus, but cannot be the *Gramen equinum* Gesneri, as Bauhinus thought, for Camerarius saith it was white and woolly, which this is not.

The Vertues.

The first is said to have the like properties unto the Quick grasse but of the rest there is no certainty of any good use they have in Physicke.

CHAP. XI.

Gramen paniculatum montanum. Mountaine tufted Grasses.

The *Gramen sulcatum* or *pictum* should be here numbered with the other Mountaine kindes, but that I have shewed it you in my former Booke.

1. *Gramen montanum panicula spadicea delicatior*. The soft mountaine Panicke Grasse.

From a small white roote with short fibres, spring up three or foure joynted stalkes a foote high, having a few small and short leaves on them, and such likewise at the the foote of the stalkes, but few in number, at the toppe whereof standeth a brownish panickle of three inches height, composed of many very small huskes. This is sometimes found growing higher, and with larger Panickles.

Alterum.

2. *Gramen sylvaticum paniculatum altissimum*. Tall tufted Wood Panicke Grasse.

The roote of this Grasse creepeth in the ground, set with divers fibres from whence rise two or three very tall Reede-like stalkes, two or three cubits high, bearing faire broad Greene leaves on them, like unto *Cyperum*, and at the toppes many small tufted Panickles: both stalkes and leaves are so tough, that the Country Shepheards make them cloakes therewith against the weather, and the Husbandmen make twine ropes, and traces for their Horses to draw their ploughes.

The Place and Time.

The first groweth on the hills by Bassil, the other in the Woods by Mombelgard.

The Names.

Bauhinus onely hath set out these by the same Names are in their titles.

The Vertues.

There is as little use of these, as of the former.

CHAP. XII.

Gramen cristatum & spicatum. Crested and spiked Grasse.

Here are other sorts of Grasses that beare Panickles or tufted heads, but they usually grow in or neere waters, which shall be declared in that Classis is appropriated to such of that nature and quality. Those that beare crested or spiked beads, are of divers kindes, &c.

1. *Gramen cristatum lene*. Smooth crested Grasse.

The white rootes of this Grasse do matt themselves in the ground very much, from whence spring up divers smooth slender stalkes, two foote high, with few or no joynts on them, and with small short Greene leaves at them: the toppes of the stalkes have slender long spiked heads set on them, divided into many parts, each whereof is like unto the crest of a Bird, whereof it tooke the name, being of a pale yellowish Greene colour, and sometime reddish, or as Bauhinus compareth it to the head of *Crista galli*, Cockes combe.

2. *Gramen cristatum subbirsutum*. Hairy crested Grasse.

This other crested Grasse, differeth from the former, onely in these particulars, the rootes are of a reddish yellow colour, lower and smaller stalkes, a little hairy or Woolly at the bottomes, with longer leaves, and a more sparred white head, not so finely set together, and groweth rather among the hedges and bushes.

3. *Gramen cristatum Anglicum*. English crested Grasse.

This kinde hath fewer and longer rootes, not matting and encreasing in that manner, the stalkes are straight, with longer and narrower leaves on them, the spiked head differeth from it, in being longer and closer set, and not spread into tufts, but as it were into close short huskes, the whole spike somewhat resembling a small long Fox-taile Grasse, this groweth plentifully in many by places neere Hackney a little off from London.

4. *Gramen*

1, 2, 3, 4. *Gramen cristatum* lene, *cristatum* subvirgatum, *cristatum* Anglicum, & *spica* multiplici.
Smooth, Hairy, English and double crested Grasses.

5, 6, 7. *Gramen pratense* *spica* purpurea, *spica* flavescente, & *spica* multiplici.
Purple, yellow and rough spiked Grasses;

8. *Gramen spicatum* folijs Caryophyllis.
Spiked Meadow Grass with Gilloflower leaves.

9. *Gramen folijs Caryophyllis* *spica* squamata.
Gilloflower leaved Grass with a scaly spike.

4. *Gramen cristatum* *spica* multiplici. Double English crested Grass.

A variety hereof hath been found, bearing divers smaller parted spikes from the greater, and not differing in any thing, or very little else.

5. *Gramen pratense* *Dalechampij* *spica* purpurea. Purple red spiked Meadow grasse of *Dalechampius*.
This Meadow Grasse hath a bush of white threds for the roote, with many Grasse-like leaves rising from it, which are both narrower, softer, and greener, having divers short stalks not a foute high, with two or three joynts on them, set with leaves, and at the toppes out of a round skinned huske, picked at the end, being the uppermost leafe, breaketh forth a thicke, short, and somewhat flat spike, of a brave reddish purple colour.

6. *Gramen pratense* *spica* flavescente. Yellow spiked Meadow grasse.
This other yellow spiked Grasse differeth so little from the last, either in rootes, leaves, taste, or quality, that divers have called the one the Male, and the other the Female, the head or spike onely of this is of a pale yellow colour, and in some places on hills, of a more reddish and shining colour, not enclosed in any skinned leafe, as the other, but standing bare or naked, being also slenderer and longer.

7. *Gramen pratense spica multiplici rubra.* Rough spiked Grasse.

This spiked Grasse hath a small roote made of a few fine threds like haïres, from whence rise long and narrow leaves, ribbed all the length of them, and so composed as is hardly seene in any other herbe, for some of them are so joynted, as if one leafe grew out of another, on the top of the stalke standeth a very long head, consisting of many more reddish spikes, set together one above another, then in any other Grasse, and somewhat rough in handling.

8. *Gramen spicatum folijs Caryophyllis.* Spiked Meadow Grasse with Gilloflower leaves.

The leaves of this Grasse are somewhat hard, thicke, and short, and greener then those of Gilloflowers, or Pinkes, the stalkes are halfe a foote high, at the toppes whereof stand small spikes, sometimes more and sometimes fewer, brownish at the first, and afterwards somewhat reddish, with many yellow threds mixt among them: the rootes runne under the upper crust of the ground, foulding one within and over another: there is neither of the greater or lesser cattle that will willingly feede hereon, as being so hard and sappelesse, that it seemeth unfit to encrease any milke or nourishment in them. This cannot be the *Gramen Rabium* of Gesner, as some take it to be, although in face it be somewhat like it, for the contrary qualities of feeding cattle, sheweth a repugnancy.

9. *Gramen Caryophyllis folijs spica squamata.* Gilloflower leaved Grasse, with a scaly spike.

This small grasse hath small long leaves, narrow and bowing: the stalkes are small and low, not much above a spanne high, bearing at the toppes a short scaly head: the rootes are small blackish threds.

The Place and Time.

All these according to their titles grow in Fields and Pastures, or neere unto them, and flourish at the time when others doe.

The Names.

The first is the *Gramen cristatum Bauhini* of Lobel, and by Bauhinus himselfe, *Gramen pratense cristatum, seu gramin spica cristata brevis*: The second is a variety of the former, mentioned by Bauhinus likewise: The third is set downe, as it groweth with us, and howsoever thought by some to agree with the former, yet by comparing them, they are soone found to differ as is also shewed, the fourth is mentioned as a variety of the last: the fifth hath his name in his title, to be knowne whose it is: The sixth is called by Lugdunensis, *Gramen Anthoxanthum*: The seventh is the *Gramen spicatum Dalechampij* by Lugdunensis: The eight is so called by Lobel, as it is in the title, by Lugdunensis *Gramen nigrum*, by Tabernmontanus *Gramen Caryophylleum*, The last is the least, and the last remembred by Thalus in his *Hercynia sylva*, of his *gramina Loliacea*.

The Vertues.

These Grasses, especially the purple spiked Meadow kinde, is thought to come neere the properties of the other field Grasses, but because we have no certainty hereof, we leave it and them untill we can learne to what diseases they may be most conduicible.

CHAP. XIII.

Gramen spicatum montanum & nemorosum. Mountaine and Wood spiked Grasse.

He other sorts of spiked Grasses, as I said, were of those that grow on hills, and in Woods, which shall be here expressed.

1. *Gramen montanum spicatum Clusij.* Clusius his mountained spiked Grasse.

From a long roote, of a fingers thicke, parted sometimes into two or three stringes with many fibres thereat, and somewhat hairy at the toppes, shoote forth sundry heads of leaves each containing five or sixe somewhat long, thicke and halfe hollow like a gutter, very like unto those of the greater Thrift compassing one another at the bottome, a little bitter and sharpe in taste, from the middle of whom spring up stiffe smooth, bare, and knotlesse stalkes, about a foote high, bearing at the toppes sundry small flowers set spike fashion, and of a greenish colour.

2. *Gramen spicatum angustifolium montanum.* Mountaine spiked Grasse with narrow leaves.

This Grasse differeth onely from the eight Grasse described in the last Chapter, in that it hath longer and much narrower leaves, slenderer stalkes and longer, and in the place of the growing, for it groweth onely upon hills and mountaines, flowering and flourishing earlier then most of the other, namely in the middle or end of May.

3. *Gramen sylvaticum angustifolium spica alba.* White spiked Wood-grasse.

The roote hereof is yellowish growing aslope in the ground, with small fibres at it: the leaves which rise from thence, are many but very short and narrow, scarce foure or five inches long, the stalkes oftentimes exceede not the length of the leaves, wherein stand small white spiked heads, scarce an inch long, beset with short haïres.

4. *Gramen Caryophylleum spica multiplici.* Double spiked grasse with Gilloflower leaves.

From a roote composed of a bush of many reddish hairy fibres arise sundry short narrow leaves, like unto those of Gilloflowers, among which spring very many slender stalkes, naked without joynts or leaves, scarce growing above the leaves, sustaining very short reddish spikes many set together.

5. *Gramen Caryophylleum spica varia.* Variable spiked grasse.

The blacke rootes hereof are small long and thredde, bushing thicke together, from whence spring long and narrow leaves, like those of Gilloflowers among which grow sundry small naked stalkes, bearing a slender long spiked head, sometimes single, and sometimes divided or branched into severall long parts, made of many huskes.

6. *Gramen Caryophylleum Rabium.* The principall Gilloflower grasse.

This grasse hath many thicke firme or fleshy long and pointed leaves, lying in a round compasse, at the head of the roote, like to those of Gilloflowers, not having any nerves or vaines to be seene in them: none hath as yet described the toppes or head, what forme it beareth, but it may be Bauhinus hath seene it, in that he placeth it with these sorts of spiked Grasses.

1. *Gramen Montanum spicatum clusj.*
Cluspius his mountaine spiked Grasse.

4. *Gramen Carophileum montanum spica varia.*
Variable spiked Grasse.

7. *Gramen spica gemina Columna.*
Columna his double spiked Grasse.

7. *Gramen spica gemina Columna.*
Columna his double spiked Grasse.

From a small whitish fibrous roote, rise up diverse weake and leaning joynted stalkes, with small Grasse-like leaves thereat, and at the toppes of each, two severall spikes, joynted together at the foote of them, dented on the edges with a middle ribbe, betweene the foure angles, and consistit of three or foure rowes of leaves, like scales, in each whereof is contained a smal brownish corned head.

8. *Gramen spica nutante longissima.*

A long spiked Grasse with a bending top, or Capons taile grasse.

From among many long and narrow grasse-leaves, which by time & age, grow somewhat rounder, ariseth a slender stalke, about two foote high, with two or three small leaves at joynts up to the rop, where standeth a very long spike, bending a little downewards, composed of small and hairy tufts, which grow grayish being ripe, with small whitish seede within them, the roote is fibrous and stringy.

9. *Gramen spica aticulata Virginiana*. A goodly *Virginia* grasse with a joynted spike.

This goodly *Virginia* grasse groweth great, with many faire large and broad Grasselike leaves, very small pointed and somewhat hard in handling, the stalks is somewhat great and tall, bearing a long spike as the roppe, joynted into sundry parts, each of them almost halfe an inch apeece, being almost round, yet a little flat: the roote is bushy and liveth long.

The Place and Time.

These Grasses grow on hills, and in woods, some of them in *Germany*, *Italy* and *Virginia*, and some of them also in our owne land, as time and diligence hath brought them to light their flourishing being with the rest.

The Names.

The first of these is so called by *Clusius* as it is in the title, who saith he found it or the like, on the Sea coasts of *Flanders*, *Gerard* hath it by the name of *Gramen maritimum alterum*. The second, third, fourth and fifth, are mentioned onely by *Rauvins*, by the same titles they beare here, saving that whereas he intituleth some of them by the name of *Caryophyllatum*, I give it *Caryophyllum*, and as I thinke lesse ambiguous, for *Caryophyllata herba* differeth much from *Caryophyllus*, to the leaves whereof, and not unto *Caryophyllata*, these Grasses have resemblance: The sixth is called by *Gesner* in *hortis*, *Gramen Alpinum Rabium*, quass *prasantium*, & *precipuum*, and by *Lobel* *Rabinum vel Ravium*. The seventh is called by *Columna* *Gramen dactyloides*, and by *Rauvins*, *Gramen spica gemina*, *Alispede similis*. The eighth is the Capons taile grasse of *Master Goodiers* invention: The last came from *Virginia*, and *Master John Tradescant* the younger brought it from thence also, with a number of other seedes and rare plants.

The Vertues.

We have no evidence what properties these Grasses have in Physicke, but are onely left as food for Cattle, but the fifth is extolled by the naturalls of those places where it groweth, to be most singular to cause Cattle to give a abundance of milke.

CHAP. XIV.

Phalaris. Canary Grasse.

Of this Grasse there are three speciall varieties to be declared in this Chapter, but there are divers other bastard sorts which shall be shewed in the next.

1. *Phalaris vulgaris*. Common Canary grasse.

The common Canary grasse is but an annual plant, to be new sowne every yeare with us, by them that will see it grow, bearing joynted stalkes halfe a yard high, with grasse leaves on them like *Barley*, and at the toppe a round chaffie head somewhat pointed above, whose bloomings are yellowish, wherein lie flat round shining seede, bigger then *Millet*, and lesse then *Linscede*, of a yellowish colour: and somewhat like to the seed of *Sesamum*: the roote is fibrous, dying every Winter with us.

1. *Phalaris vulgaris*.
Common Canary Grasse.

2. *Phalaris semine nigro*.

Canary grasse with a blackish seede.

This other *Phalaris* differeth not from the former, but in being somewhat lesser both in stalk, leafe, and head, and chiefly in the seede, which is of a pale blackish and shining colour: the roote hereof perisheth like the former.

3. *Phalaris bulbosa semine albo*.

White bulbed Canary grasse.

This Grasse also groweth very like the former, but with smaller, tenderer, and taller joynted stalkes and leaves on them and at the roote more soft and gentle, the spiked heads are smaller and a little longer, and not fully so close growing together, softer also in handling, and bringing smaller, but whiter seede in them then the former: the rootes are many small white bulbes, growing in tufts together with long fibres, descending from them, whereby they are fastened strongly in the ground and dye not every yeare as the others doe, but encrease into great tufts.

The Place and Time.

All these sorts have bene found growing in *Spain*, and brought us by *Boel*, with some bastard sorts, and many other things: The first hath bene of many yeares knowledge, and brought us from the Canary Ilands with those small sweete singing birds, which wee call *Canary Birds*, whose foode these seedes are. *Lobel* saith it groweth also in *Provence* of *France*. *Rauvins* saith that the second came out of *Malta*, where those birds feede on it. They all are ripe with us in *August*.

The Names.

It is called in Greeke *καλαρίς*, in Latine also *Phalaris*, and so by all Writers, yet *Dalechampius* on *Pliny* taketh it to bee the *Milium alterum* of *Theophrastus*, and is oftentimes used in

head of *Milium*, being of so neere agreement in quality, that there is not a neerer *succedaneum*, and is called in the Canary Islands, *Alpisti* by the people there, and *Cuneno* in *Malta* as *Lugdunensis* saith, who referreth that name to both the former sorts, although *Bauhinus* referreth it only to the second. The last is not mentioned by any before.

The Vertues.

Canary seede is in some places and Islands made into bread, but it hath as little nourishment therein as Miller, or rather lesse, and therefore to mend it some put to it wheate, that the bread may be the faster, which else would be too brittle and dry. The iuyce of the herbe being drunke is very profitably used to ease the tormenting paines of the Stone, the stoppings of wine, and the discales of the bladder, and the scumme also is of the like property as *Galen* saith: it is as I said, the neerest substitute for Miller in any cataplasme or fomentation, that is used to drye and repress the fluxibility of humours.

CHAP. XV.

Gramen Phalaroides. Bastard Canary Grasse.

F this bastard kinde we have divers sorts to offer to your view and consideration, as they shall bee severally described: some of them are most like unto the true *Phalaris*, bearing but one spike or head on a stalke, which shall be declared in this Chapter: and there are some other kinds that beare many small heads in a tuft, called *Phalaris pratensis*: and we in English Quakers, and Quaking-grasse, which shall be shewed in the next, because of their differing forme and use.

1. *Gramen Phalaroides majus.* The greater bastard Canary grasse.

This greater sort is very like the true *Phalaris*, both in stalke leafe and head, but that first, this is found growing wilde by the way sides, in the Medowes of our owne Country: and then the stalkes are single, with fewer leaves on them, and lastly the head or eare is smaller, hoary, softer, and the roote likewise is smaller and fibrous perishing yeately.

Graminis Phalaroides quatuor species.
The foure sorts of bastard Canary Grasse.

2. *Gramen Phalaroides minus.*

The lesser bastard Canary grasse.

This is in all things like the former, but that the eare or head is smaller and longer, and the leaves doe so compasse the stalke at the bottome, that it seemeth to runne through it, as through a truncke.

3. *Gramen Phalaroides spica molli Germanicum.*

Bastard Canary grasse of Germany.

The stalke of this is of a cubits height, somewhat bigger then the last, with a joynt or two thereon, and short leaves at them, compassing it at the lower end: the head is shorter and smaller then the last, of a shining ashe colour, and soft in handling.

4. *Gramen Phalaroides spica hirsutiore.*

More hairy bastard Canary grasse.

This is somewhat like the last, but hath more store of leaves and stalkes, rising from the roote which is living: and the spiked head is longer, narrower, and set with short haire.

The Place and Time.

The first as I said, groweth in our fields, as well as in other Countries. The second in *Spain*. The third in *Germany* about *Ulmes*. And the last by the pathes going through many fields in this country, and flourish in *Italy*.

The Names.

Lobel calleth the first sort here, *Gramen Phalaroides secundum*, but in *Gerard*, *Gramen Alopecuroides majus*: *Bauhinus* calleth it *Gramen Phalaroides majus sive Italicum*, the other two are called by *Bauhinus* according to their titles, and saith *wichall*, that the learned about *Ulmes* where it is frequent, doe call it *Onocordon*, from the colour of it. The last is not mentioned by any before that I know.

The Vertues.

These being very like unto the true *Phalaris*, may come as neere in vertue to the former, as they doe in face but yet wee have no certainty thereof.

CHAP. XVI.

Phalaris pratensis sive Gramen tremulum. Quakers, or Maidenhaire grasse.

Because, as I said these kinds of Grasses doe differ in their forme from the other, it was fittest to separate them, and joine the most likely in a Chapter together.

1. *Phalaris pratensis major, sive Gramen tremulum maximum.*

The greatest Quaking grasse, or Lovely grasse.

This greater kinde hath many narrow Grasslike leaves, both below and upon the joynted stalkes, which

which are a foote high and better, on the toppes of the stalkes stand a number of small flat and long, somewhat scaly heads, greater then the next, and each of these are on a fine hairy footestalk and pendulous, which are sometimes of a whitish colour when they are ripe, and sometimes of a brownish green colour, being shaken with any the least winde that may be.

2. *Gramen tremulum medium.*

Maidenhair grasse, or the lesser quaking grasse.

This lesser sort groweth somewhat like the former, with fewer leaves and stalkes, and a large panicle or tufted head, of greener, shorter, and rounder scaly pointed eares, standing on smaller or finer footestalkes then the former, which are in so continuall motion, that the most stiddy hand cannot hold them from stirring. Of this kinde Boel brought us another out of *Spaine*, somewhat greater then it, and of an oblong or fullen footy colour, in nothing else differing.

We have also two other sorts hereof, growing in *Vpland* Come fieldes, as at *Hatfield*, &c. on the grasse balkes there, little differing in leaves or stalkes from the last, the heads onely are a little lesser, and so is the whole panicle also, the one whereof is partly coloured, of purplish and greene: the other of straw colour and white.

3. *Gramen tremulum minus panicula parva.*

Small Quaking grasse.

The rootes hereof are reddish, creeping here and there, from whence rise two or three short stalkes, with few joynts, and smooth narrow greene leaves at them, as the many that grow below are, but out of the uppermost joynt, and the leafe as it were out of a hose, breaketh forth a small long single spike of small scaly heads of a brownish colour, with yellowish bloomings at their season, which is the Spring.

Of this kinde there is another found in *Gascoigne*, whose panicle is more branched, somewhat like the second kind, but standing closer together.

4. *Gramen Phalaroides minus supinum Danicum Lobelij.*

Low Quakers of Denmark.

This Grasse groweth low, lying or creeping upon the ground with many small short leaves, and greater stalkes then is proportionable for the smallnesse of the plants, not above two or three inches long, having at the toppes of them a small slender spiked eare, separated into a few small chaffie pointed heads, of a whitish colour being ripe, the rooe is of a brownish colour and hairy.

3. 5. *Gramen tremulum maximum Hispanicum & minus.* The small Quaking grasse and the greatest - 6 *Spaine* called Pearle Grasse.

4. *Gramen Phalaroides Danicum & alterum minus.* Low Quakers of Denmark and the other small one.

1, 2. *Phalaris pratensis* five *Gramen tremulum maximum medium & ejus varietates.*
The greatest Quaking grasse, or Maidenhair grasse with the varieties.

Hispanicum alterum admodum Anglicum duo altera.

14
Alcerum

G s s s s s 3

There

Minimum. There is another small one with small short leaves and stalkes, full of small scaly heads, upon very short footestalkes.

5. *Gramentremalum maximum album Hispanicum.* The greatest white Spanish Quakers, or Pearle grasse.

This greater white Spanish kinde is a small grasse, with slender stalks, and a few soft greene leaves on them, at the toppes whereof stand the greatest and flattish soft scaly heades, of any of the other before, and of a silver shining white colour, very beautifull to behold, each much like unto the head of an hoppe standing on a small thred-like footestalk as the others doe, but are almost as moving and stirring as the other: the roote is small and fibrous perishing every yeare with us, and seldome rising againe by it owne sowing, but of the sowing thereof in the Spring, yet sowing it selfe in Spaine, and abiding there all the Winter, in regard they have no frosts.

The Place and Time.

All these kinds of Grasses doe grow in the Corne fields, some in Ley grounds, and others in dry Medowes, and Pastures. The first and second with the severall sorts of it in our owne Country as well as in Spaine, Italy, or elsewhere, the other sorts are all of them specified in their titles or descriptions where they are naturall. They flourish somewhat earlier then divers other Grasses.

The Names.

The first is called by Lobel *Gramen paniculosum phalaroides*, by Clusius *Gramen amourettes quasi amatorium* or *amabile* Lovely grasse, by Dodonæus *Gramen pratense sextum*, by Lugdunensis *Gramen filicem sive polyanthos secundum*, by Tabernmontanus *Gramen paniculatum sativum*, and so Gerard from him, by Bauhinus *Gramen panicula elegantissimis sive egyptiacis majus*, and I have called it *Phalaris pratensis major*, sive *Gramen tremulum majus*, because it beareth the greatest number of heads of any the rest: The second is called *Phalaris pratensis minor* by Lobel, *Amourettes tremulantes* by Clusius, *Agilops* by Tragus, and Gesner in hortis, and *Gramen polyanthos* by Lugdunensis: The third is called by Bauhinus according to the title, making it the same or very neere unto Thalium his small sort of Grasse, and the other kinde thereof *Gramentremulum minus panicula magna*, and *Aquitanicum* by Lobel in his *Illustrations*, that he intended to publish: The fourth is called as it is in the title: the last is called by Bauhinus *Gramen tremulum maximum*, and questioneth if it be not *Phalaris altera* of Cæsarpinus, Clusius in his *cure posteriores* maketh mention hereof, by the name of *Gramen amourettes majore panicula candicante*, which he saith Boel shewed him as he brought it out of Spaine, but he gave it me first, by the name of *Gramen elegans supuliglamis*, and is now adayes among our Gentlewomen much esteemed, and called Pearle grasse, the sorts of the second kinde are by them called Maidenhaire grasse, or rather Meade haire grasse: The Dutch call them *Leiflicke*, and we ordinarily Quakers, or Shakers, or Quaking grasse, &c.

The Vertues.

The chiefest use that these grasses are put unto, is for Gentlewomen to weare on their heads or armes, as they would doe any fine flower or pretty toy to behold, as also put into wreathes and Garlands, that the Country people make for their sports and pastimes, And hath no use in Physicke for any Medicine that I can heare of.

CHAP. XVII.

1, 2, 3. *Alopecurus genuina. Maxima & altera Anglica.*

The three sorts of Foxe-taile Grasses.

Alopecurus. Foxtaile grasse.

AS I handled the *Phalaris*, so will I the *Alopecurus*, that is speake of the genuine kind in this Chapter, and joyne unto it such as are likest thereunto, and speake of the bastard kinds in the Chapter following.

1. *Alopecurus genuina.*

The true Foxe-taile grasse.

The true Foxe-taile grasse groweth up with two or three soft hoary stalks about a foote high, with small long and narrow soft leaves on them, as hoary as the stalks, whereon stand soft woolly, or hoary heads, somewhat long and round, befer round with soft haire, of a pale straw colour, resembling the taile of a Foxe, whereof it tooke the name: the roote is small, and made of a few fibres which perisheth yearly.

2. *Alopecurus altera Anglica, & Flandrica.*

Another Foxe-taile grasse like unto the former.

This other Foxe-taile grasse hath leaves and rootes not much unlike to the former but longer, and the stalkes grow higher, the heads also are rounder, and shorter, and nothing so woolly or hoary.

3. *Alopecurus maxima Anglica.*

The greatest English Foxetalle grasse.

This greatest Foxe-taile grasse groweth to be halfe a yard or two foote high, sometimes having faire large leaves like unto Wheate but larger, set at the joynts, and at the toppes, large great, full soft and woolly heads like the former, but much greater and longer, either higher or lower.

The Place and Time.

The first of these is not found naturall in England, as the others are, but groweth in divers places about Mompelier in France, we onely have it in our gardens for curiosity.

The

The Names.

It is called in Greeke *Αλοπεκουρος*, Alopecuros, and so in Latine which is *Cauda vulpæ*, and so they call it at Montpellier as Lobel saith; *Pliny* seemeth to call it *αλεξοειδος* *Stelephuros*, *Lugdunensis* calleth it *gramen seminosum Alopecuros vera Plinij & Theophrasti*. The second Lobel calleth as it is in the title, because he found it in England as well as Flanders, and is that which *Dodonæus* calleth Alopecuros. The last Lobel found in the West parts of this Land, betweene *Portsmouth*, and the Isle of *Wight*, and called it *Alopecuros maxima Anglo Britannica*, and hath not bene knowne to any before.

The Vertues.

There is no speciall property found to be in any of these for Medicine, but to be worn onely as a toy, in mens or womens hats.

CHAP. XVIII.

Gramen Alopecuroides. Bastard Foxe-taile grasse.

Here are divers sorts of these wilde or bastard Foxe-taile grasses, some greater, other lesser, all which I meane to comprehend in one Chapter, seeing they are of no great moment, and but to content the curious, yet I must show you the greater first, and the lesser after them.

1. *Gramen Alopecuroides majus*. The greater bastard Foxe-taile grasse.

The greater of these wild Grasses riseth up with a stalke two cubits high, with few leaves long and narrow on them, the spike is somewhat great and long, resembling the former, but not so soft or Woolly. Hereof there is a lesser sort, differing chiefly in the smallnesse, being somewhat smaller but longer.

2. *Gramen Alopecuroides Africanum*. Bastard Foxe-taile grasse of Africa.

This African hath at some part of the stalke small long leaves, set by themselves at the joynts, and at others diverse together, the head or spike is somewhat great and very long, woolly and soft, as the other, the roote is great and long.

3. *Gramen Alopecuroides cuspidatum maximum Anglicum*. Our bastard Foxe-taile grasse of the greatest size.

This hath many long narrow leaves, rising from a bushy roote, and among them stalkes two cubits high, with few joynts and leaves on them, at the top whereof standeth the longest spiked head of any other, somewhat pointed at the top, and broad at the bottome, set about with white haire on the huskes, which are somewhat like to those of Oates.

4. *Gramen Alopecuroides cuspidatum majus*. Great spiring bastard Foxe-taile grasse.

This is somewhat like unto the first sort here in this Chapter expressed, but that the spiked head is longer and

1. *Gramen Alopecuroides majus*.
The greater bastard Foxe-taile Grasse.

1. *Gramen Alopecuroides minus*.
The lesser bastard Foxe-taile Grasse.

spiring

2, 3. *Gramen Alopecuroides Africanum et cuspidatum*
maximum Anglicum. Bastard Foxe-taille Grass
of Africa. And Ours of the largest size.

5. *Gramen Alopecuroides alterum radice repente*
sive *Pseudophenanthium Monspeliense*.
A Bastard Foxe-taille Grass called
Squinant at Montpellier.

6. *Gramen Alopecuroides spica aspera brevis*
Short rough eared bastard Foxe-taille Grass.

7. *Gramen Alopecuroides spica longa majus*.
The greater long eared bastard Foxe-taille Grass.

spring upward that is small at the toppe and somewhat broad below, with Oaten-like huskes set on them, and that the leaves are more, and much shorter.

5. *Gramen Alopecuroides alterum radice repente*
five *Pseudoschizanthum Monspeliisum*.

A bastard Foxe-taille grasle, called bastard Sqinant
at *Monpellier*.

I doe acknowledge, that this Grasle might not unfitly have bene placed among the Sea plants and Rushes, but in regard the head doth so neere resemble the bastard Foxe-taille-grasles, let me by your patience insert it here, whose description is thus. It somewhat resembleth the greatest English Foxe-taille-grasle, described in the Chapter before, differing in that this hath thicker, harder, and stiffer leaves, like unto Rushes, the head or spike is long and close, even five or six inches long, of a silver-like shining colour, but the bloomings are of a paled, and the huskes redder, which when it hath stood long, beginneth to open it selfe, and sheweth some downie matter for the winde: the roote creepeth along under ground, shooting forth leaves and stalkes in divers places.

6. *Gramen Alopecuroides spica aspera brevis*,
Short rough eared bastard Foxetaile-grasle.

This small rough eared grasle riseth up, with two or three upright but small stalkes with somewhat narrow and soft leaves on them, at the toppe whereof standeth a thicke and short rough head, about an inch and a halfe long not fully but as it were halfe round, the stalkes on the backside being as it were bare, so that it seemeth to stand but on one side: wherein is small white seed contained; the roote is small and white perishing yearly.

7. *Gramen Alopecuroides spica longa majus & minus*.

Great and small long eared bastard Foxetaile-grasle.

These Grasles, are one not much unlike another, the one being greater, and the other smaller, both in stalk and leafe, the spiked heads are long and slender, and of a whitish colour.

8. *Gramen Alopecuroides minus spica aspera longa*.

Small rough long eared bastard Foxetaile-grasle.

This differeth from the last in being greener, more stored with stalkes and leaves, and the spiked head more slender long, and rougher also.

9. *Gramen Alopecuroides minus cuspidatum*. Small sharpe pointed bastard Foxetaile-grasle.

The stalk hereof is about a foote high, stord but with few joynts, and short narrow leaves on them, the spike or eare is almost as big as the last but sharper pointed, and with some peeces growing out of the sides.

10. *Gramen Alopecuroides cuspidatum minimum*. The least pointed bastard Foxetaile-grasle.

This is lesser then any of them before, in stalkes and leaves but longer in both, as the spike or eare is also being very small and slender and pointed at the end.

The Place and Time.

All these Grasles except the second and fifth, doe grow in the fieldes and meadowes of our land, some neere *London*, toward *Hackney*, and others in *Kent*, and keepe the same time of flourishing with the rest. The fifth as is said by the Sea side of *Narbone*.

The Names.

The first sort of these Grasles, both the greater and the lesser are expressed by *Lobel* and others, under the name of *Alopecuros*, and *Canda vulpina*: The second *Boel* brought us out of *Barbary*. The third and fourth we have given titles, as well as to it. The fifth is called by *Tabermentanus* and *Gerard*, *Schizanthum adulterinum*, and by *Lobel* *Iuncus marinus gramineus folijs Schizanthi*, but after wards altering the title, he set it with these Grasles, and called it as it is in the title here: The sixth is called by *Lugdunensis*, *Gramen Echinatum Dalechampi*, but *Bauhinus* calleth it *Gramen Alopecuroides spica aspera*. The seventh and eighth are called by *Bauhinus*, *Gramen Typhoides*, and are called by others *Gramen Alopecurinum*, as the last are also.

The Vertues.

I finde nothing remembred by any, whereto any of these are profitable.

CHAP. XIX:

Gramen Typhinum vel Typhoides. Cats taile Grasle.

Although I set not *Typha* the Cats taile it selfe in this place, being referred to the wet and moorish places, where it shall be remembred among other of the like nature, yet I will here shew you the sorts of Cats taile Grasles.

1. *Gramen Typhoides maximum*. The greatest Cats taile Grasle.

This greatest sort groweth up with faire large leaves like wheate, and stalkes two foote high, on which stand long round spiked heads, foure times bigger then the next, and almost of an equal bignesse and roundnesse from the bottome to the toppe. Yet sometimes it is found with stalkes three or foure cubits

1. 4. *Gramen Typhium max & Danicum minus*.
The greatest Cats taile grasse and the Danish.

2. *Gramen Typhium medium sive vulgatissimum*.
The most common Cats taile Grasse.

2. *Gramen Typhium minus*.
The lesser Cats taile Grasse.

bits high, and the spike somewhat shorter and smaller to the toppe.

2. *Gramen Typhium medium sive vulgatissimum*.
The most common Cats taile Grasse.

This Grasse that is most common in our more barren grounds, differeth not but in the smallnesse from the former, the stalkes not rising much above a foote high, and the round spike two or three inches long: the rootes have small round heades like bulbes, from whence the leaves doe spring and encrease there.

3. *Gramen Typhium minus*.
The lesser Cats taile grasse.

This differeth not from the last, but in having more store of narrower Greene leaves and lesser stalkes with smaller long slender spiked heads.

4. *Gramen Typhium Danicum*.
The Danish Cats taile grasse.

This Danish kinde hath leaves and stalkes much like the last, and differeth in these two things onely from it, first in having shorter spiked heads and more rough, and next that at the bottomes of the stalkes next above the rootes, they have two small knots or bulbes one as it were fet upon another.

5. *Gramen Typhium alterum Zelandicum*.
Dutch Cats taile grasse.

This Grasse is smaller then the last, both in leafe and stalke, yet but little in the head or spike, the chiefest difference from it is, that it hath two little bulbes one upon another among the rootes.

6. *Gramen Typhium Harlemense*.
Harlems Cats taile grasse.

This differeth little from the Danish kinde, but in being lesse both in stalke and leafe, and having two small knots above the rootes, but lesse evident.

The Place and Time.

The three first are often found in our owne land, but the three last not knowne as yet, and doe all keepe the same time with others.

The Names.

The first here set downe, is no doubt the same with the first and greatest *Gramen Typhoides* of Bauhinus. The second hath heretofore bene called *Gramen Typhinum majus* by divers. The third is likewise called *minus*. The other three have their names in their titles, not being mentioned by any before.

The Vertues.

These are as unprofitable for any Physicall use as the last.

CHAP. XX.

Gramen Cyperoides. Cyperus Grasses.

F Cyperus Grasses there are a great number, some growing in watery and moorish places, either upland or nere the Sea, others in the corners and borders of fieldes or Woods, or the moister places of them, which shall be declared in this Chapter and the other in the next Classis hereafter, and first of that sort that partaketh both with Cyperus and Typha, to the one in the leafe, and to the other in the head.

1. *Cyperus Typhinus.* Cats taile *Cyperus* Grasse.

This *Cyperus* Grasse hath many long narrow three square hard Greene leaves rising from a bushy roote, among which rise up stiffe Greene stalkes, two foote high and better, with some joynts and leaves at them, and at the toppes two or more slender long rough heades set together one above another, like some of the Cats tailes, and of a darke Greene colour tending to purple.

2. *Pseudocyperus gramineus* sive *Milicæus*. Tufted bastard *Cyperus* grasse.

This Grasse hath divers, faire, long, and somewhat broad, and shorter, paler Greene leaves then the last, from whence arise three square stalkes like *Cyperus*, about halfe a yard high, set with leaves from the bottome to the middle of the stalkes, compassing them at the bottome, the toppes being furnished with a larger tufted head, then is equall for the plant, wherein is contained the seede: the roote is blackish and bushie.

3. *Gramen Cyperoides sylvæarum tenuius spicatum*. Slender eared Wood *Cyperus* grasse.

The stalkes of this grasse are three square, a foote high or more, with faire, but bard and rough grasse leæves, foure or five inches long, the spiked heades that grow at the toppes are many, one above another, slender and long, yet some more then others, as some of two inches, others of one inch, or an inch and a halfe of a yellowish Greene colour with long yellowish seedes in them, with yellowish great and stringy rootes.

1. *Cyperus Typhinus.*
Cats taile *Cyperus* Grasse.

2. *Pseudocyperus gramineus* sive *Milicæus*.
Tufted bastard *Cyperus* Grasse.

4. *Gramen Cyperoides elegans multifera spica.*

A fine Cyperus Grasse with many heads.

This Grasse hath slender triangular stalkes about two footes high, the leaves are long and narrow, with a long pointed spiked head, made of many small ones, so close set together that they seeme to be but one spike or head.

5. *Gramen Cyperoides echinatum montanum.*

Mountaine prickly Cyperus Grasse.

The stalkes hereof are three square, and not much above a spanne long, the leaves below, and on them are very long and narrow, the heads are short, with many rough burres on them, some separated and some close.

6. *Gramen Cyperoides sparsa panicula Altae Portae.*

Land Cyperus grasse with a dispersed tuft.

The long leaves hereof are of a browne Greene colour, and somewhat flat betwene a rush and a grasse: the stalkc also is somewhat more flat then square, sometimes but one cubit high, and sometimes two or three. the toppe whereof is furnished with a large round spread pannicle made of many parts, and each small prickly head standing on a slender footestalkc, which oftentimes is bent downe with the weight of the heades: the rootes is full of fibres.

7. *Gramen Cyperoides Norvegicum parum lanosum.*

Cyperus grasse of Norway, a little woolly.

The slender stalkes of this grasse grow about two spans high, the bottomes of them being a little woolly, and having at the middle onely a joynt with a leafe, the lower leaves set close upon the ground three or foure inches long, somewhat like those of the grasse Crowfoote: the heades of the stalkes have small round shining eares on them, of a pale browne colour, with a small long leafe under every head.

*Anglicanum
duplex va-
rietates.*

There have beene two sorts of this kinde of grasse, found nere unto High gate, the one smaller then this, but

6, 7. *Gramen Cyperoides sparsa panicula & Norvegicum parum lanosum.*

Cyperus Grasse with a dispersed tuft,
and of Norway a little woolly.

3, 4, 5. *Gramen Cyperoides sylvaticum elegans, multifera spica & echinatum Montanum.*

Slender eared grasse, with many heads, and the
mountaine Cyperus Grasse.

9, 10. *Gramen Cyperoides spicatum latifolium, & alterum. Broadleaved Cyperus Grasse of two sorts.*

with

with more store of burres at the heads of the stalkes. The other greater and somewhat higher then that of Norway.

8. *Gramen Cyperoides, Norwegicum alterum.* Another Norway Cyperus Grasse.

This other Grasse groweth in moist Woods, as well with us as elsewhere, with a number of long narrow leaves, some three or four inches, others six or seven inches long, the stalkes are cleare and smooth, halfe a yard high, bearing at the toppe many conelike heads, set close together.

9. *Gramen Cyperoides spicatum latifolium.* Broad leaved Cyperus Grasse.

This grasse may be numbred among the other of this kinde, in that it hath long blacke, creeping rootes, with many fibres at them, very like unto the sweete long Cyperus, and hath broad leaves, almost a foote long, among which the stalkes being a foote high, beare three chaffie spiked heades at the toppes, of an inch or an inch and a halfe long, whereof the middlemost is longest, each of them like unto the small Cats taile grasse.

10. *Gramen Cyperoides spicatum latifolium alterum.* The higher broad leaved Cyperus grasse.

This also is reckoned with the rest, having as long leaves, but higher stalkes by much, bearing at the toppes foure or five small long eares of spikes one above another, an inch or two long, with a small leafe at the foote of each of them: the roote is somewhat long but fealy with many long fibres set thereat.

The Place and Time.

The first groweth in the lower places of wet fieldes neare the Sea shore. The second we have sometimes found in our simpling walkes, betwene London and Kentish Towne, in the bottome of a field, some in Norway, divers of the others about High gate, and in a Wood neere thereunto, and in other places of the Land, and keepe the same time with others.

The Names.

The first is called by Tabernmontanus, *Gramen Typhinum*, and by Bauhinus *Gramen Typhoides spica multiplici*, but by Gerard, *Cyperus Typhinum*, and so doe I, finding it to participate of both, and is quite left out of the new Gerard, as divers others are, for want of the figures: The second is called by Lobel, *Cyperus graminea sive Miliacea*, by Lugdunensis *luncum latus*, by Thalinus, *Pseudocyperus nodosus*, and by Bauhinus *Gramen Cyperoides miliaceum*: The rest are not written of by any before, and therefore their titles are sufficient to distinguish them.

The Vertues.

We have nothing to set downe of the property of any of these grasses, but are wholly neglected, as unprofitable for any Physicall use, neither doe they serve for fodder, though they may for litter to horses and cattile.

CHAP. XXI.

Gramen Caninum. Dogs grasse, or Quich grasse.

Of the Dogs grasses there are many sorts, some growing in fields, and other places of the Vpland grounds, others in the fieldes nere the Sea: of the former we will speake here, and of the other in the next Chapter, among the Sea plants.

1. *Gramen caninum vulgatum.*
Common Quich Grasse.

2, 3. *Gramen Caninum longius radicans & latiore panicula minus.* Longer rooted Quich grasse and with a more spread panicke.

1. *Gramen Caninum vulgatum*. Common Quich grasse.

It is well knowne to all I thinke, that this Grasse creepeth farre about under ground, with long white joynted rootes and small fibres almost at every joynt, very sweete in taste (as the rest of the herbe is) and interlacing one another, from whence shoote forth many faire and long grasse leaues, small at the ends, and cutting or sharpe on the edges: the stalkes are joynted like corne, with the like leaues on them, and a long spiked head, with long huskes on them, and hard rough feede in them.

2. *Gramen Caninum longius radicans, & paniculatum*. Quich grasse with a more spread panicle.

This differeth very little from the former, but in the tuft or panicle, which is more spread into branches, with shorter and broader huskes, and in the roote which is fuller greater, and farther spread.

3. *Gramen Caninum latiore panicula minus*. The lesser Quich grasse with a sparfed tuft.

This small Quich grasse hath slender stalkes, about halfe a foote high, with many very narrow leaues both below and on the stalkes, the tuft or panicle at the toppe is small according to the plant, and spread into sundry parts or branches: the roote is small and joynted, but creepeth not so much, and hath many more fibres among them then the others have, and is a little browner, not so white but more sweete.

4. *Gramen Caninum supinum arvense*. Low bending Quich grasse.

This creepeth much under ground, but in a differing manner, the stalkes taking roote in diuers places, and scarce raising themselves up a foote high, with such like Greene leaues as the ordinary, but shorter, the spiked head is bright and sparfed, or spread abroad, somewhat like the Field grasse.

5. *Gramen Caninum supinum Monspelienae*. Low bending Quich grasse of Mompelier.

This differeth very little from the last in any other part thereof, then in the panicle or spiked head, which is longer and not spread or branched into parts as it is.

6. *Gramen exile tenuifolium Canarie simile sive gramen dulce*. A small sweete grasse, like quich grasse.

This small grasse hath diuers low creeping branches, and rooting at the joynts as the two last, having many small and narrow leaues on them, much lesse then they, and a small sparfed panicle, somewhat like the red dwaiſe grasse.

• 4. *Gramen Caninum supinum arvense*. Low bending Quich Grasse. 5. *Gramen Caninum supinum Monspelienae*, Low bending Quich Grasse of Mompelier.

7. *Gramen minus, radice repente.* Wall grasse with a creeping roote.

This Wall grasse from a blackish creeping roote, come forth many smal stalkes a foote high, bending or crooking with a few narrow short leaves on them, at whose toppes stand small white panickles, of an inch and a halfe long, made of many swell chaffie huskes.

The Place and Time.

The first is usuall and common through the Land in divers plowed grounds, which troubleth the husbandmen as much after the ploughing up of some of them, as to pull up the rest by hand after the springing, and being raked together to burne them, as it doth Gardiners where it happeneth, to weed it out from among their trees and herbes: the second and third are nothing so frequent, and are more naturall to sandy and chalkye grounds: the three next are likewise found in fields that have beene ploughed and doe lye fallow, and the last is often found growing on old decayed walles, in divers places: they all keepe the time of Sommer with the rest.

The Names.

This is called in Greeke usually *εὔρασις*, that is simply *Gramen*, as of most use, and in Latine *Gramen Caninum*, by *Lobel* *Gramen Canarium, medicatum*, from *Pliny* who first called it *Canaria quasi canibus inventa, qua fastidium deducant, vomitum campituita rejicientes hinc Cynoglossi alij, & a foliorum primo prodeuntium forma quibusdam Deus Canis dicitur.* *Gesner* in *hortis* calleth it, *Gramen Dioscoridis*, and other Authors call it onely *Gramen*, and *Lugdunensis Gramen vulgare*. The second and third *Lobel* called in his other part to the *Adversaria*, *Gramen Canarium longius redicatum, majus & minus*, and I thinke is also the *Gramen Caninum vineale* of *Bauhinus*. The fourth *Lobel* calleth *Gramen Caninum supinum*, and added *arvensis* afterwards to it: the fifth is so called also by him, because it was sent him from *Mompelien*. The sixth is the *Gramen dulce* of *Lobel*. The last is so called by *Bauhinus* as it is in the title. The *Italians* call it *Gramigna*, as the best of all others, the *French* *Chieu dent*, and *Dent de chien*. And we Quich grasse, or Couch grasse.

The Vertues.

This Quichgrasse is the most medecinable grasse of all others, serving to open obstructions of the liver and gall, and the stoppings of the urine, being boyled and drunke, and to ease the griping paines of the belly, and inflammations, and wasteth the excrementitious matter of the stone in the bladder, and the Vicers thereof also, the rootes being bruised and applied doth consolidate wounds: the seed saith *Dioscorides* doth more powerfully expell urine, and stayeth the belly or laske, and castings or vomittings. *Galen* saith the same thing, and further addeth, that the roote is moderately cold and dry, and hath also a little mordacity in it, and some tenuity of parts, the herbe is cold in the first degree, and moderate in moisture and drynesse: but the seed is much more cold and drying of some tenuity of parts, and somewhat harsh. *Pliny* confoundeth this and the *Parnassus* grasse together, applying the same properties to the one, that are attributed to the other: the distilled water, or the decoction alone is often given to children for the wormes: but if some wormeseede be put to it, it is the more effectual. The first Quich grasse is that which hath beene ever in use in our Land with the Apothecaries for their medicines, as it was also in the hether parts of *France*, but the further parts thereof, and about *Geneva*, they use the knobbed or bulbed kinde, but neither of them was knowne to *Matthiolum*, or the *Germanes* or *Italians* in his time, as it is evident in that he hath made no mention of it.

CHAP. XXII.

Gramen Caninum bulbosum & nodosum. Bulbed and knobbed Quich grasse.

Unto this kinde of Dogs grasse, is to be joyned some other grasses, whose rootes are knobbed or bulbed, yet that sort which *Bauhinus* maketh mention of in his *Prodromus*, growing in the water, I will referre to the next Classis, whereunto it is proper.

1. *Gramen Caninum bulbosum nodosum vulgare.* Common bulbed and knobbed Quich grasse.

This kinde of Quich grasse hath for his rootes, three or foure, or more round white knobs or bulbcs, one set upon the head of another, with divers fibres underneath them, from the uppermost of whom springeth forth divers long hard grasse leaves, sharpe at the edges, and in the middle of them a joyned stalk, with three or foure such like leaves upon them, at the toppe whereof is a long panickle, spread into many parts like to that of Oates, wherunto some have compared it. *Lobel* exhibiteth another sort hercof differing little in any part, but the rootes which are small and round, and set at distances all along the rootes, and as sweete as the other.

2. *Gramen nodosum spica parva.* Knobbed grasse with a small round spike,

This small Grasse hath a small whitish round knob or bulbe for the roote, with small fibres under it, shooting forth from the head thereof another, somewhat like unto a bulbe, but much smaller, and like a slender knob, with a small joyned stalk above it, and a long narrow pointed leafe at each of them being foure or five inches long, and at the toppe one short soft spiked head, somewhat like unto the head of the Cats taile grass.

3. *Gramen bulbosum geminum.* Double bulbed grasse.

This double bulbed Grasse, hath a greater round sweete bulbed roote below, covered with a reddish skinne, and one like a lesser at the head thereof, the upright stalk is not a foote high, joyned and kneed, like unto a Wheate straw, having foure or five narrow grasse-like leaves on them, and at the head thereof a small long panickle made of diverse huskes, each standing by it selfe, like the huske of an Oate, out of which appeareth small reddish bloomings.

4. *Gramen bulbosum Alepinum.* The bulbed grasse of Aleppo.

This Aleppo grasse hath a firme white round roote, covered over with a netted outer skinne, and small white fibres underneath, from the midst whereof come forth two or three fluted stalkes, above a foote high, and with many grasse leaves set on them, the spike is somewhat like to the Wall Barley, breaking out of a broad leafe whose point riseth above it.

H h h h h 2

5. *Gramen*

1, 2. *Gramen Caninum bulbosum vulgare* &
aliis nodosum spica parva.
 Common knobbed Quich-grasse. And
 another with a small round spike.

1, 3. *Gramen bulbosum geminum, & nodosum vulgare.*
 Knotted Quich-grasse, and double
 bulbed Grasse.

5. *Gramen bulbosum Messanense.* The Sicilian bulbed Grasse.

Let me adde this plant here, for I know no fitter place to insert it, although it be not answerable to the rest, whose description is thus. The roote is very small and round somewhat like unto a wilde Saffron roote, and of the table of a Chestnut, having onely two or three long leaves, as small as haire, with some shorter on the stalk on the toppe whereof groweth a small long and round knob or bulbe, of the bignesse of an ordinary beane, somewhat yellow or browne on the outside, and having three rough circles about it, equally distant one from another, but white within, and of the substance of a Chestnut.

The Place and Time.

The first groweth not so common with us as the creeping rooted Grasse, yet sufficient plentiful in many plowed fields in the Land. The second neere Bassill. The third in Spaine. The fourth neere Aleppo in Syria. The last both nere Verona and Italy, and at Drepanum, and Messina in Sicilia.

The Names.

The first is called *Gramen nodosum avenacea pluma* by Bauhinus, who also doubteth whether it may not be the *Egilops Plinij*, which hath a kinde of bulbe; others call it *Gramen bulbosum, tuberosum, or nodosum*: The second is mentioned onely by Bauhinus in his *Prodromus* and *Pinax*, by the same title it hath. The third is the second *Gramen nodosum* by Bauhinus, and the *Coix Mycom* in *Lugdunensis*, who tooke it to be the *Coix* of Theophrastus, lib. 8, c. 16. Cesalpinius saith it is called by the common people in Italy, *Perlara*, and *Orza sylvestris*. The last is mentioned by Iohannes Baptisti Cortesius in *Miscalancorum medicinalium decade quinta*, fol. 206. where hee saith that it is called *Basyli* by the Sicilians, that usually sell it in the Markets, and by some others there where it groweth, *Castancales*, from the sweete taste like Chestnuts, that both roots and heades have in eating. Montagnana also, as he there saith, mentioneth this roote, and that they of Verona call it *Entrofum*, or *Lulinum*.

The Vertues.

The first knobbed Quich-grasse is found by certaine experience not onely with us, but in Savoy, Geneva, &c. where it plentifully groweth, and is used to be more effectually to provoke urine and to breake the stone, to ease those torments of the belly, that come by loosenesse, crudities of humours, and obstructions, and generally is held safely to be used in any the like causes that the other is, and with as good successe: The third *Mycom* saith hee could understand of no physickall use it was put unto, but that Hares were much delighted to rest by it, and to digge up and eate the rootes: the last is used for food, being windy withall, that is not used Physically.

CHAP. XXIII.

Gramen geniculatum. Kneed Grasse.

Of that kinde of grasse that groweth in the uplands, there is onely a greater and a lesser as shall bee shewed in this Chapter, but there are others growing in the waters, and neare the Sea side, which shall be declared in their proper places.

1. *Gramen geniculatum majus*. The greater Kneed Grasse.

The greater of these grasses hath many long trayling branches upon the ground, with sundry great joynts on them, and shooting out fibres from those joynts that lye next the ground, so that it doth sometimes run twentie foote in length, with one long leafe at each joynt, small at the end but broadest below, from which as

1. *Gramen geniculatum majus*.
The greater kneed Grasse. 2. *Gramen geniculatum minus*.
The lesser kneed Grasse.

well as at the toppe come forth divers small long spikes of chaffe huskes of an overworpe colour, which stalkes and joynts are so full of a most pleasant juice that it feedeth Cattle much more than any other Hay, and therefore those Farmers that have it growing in their grounds, doe keepe the Hay thereof for their chiefe winter provision, and in stead of Provinder; the roote is bushing and fibrous.

2. *Gramen geniculatum minus*. The lesser Kneed Grasse.

This other kneed grasse creepeth not so much on the ground as the former, but spreadeth more upright with his branches, whose joynts are not altogether so great as the other, the stalkes send forth spiked heads at the tops, but somewhat larger then the former, and of a sadder overworpe colour: the roote is threddy like the precedent.

The Place and Time.

They both grow in most meadowes in sundry places of this Land, but have beene especially observed, the greater to grow about *Wiltan*, in a great meadow lying among the bridges at the townes end, belonging to the Earle of *Pembroke*, and the other at *Waminster*, both of them in *Wiltshire*.

The Names.

Tauhinus as not well knowing these referreth the former sort to the kindes of *Gramen dactylon*, or *Ischamon*, because of the divers Panicles it beareth together in a tuft, and calleth it *Aquaticum* as *Tabermontanus* and *Gerard* did, but both mistooke it for that other which groweth in waters in our Land as well as others: they have their names from the great joynts or knees on their stalkes.

The Vertues.

We have not knowne these used to any other purpose then is formerly declared.

CHAP. XXIV:

Gramen Dactyloides sive Ischemon. Dew Grasse, or Cockes foote Grasse.

Although formerly there was but one sort of *Ischemon* knowne, yet since for the likenesse of the panicles or tufts thereof, there are divers others referred thereunto as species thereof.

1. *Ischemon sylvestre latiore folio.* Common Cockes foote Grasse.

The common Cockes foote grasse hath sundry cleere reddish joynted stalks, with faire grassy leaves on them somewhat dented on the edges, broad at the bottome and small to the end, of an harsh or binding taste, at the toppes of the stalkes grow divers long and slender rough spikes of a brownish colour when they are ripe: the roote is made of many fibres.

2. *Ischemon sylvestre spicu villosis.* Another Cockes foote grasse.

This other grasse hath purplish stalkes, a cubit high, with fewer and much narrower leaves on them, the spiked heads are more in number then the former, and more hairy, having as it were short yellow beards set on both sides of the panicles, wherein lye the feede: the roote is bushie like the other.

3. *Ischemon sativum sive Gramen Mannæ esculentum.* Dew Grasse.

The Dew grasse hath likewise faire joynted purplish stalkes, and larger grasse or reede like leaves on them, somewhat hairy or woolly at the bottome of them, and about the joynts at the toppes of the stalkes stand larger spikes or panicles, and more also set together, made of many small chaffie huskes, with long white feedes in them, somewhat greater then Millet, and lesse then Rice, standing all as it were on the one side: the roote is greater and more bushy, whose plante differeth from the former no otherwise almost then a manured from the wilde plant.

4. *Gramen Scoparium Ischemi paniculis.* Brush Grasse.

The brush grasse hath a roote consisting of many very long hard threds or fibres, a cubit long or more (whereof are made in France where it is naturall those brushes that wee doe usually brush our heads, &c. withall) the stalkes are hard, slender and joynted, about a cubit high, with small long leaves on them like unto the second sort of *Ischemon* here before set forth but sweeter in taste, at the toppes of the stalkes stand five or six or more bright long panicles, like unto the Cockes foote but larger, flatter and lesse dented.

5. *Gramen Canarium Ischemi paniculis.* Cockes foote like Quich Grasse.

The Cockes foote like Quich grasse might as well have beene numbred among the Quich grasses as among these, being as it were indifferent betweene them both; it hath running joynted rootes like the ordinary Quich grasse, and so both stalkes and leaves some what resemble it, but the head is disperfed or spread into such like slender long panicles as the Cockes foote grasse, the small chaffie huskes whereof containe rougher feede.

1. *Ischemon sylvestre latiore folio.*
Common Cockes foote Grasse.

3. *Ischemon sativum sive Gramen Mannæ esculentum.*
Dew Grasse.

4. *Gramen scoparium* / *Scirpus panicula*.
Bush Grass.

5. *Gramen Canarium* / *Scirpus panicula*.
Cocks foot like Quich grass.

6. *Gramen Dactylon repens*.
Creeping Cocks foot Grass.

This small grass sendeth forth from a sparfed threddy roote many long slender and weak branches, trayling or creeping upon the ground, and shooting forth roots at the joynts, the leaves that grow at the joynts are small and grassie long and narrow, and at the toppes of the stalkes which rise not much above a spanne high, foure or five small slender blackish spikes within the huskes whereof lye the feede.

7. *Gramen Dactylon Egyptiacum*.
Egyptian Cocks foot Grass.

The roote of this Egyptian Grass doth somewhat creepe under ground like unto Quich grass, but much lesse, the leaves are very small, set upon small stalkes of an hand breadth long, having foure small long panicles set at their tops and no more, opposite one to another like a crosse, with small feede in them.

This is *Alpinus* his figure and description, but *Joannes Veslingius* *Mindanus* a Chirurgion having lived long in *Egypt*, hath set out some nores upon *Alpinus* his *Egyptian* plants, and among others giveth us a little differing figure, with the toppes pannicles distributed into five or six parts resembling a starre, and therefore calleth it *stellatum*, one of the toppes whereof I have thought good to joyne unto the other, that the difference betweene them may be discerned.

8. *Gramen Dactylon Africanum*.
Cocks foot Grass of Africa.

This grass of *Africa* is in most things like unto the last, but growing a little higher, the leaves are as small, and the spikes or panicles somewhat longer and bigger, more indented or set as it were with graines: the root creepeth about as the last and abideth extremitie of our winters.

The Place and Time.

The two first are usually found naturall in divers places of *Italy*, and *Narbone* in *France*, as also in divers places of

of our owne Land, but he third is usually sown as Corne is in their fields in many places in Germany, yet it is sayd to be naturall in Italy: the fourth in the Ile which is not farre from Orleanne: the fift is found in Spaine and Narbone in France, and so is the sixt also, and is there the most common: the two last are knowne by their titles; they all keepe the same time that the others doe.

The Names.

It is called in Greeke *Tripuros*, and likewise *Ischemen* in Latin, it is also taken to be *Canaria Plix* by *Anguilara*, and called *Gall crus Apulei* by him also, and *Gramen Ischemen* by all other Authors, or else *Leccicium* was decreaved in taking it to be *Coronopus*, because the *Sclavonians* called it *Cernic* *pes Bauhinus* and *Tabernemontanus* creely make mention of the second: the third is called generally *Gramen Manna*, and some adde *esculentum*, because it is of so much use among the *Germanes*, yet *Thalys* and some others call it *Gramen aculeatum*. *Cerdes* upon *Dioscorides* also calleth it *Frumentum Germanicum* *Schwaren Oryze* species: the *Italians* call both this and the fift *Sanguinaria*, *Sanguinella* and *Capriola*: the fourth *Lobel* calleth *Gramen Scoparium* *Ischemi paniculis* as it is in the title: the fift *Lobel* formerly called *Gramen Canarium* *alterum*, but afterwards *Gramen Canarium* *Ischemi paniculis*, *Lugdunensis* *Gramen vulgare Dalechampi* as *Bauhinus* saith, but I thinke he is mistaken, for I cannot finde it so, others call it *Gramen* as if it were the fift of *Dioscorides*, and so *Clusius* also taketh it to be, calling it *Gramen legitimum*: the sixt is called by *Lugdunensis*, *Gramen vulgare Dalechampi* as *Bauhinus* noteth it truly but not so in the other: the seventh *Proffer* *Alpinus* hath made mention of in his booke of Egyptian plants, and saith that the *Egyptians* call it *Neiemen* *salb* or *Gramen crucis*: The last is not remembered by any before, and therefore this title is sufficient for it. They may be all called *Gramen Daelylon* or *Deyleides*, as *Bauhinus* doth from the forme of the pannicles, representing spread fingers, and thereupon might as well be called in *English* Finger grasse as Cocks foote grasse: the *Germanes* call the third *Himmeldau quasi caliros*, and wee in *English* Dew Grasse.

The Vertues.

Cocks foote grasse bruised and layd to any place that bleedeth, doth stay the blood presently, whether from the nose or wound, yet if the rough spike be put into the nose and rubbed it will make it bleed: thus the divers manner of using it workes a contrary effect, both to draw blood and to stay it: being boyled with *Axungia*, that is, Hogs Suet and some should bread doth quickly heale the biting of a mad dogge: the same also applied to hard tumors dissolvethe them: it is sayd that the juice of branch that beareth onely three spikes together taken in the waime of the Moore, and put into the eyes that runne and water by some distillation of the same, making them to lock red & to be bleare eyed, or else being bound to the necke in the beginning of the sayd disease, doth quickly dissolvethe the humour and heale the eyes. The Dew grasse is sayd to dissolvethe the hardness of womens breasts: the feede is food for small birds, and Pidgeons and Hens and for men also, for the *Germanes* and others seeth it like Rice, and so eat it; or put it into the broth of flesh as we doe Oatemeale and divers other wayes, being as familiar and common to them as Oatemeale is to us. The Cocks foote Quich grasse is thought to have all the properties, and effectually also that eyther of the Quich grasses before spoken of have, and therefore for brevities sake referre you to them. The *Egyptian* Cocks foote as *Alpinus* saith is used by the *Egyptian* women to helpe to breake the stone, eyther in the reins or bladder, but *Veslingius* aforesayd saith he could not learne it to be so effectually, yet saith that he met with a Religious man coming from mount *Sinai*, that declared that the stone in the urinary vessels, but not in the bladder might be voyded, by putting up the finger and pressing the bladder, and by putting into the neck of the bladder by the Urinary passage a Goose quill, and blowing strongly therein, which he himselfe saith knew to be true. They also use the decoction of the rootes and feedes to provoke their courtes and to give it to children to expell or drive forth the measles, small pox, faint spots, purples or petechiae in them, as also they use to give it in pestilentiall feavers: the whole herbe, but especially the rootes they hold to be of singular good use to heale both greene wounds and old Vleers; some of them also use the decoction thereof to procure sweate familiarly.

CHAP. XXV.

Gramen Arundinaceum. Reede grasse.

Of the Reede grasses there are divers sorts, some grow on the land and others in the water, those that grow in the Vp-land grounds, shall be entreated of in this Chapter, and the other hereafter.

1. *Calamagrostis* five *Gramen Arundinaceum majus*. The greater Reede grasse.
The greater Reede grasse riseth up with many joynted stalkes and large sharpe cutting leaves on them like to those of the water Reede, but lesser: the toppes of the stalkes are furnished with divers hard long spikes or heads, somewhat like the common Reede, which when they have stood long doe open, and having a flocky substance in them are carryed away with the wind: the root is full of white strings, and some joynted ones, which spread in the ground. There is a lesser sort hereof, whose toppe is not so full of spikes, as having but one or two thereon.

Alia.

2. *Calamagrostis altera Norwegica*. Reede grasse of Norway.

This other Reede grasse of Norway groweth not so great but harder and rougher, both in stalkes and leaves than the former: the spiky tuft at the toppe is larger, more spread into severall panicles, sharper also and rougher in handling: the rootes hereof likewise consist of many long strings. We have one like herunto, growing nere *Hackney*, if it be not the same (our milder Country altering the roughnesse) saying that this hath tufts of hairy threds growing at the head of the roote.

Anglica.

3. *Calamagrostis nostras Sylva St. Iohannis*. Reede grasse of Saint Johns wood.

This Reede grasse is in stalk and leaves somewhat like the next woolly Reede grasse, but the stalkes are joynted in two or three places, two or three cubits high, with narrower leaves sharper and almost two cubits long, and a little striped withall: the toppe pannicles are sometimes a foote or more long, parted into many long spikes, which are soft as silke, and of a shining over-worne murrey colour: the roote is white with thicke strings, which spread in the ground sometimes.

4. *Calamagrostis*

1. *Calamagrostis* sive *Gramen Arundinaceum majus*.
The greater Reede grasse.

1. *Gramen Arundinaceum minus*.
The lesser Reede grasse.

2. *Calamagrostis altera* Norvegica.
Reede grasse of Norway.

3. *Calamagrostis sylvæ* Di Joannis.
Reede grasse of Saint Johns Wood.

4. *Calamagrostis* five *Gramen tomentosum*.
The soft or woolly headed Reed grasse.

5. *Calamagrostis torosapanicula*.
Round tufted Reed grasse.

6. *Calamagrostis montana erodia* five *Scirpus Trag.*
The greater Mountain Reed grasse.

4. *Calamagrostis* five *Gramen tomentosum*.
The soft or Woolly Reed grasse.

This woolly Reed grasse, is in the roughness, dryness, and forme of the leaves, not much unlike to that sort of Foxetaile grasse before spoken of in the Chapter of Foxetailes, which they of Mompelner called *Pseudosphenanthum*, but much greater, and not woolly as some related them: the stalkes likewise being two or three cubits high, and with few joynts are rough, bearing large spiked heads, set all along a panicle, reddish for some time, but growing to ripeness of a shining silver like whitenesse, and as soft as wool in handling, from whence it tooke the name, the roote is somewhat hard and rough at the toppe, with divers long fibres issuing from it. This description is according to the Dutch copy, translated by Lebel himselfe.

5. *Calamagrostis torosapanicula*.
Round tufted Reed grasse.

This sort of Reed grasse hath narrow long leaves somewhat softer and gentler in handling then the others before, yet not eaten by any cattle: the tuft or panicle it selfe is more round, and thicker, with shorter heads, set close together like small knots or knobs, but somewhat flat on one side, the bloomings hereof are of a yellowish purple colour, some panicles likewise are found to be more long and narrow: the rootes are small and stringy.

6. *Calamagrostis montana enodis* sive *Scirpus primus* Tragi. The greater Mountaine Reede-grasse.

This greater mountaine Reede-grasse groweth up with strong stalkes, as high as a man, without any joynts on them, or but one at the most, having thereat soft, and not hard long leaves: at the toppes whereof are many long slender chaffie spikes, set more sparsely then the others, each whereof is of a bright reddish yellow colour, and standing upright. Another sort hereof is much lower and smaller, the spikes being smaller and shorter, and not so upright, of a darke red colour: the roote is somewhat hard, but with divers fibres thereat.

Alterum.
The Place and Time.

The first sort, both the greater and the lesser grow in moist Medowes that are sandy, rather barren then fertile. The second and third are expressed in their titles. The fourth in the borders of dry fields, and by the hedge sides in many Countries of this Kingdome, especially in *Dorsetshire*. The fifth also in the like places. The last groweth in the moist Woods that are on hills and mountaines: they flourish in the Summer time, and their stalkes perish before Winter.

The Names.

The Greekes call it *καλαμὰ ῥοστόν*, *Calamagrostis* also and *Gramen Arundinaceum* in Latine, *Lobel* calleth the first *Calamagrostis forte Babylonicum*, and *Bauhinus* *Gramen arundinaceum spica multiplici*. The second is not remembered by any, before *Lobel* noted it in *Norway*, when he went into those parts with the Lord *Zanche* Ambassadour. The third also is to be knowne by the title. The fourth is called by *Lobel*, *Gramen tomentosum Calamagrostis quorundam*, & *unligi Gramen plumosum*, extant in his *Dutch Booke*, and it may be is that *Gramen arundinaceum plumosum album*, that *Bauhinus* describeth for the 44. in his *Prodromus*, or very like it. The fifth also is not remembered by any Authour before. The sixth of both sorts is called by *Tragus*, *Scirpi primum* & *alterum* genus, and is thought to be the *Luncus Lychnanthemos* of *Thalys*, and by *Bauhinus*, *Gramen arundinaceum enode montanum*.

The Vertues.

There is none of these Grasses serviceable for any Physicall use that we know, neither doe any Cattle feede thereon, by reason of their hard and sharpe cutting leaves except the first, and that but seldome neither: the stalkes of some of them are platted into mats, for Country women to lay and dry their new pressed cheefes on, and for other like uses.

CHAP. XXVI.

Gramen Nemorosum glabrum. Smooth Wood Grasse.

Here are two kinds of Wood grasses, the one with smooth leaves, whose sorts shall be entreated of in this Chapter, and the other with rough or hairy leaves, in the Chapter following.

1. *Gramen nemorosum capillaceum panicula alba*. White tufted Wood grasse.

This small grasse groweth thicke and close together in a tuft having a number of greene leaves rising from the roote, being as small as haire, and of a foote long, the stalkes rise up among them a cu-

2. *Gramen nemorosum majus spica rufescente*.
The greater browne Wood grasse.

4. *Gramen nemorosum exile durum*.
Small hard wood grasse.

bit or more high, smooth and bare almost without joynt or leafe on them, the toppes whereof end in a slender white panicle, not an hand breadth long, composed of small huskes set with bearded: the roote is small and threddy.

2. *Gramen nemorosum majus spica rufescente*. The greater browne Wood grasse.

The greater Wood grasse hath a number of narrow grasse leaves springing from the roote, among which come forth many smooth round stalkes, without any joynt or leafe on them, at the toppes whereof stand loose smooth brownish spiked heads, seperated a little one from another, and as it were a little bearded: the roote is a bush of many small fibres or stringes.

3. *Gramen nemorosum minus*. The lesser Wood grasse.

The lesser sort differeth not from the greater, but that it is in all parts lesser and lower, the small chaffie bearded eares being smaller and nothing so soft, but rather hard and a little more sparsed.

4. *Gramen nemorosum exile durum*. Small hard Wood grasse.

This small grasse hath divers small hard leaves a span and a halfe long, the stalkes are slender, with very few joynts and leaves on them, at which joynts, and at the toppes also come forth small long chaffie spiked heads.

The Place and Time.

These according to their titles doe grow in Woods frequent enough in our owne Land in divers places, *Bauhinus* saith the first groweth plentifully in an Oaken wood not farre from *Michelfield* in *Switzerland*, and flowerish when others doe.

The Names.

These have their names in their titles, being called *Nemorosum* or *sylvaticum* by all Authors that have written of them.

The Vertues.

These Grasses are not used in Physicke, nor are they any good fodder for cattle, but are utterly neglected both by man and beast.

CHAP. XXVII.

Gramen nemorum hirsutum. Hairy Wood Grasse.

f this kinde of hairy Wood grasse, there are some more sorts then of the precedent, as shall be presently shewed.

1. *Gramen nemorum hirsutum latifolium majus*. The greater broad leaved hairy Wood grasse.

This greater Wood grasse hath divers long and somewhat broad leaves turning downwards, rising from the roote, smaller to the end, grayish underneath and Greene above, set about the edges with whitish

1. *Gramen nemorum hirsutum majus*.
The greater hairy wood grasse.

2. *Gramen nemorum hirsutum majus alterum praecox tuberosa radice*. A greater early hairy wood grasse with a knobbed roote.

3. *Gramen nemorum hirsutum latifolium minus juncea panicula.* The lesser broad leaved hairy Wood grass with Rush like leaves.

4. *Gramen nemorum hirsutum majus angustifolium.* The greater narrow leaved hairy Wood grass.

5. *Gramen hirsutum angustifolium majus alterum.* Another sort of narrow leaved hairy grass.

6. *Gramen nemorum hirsutum minus angustifolium.* The lesser narrow leaved hairy Wood grass.

small long haire, the stalke from among them groweth to be two foote high, with leaves at the joynts, and set at the toppe with divers small greenish flowers in little huskes which containe small feede when it is ripe: the roote is a tuft of many small long threds.

2. *Gramen nemorum hirsutum majus alterum praeor tuberosa radice.*

A greater early Wood grasse with a knobbed roote.

This early Wood grasse hath larger leaves then the former, of a deeper greene colour and as hairy also, on the stalkes are leaves at the joyntes, as in the other, and such like heads or knaps of flowers, the roote is thicke, somewhat short and browne, almost like a Tormentill roote, with a number of small brownish haire covering it very thicke.

3. *Gramen nemorum hirsutum lasifolium minus juncea panicula.*

The lesser broad leaved hairy Wood grasse with Rush like panickles.

This lesser Wood grasse is very like in the growing unto the first or broader sort, but that the leaves hereof are narrower and the panicle or tufted head, at the toppe of the small stalke, is smaller and somewhat resembling the toppes of Rushes.

9. *Gramen hirsutum capitula globosa.*
Globe headed hairy Wood grasse.

4. *Gramen nemorum hirsutum majus angustifolium.*

The greater narrow leaved hairy Wood grasse.

The greater narrow leaved hairy Wood grasse, is very like in the manner of growing unto the first sort of Wood grasses, but that the leaves are much narrower, shorter, and turning downwards as the first, the stalke is bare without joynt or leafe, having at the top three small rough and almost round scaly heads set together: the roote is small and long with small fibres set thereat.

5. *Gramen hirsutum angustifolium majus alterum*

Another sort of narrow leaved hairy grasse.

From a small reddish fibrous roote riseth up a stalke neere two foote high, and smooth, usually bearing at the toppe a soft white panicle, some what spread, and made of sundry small scales as it were, in every one whereof lyeth a small round blackish feede: the leaves are few a little hairy and some of them compassing the stalke: the whole panicle hath two small leaves set at the bottome thereof, the one rising higher then it, the other lower: this saith Bauhinus, groweth in the moist fieldes of Michelsfeld by Bassil.

6. *Gramen nemorum hirsutum minus angustifolium.*

The lesser narrow leaved hairy Wood grasse.

This lesser Wood grasse is lesser then the last sort, having many long and narrow leaves growing at the roote, as hairy as any before, the stalke hath two or three joynts, and short leaves on them, and at the toppe divers small heads standing upright, each standing on a small hairy footestalke; the roote is somewhat long, like a *Cyperum* roote with a bush of small long threds.

7. *Gramen nemorum hirsutum minimum.*

The least hairy Wood grasse.

The least hairy Wood grasse hath more store of narrow long hairy leaves then the last but else in all things it agreeth with the first in beads and flowers, but being whiter then the rest.

8. *Gramen hirsutum sive exile ferrugineum.* Small hairy browne Wood grasse.

This Wood grasse is as small as the last, but with lesser store of leaves, the heads on the stalkes that are not above foure or five inches high, are Woolly and not fully round but a little flat and of a yellowish browne colour, the roote is small and fibrous.

9. *Gramen hirsutum capitula globosa.* Globe headed hairy Wood grasse.

This Wood grasse hath long leaves as broad as the third sort here before, with some small soft haire about the edges, the stalkes are about a foote high, with joynts and leaves on them, the toppes being furnished with two or three round soft white woolly heads, composed of many small silver like threds: the roote is small and thred-die.

The Place and Time.

All these grow in Woods, some about High gate, and other places, and flowerish in the end of Summer, except the second, which is earlier then any of the rest by a moneth or two sometimes.

The Names.

The first is called by Lobel and others, *Gramen hirsutum nemorosum*, Bauhinus giveth the figure of the third, and of the fifth, but I have thereunto added *alterum* to distinguish it from the fourth, being of later invention: The sixth is called *Cyperella Cordi* by Gesner in hortis, and *Gramen exile hirsutum Cyperoides* by Lobel, *Gramen nemorum Dalechampii* by Lugdunensis, and *Gramen hirsutum capitula Psylli* by Bauhinus. The seventh is the *Gramen Leucanthemum Dalechampii* by Lugdunensis. The eighth is not mentioned by any before now. The last is called *Combratum* Plinij by Anguilara, *Gramen Lucidum* by Tabernmontanus, Casalpini saith the Italians doe usually call it *Herba Luziola quia nō tu lucet*, it shineth more by night then by day.

The

The Vertues.

There is nothing of any propertie in them fit for medicine or any other use, the Cattle also refusing them by reason of their harinnesse.

CHAP. XXVIII.

Gramen aculeatum & Echinatum. Prickly headed Grasse.

Although some of these grasses grow sometimes in moorish grounds yet they are as often found in the moist corners and low places of meadows also, and therefore may more fitly be inserted into this Classis then the next.

2. *Gramen aculeatum Germanicum.*
The prickly headed Grasse of Germany.

1. *Gramen aculeatum Italicum.*

Matthiolus his prickly headed grasse.

This small grasse hath leaves and stalkes somewhat like the small ordinary grasses but that at the joynts with the leaves come forth small prickly heads, foulded in huskes, and ending in three points wherein lye small long pointed feede.

2. *Gramen aculeatum Germanicum.*

The prickly headed Grasse of Germany.

From a white threddy roote rise up divers grasse leaves, and among them sundry slender stalkes leaning this way and that, where on are set short spiked heads very rough and sharpe, made of many huskes wherein lye white feede.

3. *Oxagrostis pumila Hispanica.*

Spanish sharpe pointed Grasse.

This small *Spanish* grasse groweth not above halfe a foote, and sometimes but three or foure inches high rising from the roote, with two or three stalkes branching forth into sundry sprigs, and somewhat long, narrow and sharpe pointed hard leaves set one against another, and at the toppes of the stalkes small spiked heads of halfe an inch or more in length, fashioned somewhat like the heads of *Holcus* *Matthiolus*: the roote is white, long, joynted and creeping in the ground.

3. *Oxagrostis pumila Hispanica.*
Spanish sharpe pointed Grasse.

6. *Gramen Triglochin.*
Arrow headed Grasse.

5. *Echinato capite.*
Round prickly headed Grasse.

1. *Italicum Aculeatum.*
Matthiolus his prickly headed Grasse.

4. *Gramen echinatum planum*. Flat prickly headed Grasse.

This small grasse riseth not much higher then a palme or handbreadth, and from a white roote made of many fibres sendeth forth a few small hairy leaves an inch long, as also a small and fine stalke, with a flat spiked head and most sharpe aunes at the ends of the huskes whereof it consisteth.

5. *Gramen echinatum capitulo*. Round prickly headed Grasse.

The roote of this grasse is composed of many white threds, sending forth some few narrow rough leaves two or three inches long, among which rise up slender, some higher and others lower stalkes, with one or two joynts and leaves at them, each having at the toppe a small round head set with very sharpe prickles, within the huskes whereof lye white cleere feede.

6. *Gramen Triglochin Dalechampi*. Arrow headed Grasse.

Vnto these grasses let me adde this also, which although others doe referre to another genus, yet I doe to this for the sharpe heads sake: it hath sundry narrow slender leaves foure inches long, among which the stalke that hath no joynt or leafe thereon groweth a foot high, bearing many small three square heads in a long spike one above another, each on a severall short footstake, fashioned somewhat like to a broad Arrow head, or the leafe of *Sagittaria*, but that they are small and rounder, biforked below and sharpe pointed above; the roote is a small bush of many small white fibres.

The Place and Time.

The three first grow in dry places and old mudde walls, and in the like places doe the other also grow and flourish at the same time with other sorts of grasses.

The Names.

The first was first called by *Matthiolus* *Gramen aculeatum*, and since by others in like manner, *Bauhinus* calleth it *italicum* as he doth the second *Germanicum*, which *Lobel* called *palustre echinatum*, and *Lugdunensis* *Gramen aculeatum Dalechampi*: the third is not mentioned by any before now: the fourth is set forth by *Bauhinus*, and called *Gramen spica plana echinata*: the fifth is described both by *Bauhinus* and *Columna* this calling it *Gramen montanum echinatum tribuloides capitatum*, the other *Gramen spica subrotunda echinata*, or *Gramen echinato capitulato*: the last is called by *Lugdunensis* *Gramen Triglochin* sive *Vermiculatum Dalechampi*, which *Bauhinus* doth diversly referre, as unto that *Gramen* of *Thalium* that some as he saith would make a rush, but hee would not doe so for that the leaves were grasse, and groweth in wet or moorish places, but *Lugdunensis* saith his doth spring up in dry grounds; as also unto *Gramen spicatum marinum alterum of Lobel*, whereunto I acknowledge it hath some resemblance, but that the place seemeth to contrary it: and that it is also the second *Calamagrostis of Tragus*, and the fourth *Calamagrostis of Lugdunensis*; so that it seemeth that for some likeness he applyeth the one to the other.

The Vertues.

Matthiolus would transerre the vertues of his *Gramen aculeatum* to those of *Dioscorides*, but there is much doubt made thereof by the learned, and of the rest there is nothing can be learned worth the relating.

CHAP. XXX.

Schenogrostis sive *Gramen Inuncum*. Rush Grasses.

Here are divers sorts of Rush Grasses, some that grow in the upland grounds, some in the watery and moorish places, and some neare the Sea shores, of the former onely I meane to entreate in this Chapter, and of the rest in the next Classis among the moorish and water plants.

1. *Gramen Inuncum montanum subcerulea spica Cambro britannicum*.

The gallant mountaine Welsh Rush Grasse.

This gallant Rush Grasse hath a great many fine slender Rush like leaves, little lesse then a cubit or halfe a yard long, from among whom riseth up two or three slender small stalkes, eight or nine inches long and much lower then the leaves, bearing at their toppes out from betwene two leaves which are rather like skins, being broad below and small toward the end yet one alwayes longer then the other, a small spiked scaly like head, of a fine blewish colour.

2. *Gramen Inuncum spetosum minus*. Another gallant small Rush Grasse.

This small Rush Grasse is very like the former, but that it hath much smaller rush like leaves not past three or foure inches long, rising out of a browne hard huske or hofe, set at the toppe of a small fibrous roote, from among which spring up divers joynted stalkes with such like leaves on them, and a small head at the toppe like unto the former, but of a browne cleere Chestnut colour and smaller as the whole plant is, having two small leaves thereat as in the former.

3. *Gramen Inuncum Dalechampi*. Dalechampi his Rush Grasse.

Dalechampi his small Rush grasse that groweth in cold and dry places, hath a number of small round rush-like greene leaves rising from a very long white fibrous roote, whence spring divers joynted stalkes with some few leaves on them, and at the toppe a sparfed or open spiked head, somewhat like unto the *Holosteum Salamanicum* of *Clusius* consisting of many purplish huskes.

4. *Gramen Inuncum vulgare*. The common Rush grasse.

The leaves of this common Rush grasse are almost round, seven or eight inches long, among which the stalkes that are a span long, beare at their heads severall small panicles spike fashion one above another: the roote is composed of brownish yellow threds.

5. *Gramen Inuncum sylvarum majus articulato folio*. The greater joynted wood Rush Grasse.

The stalkes of this Rush grasse are somewhat flat and very greene, the leaves are almost round with many severall crosse joynts on them; the tufted heads at the toppe of the stalkes that are neare two cubits high, are much spread into many rush-like pannickles and somewhat flat also; the roote creepeth a little set with many small fibres.

6. *Gramen*

1. *Gramen Lunceum subcaerulea spica Cambro Britannicum*,
The gallant Welsh Rush Grasse.
2. *Gramen Lunceum speciosum minus*.
Another gallant small Rush grasse.

3. *Gramen Lunceum Dalechampij*.
Dalechampi's Rush Grasse.

4. *Gramen Lunceum vulgare*.
Common Rush Grasse.

5. *Gramen Lunceum Sylvaticum sparsa panicula*.
The greater joynted wood Rush Grasse.

6. *Gramen Lunceum Sylvicolum minus articulato folio*.
A lesser joynted wood Rush Grasse.

6. *Gramen Lunceum Sylvicolum minus articulato folio*. A lesser joynted wood Rush Grasse.

The divers stalkes of this Grasse that rise from the hard spreading roote with many fibres thereat doe take roote againe in the ground and beare such like joynted leaves, and small spread pannickle heads above, very like unto the last but smaller by the halfe in each. And there is a smaller also whose leaves are long and slender, but not joynted, the pannickle whereof is smaller also but sparfed in like manner.

7. *Gramen Lunceum Luncei sparsa panicula*. Rush Grasse with rush-like sparfed heads.

The stalkes hereof are slender, somewhat flat and almost two foote high, the leaves are smaller then the common sort about two spans long; the toppes likewise are smaller and spread with whitish heads: the roote is yellowish, spreading it selfe with long fibres.

7. *Gramen luncoides lunci sparsa panicula.*
Rush Grasse, with rush-like sparsed leaves.

8. *Gramen luncum parvum sive Holostium Matthioli.* Tode Grasse.

9. *Gramen montanum luncum capite squamoso.*
Mountain Rush Grasse with scaly heads.

Medium &
minus.

8. *Gramen luncum parvum sive Holostium Matthioli* & *Gramen luncum Flandrorum*. Tode Grasse.
This small Rush grasse (which the Flemmings generally call *Padde grasse*, that is, Tode grasse, and taken to be the *Holostium* of *Matthioli* in his last edition) groweth not much above a spanne high, whose leaves are very small, and those on the slender stalkes and branches from the joynts lesser, whereat and likewise at the toppes grow forth small yellowish chaffie heads or huskes, with short aunes as it were at the ends, each upon a short footstalk one above another: the roote is fibrous and reddish. There groweth about *Highgate* and some other wet places one or two other sorts hereof differing from it in smalnesse, and likewise the one smaller then the other, whose heads are thicker or closer set together.

9. *Gramen montanum luncum capite squamoso*. Mountain Rush Grasse with scaly heads.
From a small fibrous roote rise up two or three rush-like leaves about halfe a foote long; the stalkes are smooth and without any joynt or leaf thereon rising a foote high, at the toppe whereof from betweene two rough leaves the one being long the other short shooteth forth a scaly head, small at the toppe some what resembling the head of the *Phalaris* Canary Grasse.

The Place and Time.

Some of these grasses grow on hills others in woods or neare them: the first on a high hill in *wales* called *Berwin* continually covered with clouds and mists, and watered with sundry showers of raine, when at the same time the Sunne will shine faire in the vallies below it: the woods neare *Highgate* and the meadowes thereabout doe nourish many of the other varieties: the last was found on mount *Baldus*, and doe all flourish in the Sommer moneths of *June* and *July*.

The Names.

By the name *ῥυζος* in Greeke, and *Gramen luncum* or *luncoides* in Latine be all these plants knowne: The first *Lobel* had entended to call *Nardo Gangiti spuria similis capillaria planta*, but I have altered it and referred it rather to these Rush Grasses whereunto it is most like, and so is the second also, being neither of them mentioned by any before: the two sorts of the sixth, the seventh and the two smaller sorts of the eight are not likewise extant in any other author: the third fourth fifth and eight are so entituled by others as they are here set downe, yet *Thalium* calleth the eight *Gramen epigonato caulon*, and *Banhusius* *Gramen nemorosum caliculis paleaceis*: but I thinke it is seldome in any wood: the last *Banhusius* so called as it is in the title.

The Vertues.

All these sorts of Grasses have beene so lately found out, that there is no knowne use made of them in Physicke; and for the eight although *Matthioli* in his last edition gave the figure of it, entitling it *Holostium*, and without any description, and seemed to referre it to that of *Dioscorides*, whose propertie is to binde and consolidate flesh whereof this is no way guilty, but it is altogether insipide like a grasse and without sappe like a rush, and is therefore called *Holostium Matthioli* ever since by all authors, or by these other titles it beareth, for it is not yet knowne what that true *Holostium* of *Dioscorides* is, not any knowne plant can bee found in all things to equall it fully.

CHAP. XXX.

Juncus. Rushes.

T Here are divers sorts of Rushes, some great some small, some soft and smooth, others hard, some barren others bearing seede, some sharpe pointed, others not, some on the Land, eyther in uplands or neare the Sea, others in the fresh waters, some againe sweet, others not at all of those I meane to entreate in this Chapter that are not sweete, for or those kindes, the one called *Schoenanthos* or *Juncus odoratus*, and the other *Juncus angulosus* or *Cyperus odoratus*, I have spoken in the first Classis of this worke among the the other sweete herbes : and first of the soft or smooth sorts of Rushes in this Chapter.

1. *Juncus levis maximus*. The greatest Bull Rush.

The great Bull Rush sendeth forth sundry tall, soft round smooth shootes which are the Rushes, of a fresh pale greene colour, greater then any of the other sorts of Rushes, having certaine sheathes like leaves compassing them at the bottome, and pointed at the ends but not sharpe, full of a white pith which are serviceable (the outer rinde being pilled away) for lights, being divers of them bound together and dipped in Suct or Tallow : towards the toppes of which on the one side breake forth sundry small brownish chaffie heads, each upon a short footstake, wherein lye three square blackish feede : the roote is of a blackish browne colour, and groweth somewhat great and slope with divers strings or fibres thereat.

2. *Juncus levis vulgaris*. The common smooth Rush.

This Rush is in all things like the former but much lesser and shorter having a whitish pith within them as the other hath fit for the like uses, but that the heads are longer and the tuft or pannicle is close and not spread open as the next is : the rootes hereof are not great as the other, but are a bush of strings or threds.

3. *Juncus levis panicula sparsa major*. Another sort of great smooth Rushes.

This other greater sort is like the last but with fewer store of Rushes, of a darkish greene colour, and the tuft also or brownish pannicle is more spread at large, and each part standing on a pretty long footstake, and is broad below and pointed upward : the roote is bushie like the last.

4. *Juncus levis glomerato flore*. Round headed Rushes.

Round headed Rushes have divers shootes rising from the roote like unto the second sort and pithy within like it, the chiefest difference consisteth herein that the tufted heads stand somewhat close together and are round, not pointed at all.

5. *Juncus levis panicula sparsa minor*. Small Rushes with disperfed tufts.

This differeth from the greater sort before described, onely in the smallnesse of the plant, and growing in drye grounds, which may peradventure cause the smallnesse.

1. *Juncus levis maximus*.
The great Bull Rush.

2. 3. *Juncus levis panicula sparsa major et glomerato flore*.
Another sort of great smooth Rush and round headed Rushes.

6. *Iuncus exiguus montanus mucrone carens*. Small smooth pointed Rushes.

The roote hereof is small blacke and threddey, shooting forth a smooth round stalke foure or five inches high bearing at the toppe, a brownish red foure square head, having a small hard long thred above it, it hath also three small long leaves at the foote of the stalke of an inch long, like unto Rushes.

7. *Iuncellus sive Chamaechenos*. Smell of Dwarfes Rushes.

Dwarfes Rushes grow not above an inch or two high, although they naturally grow by ponds sides, having three or foure Rushes somewhat great and thicke for their proportion rising from a fibrous roote, this hath not bene observed to bring any heads for feede, and therefore is called *inutilis*. Like hereunto is that small Rush mentioned in the *Adversaria* by the name of *Iuncellus* but that it groweth somewhat higher, and beareth round tufts on the Rushes.

The Place and Time.

Many of these Rushes grow in watery plasches and grounds, and the first usually in the deeper waters; the threed last grow in dryer places: and flourish chiefly untill the end of *August* or *September*, yet abide greene all the yeare.

The Names.

Ξυλιν in Greeke so called a *loris* & *funibus* for so in former times it was used, is *Iuncus a jungendo* in Latine; from the same effect of binding things together: the first is taken by *Cordus* and *Bauhinus* to bee the *Mariscus* *Pliny*, furthered by *Gazal* his translation of *Theophrastus*, setting downe *Mariscus* alwayes for his *Holoschenos* as being the greatest, which is as *Pliny* saith *ad texandas tegetes apium*: yet as *Lugdunensis* saith, some take the *Iuncus floridus* or *Gladiolus palustris* to be it, seeing it as well as this is fit to be brought into sundry workes: *Bauhinus* also and others take it to be *Scirpus*: yet it is thought that the ancients tooke them to be different plants. *Terence* in *Andria* bringeth in *Donatus* to say *Junci species est scirpus levis et enodis*; and such an one is this Rush without any joynt therein, whereupon came the proverbe, *Nodum in scirpo quarere*, to seeke a knot in a rush, spoken of such as are scrupulous and doubtfull, whereof no scruple or doubt neede to bee made: some thinke that the text of *Dioscorides* is corrupt and that in stead of *Ξυλιν* & *λεία* *Iuncus levis* it should be *γλιν* & *λεία* *Iuncus palustris*, and that by comparing *Paulus Aegineta* therewith, who hath *λεία* and so hath *Hermolaus Barbarus* also observed it. *Gesner* and *Dodoneus* call it *Iuncus grandis Holoschenos*, and *Lugdunensis Holoschenos Theophrasti*, *Tragus* and others *Iuncus palustris major*, and *Lobel* and others *Iuncus aquaticus* & *levis maximus*: the second *Bauhinus* calleth *Iuncus sive Scirpus medius*, and saith it is the same that *Tabernmontanus* calleth *Iuncus sylvaticus*: the third is the *Iuncus vulgaris* alter of *Tragus*, *Iuncus levis* & *vulgaris* of *Cordus*, *Dodoneus* and *Lobel*, and *Oxychenos* by *Anguilara* and *Lugdunensis*: the fourth *Lobel* calleth *glomerato flore* and *Iuncus* simply by *Matthioli* and others, and *Iuncus levis* by *Lugdunensis*: the fifth is *Bauhinus* his title and so are the two last: the *Arabians* call it *Dia*, the *Italians* *Giunco*, the *Spaniards* *Iunco*, the *French* *Jonc*, the *Germanes* *Bintzen*, the *Dutch* *Biesen*, and we *Rushes*.

The Vertues.

The feede of Rushes of this soft kind especially saith *Galen* and *Dioscorides*, tossed saith *Pliny* being drunke in wine and water, doth stay the flux of the belly or Laske and womens Courfes, when they come downe two abundantly: it provoketh also Urine; but it causeth headach: it provoketh sleepe likewise, but it must be given with caution, least it bring a dead sleepe with it: the bottome or tender leaves or part of the Rushes next to the roote being applied to the bitings of the *Phalangium* or poysonous Spider healeth them; the roote saith *Pliny* boiled in water to the thirds helpeth the cough. *Pliny* maketh mention of an *Olenm Iuncinum* made of *Iuncus* as sweete as that of *Roses*, but sure it was not made of any of these sorts of Rushes but of the *Iuncus odoratus*, sweete smelling Rush. *Galen* sheweth excellently the property of the feedes of Rushes, that it is compounded of an earthy essence somewhat cold, and a watery somewhat hot: so that by drying the lower parts it doth leasurely send up vapours to the head, whereby sleepe is procured.

CHAP. XXXI.

Iuncus asper sive Acutus. Hard or Sharpe Rushes.

Of this kinde of Rushes there are also divers sorts, some great, and some small, some bearing feede others barren or bearing none.

1. *Iuncus acutus vulgaris*. Common hard Rushes.

Our common Rushes that serve to strew the roomes and chambers in houses, groweth in the same manner that the former sort doth, but that sometimes the stalkes as it were give Rushes one from out of another, and not all from the roote seperately as others, and are also hard and sharper pointed, with little or no pitch within them, the tufts are small, hard, spread abroad and short, that breake out towards the toppes as the other sorts doe.

2. *Oxychenos sive Iuncus acutus Alpinu. Cambrø britannicus. Welsh* hard or sharpe Rushes.

The Rushes of this sort are many about halfe a foote long or more, somewhat great hard and sharpe pointed, from among which rise up naked Rushes or stalkes halfe a yard high, and from betweene two short leaves breaking forth a sparsed pannicle, of sundry small chaffe huskes like unto Reed graffe, of a brownish colour: the roote is a bush of brownish hard fibres.

3. *Oxychenos sive Iuncus acutus minor*. Small hard Rushes.

This small Rush groweth very like unto the first, but with finer smaller, and as hard Rushes as the other, the tuft or panicle also is very like it, but closer and not so much spread open.

4. *Iuncus maritimus capitulis Sorghi*. Sea hard Rushes with blackish round heads of feede.

This hard Sea Rush hath sundry skinny browne heads, set next about the hard long slope roote which hath many small fibres under it, out of which rise thicker round hard, long and very sharpe pointed Rushes, from among which rise other Rushy stalkes three cubits high sometimes, bearing at the toppes from betweene two short leaves a number of blackish round heads a little pointed, sometimes but one and sometime two or thre standing close joynted.

1. *Juncus acutus vulgaris*.
Common hard Rushes.

2. *Juncus acutus Cambro-britannicus*,
Wetish hard or sharp Rushes.

3. 7. *Oxysphenos Juncus seu acutus minor*, & *Juncus acutus maritimus Anglicus*. Small hard Rushes and English Sea hard Rushes.

4. *Juncus maritimus capitatus Searhi*.
Sea hard Rushes with blackish round heads of seeds.

5. *Iuncus acutus maritimus alter*.
Sea hard Rushes with whitish round heads of feede.

8. *Iuncus maritimus Narbonensis*.
The Sea hard Rush of Languedocke.

joyned together, hanging downe from a short footstalkē, which when they are ripe, open into three parts, fl. c. w. ing small and somewhat long feede within them.

5. *Iuncus acutus maritimus alter*. Sea hard Rushes with whitish round heads of feede.

This other Sea Rush groweth after the same manner that the last doth in all things, as well in height as in thicknesse or greatnesse, onely the heads of feedes are rounder, and not pointed, and breake out of the Rushes, two or three inches under the toppe, or sharpe pointed ends, about Midsomer each of those round heads will be covered as it were with a white downy or cottony matter, which bindeth and dryeth exceedingly.

6. *Iuncus acutus maritimus caule triangulo*. Sea sharpe Rushes with three square stalkes.

The roote hereof is creeping and fibrous, sending forth a few short leaves, and long three square stalkes about a foote in length, vety sharpe pointed at the end, two or three inches under which breake forth sundry scaly and woolly heads of a brownish colour.

7. *Iuncus acutus maritimus Anglicus*. English Sea hard Rushes.

Our English Sea Rushes differ little in the growing from the other Sea Rushes, but that the pannickle is longer and slenderer, composed of many chaffie huskes.

8. *Iuncus maritimus Narbonensis*. The Sea hard Rushes of Languedocke.

This French Rush hath many slender tough and pliant long and sharpe pointed Rushes, of a pale Greene colour, from among which riseth a small stalk, little longer then the leaves, bearing at the toppe three leaves, whereof one is exceeding long, and the other are short, in the middle of whom stands a large round head composed of many long sharpe huskes set in eares, of a pale brownish colour, wherein lye small feede: the roote is browne long small, and creeping, set with divers short fibres thereat, smelling reasonably well.

The Place and Time.

The first groweth in many low moist neglected grounds and fields, where it taketh up much roome and doth little good: The second was found by Doctor Lobel, in his life time, upon a high hill in Wales called Benrin, in sundry the wet and moorish grounds, in many places thereabouts. The third about Montpellier or thereabouts. The fourth and fifth in Narbone as Lobel saith, and betweene Saint Johns de luce and Bayon, as we have bene informed. The sixth both on the Venetian shore, and in the way from Montpellier to the Sea. The seventh groweth on many of our English coasts. And the last about Narbone in France also. And doe all flourish in the end of Summer.

The Names.

The Greekes call it *Ὠξυς*, *Oxychanos*, and in Latine thereafter, *Iuncus acutus* & *asper*. The first is called *Iuncus acutus* & *vulgarior* by Lobel and Dodonæus. The second hath not bene set forth before, and therefore hath the name according to the place of the growing thereof. The third is also but now made knowne to all. The fourth and fifth are set forth by Lobel and Pena in their *Adversaria*, under the title of *Iuncus maritimus duplex*. The former Banhinus calleth *Iuncus acutus, capitulis Sorghi Oxychanos Dioscoridis*. The later is referred by him unto the *Iuncus Holoschanos major* of Lngdunensis, and was brought by Boel, from Bayon, by the name of *Iuncus Coriandri semine rotundo*, and taken to bee the true *Oxychanos* of Dioscorides. The sixth Banhinus calleth as it is in the

in the title: The seventh is peculiar to our Coasts, and hath the name accordingly. The last is the *Iuncus maritimus* *Narb onensis* of Lobel, whereof I cannot finde that *Bauhinus* hath made any mention.

The Vertues.

The properties of this hard Rush, are referred to the former, working the like effects as it is thought, but more weakly.

CHAP. XXXII.

Iuncus acuminatus reflexo. Hard Rushes with bending heads.

Here are yet some other kinds of Rushes to be handled, which because I would not huddle together, I must distribute into sundry Chapters, that so every species may be under his owne genus, as neere as may be.

1. *Iuncus acuminatus reflexo major.* The greater bending Rush.

The greater of these turning Rushes, groweth after the manner of the greater soft Rushes, hath for his rootes somewhat round heads, covered with blackish browne coates or filices, and

under them, tufts of threds, from which heads rise sundry long Rushes halfe a yard long or more, breaking a good way under the toppe, which bendeth or turneth downwards, out of a round skinny head into many skinny round heades, standing on short footstalkes, which have as it were five corners, full of cornered sharpe very small yellowish seede, of a little harsh taste.

2. *Iuncus acuminatus reflexo alter.*

Another turning or bending Rush.

This other hath the Rushes more then halfe a yard long, having a blackish shining tuft or umbell, breaking forth two or three inches under the turning end, and standing without any footstalkes, which are composed all of threds or thrums and blewish at the toppes.

3. *Iuncus acuminatus reflexo trifidus.*

The triple tufted Rush.

The roote hereof is blacke, joynted, and fibrous, the Rushes are many, slender and foure or five inches long, the stalkes are parted at the toppes into three, and seldome into foure slender long Rushes, three or foure inches long a peece, betwene which come forth three small chaffie tufts or panickles.

The Place and Time.

They all grow in France and Germany, and keepe the same time that others doe.

The Names.

The first is called by *Lugdunensis* *Iuncus Melancranis* of *Theophrastus*, who taketh it also to be the *Iuncus Oxysphenos femina* of *Theophrastus*, *Gesner* and *Tabernaemontanus* call it *Iuncus lavis*, and may be *Thalium* his *Iuncus Lychnanthemus*. The other two are remembered by *Bauhinus* in his *Pinax* and *Prodromus*, but in my opinion on the last is the small *Iuncus maritimus alter* of Lobel, as who so will compare them shall finde.

The Vertues.

Wee have no other certainty of the Vertues of these, but a likelihood to be as effectuell as the last kinde of Rushes.

CHAP. XXXIII.

Iuncus aquaticus capitulis Equiseti. Aglet headed Water Rushes.

Here are two or three sorts of this Aglet headed kind of Rush, which for the difference sake from the other kinds of Rushes, I thought good to entreate of by themselves.

1. *Iuncus capitulis Equiseti.* Aglet headed Rushes.

This lesser sort bringeth forth from a creeping spreading roote, stored with many intricate fibres, divers slender naked Rushes about a cubit long, full of whitish pith, and having at the bottomes of them certaine reddish skinnies compassing them, and bearing each of them at their toppes, a small catkin or Aglet like the first head of an *Asparagus*, blooming with small white threds, like a Plantane head, which fall away quickly.

2. *Iuncus capitulis Equiseti alter.* Another Aglet headed Rush.

This other Rush hath sundry short Rushes rising from the creeping roote, from among which, other slender and taller Rushes doe spring about a foote high, each of them bearing such a like Aglet as the former, but somewhat lesser.

3. *Iuncellus*

1. *Juncus aquaticus capitulis Equiseti.*
Aglet headed Rushes. 2. *Juncus Equiseti capitulis alter.*
The other Aglet headed Rush. 3. *Juncellus capitulis Equiseti fluitans.* Floating Rushes with Aglet toppes.

This small Rush hath from a small threddy roote, cometh forth a very small slender bowing Rush, which divideth it selfe into many other small Rushes about two or three inches long, floating upon the waters, where it groweth. Whereof some grow upright and others doe bow or bend downe againe, each of them bearing a small head like the former, with a small long Rush growing by it.

The Place and Time.

These all have beene found in our owne land, as well as beyond Sea, the first not onely in the ponds and waters of a small village called *Austroyel* hard by *Antwerpe*, but in divers places with us also, the other in the brookes and ponds, of both *Wales* and *England*, in sundry places and are to be seene in the end of Summer when they flowerish.

The Names.

The first is called by *Lobel* *Juncus aquaticus minor capitulis equiseti*, and by *Engdannen* *Juncus clavatus Dalechampi*. The second hath his title sufficient to expresse it, not being described by any other. The last *Banhinus* so calleth as it is in the title, yet calling it *minor*, as he doth the first *major*.

The Vertues.

There is no property knowne to what malady any of these may be applied but are held unprofitable as a great many others be.

CHAP. XXXIV.

Juncus cyperoides floridus. The flowering Cyperus Rush.

Here hath formerly beene knowne but one sort of these flowering Rushes, but *Banhinus* hath added another lesser sort.

1. *Juncus floridus major.* The greater flowering Rush.

This greater flowering Cyperus Rush (as it is differing from all the other sorts of Rushes, so it excelleth them all in beauty) hath sundry heads of leaves like unto those of *Cyperus*, rising from a long creeping or spreading roore like the Rushes, bushing with many fibres, from whence spring round smooth Rush like stalkes two or three cubits high, bearing at the top a large spread tuft or umbell of pale bluish coloured flowers (yet *Tragus* describeth them to be white) with some threads tipt with yellow in the middle, which falling away bring in their places small round blackish heads, containing small seede within them.

2. *Juncus floridus minor.* The lesser flowering Rush.

The smaller Cyperus Rush hath a whitish joynted roote, a small stalke of a hand bredth high, having three long sharpe, pointed Rush like leaves, two whereof rise higher then the stalke, and at the toppe five flowers, one
flowering

flowering after another, after which come two small round heads set together on each footstalk, of the bignesse of the Candy bitter Vetch.

The Place and Time.

The first growth in watery ditches, pooles and plashees, in most parts of this Kingdome: The other hath been observed in *Switzerland* in sundry places, and are flourishing all the Summer long, ripening the seede in the meane time.

The Names.

Although this hath no Greeke name, yet it hath found divers Latine names, being called by *Tragus Calamagrostis secunda*, by *Marshallius, Lugdunensis, Camerarius*, and others, *Iuncus floridus*, by *Label, Iuncus Cyperoides floridus paludosus*, by *Cordus, Gladiolus palustris*, by *Dodonaeus, Gladiolus aquaticus*, who findeth it erroneous in them that call it *Iuncus floridus*, but is in as great an error himselfe to follow *Cordus*, that calleth it *Gladiolus* from the false translation of *Gaza*, making *Theophrastus* his *Cyperus* to be *Gladiolus*, as *Pliny* (it may be) misled him before, whereunto it hath no correspondence, saving a little in the leaves, hee also taketh it to be *Sparanium Diofcoridis*, wherunto it agreeth as little, some also call it *Butomus Theophrasti*, and *Lonicerus Carex alterum*. The *Italians* call it *Gianco florido*. The *Dutch* *Water Lisel*, and *Gerard* *Water Gladiol*, following *Cordus*, who confoundeth *Theophrastus* his *Cyperis*, with *Diofcoridis* his *Gladiolus*.

The Vertues.

Matthiolus saith it is thought to worke the like effects that the other sorts of Rushes doe, but according to *Cordus* his mistaking it to be *Gladiolus*, he saith it is good to helpe the paines of women in their delivery of chiding, being boyled in wine and drunke.

1. *Iuncus floridus*. The flowering Rush.

CHAP. XXXV.

Spartum herba five Iuncus. Mat weed or Mat Rushes.

Although the *Spartum Pliny* be a kinde of Rush, growing rather in dry then moist places, yet because the other sorts of Grasses that serve with us for the same purposes, to make Mats and other such like workes, doe grow in wet and Moorish grounds, neare the Sea side, and are called by the same name of *Spartum*, I must rather then divide it place it with the other.

1. *Spartum Plinij five Iuncus Hispanicus*. Spanish Rushes.

The Spanish Rush riseth up with a number of round Rushes a cubit long, each whereof is parted a little above the ground, into three or foure more slender long, tough and Greene Rushes, somewhat broader at the first, being whitish in the middle, which soone after have both their edges so drawne together, that it maketh them seeme round, so that the partition is hardly discerned, and then grow harder, and whitish, when they are dry, (as we see them in frailes, and in the round mats wherewith the floores of chambers are matted, as they are wrought there and brought over to us) from among which rise up sundry stalkes, somewhat higher then the leaves bearing at the toppe a small long head of many sharpe pointed huskes, after which come small long seede, like unto some of the other Grasses: the rootes spread in the ground into many tufts, matting therein that in some places they take up two foote square or more.

2. *Spartum Plinij alterum mollius*. The softer Spanish Rush.

This other Spanish Rush groweth in the very same manner and order, that the former doth, and differeth from it onely in these particulars, the Rushes are more fine and slender, softer also and bearing a shorter tuft at the top, breaking out of a skinny huske or hole: the rootes hereof doe mat like the other, and grow in moister places.

3. *Spartum maritimum nostras*. Our Matweed or Marram.

This Matweed hath divers long hard, and very sharpe pointed Rushes, piercing their legges that are not boord going among them, the stalkes have soft spiked long heads, like unto the cares of Rye, and blooming like it also, the rootes creepe in the ground, and fasten themselves strongly therein.

4. *Spartum maritimum nostras alterum*. The other of our Sea Matweedes.

This other Matweede is in the growing like the former, but that the rushes are broader and shorter, and the heads or spikes also: the rootes likewise creepe and are strongly fastened into the ground.

5. *Spartum parvum Batavicum & Anglicum*. Small Matweede.

The Small Matweede hath shorter smaller and harder rushes, the stalkes are a cubit high, having small thin long spikes, and harder at the toppes then the former: the rootes likewise are long, hard, and somewhat tough, fit to be wrought into little baskets or the like.

Kkkkk

6. *Spar*

1. *Spartum Pini* five *Juncus Hispanicus*.
Spanish Rushes.

2. *Spartum Pini* alterum mollius.
The softer Spanish Rush.

3. *Spartum marinum nostras*.
Our Matweed or Marjoram.

4. *Spartum marinum nostras alterum*.
The other of our Sea Matweeds.

5. *Spartum parvum Batavicum & Anglicum.*
Small Matweede.

6, 7. *Spartum Narbonense & minimum Anglicum.*
The small French and English Matweedes.

6. *Spartum Narbonense.* French Matweede.

The French Matweede hath smaller rounder and whiter leaves or rushes then the last, and closer growing together like unto the smallest and finest sort of rushes, and are about a spanne long apeece, or somewhat more: the small slender stalkes have small single headed whitish spikes on them, smelling like Mosse: the rootes are small short threds.

7. *Spartum minimum Anglicum.* The smallest English Matweede.

The smallest English Matweede hath many small slender round rushes like threds, almost foure or five inches long, growing thicke together, among which the stalkes which are very small, have smaller heads and single like the last, that is consisteth but of one or two small rowes: the rootes are long and yellow, like the former small English sort.

8. *Spartum Basilienae capillaceo folio.* The Germane Matweede.

The Germane Matweede hath sundry rushes rising from the small threddy roote, which divide themselves into soft very fine Rushes, sometimes but halfe a foote long, and sometimes a foote, there hath beene no head or spike found with it as yet.

9. *Spartum variegatum.* Party coloured Matweede.

The round rushes of this Matweede are seldome above foure or five rising from the roote, parted red and Greene, but being transplanted change their beauty, and come all to be of one colour, this was found on the hills by Franckenisse in Germany. The *Spartum Anitricum* of Clusius I have set forth in my former Booke, under the title of *Gramen Plumarium*.

The Place and Time.

The two former sorts grow not onely in Spaine, but in divers Islands belonging thereto, as the Canaries, Madeira, &c. The rest are specified in their titles or descriptions, and doe flourish in the end of Summer.

The Names.

As we have formerly shewed you the *Spartum Gracorum*, which is a shrubby kinde of Broome, so doe I this here, to be called *Spartum latinozum*; or herba to distinguish it from the other. The first is the *Spartum* of Pliny, which was in his time as plentifully growing in Spaine as now, and therefore the Tract thereof was called *Spartarium campis*, wherein new Carthage, called *Carthago* now standeth, and therefore all Writers call it *Spartum* Plinij or herba, onely Dalechampius upon Pliny calleth it *Iuncus Ibericus* sive *Hispanicus*, and Banbinus, *Gramen Spartium primum panicula comosa*. The second is also called *Spartum Plinij*, or herba alterum, by all but Banbinus, who calleth it *Spartum secundum panicula brevi folliculo inclusa*. The third is the *Spartum herba tertia maritimum* of Clusius, who calleth it *Spartum nostras*, meaning his owne Country, but Gerard transferreth this title to our owne Land, and so doe I, for so he and I might very well doe, growing plentifully on the Coasts of Norfolk, and Suffolke, and in other places with us also. The fourth is the *Spartum herba quartum Batavicum* of Clusius, which

Kkkkk 2

Lobel

Lobel calleth *Spartum nostris alterum*, and Bauhinus, *Gramen Spartum spicatum latifolium*. The fifth is the *Spartum nostras parvum* of Lobel and I have added *Anglicum* to it in the title, being to be found with us as well as with them, Bauhinus calleth it *Gramen Spartum luncifolium*. The sixth is the *Gramen Spartum Monspelienfe* of Bauhinus, but it being sent to Doctor Lobel from thence was named as it is in the title, which is not much differing. The seventh was found in our owne Land, and for the smallnesse called *minimum*. The two last are called by Bauhinus, *Gramen Spartum*, with the rest of their titles as I here set them. The Italians, and Spaniards, call it *Sparto*, and the second sort *Alhardi*, The Dutch *Halm*. And we in English, *Helme*, and *Matweede*, but the people all along the Coasts of *Norfolke* and *Suffolke*, call it *Marram*, and may be called *Sea Rushes* as well.

The Vertues.

We know of no use these have in Physicke: but are employed wholly by the Spaniards, in all the places where it groweth (I meane the Spanish kinde) not onely for Mats, small and great, for Chambers, frailes, and baskets sowed with the same stuffe together, or for Bootes, Shoes, Coates, Ropes or Cords, and many other such like uses: but the second in being softer, and not fit for such purposes, are used to fill sackes to serve them for beds, as we doe with straw to lye upon, our Sea kindes are used by diverse, both with us and in the Low Countries for Mats, Hassocks, and diverse other such like meane workes very serviceable.

CHAP. XXXVI.

Equisetum. Horsetaile or rough joynted Rushes.

As a Complement to finish this history of Rushes, let me joyne this unto them, for so I think they may very well be, both for their forme, although differing in roughnesse, joynts, and posture of leaves, as place of growing, whereof there are many sorts, both of the moorish and Vpland grounds, as shall be shewed.

1. *Equisetum majus palustre*. The greater Marsh Horsetaile.

The greater Horsetaile that groweth in wet grounds, at the first springing hath heads somewhat like to those of Asparagus, and after grow to be hard rough, hollow stalkes, joynted at sundry places up to the toppe, a foote high, so made as if the lower part were put into the upper, whereat grow on each side a bush of small long Rush like hard leaves, each part resembling a Horsetaile, whereof it came to be so called, at the toppes of the stalkes come forth small catkins like unto those of trees: the roote creepeth under ground having joynts at sundry places.

2. *Equisetum palustre Linaria scopariae folio*. Broad leaved Horsetaile.

The roote of this Horsetaile creepeth, and is joynted like the former, the stalkes likewise are a cubit high, hol-

1. *Equisetum majus palustre*.
The greater Marsh Horsetaile.

3. 4. *Equisetum palustre minus & alterum brevioribus folijs*.
Small Marsh Horsetaile, and Barren Horsetaile.

5. *Equisetum omnium minus tenuifolium.*
The smallest and finest leaved Horse taile.

7. 8. *Equisetum luncum sive nudum & ramo sum.*
Naked and branched Rush Horse taile.

low and joynted in the same manner, set with leaves after the same fashion but that they are broader then those of Tode Flax, and like almost unto those of Broome Tode Flax. greene rough, long, and easie to breake, what iule or catkins it beareth hath not bene observed.

10. *Equisetum fetidum sub aqua repens.*
Stinking Horse taile.

3. *Equisetum palustre minus.* Small Marsh Horse taile.
This smaller Horse taile differeth not in the manner of growing from the former, the chiefest difference resteth in that it is smaller, and the leaves or bristles as some call them fewer and shorter that are set at the joynts.

4. *Equisetum alterum brevioribus folijs.*
Barren Marsh Horse taile.

This other small Horse taile differeth litle from the last, saving that this is often found not to beare any feede as the others doe, and yet Bauhinus calleth it *Poly spermon*, as being plentiful in bearing feede at the joynts at some times and in some places.

5. *Equisetum omnium minus tenuifolium.*
The smallest and finest leaved Horse taile.

This Horse taile that for the smallnesse and finenesse of the leaves growing in the lower wet grounds in the woods about Highgate not farre from London, deserveth also to be numbred with the rest, growing in the same manner that the others doe, & differing onely in the forenamed parts. This seemeth to differ from that which with Bauhinus in his *Prodromus* is the third calling it *Equisetum palustre tenuissimis & longissimis folijs*, onely in growing higher and the leaves somewhat longer.

6. *Equisetum minus polystachion.*
Many headed Horse taile.

In the joynted and running rootes, in the joynted stalkes and in the catkins that it beareth at the toppes, this Horse taile differeth not from the former small ones: but in this, that at the joynts it beareth three or foure fine small stalkes with a small close spiked catkin on the toppes of them, and a greater at the head of the maine stalkes, more loosely set or more opening then the rest blooming very pale bluish flowers.

7. *Equisetum luncum sive nudum.* Rush or naked Horse taile.

The rush Horse taile groweth up with sundry joynted rough Rushes about a foote high or more sometimes, without any leaves at the joynts, and hereby it is knowne from all the rest, and is more used by sundry workmen.

11. *Equisetum pratense majus*.
The greater meadow Horse taile,

14. *Equisetum montanum Creticum*.
Mountaine Horse taile of Candy.

to smooth and polish their workes of wood and bone then any other: the roote is joynted likewise and creepeth.

8. *Equisetum lanceum ramosum*. Branched Rush Horse taile.

This differeth onely from the last, in growing with many stalkes from the toppes of one, that first riseth out of the ground, and that many of those stalkes doe branch themselves forth into others, all of them full of joynts and without leaves.

9. *Equisetum nudum minus variegatum*. Small party coloured Horse taile.

From a small blackish creeping roote spring up sundry small hollow pale Greene stalkes of a foote and some much lesse high, full of joynts, the lower joynts whereof are blackish and the upper whitish without leaves (yet is most likely to bee the same Mr. Johnson in his Gerard saith hee found with small leaves, and calleth Horse taile Coralline, howsoever this may sometimes seeme to differ both from Gesner and his) at the toppes whereof standeth a small short head, somewhat like a small catkin, the crowne whereof being white hath eight or ten very small sharpe pointed leaves under it, which being troden on will cracke and make a noyle.

10. *Equisetum fetidum sub aqua repens*. Stinking Horse taile.

The stinking Horse taile groweth up both in and out of the water, with sundry branched stalkes, but striped athwart, and set with short leaves at every joynt, having divers small threds growing at spaces on them, Greene while it is in the water, but taken forth and dried it becommeth gray and brittle, easie to be rubbed into poulther with ones fingers, and falling also into poulther of it selfe by lying, and smelling somewhat like unto Brimstone: it groweth not onely in the ditches of the bathes of Aponia neare Padon but in Lusarne and Bassill also. And these be the sorts of Horse taile that delight to grow in waters and wet grounds onely, and are not to be found elsewhere. There are some other sorts that are sometimes found growing although seldome as well in the lower wet grounds as in the uplands, which for their double habitations I thought good to seporate by themselves, and speake of them in the last place.

11. *Equisetum pratense majus*. The great Meadow Horse taile.

For the forme and manner of growing this differeth not from the former but in growing greater and bushing with more flore, and longer leaves then any at the joynts, each leafe being also joynted with little, scarce discernable joynts.

12. *Equisetum arvense longioribus setis*. Corne Horse taile.

This Corne Horse taile groweth very like the last, but greater in bulke although somewhat shorter in leaves, and not joynted at all that ever I could observe, yet I have seene it in Kent and other places growing in the borders of the Corne fields, and often ploughed up when they fallow their grounds, so great, that a stalk hath bene like a small bush.

13. *Equisetum*

13. *Equisetum sylvaticum minus*. Wood Horsetaile.

This small Wood Horsetaile groweth like the rest, but the joynts are farther seperate in sunder, and the leaves being few are somewhat small and long withall, the rootes are like the rest.

14. *Equisetum montanum Creticum*. Mountaine Horsetaile of *Creta*.

This mountaine horsetaile is somewhat like unto the eight sort here before set downe, having divers Rushe stalkes with leaves on them, branching forth both above and below, at severall places whereof come forth small flowers, and after them small long and round reddish huskes containing small seede within them: the roote is small and long.

The Place and Time.

By the titles or descriptions for the most part may the places of all these be knowne where they grow, and needeth not to be here repeated againe: they doe spring up with their blackish heads in *Aprill*, and their blooming eackins in *Iuly*, feeding for the most part in *August*, and then perish downe to the ground, rising afresh in the Spring.

The Names.

The Greekes call it *ἵππων* and *Hippuris* in Latine also by divers, and *Equisetum* or *Cauda equina* which is the same with *Hippuris* of the forme of an Horsetaile, and with the stalke of leaves being turned downe doth resemble by other names it is called as *Equinalis*, and by *Pliny* *Equisetis*, and of some *Salix Equina*, and *Sanguinalis* from the especiall effect it hath to stanch blood. The first is the *Hippuris* major of *Dodonæus* and others, and *Equisetum majus* by *Lebel* and others, *Anguilara* tooke it to be *Cancon* *Pliny*, but that I have shewed you before is another plant that is shubby and liveth: the second *Bauhinus* onely maketh mention of by the same title it beareth: the third is the *Equisetum palustre* of *Lebel* in his *Dutch* booke, the fourth is taken by many to be the *Polygonum* *femina* of *Dioscorides*, and *Pliny* his third *Polygonum* of the many joynts it hath, as *Matthiolus*, *Gesner*, and sundry others, by *Lebel* *Polygonum* *femina* *femine vidua*, and by *Cordus* *Sanguinalis* *femina* and *Limnopena*: the fifth is of our owne land not mentioned as I take it by any auther, although as I there say *Bauhinus* his *Equisetum tenuissimis & longissimis folijs* is somewhat like unto it: the sixth, ninth and tenth are all of *Bauhinus* his demonstration as they are entituled, yet *Lugdunensis* mentioneth the tenth by the name of *Equisetis quintum genus minimum*: the seventh is the first *Hippuris* of *Tragus* and called also by him and *Lugdunensis* *Equisetum luncum*, by *Cordus* *Sanguinalis* *femine similis* and by *Bauhinus* *Equisetum folijs nudum non ramulosum sive luncum ἵππων* *ἵππων*: the eighth is the *Equisetum* of *Matthiolus* and *Lugdunensis* called by *Lebel* and *Dodonæus* *Hippuris minor*, the eleventh is the *Equisetum alterum* of *Matthiolus* *Lugdunensis* and others, the *Hippuris altera* of *Tragus*, *Hippuris fontalis* of *Lebel* and *Equisetum pratense longissimis folijs* by *Bauhinus*: the twelfth is the *Hippuris minor* of *Tragus*, *Polygonum* *femina* of *Fuchsius*, and *Hippuris arvensis* major of *Tabernmontanus* and *Bauhinus*. The Arabians call it *Then ben alcais* *Dhemb alchi* and *Dhaneb alcais*, the Italians *coda di cavallo*, the Spaniards *Coda di mula* and *rabo de mula*, the French *Queue de cheval* and *Prelles*, the Germans *Schafffers*, and *Ross schwantz*, the Dutch *Peert steert*, and wee in *English* generally Horsetaile, and of some Shave grasie, and as I sayd in the beginning by resembling a Rushe might be called rough joynted Rushe.

The Vertues.

Horsetaile the smoother rather then the rough, and the leaved then the bare, is both more used and of better effect in Physicke, and is as *Galen* saith with the bitternesse of a binding qualitie, and dryeth without sharpenesse. It is very powerfull to stanch bleedings wheresoever, eyther inward or outward, the juice or decoction thereof being drunke, or the juice, decoction or distilled water applied outwardly, it stayeth also all sorts of Laskes and Fluxes in man or woman, and the pissing of blood, and healeth also not onely the inward Vicers and excoriations of the intralls, bladder, &c. but all other sorts of foule moist and running Vicers, and scone sodereth together the toppes of greene wounds, not suffering them to grow to maturation: it cureth also Ruptures in children quickly, in the elder by time, according to the disposition of the partie, and the continuance: the decoction hereof in wine being drunke is said to provoke urine, to helpe the strangury and the stone, and the distilled water thereof drunke two or three times in a day a small quantitie at a time, as also to ease the paines in the intralls or gurs, and to be effectuall against a cough that cometh by the destillation of rheume from the head: the juice or distilled water being warmed, and hot inflammations pustules or red wheales and other such eruptions in the skinned, being bathed therewith doth helpe them, and doth no lesse ease the swellings, heare and inflammations of the fundament and privy parts in man or woman. Countrey huswives doe use any of these rough sorts that are next at hand to scoure both their wooden, peuter and brasie vessels, the young buds are dressed by some like *Asparagus*, or being boyled, are after bestrewed with flower and fryed to be eaten.

CHAP. XXXII.

Typha. Cats taile or Reede Mace.

Being next to shew you all the sorts of Reedes, I would set this in the first place to be entreated of, as a meane betwene the Rushe and Reedes, before I come to those are properly called Reedes, whereof there are three sorts.

1. *Typha maxima*. The greater Reede Mace.

This great Reede Mace shooteth forth divers very long, soft and narrow leaves, pointed at the ends in a manner three square, because the middle on the backside is great, and sticketh forth, amongst which rise up sundry smooth round and taper-like stalkes, stuffed and not hollow above a mans height, with joynts and leaves on them, from the lower part upwards a good way, but bare and naked thence to the toppe, where they have small long and round heads, shewing forth at the first some yellowish flowers, which being past the torch or spike groweth greater, and consisteth wholly of a flocky substance, of a blackish browne colour on the outside, somewhat solid

1. *Typha maxima*. The greatest Reede Mace.2. 3. *Typha minor & minima*.
The two lesser sorts of Reede Mace.

or weightie, yet is in time blowne away with the winde: the roote is white somewhat thicke knobbed and joynted, spreading much with many long fibres at it, sweet in taste if it be chewed.

2. *Typha minor*. The lesser Reede Mace.

This differeth in nothing from the former, but in that it attaineth not to that height and greatnesse that the former doth.

3. *Typha minima*. The least Reede Mace.

The least Reede Mace likewise differeth not from the last, but in being smaller both in leafe and stalke, which are more hard or rough, and in the top which in some places beareth a smaller spike above, the lower being greater with a small distance betwene them, and a small leafe at the bottome of it.

The Place and Time.

They doe all grow either in the middle of watery ditches or ponds, or by the bankes and sides of them in many places of this kingdome, and flower about Midsummer, the Torch Mace being ripe in August.

The Names.

It is called in Greeke Τύφω and in Latine *Typha* a cylindro turbinataque spice effugie, quasi typhonis sese gyrantis turbinem, aut gigantis staturam minacem imitatur: aut ut inquit Ruellius, quod scepra regum & clavus argenteus vel aureus, quæ ante primos magistratus gestantur, vulgo a Mace, dictus perpolitus, caulis lanosa floccum densitate, summum fastigiatus emulsetur: some call it *Cestrum morionis* as *Dodonæus* saith, and some *Typha aquatica* or *palustris*, to put a difference betwene it and that kind of *Typha* is put among the Cornes, and therefore called *Typha Cerealis*: *Theophrastus* maketh mention of them both as it is thought, and *Diocorides* but not this one; but *Theophrastus* saith that his *Typha palustris* is without leaves, which therefore cannot agree hereunto *Pliny* also speaketh hereof, lib. 16. c. 36. among the sorts of water Reedes. It hath no other name given it by any author, saving that *Anguilara* tooke it to be *Ulna* and *Dodonæus* calleth it *Papyri species*, and *Lugdunensis* putteth it by the name of *Incanus* after *Dodonæi*: *Dodonæus* seemeth to take this to be that *Scirpus* that *Ovid* in *Sexto Fastorum* mentioneth in these words, in palustro *scirpea* matta fuit: but not onely I but divers others more learned doe doubt thereof, as also that he referreth it to the *Phleum* of *Theophrastus* (but not *Phleus*, for that is a thorny plant, as I have here before shewed) which he numbereth inter *palustria* *Orchomeni*, and *Aristophanes* also as I recited him in the Chapter of the sweete *Cyperus* bringeth in the Frogs rejoicing that they had spent the day inter *Cypirum* & *Phleum*, whose flower *Theophrastus* saith is called *Anthela* as *Dodonæus* saith, but I rather judge it of the fruit; for *Theophrastus* mentioneth both *Typha* and *Phleum*. The second is onely remembered by *Clusius* if it be not the same that *Cerard* saith he saw growing in *Shepey*: the last is called *Typha minor* by *Lobel* in his *Adversaria*, and by *Lugdunensis*, as also *Typhula* and *murina* by *Clusius* in his *Pannonick Observations*. The *Italians* call it *Mazzaforda*, because that if the dust of the heads get into the eares of any it will make them deafe: the *Spaniards* *Beboards* and *Linco* *ma-*

recodace;

rocodaco. The French *Masse de Junc.* The Germanes *Narrenkolben.* The Dutch *Lisch doden.* and *Donsen.* And we in English in divers places Cats taile, and Reede Mace by others: but in being betwene a Rush and a Reede, it might fitly be called Torch rush, or Torch reede: Some also call this as well as the next, by the name of Sedge.

The Vertues.

Matthiolus giveth such a property hereunto, that the pouthier should helpe children when they are bursten, being mixed with Betony, and the rootes of *Gladioll* and Horfe-tongue, but others doe utterly contest against it, to be taken inwardly being too dangerous, in that it would rather strangle then helpe them, for it is usually known and mixed as a baite to kill Mice. *Dioscorides* onely saith that the flocky substance mixed with *Axungia*, is good to heale burnings; it is held by good Authors to be used in the place of the true Paper reede, for those uses it is appointed. It doth moderately cleanse and dry, and being applyed to the bleeding places stancheth blood. The leaves hereof are usually kept to make Mats, and for childrens chaires, and many other the like uses.

CHAP. XXXVIII.

Sparganium. The Burre Reede.

OF this kinde of Reede I have foure sorts to shew you, two whereof are generally remembered by most Writers, a third as the least of them all, is mentioned by *Bauhinnus*: but we have a fourth sort lately brought from *Virginia*.

1. *Sparganium ramosum.* Branched Burre Reede.

This branched Reede hath larger, broader, and rougher leaves then those of the Reede mace, yet three square as it were like them, and sharpe, both at the edges and points, among which riseth a rough round stalke two foote high, with the like but lesser leaves on them, dividing it selfe toward the toppe into sundry branches, bearing on them divers small Greene burres, which are not rough at the first, but growing ripe are hard and prickly, somewhat resembling the rough burres of *Platanus*, the Plane tree, with a leafe at the joynt, up to the toppe, the roote bussheth into many strings and fibres.

2. *Sparganium non ramosum.* Vnbranched Burre Reede.

This other burre Reede groweth up in the like manner, with leaves somewhat broader then the former, and a single lower stalke, not branched at all, but bearing the like balles or burres, but somewhat softer and not so prickly with a leafe at every one of them like wise: the roote also is like the other.

3. *Sparganium minimum.* The least Burre Reede.

This small Burre reede hath a stalke about two inches high, rising from a small roote, composed of a few long

1. *Sparganium ramosum.*
Branched Burre Reede.

1. 2. *Sparganium minus ramosum, & non ramosum.*
Branched and Vnbranched Burre Reede.

Strigos

2. *Sparganium non ramosum.*
Unbranched Burre Reede.

4. *Sparganium majus seu ramosum Virginianum.*
The great branched Burre Reede of Virginia.

strings or fibres, on the toppe whereof standeth a small round head, and another lesse then it thereupon, of the same forme and colour of the former, having foure or five long narrow leaves standing on each side of the stalk, and rising higher then the stalk it selfe.

4. *Sparganium majus seu ramosum Virginianum.* The great branched Burre reede of Virginia.
This kinde of Burre reede hath onely two or three very long and somewhat broad, pale Greene leaves rising from the roote, and in the midst of them a strong round stalk, without any leaves thereon, but branching forth neare the toppe into many round somewhat prickly Burres, of the bignesse of a Wallnut, without any shew of flowers appearing thereon. The roote is somewhat knobby at the head, with divers strings thereat.

The Place and Time.

These Burre Reedes grow in watery ditches, ponds, and rivers usually, or by the sides of them in sundry parts of this Land, except the two last, the one whereof in Germany, the other in Virginia, brought by Mr. Tradescant the younger, they flourish with the Reede mace or thereabouts.

The Names.

It is called in Greeke *Σποργανιον* *quod solis ejus latin & vitilium modo lentis, pro fascijs, nutrices utantur*: in Latine also *Sparganium*, and Xiphidion also as *Dioscorides* saith in his time. The first is called *Sparganium* generally by most Authors, yet *Anguilara*, *Ruellius*, and *Dodonaeus* take it to be *Butomos* *Theophrasti*, *Dodonaeus* also and *Thalium* call it *Platanaria*, because the burres of it as I said are like those of the Plane tree. *Lonicerus* taketh it to be *Carex*, *Lugdunensis* maketh it to be *Phleas femina* of *Theophrastus*. but as I have formerly shewed, there is great difference betwene his *Phleas* and *Phleum*, this last being a moorish plant, and the other a thorny. The second is called *Sparganium alternum* by *Lobel*, *Lugdunensis* and others, and *Platanaria altera* by *Dodonaeus*, who findeth fault with that which *Matthiæus* set forth for *Sparganium*, and saith this without branches doth better agree to *Dioscorides* his description, having burres at the toppe of the stalk. The third *Banhusium* onely maketh mention of, and the last by no other before.

The Vertues.

Galen onely saith that *Sparganium* is of a drying faculty, and *Dioscorides*, that the roote taken in wine is good against the poyson of Serpents.

CHAP. XXXIX.

Papyrus. The Paper Reede.

The ancient Reede called *Papyrus* by *Theophrastus*, *Dioscorides*, *Pliny*, and others, whereof the Paper, and bookes were made, that were used in their and their former times, we may out of their writings describe unto you, if it be the same which *Alpinus* and others say, groweth now in *Egypt*, and they call by that name: however we will shew you what they said it was, and how it grew, and withall shew you how *Alpinus* and others describe it now, and likewise shew you another sort thereof, as it is taken.

1. *Papyrus antiquorum Nilotica.* The Paper Reede of the ancients growing in *Nilus*.

This ancient Paper reede (which *Theophrastus*, & from him *Pliny*, do describe) growing say they not in the depth of the River *Nilus*, but in the pooles of *Egypt*, whereinto the River *Nilus* hath broken out, and in the River it selfe also, yet not in the depth of the streame, but neere the bankes, where the water is onely about two cubits from the shore, or lesse, whose roote is of the thickenesse of a great mans wrist or fist, as he can graspe, (*Pliny* hath an armes thickenesse) about tenne cubits in length, spading divers of the long but small and thicke rootes, above on the toppe of the mudde and earth wherein it groweth, from whence rise three square corned stalkes, (they are in the Text termed *Pappos*, which I so translate, for of leaves they have no mention) of foure cubits bignesse almott, spreading into many parts, and growing smaller to the toppe, where it carrieth an unprofitable bush or tuft, without any fruite or seed. This is *Theophrastus* his relation word for word, as neere as the description could be brought into fence, which *Pliny* hath altered in some things and curtailed in others, setting downe *Thyrus* for *Coma*, they being of different forme, yet *Veslingius* saith the tuft expresly them both, and leaving out *Theophrastus* his foure cubits greatnesse, which is somewhat difficult well to understand and to apply to the purpose: therefore will I here give you the description therof, as *Alpinus* first, and *Veslingius* since hath amended it. It riseth up above the water, from a reede like roote, with many fibres thereat, with sundry three square stalkes, sometimes seven cubits high or more, with a pith in the middle, with leaves both above and below it, the greater that are at the bottome are large (and three square as *Alpinus* saith, but *Veslingius* saith nothing thereof) bending downeward like to the Burre reede or *Cyperus*, the lesser are under the tufts at the toppes, which are composed of divers long and upright threds, set thicke together, and small flowers at the toppes of them, which passe away without seede, as it is thought, for none hath bene observed. This is their exact description of it, so that by comparing them both together, we may say that the roote is like other Reedes, but much greater, that is as bigge as ones wrist or arme, yet not of ten cubits long, for that size I thinke is more proper to the stalkes, from the roote to the toppe of the tuft, the stalkes it selfe (cannot be of foure cubits greatnesse, for that compass exceedeth a great tree but) are about foureteene or fiftene inches compass, which may very well agree to the naturall largest breadth of Paper, which was thirteene inches as *Pliny* recordeth it, which was after it was wetted with the water of *Nilus* and smoothed out, and thereby enlarged, each fold cloven out from the stalkes, those inward being lesser and lesser. The plant say the ancients is sweete and used by the *Egyptians*, before that bread of Corne was knowne unto them for their food, and in their time was chewed and the sweetenesse sucked forth, the rest being spit out, the roote serveth them not onely for fewell to burne, but to make many sorts of vessels to use, for it yielded much matter for the purpose: *Papyrus ipse* (say they) that is the stalkes, as I translated it before, is profitable to many uses, as to make Ships, and of the barked to weave, and make sailles, mats, carpets, some kindes of garments and ropes also.

Papyrus Nilotica Alpina.
The Paper Reede of *Nilus* now growing.

2. *Papyrus Siciliana.* The Paper Reede of *Sicily*.

This other Paper Reede (which may be the *Sari* of *Theophrastus*, mentioned by him, next unto the *Papyrus*, lib. 4. *hystor. c. 9.* which as he saith is very like it but lesse, being three square also) riseth fixe or seaven cubits above the water, having many three square and soft leaves broader and longer then those of *Cyperus* or *Sparganium*: the stalkes are many, full of pithy wooll, smooth and naked, without any leafe unto the toppe, where it beareth a faire large thicke tuft of close set slender stalkes, with small Mossie flowers on the heads of them, and a few short leaves under the tufts, which become fruitelesse, nor bearing any seede: the roote is somewhat long like a reede, with many fibres thereat.

The Place and Time.

The places of both these Reedes are expressed in their titles, the former properly in *Egypt*, and *Syria*, as *Theophrastus* saith, and in *Euphrates* also, neere *Babylon* as *Pliny* saith. The other groweth in *Sicilia*, and as it is thought in *Italy*, and other places, being in growth much lesse then the former; and flourish in the end of Summer.

The Names.

It is called in Greeke *πῦν*, and in Latine *Papyrus* also, the stalk was called *βίβλος* whereof were made *βιβλία*, which the Latines call *Charte* or *libri*, because the translators set *liber*, or *cortex* for *βίβλος*, not knowing otherwise the property of the word, but as *Pliny* sheweth, there was no *Charta* leaves of Paper made of the bark, but of the inner foulds, which they divided into thinne flakes, whereinto it naturally parteth, then laying them on a Table, and moistening them with the glutinous water of the river, they press them, and after dried them in the Sunne, and according to the largenesse thereof was the greater price, but because the later times of that old age, grew to copious in writing and transcribing Bookes, that they could not at any price, get sufficient for their use. *Attalus* as it is thought first at *Pergamus*, invented the skintings of beasts to be dressed and dried, fit to serve that purpose, which ever since have beene called *Pergamene*, sheetes or Bookes of Parchment, for it is said that *Attalus* furnished his Library at *Pergamus* with 200000. volumes, written on this Parchment. This by *Eustachius* & *Guilandinus* de *Papyro* is called *Papyrus ægyptia* sive *Bibulus ægyptia*. The second is called by *Eustachius*, *Bibulus secunda*, by *Guilandinus* *Papyri altera species, quæ Papyrus in Sicilia vocatur*, by *Lobel* *Papyrus Nilotica*, and by *Bartholinus* *Papyrus Syriaca*, and *Siciliana*, and is likely to be that *Papyrus* that *Alpinus* saith, groweth now in *Egypt*, and called *Berd* or *Bardi* by the *Egyptians*, and as I said before, is most likely to be the *Sari* of *Theophrastus*, which some doe thereupon call *Pseudo papyrus*.

The Vertues.

The rootes of the ancient *Papyrus* was much used to be eaten, as is before said, either raw, boyled, or roasted, by the people of *Egypt* in former times sucking the juice, and spitting out the rest as *Theophrastus*, *Dioscorides*, and *Pliny* doe shew, it was used as *Dioscorides* saith, to open the closed mouthes of *Fistules* being put into them, the manner whereof is to take the dryed stalkes of Paper, and to lay them in soake, which being bound about close with a thred, is to be dried againe, and then being unbound is to be put into those *Ulcers*, whose mouthes are too suddenly closed, thereby not easily to be cleansed and healed, which this being put therinto, by the heate and moisture of the *Ulcer*, is caused to swell to that bignesse it had when it was greene, or soaked, making a fairer way for the cure, in which manner also *Guilandinus* in *Papyro*, saith that the *Chirurgions* in *Italy* used the pith in the stalkes of the *Astilum Indicum*, Indian Millet. The burnt ashes thereof were used to stay running *Ulcers*, in any place of the body, but especially those in the mouth. But the ashes of the writing Paper it selfe, that was made of the stalkes performed it better: but whereas now adayes many by mistaking the ancient word *Charta*, doe use the ashes of our Paper, which is made of linnen cloutes, for the same purposes aforesaid, they erre grossely, and besides doe no good at all therewith, but in the stead thereof divers learned men doe advise to take the dryed stalk of *Typha*, to performe the same effect. *Theophrastus* declareth that they formerly used to burne the rootes hereof instead of fewell, as also applyed them to make many sorts of utensils, or household vessels, for they yielded much wood and very good, for as he saith, they made Slips thereof, and of the *Biblos* (which I shewed, the Translators not knowing the true meaning of the word, did turne it into *Cortex*, the bark) the stalk they made sailes, and coverlets, a kinde of garment also, mats, and ropes. *Alpinus* saith that the *Egyptians* use the ashes of the burnt stalkes of this their sort, in the same manner, and to the same purposes that the formed was used to be put unto. And besides, saith that the distilled water of the stalkes is very profitably used to take away the pin and web, and other mists and darknesse happening to the eyes.

CHAP. XL.

Harundo. The Reede.

OF Reedes there are two principall kindes, the one sweete, called *Calamus aromaticus* or *odoratus*, whereof I have spoken in the end of the first Classis of this Booke: the other not sweete, whereof there are many sorts, *Dioscorides* numbred up five, *Nastus* five severall, *Thely* five *Famina*, *Syringias* five *fistularis*, *Donax* five *Cypria*, and *Phragmites* five *Vallatoria*. *Theophrastus* hath many more, and *Pliny* numbred up five and twenty: most of which being knowne onely to us by the dry Canes, I shall give you the figures of some here, and speake of those that are proper to these neerer climates in this Chapter.

1. *Harundo Vallatoria* sive *vulgaris*. Our Common Reede.

Our Common Reede shooteth forth with many great round hollow stalkes, full of joynts, somewhat closely set one unto another, to a great height in some places more then in others, with long and somewhat broad hard greene leaves at each of them, sharpe on both edges and somewhat compassing the stalk, at the bottomes bearing a long and broad spread soft brownish pannicle at the toppe, whose chaffie or downy seede, flyeth away with the winde: the roote is white, hard, round, long, and with divers knobbed joynts therein, running aloope, but not deepe, and shooting up stalkes from divers of the joynts: the whole stalk dyeth and perisheth every yeare, yet is usually cut downe before Winter, when as it is growne white to serve for many purposes.

2. *Harundo Anglica multispida*. Finger Reede.

This rare Reede is like the former, in the manner and greatnesse of growing, differing onely in the leavés, which are each of them halfe a yard long, and two or three inches broad, with sundry great ribbes or veines running along them, and parted at the ends into three or foure parts, some what like unto the Finger Harts-tongue.

3. *Harundo Donax*. The Spanish Reede or Cane.

The Spanish Reede differeth not in the manner of growing from the former, but in the greatnesse, the canes or stalkes being harder, thicker and rising unto two mens height sometimes, whose joynts are more sepeate in sundger, with larger leaves at them, and a larger pannicle at the toppe. Very like here unto are the Reedes that grow

in the *Indies*, but by reason of the greater heate they grow both taller and greater, so that they serve in stead of timber both to build their houses and to cover them.

4. *Harundo Indica variegata*.

The striped or party coloured Reede.

This Reede is in the growing like unto the last, growing in its naturall place as great and as high, although it be not so with us, the chiefest difference herein consisteth in the arge long leaves which are p.ired with white & green like the Ladies Laces or painted grasses but with larger stripes There is another sort hereof growing in *Bengala* which is smaller and more pliable and apt to bend, whereof they make Baskets and many other such pretty things.

5. *Harundo Saccharifera*. The Sugar Cane or Reede.

The Sugar Cane or Reede groweth (naturally both in the East and West *Indies* but planted in sundry warme countries) to bee seven or eight foote high, whose Canes are bigger then ones thumbe, full of a sweete pith, thicke set with joynts and very long but narrow leaves at them, with divers great ribbes in them, the tuft or pannicle at the top is like unto the other but shorter: the roote is not so hard or woody but spreadeth knobbed joynts and heads at them whereby it may be encreased, and is almost as sweete as the Canes; In the naturall places this yeeldeth forth of it selfe oftentimes or else being cut a certaine white juice or liquor which being dried and hardned in the Sunne was called by the ancient writers *Sal Indum* and *Saccharum Indum*, which was used before Sugar was made out of the Canes by boyling.

6. *Harundo ramosa sive Epiglos Lugdunensis*.

Low branched Reede.

The branched Reede hath the lower part of the stalke with short joynts onely without any branches, covered with a yellowish barke, but upwards it shooteth forth branches on all sides, and they againe other lesser branches up to the toppe almost at every joynt, and all of them

1. *Harundo Vallatoria sive vulgaris*. Our common Reede.

4. *Harundo Indica Lacónica variegata*. The party coloured Reede.

LIU

striped

5. *Harundo Saccharifera*.
The Sugar Cane or Reede.

6. *Harundo ramosa* sive *Spigelia*.
Low branched Reede.

7. *Harundo Elegia*, *Sagittalis*, & *farcta*.
The small winging Reede, the Arrow or Dart Reede;
and the greater and better solid Reede.

8. *Arundo graminea aculeata*.
The thorny Reede.

striped athwart, with lines and scales thicke set on them without any leaves that were seene on it, being onely found by chance, in a sacke full of *Coffus* and Ginger as it was brought from *Arabia*.

7. *Harundo minor* five *Elegia*. The small writing Cane. This small Reede may seeme to be the same with the last recited, and so *Lugdunensis* doth take it, correcting *Pliny* where he mentioneth the Reede *Elegia*, that it groweth not high but spreadeth about the ground like a bush, being pleasant to cattle while it is fresh, saying it should be rather *Epigeios*: but *Belonius* in his first booke of Observations and 47. Chapter saith, he found this Reede growing in a valley on mount *Athos*, which the Greeke that was with him called *Elegia*, whereof they made writing pens; as also *lib. 2. c. 86.* in the River *Iorden*, knowing it then as seene before, for throughout all *Turkey* they use no pens made of Goose quills as we doe, and those writing pens which we have seene have beene brought us out of *Turkey* doe declare it to bee a small Cane with joynts like unto other Reedes, hollow like a quill, whereas that *Epigeios* of *Theophrastus* and *Lugdunensis* have greater stalkes and thicker joynts, then that thereof can be made any quill or pen to write withall, wee have yet no further knowledge thereof: this onely let me adde hereunto that none may mistake this for the *Harundo Sagittaria* which is bigger and solid, not hollow.

8. *Arundo graminea aculeata*. The thorny Reede. This Reede shooteth forth thicke and short rootes with fibres at them, from whence extend on the ground many joynted round Reede-like stalkes about a finger thicke, spreading out into branches with small and long leaves set on both sides at distances, whose lower parts being broad compasse the joynts, growing narrow to the end which is very sharpe, hard and thorny; yet it hath neyther flower nor feede that ever could be observed, and is almost without taste or but a little acrimony therein: it groweth in moist grounds and watery places as other Reedes doe.

The Place and Time.

All these sorts of Reedes delight to grow in waters or watery overflowne grounds, the severall countreys are specified in their titles or descriptions, and are all ripe about the end of September.

The Names.

It is called in Greeke *ῥαβδος* and in Latine *Calamus* and *Harundo* or *Arundo* as some writes it, whereof the *mas* according to *Theophrastus* is the *Nastor fasciata*, the solid or stuffed Reede, and the *femina* the hollow. The first is *Phragmites* as *Ruellius* and *Dodonaeus* call it and *Vallis* or *Vallatoria*, as *Lobel*, *Dodonaeus*, *Lugdunensis* and others doe call it, and *Arundo palustris* as *Matthiolus* and *Tabernaemontanus* doe, but *Angulata* call it *Corda femina* *Discoidea*, and *Corda Calamus vulgaris*: the second hath beene onely found with us: the third is called *Arundo domestica* by *Matthiolus* and others, and *Donax* five *Cypria* by *Dodonaeus*, *Lobel* and others, and *Italica* major by *Cappucinus*, for indeede it is one: and the same sort whether it grow in *Italy*, *Spain* or else where, although one country greater and higher then in another, according to the soile and climate: the fourth is probable to me to be the same that *Theophrastus* calleth *Laconica*, although it was entituled *Indica* by them that sent it: the fifth is generally called *Arundo Saccharifera* and *Saccharata* by all that have written of it: the six is as I sayd the *Arundo Epigeios* of *Theophrastus* by *Lugdunensis*, which *Babbinus* calleth *Arundo repens*, for what cause I know not, and *Chamecalamus*, and thinketh it to be that which *Gesner* in *hortis* calleth *Arundo humilis*, and *Copia Elegia* as it was termed by them that had it, but surely the *Epigeios* is differing from the true *Elegia* as I have before shewed: the seaventh is called as I sayd before *Arundo Elegia* by the Grecians with whom it groweth. The last last is so called by *Alpinus* as it is here. The *Arabians* call it *Casab*, the *Italians* *Canna*, the *Spaniards* *Cannus*, the *French* *Canne* and *Roscan*, the *Germans* *Korb*, the *Dutch* *Riet*, and we Reede.

The Vertues.

Galen saith that the rootes have a cleansing quilitie but not sharpe and the leaves also: The fresh leaves bruised, or the rootes applyed to those places that have thornes splinters or the like in the flesh, doe draw them forth in a short space: the same also applyed with vinegar helpeth members out of joynt, and easeth the paines in the loines, the fresh leaves also bruised and applyed unto hot impostumes, inflammations or *S. Antonies fire*, easeth them: the ashes made of the outer rinde of the stalke mingled with Vinegar helpeth the falling of the haire, the same things doe the other sorts of Reedes as well: the flower or woolly substance if it happen into the eares, it sticketh therein so fast as that by no means it will be gotten forth againe, but will procure deafenesse withall: Some have as it is sayd observed, that the Ferne and the Reede are at perpetuall enmitie the one not abiding where the other is, as also the amitie betweene the *Aparagus* and the Reede to thrive wondrous well being planted among Reedes. They are also put to many very necessary matters both to thatch houses, to serve as walles and defence to gardeners in the cherishing of their plants, to Watermen to trim their Boates, to Weavers to winde their yarne on, and divers others uses. The Sugar that is made of the Sugar Reede, hath obtained now a dayes so continuall and daily use, that it is almost not accounted Physicall, because of the temperatenesse of heate and moisture therein, nourishing much and helping coughes and hoarsenesse of the throate, and is used to be put into cooling as well as heating and warming medicines.

PLANTÆ PALVDOSÆ
AQVATICÆ ET MARINÆ
MVSCI ET FVNGI.

MARSH, WATER AND
SEA-PLANTS, VVITH MOSSES,
AND
MVSHROMES.

CLASSIS DECIMAQVARTA.
THE FOVRETEENTH TRIBE.

CHAP. I.

Having declared all the Grasses of the Vplands, with Rushes and Reeds, in the last foregoing Tribe, I thinke it fittest to joyne those other Herbes & Grasses, that grow either in the Marshes or Waters, or neere the Sea side, before I entreate of the other *Maritime* Plants, & then follow on *us supra*.

Trifolium Paludosum.
Marsh Trefoile.

The Marsh Trefoile riseth up with a spongius flexible stalke halfe a yard high or more, with sundry smooth, thicke and somewhat broad darke greene leaves set thereon, at farre distances, three alwayes joyned together, and standing on a long footestalke, from the middle of the stalkes up to the toppes, where commeth forth a long bush or spike of fine pale-blush flowers, each of them consisting of five round pointed leaves, with a long thicke pointed umbone in the middle, which together with the leaves thereof are covered with a fine hairy downe or frize, which addeth the greater beauty to it, after which are past, come small round heads in their places, containing in them brownish yellow seede and bitter: the roote is long and white, creeping in the mud all about, and shooting afresh at the joynts.

The Place and Time.

It groweth onely in wet and moorish grounds, and will not abide out of it, for the stalke doth quickly grow lawcke and withered being broken off from it, it flowreth in *Iuly*, and the seede is ripe in *August*.

The Names.

It is generally called *Trifolium palustre*, or *paludosum*, and is the *Athenianthes* of *Theophrastus*, which he saith groweth

Trifolium paludosum. Marsh Trefoile.

in watery places, whereupon it is called by *Lugdunensis*, (who giveth two figures being all one,) *Menianthes palustris Theophrasti*, which differeth from the *Menianthes* of *Dioscorides*, being the *Trifolium Asphalites* or *bituminosum*. *Dodonæus* taketh it to be *Isopyrum* of *Dioscorides*, by correcting his Text, and yet it will not be, and besides saith, that some called it *Trifolium hircinum*, and others *Fibrinum* as *Tabernmontanus* also doth, who maketh two sorts thereof, *maius* and *minus*, and both names made from the Dutch appellations. The *Germanes* calling it *Biberklee* a *Castore*. And the Low Dutch, *Boex boonen*, but *est fæselum hircinum*. We call it in *English* generally *Marsh Trefoile*, yet some *Marsh Claver*.

The Vertues.

We know of no property in it to be applied as a remedy for any disease, but if you will take it to be *Isopyrum*, because the feede is bitter as *Isopyrum* is, then *Dioscorides* sheweth that the feede is good against the cough, and other griefes of the brest or chest, for as *Galen* saith, it clenseth and cutteth rough and grosse humours, and maketh them the easier to be expectorate or spit forth; it is also good to purge or cleanse the liver, and helpeth those that spit blood.

CHAP. II.

Caltha palustris vulgaris simplex. Common single Marsh Marigold.

He single Marsh Marigold (for I have spoken of the double in my former Booke, although I give you the figure of it here againe) hath divers great broad round deepe greene shining leaves, a little dented about the edges, every one on a long thicke round fleshy stalk by it selfe, among which rise up fat thicke stalkes, a yard high or neere, with some leaves thereon, and at the toppes divers faire great gold yellow flowers, like unto *Crowfoote* flowers, but much larger and shining, the roote is composed of many long strings, which grow deepe in the myre.

The Place and Time.

It groweth onely in waters, and watery ditches, and by their bankes sides, and flowreth somewhat early yet continueth a good while, and is past before the end of *Aprill*.

The Names.

It is generally called *Caltha*, and to put a difference betweene it, and the *Calendula* which is also called *Caltha* it is called *Caltha palustris*. *Tragus* calleth it *Caltha Virgili*, and *Gesner*, *Caltha palustris*, who all saith it was called of some *Ferraria* from the likenesse of the leafe unto an *Horse shoe*, *Cordus* calleth it *Chelidonia palustris*, and *Tabernmontanus* *Populago*, for what cause I know not, nor yet why two sorts, where as they are all one, although

Caltha palustris vulgaris simplex.
Common single Marsh Marigold.

Caltha flore pleno.
The double Marsh Marigold.

lesser or greater in one place then another. The Dutch call it *Dotter bloemen*. And we Marsh Marigolds, of some Countie, and in some Countiees Bootes.

The Vertues.

We have not understood that any hath applied this in Physicke for any grieve or disease.

CHAP. III.

Cotyledon palustris. Marsh Penny wort.

The Marsh or water Penny wort, as some call it, groweth creeping on the ground, with long trailing branches, shooting forth fibres at sundry joyns, and roundish deep Greene leaves, a little hollow in the middle and unevenly dented about the edges, each standing on a small long footstalk, the flowers are very small and white, coming forth under the leaves, the rootes are very small fibres that doe not grow deepe in the ground.

The Place and Time.

It groweth alwayes in wet grounds, marshes or bogges, as on *Hampsteede* heath, and in many other places neere *London*, and flourisheth in *July*.

The Names.

It is called by most Herbaristes in these daies *Cotyledon palustris*, and *aquatica*, *Lobel* call'eth it, *Cotyledon aquatica acris Septentrionalium*, and in his observations maketh a doubt if it be not the *Callitriche* of *Pliny*, but is taxed therefore by *Colonna*, who calleth it *Ranunculus aquaticus umbilicato folio*, making it a *Ranunculus*, as it is most probable, howsoever it be termed *Cotyledon*, from the forme of the leaves. Our Apothecaries as well as they beyond Sea, did use this kinde instead of the true *Umbilicus Veneris*, being deceived in that the forme thereof doth somewhat resemble it, but sure they have amended that error now, in better knowing the true plant. It is called in some Countiees of this Land the *White rot*, because if sheepe feede thereon, it will kill them.

The Vertues.

By reason of the sharpe taste it cannot but be of an hot quality, somewhat like the *Crowfeete*, and therefore requireth respect in the use and not a current tradition, we have no certaine property recorded of it.

CHAP. IV.

Ranunculus palustris. Marsh Crowfoote.

Of this kinde of Crowfoote there are divers sorts, which shall be declared in this place, being reserved for it.

1. *Ranunculus palustris flammens major*. The greater or Marsh Spearewort.

This greater Marsh Spearewort hath a long joyned roote, stored with many blackish fibres from whence riseth up a thicke joyned smooth stalke two foote high, furnished with large and long shining, and smooth thinner leaves then in the next, some being more then halfe a foote long, and two or three inches broad, but smaller up to the toppre, where stand a few pale yellow Crowtoote like flowers, but larger then in others.

2. *Ranunculus palustris flammens minor sive angustifolius*. The lesser Spearewort.

The lesser Spearewort groweth up with more store of sappy Greene stalkes, with longer, thicker, and narrower leaves thereon, and more store of pale yellow flowers, like other sorts of Crowfeete, the seedes that followeth is like other sorts of Crowfeete: the roote is nothing but a bush of shredde or fibres that grow deepe in the mudde.

3. *Ranunculus flammens serratus*. Dented Spearewort.

This other dented Spearewort is altogether like the last, or is the very same but that this is oftentime found, having the leaves dented about the edges in more plenty then in the other, for both of them is often seene, the plaine with some dented leaves, and the dented with some plaine leaves among them.

4. *Ranunculus flammens Bayonensis*. The French Spearewort.

We have had another sort of Spearewort sent us from *Bayon*, growing in their Marshes neere the Sea coasts, whose leaves are long and narrow, sharpe pointed at the ends, the stalke is branched and beareth larger yellow flowers then the last, the rootes are like it.

5. *Ranunculus flammens flore albo minor*. Small white flowered Spearewort.

This little Spearewort hath such like long leaves as the lesser Spearewort hath, standing upon long footstalkes but lesser and narrower by much: the stalke is bare without leaves, saving that at the toppre where the flowers breake forth it hath two small long leaves, the flowers are smaller then the common small sort, but pure white, the seedes and rootes are alike also.

1, 2, 3. *Ranunculus flammulus major, minor & fulvo-ferratus*. The greater and lesser Marsh Crowfoot or Spearwort, and with dented leaves.

4, 5. *Ranunculus flammulus maritimus Bayonensis & alter flore albo*. The French and small white flowered Spearwort.

6. *Ranunculus palustris sardonicus letia*. Round leaved Marsh Crowfoot.

7. *Ranunculus Sardinia lanuginosus*. The true Sardinian Crowfoot.

8. *Ranunculus aquatilis* Hepatica facie.
Water Crowfoote.

9. *Ranunculus Hederaceus aquaticus*.
Water Crowfoote with Ivy leaves.

6. *Ranunculus palustris* Sardinia lexia.
Round leaved Marsh Crowfoote.

This kinde of Crowfoote shooteth forth a round hollow stalke neere halfe a yard high, branching forth into sundry parts, the lower leaves whereof are more round then those above, and are divided, some into three, which are the first and lowest, others into five divisions, and each of them dented about the edges, somewhat like unto Coriander leaves, of a pale Greene colour and smooth, but those up higher on the stalkes and branches are still more and more divided, so that some of the highest have no division or dent in them, at the toppes stand small yellow (yet Cordus saith he hath observed some to beare purplish) flowers, after which cometh a small long round head of many crooked feedes fit together, as in other sorts is to be scene, the rootes are a bush of small white stringe. the whole plant is as sharpe and virulent as any of the other sorts, here or else where described.

7. *Ranunculus palustris* Sardinia lanuginosus. The true Sardinian Crowfoote.

The true Sardinian Crowfoote groweth very like unto the last, but somewhat higher with such like leaves, but more divided and hairy, like a small cotton upon them, in other things there is little or no difference.

8. *Ranunculus aquatilis* Hepatica facie. Water Crowfoote.

The Water Crowfoote shooteth forth from a small threddy roote, a long trailing tender stalke with sundry joynts thereat, at every one whereof that are under the water standeth divers fine jagged or feathered leaves, almost like as if they were fibres, but that they are Greene, but toward the toppe those that grow above the water, have none of those fine leaves at the joynts, or very few, but onely round leaves upon short footestalkes, cut in a little and dented about the edges, and with them come forth likewise small milke white flowers, of five round leaves apeece, with some yellowesse in the middle, after which come small rough heads like a Crowfoote.

9. *Ranunculus Hederaceus aquaticus*. Water Crowfoote with Ivy leaves.

This small Crowfoote groweth up with divers triangular leaves upon slender trayling stalkes, shooting out fibres at the lower joynts, and with the leaves which are sometimes marked with a blacke spot, come forth small knots of yellow flowers likewise upon short footestalkes.

10. *Ranunculus hederaceus* folio aquaticus.
Water Crowfoote with A. cosli leaves.

10. *Ranunculus Hederula folio aquaticum*. Water Crowfoote with Ale-coast leaves.

This Water Crowfoote creepeth likewise, and shooteth fibres at sundry joynts of the stalkes, whereon stand pretty roundish indented leaves, somewhat like unto those of Ale-hoofe, or Ale-coast, having palish flowers, made of five pointed leaves with roundish heads of seed after them.

The Place and Time.

All these sorts of Crowfoote grow in Moorish and wet grounds, and sometimes at the brinckes of Waters, Ponds, and Ditches. The first is scarce to meete with, but the two next, and the two last are plentifully enough in divers places of the Land, the fourth and fifth came out of France, the sixth and seventh, are found likewise in some places, but not so frequent as the other following. They flower in May, and June, and give their seede soone after.

The Names.

The Greeke name *Βαρβακκον*, and the Latine *Ranunculus*, doemost fitly agree to this herbe, in that Frogges have their chiefeft residence where these grow. The first is the *Lingua Plinii* of *Lugdunensis*, which *Thalins* saith *Cordus* called *Ranunculus maritimus*, & *Ranunculus Lanceolatus major* by *Tabernmontanus*. The second is the first *Ranunculus* of *Anguilara*, and the twelfth of *Cordus* in *Historia*, the *Ranunculus flammula* *aquaticus longifolius* of *Lobel*, and *Lugdunensis*, the *Flammula Ranunculus* of *Dodonæus*, the *Ranunculus aquaticus* *apocynifolius* of *Lobel*, & *major* of *Thalins*, and *Lanceolatus minor* of *Tabernmontanus*; some take it to be *Pliny* his *Agolethron*, lib. 21. c. 13. and others his *Emnaphylon*, lib. 27. c. 9. The third is set forth by *Dodonæus* without any description, and by *Lugdunensis* called *Flammula aquatica*. The fourth and fifth have their names in their titles, sufficient for them. The sixth is the *Strumea* & *Apiastrum* of *Pliny*, although he confoundeth the *Melissa*, which is also called *Apiastrum*, in that Bees delight to feede thereon, with this, which is in the lease somewhat like *Apium* (but the next much more) and therefore by some called *Apiumrisus* & *Herba Sarda*, as *Guilandinus* doth; who when he was taken prisoner by Pyrates, and carryed into *Sardinia*, saw this herbe growing plentifully there; it is the *Apium aquaticum* of *Tragus*, and *Apiastrum* of *Cordus* on *Dioscorides*, by *Apuleius* called *Scelerata*, and is the first *Ranunculus* of *Matthioli*, *Gesner*, and others, the first *Ranunculus palustris* of *Cordus* in *historia*, of *Lugdunensis*, *Thalins*, and others, and the *Ranunculus palustris apifolio levis* of *Bauhinus*, but by *Lobel*, *Ranunculus palustris rotundior folio*. The seventh is as I take it the true *Sardonius* of *Dioscorides*, described by him in the second place, and called by some in his time *Apium sylvestre*, and called also *Ranunculus Sardonius* by *Anguilara*, and is the second *Ranunculus* of *Matthioli*, and of *Cordus* in *hist.* *Bauhinus* calleth it *Ranunculus palustris apifolio lanuginosus*. The eight is called by *Lobel* *Ranunculus aquaticus hepatica facie*, and so it is generally called of all Herbarists with us, by *Dodonæus*, *Ranunculus aquatilis*, by *Lugdunensis* *Hepatica aquatica*, and by *Thalins* *Hepatica palustris*, by *Bauhinus* *Ranunculus aquaticus folio rotundo & capillaceo*, who maketh that other of *Cassalpini*, with onely five leaves to be another sort, when as they are both but one, even as that *Trichophyllum* of *Columna* is also. The ninth is called by *Lobel*, and *Gerard* *Hederula aquatica*, who saith he never saw flowers or seede on it, *Lugdunensis* calleth it *Ranunculus Hederaceus Dalechampii*, and *Bauhinus* *Lenticula quincor trifolca*. The last hath not bene mentioned by any before. The Dutch call the first sort *Egelacolen*, because if it creepeate thereof it doth enflame and exulcerate their entrails, which disease they call *Egel*, as *Dodonæus* saith, some call it in *Englisch* Banewort, and others Spereawort.

The Vertues.

These Marsh and Water Crowfoote are no lesse sharpe and exulcerating, then any of the other sorts of *Shag Crowfoote*, and therefore whatsoever hath bene said before of the properties of them, may fitly be applied to these, for any of the remedies there set downe, and any of these may be used, if the other be wanting, either for Plague sores, rough nailes, warts, ulcers, or any foule markes in the skynne, &c. and for preivity, not willing to repeat the same things, expresse in the Chapter of *Ranunculus Crowfoote* before, I referre you thereunto.

CHAP. V.

Pseudo Asphodelus palustris. Marsh or water Asphodill.

Here are two sorts of this Bastard Asphodill the one greater then the other as shall be shewed in the subsequent discourse, for of the other Asphodills I have shewed you their sorts in my former booke although I shew you here some of their figures.

1. *Pseudo asphodelus major*. The greater bastard Asphodill.

The roote of this greater Bastard Asphodill is long and joynted, with many fibres thereat from whence rise up sundry long and narrow leaves like unto Corne Flag, but not so stiffe or hard, and straked downeright, yet compassing one another as they and the Flowerdeluces doe at the bottome, of a deepe Greene colour, among which riseth up a stalke halfe a yard high, with divers short leaves enclosing the stalke as it were with hoes at their bottomes, and at the toppes stand sundry yellow flowers as it were in a spike, each of them made of six leaves a peece, like the other Aspodells with some threds in the middle, after which come somewhat long and square pointed huskes with small blackish seede in them.

2. *Pseudo asphodelus minor folio Indis angustifolia*. The lesser bastard Asphodill.

This lesser Asphodill hath many narrower shorter and fresher smooth Greene leaves, somewhat like unto a narrow leaved Flowerdeluce, but neither so hard nor so thicke, the stalke riseth from among them scarce a foote high, having very few small leaves thereon, and paler yellow small flowers at the roppe of it, which turne into small three square reddish huskes, containing small reddish browne seede within them: the roote consisteth of a few whitish long fibres not spreading farre or much, but increasing into sundry heads.

The Place and Time.

Both these sorts have bene found in our owne land as well as beyond Sea in the marish and wet grounds, the former not onely in *Lancashire* as *Gerard* hath recorded, but in divers other places: and the last likewise by *Egham* not farre from the River side there, and in the West parts of the Land also and in other places, flowing in *June* and *July*, and seede a moneth after.

The

1. *Pseudo-asphodelus major* five palustris.
The greater bastard Asphodill.

Pseudo-asphodelus minor folio iridis.
The lesser bastard Asphodill.

Asphodelus major albus remosus.
The greater white branched Asphodill.

Asphodelus luteus minor.
The Kings Speare.

The Names.

They are called both *Aphodelus luteus palustris* as *Dodonæus* doth the first, and *Pseudo aphodelus* as *Clusius* doth but calleth the last *Aphodelus pumilio folio Iridis*. And although *Bauhinus* hath three sorts, making the *Aphodelus lanceolatus* which *Lobel* saith he had out of Scotland, and saw it likewise in Norway to differ from the first, yet surely he is mistaken therein for it is all one sort.

The Vertues.

Wee have not knowne these used in Physicke for any purpose, but I have had intelligence from my good friend Doctor *Anthony Salter* of *Exeter*, that he having found it in some places neare unto him, could understand of the country people no other name thereof, or propriety appropriate unto it but knavery, which whether they named it so in knavery, or knew any use of knavery in it, I neyther can learne nor am much inquisitive thereafter.

CHAP. VI.

Acorus palustris sive *Pseudoiris* & *Iris lutea palustris*. The yellow water Flag.

The water Flag groweth like the Flowerdeluces, but that it hath much longer and narrower sadde greene leaves joynted together in that fashion, the stalk likewise groweth oftentimes twice as high, bearing small yellow flowers, shaped somewhat like unto the Flowerdeluce, with three falling leaves and other three arched that cover their bottomes, but in stead of the three upright leaves as the flowerdeluces have, this hath onely three short peeces standing in their places, after which succede thicke and long three square heads, containing in each part somewhat big and flat seede, like unto those of the Flowerdeluces: the roote is longer and slenderer then of the Flowerdeluce, of a pale brownish colour on the outside, and of an harte flesh colour on the inner side, with many hard fibres thereat, and very harth in taste. *Lobel* sheweth in his *Adversaria* that there was a great roote brought from *Thebes*, which was taken for *Radix China*, but deceived many in that it was no such thing in effect, for it was in taste astringent, and in the proote not much differing from the former.

The Place and Time.

It usually groweth in watery ditches, ponds, lakes, and moores sides, which are alwayes overflowne with water, as at *Lambeth* in the ditches on the bankes side may be yearly seene, and in many other places, flowering in *July* and ripening its seede in *August*.

The Names.

This is not *Iris* which was called *Iris idest consecratrix* as *Gaza* translate it, but is rather *Pseudoiris* a bastard brother of that stocke: in the former ages of our fathers it was held by many to bee the true *Acorus* of *Dioscorides*, so ignorantly had the world bene trayned for many yeares, untill scruples began to arise in mens mindes, not finding the things answerable to their deliniations in old writers, which caused them in these later times to be somewhat more inquisitive and diligent, to finde out the true and genuine plants, and give them their proper names (and hath it not so fallen out in Divinitie thinke you as you see it hath done in Philosophie) for thereupon although *Bruntellius* call it *Acorus*, yet *Tragus* called it *Adulterinus*, and *Cordus*, *Gesner*, *Matthioli* and others call it *Acorus falsus*, and *Lobel* *Acorus palustris*, *Fuchs* *Turner* and others call it *Gladiolus luteus*, but *Dodonæus* *Pseudoiris*, and others *Iris palustris lutea* which *Clusius* in speaking of the true *Acorus* saith that the most judicious take it to be the *Butomus* of *Theophrastus*.

The Vertues.

The roote of this water Flagge is very astringent cooling and drying, and thereby helpeth all Laskes and Fluxes, whether of blood or humors, as bleedings at mouth, nose or other parts; bloody Fluxes and others of that nature, and womens too abounding courses: the distilled water of the whole herbe flowers and rootes is a soveraigne good remedy for watering eyes, both to bee dropped into them and to have clothes or sponges wetted therein and applyed to the forehead, it also helpeth the spots or blemishes that happen in or about the eyes, or in any other parts: the sayd water fomented on swellings and hot inflammations of womens fore breasts, upon cankers also and those spreading ulcers called *Noli me tangere* doth much good: the same also helpeth such foule ulcers as happen in the privy parts of man or woman or else where.

Acorus palustris sive *Pseudoiris lutea palustris*.
The yellow water Flagge.

Acorus A-
quatunicus.

CHAP. VII.

Tussilago. Coltsfoote or Folefoote.

Coltsfoote shooteth up a slender stalke with small yellowish flowers somewhat earlie, which fall away quickly, and after they are past, come up somewhat round leaves, yet sometimes dented a little about the edges, much lesser, thicker and greener, then thote of Butter burre, with a little downe or freefe, over the Greene leate on the upper side, which may be rubbed away, and whitish or mealy underneath: the roote is small and white, spreading very much in the ground, so that where it taketh, it will very hardly be clesed from it againe, if any little peece be abiding therein, and from thence springing fresh leaves.

The Place and Time.

It groweth in wet grounds usually, yet as well also in the dryer places, and flowreth in the end of February, the leaves beginning to appeare in March.

The Names.

It is called in Greeke *Σάγγω*, and *Tussilago* in Latine, a notissima utilitate quam pre ophthalmicis & tussi vexatis, and in the Apothecaries shops *Farfara*, and *Ungula Caballina*, and of some *Populago*, from the likeresse of the leaves unto the white Popler leaves: many suppose that this may be *Tiphym* of *Theophrastus*, as well as the *Petasites*, in that both of them bring their flowers before their leaves: *Pliny* calleth it *Farranum*, and *Farrugium*. All Authours call it *Tussilago* but *Camerarius* maketh three sorts of *Bechium*, that is this and the *Petasites*, which he calleth *Tussilago major*, and the third he saith is the *Caltha palustris*, which as he thinketh may be used instead of *Tussilago* which is assuredly a great error, the *Caltha* comming neerer to the nature of *Ranunculum*, then *Tussilago*. The *Italians* call it *Farfara*, and *Farsarella*, and *Vnglia di cavallo*. The *French* *Pas de cheval*, and *Pas d'asne*. The *Germanes* *Brandat lettich* quasi *Vitulorum lactuca*, and *Rosrub* that is, *Ungula Caballina*. The *Dutch* *Hors bladeren*, that is foote leafe. And we in *English* *Folefoote*, and *Coltsfoote*, and *Horse hoofe*.

The Vertues.

Coltsfoote while it is fresh is cooling and drying, but when it is dry the cooling quality which remained in the moisture, being evaporate it is then somewhat hot and dry, and is best for those that have thinne rheumes and distillations upon the Lungs causing the cough, thereby to thicken and dry it, as the fresh leaves or juyce, or Syrup made thereof, is fittest for an hot drycough, and for wheefings, and shortnesse of breath: the dried leaves taken as *Tabacco* is in the like manner good for the thinne rheumes, distillations and coughes, as also the roote taken in like sort as *Dioscorides* and *Galen* say. The distilled water hereof simply or with elder flowers and Nightshade is a singular remedy against all hot Agues, to drinke two ounces at a time, and to have some clothes wet therein and applyed to the head and stomack, the same also applyed to any hot swellings or any other inflam-

Tussilago Herba sine flore.
Colts foote without flowers.

Tussilago flores.
Colts foot in flower.

inations

mations doth much good, yea it helpeth that diseale called Saint *Anthones* fire, and burnings also, and is singular good to take away wheales and small pusshes that rise through heate, as also against the burning heate of the piles or of the privy parts, to apply wet clothes therein to the places. *Maribolus* sheweth that in the roote of this Colts foote there groweth a certaine Cotton or white Wool, which being clenfed from the rootes and bound up in linnen clothes and boyled in lye for a while, and afterwards some salt niter added unto it, and dryed up againe in the Sun is the best tinder to take fire, being stroke from a flint that can be had.

CHAP. VIII.

Cacalia. Great and strange Colts foote.

This kinde of Colts foote as I may so call it there are two sorts described by authors which I meant to shew you in this place, and unto them adde another *American* plant which in my opinion cometh nearest unto the others.

1. *Cacalia incana rotundo folio*. Hoary strange Colts foote.

The hoary strange Colts foote hath a long white roote divided into many heads, with many long strings and fibres thereat, of a clammy taste like unto gum *Tragacant*, encreasing thereby much and shooting up many hoary reddish striped stalkes, with large round leaves on them, bigger and thicker then Colts foot, and more woolly also on the upper side, yet with a greenesse to be seene in them, but very woolly and white underneath, with some ribbes and veines in them of a little bitterish unpleasant taste, from among which rise up the striped woolly yet reddish stalkes two or three foote high, having sundry lesser leaves on them, and all of them dented about the edges, branching forth at the toppes into sundry small sprigges of pale purplish flowers made of foure small leaves a peece, with some threds in the middle, which after they have bene a while blowne doe passe away into downe that is carried away with the winde. *Dalechampius* saith that in the middle of the flowers are found hanging downe small white graines like pearles to make it answere to *Plinies* description.

2. *Cacalia glabro folio acuminato*. Smooth strange Colts foote.

This other sort hath as large leaves as the former, but thicker harder greener and smoother and not hoary at all but dented or waved on the edges, and pointed also with the roundnesse and not open at the stalkes as the other, the stalkes are in like manner smooth and striped, bearing the like flowers at the toppes but somewhat paler; the roote also is alike.

1. 2. *Cacalia folio incano rotundo & glabro acuminato*.
Hoary and Smooth strange Colts foote.

3. *Cacalia Americana*.
Colts foote of America.

3. *Cacalia Americana*. Strange Coltsfoote of America.

This stranger riseth up with many round stalkes about a yard high, and two somewhat round but pointed leaves a little dented about the edges, at each joynt of them, the upper leaves being smaller, and little or nothing dented, at the toppes of the stalkes come forth divers branches with pure white flowers, divers small ones, made of five leaves apiece, rising out of each huske, which being past, there succede small long feede, sticking each to a little downe, which are carryed away together with the winde: The roote consisteth of a bush of blackish threds or fibres, which abideth the extremity of the Winter, both stalkes and leaves perishing yearly, but grow brownish at the end, this hath no sent that I could perceive, neither in roote, leafe, nor flower, whatsoever *Cornutus* saith thereof.

The Place and Time.

The two first sorts grow in the vallies of mountaines in sundry places beyond Sea, and by the Bathes, where they want not moisture, but not in our owne Land that as yet I can heare of, and flower and feede in the Summer time: The last in America, both *Virginia* and *Canada*.

The Names.

It is generally taken by all our later Writets to be the *ῥαδιζα* five leaved of *Dioscorides*, which *Galen* calleth *Cacanthum* and not *Cacanthum*, as some copies have it, for he mentioneth not *Cacalia* as *Dioscorides* hath it, yet giveth the same properties to *Cacanthum*, that *Dioscorides* doth to *Cacalia*, which is not usual with him, unless he meane the same thing. These plants are called by no other name then *Cacalia* by any Writer but *Engelmann*, who calleth the second *Trifolago Alpina* five montana *Dalechampij*. *Bauhinus* would make a third sort of these European kinds, but I finde his description so answerable to the first sort, that I thinke it is the very same, and therefore give no further description of it. The last *Jacobus Cornutus* calleth *Valeriana* *Urtica folio flore albo*, because he hath another of that sort with a purple flower, saying the roote smelleth like *Nardus* or *Valeriana*. But I can find no such thing in it, I have called it great and strange Coltsfoote, and not mountaine Coltsfoote, as some have done, because there are other herbs more properly to be called Mountaine Coltsfoote, which grow alwaies on the dryer grounds, as shall be shewed in due place, and these in the moister parts of the mountaines; and because the flowers are white and stand like a *Valerian*, I have therefore as I thinke added it to these *Cacalia's*, for by that name did Master *Trudeant* receive it first from beyond Sea, of whom I received the plant that groweth with me.

The Vertues.

The roote steeped in wine and eaten is good for the cough, and the hoarseness of the throate, which *Galen* confirmeth saying the same of his *Cacanthum*, that it is without sharpenesse and good for the hoarseness. *Dioscorides* addeth that the Pearlike graines which are found in his *Cacalia*, beaten and mixed with a cerote or ointment, doth make the skine smooth, and will stay the falling of the haire as *Pliny* saith.

CHAP. IX.

Lappa five *Bardana*. The Burre Docke.

We have three or four sorts of Burres some greater then others, and some with more woolly heads, as also a strange American sort.

1. *Bardana major vulgaris*. The common Burre Docke.

The common Burre Docke bringeth forth many large hard greene leaves, somewhat like unto the Butter Burre or wild Docke, but more crumpled, and of a darker greene colour on the upper side, and somewhat grayish underneath, among which rise up hard and rough greene stalkes, two or three foote high with many the like but lesser leaves on them, and many branches also, bearing at their toppes divers rough heads or burres, with crooked pointed prickles, apt to sticke on any garment or other thing that toucheth it, out of the toppe of each of them come forth many hard purplish threds, which are the flowers, which after they are faded and past, turne to downe in the heads, and opening themselves shed their grayish feede, like to the Knapweedes, which together with the winde is often carryed away, and often falleth downe on the ground, the roote groweth great and thicke, blacke on the outside and whitish within, sweete and pleasant in taste at the first, but somewhat bitter after. We have had from *Virginia*, and those other Northerly parts, another sort thereof, whose leaves are rounder and smaller, and the burre smaller, harder and with very sharpe hard crooked points, strongly sticking to what it toucheth.

*Altera
Virginia.*

2. *Bardana major rosea*. The Rose Burre.

This Burre differeth in little or nothing else from the former, but in the head, which instead of the prickly burres hath many small greene leaves, set together like a small Rose Plantane, and but little prickly at their endes.

3. *Bardana major lanuginosa capitulis*. The woolly headed Burre.

This also differeth little from the first but onely that the leaves grow not altogether so great, and the heads being smaller are woolly all over, and the prickles not so sharpe or sticking.

4. *Xanthium* five *Lappa minor*. The small Burre.

This small Burre riseth up with a rough crested stalke, about two foote high, with many blackish spets upon them, breaking out into sundry branches, with two much smaller and whiter leaves at every joynt, standing upon long foote stalkes, divided into three parts usually, somewhat like unto a Marsh Mallow leafe, unevenly dented about the edges: at the joynts of the stalke and branches with the leaves towards the toppes of them, come forth small flowers, which abide not long, and after them two or three small close burres, a little pointed at the toppe, wherein lye two or three small lancke feedes somewhat like unto an Oate which fall not out, nor doe the heades open: the roote is small somewhat long and fibrous, perishing yearly.

The Place and Time.

Some of these grow not in our Country that I can learne, but neere *Lipswicke* in *Germany*, which is the Rose Burre, the ordinary is plentifull enough with us by ditches and water sides, and the high wayes likewise, every where

1. *Bardana major vulgaris.*
The Common Burre Docke.

4. *Xanthium five Bardana minor.*
The lesser Burre.

where, but the two last are not so frequent, yet are found in sundry places, and the last in two or three places betwene Tidenham, and Cheshow in the foote way.

The Names.

It is called in Greeke *ἀρκίον* *Arcium* (and not *Αρκίτιον*, for that is *Arctium* a plant with leaves like *Blattaria*, whereof I have entreated in the first Classis of this Worke and the 22. Chapter:) in Latine *Personata*, and *Lappa*, by many: it is called *Bardana* in shoppes. The first is called *Personata* & *Lappa major* by most writers. *Dodonæus* call'd it *Bardana five Lappa major*, *Bauhinnus* *Lappa major Arcium Dioscoridis*. *Tragus* putteth it *inter vitia herbarum*, as he and others doe *Lolium* and the like, *inter vitia frugum*, thinking belike that this is a degeneration from other good Herbes, by reason of the burres, as *Cardus* and *Tribuli* be also accounted as they thought, which is an errour intollerable for Christians to averre, who doe or may learne out of a truer Schoole then *Galen*, or the heathens could, that the sinne of man caus'd God to curse the earth, and to cause it to produce *Cardus* and *Tribulus*, as they are translated, as severall kindes of herbes, even as *Lolium* and the rest are, and each seede bringeth forth its owne kinde, according as God appointed it in the beginning, from the Creation, or mans fall at the least. The second is remembred onely by *Bauhinnus*, under the title of *Lappa major rosea*. The third is called by *Marthiolus*, *Personata five Lappa major altera*, and thinketh it to be the *Perfolata* *Plinij*, for he maketh mention both of *Perfolata* & *Personata* in the same Booke and Chapter, and *Lobel* calleth it *Arctium montanum* an *Perfolata* *Plinij*. *Bauhinnus* calleth it *Lappa major montana capitulis tomentosis five Arctium Dioscoridis*, as *Lobel* doth, whereby it seemeth they confound *Arcium*, and *Arctium* of *Dioscorides* together, which *Dodonæus* before his edition mistooked in him or others: for although *Bauhinnus* applyeth *Arcium* to the former, and *Arctium* to this later, yet these two being so like one to another, and the description of *Arcium* and *Arctium* in *Dioscorides*, so differing both in leafe, seede and roote, I doe wonder how he can make them to agree. The last is assuredly the *Xanthium* of *Dioscorides*, although *Tragus* was doubtfull so to call it, but rather *Lappa minor*, and is called *Phasganion*, and *Phraganion* by *Galen*, but *Marthiolus* and all other Authors since, doe call it *Xanthium*, yet some *Strumaria*, and we generally call it *Lappa minor*, and *Bardana minor*. The Italians call the greater sort *Lappola maggiore*, and the lesser *minore*. And the French *Gressue Glouteron* or *Gleueron*, and *grande Bardane*, and *petit glouteron*. The Germanes *groß kletten* and *klein kletten*. The Dutch *grootte clissen*, and *kleine clissen*. And we in English *great Burre* or *Burde Docke*, *Clote Burre*, and *Ditch burre*: and the lesser, the small *Burde* or *Louie Burre*.

The Vertues.

The Burre leaves are cooling, and drying moderately, and discurrith withall as *Galen* saith, whereby it is good to heale old Vicers and sores: a dramme of the rootes taken with Pine kernels, doth helpe them that spit foule mattery and bloody flegme: The leaves applyed on the places troubled with the shrinking of the sinewes or arteries give much ease: the iuyce of the leaves, or the rootes rather themselves, given to drinke with old wine doth

doth wonderfully helpe the bitings of any serpents, as also of a mad dogge, and if the roote be beaten with a little salt and laid on the place, it will suddenly ease the patient of the paine: the juyce of the leaves taken with hony provoketh urine, and remedyeth the paines of the bladder: the seede being drunke with wine, forty dayes together doth wonderfully helpe the Sciatica: the leaves being bruised with the white of an egge, and laid on any place burnt with fire, doth take out the fire, giveth suddaine ease, and healeth it up afterwards. The decoction of them fomented on any fretting sore or cancker, stayeth the torroding quality, which after must be annointed with an ointment made with the said liquor *Axungia*, niter and vinegar boiled together. The rootes may be preserved with Sugar and taken fasting, or at other times for the said purposes, and for Consumptions, as also for those that are troubled with the stone or laske: the seede is much commended to breake the stone, and cause it to be expelled by Urine, and is often used with other feedes and things for that purpose: The lesser burie feedes as *Galen* saith have a digesting quality in them, and are hot and dry, and thereby good to aswage tumours, the seede or the roote bruised and often imposed on kernels or hard knots in the flesh doth dissolve them: the decoction also of the rootes made with wine, helpeth to consume the hardnesse of the spleene, being fomented warme on the place: the burres being gathered before they be ripe, bruised and laid to sleepe in warme water or wine, and the haire moistened therewith, after they have beene rubbed with a little niter doth make them yellow.

CHAP. X.

Lapathum. The Docke.

THe Docke is of a large extent comprising within it sundry sorts of herbes: some whereof are fit to be planted in Gardens, as being rare and worthy plants, and therefore worthy to have some care and paines bestowed on them, which are entreated of in the second Classis of this Worke: others belong to the Kitchin Garden, as fit for sawce and meate, and such are the Sorrels which are called sowre Dockes, spoken of also before in the sixth Classis of this Worke, and some are found in the fieldes and wet places where they grow, which shall be described in this place. Vnto these also I might adde all the sorts of Spinage, if I had not set them forth in my former Booke, or were of *Bauhinus* minde, that they belonged to this family.

1. *Lapathum acutum majus.* The Red Docke.

The red Docke from a great and long blackish roote on the outside, and somewhat reddish and yellowish within sendeth forth many long hard and narrowish greene leaves, more pointed at the ends then in other sorts, among which riseth up a stiffe hard stalke, three or foure foote high, set with the like leaves, but smaller still up to the top,

1. *Lapathum acutum majus.*
The red Docke. 3. *Lapathum acutum minus.*
The smallest pointed Docke.

4. *Lapathum sylvestris vulgatus.*
The ordinary wilde Docke.

6. *Lapathum rubrosum* sive *Verus Henricus.*
Englisch Mercury.

7. *Hydrolapathum majus.*
The greater Water Docke.

8. *Hydrolapathum minus.*
The lesser Water Docke.

9. *Lapathum maritimum* Fenzl. dum.
The Wrong fented Sea Docke.

10. *Lapathum sanguineum*.
Bloodwort.

and brancheth forth into sundry spriggēs, bearing small reddish flowers, and browne triangular seēde after them.

2. *Lapathum acutum minus*. Small sharpe pointed Docke.

The roote of this Docke is long and slender, parted diversly with small fibres thereat, and of a yellow colour on the inside, the leaves are narrow and long waved in on the edges, as if they were crumpled, the stalks and flowers, with seēde following, is like unto the former, but that they stand not on such long spriggēs, but closer together, some at the joynts, or compassing the stalkes, and others at the toppes, and of a darker colour.

3. *Lapathum acutum minimum*. The smaller pointed Docke.

This small Docke differeth little from the first, for forme and manner of growing, but in the greatnesse, this being much smaller and lower, the roote is small and more yellow.

4. *Lapathum sylvestre vulgatum*. The Common wild Docke.

The common Docke that groweth every where, differeth little from the Garden Docke or Patience, but that the leaves hereof are somewhat broader and rounder at the points, and the rootes more yellow, and of lesse use then it.

5. *Hippelapathum rotundifolium Africanum*. The round leaved Docke of Africa.

This round Docke is very like in the leaves unto the other round leaved Docke, mentioned in the second Classe before, in this worke, but somewhat thicker, the stalks riseth higher, the flower is greenish, and the roote is somewhat round like unto a Turneppe, but yellow both within and without, the whole plant and every part thereof is sweetish without any other manifest taste, and is therefore not cold as the other Dockes are, but hot in the first degree.

6. *Lapathum unguiculatum sive borum Henricum*. English Mercury.

I must needs put this herbe among the Dockes, according as the best Herbarists doe, rather then with the wild *Arraches*, as some others have done, and shew you that it hath divers broad and long thicke fat darke greene leaves, upon long stalkes, pointed at the ends, and double pointed at the bottomes, somewhat like unto Sorrell, the stalkes are many, two foote high, full of leaves, and at the toppes many spikes of greenish flowers, and flat seedes after them, the roote is thicke great and long, and yellow like a Docke: the whole plant is often overspread with a mealy dust, like unto *Arrache*, which hath caused divers to referre it to them.

7. *Hydrolapathum majus*. The greater Water Docke.

This great Water Docke, groweth very like the common wilde Docke, but greater and higher, with larger and longer leaves, and not so round pointed, the rootes also are shorter, and fuller of fibres, and of a darke red colour.

8. *Hydrolapathum minus*. The lesser water Docke.

The lesser Water Docke hath lesser leaves, long and narrow, and lower stalkes, fuller of branches, with flowers and seedes like unto the rest of the Dockes, and so are the rootes likewise, but smaller and full of long stringes and fibres.

9. *Lapathum*

9. *Lapathum maritimum fatidum*. The strong scented Sea Docke

Because *Bauhinus* putteth this herbe among the Dockes not knowing belike whereunto else to referre it, even so must I see more of it, and say with him that the stalke is reddish, a foote high and bending divers waies: the leaves that stand on long footestalkes are somewhat round, and of a darke red colour, sometimes waved about the edges, and winged usually at the bottomes, or with two small peeces like eares: the stalke is parted into many branches, with the like but lesser leaves on them, and a little dented about the edges: at the toppe of the stalke standeth a spike of flowers, composed of foure mossie leaves a peece, after which follow leaved round heads, containing the seede.

10. *Lapathum sanguineum*. Bloodwort.

This Docke, because it is often used as a pot-herbe, is planted in Gardens, yet found wild also, having reddish long leaves, or greenish with red stripes, the rest of the plant coming neereft unto the red Docke, but smaller as the roote is also, yet not so reddish. *Casalpini* mentioneth another sort hereof, with broader and rounder leaves.

Lapathum rubrum Cratoge.

The Place and Time.

All these Dockes except the fifth and the ninth, grow in moist and wet places on the Land, and those other in the like places neer the Sea, that of *Africa* neere *Sophia*, and the other neere *Mompelier*: And beare seede in the end of *August* at the furthest, and some earlier.

The Names.

It is called in Greeke *λαπάθιον* *quod valet exinanire*, & pro ventrem levare usurpatur, the word *λαπάθιον* is used by *Aristotle*, lib. 2, *Physicorum* *ἐν λαπαθίων ἐλαπίδι* *ἢ ὡραὶ ἰ*, id est verbigratia, ambulare, sicut alvi levande gratia. *Lapathum* also, and *Rumex* in Latine. The first is the *Oxylapathum* of *Discozides*, and so called by *Fuchsius*, *Matthiolus*, and others, but it is not the *Oxalis*, for *Discozides* doth distinguish betweene them, the one from the lower juice the other from the sharpe leafe, for *ὄξυς* is referred both to the talfe and forme. *Cordus* on *Discozides* calleth it *Rumex acutus*, *Tragus*, *Lobel*, and *Dodonæus*, *Lapathum acutum*. The second is called by *Bauhinus*, *Lapathum acutum folio crispo*, as *Tabernmontanus* did, whose figure *Gerard* used and called it *Hydrolapathum minus*. The third is so called by *Lobel*, as it is in the title. The fourth is called *Rumex agrestis* by *Cordus*, and *Lapathum folio minus acuto*, or retuso by *Lobel*, *Hippolapathum sylvestre* by *Tabernmontanus*, whose figure *Gerard* using, entituled it *Hydrolapathum magnum*. The fifth was brought us out of *Africa* by *Boel*, who for the likeness of the leaves, and some other respects called it as it is in the title, which we have continued, not knowing where else to place it, untill we have further knowledge of it, then of the dried plant which he brought. The sixth is usually called *Bonus Henricus* by *Matthiolus*, *Brinsfelfius*, *Tragus* and others, *Rumex vesiculosus* also by *Tragus*, and *Rumex* genus by *Fuchsius*, *Tota bona* by *Dodonæus* and *Lobel*, and *Lapathis sylvestris secundum genus* by *Dalechampi*, and by *Bauhinus* *Lapathum vesiculosum*, by *Gesner* *Atriplicis species*, and by *Lonicerus* *Atuplex Canina sylvestris*. The seventh *Tragus* calleth *Rumex palustris*, *Tabernmontanus* *Lapathum palustre*, *Gesner*, *Matthiolus*, and *Dodonæus*, *Hippolapathum sylvestre*, *Lobel* and *Lugdunensis* *Hydrolapathum magnum aquaticum* or *maius*. The eighth is called *Hydrolapathum minus* by *Lobel* and *Lugdunensis*, and not *sativum* as *Bauhinus* setteth it downe in his *Pisax*. The ninth is by *Bauhinus* his appellation so called as it is in the title. The last is called *Lapathum nigrum* by some, and *rubrum* or *rubens* by others, *Sangerius* *draconis herba* by *Gesner* in *hortis*, and *Lapathum sanguineum* by *Lobel*. The *Arabians* call the Docke *Himnath*, and *Hamad*. The *Italians* *Rombice* and *Lapacio*. The *Spaniards* *Labasa*, and *Paradella*. The *French* *Pareille*. The *Germanes* *Amppfer* for the generall word as *Savv amppfer* for *Sorrell*. The *Dutch* *Patsch* and *Peerdick*. And we generally Docke, and then adde the severall denominations as fower Docke or *Sorrell*, wilde Docke, Garden Docke, &c. The *English* *Mercury* is called by the *Germanes* *Goster* *Henrick* and *Schmerdel*, The *Dutch* *Garden Henrick* and *Lammekens bore*. The *French* *Herbe de Charpentier*.

The Vertues.

All the sorts of Dockes have a kind of cooling but not all alike drying quality, for the *Sorrells* are more cold then any of the rest, and the *Bloodwort* more drying, but the seedes of most of them be drying and binding: some of them besides the *Sorrell* were used to be eaten. *Theophrastus* therefore put them *inter oleracea*, and for the most part the leaves were stewed or boyled, and so they did the more easily passe through the belly, without giving either any great or good nourishment, saving a moisture to the body. The seedes of most as I said, either of the Garden or the fieldes, doth stay laskes and fluxes of all sort, and the subversions or loathings of the stomacke through choller, and is as helpfull to those that spit blood. The rootes likewise of the most of them except the *Rhæus* or *Rubarbes*, and the red Docke are drying and binding, conducing to the same effects aforesaid, but all they have an opening quality in them, fit to loosen and make the body soluble, and are therefore of greater use then all the other parts besides, opening the obstructions of the blood, and cooling and cleansing the blood, and helping those that have the jaundice, and for that purpose are our *English*, and *Munkes* *Rubarbe*, the Garden and the wilde red Dockes used with other things to make diet Ale or Beere: the seedes being taken in wine helpeth the birings of the *Scorpion* faith *Discozides* and *Pliny*. The rootes boyled in vinegar, helpeth the itch, scabbes and other brea. kings out in the skinne, if they be bathed therewith, the distilled water of the herbe and rootes tenderh to the same effect, and besides cleanse the skinne of freckles, morpewes, and all other spots and discolourings therein. The *English* *Mercury* as it is called, or good *Henry* the roote is drying and cleansing, the herbe is mollifying and loosening, by reason of the fatnesse or moist slipperinesse therein taken inwardly, but applyed outwardly to woundes and sores, it cleanse the foulness and healeth and closeth them up afterwards wonderfully: The properties of the *Rubarbes*, and the *Sorrells* are severally declared before in their proper places.

CHAP. XI.

Raphanus palustris five *aquaticus*. Water Reddish.

Here are two sorts of herbes entituled Water Reddishes, which I must therefore here set together, and shew you which they are.

1. *Raphanus aquaticus*. Water Reddish.

The Water Reddish riseth up in the water with slender weake and bending stalkes yeelding to and fro, whereon are set at every joynt a long and somewhat broad leafe, very deeply endented or cut in on the edges, unto the middle rib, at the toppe of the stalke commeth forth a small tuft of yellowish flowers, made of foure leaves a peece, after which follow small and almost round pods with round seede in them: the roote runneth in the mudde, shooting out fibres in sundry places. I have thought good to give you both *Bauhinus* his figure hereof, which he saith is more exact then that of *Lobels*, and *Lobels* also but surely *Lobels* life, as both he and I have seene such growing, it seemeth that *Bauhinus* his figure is of another sort, being to the

2. *Raphanus aquaticus* alter. Another Water Reddish.

This other Water Reddish groweth more upright in that it seldome groweth in ponds of water, as the other doth, but in or neere watery ditches to be a yard high or better, with sundry stalkes rising from a long tough white roote, with divers strings and fibres theat, whereon are set many long leaves, much torne or cut in on both edges, at the toppe of the stalkes stand large tufts of whitish or purplish flowers, which turne into short pods and seede in them, not so round as the former.

The Place and Time.

The first groweth as ever but in waters or brookes, or where store of water is continually, the other as well in bottomes neere the waters as in small watery ditches sometimes and flower after Midsummer, the seed ripening above a moneth after.

The Names.

The first is called *Raphanus aquaticus* by *Tabernmontanus* and *Gerard*, and *Bauhinus* addeth in profundas lacinas divisus, (who taketh it may be the *Raphanus* of *Theophrastus*, that is like to Rocket) and *palustris* by *Lugdunensis*, *Lobel* calleth it *Raphanus sylvestris officinarum aquaticus*, and *Dodonaeus* *Radicula sylvestris*. *Casalpinius* called it *Symbrium sylvestre*. The other is the *Rapistrum aquaticum* of *Tabernmontanus* and *Gerard*, which *Bauhinus* calleth

1. *Raphanus aquaticus* *Lobelij*.
Lobels Water Reddish.

2. *Raphanus aquaticus* *Bauhini*.
Water Reddish of *Bauhini*.

Raphanus aquaticus alter, for finding it did better agree with the Reddish then with the Charlocke, he altered the title as I there declare it unto you:

The Vertues.

Neither of both these are properly used in Physicke that I know, yet they both taste somewhat hot in the mouth, and the former Water Raddish more then the other, and therefore I thinke may be used in the stead of Horfe Raddish, to warme a cold stomacke, and to helpe both to provoke urine and to expell winde, for which purpose, the seede is more effectuell then the herbe, and the roote of more force then the seede.

2. *Raphanus palustris* alter. Another water Raddish.

CHAP. XII.

Vaccinium palustre. Marsh Whortes.

MArsh Whorts, hath sundry slender brownish branches like threds, scarce a foote long, creeping upon the ground, and rising from a long white roote, that groweth aslope and not downeright, beset with many small leaves like those of Time, at certaine distances, greene on the upper side, and hoary underneath oftentimes, the flowers rise out from the toppes, set upon long threddy footstalkes, consisting of five reddish leaves, with an umbone in the middle, which turne into round reddish berries, spotted with fine small spots and prickles, with some lancke seedes in them, the berries have a sowerish taste, and the leaves are asfringent.

The Place and Time.

It groweth in Moorish places, where it is often covered with mofse, and flowreth in July, the berries being ripe in August.

The Names.

Dodonæus and *Lobel*, call this *Vaccinia palustris*. *Gesner* in *horii*. *Rosa Alpina* calleth it *Asinnaria palustris*, *Cordus* in his history Fol. 140. *Oxycoccum*: but *Gesner* doubteth it to be another sort from this, and *Bauhynus* *Vitis Idea palustris*, saying it is the third *Vitis Idea* of *Clusius*, wherein he is much mistaken, for he doth but onely name it there, and doth not say that it is the same, as any man that readeth the place may easily understand.

The Vertues.

Dodonæus saith it is good against hot agues, and quencherh the thirst in them, and the heate of choller: it stayeth vomitings, and restoreth a decayed stomicke, that hath lost the appetite by corrupt humours, and doth resist pestilentiall diseases.

Vaccinium palustre. Marsh Whorts.

CHAP. XIII.

Marrubium aquaticum. Water Horehound.

Unto the Water Horehounds I must adjoyne two or three other plants, neereſt thereunto both in face and place, which I referred out from the former Horehounds, to ſet here.

1. *Marrubium aquaticum vulgare.* Our ordinary Water Horehound.

This Water Horehound groweth ſomewhat great and high, with ſtrong ſquare ſtalkes, having two ſomewhat large and long leaves ſet at every joynt, ſomewhat deeply dented about the edges, not hairy or rough at all, but ſmooth and greene: at the joynts with the leaves towards the toppes, ſtand ſmall whitish flowers in rough greene huſkes compaſſing the ſtalkes about: the ſeeds that followeth is blackiſh and round, foure uſually ſet together in the huſke: the roote is a tuft of blackiſh ſtrings.

2. *Marrubium aquaticum alterum.* Hairy Maſh Horehound.

This other Water or Maſh Horehound hath ſquare ſtalkes, but hairy and a little hoary and rough, whereon are ſet leaves by couples, as in the former, hairy hard and hoary, much more cut in on the edges, even to the middle ribbe, making them ſeeme like the leaves of the great Mountaine Scabious, the ends being pointed and ſharpe: the flowers are white and ſmall, ſtanding in rough ſharpe pointed huſkes compaſſing the ſtalkes at the joynts, as the former doth.

3. *Marrubium nigrum fetidum Ballote dictum.* Stinking blacke Horehound.

The ſtinking blacke Horehound hath divers ſquare blackiſh hairy greene ſtalkes riſing from the roote, whereon are ſet upon long foot ſtalkes round durke greene leaves full of veines, a little hairy, and endented about the edges, ſmelling ſomewhat ſtrongly two alwaies at a joynt: the flowers are gaping and of a purpliſh colour, ſomewhat like the red dead Nettle, in greeniſh huſkes compaſſing the ſtalkes as the others doe, the ſeeds like wiſe is blacke and round, and foure ſet together uſually alſo: the roote is blackiſh and threddy. I have found this with white flowers, in the way to Rochefter, halfe a mile from Graveſend.

4. *Marrubium nigrum Creticum.* Candy blacke Horehound.

This blacke Horehound of Candy, hath the firſt leaves that riſe from a ſtringy roote, ſomewhat like unto that of a Primroſe, being many larger and longer then thoſe of the white Horehound, dented about the edges and ſharpe pointed, as big as thoſe of Balme, and of ſo blacke a colour as it may ſeeme to be ſo coloured or dyed by art, and ſo are both the ſquare ſtalkes, and the many like leaves but leſſer that grow together, at the ſeverall joynts of them, up to the toppes, where the flowers ſtand compaſſing them, being in forme like unto thoſe of Horehound, but blackiſh alſo, it is wholly without ſent or taſte.

1. *Marrubium aquaticum vulgare.*
Our ordinary Water Horehound.

3. *Marrubium nigrum fetidum Ballote dictum.*
Stinking Horehound.

The Place and Time.

These doe all grow in moist and wet grounds: the first and third in our owne Country in sundry places. The second in Austria. And the last in Candy. They flower in the Sommer moneths, and give their seede soone after.

The Names.

The first is called *Marrubium aquaticum* by Tragus, Dodonæus, Lobel, and Lugdunensis, or *Marrubium palustre* by others, Matthioli putteth it for the first *Sideritis* of Dioscorides, and so doe Anguilara, Gesner in borti, Lacuna, Camerarius, Thibaut, and Lugdunensis: but Lonicerus and Lobel put it for his second *Sideritis*, Gesner also calleth it *Lancea Christi*, and Bauhinus *Marrubium palustre glabrum*, as he doth the second *palustre hirsutum*. The third is called in Greeke by Dioscorides *Βαλάντι*, and *μυδάριον*, Balote, and *Marrubium nigrum* in Latine, and so most writers doe call it, yet some call it *Marrubium* or *Marrubium spurium* as Lobel doth, and Bauhinus *Marrubium nigrum fetidum*, and Balote. The last is so called by Alpinus as it is in the title, who saith that the seede was sent him from Candy, by the name of *Marrubium nigrum*.

The Vertues.

Galen saith that the blacke Horehound, for there is no use of the others in Physicke, that we know it is of a sharpe and cleansing quality, and being applied with salt, doth heale the bitings of dogges, as Dioscorides before him did set it downe. The leaves heated under the ashes untill they grow yellow, and applied to the hard swellings of the fundament that bleed, being like unto the Hemorrhoides, doe stay the bleeding, and ease the paines, and being used with honey they cleanse foule ulcers.

4. *Marrubium nigrum Creticum*. Candy blacke Horehound.

CHAP. XIV.

Stachys palustris. Marsh bafe Horehound.

His hath square round and hairy stalkes, about two foote high, with two somewhat long and narrow, darke greene leaves, and gray underneath, pointed at the ends, and dented about the edges, with round dents like Betony, set at every joynt, and somewhat a strong unfavoury sent at the upper joynts, with the leaves come forth sundry pale reddish flowers, set in rankes like unto Betony, the roote is somewhat long and thicke, joynted at severall spaces with fibres at them.

Stachys palustris. Marsh bafe Horehound.

The Place and Time.

It groweth in the plashy places, of low grounds, in sundry Countries and blowreth in July.

The Names.

Camerarius calleth it *Stachys palustris* Gesneri, but Gesner himselfe in *Collatione Stirpium*, calleth it *Betonica fetida*, and questioneth whether it should not be the *Herba Indica*: Lugdunensis saith it is *Clymenum minus*, Dalechampy and Thibaut calleth it, *Sideritis prima gravis odoris*, Cesalpinius Terziola, because it cureth a tertian ague, Bessler in the great *hortus Eystetensis*, saith it was called with them *Lyfimachia galericulata adulterina*, and Gerard *Marrubium aquaticum acutum*, yet it is not his *Pinax Coloni*, as some would thinke, which is not of so strong a sent as this, neither is the leafe of this so long, nor rootes so scrobbulous.

The Vertues.

It is a singular good wound herbe, serving both to heale greene wounds, and foule old Vleers, the juyce taken in some drinke an houre before the fit of an ague, will lessen and alter the fit, and at two or three times taking, quite rid it away.

CHAP.

CHAP. XV.

Conyza palustris major. The greater Marsh or water Fleabane.

He roote hereof is thicke and diversly spread, sending forth hollow and crested stalkes three foote high with sundry joynts and branches, bearing two long leaves at each joynt, which are dented about the edges, greene on the upper side, and gray or woolly underneath, at the toppes of the stalkes and branches stand many small yellow flowers together, like unto those of Ragwort, which when they are ripe the seede flyeth away with the winde.

Minor
aquatica.

There is another smaller and lower then this, growing in the like watery places, the leaves will be sometimes much lesse dented or jagged on the edges then in others, the flowers likewise stand not but one on a stalke for the most part and yellow.

The Place and Time.

The place is declared by the titles and description, and their time of flowering and seeding, is the end of Sommer.

The Names.

The former is the *Conyza aquatica* of Gesner in hortis, *Conyza maxima serrati folia* of Thalius: *Lingua major* Dalechampij of Lugdunensis, called *Consolida palustris* by Tabernmontanus, and *Solidago Sarfarnica* by Gerard, according to his figure, but not description. The other is called *Conyza aquatica* both by Thalius and Bauhinus, and that which hath more jagged leaves may be also the *Conyza Helenitis folijs laciniatis* of Lobel.

The Vertues.

This is as effectuell a wound herbe as any is used, and is also as available to all the purposes that the other *Conyza's* are applied, whereunto I referre you for brevities sake.

Conyza palustris. Marsh Fleabane.

CHAP. XVI.

Oenanthe aquatica. Water Dropwort.

Here are two sorts of this Water Dropwort, a greater and a lesser, both which are exhibited by Lobel in his *Icones*, under one title as one would thinke, but distinguished the one by *Oenanthe aquatica*, which is the lesser, the other which is the greater, by *Oenanthe quarta Matthioli*, but confounded in his Observations, both titles being referred to one, which confusion I would avoid, and shew you them both distinctly. The greater hath divers large spread leaves next the ground, among which rise crested thicke hollow stalkes, with leaves on them, cut into longer and finer divisions, bearing white flowers at the toppe, which turne into close umbels of small flat grayish seede, somewhat lesser then Fennell seede, the roote hath sundry small white knobs growing among the strings.

2. *Oenanthe aquatica minor*. The lesser Water Dropwort.

The lesser hath very finely cut small leaves lying on the ground, before the stalke beginneth to rise, which then being carryed up with it scarce seeme to be leaves but rather like the ribbes of leaves, of a darke and shining greene colour, as the stalke is also, which resembleth a Rush very nearely, and below the toppe thereof, which is pointed like a Rush, (and not at the toppe as the figure expresseth it) breaketh forth a small umbell of small whitish sweete flowers, which turne afterward into as small seede as Smalage but blacker, the roote hath many small kernels among the fibres, which are as small as haire or finer.

3. *Oenanthe altera minor Africana*. The small Water Dropwort of Barbary.

This other lesser sort being brought us by Boel from Barbary doth most neerly resemble the last small sort in the fine

1. *Oenanthe aquatica major*.
The greater Water Dropwort.

2. *Oenanthe aquatica minor*.
The lesser water Dropwort.

3. *Oenanthe altera minor Africana*.
The small water Dropwort of Barbary.

fine leaves, but differeth in the toppe, which is at the toppe of the stalk, the tuft being larger and the seede bigger.

The Place and Time.

Both the former grow in wet grounds, neere brookes sides with us in many places, yet will they both endure in Gardens, but are not there so great and large, as in their naturall places: the lesser floweth and feedeth earlier then the other, usually the lesser is past before the greater be in flower, which is not untill August. The last was gathered about Sapphi in Barbary by Boel aforesaid.

The Names.

The greater is the *Oenanthe quarta* of *Matthioli*, exhibited both by him and *Lobel*, separately in the figure, which may be plainly discerned, not to be all one with the other, and as my selfe have observed them in mine owne Garden, *Bauhinus* who as it should seeme knew it not, was deceived by *Lobel* his confounding of the figures and titles. *Lugdunensis* calleth it *Sisyr palmstre*, and *Tabernmontanus* and *Gerard* *Filipendula aquatica*. The lesser is referred by *Bauhinus* to both these sorts to *quarta Matthioli*, and to *Oenanthe aquatica*, which is this of *Lobel*, although expressed in the figure without any kernells to the rootes, if it doe not represent another plant, which both *Dodonæus* and *Lonicerus*, referre to *Sium* or *Laver*, *Dodonæus* calleth it *Iuncus odoratus aquatilis*, I know not by what reason, but onely that the stalk is in colour and fashion not much unlike a *Rush*, but nothing else is like it.

The Vertues.

They are both of them good to provoke urine when it is stopped, and to helpe the Strangury when the vrine passeth away by dropes.

CHAP. XVII.

Limonium. Sea Marsh Buglosse.

E have divers sorts of this *Limonium* to shew you, some whereof have beene set forth by former Authors, and some by none other before now.

1. *Limonium majus vulgatum*. The greater ordinary Sea Marsh Buglosse.

This greater *Limonium* hath sundry faire long thicke or fat Greene leaves, rising from the roote, somewhat like unto small Beete leaves, from among which spring divers brittle naked stalkes, without leaves, neare halfe a yard high, branched at the toppes into sundry partes, whereon stand many small blewish purple flowers, all on one side for the most part, somewhat like unto Buglosse flowers, but smaller, after which come long reddish feede inclosed in the huskes, that the flowers stood in before: the roote is somewhat thicke and long like unto a small red Beete roote.

2. *Limonium medium Anglicum*. The Colchester Marsh Buglosse.

This other sort is like unto the former, but lesser in leaves, and lower in stalkes, being little more then a foote high, the flowers are of the same colour with it, and almost as great, but the roote being reddish is much lesse.

3. *Limonium Narbonense parvum*. The small French Marsh Buglosse.

This small French sort, hath much smaller leaves then the last, being little bigger then Mirtle leaves, lying next to the ground, but those on the stalkes, which are about a foote high, are very small and fine like unto those of Sam-pire, the flowers are smaller then the other, but else like unto them both for forme and colour.

4. *Limonium minus foliis cordatis*. The small Marsh Buglosse of Mompelien.

This small *Limonium* likewise differeth little from the last, but in growing lower, not above sixe inches high at the most, having a tuft of small thicke smooth, and somewhat round leaves next the ground, some of them being not pointed at all, and others having a dent at the end, making them seeme like the forme of a hart, as it is painted on the cardes, the stalkes are some higher and lower then others, bare or without leaves unto the toppes, where they spread into sundry small branches, bending a little backwardes, bearing a number of small reddish flowers.

5. *Limonium minimum*. The smallest Sea Marsh Buglosse.

This least *Limonium*, is scarce foure inches high, having from a small long reddish roote parted at the toppe into sundry heads, a number of small fat roundish leaves thicke set together, in forme and manner of a small House-lecke, the flowers are few and small that grow on the small stalkes, of a faint reddish blew colour.

6. *Limonium Africum*. Sea marsh Buglosse of Africa.

Of this sort there are two or three differences, one low, scarce an handbreadth high, whose stalk is winged, like

1. *Limonium majus vulgatum*.
The greater ordinary Sea Marsh Buglosse.

3. *Limonium Narbonense parvum*.
The small French Marsh Buglosse.

6. *Limonium africanum clausii* & *humile*.
Sea Marth Bugloss of Africa both the higher and lower.

Limonium peregrinum *Rauwolfii*.
Sea Marth Bugloss of Syria or Spaine

unto that of *Rauwolfius*, having leaves on one part and bare at another, which leaves are not long, or indented like it, but somewhat round and a little waved as it were on the edges. Another sort groweth halfe a yard high, with the like winged stalkes, full of branches which are hard rough and woody, and the like leaves on them, as this other lesser sort hath, the flowers of both sorts are of a pale blew colour like unto that of *Rauwolfius*. Both these sorts we had from *Bgel*, as formerly mentioned, taken from the sight of the dried herbes: but we received from him at *Leishbone*, the feedes of two other sorts which were intituled *Lychnitis Conopiaris folio*, and *Limonium Ferule folio*, but because neither of them sprung with us, we can as yet say no more of them.

7. *Limonium congener* *Clusii*.

The hollow leaved strange plant of *Clusius*.

This strange plant hath such strange leaves, as the like are seldom seen in any other that we knowe growing, for they are nine or ten or more, rising from the head of a small long roote, each by it selfe, being small below, and growing greater upward, with a belly as it were bunching forth, and a bowing backe, hollow at the upper end, with a peece thereon like a flappe, and like unto the flower of *Aristolochia*, or *Birchwort*, and round at the mouth like a halfe circle, full of great darke purplish veines on the inside: the whole leafe is of a thicke substance almost like unto leather; among these leaves sprang a stalk but was broken short of, so that what flower or feed it bore could not be observed. This was sent to *Clusius* from *Paris*, by one that received it from *Leishbone* in the same manner. But of late Master *John Tyndescant* the younger, found this very plant in *Virginia*, having his toppe thereon, which he brought home, and groweth with him, which I here shew you with *Clusius* his figure: The leaves are longer narrower and not belying out, and the flower is borne at the top of the roundish seede vessell.

The Place and Time.

All these sorts grow in the wet fieldes neere the Sea, some in our owne land, as the first and second, the other three next them in *France* about *Mompelien*, and *Marselles*, and *Ligorne* also, the sixt *African* kinde, and the other sorts thereof, were brought us by *Boel* often before remembered, from that part of *Africa* that the *Spaniards* doe

7. *Limonium congener* *Clusii*.
The hollow leaved strange plant.

lio.

hold about *Sophia*, and those parts, but the other two sorts there mentioned, hee gathered in *Portingall*. The last came assured from the *West Indies*, for so it was signified by him that sent it, but as I have shewed you in *Virginia* also. The rest flower in the end of Summer, and their seede ripeneth not long after.

The Names.

It is taken to be the *λεμονιον* *λενεσενιδες* of *Dioscorides*, in Greeke so called because it groweth *in παλαιοις*, in *præcis riguis vel palustribus*, and *Limonium* also in Latine. The first is most frequent as well beyond Sea, as on our owne coasts, and these rootes being dryed were sold in former times by counterfettters, for *Benrbrum* to the Apothecaries, as *Guilandinum* and *Gesner* in *hortis* say, *Dodonæus* calleth it *Valeriana rubra similis*, all other Authors call it *Limonium*. The second is of our owne Land found out by Doctor *Lobel*, in the fieldes neere the Sea by *Colchester*, and as *Clusius* saith, may be the same he found about *Valentia* in *Spaine*. The third is the *Limonium parvum* *Narbonense* of *Lobel*. *C. mercurius*, and *Lugdunensis*. The fourth and fifth, are set forth by *Bauhinn* onely in his *Pinnax* and *Prodromus*. The sixth of both sorts were never published before by any. The last is as is before said, remembred by *Clusius* in his History of Plants, and I have here amplified it: but it seemeth to mee that *Lobels Thuris Limpida folium* is this. The *Limonium peregrinum* *Ranwolffij*, I have shewed you in my former Booke, yet I thinke good to give you the figure thereof here with the rest. *Pliny* referreth the *Limonium* unto the *Beetes* and calleth it a wilde *B. etc.*, but *Galen* saith there is no wild sort of the *Beete*. *Gerard* called it in *English* Sea Lavender, but without any other good ground, then that the colour of the flowers is somewhat neere those of Lavender. I have therefore as you see altered the title unto a more proper name as I take it, being in forme and colour most like unto Buglosse.

The Vertues.

The seede of *Limonium* as *Dioscorides* and *Galen* say, is astringent, and so is this *Limonium*, and stayeth the fluxe of the belly, and the stomacke, the spitting of blood likewise, and the abundance of womens courses, the leaves are astringent also, and are good for burning by fire: the water wherein the rootes have beene boyled, doth take away the spots in garments, as also in parchment.

CHAP. XVIII.

Anagallis aquatica, Water Pimpernell.

Here are divers Sorts of this Water Pimpernell to shew you here, for of the Land sorts I have entreated in the fifth Classis of this Worke.

I. *Anagallis aquatica* sive *Becabunga*. Brookelime.

Brookelime sendeth forth from a creeping roote that shooteth forth fibres at every joynnt, as it runneth.

1. *Anagallis aquatica vulgaris* sive *Becabunga*. Brookelime.

neath divers and sundry Greene stalkes, round and fappy with some branches on them, somewhat broad, round, deepe Greene, and thicke leaves set by couples thereon, from the bosome whereof shoote forth long footstalkes with sundry small blew flowers on them, like in forme unto the land Pimpernels, that consist of five small round pointed leaves a peece.

2. *Anagallis aquatica sive Becabunga major*. The greater Brooklime.
This differeth in nothing from the former, but in having larger and rounder leaves, and in the flowers which are of a paler blew colour.

3. *Anagallis aquatica folio oblongo crenato*. Great Water Pimpernell.
There is likewise little other difference in this sort from the former, but in the leaf which is longer pointed, and dented about the edges, and in the flowers, which are of a pale whitish blew colour. There is one also of this *Minor* sort lesser then it, wherein consisteth the difference.

4. *Anagallis aquatica folijs pulegi*. Small round leaved Water Pimpernell.
The leaves of this Water Pimpernell are small and round, like almost unto Pennyroyall, two alwayes at a joynt, upon the stalkes, which are foure square, and beare blew flowers like the land Pimpernell: the white rootes creepe in the ground like the former.

5. *Anagallis aquatica tertia Lobelij folio subrotundo non crenato*. Lobel's third Water Pimpernell.
The roote of this Water Pimpernell runneth not, but is a small bush of white fibres, from whence spring many smooth pale Greene leaves, small at the bottomes, and broad and round at the ends, the stalk is round, about a foote more or lesse high, with divers smaller leaves thereon, set one by one up to the toppre, where breake forth many branched spikes of white flowers.

6. *Anagallis aquatica angustifolia sive quarta Lobelij*. Long Chickweed leaved Water Pimpernell.
This small Water Pimpernell riseth not above halfe a foote high, with divers branches spreading from the weake square stalk, having two small leaves at a joynt, somewhat like unto the greater Chickweede, but somewhat longer: the flowers are white, made of foure leaves a peece, standing on long footstalkes like the first sorts, and small seede in round heads after them.

7. *Anagallis aquatica angustifolia scutellata*. Narrow leaved Water Pimpernell.
The roote of this Water Pimpernell is reddish, fibrous, and creeping, the stalkes are smooth straked, joynted, and a cubit high, having two very narrow and long leaves at every joynt, pointed at the ends without any stalk unto them: at every joynt almost with the leaves come forth small upright branches, winding themselves one within another, as if they had claspers, from whence spring smaller footstalkes on both sides, which sustaine small whitish purple flowers like unto Chickweede, consisting of three leaves a peece, after which succede small flat double pods like a shield, that is, two set together with a thred betwene them, on both sides whereof lie the seede.

5. *Anagallis aquatica tertia Lobelij*,
folio subrotundo non crenato.
Lobel's third Water Pimpernell.

6. *Anagallis aquatica angustifolia sive quarta Lobelij*,
Long Chickweed leaved Water Pimpernell.

The Place and Time.

All these grow in small standing waters, the three first, and the fifth often found in our owne Land, the fourth and the last in Germany, The sixth by Antwerpe. And flower in June and July most usually, giving seede the next moneth after.

The Names.

It is called in Greeke ἀναγallis ἑνδύει, in Latine *Anagallis aquatica*. The first is commonly called *Beacungas*, from the Germane word *Bachpungben*, as is usuall with them to frame Latine words from their owne appellations. *Anguillara*, *Brunfelsius*, *Ericius Cordus*, *Fuchsius*, and others, tooke it to be *Sium* of *Dioscorides*, but very erroneously, and thereupon *Tragus* and *Gesner*, call it *Sium non odoratum*, *Turner*, *Dodonæus*, and *Lugdunensis* take it to be his *Cepæa*, but generally now adaies called *Anagallis aquatica*, and so *Lobel*, *Dodonæus*, and others doe, yet *Tabernmontanus* and *Bauhinus* call it *minor*, because he calleth the next *major*, and *Thalium folio maximo*. The third is called *Berula major* by *Tabernmontanus*, and by *Bauhinus* *Anagallis aquatica major folio oblongo*, as he doth the lesser of this kinde *minor*. The fourth is called by *Tragus* *Sium alterum*, and *Anagallis aquatica*, and by *Bauhinus* *Anagallis aquatica folij pulegij*. The fifth and sixth is called by *Lobel* *Anagallis tertia & quarta*, *Gualandinus* did digressively thinke of the fifth, taking it one while to be *Alisma* of *Dioscorides*, and another while to be *Cochlearia*, but neither truly. Some also tooke it to be *Samolus* of *Pliny*, lib. 25. c. 11. and *Bauhinus* calleth it *Anagallis aquatica folio rotundo non crenato*, but some of the others before have rounder leaves: The last is called by him as it is in the title. The Italians call it *Gorgostrello*. The French *Birle*, from whence rose *Berula*, yet *Marcellus* saith that *Berula* is the Greeke καρδάμων, Cressies. The Germanus as is said *Bachpungben*, and *Wasserpungen*, or *bungen* as *Tragus* hath it. The Dutch *Waterpungben* and *Beekpungben*. And we in English *Brookelime* usually for the first, and *Water Pimpernell* for the rest following.

The Vertues.

Tragus saith that *Brookelime* and *Water Pimpernell*, are both of a moist faculty, yet others say dry, being no lesse heating then *Water Cressies*, and are used both in meate and medicine, as *Water Cressies* are, yet weaker: *Brookelime* and *Water Cressies* are generally used together, much in diet *Beeres* and *Ales*, with other things serving to purge and cleanse the blood and body from those peccant humours, that would overthrow the health thereof, and the *Scurvy* also, for which they are very helpfull: they also helpe to breake the stone, and passe it away by urine, which it provoketh also being stopped, it helpeth likewise to procure womens courtes, and to expell the dead birth, being fried with butter and vinegar, and applied warme, it helpeth all manner of tumours, and swellings and *Saint Anthonies* fire also, if it be often renewed. *Fattyrus* doe much use it about their horses, to take away swellings, to heale the scab, and other the like diseases in them.

CHAP. XIX.

Nasturtium aquaticum. Water Cressies.

N Doe distinguish betweene *Sium* and *Nasturtium aquaticum*, as *Bauhinus* and *Gesner* in *hortis* doe, holding them to be differing kindes of plants and not species ejusdem generis, and therefore entreate of them in severall places, as I also must doe in severall Chapters, and speake of those sorts, that for their likeness unto *Cardamon*, Cressies may be called καρδάμων ἑνδύει, *Cardamon enudron* *Nasturtium aquaticum*: for of the *Cardamines*, which are *Field Cressies*, I have entreated in the seventh Classis of this Worke, one of whose figures I give you here to shew their difference.

1. *Nasturtium aquaticum vulgare. Common Water Cressies.*

Our ordinary *Water Cressies* spreadeth forth with many weake hollow fappy stalkes, shooting out fibres at the joynts and upward long winged leaves, made of sundry broad fappy and almost round leaves, of a brownish Greene colour, the flowers are many and white, standing on long footstalkes, after which come small yellow seed contained in small long pods like hornes, the whole plant abideth Greene in the Winter, and tasteth somewhat hot and sharpe like Cressies.

2. *Nasturtium aquaticum Italicum. Italian water Cressies.*

This differeth little from the former, but in that the stalk is crested, the leaves are cut in a little here and there on the edges, and dented, somewhat resembling *Parsley* leaves, and in the taste of both herbe and seede, more mild and pleasant, the roote likewise creepeth not as the others.

3. *Nasturtium aquaticum amarum. Bitter Water Cressies.*

This sort groweth greater then the first, with longer and more pointed leaves, when it runneth up to stalk, but the first leaves are very large and round, little differing else from the forme, but is so extreame bitter in taste, that none can a way with it to eate it, unless it be boyled in water, and shifted againe into other fresh boyling water, to take away the bitternesse, and so some doe eate it: this is often found growing in Germanie as *Thalium* saith, with the former, and knowne asunder by the greatnesse.

4. *Nasturtium aquaticum minus. Sweete smelling Water Cressies.*

This small *Water Cresse* hath a small long white roote, with some fibres thereat, from whence spring sundry winged leaves made of many much smaller then the former, and somewhat long with the smallnesse, smelling reasonable well: the stalkes have divers white flowers upon them like unto the *Cardamine*, but smaller by much: the feedes are like in such slender pods and of the same taste.

The Place and Time.

All these grow in the small standing waters for the most part, yet sometimes in small rivulets of running water: they flower and feede in the beginning of Summer.

The Names.

The first is generally taken to be the *Sisymbrium alterum* of *Dioscorides*, which as he saith, some called *Sium*, and others *Cardamine*, being so like in taste thereunto, *Matthioli*, *Cesalpini*, and *Tabernmontanus* call it, *Sisymbrium aquaticum*.

1. *Nasturtium aquaticum vulgare.*
Common Water Cresses.

2. *Nasturtium aquaticum italicum.*
Italian water Cresses.

3. *Nasturtium aquaticum amarum.*
Bitter water Cresses.

cardamine. Ladies Smocks.

aquaticum, Cordus, Gesner and Thalys *Sisymbrium alterum*, Fuchsius and Lugdunensis *Sisymbrium Cardamine*: Dodonaeus called it *Sium* and *Laver*, Ericius *Cordus Cresso Laver odoratum*, and Lobel Sion *Cratogeomys folium*: Anguillara tooke it to be *Vella Galeni*, and Tragus, Lonicus, Dodonaeus and Bauhinus call it *Nasturtium aquaticum*, the second *Martholus* calleth *Sium vulgare*, which the Italians as he saith, call *Crescione*, Lobel and Lugdunensis call it *Sium Martholi & Italicum*, and Bauhinus *Nasturtium aquaticum erectum folio longiore*. The third Thalys remembreth in his *Hercynia sylva*, by the name of *Sisymbrium alterius species secunda*, and Bauhinus *Nasturtium aquaticum majus & amarum*. The last is called by Camerarius in his *Epitome* of *Martholus*, *Sisymbrium aquaticum alterum vel minus*, and by Lugdunensis *Cardamine quarta Dalechampi*. The Italians as is before said call it *Crescione*, the French *Cresson deau*, the Germanes *Brunkressen*, the Dutch *Waterkresse*, and we in English *Water Cresses*.

The Vertues.

The Water Cresses are hotter in taste then Brookelime, and more powerfull against the Scurvy, and to cleanse the blood and humours, and for all the other uses whereunto Brookelime is before said to be availeable, as to break the stone, to provoke urine and womens courses: the decoction thereof is said to be good to wash foule and filthy Vicers, thereby to cleanse them and make them the fitter to heale: The leaves or the juice is good to be applied to the face or other parts troubled with freckles, pimples, spots or the like at night, and taken away or washed away in the morning, the juice mixed with vinegar, and the forepart of the head bathed therewith is very good for those that are dull and drowfie, or have the Lethargy.

CHAP. XX.

Sium five *Pastinaca aquatica*. Water Parsnep.

Ivers Writers have made divers sorts of herbes to suite with the *Sium* of *Dioscorides*, some whereof I have shewed you in the Chapter before, the other that are held by the most judicious to be the truest and neerest thereunto shall follow in this.

1. *Sium Dioscoridis* five *Pastinaca aquatica major*. The greater Water Parsnep.
This greater sort riseth up with great hollow and crested stalkes, two or three cubits high, parted into divers branches, whereon stand long wings of leaves made of many long and somewhat broad leaves pointed at the endes and dented about the edges, smooth thicke and sappy, every one whereof is as large as of a Parsnep, the flowers are white and stand in tufts or umbels, after which follow the feede which smelleth well, and is bigger and rounder then *Aniseede*, the roote is blacke with many fibres at the joints thereof, and of the stalke under the Water neere the ground, the whole herbe is somewhat of a strong sweete sent.

2. *Sium minus* five *Pastinaca aquatica minor*. The lesser Water Parsnep.
The lesser sort is very like the former, but lower and lesser, the leaves being long and narrow, and dented also

1. *Sium Dioscoridis* five *Pastinaca aquatica major*.
The greater water Parsnep.

about

2. *Sium minus alterum.*
Another small water Parsneppe.

3. *Sium majus alterum angustifolium.*
Another water Parsneppe with narrow leaves.

about the edges, the flowers are white and the seeds small like the former, the roote likewise is very fibrous, and both it and the leaves smelling strong like *Petroleum*. There is another of this sort lesser then it, whose white flowers stand in rounder tufts then the others.

3. *Sium majus alterum angustifolium.*

Another Water Parsnep with narrow leaves.

The stalkes of this Water Parsnep are hollow like Hemlocke, a cubit or more high, whereon are set sundry winged leaves like the former, but divided into smaller leaves, and closer set together, each of them being dented about the edges, the flowers at the toppes of the branches, are of a pale yellowish Greene colour, which turne into small seeds like unto Parsley, but tasting like Cummin or Candy Dauke seeds, and the Citron rinde, or rather somewhat hotter then they all, the roote consisteth of a number of slender writhed browne fibres, wrapped among themselves, and fastened strongly in the mudd.

4. *Sium minimum Noli me tangere dictum sive Impatiens Nasturtij sylvestris folio.*

The Quicke or Impatient Cresse.

This small plant spreadeth at the first upon the ground many small winged leaves not much above an inch long, which so abide from Autumne that it springeth up all the Winter, and in the Spring growing somewhat bigger, hath the leaves a little dented about the edges, the end leafe for the most part being the biggest, and then rising up with a slender stalke, hath sundry branches from the middle thereof to the toppes, at whose ends grow many very small white flowers with slender long pointed cods after them, and small yellowish seeds within them, when they are ripe, but so hard to be gathered, and impatient to bee touched, that the pod breaketh it selfe upon the least touch of hand or any thing else, and the seed flyeth out presently, it hath little or no taste of heate in it. Mr. George Bowles. A Gentleman of excellent knowledge in Herbariune, gave me the seedes of another sort hereof, as he saith, which he had from another skillfull Gentleman a friend of his, but because I have not yet scene the face thereof, I can passe no further verdict thereon.

4. *Sium minimum Noli me tangere dictum sive Impatiens Nasturtij sylvestris folio.*
The Quicke or Impatient Cresse.

Alterum minus.

The

The Place and Time.

The first as it is thought groweth not with us unless the greatnesse make the difference, but in Germany. For the second which is very like it groweth in Kent in divers pooles, and watery ditches. The third neere Antwerpe as Lobel saith but hath bene found in our Land also. The last likewise in our owne Land. They all doe flower in the end of Summer, and feede before the end of August.

The Names.

It is called *σίσυμβριον* in Greeke, so called *σισυμβριον*, *aconitum* quia quatitur vacillando, *perpetuo succutitur* prater labentibus undis atq; semper alluentibus, unde etiam *laveru* nomen latinis, nisi quis malit ab *urinis calculis* q; *ciendis* & *excutiendis* dictum: it is also called *Sium* in Latine, and *Lavers*. The first is called by *Tabernmontanus*, *Gerard*, and *Bauhinn*, *Sium majus* and *Latifolium*: the second is the *Sium verum* *Dioscoridis* of *Matthioli* *Thalium* and *Lugdunensis* and is the same that *Master Johnson* in his *Gerard* called *Sium majus angustifolium*. It is the *Sium odoratum* of *Thalium*, and *Gesner* in *hortis*: *Fuchs* called it *Sium primum* genus quod & *Laver*, and setteth the figure of *Apium palustre* (following his country name of *Wasser Eppich*, which is the same) to it, thinking they did agree, but was mistaken, *Anguillara* called it *Silium Flexu*, *Cordus* and *Dodonaeus*, *Sium* & *Laver*, and so doth *Lobel*, and addeth *Olusatris folio* sive *aquatica* *Pastinaca*. The smaller of this sort *Camerarius* calleth *Sium verum* in his *Epitome*. The third is called by *Lobel* *Sium alterum* *Olusatris facie*: but *Lugdunensis* and *Bauhinn*, *Sium cruce folio*, *Tabernmontanus* calleth this *Sium majus angustifolium*, and not the former as *Master Johnson* doth. The last was first remembered by *Prosper Alpinus*, in his Booke de plantis exoticis, by the name of *Sium minimum*, but with us as it is in the title. The *Arabians* call it *Rocubalmis* and *Inhamenella*, or *Hamehanella*. The *Italians* as *Cesalpinus* saith, call the *Sium Crescione*, and *Matthioli* saith, they call it *Sio*, and *Gorgolestro*. The *Spaniards* *Rabacas*, as some say, and *Berros* or *Agrivis* as others say. *Tragus* saith the *Germanes* call it *Brannen peterlin*, And we as neerer to the likenesse as I thinke, *Water Parsneppe*.

The Vertues.

Tragus and others, from their Countries erroneous appellations of this plant, tooke it to be the *Elieselinon* *Dioscoridis*, or *Apium palustre*, and therefore attribute all the properties thereof unto this plant, neither have they or any other of our Moderne Writers left in record, any other particular knowne quality in it, more then *Dioscorides* and *Galen* have left us of it, which say it is of so much more heating faculty, as it is sweete in taste, it also digesteth and provoketh urine and womens courses, and breaketh and expelleth both the stone in the kidneys, and the dead birth.

CHAP. XXI.

Eruca aquatica. Water Rocket.

His little herbe which is somewhat like the former *Impatient Cresse*, lyeth or rather creepeth on the ground, with long branches of small winged leaves, somewhat like thereto, but not so much dented on the edges, having but two or three dents for the most part, and yellowish flowers at their toppes, and slender pods following them.

The Place and Time.

It groweth oftentimes neere ditches and water courses, and often also further from them.

The Names.

It hath no other name then is in the title, for any thing I know, not finding it mentioned by any other Author.

The Vertues.

Wee have not heard or found for what grieve this is conduible.

Eruca aquatica. Water Rocket.

CHAP. XXII.

Mentha aquatica. Water Mintes.

Aving shewed you all the sorts of sweete Mintes, that grow in the dryer or Vpland grounds, there remaine yet two other sorts, that grow in Marshes, and wet places, which shall bee shew-
ed here.

1. *Mentha aquatica rubra*. The Red Water Mint.

This Water Mint riseth up from a creeping roote, running or spreading in the Muddy or watery places, with many brownish square stalkes, branched almost from every joynt, with a couple of somewhat broad, yet pointed and dented leaves, many times brownish or reddish, and of a strong sent: the small flowers that are purplish, stand at the toppes of the stalkes and branches, in loose round tufts one above another.

2. *Mentha aquatica sive palustris minor*.

The lesser Water Mint.

This other Water Mint shooteth forth a square reddish hairy stalke, and sometime a little hoary, about a foote high, whereabouts are set soft hairy round and somewhat long leaves two alwaies at a joynt, dented about the edges, of a darke greene colour on the upper side, and grayish or hoary underneath: from the joynts with the leaves come forth long branched stalkes with purplish flowers at the toppes of them, standing in round heads: the whole herbe is of a strong sent.

The Place and Time.

They both grow by ditches and water sides, in the plashy grounds, where they joy best, and flower late in the Summer.

The Names.

The Greeke name *Σισυμβριον*, which *Dioscorides* mentioneth, and many doe call this by, doth more properly belong to the wild Minte *Mentastrium*, then unto this how ever *Lobel* and others call it *Sisymbria Mentha*, for *Dioscorides* hath but one *Sisymbrium*, that is sweete and like Mintes, and that he saith groweth in waste grounds, the other *Sisymbrium* called *Sium*, and *Cardamine*, and like *Nasturtium*, as he saith groweth in watery places as I have shewed before, so that as I said his *Sisymbria Mentha*, is no watery or Marsh plant: it hath beene and yet is beyond Sea called by some Apothecaries, *Balsamina*, as *Tragus* saith, and by others *Balsamita* as *Beleser in hortis Eyslerensis* saith, Our first sort here set downe, is that which *Lobel* calleth *Aquatica Sisymbria Mentha*, and *Gesner in hortis Sisymbrium agreste aquaticum*, and *Calamenchia aquatica*, *Mattbiolin* and *Lugdunensis Sisymbrium sylvestre*, and *Sisymbrium* by many others. The other *Baubinus* onely remembreth by the name of *Mentha rotundifolia palustris minor*.

The Vertues.

There is little set downe concerning these Water Mintes, of any other speciall properties, they hold from the other Mintes being seldome used, because there are so many of the other sorts of Mintes to be had almost at hand every where, yet their strong sweete sent and quicke tastes, doe argue them to be effectuell for many of the purposes whereunto the other Mintes doe serve, especially to kill the wormes, to warme and strengthen the stomacke, to expell winde and helpe those that are splenetick.

CHAP. XXIII.

Dracunculus aquaticus. Water Dragons.

Esides that Water Dragons that many Anthours have written of, *Baubinus* hath given us the knowledge of another from *Brasil*, which for the likenesse he referreth unto the greater Dragons, but I have thought good to make mention of it in this place.

1. *Dracunculus noster aquaticus*. Our Water Dragons.

This hath a creeping roote full of joynts and fibres at every one shooting forth sundry long sheathes or skins, and with them smooth long hollow stalkes five or sixe inches high, with broad round leaves set on them pointed at the ends, bigger then Ivy leaves by much, and of a shining greene colour, from among them alsorte diverse other smooth hollow stalkes of the same height with the leaves or not much higher, bearing at the toppe of every one, a small long head encompassed with many short white threds, which are as the flowers, and with the head such a like leaf as the rest are, but lesse and white on the inside, enclosing the head before it breake open, which

which when it groweth toward ripeness, becommeth cluster fashion like the feede head of *Arum* Wake Robin; greene at the first and red when it is ripe, containing divers huskes, with small and long brownish feede therein;

1. *Dracunculus noster aquaticus*.
Our Water Dragons.

2. *Dracunculus sive Serpentaria Brasiliana triphylla*.

The three leaved Dragons of Brasil.

The stalk only of this Dragons with the leafe and flower on it, as *Bauhinus* saith was brought unto him, and therefore we can describe unto you no more, then that from a stalk that is reddish and crested, riseth the stalke of the leafe which is of an handbreadth long, and smooth, at the top whereof groweth a thin leafe of a whitish green colour, full of veines, and somewhat round, divided into three parts, ending in a sharpe point, the lower parts having each of them an hollownesse at the bottome of them, of two inches and a halfe wide apeece, and above foure inches long, the flower that stood on a three inch stalke was also like unto the greater Dragons, being five inches long, and an inch and a halfe broad, of a darke reddish colour, and striped with many white veines running through the middle, especially on the outside, having also a blackish long pestle in the middle, and twy forked at the end.

The Place and Time.

The first growth in ponds, and lakes of standing waters, but never out of it, and not in any place that I can here of in our Land, flowering in *July*, the berries being ripe in the beginning of *September*.

The Names.

It is called by almost all Writers of herbes, *Dracunculus palustris*, or *aquaticus*, yet *Lobel Anguina aquatica*, and *Fuchsii Hydropiperi rubrum*, *Gesner in hortis Aron palustre*, and is *Pliny* his third *Dracontium*, with a joynted Reede like roote, having as many leaves growing thereon as it is yeares old, and thereon *Bauhinus* calleth it *Dracunculus palustris sive arundinacea radice*. The other is named of *Bauhinus Serpentaria triphylla Brasiliana*. The *Germanes* call it *Wasser schlangenkraut*, and the *Dutch* *Water slangen cruijs*, and *We Water Dragons*.

The Vertues.

It is thought to have the same property that *Arum* hath, but yet lesse effectuell to any purpose.

CHAP. XXIV.

Plantago aquatica. Water Plantaine.

Here are three or foure sorts of Water Plantaine to be declared, some greater and others lesser.

1. *Plantago aquatica major*. The greater Water Plantaine.

The greater Water Plantaine shooteth forth sundry long thicke greene hollow stalkes, with large long greene leaves on them with some shew of ribbes in them, like unto Plantane, but are much greater, stiffer, and longer, and with sharper ends from among which rise up divers tall three square spongy stalkes, parted into divers branches at the toppes, whereon stand a number of white flowers, composed of three leaves apeece, after which follow three square small greene heads, containing the feede: the roote consisteth of a great bush of many long fibres set together.

2. *Plantago minor aquatica*. The lesser Water Plantaine.

The lesser Water Plantaine hath sundry long leaves rising from the roote, fixe times smaller and narrower then the former, from among which rise divers bare stalkes a foote high, bearing a tuft of many bluish coloured flowers, made of three leaves a peece like the former, each standing on a long footestalk, and all rising from one head like an umbell, after which follow rough heads like unto those of the Crowfoote: the roote consisteth of many small white fibres.

3. *Plantago aquatica minor muricata*. The lesser starre Water Plantane.

The starre Water Plantane, hath divers small and long leaves, like those of the Ribbewort Plantane, but much smaller, and turning themselves backewards: the slender naked stalkes which are halfe a foote high or more, beare at their toppes sparfed small tufts of white three leaved flowers, and after them prickly heads, standing out with ends like unto a starre, wherein lye the feede: the roote is a bush of long white fibres.

4. *Plantago aquatica minima Clusij*. The least Water Plantane.

This least Plantane spreadeth it selfe wholly upon the ground, bringing forth sundry small long and narrow leaves, standing on very slender footestalkes, among which come many slender stalkes lying downe on the ground, being not much above an inch long, and ending in a small head, which tending forth small fibres comprehendeth

and

1. *Plantago aquatica major*.
The greater water Plantane.

3. *Plantago aquatica minor muricata*.
The lesser starre water Plantane.

2. *Plantago aquatica minor*. The lesser water Plantane.

and taketh rootē in the ground againe, shooting forth other smaller leaves, among which spring five or sixe small round buttones, (for no flowers were observed) standing on very fine stalkes, opening into two parts, shewing very small seede within them: from among those round buttons grow also other rowes or courses of small heads, bringing forth other smaller leaves and buttons then the former, the rootes are nothing else but very fine threads or fibres.

The Place and Time.

These doe all grow in watery ditches, plashees and ponds of water. The first almost every where through the Land. The second also in divers the like places with us, for *Lobel* saith, *Doctor Penny* shewed it unto him. The third I have gathered in the ditches, on the left hand of the Highway from *Hallowey* to *Highgate*. The last hath no certaine place named where it grew.

The Names.

Most of our later Herbaristes doe call it *Plantago aquatica*, *Fistula pastoris* & *Barba Silvana*, although *Tragus* and *Lobel*, and divers others found it little to agree to, or resemble any Plantane, *Cordus* on *Dioscorides* assuredly meant

OOOO

meant this by his *Potamogeton*, although *Bauhinus* doubteth whether he meant not *Dioscorides Alisma* or *Damaſonion* which is more likely to be *Helleborine*. *Anguillara* tooke it to be *Limonium*, as *Bauhinus* quoteth it, and *Maſter Iohnſon* in his *Gerard* from him, commenting thereon very ſeriously both on the foure Greeke names given to *Limonium*, in *Dioscorides* his text, and the ſeverall parts of the deſcription of this Plantane, concludeth this to be his *Limonium* and no other, being ſo anſwerable thereto in all parts as he ſaith: but ſtay a little, mee thinkes he triumpheth afore the victory, and cannot ſo cleanly carry away the matter, but that there ſeemeth ſome blockes in the way to ſtumble at: and therefore he muſt give us leave to ſcan *Dioscorides* his deſcription thereof, a little more thoroughly: for firſt hee ſaith *Limonium* groweth *in aquis vel paluſtribus* (and therefore *Theophraſtus lib. 7. c. 7.* calleth a kinde of *Anemone Lesmonia*, which *Gaza* tranſlateth *Fremij* genus *Limonium diſtichum*, and by *Cluſius* his judgement is the *Anemone ſylveſtris*, taken from the moiſt fieldes wherein it groweth) but he doth not ſay in *aquas*, where uſually this groweth, and I thinke *Maſter Iohnſon* never ſaw it, but in ponds or ditches of water, which were never dry: then he ſaith his *Limonium* hath longer and thinner leaves then *Beetes*, but this Plantane hath not ſo, and laſtly he ſaith it beareth red ſeeds, which *Maſter Iohnſon* ſhould have found herein, if it had beene the right *Limonium*, but he wiſely concealed it, as making moſt againſt his opinion. Many plants may have ſome reſemblance in forme or name, &c. yet faile in ſome one particular, which quite altereth the whole caſe, as is ſhewed in many places of this Worke, and eſpecially in the *Faba Egyptia* *Dioscoridis* & *Theophraſti*, taken to be the *Egyptian Calcar*, and in *Lobel*s opinion of *Tripolium* to be the *Amellus Virgilij*, and ſo of divers others. And for the other Greeke names, *Neuroidus* is a terme that may be given to any other herbe, whoſe leaves are full of ribbes or nerves. *Potamogeton* & *Louchitis* are ſeverall other herbes, mentioned in *Dioscorides*, and cannot be applied to this, beſides the moſt judicious Tranſlators and Commentors on *Dioscorides*, have judged that multiplicity of names added to the text, to be none of *Dioscorides* his Worke, but thruſt in upon it by ſome other Authour, who might be as barbarous as the names. I leave the reſt to the judicious cenſure of the expert: *Lobel* alſo, and *Lugdunensis* from him taketh this Plantane to be *Alisma* of *Dioscorides*, and ſaith it doth better agree thereto then either *Bifolium* or *Saponaria*, or *Calceolus Marie*, or *Biſtorte*, or *Limonium*, which *Maſter Iohnſon* thought he had forgotten or *Matthiolus* his *Alisma*. The ſecond is called by *Lobel* *Plantago aquatica humilis anguſtifolia*, and *Plantago aquatica minor* by *Ceſalpinus* and *Tabernmontanus*. The third is by *Lobel* alſo called *Plantago aquatica minor altera*, and *Alisma puſillum anguſtifolium muricatum*, by *Lugdunensis*; *Damaſonion ſtellatum*, and by *Bauhinus* *Plantago aquatica ſtellata*. The laſt is called by *Cluſius* *Plantago aquatica minima*, and by *Bauhinus* *Plantaginella paluſtris*.

The Vertues.

It is found to be cold and dry by the aſtringent taſte it carryeth with it, but yet is not knowne to be uſed in Phyſicke to any purpoſe, either of greater or leſſer reſpect.

CHAP. XXV.

Sagitta ſive Sagittaria. The Arrow headed water plant.

Of this *Sagittaria* there are three ſorts obſerved by moſt writers as ſhall be ſhewed.

1. *Sagittaria major latifolia*. The greater Arrow headed water plant.

This greater ſort ſendeth forth ſundry thicke ſquare and ſappy ſtalkes from a thicke buſhy roote of many ſtrings, with great broad greene leaves on the toppes of them, divided at the bottomes, into two long and pointed parts, ſo that the whole ſortme of the leafe reſembleth very well the forked head of the broad Arrow as wee call it, which parts ſtand but little above the waters wherein they grow, be they deeper or ſhallower: from among which riſe up other thicke round ſpongy ſtalkes, higher then the leaves bearing divers rowes of flowers at the joynts, one above another, and three in a row for the moſt part, each whereof is compoſed of three large white leaves with ſundry reddiſh threds in the middle, after which come in their places round rough butres, that are greene when they are ripe, and like thoſe of *Sparganium*, the Butre reede.

2. *Sagittaria minor latifolia*. The leſſer broad arrow head.

This leſſer ſort hath onely leſſer leaves, and flowers, yet broad and of the ſame forme with the precedent, the butres and rootes growing as great or greater then they.

3. *Sagittaria minor anguſtifolia*. Narrow leaved broad arrow head.

This likewiſe diſfereth not from the two former, in the manner of growing, but in the narrowneſſe and length of the leaves which are not of halfe the breadth with the former, yet hold their length, the two lower forked ends being almoſt as long as the forthright leafe, the flowers alſo are leſſe, as are the butres and rootes.

The Place and Time.

All theſe ſorts may be ſeene ſometimes together, in the ſame ditches and waters where they grow, or elſe ſeparate in ſundry places of this Kingdome, and doe flower about Midſommer, their butres being ripe in the beginning or middle of *Auguſt*.

The Names.

It is called in Greeke *μαῖνα*, and as *Pliny* ſaith, *lib. 21. c. 17.* *Magopiſtana* or *Piſtana* *Μαγονῖ*, in Latine *Sagitta*, *Sagittaria*, and *Sagittalis*. *Lobel* hath a quere on the firſt, if it bee not *Stebe femina*, but called *Phleas mas latifolia* by *Lugdunensis*, as he doth the other *Phleas ſive Stebe* *Theophraſti anguſtifolia*: but as I have ſhewed in ſundry places before in this Worke, that *Phleas* and *Phleum* in *Theophraſtus* be differing plants, *Phleum* being a watery plant, growing in the Lake *Orchomenus*, and *Phleas* I have ſet downe in the Chapter of *Poterion*, and proved it I thinke ſufficiently to be the *Stebe* of *Theophraſtus* and *Dioscorides*. *Ceſalpinus* calleth the greater ſort *Barba ſylvana*, and *Dodonæus* ſaith that ſome did call it *Lingua ſerpentis*, and thereupon the Dutch called it *Serpentstouwen*, and the Italians *Gaetta*. But wee in *Engliſh* Water Archer, Arrow head or broad Arrow head as I call it.

1. *Sagittaria major latifolia.*
The greater broad Arrow head.

2. *Sagittaria minor latifolia.*
The lesser broad Arrow head.

The Vertues.

These are held to be of the property of Water Plantane, that is, cold and dry, but *Longdunensis* saith they are cold and moist.

CHAP. XXVI.

Tribulus aquaticus. Water Caltroppe.

Here is a greater and two lesser sorts of this Caltroppe to shew unto you, which are these.

1. *Tribulus aquaticus major.* The greater Water Caltroppe.
This great Water Caltroppe hath sundry broad, and more then halfe round leaves, in some places spotted on the under side, and dented about the edges, set on long footestalkes which rise in the Water from the head of the roote, every one by it selfe, being smaller at the lower end then they are next the leaves, among which rise up sappy round stalkes, no higher then the leaves, bearing whitish flowers at the toppes, and after them thicke, hard and woody, almost round heads, with three or foure sharpe points sticking out, of the bignesse of Hasell nuts in some places and blackish in others, as bigge as a great Walnut, having a sweet white kernell within it like unto a Chestnut: the roote groweth somewhat long and full of joynts with a tuft of haire or fibres at each of them.

2. *Tribulus aquaticus minor prior.* The former small Water Caltroppe.
The former of the two lesser sorts, from a long creeping joynted roote sending forth tufts of fibres at the joynts, as also at the lower joynts of the stalkes shoote forth very long flat slender and knotred stalkes, two or three cubits long, according to the depth of the water wherein it groweth, (which being dried are pliant and flexible, fit for many workes) divided towards the toppes, into many branches, carrying single leaves at the lower joynts, on both sides, being about two inches long and halfe an inch broad, thinne and almost transparent, so waved on the edges, that they seeme to be torne, of a reddish Greene colour for the most part: but those on the branches upwards stand two a waies by couples: from the joynts with the leaves come forth small footestalkes, bearing at their ends small whitish long and thicke flowers, set together in manner of a cluster of Grapes (others have found it with reddish flowers) to every of which when they are false, succcede for the most part foure sharpe pointed graines joynted together, containing a small white kernell within them.

3. *Tribulus aquaticus minor alter.* The other small sort of Water Caltroppe.
There is another small sort hereof, growing usually in the ditches of cleere Water, whose stalkes is not flat but round, bearing leaves at every joynt, shorter and more pointed at the ends, and not crumpled or waved at the edges, bearing also three or foure small flowers at the ends of long footestalkes, somewhat like to those of *Asclepias*.

1. *Tribulus aquaticus major.*
The greater Water Caltroppe.

chatelli Cordis: the fruite or head that succedeth, groweth to be sixe square: the roote is not much unlike the former.

The Place and Time.

I cannot heare as yet that the first is found in any country of this Land, as the two others are: but in sundry Lakes in Germany, as also in Brabant, and in many places in Italy, and neere the Sea also, as *Matthiolus* saith, but flower there and give their fruite in Summer.

The Names.

It is called in Greeke *τριβύλος* & *ἰσος*, and *Tribulus aquaticus* in Latine, *Anguillara* raketh the first to be *Buto-mos Damocratis*, all other Authours call it *Tribulus aquaticus* or *Lacustris* as *Cordus* doth, and the Apothecaries of Venice and other parts beyond Sea *Tribulus marinus*, and the nuts *Castanea aquatiles*. The other two sorts are called by *Clusius* *Tribulus aquaticus minor* and distinguished by him, and by *Eauhinus* referred to the *Potamogeton*, calling them *Potamogeton folijs crispis* sive *Lactuca rana-rum*, and yet his next sort, is verily the former of these two sorts, as by comparing his words may be seene. *Lobel* calleth it *Fortilapathum pusillum*, and *Tragus* maketh it his second *Alga*. Master *Finch*, a London Merchant travelling in the *Mogols* Country, in the East Indies, saw the greater sort growing like a weede, abounding in most rankes or ponds there, whose fruite hee tooke to be the *Hermodactyle*, but was much therein deceived: the kernell of the nut as he saith is much eaten by the Natives and others, called *Singarra* by them, himselfe finding them very cold in his stomacke, that he alwayes after the eating of them desired some *Aqua vita* to warme it againe. You shall find this relation and that of the *Faba Egyptiaca* (as it is extant before in this worke folio 376.) in the fourth Booke of Master *Purchas* his Pilgrims, the fourth Chapter and fifth Section, folio 429. The worthy relations of whose traualles there extant doth not onely in this but

2. *Tribulus aquaticus minor*.
The former small Water Caltroppe.

3. *Tribulus aquaticus minor alter.*
The other small sort of water Caltroppe.

in many other excellent matters declare his industry, whereby many have reaped much profit thereby. I would we had many more such worthy Merchants continually. The *Italians* call it *Tribolo aquatico*. The *French* *Maures* and *Saligot*. The *Germanes* *Wasser nuss*. The *Dutch* *Water noien* and *Minckysers*, and we in *English* *Water Caltrops*, or *Water nuts* or *Saligot* after the *French*.

The Vertues.

The leaves are cooling and repress inflammation being made into a pultis and applied: the juice mixed with hony healeth the Cankers, and sores of the mouth and throate, and the rankenesse of the gummies being gargled, *Pliny* saith that the *Thracians* that inhabit about the river *Strimon*, do fatten their horses with the leaves and make bread of the nut kernels to feede themselves which doth binde the belly.

CHAP. XXVII.

1. *Stratiotes five Militaris Aizoides*. Water Souldier.

He Water Souldier hath divers and sundry long narrow leaves sharpe pointed set close together somewhat like unto the leaves of *Aloes* for the forme, but much lesse and sharply toothed about the edges like it also, from among which rise up short stalkes not much higher then the leaves, and sometimes lower bearing one Greene threeforked head onely at the toppe much like unto a Lobsters claw, which is the huske, out of which commeth a white flower, consisting of three leaves with divers yellowish hairy threds in the middle: under these leaves there is a small short head, broadest next unto the leaves and smallest downe wards, from whence doe proceede sundry long strings, like small wormes (wherewith as *Dodonæus* saith, some crafty men and women leeches putting them into glasses with water to make them shew the greater, make others beleeve that they are wormes which came out of their bodies, to whom they have given medicines for that purpose) which take roote in the middle under the Water.

2. *Stratiotes Aquatica vera Dioscoridi & Egyptiaca*.

The true Water Houfleecke of Egypt.

This Water Houfleecke hath divers large and broad thicke, hard and hairy whitish Greene leaves lying on the water, in three or foure rows, round compassed together, like unto those of the great tree Houfleecke, but greater, the outermost row of them being broadest, and the inner smaller and smaller, *Alpinus* sheweth them to be pointed,

1. *Stratiotes five Militaris Aizoides*.
The water Souldier.

2. *Stratiotes aquatica vera Dioscoridi & Egyptiaca*.
The true water Houfleecke of Egypt.

but *Veslingius* round and plaited, and the ends a litle foulded backwards as *Veslingius* hath it, which I give you here together, this hath not bene observed by either of them what stalkes or flowers it beareth, the roote as *Alpinus* saith is a small thin peece of wooll that hangeth downe from under the leaves which lye on the water like Ducks meate, but *Veslingius* saith it hath smal threddy fibres passing downe to the ground, although *Dioscorides* said it had no rootes, the leaves are of a drying stipricke or astringent taste no lesse then *Acacia*.

The Place and Time.

The first groweth in *Germany*, and the Low Countries also plentifully, and in *Italy* and other Countries also, the other hath bene observed in *Egypt* by *Alpinus* and *Veslingius*, and no where there but in the watery ditches, neere *Damiata* or *Pelusium*.

The Names.

Dioscorides his *Στρατιώτης*, whereunto is added *πυράμις* or *ἐνυδρίς*, that it may be knowne from his *χαλκήλας*, is called by *Matthiolus* *Stratiotes aquaticus* in Latine, and so also by *Lugdunensis*, and is my second sort, here exprest in my judgement rather then the first because the leaves and the posture also doe more resemble *Houfleecke* then the former, which is like unto *Aloes*, although it be called also *Sedum marinum*, and againe, because it hath not bene observed any where but in *Egypt* as I said by *Alpinus* and *Veslingius*, however *Lobel* calleth the former *Stratiotes* sive *Militari* *Aizoides*, and *Dodonaeus* *Stratiotes potamios* & *Sedum aquaticum*. *Bauhinus* placeth the former with the sorts of *Aloes*, and calleth it *Aloes palustris*, and the other he placeth among the *Lenticule*, and calleth it *Lenticula palustris Aegyptiaca* sive *Stratiotes aquatica folijs Sedo majore laetioribus*. *Alpinus* saith that the *Egyptians* call it with them *Hayhalemel maoui*, that is as much to say as *Sedum aquaticum*. It is probable that *Theophrastus* meant this plant, whereunto he giveth no name, speaking thereof in the end of the ninth Chapter of his fourth Booke, growing in ponds like a Lilly with many leaves of a greene colour, &c.

The Vertues.

Each of these are very cooling and drying, and astringent withall, but *Galen* saith it is cold and moist, and as he and *Dioscorides* say stayeth the fluxe of blood that passeth from the kidneys, if it be taken in drinke, *Pliny* addeth thereto some *Olibanum*, it stayeth likewise the swellings of wounds and causeth that they be not enflamed: it helpeth other inflammation called *Saint Antonies* fire, and swellings in other parts, it healeth also all wounds and ulcers, and is good for fistulae or hollow ulcers, *Alpinus* saith that the *Egyptian* women use the juice, decoction or poultice of the herbe, a dramme every morning to stay their courses, or other issues of blood in any other part of the body: as also the Country people use it to heale any wound, in bruising the leaves and laying them thereon, which wonderfully healeth them,

CHAP. XXVIII.

Gladiolus lacustris Clusij sive Lencium palustre flore subcaeruleo Bauhini. Water Gladioll.

His plant that was sent to *Clusius* from *Groning* by a worthy Apothecary there called *Dottman*, found by him in a great pond or Lake of water where no other herbe did grow, besides in the Country of *Drentia*, neere unto a small village called *Norcke* and *Westervelde*, is set downe by him with this description. The leaves doe seldom exceede the length of nine inches, being thicke and hollow severed with a partition like the cods of *Stocke-Gilloflowers*, or the like, but greene and twete in taste, being an acceptable food for the Ducks that dive to the bottome of the water to feede on it, which is diverselles depth under the water: yet the stalk that springeth from among those leaves is seene to rise above the water, furnished with white flowers, larger then those of *Stockgilloflowers*, the hollow and lowest part, which is next to the stalk, being of a blewish colour, somewhat resembling the forme of a *Gladiolus*, or *Corne flagee*, but yet not much like it, consisting of five leaves, the two uppermost whereof doe turne backward to the stalk, the other three which are the larger hang downe: unto these flowers succede round heads or seede vessels broad below and pointed at the end full of seede. This was observed in flower in the end of *July*.

The Place, Time and Names:

Are related in the foregoing title and description, as much as can be said of it,

for although *Clusius* would not alter the name thereof, whereby it was sent, that others might know with what title it came to him. Yet *Banbinus* thinking it better to agree in leaf and flower unto the *Leucoium*, rather chose to call it *Leucoium palustre flore subseruleo*, but I dare not herein follow him, for it hath as little correspondence with the Stocke-Gilliflower, as with the *Gladiolus* or Corne Flagge, neither leaf nor flower being like a Stocke-gilliflower, but in that the leaves are made like the double huske or seede vessell of *Leucoium*, which maketh little resemblance of a plant, but the flowers doe more answer to the forme of the flower of *Gladiolus*, and therefore I so entitle it. And for the Vertues there is none knowne or made to appeare, that the neighbouring people make any use of it in medicine, or any other wayes more then is before said, for the Duckes to feede on.

CHAP. XXIX.

Nymphaea. The Water Lilly.

Here are divers sorts of Water Lillyes both great and small, both white and yellow, as shal be shewed.

1. *Nymphaea alba major vulgaris*. The great common white Water Lilly.
This Water Lilly hath very large, very round and thicke darke Greene leaves lying upon the water (like unto those of *Faba Egyptia* as *Dioscorides* saith, and that very truly as I have shewed before in the Chapter of *Arum*) sustained by long and thicke footestalkes that rise from a great thicke round and long tuberous blacke roote, spongy or loofe and with many knobs thereon like eyes and whitish within, from the miditt whereof rise other the like thicke and great stalkes, fullenning one large white flower thereon Greene on the outside but exceeding white on the inside, as pure snow consisting of divers rowes of long and somewhat thicke and narrow leaves, smaller and thinner, the more inward they be, encompassing a head within, with many yellow threds or thrummes in the middle, where after they are past stand round Poppy like heads full of broad oily and bitter seede.

2. *Nymphaea alba major Egyptiaca sive Lotus Egyptia*. The great white Water Lilly of Egypt.
This other great white Water Lilly, that is entituled of Egypt, sendeth up out of the Water divers faire broad leaves like the former, but somewhat lesser, and more waved about the edges, and with more veines in them lying on the superficies of the water, as they doe upon severall footestalkes also: the flowers also are faire large, and double, that is of many rowes of leaves in the like manner, inclosed in a huske, consisting of foure leaves, Greene on the outside, and white within, the middle leaves of the flowers are often upon the first opening somewhat foulded inwards at the ends, but growing elder grow straight forth, all of them being white in the middle part, and yellowish towards the brims of a sweete sent like a Violet, in the miditt of whom when they beginne to

1. *Nymphaea alba major vulgaris*.
The greater common white Water Lilly.

2. *Nymphaea alba major altera sive Lotus Egyptia*.
The great white Water Lilly, of Egypt.

3. *Nymphaea alba minor.*
The small water Lilly.

4. *Nymphaea alba minima sive Morsus ranae.*
The small white Water Lilly called Frogge bit.

5. *Nymphaea lutea major.*
The great yellow Water Lilly.

6. *Nymphaea lutea minor.*
The lesser yellow water Lilly.

decay riseth up a small head, which growing greater becommeth the feede vessell, not much unlike unto the other as bigge as a good Medlar, parted on the inside into cels longwise, containing round feede like unto those of Coleworts, the roote is not tuberous as the former, but small round and almost peere fashion, of the bignesse of an hens Egge, blacke on the outside and yellowish within, with many small fibres thereat, the inner substance being fleshy firme and hard, somewhat sweete and binding withall, which when it is boyled, or toasted under Embers, becommeth as yellow as the yolke of an egge, which the *Egyptians* familiarly eate with broth or without, raw also oftentimes, as well as roasted, this loseth both leaves and stalkes after feede time, especially upon the decay of the water wherein it joyed, the roote abiding in the ground, which thereupon was called annuall, but I would rather call it reftible.

3. *Nymphaea alba minor*. The lesser white Water Lilly.

This lesser Water Lilly differeth not from the former, but in the smallnesse both of roote and leafe, and in the singlenesse of the flower, which consisteth but of five small and pointed leaves, spread open and laid abroad, with yellow threds in the middle, and small heads with small feede in them.

4. *Nymphaea alba minima* quæ & *Morus rana vocatur*.

Small white Water Lilly, called by many Frogge bit.

The roote of Frogge bit is long and creeping, set full of joynts, sending downe from thence long fibres, and whereat spring divers small round leaves very like the last small water Lilly, but much smaller, from which rise also other stalkes, bearing on each head one small white flower, made of three small and round pointed leaves with some yellow threds in the middle: the heads and feede are small. This is in all the parts neerer resembling the last white Water Lilly, then any pond weede, whereof some have made it a *species*, and therefore I have placed it with them.

5. *Nymphaea lutea major*. The great yellow Water Lilly.

This greater yellow sort groweth much like the great whire, with leaves almost as large as they, but somewhat longer, and standing on cornered stalkes, the flowers also that stand on the toppes of the crested stalkes, are not so thicke of leaves as the white (although *Lugdunensis* doth so describe it, and giveth a figure answerable) in any that ever I saw, but made of five large round shining yellow leaves, with a round Greene head in the middle, compassed with yellow threds, which head when it is ripe, containeth within it greater feede then those of the white, and more shining: the roote is great and very like unto the former, yet not blackish, but somewhat whirish on the outside as well as within; each of them being somewhat sweete in taste, and this more loose or spongy then it.

6. *Nymphaea minor lutea*. The smaller yellow Water Lilly.

The leaves hereof are round, but larger then those of the lesser white sort, and so are the flowers larger also, but yellow: the roote hath many strings fastened to a bigge head, and tasteth hotter then the other.

7. *Nymphaea lutea flore minore*. Small yellow Water Lilly with lesser flowers.

There is no other difference betwene this and the last, but in the smallnesse both of leaves and flowers, the roote groweth with long strings strongly fastened into the mudde,

The Place and Time.

All these sorts except the second are found growing with us in sundry places of the Land, some in great pooles and standing waters, and sometimes in slow running Rivers, other in lesser ditches of water, as the Frogge bit, in many ditches about London, as well as in the ditches on the Bankes side, in Saint Georges fieldes. They flower most commonly before the end of May, or soone after, and their feede is ripe in August.

The Names.

Nymphaea in Greeke, and *Nymphaea* in Latine, quod loca aquosa amet, be the chiefe appellations of these plants with their severall adjuncts, of *alba* and *lutea*, white and yellow, and called *Nenuphar* in the Apothecaries shops, yet hath it also divers other names by divers Authours: *Apuleius* calling it *Mater Herculeana*, *Alga palustris*, *Papaver palustre*, *Clavus Veneris* and *Digitus Veneris*, and *Marcellus* an old Writer, saith it was called *Clava Herculis*, and *Baditin* in French, but the French at this time call it *Blanc d'aue*, and *Lil de sang*, the *Arabians* *Nikisur*, and *Nisur*, the *Italians* *Ninfea*, the *Spaniards* *Escudetes del rio* and *Higos del rio*, the *Germanes* *Seebumen*, and *Wasser Gilgen*, the *Dutch* *Plompen*, and we Water Lilly. There hath beene great controversies among the learned Herbarists, whether this *Nymphaea* be not the *Lotus Aegyptia* of *Dioscorides* and *Theophrastus*, because the description of the one so neerely resembleth the other, which made *Clevisius* confident, upon *Alpinus* his Allegations, in his Booke de plantis Aegypti, to determine them both one, when as there is shewed two maine differences in them, besides that *Dioscorides* describeth them both in two severall Chapters, the one in the roote, that the *Lotus* roote was called *Corisum*, and was round of the bignesse of a Quince, which was used to be eaten, either boiled or roasted under the fire, which the roote of *Nymphaea* faileth in, (this is most probable to bee the *Lotus Aegyptia* of *Dodonæus*;) And then againe in the feede, which as *Dioscorides* sheweth, is flat in the head of the *Nymphaea*, and like *Milium*, that is round in the *Lotus*: but the leaves and flowers in both being so like, the other being hid under the water, caused *Alpinus*, as he saith himselfe to take no further knowledge or marke any difference in them then of a *Nymphaea*, (and I am halfe perswaded the like neglect hath happened to the *Faba Aegyptia*, that it is not yet found in the waters of Egypt, because the leaves thereof also are round like the *Lotus* or *Nymphaea*) but now in his Booke of Exoticke plants, he changeth his note, and sheweth there that this is the true *Lotus Aegyptia*, and all the parts thereof particularly desciphered. All these sorts of Water Lillyes, are so called by all Writers almost as I doe, and therefore neede no further explanation or amplification. But hereby all men may take a good caveat not to be too forward, either to condemne the Text of the ancients as judging it erroneous, or to be too confident of their owne judgement, without well considering all parts: For the like heretunto happened unto the *Faba Aegyptia*, which formerly was confidently supposed to be *Colocassia*, ignorance being the cause of error, which knowledge since by industry hath corrected.

The Vertues.

The leaves and flowers of the water Lillyes are cold and moist, but the roote and feede is cold and dry: the leaves doe coole all inflammations, and both outward and inward heales of agues, and so doe the flowers also, either by the Syrupe or Conserve, the said Syrupe also helpeth much to procure rest, and to settle the braines of franticke

franticke persons for it wonderfully helpeth the distemperature of the head arising from heate: the seede is sometimes used to stay fluxes of blood or humours, either of wounds or of the belly, yet is as effectual as the roote, but the roote is of greater use with us, some taking the white roote (which is of the yellow fort) and some the roote of the white Water Lilly, which hath the blacke roote, to be the more effectual to coole, binde, and restrain all Fluxes or defluxions in man or woman, as also the gonorrhea or running of the reines, and the involuntary passage of sperme in sleepe, and is so powerfull that the frequent use thereof extinguisheth Venerious actions: the roote likewise is very good for those whose urine is hot and sharpe, to be boiled in wine or Water, and the decoction drunke: the blacke roote which beareth the white flowers, is more used with us in these times then the other, because it is more plentifully to be had, then that with yellow flowers: but the white roote of the yellow kinde is lesse pleasant, and more astringent and harsh in taste, and therefore not without just cause doe most preferre it before the other to stay womens courtes and mens spermaticall issues. The distilled water of the flowers is very effectual for all the diseases aforesaid, both inwardly taken and outwardly applied: it is much commended also to take away freckles, spots, sunburne, and Morpew, from the skinne, in the face or any other part of the body. The oyle made of the flowers, as oyle of Roses is made is profitably used to coole hot tumours, and the inflammations of ulcers, and wounds, and ease the paines, and helpe to heale the sores. The Frog bit as being a *species* as I said of the *Nymphaea minor*, and so likewise these lesser sorts, have generally a cooling quality in them, yet in a weaker measure then the greater sorts. But let no man mistake the yellow Marsh Marigold, instead of the yellow Water Lilly, as it is likely, *Serapio lib. simplicium* cap. 144. and some other *Arabian* Authours did, that said there was another kinde of *Nenfar*, which was sharpe and hot, and of subtil parrs, and is fit to warme and give heate to cold griefes, for assuredly they meant hereby the *Caltha palustris*, which they mistooke to be a kinde of *Nenfar*, as is evident by this their relation.

CHAP. XXX.

Potamogeton sive *Fontalis*. Pondweede.

Of the Pondweedes there are divers sorts, more found out and referred to them then was in former times, which are these that follow.

1. *Fontalis major latifolia vulgaris*. The greater ordinary Pondweede.

This greater Pondweede riseth up with sundry slender round stalkes full of joynts and branches, and faire broad round pointed darke Greene leaves with long ribs in them like Plantaine, set singly at the joynts and lying flat on the toppe of the water: at the toppes of the stalkes and branches usually, and seldome

Potamogeton sive *Fontalis* major & minor latifolia vulgaris.
The greater and lesser broad leaved Pondweede.

2. *Fontalis major longifolia*.
The greater long leaved Pondweede.

at the lower joynts come forth long spiked heads, of bluish coloured flowers upon long foote stalkes like unto those of *Bistort*, or *Arismart*, whereon after they are past stand chaffie huskes, containing within them blackish hard seede: the roote creepeth to and fro in the muddle, with divers joynts and tufts of fibres at them, whereby they are fastened to the ground. There is another of this sort that is lesler, not much differing in any thing else. *Minor.*

2. *Fontalis major latifolia*. The greater long leaved Pondweede.

This other greater sort differeth little from the former, but in the leaves which are longer and narrower, and the ribbes running across in them, and not at length as the former doth, the spiked heads of flowers hereof are in some more whitish, and in others as faire a bluish colour as the former, and come as well from the upper joynts as the toppes of the stalkes and branches. There is another sort hereof also, with leaves not altogether so long or narrow. *Alter.*

3. *Fontalis serrato longifolia*. Dented Pondweede.

The roote of this is joynted and creepeth like the former, bringing very long and narrow leaves at the joynts of the stalkes, and dented about the edges without any order on both sides, and beareth at the toppes such like spiked tufts of flowers and seede after them as the others doe.

4. *Potamogeton graminum ramosum*. Grasslike Pondweede.

The stalke hereof is a foote high or more, being very slender round and whitish, parted into sundry branches with many small grassy round darke greene leaves not set together, but by spaces a good way in sunder, which end in other leaves, that are almost as small as haire, yet notwithstanding from the wing of the first leate, cometh forth a stalke with the like leaves at the end, and thereat a small foote stalke three inches long, sustaining certaine small flowers, dispersedly set in a spike and not in a cluster, and small rough graines succceding them.

5. *Potamogeton minimum capillaceo folio*. Small fine Pondweede.

This fine leaved Pondweede hath a very fine slender stalke, with small long pale greene and haire-like leaves, set thereon without order, at the toppe whereof spring forth one or two small foote stalkes, which sustaineth a very small and pointed head, like unto the precedent, followed by very small pale coloured flowers, whereof one is laid open, and another is inclosed in a skinny huske, ending in a point.

6. *Potamogeton capillaceum capitulis ad alas trifidis*. Triple headed Pondweede.

This Pondweede hath a stalke an handbreadth long, no thicker then an haire, yet joynted and branched, and two small long leaves at every joynt which are smaller then any haire, and thereat likewise stand very small pale coloured flowers, which growing close, do forme a knot or head, which being ripe appeareth as made of three semicircular reddish parts ending in a sharpe point, yet from the bosome of the former leaves, riseth a small foote stalke, divided into three or more small leaves, the like knot or head being set in the middle, for at the top there is no head at all.

The Place and Time.

The two first sorts are to be seene in many places of the Land, no Country almost being without the one or the other, the third is more rare, and seene but in very few places with us, the three last are strangers and doe all shew their flowers in the end of *August*, or seldome sooner.

The Names.

It is called in Greeke ποταμογενής, *quasi fluminibus vicina*, and *saxilum, quasi spicata Fontalis*. The two first are generally called by all Writers *Potamogeton*, and by *Lobel Fontalis & spicata*, who it is very likely intended this first sort, and not a different kinde from it, although his figure have more pointed leaves, for the veins goe longwise, as in the former, which doe not in any other sort, although it doth expresse many small round heads on a long stalke, and saith the flowers are white, and the seede like *Aphaca*, and that his first sort is another species of the *longifolia*, if not the same, for we have seene some variety here of in the Ponds and Waters of our owne Land. The third is called *Oxylapathum aquaticum* by *Lugdunensis*, and by *Gesner in hortis*, *Lapathi genus sylvestre*. The three last are mentioned onely by *Bauhinus*, by the same titles they here hold. The *Italians* call it *Potamogeto*, The *French* *Espil de can*, The *Germanes* *Samkrant*, The *Dutch* *Founteinruit*, And we in *English* Pondweed, Water Spike, and of some River wort.

The Vertues.

Pondweed is cooling and drying as *Galen* saith, like unto *Knorgrasse*, but of a thicker essence: the decoction of the leaves in wine, stayeth the *Laske*, and griping paines of the belly, and being bathed, is good to helpe itches, old ulcers, and corroding cankers and sores, the leaves applyed as swageth inflammations, and *Saint Anthonies* fire, the freckles and heate in the face: if the leaves be boiled with oyle and vinegar, and applyed to the place pained with the hot Gout, it doth give present ease: it is profitably also applyed with honey and vinegar to helpe those that have foule sores in their legges, the roote helpeth to dissolve knots and kernels.

CHAP. XXXI.

Millifolium aquaticum. Water Yarrow.

Here be sundry sorts of herbes that for their fine Fennell like leaves, and growing in the waters, so neerely resembling Yarrow or Fennell, are called *Millifolium*, and *Feniculum aquaticum*, yet differing each from other in some notable part, all which I meane to comprehend in one Chapter.

1. *Millifolium aquaticum vulgatum*. Ordinary water Yarrow.

This Water Yarrow which groweth most plentifully with us about *London*, riseth up with a round straight stalke, having divers long winged leaves at the bottome of it, cut and divided into many fine small leaves set on both sides of the middle ribbe, like unto the land Yarrow, but much tenderer and with as fine leaves almost as Fennell it selfe, at the stalkes likewise grow such fine leaves up to the toppe, where stand on branches, large tufts of small white flowers set close together, the roote is somewhat long white and slender with divers fibres at it.

2. *Millifolium Coriandrisolium*. Broad leaved water Yarrow.

The lower leaves of this Yarrow are somewhat like in the forme and divisions of them unto the lower leaves of

1. *Millifolium aquaticum vulgatum.*
Ordinary Water Yarrow.

3. *Millifolium aquaticum minus.*
Small water Yarrow.

4. *Millifolium aquaticum floridum* sive *Viola aquatica.*
Water Gilloflower.

5. *Millifolium aquaticum Ranunculi fœc & caprula.*
Crowfoote Millfoil.

of Corianders, but much smaller and of a fresh yellowish Greene colour, but those that grow from thence upwards on the stalkes, are smaller and more finely cut in like unto Fennell, bearing umbels or tufts of yellowish flowers.

3. *Millefolium aquaticum minus*. Small Water Yarrow.

This small Yarrow spreadeth many long round Greene stalkes full of joynts, and thereat sundry fine small feres, which take hold of the ground as it creeper: the upper part of the stalk that riseth above the water, hath five or six joynts, and at each of them sundry fine smal green leaves scarce an inch long beinglesse and lesse upward, so as the toppe of the stalk seemeth to be steeple fashion, which beare at the toppe to many very small flowers, consisting of eight small white leaves apeece, joynted together and not opening themselves, as there are leaves at every joynt, which afterwards passe into certaine round heads, which have foure spokes or points apeece.

4. *Millefolium aquaticum floridum* five *Viola aquatica*. Water Gillovers.

The roote of this Water Gillover is very small and creeping, shooting forth fibres every where, from which rise up sundry long winged leaves, consisting of many small leaves set on each side of a middle rib, which are larger and greater then those of the first sort here set forth, of a sad Greene colour, the stalkes that rise up among them are bare of leaves, from the bottome to the upper joynts, whereabout stand divers small whitish and sweete flowers, somewhat like unto Stockegilloflowers, of five leaves apeece, one row above another, with yellowish threds in the middle. There is another sort hereof very like it, but that it hath larger winges and finer jagged leaves.

5. *Millefolium aquaticum Ranunculi flore & capitulo*. Crowfoote Millfoile.

This is a lesser herbe then any of them that goe before growing onely in shallow waters, where it seldome riseth above an handfull high, with very many and very fine short leaves, as small as Camomill, and of a yellowish Greene colour, the short stalk among them carry single small white flowers, resembling the water Crowfoote both in the flowers, and in the finer leaves, but hath no broad leaves at the bottome as it hath, and might as well be accounted a Crowfoote, as a Water Millfoile, but that all Authors that write of it doe number it among them, especially because that it beareth a head of seede after the flower is past, very like unto those of Crowfoote, that is a small bunch of feedes set close together.

6. *Millefolium maritriphyllum Ranunculi flore*. Fennell leaved Crowfoote Millfoile.

The roote hereof is very long and creeping, the stalkes grow much higher then the last, the leaves are much longer and greener, very like to those of Fennell, the flowers are white but much larger then the last, the head of seede being somewhat like unto it.

7. *Millefolium aquaticum pennatum spicatum*. Feathered Millfoile.

This Millfoile fenderth forth from a bushy fibrous roote divers round joynted stalkes, hollow, striped and branched at the toppes, swimming on the water a cubit high, and at each three or foure leaves so finely cut that they seeme to be feathers, of a browne Greene colour: at the toppes of the stalkes come forth long purplish spikes, as it were containing sundry knots of small yellowish flowers, set one above another by spaces, after which come small blacke and very hard heads, foure or five together about the joynt, in the hollow part whereof lyeth the seede.

8. *Millefolium aquaticum cornutum majus*. The greater horned Millfoile.

This like wise hath sundry slender and brittle joynted stalkes swimming upon the water a cubit high, with many fine thinne and small leaves compassing them at the joynts, whereof the lowermost are jagged like a Harts horne, but upwards they are finer, from the joynts also rise small slender foote stalkes, three or foure inches long,

7. *Millefolium aquaticum pennatum spicatum*. Feathered Millfoile.

8. *Millefolium aquaticum cornutum majus*. The greater horned Millfoile.

Ppppp

some

9. *Millefolium aquaticum flore luteo galericulato.*
Water Millfoile with a yellow hooded flower.

10. *Stellaria aquatica.*
Starre-like Water Fennell.

somewhat like hornes, bearing at the toppe of each a small white flower, made of foure leaves a peece, and after them a small head, with divers seedes set together like a Crowfoote. *Bauhinus* in his Appendix to his *Pinax*, maketh mention of a sort hereof, much lesler then the other, with small leaves like hairens and short, so that the whole wing of leaves set together, doth not exceede one leafe of a Lentill.

9. *Millefolium aquaticum flore luteo galericulato.* Water Millfoile with a yellow hooded flower.

This hooded water Millfoile hath divers long leaves issuing from the roote lying within the water, made of many parts set on each side of the middle ribbe, each part consisting of many very fine and short Greene Fennell-like leaves, set as it were in tufts, one against another: the stalkes rise up some what high, and reddish, without any leafe on them, but with sundry pale yellow flowers, set in a good distance one from another, from the middle almost to the toppe, which flowers consist of three leaves, the middlemost whereof is as it were hooded, before it be blowne open, but then is the broadest, and round at the end with a dent in the middle thereof making it represent the forme of an Hart as it is usually expressed on the cardes.

10. *Stellaria aquatica.* Starre-like water Fennell.

Unto these Water Millfoiles is adjoynd by *Lobel* and others this water Fennell, that from a long fibrous roote sendeth forth sundry weake slender and flexible stalkes, bending to and fro in the water, full of joynts, from the bottom to the toppe, having two small fine leaves like those of Fennell almost, set at every one of them, and at the toppe of each a small white flower, consisting of eight leaves, laid open like a starre from whence rose the name.

The Place and Time.

All these grow in the very waters, divers of them being often found in our owne land. The first whereof is the most frequent and the fourth and fifth next unto it, but the second and third are strangers as the rest that follow are, and doe all flower for the most part, in the middle or in the end of Sommer.

The Names.

Diocorides and *Galen* call it in Greeke μυριόφυλλον *Myriophyllum* from the abundance of leaves that it hath, even a million as the word importeth, and *Millefolium* in Latine. Some as *Matthiolus* sheweth, would referre our *Millefolium* which is a Land herbe unto this *Myriophyllum* of *Diocorides*, but he there sheweth their error. The first here set forth is *Matthiolus* his first *Myriophyllum*, and called by *Dodonaeus* *Millefolium aquaticum*, by *Lobel* *Myriophyllum* aut *Maratriphyllum*, and by *Bauhinus* *Millefolium aquaticum umbellatum capillaceo brevique folio*. The second is *Matthiolus* his *Millefolium aquaticum*, set to the Chapter of *Stratiotes*, in his *Diocorides*, which *Lugdunensis* calleth *Stratiotes millefolium aquaticum*, and *Bauhinus* doubteth that it was a figure made of two herbes and sent to *Matthiolus*, for *Lobel* in calling it *Millefolium aquaticum alterum Coriandris folium*, doth rather referre it to the upper fine leaves then the lower of Coriander. The third is called by *Clausius* *Myriophyllum aquaticum minus*. The fourth is the *Viola aquatilis* of *Dodonaeus*, the *Myriophyllum alterum* of *Matthiolus* and *Lugdunensis* and

and the *Myriophyllum equisetifolium*, fluviatile of Lobel. The fifth is called by Lobel *Millefolium marasphyllum* flore & semine Ranunculi aquatici Hepaticæ facie, and by Clusius *Millefolium aquaticum flore albo*, Gesnerus in hortis calleth it *Alga palustris sive flaviorilis*, and is the first *Alga* of Tragus: The sixth is the *Myriophyllum marasphyllum* palustre alterum of Lobel, & is the *Feniculum aquaticum* Dalechampi of Lugdunensis, but badly figured, and the *Pucedanum aquaticum* of Tabernmontanus. The seventh and eighth, are onely mentioned by Bauhinus. The ninth is called by Lobel *Millefolium aquaticum flore luteo galericulato*, and *Feniculum aquaticum galericulatum* by Tabernmontanus. The last is the *Stellaria aquatica* of Lobel, and the *Feniculum aquaticum stellatum* of Tabernmontanus. The Italians call it *Mirioglio*, the French *Gyroslee de Peau*: the Dutch *Water Violetteren*, and we in English *Water Yarrow*, *water Millfoile*, *water Gillovers*, and *water Fenicell*.

The Vertues.

The Water Millfoile is of such a binding and astringent cold quality as Galen saith, that it healeth wounds and asswageth the heats and inflammations of them, and as saith Dioscorides, it freeth wounds from inflammations, being applied fresh or dried with Vinegar, it is also given with vinegar and salt, to them that have had shrewd bruises or falls from some high place: it is likewise taken with vinegar to help them that cannot make water, and the other gricfes in the bladder, casual sighings also and the Toothache.

CHAP. XXXII.

Alfne aquatica. Water Chickweede.

Here are divers sorts of Chickweedes that grow in or neere the waters, that were reserved for this place, and there are others that are left for the Sea, to be entreated of there.

1. *Alfne aquatica major*. The greater water Chickweede.

This greater Chickweede hath a creeping roote, shooting out fibres in divers places, from whence spring up sundry upright stalkes, joynted from the bottom to the toppe, and two somewhat long leaves at every joynt, somewhat like those of Pelletory of the Wall, and at the toppe divers white flowers like Chickweede, having many small and pointed leaves in each flower.

2. *Alfne aquatica media*. The meane Water Chickweede.

The meane Chickweede hath from a fibrous roote sundry stalkes rising up to a yards height full of branches and small long leaves on them, of a pale Greene colour, the flowers are many, small and white, made of five leaves a peece standing at the toppe of every branch.

3. *Alfne aquatica minima*. The least water Chickweede.

This lesser Chickweede hath a number of small tender branched stalkes, and small leaves growing on them, thicker set then in the former, but lying for the most part, on or neere the ground or in the water where it grow.

1. *Alfne aquatica sive palustris major*.

The greater water or Marsh Chickweede.

3. *Alfne aquatica minima*.

The least water Chickweede.

4. *Alfne aquatica folio oblongo*
five *Portulaca aquatica*.
Water Purslane.

5. *Alfne palustris minor*
Serpillifolia. Small
Marsh Chickweede.

6. *Alfne vella flore ceruleo*.
Vpright blew Chickweede.

eth, the flowers are smaller and white, and the roots a tuft of many fibres.

4. *Alfne aquatica minor folio oblongo*
five *Portulaca aquatica*.
Water Purslane.

This small Chickweed or Purslane groweth like the last Chickweed, with many trailing branches, that take roote as they spread, but not so thicke set with leaves, which are somewhat long narrow and round pointed, of a pale greene colour, two alwayes growing at a joynt, the flowers are small and white, set in long clusters together, on small footestalkes, with very small feede following them, the roots are nothing but small thrēds.

5. *Alfne palustris minor Serpillifolia*. Small Marsh Chickweede.

From a small fibrous roote springeth up sundry slender stalkes and branches, rooting againe as they lye, and spreading, with very small leaves thereon by couples, lesser then those of *Serpillum*, or Mother of Time: after the small white flowers are past, succede small flat pouches, one on each side of the stalke, with small feede therein.

6. *Alfne vella flore cernleo*. Vpright blew Chickweede.

This Chickweede riseth up for the most part with divers upright stalkes, joynted in sundry places, and divers small leaves growing thereon at the severall joynts, somewhat divided like unto the leaves of Rue, or somewhat resembling a Trefoile leafe, at the toppes, as also at the joynts come forth small blew flowers, consisting of foure leaves apeece, after which come small round Chickweede like heads with feede, the roote is white and long, with some fibres thereat.

The Place and Time.

All these sorts grow in or neere Waters, and are found in sundry places of the Land, flowering in the heat of Sommer.

The Names.

Tabernmontanus and *Gerard* from him make mention of most of these sorts. The fourth *Bauhinus* saith was sent him by the name of *Portulaca aquatica*, yet calleth it *Alfne palustris minor folio oblongo*. The fifth he also calleth as it is in the title. The last was called by *Tragus Hendlekrans*, not well knowing what title to give it, having the leaves divided somewhat like to ones hand, and that made *Thalsius* also to call it *Dactilio botanon ceruleo flore*, *Lugdunensis* saith that some in those parts called it *Elatine triphyllus*. *Tabernmontanus* called it *Alfne vella*, and so doth *Gerard* also, but *Bauhinus* *Alfne triphyllus cerulea*.

The Vertues.

The properties of these Chickweedes, are no doubt like unto the other Chickweedes, their place of growing forme and taste being insipide, watery and cold, declaring the same, and therefore whatsoever may be said of these is to bee found among the other, and therefore to avoid repetitions, I referre you to the rest spoken of before, where you may be abundantly satisfied.

CHAP. XXXIII.

Alga aquatilis & Conserua. Fresh Water Extrēssences.

Here are an infinite number as I may so say, of Sea Extrēssences, called by sundry names as you shall further understand when I come to speake of them, which I would separate from those that grow in the fresh waters, and entreat of these in this Chapter, which although few, have yet severall titles whereby to be called.

1. *Alga five Conserua fontalis trichodes*. Water Maidenhaire.

The water Maidenhaire groweth upon the stones in the bottome of springs, fastening it selfe thereto, and from thence,

1. *Alga five Conserua fontalis trichodes*,
Water Maidenhaire.

2. *Alga aquatilis Capillacea five Conserua Plinij alij*
Linum aquaticum. The threddy or hairy water weede.

thence shooteth forth sundry fine greenē stalks with many fine threds on them, of a cubits length sometime, growing smooth out at length, and sometimes fouled one within another, without any other leaves upon them which when they are dry turne to be somewhat browne, and are of little or no taste at all.

2. *Alga aquatilis Capillacea five Conserua Plinij, alij Linum aquaticum*.
The threddy or hairy Water weede.

This Water weede groweth from the muddie in the bottome of lakes and other standing waters, and sometimes in flow running Rivers, which is wholly composed of a number of Greene brownish threds or haire joined together, floating thereon, passing and waving to and fro all the length thereof, as the current of the streame runneth, or the winde driveth them, and are sometimes a yard long or more.

3. *Filum nigrum Scoticum five Germanicum*. The Scottis or Germane blacke stringy plant.
This likewise groweth from some small stone in the bottome of the cranks of wauer neere the Sea shore, to be of two cubits in length, being nothing else then a number of thicke firme smooth, and blackish long strings, folded one among another, and hath neither roote leafe nor flower.

4. *Alga Bombycina*. The Water Cotton plant.
This excreffence is like unto a long and much spread Locke of soft Wooll or Cotton, growing close together, spreading somewhat in breadth of a pale Greene colour on the upperside, and whitish underneath, and swimmeth on the toppe of the water in pools, &c.

The Place and Time.

The most of these doe grow in rivers and ponds, some not farre of this City, and others in other places, and are to be seene in the Sommer time onely floating upon the Waters. *Lugdunensis* saith that the second was found in the greater Lake of Lombardy, neere *Milane*.

The Names.

The first is called by *Lugdunensis* *Conserua trichodes*, vel *Trichomanes aquatica*, and *Bauhinus* *Alga fontalis trichodes*. The second is the *Conserua Plinij*, by *Lobel*, *Lugdunensis* and *Angulara* before them, and as saith *Matthiolus*, called *Lima* by the *Florentines*. *Imperatus* called this *Linum aquaticum*, as he doth another very like this *Linum maritimum*: *Bauhinus* calleth it *Alga viridis capillacea folio*. The third *Bauhinus* calleth *Alga nigra capillacea folio*, & *Filum maritimum Germanicum*, saying it was sent him out of Scotland. The last he also saith that he had from the Balticke Sea, and giveth it the same title that I have prefixed before it. I have also given them their *English* Etymologies, as is fitting unto them as I thinke.

The Vertues.

Pliny hath recorded that he knew one cured incredible quickly, with his *Conserua* of a fall from a tree, while he was lopping it, which fall brake almost all his bones, by having the herbe bound to his whole body when it was fresh, and moistened with the water thereof, as often as it grew dry, and but teldome changed.

Pppp 3

CHAP.

Lens palustris, five *Lenticula aquatica*. Water Lentils.

Here are three or foure herbes to be referred to these Lentils, which are differing one from another; their place of breeding being their chiefest cause of affinity.

1. *Lens palustris* five *aquatica vulgaris*. Duckes meate.

This small water herbe consisteth of nothing but small round greene leaves, lying on the toppe of standing waters, in ponds, pooles, and ditches, without either flower or seede that ever could be observed, onely from the middle of each leafe on the under side, there grow certaine small threds finer than haire, which passe downe into the water, but are not thought to descend to the ground from thence to draw nourishment. *Matthiolus* (and from him *Lugdunensis*) reporteth a strange variation, and I may say incredible; That if it should happen (as sometimes it commeth to passe) by inundations, that these small Lentils or Duckes meate be carried away into running rivers, as soone as they cleave to the shore, they are wonderfully encreased: for by the rootes that will grow from them like threds, they fasten themselves into the ground, and then growing, becometh to be plantes like unto *Sisymbrium* water Mintes, or Ladies smockes; and that this thing hath beene observed by diligent searchers of nature, not without much wonder of the matter: *scilicet*.

2. *Lens palustris* five *aquatica quadrifolia*. Crosse leaved water Lentils or Duckes meate.

This other *Lens* hath a small long slender roote shooting forth square slender weake and trailing stalkes, with sundry small leaves upon severall long foote stalkes, standing together at the joynts distinct one from another, which are parted into foure leaves a peece, and sometimes it hath beene observed with six leaves, each end being round and lying in a square forme like a crosse upon the water: at the joynts likewise with the leaves, come forth diverse small heads of seede in clusters, wherein are enclosed small blackish seede like unto the fiele Lentils, but not so flat, being thicke and hard. *Lugdunensis* setteth forth this kinde of water plant, by the name of *Lenma Theophrasti*, in a much differing manner.

3. *Lens palustris latifolia punctata*. Broad leaved spotted water Lentils.

This water Lentill hath sundry round leaves set by couples on long stalkes, of an excellent greene colour on the upper side, prickt very full of very fine spots, and under them many small Lentill like heads cleaving unto them, some having but one, others two three or foure at a place, covered with a rough or rugged thin huske, very full of fine small yellowish seede: at the bottome of these winged stalkes of leaves grow the rootes, which are a tuft of long strings and fibers: it is onely of a waterish taste.

4. *Lenticula aquatica bifolia Neapolitana*. Neapolitane water Lentils.

The water Lentils of *Naples*, hath very fine long slender stalkes, with leaves set together by couples, lying along upon the water, having seede vessels growing hard unto them, foure usually joyned together.

The Place and Time.

The first onely of these is familiar in our land as I take it: the third *Bauhinus* saith, groweth in the watery ditches at *Padoa*, in the river *Axxeris* by *Pisa*, and in *Silesia* neere unto *Utravslavia*, the rest are all strangers, and are in their freshest beaurty in the beginning of the yeare.

1. *Lens palustris* five *aquatica vulgaris*. Duckes meate. 2. *Lens palustris quadrifolia*. Crosse leaved water Lentils, or Duckes meate.

The Names.

It is called in Greeke *οαυδὸντι τῶν τετρατῶν*, some take it to bee *Ἰνvor* of Theophrastus: in Latine *Lens palustris*, and *Lenticula palustris* & *aquatica*, and so do all Authors call the first sort: the second is the *Lens palustris altera* of *Matthiolum*, and *Lemma Theophrasti* by *Lugdunensis*; as also the *Lenticule alterum* genus of *Cesalpinius*, which *Bauhinus* calleth *Lenticula palustris quadrifolia*: the third is called by *Bauhinus* in his *Pinax*, *Lens palustris latifolia punctata*, being better exprest in his *Matthiolum*, then in his *Phytopinax*, and by *Cesalpinius* taken to bee *Stratiotes aquatica* *Dioscoridis*: The last is mentioned by *Columna* by the name of *Callitriche* of *Pliny* li. 25. c. 11. mervailing at *Lobel* for supposing the *Corylidon aquaticum*, as it is erroneously called (being a marsh Crowfoote, as the hot, sharpe taste thereof doth testifie) to be *Callitriche* of *Pliny*; but yet saith this of this is not the right, but taketh that *Pliny* meant the *Trichomanes*, by his *Callitriche*, which I thinke cannot hold good, neither the one nor the other, for *Pliny* his words in the place before cited are these. *Fit ex Callitriche sternitamentum, folia sunt Lenticule similia, caulibus punctis tenuissimis, radice minima nascitur in opacis & humidis gustatu fervens*; thus much *Pliny*: which it is likely made *Columna* comparing his with this of *Pliny*, both for forme and quality, not to dare to affirme it the same, because saith *Pliny* it is *gustatu fervens*, which neither his nor *Trichomanes* is. *Bauhinus* calleth it *Lenticula palustris bifolia fructu tetragono*. The *Arabians* call it *Tahaleh* and *Tahaleb*, the *Italians*, *Lente de palude*, and *Lenticularia*; the *Spaniards*, *Lentille del lagua*; the *French*, *Bentille d'eau*; the *Germans*, *Wasser linsen*; the *Dutch*, *Water linsen*, but more usually, *Enden gruen*, that is *Duckes herbe*; and so we in *English*, *Duckes meate*, and of some, *Water Lentils*: the second sort is called by the *Italians*, with whom it is plentifull, *Lente palustre del seme*.

3. *Lens palustris latifolia punctata* & *Lenticula aquatica Neapolitana*. Broad leaved spotted Water Lentil, and that of Naples.

The Vertues.

It is cold and moist as *Galen* saith in the second degree, and is effectuall to helpe inflammations, and *Saint Antho-*
nias fire, as also the Gouté, either applied by it selfe, or else in a pulvis with barlie meale: it is also good for ruptures
in young children. Some saith *Matthiolum* do highly esteeme of the distilled water of the herbe against all inward
inflammations and pestilent feavers, as also to helpe the rednesse of the eyes, the swellings of the eods, and of the
brefts before they be grown too much, for it doth not weakly repell the humours: the fresh herbe applied to the
forehead, ease the paines of the headache comming of heate. *Duckes* do greedilie devoure it, and so will *Hens*
if it be given then mingled with branne.

CHAP. XXXV.

Scandocyperis. Bastard or unfavoury Cyperus.

IN the end of the first Classis or Tribe of this Worke, I have shewed you sundry sorts of sweete smel-
ling Cyperus: but there are many other sorts that smell not at all, called either bastard or unfavoury
Cyperus, somewhat resembling the sweete sorts, both the round and long rooted Cyperus, and there
are Grasses also growing in the moorish places like unto them in roote or leafe, and therefore called
Cyperus Grasses. Of the former sorts called Unfavoury Cyperus, I meane to entreate in this Chapter,
and of the Grasses in the next following.

1. *Cyperus longus inodorus vulgaris*. Unfavoury Cyperus with long rootes.

This long rooted Cyperus hath divers long and narrow rough three square leaves rising from the roote, enclo-
sing or encompassing one another at the bottome, from among which riseth up a three square stalke foure or five
foote high, with some such leaves thereon, but smaller to the toppe, at each of whole upper joynts breake forth
three or foure rough and almost round burres upon short footestalkes, the roote creepeth under ground somewhat
like the true sweete long Cyperus, but blackish and with many more fibres thereat, and without any sent in
them.

2. *Cyperus longus inodorus sylvaticus*. Mountaine or Wood unfavoury Cyperus.

This other long rooted Cyperus hath long joynted reddish rootes, and many long and narrow rough Greene
leaves rising therefrom, compassed in the beginning with a reddish skinne: neither stalke nor head hath as yet
beene observed,

3. *Cyperus rotundus historeus inodorus Anglicus*. English round rooted unfavoury Sea Cyperus.

Our round rooted Sea Cyperus hath divers round rootes fastened together by strings, almost after the manner of
Filipendula rootes shooting forth sundry heads of leaves that are long and narrow, three square and cornered, the
stalke

1. *Cyperus longus inodorus.*
Unfavoury Cyperus with long rooters.

3. *Cyperus rotundus littoreus inodorus Anglicus.*
English unfavoury round rooted Cyperus.

5. *Cyperus rotundus inodorus aquaticus.*
Unfavoury round rooted water Cyperus.

4. *Cyperus rotundus littoreus inodorus Anglicus alter*
Another round rooted unfavoury Sea Cyperus.

stalks also is three square, two foote high and more, at each upper joynt whereof with the leaves come forth long close heads, the whole plant is utterly without sent at all.

4. *Cyperus rotundus littoreus inodorus Anglicus alter.* Another round rooted English Sea Cyperus.

This other English sort is very like the last, both in rootes and leaves, but differeth from it in this, that it hath at the toppes of the stalkes three or foure blackish scaly heads set together at severall places with the leaves.

5. *Cyperus rotundus inodorus aquaticus.* Unflavory water round rooted Cyperus.

This sort of Cyperus hath sundry blackish round rootes, set with many small fibres as they spread in the ground from whence rise such like cornered leaves and stalkes, as in the former, at the toppes whereof with the leaves come forth long pannickles.

6. *Cyperus rotundus inodorus aquaticus alter.*

6. *Cyperus rotundus inodorus aquaticus alter.*
Another unflavory water round rooted Cyperus.

Another Unflavory water round rooted Cyperus.

This Cyperus is very like the last sort in the rootes, being somewhat long and round, like Olives, and many fibres at them, but the leaves are much longer, and the stalkes farre higher, the rough heads likewise or pannickles are shorter and more eminent, with some long leaves amongst them.

The Place and Time.

The first is often found with us in the borders of fields and in woods; the second in Germany, the third and fourth in our Sea coasts, in divers places both of Shepey, and Thames in Kent, and in other places, the fifth on the bankes and in the ditches of the river Scheld by Antwerpe, and the last plentifully in the low marshes beyond Ratcliffe, and are in seede in the end of August.

The Names.

The first is called by Lobel *Cyperus longus inodorus Sylvesteris*, and by Bauhinus *Cyperus longus inodorus Germanicus*; The second he calleth as it is in the title. The third Lobel calleth *Cyperus rotundus inodorus littoreus*, Cesalpinius *Pseudocyperus*, saying the Florentines call it Noalo, and Bauhinus *Cyperus rotundus inodorus Anglicus* as I doe, but that I adde *littoreus* thereunto, and terme both it and all the rest *Cyperus* for the reasons shewed before in the first Classis. The fourth is a species of the last, chiefly differing in the toppe heads, which Bauhinus calleth *Cyperus rotundus inodorus Germanicus*, and saith that because the figure of Lobel's *aquaticus Septentrionalium*, which is my fifth was false, he set out this as the right, but this differeth both in roote and heads from it, and agreeing better with the former, which is my third for Lobel saith his *aquaticus Septentrionalium* hath long pannickles which this hath not. The fifth is termed as I said by Lobel, *Cyperus aquaticus Septentrionalium*, by Camerarius *Cyperus rotundus nigras inodorus radices habens*, being a different sort also from the next, especially in the heads, the last hath not beene published by any before.

The Vertues.

All these sorts of unflavory Cyperus, doe declare that they are as defective in heate and drynesse, as in sent from the sweete kindes, and therefore for any thing I can learne are not used for any purpose in Physicke.

CHAP. XXXVI.

Gramina Cyperoides. Cyperus like Grasses.

Here are so many sorts of these Cyperus like Grasses that I know not well how to divide them, and therefore must set them all together in one Chapter, and speake as briefly of them as I can.

1. *Gramen Cyperoides majus latifolium.* The greater sort of Cyperus Grasse.

This greater Cyperus Grasse hath sundry large and long leaves like unto those of Reedes, (Lobel saith like unto those of Gilloflowers) among which rise up divers three square stalkes, bearing three or foure close spiked brownish heads thereon one above another: the roote is brownish and foulding it selfe one within another with many fibres at them. Of this sort there is another, called by Bauhinus, *Gramen Cyperoides latifolium spica spadicea viridis majus*, whose rootes are more bushy and fibrous, and the spiked heads more Greene, having a long narrow leafe under the lowest head.

2. *Gramen Cyperoides majus angustifolium.* A great sort of Cyperus Grasse with narrow leaves.

This other differeth little from the last, but in growing lower, with narrower leaves and spiked heads, that are thinner and longer, but of the same brownish Greene colour with it.

3. *Gramen Cyperoides minus angustifolium.* The lesser narrow leaved Cyperus grasse.

This lesser sort hath narrower leaves and three square stalkes, bearing smaller and more spiked long heads, at the toppes, three usually set together one a little from the other more thicke also and upright, the roote hath long stringes and fibres thereat, shooting forth like Cyperus.

4. *Pseudocyperus spica brevi pendula.* Bastard Cyperus with short pendulous heads.

This Bastard Cyperus groweth somewhat like unto the true long Cyperus, having large and long grasse leaves

in

1. *Gramen Cyperoides majus latifolium.*
The greater sort of Cyperus Grass.

3. *Gramen Cyperoides minus spicatum argyris folium.*
The lesser Cyperus Grass with long spiked heads.

4. *Cyperus siccus Pseudocyperus spica brevis pendula.*
Bastard Cyperus with short pendulous heads.

6. *Gramen Cyperoides palustre panicula compressa.*
Marsh Cyperus Grass with spaled heads.

7. *Gramen Cyperoides palustre majus.*
The greater Marsh Cyperus grass.

8. *Gramen Cyperoides palustre minus.*
The lesser Marsh Cyperus grasse.

11. *Gramen Cyperoides Danicum glabrum.*
The Danish Cyperus grasse.

12. *Gramen Cyperoides spicata fusca elegantissima*
panicula Batavica. The fine brown
Spiked Cyperus grasse of Bayon.

in a manner three square, and so is the stalk also, at the top whereof from among divers leaves come forth great spiked thicke and short heads hanging downwards, every one by a short footstalk: the rootes likewise doe somewhat resemble the true sweete long Cyperus, but looser and not so firme, fuller also of fibres, and not smelling sweet at all.

5. *Gramen Cyperoides spica pendula longiore.*

Another sort of Bastard Cyperus grasse.

This wild Cyperus grasse hath a cornered striped stalke, about two cubits high, bearing long and narrow leaves thereon, which compasse the stalke at the bottome, with a skinne or hollow sheath, and hath severall long and narrow pendulous heads at the toppe, five or sixe inches long a peece with a long leafe under each head.

6. *Gramen Cyperoides palustre panicula sparsa.*

Marsh Cyperus Grasse with sparsed heads.

The leaves of this Cypetus Grasse are long and somewhat narrow, hard and cutting on both edges, the stalke is tall without any leaves thereon unto the toppe, where betweene two long leaves and very narrow, spread forth divers short footstalkes, bearing each foure or five small rough heads: the roote spreadeth somewhat like the true Cyperus, but harder, fuller of blackish fibres and without smell.

7. *Gramen Cyperoides palustre majus.*

The greater Marsh Cyperus Grasse.

This greater Marsh Grasse hath sundry long and narrow hard cutting leaves like the last, and among them divers tall upright naked stalkes, without any leaves on them at all, each of them bearing a long round and somewhat large rough prickly head wherein lye the seede, the roote is a bush of many blackish fibres like unto a Grasse.

8. *Gramen Cyperoides palustre minus.* The lesser Marsh Cyperus Grasse.

This lesser sort is like unto the greater but smaller, the stalke bearing sharpe rough spiked heads, foure or five together one above another on both sides thereof, with a long leafe at the foote of them oftentimes.

9. *Gramen*

13. *Gramen Cyperoides palustre Baionense.*
Marsh Cyperus Grasse of Bayon.

14. *Gramen Cyperoides Bayonense Ischemi paniculis fuscis.*
The Cyperus Grasse of Bayon with browne Cockes foote pannicles.

9. *Gramen Cyperoides spicatum minus compactis.* Marsh Cyperus Grasse with more open heads.
The roote hereof is somewhat hard or woody and full of fibres bearing many long and narrow leaves like to Grasse, among which riseth a rough three square stalke bare of leaves for the most part unto the toppe, where stand severall small rough heades or spikes, more loose or open then the former, having sharpe pricking seede within them.

10. *Gramen Cyperoides panicula sparsa subflavescente.* Yellowish open headed Cyperus Grasse.
This yellow headed Grasse hath smaller and shorter leaves and naked stalkes then any of the former, bearing at the toppes betweene two small long leaves, a head severed into many small parts or spikes of a yellowish colour: the roote is great at the head with divers fibres thereat. Of this sort there is another differing little from it, but in the colour of the small spikes which are blackish.

*Panicula
nigrisante.*

11. *Gramen Cyperoides Danicum glabrum folijs Caryophyllis.* A Danish Cyperus Grasse.
This Danish Cyperus Grasse hath divers stalkes with sundry narrow thiffe and smooth leaves, three or four inches long apeece, set together at the middle of them, from among which rise naked short stalkes, bearing at the toppes from betweene usually two long leaves, diverse small long spiked heads, spread like those of Rushes, of a brownish Greene colour: the roote is slender creeping under ground, shooting forth in divers places.

12. *Gramen Cyperoides spicata fusca elegantissima panicula Bayonense.*

A fine browne spiked Cyperus Grasse of Bayon.

This fine spiked Cyperus grasse hath sundry long and narrow leaves among which rise up three square stalkes, joyned in divers places and long leaves at them, with whom towards the toppes come forth long bushing spiked heads, somewhat hard but not pricking each being two or three inches long of a very fine pale brownish colour: the rootes are a bush of many thicke strings.

13. *Gramen Cyperoides palustre Baionense.* Marsh Cyperus grasse of Bayon.

This Cyperus grasse of Bayon, hath divers narrow long leaves, both below and on the small stalkes, which are about two foote high, bearing at the toppes sundry long and sharpe prickly heads with long leaves at them, the roote is composed of sundry long thicke strings and fibres.

14. *Gramen Cyperoides Bayonense Ischemi paniculis fuscis.*

Cyperus grasse of Bayon with browne Cockes foote pannicles.

This Grasse of Bayon hath three square stalkes almost two foote high, and very long narrow leaves even a foote and a halfe a peece at the bottome of them, and the like also at the joynts, with whom towards the toppes come forth very long and slender pannicles of a brownish colour, being three or foure inches long and of the thicknesse of a Mouse taile, sometimes but one at a joynt, but usually two, and sometimes three, the rootes are a bush of many greater strings and fibres at them.

The Place and Time.

All these sorts of Grasses grow in low moist and moorish grounds many of them as well in our owne land as in others, divers also have their severall places expressed in their titles, and dee all flourish and recede in the end of Summer.

The

The Names.

From the likenesse as I said unto both Cyperus and Grasse in leaves or rootes, be all these sorts entituled *Cyperoides Gramina*. The first whereof is the *Gramen Cyperoides* of Lobel, Camerarius and others, Banbinus taketh it to be the *Gramina quatum* genus of Tragus, which Lugdunensis calleth *Carex Tragi*: but in that Tragus saith, his groweth in dry sandy grounds and fieldes, and having the spiked heads more dispersed then that of Lobel; I presume they cannot be both one plant. The second is by Bauhinus called *Gramen Cyperoides angustifolium spica spadicæ viridi minus*, as the other sort of the first he called *Latifolium majus*. The third hath not beene described by any before. The fourth is the *Pseudocyperus* of Lobel, Gesner and Dodonæus. The fifth is described by Bauhinus in his *Prodromus* under the twelfth title. The sixth is the *Gramen Cyperoides aquaticum vulgatum* of Lobel. The seventh is so called by Lobel as it is in the title, but Thallus calleth it *Gramen luncum triquetrum*. The eighth is called by Lobel *Gramen Cyperoides parvum aquaticum*. The ninth is so called by Banbinus as it is in the title, and so is the tenth also, but saith it is the *Carex minus* of Lonicerus, and the fourth *Calamagrostis* of Tragus, which Lugdunensis putteth in the third place and figure, as also his *Luncus exiguus pratensis*, and the *Gramen maritimum spicatum minus* of Camerarius. The foure last sorts have not beene set forth before now.

The Vertues.

There are none of these Grasses used for man or beast that I can learne, being most of them sharing or cutting Grasses, but especially unprofitable for any Physicall use.

CHAP. XXXVII.

Gramina luncæ palustris, aquatica, &c. Rush-like Grasses of the Marshes, Waters, &c.

IN the former Classis I shewed you divers sorts of Rush-like Grasses, that grew on the upper grounds, in this I meane to exhibite those of the lower, and indifferently dispose them together, whether they be natural to the Marshes, or Moorish grounds, the waters, or the Sea sides.

1. *Gramen luncum palustre racemoso semine.* Marsh Rush like grasse with feedes in clusters.

This Rush grasse hath but few small Rush like leaves, rising from the blackish threddy roote: from among which cometh up divers stalkes a cubit high, bearing at the toppes betweene small long leaves a small head, formed like unto a bunch of grapes, wherein lie the seeds.

2. *Gramen luncum minimum aquaticum capitulo squamoso.* A very small water Rush like grasse.

This small water Rush grasse, hath as few, but smaller leaves than the former, being about two inches long a piece, the stalkes are foure or five inches high, each of them bearing a small scaly reddish head, with the toppe of the stalk appearing above it: this is not that sort expressed in the former Classis among other Rush grasses.

There is another somewhat like hereunto, but that the stalk appearing above the head, which is not scaly.

3. *Gramen aquaticum luncum vulgare.*
The Common Water Rush grasse.

4. *Gramen luncum aquaticum magis parva panicula.*
Another water Rush grasse with joynted leaves.

5. *Gramen luncum aquaticum* Bauhinifolia
articulato & cum nrisulis. Bauhinus
his double forme of Water Rush grasse.

6. *Gramen luncum maritimum majus*,
The greater Sea Rush-like Grasse.

7. *Gramen luncum marinum*
densiflorum. Thicke
Sea Rush Grasse.

9. *Gramen luncum exile*
Plummosij. Small Rush
grasse of Plummouth.

10. *Gramen luncum magis*
exile pauciflorum. The lesser
Rush grasse with few leaves.

11. *Gramen luncum minimum*
Haloisio Matthioli congener.
The smallest Rush Grasse like
the former Toade grasse.

3. *Gramen luncum aquaticum vulgare*. The common water Rush grasse.

The common water Rush grasse shooteth forth sundry joynted stalkes, from a long thicke spreading roote, and at each joynt a narrow Rush like leafe, at the toppes of whom stand divers small heades somewhat like unto those of Rushes.

4. *Gramen*

4. *Gramen luncum aquaticum magis sparsipanicula.* The other water Rush grasse with joynted leaves. This other water Rush grasse is very like in the growing unto the last, the chiefest differences be in the stalkes, that are greater and rise higher, in the leaves which are joynted like unto the wood Rush grasse, and in the toppes which are more spread with small heads.

5. *Gramen luncum aquaticum Bauhini.* Bauhinus his double formed water Rush grasse. I have hereunto added this double formed kinde of Rush grasse of Bauhinus, called *aquaticum*, whereby he would correct that *Gramen aquaticum alterum* which Lobel and Tabernmontanus set forth, because the leaves had no joynts in them as he saith the true sort should have, (but is rather another sort as I thinke,) for having given one figure with many small tufts or heades, such as it beareth in the summer time, he sheweth another, that the same plant be saith after hay harvest, shooteth forth another hand-high stalke with certaine chaffie heades, parted into many threds, and seldome beareth then any such like heads as the former on it: not having seene his sort, I can no further judge thereof, but give you my opinion.

6. *Gramen luncum maritimum majus.* The greater Sea Rushlike grasse. This greater Sea Rush grasse hath many hard smooth leaves, like Rushes, rising from the tufted roote, and among them sundry slender naked stalkes about a foote high, with Rush like heades growing at the toppes, but much smaller.

7. *Gramen luncum maritimum dense stipatum.* Thicke set Sea Rushlike grasse. This other Sea grasse hath long hard leaves like Rushes, growing thicke and close together, the stalkes are slender and not much longer than the leaves, every one bearing a small head at the toppe like unto a Rush, whereunto the roote is like also.

8. *Gramen luncum maritimum minimum Zelandicum.* The least Sea Rushlike grasse of Zeland. This whole plant scarce exceedeth halfe a cubit in height, but spreadeth like a small tussocke from each severall roote, whereof riseth a single small stalke, with small bairy like leaves therewith, &c a small thicke head at the top.

9. *Gramen luncum maritimum exile Plimouthij.* Small Sea Rush grasse of Plimouth. The leaves of this small Rush grasse are many, growing thicke together, and as fine almost as hairs or threds, among which rise up sundry slender unjoynted stalkes, bearing exceeding small sharpe pointed heades thereon, the stalkes appearing above them, and pointed: the rootes are many small long fibers. This was found as well at Plimouth as Dover in their wet grounds.

10. *Gramen luncum magis exile paucifolium.* A lesser Rush grasse with fewer leaves. This small grasse hath fewer and shorter stalkes and leanes than the last, more soft also and delicate, whose heads are a little bigger and prickly, and the stalke rising above them as in the other: the roote is small and slender.

11. *Gramen luncum minimum Holofoi Martialis congener.* The smallest Rush grasse, like the former Toad grasse. This little grasse groweth with sundry small thred like leaves, scarce an inch and a halfe long, with smaller on the stalkes, which are about twice their length, at whose toppes stand two or three small heades like to those of Rushes, but with rounder graines or feedes therein, and closer set together; the roote is very small and threddy.

The Place and Time.

All these grasses are sufficiently declared in what manner of places they grow, flourishing in the summertime, as the rest doe.

The Names.

The first, second, fifth, and eight, are of Bauhinus mention. The third of Tabernmontanus and Lobel, and so is also the sixth and seventh, the rest have not beene exhibited by any before.

The Vertues.

There can as little be said of these Grasses being hard and saplesse, that no cattle will feede thereon as of others the like, nor having in them any medicinable quality for man.

CHAP. XXXVIII.

Gramen luncum lanatum sive Bombycinum, vel luncus Bombycinus. Cotton Grasses or Rushes.

HAVE foure or five sorts of these woolly or Cotton Grasses so shew you in this Chapter, which although they grow not all in wet grounds, yet resembling one another so neerely, I did not thinke it good to separate them, but set them altogether.

1. *Gramen luncoides lanatum sive luncus Bombycinus vulgaris.* Common feather or Cotton grasse. The ordinary Cotton Grasse hath a few long slender leaves, almost like Rushes rising from a small tuft of threds thrusting downe somewhat deepe into the moorish ground, wherein it usually groweth, and among them hard slender stalkes, about a foote high, sometimes with a leaf or two thereon, and sometimes without either leaf or joynt, bearing at their toppes a fine soft woolly or rather white silkelike head, finer then the finest white wooll that is, of the bignesse usually of a Walnut, with the outer huske, which is so eminent in ones eye a farre off, that it giveth much delight and admiration to the beholders, which passeth away into the winde being full ripe, what feede it hath is not observed.

2. *Gramen luncoides lanatum alterum Danicum.* The Danish Cotton Grasse. This Cotton Grasse hath many more and narrower Rush like leaves growing from the roote, then the former, the stalkes are nothing so high as it, and the fine Cottony head is smaller and not so pure white: the rootes are much alike.

3. *Gramen luncum lanatum minus.* Small French Cotton Grasse. Although this hath many more Rushy leaves then any of the former, yet doe not the stalkes rise much higher, nor beare they at their toppes so great a tuft or Cottony head, but are small and somewhat long, flying away with the winde being ripe, but leaving a small head like a Crowfoote head of feede behind it: the roote is somewhat blacke, and not much unlike the former.

Q9999 2

4. GRAMEN

4. *Gramen tomentosum Alpinum minus.*
Small mountaine Cotton grasse.

From a small unprofitable roote riseth a small stalke halfe a foote high, with two or three leaves thereon, at the toppe whereof standeth a small round head of Cotton.

5. *Juncus Alpinus Bombycinus.*
Mountaine Cotton Rush.

This also sendeth forth from a Rush like roote, divers Rushes, and among them sundry slender stalkes an handbreadth high, bearing a small white head of wooll or cotton like the rest.

The Place and Time.

The first groweth in many places of this Kingdome, and on *Hampstead* heath neere *London*, about a bogge there, the second at *Elfrere*, in great abundance, and in *Germany* also, the third about *Mompelier*, the fourth in some moist places of the *Alpes*, the last in *Afravia*, and flourish chiefly in July.

The Names.

The first is diversly called by divers Authors, according as their knowledge and opinion thereof led them, for *Tragus* tooke it to be the *Gnaphalium* of *Dioscorides*, *Anguilara* his *Typha*, *Gesner* and others *Linum pratense* the *Germane* name being *Matten flachs*, *Lobel* *Juncus Bombycinus*, *Dodonæus* *Gramen Eriophorum*, *Thalins* *Gramen Juncum lanigerum*, *Tavernerianus*, *Gramen tomentosum* & *Linagrostis*. The second is the *Juncus Alpinus*: *capitula lanuginosa* of *Bauhinus*, although

3. *Gramen Juncum lanatum minus.*
Small French Cotton grasse.

1, 2. *Gramen Juncoides lanatum five Juncus Bombycinus.*
vulgaris & alter *Danicus*. Common Feather or Cotton grasse, And another of Denmark.

5. *Juncus Alpinus bombycinus.*
Mountaine Cotton Rush.

the figure exhibited was taken after the manner of the Danish growth, the fourth was sent by the title it beareth, The last is entituled as *Bauhinus* giveth it.

The Vertues.

Cordus onely saith of the first, that the decoction thereof in wine, and taken warme, easeth the griping paines in the belly. The woolly heads are gathereth by divers, to serve both to stuffe beds and cushions, and the like, which for the softnesse and goodnesse farre excelleth any Thistle downe.

CHAP. XXXIX.

Gramen Arundinaceum palustre. Marsh Reede Grasse.

Have shewed you in the last Classis before this, those sorts of Reede grasses, that usually grow on the upper groundes, although sometimes in the lower also. In this I shall entreat of such as grow in watery or marshy places.

1. *Gramen Arundinaceum maximum Bayonense*, Great Marsh Reede grasse of Bayon.

This great Reede grasse shooteth forth great thicke and very tall stalkes, as high as any man, joynted up to the toppes, with long & somewhat broad hard rough and straked leaves set thereon, but lesse then those below, towards the toppes of the stalks, with the leaves come forth many sparfed tufts of chaffie heads, standing on small long foote stalkes, the whole pannicke being a foote long and more: the roote creepeth farre about in the watery ditches and places neere *St. Iohn de Luce*, where it groweth.

2. *Gramen Arundinaceum acrota gluma nostras*. Our great Reed grasse with chaffie heads.

This sort of Reede grasse hath many faire large Reedlike leaves, springing from a joynted reddish roote, and are not much unlike to those of Millet grasse, but harder rougher, and straked all the length of them, having great Reedlike stalkes three cubits high, joynted also and branched, and towards the toppes bearing large, and somewhat hard pannickles of spiked chaffie heads, each of them about a spanne long, of a whitish colour in some places, and reddish in others, wherein lye small feede.

3. *Gramen Arundinaceum sericea molliore spica*. A lesser soft headed Reede grasse.

This other Reede grasse is somewhat like the last, but lesser, with narrower and shorter leaves, and lower stalkes, with but few joynts and leaves on them, the tufted heads that stand at the toppes, are somewhat like to the Rush that is called bastard *Schwananthum*, and turne into downe that is carryed away with the winde: the rootes are sundry long strings, set together at a head.

The Place and Time.

The place of the first hath beene expressed in the description, the two other grow in the low moist grounds by *Ruscliffe* neere *London*, and flourish in the Summer time.

The Names.

Καραμύρωσις in Greeke, and so also *Calamagrostis* & *Gramen Arundinaceum* in Latine, are as fitly applied to these sorts as the former, all these being of later invention, none having published any of them before.

1. *Gramen Arundinaceum maximum Bayonense*.
Great Marsh Reede grasse of Bayon.

2. *Gramen Arundinaceum acrota gluma nostras*.
Great Reede grasse with chaffie heads.

The Vertues.

We have not yet heard or learned of any good property they have for medecine.

CHAP. XL.

Gramen aquatica. Water Grasses.

Here are some other sorts of Grasses that properly grow in the Waters, and not spoken of before, after whom shall follow the Sea Grasses that they may vsher in the rest of the Sea plants.

1. *Gramen aquaticum majus.* Great water Grasse.

This great Water Grasse hath great and tall stalkes full of joynts, with large Reede-like leaves at them striped with white and greene, like Ladies faces, but not so evidently to be seene, up to the toppe almost, where standeth a large and long tufted pannicle of many parts and branches, like the common Reede, the rootes runne and spread farre, shooting up in sundry places.

2. *Gramen arundinaceum aquaticum.* Great Water Reede-grasse.

The stalkes of this are great and high, having broader and longer leaves then the former, and somewhat harder also, the joynts also be fewer, and the tufted pannicle is more spread and soft in handling, and of a purplish greene colour, whose bloomings are white, the rootes creepe not so much as the former.

3. *Gramen aquaticum panicula speciosa.* The faire headed water Grasse.

This Grasse riseth to be two cubits high, the leaves are broad and a foote long, but slenderly set on the stalkes, somewhat rough on the edges, some whereof will be hollow like a trunke that the stalk will goe through it halfe way, the toppe pannicle is made of many fine soft scaly tufts very beautifull.

4. *Gramen aquaticum paniculatum minus.* Small bearded Water Grasse.

This Grasse sendeth forth from a thicke hard white fibrous roote, a round straked stalk, about two foote high, compassed with sundry broad rough pale greene leaves, neere a foote long, the toppe pannicle is a spanne long, thinnely or sparsely placed, made of many whitish heads, compassed with long aulnes or beades.

5. *Gramen Echinatum aquaticum majus.* The greater prickly headed water Grasse.

The stalk of this Grasse riseth up two or three spannes above the water, in the ditches where it groweth with divers long and narrow leaves, bearing at the toppes of the stalkes, divers small prickely heads with long leaves at them, the rootes thrust deepe in the mudde.

6. *Gramen echinatum aquaticum minus.* The lesser prickely headed water Grasse.

This other Grasse is like to the last both in the leaves and prickely heads but smaller, and have no leaves standing with them as the former hath.

1. *Gramen aquaticum majus.*
Great Water Reede.

2. *Gramen Arundinaceum aquaticum.*
Great Water Reede-grasse.

7. *Gramen aquaticum spicatum.*
Spiked Water Grass.

8. *Gramen flavatile.*
Flower Grass.

9. *Gramen aquaticum alcyon.*
An other Water Grass.

11. *Gramen bulbosum aquaticum.*
The Water bulbed Grass.

7. *Gramen aquaticum spicatum*. Spiked Water Grasse.

The Water spiked Grasse hath sundry weake stalkes, leaning every way, full of joynts which are somewhat knobby or round, taking roote againe in divers places, having long and narrow leaves upon them, which lye floating upon and under the Water, that part that groweth up hath some leaves likewise thereon, and a long slender browne spikd head at the toppe, the roote bussheth thicke in the mudde with many strings and fibres thereat.

8. *Gramen fluviatile*. Flote Grasse.

The Flote grasse groweth in the very like manner to the last, with leaning stalkes, and rooting at the joynts, but hath more store of leaves on them, the toppes being furnished with sundry spiked heads, two or three together at a joynt upwards.

9. *Gramen aquaticum alterum*. Another Water or Burre Grasse.

The leaves of this Grasse are long smooth and tender, among which riseth up a stalke about halfe a yard high, with a few leaves set thereon, and at the toppe a many small rough heads like burres.

10. *Gramen Fluviatile cornutum*. Horned Flote grasse.

This strange Grasse hath a very slender stalke about two foote high, joynted at sundry places, and two small Russhy leaves for the most part set at each of them, growing somewhat broad, and compassing it at the bottome with a large skinne, from whence also rise one or two stalkes ending in a skinny head, which hath at the end of them three or foure very narrow leaves, turning downewards, and seeming like hornes: the roote is small and threddey.

11. *Gramen bulbosum aquaticum*. The Water bulbed Grasse.

This Grasse hath an oval bulbed roote spotted with yellow markes, and white within, not having any sent or taste, from whence springeth up betwene two eares as it were, a small stalke about two inches long, with another longer peece thereon, at the toppe whereof thrusteth forth divers fibres, and from them divers long and broad leaves: but what stalke or flower it bore, we are yet to learne, being thus much onely brought and thereby described.

The Place and Time.

The two first doe grow in ponds and lakes, in sundry places, as well of this Land as of others: The third in the watery places about *Padoa* and in *Hassia* also. The fourth in the waters about *Michelfield* by *Bassill*. The fifth sixth, seventh, eighth and ninth, in watery ditches and ponds in divers parts of the land. The last in the Lakes neere *Montpelier*, and doe all flower in the Summer time.

The Names.

The first is the *Gramen aquaticum harundinaceum paniculatum* of *Tabermontanus*. The second the *Gramen majus aquaticum* of *Lobel*. The third and fourth are called by *Bauhinus* *Gramen palustre*, &c. but I have set them both under the title of *aquaticum*. The fifth and sixth are not mentioned by any before. The seventh is so called by *Lobel* as it is in the title. The next hee calleth *Gramen aquis innatans*. The ninth is called by *Lobel* *Gramen aquaticum alterum*. The last is so called by *Bauhinus* as it is in the title.

The Vertues.

Most of these Grasses will Horses eate of, although we know not any use they have for any humane griefe.

CHAP. XLI.

Lythoxylon sive lignum lapideum. Stone Wood.

Lythoxylon sive lignum Lapidum.
Stone wood, or Wood made Stone.

ET me yet addethis Wood made Stone, in the end of these fresh Water plants, seeing diverse waters in this Kingdome as well as others have that property, that what wood soever greater or lesser, wrought or unwrought, by letting it abide in the water, in the Sommer time or Spring, for some time, according as the thickeesse will give time to penetrate it, the branches of trees and greene herbes, yea leather gloves, and many other have bene metamorphosed into stone, keeping that forme it held before it was put in, by the chilling quality of the water.

CHAP. XLII.

Gramina maritima. Sea Grasses.

THE Sea Grasses as I said before, are fittest to be joynted next unto the former Water Grasses, that after these I may shew you the rest of the plants that grow in or neere the Sea, or within the aire or breath thereof, which are properly called Maritime plants.

1. *Gramen Caninum geniculatum maritimum spicatum*. Sea spiked Dogs grasse or Quich grasse.

This Sea Grasse hath divers joynted stalkes about a foote high, with hard leaves thereon, a spanne long, and like the other quich grasse, the spiked heads are shorter by much and harder then the common kinde: the roote is full of joynts and creeperh under ground like it.

2. *Gramen*

1. *Grassum Caninum geniculatum tortuosum spicatum.*
Sea spiked Dogs grass or Quich grass.

3. *Grassum Caninum maritimum alterum longius radicans.*
Sea Dogs grass with longer roots.

4. *Grassum Caninum maritimum spicatum Monspeliense.*
Sea spike grass of Montpellier.

5. *Grassum Caninum maritimum asperum.*
Rough Sea Grass.

2. *Gramen maritimum vulgato Canario simile.* Sea Quich grasfe.

This other Sea grasfe is a slenderer, harder, and lancker Grasfe then the ordinary quich grasfe, and of a more blewish Greene colour, and differeth not in any thing else. But there are two other differing sorts hereof observed, the one in the rootes, which at the severall joynts as it runneth, doth shoote up the like stalkes, leaves, and spiked tufts, and will be sometimes twenty foote in length, with a number of those tufts of stalkes and leaves at them: the other in the spikes, which will have two rowes or orders in them.

3. *Gramen Caninum alterum maritimum longius radicans.* Sea Dogs grasfe with long rootes.

This long rooted Sea Grasfe differeth little from the former, either in the hard leaves or in the running rootes, but that they spread more, and instead of spiked heads at the toppes of the stalkes, this hath chaffie heads among the leaves.

4. *Gramen Caninum maritimum spicatum Monspelienfe.* Sea spiked Dogs grasfe of Mompelie.

This French Sea grasfe hath slender woody rootes, with but few fibres set thereat, from whence rise divers trailing stalkes a foote or more high with sundry joynts and branches at them, and short narrow reedlike leaves on them, at the toppes whereof grow spiked heads of three inches long apeece, of a darkish ash colour.

5. *Gramen Caninum maritimum asperum.* Rough Sea grasfe.

The roote of this grasfe is a bush of long white fibres, from whence spring many reddish round small stalkes, which at the first leane downewards, about a foote high, compassed with hard short and sharpe pointed leaves, standing as it were in a tuft together, with hard rough dents about the edges: the spiked heads are somewhat like unto small rough hard burres, breaking out of a skinne wherein they were first enclosed.

6. *Gramen exile vicinarum maris aggerum.* A small grasfe of the Sea downes.

This small Sea grasfe shooteth forth divers short stalkes of two inches long, full of small long leavies like haire, set close together, and among them at the toppes small heads, like the catkins of the dwarfe Willow, the roote is small and threddey.

7. *Oxygroffis maritima Dalechampij.* Sharpe pointed Sea grasfe.

The bushy stalkes hereof are about two foote long, full of joynts, with two long and narrow grasfe like leaves at every one of them, of a darke Greene colour, and so sharpe at the points that they are ready to pierce their legges that passe by it unawares.

8. *Gramen Inuoides maritimum.* Sea Rush grasfe.

The Sea Rush grasfe hath from a blackish browne single roote, pleasant in taste and full of hairy fibres, sundry short stalkes about a foote long with slender limber Rush like leaves thereon, twice as long as the stalkes, and at the toppes three or foure leaves a spanne long, encompassing a rough head like a Rush which is full of chaffie seedes.

7. *Oxygroffis maritima Dalechampij.*
Sharpe pointed Sea grasfe. 9. *Gramen maritimum spicatum.*
Spiked Sea grasfe. 9. *Gramen*

9. *Gramen marinum spicatum alterum.*
Another sort of spiked Sea Grasse.

9. *Gramen marinum spicatum.* Spiked Sea Grasse.

The roote of this Grasse is composed of a bush of many long stringes or fibres, from whence rise many long hollowed or guttery leaves, compassing one another at the bottome, among whom spring two or three stalkes bare of leaves unto the toppes where they beare long spiked heads of greenish flowers set close together.

10. *Gramen marinum spicatum alterum.*
Another sort of spiked Sea Grasse.

The leaves hereof are slender long narrow hard, and sharpe pointed growing often on the low places nere the Sea, that sometimes washeth over it, which no cartle will eate willingly, it beareth sundry low stalks with small long and round heads thereon.

11. *Gramen marinum mediterraneum majus Statice quibusdam.* Great Sea Thrift.

Although I have in my former Booke described and pictured both the sorts of Thrift, the greater and lesser, yet because I am to shew you another sort of the greater kinde. I will here againe briefly remember them, and shew you that the greater of them groweth with many faire long and somewhat broad whitish Greene leaves, lying close together upon the ground, from whom rise slender stalkes, naked unto the toppes, except in one place toward the middle, where it hath two small leaves, turning downewards contrary to almost all other herbes and at their tops a tuft of bluish coloured flowers, opening by degrees.

12. *Statice Americana.* Great Sea Thrift of America.

This other great Sea Thrift of America, hath likewise many such leaves as the last hath, but they are of a sadder Greene colour, and somewhat shining with two ribbes in each, and blunt at the ends, the slender stalkes beare also such a tuft of flowers, but they are white and breake out of a skinne which falleth downe about the stalk, the roote is long and with but few fibres thereat.

13. *Gramen marinum minus.* Small Thrift or Sea Cushion.

This other smaller sort is well knowne to have many small hard short Greene leaves thicke growing together and

11. *Gramen marinum mediterraneum majus Statice quibusdam.* Great Sea Thrift.

13. *Gramen marinum minus.*
The small ordinary Thrift or Sea Cushion.

and spreading on the ground, the stalkes are many of a spanne high, without any leaves on them, but at the tops a small round tuft of bluish coloured flowers.

The Place and Time.

The three first sorts, the sixth and the last, have beene observed on our Sea coasts, especially in *Kent*, the fourth and the eighth, about *Mompelier* and *Narbonne*, and the fifth both on the *Venetian*, *Anconitan* and *French* shoates, also about *Mompelier*, the eleventh as well on the hills, as neere the Sea, and hath beene often sent us from *Portugall*, the rest are found neere the Sea coasts in many places, and are in flower and feede in the end of Summer.

The Names.

The first and third sorts are mentioned by *Lobel*, the second sixth and eight have not beene remembered by any other Author before, the fourth and fifth are mentioned by *Bauhinus*, by the names of *Gramen Caninum maritimum spicatum*, and *Gramen Caninum maritimum asperum*, the seventh is so called by *Lugdunensis* as it is in the title, the ninth and tenth are mentioned by *Lobel*. The eleventh *Clusius* first called *Gramen maritimum majus*, and so doth *Tabernmontanus* also, but afterwards in his history of Plants, he calleth it *Armeria montana tenuifolia major*, *Lobel* *Caryophyllus montanus*, *Lugdunensis* saith it is called *Statice* by some from the present help in staunching blood in the body wherefoever, and so by *Camerarius* also, but differeth from the *Statice* of *Pliny*, and as divers from his *Cantabrica* although *Camerarius* taketh it to be the *Cantabrica* of *Anguillara*, yet surely it is called *Statice* by divers now adayes, and as *Lugdunensis* saith, divers herbarists of *Paris* called it *Catanances alterum genus*, but by many also *Caryophyllus montanus alter* or *major*, as *Bauhinus* also doth adding thereto *flore globoso*, and others *Gramen maritimum majus*, as they doe the last *Gramen maritimum minus*, and others *Caryophyllus maritimus minimus*, but *Clusius* *Armeria montana tenuifolia minor*; *Dodonaeus* calleth them both *Gramen polyanthemum majus & minus*, and the lesser *Pseudimoly* in his *French Herball*, as *Gesner* in *hortis* doth also, the twelfth is stiled *Statice Americana* by *Cornutus*.

The Vertues.

It is generally held that the rootes of the Sea Quich grasse is as effectuell as the ordinary or common sort, and therefore for the qualities, I must referre you to be enformed there where I speake of it, that so I may avoide a double repetition of the same things, the rest are not put to any use in Physicke that I know. This difference betwene these and those of the Land hath beene observed that cattle will not feede on the leaves of these by reason of their hardnesse, roughnesse, and sharpenesse, when as they refuse not the other.

CHAP. XLIII.

Alfina marina. Sea Chickweede.

Here are some sorts of Chickweede that are reserved out of the family of the former Chickweedes to be entreated of in this place.

1. *Alfina minima.*
Sea Chickweede.

2, 3. *Alfina maritima Neapolitana* & *Coronopus tenuifolius Neapolitanus marit.*
Bluish Chickweed of Naples, and small Sea Buck's home or Naples.

I. *Alfne marina*. Sea Chickweede.

This Sea Chickweede groweth for the most part with the branches lying on the ground, very like unto the middle sort of Chickweede, but that the stalkes are shorter and thicker, and closer joynted with such like leaves at them, yet thicker and whiter, the flowers are composed of many small leaves standing like a starre: the seede vessells that follow, are not long and round like the other, but flat and somewhat broad, wherein are contained three or foure greater feedes: the roote is threddy. Another like hereunto is that Sea Chickweede that *Clusius* saith be found with thicke leaves, like unto Purslane, growing on the sandy hills neere the shore in Holland, but that the flowers as he saith were greenish.

2. *Alfne maritima Neapolitana flore rubente*. Blush Chickweede of Naples.

The stalkes of this Chickweede are exceeding small, lying on the ground, round about the rootes, with as fine and small leaves almost thereon, two alwayes or more set crosswise at the joyntes, being of a fingers length almost: the flowers stand at the toppes, as in the former Sea Chickweede, but of a bluish or pale purple colour, whose seede is contained in the like long heads as others: the roote is threddy as the rest. With the figure hereof you have in the same table that small Sea Buckles borne of Naples set forth by *Columna*, the description whereof you shall finde before in pag 501. and might very well have bene brought hither, among these other Sea plants.

The Place and Time.

The titles of these declare their places of breeding, and their time is with the others.

The Names.

The first is called *Alfne marina* of *Dodonaeus* and *Tabermontanus*, but *Lobel* calleth it *Alfne seu Hippia major*, and *Casalpini* *Centunculus*, the other kinde whereof *Clusius* calleth *Alfne genu pelagicum*. The second is called by *Columna*, *Alfne maritima Neapolitana*.

The Vertues.

There is little use made of these Chickweedes in Physicke, and yet their taste as well as their forme, declare them of the same temperature with the other sorts.

CHAP. XLIV.

Lenticula marina vulgaris, & serratis folijs.
Ordinary Sea Lentils.

Lenticula marina vulgaris. Ordinary Sea Lentils.

Naturall to the *Tyrrhene* and *Adriaticke* Sea, betwene the *Florentine* and *Venetian* Dominions, there groweth, saith *Lobel*, this plant, which hath the long and narrow leaves of *Scoparia* or Broome Flax, very thicke set on weak bending stalks, halfe a foote long and full of empty round skinny berries, like unto Lentils, from whence it came to be so called. There is another sort hereof called *Lenticula marina serratis folijs*, very like it differing onely in that it hath broader and shorter leaves, dented about the edges.

The Place, Time, Names and Vertues.

Their Place is declared, and Time to be understood the Sommer. *Lobel* calleth it *Lenticula marina Serapionis*, and so doe *Tabermontanus* and *Leidenensis* after him, who also saith it is called by some *Vivamarina*. *Bauhinus* calleth that with plaine leaves *Fucus foliculaceus* *Linaria folia*, and saith that *Imperatus* called it *Acinariae marinae altera species*, but the other with jagged leaves, he calleth *Fucus foliaceus serratis folijs*, and of *Imperatus* *Acinariae marinae cetera species*, but to what use it may serve in Physicke hath not yet bene observed. *Clusius* in his *Scholia* on the last Chapter of *Acofta* his Booke of simples putteth it to the question whether that with dented leaves, should not be that herbe that is called *Sargasso*, but *Bauhinus* in his *Pinax* setteth it downe as if it were certaine. These have bene often seen covering the Sea, in sayling to the East Indies, betwene eightene and thirty foure degrees of Northerly Latitude, which by hindering the ships passage, some of the Saylers in clearing the sides of the ship, brought it into the ship, and while it was fresh did eate thereof both raw and hoyled, but grew hard and brittle when it was dry, and was of a cleansing property for urine, as one of the Saylers troubled with foule humours and the stopping of those passage, found to his ease that did eate thereof. *Acofta* his description thereof is in this manner. This plant groweth in a large smooth Sea covered therewith, as farre as the eye could discern, whose bottome could not be reached unto by our plumme line, yet very likely to rise from the bottome, as might be discerned by the berries wrapped together thereon on the branches, and being pulled up was of an hand length, with leaves halfe an inch long, dented about the edges, and of a reddish colour, without taste but what it had from the Sea water: at every leafe it bore a berry like a Pepper corne, but hollow full of salt water, and of a white colour, or mixt of white and red: being fresh and new taken up it is tendet, but brittle and hard when it is dried.

RIIIE

CHAP.

Serratis folijs

CHAP. XLV:

1. *Parthenium marinum*. Sea May weed or Featherfew.

His spreadeth many short branches on the ground about an handbrédth long, having divers long and narrow leaves set about them. cut in on the sides like to the greater Daisy leaves, of a strong or stinking favour like unto the ordinary May weede, and having flowers not much unlike it also, the roote is long and slender, and shooteth forth divers fibres from it.

2. *Chamamelum maritimum*. Sea Camomill.

The roote hereof is blackish spreading into many long fibres, sending forth sundry weake stalkes lying on the ground, set on both sides with larger leaves then are in the ordinary May weede, having a large white flower, and a yellow thrum in the middle.

The Place and Time.

The first groweth neere the Fishers Cottages at the foote of the hill *Cesium* in *Narbonne* in *France*, the other in the sandy grounds neere the Sea shore, and flower in Summer.

The Names.

Lobel calleth the first *Cotula* five *Parthenium marinum minimum*, *Lugdunensis* *Parthenium marinum minimum*. *Bauhinus* *Matricaria maritima*, and thinketh that it is the *Chamamelum maritimum* *Dalechampi*, set downe in the second place and called *Cotula marina* by *Lobel*.

The Vertues.

The first hath neither weaker, (saith *Lobel*) nor differing propertiés from the ordinary May weede, which for to avoid a double repetition of one thing, I referre you to the Chapter of May weede in the first Classis of this Worke. Of the other there is no particular property recorded.

Parthenium marinum.
Sea Mayweed or Featherfew.

CHAP. XLVI.

Conyza marina. Sea Fleabane.*Conyza marina*. Sea Fleabane.

His kind of *Conyza*, that groweth in the fields neere the Sea Coasts, hath a long dry hard roote, and from thence riseth a round stalke, about a foote high, branched into sundry parts, set with long and narrow leaves somewhat like unto the smaller Ribbewort Plantane, almost without taste yet a little bitter: the flowers are yellow, standing in a close tuft together, and are blowne away with the wind when the head is ripe.

The Place and Time.

The place is declared before, and the Sommer is the time of its flowering.

The Names.

Lugdunensis calleth it *Conyza marina*, and *Bauhinus* as I said in the six and twentieth Chapter of the sixt Classis here before, would referre it to the *Chondrilla altera* *Dioscoridis* *Rauwolfio*, which I there said, I thinke to be erroneous for the reasons there alledged.

The Vertues.

It is thought to have the same propertiés, that the other Fleabanes have.

CHAP. XLVII.

Glaux maritima. Sea Milkewort.

Our moderne Authours have mentioned divers sorts of *Glaux*, whereof that of *Cistus* and another called *Vulgaris*, have beene formerly handled before in this Worke. *Dodonæus*, *Lobel* and others, have exhibited one that I meane to entreate of in this Chapter, which is the lesser, *Cordus* and *Camerarius*, a greater, and *Alpinus* one differing from them both, each supposing theirs to be the necest unto *Dioscorides* his *Glaux*.

1. *Glaux maritima major.* The greater Sea Milkewort.

The greater of these Milkeworts hath sundry slender weake stalkes spread on the ground, beset with divers Lentill like leaves, yet a little larger, and of a grayish Greene colour on the upper side, and more grayish underneath, the flowers are purple set at the joynts with the leaves, after which come small buttons with feede in them, the roote shooteth downe right, but the branches as they spread take roote againe. *Bambinus* saith there is some variety observed herein: the greater sort having sometimes much larger leaves, and sometimes narrower, the lesser sort having the stalks thicker stord with leaves, especially upwards, the lower being false away, leaving the stalkes bare, and as if they had great joynts.

2. *Glaux maritima minor.* The lesser Sea Milkewort.

The lesser sort differeth little from the former, in the manner of growing, but in the smallnesse both of stalkes and leaves, and that this is found growing in places neere the Sea or salt Lakes, and the other as well on the hills, &c. as neere the Sea.

3. *Glaux maritima Veneta Alpina.* The Venetian Sea Milkewort of *Alpinus*.

This Venetian Sea Milkewort riseth up from a slender long woody branched roote, with foure or five slender stalkes a cubit or more high, set at equall distances with sundry somewhat long and narrow leaves, Greene on the upper side, and hoary white underneath, and at the toppes foure or five flowers standing together, as it were in an umbell for forme and bignesse, being very like unto the bastard Scorpion like podded *Sena* of Candy, but of a whitish bluish colour, and are succceeded by small short round pods, having small hard round feede within them, tasting a little sweetish.

The Place and Time.

The first groweth in many places of *Germany*, and was sent as *Bambinus* saith, to him from out of *Stotland*, but the lesser is often found, both on the *Kentish* and *Essex* shores, and the last as *Alpinus* saith in the salt marshes neere unto *Clodio*, a City of the *Venetians*, flowering and seeding in the end of Summer.

2. *Glaux exigua maritima.*
Small Sea Milkewort.

3. *Glaux maritima Veneta Alpina.*
The Venetian Sea Milkewort of *Alpinus*.

The

The Names.

The Greeke name γλαυξ is taken from γάλαξ or γάλα, which is milke, and the Latines follow the Greeke name *Glaux*, and not as some thinke a *glauco colore*, for the Latine derivation cannot suite with the Greeke word. *Pliny* saith it is called also γαλακτων, because it restoreth the decayed milke in Nourishes breasts. *Cordus* on *Dioscorides*, and *Camerarius* in *horto*, mention the first, which *Bauhinus* calleth *Glaux latiore folio Thuringiaca*, The second, *Dodonæus*, *Lobel*, *Camerarius*, *Tabernmontanus* and *Lugdunensis* speake of, and call it *Glaux exigua maritima*. The last is mentioned by *Alpinus* in his Booke of *Exoticke* plants, by the name of *Glaux in maritima*, but *Bauhinus* would referre it to *Clusius* his *Dorychnio congener*, as if they were both one plant, and of the Family of the Trefoiles, or Lotus, yet surely howsoever they be in some things alike, they are most likely to bee different plants, and therefore I have placed it here, being of *Alpinus* his judgement, that it doth come as neerely if not more, unto *Dioscorides* his *Glaux* then any others.

The Vertues.

It was used to be eaten after it was boiled as a Sallet herbe, with oyle and salt, in generall by all, but in especiall by Nourishes that wanted milke in their breasts, to helpe to encrease it, for which purpose also it is used now a dayes.

CHAP. XLVIII.

Kali. Glasfe wort.

Aving by I know not what chance left out some sorts of *Kali* from the other formerly exhibited, let me place them here among the Sea plants, rather then leave them cut altogether,

1. *Kali spinosum*. Prickly Glasfe wort.

This sort of *Kali* or Glasfe wort riseth up with one hard stalke, three or foure foote long, sometimes branched from the very bottome, each of them three foote long for the most part, whereon are set narrow leaves, without order, in some places but one at a joynt, at others two or three, standing opposite all along, and others two or three together, some longer then others, the longest being usually about two inches long, at severall joynts with the leaves, both on the stalk & branches come forth certain hard huskes, pointed out into sixe sharpe prickely ends, formed somewhat like a Starre, with a small white flower in the middle, which abideth not long, that middle part afterwards swelling somewhat higher, hath a small pricke thereat, in which head lyeth one seede, almost like a graine of Wheate: the roote is spread into some branches, and periseth or withereth at the first approach of Winter with us, although it will abide in the forme as it grew a great while after it is withered and dry.

1. *Kali spinosum*. Prickly Glasfe wort. 2. *Kali floridum repens Neapolitanum Columina*.

Columina his *Neapolitan Glasfe wort*.

This small creeping or spreading Glasfe wort, shooteth forth sundry weake branches, lying for the most part upon the ground, and raising it selfe up but a little, parted likewise into branches, set confusedly with small, thicke, round leaves, at the toppes of the severall branches whereof, stand many small white flowers clustering together, made of five or sixe small pointed leaves a peece, after whom succede small heads opening into five parts, each being pointed at the ends, containing within much very small brownish seede, the roote is composed of many small long strings and fibres at them: the whole plant is very salt and covered with a rough meallinesse, as many Sea plants are, which although in its naturall place, or in the warmer climates, it will abide in Gardens, yet will it not doe so in our Country.

3. *Kali longissimis folijs Egyptianum*.

The longest leaved *Kali* or Glasfe wort of *Egypt*.

This *Kali*, that as *Alpinus* saith is more proper to *Egypt* then to any other place, riseth up with a long weake and a little hairy bending stalke branched forth into divers parts, having the lower leaves very long and narrow, a little bowing backwards and hairy with all, those on the stalke and branches, upwards, being like unto the other, but somewhat shorter, and at the toppes foure or five much smaller, and more bowing or bending downwards, from the middle of whom come forth many flowers, like unto *Roses* saith mine Author: the whole plant hath a salt and sharpe taste, being smart upon the tongue.

4. *Kali*

2. *Kali floridus* repens Neapolitanum. Columna his Neapolitan Glassewort.

3. *Kali longissima* folijs Egyptian. The long leaved Kali or Glassewort of Egypt.

4. *Kali Arabum primum* genus Rauwolfia. Rauwolfia his first Arabian Kali.

4. *Kali Arabum primum* genus Rauwolfia. Rauwolfia his first Arabian Kali.

It is a small plant (saith he) full of slender branches very orderly set or placed together, sending forth many small knotted joynts disperedly thereon, and at them sundry small narrow tender and pointed leaves, being of an ash-colour on the upper side and whitish underneath, as the stalkes and whole plant is also.

The Place and Time.

The two former sorts grow neere the sea side, the former both in France and Italy, the other Columna first found on the Westerne shore of Naples, and flower and feede late in the yeare, the third Alpinus saith is most proper to Egypt, and the last to Syria.

The Names.

The first of these hath beene taken for *Tragum Matthioli*, but his is alwayes found growing lower and smaller, and without leaves, and this never without, whereby it appeareth plainly that they are two severall plants, and so doth Antonio Donati of Venice account them. *Banbinnus* in making two sorts of *Tragum*, calleth one *Kali*

Rrrrr 3

spinosum

spinosum cochleatum, but why *cochleatum*, I see no cause, for it is not *Lobel* his *Kali cochleato semine*, for that hee made the first of his *Kalies* in the foregoing Paragraph, and I thinke there is no other *Kali cochleato semine* besides, the other he calleth *Kali spinoso affinis*, referring it to the *Tragum* of *Marthiolus*, as all Anthours since him have called it, and saith withall that because *Dioscorides*, gave no leaves to his *Tragum*, therefore *Marthiolus* and *Tabernmontanus*, did expresse their *Tragum* without leaves: but *Lobel* set leaves, to his *Tragum*, as he himselfe saith he found it on the *Venetians* Island called *Lio*: but *Donatus* as I said before, saith he found that sort also without leaves in the same Island. The second *Columna* calleth *Kali floridum repens Aizoides Neapolitanum*, and *Bambinus* *Kali Cressule minoris folio*. The third is the third *Kali* of *Alpinus* in his Booke of *Egyptian* plants. The last is called by *Ranwolffius* *Kali Arabum primum genus*, which as he saith is called *Usneby* the *Arabians*, but by the *Natives* where it groweth *Schikan*.

The Vertues.

The ashes of all these sorts, as well as of the former sorts are both used to make Sope and Glasse, and to purge the belly also, from a dist choller as *Alpinus* saith, especially of his sort, either the juice of the leaves or the pouther of them taken in Wine.

CHAP. XLIX.

Crithmum maritimum. Sampire.

In this Chapter I must joyne, for the name and places sake, thre or foure other plants, because I would not make many of them.

1. *Crithmum maritimum vulgare*. Rocke Sampire.

The Rocke Sampire groweth up with a tender Greene stalk, about halfe a yard or two foote high at the most, branching forth almost from the very bottome and stored with sundry thicke and almost round, somewhat long leaves of a deepe Greene colour, sometimes three together, and sometimes more on a stalk, and are sappy, and of a pleasant hot or spicy taste: at the toppes of the stalks and branches stand umbels of white flowers, and after them come large seede bigger then Fennel, yet somewhat alike: the roote is great, white and long continuing many yeares, and is of a hot spicy taste likewise.

2. *Crithmum maritimum majus*. The greater Rocke Sampire.

This greater sort differeth little in forme from the precedent, but in the largenesse, and in not being of so good a tellish or spicy taste as it, but smelling somewhat strongly of Smalage, and tasteth more bitter.

3. *Crithmum maritimum spinosum sive Pasticaca marina*. Sea Parsneppe.

This Sea Parsneppe is very like the former Sampire, but it groweth greater and higher with shorter and nar-

1. *Crithmum maritimum vulgare*.
Rocke Sampire.3. *Crithmum maritimum spinosum sive Pasticaca marina*.
The Sea Parsneppe.

lower leaves, much more divided, and sharply pricking at the ends, the stalks are more sappy and of a fresher green colour, breaking into three or foure branches towards the toppes where stand large umbels of white flowers, and afterwards Fennell like seede in prickly huskes: the roote is long and white, somewhat like unto a Parsneppe, but more divided into parts, and is of a good rellish, somewhat resembling a Parsneppe.

4. *Crithmum Chrysanthemum.*

Golden flowered Sampire.

The Golden Sampire hath sundry hard round stalkes, rising from the roote, thickly stord with very narrow long and somewhat thicke leaves cut in at the ends: at the toppes of the stalkes stand single flowers, like unto *Aster* or *Chrysanthemum*, wholly yellow, both the border and the thrumme in the middle, wherein lye the seede when they are ripe and are blowne away with the winde: the roote is divided into many strings.

The Place and Time.

All these plants grow in or neere the Sea. The two first on the Rocks that are often moistened at the least, if not overflowne with the Sea water, the other in grounds not farre from the shore: and doe all flower and seede in the end of July and August.

The Names.

The Greekes *κρίθμον* or *κρίθαλλον*, or *Γαλεις κρίθμον*, and the Latines *Crithmum*, is generally not onely given to the two first sorts here set forth, but to the two latter sorts also, of which *erour Matthiolus* is the first Authour as I take it, and from him all others have deduced the title: but *Lobel* and *Lugdunensis* first put in the doubt, and exposed another herbe, that did more rightly as he saith, agree to *Dioscorides* his description of *Crithmum* than this, namely the *Portulaca marina*, for as he saith, this hath no resemblance with the *Crithmum* of *Dioscorides*, which he writeth hath whiter and broader leaves then Purslane, and such saith he hath the *Portulaca marina*, but such hath not this *Crithmum*, but very Greene, and nothing so large as Purslane, and may more fitly be called, even as the very common sort of people doe *Foeniculum marinum*, Sea Fennell, for so in the umbels and whole face thereof it doth assimilate a Fennell: but if I may be so bold to scanne Doctor *Lobel* his *Crithmum*, I belevee it will be found as defective in some other part as the former: for although *Portulaca marina* agreeth with *Dioscorides* his *Crithmum* in the leaves, yet it doth not so in the seede, wherein it must also agree if it be the right: but the seed of *Portulaca marina*, is flat like an *Arrach*, and hath not in it a kernell like wheate, as *Dioscorides* description doth enforce it, and therefore we may conclude that neither this nor that doth answer *Dioscorides* his Text in all points: this is therefore more properly to be called *Foeniculum marinum*, untill it can be better determined wherunto it may be appropriate: Some would also make it to be *Empetron Dioscoridis*, but *Matthiolus* hath dissolved those errors, shewing that this Sea Fennell hath no purging quality therein at all, and that it was never seene naturally growing as well on hills, as neere the Sea side. *Casalpinus* onely, and *Bauhinus* from him maketh mention of the first *Crithmum* here, calling it *Baticula alterum genus ex Sicilia*, as he doth the second *Baticula quasi parva Batis*, for it is thought to bee that which *Pliny* called *Batis*, as *Geiner* in *hortis* doth, and *Crithmum marinum* also: It is the first *Crithmum* of *Matthiolus*, whom almost all other Authours doe follow, who also saith the *Italians* his Countrymen called it *herba de San Pietro*, and some from thence *Sampetro*, and the *French* thereafter, *San Pierre*, and we from them, being our neerer neighbours, *Sampier*. *Bauhinus* calleth both these first sorts *Crithmum sine Foeniculum marinum majus & minus*. The third is the second *Crithmum* of *Matthiolus*, called *Crithmum spinosum* by *Dodonæus* and *Tabernaemontanus* but *Pastinaca marina* by *Lobel*, *Lugdunensis* and others, and as *Bauhinus* thinketh, is the *Tribulus marinus quorundam* of *Dalechampius* also. *Angulara* took it to be *Secacul*, and *Camerarius* calleth it *Cachry marinum*. The last is *Matthiolus* his third sort of *Crithmum* whom *Lugdunensis* and *Camerarius* doe follow, *Dodonæus* calleth it *Crithmum Chrysanthemum* and *Lobel* *Chrysanthemum litoreum*, *Casalpinus* *Anthyllis prima Dioscoridis*, *Cordus* in *observat Sylva Anthyllis major* and *Bauhinus* *Crithmum maritimum flore Asteris Attici*, and by some *Aster Atticus marinus*. The *Italians* besides the former name call it *Finochio marino*, the *Spaniards* *Perrexil de la mar* & *Hinojo marino*, the *French* *Fenouil marin* and *Bacille* and *Cretemarine*, as the Apothecaries in their shops, beyond Sea *Crete marina*, this from them, or they from it: the *Germanes* *Meerfenchell*, the *Dutch* *Zee Venckell*, and We as I said *Sampier* and *Sea Fennell*. *Petrus Geseentius* calleth it *Crithmum & Rincum marinum*.

The Vertues.

To shew you the Vertues of *Dioscorides* his *Crithmum*, is but to put you to try whether they answer unto our Sampire: which are these. The rootes and the leaves boyled in wine and drunke helpeth the difficulty in making water, and the yellow jaundice: the same also provoketh womens courses, it is eaten both raw and boyled as other herbes and pickled up to be kept, *Galen* saith it is salt and a little bitter withall, whereby it hath an effectuall property to dry and to cleanse, but yet each of these properties are weaker in it, then it is in those things that are bitter. Our Sampier is a safe herbe, very pleasant both to the taste and stomacke, not onely by the saltnesse, but by the spiciness in it likewise in helping digestion, opening in some sort the obstructions of the Liver and Spleene, provoking

4. *Crithmum Chrysanthemum.*
Golden flowered Sampire.

provoking urine and helping thereby to wash away the gravell and stone engendred in the kidneys or bladder : Many other Sea plants might have bene put into this Classis, which I have disperfedly handled and spoken of through this whole worke, because they were so like unto those plants, whereunto I have joyned them, that they could not well be sepetated, I thought them therefore fitter to be entreated of there, and reserved onely these few for this place.

CHAP. L.

Bulbus Crinitus marinus. The Sea Bulbe with hairy bush toppes.

Efore I come to the Sea Mosses, let me add this uncouth, unheard of, and peradventure untrue, or at least uncertaine Sea plant, in that we have not yet read or heard of any found Authour that hath mentioned it, but *Lugdunensis* and he, as he saith out of certaine Navigations in the *Italian* tongue, but neither persons that saw it, nor place of the Sea where it grew but onely among certaine Islands, nor time when it was found, are expressed in the declaration thereof: which maketh it the more suspitious: but as *Lugdunensis* hath set it downe, so I will give it you to cause others to finde out the truth, or folly of the matter. Among certaine Islands doth grow so great abundance of this finely expressed plant, that shippes being forced to passe over it, are often stayed in their course: it groweth in the bottome of the Sea, to the length of foureteene or fiteene fathome (or braces) and rising foure or five above the water, of the colour of yellow waxe, with a reasonabie bigge stalke, from whence at certaine spaces are set divers bulbes, sending forth at their ends, certaine bushes or tufts of haire, the roote is bulbous also, but thicker and greater then the others on the stalkes, and bushing out many hairy fibres: Thus much hee. *Bauhins* saith hee knoweth not what it is, and surely I thinke if there were any such thing, in *rerum natura*, others besides *Lugdunensis* might have the fortune to light upon that unnamed Authour to certifie us of his honesty and knowledge, I can goe no further, not having any further limits allotted me.

Bulbus marinus crinitus. The Sea bulbe with Feather tops.

CHAP. LI.

Musculus marinus. Sea Mosse.

F Mosses I am next to speake, which are of many sorts, some of the Vplands, and others of the Sea, which must be joyned next to those other Sea plants, and those of the Land after them, and because these also are of divers sorts, I thinke fit to distribute them into three rankes. the first to be of those that are of an herby substance, the second of an harder stony, and the last of a spongy matter: the first sort also is to be divided into these plants, that beare fine cut leaves, like Mosse or Fearn, and into those that have broader leaves, of those with fine cut leaves I shall entreate in this Chapter, and of the broader in the next.

1. *Musculus marinus capillaceus* *Discozoidis*. The soft Sea Mosse.

This soft Sea Mosse (is not *Corallina*, which is hard and hath a branched stalke, but) is like unto those Mosses that grow upon the ground or trees without any rootes, onely growing upon the rockes, or upon the shells of sundry fishes, being a soft herbe composed wholly of woolly white haire, without any branch or stalke, and is oftener found white then reddish or gray, but is not Greene. There is another small sort hereof, found growig on the stones by the Sea side, as also sometimes upon wood, and is likewise sometimes cast up by the Sea on the shore among the *Alga* of divers sorts, growing somewhat at like the former or ground Mosse, but that it is white and tasteth a little saltish and binding.

2. *Musculus marinus Neapolitanus*. Sea Mosse of Naples.

This Sea Mosse likewise groweth unto some rocke or stone, rising with a stalke more then foure inches high, with

1. *Muscus marinus capitatus* *Droseridi* & *alter parvus Venetus*. The soft Sea Mousse, and another small sort from the Venetian shore.

2. *Muscus marinus Neapolitanus*. Sea Mousse of Naples.

3. *Muscus marinus seu Alga tinctoria*. Dying red Sea Mousse.

4. *Muscus marinus sive Faniculaceus*. Short Fennell like Sea Mousse.

5. *Muscus marinus Ferulaceus*. Long Fennell like Sea Mousse.

6. *Muscus maritima Aërotomonides.*
Sea hawewood like Sea Mollie.

8. *Muscus maritimus pectatus Caltra lico eff. g.*
The long close Sea Mollie of Venice.

7. *Muscus maritimus argenteus flomiformis.*
The silver like Sea Feather.

9. *Perma aurea Marina.*
The goulden Sea Feather.

with sundry branches on both sides, and they againe divided into lesser, all of them plentifully stored with very fine leaves, as small as Camomill leaves, or finer then they if any other be finer, soft in handling at the first, easie to be bended, and transparent if they be interposed to the light, greene below at the lower part, and purplish above: this is not so brittle as Coralline when it is dyed, and groweth more rough by the drynesse, although it may well be referred unto some kind thereof, and retaineth a very salt taste with it, but being put into water or a while steeped therein, it will grow soft againe.

3. *Muscus maritimus tinctorius sive Alga tinctoria Ingdamensis.*
Dying red Sea Mollie.

This small red Sea Mollie is somewhat like the last, but with more store

store of soft stalkes and fewer branches, and with as fine small leaves on them like unto Fennell of a reddish colour, but with some whiteneffe mixed together, this is used by divers to strike a deepe crimfon, or reddish purple colour, which will last long.

4. *Muscus marinus virens Fœniculaceus*. Short Fennell like Sea Mofse.

This short Fennell like Mofse groweth up from blackish round and fibrous rootes, with divers fine short leaves like Fennell, of an herbby or Greene colour, among which an herbby stalk riseth also with such like leaves on it, and having sundry swolne eminences thereon.

5. *Muscus marinus Ferulaceus*. Long Fennell like Sea Mofse.

The leaves hereof are very long and fine like unto the *Ferula*, or Fennell giant, growing from stalkes neere a foote long, divided into branches, this springeth from Rockes or the like.

6. *Muscus marinus Abrotanoides*. The Southernewood like Sea Mofse.

This also riseth up from the Rockes with thicke stalkes and branches, with fine cut leaves on them, somewhat like unto Southernewood, but much bigger, and of a brownish red colour.

7. *Muscus marinus argenteus plumiformis*. The silver like Sea Feather.

This most beautifull Mofse groweth on the Rockes in the Sea, upon the dry shells of Fishes, and is also often found wrapped amongst the wrake of Sea weede, cast upon the shore, growing up as the figure sheweth, into many particular parts or branches, made as it were all of haire like other Mosses, but verily representing severall sprigs of Feathers, of so pure a white silverlike colour, that it is to be wondered at, that any Sea Mofse should become so white by nature, or made by Art, the property whereof is to wasse the Spleene applied with Vinegar, it quickly also dissolveth the scrophules or kernels in the throat, or elsewhere: it helpeth the Drop-sie in that it doth abundantly provoke urine: it cleanseth likewise the reins, and gravell or stones engendred in the kidneyes, if a dramme of it in poulder be taken in the distilled water of *Erysimum*, Hedge Mustard or Sea Holly with an equal proportion of the juice of Lemmons.

8. *Muscus marinus Venerum Costi Indici radice effigie*. The Venetian Costus like Mofse.

This Venetian Mofse groweth on rockes in the Sea, which by the often agitation of the water, is broken from it, and caried to the shore, not having any roote, but being made as it were of a tuft of small stickes set together, and being dry resembleth the roote of *Costus Indicum*, but whiter, and being moistened againe, openeth it selfe into the forme aforesaid, and as it is expressed in the figure, it is very salt, and full of it like sand.

9. *Pennis marina aurea*. The goulden Sea Feather.

This Sea plant that for the beauty and excellency thereof, doth worthily deserve his name, although sent thus maimed as it were, being but a peece as it is likely, of what it was when it grew, yet such as it is I here offer to your view, being of a most shining gold colour, both stalk and leaves, which very neatly resembleth the *Spartum Austriacum* of *Clusius*, which we call the Feather grasse.

The Place and Time.

Their places are all declared by their titles to be the stones on the shore, or Rockes in the Sea, and the shells of fishes, &c. whereon many of them breede, and but few spring out of the ground as the fourth doth, some in other Countries, and some on our owne coasts, and perish not in Winter or Summer.

The Names.

The Greekes call it *Scopos Salsator*, and *Muscus marinus* in Latine, yet some promiscuously call these *Fucus marinus*, as well as *Muscus*, but *Dioscorides* distinguisheth betweene them, entreating of them in two sundry Chapters, and although *Pliny* be inconstant herein, making Mofse sometimes an herbe, sometimes a shrubbe, and sometimes confounding both *Muscus* and *Fucus* together. The first of both sorts is mentioned by *Antonio Donati*, in his herbarion of the Ile of *Leo* of the *Venetians*, and is also the *Muscus marinus* of *Dioscorides*, according to *Constantinus*, his more exact consideration, as *Lugdunensis* doth relate it, and the *Fucus capillaceo folio* of *Theophrastus*, as it is thought. The second is *Clusius* his *Muscus marinus*, which he received from *Imperatus* of *Naples*, and sent by the name of *Palmita marina*, but nothing agreeing with that of *Theophrastus*. The third is the *Fucus* five *Alga tinctoria* of *Lugdunensis*. The fourth is the *Muscus marinus virens*, which *Casalpinius* calleth *Muscus marinus herbaceus mollior*. The fifth the *Fucus Ferulaceus* of *Lobel*. The sixth is his *Fucus marinus folijs Abrotani maris*, whom *Lugdunensis* followeth, calling it *Muscus marinus folijs Abrotani*. The seventh and the last are so called by *Donatus* as their titles declare them, and the eighth is mentioned by *Pona* in his *Italian Baldus*. The *Arabians* call the Sea Mofse *Thahaleb* and *Thaleb*, the *Italians* *Mosco marino*, the *Spaniards* *Malboquiana yerva*, the *French* *Monste de mer*, the *Germanes* *Meermoss*, the *Dutch* *Zee mosch*.

The Vertues.

Most of these Sea Mosses doe binde much, and coole inflammations, and being applied while they are fresh give much ease to those are troubled with the hot Gour, they have an especiall property in drying, thickning, & cooling, what part soever standeth in neede of any of these qualities: both the sorts of the first, killeth wormes in the body, and the second of them is very effectual for watering red eyes, if the poulder mixed with some Fennell Water be put into them: the same poulder taken with Vinegar stayeth vomiting, and strengtheneth the stomacke, but if the decoction thereof in wine be injected into the bladder by a siringe, it cleanseth the carnosity in the necke of the bladder and ulcers therein, proved effectually to helpe one troubled with that disease in a short time: the eighth likewise is said to helpe to cleanse foule ulcers of all sorts, either inward or outward, being made into poulder and given in wine, and cleanseth the stone in the kidneyes: the vertues of the seventh are declared in the description.

CHAP. LII.

Fucus marinus sive *Alga marina*. Sea wrake or Sea weede.

This kinde of broader leaved Sea excreffences, that are soft and herbby, some more and some lesse, there are many sorts, as they shall be here expressed.

1. *Fucus marinus* sive *Alga marina graminea*. Wrake or Sea weede, or Grasse.

The roundish rootes hereof are hairy, and blackish on the outside, from whence rise up small and round

round and long white hairy heads, breaking out at the sides as it were into branches, on the toppes whereof stand three or foure very long and narrow soft Greene leaves, some being an ell or more long, and about an inch broad: this hath neither seede nor stalke, but lyeth on the ground untill the tide raise it on the water, which being broken by the force of the waves, is carryed to the shore, where it is kept for many things.

2. *Fucus marinus crassus latifolius*. Broad and thicke Sea Girdle.

This differeth from the former in that the roote is wbolly fibrous, the stalke rising from thence, thicke and round two or three inches high, and the leaf which is sometimes but one, and seldome two, of a very great length, even divers feete or els long, and above foure inches broad, equall from a little above the setting on to the end, but somewhat waved or crumpled on the edges, being thicke and of a deepe Greene colour, so soft and moist while it is fresh, that it is like unto moist glue or gelly, and will hardly dry unless it lie long in the Sunne, and will not be fit to be kept without rotting untill after many dayes drying.

3. *Fucus marinus latissimo tenui folio*. Broad and thin Sea girdle.

This is in all things like the last, but that the leaves are thinner broader and shorter, yet crumpled on the edges, and of a paler Greene colour, and is like unto thin parchment.

4. *Fucus alatus sive phaeogonoides*. Winged Sea girdle.

This cleaveth unto stones, and shels of fishes likewise both in the deeper and shallower places of the Sea, having a round darke reddish stalke of the bignesse of a Goose quill, which being growne to the full length is very weake, lying on the ground, unless the water raise it, and an ell long: on each side whereof groweth a wing, all the whole length of it, like unto a skinne, or parchment with veines therein, which being like the feather of an arrow, is small below and broader above equally to the toppes, of two or three inches breadth: the leaves that grow next the ground are many (and some are set also on the stalke) of a yellower greenish colour, and of an hand breadth, being foure, six, or eight inches long, lither of of a skinny substance like unto the other girdles: the stalke doth very well resemble a two edged sword: and is used to be dressed and eaten by the inhabitants of the Sea coasts where it groweth after it is cleared from the skinny wings, and hath a little sweete taste with the salt-nesse which maketh it the more acceptable.

5. *Fucus maximus polyschides*. Great Sea girdle with many Labels.

The manner of growing hereof, and the use likewise is alike with the last, but is the greatest of all these sorts of Sea weedes, having a stalke as thicke as that of Angelica, of a browne colour like a Cheshnut on the outside, and so are the round leaves likewise, which are three or foure cubits long, being not so thicke as ones little finger, and ending in divers broad and short skinny Labels, in like manner as the lower part of the swords hangers, which are of a yellowish colour. Both these last sorts were sent unto *Banhus* from *Aberdeen* in *Scotland*, by *De Flor Cargillius*, and as it seemeth this and the second are somewhat differing from *Mr. Johnsons* figure and description, which containeth both of them in one, yet I have thought good to give you his figure, for want of them severall, although his groweth from a roote, and this from shels, &c.

6. *Fucus marinus secundus Dodonaei*. Narrow long and thicke Sea girdles.

The roote hereof is round and flat, from whence spring two or three narrow thicke leaves, about a foote and a halfe long, divided into sundry flat thicke thongs like leather, some long and some shorter, and they againe divi-

1. *Fucus marinus sive Alga marina graminea*.
Wrake or Sea weedes or Grasse.

5. *Fucus maximus polyschides*.
Great Sea girdles with many Labels.

6, 7. *Fucus marinus* 2, 3, & 4. *Dodonei*.
Two or three sorts of Sea thongs or girdles.

9. *Fucus marinus* *Ladacea marina diffus*.
Oyster green.

10. *Fucus* five *Alga intubacea*.
Sea Curls Endive.

11. *Quercus marina herbacea* & *varietas*.
Sea Oake or Sea Wrake some variegous.

ded into smaller ones, this hath but few or no swolne parts thereon. But there is another of this sort that hath shorter and narrower leaves, the stalkes ending all in swolne points.

7. *Fucus membranaceus ceranoides*.
Sea weed with skinnny hornes.

This hath a stalke little above an handbreadth long, an inch and a halfe broad, divided into sundry branches, some broader, and others narrower, varying wonderfully, each whereof endeth in divers short parts, like unto small hornes: hereof are seene divers sorts, differing somewhat, though not much one from another, and are used to take away the hurtfull longings of women with childe.

S f f f

8. *Fucus*

12. *Opuntia marina*. The Sea Garland. 8. *Fucus maritimus* Gallogavonis pennas referens. The Peacocks Feather.

This also is of a skinny substance, spreading it selfe by little and little wide abroad, cut into many jagges, which end in halfe circles, lying sometimes one upon another, whereon are set sundry semicircular spots, and stroakes of divers colours, and of differing bignesse one from another, like as is seene in the Peacocks feathers: this groweth on the Rockes in the Sea: somewhat like hereunto there is also a certaine barketaken from Scallops, that breede on the same Rockes.

9. *Fucus maritimus* *Lactuca marina* distans. Oyler Greene, or Sea Lettice.

The Oyler Greene, as all know is a soft tender herbe growing on Rockes, with thinne crumpled, and darke Greene leaves, somewhat like unto the curld Lettice, and hath neither stalke nor roote, but growing as most of these Sea weedes doe, upon Rockes or Stones.

10. *Fucus* sive *Alga* *Intubacea*. Sea curld Endive.

The Sea curld Endive, hath divers long and round leaves lying on the ground, and shooing forth others on all sides, as it runneth thereon, sending out small fibres from the joynts under the leaves, which are dented round at the sides, making the proportion of a ragged staffe, as it is painted on every leafe.

11. *Quercus marina*. Sea Oake, or Sea Wracke.

This likewise in the same places, and after the same manner groweth on the Rockes, and lyeth thereon flat, when the water is false therefrom, shooting forth many long stalkes of leaves, to a great length, cut in and divided somewhat like unto Oaken leaves, set here and there with blisters, as it were berries full of winde, and some full of water, which being troden on will give a cracke, the whole herbe is of a very Greene colour, soft and rough, which while it is wet is like wet skinnies, some doe call this herbe *Quercus marina* *baccifera*, by reason of the small round knots, which is like hollow berries, and is blacke being dry. Another sort is called *Glandifera*, because that being somewhat like the other, but with shorter leaves, and some also growing from the middle ribbes, it hath no knots or blisters on the branches, but at the ends thicke small long bunches like small Aekornes, and is white when it is dry. And a third sort called *Quercus marina* *barbata*, because the ends of the leaves are very finely cut into long hairy threds, representing a beard.

12. *Opuntia marina*. The Sea Garland.

This dainty plant groweth up from some Rockes or Stones, in or nere the Sea, spreading sundry flat, thicke, short and round leaves, one set on the toppe of another, and some also growing from the sides, forming branches of leaves leaning downewards, each being as it were strung on a thred which yet is scarce to be discerned, like as a Country Garland of field and corne flowers, are used to be made to decke the Country houles, and their places of sport, so that the whole plant seemeth to be made of nothing but strung leaves, bearing a large yellow flower at the toppe saith *Bauhinus*, but I much doubt he taketh that supposition from the *Ficus Indica Americana*, the lower leaves are somewhat browne, the rest are whitish Greene, and those that are new sprung are Greene, and all of them smooth and shining, even kept betweene papers for a long time, and of a saltish taste, yet by long time growing rougher and full of wrinkles, but still tough and not brittle like Corall or Coralline, and growing soft againe steeped in water, yet still very salt.

The Place and Time.

Divers of these are found on our *English* and *Scottish* coasts, but some in the warmer Countries, their cheifest time of beauty and use, is the end of Summer.

The Name.

It is called in Greeke *φύκος θαλάσσιος*, and in Latine *Phycos* or *Phucus*, or *Fucus maritimus*, *maritimus* being added thereunto to distinguish it from the *Fucus herba*, which is *Anchusa*, and *Alga marina* also, because divers Authours have called divers water herbes by the name of *Alga*, some *agmatica*, some *palustris*, *Pliny* his inconstancy as I shewed in part in the last Chapter, appeareth plainly herein, in that in one place, *lib. 13. c. 2.* he saith that the *Grecians* *φύκος*, hath not found another name in any nation whereby it may be called, because *Alga* is the name of herbes, and *Phycos* is of a shrubbe, and yet in another place *lib. 3. c. 6.* he translateth *Theophrastus* and *Nicander*, *φύκος*, that saith it is the Treacle of the Sea to be *Alga*, and say there are many kindes thereof, as they doe of *φύκος*, and thereupon *Gazius* doth alwayes translate *Theophrastus* bis *φύκος*, to be *Alga*. The first of these is the *Fucus maritimus* alter of *Dodoneus*, the *Fucus* sive *Alga marina* *graminea* of *Lugdunensis*, called by those of *Montpelier* *Palca marina*, being used by them both for litter for their cattle, and for the best sort of dung for their fieldes, but *Lobel*

Alga

Alga marina, and by *Bauhinus* *Alga angustifolia vitrariorum*, the broader sort is called by *Imperatus* *Fucus giganteus*, and *Palmifolium giganteum*. The second, third, fourth, fifth, seventh, and eighth, are set downe by *Bauhinus* in his *Prodromus* by the same names in their titles, or very little differing. The sixth is likewise set downe, in the title, and is likely to be the *Fucus Zoster*, by *Lugdunensis* to whom it doth belong, which *Bauhinus* in his *Prodromus* calleth *Fucus longo angusto & crasso folio*. The ninth is the first sort of *Fucus marinus* by *Dioscorides*, and called *Bryon Lactuca folijs* by *Pliny* and *Lobel*, by *Matthiolus* *Muscus marinus alter*, *Dodonæus* calleth it *Fucus marinus prior*, *Lugdunensis* *Muscus marinus Theophrasti*, and by *Bauhinus* *Fucus marinus primus* *Dioscoridis & Theophrasti*. The tenth is called *Fucus* five *Alga Intybacea* by *Lugdunensis*. The eleventh with the varieties thereof are mention'd by *Lobel* and *Clusius* calling it *Quercus marina*, by *Dodonæus* and *Bauhinus* *Fucus maritimus*. The last was first set forth by *Clusius* under the name of *Lichen marinus*, and saith he received it first from *Imperatus* of Naples, by the name of *Sertularia*, and after from *Cortusius* by the name of *Opuntia marina*, and *Corallina latifolia*. *Bauhinus* calleth it *Fucus folio rotundo* in his *Prodromus*, but *Fucus maritimus* in his *Matthiolus*.

The Vertues.

All the kindes of Wrake, saith *Dioscorides* and *Galen*, doe coole and dry, and is good to ease the Gout, and inflammations, being used fresh, but *Lacuna* correcteth the cooling word in *Galen*, and saith it doth better agree with Sea plants, to dry rather then to coole, by reason of their saltneffe, which doth binde and constraîne, but not coole. *Nicander* in *Theriacis*, commendeth the red sort of *Fucus* to be good against the venom of Serpents, and other venomous creatures. The first sort is much used by the *Venetians* instead of hay or straw, to packe up Glasses to preserve them from breaking, but at *Mompelier* and other places, they use it as litter for their horses, and being made into compost is excellent good manure, to refresh their barren or out eaten grounds: divers of the other sorts are eaten as salter herbes, as the fourth, fifth, and twelfth, the seventh as is said, is good to repress the hurtfull longings of women with childe, and *Clusius* saith that *Cortusius* signified unto him that the common people of *Corfica* did use the last, instead of *Corallina* to kill the wormes in children.

CHAP. LIII.

Muscus marinus Corallina dictus. Hard Sea Mossie or Coralline.

According to the method before prescribed I am in this Chapter to shew you all those sorts of hard Mosses that are either Coralline or come nearest to them.

1. *Muscus marinus sive Corallina alba effcinatum*. Common white Coralline.

The ordinary Coralline which is used in the Apothecaries shoppes, is a sort of white, hard or stony Mossie, growing usually on the Rocks in or neere the Sea, rising either from the stones thereof, or from the shells of Scallops, Oysters, or the like, and groweth not above an handfull high, spreading sundry small branches like a Greene herbe, with divers small short leaves, like haire thereon, which is soft,

under the water, but taken forth groweth as hard almost as a stone. This is our ordinary Coralline, which is gathered in all our Coasts Westwards, and in these Northerne parts of Europe, as farre as I can learne, but some have affirmed that it hath beene found somewhat reddish, growing upon the Corall it selfe, which is not found but in the deeper Mediterranean Seas, on Rockes under water.

1. *Muscus marinus sive Corallina alba*. Common white Coralline.

2. *Muscus marinus niger Germanicus sive Corallina nigra*. Blacke Germane Coralline.

This groweth like unto a Coralline, with branches and fine cut leaves, but blackish of colour, which is a sort feldome heard of before, and creepeth as it groweth.

3. *Muscus marinus sive Corallina rubens*. Reddish Coralline.

This sort of Coralline hath no branched stalkes like the former, nor spreading much, but growing more upright, hath longer leaves thereon then the other, as fine as Fennell, and of a reddish colour.

4. *Muscus marinus latifolius sive Corallina latifolia*. Broad Coralline.

This broad Coralline spreadeth leaves as it were on both sides of a middle stalk, each whereof is broad, and parted into sundry divisions.

5. *Muscus marinus longifolius sive Corallina longa*. Long Coralline.

This Coralline hath divers upright stalkes set with two, three or foure long leaves by spaces, one above another, in three or foure rowes, each whereof is somewhat flat, and dented or cut in all along the edges.

6. *Muscus marinus squamatus sive Corallina squammata*. Scaly Coralline.

This sixth sort of Coralline hath sundry sprigs, with joynts at them, like unto scales, and small hairy Mossie like leaves on each side of them, being wholly white.

3. *Muscus marinus rubens* five *Corallina rubens*.
Reddish Coralline.

6. *Muscus marinus squamatus* five *Corallina squamata*.
Scaly Coralline.

The Place and Time.

All these Mosses are expressed to grow on the Rocks and Stones, in and by the Sea, and are to be found growing at all times of the year.

The Names.

All these sorts may be referred to the *Species* *Muscus marinus* before set forth, both their place of breeding and manner of growing declaring it, and came to be called *Corallina* chiefly from that sort that grew upon Corall itselfe. The first is the *Muscus marinus* of *Matthiolus*, *Dodonæus*, *Lugdunensis* and others, *Lobel* calleth it *Corallina*, and *Lugdunensis* *Fucus capillaceus*. The second *Banbinus* onely remembreth in his *Pinax*, to have received it from the *Balticke* Sea, calling it *Muscus capillaceus multifidus niger*. The third is the *Muscus marinus vulgarissimus* of *Lobel*, and the second *Muscus marinus* of *Dodonæus*, *Tabernmontanus* and *Gerard*. The fourth is the *Muscus Coralliformis* of *Lobel*. The fifth is the *Corallina minima* in the new *Gerard*, whose description doth nothing answer the figure, for *Gerard*'s figure is quite differing from this, yet is answerable to his description. The last is called by *Lobel* *Muscus candidus Coralloides squamulis loriciatus*, and is the third *Muscus marinus* of *Dodonæus*, although the new *Gerard* doth entitle another figure by that name, and giveth a description farre differing from his figure.

The Vertues.

Coralline is in a manner wholly spent among us to kill the wormes in children, or in elder persons, and as the matter to the manner, not knowne but in these latter times to Authours, but by what quality it worketh this effect is not declared by any, for it is altogether insipide, or without taste of heate or cold, as Corall itselfe is, and if Corall be so much commended against the stone and fluxes, crampes, the falling sicknesse, and melancholly, &c. as you shall heare in its proper Chapter, doe not thinke but these may conduce somewhat thereunto also.

CHAP. LIV.

Frutices Coralloides five *Corallina fruticantes*. Shrub Corallines.

Unto the Corallines mentioned in the last Chapter, I must adjoyne sundry sorts of woody, gritty, or stony shrub like Corallines, as I may so call them, of severall differing matters and formes, which I would place in a Chapter by themselves, and neither mingle them with the former Corallines, nor with the next Corals, because different from both.

1. *Corallina fruticans alba*. The white crusted Shrub Coralline.

This white Shrub Coralline groweth up from the Rocks or some shell, in forme of a small shrub or low tree, to a cubits height, more or lesse, with a flat stemme or trunk below, and sundry flat branches also issuing from it on both sides, and not round like an ordinary shrub or tree, which branches are divided into other smaller sprigs above, and those againe into lesser, it is wholly covered over or crusted with a white hard crust like unto Coralline, or white Corall, but rough or rugged, the middle part or heart being woody and bending like the branch of a tree, yet very hard also.

2. *Corallina fruticans rubra*. Red crusted Shrub Coralline.

This red Coralline is like the former in all things, saving that the colour hereof is in some wholly of a reddish colour, and in others the branches part white, and part purplish. And another sort there is also, that is of a whitish yellow, spotted, which as I take it *Banbinus* calleth *Corallina pallide flavescens coloris*, & *lutea punctata*, for I thinke them both one.

3. *Corallina lignosa rufescens Erica facie*. Brownish woody Coralline or Sea Heath.

This sort also groweth flat like the former, and from some stone or Rocks riseth halfe a yard high or better, with divers spread branches, divided againe into other smaller ones, somewhat like unto Heath, spreading almost to a yards breadth, all covered with a thinne brownish barke, and a very hard woody substance underneath, set thicke with small knots or bunches, as if they were the buds of flowers, easily rubbed to powder: the whole plant being of a saltish taste.

4. *Corallina plumata* five *Myriophyllum Pelagium Cortusi Cniso*. The *Selavcaian* Sea Feather.

This Sea Coralline (for so in substance it is not unlike, and *Cortusus* found the effects to be alike also) groweth not

not as the former, from some stone or shell, but out of the ground in the Sea, from a roote fastened therein, with very hairy fibres, growing up with a slender stalk, (as *Cuscuta* guessed by the sight of the figure about a cubits height) which did send forth branches of long leaves, very finely cut into many long parts on both sides and bending the toppe downwards, very like to the branches of the Date tree, or as I may say, unto a Feather, of a pale or whitish colour: the upper leaves are smaller then the lower, else alike, and the toppe of the stalk endeth in a certaine head, composed as it were of many scales wherein is no feede, these scales being as it were young plants, which falling to the bottome of the water, take roote therein, and grow up like the mother plant, this while it groweth in the water, or is fresh new taken forth is tender and pliant to be bended any way, but when it is dry it is as hard as Coralline or Glasse, and as brittle.

5. *Corallina albanodosa*.

The knotted white Coralline or Barbary Feather.

The stalk hereof is a foote high, white, hard, and woody, covered with a rugged white barke, having fundry straight but weake branches, issuing out on all sides without order, three or foure inches long apeece, and some parted into lesser ones, of not above an inch long, on each stalk there stand divers, even thirty or forty small knots or buttons, for the most part bored through, composed of two halfe circles compassing it round about: this was brought out of Barbary to Marcellus and there worn in hats like Feathers.

6. *Corallina rugosa duplex & alba minus rugosa*.

Two sorts of rough Coralline and a smooth,

The one of these is of a hard woody substance, without coare or heart, of a brownish colour, cruised over with a rough knotted or bunched coare or barke, of an ash colour, which is brittle, easie to be rubbed to poulder, from whence spring crooked or bending stalks, and smaller branches from them, all of them cruised and bunched rough, as the stalk and ending in a blunt point, or end. Another is both whiter and smoother, but else not like it in stalks and branches. There is another also whose cruised coate is pale yellow.

7. *Corallina reticulata plana purpurascens*.

The red Sea Fanne.

This pleasant and delightfull Sea plant is of divers sises some greater and other lesser, yet all of growing flat like a fanne or large leafe with fundry greater branches spreading on both sides of the maine stemme, and they again into smaller and smaller, ending in very fine and small points, yet all of them joynd close together, so that there is no separation of branches one from another, but yet with fundry small or greater holes, like the meshes of a net, (yet some sorts have beene seene that have had no holes in them, but were whole with some spots on them like unto holes, of a very hard and woody matter or substance, easie to be cut with a knife, of a brownish red colour yet tough or hard to breake, although it may bee somewhat bended, and covered in many places, in some more or lesse (but peradventure all over, when it is first raken out of the Sea, or before it be rubbed with handling and carriage,) with a whitish saltnesse. This groweth to the Rockes, which the Seas goe over often times. Captaine Smith in his Booke of the plants growing in the Bermuda Isles, compareth it to a Vine leafe, as some others that first saw it here did, and called it the Feather. It hath beene brought both from the East and West Indies to us.

8. *Corallina nigra altera duplex*. Two sorts of tall blacke Scrines or Sea Fannes of Italy.

For some likenesse unto the last mentioned pleasant Fanne, I thought good to adjoyne two others, each whereof grow to a mans height from the Rockes in the Sea, and gotten by them that dragge for Corall: the one of them is branched as it were in one or two places, that is, hath a small fanne issuing out from the maine stemme, and the other hath none, but the stemme thereof is turned or wound round, like as is to be seene in the Vnicorne's horn, or

1, 2. *Corallina fruticans alba vel rubra*.
The white or red cruised shrub Coralline.

3. *Corallina rugosa Erica facie*. He dith like woody Coralline.

4. *Corallina plumosa* frut. *Myriophyllum pelagium* Cortusi Clusio.
The Slavonian Sea Feather.

Quercus marina Theophrasti Clusio.
Clusius his Sea Oake or Theophrastus.

7. *Corallina reticulata* plana purpurascens.
The red Sea Fanne.

8. *Corallina nigra* altera doctex.
Two sorts of blacke Scrines or Sea Fannes of Italy.

in a thicke that hath had a Withwinde, or Hony suckle run up upon it, and the other not, both of them consist of a number of small and long leaves, as I may so call them, or rather blacke Hogges bristles, one row or order growing upright from the middle stalk, and another from it thwarting them, so right all joyning together, in forme of a net, with the holes or spaces to be seene through them, the sides being even and the toppe round.

The Place and Time.

The place of the two first are *Mompelier*, and some places in *Spain*. The third *Clusius* saith he had from *Norway*, but not knowne whether growing there or no. The fourth and fifth are expressed in their descriptions, the first with all the forts is not expressed: The seventh hath beene often brought from sundry parts of *America*, both of our owne and other Colonies. The eighth is not mentioned by *Pona* from what place it was taken. They keepe the same time with the rest.

The Names.

The two first are called by *Lobel* *Corallina alba* & *rubens* *Antipathis facie*, and by *Bauhinus* *Corallina fruticosa*, who referreth them to *Clusius* his *Quercus marina* *Theophrastus*, whose figure I here also give you for the difference sake, but *Theophrastus* his description thereof lib. 4. c. 7. can in my opinion no way agree thereunto: for hee there saith *Abies marina* & *Quercus marina* have a thicke long and fleshy leafe, but this is hard stone like, or Corall like on the outside, and woody inward. *Anguillara* calleth it *Juncus petrosus*, and *Gesner* *Lithophyton maritimum*. The third is called by *Clusius* *Frutex marinus* *Erica facie*, in his sixth Booke of Exotickes, and ninth Chapter, set downe by *Bauhinus* both among the Corallines by the name of *Corallina rufescens exasperata*, and among the *Fuci fruticibus assimilati*, by the name of *Erica similis maritima*. The fourth is as is said in the title, *Clusius* his *Myrsophyllum Pelagium* *Cortusi*, which *Bauhinus* numbred among the *Musci maritimi*, calling it *Muscus maritimus filicis folio*, but as I there say, finding it both in substance and quality like unto Coralline. I reckon it here among them, and called as *Clusius* saith by the Italian Fishermen *Pennachie delle Ninfe*, & *Palma di Nestuno*. The fifth is so called by *Bauhinus* as it is in the title, and so is the sixth also of both forts. The seventh is called by *Clusius* *Frutex marinus elegantissimus*, and *Planta marina retiformis*, for I reckon them both as one, or so little differing that they deserve not to be separated, which he thincketh cometh neere unto the *Palma marina* of *Theophrastus*, or some kinde thereof, but *Theophrastus* saith, his *Palma marina* hath thornes or prickles for the leaves, which may better agree with the eighth, if the colour were red and not blacke. *Bauhinus* calleth them *Corallina cortice reticulato*. The last of both forts is set forth in the Italian *Baldus* of *Pona*, by the name of the third and fourth forte of *Antipathes* or blacke Coralline.

The Vertues.

We have little or nothing to deliver unto you of any vertue any of these hath beene tryed to have, saving that the fourth is said to helpe the bitings of any venomous creature, to heale wounds speedily, and to kill wormes, taken in lesse quantity then Coralline, but are kept as rarities to declare the wonderfull workes of God, in these Sea plants, which are as much to be admired as any of the Land.

CHAP. LV.

Corallium. Corall.

TO end this relation of the stony Sea Mosses, I must also shew you the Corals (for there are a number of other Sea Excressences, which I must passe over, being of little or no use in Physicke, and would fill up sundry sheetes of Paper) which are, as of sundry colours, so of formes likewise.

1. *Corallium rubrum majus*.

The greater Red Corall.

This greater red Corall groweth on the Rocks in the Sea, like unto a small shrub with armes and branches, breaking forth some into greater others into smaller sprigs, set full of knaggy eminences, of a pale or whitish red colour on the outside for the most part, as it is taken forth of the water; but being scraped or filed, and polished, becometh very faire, as it is usually seene, yet some will be much more red on the outside at the first taking up, and much redder within of a firmer or hard stony substance, after it is kept a while out of the water, but palble while it is there. There is some other forts hereof which grow smaller by much, and fuller of branches, and are usually of a better colour on the outside. *Cesalpinus* maketh mention of a kinde of Corall that hath beene found red on the outside and blacke within.

2. *Corallium album majus & minus*.

The greater and the finer white Corall.

The greater white Corall groweth like the red, but is seldome found with so small branches, being thicker for the most part, and although white within, and not so firme, yet somewhat darke coloured on the outside, and as rugged as the red. As there is

2. *Corallium rubrum majus*.
The greater red Corall.

Tenina.

Rubra cortice nigro.

1. *Corallium album majus & minus.* The greater and the finer white Corall.

3. *Corallium album alterum.*
Loose white Corall.

4. *Corallium nigrum Dioscoridis* sive *Antipater.*
Blacke Corall.

of the red, so is there of the white Corall, other sorts of smaller, or even as small, and some smaller and finer then the red, some also of a most pure white Corall.

3. *Corallium album alterum.* Loose white Corall.

This white Corall groweth greater and with blacker armes and branches then the last, but is not of so firme a substance being lesse solid and more porous or spungy then it within, and with sundry holes or hollow markes on the outside.

Album fistulosum.
Verrucosum punctatum.
Album stellatum.

Sundry other sorts of white Corall have beene observed by *Imperatius* of Naples, one fistulous or slender like a pipe, with many branches called *Corallium album fistulosum*. Another is bunched out with knots like warts and spotted with black, called *Corallium verrucosum punctatum*. A third hath markes like flares, set on all the branches, and is of two sorts both a greater and a lesser, called *Album stellatum*. A fourth hath certaine divisions therein, as if they were joynts and called *Corallium album articulatum*.

4 *Corallium*

4. *Corallium nigrum* five *Antipathes*. Blacke Corall.

The blacke Corall groweth great below, where it sticketh to the Rocks, spreading into fewer branches, but as smooth as if they were polished and shining like Jet it selfe. There is said to be one found that is yellow, else like unto the blacke.

5. *Corallium nigrum hirsutum*. Rough bristly blacke Corall.

This sort is often found as tall as any man, and of a large size in the trunk or body, having sundry blacke sprigges like rough bristles, or the awnes of Corne standing round about it one above another up to the toppe.

The Place and Time.

Most of these Coralls are found about *Marselles*, and the Ile of *Sardinia*, and other places in the *Mediterranean Sea*, and seldome on this side it, and their time is with the others.

The Names.

Regius or in Greeke is likewise *Corallum* in Latine, and so called by all that have written of it, and thereto *rubrum* or *album*, &c. is set for distinction sake, yet the white is not remembred by *Dioscorides*, *Theophrastus*, or *Pliny*, and but only by our moderne Writers: the blacke sorts are called *Antipathes*, and *Corallium nigrum*. The last is set forth in the Italian *Baldo* of *Pona*, by the name of the second sort of *Antipathes*, or blacke hairy Corall, and is called by the Fishers of *Sardinia* *Sambeggia*.

The Vertues.

All the sorts of Corall doe coole and binde, yet the white is thought to be of a colder operation then the red and the blacke, to be as effectually to all purposes as either of the other: but red Corall is of most use, and is commended to be very effectually for those that spit blood, or that bleede much either at the mouth or nose, or any other flux of blood in man or woman, and being often taken in wine or other drinke doth diminish the spene, it helpeth also the gonorrhea in men, and the whites in women, it likewise helpeth them much that are troubled with the stopping of their water, or hardly make it but by dropes, and also those that have tormenting paines of the stone in the bladder, if the poulder when it is burnt be taken in drinke: the poulder taken in wine, or in water if they have an agne procureth rest as it is said: it is good to be given to those that have the falling sicknesse, or have crampes when it is burned and made into poulder: it doth yeth and bindeth more then before it did: it is also much commended against melancholly and sadnesse, and to refresh and comfort the fainting spirits: it stayeth the bleedings of the hemorrhoidal veins, and of wounds, and of the menstres, causing also an easie delivery of the birth, it also fasteneth loose teeth, helpeth sore gummies and ulcers in the mouth, and healeth up foule hollow ulcers in other parts: the ashes thereof being burned, mixed with other medicines for the eyes, helpeth the watering, heate and rednesse in them, by cooling and drying up the moisture in them, although *Galen* hath made no mention of Corall in his booke of simple medicines, yet he appointeth it as an ingredient into sundry medicines, that are for those that have the phisicke or cough of the lungs, tending to a consumption, and that spit blood, and that have foule running sores or ulcers, and to cleanse Imposthumes.

CHAP. LVI.

Alie marine plantæ. Other Sea Plants.

Here yet remaine some other sorts of Sea plants, which are many of them of a stony substance, or cruſted over like as if they were so, although while they are in the water, they grow like unto trees of divers shapes and formes, and because there is no use in Physicke knowne of them, nor yet for any other purpose then to behold the variable workes of nature, or rather of the God of nature in the Sea, and to feede the mindes of the curious, I will be brieve in them, and but only shew you them.

1. *Abies marina*. The Sea Firre.

This as *Clusius* hath set it downe (who found it on the Sea shore of *Flanders*,) groweth upon Oyster or Musſell ſhells, seldome above an handfull high, very neerely resembling a low or dwarfe Firre tree, with branches set in order, being small and brittle, composed as it were of scales, some being flat and others round compassing the branches all about. *Label* referreth it to the Corallines, calling it *Musſum Coralloides alter*.

2. *Cypressus marina*. The Sea Cypresse.

This also is so like unto the small Cypresse tree, as nothing can be more, having branches set round but without order, and rising upwards, as the sprigs of the Cypresse doth, and with leaves thereon in the same forme and manner: this having bene long kept in a paper booke, and set in water, will spread it selfe abroad, and shew the forme as it grew.

3. *Myrica* & *Erica marina*. Sea Tamariske and Sea Heath.

Others also he saith he found growing on the like shells, that were like some unto Tamariske, and some unto Heath, being but of a fingers length, with short branches covered over with a hoary saltnesse of the Sea.

4. *Rafeda marina*. Base wilde Rocket of the Sea.

Clusius in his sixth booke of *Exotickes*, and sixth Chapter saith, he had this at *Amsterdam*, and for the rarenesse, there set it forth to be of a hard woody substance, cruſted over with the white saltnesse of the Sea, being not the whole plant, but much of the lower parts, broken away, yet containing sundry branches, covered upwards with sundry small rough cups or vessels hanging downwards, of a whitish ash colour, not much unlike unto the seede vessels of *Rafeda* when they are ripe, but much lesse, and so brittle that they might be rubbed to poulder betweene ones fingers.

5. *Hippuris*

1, 2. *Abies & Cupressus marinae.*
Sea Firre and Cypressse.

4. *Refesla marina.*
Bale wild Rocket of the Sea.

5. *Hippuris saxea.*
Stony Sea Horsetaile.

6. *Abrotanoides saxea* five *Abrotanifemine similis*
planta saxea. Stony Lavander Cotton.

This likewise seemed to grow to some Rocks, a peece thereof remaining to the branch that contained sundry small sprigges leaning or bending one way, full of knots and joynts, of a browne shining colour, else all white cru-
sted over with a stony matter, the middle or inner part being woody.

7. *Salix marina.* The Sea Willow.

This is wholly of a stony substance, rising up a foote high spread into sandy branches, yet joyning as it were close together at the bottome of them, and they againe spread into smaller sprigs, which containe five or sixe, or more rowes of short hollow leaves like pipes, almost like unto the leaves of Lavan der Cot on, some part of the lower leaves being broken the upper part was whole, being of a purplish colour, the rest white, of a stony salt substance, shewing the originall to be the Sea.

This groweth likewise upon Oyster shells or the like, rising up with sundry stalkes, of a grayish ted colour, and set with narrow long leaves like Willow leaves, which lye on the water, some being smooth, and some a little waved or dented about the edges, among which rise also other stalkes bearing flowers like those of the Willow, with many points like the scales of the carkins, when it is ready to bloome.

8. *Androsace Matthioli* five *Coryledon marina* & *Umbilicus marinus.* The Sea Navell.

Least this Sea plant (if you will so call it, or what else you please) should be quite left out of this Classis, let me thrust it in, in the end of this Chapter, being a sea excreseance, formed like small round sawfers, hollowish in the middle like unto a Navell, and borne up by small smooth footestalkes about two inches long, every one by it selfe, from some stone, or rocke, or shell in the Sea, or salt pooles, being of a pale greenish ash colour, while they grow under water, but afterwards grow as white almost as Corall, or the like, and of a stony substance. This is generally called *Androsace Matthioli* by divers authours: because he first set it forth, being sent him from *Pisa* by *Lucas Ghinus* for the right, and *Lobel* seemeth to be of the same minde also, saying he can finde no other herbe that cometh so neere thereunto, calling it *Coryledon foliosum marinum* & *Umbilicus marinus Monspeliensis*: but *Cesalpini* it seemeth gave it a truer name, calling it *Fungus marinus minimus*. For it can no way agree in my judgement unto the *Androsace* of *Dioscorides*, if we will beleieve he knew the thing he wrote of, for he saith, it hath no leafe but a huske with seede in it, and doth appropriate whereunto both huske and seede is good, but this plant hath never beene observed to beare huske or seede, for being a stony Sea excreseance, as Corall and many other the like, growing

6. *Abrotanoides saxea* five *Abrotanifamina* five *planta saxea*.
Stony Lavender Cotton.

7. *Salix marina*.
The Sea Willow.

growing upon shels stones, &c. in the Sea how should it be expected to beare any seede, yet *Lobel* and others would wrestle, curtail, and alter *Dioscorides* text, to make it serve their turne, but assuredly the true *Androsace*, is not yet found out and made knowne for any thing that I can understand, and therefore let *Matthiolus* still have the honour of this Sea plant.

8. *Androsace Matthioli* five *Cotyledon maritima* five *Umbilicus marinus*.
The Sea Navell.

The Vertues.

There is nothing extant of the properties of any of the former recited plants, and but by *Lobel*, none of this who yet would assimilate some of the properties of *Dioscorides* his *Androsace* unto this, that is, to proveke urine, and to digest the humours gathered to the joynts, procuring paines and aches, goutes, and the like, wee know saith *Lobel* that this doth binde the belly, so farre of it is from loosening it, as some have thought. I have knowne some to put this stone into the *Unguentum Citrinum* because it is called *Umbilicus marinus* yet I have seene a sort that is reddish.

CHAP. LVII.

Spongia & Spongiae plantae. Sponges and Spongy plants.

Besides the Sponges themselves, which are of sundry differing formes and colours, there are also many other Sea Excreescences, (whether I should call them plants or no I know not well) that are of a Spongy substance, which lastly I must bring to your view.

1. *Spongia marina usualis.* The ordinary Sponges.

The ordinary Sponges that we have daily use of, are some bigger others lesser, some round, some flat, some of a browne yellow colour, others pale yellow or almost white, some also close and hard, others more loose and open and some of a fine thinne substance, and others of a courter and thicker, *Bambius* relateth that some sorts were called *Hircina*, another *Velaria*, another *Ramosa fistulosa*, with divers other names. I will therefore onely shew you that Sponges like other excreescences are bred in the Sea, growing from some stone, Rocke, &c. or the ground it selfe, and by the Seas operation in some places differing from others, brought to the forme as well as colour,

1. *Spongia marina usualis.*
The ordinary Sea Sponges.

2. *Spongia infundibuli forma.*
A Funnell like Spong.

3. *Spongia ramosa Britanica.*
The branched English Sponges.

4. *Spongia ramosa altera Anglica.*
Another branched English Sea Sponges.

colour that it holdeth, being as all know of a soft substance, neither stony, woody, nor herbe like: but rather like a peece of wooll or cloth so wrought together by nature, that being full of holes, it is ready to receive and hold much water and by pressing or wringing ready to yeeld it out againe, but as it encreaseth in the water, it gathereth into it, or else there is driven into the holes thereof divers small gritty stones, which are usually found therein, declaring the breeding thereof, not to be farre from the ground, by the receipt of these stones. *Aristotle* in his fifth booke and 16. Chapter. *de historia animalium*, saith that divers did thinke and say in his time that Sponges had sence in them, for that (as they say) they would shrink if any did plucke them, and were hard to be pulled up, and that they doe so like wise, when the surges of the Sea would breake them off from their residence, but saith *Aristotle* in the same place, divers did doubt of the trueth of that relation, and those were they that dwelt at *Toronna*. I have bene bold to insert this proove of *Aristotle* in this place, to refute the opinion of those that hold Sponges, and the like to be *Zoophytes*, sensitive creatures, for all though affirmed in *Aristoteles* time, yet doubted of them also: and therefore wee that have bene better taught, and in a Schoole of farre greater knowledge, both of Divine and humane things, may well cast off such fond conceits.

2. *Spongia infundibuli forma.* Funnell like Sponges.

This Sponges *Clusius* hath set forth to have sence cleaving to a very hard blackstone of twelve pound weight, and was broad above and narrow below, where it grew to the stone like unto a funell, or to the flower of an herbe yet not of an equall height at the brims, which also were so turned inwards that they seemed to be like leaves foulded inwards. One saith *Clusius*, I remember I saw while I lived at *Mompelien*, that did most exactly resemble the forme of a very large hat.

3. *Spongia*

5. *Spongia ramosa fistulosa Veneta.*
The Venetian Sea hollow Sponge.

6. *Arbuscula marina spongiola Coralloides.*
A Spongie Corall like tree.

3. *Spongia ramosa Britannica.* The branched English Spong.

This faith *Lebel* I found in the Ile of *Portland*, among other Sea excrements, which for substance and colour, you would say was a Sponge, but if you marke the forme of branches in it, you would say it was neere a Coralline, for it was neere a handfull and a halfe high, full of blisters, soft and easie to be bowed any way. Some would take this to be the *Isados Plocamon* of *Pliny*, that was like unto Corall without leaves, growing hard changing the colour to be blacke, and ready to breake if it fall, which is more likely to be the *Antipathes* or blacke Corall of *Dio- scorides*.

4. *Spongiola marina Anglica planta nodosa.* The English soft Sea ragged flasse.

This soft Spongie plant hath beene found on our *Kentish* Sea shore, by Master *Johnson* and his Associates, in a simpling voyage to those parts, and is about the thickenesse of ones thumbe, about a foote in length, set with many tuberos, uneven or knagged excressences on all sides, like unto short branches, being very sappy, and of a soft Spongiuous substance, and of a brownish yellow colour: it was not observed growing, but broken, and among other such like things cast upon the shore.

5. *Spongiaramosa fistulosa Veneta.* The Venetian Sea hollow Sponge.

The Venetian kinde groweth on Rocks in the Sea like other excressences, rising up as it were with stalkes, and breaking out on all sides into sundry short branches, the substance whereof is Spongy, and hollow, as soft at the first, as the crumme of bread, which may then be made into paste, and afterwards being dry, may bee made into poulther.

6. *Arbuscula marina spongiola Coralloides.* A Spongie Corall like tree.

From the largenesse hereof *Clusius* calleth this a shrubbe or low tree, being three foote high, and seven inches compasse at the bottome, which although it seemed firme and solid, yet was but of a Spongie substance, and white, and cutting like unto dry Ginger: both the tranck or body with the many branches thereon, were set full of knobs, the branches themselves ending in greater, which were spongy on the inside, but without any seede in the seeming places, and marked on the outside like flares. The whole plant was covered with a thinne knobby reddish barke (which colour *Clusius* who first set it forth, doubted was not naturall, because he saw others the like which had a white coare) but of so salt a taste, that the salt it selfe did not excede it. Within a while after (*Clusius* saith) he saw another which was six foote high or more, being wholly flat and halfe a foote broad and two inches thicke, set with branches and knobs in the like manner.

The Place, Time, and Names:

Are sufficiently declared in their descriptions, so that I shall not neede further to insit thereon. The Grecians call it *σπγγη*, The Latines *spongia*, and so doe both the *Italians* and *Spaniards*. The *Arabians* *Afferagi alhairi* or *alhar*, The *French* *Eponge*. The *Germanes* *Baischwam*.

T t t t t

The

The Vertues.

Sponges are put to many uses, both civill and Physicall, as for fomentations or bathings, which moistened and applyed containe the warmth of the decoction, much longer and stronger then either linnen or woollen cloth: peeces of Sponges very well dried and put into hollow ulcers, that are ready to close, before they be thoroughly clement and healed, doth open the sores againe, being to be pulled forth by the thred is fastened thereto, before it be put in: the ashes thereof mixed with a little wine or vinegar, is used to cleate the eyes when they are bloodshot, ten, or watering: the stones in the Sponge are used by some to be given to them that are troubled with the stone, to helpe to breake it, and cause it to passe away with the urine. The *Venetian* Spongie plant is said to clenfe the face, being washed with a decoction made thereof in honied water, and is a remedy for them that have eaten dangerous Mushromes to be boyled in Vinegar and taken: the poulder thereof taken in wine purgeth like *Cremor Tartari*, and cutteth and thinneeth grosse and viscous humours.

CHAP. LVIII.

Britanica Conche Anatifera. Barnackles or Brant Geese.

O finish this Treatise of Sea plants, let me bring this admirable tale of unrith to your consideration, that whatsoever hath formerly bene related concerning the breeding of these Barnackles, to be from shels growing on trees, &c. is utterly ertonious, their breeding and hatching, being found out by the *Dutch* and others, in their Navigations to the Northward, as that third of the *Dutch* in Anno 1536. doth declare.

Britanica Conche anatifera.
Barnackles or Brant Geese.

CHAP. LIX.

Muscu terrestris. Land Mosse.

Having shewed you the Mosses and excellences of the Sea, let me exhibite also to your knowledge in this place, and not put them to any other, the Mosses and Mushromes of the Land: The varieties whereof are many, and therefore to be divided into those that grow on the ground, and to those that grow on trees and other things, of each of these in their order.

1. *Muscu terrestris vulgarissimus.* Our common ground Mosse. This common Mosse that usually groweth in our moist woods, and the bottomes of hils in boggy grounds, and shadowy ditches and places, groweth very thicke together with many small single stalkes about a foote high sometimes, and often not above halfe the height, with a number of soft leaves like haire, growing thicke and close together, the toppe whereof in the hottest time of Summer will be somewhat round and whitish, the whole tussocke is often found differing in colour, being either Greene or reddish, or of a whitish yellow, it hath very short rootes fastened in the earth.

2. *Muscu terrestris vulgaris alter.* Another ordinary ground Mosse. This other Mosse that is more common in Germany, &c. then with us, groweth up with many branched stalkes of long winged but short Greene leaves a most like Heath, smooth, and soft, and not hard like heath, it spreadeth on the ground and riseth not above halfe a foote high.

3. *Muscu terrestris scoparius.* Beesome Mosse.

The Beesome Mosse taketh the name from the manner of the growing thereof, which is, from a small head below, sending up divers shining blackish purple stalkes of winged green thredlike leaves about a foote high, which spread themselves out broadest in the middle, at the top whereof breaketh forth sometimes small yellowish heads which fall quickly away without any feede following them.

1. *Muscu terrestris vulgarissimus.* Our common ground Mosse.

4. *Muscu*

3. *Muscus terrestris scoparius.*
Beech Moss.

4. *Muscus clavatus sive Lycopodium.*
Club Moss, or Wolfes claw Moss.

4. *Muscus clavatus sive Lycopodium.*
Club Moss, or Wolfes claw Moss.

The club Moss runneth upon the ground to a great length, breaking into other long round branches, shooting forth fibres into the ground as it creepeth, being made of many short yellowish green hairy leaves: at the joynts of the branches grow in severall places two or three small round and long yellow scaly heads, like the catkins or bloomings of the Hazell tree, which as in all the other Mosses come to nothing.

5. *Muscus denticulatus major & minor.*
The greater and the lesser dented Moss.

Both these sorts of Mosses grow one like unto another, but one bigger then another, and each of them somewhat like unto the last, rooting in divers places, as it runneth on the ground: the stalkes are as small as haire almost, upon which grow the small leaves thicke set together, as if they were scales, laide close one unto another, the ends of them sticking out like teeth, we have not seene what flower or seed it beareth if it have any.

6. *Muscus pennatus major & minor.*
Winged Moss small and great.

Both these Mosses also neede but one description, not differing but in the largenesse, and multitude of branches, one from the other, creeping on the ground and rooting as they runne, whose stalkes and short branches are thicke set with fine yellowish green leaves like wings on both sides, and thereof tooke the name: these grow in woods as also upon Rockes and stones.

7. *Muscus spicatus repens.*

Creeping Moss with spiked heads.

This Moss groweth hard by, and under trees, creeping farre with thicke, and long branches, which send forth many

9. *Muscus parvus stellaris*. Heath Mofse. 11. *Muscus pyxidatus*. Cup-like Mofse.

many fine leaves close set together in manner of long spiked heads, one sort being Greene and another white.

8. *Muscus erectus ramosus major*.

The greater branched Mofse.

The greater branched Mofse groweth thicke and close together like a turfe or tussocke of high grass, whose stalkes are three or foure inches long, spreading into branches of two or three inches apeece, and those into others againe, all which are covered with very fine haire like leaves, among which shoote forth small naked stalkes of an inch long, with small yellow round heads like wheate cornes. There is also a lesser hereof whose stalkes are shorter and leaves so small that they are scarce to be discerned.

St. nor.

9. *Muscus parvus stellaris*. Heath Mofse.

This small Mofse riseth up with divers hard stalkes of small short leaves, and at the top a many other set thicke and round in a turt: it groweth much on dry heathy grounds.

10. *Muscus stellatus roseus*. Starre Mofse.

The stalkes of this small Mofse, rise scarce above an inch which have many small pale Greene sharpe pointed leaves, set at the toppes of their small stalkes, in manner of a Rose, spreading forth like a little starre, this groweth upon Rocks and stones.

11. *Muscus pyxidatus*. Cup-like Mofse.

The leaves of this Mofse that lye like Liverwort creeping upon the ground, are of a whitish yellow colour as the small hollow heaves like cups, that rise from them are also. There is another sort here of growing not on the ground as the former, but on rockes and stones whose cups are smaller, more in number and not so white.

alter.

12. *Muscus corniculatus*. Horned Mofse.

This horned Mofse which groweth on those rocky barren hills, and rocky grounds, where almost nothing will grow, riseth out of the ground, with divers slender weake and somewhat broad stalkes three or foure inches high naked and without leaves from the bottome to the toppe, but parted into smallet branches, and they againe into lesser, which are forked at the ends like unto hornes of a dusky white colour.

13. *Muscus corniculatus*. Horned Mofse. 13. *Muscus*

13. *Muscus minimus terrestris*. The smallest ground Mosse.

We have a small kinde of Mosse (usually growing with us not onely upon those grounds that are not stirred or turned up for two or three yeares together, but in flower pots of earth in Gardens oftentimes, especially some that are not stirred) which is nothing else but a number of greene short haire matting upon the ground, which in the heate of Summer, and sometimes sooner will send forth small short stalks an inch high with small yellowish or greenish heads on them.

The Place and Time.

All these are in a manner particularly declared where they are most usually growing and are in their perfection in the Summer time.

The Names.

Mosse in generall is called in Greeke *σπῆον* and *σπάγγιον*, and in the Atticke tongue *Sphagnum* and *Hypnum*, and *Pliny* thereupon in one place calleth it in Latine *Bryon* and *Sphagnum*, and in another place *Sphagnos* five *Phacos* five *Bryon*, in Latine it is usually called *Muscus*, and properly betokeneth any herbe that is composed of haire or threds instead of leaves. The first here set forth, is the *Muscus terrestris vulgaris* of *Lobel*, and *Dodonæus*, and thought by *Bauhinus* to be the *Muscus hortensis* of *Tragus*, but I suppose rather his is the last that I here set forth in this Chapter, and none other that I know growing so familiar in Gardens: The second is the *Muscus montanus* of *Tabernmontanus*, and *Muscus terrestris* of *Gerard*, which *Bauhinus* calleth *Muscus denticulatus* *fusilis*, because it is very like the small *Denticulatus*, but that it rooteth not as it lyeth: The third is the *Muscus scoparius* of *Lobel* and others, and *Selago tertia* of *Thalium*. The fourth is called *Muscus clavatus* by *Lobel* and *Dodonæus*, who calleth it also *Lycopodium*: *Tragus*, *Matthioli*, and others *Muscus terrestris*, and is the *Selagin* species altera of *Thalium*, *Gesner* in *fracti montis* descriptione calleth it *Muscus urinus*, and set it forth for *Chamaepence* *Ceruin* *historia*, but *Thalium* saith it was imposed on him by others, for *Cordus* sent the true *Chamaepence* to *Gesner*, a little before his death, *Anguilara* and *Cesalpinius*, say that it was of long time used in the shops of Italy, &c. for true *Spica Celtica*: The fifth of both sorts is called *Muscus terrestris* by some, and *denticulatus* by others, and *Leptaniscus* by *Clusius*. The sixth of both sorts is mentioned onely by *Bauhinus* in his *Pinax* and *Prodromus*, and so is the seventh also: The eight is called by *Bauhinus* *Muscus ramosus erectus major* & *minor*. The ninth is called by *Lobel* *Muscus in cricetis proveniens*, and by *Bauhinus* as it is in the title, *Muscus parvus stellatus*: The tenth is by *Bauhinus* onely called as it is in the title, *Muscus stellatus roseus*: The eleventh is the *Muscus pyxidatus alabastricus* imitatus by *Lobel*, the other sort whereof *Bauhinus* calleth *Muscus pyxidatus saxatilis*, as he did the former of *Lobel*, *pyxidatus terrestris*: The twelfth is called *Muscus ceranoides major* & *minor*, by *Bauhinus*, and no doubt is the *Muscus corniculatus* of *Tabernmontanus* and *Gerard*, however his *Corrigidor* hath put as he saith a better in the place, namely the *Filix petrea* of *Tragus*, when as no other Authour doth referre it to any of the Mosses, but *Bauhinus* who mistooke his reference herein, for as I shewed in the description thereof among the Feernes, that both spots on the leaves as other Feernes and Capillare herbes have, which argueth it plainly to be of that family, and no Mosse, and *Bauhinus* his description of his *Muscus ceranoides major*, doth plainly agree with this *corniculatus*. The last although best knowne to many, yet little regarded by most, and not mentioned before by any except *Tragus*, if his be it.

The Vertues.

All the Mosses are somewhat cooling and drying, and thereby stay fluxes and bleedings, these earth or ground Mosses, especially the first and the fourth, are held to be singular good to breake the stone, and to expell and drive it forth by urine, being boyled in wine and drunke, the herbe bruised and boiled in water, and then applied to any inflammations or paines arising from a hot cause doth allay and ease them, and therefore many doe apply it to the hot gout, to ease the paines thereof. The cup Mosse is said to helpe the chincough in children effectually, if they drinke the poulder thereof for certaine daies together. The club Mosse hung in a vessell of wine that hath lost the vigour and verue, so much as is convenient for the bignesse of the vessell, is said in short time to recover it againe, whereupon *Bruselsius* called it *Wein kraut*, the Wine herbe.

CHAP. LX.

Muscus herbe formis & *coralliformis*. Mosses that resemble some herbes or Corall.

Here be divers other sorts of Mosses that have some resemblance, either to some herbes or to Corall, and because I thought it fittest to ranke them together, I have as you see kept them out of the last Chapter, to insert them here into this.

1. *Muscus clavatus Cupressiformis*. Cypress like Mosse.

This small Mosse abideth alwayes greene sending forth sundry hard branched stalkes, with very short and thicke leaves settled upon them, somewhat resembling the branch of a Cypress, being of a darke greene colour, from the top whereof sometimes come forth small and soft spiked heads standing on small foote stalkes: Another somewhat like hereunto is remembered by *Bauhinus*, which he entituleth *Muscus Cupressiformis ramosus*, to distinguish it.

2. *Muscus Abietis facie*. Firre like Mosse.

The Firre like Mosse groweth close upon the ground, and creeping thereon with sundry long branched stalkes, with fine short hayre greene leaves, set on both sides of the middle thereof, resembling a Firre tree branch, whereof it tooke the name.

3. *Muscus Filicinus*. Ferne like Mosse.

There be divers sorts of this Mosse, some bigger and some lesser than others, all of them rising up with sundry stalkes some blackish, some reddish, and fine leaves on them much like to Ferne leaves, but in some more finely jagged or cut into severall parts than in others, on the toppes of the branches of the lesser sort hang small round pointed crooked heads.

4. *Muscus Polytrichoides*. Maiden haire Mosse.

There are three sorts of this Mosse, the one hath many short stalkes thicke covered with short, but somewhat hard,

1. *Musci clavatus Cupressiformis.*
Cypresse Mofse. 3. *Musci filicinus.*
Ferne-like Mofse. 8. *Musci Corallinus montanus.*
Mountaine Coralline like Mofse. 9. *Musci Coralloides saxatilis.*
Rockie Corall like Mofse.

hard, rough, haire like leaves, the other is lesse in each part, and the leaves not rough or hard at all: the third is the least and the leaves smoothest: the first groweth in wet wood grounds and the other upon old walls.

5. *Musci saxatilis Ericoides.* Stone Heath Mofse.

This small Mofse hath many small hairelike leaves, next the ground like unto the common ground Mofse among which rise rough stalkes an hand bredth high, in some places bare of leaves, and covered in the rest, with many such like small leaves, as are growing on the *Erica Coris*, the faire heath low Pine, but without order, on the tops of each whereof standeth a small head.

6. *Musci terrestris coralloides incanus.* Hoary Corall like Mofse.

This Mofse is all hoary white about a foote high, whose upright branches are thickē, solide, and not hollow, divided into many branches, each whereof is like a stagges hornē, and sharpē or small at the ends.

7. *Musci terrestris coralloides rufescentibus cornibus.* Reddish Corall like Mofse.

Among the ordinary ground Mofse doth this Mofse grow, and is a fine sight to behold the pale Greene ordinary Mofse to grow on the ground, and this Mofse being all white to grow out from among it parted like Corall into many branches hard or rough in handling, but the ends or tops of them all are of a yellowish or reddish colour, like small hard or rough hornes.

8. *Muscus Corallinus montanus*. Mountaine Coralline like Mosse.

The Coralline like Mosse is a small low whitish dry herbe, with small hollow stalkes, not stony nor hard at all, but finely cut and divided into many parts, much resembling the true Coralline, this is often found upon dry Heath grounds.

9. *Muscus Coralloides saxatilis*. Rockye Corall like Mosse.

This groweth on the Rockie hills among other Mosses in Naples as *Columna* saith, whose branches are many and each ending in a twoforked like horne, somewhat like the double forked horne of a Stagge, being hollow and Greene without, and white within, but of an evill earthy sent; there is an other sort of a grayish ash colour and much lesse than the other, growing in the same place with the former.

The Place and Time.

The places of most of these are exprest in their descriptions, and they keepe the Summer time for their flourishing.

The Names.

The first is called by *Tragus* and *Gesner* in *hortis Sabina sylvestris*, and by *Thalins Selaginis Pliniane prima species* for *Pliny* in his 25. booke and 11. Chapter hath these words, *similis herbe Sabine est Celago appellata*, and therefore all doe generally hold this to be his *Selago*, not finding any other herbe so neere to resemble it, although hee call *Sabina* an herbe which is a tree, *Turner* and *Tabermontanus* call it *Chamecyparissus*, and so doth *Gerard*, but they did not meane *Lauender Cottenjas Gerard* doth, but a kinde of Mosse, which *Turner* fitly Englished *Heath Cypresse*; the second is remembered onely by *Bauhinus*, for that of *Clusius* is a Sea Plant, as is before shewed in his place: the third is set downe by *Tabermontanus* and *Gerard*, but the lesser by *Bauhinus* onely: the fourth, fifth, and sixth, and seventh, are spoken of onely by *Bauhinus*, the eighth is called by *Tabermontanus* and *Gerard* *Muscus corallinus sive Corallina montana*, but yet *Gerard* was much mistaken, to understand this of stone or Sea Coralline, which is hard like Corall: the last is remembered by *Columna* in the second part of his *minus cognitarum Rhipisum*, and calleth it *Litobryon coralloides*.

The Vertues.

There is nothing recorded in particular of any of these sorts of Mosses, to be available for any grieve or disease.

CHAP. LXI.

Muscus arboreus. Tree Mosses.

Here are other sorts of Mosses which grow upon trees, which are next to be spoken of.

Muscus arboreus vulgaris & Quercinus. Common Mosse growing on other trees as well as Oakes.

The usuall Mosse that generally groweth on all trees, is nothing else but a number of haire issuing from the bodies and branches of them, in some shorter in others longer, all for the most part hoary or of a grayish white colour, which yeeldeth neither roote nor stalke neither flower nor fruites some onely are found to be reddish, and sometime blackish, which is the worst sort of all: It groweth upon sundry trees, upon the great Cedar as *Dioscorides* saith, which is the best of all other, and is very sacrete: the next in goodnesse (saith he) is that which groweth on the Poplar tree, especially if it be white and sweete: that which groweth on the Oake, saith he, is the worst: It is also found growing in severall Countries on sundry other trees, *Martholus* commendeth it for the best, the whitest, and the sweetest, that groweth on the Larch tree: others thinke that to be as good that is found upon the Pine, Pitch, or Firre trees, *Clusius* saith he found a kinde of ash coloured Mosse hanging downe from the armes and boughes of the Ilex, or ever Greene Oake, in some places of Spaine.

2. *Muscus quercinus Foeniculaeensis*. Fennell-like Oake Mosse.

This Mosse usuall groweth upright on the bodies, and the Elder armes and branches of old Oakes and sometimes on Beeches also, fastening a small brackish roote into their barke, and from thence sendeth forth sundry slender blackish branched stalkes about two inches, with a number of most fine grayish Fennell like leaves which smell somewhat sweete, at the toppe whereof stand small round hollow vessels a little rough or hayrie about the brimmes, which quickly fall away without any seed following them.

3. *Muscus quernus fruticosus capitulis cavis*. Tree Mosse with hollow beads.

This tree Mosse hath stollow stalkes, with broad flat leaves, somewhat hayrie on both edges, the heads are hollow, with a blackish umbone in the midst of them, and sometimes compassed about with a dented verge: this hath some short branches spread divers wayes, and is wholly of a grayish ash colour.

4. *Muscus alter quernus latifolius coralloides*. Oake Mosse with broad horned leaves.

This Oake Mosse is of a whiter ash colour, branching it selfe into many thicke and broad parts, like unto the hornes of a stagge, bearing at the toppes of them certaine small vessells of the bignesse of Cicers or Ciche peason at the biggett. This doth sometime grow luxurious swelling greater from the bottome to the toppe.

5. *Muscus arboreus nodosus sive geniculatus*. Knobbed or kneed tree Mosse.

This grayish Mosse is very frequent in Italy, hanging from the trees with a large spread bush of haire, a foote and sometimes halfe a yard long, with divers small knotted joynts like beads, growing upon them towards the lower end, which are hollow and doe so grow as if they were strung together, some being lower and others shorter than the rest.

6. *Muscus pulmonarius sive Cichen arborum*. Tree Lungewort.

This kind of Mosse that groweth on sundry sorts of trees, especially Oakes, and Beeches with broad ash coloured or grayish tough leaves, diversely fouled, crumpled and gashed in on the edges, and spotted also in some places with many small spots on the upper side, it never was seene to beare any stalke or flower at any time.

7. *Muscus*

1. *Mossus arbores vulgaris & quercinus.*
Common Moss growing on other trees as well as Oaks.

2. *Mossus quercinus feniculaceus.*
Fennell-like Oak Moss.

3. *Mossus quercus fruticosus capitulis cava.*
Tree Moss with hollow heads.

5. *Mossus arbores nodosus fruticulatus.*
Knotted or knotted Oak Moss.

4. *Mossus arbores quercinus latifolius Cornuoides.*
Oak Moss with broad horned heads.

6. *Muscus Pulmonarius* fœe *Lichen arborum*.
Tree Lungewort.

8. The Mosse upon dead mens Sculls.

Muscus
ex *Cra-*
neo Hu-
mano

7. *Muscus aridus crustaceus*. Crustie dry Mosse or Liverwort.

This kinde also doth not much differ in forme or colour from the former, but in being dryer or more crustie or hard, growing oftentimes as well on trees as one the cleft pales, and shingles of Oaken boards, as also sometimes upon the stones and rocks on the ground, and sometimes also upon the very ordinary Mosse it selfe, as Sir Matthew Lyffer one of his Majesties Physitians assured me, and sent me some to see which he gathered in Windsor Forrest.

8. *Muscus ex cranio humano*. The Mosse upon dead mens Sculles.

Let me here also adjoyne this kinde of Mosse, not having any fitter place to insert it. It is a whitish short kinde of Mosse somewhat like unto the Mosse of trees, and groweth upon the bare scalpes of men and women that have lyeen long, and are kept in Charnell houses in divers Countries, which hath not onely beene in former times much accounted of, because it is rare and hardly gotten, but in our times much more set by, to make the *Unguentum Sympatheticum*, which cureth wounds without locall application of salves, the composition whereof is put as a principall ingredient, but as *Crollius* hath it, it should be taken from the sculls of thote that have beene hanged or executed for offences.

The Place and Time.

The first is found in many Forrests and Woods in this Land, but the places of the second and third are *Italy*, as the fourth is also, the rest are as usual to our Land as to others, but the last is ofner brought out of *Ireland* than found with us, and they are to be gathered in the Summer time.

The Names.

I have shewed you before how the Greckes and Latines called the Mosses, which names indeede doe more properly belong to these tree Mosses, for I cannot finde that any of the ancients made any account of the ground Mosses, or put them to any use, the *Arabians* called it *Axne* and *Usne*, and by the Apothecaries *Usnea*, the *Italians* *Mosco*, the *French* *Mousse*, the *Germanes* *Mooss*, and the *Dutch* *Mosch*. The first here set downe is called *Muscu arborum* and *Muscu quercus*, by most writers: the second third and fourth are remembered by *Columna*: the fifth is generally called *Pulmonaria* by most writers of this latter age (for it is thought it was not knowne to the elder times) but without distinction almost, whereby many were misse led, taking one herbe for another, because there are divers included under that name, and therefore *Lobel* to distinguish it called it *Muscu pulmonarius*, and others *Pulmonaria fungosa*, or *Lichenis genus*, and yet some more properly *Lichen arborum*, the seventh became it is a dryer substance, is so called as it is in the title, and as I take it is *Columna* his *Lichen Dioscoridi* and *Plinii altera*, putting a difference betwene them, this of trees and that on the ground by these titles *Lichen foliosum* being that of the ground, and *Lichen adhaerens* being this of the trees.

The Vertues.

The Vertues that the ancients attributed unto Mosse, are wholly to be understood concerning these of trees, being cooling and binding, and partake of a digesting and mollifying quality withall, as *Galen* saith, especially that of the great Ceder, for each Mosse doth much partake of the nature of the tree, from whence it is taken, as that of

of the Oske to be more binding than those of the Cedar, Larche, Ivie, Pitche, and Firre, to be more digesting and mollifying, it is of good use and effect to stay fluxes and laskes in man or woman, as also vomittings and bleedings, the powder thereof to be taken in wine: The decoction thereof also in wine is very good for women to be bathed with, or to sit in that are troubled with the abundance of their courses: the same also drunke doth stay the troubled stomacke, perplexed with casting or the hickocke, and doth also comfort the heart as *Avicenn* saith, and as *Serapio* saith procureth deepe sleepe, some have thought it availeable for the Drop sicke to take the powder thereof in drinke for some time together: the Oyle of Roses that hath had fresh Masse steeped therein for a time, and after boyled and applyed to the Temples and forehead, doth mervellously ease the head ache that commeth of a hot cause, as also the distillations of hot rheume or humors to the eyes or other parts: the ancients much used it in their oynments, &c. against lassitude, and to strengthen and comfort the sinewes. The Lungwort is of great good use with many Physitions, to helpe the diseases of the Lungs, and for Coughes, wheefings, and shortnesse of breath, and the sheapheards also to their Cattle doe give it for the same purpose with good successe with a little sale, it is also very profitably put into lotions, that are taken to stay the moyst humors that flow to ulcers, and hinder their healing, as also to wash all other ulcers in the secret parts of man or woman.

CHAP. LXII.

Lichen five Hepatica. Liverwort.

The Liverworts also there are diverse sorts, which are also other kindes of Mosses that doe either grow on the ground or on rockes and stones, yet moist withall.

1. *Lichen five Hepatica vulgaris. Common ground Liverwort.*

The common Liverwort groweth close and spreadeth much upon the ground in moyst and shadowie places, with many sad Greene leaves, lying or rather as it were sticking flat one unto another, very unevenly cut in on the edges and crumpled, from among which rise small slender stalkes, an inch or two high at the most, bearing small starre like flowers at the toppes, the roots are very fine and small whereby it liveth.

2. *Lichen five Hepatica minor stellaria. Small ground Liverwort.*

This small Liverwort groweth in the like manner as the former, and sendeth forth such like starrie flowers but is smaller for the most part in all places where it grow, for so as it groweth in the shaddow, it will abide in pots as well as on the ground, if the place be not stirred or turned up. There is also another sort that beareth not

3. *Lichen five Hepatica minor umbellatus.*
Small ground Liverwort with round heave.

4. *Lichen marinus pileatus & calcato folio.*

2. *Lichen five Hepatica minor stellaria.*
Small ground Liverwort.

divided leaves, and the small stalkes have round heads not differing in any other thing from the last.

3. *Lichen petræus racemosus*. Cluster headed Liverwort.

This Liverwort that groweth upon the stones by wells and springs, hath much lesser leaves than the former, but lying flat one upon another in the like manner, and of a pale green colour and somewhat hayrie, from among which rise slender naked stalkes, two inches high, bearing at their toppes small heads made like a cluster of divers graines set together of a reddish colour.

4. *Lichen petræus pileatus*. Liverwort with a hooded head.

This Liverwort groweth in the like moyst stony places, and hath such like leaves lying one upon another of a yellowish green colour, daist over with an ash colour, and spotted a little in the middle of them, the stalkes groweth to be three or foure inches high, being white smooth cleare or transparent, and of the thickenesse of a rush, whereon standeth a small head, somewhat like unto a hat divided underneath into five parts, of a spongie substance, green at the first, then yellow, and lastly reddish, under which are growing the fruite, which are of a darke purple colour and fappie while they are fresh, but being dry have a smoakie powder within them in stead of seede: the rootes are small fine and white.

5. *Lichen alter minor folio calceato*. Small Liverwort with skinnie heeles.

This small Liverwort hath smooth transparent leaves more tender and small than any of the former, growing in the robe of a blackish purple colour, and not lying or sticking one to another, as the other: from the backe whereof groweth forth a skinnie sheath, shaped like a shoe, whose brimmes are a little crumpled and rayed higher than the rest, from whence rise up foure little darke green shining heads, of the bignesse of the smallest Pease, which afterwards open into yellow flowers, with foure leaves a peece, standing on yellowish stalkes foure inches high, with divers impalpable threads in the middle, the roote hath fibres as small as silke.

6. *Lichen petræus minimus acaulis*. The smallest Liverwort without stalkes.

This Liverwort is the smallest of any, having leaves no bigger than the nayles of ones finger, green and rough with white spots, this hath certaine sad purplish skins set on both sides of the lower part of the leafe, before any flower appeare, but when the leafe groweth greater, it waxeth of a sad purplish colour like the skins and swellth at the end, sending forth a small fruit, as big as a small Pease, being of the same colour with the leafe, fappie or full of whitish watry juyce, which afterwards as the fruite groweth ripe, changeth yellow, and being broken hath then a yellow powder, which will colour their fingers that touch it; to the leaves cleave very fine short white fibres whereby it liveth.

7. *Lichen petræus purpureus Derbensis*. Corke or Archall.

There is growing in *Derbshire* upon the free stones of the Mountaines a kinde of herbe, much resembling Liverwort, but of a sad putrlish colour which the poore people there gather, and grinding it make into a moyst masse, keeping it in barrels, and therewith make a kinde of murrie or purplish dye which although it will not hold colour in the cloth long, but will starve and change, yet it serveth the poore people for their wearing very well.

The Place and Time and Names.

There needeth no further declaration of any of these Liverworts, then hath bene specified in their descriptions, onely let metell you that the third is taken from *Bauhinus*, as the fourth, fifth, and sixth from *Columna*, whose title to the fifth is *caule calceato*, but his description thereof sheweth it rather in the leafe then stalkes, and therefore I have so called it. The Greekes call it *αρχαλλ*, and so in Latine *Lution* of some, *Hepatica* and *Tecoraria*, taken either from the forme of the leaves or from belons, the disease called Lichen tetter, which deforme the skinnie and make it rough, or from helping the diseases of the Liver. The *Arabians* call it *Azer* and *Alsachel*. The *Italians* call it *Fegatella*, the *French* *Hepatique*, the *Germanes* *Stein Leber kran*, The *Dutch* *Steene lopecrmit*.

The Vertues.

Liverwort is a singular good herbe for all the diseases of the Liver, both to coole and cleanse it, and helpeth also inflammations in any part, and the yellow jaundice likewise. Liverwort being bruised and boyled in small beere and drunke, cooleth the heate of the liver and kidneyes, and helpeth the gonorrhea in men, and the whites in women. *Galen* insitteth on the qualities of cooling, cleansing and drying, but doubteth of the stanching of blood, which *Dioscorides* reporteth of it: it is a singular remedy to stay the spreading of tetter, ringwormes, and other fretting and running sores and scabs, &c. the name it selfe importing so much.

Having

Having thus passed through the fieldes of grasses, and the rockes and bogges of Mosses, let me last of all runne through the woods and by places of Mushromes, that therewith I may finish this Classis or Tribe: but they are of so great variety that for methods sake, not to huddle them together, and the more orderly proceeding with the them, I must distinguish them into two primary kindes, namely into those that are not dangerous, but edible, and into those that are dangerous and poysonous, unto the former sort belongeth *Agaricke* whereof I have entreated in the second Classis or Tribe of this worke, and Jewes eares which shall be last of all mentioned among the edible ones, although *Clasius* numbeth it with the perillous, and unto the other pertaineth Touchwood, which are woody Mushromes, and some other that are of a soft stony substance, which I shall also adjoyne there, being not many of them, that are fit here to be spoken of in this place. And first to speake of those that are not dangerous but edible, that is, may be eaten, and because our Country neither produceth much variety of good or bad, to like or dislike, our Nation also not being so addicted to the use of them, as the *Italians* and other nations are, where they grow more plentifully. I will therefore but runne them over briefly, and not insitt so much on them, as in other things of better respect.

CHAP. LXIII.

Fungiesculenti. Holsome Mushromes that may be eaten.

IN the handling of these Mushromes I must take a differing course, and manner then I have observed formerly, or shall doe hereafter, for concerning *Place, Time, Names* and *Vertues*. I will speake of so many of them in their recitals, as shall be sufficient to expresse whatsoever is contingent unto them. The most usuall sorts of Mushromes, have small smooth round heads, standing upon thick short stalks, and are for the most part white, yet in some the upper skine is brownish or yellow, but generally more yellow after they have stood long and are decaying, most of them are somewhat flat and hollow underneath with many lines running directly from the middle to the edges round about: the substance of them generally, is loose and spongy, easily yielding to be broken betweene the fingers if they be but pressed a little hard: the taste or relish of them is no doubt according to the soile and place where they grow, for those that grow in the open champion fieldes and meadowes, are not onely safer from danger, but of better relish then those of the same kinde that grow in woods and under trees, I speake of them that grow in our owne Land: agreeing with *Horace* in his second booke and fourth Satyre, who saith,

*pr. tensibus optima fungus
Natura est: alijs male creditur.*

But I know *Clasius* saith the *Hungarians, Germanes*, and others, doe most esteeme of those that grow in the woods, and chiefly of those under the Firre trees, and next unto them, those that grow under Oakes, the ordering and dressing them to be eaten is diversly, as every one pleaseth, some boyle them and draine or presse the water out of them, and then slice them, and put oyle and vinegar to them, and some a little salt, or as others please sugar, and some spice, and so eate them cold: others put butter, sugar and spice, and so eate them hot: or boyle them in milke or creime, or fat broth, others againe slice them and strow fine flower on them, and then fry them with butter, suet, or oyle, and so eate them: *Clasius* saith that they use in *Germany* to hang them in strings, and keepe them dry, others salt them and so keepe them untill winter, (for the best grow up and are gathered in the spring, and not in the Summer or Autumne yet it is observed that they grow most in a rainy season, and often after thunder) and then drie and eate them. I have bene the longer in the narration hercof, to save the often repetition of one and the same thing in the rest, as also that the difference in others from this may bee the better knowne and discerned.

Mushromes are called in Greeke *μυκάρις*, in Latine *Fungus*, by the *Arabians* *Hater* and *Father*. The *Italians* *Funghi*, the *Spaniards* *Hongos*, *Cogomelos*, and *Cilbergas*, the *French* *Campignons*, *Potirions*, and *Moncerons*, the *Germanes* properly *Schwem*, and particularly *Heyderling*, and the *Dutch* *Campervoelen* *Pfifferling*.

1. Some of this kinde grow bigger then others, and some more topped or spiring, and some are parted as it were all over into sundry divisions, making it seeme like unto an hony combe, and therefore are called *Favaginosi*, but are not dangerous as *Gerard* saith, for *Clasius* putteth it as one of his principall or first kindes of edible Mushromes, and saith it seemeth to be that which *Dalechampius* calleth *Spongiosus*, and

Fungi esculenti varij.
Divers sorts of edible Mushromes.

F. *Fungus spongiosus* 3. *saffigatus* 4. *orbicularis*.
Three of the first sorts of edible Mushromes.

the *Italians* *spongiosa*, and the *French* *Morilles*, because the head doth well resemble a Mulberry, and *Camerarius* saith are called *Morchell* by the *Germanes*, who be much delighted with them.

2. Another kinde is more sharpe and spiring, then in any of the rest of the edible kindes, and small withall.

3. Another whose outside is of a whitish browne colour, is more steeple fashioned and bigger, and is therefore called *pyramidalis*, and are as good as any of the former, being the greatest of the fourth sort of *Clusius* his edible Mushromes.

4. Another sort is round, some what soft and whitish, having a slit on the edges most usually, and are called *St. Georges* Mushromes, because they grow up chiefly about that time: this is the third kinde of edible Mushromes with *Clusius*.

5. Another is cornered either more or lesse and some jagged about the edges, having longer and shorter stalkes, and some of them fuller or lancker then others, which are often found under Elmes, and white Poplar trees, and therefore called *Fungus Populneus*: yet *Casalpini* saith that at *Turin*, those that grow under the Poplar trees are misliked, which thing proveth my former assertion that the ayre and soyle bettereth many of these kindes.

6. There is a kinde of Mushrome called by the *Grecians* in former times *μηχοι* and *μηχοι*, and by *Pliny* *Peziza* in Latine, which may be called Cup Mushromes in *English*. For they doe grow out of the solid ground, whereunto they adhere so strongly, that hardly without breaking they can be got up, sticking to the earth by certaine small fibres, that are almost insensible and spreading low upon the ground without any stalke, into broad deepe and hollow cuplike peeces, the brims or edges whereof are either plane or crumpled, or cornered and containing many times within the hollownesse, three or foure ounces of raine water, especially the greater of them, which by reason of the thicke skinny or fleshy substance thereof corrupteth not, nor the water therein reserved for a long time, being white on the outside and reddish within, and are found growing in the fieldes of *Italy* in divers places by the path waies as *Columna* saith, and certainly determineth them to be the true *Peziza* of the ancients and *Pliny*. Hereof likewise he saith there is another sort, which is more crumpled or divided into sundry folded parts, not else differing in substance, and are thought to be none of the pernicious sorts, because they are not moist or glutinous in handling, and doe not rot but endure a long time, and become wholly dry. *Dodonaeus* tooke the *Fuffle* bals to be it, but erroneously.

7. Another sort is somewhat flat on the head, a little turned in like a Navell, and are of an unequall life, being brownish greenish or yellowish coated, whereof the largest is called the *Frowes* Mushrome, and the first of the thirteenth sort with *Clusius*.

8. Another likewise not so flat throughout, but round in the body, and sometimes torne on the edges, of a pale browne colour, and spotted with white: this is called *tuberosus fungus*.

9. There is another called by *Cordus* *Boleti*, and by others *Fungi nemorum*, which is almost round and white, spotted with yellowish browne markes, some of them bigger then others, those growing under Beech trees are redder then others, whereof some are choise in eating them, rather taking the pale then the redder.

10. Another is called *Capreolini*, differing not much from some of the last, but in being yellower above, and browner underneath, being the twelfth with *Clusius*.

11. Another sort groweth in woods about the beginning of Summer, and for their rednesse above are called red Mushromes, although both the stalke and the under part be not so full of stripes.

12. A twelfth sort *Tragus* calleth *vulgares Amanita vel Boleti*, and are called the most common also by *Lebel* and others.

13. Another sort being round and a little flat above, are all hairy, and of a bluish colour, and are therefore called *villosa* or *hirsuti cervini Fungi*; and some of them will be blackish also, some also will grow two together.

14. Another is lesse hairy, but otherwise much like the last, whereof some are mixed with white, pale, and browne, and some are smooth withall, with many blackish purple lines underneath, and are called *Firre* Mushromes, because they alwaies grow in the *Firre* tree woods.

15. There is another which is called the *Goates* hoofe, because it is cut in on the edges into such parts, that it very well resembleth it, being browne above, and white underneath, and more torne on the edges when it groweth old, then while it is young and new sprung up.

16. Another sort hath the stalke sometimes bigger in the lower part, then the upper bole is, and is much discoloured with blew, greene, and browne, or in some yellowish, the upper part of the bole being browne, and without any lines underneath. *Clusius* thinketh that this sort commeth nearest unto the *Amanita* of *Paulus Aegineta*.

V u u u u

17. There

6. Fungi Pezize.

26. Fungus ramosus Barba caprina dictus.
Branched Mushrome called the Goats beard. 23. Fungus Diplocoides.
Teafell Mushrome. 27. Fungus terrestris Diguatus dictus.
Finger formed Mushromes.

17. There are two other sorts of so delicate a taste that they are eaten raw, the one is flat at the head, and of a reddish colour, giving a sweet milke when it is broken, and is the sixth sort of *Tragus*, the other is great, white and round, smelling very sweet and called *Richione*, as *Baptista Porta* saith, that is, the King of Mushromes, and for the pleasant taste may be given to the sicke without danger.

18. Then there is one which *Cesalpinus* calleth *Lingua*, growing on the bodies of Chesnut trees, whose stalke is not so red as of the true *Boletus*, and the head is somewhat red.

19. And then there is the true *Boletus* of the ancients, which is of so delicate a taste, that they that are accustomed to the feeding on Mushromes, desire them more then any, and can never be satisfied with them, which *Claudius Cesar* found to his cost, being killed with them: they are as white as an egge, and of the same forme when they

30. *Tubera terra edibilia* & *Tubera ceruina*. Underground edible Mushromes, or Spanish Trubbes, and underground Deeres balles or Mushromes.

they first spring up, but after two or three dayes the white skinne or coate breaketh above and sheweth yellow, like the yolke of an egge, which then groweth greater, and into the forme of a Mushrome (the white skinne falling away by little and little) being rayed somewhat higher in the middle, and of so gold a yellow colour, that it seemeth deeper coloured then the saffron it selfe, and lesse yellow underneath, with as many lines as in other Mushromes, the stalke likewise is yellow and an inch thicke, when it groweth old it breaketh into three or foure parts, and looeth the fresh colour above, becoming more pale, and underneath almost white: these being dressed and served as a dish to the table where *Clusius* was, seemed unto him to be coloured with Saffron.

20. There is some that are called *Porcini* or *Suilli*, Swines Mushromes, which are somewhat pointed, and of a smokie colour, spotted with white spots, and underneath with blackish lines, the upper part in some will be red, but *Cesalpinius* saith that those which were called *suilli* or *porcini* with them, were of a brownish yellow above, and of an ash colour underneath.

21. Then are there such which those of *Naples* call *Conocielle*, as *Baptista Porta* saith, and peradventure may be those that *Cesalpinius* saith were called *Scarogia*, growing in meadowes, the head being broad, and the stalke very long and of divers colours, this with *Clusius* is his eighteenth.

22. Another sort is called *Quercinus dispacoides* by *Columna*. The head hereof is white, and like unto the ordinary sort for forme, but that the toppe is browne, and groweth to be spotted, but the chiefest matter of difference is in the stalke, which hath about the middle of it, or higher, a certaine hollow diih, like as the Teasell seemeth to have, being rough and browne, about the brimmes: the lower part of the stalke is as it were knobbed, and blackish next to the ground, with some hairy fibres thereat: it groweth among Oakes, this may be called the Teasell or *Bafon* Mushrome.

23. There is another that groweth on the Larche tree, besides the *Agaricke*, which is of an huge size, containing thirty pound in weight as *Mathiolus* saith, and is of a gold yellow colour, somewhat torne about the edges, and is most pleasant.

24. Then is there another called *acris* or *piperitū*, and peradventure may be that which *Cordus* or *Dioscorides* calleth *Piperis sapore*, being a white Mushrome, and tasting sharpe and hot like pepper.

25. There is another sort which *Cesalpinius* saith the vulgar people called *crunuli*, being very small of an ashy colour, and very sweete in sent.

26. Another is branched and is the nineteenth with *Clusius*, being in some yellow, in others reddish, and in others of a pale white, which they call the *Goates bearde*, and adde their colour, the most conspicuous is that which is yellow and spotted with white spots, *Clusius* saith that these are some what like those Mushromes that *Baptista Porta* saith, were brought from mount *Garganus*, like young *Asparagus* buds, and then breaking out into branches.

27. There are two other sorts called *Digitatus major* & *minor*, and *Digitelli* by the *Italians* being of a large size, and parted as it were into long white fingers, one whereof will suffice a man at a meale.

28. Then is there a monstrous great kinde growing in *Hungary*, being of two foote in breadth, having many large torne leaves like scales lying upon it, and fashioned like an Oaken leafe, some of them of a darke red. and some of a blackish white colour, with many blacke spots in the white, the stalke is halfe a foote high, and an hand-bredth and a halfe in thicknesse, *Clusius* thinketh this to be that mushrome which *Baptista Porta* saith the *Negapolitanes* call *Gallinacia*, being of so large a size that it doth weigh fouretcore pound, and that one will satisfie a great family, *Bambinus* referreth it to the *Fungus Leporinus* of *Clusius*, which is his foureteenth, *Clusius* saith hee hath scene in *Hungary* those that have beene so great, that one might well suffice foure men at a meale.

29. There is also one that is very small and a little long, formed like unto a tooth, and therefore called *Dentatus*.

30. There is yet another kinde of mushrome (for so it may most fitly be termed, and not rootes, as some would make them to be) that groweth not out or above the ground, as all the former sorts doe, but within or under the upper crust thereof, called in Greeke either *ὄστρον* or *ὄστρα ab imbribus*, or *ὄστρα ab humore*, in Latine *Tuber* and *Tubera* (or *Tubera terra* to distinguish it from *Tuber arbor*) in the Arabian tongue *Ramech* *Alchamech*, *Turner* & *Kema*, in Italian *Tartuffi* and *Tartufole*, in Spanish *Turmas de tierra*, in French *Truffes* and *Truffes*, in the Germane tongue

tongue *Hirtz brumst*, in *English* some call them *Spanish Fassebals*, because they are somewhat like our *Fussebals* which are not edible, but containe a smoaky dust or poulter in them: but I would rather call them *Vnderground Mushromes*, or *Spanish Trubbes* to distinguish them. *Matthiolus* saith there are three sorts of them, (*Pliny* mentioneth two sorts, one whereof is gritty betwene the teeth, and are some bigger then a Quince, and some of a pound in weight, and saith, that hee knew in his time *Martius Lucinius* a *Pretor* and *Iudge* at *Carthage* in *Spaine*, that bowed a penny betwene his teeth, that was in that bit of the *Tuber* that he did eate, whereby is manifest that the earth did gather it within it of it owne nature, being a thing not to be planted) one whose inner pulpe or substance is white, another more browne, yet the barke or outer rinde of both is blacke and full of rifts or chaps, a third sort that groweth in the coast of *Anania* and *Trent* is lesse, the barke smooth and more browne, and lesse pleasant in taste or insipide. They grow as I said under the superficies of the earth, yet not cleaving thereto, causing it sometimes to swell, and sometimes to rift and cleave, whereby it is discerned where they grow (yet *Pliny* saith the contrary, and that they have no seede, which will presently be gaine said) being of a blacke or browne colour on the out side, and of a soft white substance within, having as *Iohn Baptista Porta* saith, under the outer skinn, certaine small blacke feede, like unto the feede of the Cypresse tree, whereby it not onely propagateth it selfe, where it is naturall, but as it hath beene often observed, there have some of them growne where the parings of them have beene cast. For the qualitie or property of them, they have none evident in them saith *Galen*: but *Avicen* saith, that they have a more earthy then watery substance, breeding grosse and melancholicke humours, more then any other foode, and that they that eate much of them are subject to the Appoplexy, and Palsie, and besides are hard of digestion, and trouble the stomacke, whether they be roasted under embers or otherwise boiled in broth, and eaten with pepper, oyle and vinegar: Vnto *Ramphylus* or *Diphilus* in *Athenais*, therefore we must not give credit herein, who saith that these *Tubers* yeeld a good iuice to the body, eate the belly by expelling the excrements, and by breeding winde, engender lust. And againe he saith that a certaine herbe groweth above, upon that ground where the *Tubers* breed, which he calleth *ὀρεόλαλον*, but what that herbe is he hath not declared.

Lugdunensis saith that *Alyconus* sent two sorts of plants out of *Spaine*, which the *Spaniards* in *Castile* call *Terva trimeria* (and is the *Cistus annuus*, as I shewed you before,) that is *Tuberaria*, which peradventure may be it, for they suppose where they doe grow the *Tubers* doe breede.

31. *Tubera cervina*. The Deares underground balles or Mushromes are another sort of these *Tubers* (whereof *Matthiolus* first maketh mention in his third booke of Epistles, and the last thereof, and after him *Lobel* in his *Dutch Herball*, growing underground, in the woods of *Bohemia*, &c. where Deare doe much haunt, especially where they couple as the former doe (and thought to grow of their sperme that falleth on the ground, and is but the opinion of hunters and Country people, whose judgement in so secret a peece of naturall Philosophy, is not so readily to be admitted) which are like them, being alwayes round, but uneven or rugged, whose outer skinn is blackish, and the inner pulpe or substance whitish: these be not eaten in the same manner as the former, that is for meate or food, but as a medicament being cut into peeces, and dried upon strings put through them, to be used upon occasion: while they are fresh they have a strong and evill sent, which they lose in the drying, and are used either alone one dramme and a halfe in poulter, taken with sweete wine, or with such other things as provoke venery, as also to increase milke in Nourishes breasts, taken in some pitane drinke, and a little long pepper added thereto: the smoake thereof when it is burned taken underneath, helpeth women troubled with the mother, and openeth the passages when they are close: they are thought also to expell poyson, and the venome of creatures, to be taken in pure wine, and also applied outwardly, I much marvelle that *Clusius* having seene and set downe so many sorts of Mushromes, remembered none of these, but I presume that if he had not hope of overground good, he sought not for underground treasure.

Vnto these Mushromes may also be adjoynd those which are made by art, whereof *Matthiolus* maketh mention, that grow naturall among certaine stones in *Naples*, and that the stones being digged up and carryed to *Rome*, and other place, where they set them in their wine cellars, covering them with a little earth, and sprinkling a little warme water thereon, would within foure dayes produce Mushromes fit to be eaten at what time one will. As also that Mushromes may be made to grow at the foote of the white Poplar tree, within foure dayes after warme water wherein some leaves have beene dissolved, shall be powred into the roote, which must be slit, and the stocke above ground.

To cause that the edible Mushromes may be lesse offensive, in that many doe too greedily desire them it is held that if they be boyled with wilde pearces, they may be eaten without danger, or for want of wilde ones to take a harder or harsher sort of other pearces, the leaves also and barke are conducing to that purpose, and so is raw Garlick taken with Vinegar.

32. And lastly there is the Jewes eare, called *Fungus Sambucinus*, (which I place among the edible sorts, and not among the venomous, as *Clusius* and others doe, because although it be not eaten in the substance as others are, (and yet *Baptista Porta* nameth one *Sambucinus optimus omnium*.) yet the broth is used after the boyling, as I shall shew you by and by) which groweth on the Elder trees that are planted on Cony-boroughes, for their shadow and shelter, and not so frequently on them in other places, being as all know soft and limber, while they are fresh, not very thicke but transparent, and of a blackish colour, of differing formes and sizes, for some will bee swolne or puffed up, in one place more then in another, having some resemblance to a mans eare, some thinne on the edge, and thicke in the middle, and some two or three growing together, all of them being dried become of a blackish gray colour, and then may be kept a whole yeare or more, safe without spoiling to be used as you neede, for lotions for sore mouthes and throates, or when they are swolne, to be boyled in milke, or steeped in Vinegar and so gargled, which is the onely use they are put unto that I know.

CHAP. LXIV.

Fungi perniciosi, Dangerous Mushromes.

He other kind of Mushromes as I told you are dangerous, if not poysonous, whereof there are many sorts which *Clausius* hath amply set down in a treatise concerning them, and *Baubin* after him hath added more out of other Authours, which because they are too numerous, and to little purpose, either for me to write, or for you to read or know, seeing neither the one halfe of them are found growing with us, nor doe we neede caution to beware of the bad, seeing our Nation is not so enclined to the good, I thinke I may well spare my paines from recounting all the severall varieties that they doe, and onely mention some of the most speciall with the Touchwoods, and some exotickes, and so end this Classis.

1. The first groweth under Plummee trees in the beginning of the yeare of differing formes, and greatnesse, for some grow many together from one roote, as it were, with very little or no stalke at all, yet some are round fashioned, others are cornered, some are larger and smaller then others, all of them being mixt with white, pale yellowish and browne together.

2. Another because it groweth among dung is called *Fimetiarius*, and is of a round flatnesse, somewhat thinne white, and covered as it were with meale all over, having browne lines underneath.

3. Another groweth under Hazell nut trees, which are sometimes of a whitish red, and as it were smoaked over, round and somewhat broad.

4. Another of a reddish Corall like colour, full of round yellowish spots above, and pale yellow underneath, full of blackish lines found in *Wales*.

5. Another is called the Toades Mushrome, being of a wan colour, and round like an helmet, or more yellowish but smoaky, or else more flat and reddish with some spots.

6. Another is very small and round not exceeding the nail of ones finger reddish above and very hollow underneath this is called the Goates Mushrome.

7. Another is somewhat like the true *Boletus*, but is

Fungi lethales, 9, 10, 19. Deadly Mushromes, the ninth, tenth, and nineteenth of both sorts.

8. *Fungus Muscarius.*
Flye bone Mushrome.

Musci parvis denticulatus.

about halfe an inch broad, spiring a litle at the toppe, and being of a whitish colour, with a long stalke, of the bignesse of ones little finger: this is called the foolish or the fooles Mushrome.

8. There are two or three other sorts, that are said to kill as many flies as sit and feede on them, as well when they are dry as fresh, some of them being greater and broader then others, and some much redder, and spotted with white spots all of them doe grow in the woods that have beene feld.

9. In the like woods are found other sorts about *August*, one whose stalke is bigger below then above, and the head or toppe round and pale whitish, but no bigger then the bottome of the stalke.

10. Another sort is much frequent with us, and is of a blackish colour much rent or torne on the edges, and hanging lanke about a small long stalke.

11. There is another kinde which is *Clausius* his nineteenth, and is of divers sorts, which because they are so like unto some of the edible sorts, deceive many that gather them, and are often a speedy death to them that eate them, whereof some are reasonable small, others very large, and most of them of some beautifull aspect, either

whitish or reddish, or more red and smoaked over.

12. Another sort growing under the Firretrees, that is so like unto them that grow there likewise and may be eaten, that they know no other difference but that these are hairy underneath, for which cause they are refused.

13. There is a kinde which is called *Phallus Hollandicus* by *Hadrianus Junius*, and may be called the *Hollanders workingtoole*, which at the first rising up of it, is somewhat round, but the skinn breaking, there riseth up a stalke of the thicknesse of ones thumbe, and of a fingers length, somewhat like a dogges pricke, having a nut or cappe on the toppe an inch thicke, of a blackish Greene colour at the first, and after blacker, with certaine celles or hollow places in it: the lower part or purse from whence the stalke riseth, is of an ashecolour, and sometimes brownish, the stalke at the first is white, but afterwards of divers colours, and spotted, this sort stinketh at the best, but withering, is turned into a moist blacknesse, colouring the very ground whereon it falleth: Fijes are killed that sit and feede hereon, this is *Clusius* his description of the fifth sort, of his three and twentieth kinde, which as hee saith doth come nere unto that which *Hadrianus Junius* reporteth to be much found on the *Hollanders* sundry Sea shores, and although their figures be somewhat differing one from another, yet surely they both expresse but one thing.

14. On some Cherry trees that begin to putrefie, sometimes groweth a kinde, rising many together, laid flat one upon another, about an inch or more broad below, and spreading to bee three or foure inches above, and about halfe a foote high, being of divers colours at the toppes, the edges being of a deepe red colour, with a mealy white list about: the lower part for an inches breadth upwards is pale whitish, up higher being yellow and red mixed to-

14. *Fungus imbricatus difpositus variegatus*.
The fouled changeable Mushroome.

13. *Phallus Hollandicus*.
The *Hollanders* Workingtoole.

20. *Fungus Coralloides cancellatus Clusii* sive *Lupis crepitans efflorescens Columne*. A deadly stinking Mushroome, though finely branched.

gether, crossing it athwart, then yellowish, and above it red and yellow mixed againe, and then yellow to the very edge, but spotted with divers smoaky spots and pale or yellowish underneath. This although it be deadly to men yet is given cattle with their fodder, dried and made into peather safely.

15. Then is there another large round & whitish one, as full of black lines, from the center to the circumference above and below but that those above are greater, and not straight as those below and a little waved, the edge also being finely dented about.

15. Another

24. *Fungus fruticosus argenteus.*
The branched silver Mushrome.

26. *Fungus durus arborum sive Ignisius.* Touchwood.

27. *Fungus lapideus.*
A Stone Mushrome.

32. *Lupi crepitans sive Fungus ovatus.*
Fuffe Ball.

16. Another little one hath beene found about Hackney, dented in the like manner, about the edges, and of blacke chefnut colour, but not striped above.

17. Some grow on the rotten boordes and timber that lye or are set into the earth, being small and like a greene figge, having small seed within it, which was sent unto *Clusius* to try his skill.

18. And some are round like a Fuffe ball, being of a brownish colour, above and darke red underneath, which when they are broken are of a blewish greene colour.

19. Some others are like brimlesse hats, many growing together and some broad like shields, their brimmes turned up.

20. And there is another which *Columna* calleth *Lupi crepitans*, and with *Clusius Cancellatus*, which hath a small stringier roote, differing from all others, and a round white *Fungus* at the first, which afterwards breaking open, divers reddish branches doe arise out thereof, which doe all joyne together, making round arches of hollow netted barres, or lattises as it were, seperated one from the other, this hath a very stinking savour, whereof cometh the name, and is much devoured by flies that eate it.

21. These Mushromes likewise that grow upon the stockes or bodies of trees or their armes, or at the rootes of those that are rotting or dead, or upon dry boards are very diverse also, yet are none of them of the hardnesse of touchwood, some whereof are like unto Iewes eares, either whitish or yellowish, crumpled and of a skinnie substance like them.

22. Others grow on Birch trees Willowes Cherry trees, divers growing one upon another of very variable and delightfull colours, which as *Clusius* saith the Country people use to keepe dry, and although it be deadly to man, yet as they thinke it helpeth their cattle when they are sicke, being broken small and given them with a little salt in their fodder.

23. Some grow like ordinary Mushromes, very many together, on severall stalkes, differing in brownesse, whitenesse, and rednesse, one from another, either on the dead rotten bodies or on the armes of trees.

24. And some that grow like a shrubbe with many branches, and are of so pure a whitenesse that they seeme

as if they were made of pure silver, if they were shining withall, this hath oftentimes no stalke, or but of halfe an inch long, and groweth on the rotting bodies of trees, that lye upon the ground.

25. There hath beene another sort observed growing in *Kent*, in sundry places, as at *Ripton* neere *Ashford*, on *Bramley* greene also, and at a place in *Rumney* Marsh called *Warborne*, the stalke whereof is like unto other Mushromes, but the head is made of scales, like unto an Artichoke of a faint yellowish colour, and may be called *Fungus Cinaræ* forme Artichoke Mushromes.

26. The Touchwoods are likewise kindes of Mushromes which grow harder than the others, and are of a dry fungous or spungie substance on the inside, that may be cut or broken into severall peeces, having a hard or woody crust on the outside, and are of differing formes and colours, some being very great, and flat at the head, and smaller and rounder underneath, of a brownish yellow colour, and such be they which *Lobel* compareth to *Agaricke*, and are once or twice boyled in lye, made with wood ashes, and being afterwards dried, are kept broken into peeces, serving to take fire like lint.

27. And lastly there are some of a stony substance, whereof some are of a round forme, very neere unto an ordinary Mushrome, being of a grayish blacke colour, full of white lines and strakes, on the upper side, embowing a little from the middle to the edge, and with many lines likewise underneath, but not passing above halfe way from the edge to the middle.

28. And another greater than it, whose diameter is about three inches and a halfe all whitish, and full of deepe lines, somewhat embowed from the Center to the circumference, where it is finely dented like a saw, the underpart is also full of rough lines, but shallower, browner, and variously bending.

29. Another is somewhat long with the roundnesse, and hollow in the middle, the edges being cut in halfe way almost, and forming round ends like unto some flower, descending thence smaller unto the stalke.

30. Another is like unto *Agaricke* found in hollow places of the hills in *Helvetia* and called by *Gesner* *Agaricum saxatile* vel *Fungus petreus*, and by the Country people *Las Luna*, whose substance is white and frothy.

31. Another is halfe a foote long and two inches broad, channelled or guttered, and somewhat rough on the upper part, and full of strakes underneath, running two wayes a crosse the whole, being in forme like unto a neares tongue.

32. The Fusse balls or rather Foist or Fift balls, taken from the *Germane* word *Fist* quod *crepitum* significat, called in Latine *Fungus ovatus*, or *Orbicularis lupi crepitum*, and *Lucernarum fungi* of some (and taken by *Dodonæus* to be the *Peziza* *Plinii*, as I sayd before, but *Columna* hath first set forth the true sort of it, whereof I gave you the figure before) but without reason, the *Lucernarum fungi*, being the small peeces of the Weeke or Cotten, that lyeth in the Oyle in Lampes that sticking forth, trouble the burning thereof, which assuredly *Virgil* meant by those *Phœrescentes fungos* in the Lampes, as his verses in his first of *Georgickes* doe expresse and not these Fusse balls although *Gerard* would so inferre it, because in divers Countries of this Land they use to carry fire in them from their houses, distant a good way in funder. They are of severall sizes, some of the bignesse of a ball or balloone or a childe's head more or lesse, round smooth and whitish at their first rising, but growing in time to be of a dusky colour, cracking in sundry places of the outside, and growing on the ground most usually in the dryer fields, and seldome in the moyster (which while they are young and white, as *Clusius* saith, he and others of his schoole fellowes, being children, would in sport throw one at another) containing within that outer skinne certaine dust or powder, which if by the breaking or treading on should flye up into the eyes, would trouble them shrewdly, if not goe neere to blind them: yet serve to many good uses, Country Chirurgeions using often to string up the skinner of them, to serve them to staunch bleeding in wounds or otherwise, and the Country people with the powder doe dry up kited heeles, and the fretting of the skinne in any place of the bodie, as also to hold fire as I sayd before, and with the smoake of them being set on fire to drive as they call it their swarmes of Bees.

Thus have I shewed you all the kindes and sorts of these Mushromes, both wholsome and dangerous, that whosoever is addicted to the delight of them, may take heede in time upon this admonition, that although many may be found of a pleasant and delightfull shew in our owne Country as well as in others, yet the danger is so great yea of the best, that many upon surfets by over eating of them have dyed remediless, and therefore it is not good to lick your honey from such thornes.

MISCELANEA.

THE VNORDERED

TRIBE.

CLASSIS DECIMAQVINTA.

THE FIFTEENTH TRIBE.

CHAP. I.

In this Tribe as in a gathering Campe I must take up all those straglers, that have either lost their rankes, or were not placed in some of the foregoing orders, that so I may preserve them from losse, and apply them to some convenient service for the worke.

Gramen Leucanthemum. Stichwort.

Although Stichwort is called *Gramen*, yet it much differeth in forme from them, and there-

fore not fit to have beene there inserted, whereof there are two principall sorts, a greater and a lesser or an earlier, and later, but in each of them there are also some small diversities, as shall be presently shewed.

1. *Gramen Leucanthemum majus.* The greater Stichwort.

The greater Stichwort hath sundry round slender stalkes, rising from the roote: scarce able to sustaine themselves, but by the helpe of the hedges or other things that grow neere it, being full of joynts, with two small long hard rough and pointed leaves at each of them, at the toppes whereof stand many small flowers, composed of white leaves, standing like a starre, with some white threads in the middle, the roote runneth or creepeth in the ground all about, with many small fibers thereat. Of this sort there hath beene some varieties observed, partly in the stalkes and leaves being in some higher or greater than others, and in the flowers likewise, being larger or lesser, and in the threads in the middle, some being paler or redder than others.

2. *Gramen Leucanthemum minus.* The lesser Stichwort.

This lesser groweth like unto the form̃er, and differeth onely in being lesser, the leaves shorter and the flowers smaller, whereof each leafe divided as it were into two, maketh it seeme to have

Gramen Leucanthemum.

Varietas.

more

more leaves then the former, the seede of them both is small and somewhat like unto Linseede contained in round buttons.

This also is found to have some diversity both in the stalks growing more upright, or else lying upon the ground, and also in the flowers, some having the white threds in the middle tipt with blacke, that it maketh the whole flower seeme to be blacke or else with pale yellow.

The Place and Time.

The first sort groweth more usually under hedges, and upon dry bankes of ditchēs or the like, and flowreth a moneth earlier then the other, that is in *April*, the other is more common in the fields of *Corn*, and elsewhere in the more open and champion grounds, and flowreth not untill *May* or *June*.

The Names.

Tragus calleth it *Enfrasia gramen*, and *Lonicus* *Enfrasia major*, *Camerarius* *Gramen floridum*, *Mattiholus* *Gramen alterum*, *Fuchsius*, *Dodonæus* and others, *Gramen Lencanthemum*, *Dodonæus* and *Lobel* call it *Holostium Ruelij*, who took it to be the *Holostium* of *Dioscorides*, *Dodonæus* also referreth it to the *Cratægonon* of *Dioscorides*, which he saith was also called *Melampyrum*. *Basbinus* calleth them both *Caryophyllus arvensis*, glaber flore majore & minore, but why he should referre them to the *Caryophyllis* I see little reason, I would thinke they should better agree with the Chickweedes. The *Germanes* call them *Augen trostgras*, and the *Dutch* *Oogben troest gras*, and we in *English* *Stichwort*.

The Vertues.

It is much commended by some to cleere the eyes of dimnesse, or films that beginne to grow over the sight, to drop some of the juice into them. It is no lesse accounted of to helpe stiches in the sides, to drinke the pouther thereof with white wine. Other properties this is said to hold, but they are onely taken from *Dioscorides* his *Holostium*, which whether this be it, is much doubted, and therefore, the properties, whereof one is that *Dioscorides* saith it is sharpe, is not found in this herbe.

CHAP. II.

Melampyrum & Cratægonon. Blacke Wheate, and Cow Wheate.

Hese two names although they seeme to be different, yet are the plants referred unto them, not so much differing one from another, but that I may joyne them both in one Chapter, their varieties to be explained are as followeth.

1. *Cratægonum vulgare.* The common Cow wheate.

This that is most frequent in our Land, hath an hairy square stalk, branched almost from the bot-

1. *Cratægonum vulgare.*
The common Cow Wheate.

2. *Cratægonum flore varia.*
Another partly coloured Cow Wheate.

come, halfe a yard high or more very weake and slender, and sustained by the bushes among which it groweth, having two long and narrow leaves set at each joynt, broadest next to the stalke, and pointed at the end, somewhat rough also on the under side, if it be drawne downewards: the toppes of the stalkes and branches, are set with tufts of leaves and flowers together, which being growne are separated, two flowers onely standing at a joynt with the like leaves set with them, but shorter and smaller, the flowers are long round and hollow, gaping open at the end, and standing looking all one way, of a pale yellow colour, and white together, but grow yellower in time, yet in some of a blewish or purplish colour, either deepe or paler, each standing in a small Greene huske, wherein afterwards grow round cups or vessels, containing brownish feede, not much unlike to wheate: the roote is composed of small threds. I give you here the figure of another sort of this Cow Wheate, which I found among Doctor Lobels papers, without description, and therefore can frame none thereto.

1. *Cratogeomum flore vario.*

Another party coloured Cow Wheate. This other groweth like the former, but the stalk is more reddish, and so are the leaves also, and more finely dented upwards, where the spikes or tufts of flowers are of a reddish or bluish colour, before they spreade open, and then shew the flowers to be yellow, about the mouth or gaping place, and the rest purplish red.

3. *Cratogeomum incognitum.*

4. *Melampyrum.* Blacke Wheate.

Incognitum

5. *Melampyrum perfoliatum luteum.* Small blacke Wheate.

3. *Cratogeomum luteum angustifolium.*

Yellow narrow leaved Cow Wheate.

This differeth little from the former, but that the stalkes being red, the leaves are long and narrow, like unto *Linaria* or Tode-flaxe, without any cut or dent at the edges, the flowers are long gaping and hollow, of a pale yellow colour, standing in a long spike and looking forward.

4. *Melampyrum.*

Blacke Wheate.

This in the forme being so like the rest, sheweth that it is of the same family, for but that it groweth greater in the Corne fields, where it most delighteth, and the leaves be short and narrow,

row, set on the stalkes and branches which are many, and having other smaller leaves coming forth at the joynts likewise, the spiked head of flowers opening not so much, but abiding closer, in some wholly reddish, both above and below, and white in the middle, in others reddish below, and yellow above, or mixed with white yellow, and greene amongst, you may say it is the same, with these onely differences.

5. *Melampyrum perfoliatum luteum*. Small blacke Wheate.

This small plant growing among the corne, in the fieldes of *Provence* in *France*, riseth not above two inches high, with slender small narrow leaves, deeply cut in on the sides, like unto Harts horne, the heads being close, and the flowers yellow, somewhat resembling the forme of *Alopecurus*, the Foxetaile.

6. *Melampyrum lanuginosum*. Woolly blacke Wheate.

This woolly Wheate hath a square hoary or woolly stalke a foote long, branching forth from the roote with two long and narrow woolly leaves set at every joynt, finely dented on the edges, much like unto those of the detented *Cassidy*, on the toppes of the stalkes and branches are set long spiked heads, soft and woolly, with long flowers breaking out of them like the others, but spreading a little broader.

The Place and Time.

The first as I said groweth among bushes and brakes and the like, upon barren heathes, as at *Hampsteede*, neere *London*, and many other places of this Land, but I have not heard that any of the rest have beene found with us, but in *Austria* and *Germany*, the fifth in *France*, and the last in *Spainne*, and doe flower most of the Summer, the seede ripening soone after.

The Names.

Κραταγονν, *Cratogeomum* is remembered by *Dioscorides*, id enim τὸν πόνον κερταῖν δicitur, hoc est, semen robore acere, & quā viribus imbuerē, but *Melampyrum* is not, saying that he saith *Cratogeomum*, hath the like leaves to *Melampyrum* and that *Myagrum* was called also *Melampyrum*, but *Theophrastus* in his eighth Booke and fifth Chapter, mentioneth *Melampyrum* to grow among corne, and which in comparison of *Lolium Darnell*, thar troubleth the braine, he calleth *res innocens*, a harmelesse thing. *Galen* hath it primo alimentorum ultimo, to grow from degenerated Wheate, and some thinke that the *Stelophorus* of *Pliny* lib. 21. c. 17. is it, and as some thinke it is his *Alopecurus* also, but rightly in neither, as it is likely, *Bauhinus* also thinketh it may be *Aera* of *Theophrastus*, which is generally taken to be *Lolium*, but it cannot be his *Aera*, because he nameth them both in one Chapter, and compareth them together: Most men now adayes call it *Triticum vaccinum* or *bovinum*. *Bauhinus* maketh all these to be *Melampyrum*, not allowing any one distinctly to be called *Cratogeomum*, but as others doe to call them, *Clusius* in following an ancient error among the *Germanes*, whereas *Tragus* first as it is likely remembreth it, calleth them *Parietaria sylvestris*, which he saith himselfe he knoweth no reason or cause why it should be so called. The first here is the *Parietaria sylvestris secunda* of *Clusius*, called *Cratogeomum* by *Lobel* and others, *Lugdunensis* hath it both by the name of *Satureia lutea* *Dalechampi* in one place, and by *Hippocris nemorensis lutea* in another. *Tabernaemontanus* calleth it *Milium sylvaticum*, and *Thalius* and *Bauhinus* *Melampyrum*. The second is *Clusius* his third *Parietaria sylvestris*, and called *Triticum vaccinum* by *Tragus*, *Dodonæus* and *Lugdunensis*, and *Melampyrum* by *Camerarius* and others. The third is the last *Melampyrum* of *Thalius* as it is likely, and the *angustifolium*, or *luteum* *Linaria folio* of *Bauhinus*. The fourth is the *Melampyrum* of *Lobel*, and the first *Parietaria sylvestris* of *Clusius*. The fifth is called so by *Lobel* as it is in the title. And the last is called *Parietaria montana Betica* by *Clusius* in his *Cura posteriores*, which *Bauhinus* calleth *Melampyrum lanuginosum* *Beticum*. The French call them *Ble de vache*, and *ble de beuf*, the *Germanes* *Kuweissen*, and *brown ffeisch blumen*, the Dutch *Peeters bloemen*, and wee in *English* Cow wheate, and *Melampyrum*, Blacke wheate generally, some at hours, account them degenerations of wheate and Rye, others take them to be the faults of the Corne when as they are with them as well as with us, no other then weeds, as Cockle, Blew bottles, and Cornrose, which come where they are sowne, as well out of the Corne as in it.

The Vertues.

The Cow Wheates generally in all the places where they grow among Cornē, if they be not weeded out, but suffered untill the Corne is gathered, doe make the bread blacker then that which hath it not as *Tragus* saith, and causeth the like dissignes in the head and eyes that *Darnell* doth, as *Lobel* saith, yet he saith the seede is a great incendiary to Venerie, as *Dioscorides* and *Pliny* speaketh of it before. *Galen* saith that the seede of *Cratogeomum* is sharpe in taste, and is used as Millet is.

CHAP. III.

Eufragia. Eyebright.

Although formerly there hath beene but one sort of Eyebright knowne, yet these later times have found out divers herbes thar for their likeness thereunto they have entialed by the same name with their diversities as shall be shewed together.

1. *Eufragia vulgaris*. Common Eyebright.

The common Eyebright is a small low herbe, rising up usually but with one blackish greene stalke, a spanne high, or not much more, spread from the bottome into sundry branches, whereon are set small and almost round yet pointed darke greene leaves, finely snipped about the edges, two alwayes set together and very thickes at the joynts with the leaves from the middle upwards, come forth small white flowers striped with purple, and yellow spots and stripes, after which follow small round heads with very small seede therein, the roote is long small and threddy at the end, this is found on some hills, to vary in the colour of the flower to be more whitish, yellow, or more purple.

2. *Eufragia minima*. Small Eyebright.

This small Eyebright groweth not much above two inches high, having narrower and smaller leavēs thereon then the former, in all other things not differing from the former.

3. *Eufragia pratensis rubra major*. Great red Woody Eyebright.

This woody wilde kinde riseth up with one woody square brownish stalke divided into sundry branches, a little

1. *Eufragia vulgaris*.
Common Eyebright.

3. *Eufragia pratenfis rubra major*.
Great red woody Eyebright.

5, 6. *Eufragia purpurea latifolia*; & *pratenfis major latifolia*.
The greater purple broad leaved, and yellow Eyebright.

7. *Eufragia leptocaulis radice squamata* Benth. five *Anonyma radice Dentata* C. clusiana. The lesser yellow Eyebright.

XXXXX

little above the ground, that it seemeth a pretty bush, about halfe a yard or two foote high, set with somewhat long and narrow leaves, pointed at the ends, and somewhat ended about the edges, two alwayes set together at a joynt one against another, which will in the heate of Summer turne somewhat reddish: the flowers are gaping and hooded, of colour purplish red, the roote is made of divers hard woody strings.

4. *Eufragia pratensis minor purpurea*. Small red woody Eyebright.

This smaller red Eyebright hath one square reddish hairy stalke, an handfull high, sometimes without branches and usually but with two feldome more branches, compassed with a few thicke, hairy, almost round leaves, two together and deeply cut into parts, the lower leaves which are the lesse but into three parts, the upper into five or sixe: the flowers breake forth, sometimes from betweene the leaves and the stalkes, and sometimes they stand in tufts at the toppes, two standing together hooded and purplish, coming out of long Greene huskes, sometimes the flowers have beene observed to be white, but very feldome: after which come long and cornered white feede in the said huskes, the roote is small woody and blacke.

5. *Eufragia purpurea latifolia*. Broad leaved purple Eyebright.

This is somewhat like the last, but that it hath broader leaves, and the flowers are set by spaces up to the tops, of a finer purplish colour, in other things not much unlike the last.

6. *Eufragia pratensis major lutea*. Great yellow Eyebright.

This great yellow Eyebright hath a square hard reddish stalke neere two foote high, set with fewer joynts, and longer narrower thicke leaves at them by couples, and but smally dented about the edges: at the joynts on both sides come forth branches and at the toppes of them such like hooded flowers, standing thicke or close, two together, bending downewards and looking all one way, of a gallant gold yellow colour, and standing in long Greene huskes having in them white feede like the former: the roote is stender and woody, the whole plant is bitter and harsh on the tongue and astringent.

7. *Eufragia lutea minor radice squammata*. The lesser yellow Eyebright.

This lesser sort hath a smooth hollow stalke a foote high or lesse, set with branches and leaves by couples on them, which are like unto the *Germander*, or Ivy leaved *Chickweede* but longer pointed, the flowers are yellow, but like unto those of the common Eyebright, the feede is small blacke and round, and pointed at the ends, standing two together on a small footestalke: the roote is white and round like a bulbe, composed of foure thicke coates or scales lying close together, the whole plant is without taste, and somewhat resembleth *Fumitory*, but *Columna* saith that the rootes are like the *Dentaria major* of *Mathiolus*, as the figure expresseth it.

The Place and Time.

The first and third are onely frequent in our Land, the former in many Meddowes and grassie places throughout our Country, and the other in many places of *Kent*, in the barren fields and waste grounds, both about *Gravesend*, and the tracts thereabouts, and in many other places, the rest some in *Italy*, and at *Naples*, or in *Spaine* and *Austria*, they all for the most part flower not untill the end of Summer, the feede ripening within a while after.

The Names.

It is called *Eufragia* and *Eufrasia*, and by some onely thought to be anciently called *Euphrasia*, (yet is *Euphrosyne* not knowne, nor described by any of the former Greeke or Latine writers,) for it is of later invention, and for the effects called *Ophthalmica* and *Ocularia*. The first is generally called *Eufresia* and *Eufragia*, or *Euphrasia* by all Writers. The second is called by *Columna* *Eufragia limfolia*, although the leaves be farre lesse then those of *Line* or *Flax*: the third is the *Eufragia altera* of *Dodonaeus*, *Lobel*, and others, the *Sideritis pratensis rubra* of *Lugdunensis*, the *Odontites* of *Tabernmontanus*, the *Ericoides rubrum* of *Thalium*, and the *Cratogeomom Euphrosyne* of *Gerard*, who would needs make it a kinde of *Cratogeomom*, against the saying of *Dodonaeus*, from whom he hath the most that he hath, saying it cannot agree with *Cratogeomom*, by the defect in many parts, and yet his Corrector doth so let it passe. The fourth *Baubinus* called in his *Phytopynax*, *Brunella Italica*, but in his *Pinax Euphrasia pratensis Italica latifolia*, and in his *Prodromus Eufrasia purpurea minor*, and is the third *Eufrasia non scripta* of *Columna*. The fifth is the *Eufragia major sylvestris purpurea latifolia* of *Columna*. The sixth is the *Sideritis pratensis lutea* of *Lugdunensis*, *Ericoides luteum* of *Thalium*, *Odontites flore luteo* of *Tabernmontanus*, and the *Eufragia sylvestris major lutea angustifolia* of *Columna*. The last *Columna* calleth *Anonyma radice Dentariae*, and *Baubinus* *Euphrasia lutea Alsinifolia radice squammata*. The *Italians* and *Spaniards* call it *Eufrasia*, the *French* *Eufrase*, the *Germanes* *Augencroft*, the *Dutch* *Ooghentrooft*, and we Eyebright.

The Vertues.

The bitter taste that is herein sheweth it to be hot and dry, and is especially used for all the diseases of the eyes, that cause dimnesse of the sight, for either the Greene herbe or the dry, the juice or the distilled water is very effectually for the said purpose, to be taken either inwardly in wine or in broth, or to be dropped into the eyes, and used for divers dayes together: Some also make a conserve of the flower to the same effect. Any of these wayes used, it helpeth also a weake braine or memory, and restoreth them being decayed in a short time. *Arnoldus de Villa nova*, in his booke of wines, much commendeth the Wine made of Eyebright, put into it when it is new made, and before it worke (which because we cannot make in our land, I could wish that the Eyebright might be tuned up with our strong Beere in the same manner, which no doubt would worke the like effects, their Wine and our Beere having a like working, as we use with Wormewood, Scurvigraffe and the like) to helpe the dimnesse of the sight, and saith that the use thereof restored old mens sight, to read small Letters without spectacles, that could hardly read great ones with their spectacles before: as also did restore their sight that were blinde for a long time before. If this drinke be not to be made or had, the poulder of the dried herbe either mixed with Sugar, a few Maces and Fennell feede, and drunke or eaten in broth, or the said poulders made into an Electuary with Sugar, doth either way tend to the same effect.

CHAP. IV.

Speculum Veneris five *Viola pentagona*. The Corne Violet.

WE have in our Corne fields in this Land, two sorts of Corne Violets a greater and a lesse which shall be shewed to you in this Chapter.

1. *Speculum Veneris majus*. The greater Corne Violet.

The greater of these Violets hath sundry slender weake trayling stalkes, lying on the ground, and rising from the roote, divided and subdivided from every joynt into branches so plentifully, that one plant growing in a good Garden ground, will be hardly covered with a pecke measure, thicke set without order, with small and somewhat long leaves, slightly dented or rather waved on the edges, at every leafe from the middle upward, cometh forth a flower, of the bignesse of a two pence, so (that five hundred flowers almost, will be seene open at once, a goodly spectacle) set in a fine pointed Greene huske, of a faire purplish blew colour, made of one whole leafe, plaited into five round pointed ends, white at the bottome, with a white pointell in the middle, closing up every night, and opening in the day onely, the seed is yellow, and contained in small long heads, the roote is small threddy, and annuall.

2. *Speculum Veneris minus*. The lesser Corne Violet.

The lesser sort groweth more upright like unto the little Centory, with stiffer and fewer branches, more harsh or rough also in handling, the leaves are like unto the former but somewhat lesse, at each joynt almost come forth two or three flowers, standing at the ends of long eods like unto *Lysimachia siliquosa*, of the same fashion and colour as the former, but so small as the eye of a little bird, never rising above the huske it standeth in, and not but in the heate of the day to be seene, which then onely layeth it selfe open, the feede is small and yellow as the former, the roote is small and annuall also.

The Place and Time.

The first groweth in the Corne fields, betweene *Greenehithe* and *Dartford* in *Kent*, as also in the Corne fields about *Lilly*, a towne in the uttermost part of *Hartfordshire*, towards *Bedford*, the other about *Hartsfield*, and in sundry other places in this land, being more frequent by mach, and flower from Midsummer untill the end of *August* almost, the feede ripening in the meane time.

The Names.

We have not understood as yet by any that the lesser sort hath beene observed by any Authour beyond sea but onely the former, which is called *Onobrychis* and *Campanula arvensis* by *Dodoneus* and *Lugdunensis*, and *Onobrychis altera Belgarum* by *Label*, *Viola anonymos inodora* by *Gesner*, and *Viola arvensis*, and *Viola Pentagonia* by *Tabernaemontanus*, but *Speculum Veneris* by *Gerard*, from the *Dutches Vrouwen Spiegel*, which is *Venus* looking Glasse in *Englishe*.

1. *Speculum Veneris majus*.
The greater Corne Violet.

2. *Speculum Veneris minus*.
The lesser Corne Violet.

but because it usually groweth in Corne fields, and that some have called it a Violet, I have thought it fittest to terme it a Corne Violet, which if any list to alter they may at their pleasure.

The Vertues.

We have not understood that any hath made triall what vertues it is endued withall, and therefore I can say no more thereof.

CHAP. V.

Polygala. Milkewort.

F this Milkewort besides that therè is a greater and a lesser kinde, and each of much variety in the colour of the flowers, there are some other plants somewhat resembling them, which must be entreated of together.

1. *Polygala major.* The greater Milkewort.

This greater kinde shooteth from the roote five or sixe hard, slender, and flexible stalkes, a foote high or more, thicke set with somewhat long and narrow leaves like those of Diers weede: the flowers grow at the toppes in a long spike thicke together, somewhat like to those of Fumiterrey, but larger and of a fine delayed reddish purple colour and shining withall, after which follow flat pouches, with two feedes in them usually, which are long blackish and hairy: the roote is hard and woody, with divers fibres thereat, and abideth long. This hath bene found to vary, the colour of the flower, especially in shadowy and moist places, to be either blew or white, or mixed as the smaller kinde is.

2. *Polygala minor.* The lesser Milkewort.

The lesser kinde groweth in all things like the former, but with lower and slenderer stalkes, yet somewhat hard or woody, not so many rising from a roote and with fewer and smaller leaves on them: the flowers also are alike but smaller and vary as much or rather more in their colour, some being of a blewish purple, others purple and white, some all white, other reddish or of a wan colour, or overworne red, &c. There is also another sort hereof whose lower leaves that spread on the ground are many, and rounder then in any of the former, but those that grow on the stalkes are long like the rest, the flowers whereof are onely blew, without mixture or variation.

3. *Polygala Monspeliana.* Milkewort of Mompelie.

This French Milkewort hath upright stalkes a foote high, many rising from a small long white roote, with sundry longer and narrower leaves on them set without order: the flowers grow one above another, in longer spikes then in the other smaller, and not fully like the other, but of a reddish colour, the feede that followeth is small contained in long cornered huskes.

1. *Polygala major.*
The greater Milkewort.

2. *Polygala minor.*
The lesser Milkewort.

4. *Polygala repens*. Creeping Milkewort.

This small Milkewort hath a number of stalkes, full of branches lying and spreading on the ground, not above a span long, yet thicke by couples with very small leaves like *Herniaria* Rupture wort: the flowers are of a whitish colour, standing among the leaves at the toppes in wharles compassing the stalkes one above another.

5. *Polygale affinis*. Bastard Milkewort.

This small plant spreadeth many weak slender round stalks upon the ground a fpanne long or more, set with sundry small leaves without order, in fashion somewhat like unto Mirtle leaves, but not so much pointed, the flowers are very beautifully, standing in a small spike one above another, with leaves amongst them, consist of fixe leaves of a fine bright shining purple colour, the feede is small, contained in small huskes: the roote is made of small long and white fibres.

The Place and Time.

The first kinde groweth not in our Country that I can heare of, but in *Austria, Germany* and the parts therabouts, found out by *Clusius*. The second is frequent with us, as well in barren and untilld places, heathes and the like, as in fertile and pasture grounds, yet there it will be more fresh and large. The third about *Asompeliet*, and so doth the fourth and last, and in other places in *France* not farre off. They all flower in the beginning or middle of May, and continue flowering a moneth, and perfect their seede presently after.

The Names.

The name *Polygala* or *Polygonum* as *Tragus* doth call it, is imposed on these plants, upon supposal that they are the *Polygala* of *Dioscorides*, but they doe but resemble it, and are not the same, and therefore *Lobel* calleth it *Polygala rectorium*, as not judging it to be right, which *Gesner* also before him perceived by the bitter taste it hath, and therefore called it *Amarella*, yet according to the *German* vulgar name, he called it also *Cruis flor.* *Dodonæus*, *Clusius*, *Lobel*, and sundry others following the current known name, call it *Polygala*, as not knowing a fitter to call it by, yet *Angulara* seemeth to call it *Thesion*, and *Dodonæus* *Flos Amberisii*. *Clusius* calleth the first *Polygala vulgaris major*, and the second *minor*, although it be set amisse, *major* for *minor*. The third *Bauhinus* referreth to the *Onobrychis tertia purpurea* of *Lugdunensis*, and calleth it himselfe *Polygala acutioribus folijs Monspeliaca*. The fourth is generally called *Polygalarepens* by *Lobel*, and all others that have written of it: The last is the *Chamæmyrsine quorundam* of *Lugdunensis*, which *Bauhinus* calleth *Polygala affinis* as I doe. *Bauhinus* numb'reth up among these *Polygala's*, one with a yellow flower, which he referreth to a plant that *Angulara* found, and was like unto a *lentil*, but had thicker and fuller leaves, a yellow flower and seeds in pods, which I have referred rather to the *Scorpioides leguminosa*, as I have there shewed. The *Italians* call it *Poligala*, the French *L'herbe ancroix*, the *Germanes* *kreutz blumlin*, and *Ramsel*, the Dutch *Cruys bloemen*, and we in *English* *Gang-flower*, *Crosse-flower*, or *Milke-wort*.

The Vertues.

The verities.
Gefner as I shewed you before, by reason of the bitternesse of this herbe, having called it *Annella*, faith that he found it to purge choller, having made the tryall of it on himselfe, by sleeping a handfull thereof all night in wine, and drinking it in the morning, and therefore is not likely to encrease milke in womens breasts, neither bitter nor purgings thing working any such effect that we have known, and therefore cannot be the *Polygala* of *Dioscorides*, which worketh not that effect: other certainty hercof we have not yet learned, and therefore we forbear to set downe ghessees or falsities.

CHAP. VI.

Antirrhinum sylvestre medium. The greater wild Snapdragon.

THē wijlde Snapdragon is of two sorts, one greater then another, the greater whereof riseth up usually but with one stalk, branching forth on all sides into some other, wheron are set long and somewhat narrow thicke darke greene leaves, by couples : at the toppes of the stalkes and branches stand in severall places reddish purple gaping flowers, in shape like those of the garden or manured kinde, but farte lesse and without any white colour therein, after which come such like heads, like calves houtes, as in the other, but not halfe so bigge, wherein is contained very small blackish browne feede : the roote is small and perishing, every yeare regaining it selfe from the shed feede. We have had another of this sort brought us out of *Spain*, by *Toel*, often remembered before, whose flower was much more beautiful, being of a bright crimson colour, the mouth or chappes being of a yellowish white, much like some of the garden kindes, but more lively for colour. As also another with milke white flowers, which spreadeth abroad a little more then the former. The lesser sort groweth lower by the one halfe, yett bushing thicker with branches, having long narrow leaves not halfe so great, and the flowers very small also and whitish, the feede is

Antirrhinum sylvestre minus.
The least Snapdragon.

*Saxatile
R. subit.*

small and blacker then the former, and the roote perissheth alike and is so also raised againe, *Bauhinia* hath another of this sort with red flowers, whose leaves he saith are like *Serpikium*, Mother of Time.

The Place and Time.

These grow wilde in *Spaine, Italy, France*, and other places, but we have them onely in Gardens, where they that once sow them, shall lightly have them continually, if they will suffer them to shed their feede being ripe, and are in flower from *July* unto the end of *August*.

The Names.

They are called *Antirrhinum sylvestre*, and *arvense majus*, and *medium & minus*, or *minimum* by all our moderne Writers, yet some call them *Orontium* or *Aurantium*, and *Olerius*: *Honorius Bellus* in his second Epistle to *Clusius*, calleth it *Phyteuma*, and saith that in *Candy* the people call it *χακκονα*.

The Vertues.

There is as little use of these wilde kinds in Physicke, as of the garden kinds in our dayes, although *Matthiolus* saith that the leaves, flowers, and feede are good for the rising of the mother, to be mixed with Rose water and honey, and that the herb doth caule the Scorpion presently to lose the force of his poyson, as soone as he seeth it, and that the herbe applyed to the forehead taketh away the pin and web in the eyes.

CHAP. VII.

Linum sativum & sylvestre. Manured and wilde Flaxe.

Aving divers sorts of wilde Flaxe to shew you in this Chapter, I thought it fit to prevent them with the manured kinde, and rather speake thereof together, then distinctly in a Chapter by it selfe.

1. *Linum sativum*. Manured Flaxe.

The manured Flaxe hath a slender round pliant stalke three foote high, beset with narrow long and soft leaves without order, branched at the toppes into three or foure small branches, each of them bearing two or three faire blew flowers, made of five round pointed leaves apeece, with some threds in the middle, after which come round buttons pointed above, wherein is contained flat shining smooth browne feede: the roote is small and threddy, perishing every yeare.

2. *Linum sylvestre vulgatum*. The more common wilde Flaxe.

This wilde Flaxe groweth like the former, but hath greater and higher stalkes, more branched at the toppes, and more store of blew flowers on them, the feede also is like the former, but the feede vessels will hold the feede therein, and not breake open with the heate of the Sunne, when it is ripe, as the manured kinde will doe, which must be presently gathered and kept.

3. *Linum*

1. *Linum catharticum* fructu vulgare.
Manured Flaxe.

2. *Linum sylvestre latifolium caeruleum*.
Broad leaved blew wilde Flaxe.

3. *Linum sylvestre latifolium caeruleum*.
Broad leaved blew wilde Flaxe.

This wilde Flaxe riseth up sometimes but with one stalke, and often with more, a foote or sometimes more high, which are stiffe, thicke, and hairy, set with greater and broader hairy leaves, then in any of the other sorts, the stalkes branch forth towards the toppes, bearing smaller leaves then those below, and larger flowers, even as great as Mallowes, of a deeper or paler blew colour, the heads containing the feede are set in the greene huskes, that held the flowers, which open being ripe, shewing a blacke flat shining feede like the rest, the roote is great and liveth after feede time, shooting new stalkes with woolly leaves on them, and to abide all the Winter: this groweth in Hungary and Austria.

Of this sort there was observed by Clusius in Spaine, one with large broad woolly leaves like it, but the flowers were white with purple veines in the leaves.

4. *Linum sylvestre latifolium luteum*.
Broad leaved yellow flowered Flaxe.

The divers stalkes of this Flaxe are round browne, and stiffe, with large leaves on them, and not hairy but hard: the flowers are many that stand at the toppes of the stalkes, and large, of a faire shining yellow colour, with some threads in the middle, the feede vessels are flatter, and the feede blacker then the other, and not shining like them: the roote is thicke and crooked, with fibres thereat and perisheth not but abideth many yeares.

Bauhinius maketh mention of one with broad leaves, whose stalke is glutinous or clammy, and the flower of a red colour which grew on the hills by Bononia, and about Ingolstadt in Germany.

5. *Linum sylvestre angustifolium caeruleum vel albo flore magno*. Narrow leaved wilde Flaxe, with either white or blew flowers.

This Flaxe hath sandy stalkes, of a foote high, and ma-

ny

7. *Linum sylvestre angustifolium luteum.*
Narrow leaved wilde Flaxe with yellow flowers.

10. *Chamelinum Clusij flore albo* five *Linum sylvestre Catharticum.* Dwarfie wilde Flaxe with white flowers, or Mill mountaine.

ny narrow long leaves on them, the flowers are very large, and are either of a pale blew, tending to an ash colour, or else white, each leaf having a purple line running through the middle, in the rest there is little difference from the former wilde sorts, the roote abiding.

6. *Linum sylvestre angustifolium flore minore.* Narrow leaved wilde Flaxe with small flowers.
The stalkes hereof are many round and stiffe, a foote long, having many narrow short leaves thereon, of a blewish Greene colour: the flowers are blew and no bigger then those of the manured Flaxe, the heads, seede, and rootes are like the rest.

7. *Linum sylvestre angustifolium luteum.* Narrow leaved wilde Flaxe with yellow flowers.
This yellow wilde Flaxe hath sundry stalkes halfe a yard high, with few leaves set on them like unto the manured Flaxe, the flowers are smaller then it, but of colour yellow.

8. *Linum fruticosum semper virens.* Everliving wilde Flaxe.
This Flaxe hath divers woody stalkes of a foote high, with a number of leaves thereon, somewhat short and narrow, of a whitish Greene colour, and abiding in the Winter on the stalkes, not falling off as the rest doe, the flowers are wholly white, and a little larger then the last, standing at the toppes of the stalkes like others.

9. *Linum arboreum Creticum luteum.* The yellow shrubbe Flaxe of Candy.
This groweth like a small shrub, covered with a blackish barke, with long leaves, thicke set on the branches, somewhat like unto those of Flaxe but larger, comming neereft unto large Myrtle leaves, the flowers are yellow and very bitter in taste: the seede vessels are as bigge as Ciche pease, containing foure seedes within them very like unto Flaxe seede.

10. *Chamelinum Clusij flore albo*, five *Linum sylvestre Catharticum.*
Dwarfie wilde Flaxe with white flowers, or Mill mountaine.
This Dwarfie Flaxe hath many slender stalkes, of about a spanne and a halfe long, with divers small long leaves set by couples on them, and white flowers at the toppes of the branches, lesser then those of the manured, with yellow threds in the middle, the seede is small that followeth in the small round heads: the roote is small also and threddey.

Flor. luteo Lobel setteth forth another small one, not rising above foure or five inches high, with small leaves and yellow flowers.

11. *Chamelinum stellatum.* Dwarfie wilde Flaxe with starre like flowers.
This whole plant is scarce three inches high, having but one or two very small stalkes at the most, and as small leaves ending in a very sharpe point, the flowers are few and small, made of five narrow pale Greene leaves, pointed at the ends, and standing forth in that manner that every flower resembleth a starre, with a round umbone in the middle.

The Place and Time.

Some of these as is before said, grow in Spaine, some in France or Germany, and some in our owne Land also: they all are in flower for the most part from Midsummer untill August, and some abide longer, the seede ripening in the meane time.

The Names.

Linum in Latine, and *λίανον* in Greeke, signifieth as well the herbe as it groweth, as the same prepared to be spun, and when it is made into cloath also. The first is called by all Authours *Linum sativum*, and the second *Linum sylvestre* by *Tragus*, who saith it is sowne in the fields of Germany in sundry places, because it yeeldeth more store of Flaxe, and yet is found naturally growing among Oates. The third is *Clusius* his first *Linum sylvestre latifolium*. The fourth is the third *Linum sylvestre* of *Clusius*. The fifth is *Clusius* his second *Linum angustifolium* which *Lobel* and others call *Linum sylvestre floribus albis*. The sixth is *Clusius* his *angustifolium primum*, which *Lobel* and others call *tennifolium*. The seventh is the *Linum sylvestre* of *Martius*, *Dodonæus*, *Camerarius* and others, the *Linum maritimum* of *Lobel*, and may be the first *Linum fruticosum subflavum* of *Bauhinus* in *Prodrome*, and the *Linum luteum sylvestre latifolium* of *Colonna*, for they differ little. The eighth is the *Linum sylvestre fruticosum* of *Clusius*. The ninth is the *Linum arboreum* of *Alpinus* in his booke de plantis *Exoticis*. The tenth is the *Chamalinum* of *Clusius*, which is called Mill mountaine in many parts of this Land, by the Country people where it groweth. The last is called *Linum minimum stellatum* by *Bauhinus*, who saith it is also called by some *Passerina minor saxatilis*. The Arabians call it *Baxari-chichen* or *Bezerchetan*, which is the seede thereof onely, the Italians *Lino*, the French *Lin*, the Germans *Flachs*, the Dutch *Ulas*, and we Flaxe, and Line.

The Vertues.

There is neither leafe, flower, nor roote of Flaxe used in any medicine with us, that I know, neyther Greene nor dried, neither the juice, distilled water, or any other composition made thereof, but onely the seede, and that more in outward then inward Physicke in these dayes, although in former times as *Galen* sheweth, that some used the seede parched for their food, taken with honey, and some used to put it into their bread, but saith he *primo alimentorum*, it troubleth the stomacke, hardly digesteth, and giveth little nourishment to the body: but concerning the moving of the belly downwards, saith he, I will neither praise nor dispraise it, yet it hath a small property to provoke urine, which it doth best being parched, thus saith *Galen* of the manured kinde, but the wilde kinds that are more bitter have another property: The seede of Line made into pouther, mixed with honey and some pepper into an electuary, and there of the quantity of a Nutmeg taken every day, doth helpe the cough: some say, the seede also boyled in water, and some honey put unto it and drunke, is said also to ease the paines of the body, as the collicke, and stitches, and all inflammations; if it be outwardly used also, with Fenugrecke and Linseed, and some Mallows, a pultis being made thereof is of good use to mollify and disperse any tumour or hardnes in any part of the body, or of the mother by sitting in the warme decoction of the seede, or to receive the hot fumes through a teate for the purpose: being taken with Raisins saith *Pliny*, it helpeth the obstructions of the Liver: the seede mixed with niter or salt, and figge tree ashes, easeth the paines and hardnes of the muscles, sinewes and arteries, and used with figges, it ripeneth and digesteth, mixed with the wild Cowcumber roote, it draweth forth splinters, thornes, nailes or any other thing sticking in the flesh, and broken bones also: the decoction thereof made in wine and applied to any fretting or running sore, stayeth it from spreading further: used with as much Cresses, it taketh away the ruggednesse of the nailes, and with Myrthe, and Rosin, it helpeth ruptures, and the swellings of the cods: used with *Olibanum* and water, or Myrthe and wine, it helpeth watering eyes, and mixed up with hony or suet, or waxe and applied, it helpeth the hard kernels and swellings under the eares or throate, it taketh away also the spots and blemishes of the skin, Sunburning and other discolourings. The oyle of Linseede (besides that it is of much use for Painters to fasten their colours, either on cloth, wood, stone, iron, or glasse, and to burne in lamps abiding longer then the Oyle of Olives, although it giveth much more smoake and soote) is of exceeding good use, to mollifie the hardnes and shrinking of the sinewes, helpeth the hemorrhoides or piles, the rifts and chaps of the fundament, and the hardnesse and paines thereof, and of the mother; being beaten with Red-rose water it is good against burnings. The wilde Flaxe is of the like use in most things, and the more effectually, by reason of the bitternesse in many others: the decoction thereof with the flowers doth resolve tumours, and lenifie inflammations, the arteries also when they grow hard and stiffe, and the swellings and sores in the groine: of Mill mountaine some triall hath bene made among the people, to move the body to the stoole.

CHAP. VIII.

Caryophylli sylvestres minores. Small wilde Pinckes.

Having shewed you so many Gilloflowers, Pinckes, sweete *Williams* and *Johns*, of beaurty in my former Booke, let me also here shew the rest of that family, which are not of that respect, and doe rather delight in their owne naturall, then in any other foraine habitation, and they are of three sorts, growing either in the fields, on the mountaines, or among the rockes and stones: of these severally in their order.

Caryophylli arvenses. *Primus Ordo.* The first Rancke of wilde Pinckes of the Fields.

1. *Caryophyllus prolifer.* Childing Pinckes.

This wilde Pincke is but annuall, that is perishing after seede time, having a few pale Greene grassie short blunt leaves lying on the ground for the first yeare, and are the next yeare carryed up with the stalkes, divided into some branches, and set by couples at the joynts, having a short thicke grayish Greene huske at the toppes, out of which start out by degrees one after another, seven or eight small faint red flowers, smaller then the smallest Garden Pincke by much, which scarce shew themselves above the brimme of the huske: more flowers then one as I said, appeare not at a time out of the huske, or very seldome two, whereby they are long in flowering, in the outer huske

1. *Caryophyllus prolifer*.
Childing Pincke. 3. *Caryophyllus aconitifolius glaber minimus*.
The smallest white wilde French Pincke. 4. *Caryophyllus caruleus* Montpelienfis.
The blew Pincke of Montpelier. 6. *Caryophyllus aconitifolius umbellatus*.
Wilde Pinckes in tufts.

huske is found after they have done flowering, so many severall small long huskes as there did flowers shew forth, each containing within them small blackish seed, the roote is small white and hard, perishing every yeare, and raising it selfe by its owne sowing, or else must be sowne in the Spring.

After usio
note.

Of this sort there is one that hath but one flower rising out of the huske, and of a paler reddish colour then the former.

2. *Caryophyllus pratensis noster major*.

Our greater wild field Pincke.

Wee have in many places of our Land growing wild a small kinde of Pincke, as I may so call it, and especially by Depsford and Rederiffe, which spreadeth much oftentimes, and rooting by the branches as it

groweth

groweth with small short greene leaves next the ground, and by couples on the stalkes, with small reddish Pincke-like flowers on the toppes. Of this sort also there is a lesser, growing among the thicke grasse in our medowes about London, namely towards Totnam Court, whose roote is so small and threddy, that it will not abide transplanting, having very slender stalkes, and smaller, shorter, and greener leaves set thereon then in the former, the flowers also are smaller, and of a cleare red shining colour sometimes, but one of a stalk, and sometimes more especially under hedges and bushes that may defend it by the shadow. Of neither of both these have I any true figure, to exhibite here and I am loath to insert Master Johnsons figure, because it doth not truly expresse it, as also that it is Lobels figure of a small *Armeria*, which hath leaves among the flowers, which these have not.

3. *Caryophyllus arvensis glaber minimus*.

The smallest white wild French Pinckes.

So a few what like unto the former two sorts is this small one also whose rootes are small, thred like and reddish, the stalkes are slender, small and joynted about a foot or lesse high, having small long narrow greene leaves, set singly thereat, and spreading at the toppes, into many threddey branches, full of very small white flowers, consisting but of two leaves like threds.

4. *Caryophyllus carneus Monspelienisum*.

The blew Pincke of Mompelien.

The leaves of this Pincke that are next the ground, are so fine and small like Rushes that they will be withered almost as soone as they be gathered, but of a whitish greene colour from whence rise sundry slender smooth joyntlesse rushy stalkes halfe a foote high, bearing every one a flower at the toppes, out of a small huske, consisting of five blew round pointed leaves, finely dented about the edges, but no bigger then those of the ordinary wilde Centory, the whole plant tasteth somewhat hot and bitter.

5. *Caryophyllus arvensis holostius hirsutus*.

Wilde hairy Sea Pinckes.

This Pincke groweth very like a garden Pincke, but of a grayish or hoary greene colour, and somewhat hairy withall, the flowers grow not like Pinckes in long huskes, but more like unto a small wilde Campion, of a reddish colour tending to murrey, and give smaller seede unlike to Pinckes, the roote abideth.

6. *Caryophyllus arvensis umbellatus*. Wilde Pinckes in tufts.

This wilde Pincke also doth much resemble a wilde Campion, having short broad leaves, somewhat like unto Lobel his Catchflye, but of an hoary greene colour, the stalkes have the like leaves by couples on them, and at the toppes divers small flowers, rising altogether from one joynt, and each standing on a short foote stalk, composing thereby a kinde of umbell, and are some of a reddish, and others of a whitish colour. I give you here Gerard his figure thereof, more to please others then my selfe.

7. *Caryophyllus holostius tomentosus*. Hoary Pinckes.

From a small creeping roote riseth sundry slender round joynted stalkes lying on the ground and dividing themselves into many branches a foote or two long or more, whereon are set leaves by couples, some of them broad and long, and others more round, yet all of them hoary white, like unto the leaves of the *Gnaphalium americanum* called white Live long, or Life everlasting, bearing white flowers of five leaves a peece round pointed, this abideth long, and spreadeth much upon the ground.

8. *Caryophyllus angustifolius tomentosus*. Hoary narrow leaved Pinckes.

This small low Pincke that scarce riseth with the stalkes an hand breadth high, which are woolly, branching into two or three parts, hath very narrow long and woolly greene leaves on them, one being longer then another, each of the stalkes bearing a white flower, made of five leaves, standing in a greene huske.

9. *Caryophyllus pumilus latifolius*. The low broad leaved Pincke.

This small Pincke hath a short low stalk rising from the roote, presently dividing it selfe into two branches, of halfe a foote high, whose lower leaves next the ground are somewhat broad and short, but a little longer on the branches, being soft and of a pale greene colour, set by couples at the joynts: each of the branches bearing but one small pale purplish white flower rising out of a small short huske.

The Place and Time.

Some of these as I said grow in our owne Land, some in Germany, France, and Spaine, some also flower ea lier then others.

The Names.

Lobel and Camerarius call the first *Armeria prolifera*, and *Thalium Caryophyllae sylvestris quartum*. The second of both sorts have their titles as best becometh them, Gerard mentioning the first and my selfe the other. The third is so called by Bauhinus as the title beareth. The fourth is called by Lobel *Aphyllanthes Monspelienisum*, and by Tabernmontanus and Bauhinus, *Caryophyllus carneus Monspelienisum*. Lobel calleth the fifth *Caryophyllus holostius*, and Tabernmontanus both it and the six *Holostium Caryophyllum*. The seventh is usually called with us *Caryophyllus Holostius*, and *Holostium* simply, Bauhinus as I take it, meaneth this which he calleth *Caryophyllus holostius tomentosus latifolius*, and said he had not seene the flowers: And the eighth also *Caryophyllus holostius tomentosus angustifolius*.

7. *Caryophyllus holostius tomentosus*.
Hoary Pinckes.

angustifolium. The last he also calleth as is in the title, I have *Englisht* them all Pinckes, not knowing how better to entitle them.

Caryophylli Alpini, *Secundus Ordo*. The second Ranke of Mountaine wilde Pinckes.

1. *Caryophyllus Alpinus latifolius*. Mountaine broad leaved Pinckes.

This hath a small white fibrous creeping roote, and from thence rise some bending hairy stalkes, three or foure inches long, with two small broad and somewhat round pointed hairy thicke leaves, at each joynt, and from thence upwards come forth small footestalkes, bearing each of them a large white flower of five leaves, standing in a Greene huske, whereon after wards standeth a long huske with feede therein.

2. *Caryophyllus Alpinus angustifolius purpurascens*. Narrow leaved mountaine wilde Pinckes.

The roote of this is creeping like the last, and the stalke being somewhat hairy is three inches long, with paires of small long leaves thereon, pointed at the ends, with two or three purplish flowers at the toppes, laid open like a flaire and the Greene leaves of the huske, set betweene them.

3. *Caryophyllus Alpinus gramineus*. Mountaine Pincke with Grasse like leaves. The leaves of this sort are very narrow, and about an inch long, of a darke Greene colour like unto grasse, set by couples on the stalkes, as in others, which are a little hairy, the flowers are white made of five leaves, standing in small Greene huske, out of which rise small heads, with small feede in them: the roote is small and white.

4. *Caryophyllus montanus angustifolius albus*. White mountaine narrow leaved Pinckes.

The stalke of this Pincke is small and reddish, three or foure inches long, having long and narrow smooth leaves thereon, and smaller white flowers at the toppe then those of the first, here in this Ranke or Order mentioned.

5. *Caryophyllus montanus Clusij*. Clusius his mountaine Pincke.

6. *Caryophyllus minimus muscosus nostras*. Our smallest Moss like Pincke.

5. *Caryophyllus montanus Clusij*. Clusius his Mountaine Pincke.

The leaves of this pincke, are sappy thicke and short, somewhat like to those of Thrift growing thick together: from among whom rise sundry slender footestalkes, rather then stalkes, about an inch high, yet having joynts and leaves set by couples thereat, on the toppes whereof stand the flowers, each for the most part by it selfe, whose huskes are large and hollow, greater also then becometh the smallnesse of the plant, and of a purplish Greene colour, ending in five poynts, out of which start small pale reddish flowers of five leaves apeece.

6. *Caryophyllus minimus muscosus nostras*. Our smallest Moss like Pincke.

This small plant seemeth more like unto a Mosse, but that it hath some thredlike stalkes about two or three inches high, branching forth diversly, thicke set together and without order, with small short grasse Greene leaves, that are very narrow, and more like hairens then leaves, seldome exceeding halfe an inch in length, whereof although the most be plaine, yet some also will be parted on the side and forked like hornes at the ends, at the toppes of the branches stand divers very small and scarce to be discerned, greenish white flowers, which urne into small rods with feede in them as small as dust: this spreadeth into many small tufts, rooting afresh as it groweth, but dyeth after feede time, and springing from the feede that sheddeth and abiding in the Winter, with such a tuft of small Greene haire like leaves as Rand by the sides of it, untill that it encreaseth and groweth bigger, as the whole plant is expressed.

The Place and Time.

All these grow on hills and mountaines for the most part, the first and third in Germany and Austria, the second in Spaine, the fourth in France about Mompelie, the last no where but in mine owne Garden that ever I could know, and doe flower in July, giving feede quickly after.

The

The Names.

All these are lately found out, the foure first whereof are recorded by *Bauhinus* in his *Pinax* and *Prodromus*, by the same names they hold here in their titles, but that he addeth *Holostium* unto them. The last is as is said, not mentioned by any before that I know.

Caryophylli saxatiles, tertius ordo. Rocke Pinckes, the third Ranke.

1. *Caryophyllus saxatilis Erica folius umbellatis corymbis.* Rocke Pinckes with heath like leaues.

This Rocke Pincke from a slender crooked and woody roote, sendeth forth diuers brownish joynted stalkes, halfe ones hand high; having diuers short and narrow leaves at their bottomes like unto Heath, and at the joynts two very short and hard leaues: the toppes of the stalkes are furnished with tufts of white flowers, made together like unto an umbell.

2. *Caryophyllus saxatilis Erica folius ramosus repens aut et similia.*

White or purple Mosse Pinckes, or one somewhat like it.

This kinde of Pincke groweth like Mosse on the ground, and doth somewhat resemble the *Ocinoides Muscosus*, or *Muscus floridus*, set forth in the 78. Chapter of the fifth Classis of this Worke, but yet is not the same: it hath sundry small hard branches rising from a woody roote, divided into many other lesser encompassed with small Heathlike leaues, and with a number of large snow white or purple flowers standing at their toppes.

3. *Caryophyllus saxatilis stylosus.* Codded Rocke Pinckes.

This living or ever Greene plant is here thrust in the end of a Chapter, which I thinke did never please his founder to be so placed, I am sure it doth not me, but seeing it hath taken the like place before, let me also for this time not disfranke it: but describe it to shoote forth many leaves next the roote, somewhat like unto Daisie leaves, but much lesse, of a whitish Greene colour, and set upon long footestalkes, among which rise the slender smooth stalkes a spanne long, divided into many long branches, set with a few long and narrow leaves and small white flowers of foure leaues apeece at the toppes, which are followed by very slender, and narrow long pods containing very small reddish seed: the roote continueth and holdeth the lower Greene leaves all the winter.

The Place and Time.

These grow in the rocky grounds on hills, the first in *France*, the second in *Spain*, on the *Pyrenean* hills, and the last from among the chinks of the *Rockes* in *Hacymia*, and flower when the rest doe.

The Names.

The names of these are likewise mentioned by *Bauhinus*, who hath given them the same titles that they are here set downe, yet I take the second to be called by *Antonio Donati Erica marina Thymefolia.*

The Vertues.

The most of these being of late invention, are of small or no use that we can understand, they must all therefore passe for this time, without being further questioned.

CHAP. IX.

Satyrion & Orchis. Cullions or stones.

If the sorts of *Orchides* there are such a number that to avoide confusion, and to bring them into some methodicall order, I must distinguish them by severall Rankes or Orders, that is unto those that have round rootes, and into those that have handed rootes, many sorts whereof have bene called *Satyrion* by diuers but erroneously, and therefore to avoide that Rocke, I would bring you into the safe Haven, where you may be assured that those rootes which are properly and truly the *Satyrion* of *Dioscorides*, are those which we usually call in these dayes *Tulipa*, as I have shewed in my former Booke (although Mr. *Johnson* in his *Gerard* seemeth not to take knowledge that I had there so declared it before; but delivereth it as if it were the fruite of his owne travels) whereof this age hath produced such an infinite variety, both for time of flowering, and forme of being, but in the placing and distinction of the colour especially, that it is I may say almost impossible to expresse them all. I will therefore here in the first place, before the *Orchides*, but shew you the formes and names of some of them, and referre you to my Booke to be further enformed of them. Of the round rooted kindes, some have two rootes, some have three, which I would

Y y y y

separate

Satyria sive Tulipa bononiensis
The Bononian Tulipa.

Satyria sive Tulipa pumilio
The Dwarf Tulip.

Satyria sive Tulipa praecox
The early Tulip.

Satyria sive Tulipa scotina
The late flowering Tulip.

separate into five parts, as first into *Cynorchides* five *Testiculos caninos*, Dogges stones. Secondly into *Orchides* five *Testiculos morionis*, tooles stones. Thirdly into *Tragorchides* five *Testiculos hircinos* vel *fatidos*, Stinking Orchis or Goates stones. Fourthly into *Serapiadas* vel *Testiculos vulpinos*, Foxe stones. And fifthly into *Triorchides* aut *Testiculos odoratos*, Sweete Cullions or stones, in which five Rankes all the sorts of *Orchides*, that have round rootes, are comprehended. And then there are the handed *Orchides*, to be entreated of lastly, which are so called because their rootes are flat like hands, with the ends of the finger cut short of, which shall be wholly declared together, nor making any division of parts in them, and first of the *Cynorchides* Dogs stones, after the figures of the true *Satyrion* or *Tulipa*.

Cynorchis Testiculus canis, *Primus Ordo*. Dogges Stones the first Ranke.

This kinde of *Orchis* is distinguished into two sorts, the one hath flowers resembling hoodes, with small things hanging one of the midst of them, the other hath flowers like unto the bodies of men, with their armes and legs cut short of.

1. *Cynorchis major latifolia*. The first great Dogges stones.

The first of these greater Dogs stones hath five or sixe broad leaves on the ground, among which riseth up a round Greene stalk, halfe a yard high, bare or without leaves, or but one or two smaller standing below, at the toppe whereof standeth a spiked head of purplish flowers, set thicke and close together, made like unto open hoods, from the middle whereof hangeth downe, a small body, as it were of a Dog, or other such creature, being of a pale purple colour it selfe, spotted with deeper purple spots and lines, after which come somewhat long and round small huskes, containing therein rather small dust then seede it is so small: the roote is composed of two round white bulbes, set together like the two stones of a dog, with long fibres at the heads of them, one somewhat higher sometimes then another, and alwayes one of them which is the higher, is firme full and hard, the other lancke, wrinkled and soft, which wasteth away to nothing, leaving the firme roote, which so abideth all the Winter, and in the Spring another springeth and encreaseth from the side of the old one, and then that beginneth to grow lancke, while the other new one encreaseth.

2. *Cynorchis major latifolia altera*. The great purple Dogs stones.

This other greater sort hath somewhat narrower leaves then the former, the spiked head of flowers, is neither so long nor so thicke, and the flowers of a whitish purple colour, marked with some purple spots and lines more inward, formed like open hoods, and small bodies hanging forth like the former, the seede and rootes are like the former.

3. *Cynorchis major spica compalla*. The greater pale purple flowerd Dogs stones.

The leaves of this are somewhat narrower then the last, and sometimes spotted, the stalk also is somewhat lower with leaves upon it, and the spiked head short and close, with the like flowers for forme, thicke set together but somewhat lesse, and of a whitish purple colour, spotted also, the rootes also are like the former.

1. *Cynorchis major latifolia*.
The first great Dogs stones.

2. *Cynorchis major latifolia altera*.
The great purple Dogs stones.

Y y y y

4. *Cynorchis*

3. *Cynorchis major* spica compolla.
The greater pale purple flowered Dogs stones.

4. *Cynorchis latifolia* minor.
The smaller pale purple Dogs stones.

6. *Cynorchis militaria* five *Strateuathia* major.
The greater Souldiers cullions.

8. *Cynorchis militaria* minor.
The lesser Souldiers cullions.

4. *Cynorchis latifolia minor*. The smaller pale purple Dogs stones.

This groweth as high as the last, the leaves also somewhat narrow like it, and divers in like manner set upon the stalk, the flowers are not closely set but more sparsely of a pale purple or bluish colour, spotted also, the forme like wife is with open hoods and bodies hanging forth.

5. *Cynorchis angustifolia biant cucullo*. Narrow leaved Dogs stones.

The stalk hereof is not above a spanne high, having narrow long leaves below, and one or two above upon the stalk, compassing it at the bottome, of a pale greene colour: the toppe whereof is furnished with a thinne long spikd head of purplish white flowers in forme as the former, representing open hoods, each flower standing on a long foot stalk.

6. *Cynorchis militaris sive Stratonematica major*.

The greater Souldiers cullions.

The greater of these Souldier cullions hath large leaves below, and some lesser on the stalk, which is halfe a yard high, the spikd head of flowers stand somewhat separate, each flower being like unto a man, whose body had the armes and legs cut off, and a hood set thereon, or a leglesse Souldier with his helmet on, the hood or helmet being white, and the body spotted with purple spots, the rootes are great and thicke.

7. *Cynorchis militaris rubra*.

Red flowered Souldiers cullions.

The leaves hereof are narrower, and the stalk smaller and lower then the last, scarce a foote high, the flower also are somewhat like, the last, but of a fairer bright red colour.

8. *Cynorchis militaris minor*.

The lesser Souldiers cullions.

This is in all things like the greater of this kinde, but lesse and the flowers somewhat whiter.

9. *Cynorchis militaris spica rubente conglomerato*.

Round headed red Souldiers cullions.

This groweth higher then the former red Souldiers cullions, and the leaves longer, narrower and but few, the flowers grow in a round forme together, being like them both for forme and colour, but that the lower part of the body hath foure divisions or short parts, and a very small heele behind the backside.

10. *Cynorchis militaris latior floribus variegatis*.

Partly coloured small Souldiers cullions.

This is much smaller and lower, both in stalk and flowers, then the last, the leaves are broader and shorter, and the small flowers (which make a much shorter spike) are finely parted with white and red.

11. *Cynorchis militaris Pannonica*. Hungarian Souldiers cullions.

The stalk hereof is a palme high or more, with some narrow leaves thereon, the spikd head hath the small flowers like these of this kinde, the hood whereof is of a purplish colour, and the body or lippe hanging downe, is divided into foure white parts, spotted with purple, and a small spurie behinde: this hath a small weak sent.

12. *Cynorchis militaris purpurea odorata*. Purple sweete Souldiers cullions.

This hath a stalk about a foote high, set with narrow long leaves with a long slender spikd head at the toppe whose flowers are for forme like unto these two last sorts going before this, and are differing in colour, some being wholly of a fine purple colour without any spot, others are white without spots, and some have the hood or helmet of a deeper purple, the hollow part and the body hanging downe being white, spotted with purplish, yet all of them have a fine sweete sent.

13. *Cynorchis capitulo globoso*. Round headed Orchis.

This round headed Orchis hath three or foure broad and short, smooth and pale greene shining leaver, set on the slender stalk, compassing it round at the bottome, bearing a short round head like as Cives doe at the top, and not spikd as most of the other, each flower being of a purplish red colour.

14. *Chamaorchis Alpina flore viridi*. Dwarf Orchis with a greene flower.

This low Orchis hath a bare stalk about three inches high, above the very narrow long leaves that grow below on each side flower, the spikd head is about an inch long, with two short leaves under it, and sundry hooded greene flowers thereon, the roote hath two small round bulbis.

The Place and Time.

Many of these grow in the fieldes of our owne Country in divers places, and many others in Germany, where they have bene observed by Clusius, they flower from May untill the middle of June for the most part.

The Names.

It is called in Greeke *ὄρχις* in general, and *κυνόρχις*, this in particular, in Latine also *Orchis*, and *Cynorchis* or *Testiculus canis*: divers have taken some kinde or sort of these *Orchides* to be the *Satyrion* of Dioscorides, the error it should seeme first rising from *Pliny* and *Apuleius*, who made no difference betweene the *Orchis* and *Satyrion*, but *Matthiolus* contesteth against them, in that his *Satyrion* hath but one roote, and therefore he set forth the figure of such an one moulded out of his owne conceit, as it is generally thought, for no such thing can since be found in verum natura, and I have shewed you both in my former Booke, and in the preamble of this Chapter, that the *Tulipa* is the right *Satyrion* of Dioscorides, without peradventure, both the one and the other, and that

the seed is like *Mor* or rather as I thinke it should be *releior* or *relior*. I have given you in the margent against every one, the severall Authour (although but one or two at this time) that hath described it before. I finde that *Tragus* was of a strange conceit about the encrease of these kinds of *Orchides*. First that they bore no seed (for he supposed that the small seede which as I said is like dust, found in the long heades of them, after the flower is past was not the seede) for he said the heads that it bore after were idle, containing nothing within them: and secondly, he thought that seeing they were not procreated by their owne seede, but that they were encreased by forraigne seed, namely of Blacke birds, and Thrushes, that in their copulation let fall some of their sperme upon the ground, and that because they are found in greatest plenty among the woods where these birds resort, and have their chiefest food. The *Arabians* call it *Chasi alkes*, and *Chasi alcheli*, the *Italians* *Satirione*, and *Tesciculi de cane*, the *Spaniards* *Coyon de perro*, the *French* *du Satyrion*, and *Covillon de chien*, the *Germanes* *Knaben kraut*, *Stendelwurtz*, and *Margendrehen*, the *Dutch* *Knabencruit*, and *Standelcruyt*, and we in *English* (of the Apothecaries generally taking all sorts for their use) *Satyrion* and of some Dogges stones, of others Standle wort, and Standle grasse, and of some also *Orchis*.

The Vertues.

Dioscorides saith of *Cynosphidis* that the roote thereof being boyled is eaten as other sorts of bulbes are, and that if men eate the greater, they shall beget men children, and if women eate the lesser they shall bring forth women children: And that the women in *Theffalye* give the soft roote in Goates milke to procure lust, and the dry roote to restraine it, and that the vertue of the one is extinguished by the taking of the other. *Pliny* also writeth the same words out of *Dioscorides*, yet it is generally held, by almost all now adayes, that the firme roote onely is effectuell for that purpose, and the loose or soft spongy roote to be either of no force or to hinder that effect: but most of our Apothecaries doe promiscuously take, not onely both of those rootes to use, but of all sorts of *Orchides* in generall.

CHAP. X.

Orchis Morio. Fooles stones.

Secundus Ordo. The second Rancke.

Any of these *Tesciculi* are referred by divers Authours, unto the former Rancke of *Cynosphidides*, but in regard the posture of the flowers have different shapes from them, that is of Fooles caps, with eares at them, I have thought good to speake of them apart by themselves.

1. *Orchis morio mas folijs maculatis*. The greater male Fooles stones.

This greater sort hath five or sixe broad and smooth long leaves like Lillies, spotted with blacke spots on the up-

The greater male Fooles stones.

2. *Orchis morio altera maculata*.
Another Fooles stones with spotted leaves.

4. *Orchis morio* famina.
The female Fooles Stones.

per side, the stalk likewise hath some thereon, that compass it at the bottome but smaller, the spike of flowers is small and purple, each of them having an open hood or helmet highest, with two small leaves like cares, standing upright at the sides of them, the belly that is lowest is whiter, having on the backside a crooked heele or horne, the whole flower is sweete and very comely to behold.

2. *Orchis morio altera maculata*.

Another Fooles Stones with spotted leaves.

The stalk of this groweth bigger, the leaves are not altogether so large, but lying on the ground spotted in the same manner, and somewhat rounder pointed, the flowers are somewhat like the other for the forme, but of a more blewish purple colour, with a spur behind.

3. *Orchis morio non maculata folijs*.

Male Fooles Stones unspotted.

The leaves hereof are somewhat large like the last, but not spotted, the flowers are either of a deeper or paler purple colour, or somewhat bluish, or altogether white, the belly that hangeth downe, is sometimes spotted with purple spots, and sometimes it hath none, especially in those flowers that are all white.

4. *Orchis morio* famina. The Female Fooles Stones.

The female fort hath narrower leaves, and ribbed almost like unto Ribwort Plantane, lying on the ground, and some up higher, compassing the stalk: the flowers at the toppe of the stalk, have gaping or open hoods like the former, but the cares on each side stand not upright, but lye so close thereon, that they are hardly discerned, with a heele behind them as the others have: this is found either of a darke violet purple colour, the middle part whiter and spotted, or of a pale red, whose stalk is shorter and the leaves lesser, or else of a scarlet red colour, the scarlet head being thicke and short, and the flowers smaller.

5. *Orchis Anthropephora* Oreades mas.
The male Neapolitan: Fooles stones.

Tessiculus morio mas.

Disticta-fis descript.

Tessiculus morio mas.
fem. Lugd.

5. *Orchis*

5. *Orchis morio minor folijs maculatis*. Small Foolesstones with spotted leaves.

Label C. This small *Orchis* hath two or three small long spotted leaves upon the lower part of the stalk, those up higher being much smaller then they, the flowers are purple spotted and striped very finely.

*naorchis
minima
folijs macu-
latis.*

6. *Orchis Anthropophora oreades ma.* The male *Neapolitane* Foolesstones.

Columna. The stalk of this is a foote high, having leaves of the length of ones hand, and an inch broad, of a pale fresh greene colour, waved about the edges: the toppe of the stalk hath a bush of flowers, red before they open, and of a faire bluish colour being blowne; in forme like unto the other, before the hood or helmet open, and small leaves like eares on the sides, with short armes as it were hanging downe by the body, and the lower part with legs as it were cut of:

7. *Orchis Anthropophora Oreades femina.* The female *Neapolitane* Foolesstones.

Cor.

This other Foole of *Naples*, hath longer leaves, but not broader then the last, sp ead on the ground, and some smaller on the stalk, which is higher, the spike of flowers are not so great or thicke, yet in forme like the last, but of a pale colour, spotted very thicke, as small as sand, having the hood greenish with purple edges.

8. *Orchis Zoophora Cercopithecam exprimens Oreades.* The apish Foole of *Naples*.

Cor.

The lower leaves hereof are shorter but broader, then the last, but those on the stalk are much longer and narrower, the spiked head of flowers is greater then the last, each of them being of a reddish purple colour, so lively expressing the forme of an Ape as can be, but that the head is greater, as it were of a monster, covered with the small white silver like eares or leaves that are by it, and both it and the lower part which is biparted is spotted very finely.

The Place and Time.

All these sorts grow, most an end in fields, and by woods sides, and many in our owne land, and the three last on the hills in *Naples*; they flower in *May* as the rest doe.

The Names.

The names of all these are expressed in their titles, and the Authours are expressed in the margent, that have writen of them, as is done in the last Chapter, which may suffice for this time.

The Vertues.

The properties of these are like those in the former Chapter, and therefore whatsoever is said of them may be well referred to these.

CHAP. XI.

Tragorchis sive Testiculæ hircinæ. Stinking Goates stones,

Tertius Ordo. The third Ranke.

Here *Orchies* are so named not onely because they have a strong foule sent like a Goate, but that most of them have long tailes like beards hanging downe from them.

*Testiculæ
hircinæ Dod.
& Lob.*

1. *Tragorchis maxima.* The greatest Goates stones.

1. *Tragorchis maxima.* The greatest Goates stones.

2. *Tragorchis vulgaris.* The ordinary Goates stones.

shorter

3. *Tragorchis minor* & *varior*.
The lesser but truer Goatestones.

4. *Tragorchis Batavica* Clusij.
The Hollanders Goatestones.

shorter, the stalk likewise which is halfe a yard high, hath divers leaves thereon and a small spiked head of purple flowers, set in a comely row or order, having a long crooked thred or string hanging downe from each of them, and twining themselves one within another, both the hood and the taile is spotted, and have a strong sent: the bulbes are greater in these then in many other.

2. *Tragorchis vulgaris* five *Testiculus leporinus*. The ordinary Goatestones or Harestones.
This other which is the more common with us, hath longer and narrower leaves, the flowers are smaller and whiter, spotted with reddish spots, and the tails are more twining, the smell hereof is as strong as the former, but the bulbes are lesser.

3. *Tragorchis minor* & *varior*. The lesser but truer Goatestones.
The smell hereof causeth the name of this *Orchis*, which doth nearer resemble the rancke smell of a Goate, then the former doe, but differeth in the leaves being much lesser, and the flowers being without spurres or tails, and somewhat like unto those noisome wormes that wee call woodlice, for their proportion, the colour whereof is somewhat brownish.

4. *Tragorchis Batavica* Clusij. The Hollanders Goatestones.
This stinking *Orchis* of Holland that was found about the Hage, as also about their Sea coasts, and as fittest referred to this Ranke or Order, hath three or foure narrow small leaves, compassing a low stalk, about a span long, whose toppe endeth in a short spiked head of flowers, of a fine purplish red colour on the inside, and paler without, having a belly or lippe hanging downe, which is terminated in three short and equall parts.

5. *Tragorchis altera purpurea*. Stinking Goatestones of Austria.
The leaves of this *Orchis* are like Lilly leaves, of a pale Greene colour, with some smaller about the stalk which is an hand high, the spiked head of flowers is either of a whitish or pale colour, without any spots, or else purple with some purple leaves under them, each whereof is hooded and eared with a hanging belly, notched as it were at the bottome: the strong rancke smell hereof maketh it one of this ranke, and to be numbred with them which else might have bene set in another place.

The Place and Time.

The former three sorts grow chiefly in clay grounds, the other two are expressed in their titles, and flower with the rest.

The Names.

These kinds are chiefly mentioned by *Lobel* and *Clusius*, whose names I have enrolled in the margent how to finde them which shall be sufficient.

The Vertues.

Eugdunensis from *Dodonæus* saith that the rootes of these *Orchies*, are better then any of the other, for the purposes afore said, of what other good quality they chiefly partake we cannot out of any ones experience relate unto you.

CHAP. XII.

Orchis Serapias sive Testicululus vulpinus. Foxestones.

Quartus Ordo. The fourth Ranke.

His fourth Ranke or order must comprehend all those sorts of *Orchides* whose flowers doe represent sundry sorts of insects, flies, or other small creatures, which for their fruitfull generation were anciently dedicated to *Apis*, who was worshipped as a God at *Canepe*, not farre from *Alexandria* in *Egypt*, and from thence tooke the name *Serapias*.

1. *Orchis Serapias bifolia latissima*. The greatest twiblade Foxestones.

This hath onely two very large leaves, not much lesse then those of the white Elletore or Neesewort, with divers veins running through them, Greene on the upper side and paler underneath, but shining withall, the stalke riseth a cubit high, five square, with a few leaves or skins thereon, closing it as it were about, the flowers grow in a spiked head like unto others, but great and large, being either purple spotted with white, or wholly white: the rootes are great and somewhat long like unto small Turneps.

2. *Orchis Serapias latifolia altera*. Hungarian twiblade Foxestones.

This other is very like the last, but somewhat lesser, and lower, both in leaves, stalkes, and flowers, and is found also both purple and spotted, and white as the former is.

Clus. Thal. descriptio.

3. *Orchis Serapias bifolia vel trifolia minor*. The lesser twiblade or three leaved Foxestones, or white Butterfly Orchis.

Orchis Sphegodes d'phyla Lob. sive Hermaphrodica Testicululus secundus Lobelij.

This lesser Foxestone hath two or three large leaves next the root, yet lesser then the last, the stalke is more then halfe a foote high, with two or three peeces thereon, and a small tuft or spike of white flowers at the toppe, thinly set thereon, somewhat resembling white butterflies with their wings spread, each flower having a crooked taile behind it full of a sweete liquor.

4. *Orchis Sphegodes sive fucum referens*. The greater Drone Bee flower.

The leaves of this *Orchis* are five or sixe, long narrow, and ribbed like Ribwort Plantaine, yet somewhat lesse, the stalke is about a spans height, bearing five or sixe flowers at the head thereof, in fashion somewhat like a Bumble, humble or drone Bee, as it is called, having some few small whitish purple leaves likewings above, and a brownish belly or body below.

There is a lesser sort hereof, whose flower is lesser as well as leaves, and of a more whitish Greene colour.

Mient. ejusdem.

3. *Orchis Serapias bifolia vel trifolia minor*. The lesser twiblade or three leaved Foxestones, or white Butterfly Orchis.4. *Orchis Sphegodes sive fucum referens*. The greater Drone Bee flower.4. *Orchis Sphegodes minor*. The lesser Waspe Orchis.

5. *Orchis Sphegodes altera*.
The Wasp Orchis.

7. *Orchis major Sphegodes five Testiculus Vulpinus primus*.
The greater Gnat flower.

5. *Orchis Sphegodes altera*. The Wasp Orchis.

The Wasp Orchis hath narrower leaves then the last, the flowers stand in the same manner, and of the same fashion almost, but somewhat greater and of a browne yellow colour, the wings being a little enclining to purple. This the new Gerard maketh the humble Bee Orchis.

Sphegodes
secunda
Lob.

6. *Orchis minor culicem exprimens*. The lesser Gnat flower.

The lesser Gnat flower, hath three leaves usually standing below the stalk, with some few short ones up higher, the flowers are many but small, much resembling a small gnat or flye, of a yellowish browne colour, whose lower part is smaller then the greater sort.

Culices
minores
tribylla
Lob.

7. *Orchis Sphegodes five Testiculus vulpinus primus*. The greater Gnat flower.

The stalk hereof is greater and higher, the leaves also are larger then the two last and smaller upon the stalks, the flowers are fewer at the toppe but larger by much, the colour doth not much differ, but is rather fadder.

Testiculus
vulpinus
Lob.

8. *Orchis Melittias five aspera*. The hony Bee flower.

The stalk hereof is seldome a span high, the leaves thereon are few, narrow and small, turning sometimes inward, some rising upon the stalk: at the toppe usually stand two or three flowers, seldome many more each whereof is in shape much like an hony Bee, that many that have not seene it before, would verily beleeeve that it were either a living, or the carcase of a dead one, but that the upper leaves which are like wings, are of a pale blewish purple colour, and the head yet paler, the body full and round below, of a darke browne colour with some spots of yellow thereon, the rootes are small.

Orchis
Melittias
Lob.

9. *Orchis Myodes major*. The greater or flesh flye flower.

This greater flye flower hath three or foure, somewhat broad and long smooth Greene leaves next the ground, the stalk riseth about an hand breadth high, with a few large flowers set at the toppe, resembling a great Flesh flye made of foure leaves, the three uppermost, and a long one lowest.

Myodes
altera flore
grandis
Lob.

10. *Orchis Myodes minor*. The lesser Flye flower.

The lesser Flye flower hath somewhat lesser leaves and more ribbed, the stalk riseth not fully so high, the flowers grow in the same manner, very like unto the last sort, but lesser, and of a little darker colour both the bottom, and about the middle part, but paler betweene the wings, being of a pale colour, enclining to blew.

Myodes
minor
Lob.

11. *Orchis Myodes minima*. The least Flye flower.

The least Flye flower hath three leaves narrow and ribbed, growing closer to the stalk, which is smaller and lower then the last, having two or three small flowers at the toppe like the other, but smaller, and of a brownish purple colour, somewhat spotted.

Scrapias
tertia
Lob.

12. *Orchis Myodes lutea Narbonensis*. The great yellow Flye flower of Narbone.

This great yellow Flye hath three or foure larger leaves then the last, full of ribs, the stalk is higher, and the flowers

Frogge Orchis,

14. *Orchis strachwitzii*.
The Spider flower,

16. *Orchis Ornithophora folio maculosa*, 600
White or purple Birds flower.

17. *Orchis Myodes angustifolia*.
The narrow leaved Flye flower.

flowers much greater, and of a yellow colour, like some flies with us.

13. *Orchis Brachistis*. Frogge Orchis, or Frog flower.

The Frogge flower hath broad and short leaves below, and narrower and longer up higher on the stalk, at the toppe whereof grow sundry yellowish flowers, resembling the bodies of Frogs, with the head and wings greenish, from whence it took the appellation: the rootes hereof are large, a little longer, and more pointed at the bottome then of others.

14. *Orchis Arachnitis*. The Spider flower.

The leaves hereof are more then in the last, narrower also and longer, the stalk is not higher, and bearing but three or foure flowers at the toppe, resembling a spider in the round belly, and the small necke or partition betweene it and the toppe wings.

15. *Orchis Pycnos herbae coloris*. The Greene Butter flye.

This Butter flye hath divers large smooth Greene leaves next the ground, and other smaller and longer upon the stalk, the flowers are many and great, resembling Butter flies with their wings spread abroad, of a kinde of herby Greene colour, with a spurie behinde.

16. *Orchis Ornithophora folio maculosa*. White or purple Birds flower.

The leaves hereof are somewhat large and spotted for the most part (for there is much diversity herein, some having broad large or pointed, others narrow lesse or rounder leaves) the flowers are large and like the last, with a spurie also behind them but some are all white, others are purple, and some betweene both, of a purplish white colour, this kinde flowreth with the first sorts.

17. *Orchis Myodes angustifolia*. The narrow leaved Flye flower.

This hath sundry narrower leaves then many other, standing upon the stalk, up to the toppe, where the flowers resemble a small short flye.

18. *Orchis macrophylla Colatinnæ*. Narrow leaved Flye flower of Naples.

The stalk of this Flye flower is three foote high, having two very long leaves at the bottome, but of an unequal length, those that grow next on the stalk are much longer, some being a foote and a halfe long, and very narrow, but those up higher are shorter and broader, at the top are set divers flowers in a spike to a footes length, each whereof standeth like a croffe hollow pipe, having a broad and long beard thereat, of a fine bluish colour, with a more purplish leaf like a tongue, hanging downe broad above and small below: this is found usually but with one found roote (the other as it should seeme being decayed and gone) with some fibres both at the head, and from the sides which is not seene in any sort of Orchis.

The Place and Time.

All these sorts grow not in one sort of ground or ayre, for some are found in woods, some in clay grounds, others in fertile or barren fields, and in dry sandy soiles most of them in our owne land, yet some are strangers, and doe all flower from before May unto the end of it.

The Names.

I have done with these as I have done with the rest, and given you one Authour in the steede of many that hath written

2 z z z z

written

written of it, with the names how he calleth it, for it were too tedious to write all the severall titles that severall Authours have given to these sorts of Orchides.

The Vertues.

The properties of these *Serapias* are recorded in particular by *Dioscorides* and *Galen*, to be not so effectuell for Venerie, but are of force to dissolue swellings, and to cleanse foule vlcers and fistulas, that is, hollow vlcers, and the vlcers of the mouth, and inflammations also, and stayeth those that are eating or fretting, it dryeth much when the roote is dryed, and stayeth the flux of the belly thereby.

CHAP. XIII.

Orchis sive Testiculus odoratus. Sweete Cullions.

Quintus Ordo. The fifth Ranke.

His fifth and last Ranke of round rooted *Orchides* must comprehend a few small ones, that smell sweete some whereof have but one, some two round rootes, others three, and some more, as shall be shewed.

1. *Orchis pusilla odorata.* The sweete Muske Orchis.

cl. s. j. 7.

This sweete Orchis hath usually but three small and narrow Greene leaves, the stalke is of an hand-breadth height, having a long narrow spike of pale Greene flowers, ending in three points, and smelling like Muske, this hath but one small round roote of the bignesse of a pease, above which it hath long strings running forth, by which new plants are encreased.

2. *Triorchis alba odorata major.* The greater Sweete Lady traces.

Triorchis
alba spi-
ridis Lob.

The great Lady traces hath sundry very sad Greene shining leaves like unto the lesser Plantane, but sharper pointed, which rise up in September after the stalke with flowers is withered which doe abide Greene all Winter, and perish in May, the slender stalke which crooketh and windeth it selfe a little, riseth up in August stored for a great length with many small white and sweete flowers, compassing it round and hanging downe round about it: the rootes grow sometime three, and sometimes foure together, being round and longer then in any of the former Orchides, with divers short fibres set round about them, contrary to the order observed in all the rest.

3. *Triorchis alba odorata minor.* The lesser Sweete Lady traces.

Triorchis
gracilis int.
nor Lob.

The lesser traces hath much smaller leaves lying next the ground, but of the same fashion like unto a very small Plantane, the stalke is little above an handbreadth high, with some small shew of little peeces of leaves, thereon the flowers which are white dash over with a thinn bluish, standing in thin long spikes, compassing the stalke and are very sweete: the rootes grow by couples, and are small somewhat long as well as round.

4. *Orchis lutea Lendensis.*

Lady traces of Liege.

Orchis mi-
nor Len-
densis
Lob. Obz.

The leaves of this are somewhat more like unto a broad leaved Plantane, yet smaller and narrower, three or foure at the bottome of the stalk which hath none on it, and hath yellowish flowers like the others at the top, one above another, the roots grow three, and sometimes foure together.

5. *Orchis Frisia littoralis.*
Friesland Orchis or Lady traces.

Frisia Lob.

This hath but two small round bulbes for the roote, from whence spring up two or three small, somewhat long and hairy leaves, yet shorter then of the Ribwort Plantane, the stalke is above a span high, bearing small yellowish Greene flowers like unto the former, and set in the same order. In the same table with this *Orchis* you have the next *Triorchis*, as *Lobel* hath given it us, from *Cornelius Gemma*.

6. *Triorchis lutea altera Gemma folio glabro.*

Yellow Traces with smooth leaves.

Triorchis
lutea 3.
Gemma Lib.
obser.

This hath longer leaves and smother then the last, and stalkes and flowers very like, yellow also and sweet, the roote is composed of three small round bulbes.

7. *Chamaorchis latifolia Zealandica.*

The dwarte Orchis of Zealand.

Orchis
latifolia
Lob ap-
pendice
et forte
Pseudo-
orchis Cl.

This smal Orchis hath two, and sometimes three round bulbes for the rootes, covered with whitish coates or skinnes, being greenish within, and sweetish in taste, the lower of them being lanke as in others, it hath two faire but small Lilly like leaves, about two inches long rising from them, some three or foure inches high: this peradventure may be the *Pseudoorchis Clusij*.

8. *Orchis*

4. *Orchis lutea* Ledebur.
Ladytraces of Liege.

5. *Orchis Fritia* Litoralis & ejus varietas.
Friedland Orchis, or Ladytraces.

6. *Triclis lutea altera*.
Yellow Trace, with smooth leaves.

8. *Orchis radice repens*.
Small creeping or bastard Orchis.

Zzzzz 2

8. *Orchis radice repente*. Small creeping or Ballard Orchis.

The roote of this Orchis, if it be one, are unlike all the rest, being many long and full of strings, growing thick together, and enterlacing themselves one amongst another, yet have they at the upper part thereof next under the leaves as *Camerarius* saith, some shew of small bulbes sometimes to be seene, the leaves that rise from thence are thicke and somewhat broad like Plantane, of a darke Greene colour, the stalk is slender furnished at the toppe with divers white flowers spotted with blood red spots. Why *Gerard* should call this *Palma Christi*, I see no reason, when as it cometh neerer to an *Helleborine* then *Orchis*.

The Place and Time.

These kindes of Orchies grow in dry grounds, heaths, and waste untilled places, and the like, many of them in our Land, and others in other places, and doe all or for the most part not flower untill *August* or *September*.

The Names.

These also as the former have their Authours names set downe in the margin, and how they called them.

The Vertues.

It is recorded by some, that the rootes of these kindes of Orchides are marvellous effectuall above any other to incite Venery.

CHAP. XIV.

Orchis Palmata. Handed Orchis.

Having shewed you all the kindes of bulbous Orchides in the Chapters going before, there doth yet remaine the other kinde of handed Orchies to be entreated of, which although they be many, yet I thinke meete to comprehend them all in this one Chapter, without parting of them.

1. *Orchis palmata major* mas five *Palma Christi* mas. The great male handed Orchis.

*Palma
Christi mas
lucifolia
Lob.*

This male Orchis hath divers large broad and long smooth Greene leaves lying on the ground, among which riseth up a round stalk, with some such leaves on it, but lesser up to the toppe, where grow a large head of pale purple flowers, spotted with a deeper purple colour, each flower having a heele of the same colour behind it: the rootes are flat and broad, two joyned together at the head, like unto handes, parted at the bottome into short peeces, as if the fingers were cut short off by the knockles, with some fibres at the head thereof also, one of them being firme, and the other loose or spongy, as in the former Orchides, which rise and decay in the like manner.

2. *Orchis palmata major pratensis angustifolia*. The great male handed Orchis with narrow leaves.

Prodro

The rootes of this are double handed like the former, parted into three parts below: the leaves are long and

1. *Orchis palmata major* mas five *Palma Christi* mas.

The great male handed Orchis.

2. *Orchis palmata major pratensis angustifolia*.

The great male handed Orchis with narrow leaves.

narrow

3. *Orchis palmata femina* five *Palma Christi* femina maculato folio. The female handed Orchis.

4. *Orchis palmata pratenfis maxima* *Conopsea* diffla. The greatest handed and hooded Orchis.

narrow through which the stalk riseth, as through a pipe, to be a cubit high, whereon is set a spiked head of flowers, of a pale purple colour, with a spur behind, and a small leaf set with every flower at the bottom.

3. *Orchis palmata femina* five *Palma Christi* femina maculato folio. The female handed Orchis.

The leaves hereof are long and narrow, spotted diversly with blacke spots, the stalk hath likewise some narrower leaves thereon, and a spiked head of hooded flowers, some reddish, either deeper or paler, or bluish, or else white, the lowest of them will be spotted, yet some will have none, the rootes are handed like the other.

Palma Christi
Jan. Lob.

4. *Orchis palmata pratenfis maxima* *Conopsea* diffla. The greatest handed and hooded Orchis.

This riseth with a stalk two cubits high, having sundry long and narrow leaves set thereon, compassing it almost at the bottome, the flowers whereof are hooded like the last, but of a dainty pale purple colour, and sweet withall, and flower late.

Conopsea
Lobelia.

5. *Orchis palmata minor flore rubro*. Small handed Orchis with red flowers.

This small Orchis hath a slender stalk, with a few long and narrow leaves set thereon, smaller above then those below, having a spiked head of shining red flowers: the root is small and handed like the rest.

Serapias minor Lob.

6. *Orchis palmata angustifolia minor*. The lesser handed Orchis with narrow leaves.

The roots of this sort is handed but lesse, and the lower divisions of them are longer, the leaves are very long and narrow, the stalk groweth a foote high, and the flowers thereon are of a pale purple colour, and the whole spike shorter then others.

Orchis fe.
Trag.
icon. Thal.
descriptio.

7. *Orchis palmata angustifolia minor odoratissima*. The sweetest small handed Orchis.

This small sort hath rootes like the rest, the leaves are much narrower and long almost as grasse, the stalk is a hand high, with very few leaves up to the toppe, bearing thereon a small spike of pale purple flowers, very sweet each having a hood and a lip hanging downe, divided at the bottome into foure parts with a heele behind.

Pedro.

8. *Orchis palmata corymbellata*. Handed Orchis smelling like Cloves or Gilloflowers.

The leaves of this sort are long and narrow, the stalk slender with sundry short leaves thereon, the spiked head of flowers is purple, each resembling small flies, and swelling as sweete as a Gilloflower, after which come great heads of small seeds, the root is handed, but hath the lower divisions much longer, running downe into the ground.

Lob.

9. *Orchis palmata batrachites* vel *Myodes*. Handed Orchis resembling frogs or flies.

The leaves that grow on the stalk are somewhat short and broad compassing it at the bottome, the flowers that stand above are small with wings as it were above, and a long small body hanging downe and doth in some sort resemble a frogge as well as a flye, the root hath shorter divisions in one part, and longer in another.

10. *Orchis castrata*. Gelded Orchis.

This hath also long narrow leaves set on a slender stalk, and smaller up to the toppe, where standeth a bending head of white flowers spotted, each resembling a flye, the lower part of whose hanging body is more pointed: the root is made of two long peeces like legs, ending in small pointes, and hath neither hands nor bones.

Lob.

Zzzzz 3

11. *Orchis*

5. *Orchis palmata minor flore rubro.*
Small handed Orchis with red flowers.

7. *Orchis palmata angustifolia minor flore odoratissimo.*
The sweete handed Orchis.

8. *Orchis palmata Caryophyllata.*
Handed Orchis smelling like Cloves.

9. *Orchis palmata batrachites vel*
Aquatica. Handed Orchis resembling
frogs or fl. es.

10. *Orchis Castrata.*
Celded Orchis.

11. *Orchis palmata palustris latifolia.*
Marsh handed Orchis with broad leaves.

12. *Orchis palmata palustris altera*.
Another Marsh handed Orchis.

13. *Orchis palmata levisolia palustris*.
Another Marsh handed Orchis.

11. *Orchis palmata palustris latifolia*. Marsh handed Orchis with broad leaves.

The large and broad smooth Greene leaves hereof, are set in order upon the stalk up to the top, growing smaller still upwards unto the large spike of pale bluish flowers, with every one a small greenish leaf at the setting on, the roote hath long divisions at the bottomes of the hands, this flowreth more early then the ordinary pasture kind of Dogges stones.

12. *Orchis palmata palustris altera*. Another Marsh handed Orchis.

The leaves of this are not so long nor broad as the last, sometimes spotted but more usually without, the flowers are thicke set like the last, but of a violet purple colour: this flowreth after the last.

13. *Orchis palmata palustris levisolia*. Another Marsh handed Orchis.

This differeth little from the last, but in the leaves being without spots, and in the flowers which are more white.

14. *Orchis palmata palustris maculata*. Spotted marsh handed Orchis.

The stalk hereof is tall and strong, the leaves large and full of spots, the flowers purple with Greene leaves set amongst them.

15. *Orchis palmata, Pannonica quarta Cinsij*. Hungarian handed Orchis.

The lower leaves hereof are like unto those of the white Lilly, and of a whitish Greene colour without any spots on them, and of an unpleasant taste, the flowers are large growing spike fashion one above another, of a whitish colour without any spot, resembling a foolkes coule or hood, with eares on both sides and a broad lip hanging downe, and with a broad blunt taile behind, smelling somewhat strong like Elder flowers: it hath also a small whitish leaf at the foote of the flower next to the stalk: the roote is handed also.

There is another sort hereof whose flowers are purple and the small leaf set at the stalk of the flower, purplish also.

16. *Orchis palmata palustris Dracontias*. The marsh Dragon handed Orchis.

The leaves of this Orchis are like unto those of the Lilly, compassing the stalk almost round at the bottome, the spiked head groweth thicke, with very red and hooded flowers like the last, and Greene leaves among them.

17. *Orchis palmata flore viridi*. Small mountaine handed Orchis with Greene flowers.

The roote hereof is handed but small, the stalk is about a span high, the leaves are but few long and narrow, the flowers are small and Greene, hooded, parted at the bottome with a small long leaf at each of them.

18. *Orchis palmata montana maxima*. Great mountaine handed Orchis.

This greater sort hath a stalk two cubits high, whose lower leaves are a foote long, and an inch and a halfe broad, and those up higher, smaller and smaller, at the toppe standeth a spiked head of small flowers, an hand breadth long, of a pale purple colour, hooded and heeled, and the lower part of the lippe or belly, parted very much with a leaf at the foote of each likewise: the roote is handed like the rest, with long divisions.

19. *Orchis palmata montana Lobelij*. Lobelij's mountaine handed Orchis.

There is small difference betweene this and the foureteenth, which is the spotted marsh handed Orchis, but that

that the leaves hereof have no spots and are more smooth.

20. *Orchis palmata montana maculata flore candido.*
Spotted mountaine handed Orchis.

The leaves of this Orchis are somewhat narrow, and spotted like unto the female handed Orchis, the stalks and flowers also are like unto it, and differeth not but in the colour, which is white.

21. *Orchis palmata angustifolia Alpina.*
Small mountaine handed Orchis.

This small Orchis hath very narrow leaves as small as *Crocus* as *Marshallus* saith, the stalks is low and small, bearing small flowers of a sad purple colour, like unto the purple flower gentile, and of a sweet fragrant smell while it is fresh and Greene.

The Place and Time.

Some of these Orchies grow in fieldes and meadows, some in moorish grounds and marshes, and others upon hills and mountaines, and flower in the moneths of April, May, and June, some earliyer and later then others.

The Names.

Every one of these hath one Authour named in the margin that hath written of it, and how he hath called it: as I have done with all the rest of this family of the Orchides.

The Vertues.

These marsh stones are thought best to agree unto the *Serapiades*, and not so available to Venereous purposes, being more heating and drying then the *Cynorchides*, and therefore may performe the cures that the *Serapiades* doth in ulcers and the rest. *Camerarius* saith of this last sort that it is very profitable to stay the bloody Fluxe, if the flowers be made into pouther and taken in wine, or the fresh flowers fried with egges into a Tansie, and so eaten. The rootes of all the other sorts of *Orchides* being boyled in red wine, and after they are dried againe, made into pouther and drunke, doth stay the bloody fluxe in a speedy manner.

CHAP. XV.

Orchis abortiva five *Nidus avis*, Mithapen Orchis or Birds nest.

Here are two sorts of Birds nest, the one not much differing from the other, but in the colour, the first and most anciently knowne, of a yellowish colour, the other of a purplish violet.

1. *Orchis abortiva ruffa*. Ordinary birds nest.

The common Birds nest riseth up with upright fappy weake stalkes, having a shew of leaves on them, which are very short thin skins rather then leaves, of the same colour with the stalkes and flowers, that is of a brownish dead yellow, the flowers stand upon a spiked head, like unto that of Orchis, and of the same fashion, with huskes of dusky seede following them: the roote is composed of a number of fibres, that crosse and entangle themselves one within another very intricately.

2. *Nidus avis purpurea*. Purple birdes nest.

This purple birds nest groweth somewhat lower having some longer skinny leaves on the stalkes then the former with flowers on a spiked head very like unto the last for forme, but the whole stalks leaves, and flowers are of a violet purple colour, after which follow small seede like the other, the roote also is like the former.

The Place and Time.

Both these sorts are sometimes found in our owne Land, in Woods and low Coples, and are in flower in July and August.

18. *Orchis palmata montana maxima.*
Great mountaine handed Orchis.

Serapias
candida
flore mon-
tana Lot.

Dod. Ca-
mera de-
scriptio.

The Names.

Dodonæus calleth it *vicina Neottia*, id est, *Nidus avis*, as it is with most now adayes, it is thought also to be the *Coagulum terre* of *Pliny*, *Gesner* calleth it *Orobanche*, and *Lobel Satyrium abortivum* & *Orchis abortiva*. *Clasius* calleth the last *Limodorum* first, and then *Pseudolimodorum*. The French call it *Nid de seau*, the Germanes *Marthen drehen*, the Dutch *Vogelsnest*, and we in English Birds nest, or Goose nest, from the platting of the rootes like the stickes and straws in a Crowes nest.

The Vertues.

There is no use made of either of these that I have knowne in Physicke, or applyed to any other u.c.

Orchis abortiva rufa. Ordinary Birds nest.

CHAP. XVI.

Orobanche sive Hemodorum vel Limodorum.
Kill herbe or herbe bane.

Here hath bin found out of later dayes, divers sorts of this Excreffence of the earth (whereof there was but one sort or two as it is likely knowne to the ancients, or at least, no more exprest in their writings, under these names, which shall be here shewed you: but because I have already delivered you two sorts thereof, the one rising from Broome, called Broome rape, the other from the *Cistus*, called *Hypocistus*, which may justly be referred to this family, I will not further mention them here. I confesse they might have been placed neere the Mosses and Mushromes as being excreffences of the earth, as they are, but because their flowers and seede doe more neerely resemble the former *Orchides*, I thought meetest to joine them unto them here.

1. *Orobanche major Montpellierana.*
Great Herbe bane of Montpellier.

This kill herbe hath a long and round small roote without scales, and with some fibres under it, the stalke is great and thicke, with very short leaves thereon from the bottome unto the middle thereof, where the flowers begin to grow, and with every one of them a larger and longer leafe: the flowers are long and brownish.

2. *Orobanche flore majore purpurascens.*
Great purple Herbe bane.

This from such a like roote with fibres thereat as the former, sendeth forth sundry stalkes with many thicke and short leaves on them sharpe at the ends, having sometimes branches rising therefrom, and sometimes two or three stalkes from the roote, and at the toppes are set with longer flowets then those of Broome rape on long foot-

1, 2 *Orobanche major Montpellierana* & *flore majore purpurascens.*
Great Herbe bane of Montpellier, and the great purple.

Stalke,

3. *Orobanche ramosa*.
Branched Herbe bane.

4, 5. *Orobancheradice dentata* five *Dentaria Matthioli major & minor*.
Toothwort or Lungwort, the greater and the lesser.

stalks, each standing in a huske, with a long thred as it were growing out of the flower that turneth up againe, the whole stalks, leaves, and flowers are of a blewish purple colour.

3. *Orobanche ramosa*. Branched Herbe bane.

Although many of these herbes are found with single and unbranched stalks, yet some are found also that have them much branched, but then for the most part, they grow lower then others, and are of differing colours, some whitish, some more yellow, some brownish yellow, and some blewish or purplish, for such are found in sundry places. *Bauhinus* remembereth a small sort hereof, that groweth lower, under Pine trees, Firre and Pitch trees, differing else in nothing, but in being of a darker colour, and the flowers whiter.

4. *Orobancheradice dentata major* five *dentaria major Matthioli*. Great Toothwort or Lungwort.

Most properly may this herbe be joyned to these formerly set downe, for their neere affinity in many things: it hath for the roote small scales, if it may be so called, like as the stalks or branches have, which consist likewise wholly of blackish purple, shining thicke scales, lying somewhat closely, compact one upon another: in the beginning of the Spring, there riseth out from the toppes of these scaly branches, tender and brittle sappy stalks, to a span long, without any leaves, but bearing many whitish purple gaping flowers, and blackish inward, standing in huskes, wherein afterwards grow up vessels with small feede in them.

5. *Orobancheradice dentata minor*. Small Toothwort or Lungwort.

This lesser sort consisteth of a smaller lesse scaly, and more white transparent roote, with a tender sappy whitish purple stalke in like manner, without leaves and whitish purple flowers at the roppes, sometimes but two or three, and sometime many more. This varieth in some places being of a more purplish colour.

The Place and Time.

The first three sorts grow many times from the rootes of sundry herbes, and by their sappinesse draweth out the nourishment, thereby ipoyling them, and sometimes among a field of Corne, Pulse, Hempe &c. sometimes also of it selfe among the grasse and herbes, by the sides of hedges, and under the shadow of trees, and many times also without shadow, the other two most commonly under trees, where they have much shadow, and doe most flourish in May and June, yet some have beene found in flower in August.

The Names.

Dioscorides calleth it *ὀροβανχε*, and *Orobanche* in Latine, but doth much differ from that *Orobanche*, of *Theophrastus*, which with the clasping branches killeth the *Orobanch* that it grows withall, and therefore *Lugdunensis* taketh that pulse which is called *Aphaca*, to be *Theophrastus* his *Orobanche*, as I shewed before in the Classis of the pulses, but out of doubt, it agreeth with *Theophrastus* his *Limodorum*, as some have it, but more truly *Hemodorum*, some would have it *Limodorum pratensis* donum, or else *Limodorum samum adferens*: but *ἀνιδόρον* is the truest name in the best copies, or as some thinke *ἀνιδόρον* quod a cute tanquam cruce infella: for *Theophrastus* describeth his *Hemodorum*, almost in the same manner that *Dioscorides* doth his *Orobanche*, it is thought also to be *Pliny* his *Cynomori*, or a canis genitalis similitudine. Most Writers call them *Orobanche*, and some *Limodorum*. The *Dentaria* is called of some *Squamaria*, or *Squamaria*, and *radix squammata* by *Dodonaeus Anblatum*, by *Cesalpini* *Arachidum*, and by *Gesner* *Egoletros* *Pliny*, and faith the people in Germany that keepe Vineyards, call it *Malus Henricus*; but generally by all *Dentaria*, and *major*, the lesser being called by *Clusius* *Dentaria aphyllor*, and *Dentaria coralloide radice*, and *minor* by others. The *Italians* as *Matthioli* faith call *Orobanche* *Herba Tora*, because Kine eating thereof will

will presently goe to the Bull, some also as he saith *Herba Lupa*, and some *Coda di Leone*. Because we had no proper *English* name for the former sorts, and I thought it improper to call them Broome rapes, as that is called which groweth from the Broome, I have given them another *English* one, fitting their property as I take it: yet let every one doe as they thinke meetest.

The Vertues.

Diocorides saith of his times, that it was used to be eaten as other herbes are, either raw or boyled with pulse, which would helpe their digestion: *Galen* saith it is cold and dry in the first degree: our people doe many times use the latter sort in medicines for the Lungs, having received it as a tradition from their ancestors, and therefore called the greater Lungwort: we have no other properties of any of these herbes, to open unto you.

CHAP. XVII.

Cyclamen. Sowbread.

Although I have given you in my former Booke a doozen sorts or more, of *Cyclamen* or Sowbread, for whose knowledge I must referre you therunto, a figure of one or two being here shewed you instead of the rest, yet I have a strange plant to exhibite to your consideration, which was found and sent for a bastard kinde thereof, and withall shew you the properties of the right more amply.

Pro Cyclamino uerno spurio missa planta. A strange plant sent for a bastard Sowbread of the Spring.

It had a tuberous roote varying from the forme of the *Cyclamen* roote, being long and thicke, small at the head and broad at the bottome, with a dent in, somewhat like unto the forme of an heart, as it is pictured on the cards, or rather like those pin-pillow-purses, that poore women use to sticke their pinnes round about the brims or edges, having a hard thicke skinne of a brownish colour, with sundry hard long rough fibres underneath, and about it, from the toppe whereof rose divers somewhat round leaves a little pointed, resembling those of the violet but smaller, some being larger and smaller then others, with three, five, or seven nerves or ribs in them, each upon a long footstalk, and of a brownish Greene colour, from among which iserth up a reddish stalke, divided from the bottome into three or foure branches, with the like leaves on them; and at the head of every branch, two or three small greenish yellow mossy flowers, much like unto those of the Ribes, or red Currans, with divers yellow threads in the middle.

The Place and Time.

This grew on the *Pyrenean* hills, sent by *Venerius* to *John Hogheland*, and other his friends in the low countreys; and flowering in the Spring time.

Cyclamen autumnale folia Hederæ.
Ivy leaved Sowbread.

Pro Cyclamino uerno spurio missa planta.
A strange plant sent for a bastard Sowbread of the Spring.

The Names.

Venerius sent this for a differing kind of *Cyclamen*, by the title it beareth, but as the description and figure declare, it is much different therefrom, almost in every particular, and therefore not knowing what other denomination besitteth, it must hold the first imposed for me, until I or some other, can better dispose of a more certainty.

The Vertues.

The plant being rare and lately found out and known but to few, I have not yet learned that any experience hath bin made thereof, whether it hath any medicinal or other property therein: but because in my former Booke, I was so briefe in declaring the vertues of the true Sowbread, I think good upon so fit an occasion to expatiate them further here: Although *Mesues* doth determine the degrees hereof to be hot and dry in the beginning of the third, yet *Galen* doth not so, but saith only 70. *Simplicium*, that it cutteth, clenseth & openeth the mouths of the veines, draweth and digesteth, which is plainly scene by the particular operations thereof, for the iuyce of it openeth the hemorrhoides or piles, and strongly mooveth to the stoole, being put up in wooll, and saith *Mesues*, it avoideth tough flegme used in a glister: it is also mixed with such medicines as disense swellings, kernels, and other hard knots in any part of the body: it helpeth also the pinne and webbe in the eyes, being infused with honey, as also avoideth it by the nostrils, which *Mesues* also affirmeth, and that by snuffing up the iuyce, the head and braine is purged from those humours that offend it, the ache also, and daily paines of it, and the Meagrome. *Galen* further saith, that if the belly be bathed with the iuyce, it will forceably moove it downwards, and kill the birth, or to be put up in a pessary, and although the roote is weaker then the iuyce, yet the roote being either drunke or applyed, provoketh the termes, and is profitable for those that have the yellow jaundice, to drive it forth by sweating, if after the taking of three drams thereof in powther, in Meade or honied water, they be carefully ordered to sweate: it helpeth also to cleane all the deformities or discolourings of the skin, and the freckles and spots thereof: as well fresh, as dry; applyed to the region of the spleene, it easeth the hardnesse thereof: some also saith he gave the dried roote to them that are purse or short winded. *Matthiolus* saith that the distilled water from the rootes snuffed up into the nostrils, stayeth their bleeding wonderfully: and that if six ounces of that water be drunke wth an ounce of fine sugar, it will stay the blood that cometh from the breast, stomacke or Liver, in a wonderfull manner; or if any veine be broken in them, and this is his attestation: to hinder saith he, the violence thereof in purging, it is fit to mixe therewith some Malticke, or Nutmegge, or a scruple of Robarbe: many have been holpen of the hardnesse and swelling of the spleene, by the use thereof, which could not be holpen by other things: It easeth also the paines and torments in the bowels, which we call the chollicke; If saith he the roote hereof be beaten with a few Peach stone kernels, and bitter Almonds, and after laid to sleepe in *Aquavite* for three dayes: a drop or two of the expressed cream thereof dropped into the eares that are deafe or have much noise in them helpeth them: the iuyce mixed with honey or Plantane water, helpeth all manner of sores in the mouth or throate being gargled therewith, and the toothache also. *Dioscorides*, saith many of the same things, and besides that the decoction thereof healeth wounds, the running sores also in the head, bones, or members out of joynts kibes or chillblanes, and the Goute. *Pliny* saith the roote is good against the venome of Serpents, and that it will kill Swine, which is contrary to the received opinion of most, that they are delighted therewith, and greedily devour the rootes, after they have rooted them up, from whence came the name *Panis porcinus*, Sowbread: yet *Thalys*, saith the roote is fitter for Wolves, and Foxes then Swine, and that it is not to be inwardly taken, but by good advise and caution. *Dioscorides*, and *Pliny* from him say, that if a woman that is with child goe over a plant thereof, it will cause abortion that is, to be delivered before her time; but it is certainly knowne by many experiences that some of the fresh greene leaves, but much rather, the fresh roote which *Theophrastus* also affirmeth, put into a cloth and applyed for a little time to the secret parts of a woman, that is in fore hard and long travaile in child birth, hath holpen them to a speedy and easie delivery: the roote beaten and applyed with honey, draweth forth splinters &c. out of the flesh.

CHAP. XVIII.

Epimedium, Batten wort.

BArrenwort is a pretty shublike plant shooting forth sundry hard round stalkes, halfe a yard or two foote high, each stalk divided for the most part into three branches, and each of them bearing three leaves a peece, which are severally, somewhat broad and round, yet pointed at the endes, hard or dry in feeling, and a little sharply dented about the edges, of a light greene colour on the upper side and whiter underneath: from the middle of some of the stalkes of leaves, shooteth forth with them from the first rising up of them, a small long foote stalk of flowers not much higher then the stalkes of leaves, divided into branches, containing on each of them three flowers a peece, separated into foure parts, as if the flower consisted but of foure leaves, when as each part hath two leaves, one lying close upon another, the inner being yellow and smaller then the lower, which are red, so that the red edge appeareth round about the yellow, making it seeme a yellow flower of foure leaves with red edges: it hath also a few yellow threds in the middle, set with greene, the under side of the flowers, being of a yellowish red colour, stript with white lines, which being past, small long pods appere, with flattish red seede in them, the rootes are small and fibrous, hard and reddish spreading much underground, and delighteth best in shaddowy, rather then Sunny places; the sent of the plant is rather strong then pleasant.

Alterum Americanum magis fruticosum.

We have had brought us from some of the Northerne plantations of *America*, a certaine shrubby and woody plant, bringing forth thrice three leaves, composed in the same manner with the former, but each leafe was twice as bigge: but we never saw it beare any flower or fruite with us, nor did the plant long endure with us but by degrees grew weaker, and in the end utterly perished, so that I cannot determine it as I would, and we could never get the same kinde againe: but the *Hedera trifolia*, set forth in this Worke before, cometh somewhat neere thereunto, but yet is not the same, having onely three leaves at a place upon the stalkes, and not nine, that is thrise threes as that had,

The Place and Time.

Cesalpinus saith it groweth on the mountaines of Liguria, Camerarius neere unto Vicenzo in Italy, Bauhinus on the Euganean hills, and in Romania, in shadowy wet grounds, and flowreth from Iune, unto the middle of August.

The Names.

The *Epimedium* of *Dioscorides*, hath beene diversly interpreted by sundry writers, some taking it to be one thing, some another: for *Columna* in his *Phytobasanos*, tettereth the *Lunaria minor* for it, but surely erroneously, and saith that neither the *Hepatica trifolia*, nor that *Seseli Ethiopicum*, which is the *Libanotis Theophrasti* with us, which some in and before his time tooke to be it, can be it. *Bauhinus* would seeme to make *Thalium* to meane the *Caltha palustris* to be *Dodonæus* his *Epimedium*, when as I cannot finde in any of *Dodonæus* his workes, that he meant, or set forth any other *Epimedium* then this I here shew you. So that I hereby thinke *Bauhinus* was mistaken to quote *Thalium* to meane *Caltha*, and that *Thalium* also was mistaken in taking that herbe which he gathered as he saith in some place of the *Harcynia sylva*, and kept in his booke of dried herbes, that had foure round leaves a little dented about the edges, standing each upon a slender foore-stalke, and with a blacke tuberous roote to be *Epimedium Dodonæi*, which neither hath such round leaves, nor such a blacke tuberous roote. *Anguilara* it is thought, first entituled this *Epimedium* (which some in his time called *Lunaria*) whom all others that have set it forth since, have so called, and yet some make a doubt whether it be *Dioscorides* his or no. First in th three saith, *Epimedium* hath tenne or twelve leaves, when as the triplicity is so conspicuous, that it is a wonder he should omit that, if he meant this: againe he saith it beareth neither flower nor fruite, when as this giveth both, yet hereunto it is affirmed that *Dioscorides* might faile in this, as he did in *Dillanum* *Tussilago* *Cynoglossum*, &c. It is likely also that *Theophrastus* should meane this of *Dioscorides*, which in his seventh Booke and eighth Chapter, he calleth *Epimelrum* and saith it beareth no flowers, which *Pliny* calleth also *Epipetron*, and some *Epimenidium*.

The Vertues.

We have not any late experience hereof to shew but as *Dioscorides*, *Pliny* and *Galen*, have set downe of it, that it is moderately cold and moist, and without any speciall property more then to keepe womens breasts, from growing over great being made into a cataplasme, with oyle and applyed thereto: and that the report went that the roote would make women barren that tooke it inwardly, as also the leaves made into powdher and taken in Wine for sometime.

E. pimedum. Barrenwort.

CHAP. XIX.

Viola Lunaria seu *Bulbonach*.
The white Sattin flower.

Here are two sorts of this Sattin flower, one that dyeth after seede time, and another that abideth, both which I have so sufficiently declared in my former Booke, that I neede not further to amplifie them. I will therefore referre you thereunto, to be enformed of them, and onely here give you the figure of it.

Viola Lunaria seu *Bulbonach*. The white Sattin flower.

CHAP. XX.

Aquilegia, Columbines.

I Have shewed you in my former Booke so many sorts of Columbines, and of so many colours, both single and double, that I then thought there had beene no more to be set forth, yet since that time I have attained the knowledge of some others, which I thinke meete to expresse here, especially one out of *Virginia* with a single flower, which *Malter John Tradescant* brought from thence.

Aquilegia Virginiana flore rubescente precox. The early red Columbine of *Virginia*.

This *Virginian* sort differeth little from the ordinary single sort, but in these particulars: the stalk is as tall as some *Aquilegia*, although *Cornutus* make it a dwarfe and reddish, the leaves are smaller and somewhat like unto those of the *Thalictrum*, Meadow Rue, but of a paler Greene colour, the flowers are of a sad reddish colour, and single from the middle of them to the ends, but yellowish from thence to the bottomes, the ends of whose leaves are not blunt as in ours, but stiffe rough, and pointed, within which horned leaves there are five other smaller, and of a reddish colour also, their points bending downewards, having many small white threds in the middle, ript with yellow, after which come five pointed or horned feede vessels, with blacke shining feede in them: the roote is long with many fibres thereat. I here also give you the figure of the ordinary one, that you may see the difference.

Aquilegia flore pleno maculato diversorum colorum. Double party coloured Columbines of sundry colours.

As I before said, I shewed you all the varieties of colours that I then knew, but since I have seene and have some other sorts, as first a kinde of darke red, which we call a deroy colour, both single and double, and a double with white stripes therein, as is the party coloured blew, and white: then have wee a faire double red or crimlon colour, striped in the same manner with white: another spotted as well as striped, very thickely, and of a haire colour, double and striped as the rest: and another striped and sometimes spotted, of a lived colour, or betweene blacke and blew. Besides the starre or Rose Columbines party coloured purple and white, and red and white.

The Place and Time.

The first was brought out of *Virginia* by *Malter Tradescant*, and flowreth somewhat earlier then any of our Garden kinds usually by a moneth.

The Names.

I have shewed in my former Booke, the sundry opinions of Writers hereon, some referring it to one thing, some to another of the ancients: but *Cornutus* is definite upon the point, that it was not knowne. And to moove one

Aquilegia vulgaris simplex.
The ordinary single Columbine.

Aquilegia Virginiana flore rubescente.
The red Columbine of *Virginia*.

to thinke his sort that came from *Canada* (which as I take it is the same with ours of *Virginia*, howsoever he saith his scarfe rise a palme high) would by foulding the leaver, containe Water in them, and therefore would refferre the name to *Aquileges* that *Pliny* mentioneth, the pipes that convey water which containeth more conceit then verity.

The Vertues.

The leaves of Columbines are commonly used in lotions, for sore mouthes, and throates, which effect it worketh by the drying and binding quality therein. *Tragus* saith that a dramme of the seede taken in Wine with a little Saffron, doth open the obstructions of the Liver, and is good for the yellow jaundise, and adviseth that the parties after the taking thereof should be laid to sweate well in their beds. *Clusius* saith a Physitian in *Bruges* used the seede for women that were in foretravell of childe birth, to cause a speedie delivery, being taken in Wine, and a second draught to be taken, if the first did not the effect. *Camerarius* saith that diverse in *Spaine* did catea peece of the roote for many daies together, to helpe those that were troubled with the Stone in the reins and kidneys. Others doe use the decoction both of herbe and roote in Wine, putting thereto some Ambergrise, against these fwoounings that the Greekes call *hematuria*.

CHAP. XXI.

Hepatica nobilis sive trifolia, Noble Liverwort, or *Hepatica*.

Although I shewed you in my former Booke, all the sorts of *Hepatica* that then I knew, yet since Master *Tradescant*, found one other sort, as I take it growing in *Virginia*, and brought it home with him, which differeth somewhat from the other sort wee formerly had, this bearing very darke Greene leaves, and a small white flower, with a few white and not red threds in the middle, but because I had some of the figures by me, I thought good to exhibite them in this place.

Their *Place*, *Time*, *Names*, and *Vertues* are expressed in my former Booke, whereunto I referre you, but as I here shew you, there is little Physicall use made of them, else I would willingly have enlarged the properties here: these being more for pleasure to the senses then helps for any disease.

Hepatica nobilis sive trifolia simplex.
The ordinary single *Hepatica* or Liverwort.

Hepatica nobilis sive trifolia flore pleno.
Double *Hepatica* or Liverwort.

CHAP. XXII.

Chrysanthemum & Bupththalmum. Corne Marigolds, and Oxeye.

THere are sundry sorts of these Golds, or Corne Marigolds, to be entreated of here, some whereof grow plentifully enough, in our Cornefields, others being strangers, we have received from beyond Sea, and some I have set forth in my former Booke, whereof I thinke good to give you the figures, of some of them, and therewith of our garden Marigolds, and referre you to the Booke: and for the neere affinity betweene these and the *Bupththalmum*, I thinke it not amisse to joyne them here also.

1. *Chrysanthemum segetum nostras.* The Corne Marigold of our owne Country.
This Corne Marigold hath sundry tender pale greene herby stalkes, breaking forth into some few branches, with divers long blewish greene leaves, set without order on them, being narrow at the bottome, and broader at the end, cut in a little on both edges: the flowers grow singly at the toppe of every branch, being large, growing out of greene scaly heads, and of a shining yellow colour, both the thrumme and the border of leaves about it, each leaf being broad or flat pointed, and cut into three or foure parts, smelling a little sweete: the roote perisheth every yeare, and riseth from it owne sowing. *Matthiolus* hath set forth one of this sort, with leaves jagged like Feverfew. The chiefest difference in this from the former, consisteth in the leaves, which are whole small, long and round pointed like those of the Daylies.

2. *Chrysanthemum segetum Baticum.* Spanish Corne Marigold.
The stalkes hereof are harder and browner then of the former, and stand more upright, the leaves are greener and not so much divided or cut in on the edges, the flowers are not of so shining a yellow colour, but somewhat deeper yellow, the feede is small and whitish, and is bitter as the former is, although the herbe is sweete and eaten as a Sallet herbe, and herein consisteth the chiefest difference.

3. *Chrysanthemum tenuifolium Baticum Boetij.* Boet his Spanish Marigold.
In the leaves chiefly consisteth the greatest difference, betweene this and the last, for this hath sad greene leaves, very much jagged and cut into very small and fine pates, almost as small as Camomill, the flowers are yellow, and so like that but for the leaves, they could hardly be distinguished.

4. *Chrysanthemum Valentinum Clusij.* Clusius his Spanish Marigold.
Clusius his *Chrysanthemum* of *Valentia* in *Spain*, riseth up usually, but with one stalke of a foote high, parted into some branches, belet without order, with finer leaves then the last, but of a hoary colour. the flowers stand singly like the rest, and of a shining gold yellow colour, but unlike in this, that this hath no border of leaves at all about the middle head, but is bare and naked.

5. *Chrysanthemum Hispanicum Clusij.* The first Mountaine Corne Marigold of Clusius.
This hath many long leaves next the ground, resembling those of the white Wormewood, in the forme and

Chrysanthemum Craticum.
Candy Corne Marigold.

Calendula multiplex, & prolifera.
Double Marigolds, and Jacke snapes on horse backe.

Aaaaaa 3

divisions,

1. *Chrysanthemum segetum nostras.*
Corne Marigold of our owne Country.

4. *Chrysanthemum Valentium Clusj.*
Clusius his Spanish Corne Marigold.

5 6. *Chrysanthemum Alpinum primum & secundum Clusj.*
The first and second Mountain Corne Marigold of Clusius.

10. *Euphthalmum Matthioli seu vulgare Oxi-folij folijs.*
The more vulgar Oxe eye.

divisions, the stalks is a spanne high, set with finer cut leaves, and at the toppe many yellow flowers set together, like unto those of Raggewort, the roote hath many white fibres.

6. *Chrysanthemum Alpinum secundum Clusij.* *Clusij* his second Mountaine Corne Marigold.

The leaves of this sort is much more finely cut, most like unto thole of Southernwood, of a pale greene colour, and of no unpleasant flavour, but somewhat bitter in taste: the stalks are divided into some branches, bearing each of them one or two flowers, greater then Camomill flowers, and without sent, of a yellow colour wholly, both the middle and the border, the roote hath blackish fibres.

7. *Chrysanthemum tertium ejusdem.* His third Corne Marigold.

Differeth little from the second in the leaves, being as fine cut, but are longer, thicker and greater, and the flowers grow more together, and lesser then the former, and the roote hath white fibres.

8. *Chrysanthemum Hispanicum rotundioribus folijs.* *Spanish* round leaved Gold.

The greatest difference in this from the others, consisteth in the leaves, which are not divided at all, but are long and broad, somewhat round pointed, and onely dented about the edges, the flowers are greater than grow on the top of the branches and stalks, of a shining yellow colour, both border and middle thrum: the roote is woody, having many strings thereat.

9. *Chrysanthemum latifolium Brasiliannum.* Sweete Corne Marigold of *Brasill.*

This sweete Marigold springeth up with a stalk about halfe a yard high, somewhat rough and crested, having sundry leaves set thereon, of foure or five inches long, and two broad, compassing it at the bottome, and growing smaller to the end, somewhat dented about the edges, with sharpe dents, from the bosome of whom come forth somewhat long footstalks, sustaining each of them a faire yellow flower, set in a greene huske or cup, having seven or eight leaves for a border, dented at the ends, and compassing a middle thrumme, consisting of long threds, wherein afterwards lyeth the seede, very like unto the former *Spanish* kinde, the roote perisheth yearly in like manner, the herbe is so sweete that the Slugges and Snailles doe eat it above many other herbes in the Garden.

10. *Bupththalmum Matthioli sive vulgare Millefolij folijs.* The more vulgar Oxe eye

The more common *Bupththalmum*, with us, hath sundry faire greene leaves, divided very much into sundry other leaves, somewhat resembling common Yarrow, and so taken to be by diverse that looke but superficially thereon, but heedfully marked differeth plainly from it, the divisions not being so thicke or small, the stalks and branches stand not up so strongly as Yarrow, and at the toppes of them beare but single flowers, lesser then the Corne Marigold, but wholly of a deepe yellow, and not shining, the seede followeth in the thrumme, the roote is fibrous and perisheth yearly, or abiding the second yeare after the first sowing, which the Yarrow doth not.

11. *Bupththalmum alterum Cotula folio.* Camomill-like Oxe eye.

The weake sappy greene bending stalks hereof, grow two foote long sometimes, with fine Camomill-like leaves set dispersedly thereon, and the branches every of which beare a flower like unto the former Oxe eye, but the leaves hereof are somewhat larger, and fewer, and yellow, the middle thrumme being of a deeper colour, and somewhat hollow.

12. *Bupththalmum flore purpurascense.* Oxe eye with purplish flowers.

This Oxe eye with purplish flowers, differeth not much from the last, in the manner of growing, or forme of leaves and flowers, but herein chiefly, that the backe of the leaves of the flowers are either wholly purplish or else

11. *Bupththalmum alterum Cotula folio.*
Camomill-like Oxe eye.

12. *Bupththalmum flore purpurascense.*
Oxe eye with purplish flowers.

13. *Bupthalmum peregrinum* Alpino.
Shrubby Oxe eye.14. *Bupthalmum Africanum tenuifolium* Boelij.
Thinne leaved Oxe eye of Barbary.

purplish in the middle: the stalks also which in the other is Greene, is more reddish in this.

13. *Bupthalmum peregrinum* Alpino. Shrubby Oxe eye.
This strange Oxe eye riseth up with divers fireight, round, slender, darke Greene stalkes, three cubits high; branching forth into divers parts, whereon are many small fresh Greene leaves, much divided, and somewhat like to those of Fennell, the flowers are twice as large as those of Camomill, and wholly of a shining gold yellow colour, set in Greene heads or bushes, wherein afterwards the small long white seede is contained: the roote is long slender and blackish, abiding fresh and not perishing after seede time. *Alpinus* misliketh that of *Matthiolum*, because the leaves were not like Fennell, nor the flowers bigger then Camomill.

14. *Bupthalmum Africanum tenuifolium* Boelij. Thin leaved Oxe eye of Barbary.
Although *Alpinus* supposed that I had set forth the truest Oxe eye of *Dioscorides*, yet as you may see both by the figure and description of this I here give. His is in some things defective, and this in my opinion is the needfullest in all things therunto, it riseth up with one slender stalk, with divers long thinne leaves diversly parted, coming nearer unto Fennell then any before, bearing a large yellow flower at the toppe, where it brancheth forth, and beareth leaves and flowers on them likewise: the roote is full of strings, and perissheth after seede time.

The Place and Time.

The Corne Marigolds grow for the most part in the Corne fields, and about the borders of them, or where Corne hath bene sowne formerly, either in our owne land or in others, as by their titles are to be knowne. The Oxe eyes generally grow in the moister grounds, by water courses and the like, in other Countries; but in Gardens onely with us, where they are sowne, and carefully kept, and doe flower in the end of Summer.

The Names.

Xpouos *Depon* in Greeke, is *Chrysanthemum* in Latine: *ab aureo floris colore seu dictum*: there is much controversy among divers, concerning *Dioscorides* his *Chrysanthemum*, which he saith some called also *Bupthalmum*, because whatsoever he had said of *Chrysanthemum*, he said the same in the Chapter of *Bupthalmum*, thereby suspecting the Chapter of *Chrysanthemum* to be thrust into the worke of *Dioscorides*, by some others, and they are the more endued herunto, because neither *Pliny*, *Galen*, nor *Agineta*, make any mention of *Chrysanthemum*, but of *Bupthalmum* onely, as though they knew no other *Chrysanthemum*: but *Matthiolus* evidently cleereth the matter, shewing how *Dioscorides* by their severall markes, doth distinguish them, saying *Bupthalmum* hath Fennell like leaves, which he saith in *Chrysanthemum* are onely cut or jagged: againe the stalks of *Chrysanthemum*, are eaten as other herbes, which he doth not say of *Bupthalmum*: and lastly, the flowers of *Chrysanthemum* he saith are much shining, but he saith of *Bupthalmum*, that they are greater then of Camomill, besides the flowers of *Bupthalmum* made up with waxe, is a salve to dissolve swellings and knots, but of *Chrysanthemum* he saith, simply it discusseth that Impostume that hath like fat in it. There is no lesse doubt about his *Bupthalmum*, what herbe knowne thus should be the right, some taking the great white Daisie and *Fuchsium* and *Lonicernum*, the May weede to be the right, neither of which can be so, in that they are not all yellow, as *Dioscorides* saith *Bupthalmum* flowers are *Matthiolus* therefore hath set forth one, which is most commonly received by most to be the truest, although both *Lobel*, *Dodonaeus* and *Dalechampius* have set forth others, which they tooke to be rightest. The first here

here is called *Chrysanthemum* and *segetum* by all Writers almost, yet some and *Banbinus* with them call it *Bellis Insea*. The second hath no Authour before that expresseth it. The third is very likely to be the second sort of *Chrysanthemum Creticum* of *Clusius*, which *Banbinus* referreth to the *Achillea montana arthemisia tenuifolia facie* of *Lobel*, and the *Ageratum fernulaceum* of *Lugdunensis*, but neither of them truly. But the first *Chrysanthemum Creticum* of *Clusius*, I take to be that *Chrysanthemum Creticum* that I have set forth in my former Booke; and which *Gesner* in *hortis* calleth *Buphthalmum alterum partim candido partim laeo flore*: But *Besler* in *horto Eyst. tensi* *Chrysanthemum Creticum mixtum*. The fourth is the *Chrysanthemum Valentinum* of *Clusius*, which *Lugdunensis* setteth downe for the *Buphthalmum verum* *Dalechampi*, but *Clusius* mistaking him, tooke that he referred his *Valentinum* to *Matthiolus* his *Chrysanthemum*, and for it is a little bitter against him, but it was *Clusius* his oversight, for he saith this of *Dalechampi* is diverse from that of *Matthiolus*: *Clusius* his *Valentinum* is also referred to the *Buphthalmum Narbonense tenuifolium* of *Lobel* in his Observations, as *Banbinus* quoteth it, which *Cesalpini* calleth *Chrysanthemum alterum ex Sicilia*: The three next are *Clusius* his sorts of *Chrysanthemum Alpinum*, wherof as I said before, his second is very likely to be also this third sort here expressed, or very like it. The eighth is *Lugdunensis*, his *Chrysanthemum Myconi*, which hee saith the *Castilians* called *Giralda*. The ninth wee received by the same name that *Banbinus* calleth it by in his *Prodromus*, and is of *Brassill*. The tenth is generally called *Buphthalmum oculum bovis*, by most Writers, and taken to be that of *Dioscorides*, which he saith is called *Cachle* also, yet some entitle it also *Chrysanthemum*, as *Fuchsius*, *Cordus*, *Gesner*, and *Turner*. The eleventh is mentioned onely by *Cammerarius* in his *Matthiolus*, and by *Banbinus* after him. The last is called by *Lobel* *Buphthalmum folio & facie consule feride*, both in his *Adversaria* and *Icones*, and is the same with the *tenuifolium Narbonense*, in his Observations although *Banbinus* quoteth them as differing plants.

The Vertues.

I cannot finde that any Authour hath enlarged the properties of *Corne Marigold*, beyond that which *Dioscorides* hath set downe of it, which is to discusse that Impoistume, that hath like fat in it, and that it will helpe them that have the yellow jaundise, to have a good colour if they drinke it for some long time, continually after bathing. And of *Buphthalmum*, the Oxe eye, that the flowers made up with a cerore, doth discusse tumours, and hardnesse, and helpeth the jaundise (as he saith by heare say in both these) and to get a good colour, to drinke it after bathing by continuance.

CHAP. XXIII.

Tussilago montana. Mountaine Coltsfoote.

Here are two or three sorts of these Coltsfoote of the Mountaine to shew you in this Chapter.

1. *Tussilago Alpina folio glabro*. Smooth leaved Mountaine Coltsfoote.

The roote hereof creepeth under ground like the common Coltsfoote, and will almost spread as much ground, from whence spring sundry round leaves, each rising by it selfe, with a long footestalke under it, and are a little notched or waved about the edges, smooth, and of a darke Greene colour on the upper side, and not shining as the other, nor woolly underneath, among which riseth up some stalkes, a spanne long, with a small long leafe or two thereon, and a purplish flower at the toppe composed of threads which when it is ripe hath seede therein, that with the downe sticking to it, is carryed away with the winde.

2. *Tussilago Alpina folio canescente*. Hoary Mountaine Coltsfoote.

This other Coltsfoote differeth not in forme of leaves or flowers, being also purplish, nor in the manner of growe.

1. *Tussilago Alpina folio glabro*.
Smooth leaved Mountaine Coltsfoote.

2. *Tussilago Alpina folio canescente*.
Hoary mountaine Coltsfoote.

ing, but onely that the stalke is woolly, and the leaves hereof are very rough, and of a darker greene shining colour, on the upper side, and more hoary or very woolly underneath. *Clusius* giveth another figure also hereof, not that the one differeth from the other, but to shew the full open flower of the one, and the cloied and decaying of the other.

3. *Tussilago Alpina folio oblongo* Mountaine Coltsfoote with longer leaves.

This hath five or six somewhat long leaves, rising from a blacke roote, of the bignesse of ones little finger, with some fibres at ir, each set upon a long stalke of an unequall length, some longer then others, hard, rough, hairy, and of a darke greene colour, snipped about the edges, from whence riseth the stalke of a cubits heighr, set with two or three narrower leaves, branched sometimes with a large yelow mossie flower at the toppe, which being ripe, vanisheth with the winde.

The Place and Time.

These grow on the *Alpes* of *Austria*, and *Syria*, and elsewhere in *Germany*, and on Mount *Baldus* in *Italy*, and flower in *June* in their naturall places, but in *Aprill* and *May*, being transpoled into Gardens.

The Names.

These being but of late invention, have no other name imposed on them then the first finders gave them, which is *Tussilago Alpina*, for so *Clusius* doth entitle them, the first being his second, and my second his first, which *Clusius* as I said in the Chapter of *Asarum*, suspected to be the *Asarina* of *Matthiolus*, but assuredly was mistaken therein, for although he seeme to determine the question absolutely to be the same, yet he leaveth it for every one to judge as he list. The last is so termed by *B. rhinus* as it is set downe in the title.

The Vertues.

Although the forme of the leaves and flowers doe cause them to be referred to the Colts foote, yet it is not knowne, or at the least made knowne to us, of any the like faculties, any of them are endued withall, and therefore untill they can say more for themselves let them be held to be mutes.

CHAP. XXIV.

Arctium montanum quibusdam. A kinde of mountaine woolly plant or Beares wort.

THis plant hath diverse faire and somewhat large long leaves like unto Mullein, somewhat greene above, and hoary or very white below, and full of veines: the stalke is smooth and covered with much wooll, bearing one great head, scaly on the outside, but without any prickles, and with a yellow thrumme for the flower standing within it, which when it is ripe is by peece meale carryed away in the winde, with the seede hanging thereat, which is like unto Cummin seede, the roote is thicke long white and tender.

Arctium montanum quibusdam.
A kinde of woolly plant, or Beare wort.

Arctium ex codice Casareo.
Casar. booke *Arctium*.

I have hereunto put the figure that *Dodonæus* saith, hee tooke out of a Manuscript Herball of the Emperours, which whether he tooke to be true or no, he doth not set downe, but surely I thinke both this and all the others he rooke thence, are but *segmenta Botanologi cuiusdam calidi*, they are so artificially composed, although but rudely, according to the times exprest, like unto many others of this name, though much set by by others, for the heads, being so like unto burres, sheweth that he would frame it to a kinde of *Arceion*, a Burre, which differeth much from *Arction* or *Arcturon*.

The Place and Time.

This groweth among the Rockes, on the Mountaines in *Savoy*.

The Names.

It is taken by some to be the *ἀρκύριον* or *ἀρκύριον* of *Dioscorides*, *Galen*, and others, which *Pliny* also calleth *Arctium* and *Arcturum*, *Lugdunensis* onely doth exhibite this to view, under the name of *Arctium querundam*, which *Bauhinus* calleth *Lappa montana altera lanuginosa*: falling on the same rocke that others before him did, to put no difference betweene *Arceion* and *Arctium*, when as *Dioscorides*, hath so punctually divided them, for assuredly it is *planta sui generis*, and hath no fellow.

The Vertues.

If this be the true *Arctium* of *Dioscorides*, then he saith that the roote and seede boyled in Wine, will helpe the Toothache, if the decoction be held in the mouth: the same decoction is good for burnes, kibes, and chilblanes on the heeles and hands to be bathed therewith: it is also drunke with Wine against the paines of the Hip-gout or Sciatica, and the Strangury. *Galen* confirmeth the same things, saying it is of thin parts, and doth moderately dry and cleanse.

CHAP. XXV.

Melanthium sive Nigella. Nigella or Fennell flower.

Here be sundry sorts of *Nigella*, some sowne in Gardens, others growing wilde, most with single, and some with double flowers of the double sorts, and of the Spanish single kinde, I have spoken already in my former Booke, the rest shall follow here.

1. *Nigella Romana sive sativa. The Romane or sweete smelling Nigella.*

This sweete *Nigella* groweth up to be two foote high, with sundry slender branches, and many finely cut and divided leaves on them, almost as small as Fennell, and very like unto those of the Larkes heeles, at the top of every branch standeth one flower, made of five blew leaves laid abroad like a star, without any greene leaves under the flower, as in some single and another double blew sort, with a greene head in the middle, compassed with some few threds, which head groweth to be the seede vessell, being a little long and round, with five small short toppes like hornes, standing at the toppes of the heads, in which lye in severall cells, small blacke, and very sharpe sweete strong smelling seede: the roote is small threddy and yellow, perishing yearly.

1.3. *Nigella Romana sativa. & sylvestris, floribus nuda & foliis.*
The first Romane *Nigella*, and both the sorts of the wilde,

Nigella Hispanica.
Spanish *Nigella*.

2. *Nigella*

2. *Nigella sylvestris* five *Damascena inodora*. Wilde Damaske *Nigella*.

This *Nigella* groweth very like the former, for the greene leaves, but a little smaller and shorter, the flowers are blew, and like the former, but the head with seede is larger, and the hornes longer, the seede also within is blacke usually, but sometimes a little whitish, or yellowish, and without any sent at all. There is another of this sort as I take it, that differeth onely in bearing single white flowers and blacke seede without sent.

*Altera alba
flor.*

3. *Nigella arvensis*. Field *Nigella*.

This field sort is very like the last, but groweth thinner of branches and leaves, and they shorter also, the heads are smaller and longer, as the flowers are also but of a pale blew colour, the seede is blacke and without any sent. There is of this sort another, differing little from the other, but in the flowers that being single and blew like it, hath greene leaves under them, and the seede being blacke is somewhat sweete.

*Altera capi-
tibus folijs.*

4. *Nigella Cretica inodoro semine*. *Nigella* of Candy without sent in the seede.

This Candy *Nigella* groweth with fine cut leaves like the other, but of a darker greene colour: the flowers are small, and stand singly as others doe, at the toppes of the stalkes and branches, greenish at the first, but blewish afterwards, the ends of the leaves keeping a little greenenesse still in them, with many greenish threds in the middle, tipped with blew: the seede is blacke like others and without sent, that followeth in such like horned heads as others: the roote is fibrous yellowish and annual.

5. *Nigella Cretica latifolia odorata*. Candy *Nigella* with broad leaves, and sweete smelling seede.

This broad leaved *Nigella* riseth up from the yellowish, threddy and annual roote, with one slender weake stalk, divided into some branches, having long and divided leaves set thereon, but not of the forme of the other *Nigella*, which are fennell like, or Laikes purre like, but much broader and parted into divisions, somewhat like unto those of Groundsell, but cut into lesser and finer parts, at the toppes of each of the branches standeth a single white flower, like unto the other *Nigella*s, and heads somewhat like them succeeding, containing blacke seede also, but smelling sweetely.

6. *Nigella Cretica altera odorata tenuifolia*. Another sweete Candy *Nigella*.

The rootes of this Candy *Nigella*, are said to be harder then the rest, yet annual like them, the stalkes that rise from thence are many, upright and slender, parted into severall branches, with but few leaves set thereon, those below being not so finely minced as the former, that are upwards, having smaller yellowish white flowers, at the toppes of them, and cornered blacke seede, sharpe and somewhat sweete, contained in small biformed seede yefselor heads, like two small berries.

7. *Nigella Cretica odorata seminibus biforimis*. A sweete *Nigella* of Candy with double formed seedes.

This wonderfull kinde of *Nigella* (for so it is called) groweth from a small fibrous roote, with many slender stalkes, and few branches rising from them, not much above halfe a foote high, set with long winged leaves like those of Flaxe, opposite each to other, on a middle ribbe, at the toppes of each whereof standeth a large blew flower, somewhat like unto the flower of a Poppy, after which come five cornered heads, containing small blacke

4, 5, 6. *Nigella Cretica inodoro semine latifolia & tenuifolia odorata*. Candy *Nigella* without sent, and two other with sweet smelling seed.

7. *Nigella Cretica odorata folijs lini seminibus biforimis*. Sweete *Nigella* of Candy, with double formed seedes.

sweete smelling seede : but besides these at the joynting of the branches, come forth other sorts of seede clustring together like a bunch of grapes, which are whitish, nature thus providing it with a double issue, least it should faile.

8. *Nigella Citrina flore albo simplici.* Single white Nigella with yellowish seede.

Wee have also in our Gardens, another single sort of Nigella, that hath come among other seedes that hath beene sent from some of our friends beyond Sea, that differeth so little from the other usuall sorts, that it can hardly be discerned, except it be in the fresher greenesse of the leaves before it come to flower, which then is small like the third wild sort here set downe, but white : the heads also are small but formed alike, having smaller seede within them, not blacke as others are, but yellowish and without sent, and herein it is somewhat like unto the double white kinde, described in my former Booke.

The Place and Time.

The first is usually sown in Gardens even in Italy or else where, the other sorts grow wilde and in the fields of Corne in Italy, Candy, Germany, &c. they are all annuall to be sowne in the Spring, if they doe not sow themselves, and flower in June and July, giving ripe seede in August.

The Names.

It is called in Greeke *μελαστιν* and *μελανανθου*, *Melanthium* also in Latine, and *Nigella a nigro seminis colore* *u* *fertur*, and anciently called *Gith*, divers other ballarde names have beene given it, as *Salusandra* and *Papaver nigrum* from the Greeke word : all late Authours call them either *Melanthium* or *Nigella*, onely *Euchsin* and *Cordus* tooke it to be the *Cuminum sylvestre alterum* of *Dioscorides*. The Arabians call it *Xanim Sanis* or *Sunizi*. The Italians *Nigelle*, the Spaniards *Azenuz*, and *Niguillia*, the French *Poyfrette* and *Nielle*, the Germanes one sort *St. Katherinen blumen*, that is, *St. Katherines flower*, the wilde sorts *Schwartz Kummel*, and *Schwartz Remmich*, the Dutch *Nardus saer*, because they and others had a persuasion that the oyle made out of the seede was *Olenim Nardinum*. We call it in English either *Nigella* after the Latine, or *Fennell flower*, as I doe. For the understanding of the severall Authours of these : the first, second, and third, are mentioned by our later Writers, by those titles they have, or very neere them. The fourth is called by *Barbimus* *Nigella Cretica* simply, and by *C. Infus Melanthium Creticum* : The fifth is mentioned by *Pona* in his *Italia* *Baldus*, the seventh by *Alpinus* in his hooke of Exoticke plants. The sixt by *Pona* in his *Italian Baldus*. The last as I thinke is not mentioned by any Authour.

The Vertues.

The sweete smelling seedes are effectuall to many diseases, but the first kinde is onely used in medicines, the other that doe not smell well, are in a manner refused. *Galen* saith it is hot and dry in the third degree, and of thin parts, and thereby it helpeth to dry up rheumes and distillations from the head, being tyed in a cloath, and smelled unto, but being put into a cappe among other things for that purpose, it doth much good : being taken inwardly it expelleth winde, the wormes, and womens courtes ; it helpeth also the shortnesse of breath, and cleanseth the kidneyes of gravell, and the stone, and provoketh urine, being taken with honey, and is a remedy against poyson, and the biting of the Spider *Phalangium*, and the Scorpion, and as it is said encreaseth milke in womens breasts, being hoyled in Vinegar, it helpeth the tooth ache to be held in the mouth : the same used outwardly helpeth the faurie, freckles, spots, &c. in the skinne, and hard swellings also, and cleanseth the eyes : being burned, it driveth away flies, gnats, and the like, the seede was familiarly eaten in former times, being strawed on their bread, or put therein as Poppy seede was. *Alpinus* saith, that the use of the fifth sort is very effectuall, both in tertian, and quartane agues, to open obstructions especially, if the seede thereof be boyled with Vinegar and so taken, and killeth the wormes also.

CHAP. XXVI.

Pisum cordatum vesicarium. The bladder heartlike spotted Pease.

Although divers have diversly thought of this plant, some referring it to the kinde of *Halicacabum*, or *Alkakengi*, Winter Cherry, others to other plants, yet seeing it agreeth with none of them all, but in some one thing or other, in others, wanting some one thing or other. And because I could not finde a family whereinto I might thrust it, I have kept it for this place, untill some fellow may be found to match it with. Take therefore the description thereof thus. It riseth up and spreadeth much, if it have good ground to grow in, having sundry slender weake stalkes, which will lie down on the ground, and entangle it selfe with the claspers it hath, unlesse it be sustained with some stakes, sending forth large long, thinne, and very Greene leaves on all sides, upon long footestalkes, being divided either into three or five parts, each whereof is much rent or cut in on the edges : at the joynts with the leaves from the middle of the stalkes almost, upwards, and at the toppes of them likewise, come forth divers small whitish flowers set together upon a footestalke, each consisting of five small leaves apeece, which passe into small fruite, contained in round Greene bladders, growing more whitish as it ripeneth, having fixe ridges, whereof three are the more eminent, and open into three parts, in each whereof lyeth one round hard, blackish seede, of the bignesse of a great Pease, spotted on the side with a marke, of the forme of a white Hart, as it is usually set on the cards, or as some compare it to the shaven crowne of Monckes and Fryers, the roote is bushy or stringy, with many fibres thereat, yet perishing every year, at the first approach of a Winters day, whether it be ripe or no, and indeede I did never see it beare ripe fruite with us, no not in the hottest year that I have sowne it.

The Place and Time.

It hath come from Italy, and other parts beyond Sea, but surely even they have received it from other places also, nor doe I thinke it groweth naturally in any part of Europe, it bloweth as is said very late, and the seede ripeneth thereafter.

The Names.

Some as I said have referred it to the *Solanum vesicarium*, or *Halicacabum* of *Dioscorides*, and thereupon have called it, *Vesicaria peregrina*, or *Halicacabum peregrinum*, or repeats as *Tragus*, *Euchsin*, *Gesner*, *Mathiolus*, *Dodonaeus*

Bbbbbb

and

and others, but *Cordus* on *Dioscorides* earnestly striveth to make it the *Dorycnium* of *Dioscorides*, whereunto it seemeth he was led, not onely from the severall parts of the forme thereof, except the leaves, but also from the properties of the *keede*, which as hee saith, he tryed in himselfe to be dangerous in provoking sleepe, if too much should be taken, although as he saith it causeth a sweeter sleepe then *Opium*: but *Matthiolus* contesteth against him for this his opinion, but sheweth no reasons for it: *Dodonæus* misliking others opinions, bringeth in one of his owne, that this is *Serapio*, his *Abrong* or *Abrugi*, mentioned in his 153. Chapter, in these words: *Abrong*. It is a small graine spotted with blacke and white, and like unto the graine *Maize*: *Lobel* assenteth unto such of his friends as tooke it to be *Dioscorides* his *Isoptum*, whereunto it commeth neerer as he saith, then unto any sort of *Melanthium*, such as *Matthiolus* gave it for, or as *Dodonæus* in his French Herball, *Trifolium palustre*: but all alike, every one wanting some thing or other. *Lobel* calleth it therefore as it was usuall, *Cor Indum*, or *Pisum Indicum*, *Cordus granum cordis*, and *Tabermontanus* *Cardiasseron*: *Tragus* also saith it was called with them *Muncks Kopfflin* id est, *Monachi calvaria*, or as *Gesner* saith, *Caput Monachi*. *Lobel* also calleth it *Pisum Cordatum*, but *Ranbinus* putting it among the Pease, as a sort thereof, calleth it *Pisum vesicarium* fructu nigro alba maculata notato.

The Vertues.

Some assignatur would make it availeable for faintings and other diseases of the heart, but without experience as I thinke. *Cordus* saith as is before related, to be a great provoker to sleepe, even to the danger of life, if the quantity be not proportioned: I find not any of the other Authors that hath written of it, hath set downe any property they knew, or heard to be in it.

Pisum Cordatum vesicarium.
The bladder hart like spotted Pease.

CHAP. XXVII.

Delphinium sive Consolida regalis.
Larkes spurres or heeles.

Have in my former Booke shewed you all the sorts of Larkes spurres, both tame and wilde, both single and double, both simple and severall colours, and party coloured, that I have not any more to bring to your consideration: Yet I thinke good here to present you with some figures of them, that I had by mee, and with them a kinde of different *Nasturtium Indicum*, in the forme of the leaves, which *Lobel* had formerly set forth, taken as it is likely, to the life of the viewed plant, howsoever it hath bene since misliked by many others, who since his time have not obtained the like to see againe, yet that hindereth not much the verity of the thing, no more then the relation of *Hondius* the younger, of a white flower of this kinde, which wee have not as yet scene neither.

Delphinium sive Consolida regalis gigantea.
Wild Larkes Spurres.

Delphinium sive Consolida regalis latifolia.

CHAP. XXVIII.

Peonia. Peony.

Although in my former Booke I have shewed you some sorts of Peonies, which were the male; two sorts of double, and three of the female single, yet not all that are extant, those that wanted there shall be supplied here, with the Vertues more largely applyed. Of the male kinde I know but one sort, which is single and not double, howsoever *Besler in horto Eysketensi*, erroneously hath entituled many therewith, wherefore I thinke it not amisse to give you the figures of both sorts, that the rest may be knowne by them.

1. *Peonia femina Hispanica pumila.* The Spanish dwarfe Peony.

This dwarfe Spanish kinde as *Clusius* saith, rose with him from the seede he received thence, growing with leaves that were more finely cut into divers parts and more pointed also, Greene on the upper side, but not shining as others, and hoary white underneath, among which sprang slender pale Greene stalkes, lower then others, and at the toppes of each a smaller flower, made of eight leaves, of a more purplish colour, then the ordinary double Peony and as sweete, with many white threds tipt with yellow, standing about the middle bicorned head, which growing ripe, containeth within it, blackish blew seede: the roote is glandulous like other female Peonies but smaller.

2. *Peonia femina Aquilina folijs.* Columbine leaved Peony.

This hath sundry dissected leaves rising from the roote, which hath many long clogs hanging thereat; as other sorts of female Peonies have, parted into three divisions, each producing three rounder pointed short leaves then in any other, cut likewise in on the edges, of a pale Greene colour on the upper side, and woolly or hoary white underneath, so neerely representing Columbine leaves, that it will soone deceive one that is not well versed in these things, *Clusius* saith that *Hogeland* from whom he received the plant, which as then had not borne flowers and therefore could not describe them; signified unto him that it was a kinde of male Peony: but I thinke hee was therein deceived, the forme of the rootes being as others of the female kinde, contradicting that opinion.

3. *Peonia femina versicolor.* The party coloured Peony.

The difference of this from the others consisteth chiefly in the flowers, which are sometimes of a pale red, and sometimes of a deeper red colour wholly, and sometimes parted with both these colours, either to the halves, or with stripes and veins.

4. *Peonia femina Leucanthemos & Ochranthemos.* The female white and pale yellow Peony.

Both these sorts of Peonies I must deliver you but upon trust of others fidelity, that have related them, the white Peony

Bbbbbb a

Peony having two witnesses, the one *Belonius* in his Observations, the other *Honorius Bellus*, each of them attesting that in the Mountaine *Ida* in *Canay*, there groweth in great plenty, a white Peony, and *Honorius Bellus*, that in the whole Island there is no other sort of Peony to be found, but yet is a *promiscuous* or doubtfull sort, and yet since their time we have not heard of any hath enjoyed one of such a colour, unless *Besler in horto Eystetensi* should meane it that he calleth *Peonia mas flore albo*. But *Camerarius* saith that that which passeth under that title, is not perfitt white, but whitish with some rednesse among it, which maketh a faint blush colour. For the pale yellow, *Camerarius* also saith, that one by such a name he had out of the *Lantsgrave* of *Hessen* his Garden, but had not as then when he wrote thereof flowred with him, neither yet to this time that I write this, can I heare of any that hath it, but words enough I heare.

5. *Peonia femina promiscua*. The doubtfull female Peony.

Because the leaves of this Peony have some resemblance to those of the male, it caused *Lobel* to entitle it *Promiscua sive neutra*, saying, if you behold what growes above ground, you would say it were a male, but if the rootes underground, a female, and saith that *Pliny* made this the *mas*, but *Dodonæus* referreth it to the other sort, which hath longer and smaller rootes, calling it *femina altera*, whereby it is plaine that one of them was deceived therein also, & as I thinke a transposition of the figures in *Lobel*, for that figure in *Lobels Icones*, that beareth the title *Promiscua* is the first female in *Dodonæus*, which hee saith was most common with them, as it is with us, the other being brought in afterwards, which I thinke doth neerer resemble the leaves of the male, let the judicious consider this well, and gaine say it if it be erroneous, for although *Bauhinus* taketh *Dodonæus* his *femina altera*, to be the most common, yet surely I can not finde it so with those plants, that are the most common female in our Country, and so he doth *Besler* his error of divers sorts of the male, and of divers colours, and the white one likewise, among the rest, which he calleth *Peonia mas flore albo*: but as *Dodonæus* sheweth, *Dioscorides* doth plainly distinguish betwene the male and female Peony, first by the leaves, the male to be whole and not divided, but like unto those of the Walnut tree, and secondly in the rootes, that they are single and not glandulous, as is the female, which truth will utterly confound both *Besler* and *Bauhinus* opinions therein, and *Lobel* and *Camerarius* also, to make any *promiscua*, all the other sorts shewing themselves to be females by their rootes.

6. *Peonia femina simplici flore & pleno, ex femine floribus plenioribus vulgaris Clusio nate*.

Certaine single and double female Peonies, that sprang with *Clusius* of the seeds of the double red. *Clusius* saith that having in some yeares seeds from the ordinary double red Peony (which is not usuall) hee sowed them, and within three yeares he had plants that bore flowers, some single and some double: of the single sorts, one bore flowers for colour most like unto the mother, but was single, consisting onely of six leaves, as the ordinary female doth: Another bore a larger flower of eight leaves, whose colour was of a deeper red, drawing somewhat to blacknesse: A third bore a double flower, as great as the mother plant or greater, and of the same colour: but he had also as he saith another like the mother plant in leaves, &c. whose flower was double, but lesser and not so thicke of leaves, the colour whereof was of a deepe red, being neere the bignesse of the double blush, having some blacke veins in those leaves that grew in the middle.

Peonia femina vulgaris flore simplici.
The ordinary single female Peony.

Peonia femina flore pleno purpureo.
The ordinary double red Peony.

Peonia mas. The male Peony.

1. *Peonia pumila Hispanica.*
The dwarf Spanish Peony.

7. *Peonia femina flore pleno carneo major.* A greater double bluish Peony.

From Count Aremburg, and John Boissot, persons worthy of credit saith *Clusius*, I received intelligence, that at Brussels in the garden of the Lady Tisenac, who was the Presidents Widdow, they saw growing a bluish double Peony, greater then the ordinary, and as great as the ordinary double red, yet holding the naturall property of the other double bluish flower, which is to grow whiter by standing, and to hold the leaves without shedding for a long time.

The Place and Time.

The places of the most of them are declared in their titles, or descriptions, and their flowering, &c is about May, with the other sorts.

The Names.

It is called in Greeke *πεωνία* and *παιωνία*, in Latine also *Pæonia*, many other names are given it both in Greeke and Latine as *Pentorobos*, (yet some have it *Pentoboros*) *Orobolion*, *Hernaggon*, *Pæonion*, *Panthieraton*, *Theodonion*, *Selenion*, *Selenogonon*, *Pithis*, *Aglaophotis*, *Ideus dactylus*, and some others: in Latine also *Rosa farinaria*, *Herba Casta*, *Hastaregia*, *Rosa aspinarum*, and *Glycyfide* or *Dulcissida*, from the red grains in the P ingarner, called *Sida* in Greeke, but *Peonia* from *Pæon*, that famous Physitian in his time. And *Aglaophotis* from the shining rednesse of the red grains or feedes, from whence so many fabulous and detestable illusions of *Alianus* his *Aglaophotis*, and *Iosephus* his *Baciaras* are referred and reported of Peony, as may be seene in the Writings of the Auncients. *Tragus* sheweth that in his time the male Peony rootes were sold for *Dillamnus albus*, but I thinke *Tragus* was therein deceived, for I verily thinke they were the same white rootes which now are taken and called *Dillamnus albus*, when they are the rootes of the *Fraxinella* as I shewed before in that Chaptes, for the rootes of the male Peony are not so white as they, which confirmeth me the more herein, because *Tragus* saith, the leaves of that Peony which he tooke to be the male, had leaves like an Ash, or Licoris, and such are the *Fraxinella* leaves, which also himselfe describeth reasonable exactly, in the seventh Chapter of his first Booke, with *Dillamnus Cretensis*, but much mistaken in the sent to be like Cinamon, unlesse it be divers in the Rhyne tract from others. And I have shewed before also, that we want not couzeners, and deceivers, to sell the white rootes of the greater *Oenanthe*, for white Peony rootes. There needeth not any further explication of these sorts of Peonies, since *Clusius* hath made mention of all save one, and that *Camerarius* in *horto*, and *Belonius* doe expresse, which is the fourth. The Arabians call it *Feonia*, the Italians *Peonia*, the Spaniards *Rosa del monte*, and *Rosa Albardeira*, the French *Pivoine*, the Germanes *Peonien Rosen*, *Benedicten Rosen*, *Pfingst rosen*, *Königs blumen*, and *Gichmurtz*, the Dutch *Pioen ende Maest bloemen*, and we in English *Piony*, or *Peony*.

The Vertues.

It is saith *Galen* of thin parts, and drying, yet not very notably hot, but according to our owne symmetry, or constitution, or rather a little hotter, an astringent quality also, with some sweetnesse it hath, and some acrimony likewise, and bitternesse joyned together, whereby it is effectfull to procure womens courses, if the biggnesse

Bbbbbb 3

ness of an Almond, in powder be taken in honied Wine: by the acrimony and bitteresse therein, it is good to open the obstructions of the liver, and kidneyes, and the yellow jaundise and stone: and by the astringent quality to stay the fluxes of the belly; but the more effectually it the decoction thereof be taken, that is made with harsh or red Wine: by the notable drying quality therein also. faith he, I doubted not to helpe children therewith that had the falling sicknesse, by tying it about their neckes. And indeede I saw a childe freed from that disease, that had for eight whole moneths together, worne a good peece of the roote about him, and that as soone as that peece by some chance fell from about his necke, or was taken away for tryall of the matter, he fell into the disease againe: but having a fresh one applyed to him againe, he became perfectly well: the reason whereof may be, that the Spirits thereof drawne into the pores by the inward heate, and outward aire, pierced the places, effected with the disease, and cured it: for after the same manner doth the *Succum Cyrenaicum*, that is the best *Laser*, or *Laserpitium*, cure the uvula, or palate of the mouth as we call it, when it is false downe, or swolne through rheume: or as *Nigella* seede being fryed, and bound in a thinne warme linnen cloath, doth dry up the thinne and troublesome distillations of rheumes, by the hot breath thereof rising through the nostrils: as also if divers threds dyed in the purple fish colour, be bound about a Viper or Adders necke, and it thereby strangled, and they afterwards bound about their neckes that have swellings or other diseases in their neckes and throates, doe marvailously helpe them: these be *Galenus* words: but our age hath not onely found *Galenus* experiments true on children, the roote (of the male rather then the female, yea the male not the female, and that fresh and not dry, if you meane it should doe good) is to be hanged about their neckes, and that the decoction thereof is to be taken inwardly, to make it the more available, and that also in older persons, if the disease be not growne too old and past cure, for whom the roote of the male kinde washed cleane, stamped somewhat smill, and laid to infuse in a sufficient proportion of Sacke for twenty foure houres at the least, after strained, and given first and last, a good draught for sundry dayes together, before and after a full moone, cureth that sicknesse, if there be a due and orderly preparation of the body also, and with poset drinke made of Betony, &c. as the learned Physician can best appoint: the roote also is effectual for women that are not sufficiently cleansed after child-birth, and for such also as are troubled with the mother, for which likewise the blacke seed being beaten to powder is given in wine, the red seedes being taken for fluxes: the blacke also taken before bed time, and in the morning also is very effectual for such as are in their sleepe troubled with the disease called *Ephialtes*, or *Incubus*, which *Pliny* calleth *suppessio nocturna*, we usually call it the night mare, which is a suppressing both of voice and breath, and oppressing the body as it were, with some heavy burthen, striving to be eased thereof, but seeming not to be able nor to call for helpe, Melancholly persons being for the most part subject to this disease: it is also good against melancholly dreames, *Matthiolus* doubteth whether our Peony, be that which *Galen* used, because many Physicians as he faith in his time failed in the tryall thereof on young children, and I am in doubt that *Tragus* his male Peony spoken of here before, was that which they used, and then no marvaile if it proved not effectual as they expected, yet faith *Matthiolus* our Peony leedes is available to restore speech to those that have lost it, if thirty graines husked be made into powder and given in Wine: it is also faith he, good against the bitings of Serpents not onely to be drunke but to be laid on the bitten place, which thing *Tragus* faith of his male Peony, which as I shewed you before, is the *Fraxinella*. The distilled water or Syrupe made of the flowers, worketh to the same effects that the roote and seede is applyed before, although more weakely. The male kinde being to scarce a plant and possessed but by a few, and those great lovers of rarity in this kinde, and the Female being more frequent, the one is usually put instead of the other.

CHAP. XXIX.

Pappas sive *Battatas*. Potatoes.

Here are divers sorts of rootes that are called Potatoes with us, serving for toode or delight, more then for medicine whereof all that are truly knowne to us, what face or forme of leaves and flowers they beare are exprest in my former booke: there are many more of the same quality; besides others that serve in stead of bread, familiar to the Natives both of the East and West Indies, whose names or ely are extant in those Authours Workes that have written of them, without any further declaration either of forme or any property, but that the rootes are eaten by them, some being of better taste then others & longer lasting, among whom as I take it the *Igname* or *Inhame*, is a principall one, whereof *Scaliger* first, and *Clusius* afterwards, have given us the best information. *Clusius* saying it is also called by some *Camotes*, *A-motes* and *Aies*. All he faith of it is this, that some *Portugall* Ships that were taken by the *Hollanders*, had divers of these rootes in them some bigger then others: for some as he faith were as bigge as ones arme, and of a foote long or more, others lesser, and some thicke and short having some small tubers thrusting out at the lower parts of them, but all of them covered with an uneven and rugged barke, with many fibres at them: the substance of the roote within, being white, soft, sappy, tender, and as it were kernelly, and of no unpleasant taste (that is the raw roote for he faith he tasted it) at the first, but a little rough and sharpe afterwards: but being roasted under the embers it tasteth more tender then any Chestnut, and somewhat like a Pearre, but faith he what stalk or leafe it bore hee could not understand of any: onely he faith he received one that was sent him that had a sprout at the head of it, which was broken off in the carriage, as the figure here expresth it unto you, but *Lobel* in his *Adversaria*, faith he understood that those rootes of the *Inhame*, that were brought from *Ethiopia* and *Guiney*, bore Mallow-like leaves (and differeth from those of *Spain*, and the *Canary* Islands, which are our ordinary great Potatoes) and such like leaves doth *Lugdunensis* give to an *American* plant called *Heitch* whose roote is somewhat like it and edible. *Clusius* also speaketh of another sort of these *Inhames*, which as he faith some called *Team Pern*, but the *Portugals* *Inhame* as the former, which although it were like the other, yet the barke was more uneven, and some as it were some knobbes thereon, with small fibres going from them, and from the head of the roote, went but hard great stringes, of a foote long, which were prickly for the most part. *Clusius* seemeth to referre the *Virginia* Potatoes, to the *Arachidna* *Theophrasti*, and *Lugdunensis* faith some did the *Manihot*, and that this *Inhame* was referred

Battatas de Canada,
The Frenches Battatas, or Hierusalem Artichokes.

Battatas Virginiana.
Potatoes of Virginia.

Battatas Occidentalis Indica & Americana Orientalis Lusitanica,
The West Indian, and the Negroes Potatoes.

referred to Theophrastus his *Araco similis*. But Bashinus his *Ovingum*, or *Vingum*, and Oetumby Pliny, so variable are mens conceits, especially in things obscure or unknowne, or when they doe *raptim* without due consideration *sententium proferre*. But Scaliger *Exercitat.* 181. 17. seemeth to know three other sorts, besides the ordinary, which will abide good without perishing for a whole year, and therefore the Spaniards use to bring them to Sea with them, and call it *Igname cicovero*: the other will last nothing so long, whereof that which groweth in the Country of *Benim*, is of an excellent relish, but that of *Manicongo* is the worst, and that of *Saint Thome*, which is as yellow as a Carrot, is of most esteeme: the planting hereof saith he, is wonderful, for it is not done by putting the rootes into the ground, but a stalke taken therefrom cut in long peeces, and holding some barke thereon, and so thrust into the ground, will in five moneths be good to be gathered: it hath saith he, a leafe somewhat like unto that of the Citron tree, both in forme and luster, but smaller and thinner: it runneth on poles that are set for it like Hoppes: the roote like the Reede or Dragons hath foure or five suckers joynted to it: this manner of planting this *Inbame* favourereth something of that of the *Manihot* or *Lucca*, whereof the Cassavi is made: if there be not a mistake, it is wonderfull that two rootes should be so propagated.

C H A P. XXX.

Rosa Hiericonta. The Rose of Hiericho.

Here hath been observed two sorts of this small plant, called the Rose of Hiericho, the one accounted a wilde sort, and yet the one groweth in as barren places as the other.

1. *Rosa Hiericonta vulgo dicta.* The vulgar Rose of Hiericho.

The Rose of Hiericho is a small bushy plant growing full of woody brittle branchies, set in a round compasse, and sundry small leaves on them, farre lesser then those of the Willow, and more neere unto the Privet: the flowers stand thicke clustring together, made of foure white leaves growing out of long huskes, wherein afterwards is contained two small seede, the roote is long and woody. This is said to smell somewhat sweete, but I could never finde it so, and to taste somewhat sharpe.

2. *Rosa Hiericonta sylvestris.*

The wilde Rose of Hiericho.

The wild sort groweth in the same manner, as the former, but the woody stalkes are stiffer and harder to breake, and hath (as it is said) neither smell nor taste.

The Place and Time.

Both these sorts grow in Syria and Arabia, as Bellonius and Ranwolffius have observed in their traualles.

The Names.

It is called *Rosa de Hiericho*, and *Hiericonta*, and *Rosa Maria*, by all that have written of it, (the Monkes as Bellonius saith, being the first inventers, of the name, and of the superstitions they added to it, when as he saith he found none hereof growing about Hiericho, but onely in Arabia, in the desert land neere the red Sea) except Cordus and his Father before him, who tooke it to be *Amomum*, but saith *Antonius Musa* contraryed that opinion for divers respects, and yet hee contumaciously would uphold his fathers error, which sheweth how necessary it is to see the face of things growing as *Camerarius* and others, who having sowne the seede, doth say it doth in some sort represent a *Thlaspi*, having but a little sharpe taste in the branches onely and roote. *Ranwolffius* saith he found the other sort in Syria, growing among the rubbish, and on the houses, and therefore called it a wilde kinde. Cordus to put a distinction betweene these two sorts, called the former *Amomum*, and the later *Amomus*, comparing and fitting the description of *Amomum* in *Dioscorides*, unto the forme and parts thereof, yet how like soever he would make it, it commeth farre short of the true *Amomum*, as it is well knowne now adayes. Gerard on the contrary side would referre it to a Heath, who is as farre wide as the other.

The Vertues.

It is not found usefull in physicke for any respect that I can learne: this onely property is in it, that how dry soever the plant is, being brought from beyond Sea, yet if it be set in water for a while, it will dilate and open it selfe abroad, that all the inward parts may be distinctly observed how it groweth, and although the leaves are all lost, yet the seede and the vessels remaine, from whence if it be fresh, the seede taken hath growne, and will close up againe after a while, that it is taken out of the water, not as the superstitious Monkes, falsely fained that it did open miraculously, that night that our Saviour was borne, and that it would doe so in what house soever it is, when the woman with childe abiding therein, shall be neere her time of delivery: for with moysture as I said it will open, and not without it.

Rosa Hiericonta.

ARBORES,

ET

FRUTICES.

TREES AND SHRUBS.

CLASSIS DECIMASEXTA.

THE SIXTEENTH TRIBE.

CHAP. I.

Quercus. The Oke.

IN this Classis, I am to shew you all those kindes of Trees, whether they be tall and great, or lesser, usually called Shrubbcs, which grow naturally in these Countries of *Asia minor*, the hether part of *Africa*, best and longest knowne to us, and *Europe*, and that have not beene disperledly already spoken of heretofore: For the infinite kindes that grow in *Asia major*, the East India, and *America*, the West India, besides that we want the knowledge of the most of them; would furnish a capacious volume by themselves: and therefore in my last Classis I will onely give you a hint of some, either of best use, or best knowne, and in this, as I thinke is fittest, begin with the Oke.

The Trees that beare Acornes, called in Latine *Glandifera arbores*, doe comprehend five severall kindes, which are *Quercus*, *Ilex*, *Suber*, *Smilax* *Arcadum glandifera*, and *Phellodrys*, and for want of fit *English* names to sort unto each, we are forced to call them all Okes, and to distinguish them, give them severall epithites, according to their qualities. The *Quercus* or Oke is parted againe into five sorts, all of them having divided leaves, called first, *Platyphyllos* *Latifolia* *Quercus*, *Hemeris* five *Erymodrys* *Veriquercus* or *Robur*, *Phagos* *Esculus*, *Agilops* *Cerrus* *mus vel majore glande*, and *Haliphleas* *Cerrus* *femina* five *minore glande*: Of these and their severall species in this Chapter, and of the rest in the succeeding, every one in their order.

1. *Quercus latifolia*. The broad leaved Oke.

This Oke, which as I take it is the most common in our Land, groweth to be a great tree, and of long continuance, especially if it grow in a fertile soyle, the trunk or body whereof is covered with a thicke rough barke, full of chops and cliffs: the armes or boughes likewise are great, dispersing themselves farre abroad, and bluntly cut in or gashed about the edges, smooth, and of a shining Greene colour, whereon is often found a most sweete dew, somewhat clammy, and upon divers of them are found growing a round spongy substance, called an Oke Apple, whereof I shall speake more hereafter, among the sorts of excressences. It beareth small, yellowish mossie flowers, standing close together upon long stalkes, which wholly fall away in the beginning of the Spring. The fruite or Acornes rising up in sundry other places, upon short stalkes, two or three for the most part joynted together, whose outer rinde or skinne is browne being ripe and tough, the lower end being set or placed in a small rough hollow cup, the nut or kernell within being hard, cleaving into two parts, and of a reasonable sweete taste. The rootes are great, and spread farre and deepe, some thinking that they runne as deepe into the ground, as they grow high above it. The timber or wood is firme, strong tough and yellowish, with a smooth great graine, yet smoother and firmer in some places then in others, being the most durable either above ground or under, on the land, or in the water, beyond any other kind of timber almost, and enduring both moiture and drough above all: the outer part being called the sappe, is as all know whiter and lesse durable.

Some have made one or two sorts more of this kinde, one with greener, yet more hairy or woolly leaves, and with so many deepe cuts therein, that they seeme as curld thereby; another with a shorter leafe and more jagged at the bottome, both of them with smaller Acornes then the former. *Clusius* also saith that he found a dwarfe kinde hereof most likely, not farre from *Lisborne* not above a foote high, bearing broad leaves with sharper edges, whose acornes were as great as those of the common Oke, but very bitter, standing in a smoother cuppe, and saith also that on the hills neere the Straights or *Hercules* pillars, there are some growing that hold their green leaves all the Winter, and *Dalechampia* reporteth the same to be found on the *Apenine* hills, and those that are *reus*, called

Altera species.

Humilis.

Semper virens.

1. *Quercus nigra* flore & fructu ferax.
The Oke with the blossomes and Acornes.

1. *Quercus humilis*.
The dwarf Oke.

2. *Robur cum Galla majore rugosa*.
The greater rough Gall of the Gall tree.

2. *Galla major altera lenis*.
Another great Gall that is smooth, of the Gall tree.

called *Audes*, bordering on *France*, as *Pliny* out of *Theophrastus* speaketh of one in *Turino agrobi Sybaris fluit* that did not spring till Midsummer, and kept the greene leaves in the winter.

2. *Hemeris five Robur*. The strong or Gall Oke.

The strong or Gall Oke (call it which you will, for both names fit it well, the one from the Latine word *Robur* that is strength, and the other because it especially beareth Gallies) groweth not so high or great as the former, but shorter and more crooked, yet spreading faire branches, set with long leaves like the former, but more cut in on the edges, and hoary underneath: they flower and beare Ackornes like the former, but not so plentiful, and are greater, standing on longer stalkes, being sweeter also, besides which Ackornes, it beareth also a round woody substance which is called a Gall; the wood or timber hereof is hardly to be bored.

Of this kinde there are divers sorts some growing much lower then others, some having their leaves lesse cut in or jagged on the edges, and some bearing more of Gallies, others no Ackornes at all, some againe beare great Gallies, other smaller, some knobbed or bunched, others smooth: some of one fashion, others of another, and of colour some white, some reddish, others yellow, and some small and greene, which is the *Omphacium*.

3. *Phagus five Esculus*. The sweete Oke.

This sweete Oke called in Latine *Esculus* (ab *esca* vel *ab esu* because the Ackorne is the sweetest in taste, and fittest to be eaten of any) hath a short trunk or body in comparison of the first Oke, and like unto the Gall Oke; growing with thicker and more bushing branches, full of leaves which are thicker and narrower, and with more separate gashes, of a darke greene colour on the upper side, and whiter underneath: the Ackornes grow seldome two together on a short thicke stalk. Slenderer, more pointed and sticking faster in the rough prickly cuppes to the middle of them, but as I said is the sweetest of any other, comparing with the Chestnut, when it is roasted or sod, and in many places in *Spain*, serve for the poore to feede on as their daily food, and the Rich for junkets at their table, as we use to doe with fruit of all sorts, according to the time of the year, and will as much intoxicate the braine as Darnell in bread. There is another differing sort hereof, whose Ackorne is greater, and will more easily fall out of the cuppe, by reason of the heaviness of the Ackorne. They have in *Virginia* a goodly tall Oke, which they call the white Oke, because the baile is whiter then of others, whose leafe because it so neerely resembleth this sweete Oke, I have joyned with it, the Ackorne likewise, is not onely sweeter then others, but by boyling it long, it giveth an oyle which they keepe to supple their joynts.

4. *Agilops five Cerrus mas*. The male bitter Oke.

The male bitter Oke so called of the extreme bitterness of the Ackorne, seldome groweth where any habitable places, but most usually in great woods, and riseth up with a tall straight body, spreading large armes and branches, whereon grow thicke long leaves, with deeper gashes therein then in any other: the Ackorne is small short and blunt, and very bitter, almost wholly covered in the rough flat huske, which is set with sharpe prickles, of a grayish colour: the wood or timber is strong if it stand upright, and durable being kept dry, but in that it is of a looser substance it quickly rotteth, yet is a fit fiewell for coales and the fire, if it doe not require any great heate.

2. *Galla minor*.
The lesser Gall of the Gall tree.

3. *Phagus five Esculus nostras* & *Folium Quercus albe Virginiane*.
The sweete Oke, and a leafe of the white Oke of *Virginia*.

4. *Agilops five Cerrus mas majore glande.*
The male bitter Oke.

5. *Halophilos five Cerrus feminamini glande.*
The female bitter Oke.

divers through necessity eat of the Ackornes, notwithstanding the bitterness, but they doe engender much headache: Dyers also use this to strike a blacke colour, but it will hold lesse then that which is made with Galls by much.

5. *Halophilos five Cerrus femina.* The female bitter Oke.

This other bitter Oke (which from the Greeke name, might be called the thicke barkt Oke, or else from the thicknesse of the barked be reckoned a kinde of Corke tree, but that other things doe not agree thereunto) hath a reasonable tall thicke, but somewhat crooked body, covered with a very thicke ashy coloured grayish barke, having such short branches, that it seemeth as continually kept lopp and poled, the leaves are like to the male kinde, but narrower and longer, whose cuts or gashes are not so broad open being hard, rough, and of a darker greene colour: the Ackorne hereof is smaller then in any other, except the Scarlet Holme Oke, hereafter set forth, and is so short that it scarce sheweth it selfe out of the sharpe and prickly cuppe, like to the male kinde, and is almost as bitter, the wood or timber hereof is loose, weake, and soft, neither firme nor strong, whereby it is the more subject to putrefaction, and unfit for building, or any other but small worke.

There is another sort observed hereof in some woods, whose leaves are not so much gashed, and the Ackornes being greater, grow three or foure together, without any stalke, whose huske or cup is as sharpe and prickly as the other of these kindes.

The Place and Time.

The first Oke is the most generall throughout the land, growing on high or low grounds indifferently, yet flourish best in a fruitfull ground: the other kindes that I can heare of, are not growing any where with us, although there is some variety found in the timber of ours, some being of a finer graine, and smoother, shorter, and whiter wood, others a coarser graine, tougher, stronger and more coloured: but they are most frequent in Italy, Spaine, and other hot climates, their long catkins or bloomings come forth early in the Spring, and fall away for the most part, before the leaves doe come forth, the fruit or Ackornes are not ripe untill October.

The Names.

The Oke is called in Greeke *ἄγινος*, and is a generall word for all trees that beare Ackornes, as the Latines *Quercus* is, but more strictly taken, it signifieth this Oke, which is called by most in Greeke *αλφεινός*, in Latine *Lanifolia*, after *Jacq.* The Italians call it *Quercia*, the Spaniards *Quevigo*, the French *Chesne* and *Querne*. *Dodonaeus* calleth it *Hemeris quercum quasi sativa vel vobana*, and the second he calleth *ἄγινος* *glauca*, or *Robur*, when as the

Cerisifera glauca immatura.
The europe Ackorne of the female bitter Oke.

as the best Authors that I read make *Hemeris* to be *R. berr.* *Gaza* translateth it sometimes *Placida*, and sometimes *Quercus*. *Theophrastus* saith that the *Macedonians* in his time called it *ἐνυδρὸς Etymodrys*, and by *Gaza* *Veri quercus*, and of some *Quercus robur*, and *Galla arbor*: the *Italians* call it *Rovero*, the *Spaniards* *Euzina*, and some *Portugalls* *Carvall*, the *French* *Roble*, and *Roure*, in *Dutch* *Eyckenboom*. The third is called in *Greece* *φύλον Phagion* in *Latine* *Esculus*, *ἰνὸν τὸ φάγιον*, as the *Latines* doe abesse *velesu*: *Gaza* in translating this unto *Fagus*, according as *Pliny* had so done before him, hath bene the cause why so many have erred in taking this *Phagion* of *Theophrastus*, to be the *Fagus* of the *Latines*, which is in *Englisch* the *Beech tree*, when as they might plainly see that *Theophrastus* reckoneth it as a kinde of *Oke*, and that beareth the sweetest *Ackones*, but *Fagus* the *Beech tree* beareth no *Ackones*, but a three square not like a chestnut: The *Italians* call it *Eschia*, the *Romanes* *Esculo*, the *Spaniards* *Euzina*, and the *Ackornes* *Valotas*. The fourth is called in *Greece* *ἀγίλοψ Agilops*, of the *Macedonians* *ῥομερὶς Aspris*, in *Latine* *Cerrus*, or *Cerris* as some have it, yet *Pliny* maketh mention both of *Agilops* and *Cerrus*, some doe call it *Cerrus mas*, & *Cerris majore glande*, in comparison of the next, *Gerard* calleth it the *Holme Oke*, and his *Corrector* leteth it so passe, when as the *Ilex Coccigera* is more fitly to be so called, because the leaves thereof are much more like unto the *Holme* or *Holly bush*, then this is; the *Italians* call it *Cerro*, they of *Cyprus* *Sio*, and other places in the bottome of the Straights, call the *Ackornes* hereof *Galliones*: the Word *Agilops* doth also signifie a kinde of wilde *Oates*, as is declared before among the *Grasses*. The tall is called in *Greece* *ἁλὶ φάγιον ἡ ὑπερλας*, or as some read it *ἡ ὑπερλας*, in *Latine* also *Haliphlem*, but of most *Cerrus semina*, and of some *Cerrus minore glande*, *Gaza* translateth it *Salsicorea*, thinking it tooke the name from *ἅλς* which is *sal*, and *φάγιον cortex*, but the barke hereof is not more salt, but more thicke then others, and therefore it is derived from *ἅλς* and *φάγιον*, a cortice crassitudine, the *Italians* call it *Farnia*.

The fruite of the *Oke* is called in *Greece* *βάλανος Balanus*, in *Latine* *Glan*, but both *Greekes* and *Latines* respect the word to divers other frutes of trees, as *ἄλς ἡ βάλανος*, *Iovis glans* the *Walnut*, and *ἐκαστὴν βάλανος Glans Sardinia* the *Chestnut*, and *βάλανος δάρας Glans Phœnicea*, or *Palma* the *Date*, and *βάλανος ὑπερλας Balanus Azyriacus* *Glans unguentaria* or *Nux ben*, the oylie *Nut Ben*, in *Italian* *Chiade*, in *Spanish* *Bellotas*, in *French* *unguentaria*, in *Dutch* *Eekel*, in *Englisch* *Ackorne*, and *Malle*, which yet is said to be the fruite of the *Beech*, and some other trees. The cup or huske wherein the *Ackorne* standeth is called in *Greece* *κάλυξ Calyx*, in *Latine* *Calyx glandis* in the *Apothecaries* shops *Cupula glandis*.

The Vertues.

The leaves and barke of the *Okes*, and the *Ackorne* cups doe binde and dry very much, and are somewhat cold withall, but the *Ackornes* themselves are neither so cold nor so much binding, yea we have a generall received opinion that *Ackornes* in poulder drunke in wine are good to helpe stitches and paines in the sides, but they usually put a few bay berries unto them in the taking: the inner barke of the tree, and the thinn skinne that covereth the *Ackorne*, are most used in Physicke to stay the spitting of blood, and the bloody flux: the decoction of that barke and the poulder of the cups doe stay vomitings or castings, spitting of blood, or bleeding at the mouth or other fluxe of blood in man or woman, askes also, and the involuntary fluxe of naturall feede: the *Ackornes* in poulder taken in wine, provoketh urine, and resisteth the poyson of venomous creatures, and the decoction of them and the barke made in milke and taken resisteth the force of poysonous herbes, and medicines, as also the virulency of *Cantharides*, when as by eating them, the bladder is exulcerated, and they piss blood. *Hippocrates* saith he used the fumes of the *Oken* leaves to women that were troubled with the strangling of the mother: and *Galen* saith he applyed them being bruised to one that had a wound with an axe or hatchet, not having any thing else neere at hand, and thereby fodered up the wound, and kept it from inflammation. The cup of the *Ackornes* are more binding then the *Ackornes* by much in any thing. The distilled water of the *Oken* buds before they breake out into leaves, is good to be used either inwardly or outwardly to assuage inflammations, and to stay all manner of fluxes in man or woman. The same water is singular good in pettilentiall and hot burning fevers, for it resisteth the force of the infection and alayeth the extreame heate: the same water also drunke as *Matthiolus* saith, coolth the heate of the Liver, weakeneth the stone in the kidneys, and stayeth womens couries: the decoction of the leaves worketh the same effects. The water that is found in the hollow places of old *Okes* is very effectuall against any foule or spreading scabbe: the *Ackornes* saith *Galen* being eaten are hard of digestion, breede windinesse, cause headache and a kinde of giddinesse, to avoid such inconveniences they are boyled or roasted, before they be eaten, and thereby they become lesse windy and more pleasant, yet it is extant by the testimony of *Historians* and *Poets*, that the elder age before it knew the use of corne and bread thereof, lived upon *Ackornes* and were sustained thereby, yea they had the *Oke* in that honour that they dedicated it to *Jupiter*, especially that kinde called *Esculus*, because that *Jupiter* himselfe sed thereon and was nourished by them, and the use of them is not every where yet utterly extinguished, for that as I said before, the poore people in *Spaine* in some places, make these *Ackornes* a part of their feeding, and the rich have them served to their Tables for an after courtes, as with us is used with *Apples*, *Nuts*, and such like frutes as the seasons require. There is said to be a great Antipathy, betweene the *Oke* and the *Olive*, as also betweene the *Oke* and the *Walnut*, the one not to grow neere where the other is planted: the cuppes of the sweete *Oke* or *Ackorne*, as *Belonius* saith in his Booke of Observations, are used in *Greece* and *Asia* the lesse, and *Natolia* to tanne or thicken their raw hides, as our *Tanners* use to doe with *Oken* barke, and I doe not thinke but the cuppes of our *Ackornes* would doe as much, if any would make the tryall. He also saith that the *Turkes* in *Macedonia* and other places in *Turkie*, use the leaves of *Sumach* for the same purpose, and they of *Egypt* and *Arabia*, use the cods of *Acacia*, the prickly binding tree, they of *Phrygia* and *Lesbos*, the barke of the *Pitch tree*, and they of *Illyria*, the leaves of the *Mirtle tree*, that beareth blacke berries: so that it seemeth many things may worke that effect, seeing every Country taketh that which is familiar to it.

CHAP. II.

Excreffentia Quercuum. The Excreffences of these Okes.

Here are a great many things that ore:de upon sundry of these Okes, some of one fashion some of another, and so in substance likewise, soft or hard, besides the Oke Apple and the Gall, whereof I intend to speake first. I have given you the description of the tree in the Chapter last going before this. I will but onely shew you here the diversities of the Gallies, and the good uses they are put unto for medicine, or other purposes, and I cannot understand that any of the other former kindes doe beare Gallies but those that are here set downe by the name of *Robur*, which is the second sort: for although divers of them have a shew of Gallies, which made *Pliny* to say that all Ackorne bearing trees, bring Gallies likewise, yet they are but spongy balls for the most part, and none so good and hard Gallies as they.

*Debita
de Baulm*

1. *Galla
curvis
troua
quercu.*

3. *Aquosa.
4. capilla-
ta.
5. Echina-
ta.
6. Lurata.*

7. *Sessilis.*

8. *Foliosa.*

The Gallies are of two sorts, smooth, and rugged or knobbed, both of them round and hard almost as wood, but all a little hollow within, and when they are dry, are either whitish or yellowish, but while they are Greene and fresh upon the trees they are somewhat soft and tender, and reddish towards the Sunne side: all of them stand close to the branches, and stalkes without order, and sometimes one joyning close to another, without any stalk under them. There is also a blacke Gall as bigge as an apple, sometimes full of a Rosin like fatnesse, which will flame being set on fire.

The Oke apple groweth upon sundry sorts of these trees, and not on any one alone, for although in our Country ours are for the most part round and soft, being fresh and full of waterish substance, but being dried do shrinke and are wrinkled, yet in other places some are found sticking to the backe of the leaves, and containe in them a cleere water and flies therein, and are white, and as if were transparent before they be dry and grow hard.

Others are called *Capitata*, because they are all hairy, and containe within them a hony like liquor in the Spring time, yet not put to any use.

One I had out of *Virginia* with round hard rough or prickly balls on the leaves.

Others are called *Lanata*, for that within an hard huske or shell, they containe certaine flockes of wooll, which are fit for Lampes, but not without oyle or other unctuous matter as *Pliny* saith it will.

They that are called *Sessilis* grow under the joynts, at the setting to of the leaves close to them without any stalk, the navell being white, and a little swelling forth, and sometimes of sundry colours, and sometimes blacke, and shining red in the middle: being hollow within, with a putride vacuity.

They are called *Foliosa*, or *Fouisse*, that are made as it were of scaly leaves, like unto the head of the Knapweed that groweth wild abroad in the fieldes.

1. *Quercus cum pilula sive in galea excremento.*

The Oke with the Oke Apple.

Quercus Excrementa.

The Oke Excreffences.

Another thing groweth on the branches under the leaves, that is like unto the cuppe or huske that containeth 9. *Gallæ.*
the flower of the Pomegranet or such like.

Sometimes there hath bene small soft stones found like pumice stones, yet not often seene.

A round thing also hath bene found, which *Theophrastus* calleth *Sycaminodes*, and is somewhat like unto a Mulberry, differing onely in the colour, hardnesse to be broken, and the harsh taste.

Another thing also like to the privy members of a man, both the yard and the testicles.

There is againe another thing found growing there on like a pricke in the beginning, called by him but afterwards growing hard, taketh the forme of a Bulles head with a hole in it, and being broken hath like an Olive stone within it. Nitar also as *Theophrastus* saith, is made of the ashes of the Oke, which *Pliny* altereth in this manner: It is certaine that the ashes of the burnt Oke is like unto Nitar, he saith, *Cinerem nitrosum*, and *Gaza* translate it after *Pliny* in the same words.

The Acornes of *Esculus* the sweete Oke, and of *Cerrus femina*, the female bitter Oke, have certaine small stones sometimes found in them, either at the end of the Acorne, or on the shell, and sometimes in the nut it selfe.

The Oke also beareth a *Cachrys*, which *Theophrastus* in his third Booke and seventh Chapter, expoundeth to be a round conception or gathering together of leaves, growing betweene the last yeares shoothe, and the young bud for the next to come. *Cachrys* also as *Dioscorides* sheweth in the Chapter of *Libanotis*, is the seede of the fruite bearing *Libanotis*, which burneth the tongue being chewed: but *Pliny* being deceived by this double acception of the word, confoundeth them both together, and maketh them both but one thing, saying *lib. 16. c. 8.* the Oke beareth *Cachrys*, which is a small ball that hath the property of a cauteriall medicine: but *Theophrastus* sheweth in the place before set downe, that the Firre tree, Larch, Pitch, Line, Nut and Plane trees, doe beare a *Cachrys* after the leaves are fallne, abiding on all the Winter.

There is growing on the Okes in *Cilicia* as *Dioscorides* saith in the 43. Chapter of his fourth Booke a *Coccus* or graine, which the women there gather with their mouthes, and is like unto small Cockles or Snayles: this seemeth not the same, which he in the same Chapter calleth *Coccus Baphica*, and groweth on a small shrubbe, &c. as *alvica*. you shall understand hereafter: but some learned Writers have taken them to be both one, namely the Scarlet graine, gathered from the lesser Holme Oke: but surely *Dioscorides* meaneth another kind of graine, which from the use in Dying was called *Coccus*, and may peradventure be the same that *Marthialis* saith he saw growing about the bodies of great Okes in *Bohemia*, not farre from *Poggibrot*, in a Hare Warren of the Emperours, which was neglected there and lost, but was carefully kept in *Polonia*, where it groweth alto: or else that which *Lobel* speaketh of in the end of the Chapter of the Scarlet graine, which he saith groweth in the middle of the leaves, and on the bodies also sometimes of Okes, which graine is bigger then the other, and is round, reddish or yellowish, and which he also saith groweth on the Okes, in the Woods by *Bassit* in *Germany*, and in divers other places of *Italy*, *France*, and *Germany*.

There are sundry Mosses also growing on these Okes, some sweete and some not, whereof I have spoken already among the Mosses: as also some Mushromes mentioned among the Mushromes, whereof it is needefulle to speake further here: but there groweth at the rootes of old Okes in the Spring time, and sometimes also in the very heate of Summer, a peculiar kinde of Mushrome or Excreffence, called *Vva quercina*, swelling out of the earth, many growing one close unto another, of the fashion of a grape, and therefore tooke the name, The Oke grape, and is of a purplish colour on the outside, and white within like milke, and in the end of Summer becometh hard or Woody.

There is a certaine venomous Serpent called *Drymus*, taking his name from the place of his breeding and chiefe abiding, which is the rootes of Okes. *Theophrastus*, *Dioscorides*, *Galen*, *Nicander*, and *Etius*, have all made mention of the wondrous venomous quality of this Worme or Serpent, and of the cure of the poyson.

The worme named *Rance araucedine forte*, breed in the rootes of Okes: and so doe those called *Galbe*, but especially on the *Esculus* or sweete Oke.

There is lastly found in our owne Land, a browne kinde of Gumme growing on Okes, which Master *Edward Hassellwood* found in *Nottinghamshire*, and sent some of it to me.

There are also found growing upon Okes, Misseito, Pöllipody, Agaricke, Mushromes of sundry formes and substances, as *Tonchwood*, &c. And the two first figures expressed in the Table, are of a differing forme from others. Manna also, or a kinde thereof, which we call in *English* a hony dew, found more plentifully on the Oken leaves then on any other trees: but because they are not peculiar onely to the Okes, but grow upon other trees also, and that I have spoken of most of them in other places of this Worke, I forbear further to mention them here, leaving the rest that have not yet bene entred off, to their fit places.

Their Place and Time are sufficiently expressed in their descriptions, and so are their Names also, saving that the Gall it selfe is called in Greeke *γάλλη*, and in Latine *Galla*, whereof one kinde fit for medicines is called *Omphacitis* both

19. *Vva quercina*. The Oke grape.

24. *Fungi peculiare*.

both in Greeke and Latine, not that it is an unripe Gall, but that it hath more acerbity and stipticity in it, then the greater and the yellower have: the Oke Apple also is called of most Writers *Pilula Quercus*, *Galla viridis* also, and *Mollis*.

The Vertues.

The small Gall called *Omphacitis* is dry in the third degree, and cold in the second as *Galen* saith, and being a sowre harsh medicine is fit to draw together, and fasten faint and loose parts, as the overgrowing in the flesh: it repelleth and dryeth up rheumes, and such like fluxes, by staying them effectually, especially those that fall upon the gummies, almonds of the throate, and other places of the mouth: the other whiter Gall doth also binde and dry, but so much lesse then the former, by how much it hath a lesser quality of sowre harshnesse in it, and is good against the dysentery or bloody Flix: the decoction of them in water is of a meane striction: but in Wine is stronger, and in harsh or red Wine stronger then it: if women sit in or over this decoction being warme, that are troubled with the falling downe of the mother, it will helpe them: the Gallies themselves after the boyling, being bruised and applyed to the fundament that isalne downe, or that hath any hot swelling or inflammation doth wonderfully helpe them: the coales of them when they are burned and quenched hot in Wine or Vinegar, are good to be applyed to stanch bleedings in any place, they also dye the haire blacke, and with them is made our writing incke, and the Dyers a blacke Dye as all know: the Oke Apple is much of the nature of the Gall, yet inferior thereunto, but may be used in the want of Gallies, for rheumes, fluxes, and such other like diseases, and that to good purpose. *Matthiolus* reciteth a tale of his Country *Italians*, as *Gerard* doth of our *Kentish* men, as much to one purpose, saying that *Matthiolus* hath it of Gallies, and *Gerard* of Oke Apples, but both a like true, as are a number of such prognosticating tales, of *Saint Pauls* day, and *Saint Swithens* day, and the like, which favour more of Paganisme then Christianity, to drive us from the confidence of Gods providence, to relye on such vaine and weake signes, or speculations, and yet maintained stiffely by a great many, which is that in the Gall (in the Oke Apple saith *Gerard*) there breedeth three small creatures, which will prognosticate the course of the succeeding year (in every Country, for the Gall or the Oke Apple doth grow I thinke in every Country) if a Flye saith *Matthiolus*, it presageth Warre, if an Ant saith *Gerard*, plenty of graine: if a creeping Worme be found in the Gall saith *Matthiolus*, it foretellethe scarcity of victuals: if a white worme like a magot saith *Gerard*, a murraine of beasts and cattle: but if a Spider say they both, there will follow a pestilence or mortality: but least I grow too tedious in this discourse, little pertinent to this our History of Herbes, I must passe no further, but leave it to every man as his minde is affected, and to God the Judge of all mens affections. The Oke grape doth binde all fluxes, whether of blood or humours, and preferred by some, before either Gall or Oke Apple, especially by *Encelius*, who is the first that I know hath written of it. Most of the rest of these Excressences are seldome used, but those that are, have the same quality of binding that the Gall or Oke Apple hath. The red graine that is found on the Okes in *Polonia*, and other places, is altogether used by the Dyers, but not used in any medicine, by any that I have read or heard.

CHAP. III.

Viscum. Misselto.

Because the best Misselto groweth upon Okes sometimes, but more usually on other trees, I thought good to entreate hereof next unto the Gall, and the other excressences of the Oke, yet in a Chapter by it selfe, not onely for the causes before alledged, but for that there are some varieties found herein.

1. *Viscum vulgare.* The ordinary Misselto.

Misselto riseth up from the branch or arme of the tree whereon it groweth with a woody stemme, parting it selfe into sundry branches, and they spreading againe into many other smaller twiggies, enterlacing themselves one within another, very much covered with a grayish Greene bark, having two leavies set at every joynt or knot and at the end like wise, which are somewhat long and narrow, small at the bottome but broader toward the end: at the knots or joynts of the boughes and branches, grow small yellowish flowers, which turne into small round white transparent berries, three or foure together, full of a glutinous moisture, with a blackish seede in every of them, which was never yet knowne to spring, being put into the ground or any where else to grow.

Pollicarion.

Camerarius maketh mention of one sort hereof, that had many more berries growing together at a knot, then the former, but not to differ in any thing else.

Baccis rubra.

Clusius and *Bellonius* have each of them recorded in their writings, to have found Misselto growing on Olive trees in sundry places, both in *Spaine* and in *Turkie*, that bore red berries not varying much in any other thing, but it maketh the trees barren that hath it growing on them.

2. *Viscum Indicum.* The Misselto of India.

The Indian trees Excressence (which for want of a fitter name was called Misselto because it groweth on their trees) doth as it were runne or creepe upon the boughes, shooting up sundry whitish Greene stalkes with foure or five joynts thereon, like to those of Grasses, but without any leafe at them, saving at the very toppe, where groweth one large leafe like the Misselto leafe, but twice as great thicke and fleshy as it, with sixe round circles on either side of the middle ribbe toward the upper end: from the bottome likewise of each of these leaves riseth up a long spiked head of small leaves as it were, which abide Greene all Winter long.

3. *Viscum Peruvianum.* Misselto of Peru.

This other strange plant also, that is referred to the Misselto groweth like a bush of small rush like spriggies with broad scales foulded one over another at the bottome, as broad as ones hand, where it is fastened to the branch whereon it groweth, with small rootes like those of Onions, but ending in small points, all which doe encompassse an hollow reddish striped branched stalk, two or three cubits high, representing the chaffie tuft or care of Oates, for the fashion, but *Asclepias* for the bignesse, and the silken downe with small seede therein like *Coryza*, of a salty unpleasant taste like Niter, perhaps taken from the Sea side it feedeth.

The

1. *Viscus quercinus*.
Mistletoe of the Oke.

2. *Viscum Indicum & Poliococcon*.
The Mistletoe of India, and that with many berries together.

The Place and Time;

The first groweth very rarely on Oakes with us, but upon sundry other as well timber as fruit trees, plentifully in Woods, Groves, and the like, in all the Land, but that with many berries in Germany, &c. the other two grow in the West Indies, from whence onely some branch or other was brought by a friend. Our Mistletoe flowereth in the Spring time, but the berries be not ripe untill October, and abide on the branches all the Winter, unless the Blacke birds, and other birds doe devour them.

The Names.

It is called in Greeke *ἰξ* by *Dioscorides*, and so is the Birdlime made thereof also, and *ἰξ* by *Theophrastus* who saith also that in *Euboea* it is called *Stelia*, and in *Arcadia* *Hypbear*: yet lib. 3. c. 16. of his History, he saith that *Stelia* groweth on the North side of the *Ilex*, and *Hypbear* on the South, & so they differed one from another in some thing, which he hath no where exprest, in Latine *Viscum* and *Viscum*, and to also the Birdlime made of the berries, as are all these sorts called by a'l Writers, that have written either of the two last, since *Lobel*, with their severall adjunctes. The *Arabians* call it *Debach*, *Dabach* and *Hale*, the *Italians* *Vischio*, the *Spaniards* *Liga mordago*, the *French* *Guy*, the *Germanes* *Mistel*, and *Eichen mistel* and *Vogeltem*, the *Dutch* *Marentacken*, and we in *English* Mistletoe. There are sundry controversies to be decided about this *Viscum*, first whether it be produced from its owne seed or no, for many have held that Blacke birds eating the berries and lying in their bellies, by dunging on the trees the seede hath thereby beene made the fitter to grow, which else is not, and so doth *Pliny* from *Theophrastus* set it downe, *turdus sibi exitium facit*, that the Blacke birds voydeth that whereby it is brought to death, but it is since found by experience, that there is no shew of seed in that dung, they voyde upon the trees or elsew here, being wholly altered in their bellies before the voyding, and further that Mistletoe groweth on trees from their owne superfluous moisture, which made *Iov* the Poet to call it *Sudor quercus*, even as *Galles* doe, and *Oke Apples* from other sort of Oakes, and have no seede of their owne, and to this purpose *Virgil* sexto *Aeneidos* saith:

*Quale solet sylvis brumali frigore, Viscum
Frons virere nova, quod non sua seminat arbor.*

Theophrastus also saith that the Mistletoe looseth the leaves in Winter if it grow on those trees that shed their leaves then: but holdeth them growing on ever greene trees, the reason whereof saith he is the tenacious humidity in the one, which the other wanteth: but the experience of our times hath shewed that it keepeth the leaves

Ccccc 3

fresh

3. *Viscum Peruvianum*.
Mistletoe of Peru.

fresh and Greene in Winter, when the trees whereon they grow have not any of their owne leaves left on them in these parts of Europe generally. Secondly about *Ixor* and *Ixia*, whether they be both one thing, *Dioscorides* calleth both the bush and the Birdlime made thereof by one name *Ixor*, as the Latines doe *Uiscum*, as you heard before, and saith further that it is also found on the rootes of other shrubs which cannot be understood of the Mistletoe, to grow from other shrubs, but is meant of that kinde of Gumme or glee called *Ixor Viscum*, that is gathered from the rootes of the white Chameleon Thistle, as is shewed before in the Chapter of the Chameleon Thistle, but *Ixia* cannot be understood to be either Mistletoe, or the Birdlime made thereof, which is called *Ixor*, as is before said, although *Dodonæus* doth much insist upon it, because the qualities of Birdlime are dangerous to be taken inwardly, for as I shewed in that Chapter of *Chameleon*, *Ixia* is either the roote of the blacke Chameleon Thistle, which *Galen* saith is very pernicious, or another very like it as *Columna* thinketh.

The Vertues.

Mistletoe is hot and dry in the third degree, the leaves and berries doe heate and dry, and are of subtil parts, for some acrimony is in them, which overcome the bitterness, the Birdlime doth mollifie hard knots, tumours, and Imposthumes, ripeneth and dissolveth them, and draweth forth thicke as well as thinn humours, from the remote places of the body, digesting and separating them: but is not of that property to heate suddainely, but after some time as *Thapsia* doth, and being mixed with equall parts of Rosin and waxe doth mollifie the hardness of the spleene, and healeth old ulcers and sores: being mixed with Sanderack and Orment, helpeth to draw of foule nailes, and if quicklime and Wine lees be added thereunto it worketh the stronger. The Mistletoe it selfe of the Oke as the best, (or of the Cheenut tree as *Matthiolus* saith to be as good) made into pouther, and given in drinke unto those that have the falling sicknesse, doth heale them as *Matthiolus* saith, and that he had tryed it and healed many assuredly: but it is fit to use it forty dayes together: and with this caution, that the wood after it is broken from the tree, doe not touch the ground, which is in my minde too superstitious, as is their conceit also, that it hath power against Witchcraft, and the illusion of Sathan, and for that purpose, use to hang a peece thereof at their childrens neckes: *Gentilis Fulginas* and others have so highly esteemed of the vertues hereof, that they have called it *Lignum sanctæ crucis*, believing it to helpe the falling sicknesse, Appoplexy, and Palsie very speedily, not onely to be inwardly taken, but to be hung at their neckes, and some to hang it at their neckes, or weare it on their arme to helpe them to conceive: and saith *Matthiolus* I have knowne ignorant empirickes, to have given the Birdlime made into pills to persons to swallow instead of the wood: and further saith that he knew the Mistletoe that grew on a Pear tree, given to one that had the parts of his body drawne together, to doe him much good and divers doe esteeme of the Mistletoe that groweth on Hassell nuts, or Peares, as effectuell as that on the Oke, so it touch not the ground, for the falling sicknesse, to be taken in Wine. *Tragus* saith that the fresh wood of any Mistletoe bruised, and the jayce drawne forth, and dropped into the eares that have Imposthumes in them, doth helpe and ease them within a few dayes: the leaves are often given to cattell saith *Pliny*, to fatten them and purge them first: but if they be diseased they cannot continue long, this manner of curing them lasteth for forty dayes in Summer.

CHAP. IV.

Ilex. The Holme Oke.

Of these Holme Oks there are three sorts, two that are great trees, and the third a small shrubbe, whose descriptions I meane to give you in this Chapter, and because there are divers Excessences growing upon these Oks, which are not found upon any of the other: I thinke it fit to entreate of them in a Chapter by themselves, that so they may be the better understood of all, and I the more scope to handle them.

1. *Ilex major aculeata*. The greater prickly Holme Oke.

This groweth usually to be a very great tree, yet sometimes groweth not so high, covered with a blackish red barke, as are also the boughes and branches, spreading farre abroad like unto a meane Oke: the leaves are like unto the Oke tree, but somewhat lesser and rounder, with prickly edges especially in the younger trees, which are wholly prickly, but in the elder doe grow smooth on the edges without prickles, Greene above and grayish underneath, which do alwayes abide Greene: the yellow mossie catkins stand at the toppes of the branches upon long footestalkes like to those of the Oke, and fall away in the same manner: the fruite or Acorne commeth not where the flowers stood, but in other places on the branches, upon short stalkes inclosed in a rough cuppe like a common Acorne, in some places bigger then the others, and shorter also, very pleasant in some places, that many delight much to eat them: the wood or timber is of a brownish red colour and very hard, not easie for an Axe, but for a Saw to cut it: the coales whereof are very durable above others: the roote groweth very deepe into the ground, and spreadeth much likewise.

2. *Ilex major non aculeata*. The great smooth Holme Oke.

This other or smooth kinde riseth also to be a great tree equal to the former, and like thereunto in stocke or body, barke, branches, flowers and fruite, onely the leaves hereof are longer and narrower, pointed at the ends, and not prickly on the edges, but finely snipt or dented onely, some what rough underneath, and Greene and smooth above: the timber likewise being as hard and heavy as the former.

3. *Ilex aquifolia sive Coccigera*. The lesser or Scarlet Holme Oke.

The lesser Holme Oke or Scarlet Holme Oke, is a small tree in manner of a hedge tree, the stocke or body whereof at the bottome is seldome bigger then of an old Rose tree, and that if it be suffered to grow without pruning: the branches are faire and many, three or foure foote high, covered with a pale reddish barke, having many small thicke and fresh Greene leaves set thereon, but hard and very prickly on the edges like unto the leaves of Holly, yet farre lesse and abide alwayes Greene as the former doe: it beareth yellow flowers like the other but smaller, and smaller Acornes also, more bitter and pointed at the end, and almost wholly covered with a very sharpe prickly huske.

1, 2. *Ilex major aculeata* & *absque aculeis*.
The great Holme Oke with prickles and without.

3. *Ilex aquifolium* *coccifera*, *um glandifera* & *Coccoloba*.
The Scarlet Oke with Achornes, and the graine.

ly huske or cup, but thus it doth onely when it is neglected, and not pruned and cut low, to canie it beare the Scarlet graine more plentifully, as shall be shewed hereafter, and which else it would not doe.

The Place and Time.

The first is more plentifull in *Spain* and *France* then the second and the second in *Italy* where the first is scarce found: they grow also in divers other Countreys, and are planted for the rarity in sundry places in this Land, one whereof may be seene in the Kings privy Garden at White Hall, just against the backe gate that openeth in o the High street over against the Tennis Court there, which both flowreth and beareth fruite, as my selfe can witnesse, who have gathered the Acornes under the tree, which *Cleopatra* not observing when he was here, doubted to be barren: the lesser groweth in many places as, *Spain*, *Portugall*, *Italy*, and *Provence* in *France*, in *Africa* likewise and *Asia*, both the greater and the lesser, as *Armenia*, *Cilicia*, *Syria*, *Pisidia* and *Galatia*, in *Candy* also, as *Bellonius* hath recorded, and in *Virginia*, *New England*, &c. likewise: they all flower although divers doe deny it, in *May*, and their fruite is ripe in the end of *September*: The Scarlet graine cometh forth in the middle of *April*, and is gathered in the end of *May*, and in *June*.

The Names.

Ilex is called in Greeke *αἰξ* & *quia serra propter duritiem secunda sit*. Some called it in Latine *Ilex major*, and *Ilex arbor*, and *Ilex glandifera*, because the lesser is called *Ilex coccifera* or *coccigera*. The first is called *Ilex major spinosa*, or *aculeata*. The second non *spinosa* or *aculeata*, and simply *Ilex* by *Matthiolus*, *Lugdunensis* and others, and *Ilex arborea* by *Lobel*, all which *Rauhinum* transferreth to the first. *Clusius* taketh it to be *Smilax Arcadium* *Theophrasti*, but *Theophrastus* maketh the timber of *Smilax* to be soft and easie to be wrought on, but the timber of this is as hard as the former. The last is called *Prinos* by *Theophrastus*, indifferently with the first, by *Dioscorides* *ῥῖνος* & *ῥῖνος* *Coccum Baphica*, and so be callth also the graine, in Latine *Ilex aquifolia*, and *Ilex coccifera* or *Coccigera*, and some *Phellodry coccifera*, in Spanis *Coccoloba*, taking the name from *Cuscutum*, one of the names given by *Pliny* thereunto. The Acorne of the first is called in Greeke *αἰξ*, and *Acylam* and from hence cometh the word *Acylaca*, which *Bellonius* maketh mention in sundry places to beare Acornes, in Spanis *Bellota*, and *Abellota*.

The Vertues.

The greene leaves of this Holme Oke, as *Galen* saith, have a greater force to coole binde and dry, then have the leaves of any other Okes: being beaten and applyed they are good against loft swellings, and strengthen weak members as *Dioscorides* saith: the rootes hereof bruised and laid on the hurts that the Serpent *Drymus* hath made, is very good to repress the venome, and to stay the paines that come thereby. The Acornes of this *Ilex*, which *Hipocrates* calleth *Acylon*, and of the first Oke, and *Phagus* of the sweete Oke, either fresh or roasted doe binde the belly, but if they be boyled they do lesse: the young rootes boyled in wine or water, till they be tender, and then made into a pulvis and applyed to any place burned or scalded doth helpe it: the Acornes of these greater Okes are generally eaten in *Spain* where they grow, of the Rich as well as poore, in the same manner that they doe with

with the Acornes of *Phagus* or *Esculus* the Sweete Oke. The *Ilex* or Holme Oke, as *Pliny* and other Authours make mention, is of an eternall durability or not decaying in many hundreds of yeares, he reciteth one that made almost a wood alone, divided into ten bodies or trees, and contained thirty five foote in compass, and each of a large greatnesse: and of another that grew on the *Vatican*, that was older then the City of *Rome* it selfe: the Crowne or Garland that was given to a Citizen, for any worthy act in former times, was made of the branches of this tree, although afterwards it was made of *Esculus* that was dedicated to *Jupiter*, the properties of the lesser Holme Oke, are chiefly remaining in the berries, of the juyce whereof you shall heare in the following Chapter.

CHAP. V.

Illicum excrecentia. The Excressences of the Holme Okes.

Here are five severall Excressences growing on these Holme Oke, differing from the former, and none of them found upon any of the other Okes, which are fitly reserved for this place, as you shall finde them set downe in order: and first of the scarlet graine as the most worthy.

1. *Chermes seu Coccus infestiorum.* The Scarlet graine.

This graine or berry (is not the proper suite of the lesser Holme Oke, for that is an Acorne as the others have) is a kinde of Excressence that nature thrusteth forth upon this tree, while the branches are young and not growne old or neglected and not pruned, which then grow barren, and with few or none upon it, and groweth all along the branches at the severall joynts and foote stalkes of the leaves, being as big as a Pease, of a reddish aske colour, before they are ripe, but of the colour of the Holly, or *Asparagus* berries, when they are ripe or somewhat darker, but are gathered for the most part before they be too ripe, when as they will containe within them a cleere juyce of a crimson colour, as deepe as any pure fresh blood, which by the heate of the Sunne breedeth small red wormes little bigger then fleas at the first, but being suffered to grow great, consume the inner substance of the berry or graine, creeping away and leaving the huske or shell empty, which empty shells are the *Kermes* berries that are found in the Apothecaries and Druggists shoppes every where, and which made *Matthiolus* who never saw them growing, to thinke that they were not the true *Chermes* of *Dioscorides*, but some other kinde of berry, because *Dioscorides* saith that they are like unto Lentils: before these are ripe, or that any wormes are bred in them, they are gathered for the Apothecaries use, that make the soveraigne cordiall confection called *Alkermes*, which is *cordi amica*, and presse forth the juyce, which being boyled up with a proportion of Sugar, fit to preserve it from fowring, is kept for a whole yeare after: but when they are somewhat more ripe, yet before the wormes are ready to breake the shell to runne away, they are gathered for the Dyers use to dye fine Scarlet cloath withall, and are brought into powder in this manner. When these graines or berries are gathered in their fit time, they cast them on a sheete or other such thing, sprinkling them with a little Wine or Vinegar, borne up from the ground by the sides or foure corners, and set them in the hot Sunne who feeling the heate of the Sunne begin to stirre, and would creepe away, but that one that is appointed to looke to them, with a small wand or sticke by striking the sides of the sheete causeth them to fall downe into the middle againe which worke is continued so long untill they be all dead, and dried sufficient with the heate of the Sunne, and are afterwards brought to the market and sold to the Merchants, that will buy them. Some doe this in a bagge or boulder, shaking them in the Sunne, or drying them in an oven. *Tellonius* sheweth the way that they use in *Candy*, is to make two sorts of Dyes of them, the one of the pulpe the other of the bladders or shells and because the pulpe maketh the richer Dye it is sold at foure times the deerer rate.

2. There is also found upon the branches of the greater Holme Oke, scatteringly here and there, and nothing so plentifully as in the other, certaine small round graines of a darke red colour which for the most part are neglected and so soft.

3. There is likewise found a kind of grayish Masse made like unto a small long bush or locke consisting of grayish hoary haire but not sweete.

4. There is a gum also found sticking to the Acornes of the great Holme Oke, which is somewhat hot in taste, but not unpleasent.

5. *Theophrastus* maketh mention of *Hypbear*, to grow as well as *Missilto*, on the *Ilex*, and that on the Southside thereof, which cannot be but a differing thing from *Missilto*.

The Place and Time.

The place of growing of these berries, hath bene set downe in the Chapter before, and they beginne to appeare in *April*, and are gathered in *May*, the best in *Greece*, *Italy*, *Spain* and *France*, and are chiefly seene in the Summer.

The Names.

The Scarlet graine is called by *Theophrastus* in Greeke *κόκκος* *Coccus* *Phenicea*, by *Dioscorides* *κόκκος* and *κόκκος* *Baphica*, in Latine of *Pliny*, *Granum*, *Coccum*, *Quisquilium*, *Cusculium*, *Scoletium*, and *Vermiculum*, as also *Hyssinum* both by him and *Pitruvius* taken from the word *Hys*, whereby as *Pausanias* saith the *Galatians* beyond *Phrigia* did call it, of the latter Writers, *Coccus infestiorum*, *Granum infestiorum*: in shoppes *Grana tinctorum*, and *Chermes* or *Kermes*, and *Grana kermes* after the Arabian name, by the Italians *Grana tintori*, in Spanish *Grana de tintoreros* and *Grana en grano*, in French *Vermillon*, and *Graine de scarlate*, by the Germanes *Scarlackbeer*, and in English the Scarlet graine, or *Chermes berry*. The second is called *Granum lignum*. The third *Muscus lignus*. The fourth *Gummi lignum*. And the last as is said *Hypbear*.

The Vertues.

The Scarlet graine is used to heale greene wounds, and sinewes that are cut, to be mixed with vinegar or Oxymell, and is much commended and given by the later Physitians to women with child, who by infirmity or other casualty are subject to miscarry with their children, by untimely travell and birth: but especially the confection which is called *Alkermes*, which is made of the juyce of these berries is effectuall for that purpose, and is also a soveraigne

Soveraigne Cordiall to strengthen and revive the fainting spirits of the heart, and to drive away melancholly. This confection also is dayly commended and used with good effect, against the trembling and shaking of the heart and against swoonings; it is often used likewise against Melancholly passions and sorrow proceeding of no evident cause, and to procure mirth as much as Physicall meanes may effect, but there hath bene formerly many errors committed in the composition of this confection, first in the *Lapis Lazuli* (first put in by *Mesue* the Arabian against Melancholly) some condemning the use of it, and some fearing the operation thereof by forcibly purging Melancholly, have wholly left it out, and others have put it in, but without that due preparation it ought to have: a second error is concerning the filke that is appointed to be put into it, some taking crimson filke dyed as our Dyes use it, which may be dangerous in that they use divers things to strike that Dye that is not safe to be used inwardly, and therefore some used to draw a tincture out of the dried berries: but our later age hath appointed a safer course, namely to steepe the raw cods of filke that hath felt no art passe upon them in the true juice of the *Chermes* berries, wherewith being imbibed and sufficiently tinted, the joyce after boyling and straining, is then fit to be used to make this confection: a third error rose from *Dodonæus*, that mistooke *Sericam*, and made it *Seta*, whose error Doctor *Priest*, that translated him into *English* did follow, and gave occasion to *Gerard* so to publish it so in his Herball, in that *Gerard* received that translation from Mr. *Norton* to finish: a fourth error hath risen from the Monckes that wrote Commentaries upon *Mesue*, who affirmed that that kinde of Crimson graine that is gathered from the rootes of Burnet is this *Kermes* of the Arabians, but *Matthiolum* hath confuted their opinion sufficiently: a fifth error is in many mens mistaking *Cocheneille* (a certaine graine or rather flye knowne but of late dayes, and brought from *America*;) for *Kermes*, of ancient and speciall use with the old Arabian and Greeke Writers: but now all these errors being taken away, men may safely repose confidence in the goodnesse of this confection, the faithfull preparations of the ingredients hereof, as well as of other compositions, being so carefully overseene by the guardians of the Apothecaries, since they were joyned into a corporation, that it may justly now compare (who were farre behinde before) with the most famous and expect in the art wheresoever: the berries that are found on the great Holme Oke saith *Matthiolum*, being bruised with vinegar, are good to be applied to Greene wounds and put also into those eyes that are blood-shotten doe much good: the other excellences are not put to any use that I know.

CHAP. VI.

Suber. The Corke tree.

F the Corke tree there are three sorts observed by divers, which yet may well be reduced into two; in that the difference is not fit in my minde to make a speciall sort as you shall here.

1. *Suber latifolium*. The broad leaved Corke tree.

The broad leaved Corke tree, groweth to be a great tree in many places, but not so high as the *Ilex* or Holme Oke, nor so farre spread, but with a thicker body, and fewer boughes, yet in some places it groweth much lower, for *Pliny* said it was a small tree: the leaves hereof are very like unto the leaves of the *Ilex*, but usually greater, broader and more prickly then those of the elder Holme Okes, and in most places abide alwayes Greene on the trees, but in some few doe fall away, as the ordinary Okes doe, which therefore being but peculiar to few, cannot I thinke constitute another species. The flowers are like the other Okes, and the Ackornes smaller then those of the *Ilex*, softer also as it were spongy and more unpleasant, standing in very rough prickly cups: the barke hereof is very thicke, rugged and full of chits if it grow too long upon the tree, and will cleave and fall off of it selfe by peecemeale: but being taken in due time, that is every third yeare, the new barke will appeare very red, as if it were painted, and if any raine should happen in the barking time, they would all wither and dye, but the Country men doe carefully observe a fit time for that purpose, and when they have taken it away they bring it to the fire to make plaine and flat, and let it lye thereon untill it be thorow hot, which then with weights they presse untill it be cold which so abideth afterwards: the timber or wood hereof is strong and fit to build withall, for *Pliny* saith, it doth *tardissime cariem vestire* asque sentire, abide longest without rotting.

2. *Suber angustifolium*.

The narrow leaved Corke tree.

This other Corke tree is like unto the former, growing to be a great tree, spread abroad with many armes and branches which are more pliant and easie to be bowed, whereon grow longer, narrower and sharper pointed leaves then the former but not ended or prickly on the edges at all: in all other things it is like unto the former.

The Place and Time.

The first groweth in many places of Greece, Spaine, Portugal (where in some places it groweth low) in Italy also

and France, the other sort whereof that loseth the leaves in Winter, groweth in Aquitaine neere the Pyrenean hills where Theophrastus did observe it to grow: the other about Pisa more plentifull then any where else in Tuscany as Marthiolus saith: although Pliny denyeth any *Suber* to grow in Italy or France, they flower and beare their fruite later then other Okes.

The Names.

The tree is called in Greeke *φύλλον* *Phellon*, in Latine *Suber*, and *Ilex femina* of some as Pliny saith. The first is by Marthiolus, Lobel, and others called *Suber latifolium*, but that whose leaves fall in Winter (which Bauhinus maketh another species, but he might as well make the low one of Pliny to be another sort likewise) *Suber Aquitanicum folio deciduo*. The other is called *Suber angustifolium* by the said Aithours. The Italians call it *Sugaro*, the Spaniards *Alcornoque*, and the barke *Corcha* or *alcornoque*, the French *Liege*, but surely this is not that *Liege* that Bellonius saith the fruite is edible, the Germanes *Pantoffelhout*, and *Ulohon*, the Dutch *Corke*, as we doe.

The Vertues.

The Corke hath a manifest drying and binding faculty, more as it is thought then the barke of any other Oke: the ashes of the burnt Corke stancheth any fluxe of blood, whether in men or women as Severinus saith:

Quacunque fluit vis immoderata cruoris.

Being drunke in Wine or any other convenient drinke. Corke is profitably used for many purposes to stoppe all sorts of vessels, to peise fishermens nets, and to be put into shoes and slippers to keepe our feete warme and dry.

CHAP. VII.

Smilax Archadum major glandifera. The great Laurell Oke.

Noto the kindes of *Ilex* divers have joyned this *Smilax* for some likeness, but differing in more, being unknowne to many of our moderne Writers for they still understood the Yew tree to be meant by this name, and no other: of this there are two sorts, one greater and the other lesser, both which shall be shewed in this Chapter.

1. *Smilax Archadum glandifera major.* The greater Laurell Oke.

This greater kinde riseth up to a reasonable height like an indifferent tall tree, covered with a grayish smooth barke, and the younger branches, with an hoary soft downe, the leaves are very like unto Bay leaves, or as Theophrastus saith like unto the smooth *Ilex*, being Greene above, and with a soft white woolliness underneath, without any dents or prickles on the edges: it beareth yellow flowers on long stalkes as all other Okes doe, and fall away in like manner bearing small Acornes like the great Oke.

2. *Smilax glandifera minor.*

The lesser Laurell Oke.

The lesser sort that never groweth high, but ever remaineth like a low shrubbe, hath longer leaves then the former, and narrower also, but as white and woolly underneath, in other things they are alike.

The Place and Time.

The first groweth plentifully about Mompelien, and in many places in Italy and Spaine, the other upon the hills about the river Rhodanus, that runneth through Provence, and flower and beare fruite when the others doe.

The Names.

The old Grecians, and especially the Arcadians, as Theophrastus saith called this tree *αἰνῆξ* and *πινῆξ*, *Smilax* & *Milax*, but they that live in those Countries now, doe call both the Tree and the Acorne thereof *Acylaea*, by corrupting the word *αἰνῆξ*, as it is very probable, Bellonius saith that the tree, which the Cretanes call *Acylaea*, they of mount Athos, keeping the old name doe call *Aria*, keeping the leaves alwaies Greene, whereby Bellonius sheweth how much we are mistaken herein, for Theophrastus lib. 5. c. 5. doth number *Aria*, among the everliving trees, such as the *Ilex* that beareth *Acylaea* is, but not among such as beare sowre harsh berries, as the Service tree doth, unto the kindred whereof *Aria* is referred by our moderne Writers, and besides Theophrastus in his 4. Booke and 8. Chapter saith, *Laurus Aria similis extor*, so that this *Smilax* or Laurell Oke is most likely to be that *Acylaea*, and their *Aria* also, and but the wood hereof is white and loose as Theophrastus sheweth, much differing from *Ilex*, which is firme and browne, it might be accounted a species thereof, and *Clusius* indeed doth referre the great *Ilex* that he saw in Spaine, to be this *Smilax*, and so doth Bauhinus also, the vicinity of their

names of *Smilax* and *Ilex* peradventure mooving somewhat thereunto, for *Banbinus* doth not account this *Smilax* to be a proper species of Oke it selfe but putteth it among the *Ilices*, calling it *Ilex foliorum undiorum molli modicoque sinuato five Smilax Theophrasti*: the word *Smilax* is of a large extent, comprehending under it divers sorts of trees and herbes, as first this *Smilax* of the *Arcadians*, which we therefore call *glandifera*, to distinguish it by a severall epithite, from *Taxus* the Yewe tree, which is also called *Smilax*, but *baccifera*, the better to be understood: then is there *Smilax aspera*, & *levis* among the binde weedes, and lastly *Smilax hortensis* of *Dioscorides*, which is accounted to be *Phasiolum* the kidney Beane.

The Vertues.

This Laurell Oke is of a like binding quality with the other sorts of Okes, as *Galen* sheweth in his 6. Booke and third Chapter, *de compos. medic. secundum locos*, where he doth shew those things that are fit to use for the meane inflammations of the paller, appointing the decoction of Mirtles and the berries to be stronger remedies then were before remembered, as also of lowre Quinces, and likewise the young and tender branches of the *Ilex*, *Arbutus*, *Smilax* and *Phagus*, which *Cornarius* in commenting upon seemeth to wonder at, that *Galen* should appoint the *Smilax*, which is *Taxus* a dangerous and deadly tree as *Dioscorides* and *Pliny* doe write, to be used inwardly, and thereupon thinketh that the *Taxus* may be lesse dangerous in one place then another, and then that to be taken, but *Matthioli* taxeth him for that opinion, saying that if he had taken better Counsell of his *Theophrastus*, with whom he was so conversant, who sheweth a kinde of *Smilax* that is like unto *Ilex*, he would have beene of a better judgement: and *Galen*, as you heare placeth it with other Acorne bearing trees.

CHAP. VIII.

Phellodrys. The Corke Oke.

Here are five sorts of this kinde of Oke, as *Dalechampius* in *Luodanensis* hath observed and recorded, although *Theophrastus* and *Matthioli* have made mention but of one, which shall briefly be declared here.

1. *Phellodrys alba angustifolia*. The narrow leaved white Corke Oke, The first white leaved Corke Oke groweth reasonable great, and almost as tall as the Corke tree, covered with a smoother and whiter barke then either the Corke or the Oke: the leaves are somewhat long and narrow, greene above and gray underneath, dented about the edges but not very deeply, and rather hard then prickly, the flowers and fruite are like the other Okes, but the Acornes are of a darker yellow colour. There is also a sort hereof whose leaves have no dents or very few the timber or wood is not so hard as the *Ilex*, and not so soft as the Oke.

2. *Phellodrys alba angustifolia & laevifolia*. The narrow and broad leaved white Corke Oke.

4. *Phellodrys folijs l. & junis & folijs muricatis*. The broadest greene leaved Corke Oke, and the prickly one.

2. *Phellodrys*

2. *Phellodrys alba latifolia*. The broader leaved white Corke Oke.

This other white leaved Corke Oke is like unto the former in growth, and differeth in the barke, leafe and Acorne of the tree, the leafe is white on the under side as the former, but broader then it, and lesse hard, and lesse dented also, the barke as well of the branches as of the Acornes, are of a blackish red colour.

3. *Phellodrys nigra mediocrifolia*. The greene leaved Corke Oke.

This greene leaved Corke Oke groweth not so high as the former, the barke of whose branches are grayish, the leaves are of a meane size, of a darke greene colour, and not at all white underneath, with but few snips or dents, and those not deepe, and very little prickly at the edges, the Acornes are of as bright a yellow colour as the first.

4. *Phellodrys nigra latissimis folijs*. The broadest greene leaved Corke Oke.

This differeth from the last in the leaves, being larger and broader then the last, and more deeply dented and very prickly, but greene as it is: the cups of all these Acornes are onely rough as the ordinary Acornes, and not prickly.

5. *Phellodrys muricata folijs*. The prickly Corke Oke.

The prickly Corke Oke has a grayish barke on the body and armes, the leaves are smaller, and of a pale greene colour, deepeley dented and with sharper prickles: the Acornes hereof are like the other, but the huske or cuppe is much more prickly then any of the rest.

The Place and Time.

These doe all grow on the hills neere the *Rhotanus* in France, in Italy also by *Siena* as *Matthiolus* saith, and in many places of *Portingall* also, where the two former sorts doe beare Galles likewise, they keepe the same time with the rest.

The Names.

It is called in Greeke *πινελύς* *Phellodrys* quasi *Suberiquercus* in Latine, but *Theophrastus* saith it is a meane betweene the *Ilex* and the Oke, and therefore some did call it *Ilex femina*. But because the *Suber* or Corke tree is so like unto the *Ilex*, it may as well be said to partake of the one as well as the other. The first is the *Phellodrys* of *Matthiolus*, *Lobel* and others, and is the *Phellodrys alba angustifolia folio serrato* of *Lugdunensis*, the rest are onely mentoned in *Lugdunensis*, and *Paulus Renealmus* from him, the Greekes doe promiscuously call these sorts *Acylos*, as they doe those in the last Chapter. The *Italians* call it *Cerrosugaro*, as partaking of *Cerrus*, and *Suber*, it is not distinguished by any French name that I know of.

The Vertues.

There is nothing remembered of the faculties hereof, but as *Matthiolus* saith, it is of the like properties, and differeth not from the other Okes.

CHAP. IX.

Castanea. The Chestnut Tree.

Although the fruite of the Chestnut tree is not an Acorne, yet because some of the ancient Writers have assimiled it therunto, and have given it the name of *Sardinia glans*. I thought it fittest to joyn it next unto them, whereof there are foure especiall sorts, yet one is not of ours, but the new world, and there-

1. *Castanea vulgaris*. The ordinary Chestnut tree:

2. *Castanea equina*. The Horse Chestnut.

4.3. *Castanea Peruviana*, or *Castanea humilis*. The Chestnut of Peru, and the dwarfe Chestnut.

fore I shall give you but a bare description of the Nut, and not of the tree untill we can learne more of it.

1. *Castanea vulgaris*. The ordinary Chestnut.

The ordinary Chestnut tree groweth very great and high, equalling many times great and large spread Oakes, the leaves are long great rough and wrinkled dented about the edges, the bloomings or catkins are long and somewhat like the Oke, but more greenish yellow: the fruite groweth betweene the leaves and the branches, towards the end of them, inclosed within three severall huskes, the outermost whereof is the whitish vrrchin prickly huske, hairy and smooth on the inside, which when it is ripe openeth it selfe, and sheweth the nut being flat on the one side, and round, bunched out on the other whose shell or huske is smooth browne, and shining as it were on the outside and hairy within, tough also and not easie to breake, within which lyeth the nut it selfe, covered with the third huske, which is a thinne reddish bitter skinne or peeling, the kernell being of a firme substance and white, sweete and pleasant in taste, formed somewhat like unto an heart: the timber or wood hereof is rough and of a brownish colour. Some have made divers sorts hereof greater and lesser wilde and tame, but I doe not hold them differences, but as the climate causeth it.

2. *Castanea Equina*. The Horse Chestnut.

The Horse Chestnut groweth like wile to be a very great tree, spreading great and large armes and branches, the leaves are very beautifull, set by couples, and divided into five, but most usually into seaven divisions, every one being dented about the edges: the flowers grow at the toppes of the branches, on long stalkes consisting of foure white leaves a peece, the two uppermost whereof are larger then the two undermost, and have a round purplish violet coloured spot in the middle of the leafe, with many yellow threds and gold yellow tips rising from the middle: the fruite is contained in rounder and thicker prickly huskes, the nut within this huske is rounder then the other, and covered with a thicker and browner shell, and having a whitish marke or spot at the head, where it is joynted to the outer huske: the nut within this shell is white, without any such thin skin or peeling as the former hath.

3. *Castanea humilis*. The dwarfe Chestnut.

The dwarfe Chestnut tree doth alwayes grow low in comparison of the former, being like in leaves and fruite unto the former, but that they grow more together, and the nuts are no bigger then Hazell nuts, having alwaies more then one enclosed in every prickly huske, and is unpleasant in taste scarce fit to be eaten.

4. *Castanea Peruviana*. The Chestnut of Peru.

What manner of tree this is that beareth these Chestnuts, or what forme the leaves carry that grow thereon, is not knowne I thinke to any in these parts, I must therefore as I promised in the beginning shew you of the fruit that it is almost round, yet a little pointed toward the stalk covered with a thicke barke easie to be broken, yet somewhat spongy, of a darke or brownish yellow colour, under which grow a number of prickles, sticking to the inner huske, that covereth the nut or kernell it selfe, which inner huske is tough and hard to breake, and containeth within it a nut like an Almond out of the shell, both for colour and bignesse, but of the forme of a small kidney, and of a reasonable sweete taste like an Almond or the common Chestnut.

5. *Castanea Americana Cathartica*. Purging Chestnuts of America.

This tree saith *Monardus* groweth in the Continent of America, great and vasse, whose fruite is like unto a Chestnut but that the outer huske is smooth and not prickly, nor having any rough shell, but a thin skin that both compasseth the whole fruite which is almost foure square, and divideth it in the middle into two parts.

The Place and Time.

The first groweth on mountaines and in woods usually, both in the South and Northernne Countreies, but the warme Countreies for the most part breede the greater nuts. The second groweth in the Easterne Countreies of Turkey, for our Christian world hath first had the knowledge of it from *Constantinople*. The third groweth not farre from the Hill by *Lyon* in France, called *Pilates hill*, and not elsewhere as is knowne. The fourth in Peru in the West Indies. And the last neere the shore of *Nichragna*, &c. And flower in Aprill, after the leaves be come forth, the fruite is ripe in Augumne.

The Names.

It is called in Greeke *καστανά* and *καστανία*, *Castana* and *Castanea*, and *Castanea* in Latine, the fruite is also so called, and *σαρδανιά* *βαλανόνη* *δ' ο βαλανόνη* *λόπιμα*, that is, *Sardiana glandes Iovis glandes* & *Lopima*: It hath also some other names given it, as *Enboia* or *Enboica*, and *Heraclonica nux*, yet *Gaza* translateth it out of *Theophrastus Nux*

D d d d d

avellana,

avellana Agelochus as *Athenæus* saith, called it *Mota* and *Amota*: *Pliny* maketh divers sorts hereof, as by the names he giveth them should seeme, as *Tarentina*, *Salariana*, *Meterana*, *Coreliana*, *Balanitis*, &c. When as the climate and soyle make this diversity as it is in our dayes that the *French* and *Spanish* great nuts, that are of a sweeter relish are called *Marrons*, which hath caused *Matthiolus*, *Ruellius* and others, to set downe two sorts of it, one to be wilde, and another tame, because one is greater then another. The first is generally called by all Writers *Castanea*, and the fruit *Nux Castanea*. The second is also called *Castanea equina*, by all Authours that have written of it, not being knowne as it is thought, to any of the auncient Writers, unlesse as *Cesalpinus* thinketh, it may be the *Myrobalanus folio heliotropij* of *Pliny*, lib. 12. c. 21. The *Turkes* call it *At* or *Adcastaneji*, which doth signifie as much as *Castanea aquina*. The third is called *Castanea humilis* by *Lugdunensis*, and *Iohannes de Chou* in his *Historia montis Pilati*. The fourth is remembred onely by *Clesius*, who had it from *Abramus Ortelius*, who received it from *Benedictus Arius Montanus*, brought out of the West Indies. The last *Monardus* called *Fructus Cholugogus*, and *Lugdunensis* from him, but *Cassor Durantes*, *Castanea purgatrix*, and *Bauhinus* from him. The *Arabians* call it *Sadianalach Castal* and *Seebulot*, the *Italians* *Castagne*, the *Spaniards* *Marrons*, and so doe the *French*, as is before said, and *Castaignes* also, the *Germanes* *Kestten*, and the *Dutch* *Castanieboom*.

The Vertues.

Our Chestnuts are much of the property of Acornes, being hot and dry in the first degree, with a certaine windiness in them, which is perceived by those that are put into the fire to roste, by skipping the coout suddenly with a great cracke or noise, but will not doe so if it be a little flat by thrusting the point of a knife into them, whereby the heate may expell the windiness. Of all the kinds of Acornes saith *Galen* the Chestnuts are the best, and doe onely of all wild fruites yeeld unto the body commendable nourishment, yet not to be overmuch eaten, in that as he saith they breede thicke blood, and being windy procure headache, are hard of digestion, and binde the body by an astringent quality, whereof they partake not a little. The inner skinne that covereth the white nut is so astringent, that if the decoction thereof in wine or water, or the pouther thereof be taken in some convenient drink it will soone stay any super-purgation, or any flux of blood in man or woman. *Dodonæus* saith that if the meale of Chestnuts be made into an Electuary with hony, it is very profitable for those are troubled with a cough or with spitting of blood. In many places where there are great store growing, they fatten up their hogges with the nuts as we doe in *England* with Acornes, and Beech-mast. The Horse Chestnuts are given in the East Country, and so through all *Turkie*, unto Horses to cure them of the cough, shortnesse of winde and such other diseases: the low or dwarfe Chestnuts by reason of the unfavoury taste, are not used by any: and the Chestnut of *Peru*, is not recorded of what quality it is more then that *Clesius* as is before said, saith the taste is like an Almond or an ordinary Chestnut. The last sort *Monardus* saith purgeth gently, and choller especially, eaten when it is fresh, or bruised and drunke in Wine, but being dryed the pouther is given in broth, and if it be rolled it purgeth the lesser: but this is to be observed saith he, that the thinne skinne is to be taken away howsoever you take it, least it procure vomittings, laskes, and other daungerous symptoms.

CHAP. XI.

Fagus. The Beech tree.

BEcause this tree beareth fruit somewhat like unto a Chestnut, having beene reckoned also a kinde of Acorne bearing tree, I thought it fittest to place it next after the Chestnut, both because it is found growing in woods among Okes, and that the fruit serveth as Acorne mast to fatten up swine. *Theophrastus* maketh two sorts, *montana* and *campestris*, the former white, the other blacke, but wee can finde no such diversity in those that grow with us. Our Beech therefore groweth to be a great and tall tree, spreading the boughes and branches on every side, whereby it maketh a goodly large shadow, unlesse it be shred below to make it spring up higher, covered with a smooth white barke, whereon are placed many broad smooth leave, almost round yet pointed at the end, and a little finely dented about the edges, of a sad Greene colour, which usually turne yellow before they fall away, and whereon are often found certaine small round hollow berries pointed at one end, Greene at the first and red afterwards, wherein are found small wormes: The blowings or catkins are small and yellow, like those of the Birch tree, but lesse, and quickly falling away: The fruit is contained in a rough huske somewhat like the Chestnut, but not prickly sharpe at all, which being ripe openeth it selfe into three parts, and sheweth a small three square nut, covered with a smooth soft skin, browner then the Chestnut, and under it a sweete white kernell like the Chestnut, but more astringent: the rootes grow not deepe, nor yet spread farre; the timber is smooth and white, but brittle, yet profitable to many uses.

The Place and Time.

This groweth through most Woods in *England*, among the Okes and other trees, and is planted also in Parkes, Forrests, and Chases, to feede the Deere, but in other places to fatten Swine, whose fat will bee softer then theirs that are fatted with Acornes: it bloometh in the end of *Aprill* or beginning of *May* for the most part, and the fruit is ripe in the end of *September*.

The Names.

It is called in Greeke *ἰξ* *Oxya*, in Latine *Fagus*, *Gaza* translateth it *Scissima quod sit in Laminis Scissilis*, it is easie to be cloven: yet he also translateth the word of *Theophrastus* which he numbred among the Okes, to be *Fagus*, whose ill sample *Tragus*, *Fuchsius*, *Ruellius*, *Matthiolus*, *Dodonæus*, and almost all other Writers thereof since his time have followed as I said before in the Chapter of Okes, whose difference many yet have acknowledged, but none before *Dalechampius* have plainly detected: another error also hath spread among many, in taking *ἰξ* or *ἰξ* *Oxya*, *Ostrya* or *Ostrya* of the Greekes, whereof *Pliny* speaketh lib. 13. c. 21. to be this *Oxya* but *Pliny* sheweth plainly in the description of *Ostrya* that the fruit or seede is like unto Barley, which they would correct, and make it to be like the Chestnut, thus one error begetteth another: but *Ostrya* or *Ostrya*, as shall be shewed hereafter is rather a kinde of Elme, yet improperly he calleth it *Carpinus*, when as the *Carpinus* of the ancients is a kinde of Maple, as shall be shewed, and *Dodonæus* to mend the matter placeth the *Ostrya* among the Maples, under the

the name of *Carpinus*: but the truth is that *Quercus* and *osia* are three severall trees, and *Carpinus* the fourth, of severall kindes, and not to be so confounded together. The *Italians* call it *Faggio*, the *Spaniards* *Hain*, the *French* *Fan Fouslean*, and *Hefire*, yet *Bellonius* in the 52. Chapter of his first Booke of Observations doth distinguish *Hefire* from *Fouslean*, saying that the *Greekes* *Ostrya* is The *Frenches* *Haisfre* & their *Oxya* the *Frenches* *Fouslean* both of them growing wilde in the woods, upon the mountaines or hills of *Sidero capsa* in *Alacedonia*, the *Germanes* call it *Buchbaum*, the *Dutch* *Buickenboom*, and we in *Engliff* *Beeche*.

The Vertues.

The leaves of the Beeche tree are cooling and binding and are therefore applied unto hot swellings to discusse them: the nuts are hot and moist in the first degree, and thereby nourish much all creatures that feed thereon. *Petrus Crescentinus* writeth, that the ashes of the wood is good to make glasse. *Tragus* saith that he hath proved by good and often experience, that the water that is found in the hollow places of decaying Beeches will cure both man and beast of any scurfe or scabbe, or running reiters, if they be washed therewith: *Ruellius* reporteth that if a Viper or Adder be stricken with a rod of the Beech tree, or if it be but onely put unto it, it hath such power as to slay the Viper from getting a way while it is by it: the barke of the Beech tree is so flexible, that many Country people doe double it, with a stick thrust through both sides at the toppe, to carry Cherries, Strawberries, and many other such like things therein, which *Pliny* also noteth was used in his time.

Fagus. The Beech tree.

CHAP. XI.

Ulmus. The Elme.

U *Heophrastus*, *Columella*, and many also of our moderne Authours, have made mention onely of two sorts of Elmes, *Pliny* hath made foure sorts, which notwithstanding may be reduced into the former two: we have observed in our Country three sorts, and *Matter Goodier* a fourth, besides another very like unto them, but yet notably differing, which shall therefore bee set downe in the Chapter following by it selfe.

1. *Ulmus vulgaris.* Our common Elme.

That Elme which is most frequent and best knowne in generall throughout the Land, groweth more upright, and not so much spreading as the rest, to bee a very great tree, with a body of a very large life covered with a thicke rough barke, chapt or crackt in many places, but that on the branches is smoother, the blossomes that appear before the leaves come forth are like small tassells of red threds, which falling away there come up in their stead, broad, flat, whitish skinnes, which are the feede being not much unlike to the feede of the white Garden *Attache*, which doe fall away by degrees, some quickly, and some holding on a good while after the leaves are fully come forth, the leaves are of a sad Greene colour, broad, somewhat round and pointed at the the ends, rough and crumpled for the most part, and dened about the edges, one side of the leafe next to the stalk being longer then the other, and more eaten by all sorts of cattle then any of the rest, having certaine small bladders or blisters thereon, which containe small wormes in them: the wood or timber hereof is of a darke reddish yellow colour, and is very tough, fit for many uses, where it may be either continually wet or dry, but not enduring both so long as the Oke.

Figur
Trag. pro
floribus.

2. *Ulmus latiore folio.* Broad leaved Elme or witch Hasell.

This other Elme groweth also to be as great a tree as the former, but spreadeth the branches more and falling downe wards, not growing so upright as the former, the bloomings and feed hereof is like the former in all things but greater: the leaves hereof are much larger then it, but crumpled and rough or hard, and like unto the leaves of the Hasell nut, from whence it became to be called Witch hasell, and hath such like bladders thereon as the former: the wood or timber of this is not so tough as the former, but is more short and will bee more easily left,

3. *Ulmus folio glabro.* Smooth leaved Elme or Witch Elme.

The Witch Elme groweth more like to the last then the first, in the bending boughes and great body, the blooming and feede also is like though lesse: but the leaves hereof are nothing so large as the last, but neerer in biggnesse unto the first yet not rough or crumpled, but smooth and plaine and without any blisters on them, as the former two have, the timber hereof is as strong and as tough as the first or rather more, and is accounted of worke: then the stronger and more serviceable kinde.

D d d d d 3

4. *Ulmus*

1. *Ulmus vulgaris cum samitis fructibus suis.*
Our Common Elm with his seeds.

2. *Ulmus latifolius.*
Broad leaved Elm or witch Hasell.

3. *Ulmus folio glabro.*
Smooth leaved Elm, or Witch Elm.

4. *Ulmus minor.* The lesser Elm.

4. *Ulmus minor*. The lesser Elme.

There is in some places of this land found a sort of Elme somewhat differing from those before, in that it groweth lower and lesser, and with smaller leaves that are as rough on both sides as the first, and easie to be distinguished if they be heedfully observed.

The Place and Time.

All these sorts are as is said, found in our owne Country yet the first is the most frequent, and the second in some Countries as much or rather more then the first, the third is to be seene in many woods in Essex: they all blossom as is said before the leaves come forth, and the seede not long after their first spreading or large.

The Names.

It is called in Greeke *Ulmia* in Latine *Ulmus*, *Theophrastus* and *Columella*, as I said, mention but two kinds *Theophrastus*, *Montium*, or *montosa Ulmus*, and *campestris Ulmus*, *Columella* hath *Ulmus Gallica*, and *Vernacula*, which is *Italica*, *Pliny* hath four sorts, *Attinia*, *Gallica*, *Nostros*, and *Sylvestris*, which will thus be reduced into the two sorts, his *Attinia* and *Gallica*, are both one sort, as *Columella* plainly setteth downe, and is the same with *Theophrastus* his *montosa*, which is *excellissima*: *Pliny* his *nostros* and *sylvestris*, are both one likewise, and the same with *Columella*'s *Vernacula*, which as I said is called *Italica*, and the same also with *Theophrastus* his *Ulmus campestris*, so that our third sort with smooth leaves, was knowne to none of them, nor yet scarce to any of our moderne Writers, unless they put it for the *Carpinus* as it is usually called, or for *Ornus* as *Tragus* calleth it, as shall be shewed in the next Chapter: so that our first here set downe agreeth with the *Attinia* of *Pliny*, *Gallica* of *Columella*, and *Montosa Ulmus* of *Theophrastus*, and our second with the *campestris* of *Theophrastus*, *Vernacula* of *Columella*, and *nostros* & *sylvestris* of *Pliny*, and called also *latifolia* by divers, but *Barbinus* in my judgement hath much confounded them, putting one for another, the seede of the Elme is called *Samarra*. The *Arabians* call it *Didar*, *Dirdar*, and *Luzach*, the *Italians* *Olmo*; the *Spaniards* *Umo*, the *French* *Orme*, the *Germanes* *Rushholz*, *Ulmerbaum*, *Isfenholz*, and *Lindhart* as *Tragus* saith, the *Dutch* *Olboom*, and we in *English* the Elme tree.

The Vertues.

All the parts of the Elme are of much use in Physicke, both leaves, barks, branches and rootes: the leaves while they are young were wont to be boyled, and so eaten by many of the common people, *Marcellus* saith that the leaves hereof beaten with some pepper, and drunke in Malmesie doth helpe an old rotten cough to be taken fasting, both *Dioscorides* and *Galen*, upon his owne experience say, that greene wounds are healed by applying some bruised leaves thereto and bound upon with the barke of the Line or Linden tree, or with it owne barke, the leaves used with vinegar cureth the scurfe and leproy very effectually, so doth the barke also in vinegar as *Galen* saith, *Dioscorides* and *Columella* do both say, that the outer bark of the Elme drunk in wine hath a property to purge flegme, which I know of none in our time hath tried to confirme it: the decoction of the leaves, barke or roote being bathed, healeth broken bones: that moisture or water that is found in the bladders on the leaves, while it is fresh is very effectually used to cleanse the skinne and make it faire, whether of the face, or of any other place, *Marthiolus* saith, he hath sufficient tryall that the water in the blisters on the leaves, if clothes often wet therein and applied to the ruptures of children will helpe them, and they after well bound with a trusse. The said water put into a glasse and set in the ground, or else in dung for 25. dayes, the mouth thereof being close stopped, and then the bottome set upon a lay of ordinary salt, that the feces may settle, and the water become very cleare, is so singular and soveraigne a balm for greene wounds, that it is a wonder to see how quickly they will be healed thereby, being used with soft tents; the decoction of the barke of the roote fomented, mollifieth hard tumours, and the shrinking of the sinewes: the rootes of the Elme boyled for a long time in water, and the fat rising on the toppe of the water, being cleane skimmed off, and the place annointed therewith that is growne bald, and the haire false away, will quickly restore them againe: the said barke ground with brine or pickle untill it come to the forme of a pulvis and laid on the place pained with the gout, giveth a great deale of ease. It hath been observed that Bees will hardly thrive well where many Elmes doe grow, or at least if they upon their first going abroad after Winter doe light on the bloomings or seed thereof, for it will drive them into a loosenesse that will kill them all, if they be not helped speedily.

CHAP. XII.

Ostrya five *Ostrya Theophrasti*. The Hornebeam tree.

His tree which as I said before, is so like unto the Elme, but notably differing from it riseth up to be a reasonable great tree with a whitish rugged barke, spreading well, and bearing somewhat longer and narrower leaves then the ordinary Elme, and more gentle or soft in handling, resembling in some sort the Beech leaves, turning yellow before they fall, for which cause some have taken it as a kinde of small Beech: at the end of the branches hang downe a large tuft of whitish greene narrow and long leaves, being almost three square set together, among which rise small round heads, wherein are contained small yellowish seede like unto barley cornes, the timber or wood hereof is whitish like the Beech, but tougher and stronger then any Elme and more durable in any worke, growing as hard as Horne, whereon came our *English* name.

Cesalpinius seemeth to set forth another sort differing in the heads of seede which in *Italy* are smaller and closer, *Alnus Italica*, and in *Germany*, and with us more loose and larger.

The Place and Time.

This groweth in many Countries in this Land, where as I said some take it for a kinde of Beech, and some for a kinde of Elme: the tuft of leaves appeareth in *June*, and is ripe in the end of *August*, or in *September*.

The Names.

This tree hath found almost as many names as there have bene Authours that have written of it, but by the judgement of the best it is the *ostrya* or *ostrya* of *Theophrastus*, which he describeth so plainly in his third Booke and tenth Chapter, that it is a wonder that so many learned men as have called it otherwise should not better heede it, but led by tradition or conceit have rather taken it to be any other thing then what it is, *Pliny lib. 13. c. 22.* describeth.

scribeth it but maketh it like to *Fraxinus* which is an error in him, when he should rather have set *Fagus*, for it no way resembleth the Ash, but very much the Beeche. *Tragus* taketh it to be *Ornus*, and saith he cannot agree to *Ruellius*, who said that *Ornus* was a species of *Fraxinus*. *Matthioli* calleth it *Carpinus* when as *Pliny* sheweth that *Carpinus* is a kinde of *Acer*, yet *Dodonæus*, *Lobel*, and others, call it so after him. *Dodonæus* also in making this to be *Carpinus*, he calleth it *Zozia quasi conjugalis* of *Pliny*, and *Gerard* doth the like *verbatim*, his *Corrigider* letting him so passe as if it were no fault or error in him, when as the true *Carpinus* or *Zygia* is not knowne what tree *Pliny* meant by it, for the other Maples that are knowne, are in leaves one like another, yet *Dodonæus* in his *Dutch Booke* maketh it his third kinde of Elme, and doubterh if it be not the *Ulmus sylvestris* of *Pliny*. *Lugdunenſis* giveth us the figure of it for *Ulmus Atinia*, but *Cordus* or *Dalechampius*, as I said before, as I take it, first tooke it to be *Ostrya* and so *Gesner* after him, and *Bellonius*, *Thalus*, *Clusius* and *Camerarius*, doe all hold it to be the right, and so call it, yet *Gesner* in *hortis* calleth it *Fagus separia*, *Lobel* *Betulus*, and *Clusius* *Fagulus herbariorum*. The *Italians* call it *Capino* according to *Matthioli*, and the *French* in calling it to be *Carpinus*, call it *Charme* and *Charpene*, but *Clusius* saith that his Country men of *Araris* called it *Hestre*, the *Germanes* *Hanbuchen*, and *Hagenbuchen* or *Hainbuchen*, and we in *English* *Hornbeam*, and *Hardbeam* tree.

The Vertues.

We have not learned that any Author hath knowne this tree to be applied to any Physicall use, but as a wood for many necessary imployments, both for Milles and other smaller workes in good account for the hardnesse, strength, and durability.

Ostrya five *Ostrya Theophrasti*.
The Hornbeam tree.

CHAP. XIII.

Tilia. The Line or Linden tree.

He *Linæe* is accounted to be of two sorts, the male and the female: that which we call the female is in great request both for the large growth and goodly verdure and greene shade that it maketh, as also for the sweete sent it yeeldeth, especially in the blooming time, when as it is much pleasure to rest under it, besides the Physicall vertues, but the male as it is more strange and lesse seene, so likewise of lesse respect and use, besides that many doe suspect it not to be a species thereof, but rather a kinde of Elme, it is so differing in forme and substance.

1. *Tiliamus*. The male Line tree.

The male Line tree groweth to be a great tree, and spreadeth the boughes largely, yet not so much as the female, covered with a thicker barke, nothing so flexible and fit to binde things withall, because it is harder and more easie to breake: the leaves are somewhat like unto Elme leaves but somewhat smaller and longer, hard in handling and on every one for the most part grow small bladders or blisters, full of small wormes or flies, which being ripe doe flye away, (but *Dodonæus* cenveth it to have any bladders on the leaves, and that they are deceived which so picture it, but he might be deceived therein, for although transplanted it bore none, yet naturally it might) this very seldome beareth either flower or fruit, and therefore it is held to be barren, not bearing any thing: yet when it doth beare, it carryeth round and flat huskes, many growing close together, each whereof hangerh on a small long footstalk by it selfe, with a notch or cleft at the head or end: the wood or timber hereof is harder, more knotty also and yellower then the female, and coming neerer unto the Elms, whereupon many have judged it to be rather a kind of Elme. *Bauhinus* maketh another sort hereof with larger leaves which he taketh to be that which *Thalus* setteth downe in his *Hercynia sylva*, to have found there wilde, and calleth *Tilia sylvestris* five *montana*, but surely I thinke it differeth not from *Tragus* his *Tilia sylvestris*, which both he and *Bauhinus* reckon a species of the female kinde, and therefore cannot fitly be referred to the male, because he never saw it beare fruit.

2. *Tiliafamina major*. The greater female line tree.

This greater Line tree groweth greater then the former (especially if it light in good ground, for I saw at *Cobham* in *Kent*, a tree whose branches were led into two severall arbours one above another, besides that on the ground under the branches, which was a goodly spectacle, and a large shadow that it yeilded) covered with a darke coloured barke, the next thereunto being very oblique, and a plant to bend and binde, having some other thin rindes within it, whereof are oftentimes made baskets, and as *Bellonius* saith, the *Greekes* doe bottles, which being pitched or lined with melted rosin, serve to carry wine or water in from place to place, as also to make cords, ropes or the like: the leaves are faire and broad, greener, smoother, gentler and rounder then Elme leaves, but with a longer end, dented also about the edges and of a reasonable good sent: at the ends of the branches oftentimes, and from the foote of the leaves also come forth long and narrow whitish leaves, alongst the middle

1. *Tilia mas*. The male Linetree.2. *Tilia femina major*. The great female Linetree.

dle ribbe whereof springeth out a slender long stalke, with divers white flowers thereon, smelling very sweete after which follow small berries wherein is contained blacke round seede: *Gerrard* saith it beareth cornered sharpe pointed nuts of the bigneſſe of Haſell nuts, (but such I never ſaw) and ſaith that the male kinde doth beare round pellets cluſtring together like Ivy berries, wherein is blacke ſeede, wherein hee transferreth that to the male kinde, which is proper to the female: the wood is whitish ſmooth and light, the coales whereof is fitteſt to make Gunpowther withall. At the rootes and under the old trees of this Linden, *Tragus* ſaith he ſometimes obſerved to grow a certaine Excreſſence like unto the Oke grape, whereof he knew no uſe.

3. *Tilia femina minor*. The ſmaller female Linetree.

This leſſer Line tree agreeeth with the laſt in all things, ſaving that it groweth ſmaller both in body, leaves and flowers, the leaves being of a darker greene colour, and beareth no fruit after the flowers, becauſe they appeare later then the former.

The Place and Time.

They all grow on the hills and high grounds, yet for the moſt part in the moiſter places, and are often found alſo in vallies: with us the greater female kinde is planted in many places of our Land, chiefly for the large ſweete ſhadow it maketh, and floweth uſually in *May*, the other are very great ſtrangers in this Land, ſcarce to be ſeene any where.

The Names.

It is called in Greeke *φίλυρα*, *Philyra*, but not *φίλυρα* as *Pliny*, that confoundeth *Dioſcorides* his *Philyrea*, with *Theophastrum* his *Philyra*, ſo called becauſe it is brought into *tenues aſſulas ſive philyras* ſmall thin ſheets or leaves, ſuch as in the elder times they uſed to write on: in Latine *Tilia*, the one is called *mas*, and the other *femina* by all Writers, but that *Bauhinus* addeth unto the title of the *mas*, *Umbroſo*, and further ſaith, that the figures thereof exant, are rather of the Elme then of it. *Tragus* onely and *Gefner* in *hortis*, have made mention of the laſt, as of a differing ſort from the ordinary female kinde. The *Italians* call it *Tilia*, the *Spaniards* *Teier*, the *French* *Tillet*, *Teillen* and *Teil*, the *Germans* *Linden*, and *Lindenbaum*, for the ſmoothneſſe and ſoftneſſe thereof, the *Dutch* *Linde*, and *Lindeboom*, and we thereafter the *Line* or *Lindentree*, and in ſome places, broad leaved Elme. *Pliny* in his 10. Booke and 16 Chapter, ſheweth that among the *Tiburti*, the Linetrees were ſeene to beare ſundry ſorts of fruits for on one arme grew Nuts on another Grapes, on another Peares or Figs, or Pomegranets, and divers ſorts of Apples, but they all were not of long continuance.

The Vertues.

The male kinde is quite without uſe for any thing that I know, nothing being extant thereof in any Authours writings. The female is of much uſe, for the decoction of the leaves is a good Lotion to waſh ſore mouthes, or that have cankers in them: the leaves alſo being bruited after the boyling, and applied to their legges or feete that have tumours in them by falling of humours, doth much helpe them. the inner bark likewise performeth the like effect: the flowers of the Line tree, and of Lily Convally, being deſtilled together, the water of them is much commended againſt the falling ſickenneſſe: the deſtilled water of the

*True
Queene
ſmille.*

the barke is of the same effect, and is also of very good use against the fretting humours that cause the bloody fluxe or griping paines in the belly: the said inner barke being steeped in water for a while, causeth the water to become thicke or *masculage*, which being applyed with clothes wet therein, will helpe any place that is burned with fire: the wood or coales of the Line tree while they are burning hot quenched in vinegar, and afterwards ground with a certaine thing or drugges, called *Oculicanci* and drunke, is found by good experience to be wonderfully good for those that by some fall or bruise, or by blowes doe spit blood: *Tragus* saith that he thinketh the flowers hereof, whereon Bees doe much desire to feede are good for them.

CHAP. XIV.

Betula. The Birch tree.

The Birch tree groweth to be a goodly tall straight tree with us, fraught with many boughes and other slender branches, bending down wards, the older ones being covered with a discoloured rough chapped barke, and the younger being browner by much, under which there is another fine white thinne rinde or barke, much used to write upon, before paper was used, the leaves at their first breaking out are crumpled, and a fter are somewhat like unto Beech leaves, but smaller and greener, and dented also about the edges: it beareth small and short catkins, somewhat like to those of the Hasell nut tree, which abide on the branches a long time, untill growing ripe, they fall on the ground and their feede with them.

Betula. The Birch tree.*The Place and Time.*

This usually groweth in woods, as well on the higher as lower and moist grounds, every where generally throughout the land, the catkins come forth in *April*, and the leaves to come after, the feede is ripe in *September*.

The Names.

It is called in Greeke *βουλεύς* by *Theophrastus* lib. 3. c. 14. yet he giveth it to be *folio Caryæ*, and some read *βουλεύς* *καρυα* but others doe thinke that it should be *folio Oxæ*, whereunto it fitly agreeth, in Latine *Betula*, and with some *Betulla* for as much as *bitumine scaturit*: all Authours call it *Betula*. The *Italians* call it *Bettola*, the *French* *Bouleau* and *Bes*, the *Germanes* *Birchbaum*, the *Dutch* *Berckenboom*, and wee in *English* Birch tree.

The Vertues.

The Birch is in our dayes applyed to little physcail uses, yet the juyce of the leaves while they are young, or the distilled water of them, or the water that commeth out of the tree of it owne accord, being boyled with an auger, or distilled afterwards, any of these being drunk for some time together, is held available to breake the stone in the kidnies or bladder, and is also good to wash sore mouths, a lye made of the ashes of Birch tree barke, is effectually for the same purposes. Many other civill uses the Birch is put unto, as first to decke up houses and arbours, both for the fresh greenesse and good sent it casteth, it serveth to make hoopoes to binde caskes withall; the young branches being fiesh are writhed, and serve for bands unto faggots: of the young twigges are made broomes to sweepe our houses, as also rods to correct children at school, or at home, and was an ensigne borne in standards by the *Lictors* or Sergeants before the *Consuls* in the old *Romans* times, with which, and with axes borne in the like manner, they declared the punishment for lesser, and greater offences, to their people.

CHAP. XV.

Alnus. The Alder tree.

Of this Alder, I have to shew you two or three varieties more then others have expressed, which are these following:

1. *Alnus vulgaris.* The usuall Alder tree.

The ordinary Alder tree groweth to a reasonable height, and spreadeth much if it like the place, covered with a brownish barke, and the wood under it more red then Elme or Yew: the boughes and branches whereof are more brittle then any other wood that groweth in or neere water: the leaves are round almost, full of ribs, rugged, thicke and clammy, by reason of a sticking dew that continually lyeth upon them, yet shining and dented about the edges, somewhat like unto the leaves of the Hasell tree, but of a darker greene colour: it beareth short browne aglets like the Beech or Birch, which fall not away before the feede is ripe within them, and

and then they are hard and scaly, a little long and round like unto an Olive: the timber is everlasting, if it be either under the water or in a watry moist place, for being made into piles it is the surest and strongest to uphold either bridge, or building thereon, but it is quickly subject to rot if it be kept dry. Under this Alder in sundry places is found such a like Excrecence, as is the Oke Grape. *Bauhinus* saith there is another sort observed whose leafe is longer then the ordinary sort, not differing in any thing else.

2. *Alnus folio incano*, The hoary Alder.

The hoary Alder is a lesser tree then the common sort, whose barke is whiter, and leaves likewise are somewhat longer, greater, and more pointed then it, not so Greene nor clammy on the upper side, but hoary, by reason of the small hairs are to be seene thereon, if they be well observed, or else not, but much more hoary underneath, that it seemeth to be of an ash colour, the footstalkes of them also being hoary in like manner, the catkins or aglets hereof are shorter and not so round as the former, but somewhat long untill it have given ripe seede.

3. *Alnus Alpina minor*.
The small Mountain Alder.

This small Alder, groweth in each part like the common Alder, but lesser and lower both in leafe and other things, and hath not the leaves bedewed with so clammy a moisture.

The Place and Time.

Both Place and Time are in a manner sufficiently expressed in their descriptions to be delighted to grow in moist woods, and in other watery places, and the last upon the hills in *Austria*, flowering in *April* or *May*, and giving ripe seede in *September*.

The Names.

It is called in Greeke by *Theophrastus* *αλνδεξ*, but not mentioned by *Dioscorides* or *Galen*, in Latine *Alnus quod ab amne alatur*, *Theophrastus* lib. 3. c. 14. saith this tree is barren, *Pliny* from him, that it beareth neither flower nor seede, and yet in the sixth Chapter of the same Booke he sheweth among other trees, when their fruit is ripe, that the Alder, the Walnut, and a kinde of Peares, doe ripen in Autumne, which declareth that he is contrary to himselfe, in saying it is barren: Some of the Poets fained that the three sisters of *Phaeton*, after three moneths mourning for their brothers death, whom *Apollo* slew with thunder for ill guiding the Chariot of the Sunne, were turned into Poplar trees, but *Ovid* in his second booke of *Metamorphoses*, and *Virgil* in *Aegloga sexta*, in these Verses following sheweth (yet both true alike) that they were Metamorphosed into Alder trees.

*Tum Phaetontidas musco circumdat amarae
Corticis, atque solo proceras erigit Alnos.*

The first is called *Alnus* and *vulgaris* by all our modern Writers, but onely *Cressentius*, who calleth it *Ameda*, as he doth the *nigra ac baccifera Avornus*. The second is called *Alnus altera* by *Clusius*, but giveth *Lobel* his figure of the ordinary *Alnus* for it, as the new *Gerard* doth also: but *Bauhinus* in his *Mathiolus* giveth the true figure of it, set forth by himselfe and there calleth it *Alnus hirsuta*, whose figure being left out here you shall have in the Appendix. The last is remembered onely by *Bauhinus* by the same name is in the title. The *Italians* call it *Anno*, and *Onio*, the *Spaniards* *Aliso*, the *French* *Aulne*, the *Germanes* *Erlenbaum*, and *Elernbaum*, the *Dutch* *Elfen*, and we in *English* *Allder*, and *Alder* tree.

The Vertues.

The leaves and barke of the Alder tree, are cooling, drying and binding: the fresh leaves laid upon tumours dissolveth them, and stayeth the inflammations: the leaves put under the bare feete of travellers, that are surbated with travelling, are a great refreshing unto them: the said leaves while they have the mornings dew on them, laid in a chamber troubled with fleas will gather them thereinto, which being quickly cast out, will ridde the chamber of them: of the barke is made a blacke dye, for the courser sorts of things, and with it, or the Greene fruite instead of galles, is made writing incke, by adding gum and coperas to it.

Alnus vulgaris. The usuall Alder tree.

*Folio ob-
longo stri-
di.*

CHAP. XVI.

Populus. The Poplar tree.

The Poplar tree hath bene aunciently accounted, but of two sorts, blacke and white, but by *Pliny* distributed into three sorts, the white, the blacke, and the Libian or Aspen tree, unto these I must adde two other out of *Lobel*, which are as followeth.

1. *Populus alba*. The white Poplar tree.

The white Poplar tree groweth great and reasonable high, covered with a thicke smooth barke, and white, especially the branches, having large leaves cut into severall divisions, almost like unto a Vine leafe, but not

of

of so deepe a green on the upper side, and hoary white underneath, of a reasonable good sent, the whole forme representing the leafe of Coltsfoote: the catkins which it bringeth forth before the leaves, are long and of a faint reddish colour, which fall away like unto others bearing seldome good feede with them: the wood hereof is smooth, soft, and white, very finely waved, whereby it is much esteemed and used in many workes. Under this tree also is found sometimes the like *Uvae* or berries that are found under other trees.

Uvae popalines.

2. *Populus alba minoribus foliis.*

The smaller leaved white Poplar tree.

This other white Poplar groweth like the former, but the branches are more knotted then the former, and the barke more rough and white: the leaves come forth at the ends of the branches and sprigs, being both smaller and lesse divided on the edges, the catkins are smaller and shorter, and nothing so red, but tending to a brownish dead colour.

3. *Populus nigra.*

The blacke Poplar tree.

The blacke Poplar groweth rather higher, and straighter then the white, with a grayish barke, bearing broad and greene leaves, somewhat like to Ivy leaves, not cut in on the edges like the white, but whole and dented, ending in a point, and not white underneath, hanging by slender long footstalkes, which with the ayre are almost continually shaken, like as the Aspen leaves are: the catkins hereof are greater then of the white, composed of many round greene berries, as it were set together in a long

2. *populus alba minoribus foliis.*

The smaller leaved white Poplar tree.

1. *Populus alba.* The white Poplar tree.

3. *Populus nigra.* The blacke Poplar tree.

cluster.

4. *Populus Lytica*. The Aspen tree.

5. *Populus rotundifolia Americana*.
The round leaved Indian Poplar tree.

cluster: wherein is much downy matter contained, which being ripe is blowne away with the wind: the eyes or clammy buds hereof, before they spread into leaves (and not of the white, as some have thought, nor yet the Vve or berries that each of them have growing under them) are gathered to make the *Unguentum Populeon*, and are of a yellowish Greene colour, and small, somewhat sweete but strong: the wood is smooth tough and white, and will quickly be cloven to make shingles or cleft pale or the like. On both these trees groweth a sweete kind of Muske, which in former times was much used to be put into sweete oymments, and commended by *Galen* and others to bethe best next unto that of the Cedar tree.

4. *Populus Lytica*. The Aspen tree.

The Aspe is somewhat likē unto the blacke Poplar for the growing, but lesser then either it, or the white, and with a darker coloured bark: the leaves are also blacker, harder and rounder, then those of the other, and a little unevenly dented about the edges, and in some places spotted with white spots, hanging by longer and slenderer footstalkes, which by their continuall shaking and striking one against another, make a noyse although the aire be calme: the catkins hereof are longer, and of a brownish ash colour, which continue a while and then fall away with the feede in it: the wood is white but nothing so tough. This tree saith *Pliny* hath the best Mushromes growing under it.

5. *Populus rotundifolia Americana*. The round leaved Indian Poplar tree.

The branches onely of this tree were brought from the West Indies, unto Mr. *Morgan*, who was *Queenē Elizabeths* Apothecary, and by Doctor *Lobel* caused to be drawne to the life, which he exhibited in his *Adversaria* and *Dutch Herball*, the branches were a little crooked, full of joynts, at three or foure inches distance, and at each a large perfect round leafe, without any dent on the edges, but where it is set on the short footstalk, being thicker rougher and broader then the leaves of *Arbor lute*: at the setting to of every which leafe cometh forth a small long catkin like a thong compassed with many small graines much resembling those of the Poplar for which cause he called it a Poplar, the taste whereof was very astringent, somewhat heating and saltish.

The Place and Time.

The foure former sorts grow in moist woods, and by waters sides in sundry places of the land, yet the white is not so frequent as the other. The last is declared of what Country breeding it is: their time is likewise expressed that the catkins come forth before the leaves, and ripen in the end of Summer: but it should seeme that the last hath leaves and catkins altogether.

The Names.

The white Poplar is called in Greeke λευκή, because of the whitenesse, in Latine *Populus alba*: and *Farfarsus* of the Ancients, the blacke is called αἰγίαιος *Populus nigra*, but with *Tragus* it is his first *Populus alba*, the Aspe is taken by many good Authours to be *αἰγίαιος* of *Theophrastus*, because he joyneth it next unto the two former, lib. 3. c. 14. saying it is like unto the white Poplar, which may breede some doubt whether he meaneth the Aspe or no, which hath no such divided leayes as the white hath, *Gaza* translateth it *Alpina*, which it seemeth he doth from *Pliny*, who

who called it *montana*, as well as *Lybica*, the other are expressed to be of *Lobel* his declaration, and of none before him, *Homer* in his fifth *Iliad*, calleth the white Poplar *ἀΐγυϊα* ab *Acheronte*, because when *Hercules* had overcome *Cerberus*, he came crowned with this Poplars branches, which he found growing by the river *Acheron*, in triumph of that victory, and from his example, all that with glory have conquered their enemies in fight, were wont to wear a garland of the branches thereof; their error that *Succinum*, yellow Amber was the gum of the blacke Poplar is so ridiculous, that but to name it is sufficient confutation. especially seeing *Matthiolus* hath done it before. The *Arabians* call the white and blacke Poplar *Haur*, and *Haur romi*, the *Italians* *Popolo bianco* and *nero*, the *Spaniards* *Alamo blanco*, and *nigricio*, the *French* *Abeau*, and *Penplier*, and *Tremble*, the *Germanes* *Bellen*, *Poppelbaum* and *Sarbaum*, the *Dutch* *Abeelboom*, and *Popelier wort*, and we in *English*, the white and blacke Poplar tree, and the other the *Aspe* or *Aspen* tree.

The Vertues.

The white Poplar saith *Galen*, is of a mixt temper, that is, of an hot watery, and of a thinn earthy essence and therefore it is of a cleansing property, the weight of an ounce in poulder of the barke of the white Poplar being drunke saith *Discorides*, is a remedy for those that are troubled with the Sciatica or the Strangury, and thereupon *Serenus* hath these Verses:

Sapius occultus viſta coxendice morbus
Perſurit, & greſſus diro langore moratur.
Populus alba dabit medicos de cortice potius.

The iuyce of the leaves dropped warme into the eares, eaſeth the paines in them: the young bourgeons or eyes, before they breake out into leaves, bruised and a little honey put to them, is a good medicine for a dull sight: The blacke Poplar is held to be more cooling then the white, and therefore some have with much profit applied the leaves bruised with vinegar, to the places troubled with the gout, the seede is held good against the falling sicknesse to be drunke in vinegar: the water that droppeth from the hollow places of the blacke Poplars, doth take away warts, pulses, wheales, and other the like breakings out in the body: the young blacke Poplar buds saith *Matthiolus*, are much used by women to beautifie their haire, bruising them with fresh butter, and straying them after they have bene for some time kept in the Sunne: the oyntment called *Populeon* which is made of this Poplar is singular good for any heate or inflammation in any part of the body, and doth also temper the heate of wounds: it is much used to dry up the milke in womens breasts after their delivery, or when they have weyned their children. The *Aspen* leaves are in the like manner cooling, and are used for the same purposes that the blacke is, but are in all things farre weaker. *Tragus* it seemeth putteth the blacke Poplars instead of the white, and the *Aspen* instead of the blacke, as his descriptions and figures declare.

CHAP. XVII.

Taxus. The Yew tree.

The Yew tree groweth with us in many places to be a reasonable great tree spreading many large branches, which make a goodly shadow covered with a reddish rugged barke, the body, and elder boughes being more grayish, and the younger redder, whereon grow many winged leaves, that is many long and narrow darke greene leaves somewhat soft in handling, and not hard as the Firre tree leaves are, whereunto they are compared by many set on both sides of a middle stalk, alwayes abiding greene and not falling away in Winter: the flowers are small and yellow, growing along close to the branches, where afterwards the berries come forth, of the bignesse and colour of the Holly, or Asparagus berries, sweete with a little bitternesse, and procuring no harme to them that eat them, for any thing that I have heard: the wood hereof is reddish tough and strong.

The Place and Time.

This groweth in many places of this Land, but planted in all whether at home or abroad: it flowreth usually in April or May, and the berries be ripe in September, and October.

The Names.

It is called in Greeke *μῦλα* and *μῦλα*, but of *Discorides* and *Galen* *μῦλα*, yet as *Discorides* saith, some called it in his time *Thymalum*, in Latine *Taxus*, and so all Latine Authours call it, except *Cordus* on *Discorides* that calleth it *Malax*, and others *Smilax*, because it was generally taken to be either deadly or dangerous to eat thereof, or under it, or to sleep under it also, which in our land is found contrary by many men & children eating of the berries without harme, it is thought that all poysons became to be called *Taxica*, and by time called *Toxica*, from hence the *Italians* call it *Tasso*, the *French* *If*, the *Germanes* *Eibenbaum*, the *Dutch* *Ibenboom*, and *Bogenhout*, and we in *English* *Yew*.

Taxus. The Yew tree.

The

The Vertues.

The opinion of harme that this tree worketh, or peradventure some accidentall harme by disemperature, either by the climate wherein it is bred, or of the persons that take it hath caused, that there is nothing of any good property recorded, by any ancient or moderne Writer hereof, but still said by most to be deadly to beasts, and dangerous to men, and therefore *Marthiolus* calleth the matter into question, whether it be hot or cold: for *Dioscorides* and those that follow him, saying it is cold, appoint those remedies for it, that they appoint for Hemlocke, that is to drinke much wine: but *Marthiolus* contesterh there against, in that the berries are sweete with some bitterneesse, neither of which qualities portend any coldnesse to be in them, and that birds that feede thereon become blacke, besides the ever greenesse of the tree, as Pines, Firres, &c. all which shew a temperate heate to be therein, and the more, because as he saith, men that have bene drawne on by the sweetenesse of the berries to eat of them, have bene driven into fevers, and laskes, by enflaming the spirits and blood, which effects come not from any cold quality. Of this tree formerly long bowes were wont to be made, which were of great account, as well with us, as with other nations long agoe, for *Virgil Georg. 2.* saith, *Ilyceos Taxi torquentur in arcu.*

CHAP. XVIII.

Nux Juglans. The Walnutt.

Noto the Walnutt that we have usually growing in our Land, I must adde some others sought out, both nearer home and farre abroad, as out of *Virginia*, two sorts, one white and another blacke.

1. *Nux Juglans vulgaris.* Our ordinary Walnutt.

This Walnutt groweth to be a very high, and great tree, spreading large armes and boughes, so that they make a goodly shadow, but by reason of the strong sent that the leaves send forth, few are delighted to rest thereunder, the bark of the body and greater armes is of a darke greenish ash-colour, cleit or chapped in divers places, that on the younger branches being more Greene: the leaves are large and great, consisting of five or seven leaves, set one against another, with an odde one at the end somewhat reddish, and very slender while they are young, and of a weak, sweete sent, but when they grow old and more hard are of a stronger smell, and somewhat offensive: at the joynts with the leaves come forth small and long yellowish catkins, which open into small flowers, and falling away the round Nuts come in their places, two or three usually set together, which are covered with a double huske, the outermost, thicke, soft, and green, the inner shell hard, wherein is a white sweete kernell contained, covered with a thin yellowish bitter peeling, which easily parteth from it while it is fresh, but will not pee'e growing old: the wood or timber hereof is hard and close, of a blackish browne colour, with divers waved veins therein, which maketh it much used in joyners workes, &c. being very durable, being kept dry, but is soone rotted in the weather.

Nux Juglans vulgaris cum fructu Virginiana.
The ordinary Walnutt, and a fruite of *Virginia*.

2. *Nux Juglans californica.*

The greatest Walnutt.

We usually call these *French* Walnuts, which are the greatest of any, within whose shell are oftentimes put a paire of fine gloves neatly folded up together, that the shell may be close, being tyed together, and carried whither one will, and of the outer rinde whereof some have made childrens purses.

3. *Nux Juglans putamine fragili.*

The thin shelled Walnutt.

The difference in this consisteth chiefly in the nut, whose shell is so tender that it may easily be broken betweene ones fingers, and the nut it selfe very sweete.

4. *Nux Juglans folio serrato.*

The long Walnutt.

Clusius as I said, first set forth the difference of this Walnutt to be longer, although not

much greater then the ordinary fort and the shell much tenderer and brittle which being planted grew, and bore leaves like unto it, but much tenderer and dented about the edges.

5. *Nux Juglans bifera*. The double bearing Walnut.

The twise bearing in a yeare of this Walnut maketh the onely difference from the common fort, for thereof there is no further mention made.

6. *Nux Juglans fructu serotino*. St. Johns Walnut, or the late ripe Walnut.

This Walnut shooteth not forth any leaves untill it be Midsummer, or Saint Johns day, as it is said, so that the tree seemeth as dead, others having had Greene leaves thereon long before: the leaves and fruite differre not from others, but that the nuts ripen not untill October, and then are fresh when others are past and dry, the shell of this is harder and the kernell sticking closer thereto, that it is more hardly taken out, they taste not so sweet as the ordinary fort, but more Wallowish.

7. *Nux Juglans alba Virginensis*. The white Walnut of Virginia.

The tree hereof groweth more upright, and spreadeth lesse, the leaves are alike, and the nut is rounder, smaller, much thicker and whiter in the outer hard shell then any of the former fort, and the kernell within much lesse also, but white and as sweete.

8. *Nux Juglans nigra Virginensis*. The blacke Walnut of Virginia.

The blacke Walnut differeth little in the tree from the white, but the nor is blacke and round, very rugged or chapped on the outside, and so hard and thicke a shell that it can very hardly be broken with great strokes of an hammer, having a very small kernell within it.

The Place and Time.

It is thought that the Walnut first came out of Persia, for it is not knowne to grow naturally any where, but still have bene planted of the Nuts put into the ground (for I have not heard that they can be produced by any other meanes) whensoever they grow, excepting onely the Virginia kindes: they blossome early, before the leaves come forth, and the fruite is ripe in September, except the late ripe, which as is said is in October.

The Names.

By the name of *καστα* did the ancient Greekes understand all sorts of fruites, whose outer shell or covering was hard, as *Nux Amygdala*, *Nux Euboica*, *Castanea*, *Nux Heracleotica*, *Avellana*, *Nux Indica*, *Nux moschata*, *Nux Pinez*, &c. and because these were brought unto them by Kings, they therefore called them *καστα βασίλεια*: *Nux Regia*, but afterward it was called *Διόκευς* *ἰοβίς* *glans*, and so the Latines from them *Diu glans*, but contracting the word, and subtracting the first Letter, they called it *Juglans*, other names are found in Pliny, whereby the varieties of them were called, as *Persica*, *Tarentina*, and *Mollusca* for those with thinn shells, and *Moracina*, and *Moracilla* in Macrobius, for those that come late, their severall titles declare these here, and their generall name by all Authours of late is *Nux Juglans*, or *Nux Regia*, the outer Greene shell or rinde, is called in Latine *Gulivca*, and by Festus *Culeolus*: the inner skinn that covereth the kernell is called *Nanci*. The Arabians call it *Leuz*, *Leuz*, and *Giausi*, which is properly but *Nux*, as *Giausi bandi*, *Nux Bandensis*. the Italians *Noci*, the French *Noix*, and *Noyer*, the Spaniards *Nueces*, the Germanes *Welschmushaum*, and *Nussbaum*, the Dutch *Noet*, and *Okernotboom*, and we in English Walnut.

The Vertues.

Dodonæus is of opinion that the fresh nuts are cold and moist, but Euchysaith they are drying in the first degree, and warming in the second: the bark of the tree doth binde and dry very much, and the leaves are neerer of the same temperatue, but the nuts when they are older are heating and drying in the second degree, and of thin parts, and are harder of digestion then when they are fresh, which by reason of their sweetnesse are more pleasing, and better digesting in the stomacke, and taken with sweete wine, they moove the belly downward, for being old they grieve the stomacke, and cause in hot bodies chollier to abound, and the headache, and are an enemy unto those that have a cough: but they are lesse hurtfull to those that have colder stomackes, and are said to kill the broad wormes in the stomacke or belly: if they be taken with Onions salt and honey, they helpe the biting of a mad dogge, as also the biting of any man, or any other venome or infectious poyson. Cicerus Pompeius found in the treasury of Mithridates King of Pontus, when he was overthrowne a scroule of his owne hand writing, of a medicine against any poyson or infection (yet Galen attributeth it to Apollonius Murus, and Etim taketh it out of Strutho his writings) which is this, two dry Wallnuts, and as many good Figges, and twenty leaves of Rue or Herbage, bruised and beaten together with two or three cornes of salt, which taken every morning fasting preserveth from danger of poyson or infection that day it is taken: the juyce of the outer Greene huskes boyled up with hony, is an excellent garge for sore mouthes, the heate and inflammations in the throate or stomacke: the kernells when they grow old are more oily, and therefore are not so fit to be eaten, but then are used to heale the wounds of the sinewes, gangrens, and carbuncles: the said kernells being burned are then very astringent, and will stay laskes, and the feminine courses taken in red Wine, and stay the falling of the haire, and make it faire, being annointed with oyle and wine, the like will also the Greene huskes doe, used in the same manner: the kernells beaten with Rue and Wine, being applyed helpeth the Quinsie, and bruised with some honey, and applyed to the eares, easeth the paines and inflammations of them: if they be eaten after Onions, they take away the strong smell and sharpenesse of them, a peece of the Greene huske put unto an hollow tooth, easeth the paines and consumeth the marrow (the worme as they call it) within it: the carkins hereof taken before they fall thereof, dried and given a dramme weight in poulder with white wine, doth wonderfully helpe those women that are troubled with the rising of the mother, some doe use the Greene huskes, dried and made into poulder instead of Pepper to season their meates, but if some dried Sage in poulder be put unto it, it will give it the better relish: in the same manner doe some use the young red leaves before they grow greater, and find it a seasoning not to be despised of poore folkes: the oyle that is pressed out of the kernells (besides that it is farre better for the painters use, to illustrate a white colour then Linseed oyle which deadeth it, and is of singular good use to be laid on guiled workes, or on those workes of wood that are made by burning, such as are those walking staves that have workes on them or the like, to preserve the colour of the gold, or of the other worke for a long time without decay,) is very profitably taken inwardly like oyle of Almonds, to helpe the chollicke and to expell winde very effectually, taking an ounce or two at a time. The young Greene nuts before they be halfe ripe, preserved whole

whole in sugar, are not onely a dainty junket among other of the like nature, but are of good use for those that have weak stomackes and defluctions thereon. The distilled water of the Greene huske before they are halfe ripe is of excellent use both to coole the heate of agues, to be drunke an ounce or two at a time, as also to resist the infection of the Plague, if some thereof also be applied to the sores thereof, the same likewise cooleth the heate of Greene wounds and old ulcers, and to heale them being bathed therewith, the distilled water likewise of the Greene huskes being ripe, when they are shaled from the nuts, is of very good use, to be drunke with a little vinegar, for those that are infected with the plague, so as before the taking thereof a vein be opened, this is of often experience: the said water is very good against the Quinsie to be gargled and bathed therewith, and wonderfully helpeth deafnesse, the noise and other paines in the eares, the distilled water of the young Greene leaves in the end of May, performeth a singular cure on foule running ulcers and sores, to be bathed with wet clothes or sponges applied to them evening and morning: there reflect on the leaves of this tree a kinde of red thicke dew in the hottest time of Summer more then on any other tree round about it, which will be rather dry then bedewed at all, which honey dew being taken doth slake the thirst wonderfully: it is averred by some, that if the ripe nuts; huskes and all be put into hony, they will then be of good efficacy for sores and sore mouthes, that thereof may fitly be made gargles and lotions, either inward or outward.

CHAP. XIX.

Nux Avellana. The Hassell nur.

these small nuts there is both tame and wilde, those that are manured and planted in Orchards, are called Fillberds and the other growing wild, Wood nuts or Hassell nuts usually, unto which I must adjoine some other sorts, brought from other farre countries.

1. *Nux Avellana sativa fructu rotundo albo*. The round white Fillberd.

The manured Hassell or Fillberd tree (of this kinde, as of the other tame sorts) groweth up into a taller and bigger body then the wild Hassell, or wood nut tree doth, but never to any great bulke or size, and with fewer suckers or sproutes from the rootes, and spread into sundry branches, covered with a brownish speckled thin barke, and Greene undermost, bearing large wrinkled or crumpled leaves, somewhat like unto the Alder leaves, cut in on the edges into some deeper dents, but not cut into divisions, of a sad Greene colour above, and grayish underneath: the catkins come forth in the Winter before any leaves appeare, being then firme and close, of a reddish yellow colour, and afterwards opening themselves, become more yellow, falling away when the leaves begin to appeare,

3. *Nux Avellana sativa & sylvestris*.
The Fillberd, and the wild Hassell Nur.

4. *Nux Avellana Macedonica sive Byzantina*.
Fillberd's of Macedonia or Constantinople.

the nuts breake forth at other places of the stalkes, three or foure or more together, each enclosed in a tough browne huske, which reacheth beyond the nut, and is parted at the end into sundry jagges; the nut with it is large and round, more then the long sort, with a white thinn shell on the outside, and a white peeling covering the kernell within which is very sweete, the wood hereof is smooth, white, and somewhat tough or hard,

2. *Nux Avellana sativa alba maximo fructu*. The great white Filberd.

This differeth in no other thing from the former, but in growing higher and bigger, and the nuts larger by the halfe, but round and white like it.

3. *Nux Avellana sativa fructu longo*. The long Filberd.

This Filberd differeth not in the bush or tree, in the leaves or catkins, in the Nut or the bearded huskes from the former, the only difference consisteth in the nut it selfe, which is long and round, and hath a browner shell, which is distinguished into two sorts, the one hath the inner thinn skinne or peeling that covereth the kernell, red, and the other white, and each of them of a sweeter taste then the former, and the red of this sort, better also then the white.

4. *Nux Avellana Macedonica sive Byzantina*. Filberds of Macedonia or Constantinople.

Although Cordus, and Gesner gave the first knowledge of this Nut to the Christian world, and that but by a short relation, yet since them Clusius hath enlarged the description thereof by the often observations thereof; it groweth up straight and tall like a tree, as Cordus saith it was observed in Macedonia and Thracia, (but as Clusius saith, it was reported to him that it grew very low) covered with a whiter and more rugged barke, having such like large crumpled leaves, but somewhat longer, the catkins are like the other, but the nuts grow many together in a cluster, whose hard skin or tough huske is much more jagged at the head then the other, and some what likewise at the bottome, the Nut it selfe is round like our wood nut with a hard shell, the kernell within being very sweete and pleasant like the Filberd; since which time Clusius hath observed it to grow somewhat otherwise,

5. *Corylus sive Nux Avellana sylvestris*. The Wood nut or Hasell nut.

The Wood Nut groweth with more stemmes or suckers, from the roote then the manured kinde, yet some of a reasonable bignesse, branching forth diversly, covered with a like discoloured barke to the former, the leaves are lesser and rounder, yet not lesse crumpled Greene above and gray underneath, the catkins and nuts come forth in the same manner, but the Nuts are smaller and rounder whose huske is shorter and whiter, and never wholly covereth the nut, but standeth therein like unto an Acorne in the cup, and herein consisteth the chiefe difference for the manner of growing.

6. *Corylus Virginensis*. Virginian Hasell Nuts.

The manner of the growing of those Nuts, we have not had sufficient instructions of all, though wee have seene and had the Nuts of a long time which are as small or rather smaller, and browner then our Wood nuts, sharper pointed and with a rougher shell not so hard or easie to breake: the kernell is somewhat sweete and white but not so pleasant as ours.

The Place and Time.

Filberds are planted in Orchards, and the wilde nuts, grow in woods and thickets, that are moist rather then dry, delighting best to grow in such a soile, the catkins as is said appeare before the Spring, and the fruite is ripe in August or September at the furthest.

The Names.

It is called in Greeke *κρυταμένη* *Nux Pontica*, and *καρυόβλα* *Nux tenuis sive parva*, in Latine *Corylus* & *Nux Avellana*, from the Country which afterwards altered and fell to *Avellana*, as also *Nux Frenestina*, and *Heracleotica*, the severall titles that they beare, decipher them out sufficiently, as wee and others have and can call them by. The Arabians call it *Agilenz* and *Bundach*, the Italians *Noctivole*, *Noctelle*, and *Avellana*, the Spaniards *Avellane*, the French *Noisettes*, *Noisettes* and *Avellanes*, the Germanes *Haselnusz*, the Dutch *Haselnoet*, and we in English Filberd, for the manured kinde, and Hasell nut, Wood nut, or small nut, for the wilde kinde.

The Vertues.

These small Nuts while they are fresh are sweete, and much pleasing to the palate, but the much eating of them breed headache and wind in the stomacke, especially when they grow older, but if they be a little heated or parched by the fire, the oyle in the doth become lesse offensive, the parched Nuts made into an electuary, or the milke drawne from the kernels with some mede or honied water, is very good to helpe an old cough, and being parched and a little pepper put to them and drunke, it doth digest the distillation of rheume from the head, some doe hold that these Nuts, and not Walnuts, with figs and Rue, was *Mitridates* medicine, effectually against poisons, the oyle of the nuts is effectually for the same purposes. The dried huskes and shels to the weight of two drammes, taken in red Wine stayeth the laskes and womens courses, and so doth the red skinne that covereth the kernels, or is more effectually to stay their termes: if a snake be strooke with an Hasell wand, it doth sooner slunne it, then with any other sticke, because it is so pliant, that it will winde closer about it, so that being deprived of their motion, they must needs dye with paine and want: and it is no hard matter in like manner, saith *Tragus* to kill a mad dog that shall be strooke with an Hasell sticke, such as men use to walke or ride withall.

CHAP. XX.

Nux Pistacia. The Pisticke Nut.

He Pisticke Nut groweth to be a tree of a reasonable large size in the warme Countries, but very slenderly in ours dispersed into sundry branches, whose barke is of a darke russet colour, the leaves are winged three, five, or seven on a stalk, each whereof is broader and larger then those of the Ash, not sharpe but blunt pointed with us, smooth, almost shining, with divers veines therein, and of a pale yellowish Greene colour. I never saw it beare either fruite or flowers in our Land, the climate being too cold for it, but else where it beareth white flowers, as I am given to understand many set together, on a long cluster, after which come the fruite many together in the same manner

manner which are somewhat long and round nuts, bigger then Filberds, pointed at the ends, with a rough oute shell somewhat like an Almonds oute shell but tough, and hard to breake, yet cleaving into two parts, and smooth and white on the inside thereof, having a full Greene nut or kernell within, filling the whole shell, whose rinde or peeling is thicker and red, the kernell is very sweete and pleasant in taste, without any offensive quality therein: this in the warmer countries beareth also a long crooked stalke like as the true Turpentine doth.

The Place and Time.

It is naturall to *Bactria*, and other those parts neere to the East Indies, and from thence brought to Syria and Egypt, and from them unto our Europe, where at Naples and other warme Countries of Italy, they thrive and prosper, and beare fruit in the end of the yeare, but not in any of these colder climates

The Names.

It is called in Greeke *μαύρα Πιστάκια*, *Pistacia*, of *Nicander* *ορώμα Πιστάκια*, and in *Theriacis Stiracis* *Pistacion*, by *Possidonius* *βούρα Βιστάκια*, in Latine *Pistacia* and *Pistacum*, and of some *Nux Pistacia*, *Theophrastus* calleth it *Terebinthus Indica*, for his description thereof agreeth so exactly hereunto, that there can be no doubt made of it. The Arabians call it *Fustike* or *Festich*, the Italians *Pistacchi*, the Spaniards *Albocagor*, and *Fisticos*, the French *Pistaches*, the Germanes *Pimper nusselin*, and by that name they likewise call the bladder nut, not putting any difference betweene them, as the most judicious in former times did, the Dutch *Fistiken boom*, and we in English *Pistackes*, and *Fistike nuts* or tree.

The Vertues.

The Pistacke kernells be little inferior in goodnesse unto the fine kernels for they are very friendly to the stomacke, whether they be eaten or drunke, they are good against the stings or bitings of serpents and other venomous creatures, by reason of the thin essence, and a little bitter and sweet substance in them: and therefore they open the obstructions of the Liver, and are good also for the chest and lungs, there is also a little astringent quality in them, whereby they strengthen both the liver and the stomacke, to be put either in creates or medicines: they are also good to cleanse the backe and the reins of the gravell and stone breeding therein: they nourish more then any other nuts and helpe to encrease seede and Venery.

CHAP. XXI.

Nux Vesicaria. The bladder Nut.

As a bastard brother to the Pistacke, I must adjoyne this bladders nut, whose groweth is not much unlike rising up sometimes into a reasonable tree, and in other places shooting forth sundry suckers, whereby it becometh rather an hedge bush to be plashed, and let spread, the bark whereof is of a whitish Greene colour, the leaves are five for the most part set together on a stalke, each a little dented about the edges, and pointed at the ends, of a pale Greene colour: the flowers grow on a long stalke many set together, hanging downwards being all white, the small round cuppe in the middle, making them seeme like unto a white Daffodill: after them come swolne russetish Greene skinny bladders, with one or two brownish nuts, lesser then Hasell nuts, with a tough hard shell not easie to breake, and a greenish kernell within it, at the first somewhat sweete, but afterwards loathsome and ready to make one cast, yet it is eaten by some Country people, whose strong stomackes are not so easily provoked: the wood is white, hard and firme. Mr. *Trudebant* hath brought a sort from *Virginia*, having divers nuts in the bladder.

The Place and Time.

Altera Virginensis

It groweth in many places of this land, both as a hedge bush, and a standard tree at *Apsford* in *Kent*, and at *Milton*, three miles from *Cambridge*, and flowreth in *May*, the fruit is ripe in *August* or *September*.

The Names.

There is no mention here of among the ancient Authours, either Greeke or Latine, except it be taken for *Phillyris Staphyloedron*, whereof some doe in some part doubt, because he saith the nuts grow in *siliquis*, but these are skinny bladders, yet the rest agreeing to his description thereof, causeth others to thinke his *siliqua* must be understood these bladders: the Germanes as I said call it by the same name they call the Pistacke, and therefore others call it *Pistacium Germanicum*. *Martholus* in his Epistles taketh it to be the *Convolvulus* and *Hebulbem* of the *Turkes*, but that is said to be a nut, of the bignesse of both ones sits, and such this is not, and is of great respect for the pleasant taste among them. It is usually from the forme it carryeth now adayes, called *Nux vesicaria*, and in some places *Pistacia sylvestris*, and so *Scaliger* taketh it to be a species of it, *Gesner* saith, that some Italians at

Rome called it *Sambucus valida*, and *Anguilara* saith the Italians in other places call it *Albero de Puna*, and *Pistachio salvatico*, the French *Noz couper*, the Germans *Pimpernuslin*, as they doe the former, the Dutch *Pimpernoeten*, and we Bladder nut.

The Vertues.

The Nuts are as is before said, loathsome and overturning their stomackes that eat them, although *Scaliger* commendeth them to be of the like taste and quality with *Pistackes*, but wee will give him leave to please his palate, and stomacke with them, and will not envy the good he shall get by them, we never yet could learne that they were accepted among our people, except with some strong clownish stomacke, which can almost digest an horse naile. They have no use in Physicke, with any judicious that I know, but some Emperickes, that dare venture to give any medicine, be it never so dangerous have boasted of the helpe they have given to those that were troubled with the stone, and others to procure Venery.

Nux vesicaria sive *Staphylea edron*. The bladder Nut.

CHAP. X XII:

Fraxinus. The Ash tree.

The Ash according to *Theophrastus* and other of the later Writers, is distinguished into a taller and a lower sort, or as with us into the tame and the wilde sort, which shall be here declared.

1. *Fraxinus vulgaris*. The common great Ash.

The common Ash groweth high quickly, and in time becommeth to have a reasonable big trunk or body, covered with a smooth grayish barke, under which there is a thinner which being steeped in water a while, will give a blewish colour, spreading reasonable well, and bearing winged leaves of many, set on both sides of a middle stalk, and one at the end, each being long and somewhat narrow, gentle, of a pale green colour, and dented about the edges; at sundry joynts with the leaves cometh forth a bunch of flowers, and after them a thicke tuft of many thinne browne huskes hanging downewards, each upon a very small short footstalk, within which lyeth a small blackish browne long flat seed very like unto a birds tongue, tasting somewhat strong and hot in the mouth: It beareth also sometimes, and in some places certaine small round balles called apples, consisting of a clammy moffe, gathered into a lump with a hard knot in the middle, the wood is white strong and tough fit for many uses, for by the touch it esse, not being apt to cleave or rend, it is much employed about Coaches Caris, &c. and for handles for tooles, and instruments of husbandry. *Homer* chaunts the praises thereof in *Achilles* speare, made of Ash, which holdeth good in all the speares, pikes, &c. used in warre ever since.

2. *Ornus* sive *Fraxinus sylvestris*. The wild Ash or Quicken tree.

The Quickē tree groweth sildome to any great height, with sundy spread branches, covered with a more rugged and darker barke then the Ash, the leaves are winged like unto them, but are lesser and so is every particular one by it selfe, not so closely set together, dented about the edges, and of a deepe greene shining colour: at the end of the branches come forth white flowers in a reasonable great tuft or umbell, smelling pretty and sweete, after which follow small round berries, greene at the first, and darke red, when they are through ripe, of an unpleasant taste, ready to provoke casting, if one eat many of them, the wood is somewhat hard and firme, but of a browner colour then Ash.

The Place and Time.

The Ash delighteth best to grow in the wetter rather then in the dryer grounds and by Medow sides: the other groweth in sundry places of the Land, in woods chiefly, and those by *Heighgate* in sundry parts, the balles or apples of the Ash come forth in the end of Winter, and then they are to be seene, but the seede and fruite of them both is not ripe untill September.

The Names.

The Ash is called in Greeke *μυζα*, and in Latine *Fraxinus*: the seede is called *lingna avis*, but the inner kernell is so called rather then the whole huske; the other is likely to be the *Opouneia*, *Fraxinus montana* of *Theophrastus*, which

1. *Fraxinus vulgaris*.
The common great Ash.

2. *Ornus sive Fraxinus sylvestris*.
The Quicken tree, or wild Ash.

which *Pliny* calleth in Latine *Ornus*, of some *Orneoglossum*, and *Columella* *Fraxinus sylvestris*. *Tragus* calleth it *Fraxinea arbor*, *Dodonæus* *Fraxinus bubula*, and *Gesner* *Fraxinus aucuparia*. *Ruellius*, *Gesner*, *Dodonæus*, and others call it *Ornus*, but *Matthiæus*, *Cordus*, *Lobel*, and others call it *Sorbus sylvestris*, *Bellonius*, *Clusius*, and *Thalium*, *Sorbus aucuparia*, because that boyes, and fowles use the berries as baits to catch Blacke birds, Thrushes, &c. and *Lugdunensis* *Sorbus torminalis*, without any sense or reason, but they that referre it to *Sorbus* the Service tree, are in my opinion as short in many things, as they that referre it to *Fraxinus*, the Ash resembling both of them in the leafe, which causeth the variation. The Italians call the Ash *Fresino*, the Spaniards *Fresno*, the French *Fresne*, the Germanes *Eschbaum*, the Dutch *Efschen*, and we in English the Ash tree, and the seedes *Ashenkeyes*: the wilde Ash is called by the Germanes, *Großer Malbaum*, because they have another they call *Kleiner Malbaum*, as shall be shewed when we come to speake of it, we in English call it in some places wilde Ash, in others and that more generally, the Quicken tree.

The Vertues.

Both the leaves and the seede of the Ash are singular good against the biting of the Viper or Adder, or any other venomous creature, for if the young tender toppes with the leaves be taken inwardly, and some of them applied outwardly, it will resist the payson that it shall doe no harme, *Serenus* saith the same of the seede. *Fraxinum semen cum Bacchi uoce bibendum est*: the wood and the barke is by others held to be effectually herunto also: and to this purpose *Pliny* writeth that those serpents will not abide the shadow that the Ash maketh in the morning and the evening which then are longest, nor will come neere it, and further saith of his owne experience, that if a fire and a serpent be encompassed within a circle of the boughes of the Ash tree, it will sooner flye into the fire then into them: the decoction of the leaves in wine, are very good to open the obstructions of the liver and spleene as also to helpe to breake and expell the stone and to cure the jaundie: The water distilled from the young and tender branches and leaves of the Ash, is a singular good medicine to take every morning fasting a small quantity, for those that are subject to a dropie, or be already grosse and fat, or tending thetoward, to abate their greatnesse, and cause them to be lancke and gaunt: *Pliny* was much mistaken in writing that the leaves of the Ash were deadly to beasts that carryed burthens, and harmlesse to the rest that chewed the cud, which he taketh out of *Theophrastus*, who saith of *pis & Taxis*, and he referreth it to *usula Fraxinus*, the ashes of the barke of the Ash made into a lye, and those heads or other places infected with leproy, or other white scurfe or scall doth helpe them much: the seede called *Ashenkeyes*, I meane the kernells within the huskes is used to be drunke against fitches and paines in the sides proceeding of winde helpeth the stone, and avoydeth it by provoking urine: it is likewise used with other things tending to that purpose to encrease seede and Venery. From the chippes of the wood by distillation *per descensum* as it is called, is drawne an oyle and a water: the water mixed with a fourth part of the distilled water of Violet flowers, and the face that is troubled with rednesse, pimples, and such like, being bathed therewith will quicklye heale it: the oyle as *Monardus* saith, conduceth much to those that are spleneticke or hepaticke: There is nothing extant that is cerraine, concerning the wild Ash in any ancient or moderne writer that I can finde, neither can I give you any thing by magistrall experience, onely I must tell you of *Symphoricarpos* error, that thought out of *Virgil* his Verses concerning *Ornus*, that he had said that it bore flowers like the Pear tree, when as *Virgil*, *Georg. 2.* entreateth onely of the inoculating or grafting of one tree into another, that the Straw berrie tree bore Nuts, the Plane tree Apples, the Chestnut tree Beech malt, the wilde Ash the Pear trees blossomes, and Elmes Acornes, in these verses following.

Inferitur

Castaneæ Fagos: Ornus incanuit albo
Florepys glandemque suos fregere sub Ulmia.*

CHAP. XXIII.

Sorbus. The Service tree.

Ecause the true Service tree is so like unto the tame and the wild Ash in the leaves, and that the wild Ash is called a Service by divers, I thinke it meete to joine it next unto them, and with it some other sorts that have obtained the name of Services, although differing much in forme from it.

1. *Sorbus legitima.* The true Service tree.

The true Service tree groweth in time to be a great and a tall tree, spreading sundry great branches, covered with a rough grayish barke, whereon grow large winged leaves, greater and longer then those of Ash, and each of them broader, more blewish Greene, and harder, and more grayish Greene underneath, and more dented also about the edges: the flowers grow in clusters, at severall places on the branches with the leaves consisting of foure white leaves a peece, after which follow the fruite as big as Wallnuts shaled out of the Greene huskes, tending to yellow when they are ripe with broad browne kernels within them, in some round, which are accounted the best, in some oval that is long and round, and in some almost Peare fashion, which like other Services are hard and harsh when they are ripe, and must be hung up on strings in a warme roome, or laid covered with straw, chaffe, or some clothes to make them mellow fit to be eaten, which then will be more pleasant than mellow Medlars, the wood is very firme and close, and yellower then the Ash.

2. *Sorbus Terminalis sive vulgaris.* Our common Service tree.

Our common Service tree riseth up to a reatonable height and bignesse, spreading largely with a whitish colored smooth barke, the leaves grow singly by themselves, which are not winged but broad and cut into sundry divisions and broad at the bottome next to the stalke, of a sad Greene colour, the flowers grow in clusters of a whitish colour at the end of the branches for the most part, which are succeeded with smaller round berries then the former, and browner also, containing within them small blackish hard kernels: these must likewise be mellowed to be eaten, or else let hung on the branches untill the frosts mellow them on the trees, unless the birds devour them being neglected: the wood hereof is of a brownish yellow colour and hard.

3. *Sorbus sylvestris Anglicus.* Red Chesse apples, or the English wild Service.

This tree which we entle a Service, from the harshnesse of the Greene fruite, groweth not high usually, but ra-

1. *Sorbus legitima.*
The true Service tree.

2. *Sorbus Terminalis vulgaris.*
Our common Service tree.

ther as a hedge bush, whose stemme and branches are covered with an hoary or grayish barke, the leaves are broad, somewhat like unto *Viburnum* the Lichee tree, (which Gerard calleth the Wayfaring tree) not cut in nor dented at all about the edges, the flowers are of an over worne mossie colour, after which followeth fruite, of the bignesse of an hedge pearce, and reddish on the outside, of an harsh talie like the unripe or hard Services, yet the Country people doe often eate of them, being ripe from the tree, instead of better fruite, but after they have bene gathered and laid by a while to mellow, become more pleasant.

4. *Sorbus sylvestris Aria Theophrasti dicta.*

The wild Service called Aria.

This wild Service tree groweth to be a very great tall and faire spreading tree, with many boughes and branches, whereon are set large crumpled hard leaves of a deepe Greene colour on the upper side, and gray or hairy underneath, with divers veines running almost upright therein, and dented about the edges, the flowers are of a white mossie colour, thicke clustering together, made of foure leaves a peece, which turne into brownish red berries, with a small tuft at the top, containing within them small blackish feedes, and are of a harsh taste like to the rest, yet very pleasant, more then any of the rest, after they are mellowed: the wood is very hard, and firme or close, and whitish withall.

The Place and Time.

The first is seene with us but in a few places, and those onely planted for their rarity. The second is found in many places of England. The third in Westmerland, on a hill that respecteth the Sea eight miles from Lancaster called *Rosher Slacke*, but more plentifully in *Wether Slacke Parke*, as I am enformed: The last groweth likewise in some places here and there, throughout England, as in the parts not farre from *Craydon*, and one tree also groweth on *Hampstead Heath* alone by it selfe, without any other nereit on the left hand of the high way, as you goe on forward to *Hendon*, they do all flower before the end of May, and the fruite is ripe in October.

The Names.

It is called in Greeke *ἄριον* and *ἄριον*, *Oa* and *Oua*, in Latine *Sorbus*: the first is the *Sorbus legitima* of *Clusius*, *Sorbus esculenta* of *Camerarius*, *Sorbus domestica* of *Mathioli* and *Lobel*, who also thought it might be *Ostrya Theophrasti* but erroneously, as by the description thereof given before may be seene, all other authois call it *Sorbus* simply: the second is the fourth *Sorbus* of *Pliny* which hee calleth *Terminalis*, as *Cordus*, *Tragus*, and *Mathioli* doe: a though *Lugdunensis* misliketh of it saying that the leaves are nothing like the *Platanus*, whereunto *Pliny* compared them, he therefore calleth that *Sorbus terminalis*, which is called *Ornus* or *Fraxinus sylvestris*, as I have shewed you before, because he would call it *Crataegus Theophrasti*, as *Angustura* did before him: which it is to no withstanding, nothing hindring but that it may as well be *Crataegus Theophrasti*, as *Sorbus* quartum genus *Pliny* dictum *Terminalis*, both the descriptions agreeing fitly hereunto, *Clusius* and *Lobel*, and divers others, and *Gesner* in his is also call it *Sorbus terminalis*, who yet thinketh it might be a species of *Mespilus Aronia*, and peradventure may be *Theophrasti* his *Anthrododoides*, which *Gaza* calleth *Gallica*, *Bauhinus* placeth it as one of the *Medlars*, as he doth also our *Hawthorne*, which in his eighth number he referreth to the *Oxyacantha Pyrastrifolia* of *Dioscorides*, and yet in his ninth number maketh that *Oxyacantha Dioscoridis*, to be *Pyraacantha* of *Lobel* and *Clusius*, which hath no such divided leafe as the *Hawthorne* hath, and yet both of them beare berries like Services, and not Apples like *Medlars*, some also tooke it to be the *Hippomelis* of *Palladius*. The third hath not bene divulged in writing by any before me, and therefore that Latine name may stand untill a fitter may be found, the Natives there call them red Chesse apples, and Sea Oulers. The last is taken by all our Moderne Herbarists to be the *Aria* of *Theophrastus*, although *Bellonius* saith as is shewed before, that that kind of *Ilex* or *Oke* that is called *Acyllaca* in *Candy*, doth hold the name of *Aria* in Mount *Athos*, as is shewed before, *Lobel* calleth it *Aria Theophrasti* effigie *Aria*. *Clusius* *Sorbus Aria cognominata*, *Gesner* in his is *Aria Alpina* vel *pilosa*, *Batoni* calleth it *Sorbus terminalis Gallorum*, and *Angustura* and *Lugdunensis* *Aria* also, and *Theophrasti* as *Camerarius* doth, who saith *Cordus* called it *Lunata arbor*. The Service is called by the *Italians* *Sorbe*, by the *Spaniards* *Servas*, by the *French* *Cormes*, and *Sorbes*, and the tree *Cormier*, and *Sorbier*, by the *Germanes* *Spürwerbaum* the tree, and *Sperbiezen* the fruite, the *Dutch* *Sorben*, and *Sorbenboom*, and we in *English* the Service tree or fruite: the last is called by the *Italians* *Matello*, and by the *French* *Alfiser*, and *Cirier* by some.

The Vertues.

Services unmellowed are very harsh, able to draw ones mouth awry almost to be eaten, or else to choke one, but made mellow they are more pleasant, and fit to be taken of most to stay fluxes, scowrings, and castings, yet lesse then *Medlars*, although many doe eate them that neede not for any such purpose: if they be dried before they be mellow and kept all the yeare, they may be used in decoctions for the said purpose, either to drinke or to

to bathe the parts requiring it, and is profitably used in that manner to stay the bleeding of wounds, and at the mouth or nose to be applied to the forehead, and nape of the necke.

CHAP. XXIV.

Mespilus. The Medlar.

Here are observed sundry sorts of Medlars whereof three were knowne to the auncient Writers, the rest are of later invention.

1. *Mespilus maxima sativa*. The great manured Medlar.

The great Medlar groweth neere to the bignesse of the Quince, but never so great as an Apple tree that ever I saw, spreading branches, reasonable largely, with longer and narrower leaves then either Apple or Quince, and not dented at all about the edges, at the end of the sprigges stand the flowers made of five white great broad pointed leaves, nicked in the middle with some white threads also: after which cometh the fruite, being round and halfe flat, of a brownish Greene colour being ripe, bearing a crowne as it were on the toppe, which were the five Greene leaves, as a huske wherein the flower stood before, which crowne of leaves being rubbed off oralne away, the head of the fruite is seene to be somewhat hollow, the fruite is very harsh before it be mellowed as is said of the Services before, and hath usually five hard kernells within it.

2. *Mespilus vulgaris five minor*. The ordinary or small Medlar.

The ordinary Medlar differeth in nothing from the former, but that it hath some thornes on it, in severall places, which the other hath not, and that the fruite is small and not altogether so pleasant.

3. *Mespilus minor folio serrato*. The common Italian Medlar.

This also differeth in nothing from the last that hath thornes, but that the leaves are dented about the edges, when as the other is not.

4. *Mespilus fructu albo magno*. The great white Medlar.

This differeth not from the first sort but in the fruite, which will be as great as it, and more white then it being ripe on the tree, and will not be so browne when it is mellowed, the kernells also within them are not so strong or hard.

5. *Mespilus Aronia five Neapolitana*. The Medlar of Naples.

The Medlar of Naples riseth to be a reasonable great and faire spread tree, bearing broad leaves, cut in or divided on the sides into severall parts, but not to the middle ribbe somewhat resembling the Hawthorne leaves, with thornes set sometimes on the branches and sometimes without, the flowers grow in tufts like unto the Service

1. *Mespilus maxima sativa*.
The great manured Medlar.2. *Mespilus vulgaris*.
The ordinary Medlar.

tree, of a greenish colour, which turne into fruite, many clustering together and hanging downe, smaller then the smallest Medlar, and with a lesser crowne of leaves, and hollownesse at the toppe then it, reddish or yellowish when they are ripe having only three stones or kernells within it, and more sweet and pleasant also.

The Place and Time.

Three of these sorts grow with us here in our Land, the two first in many places, and the last with some few lovers of rarities, the other two have not as yet bene seene here: they flower in May for the most part, and beare ripe fruite in September and October.

The Names.

It is called in Greeke *μεσπιλον* and *μεσπιλον* in Latine *Mespilus* and the fruite *μεσπιλον* *Mespilum*. The first sort may bee the *Mespilus Seranica* of Theophrastus and Pliny, and taken by many to be the *Mespilus altera* of Dioscorides, which he saith some called *Epimelis*, Tragus although he call it *Mespilus* yet taketh it to be *Crataegus* of Theophrastus, which it cannot be, for that Theophrastus saith *Crataegus* hath the leafe of *Mespilus Anthedon*, which hath a divided leafe, for hee describeth no other *Mespilus*, and is the same with Dioscorides his *Mespilus Aronia*, as you shall presently heare: it is also that which Lobel calleth *Domestica*, Cordus *sativa*, and Camerarius in *horto Seranica majoribus vulgari fructibus*, Tragus *Mespilus fructu prestantiore*, and Dodonæus *Mespilus Oxycantho infusa*, or as Lugdunensis saith, *infusione mitior satia*. The second is termed *glvestris* by Bauhinus, as well as *Laurino folio*, and Germanica being the more ordinary both with them and us. The third is set out by Matthiolum and Lugdunensis, but their figures do not expresse the leaves to be dented as they should be. The fourth is spoken of by Scaliger and Lugdunensis. The last is the *Mespilus*, called *Aronia* of Dioscorides, the *Mespilus Anthedon* of Theophrastus and Pliny, and is the first *Mespilus* of Matthiolum, and generally called *Mespilus Aronia* with all other Writers, onely Ruellius, and Gesner in *hortis* calleth it *Paliurus Africana*, and Cordus *Mespilus tricoccus*, and may peradventure be the *Mespilus Gallica* of Camerarius in *horto*. The Arabians call it *Zarar* or *Zarrar*, and Alzarar, the Italians *Mespili* (but they call the last which we call of Naples *Azarolo*, derived as it is likely from the Arabians *Zarrar*) the French *Nesflie*, *Mesplier*, and *Mesflie*, and the fruite *Nesle* and *Mesple*, the Germans *Nesfelbaum*, and the fruite *Nesfel*, the Spaniards *Nesperas*, the Dutch *Mesfelboom*, and we in English the Medlar tree and fruite.

The Vertues.

Medlars have the like properties that Services have, but are more effectual in operation to binde and stay any fluxes of blood or humours in man or woman, the leaves also have the same quality, but besides these effects the mellowed fruite is often served among other sorts of fruite to the table, and eaten with pleasure by those that have no neede of physicke, but worketh in women with childe, both to please the taste as in others, and to stay their longings after unseasonable meates, &c. as also very effectual for them that are apt to miscarry, and before their time to be delivered, to helpe that malady, and make them joyfull mothers: that of Naples is the more delicate & is also accounted the more effectual for the said purposes: the decoction of them is good to gargle and wash the mouth and throat, and teeth, when there is any fluxion of blood to stay it, and of humours, which causeth paines and swellings, to binde those distillations and ease the paines: the same also is a good bath for women to sit in or over, that have their courses come downe too abundantly, or for the piles when they bleed too much: the same also serveth well both to drinke and to bathe the stomacke warme, that is given to casting, to loath or not to hold and containe their meate and digest it, but if a pulvis or plaister be made with dried Medlars, beaten and mixed with the juyce of Red Roses, wherunto a few Cloves and Nutmegs may be added, and a little red Corall also, and applyed to the stomacke it will worke the more effectually: the dried leaves in poultice strawed on bleeding or fresh wounds, restraineth the blood, and healerh up the wound quickly: both leaves and fruite are of singular good use to binde, and to strengthen whatsoever hath need of those qualities. The Medlar stones made into poultice and drunke in wine wherein some Parslye rootes have lyen infused all night, or a little boyled, doe breake the stone in the kidneys helping to expell them.

CHAP. XXV.

Chamaepilus & Epimelis. Dwarfie Medlars and other such like small fruited.

Here are some other small fruited to be spoken of, that are fittest to be referred to Medlars and Services, though resembled to Quinces and Apples, by their Authours, and because they were not to be put in the former Chapters, I thought to entreate of them next unto them, in a Chapter peculiar to themselves.

1. *Chama*

1. *Chamaesp. lvs.* The dwarf Medlar.

This dwarf Medlar which *Gesner* so called for some likeness it had in the fruit, with the ordinary Medlar, although but a little, is a small woody shrub, covered with a reddish ash coloured bark, having small leaves growing thereon, every one by it selfe. somewhat like unto Bassil satch *Gesner*, but gray or hoary underneath, the blossomes are small and greenish, standing either singly or by couples on slender footstalkes, after which follow small reddish round berries, with a small crowne of leaves at the head like unto the Medlar, without any sappe or juyce therein, or very little, and having two or three small feedes like grape kernells within each: the leaves fall every yeare, and the roote liveth shooting up some twiggy stalkes.

2. *Epimela Galea.* The small ballard Medlar.

This differeth from the former in that it riseth with longer stemples or stalkes, whose leaves are greene above and gray underneath, somewhat like unto the former, but somewhat larger, the flowers hereof come forth upon a pretty long footstalk one above another, very like unto the blossomes of *Arbutus* the Strawberry tree, that is, like a little round bottle with small brimmes and not as the Medlar, laid open into five leaves, which flowers are of a pale bluish colour, and turne into small berries, of a yellowish red colour, with a little head or crowne like the other, but lesser, nor so bigge as Hawthorne berries, but as dry and saplesse, with three or foure hard white feedes within them, of a little dry but no great harsh taste: the leaves hereof likewise fall away in Autumne, and rise againe in the Spring.

3. *Coronaster Gesneri.*

Gesner his ballard low Quince.

This little shrub, (*Gesner* sheweth to differ from his Dwarf Medlar, least any should suppose them to be both one,) hath larger and longer leaves, a little dented about the edges, yet hoary white, as the Quince tree leaves are, and hath berries not so round nor so red as it, but tending somewhat to yellow, with foure three square feedes in each berry.

The Place and Time.

Both the former and the later, grow in sundry places of Germany, and of France also, and so doth the other also, and their berries ripen in August.

1. *Chamaesp. lvs.* The dwarf Medlar. 2. *Epimela Galea.*
Small ballard Medlar. 3. *Coronaster Gesneri.*
Gesner his ballard low Quince.

The Names.

It pleaseth *Gesner* to name the first *Chamaemespilum*, whom almost all since have followed, and called so in like manner, onely *Lugdunensis* calleth it *Epimelis*, and maketh it the *Mespilus* of *Dioscorides*, which he saith some called *Epimelis*, and some *Setainum*, when as himselfe saith in his Chapter of Medlars, that *Dioscorides* his *Mespilus* *Setania*, is our common Medlar, whose fruit as well as tree is farre greater then of this. The second is the *Epimelis* of *Galen*, whereof he maketh mention *lib. 6. simpl. medic.* and differeth from the Medlar so called, whereof he speaketh in another place; for he saith that the fruit hereof is sowre, and hurtfull to the stomacke, and that the Country people of *Italy* did call it *Vnedo*, (which is probable they did so, because the blossomes are very like those of the *Arbutus* which is also called *Vnedo*) *Lugdunensis* calleth it *Epimelis altera*, but is not *Clausius* his third *Vitis Idea*, as he thinketh, which hath blacke berries, but this hath red as he describeth it, and therefore therein was deceived, yet thinketh it to be the *Cotonaster* of *Gesner*, which *Clausius* contradicteth. The third is indeede the *Cotonaster* of *Gesner*, which *Clausius* also mentioneth in his history of plants, with his *Chamaemespilus*, and *Vitis Idea*. *Bauhinus* maketh a doubt whether it be not the *Agrimoelea* of *Bellonius*. *Bauhinus* seemeth to make two severall plants thereof, as may be seene in his *Pinax*. These plants have gotten sundry *Germane* names among the *Alpish* inhabitants and others, as by these divers names in *Latine* derived, for the *Germane* may be easily understood, and because we wanted names to call them by, I have given it them as neere as I can, either from the *Latine* or their proper effects, and thus much may suffice untill we further be informed of them.

The Vertues.

There can be little said of any of these plants, seeing so little hath beene said by those moderne Authours, that first wrote of them: for some of them being dry berries, are wholly neglected, and the other that have some better relish or sweeter taste, are onely eaten by the Mountainers and their children, and not applyed as medicinal for any griefe.

CHAP. XXVI.

Acer. The Maple tree.

Here are onely foure sorts of Maple trees knowne to us, that I am to shew you, but *Bauhinus* doth distinguish them into foure thus, *Sphenodamnus* is that Maple that is white and full of veines, *Zygia* is yellow and crispt, *Clinotrochon* is yellow and not crispt, *Glinon* is white with few veines, but we must give them you by other termes.

1. *Acer majus latifolium Sycomorin dictum.* The great broad leaved Maple or Sicomore tree.
The great Maple (which hath beene with many falsely called the Sycamore tree) groweth quickly to be a great

1. *Acer majus latifolium Sycomorin falso dictum.*
The great broad leaved Maple or Sycamore tree.

2, 3. *Acer minus & montanum.*
Our common wood Maple and the mountaine kinde.

FFFFF and

and a tall tree, spreading many faire branches, which make a goodly shadow, covered with a reasonable smooth barke, having many very faire large leaves thereon, set upon reddish footstalkes, cut somewhat deeply into five somewhat long parts or divisions, all dented about the edges, Greene above and grayish underneath, the flowers are of a whitish yellow Greene colour, standing on a long stalk, with some few threds within them, each flower yeelding two winged huskes, parted at the stalk, which are thinn skinned at the ends, and bunched out, where the seed lyeth within, and are very like unto the common or wood Maple, but much larger, and many more standing together: the wood is whitish and smooth, but not so white, smooth, and close, as the wood kinde is.

2. *Acer minus sive vulgare.*

Our common or wood Maple tree.

The common Maple tree groweth lower & slower then the former, sometimes in hedges, no higher then those other hedge bushes, or els much higher covered with a more rugged barke, spreading neither so far nor such great branches, the leaves are much smaller, thinner and not so deeply cut in, but yet divided into five parts, and somewhat broad, at the setting on of the stalk, of a deepe and shining green colour on the upper side, and paler underneath: the flowers and seede are very like the former, but fewer set on the stalkes, and lesser also in bulke or bignesse; the wood hereof is very white, very smooth, and very close grained.

3. *Acer montanum.*

The mountaine Maple tree.

This Map'e differeth little from the last, that groweth well and great, differing chiefly in the leafe which is not flat next unto the stalk, and is somewhat deeplier cut into more divisions.

4. *Acer Creticum trifolium.*

The three leaved Maple of Candy.

This Maple groweth to be a tree of a meane size, spreading branches reasonable well, the barke whereof is of a dark reddish colour, having broad Greene leaves full of veines, divided into three parts, standing equally distant one from another, with a long slender footstalk under them, the flowers stand onely a couple together on the stalk, as the seede that followeth doth also, winged somewhat like the last but smaller.

The Place and Time.

The first is nowhere found wilde or naturall in our Land that I can learne, but onely planted in Orchards or walks for the shadowes sake, but groweth in sundry places in Germany, &c. The second and third are found both on high and low grounds, in Woods, and Groves, Parkes, Chafes, and the like through most Countries of this Kingdome, the one in the moister grounds, where the wood will be looser, and the other in the dryer grounds, firmer and closer; but the last is also a stranger to us growing about Mompelien and Candy, they all flower about the middle of April, and the seed is ripe in the end of September.

The Names.

It is called in Greeke *σπένδιμνος*, & *σπένδιμνος*, in Latine *Acer*. The first is that which *Clusius* calleth *latifolium*, because it hath the greatest and broadest leaves of any, and therefore *Tragus* calleth it *Platanus*, thinking as divers did that it was the true *Platanus*, and therefore the French did call it *Plane*, before the true one was discovered and knowne. *Ruellius* and after him many others called it *Sycomorus* the Sycomore tree, which in divers Countries doth still continue, and with us also being called usually the Sycomore tree: but by this name of *Sycomorus* the Sycomore tree, divers Writers have called divers trees, as first the true Sycomore or Mulberry Figge, called of divers *Ficus Pharaonis*, *Ficus Egyptia*, *Morus Egyptia*, and *Ficus Cypria*. *Matthiolus* and others say that the Italians call the *Asad irach* by the name of *Sycomorus*. And *Petrus Crescentinus* calleth the *Virga sanguinea*, by the name of *Sycomorus*. And lastly *Ruellius* and others say that this *Acer latifolium*, is called *Sycomorus*, yet *Clusius* saith that the French call the lesser or wood sort so. The second is that which is most frequent in our Land, and called *Acer tenuifolium*, by *Cordus* in his *histor*, *Acer minor* by *Dodonæus*, *Clusius*, and *Camerarius*, *Opulus* by the Romans, *Opulus* by *Gesner* in his *hortis*, and *Cordus*, and *Opulus campestris* by *Lugdunensis*, who also taketh it to be *Carpinus*, but not rightly. The third is the *Aceris altera species*, *quæ fortè* *Zygia Theophrasti* of *Lobel*, by *Belonius* *Acer montanum*, *flavum* & *crispum*, and *Aspendannos* by the Country men of Candy, by *Lugdunensis* *Opulus montanum*, and can be no other then the *Zygia* of *Theophrastus*, which *Gaza* calleth *Carpinus*, which differeth much from the *Opulus*, which some as is before said call *Carpinus*. And the last his *Glinon*, which hee rendereth *Gallicum*. The Italians call it *Piedoca*, and *Platano aquatico*, the French *Erable*, the Germanes *Maszholder* the common sort, and *Aborne* the greatest, the Dutch *Luytenhout*, and we in English *Maple*, and some, but as falsly as the French or any other, the *Plane* tree.

The Vertues.

Neither *Discorides* nor *Galen*, in his censure of simples, make any mention of this tree, yet *lib. 3. med. part. cap. 8.* in the medicines for the Liver, written by *Asclepias*, he appointeth a dramme of the roote to be beaten to poulder, and given in water, but *Cornarius* doubteth that the word is mistaken, because none of the Greeke Writers have made any mention thereof, or that it should be used in any disease. And none but *Pliny* hath recorded any of these Maples, but saith that the roote of the Maple being bruised, is applied with very great effect unto those that have obstructions, or any other paines of the Liver, or Spleene, which *Serenus* delivereth in these Verses following:

*Si latus immeritum morbo tentatur acuto,
Accensum tinges lapidem stridentibus undis,
Hinc bibis : aut Aceris radicem tundis, & una
Cum vino capis, hoc presens medicamen habetur.*

*Thy harmlesse side, if sharpe disease invade,
In hissing water quench an heated stone,
This drinke : Or Maple roote in powder made
Take oft in Wine, a present medicine knowne.*

It is used in many joyners works, especially the finest wrought grained wood, which *Pliny* peradventure meant *lib. 16. c. 16.* by that which he there callieth *Bruscus*, and *Molluscus*, the more excellent both of them as he saith, is *ruber Aceris*, the knotty part of the tree, or of the roote thereof, which is held to be fuller of diversified veins therein : either of which saith *Pliny*, if they were large enough to make a table, would excell the Cedar, as some take it, but others thinke it should be *Citrus* the Citron.

CHAP. XXVII.

1. *Platanus orientalis verus.* The true Planetree of the East Countries.

Because in the last Chapter it is shewed that the *French* and others were utterly mistaken in calling the Maple the Plane tree : I thought it meetest to shew you which is the true kinde next thereunto, and to joyne thereunto another sort, brought by *Mr Tradescant*, out of *Virginia*. It riseth up to be a very great tree in time, spreading very largely, the barke whereof is rugged, the leaves are very large, cut into five divisions, and each of them deeply gashed on the edges, Greene above and whitish underneath hanging by a slender reddish stalke, the flowers are of a pale white colour, many set together on a long stalke, after which follow sundry round rough bales of the bignesse of Walnuts, made as it were a bur, but not sticking, wherein lye small seede, the wood is firme, hard, and yellowish browne.

2. *Platanus Occidentalis aut Virginensis.* The Plane tree of the West parts or *Virginia*.
This Plane tree likewise groweth great, and spreadeth fairly, whose leaves being broad and large, have not so deepe divisions in them, and the pills or burres are, although somewhat rough with the compleat roundnesse, not so sharpe as the former, which being set hereby is utterly spoiled in the cutting, they grow also many hanging downe from the ends of the branches, as in the others.

1. *Platanus Orientalis verus.*
The true Plane tree of the East Country.

2. *Platanus Occidentalis aut Virginensis.*
The Plane tree of the West parts or *Virginia*.

FFFFfa

The

The Place and Time.

The former groweth not naturally in any Country of Europe, but in Asia, Syria Egypt, and Africa many, and they are planted also by the way sides, and in market places, for the shadows sake onely: it is found with very few in our Christian world, and those onely great lovers of rarities, being very tender, not enduring without extraordinary care and keeping, the cold of our climates, the other is but lately brought from Virginia by M. Tradeſcant.

The Names.

It is called $\pi\lambda\acute{\alpha}\tau\upsilon\varsigma$ in Greeke, and *Platanus* in Latine, *alate diffusis ramis nomen sortita est*: and by this name all Authours have called it that have written of it. The Arabians call it *Dalb*, the Italians *Platano*, the French *Platane*, that it may differre from the *Plasne*, whereby as is said they call the Maple, the Germans know it not, and therefore they and the Dutch have no peculiar name, but as they take it from the French *Plane*, even as we doe also, calling it the *Plane tree*: *Dioscorides* calleth the fruite or burres *σφακία*, and *Pliny* *Pilula*. The Virgilians being so like the other can have no other name.

The Vertues

Galen saith that the *Plane* is of a moist and cold nature, but not farre from a temperate, and therefore the green leaves bruised and laid on inflammations and hot swellings doe helpe them, but the barke and the burres are more drying, which being boyled in vinegar, is good to gargle the mouth for the paine of the teeth: the burres also fryed with fat is good against burnings, the burnt barke mixed with water doth cleanse the skin of any scurfe, leproy, or other deformities of the skin, and doth dry up much also, old moist and unning ulcers, bringing them to cicatrising: there is saith *Galen* and *Dioscorides*, a kinde of dust upon the leaves, which every one must be carefull to avoid, that it fall not into their eyes or eares, least it put them to much paine, the burres drunke in wine, resisteth the venome of the Scorpion, and other venomous creatures, the young tender leaves boyled in wine, and the eyes bathed therewith that have either rednesse or rheumes false into them helpe them.

CHAP. XXVIII.

Buxus. The Boxe tree.

The Boxe tree, hath two or three diversities observed therein, which shall be shewed here, and with them another, which divers doe referre hereunto.

1. *Buxus arbor vulgaris*. Our common Boxe tree.

The Boxe tree groweth slowly, and seldome groweth to any great body, or any great heighr, but when it is suffered, after a long time riseth unto twise a mans height, and of the bignesse of a mans thigh, with a grayish barke, but in many places very low, spread reasonable well, with branches, whereon are set many thicke small, somewhat long and round pointed leaves, abiding alwayes greene, larger, thicker, and greener then any ordinary Mirtle leaves, greater or lesser, as the bushes be in greatnesse, at the foote of the leaves come forth small greenish flowers, which turne into whitish round berries, with foure points at the toppes, with reddish seede within them: the wood is very sould close, of a whitish yellow colour, and so heavy that it sinketh being put into water.

2. *Buxus auratus*. Guilded Boxe.

This guilded Boxe groweth in like manner as the former, in some places taller and greater then in others, the leaves are altogether like it, but that most of the upper leaves in the Summer time will have a yellow list or guard about the edges, and in nothing else differing from the other.

3. *Chamaebuxus minor*. Small low Boxe.

This small Boxe groweth never high or great, and although neglected or suffered yet still it hath many slender twigs rising from the roote, and every branch apt to take roore, whereby it may quickly be propagated and encreased, the leaves are much smaller and finer then in the former, and of a deeper greene colour, which never bore flower or seede that I could observe or learne.

4. *Pseudo chamaebuxus*. The bastard low Boxe.

This small low plant lyeth most on the ground, with the slender rushlike greene branches, rooting as it spreadeth, and not rising a foote high having divers thicke hard leaves set thereon without order, somewhat like unto Boxe leaves, or rather Mirtle leaves, being for the most part pointed at the ends, ever abiding greene: at the ends of the branches among the leaves come forth foure or five flowers of the fashion of Pease or Broom blossomes, the uppermost part whereof is whitish, and yellowish in the middle, but purplish lower, and in some purple above, and yellow below, after which come small flat cods like unto the broad *Tibalspi*, containing within them blackish gray round seede like Vetches: the roote spreadeth tough long branches in the ground, and abideth long.

The Place and Time.

The first is found with us in many woods, and wood grounds among other sorts of trees, it is also planted in divers Orchards, or house backe sides, where it never groweth high, but serveth as a bush to dry Linnen on, &c. The second hath bene likewise found in sundry places of this land, but onely neere those that have it. The third groweth also in gardens being planed either as a border to keepe up the beds, or as a hedge likewise to dry cloths on. The last *Clusius* found in sundry places of Austria, and Hungaria, and Cordus on the hills in Bavaria, &c.

The Names.

Boxe is called $\pi\upsilon\kappa\iota\delta\iota\varsigma$ in Greeke $\delta\iota\delta\acute{o}\tau\omicron\ \pi\upsilon\kappa\iota\delta\iota\varsigma\ \tau\omicron\ \xi\upsilon\lambda\omicron\varsigma$ *adenſitate ligni dicitur*, and *Buxus* in Latine, and therefrom came *pixides* the small vessels or boxes to hold and containe things in them. *Theophrastus* and *Dioscorides* have but one sort, but *Pliny* hath three, the first he calleth *Gallicum*, because it was made to grow into spires or pillars, unto a great height. The second *Oleastrum*, (but as *Dalechampius* on *Pliny* noteth, there is an error in the mistaking of the word, in some Greeke copy that he followed, and for $\alpha\gamma\epsilon\iota\upsilon\omicron\delta\eta\omicron\varsigma\ \tau\iota\upsilon\alpha\iota$, *secundum omnino agreste esse*, he tooke it to be $\alpha\gamma\epsilon\iota\lambda\alpha\omega\omicron\varsigma\ \tau\iota\upsilon\alpha\iota$ *Oleastrum esse*) is wholly wild, and not profitable for any thing as the first kind is, being of a most loathsome sent, not fit to set against the house sides, as the third is: Another error *Pliny* hath, that he saith the head of seede is called *Crategus*, which he doth confound out of *Theophrastus* that speaketh of *Crategus* next after *Buxus*, lib. 3. c. 15. and a third error herein is, that he saith the Boxe beareth *Viscum* on the

1. *Buxus arbor vulgaris.*
Our common Boxe tree.

4. *Pseudo-chamebuxus.*
The bastard low Boxe tree.

the North side, and *Hyphear* on the South, which *Theophrastus* saith of the *Ilex* to doe so. The first is generally called *Buxus* & *arbor*, or *arborescens* by all. The second hath not beene mentioned by any Writer before me. The third is called *Chama-pyxos* by *Tragus*, and *Taber-montanus*, and *Buxus humilis* by *Dodonaeus*. The last is the *Anonymos* fore *Colutae* of *Clusius*, the *Anonymos* *Pervincae folio* of *Camerarius* in *horto*: and *Rhus Myrsifolius* *Flaminij Gesneri* also, *Gesner* in *Collatione Stirpium* calleth it *Chamebuxus*, and *Besler* that let out the great *hortus Eystetensis*, *Pseudo-chamebuxus* as I doe. *Thalys* calleth that small plant *Myrtus tenuifolius*, that *Cordus* calleth in *Observationum Sylva*, *Fruticulus exiguus folijs myrtivis*, which is this very plant. Boxe is called *Bosso* by the *Italians*, and *Box* by the *Spaniards*, *Boys* by the *French*, *Buxbaum* by the *Germanes*, and *Palmboom* by the *Dutch*.

The Vertues.

The leaves of Boxe are hot and dry, and astringent withall, as the taste declareth, and therefore assuredly doth dry and binde, yet is it not much used in Physicke by any now adayes that I know, although many doe trumpet out the praise of it to be good for fluxes, and the *French* disease, as much as *Guajacum*. *Fernelius* onely doth number the leaves hereof among those things that doe purge, but the practise thereof is worne out of use, yet I remember that *Doctor Smith*, that was one of *Queen Elizabeths* Physicians, appointed the decoction of an ounce of the leaves of Boxe for a purging medicine, to be boyled in whey, and a dramme of the poutler in broth. But *Marthiolus* contesteth against such as tooke it, and the *Guajacum* to be both one: the leaves and the dust of the wood boyled in lye, will make haire of an Aborne (or *Abraham*) colour, the dwarfe Boxe is fit as is said to border the beds of a Garden, &c. and either they or the leaves of the other dried and given to horses, cureth them of the Bots, or Wormes: the wood is used for many small workes among the Turners, and the diversified boxe that hath crooked veines therein, serveth for inlaying to Joyners: there is no use knowne of the last as yet.

One medicine that I learned of a friend, who had tryed it effectually, I will here set downe unto you, to cure the biting of a mad dogge, is to take the leaves and rootes of Cowslips, of the leaves of Boxe and Penny-royall, of each a like quantity, shred them small and put them into hot broth, and let it be taken three dayes together, and apply the herbe, &c. to the bitten place, with sope and hogges suet melted together.

CHA: XXIX.

Salix. The Willow.

He Willows are to be divided into sundry parts, for some grow high, some low, some with broad leaves, some with narrow and long, and that both high and low, some also onely growing in the waters, others delighting to grow by water sides, and ditches, yet will also grow on the land. I will therefore distribute them into foure peculiar sorts or orders, that is to say into those that grow high
E f f f f f 3 And

1. *Salix arborea angustifolia alba vulgaris*.
The ordinary great white Willow tree.

3. *Salix roica*. The Rose Willow.

and beare narrow leaves, into those that grow high, and beare broad leaves into the lower sort with broad leaves, and into the lower with narrow leaves, and so I shall comprehend the whole number of them; and yet I must separte the *Spyrea* of *Clusius* and the *Vitex* or *Agnus castus* into two chapters by theielves.

1. *Salix arborea angustifolia alba vulgaris*.

The ordinary great white Willow tree.

Our ordinary white Willow groweth quickly to be a great and tall tree, if it be not lopped as it is usuall in most places, with a smooth white barke on the body, and bigger branches, the younger sprigges, being somewhat greene with the whitenesse, the leaves are long and narrow, pale greene on the upper side, and of a shining silver white colour underneath, without any dent on the edges, the flowers come forth before the leaves appeare, and are small long and round, yellow mossie heads, smelling sweete for the most part, divers standing one above another, on a long sticke, which in time turne unto downe, that is blowne away with the winde, and the seede with it if it have any: the wood is soft and white, and with the branches hereof cut into long stickees are made stakcs for hedges, or to uphold Vines, &c.

2. *Salix angustifolia purpurea seu nigra*.

The ordinary blacke Willow.

The blacke Willow differeth from the former white not growing so great or high, and that the barke is more rough and of a darke reddish colour, the branches lithy and easie to bend, as whereof hopes are made to binde caskes, the leaves likewise are narrower and blacker, and wood not so white.

5. *Salix pyramidalis nigra*. The blacke Wichye.

3. *Salix*

3. *Salix Rosca*. The Rose Willow.

The Willow that beareth a tuft of small greenish white leaves, on the reddish branches, set in order together almost like a Rose, is in growth like unto the last, the barke as rough and darke, the leaves not so long nor the branches fully so lithye and pliant, yet reasonably.

4. *Salix fragilis*. The hard blacke Willow.

This differeth from the second, in that the branches are hard and blacke, strong, and not pliant as the former, &c.

5. *Salix viminalis nigra*. The blacke Withy.

This Withy hath more slender branches, and more fit to be wound, of a darke red colour: the leaves are long and narrow, dented about the edges, of a darke greene, and a little white underneath, having two small round leaves, at the setting on of every the long leaves, which sheweth the kinde thereof.

6. *Salix Gallica nigra*. The French blacke Withy,

This differeth from the last in this, that the twigges are more yellowish browne, the leaves lesse dented and hath no small round leaves at the bottome of the longer.

The Place and Time.

Many of these sorts are found in our owne land in low grounds, neere water courses and ditches, and the Rose Willow in sundry places of *Essex*, and *Cambridge shire*: the blossomes come forth before any leaves appeare, and are in their fullest greatnesse usually before *Easter*, divers gathering them to decke up their houses on *Palme* Sunday.

The Names.

It is called in Greeke *ῥίσα, ῥίσα, ῥίσα*, quod cito in altum excresecit, and *Salix* a *saliendo* in Latine, because it groweth with that speed that it seemeth to leape. The first is common both with us and with other nations, and is that which *Theophrastus* and *Pliny* call *Salix alba*, and *Salix pericalis* by *Matthiolus*, *Corais*, *Lugdunensis* and others, because the branches thereof being strong are used as stakes to hold up any thing, or to be bound thereunto. The second is taken to be the true *Salix Amerinana nigra* & *rubens* of *Pliny*, and of *Columella* *Salix Amerina* & *Sabina*, which *Matthiolus* calleth *Grecia*, and *Dodonaeus* *Gallica*, and by *Thalium* *Sabina*, and *Amerina*. The third is not mentioned by any forraigne Authour that I know of, *Gerard* having given the first knowledge thereof to the world. The fourth is called by *Bauhinus* *Salix fragilis*, as it is in the Title. The fifth is called by *Lugdunensis* *Salix melastoma* & i. e. cortice nigro of *Theophrastus*, and the purpurea of *Pliny*. The last is the first *Salix* of *Tragus*, the *Salix Gallica* of *Corais* on *Discozides*, and by *Lugdunensis* *Salix Phenicea*. The *Arabians* call the Willow *Bulef Blules*, and *Saffaff* also, and *Chalif*, which names *Alpinus* and *Ravvolius* give to their particular kindes, the *Italians* *Salice*, the *Spaniards* *Salce*, and *Salgueiro*, the *French* *Saulx*, and *Sauile*, the *Germanes* *Weiden* and *Felbingen*, the *Dutch* *Milgeboom*.

The Vertues.

The Vertues of all the sorts of these Willows, as of the rest are set downe together at the latter end of them, except such as are mentioned in particular.

CHAP. XXX.

Salix arborea latifolia. The Sallow tree.

Of this kinde there are divers sorts that plainly differre both from the former and among themselves.

1. *Salix latifolia rotunda*. The round leaved Sallow.

This Sallow groweth to a reasonable greatnesse with a grayish white rugged barke outermost, and another redder inward, the outermost being pliant and strong, fit to binde things withall: the leaves hereof are broad and almost round, dented about the edges, darke greene above and gray underneath with two small round leaves joynd to the foote of them: the flowers or catkins are not such whole heads or tufts as the former kinde, but consist of many small heads, thicke set together, which are blowne away with the blackish seede in them as the others are: the wood hereof is more loose and spongy then the other, and may by beating the head be writhed round or downward, as is scene at the Christmas time in many Noble and Gentlemens houses set at their gates by their Porters.

2. *Salix latifolia oblongior*. The longer leaved Sallow.

This other differeth from the former onely in the leaves, which are not so round, but broad and long withall, dented about the edges, and in all things else alike: on the leaves of both these sorts are found sometimes certaine bladders or blisters, and upon the branches little rough balles.

3. *Salix latifolia minor*. The lesser broad Willow.

There is another sort hereof that groweth not so high as the former, the leaves being of a meane size, betweene them two that is not so round nor so long, but of a darker greene colour, and gray underneath like unto them.

4. *Salix subrotunda argenteo folio*. The silver leaved Sallow.

This silver leaved Sallow groweth low like the last, having a brownish barke to cover the body, but especially the branches, the leaves are more long then broad, and shining silver-like underneath, somewhat lesser then the last, the leaves and the barke being the chiefest differences in this from the last.

The Place and Time.

These sorts although they are sometimes found by waters sides, yet are they also found in the moister grounds, not neere crookes or ditches, and in the upland grounds as well: their time of flowering is with the former.

The Names.

This kinde is called *Salix arborea latifolia* to distinguish it from all the other kindes: the two first sorts are mentioned by *Tragus*, as his fourth kinde, and called *Latifolia* or *platyphyllos* by *Clusius*, *Camerarius*, *Thalium*, *Gesner*, *Lobel*, and *Lugdunensis*, which *Tabernmontanus* and *Gerard* call *Salix caprea rotundifolia*; and thought to be *Elaeagnus* by some, and called *Salix latifolia aquatica* by others. The third is mentioned by *Thalium* onely, and

1. *Salix latifolia rotunda.*
The round leaved Sallow.

2. *Salix latifolia oblongior.*
The long leaved Sallow.

and by *Bauhinus* from him. The last by *Bauhinus* onely, who calleth it *Salix subrotundo argenteo folio*, as it is in the title.

CHAP. XXXI.

Salix pumila latifolia. The low broad leaved Willow.

Here are likewise three or foure sorts of this low kinde to shew you, which are as followeth.

1. *Salix humilis latifolia cresta.* The upright low broad Willow.

The branches of this low Willow are short, not above a cubit long and straked, or as it were crested all along: the leaves are somewhat long with the roundnesse and pointed at the ends, a little wrinkled above, and soft and woolly underneath: this creepeth not as the next, which distinguisheth it.

2. *Salix latifolia repens.* Creeping broad leaved Willow.

The stalkes with the sundry branches of this low Willow, having a rugged barke, doe for the most part spread on the ground, and take roote againe as they lie, the leaves are small, yet somewhat broad and long, pointed at the ends, greene above and gray underneath and shining, the catkins hereof are thicker and shorter then in any other of these lower sorts, the rootes hereof spread much in the ground.

3. *Salix latifolia Alpina repens.* Creeping mountaine broad leaved Willow.

This other sort differeth little from the last, having a little smoother bark, a few rounder leaves, and smaller catkins, which abide untill August, and then shew their small blacke seede within them, and great rootes much spread.

4. *Salix saxatilis minima.* The least red or stone Willow.

The stocke hereof is thicke at the bottome, but short, sending forth two or three slender short branches, lying on the ground, having long and some what round darke greene leaves thereon, with many veines therein, at the end whereof standeth a small round head made of many small graines as it were set together, which when they are ripe open themselves and sheweth forth a short soft white downe, out of a three square huske, which is carryed away with the winde.

5. *Salix pumila abortiva.* The least Willow without fruite.

This Willow groweth not much higher then ones hand with such small round leaves thereon, white on both sides, that they exceede not the bignesse of a penny, standing close together, without either flower or seed, that it can scarce be taken for a Willow.

6. *Salix Egyptiaca & Syriaca.* The Egyptian Willow or of Syria.

This Willow that groweth familiarly both in *Egypt* and *Syria*, is neerer a shrub then a tree, spreading into many slender flexible and yellowish branches and stemmes also from the roote, whereon are set faire broad and large leaves

233. *Salix humilis latifolia* & *Alpina repens*.
The Creeping broad leaved and mountain Willow.

6. *Salix Egyptica* & *Syriaca*.
The Egyptian Willow or of Syria.

leaves on both sides, yet but one at a place usually, especially on the younger stemmes and branches, but grow smaller on the elder, with some lesser with them also, greene on the upper side, and grayish underneath: at every joynt with the leafe usually commeth forth a whitish ball or tuft, of a soft flocky substance, which by time is disperfed into the aire, without bearing any feede for ought that hath been observed, yet may be in that flocky matter, as is usuall in many other plants that beare flocky heads: but because the flowers are very plentifull, and sweete withall, the Natives distill a water from them, whereof they make a great account, calling it *Machaleb*, using it as an especiall helpe for all sorts of agues, but especially in pestilentiall and putride feavers, as also the infusion or decoction of the flowers and for paines in the head and faintings of the heart, and the comforting and strengthening thereof.

7. *Salix Arabica humilis folijs Atriplicis*.

The Arabian dwarf Willow.

This Arabian likewise groweth low, with many pale yellowish branches, but thicker, more solid and strong then the last, beset on all sides with leaves, that are of an handbreadth long, and two inches broad, somewhat jagged on the edges like unto a wild Arrache, what flowers or fruit it bore, was not observed, but of the coles of this sort of Willow, they make their best Gunpowther.

The Place and Time.

Some of these sorts are found in many places of this Land, as upon *Hampstead Heath*, *Rumney Marshes* and the like, although *Clusius*, *Lugdunensis*, and *Bauhinus*, have recorded them to grow in *Germany*, *Hungary*, and *Savoy*, &c. The two last according to their titles.

The Names.

Bauhynus calleth the first by the name in the title, as he doth the fourth also. The second and third *Clusius* calleth *Salix pumila latifolia*, the third here being his first, and his second, the second here. The fifth *Lugdunensis* calleth *abrotyni*, as it is in the title. The sixth is remembered by *Alpinus* among his *Egyptian* plants, calling it *Calaf five Ban*, and *Veslingius* saith the *Egyptians* and *Syrians* call it *Caleb* also, *Rauwolfius* saith the *Syrians* called it *Saffaf*. The last *Rauwolfius*, also saith is called *Garb* by the *Arabians*, and *Garrab* by the *Moores*.

CHAP. XXXII.

Salix pumila angustifolia. Low narrow leaved Willows.

Ereof there are divers kinds which grow diversly some in more wet places then others, and first I must speake of the *Oſier*, because although it grow with longer twiggies or roddees, then many of the rest, yet it beareth narrow long leaves.

1. *Salix aquatica humilis*. The *Oſier*.
The *Oſier* hath a stumpe or stocke of a tree, as bigge as ones arme at the most, and not above a foote high, put with an head as bigge as a childes head, being kept thus low of purpose, because the shootes or wands that rise out of it, are cut every yeare for use, the barke whereof in some is yellowish or whitish, in others brownish, the leaves are long and narrow, yet broader then any of the rest for the most part that follow, dented about the edges, darke Greene on the upper side, and whitish underneath: this hath not bene observed to beare any flowers, because all the shootes are yearly lopped off close to the head, but the rods thrust into the ground will spring to be young trees, to be dressed in like manner, and so will any branch of the former greater sorts.

2. *Salix pumila angustifolia recta*. The straight dwarf Willow with narrow leaves.
The stemmes of this Willow are slender yet upright, not above a foote long, covered with a yellowish barke: the leaves are narrow and long like unto those of Line or Flaxe, Greene above and gray below, the young ones being wholly gray and hoary: the bloomings or catkins are soft and yellow, like the greater kinds, and come forth before the leaves, and passe into downe being ripe, that is blowne away with the winde, the roote is blacke of a fingers bignesse with fibres thereat, growing a slope.

3. *Salix humilis angustifolia repens*. Creeping low Willow with narrow leaves.
The branches of this low Willow, grow to be a foote or more long, but slender and leaning, and lying upon the ground, where it will shoote forth rootes againe, set with shorter and narrow leaves, divers coming forth together, Greene above and gray below, in other things not unlike the former.

1. *Salix aquatica humilis*.
The *Oſier*.

2. *Salix pumila angustifolia recta*.
The straight dwarf Willow with narrow leaves.

4. *Salix*

3. *Salix humilis angustifolia repens.*
Creeping low Willow with narrow leaves.

4. *Salix oblongo incano folio.*
The black low Willow.

4. *Salix oblongo incano acuto folio.*
The black low Willow.

The stem hereof is covered with a dark red bark, parted into sundry short branches with narrow long and sharp pointed dark green leaves upon them, and hoary underneath, the rest agreeeth with the former.

5. *Salix Helice Theophrasti.*
Hungarian low Willow.

The branches of this Willow are very slender and pliant, though the body be somewhat great, covered with a pale yellowish bark, the leaves grow by couples, being long narrow and sharp pointed, green with a certain hoariness above and gray underneath, with some small leaves at the bottoms of them, and with small reddish bolls or blisters sometimes on them also: the flowers, &c. agree with the former, but this is proper hereunto to have scaly heads of leaves at the ends of the branches.

6. *Salix Alpina Pyrenaea.*

Low Willow of the Pyrenean hills.

This small Willow riseth unto scarce half a cubits height, with slender short branches, full of small long leaves, hairy all upon the edges, and as soft as Velvet, the stalk with the catkins thereon are an inch long, being soft and slender, but else like the rest.

7. *Salix Alpina repens angustifolia non incana.*

The green creeping Willow.

The branches hereof, although some of them rise above the ground, yet take they root below, having somewhat broad and long leaves on them, wholly green, so that but that the flowers do appear like unto the rest, none would take it to be a Willow.

8. *Salix angustissima & longissima folijs.*

The longest leaved Willow.

This low Willow hath yellowish rods, with the longest narrowest leaves of any of the rest, white on both sides, but

somewhat knobby underneath, this bath also scaly heads of leaves, at the ends of the branches as the fifth.

The Place and Time.

The first is alwayes planted in the low grounds that are often overflowen, where it onely will thrive: the other sorts, some are found growing with the last sort, or by them in sundry the said and the like places with us, and in *Hungaria, Austria, &c.* as *Clusius* and *Bauhinus* have set it downe.

The Names.

The first is called *Salix Vitellina* by *Cordus* on *Dioscorides*, and by *Dodonæus*, and is the third *Salix* of *Tragus* and *Cesalpinus*, *Gerard* calleth it *agnatica*, as the fittest name to distinguish it from the rest, and to doe 1: It is also called *Vincus a vincendo*. *Lugdunensis* mainraineth it to be the *Salix Amerina* of *Pliny*, against *Ruellius* and *Matthiolus*, he should have said also, who would make the *Vitex* or *Agnus castus* to be the *Salix Amerina* of the Latines, because that among the ballard names in *Dioscorides*, it is there to set downe, but they differ much, as you shall here more in the next Chapter. For *Lugdunensis* saith that they of *Lyons*, and the Mountainers in *Savoij* do call it yet to this day, *des Amerines*, which they of *Paris* call *Ofiers*, and they of *Normandy*, *des Ambres*. Some also, as *Lugdunensis* saith in the Chapter of *Grossularia* and *Salix*, would make the *Ulos* of *Theophrastus* to bee *Amerina*, but *Iso* or *Oesius* giveth *Vuas* as he saith, whole liquor he calleth *Uvond*, not unlike to thicke blackish Wine, but enclining more to purple. The second is the first *pumila angustifolia* of *Clusius*. The third is his second, and the *Salix humilis repens* of *Lobel*. The fourth is so called by *Bauhinus* as it is in the title. The fifth is taken by *Lugdunensis* to be the *Salix Helice* of *Theophrastus*, and by *Bauhinus*, *Salix humilis capitulo squammoso*. The sixth and seventh are mentioned onely by *Bauhinus*, and the last by *Lugdunensis*, and is his sixth sort. Their English names are fitted to every of them, as I thinke is fittest for them.

The Vertues.

I thought fit to shew you what particular property is in each of these Willows altogether, and not to make many places or repetitions. All of these in generall are cooling, drying, thickning and binding: both the leaves and the barke, and the seede especially, are used for any of those effects, as to stanch bleeding of wounds, and at the mouth or nose, and spitting of blood, as also al other fluxes of blood in man or woman, and likewise to stay casting, and the define thereunto, if the decoction of them in Wine be drunke: it helpeth also to stay thinne hot and sharpe, salty distillations from the head upon the lunges, causing a consumption: the leaves bruised with some pepper and drunke in wine, doe much helpe the winde chollicke, the leaves bruised and boiled in wine being drunke, doth much stay the heate of lust, and wholly extinguish it, if it be long used both in man and woman, the seede also is of the same effect. The water that is gathered from the Willow while it flowteth, the barke being slit, and a vessell apt to receive it, being fitted to it, is very good for tednesse, and dimme eye-sight, and filmes that begin to grow over them, and stay the rheumes that fall into them, to provoke urine being stopp'd if it be drunke, and to cleare the face and skinne, of any spots or discolourings: the flowers saith *Galen*, have a stronger effect to dry up any fluxe or humour, being a medicine without any sharpenesse, and the barke much more, as all barks doe, but if the barke be burnt and used, it doth yet dry more forcibly, and being mixed with vinegar, it taketh away warts, and cornes, and other the like flesh that groweth on the hands or feete, or other parts: the decoction of the leaves and barke in wine, is good to bathe the finewes, as also the places pained with the gout, and to cleanse the head or other parts of scurfe, the juyce of the leaves and greene barke, mingled with some Rose water, and heated in the tinde of a Pomegranet is singular good to helpe deafnesse to be dropped into the eares: the seede of the blacke Willow mixed with litharge of silver in equall quantity, made into an oymntment and used on any place where the haire groweth that you would take away, after it hath bene bathed well before, or else in the baine or stowe doth cause it to fall away. Of the twiggcs or rods are made many sorts of workes, both fine and coarse baskets, chaires, cradles, and many other the like: bands also both greater and lesser, to binde up Vines, Trees, Hedges, and many other things, hoops alie, and the small twiggcs, to binde the hoops flakes also, and poles both high and low, to hold up or fasten hedges, bushes, &c. unto, and many more the like things. *Tragus* remembreth a pretty fained controversie betweene the Boxe and the Willow, written in the *Germane* tongue, whether of them were of the better use in the common wealth, or might best be spared. Of the Sallow especially, but of the other Willow trees in generall, the best coles are made to make Gunpouther withall, as is well knowne, and with the coles likewise, the finest Painters draw their first draughtes: the *Castor* or *Bever* delighteth chiefly to make his residence among the Willows, and *Ofiers*, in the Waters sides.

CHAP. XXXIII.

Spiræa Theophrasti Clusio. Clusius his spiked Willow of Theophrastus.

His strange Willow (for so it is most like) groweth to be a small low bush of three or foure foote high spreading forth slender branches covered with a reddish barke, whereon are set without order, many long and narrow leaves most like unto the Willow, of a pale greene colour on the upper side, and browne underneath, finely dented about the edges, of a drying taste, with some bitternesse: at the ends of the branches come forth thick bushing spikes, or clusters of bluish coloured flowers, consisting of five leaves a peece, with some threds in the middle, of the same colour, without any sent, which turne into small five square heads with very small seede like dust within them, of a yellowish colour.

The Place and Time.

This was sent out of *Silesia* to *Vienna* to *Clusius* by *Sibisius*, the Duke of *Briga*, his learned Apothecary, where it is most likely it grew, and flowered in *May* with *Clusius*, and the seede was ripe in *August*.

The Names.

Clusius saith he that sent it tooke it to be a species of *Syringa*, and questioned *Clusius* whether it should not be referred

referred thereunto, but hee seriously considering thereon, could not finde it like to any plant that he knew, and therefore judged it most neerely to represent the *aviesgia* or as some read it *mispa* of Theophrastus, which hee putteth among those trees that beare spikes, as *Spiraea*, *Erica*, *Agnus*, and some others lib. 1. c. 23. and withall *Clasius* saith that this doth more fitly agree to his *Spiraea*, then the *Tiburnum* *Matthioli*, as some would have it.

The Vertues.

There are no property mentioned of this plant, whereunto it might be serviceable in Physick or other wise, and therefore let this suffice.

Spiraea Thophrasti sive *Clasii*.
Clasius his spiked Willow of Theophrastus.

CHAP. XXXIV.

Vitex sive Agnus Castus. The Chaste tree.

The Chaste tree is of two sorts, one with narrower, and another with broader leaves the one dented and the other not, the one with whitish and the other with purplish flowers.

1. *Vitex folio angusto*. Narrow leaved Chaste tree.

This riseth up taller then a shrub, unto the height of a low tree, with divers branches covered with a darke coloured barke, and are sithy easie to bend, with sundry large leaves cut or divided like unto Hempe leaves, either into five or seven parts or leaves, each of them being long and narrow like Willow leaves but smaller, and not dented at all about the edges: at the ends of the branches come forth long spikes of flowers, somewhat like unto Lavender spikes, stored with bluish white flowers at severall spaces up to the toppes, after which come small round seede, of the bignesse and likenesse aknost of pepper, whereupon some have called it *Piper agreste*, but neerer unto Lavender seede, but of a blackish gray colour, and tasting somewhat hot and strong.

Vitex sive Agnus castus folio angusto.
The Chaste tree.

2. *Vitex folio latiore*. The broader leaved Chaste tree.

This groweth lower and lesser then the former, having the like leaves divided as it, but each somewhat broader, and dented about the edges, more white and woolly also then they, the flowers grow in spikes after the same manner, of a blewish purple colour, the seed that followeth is also like the other.

The Place and Time.

These grow in the further part of France, in Italy, and Spaine, usually by watersides and in the milder grounds, these colder Countries doe onely nurse them up in Gardens for their rarity and use: they flower in July, and the seede is ripe in August in the naturall places, but will hardly flower with us.

The Names.

It is called in Greeke *Σπινθ*, that is, *Castus quod castitatem conservet* his quibus aut estur, aut bibitur, aut sub sternitur, as *Calen* saith, or as *Dioscorides* saith, because the Athenian matrons, in their *Thesmophoria*, did use these leaves as sheetes to lye upon, thereby to preserve their chastity, the Physitians and Apothecaries joyning both words together call it *Agnus castus*, the Latines also call it *Vitex*, it is likewise called in Greeke *λύγος*, *Lygos quasi vimen propter involuta fere ramorum flexilitatem*. *Lobel* in *Adversaria* taketh it to be *Elagnus* of Theophrastus lib. 4. c. 11. which he saith is like the other *Amerina*, but beareth no fruite, yet the flower is like the white Poplar flower, which how it may agree there with I cannot see, for

SSSSSS

this

this beareth fruite in a plentifull manner in the naturall places. Some also would make it to be the *Salix Amerina*, as I said in the former Chapter, because *Gaza* translateth *ayv* in *Theophrastus* unto *Amerina* in Latine, lib. 1. c. 5. and 22. and 23. from whence sprang that errour. Some also as *Eugdunensis* saith fol. 233. would more truly make the *ayv* of *Theophrastus* to be this *ayv* *Vitex*, because of the different colours in the flowers of both, but as I shewed in the Chapter before, *Theophrastus* giveth white and blacke berries, as well as flowers, to his *Ips* or *Oesur*, whose liquor he calleth *ayv* a kinde of Wine, so that it can no way agree thereunto: all Authours call both these sorts *Vitex* or *Agnus castus*. The *Arabians* call it *Famanehest Samacheft*, and *Bengiecheft*, the *Italians* *Vitice*, and *Agnus casto*, the *Spaniards* *Gatillo casto*, the *French* *Agnus castus*, the *Germanes* *Schaffs millem*, and *Kenschelamp*, and we in *English* *Chaste tree*.

The Vertues.

The leaves and seede of the Chaste tree as *Galen* saith, is hot and dry in the third degree, and of a very thinne essence or substance, sharpe also and binding, for so it declareth it selfe to them that use it, yea the seede is perceived plainly to be so hot that it procureth headache, yet being parched or fryed it will the lesse trouble the head, besides it dissolveth the winde in the stomacke or belly being fresh, but being fryed or parched much more: it restraineth also the intigations to Venerie in any manner used and taken: thus farre *Galen*, unto whom *Panlus* and *Aetius* doe consent affirming the same things. The seede being drunke resisteth the bitings of venereous beasts, Spiders or the like, and helpeth the dropcie, and those that are troubled with the spleene, it also procureth milke in womens breasts, it procureth their courses, and the urine stopped, if a dramme thereof in poulder be taken in Wine or with Pennyroyall: it troubleth the head and causeth sleepe: the decoction of the herbe and seedes is very good for women troubled with the paines of the mother, or inflammations of the parts: the hot fumes thereof taken underneath, is no lesse effectually applied to the head it ease the paines thereof, and with oyle and vinegar, the Lethargy, and Frensie: the same also made into a pulvis with Vine leaves, and applied to the cods that are swolne and growne hard, doth helpe them: it is said to helpe an ague, being taken before the fit, and being appointed therewith made up with oyle to provoke sweate: the same also used to the limmes taketh away wearinesse upon travaile or labour: the leaves are almost as effectually as the seede, for all the purposes aforesaid, and are good for wounds also: the seede used with Barley meale, doth mollifie hard swellings, and breake Impostumes: and with niter and vinegar it helpeth freckles of the face; used with honey it helpeth the sores in the mouth and throat. *Galen* although so famous a writer and Physition contraryeth himselfe in this one plant, once or twise, for having affirmed before that the seede hereof is hot and dry lib. 1. *Alimentorum*, he saith, having spoken of the properties of Hempe seede, that it is cooling and drying. In another place he saith (speaking of *Archigenes* medicines for the headache) among other things, that of the leaves of the Bay tree, the Poplar, and the *Vitex* or Chaste tree with vinegar and oyle, he made a medicine of differing properties: for the Bay tree leaves are very hot, and those of the Chaste tree moderately cold, and in the meane betwene both are the Poplar leaves: in both which places you see he maketh this Chaste tree to be cold, when before he had placed it next among those that were temperate, but in the third degree of heate: yet some of good Wit to free *Galen* from this last errour, would invert the Text and say that the Bay leaves are the hottest, the Poplar the coldest, and the Chaste tree leaves a meane betwene them both.

CHAP. XXXV.

Olea. The Olive tree.

He Olive is distinguished into the tame or manured Olive, and into the wild sort: for although the old Writers, as *Pliny*, *Columella*, and others set downe ten sorts, which they called by severall names, which whether it were in these as in the diversities of Vines, we know not our climate not fitting their growing, or according to Wines, which according to the severall climates and soyles, gave sweeter or harsher, weaker or stronger Wine, one then another, and so greater or lesser Ollives, and sweeter or stronger oyle one then another: for divers doe account them to be differing in *specie*, one from another, as our Apples, Peares, and Cherries doe.

1. *Olea sativa.* The manured Olive tree.

The manured Olive tree riseth in some place to be very tall, and very great, like a great Walnut tree, in others not of halfe that height and greatnesse, with divers armes and branches not very thickly set together, whereon grow somewhat long and narrow leaves like the Willows but lesser, and shorter, thicker, far, and sharpe pointed with short footstalles under them, greenish above and whitish underneath, never falling off the tree, of a bitter taste and somewhat sharpe withall: the blossomes are many set together at the joynts with the leaves, small and of a greenish white colour, made of foure leaves a peece, after which come round and somewhat long berries, greene at the first, and changing pale after wards, and then purplish, and lastly, when they are full ripe, of a deepe blacke, and some white when they are ripe, as *Clusius* saith he observed: some are great others are small, and some of a meane size betwene both, some are longer, and some rounder then others, some are fitter to eat, and yeeld not much oyle, others are not so fit to eat, and are smaller, yeelding more flore of oyle, some againe are gathered unripe and pickled up in brine, (which are the Ollives we use to eat with meate) others are suffered to grow ripe, and then pickled or dried, and kept all the yeare, to be eaten as every one list: Of those Ollives whereof oyle is made, some oyle will be delicate sweete and neate, others more fatty or full and strong, some upon the taste will leave no bitternesse or heate in the mouth, but will taste as sweete as butter, others againe will be more or lesse hot and unpleasant in taste, the wood is faire, firme, and solid full of curld veines, and as apt to burne when it is greene as dry, and will not rot in a long time.

2. *Olea sylvestris.* The wild Olive tree.

This wilde Olive tree groweth somewhat like unto the manured, but that it hath harder and smaller leaves, and thicker set on the branches, with sundry sharpe thornes among the leaves: the blossomes and fruite come forth

1. *Olea sativa*. The manured Olive tree.

2. *Olea sylvestris*. The wild Olive tree.

forth in the same manner that the other doe, and in as great plenty, yet much lesser, and scarce coming at any time to ripeness even in the naturall places, but where they doe being ripe, they are small with crooked pointes and blacke: Of the Ollives hereof is sometimes made oyle, which is colder and more astringent in property then the other and harsher in taste, and greenish in colour, but the Ollives are much also respected and gathered to be eaten.

The Place and Time.

Both these grow in the warmer Countries onely, neither will they beare fruite in any cold climate, or rather scarce live out their Winters: the manured as I said before is wholly planted wheresoever it groweth, where according to the soyle and climate come greater or lesser Ollives, and more or lesse store, sweeter oyle also, or more strong in taste. Many doe thinke saith *Columella*, that the Olive tree will not grow, or at the least not beare fruite if it doe grow, above three score miles from the Sea. For from the Isles in the Mediterreanean Sea, as *Zante* and *Cerigo*, &c. is brought the finest and sweetest oyle, and from *Majorca*, &c. a fuller or fatter oyle; from *Provence* in *France* a stronger and hotter tasted oyle, then either of them or some others: the wilde Olive groweth naturally in *Spain*, *Portugall*, *Italy*, and many other Countries. They flower in *June* and *July*, and have not their fruite ripe untill *November*, or *December*, and as *Clausius* in *Granado* not untill *February*, the wilde in *January* and after. *Virgil* sheweth in these Verses that the Olive being planted needeth no further dressing.

Non ulla est Olivis cultura, neque illo

Procuram expectant falcem, rastroque tenacet,

Cum semel haerunt arvis, auraeque tulerunt.

The Names.

The manured Olive is called in Greeke *ελαιήνη*, and *Olea sativa* in Latine, the wilde Olive *αγριαία*, *ελαιήνη* and *ελαιήνη*, that is in Latine, *Oleaster*, or *Olea sylvestris* *Corinus*, and *Olea Aethiopica*, as *Dioscorides* hath it: the fruite is called *ελια*, and *Olivea* in Greeke and Latine, and when they are neere ripe *Drupe*, and *Drupe*, and *Colymbades* when they are pickled or dried to be eaten, yet the Greekes at this day call them *Dermatidia*. The manner to make Oyle as *Matthiolus* relateth is thus: after the Ollives are gathered they are laid a little to wither, and afterwards ground in a Mill, and then put into a strong presse, with some hot water powred on them to yeelde out the oyle, which after it hath stood and is settled, the pure oyle is drawne off from the foote or bottome and kept for use. The manner to pickle Ollives to have them keepe their Greene colour, is saith *Matthiolus*, to take six pound of quicke Limestones made into pauter, which dissolved in so much water as may make it thinne, you are to put thereto twelve pounds of fine sifted Oke ashes, dissolved in as much water as will be sufficient, into which you are to put 25. pounds of fresh gathered Greene Ollives, and let them lye therein eight or ten houres at the most, to take out their bitterness, stirring them a little, and afterwards washed in many waters, shifted for five dayes together, which are lastly to be put into brine or pickle, wherein some Fennell stalkes and leaves have beene put into the boyling, and then put up into wooden or earthen vessels, as you list. The foote of the oyle is called *Amurca* in Latine. The gum saith *Dioscorides*, that the *Ethiopian* or wilde Olive doth yeelde, is yellow, somewhat like unto *Scammony*, being in small droppes, and is hot or sharpe, biting upon the

Gggggg 2

tongue :

tongue: but that saith he, which is blackish resembling *Gum Ammoniacum*, or other gum, and burneth not upon the tongue, is adulterate and false, but saith *Martholus*, this gum is neither brought us now adays, nor is in use: yet some thinke that our Gum *Elemi* is it, but therein saith he they are much deceived, in that it hath no biting taste in it, and besides it is moe like unto a Rosin that will melt with the fire, then a Gum which will burne in the fire, and will not be dissolved without wine or vinegar, or other such liquor. The *Arabians* call the manured Olive *Zarzon* and *Carton*, the *Italians* *Oliva domestica*, the *Spaniards* *Olivo* and *Azertuno*, the *French* *Olivier*, the *Germanes* *Oelbaum* and *Olvbaum*, the *Dutch* *Oliveboom*, and we the tame or manured Olive tree: the wilde Olive is called by the *Italians* *Oliva salvatica*, by the *Spaniards* *Azebuche*, and *Azuche*, by the *French* *Olivier sauvage*. And we in *English* the wild Olive tree.

The Vertues.

The greene leaves and branches of the Olive, but much more of the wilde Olive doe coole and binde, especially the juyce with vinegar, all hot Imposthumes inflammations and swellings, Saint *Ambrosius* fire, fretting and creeping ulcers, cankers in the flesh or mouth: the same also restraineth the bleeding of wounds, and womens too abounding courses, being applied to the places: the said juyce dropped into the eyes, stayeth the distillations of hot rheumes into them, and cleareth the sight from filmes or cloudes that dimme the sight, and any ulcer that doth breede therein, or ulcers that breede in the eares. The pickled Ollives doe stirre up an appetite to meate, and although hard of digestion, yet pleasing to the stomacke, being apt to putrefie therein, are not good for the eyesight and breede headache, yet if they be dried and applyed to fretting or corrhoding ulcers, doth stay them, and taketh away the scarres of carbuncles or plague fores: the pickled Ollives burned, beaten and applyed unto wheales, stay their further encrease, and hinder them from rising and cleanse foule ulcers, helpeth the gums that are loose and spongy, and fasteneth loose teeth. The water that is taken from the greene wood, when it is heated in the fire, healeth the scurfe and scabbes in the head or other parts: the Olive stones being burned are used for the said purposes, and also to stay foule spreading ulcers, and being mixed with fat and meale, they take away the ruggednesse of the nailes. Now to speake of the other parts of the Olive, which are the oyle and the foote thereof: first the oyle is of divers variable properties, according to the ripenesse or unripenesse of the fruite, whereof it is made, and then of the time and age thereof, and lastly of the washing thereof, from the salt wherewith some is made, the oyle that is made of unripe Ollives, is more cooling and binding then that which is made of them when they are ripe: which when it is fresh or new is moderately heating and moistening, but if it be old it hath a stronger power to warme and to discusse, which properties are perceived by the sweetenesse, for if the oyle be harsh, it is more cooling then warming: and if that oyle be washed it taketh from it all harshnesse. The greene oyle of unripe Ollives while it is fresh, is most welcome to the stomacke, it strengtheneth the gums, and fasteneth the teeth, if it be held in the mouth for any time, and being drunke it hindereth their much sweating that are given thereunto: the sweete oyle is of most use in Sallets and meates, being most pleasing to the taste, but the older the oyle is, the better it is for medicines, both to warme any part, and to discusse any thing that needeth it, and to open and moove the belly downewards, and is most effectually against all poysons, especially those that doe exulcerate the guts, or not being passed downe so low, but yet abiding in the stomacke, it bringeth it up by vomiting, or hindereth the malignity, from further spreading: it is also a principall ingredient into all salves almost, helping as well the forme, as the vertue in working. The foote or dregges of oyle, the older it is the better it is for divers purposes, as to heale the scabbe in man or beast, being used with the decoction of *Lupines*: it is very profitably used for the ulcers of the fundament or privy parts, with honey wine and vinegar, it healeth wounds, and helpeth the toothache, being held in the mouth, if it be boyled in a copper vessell unto the thicknesse of honey, it bindeth much and is effectually to all the purposes for which *Lycium* may be used: but if it be boyled with the juyce of unripe grapes to the thicknesse of honey, and applyed unto aking or corrupt teeth, it will cause them to fall out: if this foote or dregges of oyle be put into that mortar that shall parget the wallies or floores of your Wardrobes, where you meane to lay any woollen or silken stufes or garments, in chests or presses, it will not onely preserve the places dry, from gathering moisture, but warme also from over much cold, and will keepe away mothes, wormes, spiders, and flies, nor will suffer any to breede therein. The gumme of the Olive tree (whether tame or wilde) is used in ocular medicines to helpe the dimmesse of the eyes: the same also provoketh urine and womens courtes, and helpeth the paines of hollow teeth: it causeth abortement, it expelleth the dead childe, and healeth tetters, ring wormes, scabbes and leproy.

CHAP. XXXVI.

Cleaster Cappadocium. The bastard or fix core wilde Olive.

The bastard wilde Olive, (and why I so call it I will shew you by and by) groweth by time to be a great tree, and well spread, whose barked is very rugged on the body, but smooth and whitish on the armes, which have very strong and sharpe thornes on them, the younger branches having none: the leaves are set on both sides of them without order, long and narrow, very like unto Willow leaves, but thicker, fatter, and whiter, both the upper and under side, which inclineth to a silver shining colour: the flowers grow at the foote of the leaves, being small and of a pale white colour, very sweete and somewhat strong, sented even a farse off: after the flowers are fallen, come round and somewhat long white berries, like unto small Olive berries, with a point at the ends like unto thornes, with a sweete soft and spongy substance somewhat like a plumme, or the red *Lupine* fruite, having a chanelled hard stone, like an Olive stone in the middle: but *Lugdunensis* saith the berry is as dry, and without substance as the Hawthorne, which peradventure is so in those places neere him, but in the warmer Countries may be such as I have described them, from good Authours that have seene them to be such.

The Place and Time.

This groweth as *Bellonius* saith in divers places in *Turkie*, as he saw in his travailes through their Countries, and in the hedges of *Granado* in *Spain*, as *Celsus* observed, and in most Orchards of note in *France*, *Germany*, and other

other places with us also : and flowereth in the beginning of Summer in the warmer Countries, but very late with us the fruit ripeneth in Autumne in *Spain*, &c. but seldome with us, yet *Matthiolus* saith, hee saw fruit on the tree that grew in the Emperours Orchard in *Vienna*.

The Names.

This tree is diversly taken by divers learned Writers, for *Matthiolus* calleth it *Olea Bohemica*, and taketh it to be *Eleagnus* of *Theophrastus*, because the name being deduced from *Olea* and *Agnus*, the Olive and the Chaste tree, as like unto them both, this having leaves and branches like the Chaste tree, and berries like the Olives : but that it cannot be *Eleagnus*, let me shew you that this is a great tree, *Theophrastus* saith it is *fruticosa planta*, a shrubby plant, and againe, he saith the flower of the white Poplar which all know, doth grow in spiked heads not scatteringly on the branches, and lastly he saith, it beareth no fruit, and this is plentifull in any of those places, where *Theophrastus* chiefly gathered his knowledge of this and other Plants, and therefore as *Theophrastus* saith, being folke unto the Kindes of Willows, it is most probable to a kinde of Willow, which are thought to beare no seeds or fruit, and therefore *Amatus Lusitanus* would make it to be *Salix Amerina*, without any good ground or reason. *Bellonius*, *Clausius*, and *Camerarius* call it *Ziziphus alba Columella*, whereunto it is very like: *Gesner* also in *hortis* so calling it, and *Oleaster* species quibusdam also: *Bellonius*, *Dodonaeus*, and *Lugdunensis*, take it to be the *Ziziphus Cappadocica* *Pliny*, which it is very probable to be also, *Lobel* calleth it *Olea sylvestris Septentrionalium*, and *Eleagnus* also, and some likewise *Olea Germanica*, but in my opinion *Lobel* and *Banhinus*, and those in *Gesners* time do come neereft unto the name, whereby it may be most truly called *Olea sylvestris* or *Oleaster*, which I have followed and added *Cappadocica*, because that in lease it doth more nterely resemble the Olive tree, then the *Injube*, and that it is more naturall to be of *Cappadocia* then *Bohemia*, or any of these Northerly Regions: some also call it *Arbor Paradisea*, and some *Thuia odorata*, and some take it to be the *Burba Iovin* of *Pliny* lib. 6. c. 18. *Rauwolfius* saith it is called in *Syria* *Seisefan*.

Oleaster Capadocia.
The bastard or sweete white Olive.

The Vertues.

We have no especiall Physicall property allotted unto this tree, or the fruit, but that as *Bellonius* and *Clausius* have recorded, the fruit is eaten by the people where they grow, with delight and pleasure, and without any offensive quality. The flowers as *Lugdunensis* sheweth, might be employed to perfume gloves, or garments, or to be distilled into a sweete water as well as the flowers of *Calef*, which *Bellannensis* tooke to be this tree, and are used in the manner aforesaid.

CHAP. XXXVII.

Oenoplia spinosa & non spinosa sive Napeca sive Ziziphus alba.
The white *Injube* tree, with thornes and without.

IN regard that this tree doth so peere resemble the other *Injube* tree, mentioned here before in this Worke, I might have joyned them together, but that I could not assure it yon to be of the same property, I have therefore reserved it for this place, as partly partaking with the Olive as the *Injube* tree, and is of two sorts, the one bearing thornes, and the other none, in all other things so like, that one description may serve them both. It groweth to be a tree as great as a meane sized Pear-tree, whose body and branches are covered with a whitish ash-coloured barke, full of small short and sharpe prickles or thornes, two set at each leafe not farre in sunder, in the one sort, and without any in the other: the leaves are somewhat broad and short, very like to the leaves of the other *Injube* tree but greater, round pointed for the most part, with three ribbes in each, running all the length, of a darke shining Greene colour on the upper side, and somewhat tending to an ash-colour underneath, standing singly at the branches, one on this side and another on that up to the toppes; at the joynts with the leaves come forth divers small greenish white flowers, like the blossomes of the Olive or *Injube* tree for the forme, each standing on its owne small footestalk, after which being talne come many small round fruites, as bigge as a great Cherry, yet sometimes as great as a Wall-nut, in some whitish, in others more yellow, and reddish on the one side like an Apple, of a very sweete taste, with a stone in the middle thereof, like an Olive stone, but round and not long.

The Place and Time.

These grow in *Syria*, *Egipt*, *Arabia*, and the parts neere unto them, where they hold their Greene leaves all the Winter.

GGGGGG

Winter without falling, but in *Candy*, and other the hether parts, they have beene observed to fall off, as other trees doe: they beare in the warmer Countries twice a yeare, yet the former fruites that commeth in the Spring of the yeare, seldom e commeth to maturity, because the moisture of the time spoyleth them, that they doe not ripen kindly, but in the Autumne the fruites is ripe and delicate.

The Names.

That sort which is without thornes is described by *Alpinus* in his Booke of *Egyptian* plants, who calleth it *Nabca Palissus Athenis* credita, and very truly for *Athenas* in the foureteenth Booke of *Deipnosophistes*, calleth it *Paliurus*, and saith that *Agathocles*, in the third Booke of his History, describeth it by the name of *Connarus*, as those of *Alexandria* called it, and by *Honorius Bellus* that sent the fruites to *Clusius*, as it is set downe in his fifth Epistle to him called *Oenoplia spinosa*. That without thorne is set forth by *Clusius*, in his History of plants; as he received it also from *Honorius Bellus* of *Candy*, who calleth it *Oenoplia seu Napca Bellorij Connarus Alexandrinorum forte Atheni*: *Serapio* comprehendeth them both under the name of *Sadar* or *Sudar*, but as his manner is in other things, he confoundeth it with the *Lotus* of *Dioscorides*, from which it much differeth, it is called in *Syria* and *Egypt*, *Nep* and *Nap*, and as *Gualandinus* saith, put by many among the sorts of *Injubes*. But *Pliny* seemeth to call it *Prunus Aegyptiaca*, an *Egyptian* Plumme.

The Vertues.

The fruites of both these before they are ripe, are cold and dry in the first degree and binding, but when they are ripe they have some moisture in them, and are much used to strengthen the loosenesse of the stomacke and belly, by the iuyce of them being taken at the mouth or given in a glister: the dried fruit infused in water, and the infusion taken, is profitable against the slipperinesse and ulcers of the bowels. the decoction or infusion of the ripe fruites, being dried is of great use against pestilentiall feavers, for the fruites is held to have a wonderfull property against venomous qualities, and to resist putrefaction, and mightily to strengthen the heart: the iuyce of the fruites when it is thoroughly ripe, is very good to purge choller from the stomacke, and the first conduits of the veines: as also in all putride feavers, an infusion of them is familiarly taken to coole the heart and violence thereof.

Napca Nabca aut Oenoplia spinosa.
The white Iujube tree with thornes.

CHAP. XXXVIII.

Azadarach Avicenne. The Bead tree.

Although this tree be in forme much differing from any of the last sorts, yet because some have called it *Zizaphus*, as they did the last save one. I thought it not amisse to insert it in this place, whose description is on this manner. It groweth to be high and vaile spreading far and making a goodly shadow in the warme Countries where it best prospereth, the body and greater boughes are covered with a rugged barke and full of chinkes, but that on the younger branches is smooth somewhat like unto those of the Figge: the leaves are very largely spread and winged, having long footed edges, the end leafe being longest, yet in some places they are not so largely spread, from the footes whereof come forth long stalkes, bearing sundry blewish flowers laid open, with five small narrow leaves like a starre, and a small hollow cup more purple in the middle, after which come round fruites, of the bigne of a Cherry, Greene at the first, and white when it is ripe, of a sweetish taste at the first, but after very bitter, unpleasant, loathsome, and stinking, containing a stone within it six square, somewhat like unto the *Embleck Myrabolane* stone, with two kernels within each, from whence usually rise two spreures or stalkes of greene leaves, the fruites being drilled (which will be easily done, not being very hard) and drawne on stringes, serve people beyond Sea to number their prayers on, least they forget themselves and give God too many: this looeth all his leaves in Winter, fresh arising in the Spring.

The Place and Time.

This groweth in none of these Christian Countries naturally, but are all plantēd wherefoever they grow, in Orchards or Court yards, for the shadow sake, being of little use beside, *Clusius* saith he saw divers of them in *Spaine*, and heard they were more frequent in *Italy*, it flowreth in *June*, and the fruites is ripe in *September*.

The Names.

This was called *Ziziphus candida*, by the Herbarists at *Mompelien* as *Lobel* saith, and *Sycomor* by *Italians*, as *Matthiolus* saith, but misliking that title he called it *Pseudosycomor*, yet in other places of *Italy* it is still called *Perlaro*. *Cordus*, *Gesner* in *hortis*, and *Bellonius* call it *Sycomor* *Italorum*, *Lugdunensis* setteth it downe by the name of *Ziziphus alba*. *Gesner* saith some learned men called it *Myxus alba* & *Laurus Græca* *Plinij*. *Cæsalpinus* tooke it to be *Tuber candida*, of *Pliny*, and peradventure *Zizipha Columelle*, *Dodonæus* hath it under the name of *Azadarach*, and so have *Clusius* and *Camerarius*, some *Turkes* in these dayes call it *Thespic*, and *Rauwolfius* saith that they of *Tripoli* call it *Zenfelacht*, but generally now adayes, with most *Azadarach* or *Asederacth*, yet the *French* call it *Arbor sancta*, because as is before shewed, the fruite helpeth their deuotions, as the *Spaniards* doe, that call it *Arbol parayso*.

The Vertues.

The best use that this serueth for, is, that the distilled water thereof will kill Lice, and causeth the haire to grow faire and long, if it bee mixed with white Wine, and the headed washed therewith, the fruite is dangerous if not deadly, if it bee eaten causing the like Symptomes that the *Oleander* doth, and is to be remedied with the same helpes: *Rauwolfius* saith, that it will kill dogges, if it bee given them with their meate.

Azadarach behariorum.
The Bead tree.

CHAP. XXXIX.

Phillyrea. Mocke Privet.

If this kinde of shrub there are foure or five sorts each differing from other in the broadnesse or narrownesse of their leaves especially, as you shall heare.

1. *Phillyrea latifolia aculeata*. Prickely mocke Privet.

This first Mocke Privet riseth up with sundry stemmes, of the thickenesse of ones thumbe, covered with a whitish barke spotted with white: the leaves are set by couples at the joynts, all along the branches, which are somewhat thicke, hard, and prickely, dented about the edges very like the leaves of the *Scarlet Oke* bush but greater: the flowers come forth at the joynts of the leaves, the fruite is small, and blacke round berries hanging downe about the branches, and are like unto the berries of Privet, or of the *Masticke* tree, but having a small stone within them.

2. *Phillyrea folio lato serrato*. Toothed Mocke Privet.

This other Mocke Privet groweth greater and higher, whose branches are covered with a whitish barke, having somewhat broad and hard blackish green leaves, pointed at the ends and dented about the edges, two alwayes set at a joynt, of a little sharpe and bitter taste. The flowers grow at the joynts with the leaves, as in the former, and the berries that follow are blacke and round like *Pepper* or *Mirtle* berries, with a thin brittle shell stone within it.

3. *Phillyrea latifolia folijs fere non serratis*. The greater Mocke Privet with lesse dented leaves.

This Mocke Privet groweth lower then the last, yet unto two mens height, with a whitish barke covering the branches as in the last, but somewhat more rugged. The leaves are set on the branches in the same manner as the former, but somewhat narrower, and but seldome dented at all about the edges, the flowers are of a whitish green colour, standing thicke together, about the setting on of the leaves, somewhat like unto the *Ollive* blossomes, after which come round berries like the last.

4. *Phillyrea angustifolia prima*. The first narrow leaved Mocke Privet.

This is a low bush not exceeding a mans height, but fuller of branches, yet smaller then the last, and covered with a blacker barke: the leaves are narrower and greener then it, like unto the wild *Ollive*, and not without some bitter effe in them: the flowers are white and grow after the same fashion, thicke set together, unto which being false succede blacke round berries like unto *Mirtle* berries, with a hard stone in them.

5. *Phillyrea angustifolia secunda*. The other narrow leaved Mocke Privet.

This other Mocke Privet shooteth forth many more suckers from the roote, which are slenderer and not very

1. *Phillyrea latifolia aculeata*,
Prickly Mocke Privet.

4. *Phillyrea angustifolia prima*.
The first narrow leaved Mocke Privet.

easier to breake, nor so plentiful or thicke growing as the former, with leaves set one against another, narrower, longer, and of a darker greene colour, this was said to beare neither flower nor seede, which matter is disproved, and found to beare both, and like unto the last,

The Place and Time.

Clusius observed these five sorts in *Spain*, *Portugall*, and *France*. They flower in the Spring, and their berries are not ripe untill it be very late in the yeare.

The Names.

Divers learned men did take the *φιλύρα* *Phillyrea* of *Theophrastus*, which we have shewed you to be the Line tree, to be this *φιλύρα* *Phillyrea* of *Dioscorides*, being deceived by the vicinity of the names untill *Cordus*, who better considered them, found them much to differ, as well in forme as in properties, since whose time all that have followed him have so accounted of them. *Lobel* saith, he would rather read it *φιλανδία* or *Olea amassa*, a kinde of wilde Olive, whereunto it is most like, or little differing: The first is the first *Phillyrea* described by *Clusius*, and so is my second his second *Phillyrea* also: The third is the first *Phillyrea* of *Matthioli* and *Lobel*, and the third with *Clusius*, and is the *Phillyrea* of *Bellonius*, and *Gesner in hortis*, *Dodonaeus* calleth it *Cypripis latiore folio*, and *Lugdunensis Alaternus major* *Dalechampi*, and of *Casalpini* *latrum*, and *Phillyrea* of *Theophrastus*, *Bambus* calleth it *hillirea folio Ligustri*. The fourth is the fourth *Phillyrea* of *Clusius*, the *Phillyrea angustifolia* of *Lobel*, the *Alaternus minor* *Dalechampi* of *Lugdunensis*, and the *Cypripis* of *Dodonaeus*. The last is *Clusius* his fifth *Phillyrea* also, and both these last are called by *Lobel*, *Narbonensis*.

The Vertues.

The leaves of this Mocke Privet are binding, as *Dioscorides* saith, and are of the same effect that the wilde Olive

2. 3. 5. *Phillyrea latifolia serrata*, & *sepe non serrata*, & *angustifolia secundas*. Toothed Mocke Privet, and with less dented leaves, and the other narrow leaved Mock Privet.

tree leaves are, and used in decoctions are good against the ulcers in the mouth or to wash the teeth, the same also being drunke provoketh urine and womens courtes.

CHAP. XL.

Alaternus five Philyca Theophrasti credita. Ever greene Privet.

Here is so great affinity betwene the former Mocke Privet, and this ever greene Privet, that divers good Authours call the one by the others name, as you have in part heard in the former Chapter, and shall more in this, whereof there are two sorts a greater and a lesse.

1. *Alaternus major seu prior.* The greater ever greene Privet.

The former of these two shrubs, groweth sometimes tall like a tree, with long but not any great branches, not yet much divided into lesser ones, and are covered with a whitish greene bark, and with another yellowish one under it, or more inward, whereon grow somewhat broad leaves without any order, of a meane life betwene the Olive, and the ever greene Oke, but thicker, and slightly dented about the edges, and of a darke greene colour, of an unpleasant taste, and bitterish withall, the flowers are many tusting together at the setting to of the leaves, and are of a whitish greene colour, there hath not beene any fruite observed to follow them.

2. *Alaternus minor seu alter.* The lesser ever greene Privet.

This other groweth lower by much, with a whitish greene reddish barke mingled, the leaves are lesser, rounder, and dented about the edges, and of a paler greene colour, the flowers are greater and greener, set together like the former, unto which succede small round berries, greene at the first, reddish after wards, and blackish when they are ripe, having three stones or feedes within each of them.

The Place and Time.

Both these were observed by *Clusius* in Spaine and Portugall. They flower there in their naturall place in February, and the fruite is ripe in May.

The Names.

Pliny calleth this *Alaternus quasi inter Oleum & Ilicem media*, *Bellonius* in his first booke of Observations and 42 Chapter faith, that there is none in mount *Athos* but knoweth the true name of that tree, that *Pliny* calleth *Alaternus*, to be the *Philyca* of *Theophrastus*, but those of *Corcyra* and *Candy*, call it *ελαιςεν* *Elaprinus*. It is the first *Alaternus* of *Clusius*, and the *Alaternus Plinij* of *Lobel*, *Cesalpinus* as *Bauhinus* faith, but I thinke rather it should be *Lugdunensis*, calleth it *Celastrus mas Theophrasti*, and *Cesalpinus Philyramas Theophrasti*: *Lugdunensis* takeh it to be *Apharca Theophrasti*, which they of *Mompelier* call, as faith *Lobel*, *Bourgespine* some also call it *Phi-*

1. *Alaternus major.* The greater ever greene Privet.

2. *Alaternus minor.* The lesser ever greene Privet.

lyrea. The other is called by *Clusius Alaternus alter*, by *Lugdunensis Celsus* *femina Theophrasti*, and both of them *Phillyrea* by *Bauhinus*, not giving any peculiar title to *Alaternus*, it is likewise the *Vaccinium* *Pliny*, and *Lacatha* *Theophrasti*, as *Lugdunensis* taketh it. Some read *Lacava*, who saith it differeth much from all the other sorts of wilde Cherries, both in the forme of the leaves, bitternesse of the fruite, &c. and *Marum fol. o. ad Idem* accedente by *Celsus*, from the word *Iluro*, whereby the *Italians* of *Lucca* call it as *Clusius* saith, but *Agguilava* saith *Alaternus*, and *Linternus*, as *Bourgesme* is by the *French* as *Lebel* saith, and yet I finde that name given to many other plants, but *Dalader* and *Sarguin blanc*, as *Bellonius* saith, for as *Clusius* saith, the *Portugalls* call the first *Caseca*, and the other *Filiguero*, and *Sanguento*.

The Vertues.

Theophrastus saith that *Philyrea* hath the priority to feede sheepe in that it is ever greene: And *Clusius* saith that the *Portugalls* use the barke to dye their nets into a red colour, and with the chips of the wood which are whitish they dye a blackish blew colour.

CHAP. XLII.

Ligustrum, Privet.

BEcause our Privet hath beene so often mistaken by many for the *Cyprus* of *Dioscorides*, *Pliny* being the first Authour of the error, who although *lib. 12. c. 25.* he saith that *Cyprus* is a tree that groweth in *Egipt*, with a white sweete flower, and Coriander like feede, yet presently after he saith, that some take this to be the same, which is called *Ligustrum* in *Italy*, and *lib. 24. c. 10.* he saith plainly that *Ligustrum* is the same tree that *Cyprus* is in the East. I thinke it fit to joine that *Cyprus* of the East in this Chapter with the other sorts of Privet that you may plainly know the diversity, and that all further controversies may cease.

1. *Ligustrum vulgare*. Our common Privet.

Our common Privet groweth not into any great bodied tree, but yet it is carryed up with the many slender branches to a reasonable height and breadth to cover Arbours, Bowres, and Banqueting houses, and wrought wrought and cut into many formes of men, horses, birdes, &c. as the workeman list supported at the first with timber, poles, and the like, but afterwards groweth strong of it selfe, sufficient to hold it in the forme it is made into: it beareth long and narrow darke greene leaves by couples, and sweete smelling white flowers in tufts at the

1. *Ligustrum vulgare*.
Our common Privet.3. *Ligustrum Orientale* sive *Cyprus* *Dioscoridis* & *Plinij*.
The Easterne ever greene Privets.

ends of the branches, which turne into small blacke berries that have a purplish juyce within them, and some seedes that are flat on the one side with a hole or dent therein. *Tragus* saith that there is some found that beareth a yellow flower, but is very rare to finde differing in nothing else, which peradventure may be that other fort that *Lonicerus* calleth *minus*.

2. *Ligustrum myrsifolium Italicum*. The Italian Mirtleleaved Privet.

This groweth in the same manner that the former doth, and spreading into branches that are round and somewhat reddish, the leaves are both longer and broader, coming neere unto the greatest Mirtle leaves, and of a darke Greene colour.

3. *Ligustrum Orientale sive Cyprus Dioscoridis & Pliny*. The Easterne ever Greene Privet.

This East Country Privet, if it be suffered to grow at large without pruning, groweth to be as great as the Pomegranet tree, whose body and branches are covered with a whitish ash-coloured barke: the leaves are somewhat like unto those of the former common Privet, but whiter, broader and more pointed, growing many set on both sides of a stalk below, but singly up to the toppe at the joynts among the branches of flowers, which grow in a loose tuft, somewhat sparsely, consisting of foure small grayish ash-coloured leaves, of a very sharpe and quicke sent, farre beyond the Privet flowers, after which succede small round and white heads, somewhat like unto Coriander seede, with three or foure blackish seedes within them: the leaves fall not off in Winter as our Privet doe, but abide on fresh all the Winter long, of which and the young branches being dried and ground into powder, is made a great merchandise through all the parts of the *Turkish* Empire, and some of his bordering neighbours also, to give a yellow colour to their haire, hands, nailes, and bodies too, as also for their horses maines and tiales, for the more pompe on festivall dayes: of the rootes saith *Ramusius* being burnt, the *Arabians* make their *Spodium*, whereof *Avicen* speaketh cap. 617.

The Place and Time.

Our common Privet groweth in our owne Land, in divers woods, the next was sent from *Padoa* and *Venice*, the last groweth in *Egypt* plentifully, in *Tripoli* also and *Syria*, in sundry places: our Privet flowreth in *June* and *July*, the berries are ripe in *August* and *September*: the last flowreth late even in the warme countries, and the seede ripeneth accordingly: the other hath not as yet bene discerned so exactly.

The Names.

This our ordinary Privet as I said before, was usually taken by *Tragus*, *Cordus*, *Ruellius*, *Matthiolus*, *Amatus Lusitanus*, and *Angulara* who yet doubteth of it, to be the same *Cyprus* of *Dioscorides*, which *Pliny* also nameth, but *Fuchsius* as I take it, first doubted of it, and denyed it to be *Cyprus*, and denyeth also that it is certainly knowne by what name the *Ligustrum* of the Latines was knowne to the Greekes, and therefore *Dodonæus* after *Angulara*, doe appoint *Phillyrea* to be it: but *Pliny* in saying *Ligustrum* is the same tree, that *Cyprus* is in the East, as is before said, bred this errour in so many: but *Cyprus* of *Dioscorides* is said by him to be a tree, but Privet is not so, it is a tree growing in *Egypt* saith *Pliny*, the best is in *Canope* and *Alcalone* saith *Dioscorides*, whereby they both judged it to be a strange tree, and not naturall of *Italy*, as *Ligustrum* Privet is. It hath saith *Dioscorides* Olive like leaves but broader, softer, and greener, *Pliny* saith like *Jujube* leaves, but Privet leaves are neither broader nor softer then the leaves of the Olive tree, the seede saith *Pliny*, is like Coriander seede, which is meant by the whole seede, with the outer huske on it, for the seede within them is blacke, as *Dioscorides* compareth them to the seede of the Elder berries: the leaves also doe abide alwaies Greene, but in Privet they doe not so: the leaves saith *Dioscorides* doe give a reddish yellow colour to the haire, if they be moistned with the juyce of *Struthium* (but not of *Struthiæ malis* which is the Quince) before it be applyed, but Privet giveth no such colour howsoever used: by all which notes it is evident that *Ligustrum* and *Cyprus* be different one from the other, and cannot be both one plant, or hereafter to be confounded together as formerly they have bene. The first is acknowledged by the name of *Ligustrum* by all Writers, although some as I said would make it also to be *Cyprus* of *Dioscorides*, and some to be *Phillyrea* as is before said. The second *Banbinus* calleth *Ligustrum myrsifolium Italicum*, and saith it was first him by the name of *Myrtus ligustri folio*. The last *Banbinus* calleth *Ligustrum ægyptiacum latifolium*, because he maketh two sorts of this one, as he doth in many other things before, making that of *Ramusius*, set forth in *Bellonius* his Observations by *Clusius*, to be one sort, and that of *Alpinus* another, entituled *angustifolium*, because *Alpinus* his figure (as most of his others are) is not so exactly drawne, as *Clusius* saith it should be: he saith also that it is set forth in the history of the East Indies, part. 4. figura tab 15. under the name of *Mangostans*: but the truth is, they were both intended but for one plant, *Alpinus* saith that the *Egyptians* doe now adayes call it *Elhanne*, and *Avicen* with the *Arabians* *Alcamme* and *Henne*, the *Greekes* now adayes *Schenna* as *Ramusius* saith. The *Italians* call the ordinary Privet *Gustrico*, *Oliuella*, *Oliuetta*, and *Chambressena*, the *Spaniards* *Alfena* and *Albena*, the *French* *Troesne*, the *Germanes* *Rheinweyden*, *Reynholzlin*, and *Mundholz*, the *Dutch* *Keelcruyt*, and we in *English* Prime or Privet, and of some Prime print.

The Vertues.

Although our ordinary Privet is little used in physicke with us in these times, more then to be put into lotions to wash sores and sore mouthes, and to coole inflammations and dry up fluxes, yet *Matthiolus* saith that Privet serveth to all the uses, for which *Cyprus* or the East Privet is appointed by *Dioscorides* and *Galen*: he further saith, that the oyle that is made of the flowers of Privet infused therein and set in the Sunne, is singular good for the inflammations of wounds, and for the headache coming from choller or an hot cause: a water also that is sweere is distilled from the flowers, that is good for all those diseases that neede cooling and drying, and therefore helpeth all fluxes of the stomacke or belly, bloody fluxes and womens courses, if it be either drunke or applyed, as also for those that void blood at their mouth, or at any other place, and for destillations and rheume: into the eyes, especially if it be used with *Tutia*: All these properties may safely be transferred to the East Privet, saving that it is not so cold a constitution, yet as *Galen* saith it hath a binding quality from the earthly cold substance it hath: the young leaves and branches are of a mixt temper, for it hath a digesting faculty with the warme watery substance and drying, whereby it helpeth those places that are burnt, and cooleth hot Impollutions and sores, and doth dry without any sharpnesse: the powder of the leaves serve to heale the sores in the mouth or secret parts of man or woman, as also to helpe the moist sweatings and stinke of the feet, by applying them as a plaister mixed up with sweete wines: the Olenum *Cyprinum*, that is sweete and made thereof, doth warme and mollifie the nerves and sinnes.

CHAP. XLII.

Celastrus Theophrasti. The Staffe tree.

THis tree groweth up to a meane height, the barke of the body and elder boughes being of a darkē colour, and the younger greene, whereon are divers leaves, not greater then thole of the fruitlesse Privet, and divers smaller, of a sad greene shining colour on the upper side, and paler underneath, which are little or nothing snipped about the edges, and of a little bitter taste: at the foote of the leaves towards the ends of the youngest branches come forth short stalkes of an inch long, sustaining five or sixe flowers, consistng of foure yellowish greene leaves a peece, which turne into small berries, of the bignesse of Asparagus berries, greene at the first, and as red as the Asparagus afterwards, but growing ripe are very blacke, and somewhat long with the roundesse, wherein is contained a three square seed, like unto a Grape kernell, whole shēl being hard hach as white a firme kernell within it as the haseell nut, covered with a saftron like yellowish skin.

The Place and Time.

This grew at *Leiden* in the publike garden, but from whence the naturall place is is not knowne: but from them hath bene communicated unto divers in this Land, as well as in others: the flowers doe often appeare so late that the fruit cannot come to ripenesse, yet it is signified that the first ripe fruit that was seene growing thereon was in *August*.

The Names.

Although *Eugdamensis* referre the κίλαστον or κίλαστον of *Theophrastus* (for he hath both words) unto the *Alaternus* of two sorts that *Clausius* hath set forth, as is before shew ed you, yet *Clausius* himselfe judgeth this tree to come neerer thereunto, then either of them, and so setteth it downe in his *Cura posterioris*, some as he saith would make it a kinde of *Laurus Tinus*, but that it cannot be: I doe not find that *Bauhinus* who setteth downe all other mens observations, hath once remembered this plant to referre it to any other, or make it one of it selfe, which is not usuall with him in many other that I know.

The Vertues.

Theophrastus recounteth all the properties hercof, whereunto it is put, and that faith he, is to make staves for old men, no other having made triall of any other faculty it is endued withall.

CHAP. XLIII.

Viburnum. The plant mealy tree.*Viburnum.* The plant mealy tree.

THis plant tree hath from a small body, rising to the height of a hedge tree or bush, covered with a darke grayish barke, sundry finall (or not great) short, but very tough & plant branches, of a fingers thickness, whose barke is smooth and whitish, whereon grow broad leaves like unto the Elme, but somewhat long and hoary rough, thicke, white like meale, and a little hairy withall, set by couples, finely dented about the edges: at the ends of the branches stand large tufts or clusters of white flowers, which turne into large bunches of round and flat seed like unto Lentils but greater, greene at the first, and red afterwards, but blacke when they are ripe: the branches herof are so tough and strong withall, that they serve better for bands to tie bundels or any other thing withall, or to make wreathes to hold together the gates of their fields, then either withy or any other the like.

The Place and Time.

It groweth as a hedge bush, being often cut and plashed by the Countrymen, so spread on the hedges in length to hinder it of the height, and is found very much in *Kent*, and in other shires of the land. And floweth not until the end of *May*, and ripeneth the fruit in *Septem-*

The Names.

Although the signification of *Viburnum*, doth properly extend the young twigge or shoote from the roote of a tree, yet it is not improbable that *Virgil* in citing these verses. *Quantum lentasolent inter Viberna Cupressus*, should meane this tree also, called *Viburnum*, (that it might hold his comparifon to the Cypresse, of the meannes of other Cities unto the stacelines of *Rome*) as divers learned men think, which are *Gesner*, *Matthiolus*, *Camerarius*, *Disrantes* and *Lugdunensis*, &c. and because that the *Italians* in their vulgar tongue, call it *Lantana* (*quod lentis sunt rami*) *Gailandinus*, *Gesner*, *Lobel* and *Cesalpinius*, are content to cal it *Lantana* also, yet *Ruellius*, in writing of the *Rhus* of *Theophrastus* and *Dioscorides*, saith he found it without *Paris*, which the Country people called *Blanche putain*, and both he and *Lobel*, doe call it *Viorna Gallorum*, as peradventure derived from *Viburnum*, and yet they call another ramping bush *Viorna* also, which I have shewed you before among the clamberers, to be the *Atragene* of *Theophrastus*, unlesse the *French* have two *Viorna*'s, which is doubtfull, for *Ruellius* sheweth a shrub, which he saith the *French* call *Blanche putaine*, and is the same they call, saith he, *Viorne* and *Hardeau* also, *Lugdunensis* saith that *Dalechampius* did take this to be the *Spiraea Theophrasti*, because the pliant tough twigges may be writhed (*in spiras*) into wreathes or round circles: but as I shewed you before, *Clusius* setteth forth another *Spiraea*, which he taketh to be the truer. *Cesalpinius* and *Ruellius*, doe both thinke it to be the *Rhus Theophrasti*, lib. 3. c. 18 which *Gaza* translateth *Fluida* from the Greeke word *ῥήν*, but as they thinke is no sort of our *Rhus*, or *Sumacke*, because he there describeth it with the leafe of the Elme, but longer, &c. and therefore they both referre it to this plant. *Matthiolus* saith, he was also of that opinion, untill having better perused *Theophrastus*, he refused that opinion, acknowledging himselfe to have bene in an errour. The *Italians* as I said, call it *Lantana*, and *Viburno*; the *French* *Viorne*, as *Ruellius* saith, and *Hardeau* also, from the *French* word *Hard*, which significth a band or rope, the *Germanes* call it in some places *Schlingbaum*, but *Tragus* and *Lonicerus*, *Kleiner Malbaum*, *Gerard* calleth it in *Englisch* the Waifaring tree, but I know no traveller doth take either pleasure or profit by it, more then by any other of the hedge trees. I have therefore from *Tragus* his mealy tree, put to the plantinesse of the twigges and branches, and called it the pliant mealy tree.

The Vertues.

The leavés of this tree are harsh and binding, and are good to strengthen and fasten loose teeth: the decoction of the leaves bereof, and of Olive leaves together in vinegar and water, is of excellent good use to wash the mouth and throat that are swelled by sharpe rheumes falling into them, it is good also to set the *Uvula* or palate of the mouth into the right place, and to stay rheumes that doe fall upon the jawes: the kernels of the fruit hereof, taken before they are ripe, dryed and made into pouther and drinke, doe stay the loosenesse of the belly, and all other fluxes. Of the rootes being steeped under the ground, and then boyled, and beaten a long time afterward, is made Birdlime, with which Fowlers use to catch smaller birds: the leaves boyled in lye, and the head or haire washed therewith doth keepe them from falling, and will make the haire blacke.

CHAP. XLIV.

Sumach five Rhus. Sumacke.

Here are threë or foure sorts of Sumacke to shew you, three of them of ancient knowledge and use, but one other of later invention: whereunto I must adjoyne another plant, which both for the names sake, and some likeness thereunto, hath caused divers learned men to intitle it by their name.

1. *Sumach five Rhus obsoniorum & coriariorum. Coriars Sumacke.*

The *Coriars Sumacke* in some places riseth to be a reasonable great tree (but in dry barren grounds not above two or three cubits high, or where it is yearly or every other year pruned for the profit made of them) spreading sundry branches with large winged leaves, that is many set on both sides of a middle ribbe, each of them dented about the edges, *Theophrastus* compareth them to Eline leaves, but lesser and longer, and *Dioscorides* to the leaves of the *Ilex*: at the ends of the branches come forth large spiked clusters of whitish flowers, which afterwards become reddish, round and flat seide like unto *Lentils*, with an outward skinny huske, which was, and is yet still in divers places in *Turky*, the condiment or seasoning for meate, being dryed and made into pouther: the wood is whitish, which being dryed and ground serveth to dye blacke withall, as is well knowne to most.

2. *Sumach five Rhus Virginiana. Virginian Sumacke.*

The *Virginian Sumacke* groweth up in some places to be a tree of a meane size whose barke on the body and elder armes is rugged, and of a darke russet colour, those that are two or three year old, are smooth and not rugged, but those of the last year are of the same brownish red colour and softnesse, that the new velvet head of a deare sheweth to have, (that it might deceive a right good Woodman to see one cut of and presented him on the suddaine, yeelding a yellowish milke, when it is broken or wounded, which in a small time becometh thicke like unto a gumme: the long winged leaves grow one above another on both sides of the branches very largely spread, having eight or tenne or more long narrow leaves set on each side of a middle ribbe, and one at the end, very small dented about the edges, of a darke Greene shining colour on the upper side, and paler Greene underneath: at the ends of the branches come forth long and thicke browne tufts or heads, very soft and woolly in handling, made all of short threds or thummes from among which appeare many small flowers much more red or crimson then the tufts, which turne into a number of very red round flattish feede, thicke and close, set on the branches of the head together, lesser then the small *Lentils*, having a small blackish feede, under that outward skinny huske, whose shell is somewhat hard, enclosing a white kernell within it, the roote spreadeth much under ground, shooting forth suckers round about, and a good way off from the body of the tree.

3. *Rhus Plinij Mirtifolia. Mirtle leaved Sumacke*

The *Mirtle leaved Sumacke* groweth feldome above the height of a man having many slender branches with leaves set thereon every one of the bignesse of the broad *Mirtle* leafe, set by couples, but not so closely, or alwayes just opposite one to another, not so many together, and not dented about the edges: at the ends whereof come

H h h h h

forth

forth many small purplish red threads, set upon or sticking out of a small head, one set above another, which afterwards turneth into a round and somewhat flat crested blacke berrie, containing therein small white and rough seede, somewhat like unto Grape kernels. This in some places dyeth downe to the ground every yeare, and springeth anew, which is the cause it can give no flower, muchlesse seede, which never is found on the first yeares shoote in our Country, but in other places of our Land sheweth flowers, such as I have described, but never any fruit that I can learne.

4. *Coccygia sive Cotinus Coriaria.*
Venice Sumacke.

The Venice Sumacke is in some places a tree, rising to be of the bignesse of the Pomegranet tree, in other places it is much lower, and shooteth forth many twiggies, of two or three cubits long, and of the bignesse of ones finger, divided into many reddish branches, having sundry leaves set on both sides without order, somewhat broad, round pointed, thicke, and full of veines, and small red footstalkes under them, a little waved about the edges, of a Roselike sent, not unpleasant, and of an harsh binding taste, growing to be of an excellent Rose colour, in the end of Summer; from the ends of the branches start forth a large and long head, consisting of many tufts, of whitish Greene flowers, standing upon very fine red footstalkes, which afterwards spread themselves into so many tufts of feather-like haire or threads, having among them sundry small blackish and flat seede, formed somewhat like unto an heart, which together with the silken threads are carried away by the winde: the roote is hard and woody, not growing deep nor much spreading: the wood is yellowish, and serveth to give a yellow dye: but the

2. *Rhus Pignussum.*
Virginian Sumacke.

1. *Rhus copallinum & coriaria.*
Cotinus sumacke.

3. *Rhus Plinij Mirtifolia.*
Mirtle leaved Sumacke.

4. *Coccyria* five *Cotinus Coriaria*,
Venice Sumacke.

5. *Rhus sylvestris* five *Myrtus Brabantica* aut *Anglica*,
Sweete Gaule.

leaves and young branches, doe Dye a blacke colour; and with the barke they Tanne leather, as with the others.

5. *Rhus sylvestris* five *Myrtus Brabantica* aut *Anglica*. Sweete Gaule.

This other plant which as I said is fit to be joyned to the rest, is a small low shrub or woody bush, not above a yard high, spreading slender branches; with many browne yellow with Greene leaves somewhat long, narrow, thicke and fatish, round pointed, resembling both Boxe and Mirtle leaves in some sort, but smelling somewhat strong and sweete, the flowers are yellow, and stand upon short stalkes, coming forth at the joynts with the leaves in small tufts, many set together, which being past, the said stalkes are plentifully stored with cornered yellowish seede, bedewed with a clammy moisture, of a very bitter unpleasant taste, but strong sweete sent: the roote is hard and woody.

The Place and Time.

The first groweth in Syria and Pontus, as Galen saith; in Italy and Spaine as Pliny saith, and in divers other places, where it is manured as carefully as their Vines, and as Clusius saith he saw it so ordered in Spaine, which yielded the Owners great profit, the second groweth naturally in Virginia, from whence we had it. The third about Mompelier, and in sundry other places. The fourth in Savoy, and on the Appenine hills and elsewhere. The last groweth in many places of our owne Land, as well as beyond the Sea, as in *Sussex*, *Hartfordshire*, and *Kent*, and by old *Windfor* Parke corner.

The Names.

It is called in Greeke *ῥόδον*, and by Hippocrates *ῥόδον*, in Latine also *Rhus*, for Pliny saith it hath no Latine name although *Gaza* calleth it *Fluida* (supposing the name to be derived from *fluere*), but it is rather a *rubore vel colore coccineo acinorum*, and therefore it was called *ῥόδον*, from whence the Latine *Ruffus*, and the French *Roux* came. It is called *Rhus* simply by some, as *Matthiolus* &c. *Rhus coriaria* by *Dodonaeus*, and *Rhus obsoniorum* by *Lobel*, *Camerarius*, *Clusius*, and others, and *Sumach* both by shops and in *Rauwolfius*, or *Sumach Arabum*, because it was called *Rhus Syriaca* by some, it was thought to differ from the former, as also, that *Rhus culinaris* and *coriaria* or *rubra*, did differ one from another, and were severall sorts, but *Paulus Aegineta*, doth plainly shew that the seede and juce of *Rhus coriaria* was used by Physicians: another error *Celsus* shewed, that tooke the *Rhus Syriaca* to be *Ros Syriacus*, a kinde of *Manna*, and therefore called it *rorem Syriacum*, instead of *Rhoem Syriacum*, and *rorem sutorium* for *Rhoen Syriacum*, or *coriariorum*, not *sutorium*, as it is in *Colomella*: neither should it be *Ros marinus*, but *Rhus marinus*, or *Rhus Orientalis* in *Marcellus* who appointeth it for disenteries and the like. The second hath not bene set out by any before me, onely *Taibinus* seemeth to touch upon it, calling it *Rhus angustifolium*, saying it was brought out from *Brassile*. The third is thought by most to be the *Rhus sylvestris* of Pliny, that hath Myrtle like leaves, and so called by *Lobel*, *Dodonaeus*, and *Lugdunensis*, and *Rhus Pliny Myrtifolia Mompelienfium* by *Gesner* and *Lobel*: yet some doe thinke it better agreeth with the *Dryophanon* of Pliny: the fourth is the *κοκκινίαν* of *Theophrastus*, which *Gaza* translateth *Prunus*, but should be rather *ροζον ἐρυθρά*, which sheweth that *Gaza* was slenderly advised to give the word such a name that a Plumme should beare a seede to be carried away with the winde, Pliny calleth it *Coccyria*, or *Coccyria*, yet some have it *Coccyria*: some also thinke it to be the *Cotinus* Pliny, and for a distinction betweene it and the *Oleaster*, which is called *Cotinus* also, they call this *Cotinus coriaria* Pliny, in imitation whereof as it is thought, those that dwell at the toppes of

H h h h h a

the

the Apennine hills doe call it *Scorano*, and those at the foote *Rossolo*, of the red colour of the barke, and not of the Dye, as some thinke because *Pliny* saith, his *Cotinus* is, *adlineamenta modo conchyli colore insignem*, for this as is before said, giveth a yellow colour. The *Savoyers* call the wood here of which they loppe and fell for that purpose *Fusset*, and we *Fusticke*, which all Dyers know is of especiall use with them, both the old wood to give one yellow colour, and the young another. *Matthiolus*, *Anguilara*, *Camerarius*, and *Gesner* in *hortis* call it *Cotinus*, yet *Gesner* also call it *Coccinea forte Barba Iovis* *Pliny*, *Dodonæus* *Cotinus Corivria*, *Ceggyeria* by *Clusius* and others, and of *Cesalpinius* *Scotannus vulgo*, as the common people did. The last is liker to be the *Rhus sylvestris* and called by *Lugduneris*, *Rhus sylvestris altera*, by *Clusius* *Rhus herba* *Pliny*, and thinketh it is the *Dryophanon* *Pliny* also, as *Ruellius* did before him, and *Myrtus nemoralis*, *Cordus* tooke it to be *Eleagnus*, and *Bellonius* *stirpium cultura*, tooke it to be the *Eleagnus* of *Theophrastus*, and *Lobel* therefore called it *Eleagnus Cordi*, and *Dodonæus* *Chameleagnus*, *Lobel* calleth it *Gazel Germanorum*, and *Myrtus Brabantica*, and *Belgarum*, but I may say as well *Myrtus Anglica*, for it is as plentifull with us as with them, but that *Lobel* did not know so much? The *Arabians* call the first *Sumac*, *Adurion*, *Rosbar*, *Sadificos*, or *Rosaidicos*, the *Italians* *Rhu*, and *Sumaco*, the *Spaniards* *Sumach* and *Sumagro*, the *French* *Sumac*, the *Germanes* *Gerberbaum*, the *Dutch* *Sumack* and *Smack*, and we in *English* *Sumacke*, and red *Sumacke*, the *French* call the last *Pimentroyal*, that is *Royall Balme*: the *Germanes* *Gaule*, as is before said, and we *Gaule* and *Sweete Willow*.

The Vertues.

Sumacke both leaves and seedes, and the medicines made of them are cooling in the second degree, and drying in the third, the leaves of the first *Sumacke* have an astringent quality, that they may serve instead of *Aconia*, for those purposes it is used, the decoction of the leaves and seede is singular good for all sorts of fluxes in man or woman, to take them in broth, or in meate or drinke, and to sit in the decoction while it is warme, as the bloody flux, the flux of the stomacke, womens courses, and the whites also, to be drunke or injected by glisters or otherwise, or in bathes, it stayeth the stomacke that is much given to calling, the decoction of the leaves or seede made with vinegar, and a little honey put thereto is good against Gangrenes or Cankers, the juice that is taken out of the dried leaves by boyling them in water and after they be strayned to boyle them againe with some honey, hath the same properties that *Lycium* hath, the same helpeth the roughnesse of the tongue and throat: the seede likewise boyled in water, and the decoction thereof evaporated to the thicknesse of honey, is more effectuell then the seede it selfe: the decoction of the greene leaves maketh the haire blacke to be washed therewith: the juice of them dropped into the eares dryeth up the moisture and running of them: the seede beaten and boyled into a pultis and applyed to any inflammation or hot impostume, cooleth them much, and doth also take away the markes and paines of bruises and blowes, as also the frettings and gallings of the skinned, the same also helpeth the hemorrhoides or piles when they bleede too much, if it be applyed with the fine poulder of *Oken coales*: it is singular good also to be applyed to ruptures, both inwardly and outwardly, and to stay defluxions of hot and sharpe rheumes into the eyes, and *Damocrates* used it in a medicine with *Poppy heads*, against distillations from the head, and against want of sleepe: the gum that is found oftentimes issuing out of the tree, is good for hollow teeth, to ease the paines, and the decoction of the seede is good to wash the mouth both to fasten loose teeth, and to heale putrid and rotten gummæ. What the *Virginia Sumacke* will performe, I have not knowne any hath made the prooffe, but it is probable it might worke some of these effects if any would make the tryall. Both the *Myrtle leaved Sumacke* and the *Venice*, are in a manner as effectuell to all the purposes aforesaid, except that they are a little weaker. The *Gaule* is by the bitterness and harshnesse found to be both drying and discussing, and is very effectuell to kill the wormes in the belly or stomacke: it mightily affecteth the braine, causing first perturbations and then sopiting the senses: it is much used to be laid in Wardrobes, Chests, Presses, and the like, to keepe mothes from garments, and woollen clothes as also to give them a good sent.

CHAP. XLV.

Myrtus. The Myrtle.

Having spoken of the *Gaule* in the Chapter before, which some account a kinde of *Myrtle* both from the forme and sweetnesse, I thinke good to set the stocke of the *Myrtles* next therunto, which are many, because although I have shewed you three of them in my former Booke, yet I have not shewed you all the properties they have.

1. *Myrtus latifolia maxima*. The greatest open Laurell Myrtle.

This greatest Myrtle hath great and thicke woody branches set with a double row of large leaves yet not so close as the next coming neere unto the smaller leaves of the Bay tree, but of a paler greene colour, abiding alwayes greene and very sweete: this sort saith *Clusius* even in *Spaine* seldome beareth either flowers or fruite, because they prunne it often, being kept in hedges for pleasure.

Clusius maketh another sort hereof which differeth little from the former, but in the leaves which are somewhat smaller and thicker, whereas the former are thinner.

2. *Myrtus latifolia eximia*. The strange broad leaved close Myrtle.

This Myrtle groweth higher then the former, and shooteth from the roote store of strong thicke stemmes more plentifully stored with large leaves, yet not fully so large as the first sort, but closer set together that they almost touch one another sometimes in a double row and sometimes in a treble, and very sweete: the flowers are white like unto others but larger, after which cometh the fruite, somewhat longer then in the small sorts, greene at the first, purplish before it be ripe, and blacke when it is full ripe, with many crooked white seedes within them.

3. *Myrtus latifolia vulgaris*. The usuall broad leaved Myrtle.

This usuall broad leaved Myrtle (which I so call because we have this only in our Country, of all other sorts of broad leaved Myrtles) groweth to be foure or five foote high with us, and in the warme Countries to be a little tree full of branches and leaves, like a small bush, the leaves are somewhat large and great, yet not so large as the last, as sweete

1. *Myrtus laurifolia maxima.*
The greatest open Laurel Myrtle.

2. *Myrtus latifolia exotica.*
The Arange broad leaved close Myrtle.

5. 7. *Myrtus Battica sylvestris & minor acutifolia.*
The Spanish wild Myrtle and the small pointed Myrtle.

6. *Myrtus domestica minutissima folijs fructu a'bc.*
The small white Myrtle.

sweete as the other, and the flowers white like the rest, and sweete likewise, the fruite hereof is blacke also.

4. *Myrtus angustifolia exotica.*

The strange narrowleaved Myrtle.

This narrow leaved sort groweth in all parts like unto the second, but that the leafe is smaller, narrower, small pointed, and of a darker Greene colour, the flowers are alike, and so is the fruite blacke also, but greater and rounder, having crooked white seedes in them, as the others have.

5. *Myrtus Betica sylvestris.*

The Spanish wild Myrtle.

This wilde Myrtle groweth neither so high, nor so thicke with leaves, as the former manured sorts, but have slender and brittle branches, with broader leaves then the last, set more thinly on both sides then the rest, and of a darke Greene colour: the flowers are like the rest, and the fruite is round, standing on long footestalkes betweene the leaves in good plenty, Greene at the first, and whitish afterwards, and blackish being ripe full of sweetish juyce, pleasant, with some astringion to the taste.

6. *Myrtus domestica minutissimis folijs fructu albo.*

The small white Myrtle.

This white Myrtle groweth reasonable tall, with slender reddish branches, thicke bushing together, being thicke set with very small (even the smallest of any other,) leaves, narrowest of any, and sharpe pointed, and somewhat darke Greene also: the flowers are white like the rest, and so is the fruite likewise, but of a whitish colour, tending to a little bluish, and to abide, not changing blackish.

7. *Myrtus minor acuto folio.*

The small and pointed Myrtle.

This small Myrtle riseth not so high as the third, or ordinary broadleaved sort, but groweth fuller of branches, and thicke set with small fine and Greene, almost shining round leaves a little pointed at the ends, abiding alwayes Greene, as all the sorts of Myrtles doe, which and the flowers are sweete also, but grow not plentifully in our Country on the branches, as in warmer places, and beareth blacke berries, but never in these colder climates, howsoever housed or defended.

8. *Myrtus minor rotundiore folio.* Boxleaved Myrtle.

This other sort groweth in all points like the last, but that the leaves being as small and fresh, Greene, thicke growing, are rounder at the ends, very like unto the small Box leaves, and beareth flowers as sparingly.

9. *Myrtus flore pleno.* Double flowered Myrtle.

Of the greater kinde of Myrtle, there hath bene of later times one nourished up in the Gardens of the chiefe Lovers of rarities, with as double flowers as the double Fetherfew, coming forth of a round reddish huske, continuing flowering at the least three moneths, and each flower a fortnight, and is not over tender to be kept, yet is not so hardy to endure the frosts, as *Cornutus* saith, which *Malter Tradescant* can sufficiently witness, who by a little neglect lost a good plant overtaken with the frost.

The Place and Time.

Myrtles of many sorts are found generally upon all the Sea coasts of *Spaine, Italy*, and in divers other Countries also. The first two sorts *Cistus* found in *Spaine*, not growing naturally wilde, but in certaine Monasteries, and private mens Orchards. The third I thinke came out of *Italy*, because it is most like to that sort they so call. The fourth be likewise found in a Monastery, not farre from *Corduba*. The fifth in many places wilde, both of *Spaine* and *Portugall*. And the sixth in a private noble mans garden in *Portugall*. The two last save one, are nourished up most frequent in our Land, and better indure therein, with some good heede and looking unto: but generally even in the warme Countries they must be defended from the cold for feare of danger, as *Virgil* sheweth in this Verse *Eclóg. 7. Dum teneras defendo a frigore Myrtos*, and *Ovid* in the like manner saith *Metuentem frigora Myrtum*, and yet *Virgil* in another place saith, *Amantes frigora Myrtos*: Which how both should be true. I can imagine no other, but that *Virgil* speaketh of the first in a cold place, and of the other as they grow in a warme, that the cold place must have shelter and defence against the cold, as it is with us, who give them all the comfort we can: and that they that grow in a warme and hot Countrey must have shadow, for they love both shadow from the heate, and moisture in the warme Countries. The last hath no naturall place assigned. They flower in *May*, and the fruite is ripe about *September*.

The Names.

It is called in Greeke *μύρτις* and *μύρτιν*, so called a *Myrsine Atheniensis puella amica Palladis a qua cursum & palaestra, superata, in via ad athenas interim*; *arbuscula in demetrius vicem successit, semper ut olea Minerve chara*: but *Pena* saith, sic vocatam volunt, propter amalam *Myrrhe* odoris gratiam, in ejus bacis recentibus: yet when we shew you here a *Myrtus sylvestris*, as well as *sativa*, or *domestica*, you must not understand the *Oxymyrta*, that is *Brusew*, which some called also *Myrtus sylvestris* to be it, but as in opposition to the tame or manured of the same kinde.

9. *Myrtus flore pleno.* Double flowered Myrtle.

kinde. *Dioscorides* maketh mention of both these sorts, and the white one also, although he hath described but one: but some doe much mervaile that *Theophrastus* that doth so often make mention of the Myrtle, yet hath in no place described it. The first sort here set downe is the first *Myrtus* with *Clusius*, called by him *Myrtus Batia latifolia domestica*, and by *Lobel Myrtus laurea secunda*. The second is called by *Clusius*, *Myrtus Batia latifolia exotica*. The third is as I take it the *Italica Camerarij*, which *Matthiolus* and others doe describe, and may be the *Conjugula* of *Cato*, which *Pliny* calleth *nostras*, that is *Romana*, and *Lobel Laurea maxima*, and is most likely to be the *nigra* of *Dioscorides*. The fourth is the *Myrtus Batia angustifolia exotica* of *Clusius*, which *Lobel* calleth *Myrtus exotica Plinij*, and although it have not six order of leaves, as *Pliny* his *exotica*, yet saith *Clusius*, the leaves grow thicke together, that it seemeth to have more then it hath. The fifth *Clusius* calleth *Myrtus Batia sylvestris*, and is the *Myrtus majoris quinta species* of *Lobel*, and *Myrtus sylvestris* of *Matthiolus*. The sixth is the *Myrtus domestica fructu albo* of *Clusius*, which *Bellonius* often remembreth in his Observations, and is the *Myrtus nona angustifolia* by *Lobel*. The two last have one are very likely to be the *Tarentina*, and so *Matthiolus*, and *Clusius* take them to be. *Lobel* calleth them *Myrtus minor vulgaris*, and so others, because as I said they best abide our Northerne Countries. The last is so called by *Cornutus* as it is in the title. The Excellence that is often found growing upon old Myrtle trees, is called *Myrtidanium* and *Myrtadinum* by *Dioscorides*, and *Myrtidanium*. Yet *Pliny* calleth *Myrtidanium*, the wine that is made of Myrtle berries. There are likewise, saith *Bellonius*, in his Observations, certaine *Cocos*, or red berries, like unto the *Chermes* berries growing upon the Myrtles in many places of *Turky*, which have in them but one sye or worne, and used as the *Chermes* to dye withall. The *Arabians* call it *Aes Alas* and *As*, the *Italians* *Myrio*, and *Mortello*, the *Spaniards* *Murta*, and *Raima*, the *French* *Myrie* and *Mentree*, other Nations follow the Latine as neere as they can, the Apothecaries and Druggists shops call the berries *Myrtillus*, and we in *Englishe* Myrtle berries.

The Vertues.

The Myrtle as *Galen* saith hath contrary qualities in it, for it hath a passing cold earthy quality in it, and a certaine thinne warme essence also, and therefore it powerfully dryeth and bindeth: The dryed leaves are more drying and binding then the fresh, which being beaten and boyled with water, is good to drinke against catarrhes, falling to any part of the body, and doth helpe also the fluxes of the belly or stomacke, moist ulcers, and fretting or creeping sores, being applyed to the swellings and heate of the cuds, the Impostumes of the fundament, and Saint *Anthones* fire: the decoction of the leaves is good for the resolution of the Arteries and joynts, and their weakenesse to sit in or over the same, as in a bath, and doth helpe to consolidate broken bones or out of joynt, that will hardly be cured, it helpeth the forenesse of the nayles, and that rising of the skin about them, if the poulder of the dryed leaves be cast thereon: the juyce of the leaves is of the same effects, whether out of the fresh leaves, or taken from the dry, by infusing red Wine on them, and is safely used where there is neede of any binding medicine, or to heale the ulcers of the mouth or privy parts: the same also helpeth watering eyes or those that beginne to have a filme or skin to grow that will take away the sight. The feede is good for the tremblings and passions of the heart, and to helpe those that spit blood, or have the bloody fluxe, it stayeth also womens immoderate courses, and the whites also, it helpeth the sting of Scorpions, and the bitings of venomous creatures, and of the Spider *Phalangium*, and the danger of Mushromes: being drunke in Wine, it helpeth a stinking breath, and amendeth that which is not sweete, the same also heated with Wine healeth old ulcers, that are hard to cure: it helpeth the diseases of the bladder, and provoketh urine, it also bladdeth the belly, and stayeth the fluxe of humours, the blanes, wheales, and other breakings out in the skinne: the decoction of them, is good for women to sit in or over, that are troubled with the falling downe of the mother, and is good also for the falling downe of the fundament, and the piles. The Excellence called *Myrtidanium*, is of greater force to dry and binde then either leaf, juyce, or feede: the juyce condensate of Myrtles is commended by *Matthiolus* for a better substitute, for *Acacia*, then the juyce of Sloes, which hath not that aromaticall sent, and strenghtning quality that the Myrtle hath.

CHAP. XLVI.

Vitis Idea sive Myrtillus Germanica vel Vaccinium frutex. Whortle berries.

Here are divers sorts of these low shrubs, which must all goe under the name of Whorts or Whortle berries, although there is much difference betwene them.

1. *Vaccinia nigra vulgaris.* Blacke Whortes or Bill berries.

This small bush creepeth along upon the ground, scarce rising halfe a yard high, with divers small darke greene leaves set on the greene branches, which it spreadeth abroad on both sides, but not alwaies one against another, somewhat like unto the smaller Myrtle leaves, but not so hard, and a little dented about the edges: at the foote of the leaves come forth small hollow pale bluish coloured flowers, the brimmes ending in five points, with a reddish thred in the middle, which passe into small round berries of the bignesse and colour of Juniper berries, but full of a purple sweetish sharpe or fowre juyce, which doth give a sad purplish colour to their hands and lips that eat and handle them, especially if they brake them; containing within them divers small seed: the roote groweth aslope under ground, shooting forth in sundry places as it creepeth: this loofeth the leaves in Winter.

2. *Vaccinia nigra fructu majore.* The greater Bill berry.

This other Bill berry groweth greater and higher then the former, whose lower part of the branches are of an ash colour, but the upper part, greene and sometimes reddish, the leaves are somewhat rounder pointed, the flowers and berries, are like the other in all things, save that they are larger, but of the same colour being ripe, and of a more pleasant sweete and lesse sharpe taste: the roote creepeth in the same manner.

3. *Vaccinia nigra Pannonica.* Hungarian Blacke Whorts.

This Hungarian Whort hath tough slender stalkes, lying for the most part, on the ground, and there taking roote

1. *Vaccinia nigra vulgaris*.
Blacke Whortes or Bill berries.

2. *Vaccinia nigra fructu magno*.
The great Bill berry.

3. *Vaccinia nigra Pannonica*.
Hungarian Blacke Whortes.

4. *Vaccinia rubra Buxifolij*.
Red Whortes with Boxe leaves.

6. *Vua Vri Galeni Clusij.*
The Spanish red Whort.

7. *Vitis Idea tertia Clusij.*
The French Hony Sweete Whorts.

8. *Vitis Idea Cretica elatior.*
The taller red Whorts of Candy.

9. *Vitis Idea Cretica humilior.*
The lower Candy red Whorts.

rootē againe in some places, with many branches, scarce raising up themselves above the Mosse; among which is groweth, having sundry long and some what narrow leaves, upon long footestalkes set without order on them, greene above and paler underneath, and a little nicked about the edges, with a few soft haire on them also, and of a very astringent taste: the flowers come forth at the end of the last yeares shootes or branches, which were not observed, but there stood blacke round berries, as bigge almost as Cherries, upon long footestalkes, hanging downe when they were ripe, but reddish before, full of a not unpleasent juyce, containing within them no stones like

like Cherries but five feedes for the most part, being flat and white: the roote is woody with some fibres joynted thereto: this holdeth the greene leaves all the Winter.

4. *Vaccinaria rubra buxifolia*. Red whorts with Boxe leaves.

This red Whort riseth up like unto the great blacke Whort, having sundry harder leaves like unto the Boxtree leaves, greene and round pointed standing on the severall branches at the toppes whereof onely, and not from the sides, as in the former come forth divers round and somewhat long hollow flowers, of a pale red colour, after which succede round reddish sappy berries, when they are ripe, of an acide and astringent taste: the roote runneth in the ground like the blacke: the leaves hereof fall not away in Winter.

5. *Vaccinaria rubra longioribus folijs*. Red Whorts with longer leaves.

This other red Whorte is like a low creeping shrub, but groweth somewhat thicker and greater then the former red, the leaves whereof are longer narrower and sharper pointed then it, and growing reddish toward Aurume, but yet abiding on the branches like the former, and not falling off in Winter: the flowers are like the other, and so is the fruite, but not sappy, or with juyce therein, but dry and tastelesse, and without any manifest taste.

6. *Urtica Galeni Clusii*. The Spanish red Whort.

This Spanish Whort likewise differeth not much from the former red sorts, having slender flexible stalkes and branches, about a foute long, lying on the ground, covered with a reddish barke, somewhat like unto the tender branches of the Strawberry tree, having sundry leaves set thereon, neere resembling the Strawberry tree leaves but lesser, being thicke and sappy but not hairy at all, and somewhat bitter with the astringent taste: at the ends of the branches grow divers bottle like or hollow round flowers, growing in clusters of the same whitish bluish colour that they are of, after which follow round red berries like unto small Cherries, but of an acide taste: the leaves hereof likewise abide on the stalkes and fall not away in Winter.

7. *Vitis Idea tertia Clusii*. The French honey sweete Whortes.

This riseth higher then any of the former, to be foure or five cubits high, with sundry thicke smooth woody stemmes from the roote, the lower parts being somewhat tough and covered with a blackish barke, the upper branches being greene, stord with many leaves thereon, set without order, which are somewhat long with the roundnesse, and a little dented about the edges, of a sad greene colour above and very hoary underneath: at the joynts with the leaves come forth many white flowers, consisting of five leaves a peece, after which come small round berries somewhat bigger then Hawthorne berries, and blacke when they are ripe, having a small crowne as it were of five small points which were the flowers, sticking at their toppes, and being sappy of a sweetish taste like honey, with sundry blackish feede within them.

8. *Vitis Idea Cretica elatior*. The taller red Whortes of Candy.

This small shrubby plant sending forth sundry slender woody blacke shootes from the roote, the wood being hard and white without any sent, but somewhat heating the tongue on the tasting, parted into divers branches, furnished at the joynts, by unequal spaces, sometimes with single leaves, but usually with two, and sometimes with three or foure together, which are somewhat hard and almost round, dented also a little about the edges, being somewhat like unto Holly, but nothing so hard or prickly, of a sad greene colour on the upper side and grayish the lower, at the ends of the branches, and at the joynts also with the leaves come forth sundry white Cherrylike flowers, each on a long footstalk, and after them small round and somewhat long reddish fruite, of a pleasant taste, of the bignesse of a Beane, having a freezy or woolly crowne at the toppes, and being dry turneth blacke and hard.

9. *Vitis Idea Cretica humilior*. The lower Candyed Whorts.

This other Candyed groweth much lower, fuller of spigges slenderer also and shorter whereon at unordinary spaces, stand unordinary leaves, three or foure sometimes together, being almost round like unto the last, but lesser softer, smother and not so much dented about the edges, neyther yet of so sad a greene colour on the upper side, nor so gray on the under, at the joynts likewise with the leaves come forth long stalkes, with many the like white blossomes in a cluster, turning into smaller berries, of a darke red colour, and a little downy at the head, somewhat like unto Mirtle berries, which are familiarly eaten by the Shepheards, and others of the Country.

The Place and Time.

The first groweth in many heathes, woods and barren hilly places of this Land, as Hampseede Heath, Fincheley, and Saint Johns wood, not farre from London, and in sundry other places. The first red sort in the North parts, as Lancashire, and Yorkshire, on the hills, &c. The rest grow in Hungaria, Bavaria, and Germany, and in other Countries also. The sixth *Clusius* found in Spaine, and the branches and berries were shewed me by Boel, that brought them out of Spaine. The seventh groweth as Lobel saith on every of the hills in Provence of France, and *Clusius* on the hills nigh Vienna. The two last in Candy. They all flower in March and April, and the fruite of the blacke is ripe in June and July, the other later.

The Names.

The first blacke sorts are taken generally by the best later Writers, to be the *ἰδαία* & *σοφράστis* of Theophrastus, that is, *Vitis ex parte Ide*, quam vocant *Phalacras*, but Pliny falsly put in *Alexandrina* instead of *Idea*, in Latine by them *Vitis Idea Thophrasti*, and because all the rest have a resemblance thereunto, they are all called *Vites Idea*, likewise, with their severall distinctions, as you shall presently heare: they are many of them also called *Vaccinia*, by divers, thinking the black sort to be the *Vaccinia nigra* of Virgil, & by the transposition of a letter *Vaccinia nigra parva quasi bacca*; but that error is exploded by many good Authours, that shew Virgil putteth his *Vaccinia* among flowers and not fruites; for as he saith, *Et sunt Viole nigrae*, & *Vaccinia nigra*, intending the colours were both alike, as a kinde of *Hyacinth*, which he might meane is as the Violet flower. *Vitruvius* and *Pliny* indeede have a *Vaccinium* which giveth a purple dye to servants or others garments, which may very wel be this, for such a purple colour will the juyce hereof give, if it be rightly ordered. It is also called *Myrtillus*, and by some *Myrtillus Germanica*, because the Physicians and Apothecaries in Germany and those parts, tooke them to be true Mirtle berries, and so used them untill they were shewed their errour, and since have forsaken it, as we have done also. *Gesner* also in *hortis* sheweth, that some did take the *Vitis Idea*, to be that Vine that beareth Currans, but saith he, that noble Vine groweth not on so high or snowy mountaines, but rather in the Planes and open hills, and ordered by the industry of men. The first *Tragus* callth *Myrtillus exiguum*, and so doe *Martholius* and *Lugdunensis*. *Donatus*

donem and Lobel, called it *Vaccinia nigra*, *Anguilara*, *radix Idea fructu nigro*, *Camerarius*, *Gesner* and *Clusius*, *Vitis Idea vulgaris baccis nigris*, *Cesalpinius* *Bagole primum genus*. The second is called by *Tragus*, *Myrtillus grandis*, and is the *Vitis Idea major* of *Thalium*, the *Vitis Idea secunda* five altera of *Clusius*, and the *Vitis folijs subrotundis exalbidis*, although he hath transposed some of these titles to his second, which is my third whereof onely *Clusius* maketh mention and calleth it his first, and *Gerard*, *Vaccinia Pannonica*, and *Banbinus* calleth *Vitis Idea folijs oblongis albicantibus*. The fourth is called *Vacciniarubra*, and *Vitis Idea rubra*, by all writers thereof: *Camerarius* and *Thalium* say that some tooke it to be *Rhus minor* *Pliny*; and *Clusius* *Vitis Idea buxeis folijs*, and *Anguilara* *Radix Idea fructu rubra*, as he did the blacke before, *Radix Idea fructu nigro*, and *Lugdunensis* doth thinke that this is most properly the *Radix Idea* of *Dioscorides*. The fifth is mentioned onely by *Camerarius* in *horto*, who calleth it *Vitis Idea rubra Bavarica*. The sixth is referred by *Clusius* to the *dyptocarpia* of *Galen* in his seventh Booke, de *composit. med. secundum locos*, cap. 4. and thereupon he called it *Uva ursti Galeni*, *Banbinus* refereth it to the *Vitis Idea*, making it his sixth and calleth it *Idea radix Dioscoridis* also. The seventh is called by *Clusius* *Vitis Idea terria*, not thinking his former to be so worthy of that name, *Lobel* saith the French call it *Amelanchier*, and doubteth if it be not that shrub which they call *Alstier*, *Belonius* saith, that their *Melanchier* is called in *Candy* *Agriomela* and *Codomalo*, but I thinke he is deceived, that having blacke, and this red fruite: *Gesner* in his *Epitites*, as *Clusius* saith (if he meant this plant) giveth it divers names, as *Myrtomalis*, *Petromelis*, *Pyrus Cervina*, and *Pyraster*, *Idea*, *Dalechampi* taking it to be *Cotonastr* *Gesneri*, calleth it *Epimelis altera*, but giveth it red berries, which therefore I suppose may be rather one of the two last. The two last are mentioned by *Alpinus*, in his Booke of *Exoticke* plants, by the name of *Cerasus*, and *Chamaecerasus Idea Cretica*, thinking the former most neerely to be the *Cerasus Idea Theophrasti*. The *Italians* did use to call the first *Mirrillo*, but now *Vite Idea*, according to the *Latine*, the French *Airelle* and *Arvelle*, the *Germanes* *Heidelbeer*, the *Dutch* *Crake besien*, and we *Whorts* or *Whortle berries*, and *Bill berries* with us about *London*.

The Vertues.

The *Bill berries* doe coole in the second degree, and doe a little binde and dry withall: they are therefore good in hot agues, and to coole the heat of the stomacke and liver, and doe somewhat binde the belly, and stay castings, and loathings, but if that they be eaten by those that have a weake or a cold stomacke, they will much offend and trouble it saith *Camerarius*, and therefore the juyce of the berries being made into a Syrupe, or the pulpe of them made into a conserve with Sugar, will be more familiar to such, and helpe those paines, the cold fruite procured, and is good for all the purposes aforesaid, as also for those that are troubled with an old cough, or with an ulcer in the Lungs or other disease thereof: with the juyce of the berries *Painters* to colour paper or cards, doe make a kinde of purple blew colour, putting thereto some *Allome* and *Galles*, whereby they can make it lighter or sadder as they please. And some poore folkes as *Tragus* sheweth, doe take a potfull of the juyce strained, whereunto an ounce of *Allome*, foure spoonefuls of good Wine vinegar, and a quarter of an ounce of the waste of the copper forgings, being put together, and boyled all together, into this liquor while it is reasonable, but not too hot, they put their cloth, wooll, thred or yarne therein, letting it lye for a good while, which being taken out and hung up to dry, and afterwards washed with cold water will have the like *Turkie* blew colour, and if they would have it sadder, they will put thereto in the boyling an ounce of broken *Ganles*: *Gerard* saith, that hee hath made of the juyce of the red berries, an excellent crimson colour, by putting a little *Allome* thereto: the red *Whorts* are taken to be more binding the belly, womens courses, spitting of blood, and any other fluxe of blood or humours, to be used as well outwardly, as inwardly.

Iovis barbafrutex, The Silver Bush.

CHAP. XLVII.

Iovis barbafrutex. The silver Bush.

His beautifull fine bush groweth to the height of a man, with a number of slender branches, thicke bushing out on all sides, whereon grow long winged leaves made of many small ones like *Lentill* leaves, but narrower, each set against other, with an odde one at the end, of a faire Greene colour on the upper side, and of a silver white shining colour underneath, the young leaves being also of the same colour: at the ends of the branch standeth large umbels of yellow flowers, made after the fashion of broome flowers, set in grayish huskes, like the heads of the three leaved grasse, after which come small narrow short pods, soft and grayish likewise, with two or three small round, and somewhat long blackish gray feede in them: the roote is hard and woody: this is very tender, not induring our Winters, although houled, nor any where in our Country, but in a warme stove, where the fire may preserve it from the cold, which it will not abide early or late: that is, it must be houled betimes, and not set abroad too early.

The Place and Time.

It groweth on the hill *Serius*, called *Cap de sette* of the French, not farre from *Agatha*, by *Mompelier*, as also upon *Mons niger*, not farre from *Ligorne* in *Tuscany*. And flowreth in *May* in the naturall places, the feede being ripe in *July*.

The Names.

I finde none of our moderne writers, to have made mention hereof, before *Anguilara* (who found it on the blacke hill

by

by *Ligourne*, as is before said, and in his first kinde of *Barba Iovis* since *Pliny*, who speaketh thereof *lib. 16. c. 11* that it shunned the waters, and was called *Iovis Barba*, and was fit to make hedges and border up beds, to be framed into any worke in a Garden, and *Casalspinus* since him. *Camerarius* onely nameth it, and so doth *Clusius*, but *Lugdunensis* describeth it, and lastly *Bauhinus* in his *Pinax*, and all of them by the name of *Barba Iovis*, and yet the *Sedum majus*, great Houfleeke is also called by that name, but to put a distinction betweene them, this is called *Barba Iovis arbor* or *finetex*.

The Vertues.

There is nothing extant of any Physicall property, whereunto this plant may be applied, and therefore thus much shall be sufficient untill the Vertues be better knowne.

CHAP. XLVIII.

Periclymenum sive Caprifolium. Woodbine or Hony Suckles.

WE have divers sorts of plants under the name of *Periclymenum*, some that are winding about whatsoever standeth next them, and for the most part knowne throughout the Land, others are strangers, or not so well knowne: there are likewise divers that winde not, but stand upright, which I would separate in sunder as *Bauhinus* doth, but not make them kindes of bastard Cherries as hee doth, but joyne them in name, although I disjoyne them by Chapter, both because they have notable differences, and that I might not trouble you or my selfe with too many sorts in one Chapter.

1. *Periclymenum sive Caprifolium vulgare*. Our ordinary Woodbinde.

Our common Woodbinde is well knowne to grow up with a woody stalk and branches, winding themselves yet without claspers, so strictly unto whatsoever branch of any other tree, that it leaveth an impression therein of the winding, set with sundry leaves by couples, which are somewhat broad and long, round pointed, and of a whitish Greene colour above, and more whitish underneath: at the toppes of the branches come forth many long and hollow whitish and yellow flowers, laid open before, with many small threds sticking in the middle of them of a fine sweete scent: after which succeede small bunches of red berries, wherein is contained small hard seeds. the roote is woody with many fibres.

2. *Periclymenum sive Caprifolium Germanicum flore rubello*. The Germane red Honyfuckle.

This Germane sort groweth higher and is set spread then the former, but ramping in the like manner, with the like leaves, but somewhat larger as the flowers are also, being red in the bud before they be blowne open, and continuing reddish on the outside the bottomes of the flowers being wholly white on the inside.

3. *Periclymenum persfoliatum sive Italicum*. Double Woodbinde or Honyfuckles.

The double Honyfuckle groweth in the same manner as the other, but spreadeth more and farther, with whitish ramping branches, and such manner of whitish Greene leaves set on both sides of the branches up to the tops.

1. *Periclymenum sive Caprifolium vulgare*.
Woodbinde or Honyfuckles.

3. *Periclymenum persfoliatum sive Italicum*.
The double Honyfuckle.

where it beareth many flowers, at two or three severall distances one above another, with two round leaves under them, at the joynts joynd so close together, that they seeme like sawlers to hold the flowers, which stand in the middle, and are of the same fashion and colour with the former, that is of a whitish yellow colour, with open mouthes, dasht over with a sight shew of purple, with threds within them likewise, and as sweete: this beareth seede likewise, but not so many together.

4. *Chamaepetrum*.

Dwarfe Hony suckle.

This Dwarfe Hony suckle hath a creeping roote, running here and there underground, and shooting up stalkes with sundry leaves set by couples at the joynts, full of veines, and with five ribs running all the length of the leafe to the end, which is pointed, smooth and not dented about the edges, from the toppes of the stalkes grow forth two branches, with foure or five such like leaves as grow below, and from between the foote of them commeth a small tuft of flowers, (which were not observed) and after them many red berries set in a bunch or knob together, like the Mulberry, but longer, and therefore I thinke it should rather pertaine to the family of the *Chamaemuri*, but that, as *Clusius* to shew, not only his love to Doctor Penny, in letting it passe by his name, but also his judgement thereof by the name, to I, until I can have better knowledge of the Plant, must let it so passe, but with my caution.

The Place and Time.

The first groweth every where in this Land, in the hedges abundantly. The second in Germany. The third in Italy, Spain, Provence of France, &c. Both it and the second are onely kept in our Gardens, or Orchards, or set against an house side to runne about the Windowes, where they keepe the rooms coole, and make a goodly shew without. The last was found by Doctor Penny, as *Clusius* saith, by *Danzick*, who gave him both the figure and the description as it is here expressed. The first is in flower in June, and the fruite is ripe in August. The second and third are earlier, both for the flower and fruite, yet we never saw fruite of the second to follow any of the flowers.

The Names.

It is called in Greeke *περικλυσμην*, but the Greekes in these dayes, *περικλυσος*, in Latine *Periclymenum* also, and *Caprifolium*, but *Pliny* mistaking the word *Periclymenum*, setteth downe the properties of *Clymenum* for it, with some *Matrisylvia*, *Volucrum majus*, and *Lilium inter spinas*, and *Vinciboscum* by *Cesalpinus*, according as his *Italiani* called it. The first and third are called by all Authours that have written of them, either *Periclymenum* or *Caprifolium*, some entitle the first *Germanicum*, and some *Angare Septentrionalium*, but the second is more rightly termed *Germanicum*, because I thinke no Country hath it naturally but that. The third is *Perfoliatum alterum*, or *grandius & Italicum*. But the last was first set out by *Clusius*, and from him *Tabernmontanus*, *Gerard*, *Bauhinus*, and my selfe have it. The *Italians* call it *Vincibosco*, the *Spaniards*, *Madrefelua*, the *French* *Cheniesneille*, the *Germanes* *Geyssblatt*, and *Speck gilgen*, the *Dutch* *Gheynblatt*, and *Mechmekens*, and we in *English* *Wood binde*, and *Honyuckle*.

The Vertues.

We in our Land have by tradition continued so long in this error to use the leaves, and flowers, in all gargles, and lotions for inflammations in the mouth, or the fore privy parts of man or woman, that I thinke the custome is growne too strong by time for me with a few words to shew the inconvenience, that it may be reformed, for they are neither cooling nor binding, as they are taken to be: but are of a clensing, resolving, consuming, and digesting quality, as *Hyssope*, *Oiganum*, and *Winter Savoury* are, that with Figges and Licoris, are effectually to expectorate flegme from the chest and lungs, wherewith they are filled: and that it is not fit to be used in inflammations the very taste of the herbe holding a leafe in ones mouth will declare, by the burning heate will be felt therein, and as *Dioscorides* and *Galen* say, that the decoction thereof being drunke fixe dayes together, will render the urine as blood: although at the first they will but provoke urine onely, the fruite and leaves as well as the flowers, are of one effect: but the flowers and leaves are of more use then the seede, which is said to consume the spleene, and to procure a womans speedy delivery, but whereas it is said to bring barrenesse to men that use it, it cannot properly be said of men, but of women to be barren, and of men to be unable to generation, or their seede unprofitable upon sundry causes: the leaves or flowers in poulder or the distilled water of them, is much commended to cleanse and dry up foule and moist ulcers, and to cleanse the face and skinne from morpheus, sunburne, freckles, and other discolourings of the skinne. The oyle wherein the flowers have bene infused and sunned, is good against cramps, convulsions of the sinues, and palsies, and any other benumbing cold griefe. The double Honyuckle may safely be used to all these purposes, when the other is not at hand.

CHAP. XLIX.

Periclymenum rectum. Vpright Woodbinde or Hony suckle.

Of this kinde of *Periclymenum*, there are three or foure sorts, as you shall presently heare.

1. *Periclymenum rectum fructu rubro.* Red berryed upright Hony suckle.

The diuers stalkes of this Hony suckle, are somewhat straight and upright, about three or foure foote high, at the least, divided and spread into diuers branches, covered with a very thinne whitish barke: the leaves stand by couples on the branches and two likewise at every joynt, which are of a whitish Greene colour, smooth, and lesfer then those of the former winding Woodbindes: the flowers also stand by couples at the end of short stalkes, that come forth from the joynts with the leaves, and are much smaller then the other, and never opening or spreading much, of a pale whitish colour, after which come two red berries, long with the roundnesse, both of a bignesse in the naturall places, and in some open places, and seldome so with us, for one is usually withered and never cometh to perfection.

2. *Periclymenum rectum fructu nigro.* Blacke berryed upright Hony suckle.

This groweth not so high as the first, nor spreadeth so much but groweth greater in the stemme and more upright, whose barke is not so white: the leaves grow in the same manner, but are somewhat longer and dented about the edges, the flowers stand upon small stalkes, as in the former, two usually together, yet sometimes but one, of a more purplish colour, and somewhat lesfer, unto whom succede blacke berries, full of iuyce, of no unpleasent taste: the roote in both are hard and woody.

3. *Periclymeno rectum fructu ceruleo.* Blew berryed upright Hony suckles.

This is also a low shrubbe rising not much higher then the last, the stemme being greater and covered with a rugged blackish barke with diuers small branches thereon, the youngest being reddish at the first, and hoary withall: the leaves stand by couples as in the rest, somewhat like unto the first, of a drying and bitter taste, the flowers grow by couples, small and pale of colour, as the first, after which cometh but one berry usually, somewhat long and round, of a blewish colour with a sweete and little tart iuyce within them, colouring the hands red that handle them, and have within them many flat seede.

4. *Periclymenum rectum fructu rubro singulari majore.* The greater upright Hony suckle.

The leaves hereof are greater then any of the former, and pointed at the ends, set in the same manner by couples, on the low stalkes, that are not above a cubit high, and they are harder in handling, Greene above and gray underneath: the flowers stand by couples as in the rest, and are of a purplish white colour, or somewhat deeper sometimes but unto them succede but one berry, the biggest of them all even as large as a cherry, red, sappy, and transparent, having two markes at the top, where the flowers grew, but containing within it but one seede.

1. *Periclymenum rectum fructu rubro.*
Red berryed upright Hony suckle.

2. *Periclymenum rectum fructu nigro.*
Blacke berryed upright Hony suckle.

3. *Periclymenum rectum fructu ceruleo.*
Blue berryed Honyfuckle.

4. *Periclymenum rectum fructu rubro singulari majore.*
The greater red upright Honyfuckle.

The Place and Time.

All these sorts were found by *Clusius* in Germany, Austria, and Syria, and some on the Pyrenean hills, and in Savoy, the most of them are kept in our Gardens, they flower in May, and the fruit is ripe in August.

The Names.

Some have called these shrubs by the name of *Xylosteum quasi Lignum ossium ob duritiem*, for they have not been known to the ancient Writers, as it is supposed, but found out by the moderne, and for the resemblance of the flowers, in likeness although not in bigness, unto Honyfuckles, and that the shrub groweth upright, not leaning or winding as the former kinds doe, they have given them the name of *Periclymenum stans* or *rectum*, as the fittest Epithite to demonstrate them, and each with distinctions one from another, as is fittest. The first is the *Periclymenum Allobrogum* of *Lobel*, and *Periclymenum rectum fructu rubro*, and the first with *Clusius*, and *Xylosteum*, with *Dodonaeus*, *Camerarius*, and *Thalium*: *Gesner* in *hortis* calleth it *Periclymeno cognatus frutex*, and *Tragus*, and *Lonicerus* in the infancy of Herbarisme, not knowing whereunto well to referre them, called it *Halimus*. The second is the second *Periclymenum rectum* of *Clusius*, and so is the third here, his third in his History of Plants. The last is *Clusius* his fourth *Periclymenum rectum*, which *Gesner* at the end of *Cordus*, his history of Plants, calleth *Chamaecerasus montana*, and *Lobel* *Chamaecerasus Alpigena*, *Dodonaeus* and *Eysenckius* *Xylosteum alterum*, *Lugdunensis* taketh it to be the *Ficus Idea* *Theophrasti*, lib. 3 c. 17. and calleth it *Ficus Idea nostras vulgo Frangula*, but *Clusius* saith, he cannot consent to that opinion, nor that it should be *Pliny* his *Ficus Idea* neither. *Clusius* saith, that they of Austria and Syria call the first *Hunds kirschen*, and *Bein boltz*, and the three first sorts *Hunds beer*, and we according to the Latine name, upright Honyfuckle. *Bauhinus* calleth all these sorts by the name of *Chamaecerasus*, whereof many doe much marvell, seeing the fashion of flowers declare plainly unto what stocke of right they are to be referred.

The Vertues.

There is no one that hath shewed these, that hath heard of any property of any of these berries or the shrubs, have in Physicke, but those that are pleasant are eaten oftentimes, and the third sort is much sought after, by the people where it groweth, to serve the Dyers use.

CHAP. L.

Gelseminum sive Iasminum. The Iasminē or Gelsēminē.

Serapio hath exhibited unto us in his workes, three sorts of Iasmines, with white, blew, and yellow flowers, whom *Tabermontanus* and others doe follow, although without all knowledge of them: divers others much doubting the truth of the blew and yellow, have thought none such to be in *rerum natura*, but time and industry; the disclosers of hidden secrets, have brought them to light, yet very lately, and scarce knowne to our world, or therein but to a few; the true yellow I will shew you in this Chapter, with divers other rare ones, some true, and some that are received for Iasmines, with divers others, and in the next, that yellow Iasmine, which formerly was taken for the right, but farre differing therefrom, saving onely in the forme of the flowers, and in the next Chapter unto that, the true sort of *Serapio*, his blew Iasmine as I verily suppose, yet because the growing thereof is not answerable to the Iasmines, but more correspondent to the *Lilac*, besides the *Persian* name whereby it came, although many of the leaves thereof resemble a Iasmine, I have placed it there, not without reason as I take it.

1. *Gelseminum vel Iasminum album vulgare.* The ordinary white Iasmine.
The ordinary white Iasmine hath sundry very long shootes from the rootes, sometimes twelve, yea twenty foote high: divided in many branches, covered with a darke grayish barke, the younger branches being greene with a white pith within like the Elder, whereon are set at severall places, long winged darke greene leaves, made of many small and pointed leaves, and the largest at the end, and longest pointed: at the toppes of the young branches, stand divers flowers in a tuft together, each on a long greene stalke, which sustaineth a small long hollow truncke, ending in five white leaves, pointed and smelling very strong and sweete, which fall away without bearing any fruit in our Country, but in the hotter where it is naturall, it beareth a flat seede like a *Lupine*: the roote spreadeth much and farre in the ground, and giveth many suckers.

2. *Gelseminum vel Iasminum Catalanicum simplex.* The single Spanish Iasmine.
This Spanish Iasmine groweth lower then the former by much, but hath leaves and flowers growing in the same manner, and differeth from it onely in the leaves, being somewhat broader, shorter, and thicker, and in the flowers which are larger, and purplish on the outside, before they be open, and white with purplish edges, when they are blowen open exceeding sweete of smell more then the former.

3. *Gelseminum vel Iasminum Catalanicum multiplex.* The double Spanish Iasmine.
This kinde of Spanish Iasmine groweth very like but lesser then the single kind shooting forth such like leaves, but of a fresher greene colour: the flowers likewise stand at the toppes of the branches, many together, but the hollow trunckes are shorter by the halfe ending in five or six leaves laid open like a starre, within which rise three

1. *Gelseminum vel Iasminum album vulgare.*
The ordinary white Iasmine.

2. *Gelseminum vel Iasminum Catalanicum simplex.*
The single Spanish Iasmine.

or five dayes, yet withering upon the stalkes fall not away, but after many dayes to abiding, another flower will breake forth of the same trunk sometimes: this hath a quicker sent then the other.

4. *Gelsemium sive Iasminum Indicum flavum odoratissimum*. The Indian most sweete yellow Iasmine. This rare Iasmine riseth in the warme Countries to be two or three cubits high, the barke whereof is smooth, and as red or purple as the Flower-gentle, spreading forth branches on all sides even from the lowest almost, and they againe divided into other lesser ones, bearing at sundry places, without order in some places, three leaves, in some five on a stalk, of a very sad or deepe shining greene colour, not dented at all about the edges, nor falling away in Winter, each part whereof is somewhat like the leafe of the Pomgarner tree, but harder and thicker, the flowers grow in the same manner at the toppes of the branches, and in tufts, formed very like unto those of the Spanish Iasmine, but somewhat lesser, yet abiding longer, and of a faire gold yellow colour, and exceeding sweete, after which succeed small round heads lesser then Olives, greene at the first, and blackish blew being ripe, cleere, shining also like a grape, standing singly, and sometimes double upon a stalk including certaine blackish long seed like Peare kernels. This plant is more easie to be propagated, either by suckers or layers, but is very tender to keepe, not abiding either the least of Winters breath nor yet the cold Autumne dewes, but much delighteth in warmth and moisture, yet neither enduring much raine or watering, to fall on his leaves or flowers, which will change the flowers paler, and the green leaves yellower, and therefore must have the moisture distilled at the roots. This holdeth the greene leaves in the Winter.

455. *Gelsemium sive Iasminum Indicum flavum odoratissimum, & tutum Virginianum odoratum scandens semper vivens*. The most sweete yellow Indian Iasmine. And the sweete yellow climbing yellow Iasmine of Virginia.

5. *Gelsemium sive Iasminum luteum odoratum Virginianum scandens & semper vivens*. The sweete yellow climbing Virginian Iasmine.

This Virginian Iasmine hath a pretty bigge woody stocke next to the ground, from whence rise sundry hard stalkes, dividing it selfe into many branches, spreading very faire upon the trees, or any thing standeth next to it, whereon are set at severall small distances, two pretty large Mirtle-like smooth leaves, but placed on contrary sides, each above other, as they are disposed in the double *Syringa Arabica*, or Pipe-tree: the flowers stand three or foure together, at the ends of the branches, somewhat like unto the former Iasmines, with a long hollow trunk, ending in five points, but not laid open into leaves like them, of a yellow colour, smelling very sweete, after which follow small, somewhat flat and long smooth yellow pods, parted in the middle all the length, full of small flat brownish seeds, winged as it were or skinny at the one end, and piled close one upon another in each side of the pod.

The Place and Time.

The three first sorts have beene brought, as it is thought out of *Syria* into *Spain*, where they thrive passing well. The first sort, which they account to be wilde, serveth to graft the other two upon, that they may grow and thrive the better; we keepe the second with much care and provision, being more tender then the first, which is growing in many places of the Land, in private persons gardens: but the third, I have not heard that it hath beene as yet brought unto us, it being as yet more rare, and as tender to keepe, if not more then the second. The fourth is held doubtfull whether it came from the East Indies, *China*, or *Japan*, or the West Indies, for divers doe suppose the one and the other. The fifth groweth in *Virginia*, as Master *Tradescant*, who saw it there doth affirme, and from him I have a plant risen of the seede. They all flower late, and none of them beare any seede within.

The Names.

The *Arabians* call the Iasmine *Zambach*, and *Sambach*, and *Iasemin* as it is thought, from the Greeke word *Iasme*, which signifieth *Violaceum*, it hath no other Greeke name, unlesse as some thinke it be the *Porhus albus* of *Theophrastus*. The first is called *Iasminum* or *Gelsemium vulgatum & album*, by all Authours. The second is called *Iasminum*, or *Gelsemium grandius & Catalonicum*, but by *Lugdunensis Iasminum puniceum*. The third is mentioned onely by *Ferrarius*, in his *Flora* or *desorum cultura*. The fourth by him also, yet mentioned in the Catalogue of the French Kings Garden at *Paris*. The fifth was never mentioned by any before, and but that Master *Tradescant* is confident to call it a Iasmine, and therefore I am content to put it with the rest to give him content, I would be further informed of it my selfe, before I would certainly give my consent.

The Vertues.

Serapio delivereth it, that the white Iasmine is hot in the beginning of the second degree, that it disscusseth humours, is good against salt flegme, profitable to old cold men, and profitable for catarrhs, and the griefes that spring from rough flegme: the leaves either greene or dry, doe cleanse freckles, spots, and discolouring in the face or elsewhere, and helpeth retters or ringwormes, and the like: it is not fit that those that are of an hot constitution should use this, for this breedeth the headache. The flowers are very sweete, and therefore they serve to strow in the house for an ornament and good sent, they use also in the warme Countries to lay the flowers among their gloves

or fine linnen, to give the better sent. The oyle that is made of the flowers by insolation is good for any col part of the body to warme it, and to ease the paines of the crampe, and stitching in the sides.

CHAP. LI.

Polemonium sive Trifolium fruticosum vel Iasminum luteum vulgare.
Shrub Trefoile or the ordinary yellow Iasmine.

Although as I said in the Chapter before, this plant is not of the Iasmines, yet because it hath by time obtained that name, and that the flowers thereof in forme resemble the white Iasmine, I thought it good to joine it next unto them, because I would not put it into their Chapter. It spreadeth white rootes in the ground farre about, rising up in sundry places with many tall and slender twiggy branches, green at the first, but after of a darke grayish colour, whercon are set at severall distances, three small darke greene leaves together on every stalke, the end leaf being the biggest: at the joynts with the leaves come forth the flowers, each singly by it selfe upon a stalke which are long and hollow, ending in five leaves usually, yet sometimes in sixe, very like unto the flowers of the white Iasmine but yellow, and thereupon it was called a yellow Iasmine, which being past, there follow other round blacke shining berries of the bignesse of a great Pease or bigger, full of a purplish juyce which will colour ones fingers that shall bruise them.

The Place and Time.

This groweth plentifully about *Mompelien*, and abideth well any where in our Country: it flowreth in *July*, but we feldome see ripe froize the con.

The Names.

It is called *Polemonium Monspeliensium* by *Gesner*, *Lobel*, *Comaratus* and *Lugdunensis*, and *Trifolium fruticosum* by *Dodonæus* and *Tabernmontanus*, who also calleth it *Ruta baccifera sive trifolia*, and *Gesner* *Ruta capraria Gallorum Monspeliensis*, and by some *Iasminum luteum Italicum*, yet *Columna* calleth it, *Iasmini species trifolia non videtur ad Polemonium accedere*, *Besler* in *horto Eyslerensi*, sheweth one with foure leaves, that are greener, and not so sharpe pointed, and *Bauhinus* *Iasminum luteum vulgo dictum, bac-ciferum*, who also giveth this note of it, that at *Mompelien* it is often found but with one leafe alone upon a stalke, although in Gardens it hath three. It is very doubtfull whether it should be the *Polemonium* of *Dioscorides* or no, for you have here the judgement of *Columna*, *non videtur ad Polemonium accedere*, although *Lobel* would make it agree in all things. Some would make it therefore a *Cytisus*, but it agree hitherto in nothing, but in having three leaves together. We cannot learne what *Italian*, *French*, or *Dutch* name it hath, but in *English* it may be called *Shrubbe Trefoile*, according to the Latine, but *Gerard* saith, it is called *Make bare*, yet I know not where nor by whom: it is usually called now *adaies* the yellow Iasmine from the likenesse of the flowers.

The Vertues.

We know not of any knowne property it hath for certaine, and therefore to give you the particullar Vertues of *Polemonium*, when as peradventure not any one can belong thereunto, were needelesse, and the ground of a great circuit.

Polemonium sive Trifolium fruticosum vel Iasminum luteum vulgare. Shrubbe Trefoile, or the ordinary yellow Iasmine.

CHAP. LII.

Syringa. The Pipe tree.

Although I have shewed you these five sorts of Pipe trees in my former Booke, yet I thinke it not unfit to present you with them againe here, and give you a full description of that sort that was defective there.

1. *Lilac Matthioli sive Syringa flore caruleo.* The blew Pipe tree or Lilac.

The blew Pipe tree riseth sometimes to be as great as a meane apple, yet usually it groweth nothing so great, having oftentimes suckers rising from the roote, the younger branches being covered with a grayish greene barke, and the elder with a darker, having within them a pith like the Elder, with two faire broad, smooth deepe greene leaves, small pointed at the ends, set at every joynt, which are some distance one from another, many of them folding the leaves inwards, standing on long footstalkes: at the toppes of many of the branches come forth many long hollow blewish purple flowers, ending in five leaves, in a long tuft together,

1. *Lilac* seu *Syringa flore caruleo*.
The blew Pipe tree or Lilac.

3. *Syringa Persica* five *Lilae folijs incisiv* *Persicam*, *Laminata Persicum*
distans. The blew Persian Salmine or Pipe tree.

4. *Syringa flore alba simplici*.
The single white Pipe tree.

5. *Syringa Arabica flore duplici*.
The double white Pipe tree.

ther, hanging downe, and are of a small sent; the flowers being past, there come sometimes, but not often in our Country, long and flat cods, consisting as it were of two sides, with a thin skin in the middle, wherein are contained two long flattish red seede: the rootes are strong and grow deepe in the ground.

2. *Lilac sive Syringa flore lacteo sive argenteo.* The silver coloured Pipe tree.

This Pipe tree differeth not from the former, either in stemme or branch, either in leafe or flowers, or manner of growing from the last, but onely in the colour of the flower, which is of a milky silver colour, which hath a shew of blew therein, comming somewhat neerer unto an ashe colour.

3. *Syringa Persica sive Lilac Persicum incisifolius lasminum Persicum dictum.*

The blew Persian Iasmine or Pipe tree.

This *Persian Iasmine* (or *Persian Lilac*, whether you will) is a shrub, or shrubby plant, never rising into a tree like the former, yeelding many twiggies, or stems and suckers from the roote, whose wood is soft having a pith in the middle, as the other, seldome rising above a mans height, having a smooth blackish Greene barke, with sundry winged leaves thereon, on all sides, some where of as well those below as above, will be whole without any division therein, resembling a Privet leafe, others will be cut in on the one side or the other, or both, and divers will be halfe like, or wholly like the posture, and divisions of the *Catalonian Iasmine* resembling it so neerely that thereby it came to be called a Iasmine: at the toppes of the sprigs and branches stand many tufts of flowers, in a long spike, of foure leaves a peece, so like unto the former Lilac, that at the first view of them you may truly, define it to be a Lilac, the colour onely excepted, which in this is more purplish, and of as sweete a sent or rather stronger: after the flowers are past, follow the like small long blackish seede, inclosed in somewhat long and pointed huskes like the former but lesser. This doth in every part, except the growth and leaves, come neerer to our ordinary Lilac, and doth in nothing but the leafe, resemble a Iasmine: for both the wood is white and pithy and the flowers grow in tufts or spikes, and appeare in May when no Iasmine doth, but the Lilac: the seed likewise is contained in hard huskes, as the Lilac and not as the Iasmine, like a Lupine, of a soft substance, and lastly the taste of this is somewhat harsh, with some attrition in the end, and the Iasmine hath a bitter sharpe biting taste, and very astringent withall. Yet as I said before, this is most likely to be *Serapio* his blew Iasmine. The roote spreadeth many branches with fibres to them, underground, and may very well be propagated by the suckers: this holdeth his Greene leaves in the Winter, no more then the others doe.

This affluently is the *Lasminum ceruleum* of *Serapio*, whereof formerly there was great doubt among Herbarists whether there were such a thing in *verum natura*, very many denying it, because they either never saw this or never considered it.

4. *Syringa flore albo simplici.* The single white Pipe tree.

This Bush never beareth any great stem or body, but shooteth forth most usually many pliant brownish twigs or shootes, and grayish when they grow elder, being pithy in the middle like the former, at each joynr stand two leaves somewhat like the former, but more rugged or crumpled, a little pointed at the ends, and dented about the edges: the flowers grow at the toppes of the branches, many set together, consisting of foure leaves, as large as the Muske Roses, and of the same cream colour, with many small yellow threds in the middle, of a strong sweete, full and heady sent, not pleasing to a great many, by reason of the strong quicknesse of the sent: after which followeth the fruit, flat at the head, with many leafy scales compassing it, wherein is enclosed small long seed: the rootes runne not deepe into the ground, but spread with many fibres thereat.

5. *Syringa Arabica flore duplici.* The double white Pipe tree.

The double Pipe tree from a short thicke stump, not rising high above the ground, shooteth forth divers long and slender branches, whereon grow large leaves, somewhat like unto the last, but not so rough or hard, nor dented at all about the edges, two alwaies standing one against another at the joynts, but set or disposed on contrary sides, and not upon two onely; at the ends whereof come forth three or foure flowers, every one on a stalk by it selfe, which are long and hollow below, like the white Iasmine, and have a double row of white round pointed leaves; two or fixe in a row at the toppe, seeming like unto a double white Iasmine flower but larger, with some yellownesse in the middle, which is hollow, of a very strong and heady sweete sent like the single kinde, and abide long flowering, especially in the hotter Countries, but is very tender, and not abiding the least cold weather with us, the cold windes greatly molesting it in the hotter Countries, and must therefore be kept with us as charily as Orange trees, or rather more.

The Place and Time.

The first groweth in *Arabia* as *Matthiolus* thinketh, who had it from *Constantinople*: but now is plentifully to be found in many Gardens of our Land as well as others. The second is a stranger with us as yet. The third is very like to come first out of *Persia*, as the name importeth, it is now to be seene with Master *Tradebant*, at South *Lambeth*. The fourth is almost as frequent as the first, but the originall place is not certainly knowne. The last hath the originall from *Arabia*, as the name importeth. The first, second, and third, doe flower in *May*, the fourth in *June*, and the last later.

The Names.

Some have taken these to be kindes of Iasmines, and that therefore the *Arabians Sambac*, doth as fitly agree to these as to the Iasmines, for *Cesalpiniu* taketh the first, which *Matthiolus* called *Lilac*, and to divers others after him, to be the *Lasminum ceruleum Mauritanorum*, or the *Ligustrum Orientale* (neither of which it can be, for the *Cyprus Pliny*, as I have shewed you before, may most fitly be called by that name, and the blew Iasmine is as I said very probable to be the third, which we call the *Persian Iasmine*) *Clusius*, *Camerarius* and others, call it *Syringa cerulea*, and *Lobel* and others *Syringa cerulea Lusitanica*, it is thought that *Belonius* understandeth this plant, where he saith that the *Turkes* have a shrub with Ivy leaves alwaies Greene, bearing violet blew flowers on a long spiked stalk many together, of the bignesse and fashion of a Foxetale, and thereupon called Foxetale in their tongue, yet this of ours beareth not Greene leaves in Winter, as *Belonius* saith lib. 3. c. 50. that doth, whether it doe therein differ from ours, or whether he be mistaken, it resteth doubtfull. Some as *Lugdunensis* saith, have taken this plant to be the *Ostrya* or *Ostrya*, of *Theophrastus*, because it beareth small seede like unto Barley, and some would have the white *Syringa* here set forth, to be his *Ostrya* likewise for the same cause, but I have shewed you the true *Ostrya Theophrasti* before, as *Clusius* hath sufficiently declared it. The second is remembered in no Authour but

but the *hortus Eystetensis*. The third is called by *Prosper Alpinus*, in his Booke de plantis exoticis *Ligustrum nigrum*, by which name it came first to *Bauhinus*, as he saith, out of Italy, and afterwards, from *Signiour Contareni* his Garden, by the name of *Syringa laciniata folijs*, which he altereth to *Ligustrum laciniata folijs*, but it seemeth he had but onely a branch to see, without flower, as it is in his description, and therefore could not further determine upon it, but I have often seene it both in and out of flower, and doe hee give you both a full and true description of the plant, and the name that both we and *Iacobus Cornutus* set it out by, in his Booke of Canada plantes, viz. *Agemilaga Persarum*, which as he saith signifieth *Lilac Persicum*, *Agem enim Persiden significat*, & *Lilac florem*, but came to us by the name of *Laminum Persicum*, because many of the leaves are formed very like those of *Laminum Catalonicum*, as I have shewed you in the description, yet the truest name to be imposed on it, is *Lilac Persicum*, as I have before shewed you, and this is that *Lilac laciniatus folijs*, that I gave you understanding of in my former Booke. The fourth is called *Frutex coronarius* by *Clasius*, and *Syringa alba* by all other Authours but *Lobel*, who calleth it *Syringa Italica*, not that he ever saw it growing naturally wilde in Italy, but that he there found it very frequent in their Gardens, *Bauhinus* calleth it *Syringa alba sive Phyladelphus Athenai*. The last is called *Sambac Arabum sive Laminum ex Gine*, so that it may not unlikey be referred to either, it is called *Syringa Italica flore albo pleno*, by *Besler*, who set out the great Garden of the Bishop of *Eystot*, although *Bauhinus* seeme to make two sorts of it, as his custome is in many other things, which it is likely he never saw, but upon *Alpinus* his resembling the leaves unto those of the Orange tree, for thereby he maketh his distinction. We may call it in *English*, either the double white *Syringa* or Pipe tree, or the double white *lasmine*, according as it is in Latine, which you will, although the single white hath nothing the like resemblance in the flower to a *lasmine*.

The Vertues.

There is no use of any of these in Physicke, that I know, and are but as ornaments in a Garden, and for the beauty and sweetnesse of the flowers there cherished, unless any would make a perfume of the flowers, by infusing them in the Sunne with oyle of sweete Almonds, or draw a Chymicall oyle out from the said flowers, by distillation, onely the last *Alpinus* sheweth the *Egyptians* doe use more for ornament to trimme up and perfume themselves, then for to helpe them in their diseases, nevertheless, they make saith he an oyle thereof, which their women use in their bathings to mollifie the hardnesse and warme the coldnesse of the mother, for by their experience they have found it to be very helpfull for hard kernels and tumours in the flesh, and to cause a more easie and speedy delivery in travaile of childbirth by drinking this oyle warme and annoynting the wombe also: Some use likewise to drinke that oyle warme, and to annoynt the stomacke outwardly therewith, against the cough and shortnesse of breath, and against the dangerous pleurisie, where one can hardly bring up the slegme, or their spittle, and against Impollutions in the lungs, and against the violent paines in the stomacke, bowels, or privities: the oyle is made after the manner aforesaid, either with oyle of Almonds or *Sesumum*, and the flowers steeped and sunned.

CHAP. LIII.

1. Oleander sive *Laurus Rosea*,
The Rose bay or Oleander.

1. Oleander flore rubro.
The Rose bay with red flowers.

Here is of this Rose bay two sorts, the one with crimson coloured flowers, the other with white, which are both so like in leafe and growing, that very hardly they can be distinguished, before they be in flower, and therefore one description shall serve for them both, and so might one figure also, but that I had them both ready cut in my hand, as I had many others, that are inserted into this Woike. The stemme or trunk hereof groweth in time with us (but much more in the hotter climates) to be as big below as a reasonable mans wrist, and divideth it selfe upwards into many stalkes, three for the most part rising at a place and from each of them likewise, three other branches, and so by degrees from three to three, as long as it groweth, the lowdest part of the branches being bare without leaves, and keeping them only at the tops at the Winter, being long & somewhat narrow, more like to those of the Peach, then Bay tree, but thicker and harder, of a darke Greene above and yellowish below, the flowers come forth at the tops onely of the branches, of a deepe crimson colour while they are in the bud, and being blowne consist of foure long and narrow leaves, with round ends, somewhat twining themselves, of a paler red colour, tending to a deepe bluish, and in the other are white, without any mixture of other colour therein, but the Greene leaves are paler or fresher: after which come long crooked pods, hard or woody almost on the outside, and browne in the hot Countries, but was never seene to beare ripe pods. I thinke in our Country wherein is contained brownish flat seede, wrapped in a great deale of most fine brownish yellow downe, as fine almost as silke, the pods being somewhat like unto the pods of *Asclepias* or *Periploca*, but larger, flatter, and harder.

2. Neri

1. *Oleander flore albo.*
The Rose bay with white flowers;

2. *Nerifacie arbor Indica.*
An Oleander-like Indian tree;

2. *Nerifacie arbor Indica.* An Indian Oleander-like tree.

Because *Lobel* onely hath set forth this branch comparing it to the Oleander, I thought good to joyn it next thereunto, although wee have no further knowledge thereof then his relation which is thus. Seven or nine of these together like unto sheathes of leather, a foote, or a foote and a halfe long, every one of them resembling a slender Lamprey, did hang downe from one place of the branch, which was like a pithy Marsh Elder knotty pale browne sticke, so nearely resembling the calt skin of a Snake, or the dead body it selfe, that it might very well fright children therewith, although stuffed on the inside with woolly skins, at the same knot with these skins came forth some flowers, growing out of small huskes, as the figure expresseth them unto you.

The Place and Time.

The first with red flowers groweth in Greece, Spaine, Italy, &c. in many places but that with white in no place but Candy, that we can heare of, and flower in July, the other is an unknowne stranger.

The Names.

It is called in Greeke Νερειον, & Ρόδονδερον, & Ρόδονδρον, *Nerium*, and *Rhodendron*, and *Rhododaphnes*, and so also in Latine by most Authours, but *Laurus Rosea* by *Apuleius* and *Lobel*, and *Rhododaphne* by *Camerarius*. The last is fo entitled and deciphered as I here set it downe.

The Vertues.

We have nothing to relate of the last, but of the Rose bay, *Dioscorides* saith it is death to Mules, Dogs, Asles, and many other foure footed beasts, that shall eate thereof, but that it helpeth men that are stung by Serpents, the leaves and flowers, being taken in Wine, but *Galen* also, *simplicium*, seemeth contrary hereunto, saying that outwardly applied, it hath a digesting property, but inwardly taken it is deadly, both to man and all sorts of cattle. *Marshallus* therefore to reconcile these two sayings, finely defineth *Dioscorides*, to understand such men as are bitten or stung by Serpents, *Galen* by such as are in health and not stung: For after the same manner, *Cantbarides* saith *Avicenna* doth helpe those that are bitten by a mad dogge, and *Euphorbium* by the Scorpion, and so likewise divers other dangerous or deadly medicines, resist the venome of other things: But *Cordus* would interpret it another way, that is, that taken inwardly it was poyson, but outwardly applied it did resist it, and saith moreover that the flowers are deadly, but in some places and at some times. Yet *Dioscorides* words are plaine, inwardly taken and drunke in Wine, with some Rue, and so *Pliny* also relateth it, as taken from *Dioscorides*, *Galen* saith that the chiefe Champions in Wrestling and Running had their backs paid with Rose bayes. The Honey of *Pontus* also was accounted deadly, because the Bees there fed on the flowers hereof, as well as on those of *Acomite*. *Lucius Apuleius* in his Asles forme, and *Lucian* also, as they write of themselves, had like to have caught their banes by mistaking the flowers, hereof for Roses, which should have holpen them.

CHAP. LIV.

Cytisus. Tree Trefoile.

Having in the last Chapter shewed you a Trefoile Isamine, which some as I said, take to be a *Cytisus*. I thinke it not amisse to set downe the kindes of *Cytisus*, next unto it, and because there is such diversity among them, I would distinguish them into two sorts, that is, into the right *Cytisus*, and those that come neereſt unto it: and into a bastard kinde, that is some that are very unlike in many things, although like in some, and others like in many yet unlike in some: the sweetnesse in their taste and whitenesse in their leaves and stalkes, declaring their rightnesse unto the true sort: their blacknesse and bitternesse, to the bastard kindes: of the first we will speake in this Chapter, and of the other in the next.

1. *Cytisus Galenicreditus Marantha Cornutus*. The supposed true *Cytisus* or horned tree Trefoile.

This *Cytisus* (as *Galen* saith groweth to the height of the Myrtle, or as *Pliny*, *Columella*, and *Strabo*, to the height of a meane tree) which many tooke as *Lycium* saith, for no other then the *Medica Lunata*, and is yet described by *Besler*, as it grew in the Bishop of *Eyslor* his Garden (to be in some sort answerable to what *Matthiolum* setteth forth of it, for acknowledging his former error, in mistaking the *Trifolium caballinum* to be *Cytisus*; and finding in *Galen* *Cytisus* was a shrub and not an herbe, he sheweth this plant, which he received from *Cornutus* as the right, and the restote could be no *Medica*, which is a small creeping herbe, as all the sorts are) and groweth to be two cubits high, covered with a grayish or ash-coloured barke, the wood whereof is firme and hard: the leaves are hoary white, as is the whole shrub, and grow without order three together on long footstalkes; the flowers are of a gold yellow shining colour like unto Broome: the feede groweth in broad crooked cods.

2. *Cytisus Creticus incanus sive Ebenus Cretica Belli*. Candy tree Trefoile, or Candy Ebony.

This Candy plant riseth up to above a mans height, that is, foute or five cubits growing writhed or crooked, and of the thicknesse of ones arme, covered with an ash-coloured barke, the leaves are gray or white, longer and narrower then the former, and grow not alwayes three, but sometimes foure or five, upon a long footstalk, the flowers grow at the ends of the branches, in a tuft together like unto those of the Meadow Trefoile, or common three leaved graffe, of a gold red colour, and greater then they: in the middle of each flower stand many silver white shining threads, as fine as haire, set in grayish huskes, wherein the feed is enclosed after wards, which is like unto that Trefoile likewise: the wood is very firme and massie, and of the colour of blacke Ebony, from whence *Honorius Belli*, did call it so.

3. *Cytisus incanus Germanicus*. The Germane hoary tree Trefoile.

This Germane *Cytisus* shooteth from the roote sundry slender hoary stalkes, with three somewhat long leaves, at sundry places of them somewhat hoary also on the backside, more then on the upper part, the middle rib being somewhat great, of a kind of sweetish taste, and a little sweete in sent also: the flowers are yellow like the other sorts or Broome flowers, standing many together one above another at the end of the branches, after which follow hairy, and somewhat hoary, little long, narrow and flat cods, containing therein small feed like broome, tasting like a Vetch: the roote is woody, dispersing it selfe under ground divers wayes.

1. *Cytisus Galenicreditus Marantha Cornutus*.
The supposed true *Cytisus* or tree Trefoile.

4. *Cytisus Hispanicus arboreus*.

The Spanish tree *Cytisus*, or tree Trefoile.

This *Cytisus* riseth up with one steame usually, covered with a darke grayish barke to the height of a man, such *Clusius* in Spaine, but higher with us, spreading sundry short branches all about, whereon are small pale greenish Trefoile leaves, on the upper side, and set with a little reddish hairy-nesse underneath, the yellow flowers are somewhat longer then others, and come forth at the foote of the leaves, in sundry places, usually two or three at a place, which turne into small short and flat cods, lesser then Broome cods, and somewhat blackish when they are ripe containing small flat and blackish seed within them: as small as Broome seed, as we have observed them, although *Clusius* saith hee saw none.

5. *Cytisus incanus major folijs pinnatis sive quinti species altera Clusij*.

The great hairy tree Trefoile.

This groweth greater and more upright then the third by much, whose branches also are thicker and more hairy: the leaves are twice as big, the flowers of a deeper gold yellow colour and the cods larger.

6. *Cytisus Hispanicus incanus sive sextus Clusij*.

The low Spanish hoary *Cytisus*.

The shootes of this *Cytisus* are not above halfe a yard long, slender and hoary, whose Trefoile leaves on them have the two lowest smaller then the middlemost, which is twice as long, but of an hoary ash-colour, standing on short footstalkes, of an altringent drying taste, the flowers stand with

the

2. *Cytisus Creticus* *incanus* sive *Ebenus Cretica* Belli.
Candy tree Trefoile or Candy Ebony.

4. *Cytisus Hispanicus arborescens*.
The Spanish tree Cytisus or tree Trefoile.

3. *Cytisus incanus Germanicus*,
The Germane hoary tree Trefoile.

6. *Cytisus Hispanicus sexatus* Clusij.
The low Spanish hoary Cytisus.

7. *Cytisus Austriacus* five septimus *Clusij*.
The Austrian or Hungarian low Cytisus.

10. *Cytisus octavus* *Gerardi*.
Gerard his eighth Cytisus.

the leaves at the joynts all along the branches, two or three together sustained by soft hoary white haires, where in they stand, why Gerard should call this kinde *semper virens*, and his Corrector after him so to let it passe, I know not, for neither *Clusius* first set it forth, nor any since him that have written of it, have so related it.

7. *Cytisus Austriacus* five septimus *Clusij*. The Austrian or Hungarian low Cytisus.
The slender lathy twiggies of this Cytisus are pliable and hard to be broken, lying on or neare the ground, which are bare of leaves, unto the branches whereon they stand without order upon long footestalkes, shorter and greener then those of the third or German sort, and more hairy, greenish above and gray underneath: the flowers grow two or three at a joynt as the last and at the ends of the branches also, yellow at the first, but before they are quite past, turne more gold yellow, so deepe that they seeme red withall: the cods are small flat and hairy, with small browne seede within them.

8. *Cytisus Pannonicus* five septimi species altera *Clusij*. The hoary low Cytisus.
This is somewhat like the last in the slender pliable twigs, leaning downe to the ground and leaues like them: the flowers also are like unto them, but stand foure or five together, at the ends of the branches, and not at the joynts as in the last: the cods and seede differ not there-from, but the leaves are a little hoary, and so are the cods also.

9. *Cytisus albanicus* *Alpinus*. The whitish mountaine Cytisus.
There is little difference in this, as by the notes thereof appeareth from others in the branches or leaves, but that at some places two or three trefoile leaues, are set at a joynt, and the flowers are paler.

10. *Cytisus octavus* *Gerardi*. Gerard his eighth Cytisus.
Gerard and his Corrector after him, mention this Cytisus as taken from *Lobel* and *Pena*, when as it agreeth with neither of those that are extant in their *Adversaria*, neither doth *Bauhinus* quote him for it, as he doth all others that he knew; for the eighth of *Tabernaemontanus*, which might seeme to be this, *Bauhinus* noeth to be his *hirsutus*: the chiefest difference therein as Gerard saith, is in the leaves, which are a little dented on the edges, which yet are not seene in the figure.

The Place and Time.

The first of these *Bartholmeus Maranta* found in Naples, and *Honorius Tellus* in Candy, as he did the second also: all the rest, except the sixth and last were found by *Clusius* in Hungary, Austria, and the parts thereabout: they all flower in the Spring of the yeare, but some earlier and some later, and give their seede in August and September.

The Names.

It is called in Greeke *κύθισος*, and *Cytisus* in Latine, a *Cythisia insula*, as *Pliny* saith, from whence it was carryed to the *Cyclades*, to the Greekes, and after to the Latines, for the wonderfull fruitfullnesse it procureth both in men and cattle, but especially in their heards and flocks: the former times as *Matthiolus* and *Tragus* shew, by their mistakings

K k k k k k

mistakings of the true *Cytisus*, were finally versed in the knowledge of plants, in that for the most part, whatsoever herbe offered it selfe next to hand, that had but some shew like the true, it was presently accepted for true, although after upon better examination it proved farre short thereof. The first of these is the *Cytisus Marantha* of *Matthioli*, *Lobel*, *Lugdunensis*, and all others, and taken by *Camerarius* and others, to be the *Cytisus verus* of *Galen*, *Dioscorides*, &c. the Italian *Pona*, confounded this and the next together, as *Bellus* seemed to doe also, in calling it *Cytisus Creticus*, which he said is like unto that of *Marantha*, yea it is the same as he thought, having the like crooked cods, to be the *Ebenus Cretica*, but he afterwards corrected himselfe, in that it differeth much from the heads of flowers and feede, from that of *Marantha*, but *Bauhinus* saith, he received from *Bellus* branches of each of these to shew the difference, so that this first is the *Lignum Rhodium*, or *Cytisus verus*. And the second is that which he first called *Cytisus Creticus*, and by the *Cretanes Archontoxylum*, that is, *nobile lignum*, which for distinctions sake he calleth *Ebenus Cretica*. The third is the first *Cytisus* of *Clusius* in his history, and the *Cytisus* prior of *Lobel*, and likewise the *Cytisus albus sylvestris* of *Cordus* in his History, although *Bauhinus* doth sever them into three sorts, as who to will heedfully marke them, shall soone see that there is no such difference in them, to cause them so to be severed. The fourth is the third *Cytisus* of *Clusius*, which *Lobel* and *Lugdunensis* call *quartus Hispanicus*, because it is so in his *Spanish* Observations, but we take them all in this worke, according to the numbers expressed in his History of plants, as I have shewed you in divers places before. The foure last sorts have in their titles, the number that you shall finde them in *Clusius*.

The Vertues.
